

# **The Influence of Internal and External Factors to the Performance of Indonesian Small and Medium Enterprises**

**Herri <sup>1</sup> Syed Azizi Wafa<sup>2</sup>**

## **ABSTRACT**

This paper try to answer two basic questions i.e., first, what is the impact of internal and external environment to the performance of Indonesian small and medium scale enterprises. Second, are there any differences between high and low performance SMEs in term of characteristics of entrepreneurship orientation, strategy, structure and environmental uncertainty. One hundred and eighty four respondents were withdrawn from four provinces in Indonesia. Research revealed that entrepreneurships characteristics and strategy as well structure contribute to the performance of Indonesian SMEs. Moreover, it was found that high performance SMEs have different internal and external characteristics compare with low performance firms.

## **INTRODUCTION**

Small and medium enterprises play an important role both in develop and developing countries (Yu, 2001). Some of these roles are as job provider, income distribution through business opportunities and rural development and also increase investment and development of entrepreneurship (Kotey and Meredith, 1997).

The role of small business is more important in developing country, especially for Indonesia (Swasono, 1986). The development of Small and Medium Enterprises (SME) have brought some positive impacts although haven't able to change Indonesian economic structure as a whole. This sector has absorbed 85% of employment in all economic sectors (Wie, 1992; Swasono, 1986). In order to empower the contribution of SMEs to economic development, Government of Indonesia has issued some financial and non financial policies to achieve the goal above (Zainuddin and Basri, 1990). However, there are still some findings about SME bankruptcy while some SMEs very success running their business instead.

Some writers believed that the performance of SMEs are contributed by many factors such internal and external to the SMEs their self (Kotey and Meredith, 1997; Pearce and Robinson, 2002). So far there is no comprehensive study about factors that contribute to development and performance of SME. Based on the facts above, this empirical study is aimed to find out about contribution of the entrepreneurship characteristics of the owner of SMEs, strategy, structure and environmental conditions to the performance of SME in Indonesia. This research is trying to answer the following questions: (1) Which one of the following factors contribute significantly to the performance of SME, entrepreneurship orientation, strategy,

structure or business environment? (2) Are there any differences between highly and low performing SMEs in term of characteristics of entrepreneurship orientation, strategy, structure and environment uncertainty?

## **LITERATURE REVIEW**

### **Factors determine Company Performance**

Performance of a business is influenced by internal and external factors. These factors are entrepreneurs characteristics of the owner, strategy, structure and business environment (Pearce and Robinson, 2000; Navahandi and Malekzadeh, 1997, Herd, Wafa and Jantan, 2001). Nevertheless, research related with factors contribute toward performance of SMEs are limited. There are only small number of research in developing countries (Bjerke, 2000). In the last two decades, it seems that researches about SME are focused about (1) government role and policy in developing SME (2) Characteristic and performance of SME (Ainuddin and Sa'odah, 2001), except Hashim (2000). In his study, Hashim (2000) by using strategic model approach explained the factors contribute to the performance of SMEs. According this model, there are three strategic factors which determine business performance, they are entrepreneurship orientation, organization structure and external business environment. The integration of three factors above significantly influent business performance.

Crag and King (1988) formulated a model to find out about SME performance. The model explains that financial performance of SME is influenced by management practice as internal factor and by market as external factor. Both variables which influent financial performance are also influenced by characteristic of manager as antecedent variable.

### **Entrepreneurship Characteristics and Performance of SME**

Some research show that there some outstanding attitudes of entrepreneur. Some of the attitude are, risk taker, proactive, more flexible and innovative (Hashim 2000; Kotey and Meredith, 1997; Ainuddin and Sa'odah, 2001). Risk taker attitude shows a tendency to challenge something. This attitude related with commitment to allocate some resources in order to get appropriate return. Risk taker attitude positively related with business performance. A business/company led by this type of manager will able to win competition to cope the market (Ainuddin and Sa' odah, 2001; Collie and Sparks, 2000). Proactive is an attitude which always try to predict the future and preparing some alternative actions to enter the future. Proactive manager will always ready to face environmental change with well planned strategy and lead the company reach better performance than the competitor.

Flexible refers to social attitude and orientation to adapt with environment. Flexible person tend to be informal challenger, self confident, humorous and easy to accept changes (Miller and Toulouse, 1986). Therefore, this person will able to sensitively anticipate environmental

change and make himself succeed in highly uncertain environment (Ainuddin and Sa'odah, 2001). Innovative attitude always make improvement and create a better and different system of activities. This type of manager use to produce new product and service to win the market (Miller and Toulouse, 1986). Therefore a company with this type of manager will highly perform (Kotey and Meredith, 1997)

## **Business Strategy and Performance**

Some experts defined about business strategy and each experts has their own definition (Mintzberg, 1994). For example, Glueck (1980) said that strategy is an action to face environment by empowering coordinated resources in order to reach the goal. Generally, there are three generic strategies at company level which can be used in competition (porter, 1980).

First, *Cost leadership*, a company will try to offer product and service with relatively lower price than competitor. Therefore a company will implement tight control and supervision. Over expenses. Second, *Differentiation*, this strategy rely competitive advantage on unique product and service produced by company without ignoring quality. Uniqueness can be showed in form of frame, technology and customer service. Last, *Focus*, a company will fully empower all resources to serve a certain segment, for example, serving a group of buyer or market segment at certain geography. In serving selected target, a company is able to use cost advantage or differentiation. A company with competitive advantage will perform better than others (Kim and Lim, 1988). However, Keen et.al.,(1998) didn't find any significant relationship between generic strategy and business performance.

## **Structure and Firms Performance**

There are two general organizational structure, mechanic and organic (Burns and Stalker, 1961, in Ainuddin ad Sa'odah, 2001). In mechanic structure, relation pattern is inflexible and formal, there is no division of work, and decision making is centralised. On the other hand, in organic structure, the relationship pattern fairly informal, the decision making involve subordinate and relatively flexible with regulation. Mechanic structure is suitable for stable environment while organic structure is suitable for dynamic environment (Miller and Toulouse, 1986)

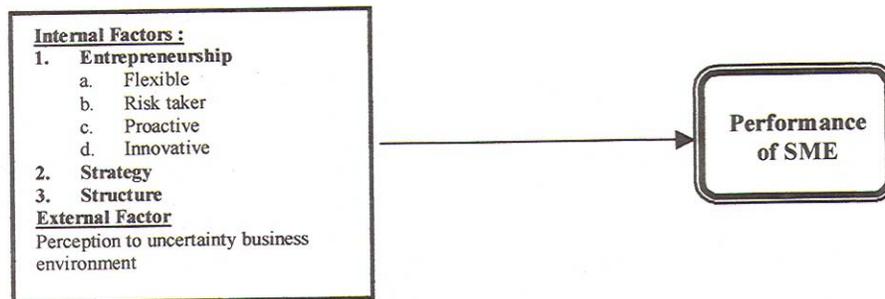

## **Business Environment**

Environment variable consist of physic and social factors which directly considered in decision making of organization (Duncan, 1972). In other word, uncertainty is a perception of someone's inability to predict something appropriately because unable to differentiate between relevant and irrelevant data (Milliken, 1987).

Environment condition directly influent company's ability to reach the goal (Pearce and Robinson, 2000), external environmental change such as, government policy, public taste, technology and socio-cultural bring effect toward company's performance. Freeman (2000) concluded that base on observation in some countries, external condition, especially government policy significantly influent performance of SME.

## Research Model

Base on literature review, this research will use the model, as described below:

**Figure 2. Theoretical Framework**

Research design above shows that performance of company is a function of internal and external factors. Success in improving performance depend on some factors such as attitude, entrepreneurship, strategy, structure and environment.

## Hypotheses

Based on the literature review and research model therefore the hypotheses of this research are:

Hypotheses 1: Entrepreneurship orientation of the owner, organizational structure, strategy and business environment will contribute to the performance of SMEs.

Hypotheses 2 : There will be difference in term of their entrepreneurship orientation, strategy, organizational structure and business environment between high and low performing SMEs

## METHODOLOGY

### Sample

Object and unit of analysis of the research is SME in Indonesian listed in Directory of Indonesia's Manufacturing Company in the 2001. The directory contains information about company's name, address, number of employment, product and contact person of about 20.000 companies.

Mostly SME located in Java & Sumatra, therefore, sample were taken from both island. According to Sekaran (2000) to guarantee generalization of the result of the research for this

research samples were targeted, as much as 377 firms. Anticipating low rate of respond rate, selected samples were greater than targeted sample (Newman, 2000). Based on condition above, the research selected about 500 SMEs as targeted sample by using stratified random sampling. Among the 500 questionnaire send to SMEs chosen as the respondents, only 183 questionnaires returned back, giving the 37 % respond rate.

## **Measurement**

### **Strategy**

Measurement for strategy is adapted and modified from Govindarajan (1989) dan Dess & Davis (1984). There are 12 items used to measure generic strategy prioritized by the SMEs by using Likert-scale from 1 to 7 (from 1 very prioritized to 7 un prioritized).

### **Entrepreneurs Orientation**

Measurement of Entrepreneurs Orientation such risk orientation, innovativeness,

### **Performance**

Financial performance is measured by using average return on equity (ROE) and sales growth in last five years. This measurement Prestasi diukur dalam bentuk data objektif dan diukur menggunakan persepsi manejer/pemilik tentang profitabilitas, pertumbuhan penjualan. Pertanyaan untuk mengukur prestasi subjektif ini menggunakan pertanyaan yang dikembangkan oleh Sulaiman (1989).

### **Entrepreneurship orientation**

This research use the measurement developed by Miller and Friesen (1982); Nahavandi dan Malekzadeh (1997) to measure the entrepreneurship orientation with the some modification and adaptation. The entrepreneurship orientation cover attitude toward risk, innovativeness, flexibility and proactive. There 16 items used that measure using Likert scale from 1 to 7 (from 1 highly agree to 7 highly disagree).

### **Organizational Structure**

This variable is measured by using questionnaire developed by Miller dan Friesen . (1982). Items related with work relationship and Likert berskala 1-7 (highly agree to highly disagree).

### **Environmental Uncertainty**

Environmental uncertainly will be measure by using questioner which developed by miles & snow (1978). The measurement used some question related to environment dimension such as : marketing condition, government policy finance, labor and competition. The measurement used Likert scale from 1 - 7 (from very predictable to very unpredictable). From the questioner

acquired some values which describe perception of manager owner of SME toward environmental uncertainty, the higher the value, the higher the environment uncertainty.

## **Organizational Structure**

Variable of organizational structure will be measured by using questioner which developed by Miller & Friesen (1982). Questioner related to organizational structure by using Likert scale from 1 - 7 (from strongly agree to strongly disagree). The higher the mean score given by respondent, the structure tend to be more mechanistic.

## **Data Analysis**

Number of research simple is 184 SME (Sole proprietorship) samples were taken in 4 different provinces, Jakarta Special Territory, west Java, west Sumatra and north Sumatra. Samples were distributed proportionally in all provinces. Fifty one sample (27,7 %) coma from DKI, fifty sample from west java and for west and north Sumatra ware 49 and 38 SME

## **Legal form of Company Business**

Composition of sample consist of 95 sole proprietorship firm or 51% of total samples, 51 firms or 27,7% ware corporation, 31 firms or 16,8% leave limited corporation and 3 samples or 1.6% were cooperation and other 2.2%

## **Number of Employed**

Sample company generally consist of 28 employed, where as minimum number is 5 and maximum number 170. Based on number of employed sample can be grouped into categories. Company with employee < 19 persons, between 20 and 99, and > 99. There 93 companies which have less than 19 employee and 88 company have between 20 to 99 employee and 2 companies have more than 99 employee.

## **How business Started**

Among 183 samples, 149 or 81 % of total sample started the business from 2000. 26 sample or 14.1% more continuity of parents business and sample that start the business through acquisition and other way were 8 or 4.4%. This composition show that company sample are started by entrepreneur.

## **Amount of Equity and Source of Initial Equity**

Majority of initial equity is less than 10 million Rupiah or 94 sample 51.1 % samples that use initial equity four 10 to 50 million Rupiah. There are 42 or 22.8%, 24 samples or 13.0% from 51 to 100 million and 23 samples or 12.5% bigger than 100 million.

Generally initial equity come from saving, 109 samples (59,2%). The second sources are loan/debts, 50 samples (27.2%) and 29 samples or 12% use other sources.

## **Product Market**

Most of 183 samples sell their product around the business location. There are 111 or 60,3% samples sell their product around the business location, 24 samples or 13,0% sell their product to other provinces, while 37 sample or 20,1 % to other town. Sample that export their product just 11 or 6%. Base on market composition, most of SME sell their product around the business location or locally, but some of them have tried to enter international market.

## **Company's Age**

As can be seen in table 4.1, the first SME was started in 1957 and the newest was started in 2000. It means the eldest company is 45 years old, while the youngest is 12 years old. In average most of SME started in 1992 or their average age is 9,377 years.

## **Manager's Characteristics**

Table 2 shows characteristic of entrepreneur of research sample. The characteristic consist of age, position in company and formal education background

### **Sex**

Most of entrepreneur are male, 145 samples or 78,8%, while female just 38 samples or 20,7% from 183 samples.. This composition shows that SME is more interesting for male than female.

### **Position in Company**

As can be seen in table 2, 137 samples or 74,5 of managers are owner of SME. There only 38 samples or 20,7% of sample just as manager, while only 8 samples or 4,3% as member of company. These figures show a phenomena that most of SME are led directly by the owner. There only few SME which led by professional manager

### **Formal Education**

Among 183 samples, more than a half or 45% are senior high school graduates. While bachelor only 12,6% and the smallest are diploma graduate, only 8,7%. This composition shows that generally, educational background of sample are relatively high. It is interesting to note that some of them are bachelor and certainly will influent the way they manage the business.

### **Age**

In average, the age owner are 43 years old, while there are 97 of respondent younger than 43 and 85 elder than 43 years old.

**Table 2**  
**Characteristic of Respondent**

	Frequency	Percentage (%)
<b>Sex</b>		
Male	145	79,2
Female	38	20,8
<b>Total</b>	<b>183</b>	<b>100</b>
<b>Educational Level</b>		
< Junior high school	41	22,4
Senior high school	103	56,3
Diploma	16	8,7
Bachelor	23	12,6
<b>Total</b>	<b>183</b>	<b>100</b>
<b>Age (year)</b>		
<43	97	53
>43	85	47
<b>Total</b>	<b>182</b>	<b>100</b>

## Validity and Reliability Research Instrument

Test Validity conducted with analyze factor to question used to measure the nature of entrepreneurship. to know reliability seen from Cronbach Alpha. Questions. told enough reliable if Cronbach Alpha is the than 0,50. conditions used to determine questions which enter in one factor if loading factor equal or more than to 0,3 and if all loading factor for a few factor, hence the questions aborted because do not authenticity as a means of measure.

## Validity of Entrepreneurship measurement

Factor analyze run for 16 questions used to measure the nature of the entrepreneurship gave 6 factors (variance 64,31 %, KMO=0,645, sig =0,000). First factor consist of 4 question which comprising the nature of innovation, pro-active and risk, pursuant to payload factor from each question, this factor is named with nature of creative and dare to (IRP) with Cronbach Alpha (*ci*) is 0.68. The second factor consist of two question, based on the factor loading the factors is called Innovative (II) and its Cronbach Alpha is 0,68. Third factor contains two item that related with risk and innovation (IP) and its Cronbach Alpha is 0,64. whereas sixth and fifth factor do not have good enough reliability hence it can not be included for further analysis. Instrument reliability can be seen in Table 3 as following:

No.	Names factor Variables	Number of Question	Cronbach Alpha
1	Innovative and Risk Averse	4	0,68
2	Innovative (II)	2	0,68
3	Active pros (PP)	2	0,56
4	Innovative and Active pros (IP)	3	0,64

## Tables 3, Number of Question and Cronbach Alpha of Entrepreneurships Measurement

### Organization Structure and Strategy

There are 15 question used to measure SMES business strategy. Result of reliability test to that question got by Cronbach Alpha equal to 69,90. Reliability test to question which measuring organization structure at SMES obtained by Cronbach Alpha 73,30. this variable can be analyzed furthermore because owning high reliability, from result of reliability test and validity to used instrument hence concluded that the instrument valid enough and reliable.

### Result

Existence of internal factor influence (entrepreneurships, structure of organization, and strategy) to SMES performance. following representing result of hypothesis test use Ordinary Least Square (OLS) analysis, independently variable of nature of entrepreneurships, strategy, structure, environmental with SMES profit margin as variable dependent. from regression analysis seen that internal factor variable which cover the nature of entrepreneurships, strategy, environmental and organizational structure of SMES give contribution to margin of profit variation by significantly ( $R^2=21,7$ , assess  $F=6,94$ ,  $p=0,000$ ). pursuant to result of this analysis hence acceptable hypothesis

Partial analysis show that strategy significantly influence the performance of SMEs ( $t=3,766$ ,  $p=0,0,000$ ,  $B=2,403$ ) so also the things of with environment ( $B=5,040$ ,  $t=6,276$ ,  $p=0,000$ ). Negative number shows progressively SMEs make account of emphasis at repair and thrift (modification) to business operation hence excelsior of performance. Nature of innovative entrepreneurships and take a fancy to risk (IRP), active pros (PP), and innovation by partial influence SMES performance.

**Table 3**  
**Summary Result of Regression Analysis**

Model	B	t	Sig
(Constant)	-4,750	-,559	,577
Environmental Uncertainty	5,040	6,276	,000
STRATEGY	2,403	3,766	,000
STRUCTURE	,277	,243	,808
IRP	7,458	2,915	,004
II	-3,997	-2,044	,043
PP	-2,765	-2,490	,014
IP	-1,544	-1,123	,263
$R^2$	21,7		
F	6,94		
Sig	0,000		

## **Hypothesis 2**

In this hypothesis test, SMES performance to the two group that is which have high performance (margin of profit > sample mean) and SMES of including faction have low performance if small margin of profit from sample mean.

Result of Test T (t-test) seen to have tendency is existence of difference of internal factor (nature of entrepreneurships, strategy, organization structure) and external (environment) among SMES which is have low performance and condition have high performance to SMES which is have high performance to have big margin of profit from 20%, more flange to emphasis strategy and cost-saving repair of process compared to SMES owning margin of profit <10. But that way, this difference not all significant, difference which is significant met for the characteristic of strategy (assess  $F=14,807$ ,  $p=0,000$ ) and nature of active pros (assess  $F=6,011$ ,  $p=0,015$ )

## **Analysis**

### **Internal Factor of SMES And Performance**

Statistical descriptive data show that generally SMES have good performance in the last three year even though Indonesian economy is still in crisis. This can be seen from their performance resilience from SMES in face of environmental situation of business although found the existence of crisis impact to SMES activities (Corpulent, 2000). Efficacy of SMES face crisis might be because of internal factor, like nature of entrepreneurships, relation pattern in used strategy and company in face of change

Nature of entrepreneurships represent of resources which can processed to become excellence compete (Littunen, 2000). Responder measuring up to entrepreneurships like having or creativity have innovative head, like risk and active pros to always to look for unusual action to face emulation of business (Miller & Toulouse, 1986). while less owning responder of creativeness and fear to take risk bring an action against which is "peaceful" and tend to as follower and often lose time in grabbing opportunity (Nahavandi & Malekzadeh, 1993). Creative entrepreneur and innovative also measure up to be never give up and accompanied with attitude like to strive and have life style which orienting at higher level performance (Atkinson, Bartlet & Duchemenaut, 1997)

### **Organizational Structure**

Although result of research shows relation among structure with performance did not find any significant, but that way, from this result is known that at informal structure, flexible and decision making have the character of democratic will push atmosphere creation which is conducive for the creativity. So that will create new idea able to fulfill requirement of consumer (Miller & Toulouse, 1986).

### **Environmental Uncertainty and SMEs'S Performance**

This research show that environment have an effect to SMEs'S performance. Environmental change of external like change of governmental policy, and change of society, technological change and social change of culture giving impact to company which finally will influence

company performance. This result is in line with Freeman's study (2000) that found out that the condition of external environment especially government policy has a significant impact on the SMEs' performance.

The ability in formulating and implementing the strategy in facing the environmental background, personality of manager, job experience, leading company (Herri, 2002). Manager which is innovative and risk taker for example facing change of social values and or technological change by implementing differentiation strategy. Creative and innovative managers tend to create marketing strategy and product and production matching with consumer needs. They can come up with difference and in advance step into market to fill the need of customers and enable to conduct market penetration and improve advantage (Porter, 1980)

## **High and Low Performing SMEs**

Result of research shows that SMES which have high performance have more giving characteristic emphasis cost-saving, marketing method modification and production, and also build good with consumer and also measure up to active pros. This matter can be explained that company clearly define the way of competing will be more have better performance (Porter, 1980). In a condition changing swiftly hence appropriate strategy is strategy which orienting at unique (Miller & Friesen, 1982) this matter can explain why company which have high performance to differ in the case of strategy compared to company which is have low performance, that is condition of Indonesia business environment changing swiftly is so that needed by strategy which is creative and innovative.

## **Conclusion and Suggestion**

As conclusion of this research is internal factor especially strategy, structure and entrepreneurships orientation contribute to the SMEs' performance. Strategy which prioritize modification and cost-cutting and also the nature of entrepreneurships which active, taking a fancy to innovative and risk taker and play a part in to determine storey; level advantage of SMES

Perception to environmental uncertainty is also influenced by SMES performance, this matter because of environmental change which deliver opportunity and threat. Company capable to harmonize change with strategy more success exploit opportunity and threat is minimized.

Ability to yield and strategy adaptation depend on nature of and entrepreneur characteristic. entrepreneur which is innovative, creative, like to account risk tend to embrace strategy which is "other" or which is unique than with competitors (Herri, 2002) :

Although environmental condition of not yet stabilized because Indonesia not yet convalesce the than economic crisis. SMES still able to performance menunjukkan is effort good, that is with profitability storey level more than 20%. authorized capital Founding of SMES generally come from saving, this matter can show that the limited SMES capital employed in opening effort

Authorized capital used to found SMES come from saving which [is] its limited amount which also pursue them to be able to go further, will very assisting if there [is] skim addressed to assist small industry in founding effort. And development of entrepreneurs orientation such as those which told previously can be disseminated by various method and forum among others with training, discourse, and discussion.

## Implication

This research give contribution to improvement the practice of SMEs, and made as basis for compilation of policy and also add research related with SMEs'S performance. Among its implication is that the importance of developing of nature of entrepreneurs giving contribution to SME's performance like risk averse and innovative. Performance not only influenced by internal factor like entrepreneurs attitude but also by external environment of SMES.

## Future Research

Although the number of sample of this study is quite large enough, however considering the large number of SME's in Indonesia. It is advisable to conduct the same research to confirm the result of this research using larger sample.

This research samples almost 100% are coming from manufacturing sector and the result is limited to this sector. For the future research, there is a possibility to use another business sector such as service or trade industries as a sample. And it will enlarge the generability of the study. Moreover, related research in the future can use behavioral and entrepreneur life style instead as the independent variable that can predict in determining the variation SME's performance.

# **EXPERT SYSTEM PARAMETERS FOR EVALUATING REASONING OF SME'S ENTREPRENEUR**

**By**

**M.A.Hegazi <sup>1</sup>**

## **ABSTRACT**

Small and medium enterprises (SME) have remarkable role in social and economic development. SME's entrepreneurs use their reasoning and knowledge in evaluating opportunities; sometimes they face confusing situations between accepting and rejecting these opportunities.

Expert Systems (ESs) are used as computer system to mimic the human experts in solving complex problems in specific domains, these ESs acquire huge amount of knowledge and reasoning.

This paper aims at initiating some parameters of evaluating the reasoning of SME's entrepreneurs using ES. The knowledge base (KB) of the ES includes marketing strategy, marketing segmentation, pricing and promotion domains.

## **RATIONALE**

Small and medium enterprises (SMEs) have remarkable role in social and economic development. The roles of SMEs in the social and economic development are respectively [5]: Raising productivity through technical, and other forms of innovation. Creating more jobs for the unemployed. Facilitating the transfer of technology. Commercializing new inventions and products. Restructuring and transforming the economies of the nation. Reducing the unprogressive social organizations. Making markets more competitive. Stimulating redistribution of wealth, income and political power within societies in ways that are economically positive and without being politically disruptive. Improving the premature talents of human resources. Creating new markets and facilitating their expansion into international markets. Performing these roles effectively is conditioned by entrepreneur's reasoning ability to explore and interpret opportunities.

## **INTRODUCTION**

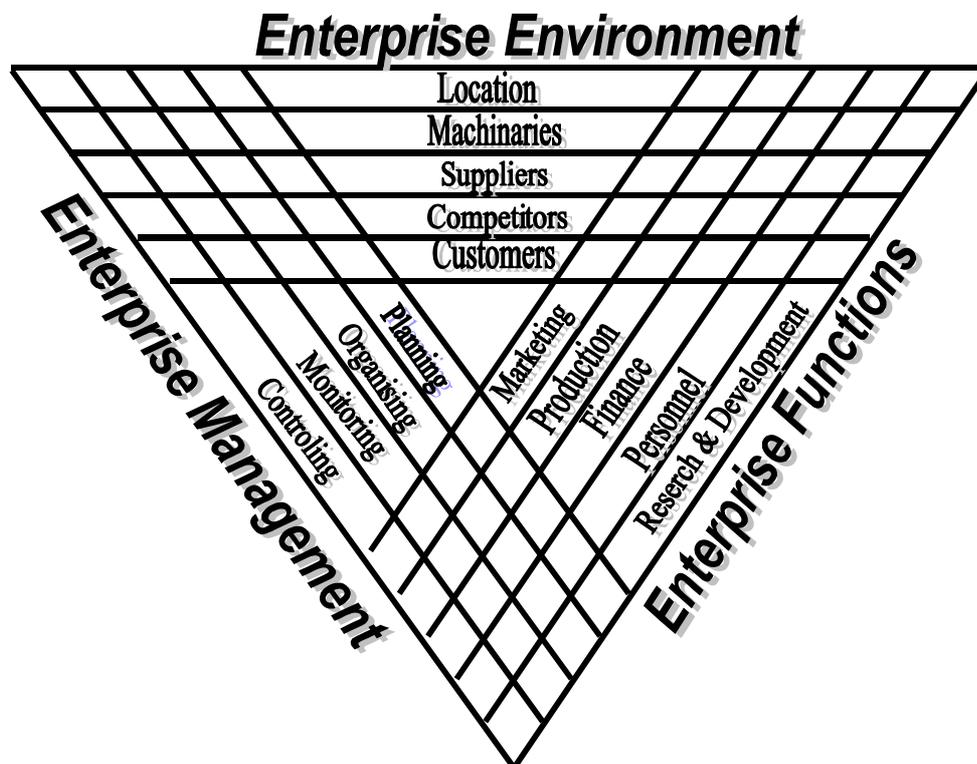

There are many definitions of SME; the definitions of SME cited in this paper are based on two sets of considerations. First set includes social and economic considerations; SME must be defined according to its expected role in the social and economic development. The second set of considerations include the enterprise ecology, i.e. SME's entities belong to large enterprise entities, in so far as its environment, management function, and enterprise functions.

**Social and economic considerations:**

The SME roles in the social and economic development can be performed if and only if entrepreneurs themselves manage SMEs.

**Enterprise ecology considerations:**

For all enterprises, they are composed of three main parts, enterprise environment, enterprise functions, and enterprise management. Enterprise environment, being a sub-environment of the general external environment, and the direct interface between enterprise and the external environment, consists of five entities: customers, suppliers, competitors, machinery, and location. Enterprise functions, which are the tools of interpreting the enterprise environment and transforming it into products or services, consist of five entities: marketing, production, finance, personnel, and R&D functions. Enterprise management, which is the brain of enterprise in achieving its objectives, consists of four entities: Planning, organizing, controlling, and monitoring functions. All these entities are interrelated and constitute the second set of considerations, as shown in Figure 1.

On the basis of the previous sets of considerations. The definition of Small Enterprise: "An enterprise owned by an entrepreneur, where all enterprise functions and

management are run by him". The definition of Medium enterprises: "An enterprise owned by an entrepreneur, where all enterprise functions, and management are mainly run by him with some other delegations". The definition of large enterprise: "An enterprise owned by stock holders, and is directed by a board of directors, where all enterprise functions, and management are run by specialized managers". Figure 2 represents the differences between small and large enterprises, where medium enterprises are a transition state between the small and large enterprises.

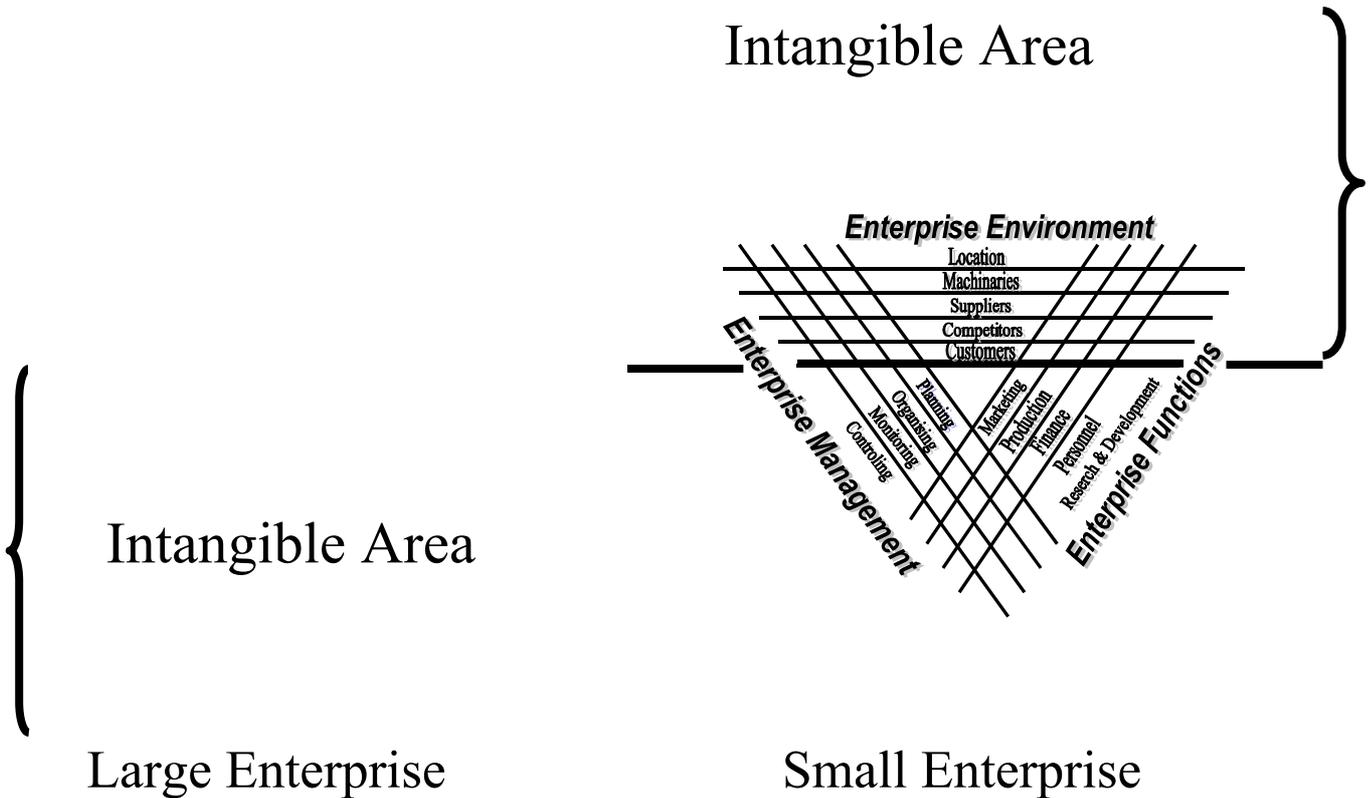

Figure-2

**Expert system:**

is a computer system used to mimic the human expert in solving a complex problem in a specific domain. ES is a branch of Artificial Intelligence (AI) [3]. ES is composed [1] of five parts, Knowledge Base, Inference Engine, User Interface, and Development Engine. Knowledge Base: contains all facts and their relations in a specific domain. Inference Engine: is the thinker of the system, which is able to think on the basis of the available knowledge included in the KB. User Interface: is the interface between the user and the ES, which has the ability to respond to the user in friendly interface, using the available knowledge and type of reasoning. Development Engine: is the tool used to develop the expert system by knowledge engineers and human experts.

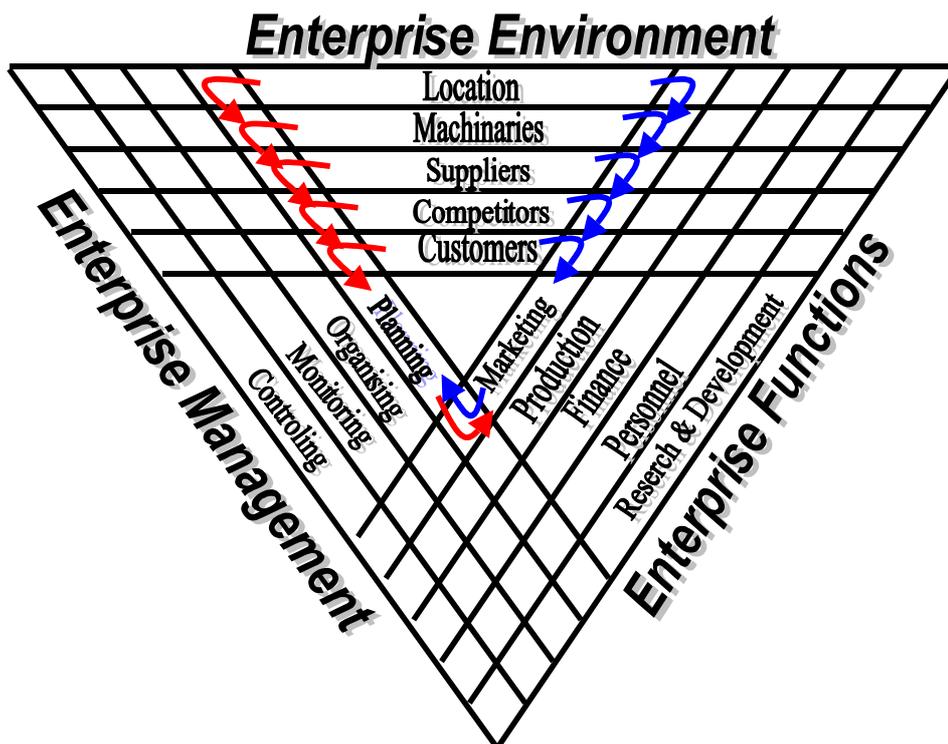

Expert system is developed through five steps. Step-1: identification and definition: At this step the domain problem will be defined. Step-2: Developing prototypes: Where the definition of the problem is completed, the ES developer should develop some prototypes to be sure that they get the right definition of the problem.

Step-3: According to the problem definition and the developed prototypes, ES developers will construct the ES using the available tools. Step-4: After constructing the ES, it should be tested by a set of human experts, providing that the results of this testing concludes that the ES and the human experts are agreed on 90%. Step-5: This is the last Sept and includes the ES maintenance and integration, where ES should be updated and integrated with whatever applications related to the same filed of interest.

At this paper, ES development will be confined to step2, where a prototype has been developed to investigate entrepreneurs' reasoning in assessing their business opportunities.

**SME's environmental changes and reasoning:**

Entrepreneurs' ability of adaptation depends on their capabilities of interpreting how to distinguish between opportunities and threats under environment changes. Opportunities are created if at least one entity of the enterprise environment changes from one state to another, as shown in red flow, Figure-3. Threats are created if at least one entity of the enterprise environment changes from one state to another, without adapting these changes by the enterprise functions, as shown in blue flow, Figure-3.

**Problem domain:**

Based on these definitions of SME, two of three parts of SME are hidden in entrepreneur's mind. Entrepreneur's decisions are taken on the basis of his/her faculty of previous

knowledge and reasoning. Reasoning is drawing conclusions from a set of facts [2], there are many types of reasoning used by entrepreneurs to solve their problems, such as spatial, memory-based, commonsense, default, causal, and case-based reasoning. There are many types of management problems, which face entrepreneurs during the enterprise life cycle, and they get used to solve these problems by reasoning. These problems are interpretation, diagnosis, debugging, prediction, planning, monitoring, and controlling problems. Problem domain will be confined to the interpretation problem.

**Interpretation problem:**

This type of problem occurs during explaining summarized results from enterprise environment changes. The explanation process is composed of two cycles. The first cycle of explanation: the enterprise management (planning entity) should transform the enterprise environment changes to opportunities, as shown in Figure 3, in red flow. The second cycle of explanation: the enterprise management (planning entity) should transform the enterprise environment changes to threats on its market situation if it failed to acquire the opportunities, as shown in Figure 3, blue flow.

Interpretation is a mental process, where entrepreneurs' decisions depend on their knowledge and some types of reasoning.

Interpretation problem is a function of time, where social needs changes by time, and also of the competition gape, as shown in Figure 4.

Interpretation of the social needs should be faster over time long. Otherwise the enterprise will lose its competitive advantage, which is the core of problem, where ES is used.

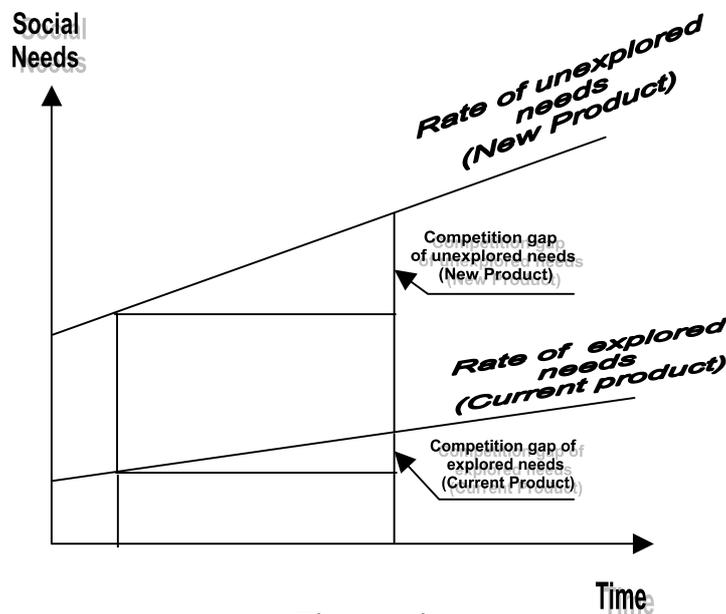

Figure-4

**Expert system parameters:**

The objective of these parameters is to explore the hidden domain of entrepreneur's reasoning in solving SME's problems in assessing opportunities. A prototype has been developed as a tool of investigating the interpretation of the entrepreneur's reasoning.

The parameters of ES for evaluating reasoning of SME's entrepreneurs of assessing opportunity will be confined to two types of SME's management problems: interpretation, and diagnosis problems, and to one type of entrepreneur's reasoning: case-based reasoning. The parameters of ES will consist of two parts: KB parameters, and User interface parameters.

**KB parameters:**

The knowledge domain used in the ES prototype consists of two types of knowledge [4]. The first type is marketing segmentation, which used as Knowledge Interpreter (KI) in interpreting the customers entity of the enterprise environment changes to a set of opportunities, as shown in class2, and class3, Figure 5. The second type of knowledge is marketing strategy, which used as KI to interpret the enterprise environment changes to threats on the marketing situation, as shown in class0, and class1, Figure 5.

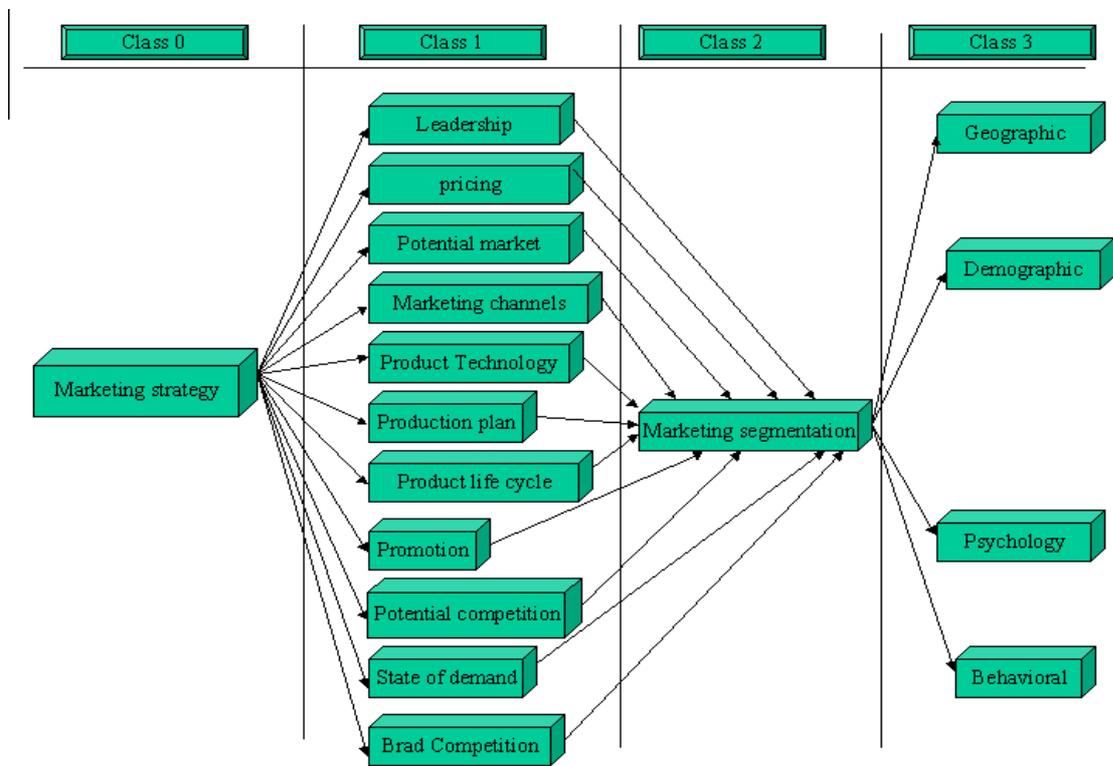

Figure 5

**User**

**Interface parameters:**

The interface used in the prototype is menu drive windows as shown in figures 6, 7, 8, 9, and 10 respectively

## Figure-10 – Marketing strategy

## RESULTS AND CONCLUSIONS

Results focus on two subjects. First, the effect of using KI in interpreting the enterprise environment changes to opportunities and threats. The second subject, observation on the entrepreneur's reasoning of interprets opportunities and threats.

## RESULTS

1. The ES prototype interpretation on 24 cases of SMEs, shown that 95% of the ES conclusions are in agreement with the human experts.
2. The ES prototype assets 88% of SMEs in interpretation opportunities and threats.
3. Experimentation shows that the entrepreneurs are accustomed to use spatial and default reasoning in identifying enterprise opportunities and threats.
4. The tentative planning manner is used for the planning and follow-up of the SMEs, it assists in minimizing their risks, while it slows their potential growth rate.
5. The main functions of the entrepreneurs emphasize of using heuristic approach in solving their problems.
6. The developed ES prototype demonstrates that it can interact with the entrepreneur's marketing.

## CONCLUSIONS

From the previous results of the ES prototype it is concluded that: The ES is considered as a reliable and efficient tool that could assist business incubators in achieving the followings:

- Assessing entrepreneur's reasoning in the domain of business opportunities.
- Approving the credibility of the SME to be granted loans.
- Training the new entrepreneurs in planning and follow-up of their enterprises.

## FUTURE RESEARCH DIRECTION

Interpretation is not only the unique type of problem that faces Entrepreneurs while managing their SMEs, but also there are different types of them, such as diagnosis, debugging, prediction, planning, monitoring, and control reasoning. This type of reasoning should be taken into consideration in case of supporting entrepreneur in SME development.

**Diagnosis problem:** This type of problem occurs during identifying causes of given information about customers, suppliers, competitors, machinery, and location, in order to identify the appropriate strategy of marketing, production, financing, personnel, and R&D.

**Debugging problem:** This type of problem occurs during formulating strategies into the enterprise functions based on given constraints of customers, suppliers, competitors, machinery, and location.

**Prediction problem:** This type of problem occurs during inferring likely consequences of the hypothetical strategies of enterprise functions in a specific product or service.

**Planning problem:** This type of problem occurs during devising a method for making enterprise strategies achieve their objectives.

**Monitoring problem:** This type of problem occurs during comparing observations of the enterprise environment with established standards of enterprise function strategies.

**Controlling problem:** This type of problem occurs during guiding the enterprise function strategies, based on the enterprise environment.

## **ABSTRACT**

The current researchable proposition, “the relationship between spirituality and entrepreneurship as the driving force behind their success,” has emerged from two previous studies conducted by the researchers. The answer to the broader question required an in-depth study of entrepreneurs, specifically to explore the underlying factors surrounding their personal values and sense of spirituality as it relates to their business and their current work life experiences. To answer those questions, twenty entrepreneurs from a diverse group, based on gender, years in business, level of profits, size, and industry, were interviewed. The respondents gravitated to one of two main motivational factors. On one end of the spectrum there were a group of respondents motivated by the accumulation of wealth. While on the opposing end, another group existed whose ultimate source of motivation rested on the belief that the entrepreneurial experience would allow them to fulfill their emotional and/or spiritual void. The most interesting finding was the subset of entrepreneurs with low socioeconomic upbringing that appeared to “straddle” the motivational spectrum by displaying an equal measure of motivational attributes from both ends of the spectrum, wealth accumulation and spiritual/emotional. A hypothesis, which needs further testing, suggests that a low socioeconomic life experience is a major contributor for their hybrid status. In addition, there was a notable difference in the entrepreneurial experience of respondents with an entrepreneurial role model and those that were foreign born.

# INTRODUCTION

The life of an entrepreneur is typically far more stressful than that of their corporate brethren. Since the ultimate success or failure of their business entity falls squarely on their shoulders, entrepreneurs must assume more areas of responsibility. An additional source of stress for entrepreneurs derives from the higher level of instability that is inherent to entrepreneurial ventures. More times than not an entrepreneur must work without the security of regular paychecks, medical insurance, and retirement funds, which as a result increases their level of anxiety. Research has shown that the average work day for an entrepreneur can easily stretch to twelve hours or longer (Jamal and Badawi, 1995), and because entrepreneurs frequently do not have a clear separation between their work and non-work activities they face higher levels of stress at work and its demands often dominate their lives (Jamal, 1997).

So the question is why, why would a person of sound body and mind willfully decide to pursue such an arduous lifestyle? What is it that drives a person to become an entrepreneur? Is it innate or is it a product of a set of life experiences? Do entrepreneurs possess an assemblage of personality traits that pull them into entrepreneurship or does their motivation lie in external factors, which push them to initiate self-employment? The research project detailed in this paper investigates the motivational factors that drive entrepreneurship by examining previous correlating research studies, as well as an analysis of in-depth interviews of a diverse sample of entrepreneurs.

## BACKGROUND LITERATURE

### Tug of War (Pull vs. Push)

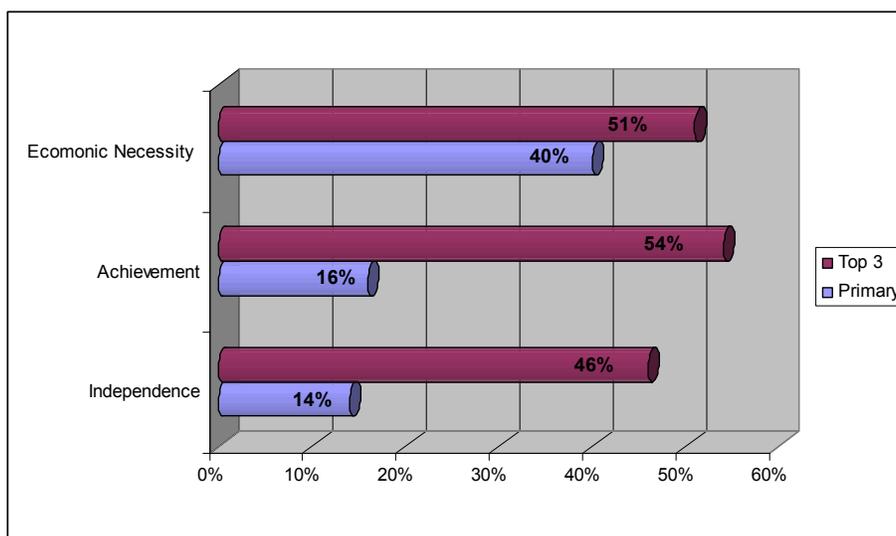

Two streams of thought have developed as to why an entrepreneur assumes the personal, social, and financial risks associated with initiating a venture; one school of thought suggest that intrinsic factors drive some individuals to engage in entrepreneurial behavior. This ideology characterizes the pull theory, wherein an individual's need for achievement (McClelland, 1961), internal locus of control, belief in self-determination (the belief that the outcome of events will be influenced by the individual's efforts) (Rotter, 1966, Brockhaus, 1982), higher propensity for risk-taking (Slevin and Covin, 1992), and strong sense of personal ability to perform (Boyd and Vozikis, 1994) beckon them into entrepreneurship. The opposing stream of thought maintains that negative situational factors result in some individuals being pushed into entrepreneurship. Among the negative events that have been categorized as push factors are low level of job satisfaction due to a lack of spiritual fulfillment (Mitroff and Denton, 1999), economic necessity, conflicts at one's place of employment, joblessness (Olofsson et al., 1986), career setbacks (Gilad, 1986), and limited alternative opportunities (Greenberger and Sexton, 1988). There is empirical evidence in support of both the pull and push theory, (Gilad, 1986, Hisrich, 1988, Olofsson et al., 1986). So the question follows, is the entrepreneurial spirit the product of pull or push factors, or are both needed

## One Size Fits All?

Entrepreneurs come in a multitude of forms; they differ by gender, ethnic background, nationality, religious affiliation, and socio-economic status. Therefore, it would follow that the motivational factors responsible for their entrepreneurial drive would vary as well. There are several studies that affirm this logic; a recent survey fielded by The Hartford Financial Services Group (Cooper, 2002) found that 60% of individuals that wanted to start their own business were primarily motivated by financial success, while the main motivator for established business owners was the ability to make their own schedule (62%), demonstrating that there are stark differences in motivation between would-be entrepreneurs and current entrepreneurs. A research study conducted in England by the Small Business Service (2001) found that entrepreneurs belonging to a minority ethnic group derived a higher level of motivation from the respect drawn from working for oneself, the ability to be at the forefront of ideas, and having the opportunity to lead and motivate others than their non-minority counterparts, substantiating that there are major motivational differences among entrepreneurs of differing ethnic backgrounds. While yet other surveys administered among men and women business owners have revealed money as a greater motivational source for men, while women were found to be more inspired by the business idea itself (Barclay, 2000; DeMartino and Barbato, 2001), noting that there are indeed disparities for entrepreneurial motivations between genders as well.

Researchers have tested the effectiveness of both pull and push motivators. One such study provided entrepreneurs with a collection of nine pull and push potential motivational influencers; job satisfaction, social status, economic necessity, power, wealth, achievement, independence, opportunity, and career security (Solymossy, 1997). The entrepreneurs were asked to select up to three influences as their key motivators, and to rank them in order of their importance. Table A below highlights the responses given most often by the respondents.

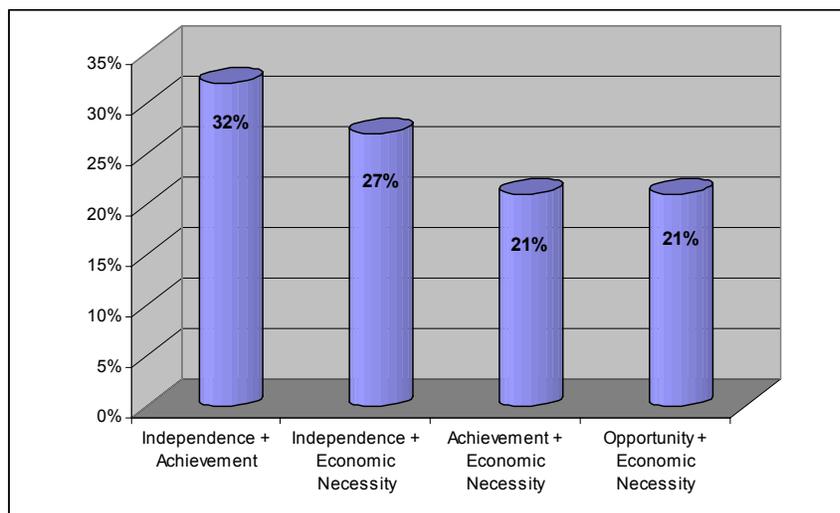

**Table A: Top motivational influences**

Solymossy's research found economic necessity (a push motivator) to be the most influential factor for starting an entrepreneurial endeavor. The majority of respondents (51% overall) chose economic necessity as one of their three motivations, with 40% listing it as their primary motivator. No other single motivator was as pronounced a primary influence. The other top two influences, achievement and independence (both pull motivators), were identified as the primary motivating influence just 16% and 14% of the time respectively. However, both achievement and independence received a high level of mention for being one of the three overall motives (54% and 46%). Which suggest that push and pull motivators must be present to trigger entrepreneurial activity.

Solymossy's work went on to demonstrate that influences taken in tandem also compel entrepreneurial behavior to occur. Table B graphically highlights the findings of Solmossy's study. Stated by a third of the sample, the two dominate pull motivators, achievement and independence proved to be the most common influence combination, but the remaining top rated pairings were blends of pull and push influences,

**Table B: Most frequent motivational influence pairings**

which suggest that the combination of pull and push influences makes for a powerful motivating force as well. Solymossy concluded that a high percentage of entrepreneurial activity is the result of the synergic combination of both pull and push factors. Interesting to note, Solymossy also found that pull entrepreneurs and non-entrepreneurs shared similar attributes and risk aversion, while push entrepreneurs where significantly different from non-entrepreneurs. Additionally, "pull" entrepreneurs were found to be more successful than "push" entrepreneurs in both personal income and the sales per employee in their ventures.

Even with the extensive amount of work done in this field, a clear understanding of the motivational force behind entrepreneurship still does not exist. The impact of life experiences and the role of genetic background remain unclear. Whether entrepreneurs are driven by one ultimate source of motivation or rather a culmination of many factors also continues to be ambiguous. The purpose of this research project was to gain additional insight into

entrepreneurial motivation factors by obtaining the true-to-life experiences of entrepreneurs from an array of different backgrounds.

## **METHODOLOGY**

This research project was exploratory in its nature and aspired to amass a wealth of candid responses from entrepreneurs regarding their life experience, both prior to and during their entrepreneurial endeavor. The project was designed in this manner so that respondents were free to provide narratives that were relatively unbiased by the researcher's assumptions.

### **Sample**

The entrepreneurs were assembled through convenience sampling. Respondents were selected from the researchers' personal and business contacts. The sample consisted of twenty small business owners from a variety of professional and educational backgrounds. The ratio of female to male respondents was 2:3, 15% were foreign born, and the total sample age distribution ranged from 25-68.

### **Research Instrument**

A loosely structured interview guide was assembled to assure that respondents gave feedback relating to their entrepreneurial experience and the motivational forces that preempted it. The interview guide ensured that each respondent spent a portion of their time to answer the following questions. They are:

- What motivates entrepreneurs to get into (or out) of business?
- What personal values do entrepreneurs find the most important in their work?
- What is the role of meaning and purpose in deciding to be an entrepreneur and do they find it in their work life? If so, how?
- What is the entrepreneur's view of spirituality and its relevance in the business world and/or in the community?
- How do they define success as it relates to their business?
- What is the current business challenge facing the entrepreneur?
- What is the impact of family experience on their current work life?
- What is the impact of career experiences on their current work life?
- 

Although the researchers were interested in the answers to these questions, every respondent was encouraged to speak openly about their entire life experience so that other areas of similarities among the respondents could be uncovered.

### **Analysis**

The interview sessions were recorded and transcribed to enable a detailed analysis of each respondent's feedback. During the analysis stage, the transcribed accounts of the interviews were thoroughly examined for commonalities and noteworthy phrases (which could be used

as the basis for future assessments). Similar responses were placed into groups; some responses were common amongst the entire collective of respondents while others were distinct to members of smaller sub-groups. The accounts given by the respondents were then analyzed and divided into three like clusters.

## **RESULTS**

### **The Sum of the Parts**

The analysis of the feedback from this study suggests that entrepreneurs across varying backgrounds share a set of attributes. Every respondent expressed each of the following characteristics at varying levels of degree:

- High internal locus of control
- Aversion to complacency
- Discomfort for numerous rules and procedures
- Instinctively opportunistic
- Need for achievement

Although these attributes have been cited many times before as being motivational factors for entrepreneurship, this research study goes further to suggest that these motivational factors are not instilled but rather inborn. The amount of multiplicity in life experiences within the sample, which consisted of a cross section of individuals from different ethnic and socio-economic backgrounds, as well as varying genders, religious affiliations, and age groups, indicates that these universal traits may indeed be the result of genetics and not social learning. Using a logical progression of thought leads to the suggestion that entrepreneurs possess a measurable size of innate personality traits that are invariably unique to them. Although due to the small sample size and qualitative nature of this research project far more work needs to be performed in this area before the existence of inherent entrepreneurial traits can be regarded as true and factual.

### **The Dichotomy of the Entrepreneur**

During the analysis process it became evident that many of the respondents gravitated towards one of two main motivational factors. The data collected represented a wide array of beliefs and opinions, but all of the viewpoints seem to adhere to a finite spectrum of motivational influences. On one end of this spectrum there was a group of respondents that were principally motivated by the accumulation of wealth. Their ultimate goal being to create enough wealth for themselves that they would one day no longer need to work, which would allow them the opportunity to pursue the things in life that they truly wanted to do. While on the opposing end of this spectrum another group existed wherein their ultimate source of motivation rested in a belief that their entrepreneurial activity would allow them to fulfill an emotional and/or spiritual void that resided within them. This dichotomy of the entrepreneur transcended gender, age, and ethnic background. Both the group of respondents motivated by money and the group motivated by self-fulfillment contained individuals with well-

established, financially secure business owners as well as individuals with cash-starved start-up organizations.

For classification purposes, one end of the spectrum was termed “cash is king”, because a respondent that adhered to this driving force would be wholly motivated by money and financial freedom, while the opposing end of the spectrum was coined “make me whole”, since self-fulfillment was the sole aspiration of a respondent motivated by this force. None of the respondents completely embodied ‘cash is king’ or “make me whole”, but instead the ultimate source of motivation for each respondent existed as a muddled mixture of the two, wherein everyone in the sample retained a distinctly singular composition of attributes from each paradigm, which resulted in most of the respondents favoring one side of the spectrum. Table C that follows illustrates the collection of attributes that exemplify each pole of the spectrum.

**Table C: Attribute Listing – Cash is king & Make me whole**

Cash is king	Make me whole
Driven by financial rewards	Their work is their passion
Success = Money	Success = Reaching full potential
Work enables the ability to do what you really want	Work enables the ability to express themselves
Aspire to have future free time	Always want to be involved in the venture
Act ethically for sake of company	Ethical behavior is simply the right thing to do
Business and personal life are kept separate	Business and personal life are fully integrated
Spirituality and workplace do not mix	Spirituality is an integral part of their operation

While no one respondent epitomized either extreme there were several that heavily favored one of the two ends. The respondents that were closest to the “cash is king” paradigm, though all male, varied greatly in age (25-62), ethnic origin, and socio-economic status (some had recently began their venture, while others possessed many years of entrepreneurial experience). The fact that this end of the spectrum was represented by males gives credence to the previous work of Barclays, DeMartino and Barbato (2000, 2001), which proclaimed that men are more likely to be driven by the accumulation of wealth. The following is a list of quotes that distinguish individuals located on the “cash is king” portion of the spectrum from the remainder of the sample:

- “The point of being in business is to make money!”
- “The only way to gauge my level of success is to calculate the return on my investment.”
- “The more money I make, the less money I need...and with time I can do the things I really want.”
- “It just makes good business sense to treat our employees well...I don’t want someone coming back and suing the company or something”

- “If I come across someone who wants to mix business and spirituality, that’s a big red flag, and I run the other way.”

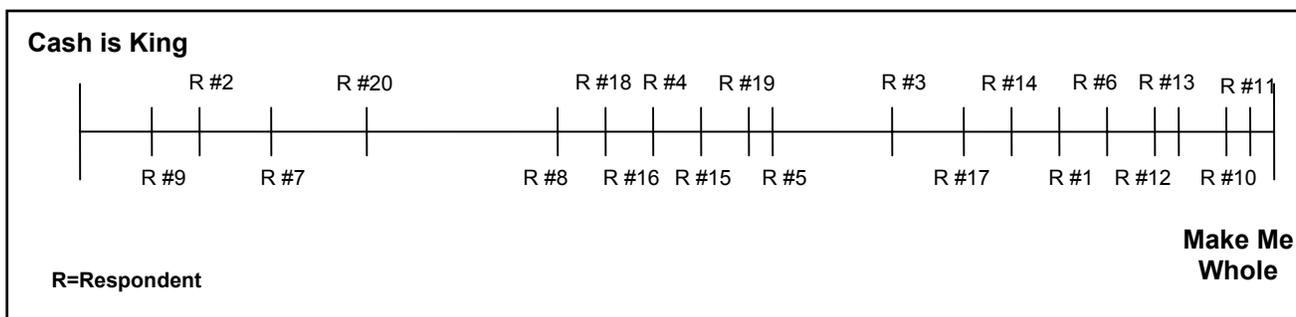

The collection of respondents that displayed the most likeness to the “make me whole” paradigm also exhibited highly dissimilar backgrounds. This group consisted of everything from an older Anglo male with no religious affiliation, to a foreign-born thirty something with devout religious beliefs, as well as a middle-aged mother who spent most of her professional life working for a corporation. Statements made by this group included the following:

- “I get so excited about it [my work] some times, I surprise myself...”
- “Purpose and meaning in my job is really doing the best that I can, but it’s also giving back...”
- “I think I’ll scale back, but I don’t ever want to stop working.”
- “It’s hard to say where my business ends and my personal life begins”
- “My spirituality gives me the foundation for how I run my business.”

Using “cash is king” and “make me whole” as archetypes, each respondent was assigned a position on the spectrum between the two opposing axioms that best represented his/her responses. Please refer to Figure 1 below for a visual representation of the motivation spectrum. A respondent’s location on the spectrum alluded to their ultimate source of motivation, those within a close proximity to “cash is king” were more strongly driven by financial rewards, while individuals situated closer to “make me whole” yearned for self fulfillment or what Maslow termed self-actualization.

However, for the individuals located in the center of the spectrum a clear sense of the origin of their entrepreneurial vigor remained somewhat obscure. Unlike the other respondents that displayed a propensity for one of the two paradigms, this group of respondents exhibited a relatively equal amount of attributes from both paradigms essentially making them hybrids, which in turn made it is much more difficult to decipher their definitive motivational source.

**Figure 1: Motivation Spectrum**

A commonality amongst the respondents that were positioned in the middle of the spectrum helped to validated their placement as hybrids; each of them were raised in a lower socio-economic environment, which may have caused them to develop a fragile, yet perverse relationship with money, wherein their presumed level of financial instability continuously outweighed their actual situation. As a result, this group of respondents formed a monetary

fixation that caused them to constantly thrive to acquire more money. So although on many levels they emulated the “make me whole” paradigm their unending need to quell their fear of returning to a state of poverty possibly drove them to embrace many of the “cash is king” attributes. This group of respondents mentioned the following phrases:

- “...I’m still not where I want to be, being comfortable in not taking everything that’s offered to me.”
- “...you cannot be big spender, we not big spenders, we saving, we saving...we work hard and save.”
- “...I have to hoard now for later.”
- “..without money I am going to fail.”
- “..I certainly do everything for money, but inside its work ability like what is really going to work.”
- “..it started out about money, but it ended up being an emotional thing.”
- “..you become too passionate about stuff and you can’t let it overrule you because it is just a business but when it is yours, it does become personal so ...it is the sad point.”

Far more research must be done in this area before socio-economic status can be deemed the basis for why some entrepreneurs demonstrate an equivalent amount of attributes from both paradigms.

The appendix of this paper contains a graphical depiction of the relationship between “cash is king”, “make me whole”, and hybrid entrepreneurs.

## **Other Notable Similarities & Differences**

### **Following in the Footsteps of...**

A significant portion of the sample had a genealogical link to entrepreneurship. These respondents had very little in common aside from sharing a family history of entrepreneurial activity, yet they all articulated an early realization of their entrepreneurial drive and actively pursued a venture much earlier than the sample segment that did not have a family history of entrepreneurship. Some of the statements made by these respondents included the following:

- “Working for someone else? No, that wasn’t even something I thought about.”
- “I just always knew...from a very young age I knew I wanted have my own business and I knew it would have to be small.”

Previous research work has shown that having the presence of an entrepreneurial role model, particularly in the same household, is extremely influential and is a significant contributor to the development of future entrepreneurship (Bandura, 1977; Scherer et al, 1989). However, in the circumstance where the entrepreneurial role model is also of the same ancestry it is unclear as to how much of the influence is due to social learning and how much is simply the result of genetics. Therefore, additional analysis work is needed in this area to better understand the relationship between entrepreneurial role models and their offspring.

## **It's all so new!**

Just over 15% of the sample consisted of immigrants. This portion of the sample communicated that their own cultural background as well as their inability to immediately adapt to American culture also served to prompt their entry into the entrepreneurial lifestyle. The foreign born segment of the sample expressed feelings of frustration upon first arriving in the United States, wanting desperately to hold on to their cultural roots, but also longing for a sense of belonging and acceptance within their adapted homeland, but cultural issues, such as the language barrier proved to be too great. As a result for this group of respondents, initiating an entrepreneurial endeavor became an attractive alternative. Responses from this portion of the sample included the following:

- “That’s the way Vietnamese people are...that’s what my Grandmother and Great Grandmother would tell me”
- “It was pretty challenging because it was all brand new to us. We come from different country so we had to get use to the methods of how things are done here...”

Prior research has deemed that there are considerable motivational differences between native and foreign-born entrepreneurs and that the majority of these differences are attributed to cultural disparities and the adapted country’s incapacity to welcome foreign cultural customs and mores (Walton-Roberts, Hiebert, 1997; Autio et al, 1997).

## **CONCLUSIONS**

The research project demonstrated that regardless of background characteristics, entrepreneurs may possess a common set of traits that are exclusive to entrepreneurial individuals. The findings also suggest that there appears to be two subsets of motivational factors, which do not appear to be dependent on age, gender or financial security that are driving entrepreneurs. For some, “cash is king” is their predominant driver; for others the entrepreneurial venture is utilized as a means of accomplishing self-actualization and/or a sense of spiritual wholeness –“make me whole.” What is not clear from the study is why there is such a difference between these groups.

Other observable conclusions included the discovery of a subset of entrepreneurs with low socioeconomic upbringings that all theoretically “straddled” the motivational spectrum by displaying an equal measure of “cash is king” and “make me whole” attributes. A hypothesis was formed that named their low socio-economic life experience as the major contributor for their hybrid status, but a more detailed investigation is needed to determine its validity. The analysis of the exploratory data also uncovered a notable difference in the entrepreneurial experience of respondents with an entrepreneurial role model and those that were foreign born.

Although this research project provided an array of information pertaining to many facets of the entrepreneurial experience, it also exposed the following subject matters as topics for future research studies:

- **Motivation spectrum:** Why are entrepreneurs drawn to one end of the spectrum versus the other?
- **Motivation type:** which entrepreneurs are more financially successful ‘cash is king’, “make me whole”, or hybrids; which are happier?
- **Motivational change:** Does an entrepreneur’s placement on the spectrum change significantly over time
- **Parental entrepreneurial role models:** How much of their influence is genetic?
- **Foreign-born entrepreneurs:** Are they more drawn to entrepreneurship because of their own cultural values or because of the adapted countries inability to incorporate them into the larger society?
- **Socio-economic background:** What influence does the entrepreneur’s socio-economic environment have on one’s motivation? Does it change over time?

The research performed in this study cleared away a portion of the ambiguity surrounding the entrepreneurial experience, but much of the road to truly understanding what drives an individual to entrepreneurship has yet to be paved.

The area of entrepreneurship and spirituality is extremely important given our current environment. Due to the fast pace of our environment and instability in our world, individuals are experiencing a lack of meaning and purpose in their lives. Consequently, for many they are seeking to discover their true selves and, in the process, a higher purpose and meaning to their lives through their work. This spiritual journey, for many, is not necessarily confined to a religious framework. It is about focusing within, in order to find greater awareness of Self. Many have suggested that work can be a place where individuals can become truly actualized and find meaning and purpose. The heightened sense of insecurity, and loss of connection to the self and their values, has prompted many individuals to reconsider how to pursue their careers. The findings present important information for those individuals considering entrepreneurship as a career option. Through our research with entrepreneurs, we have found many individuals that have found a way to integrate their quest for spirituality or emotional wholeness as a result of their work. The results provide a basis for future research, in addition to important information for teachers and consultants as they support individuals seeking entrepreneurship as an alternate career option.

## **ABSTRACT**

There has been a substantial increase in the number and variety of collaborative business relationships formed in recent years. Whilst such relationships might be important for all firms, they are likely to be even more crucial for smaller firms with scarce internal resources. Despite their recognised importance, many challenges are inherent in managing collaborative relationships, and again these may disproportionately affect small firms. These issues are illustrated using the case study of a collaborative relationship between a New Zealand (NZ) specialty chemical firm and a Japanese trading house. The case data reveals that both firms experienced difficulties attributable to differences in culture.

*Keywords:* collaborative relationships, cross-cultural issues

## **INTRODUCTION**

Collaborative relationships enable firms to access other organisations' skills, markets and resources and are generally perceived to be beneficial. Whilst such relationships might be important for all firms, they are likely to be even more crucial for smaller firms with scarce internal resources. Small firms may find that the ability to compete globally is necessary for their survival, and may enter international markets with a local firm in the hope of better access and increased local market knowledge.

---

<sup>1</sup> Please address all correspondence to Nitha Palakshappa.

Many challenges are inherent in managing collaborative relationships, and these too may disproportionately affect small firms. This research examines the challenges small businesses face in managing cultural differences with an international partner. These issues are addressed using the case study of a collaborative relationship between a New Zealand specialty chemical firm and a Japanese trading house. The Japanese trading house was to sell a commodity chemical extracted by the New Zealand firm using an innovative process. The product was to be sold in Japan for use in the manufacture of electronics.

The paper is divided into five sections including the introduction. The next section provides a brief review of pertinent literature on small and medium-size enterprises (SMEs) and cross-cultural issues in collaboration. The method through which the data were collected for the case study is then outlined. This is followed by a discussion of key insights from the case. The final section presents a summary and implications.

## **Literature Review**

### ***SMEs and collaboration***

The literature in general proclaims the benefits of collaborating to combat such forces as the fast pace of technological change and strong global competition. Collaboration provides the firm with well-recognised benefits, such as economies of scale, access to financial resources, market and/or technology access and the development of core competencies (eg, Varadarajan & Cunningham, 1995; Madhok & Tallman, 1998). For instance, a firm may have access to unique technology but lack the resources and knowledge necessary to expand into key international markets. Collaboration enables such a firm to correct this deficiency by aligning with a partner possessing the required skills.

Many argue that limited resources are a key constraint that entrepreneurs face (Beamish, 1999). The lack of resources, combined with a low level of foreign market competence may prevent a firm from considering overseas markets. The resource constraints faced by SMEs are often accentuated by risk aversion and a lack of international management expertise (Rowden, 2001). Given the problems associated with smaller firms penetrating international markets, an important question is how effective collaboration might be in achieving this objective.

The issues associated with collaboration might be compounded in the high-technology arena that is characterised by longer lead times from research to application followed by shorter time-to-market (Litvak, 1992). In their study of the internationalisation of smaller technology-based firms Karagozoglu & Lindell (1998) found that adoption of an international orientation is viewed as crucial to the success and long-term survival of smaller firms. Partnerships agreements were seen as an important strategy to support the expansion overseas. Lee, Lim & Tan (2000) also argue that apart from overcoming resource disadvantages, a key benefit of alliances for small firms is the access to complementary expertise which enables greater strength and the ability to develop competitive advantage. Their study showed that alliances allow SMEs to compete more effectively and indicate that with collaboration such firms might be able to penetrate markets dominated by larger firms.

These advantages of collaboration are also applicable within the New Zealand context. The New Zealand business environment is characterised by a large proportion of small firms. The growth of these firms, and development of key international markets, is regarded as crucial to the overall development of the New Zealand economy (Coviello & Munro, 1995). Inadequate foreign market knowledge and experience are often hurdles that such firms face (eg, Johanson & Vahlne, 1977; Glaister & Buckley, 1996; Chetty & Campbell-Hunt, 2003). However, what has been termed the 'small firm effect' means that firms trying to operate internationally are often disadvantaged in their ability to access and take advantage of foreign markets (Akoorie & Enderwick, 1992). Essentially small firms may possess unique technologies or capabilities but are dependant on larger firms for market access.

Given some of the recognised benefits of collaboration, it would appear that many of the challenges associated with a small firm entering international markets could be overcome with the identification of a suitable international partner. The formation of such collaborations with distributors, customers and other relationship partners is suggested as important for the success of the small firm in operating overseas (Coviello & McAuley, 1999). This is particularly true of markets such as Japan where existing channels are difficult to penetrate and only limited access is available to end-users.

## ***Cross-cultural issues***

The nature of international collaborations is such that managers need to be aware of differing perspectives and cultures. In particular their impact on the success of cooperative strategies needs to be understood. Many researchers have studied the influence of culture on attitudes toward collaboration (eg, Steensma, Marino & Weaver, 2000).

### *Negotiating an agreement*

With the potential problems that could be encountered in international collaborations, some emphasis needs to be placed on the initial negotiation process. This effectively allows for differences between partners to be minimised. However, Herbig & Gulbro (1997) caution that cultural differences magnify negotiation problems, the problem being that cultural differences can in fact lead to some mis-understanding during this process. The potential for disagreement is effectively accentuated when two people of differing cultures attempt to reach some form of agreement (Gulbro & Herbig, 1999). For instance, they suggest that the value of being frank and direct might be useful in some cultures, but not acceptable in others. In this paper they use Hofstede's key cultural attributes to examine the likely attitudes to negotiation. They find that culture does have an impact on negotiating behaviours with cultures that exhibit high power scores such as Japan spending less time compromising. Those cultures with high uncertainty avoidance scores would spend more time in the agreement stage, and collectivist cultures would spend more time planning and de-briefing. Overall, they summarise the key difference between for instance, the United States and Japanese culture, as that while the Americans negotiate a contract, the Japanese negotiate a personal relationship (Gulbro & Herbig, 1996).

Effectively, ignoring cultural differences might even halt the process of negotiation prior to, or during, the collaboration (Tung, 1991). This is unlikely to end once the collaboration has been initiated. During the course of collaboration it is inevitable that the forces internally and externally influencing the collaborative activity and the partners are likely to be continually evolving. Differences in uncertainty avoidance are likely to lead to differences in how partners perceive and respond to events in the environment of the collaboration

(Barkema & Vermeulen, 1997). Thus, a major prerequisite to a successful collaboration might be the negotiation of a sound agreement and accessing the necessary skills to negotiate on issues that arise during the course of the relationship. Whilst negotiating a sound agreement might be important, it is imperative that the impact of cultural differences on this process is recognised. Therefore, a formal agreement may serve as a starting point in collaboration but, where alliance partners exhibit cultural differences, what is being agreed to and how this might change in the long-term are also important.

### *Communication*

Cultural differences ultimately influence how individuals and firms interact and communicate within collaborations. In this regard communication issues become an even greater concern in international collaborations where cultural differences are apparent (Das & Teng, 1997).

Differing cultures and decision-making styles often cause considerable frustration in international alliances (Johansson, 1995). The smaller firm may also face obstacles in adapting to differences in national cultures whilst lacking the resources those larger firms might be able to employ to counter this.

The more an organisation can learn about its partner, the greater the likelihood of success within the collaboration (Rowden, 2001). The key concern is that managers learn to recognise and manage these cultural differences. For example, trust and the fostering of a long-term relationship are important aspects of collaboration for many Japanese firms. Thus, in the case of countries such as Japan or China, relationships are vital and managers might be expected to spend considerable time and effort in nurturing these interactions (Tung, 1991). This view may not be shared by partners from Western cultures (Rowden, 2001).

Studies suggest important differences in how Western culture might differ from Japanese culture with regard to the issue of trust. Western culture appears to point to the importance of a legal agreement rather than long-term relationships. In contrast, Japanese managers associate trust with sincerity, personal relationships and control of decisions whilst distrust is associated with the production of formal legal agreements (Gill & Butler, 2003). Changes in the environment or the nature of this relationship might then be regarded as situations that result in distrust.

Parkhe (1991) suggests that an important facet of managing the interests of various parties is a structure that accommodates adjustments to changes in the internal and external environments of the collaboration. Buckley, Glaister & Husan (2002) suggest that an inherent aspect of flexibility is in fact cultural awareness. Their study of international joint ventures demonstrated the importance of knowledge and empathy for another's culture in an effective relationship. This was seen as a crucial partnering skill. Managers lacking in this level of awareness of cultural differences were likely to make assumptions regarding issues that were not in fact correct.

The impact of cultural differences and communication can also be observed in the way in which partners approach problem solving and conflict resolution. Collaborations where the distance between cultures is greater are more likely to experience conflict (Gill & Butler, 2003). For instance, whilst some cultures might regard conflict as healthy and part of the process of collaboration, other cultures may regard any conflict or confrontation as distasteful (Parkhe, 1991). The management of such situations requires a considerable

degree of common understanding regarding cultural differences apparent within the collaboration.

Given that an awareness of cultural differences is undoubtedly important, the key is in recognising that conflicting cultures and attitudes may result in collaborative failure (eg, Johansson, 1995; Williams, Han & Qualls, 1998). This suggests that success of an international collaboration is influenced, to some degree, by the partners understanding of each others culture.

## **METHOD**

This case is part of a larger study on the performance of collaborative relationships in New Zealand. Case research was used in order to allow a deeper exploration of the research setting. A case study methodology was considered appropriate as it permits the study of 'real life' collaborations (Parkhe, 1993). Eisenhardt (1989) also advocates the use of case research as a strategy that focuses on understanding the dynamics present within the case. This view is supported by Bonoma (1985) who suggests that case research is ideal when the researcher wishes to build theory or theoretical insights.

Yin's (1994) guidelines for case study data collection have also been closely followed in this research. Specifically, multiple sources of evidence are used, a case study database has been created and a chain of evidence has been maintained. Data were collected from alliance participants in both organisations using a combination of in-depth interviews, semi-structured questionnaires, and cognitive mapping. Each interview was from one to two hours long. This aided a deeper understanding of the relationship from the perspective of participating managers. In particular it facilitated a comparison of the perspectives of participants within and between the two organisations. Secondary documents and archival records were used to support the contributions of key participants. For example, valuable information was collected and reviewed regarding the organisations involved in the relationship prior to the interviews. Subsequently, access was also gained to internal company documents. All interviews were transcribed and then analysed to highlight emergent themes. The transcripts were coded by two individuals according to a coding list.

This case considers a small firm with a unique technology seeking to enter the international arena. The case provides an interesting research setting for two key reasons. First, the two firms differ considerably in size. The New Zealand firm is a small entrepreneurial organisation with few employees. The overseas organisation is a significantly larger firm estimated to have billions of dollars in turnover each year. Much has been written on the advantages to a small firm in collaborating for overseas market access. In particular, small firms often rely on the resources that larger firms might bring to the collaboration. Second, technology has also been highlighted as an important aspect of collaboration. Specifically, the literature suggests that alliances are useful in dealing with technologically complex products or environments. Given that these two characteristics are present in this research setting, this case study allows for a consideration of various factors important in the formation and management of collaborations.

### **Insights from the case**

Several factors which have impacted on this particular collaboration are discussed below. The section begins by providing background information to the case and outlining how

unexpected changes in the market led to an alteration to the technology used by the New Zealand firm. Interview data are used to outline how cultural differences merely compounded the impact of this key event. The reliance of the New Zealand firm on the skills and resources of the overseas partner is also evident by the continuation of this relationship.

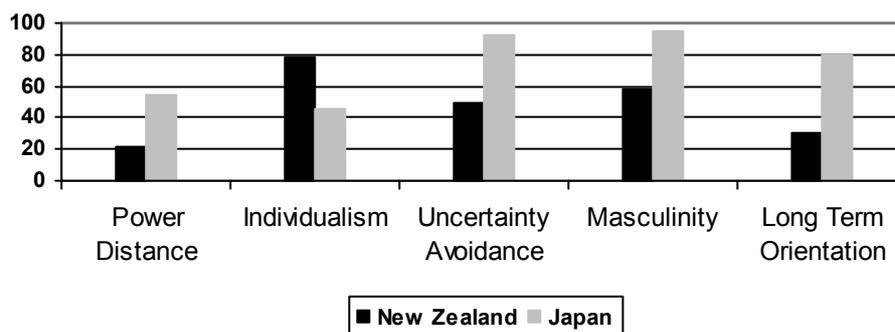

### *Background*

This relationship involves a New Zealand speciality chemical firm (ChemCo) and a Japanese trading house (Distribution International). ChemCo, a small entrepreneurial firm, differs considerably in size from their Japanese partner. Distribution International is a large commodity trader characterised by small margins and a long chain of command.

The partners in this relationship are also based in countries with markedly different national cultures. Figure 1 shows how each country rates on Hofstede's Dimension of Culture Scales (<http://spectrum.troyst.edu/~vorism/hofstede.htm>). As shown in the figure, compared to New Zealand culture, Japanese culture is characterised by greater power distance, less individualism, and more uncertainty avoidance, and is more masculine and long-term oriented.

These differences did not bode well for this relationship from the beginning since Barkema & Vermeulen (1997) found that differences in long-term orientation, uncertainty avoidance, and masculinity all negatively influence joint venture survival (in descending order of importance). New Zealand and Japanese culture differ significantly on all of these dimensions, with the greatest difference on the long-term orientation dimension, the second greatest difference on uncertainty avoidance, and the third greatest difference on the masculinity dimension.

**Figure 1: Dimensions of Culture**

The New Zealand partner in this relationship possessed a unique technology for the extraction of a commodity chemical. This process was seen as providing certain benefits and a superior final product as compared with alternative extraction technologies. The application of this technology was the key focus in this collaboration and the relationship was created to support the innovative extraction process. The product was then to be sold to Japan for use in the manufacture of electronics. ChemCo perceived a niche, especially in the Japanese environment, for offering a high quality product customised to local market requirements.

Unfortunately, the entry of an aggressive new player in the marketplace resulted in a decrease in price for the chemical. At this time the New Zealand firm was also experiencing technology-related problems. These two factors made the proposed method an uneconomical extraction process at the prevailing market prices.

#### *Smaller firms accessing overseas markets*

Collaborations have been cited as effective tools to overcome size barriers, access crucial skills or markets (Lee, Lim & Tan, 2000) and maintain long-term survival (Karagozoglu & Lindell, 1998). This provides a key motivation to align with other partners. The data from this case reflect a similar situation. ChemCo highlighted Japan as an appropriate market for the product due to its heavy concentration of manufacturers who use the chemical to be extracted. However, whilst they possessed a technology that was unique, they lacked the resources and market knowledge to venture overseas with their product. Overall, the case displayed the classic resource constraint scenario described in the literature (Beamish, 1999).

ChemCo quickly recognised that the Japanese market is traditionally accessed through trading houses; selling directly was not a feasible option. Market penetration without the support of a "big brother" was seen as very difficult by the New Zealand firm. As a smaller firm, it was clear that ChemCo felt that they needed the support of a larger, resource-rich partner.

At this time ChemCo were approached by the Japanese trading house. After years of examining the activities of ChemCo, Distribution International approached the company with the possibility of developing a relationship. The Tokyo office had originally requested Distribution International NZ to investigate the activities of the firm, and Distribution International was aware of ChemCo's technology. As one ChemCo interviewee said:

*"They approached us ... they had actually been scoping us for a couple of years."*

The extraction technology was thought to provide significant promise and have the added attraction of being marketable from an environmental perspective.

In this situation collaboration appeared to offer each firm access to complementary skills. The New Zealand firm offered a unique extraction technology while the Japanese firm provided resources, and more importantly, market access. Managers in both firms appeared to understand the value that collaboration could provide. The proposed collaboration allowed the New Zealand firm to compensate for the 'small firm effect' described by Akoorie & Enderwick (1992). The firms proceeded to negotiate an agreement.

#### *Negotiating the collaborative agreement*

The literature tends to indicate that the negotiation of an agreement might be complicated by cross-cultural issues when dealing with partners from different countries. Within this case the initial contract was essentially for the first right of refusal on the marketing and distribution of ChemCo's products through Distribution International NZ and Distribution International Japan. ChemCo was to supply Distribution International with 3,000 tonnes of the chemical per year from extraction using the innovative technology. The spirit of the

agreement was that Distribution International would purchase the product at a certain price, which would be previously agreed.

Although the agreement was designed to facilitate distribution in Japan, Distribution International provided an entrée into worldwide distribution. For ChemCo, a key requirement was that the partner staff had to demonstrate experience in marketing in Japan and be chemically minded. Managers at ChemCo went into the relationship with some awareness of the need to be cognisant of cultural differences when dealing with the Japanese market. The perceived potential for negative consequences on other opportunities and relationships from conducting business in the Japanese environment is summarised by one of the interviewees from ChemCo:

*“It’s not a case of where you are making mistakes, as can you make a lesser amount of mistakes; it is a complex society—you are always offending someone.”*

The managing director of ChemCo also outlined how cultural differences complicated the initial contract negotiation:

*“A Japanese concept of a contract is totally different to a Western concept of a contract ... It is automatically implied that it will change to suit the change in circumstances ... [Now] we don’t even bother getting interpreters, we don’t bother putting things in Japanese, we put it in English so at least we can always look at it and say ... we understand it ... all it is is a sign of good faith ...”*

*“The Japanese don’t even like lawyers – they don’t like contracts.”*

Given these challenges, ChemCo found Distribution International to be useful in the introduction stage of relationships in enabling key connections and contacts. As one of the ChemCo interviewees commented:

*“If you have the name of a company that does US\$102 billion turnover people assume that you are well connected ... that gets you in the door – relationships form – they have probably been trading with the people that we have wanted to trade with for the last 15 years ...”*

The New Zealand firm regarded the size of their partner as a key advantage. Their motivation to collaborate was based on the access to markets and resources that were more readily available to the larger partner. In the initial stages the connection with Distribution International was seen as critical in generating access to international markets. This explanation of differences between Western and Eastern approaches to negotiation is very consistent with those discussed in the literature and described previously in this paper. Cultural differences, communication and conflict are discussed further in the following section.

### *Communication and conflict*

Key differences in how both firms viewed a contract became apparent very early on in this relationship. Observations in this case support findings in the literature (eg, Gulbro & Herbig, 1999) regarding differing attitudes to negotiation and contracts. ChemCo appeared to recognise the importance of agreement while acknowledging that changes were inevitable. The Japanese firm did not see a contract as important and subsequent changes were viewed with some degree of mis-trust. This difference is described next.

The New Zealand firm responded to the previously outlined changes in the environment by searching for an alternative. In contrast the Japanese firm felt that this change in strategy on the part of the New Zealand firm was not conveyed to them in a timely or effective manner. In short, the New Zealand firm failed to consult their partner before proceeding with necessary adjustments to accommodate the fall in prices for the chemical and the technology problems that they were experiencing. As their interest was primarily based on the innovative technology initially proposed, this failure to adequately negotiate changes resulted in feelings of mis-trust on the part of Distribution International. After it had adjusted to changes in the market and proceeded with the manufacture of high-quality products, ChemCo found that the Japanese firm had considerable difficulty in adjusting and were reluctant to purchase the chemical from other processes. ChemCo management also describe themselves as naïve about Distribution International and their ability to perform:

*“[We were] a little naïve that these people would definitely be able to perform and get us the results ... we didn’t fully understand how the market works and how much time it takes.”*

The situation was, however, viewed somewhat differently by their partner:

*“We were informed of [the changes] but we weren’t involved in the decision making ... [our] thinking was that [we] had been deceived ... [we] became more cautious in dealings with ChemCo.”*

ChemCo's reassessment of the extraction process appeared to result in a loss of faith by Distribution International, who had marketed the product on the basis of this method. The Japanese reaction to these changes was that they had been ‘deceived’, the key being that they did not feel that proposed changes to the production technology were communicated effectively. As one interviewee suggested:

*I realise that we didn’t have enough information ... communication ...”*

In effect, the differing responses to the changes in environment and strategy support Barkema & Vermeulen’s (1997) findings regarding cultural differences in uncertainty avoidance and long-term orientation. Within this collaboration the link between communication and conflict was intensified by cross-cultural differences. The process through which events unfolded to create a situation of increasing conflict is described next. The change in technology clearly created problems within this relationship—exacerbated by differences in culture and communication. This process is described by one of the ChemCo interviewees:

*“I don’t put [the lack of performance] down to necessarily any fault on Distribution International’s side. The market changed – a new world competitor came in and dropped the price of the product by 50% and that ... questioned the whole economies of the relationship ... We ran into technical problems, so we couldn’t deliver at those prices ... When we adjusted to a new market we found that the Japanese company had difficulty in re-adjusting ... they just didn’t perform because they wouldn’t change.”*

In the first instance this appears to be a cross-cultural difference, highlighting how Western and Japanese views of an agreement might differ (Gill and Butler, 2003); however, the overseas partner also pinpointed the lack of effective communication:

*“It is more a case of misunderstanding ... [there] wasn’t enough communication”.*

Communication problems may have been evident from an early stage in the collaboration. However, issues associated with the change in technology served to strain these interfaces further.

The managing director of the New Zealand firm in the collaboration had this to say after things started going wrong with production:

*“[Our overseas partner] didn’t have the expertise, the commitment, the desire to figure out what the real issue was ...”*

This consequently affected the level of confidence that the New Zealand firm placed in their collaboration. As one ChemCo interviewee described:

*“Trust and competency came up, I just don’t think they are particularly confident”.*

These comments indicate that the New Zealand firm may have made certain assumptions regarding their partner’s view. This classic situation demonstrates the importance of Buckley, Glaister & Husan’s (2002) suggestion that a high level of awareness is a key component of effective collaboration.

Such issues created a perception that the partners were less compatible than previously thought. A ChemCo manager said:

*“We are an entrepreneurial, aggressive company and Distribution International are a focused commodity trader ...”*

As the following quotes suggest, cultural differences were consequently perceived by ChemCo to contribute to the deterioration of the relationship:

*“Japanese do not have the ability in their culture to handle failure—a bit of failure makes them very vulnerable and risk averse ... they march to the beat of their own drum and we march to a different beat.”*

*“The Japanese are prone to not giving you bad news ... give me bad news, I love bad news—gives me something to do ...”*

The case data, however, provide no substantial evidence that either firm really tried to isolate the underlying concerns of their partner.

Ineffective communication between the partners was merely compounded by the lack of cultural sensitivity between the partners. In this case conflicts arising from these tensions were not resolved. Parkhe’s (1991) observations regarding the differing views of conflict as healthy or distasteful may in part explain why the firms were unable to resolve the conflict through direct communication. The New Zealand firm lacked the ability to directly confront the Japanese firm. Rather than being able to directly resolve conflicts, the firms appear to have learned to deal with these issues.

Comments made by the ChemCo interviewees reflect this:

*“Our relationship ... has been a rocky one but has now stabilised ...”*

This level of stability was not achieved by clarifying or resolving issues; rather, ChemCo management suggest that they have altered the way in which they deal with their partner:

*“The relationship with [our partner] is continually evolving ... At this point in time we are ... ring-fencing [our partner], saying this is where you are ...”*

The impact of these differences has been a relationship that did not achieve its objectives.

## **SUMMARY AND IMPLICATIONS**

The purpose of this paper was to explore cross-cultural issues in collaboration using the case of a smaller firm collaborating with a larger overseas partner. The methodology used in this paper allowed a consideration of the relationship from both partners' viewpoints. The case method enabled an examination of how various facets of collaboration progressively complicated the potential for success. The case provides an interesting research focus as it involves a small technology firm thus combining two commonly cited motivations to collaborate.

The case data revealed that both firms experienced difficulties attributable to differences in culture in spite of the fact that they went into the relationship aware of the potential for such differences to create problems. A key advantage of the case method was that the process through which these differences manifested themselves was also observable.

Various factors have been highlighted as contributing to the unsatisfactory outcomes within this collaboration. In the first instance, the environment within which the relationship was functioning changed. The market was affected by the entry of a significant competitor and prices of the chemical dropped. These changes prompted a reassessment of ChemCo's technology. However, consequent modifications to production resulted in discontent between the two partners. As a smaller firm, the New Zealand partner lacked the resources and skills to enter the Japanese market. This view created a degree of dependence on the collaboration with the Japanese firm, regardless of how it was functioning.

Ultimately, cultural differences, poor communication, and a lack of consultation compounded the negative impact of environmental influences. Whilst the relationship functioned within a formal agreement, neither partner referred to this at the time of key changes to the production technology. In fact, the agreement was not able to provide guidance in this regard.

### *Implications*

The initial contract negotiation process failed to account for the cultural differences of the partners in this case. In particular, the inability of the Japanese partner to accept changes was not anticipated. Whilst the firms did have a formal agreement it did not accommodate for changes such as those experienced. This tends to indicate that in some cases the process of generating an agreement based on a shared understanding between partners might be more important than the agreement itself. While no agreement can anticipate every contingency participating firms may face in the future, a good agreement will include a process for working through and resolving unexpected events regardless of whether

these result from forces internal to the alliance or participating firms or from external environmental forces like those that affected this alliance.

These findings suggest that the process of cross-cultural management needs to receive continued attention. Managing a collaboration effectively in the long-term requires an understanding of key cultural differences and an ability to manage these differences in such a way as to reduce conflict. Shortly after this case was completed, the New Zealand firm hired a new Asian Business Manager. Such an individual would be able to provide considerable support in understanding the impact of cultural differences and how these should be managed.

## **FUTURE RESEARCH**

This case is part of a larger research project on the performance of collaborative relationships. This paper explores the impact that cultural and size differences might have on collaboration. Future papers will examine other influences on collaborative performance.

## **ABSTRACT**

This paper explores the literature on late payment of trade credit from a global perspective. Late payment of trade credit is a long-standing problem and is not isolated to one country (Pike, Cheng, & Chadwick, 1998). Poor credit management practices and being undercapitalised are two of the major concerns for small business as they feel powerless to do anything about their debtors' late payments (F. Chittenden & Bragg, 1997; Peel, Wilson, & Howorth, 2000).

The data for this paper was collected from a questionnaire on cash management practices in 2000 which included a question about the effects of late payment of trade credit on small businesses in a regional area of Australia (the Mid North Coast of New South Wales). The sample of small businesses was from manufacturing, construction and service industries. The database used to collect the names and addresses of the businesses was the Business Enterprise Register which is located at Southern Cross University, Coffs Harbour and contains over 13,000 businesses.

Pike and Cheng (2001) note that there is limited research in the main determinants of late or non-payment. Peel and Wilson (1996) found that there was a dearth of both theoretical and empirical small business research relating to cash management practices which encompasses late payment of trade credit. The paper outlines possible remedies, with legislation a starting point to finding a solution to the problem.

## **INTRODUCTION**

The problem of late payment of trade credit has existed for a number of decades (Bates, 1971; Bolton, 1971; Wilson, Watson, Singleton, & Summers, 1996). Bates (1971) found from an 1954 Oxford Survey that creditors and debts exceeded 50 per cent of net assets, with small businesses being 23.2 per cent for creditors and 35.3 for debtors, compared with 18.6 and 24.2 percent respectfully in public companies. In comparison Wilson et al (1996) report from their 1994 survey that "on average it was found that 52 per cent of all invoices were actually paid late (after the due date) and 44 per cent of companies reported that such late payments caused them a significant problem and they were sensitive to late payment".

The credit squeeze of 1969 in Bristol (UK) saw small business advancing credit and the West of England Engineering Manufacturers Association made the statement "extended

credit by delaying payment of its bills to the small business” and the position was summed up in the following manner, "The typical small manufacturer is now facing a situation in which large customers are taking extended credit at a time when his own bank manager is compelled to refuse normal bank facilities"(Bates, 1971). Wilson et al (1996) stated that “trade credit often fills the finance gap, particularly for the smaller business that finds itself credit rationed from the banking sector”.

Whilst the Bolton Committee (1971) added to the debate by reporting that the vulnerability of small businesses during periods of "credit squeeze" exists when larger enterprises and government bodies could use their greater power to delay payment to small enterprises. The late payment problem is not confined to one country "... we were told that it is often serious in Japan, for example, and that there the Ministry of International Trade and Industry has powers to intervene on behalf of small firms with legitimate complaints of delayed payment by large customers, and to enforce payment (Bolton, 1971)".

More recently Perry (1995) reported that the slow-down of economic activity in Europe over the past two years has resulted in slower receivables and financial difficulty for many businesses; and extending credit to businesses in the U.S.A from another country is not without risk. The International Credit Executives (ICE) reported that foreign affiliate trade receivables resulted from the following: excessive past dues, repetitive and large bad-debt write-offs; unusual extended credit terms situations; lack of adequate credit controls; and insufficient credit checking and credit information (Perry, 1995).

Whilst small businesses may suffer from their debtors not paying, they may benefit from making late payments to their own suppliers. The Bolton Committee (1971) claimed that “many firms grant credit in a haphazard fashion and have slow and irregular collection of debts”. The Bolton Committee (1971) goes further by stating that small businesses “on occasion neglect for weeks on end to submit bills for work completed or goods delivered and fail to take advantage of discounts for prompt payment of accounts thus failing to appreciate the effect by paying a very high rate of interest for the credit they are taking”. To continue the argument that this is happening today, from a UK small business experience suppliers have not efficient invoicing system, nor do they check credit worthiness of the clients which is seen by not having clearly established and agreed credit terms prior to sales for monitoring payment patterns (Wilson et al., 1996).

In Australia the same happens as seen from interviews conducted about payment issues... one-third of the small firms reported that their trade suppliers had been pressing for payment; had severely cut the period allowed for payment; or had introduced charges or penalties for late payment. Most of the small firms affected in this way had either been unable or unwilling to adopt similar procedures with their customers. In fact, some had been obliged to allow customers a longer period in which to pay their accounts when their suppliers were imposing more onerous credit terms than previously (Johns, Dunlop and Sheehan, 1989).

Problems with trade credit generally, and debtors in particular, are likely to vary from industry to industry. (Bolton, 1971) found that:

..as between small and large firms in similar trades it appears that there is no great difference in the use of trade credit: manufacturers, small or large, are net givers of trade credit and their ratios of debtors to turnover are not dissimilar; for non-manufacturers, a category dominated by the retail trades, debtors and creditors are more nearly equal.

Wilson et al (1996) found that the industry sectors in the UK that experienced the most severe problems from late payment of trade credit were:

- Construction
- Textiles, Leather, Clothing, Shoes
- Timber, Furniture

Yet the industries that considered credit terms to be important were:

- Metal and metal goods manufacturing
- Engineering
- Construction (Wilson et al., 1996)

It is not only industries but government departments which add to the problem by paying late and this was covered by the Bolton Committee (1971) that reported:

The public sector offers better prospects of improvement, and it is possible that a lead given here would have some effect in private industry. We were told that central Government departments themselves have a bad reputation in this connection, as well as nationalised industries and public authorities, and we therefore discussed the matter with Treasury. In the case of the departments, we are entirely satisfied that deliberate delay of payments does not occur. The number of payments is immense ..... and occasional mistakes inevitably happen, but prolonged and serious efforts have failed to produce a single valid case of deliberate delay. This is as it should be; departments have no liquidity problems and there is strong pressure to clear bills quickly. The average time taken is between one and three months, depending on the size and complexity of the contract. Some of the nationalised industries however (which do have liquidity problems) appear to be less conscientious; their average payment period is three months, but longer delays are not uncommon. Local authorities, particularly their public works departments, have also been heavily criticised, and the Federation of Building Trades Employers suggested to us that their internal audit procedures inevitable cause delays in payment of accounts.

## **Credit management**

The standard of credit management in the UK amongst small businesses is very poor (Bolton, 1971). Some of the reasons for small business failure has been the result of poor or careless financial management (Berryman, 1983; Peacock, 1985). Pike and Cheng (2001) cited the Society of Practitioners of Insolvency that said “unsecured nature of most trade credit arrangements generates significant corporate exposure to the delinquency risks of slow payment and debt default. This is compounded when many businesses operate on the principle of ‘pay when paid’ thus exacerbating the late payment problem (Howorth & Wilson, 1999).

McMahon et al (1993) report that problems with regard to payment by debtors can arise not only from the bad practices of debtors but also reflect poor credit management on the part of the business which is extending the credit. Phillips (1996), a senior manager from Ernst & Young stated that “Rather than paying attention to credit management only when confronted by a major bad debt, organisations must recognise that credit risk management warrants the attention paid to any other area of operations”.

Johns et al (1989) found that “the reduced availability of net trade credit can also have an important effect on the financial structure of small companies and that small business, rather than larger business, has tended to suffer from this problem for two reasons:

- There has been less expert control over trade debtors of small business
- Small firms have less market power than larger firms”.

Howorth and Wilson (1999) found from their case studies that some firms are more sensitive to credit management than others from two extremes; those who suffered from the late payment and those who controlled it. Howorth and Wilson (1999) found that “sensitivity to late payment was reduced in businesses with long-term financial stability and by having a good knowledge of when payments could be expected, enabling cash flow to be planned”. When good credit management procedures exist the actual late payment was less.

Wilson et al (1996) found that good credit management practices and credit terms results from 76 per cent of respondents from a Forum of Private Businesses (FPB) on their products and ranked their importance:

- 43 per cent had a formal credit policy
- 41 per cent had a credit application form
- 65 per cent checked the credit worthiness of customers before allowing credit
- 28 per cent used credit reference information (19 per cent on line)
- 39 per cent categorise customers according to solvency risk
- 58 per cent categorise customers according to late payment risk

Chittenden et al (1998) adds to the debate that 62 per cent of respondents subscribe to a credit agency to obtain information about potential customers with only 58 per cent requiring credit applications to be completed on new customers. Some of the results indicate that poor credit screening practices exist in small businesses especially when the comment was made that “We give credit to anybody who asks for it. It is as simple as that (F. Chittenden et al., 1998)”. To add to the problem Chittenden et al (1998) found that on average only 45 per cent of small businesses have a full-time credit officer.

## **Possible remedies to the late payment of trade credit problem**

The Bolton Committee (Bolton, 1971) suggest the only recourse to law is:

“penal clauses” - say, the charging of 1 per cent per month interest on delayed payment - to be ignored by companies secure in the knowledge that they will not be taken to court. An alternative remedy which has been suggested to us is the wider use of bills of exchange, which would fix a date for repayment and prohibit, except by negotiation, any extension of the credit period. Such bills could be discounted, thus providing the creditor with working capital more quickly than would otherwise be the case. We put this forward for consideration: it seems to us to have possibilities, but of course requires negotiation with the debtors. It is also administratively cumbersome when there are a large number of relatively small individual transactions.

The Bolton Committee suggested an alternative way of dealing with the problem in the form of bills of exchange. Whilst this particular financial instrument may not be relevant, it does raise the question of alternative ways of avoiding direct confrontation with

customers. One way of doing this is to use factoring. However, similar problems arise with factoring, and other devices, such as with legal proceedings in that there are some fixed costs involved which impact disproportionately on small businesses. Also, alternative approaches may require a higher level of financial management skills than many small business owner-managers possess (Hutchinson & Drever, 1998).

Both the Bolton Committee in the UK and the report by the Small Business Advisory Council on Finance for Small Businesses in Australia suggest that small businesses are at a disadvantage in their dealing with large businesses and government agencies as mentioned earlier. There needs to be two important provisos to this observation. First of all both these reports attribute at least part of the blame to poor management practices on the part of small businesses and secondly, the data are based largely on anecdotal evidence (Hutchinson & Drever, 1998).

Again, the Bolton Committee provides a useful starting point in answering this question the late payment of trade credit problem. The Committee's recommendation was that government could, indeed, play a very direct role by ensuring that departments under government control followed best practice with regard to the payment of its creditors. Prompt payment by government bodies would itself remedy a significant proportion of the problem since, although the government sector is shrinking and many small businesses do not deal directly with government, government departments still account for a very high proportion of economic activity (Hutchinson & Drever, 1998). Unfortunately there is no empirical literature to support this claim except for what Bolton as said in the past.

## **Government legislation**

### **United Kingdom**

Bolton Committee (1971).. believed the Government should ensure that in all contacts carried out by private industry on the Government's behalf, the main contractor is required to observe the payment terms of any contracts with sub-contractors. The United States Government achieves this by stipulating that for certain contracts the main contractor will not be paid until he can demonstrate that all sub-contractors have been paid. Hutchinson and Drever (1998) noted that the role of government could be extended further by using its contractual powers with large private contractors. The Bolton Committee points to the US government as an example of this and since then the US Prompt Payment Act of 1988 has provided small businesses with a right to interest on overdue payments by federal authorities but there is little empirical information available on this matter.

In the UK there were a number of papers that considered the late payment bill issue. The Department of Trade and Industry (1997a) had a consultation paper in the UK that introduced a statutory right to claim interest on late payment of commercial debt, exercisable, initially, by small business against all large enterprises, including public sector organisations.

The Department of Trade and Industry (1997b) response paper on the Government's Green Paper had over 3,500 copies circulated in the UK to a wide range of public and private sector organisations, with over 490 responses on the introduced legislation to provide a statutory right to claim interest on late payment of commercial debts (Wynarczyk, 2000). The UK Government's Bill was introduced in December 1997 and received Royal Assent in mid 1998. The rate of interest has been set at the official dealing rate of the Bank of England (the base rate) plus eight 8 per cent, which is the same rate that small businesses are able to borrow from the banks (Wynarczyk, 2000).

The legislation is called The Late Payment of Commercial Debts (Interest) Act 1998 and is phased as follows:

- for the first two years - 1 November 1998 to October 2000 – small businesses (those with fewer than 50 employees) are to be able to claim interest from large businesses and the public sector on debts incurred under contracts agreed to after that date
- the right to claim interest will be extended from 1 November 2000 to 31 October 2002, so that small businesses will also be able to claim from other small businesses on debts incurred under contracts agreed after that date
- from 1 November 2002, all businesses and the public sector will be able to claim interest from all businesses and the public sector on debts incurred under contracts agreed after that date (Wynarczyk, 2000).

One outcome from the legislation by Brun-Rovet and Meehan (2002) states that the penalties for late payment may favour big business. In the UK an estimated 10,000 businesses fail due to cash flow problems and the legislation for late payments would act as a deterrent to those contemplating to act “it’s pointless taking a customer to court for late payment because of the time involved, and because you’re unlikely to keep their custom (Brun-Rovet & Meehan, 2002).

Another outcome has seen that there is no excuse for the delay of payment beyond the agreed (or statutory) terms. Therefore the basics of credit management has been conducted through the Better Payment Practiced Group (BPPG) to educate a growing number of SMEs to develop credit policies that will help them overcome any problems they have with late payment of trade credit (Anonymous, 2003).

Wynarczyk (2000) states “that the legislation introduced by the UK Government to combat the problem of late payment is having very little impact on speeding up outstanding debts owed to small business .. and remains a major and acute problem in 1999, becoming as endemic as business failure itself”.

## **Australia**

In 1998 a report was prepared for the State Government of New South Wales, Australia on the issue of late payment of trade credit and whether such legislation should be introduced at State or Commonwealth level. It would appear to be highly problematic to introduce it on a State-wide basis given that many small businesses will have customers outside the State (Hutchinson & Drever, 1998). However in 1999 the ‘Building and Construction Industry Security of Payment Act’ was passed at State level and from early 2000 this new law in New South Wales reformed the way that contractors, subcontractors, consultants and suppliers in the State’s construction industry get paid (“Building & Construction Industry Security of Payment Act," 1999).

Furthermore in 2001 the Commonwealth introduced the late payment of trade credit known as ‘Payment of Commercial Debts (Interest) Bill 2003’, which has had its second reading and was adjourned on 6 March 2003. It penalises late payment of commercial debts by Commonwealth government agencies and large corporations to small business in relation to contracts for the supply of goods and services (The Parliament of the Commonwealth of Australia, 2002).

Currently in Australia debts outstanding can be recovered under the Credit Act, Trade Practices Act, Corporations Law and Petty Sessions. In addition, legal action can be taken to enforce the conditions of a contract, which could include the right to interest in the event of late payment, subject to the validity of the contract and providing that any such conditions are not themselves in contravention of any legislation (Hutchinson & Drever, 1998). Most of the references to these Acts and the impact of each piece of legislation can be located on the Australian Securities and Investment Commission website.

In addition, Hutchinson and Drever (1998) noted that the Department of Workplace Relations and Small Business reported that the Australian Competition and Consumer Commission (ACCC) has expanded its services and activities for small business. One of the key factors is making the legal system more accessible for small business by ensuring enforcement bodies are in a position to assist these firms when a dispute arises. "It is no good having stronger legal rights for small business if they can't be adequately enforced or if access to remedies is beyond reach of small business (Federal Government Fair Trading Statement, 1997)".

There are of course many forms of assistance provided to small businesses by government both at local, state and commonwealth level. Relevant examples in the context of the issue of dealing with customers are the Export Finance and Insurance Corporation (EFIC) and recent initiatives in terms of government purchasing with two to five years repayment period for contracts valued at \$1 million to \$5 million (Hutchinson & Drever, 1998). The EFIC provides services which include export credit insurance, export finance, bonding facilities, working capital guarantees and overseas investment insurance. The more recent creation of Export Access combined with EFIC greatly helps small businesses involved in exporting when dealing with issues regarding the provision of trade credit (Hutchinson & Drever, 1998).

Recent developments in term of government purchasing such as the Supplier Development Program, the Industrial Supplies Office Network and the National Procurement Reform Principles (February 2003) make it easier for small businesses to bid for government contracts. It is to be hoped that securing a government contract means that a small business will have not to worry about late payment (Hutchinson & Drever, 1998).

Therefore it can be concluded from the legislation that whilst there do not appear to be any legal or accounting barriers to small businesses charging interest on outstanding debts (provided that any such requirements are made clear to the customer at the point of entering into the contract), in practice this does not seem to be a feasible option for most small business owner-managers because of problems of enforcement (Hutchinson & Drever, 1998).

## **RESEARCH METHODOLOGY**

Data were collected through a postal questionnaire using 'closed' questions. The questionnaire covered a range of questions relating to credit management of accounts receivable and accounts payable and cash management. This paper is exploratory and deals with the late payment of trade credit and the literature surrounding that issue.

A database located at Southern Cross University, Coffs Harbour known as the Business Enterprise Register was used for this study. It has more than 13,000 small businesses listed in an area known as the Mid North Coast of New South Wales, Australia. The

questionnaire was mailed out to 2,000 small businesses in 2000. There were 560 returns with 352 (25 per cent) from businesses that had moved or closed their businesses, with another 208 (10 per cent) completed responses.

The survey sample closest to the present study is that of Chittenden et al (1998), conducted in the UK. Given the distance between the two countries and the changes that have taken place over the last five years it will be informative to make some comparisons between the two studies on the late payment of trade credit.

The remainder of the paper reports the findings of the study and examines empirically the arguments made in regard to the late payment of trade credit. The results of this paper adds to the literature previously mentioned which are qualitative in nature, therefore the analysis presented in the following three tables is along the lines of credit officers, the number of days for creditors and the late payment of trade credit.

## **RESULTS**

Table 1 relates to how many small businesses have full-time credit officers in Australian SMEs. As the table illustrates the figures are very low with less than 30 per cent of businesses across the board having the services of a full-time credit officer. The result are somewhat different to what Chittenden et al (1998) reported. For small companies with less than 50 employees 45 per cent operate with a full-time credit officer in UK SMEs (F. Chittenden et al., 1998). Yet 88 per cent of small businesses operate a finance department/function within the company (F. Chittenden et al., 1998) with 70 per cent having a finance director.

### **Table 1: Full-time credit officers in Australian SMEs**

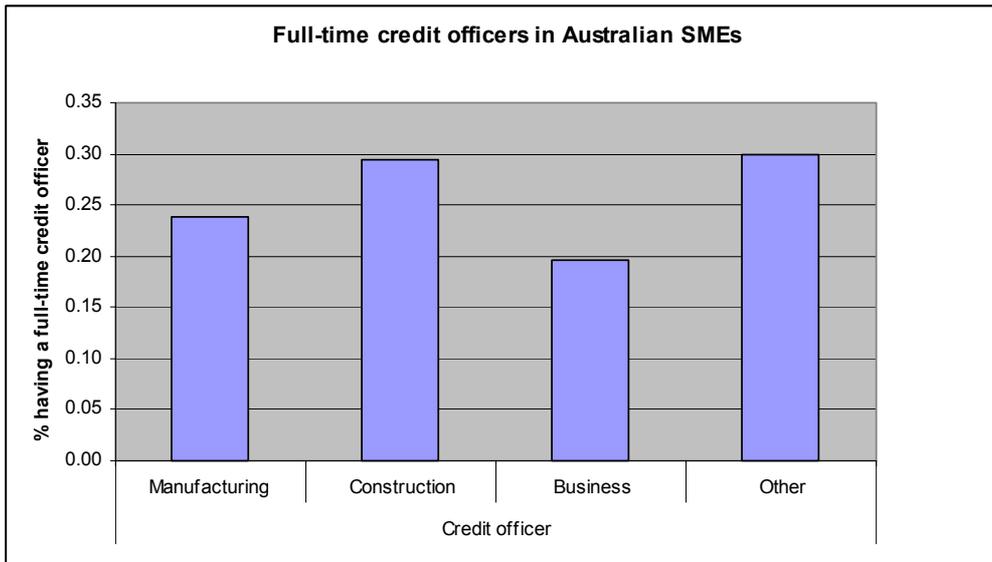

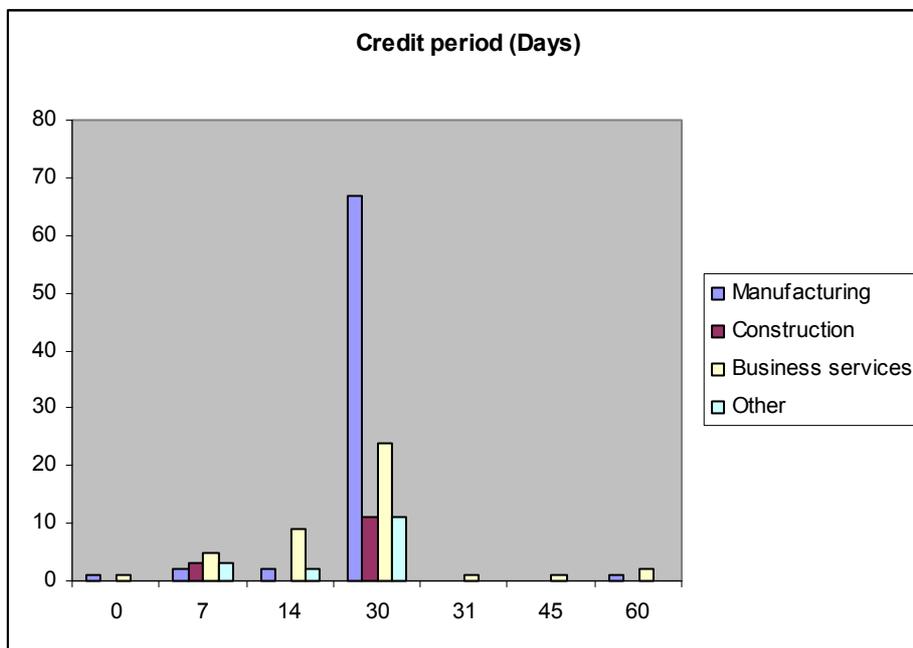

Table 2 illustrates that the credit period, in the number of days, for all industries studied is believed to be around 30 days (Pike & Cheng, 2001). The business service and manufacturing industries have credit periods going beyond the 30 days which is consistent with the literature but is inconsistent with Chittenden et al's study. Creditors days across the sectors appear to be lower in the construction industry (50 days) compared to manufacturing (61 days) and business services (59 days) sectors (F. Chittenden et al., 1998).

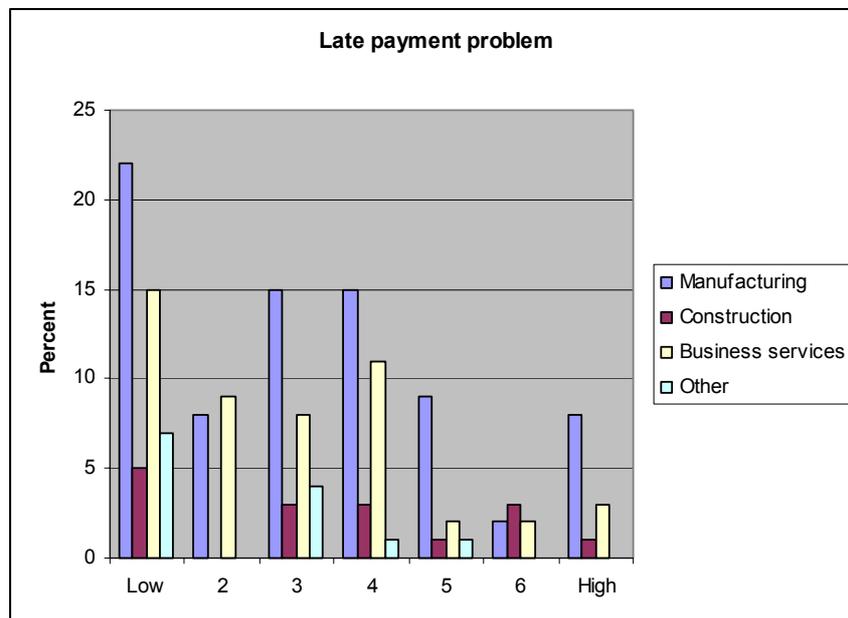

**Table 2: Creditors days across sectors**

A great deal of press comment and parliamentary interest in the late payment of trade credit problem has existed in Australia over the last three years as mentioned earlier. The late payment continues to be a problem for any business that uses credit facilities. In this study respondents indicated that on average 50 per cent of their customers settle their accounts on time that is without further communication or correspondence. From this study it was found that a very serious late payment of trade credit problem exists with 25 per

cent of SMEs which is consistent with Chittenden et al study. The results suggest that the late payment problem exists in the construction and business service industries and needs to be explored further.

**Table 3: Late payment problems across sectors**

Hutchinson and Drever (1998) list advantages and disadvantages of adopting remedies to the late payment of trade credit would appear to be:

### Advantages

1. It provides an opportunity to change the culture with regard to credit management and particularly the tendency to deliberately delay payment in order to use creditors as a source of cheap finance.
2. It would undoubtedly improve the cash flow for many small businesses, either in the form of receiving payments more quickly or receiving additional money when payments are late.
3. It could be seen as "levelling the playing field" for small businesses in their dealings with large businesses and thereby reduce some of the coercive power of larger businesses.
4. It would be consistent to study and adopt legislation similar to other countries.

### Disadvantages

1. It could be seen as another example of government interference in the regulation of commercial activities.
2. It may not be the best way of achieving the stated aims. There may be other, more cost-effective, ways of helping small businesses in relation to late payment. For example:
  - ensuring that government departments and those who deal with governments observe better practice with regard to prompt payment of accounts.
  - making more use of trade associations to act on behalf of their members in a variety of ways such as taking over the legal enforcement of late payments. This could be

funded by an industry levy and could be extended to cover bad debts as well as late payments. The government could have a role to play here in terms of allowing any such levies as a tax deductible expense.

3. The issue of late payment is much less serious now than it was during the period of high inflation. Whilst it is always possible that high inflation may return, low inflation reduces the urgency of this problem.
4. The extensive use of credit cards reduces the problem of bad debts and late payment for many small businesses.
5. Large businesses may still be able to use their market power by shopping around to find suppliers who are prepared to offer very long periods of credit or agree to bill late.
6. It may actually encourage delay in payment of debts if a customer finds that the statutory rate of interest is less than the cost of other financing.
7. Very importantly, it may "backfire" on small business in general and on rapidly growing small businesses in particular. To the extent that small businesses may be net borrowers rather than net lenders, the introduction of such legislation could increase the cost of an important source of funding to them.

## **CONCLUSION**

It can be seen that there is a role for government and that this can take the form of:

1. Ensuring that those entities directly under government control follow best practice with regard to payment of debts.
2. Using its bargaining with private contractors to ensure that they follow best practice in dealing with small businesses.
3. Providing specialist facilities such as the EFIC
4. Introducing legislation which provides a statutory right to interest on overdue accounts

Consideration should also be given to alternative ways of achieving all, or most, of the objectives of such legislation by other means. These would include the greater use of government power to enforce best practice with regard to the payment of debtors and the encouragement of trade associations to deal with such problems.

Encourage the best practice of small businesses paying accounts by those entities over which it has direct or indirect control. This, in itself, could lead to a very significant improvement in the financial position of small businesses.

# Information Systems Assessment based on Business Excellence Models

Paul B Cragg

Department of Accountancy, Finance and Information Systems

University of Canterbury

Christchurch, New Zealand

[paul.cragg@canterbury.ac.nz](mailto:paul.cragg@canterbury.ac.nz)

## ABSTRACT

Much attention has focused recently on business excellence, and excellence models have been created to encourage firms to evaluate and subsequently improve their business processes. Most of these instruments pay some attention to information systems. This paper focuses on the information systems content of both the Baldrige and EFQM excellence models. The information systems content of both models is analysed with the purpose of creating an instrument that will enable a small firm to carry out an assessment of their information systems area. The analysis identified six questions from the EFQM excellence model that could help managers of small firms assess their information systems. Although the six questions are a subset of the EFQM model, they should be validated empirically for their new purpose.

## Keywords

Information systems, EFQM, Baldrige, benchmarking, small firms.

## INTRODUCTION

Much attention has focused recently on business excellence, and excellence models have been created to encourage firms to evaluate and subsequently improve their business processes. Numerous excellence models exist, and some have been adapted for small firms. These excellence models typically cover a range of activities, including strategic leadership, quality, performance, and other key processes.

The focus on business excellence has spawned a number of self-assessment tools that have been designed to help firms identify where they stand and/or to get firms started on the business excellence journey. For example, the EFQM believe that their self-assessment instrument provides “a useful starting point and indicator for subsequent activities” (EFQM, 1999, p. 7).

The business excellence models cover a wide range of topics, eg, leadership and strategy. However, they tend not to directly refer to the area of information systems (IS) which is an

area that has become more important to small firms, spurred by the relative cheapness and pervasiveness of information technology, including the e.business revolution. This research aimed to propose a tool that could be used by small firms to conduct a self-assessment of their IS activities. If possible, the tool would be based on an existing business excellence model rather than the creation of yet another model.

Thus the research set out to analyse the content of the most popular business excellence tools. The Baldrige and EFQM models were selected and the analysis focussed on their self-assessment tools. In terms of a research question, the research set out to determine which parts, if any, of either the Baldrige or EFQM self-assessment instruments could be used to evaluate a small firm's IS. This paper presents the results of this analysis, firstly for the Baldrige model, and then for the EFQM model. The conclusions section proposes a set of six questions that could be used to evaluate a small firm's information systems activities.

## **Prior Research on Information Systems and Excellence**

Although there is growing literature in both the Information Systems area and the area of Business Excellence, there is very little work that has attempted to bring the two areas together. One rare example is the SIM working groups on quality who proposed an IS excellence model based on the Baldrige criteria (SIM, 1992). They proposed a total of 27 quality matrices for self-assessment by IS departments. They proposed that IS managers could use the tool to assess their position on each matrix ranging from "just starting" to "world class", by evaluating their current practice against five levels of practice identified by SIM.

Also, Cortada (1998) examined the practices of many large firms to identify 'best' practices in IT. Amongst Cortada's IT best practices are alignment with business strategy, and the careful selection and monitoring of IT projects.

Although little research has combined both IS and Excellence, there have been many attempts within the IS field to incorporate principles that are reflected in models of excellence. For example, there is much literature about TQM and IS, eg, Ravichandran & Rai (2000). This literature examines a range of topics, including: the quality of software systems, the quality of the software development process, and the quality of the service received by customers/users of IS. There have been many attempts to create metrics that could help firms monitor and improve IS within a firm (Seddon et al, 1999). Two of the most commonly used measures are of user information satisfaction (UIS) and IS service quality, using an instrument called SERVQUAL. SERVQUAL is the more recent of the two instruments and aims to measure how satisfied users are with the information systems within a firm (Pitt et al, 1997).

The closest work to the aim of this paper is the instrument by Ravarini et al (2002) who have created a way of providing an "IS check-up" for a small firm, ie, an instrument aimed at assessing the health of a small firm's IT. Their methodology focuses on IT alignment, based primarily on the IT fit for each part of a small firm, for example, the sales area, accounting, logistics, etc. Their assessment evaluates the actual IT support in each area and the potential for IT for the area. Their exploratory application of the model in small firms indicates that some units within small firms are well supported by IT but there are plenty of opportunities for IT to play a greater role within small firms.

## **The IS content of the 2003 Baldrige Criteria for Business Excellence**

The Baldrige Criteria for Performance Excellence (Baldrige, 2004a) contains the following seven categories:

1. Leadership
2. Strategic planning
3. Customer and market focus
4. Measurement, analysis and knowledge management
5. Human resource focus
6. Process management
7. Results

The fourth category refers to Measurement, Analysis and Knowledge Management. As a category it has a weight of 90 points in the total score of 1000 for the full model. The category is broken down further into the following two topics:

4.1 Measurement and Analysis of Organizational Performance, which is split into the two topics of 'Performance Measurement' and 'Performance Analysis' (45 pts).

4.2 Information Management, which is split into two topics 'Data and Information Availability' and 'Organisational Knowledge' (45 pts).

Under category 4.1, firms are asked to "Describe HOW your organization measures, analyzes, aligns, and improves its PERFORMANCE data and information at all levels and in all parts of your organization". The first part of this category encourages firms to focus on performance measurement practices. Firms are encouraged to have information systems that:

- Track both operational and organizational performance
- Support operational and strategic decision making
- And are up to date.

The second part of this category encourages firms to focus on the analysis of performance data. Firms are encouraged to:

- Analyse data that supports both performance reviews and strategic planning
- Communicate results to others within the firm.

Under category 4.2, firms are asked to "Describe HOW your organization ensures the quality and availability of needed data and information for employees, suppliers and partners, and CUSTOMERS. Describe HOW your organization builds and manages its KNOWLEDGE ASSETS. The first part of this category encourages firms to focus on data and information availability, including the reliability, security and user-friendliness of both hardware and software systems. The second part encourages firms to manage organizational knowledge. This includes not just the knowledge of employees, but also

knowledge from customers, suppliers and other partners. In addition, this category is concerned that all data, information and knowledge is timely, reliable, secure, accurate and confidential.

As well as the guide to the seven criteria, the Baldrige website also provides a guide to self-assessment (Baldrige 2003). As part of a ten step process, firms are encouraged to use the Baldrige self-assessment instrument (Baldrige, 2004b). The instrument has been prepared as a tool that an owner of a small firm could use with all staff including employees, managers, and supervisors. The purpose is to solicit views within the firm with the view of determining areas of the business that need the most attention. The Baldrige website also allows owners access to web-based self assessment using e-Baldrige. This instrument is aimed at helping owners carry out an 'organizational profile', which is step 4 of their 10 step process. (The instrument is not an electronic form of the "Are we making progress?" self assessment instrument).

The Baldrige self-assessment instrument (Baldrige 2004b) includes a total of 40 statements and covers the seven topics of the Baldrige model. Employees and managers are asked to rate each statement using a five point scale from 'strongly disagree' through to 'strongly agree'. The instrument includes the following six statements for category 4 on Measurement, Analysis and Knowledge Management:

- a. I know how to measure the quality of my work.
- b. I know how to analyze (review) the quality of my work to see if changes are needed.
- c. I use these analyses for making decisions about my work.
- d. I know how the measures I use in my work fit into the organization's overall measures of improvement.
- e. I get all the important information I need to do my work
- f. I get the information I need to know about how my organization is doing.

In addition, four other categories include the following statements associated with information systems issues.

Leadership: 1d - My organization's leaders share information about the organization.

Customer and Market Focus: 3d – I ask if my customers are satisfied or dissatisfied with my work.

Process Management: 6b – I collect information (data) about the quality of my work.

Business Results: 7c – I know how well my organization is doing financially.

Furthermore, the whole of the 'business results' criteria reflects a reliance on information systems, i.e., a firm would need systems that make it easy to report and analyse results for a wide range of activities including customers, products, financial, staff and society.

Overall, the Baldrige self-assessment instrument contains a total of 40 statements, 10 of which refer to information systems. Furthermore, the Baldrige criteria recognise that information flows play a key role in firms. However, the focus of the Baldrige criteria is on data, particularly the availability of data. None of the 10 statements refer to the

management of systems that would help in the collection, analysis and storage of data. Thus the Baldrige self-assessment instrument could help a firm analyse its information needs but it could not help a firm analyse its information management practices.

The Baldrige Criteria literature (Baldrige 2004a) does indicate the need for firms to manage the resource of data, information and knowledge. Category 4.2 indicates that hardware and software systems should be reliable, secure and user-friendly, and that all data, information and knowledge should be timely, reliable, secure, accurate and confidential. Thus this part of the Baldrige literature could be useful in the evaluation of data management. However, Baldrige (2004a) does not present this in a form that could be used easily for self-assessment.

## **The IS content of the 2003 EFQM Excellence Model – SME**

The small firms version of the EFQM Business Excellence Model (EFQM, 2001) contains the following nine criteria:

1. Leadership
2. People
3. Policy and strategy
4. Partnerships & Resources
5. Processes
6. People Results
7. Customer Results
8. Society Results
9. Key Performance Results

Five of the criteria are considered as 'enablers' and four as 'results', where 'enablers' influence 'results'. The 'enablers' are: leadership, policy and strategy, people, partnerships and resources, and processes. The 'results' are: people results, customer results, society results, and key performance results. (See Appendix 1).

The most obvious treatment of information systems within the EFQM model is within criterion 4: partnerships & resources. The five parts of this category refer to managing:

- a. External partnerships
- b. Finances
- c. Buildings, equipment and materials
- d. Technology
- e. Information and knowledge

The EFQM's self-assessment questionnaire (EFQM, 1999) includes a total of 50 equally weighted questions for the nine criteria. Of these, five questions relate to criterion 4 on partnerships & resources. Managers are asked to evaluate each question based on the four possible responses of: not started; some progress; considerable progress; fully

achieved. Two of the five questions relate specifically to information systems, they are:

4.2 - Does your organisation ensure that all relevant information, including data on process performance, suppliers (including supplier performance), customers (including customer satisfaction) and benchmarks, is reliable, up to date, and quickly available and easily usable by appropriate personnel (including suppliers/distributors/customers where appropriate)?

4.5 – Is there a routine method for ensuring that alternative and new technologies are developed and implemented, and the use of intellectual property and knowledge optimised in order to gain an advantage on both products and services?

In addition, other criteria include the following statements associated with information systems issues.

Policy & Strategy – 2.1 - Does your organisation use widespread and appropriate data inputs to develop its strategy and business plans and does this data include the performance of internal processes, supplier performance, customer requirements and satisfaction, competitor and benchmark data?

Processes – 5.3 – Is there a comprehensive and reliable method for understanding customer's perceptions, needs, and expectations and the markets in which it operates?

Processes – 5.7 – Are the support (“back-room”) activities (eg, accounts, IT, despatch, data processing, personnel, legal, and secretarial) documented, controlled and continuously improved to at least the same level as the main product and service activities?

Key Performance Results – 9.7 – Are the results of the support and administration activities (eg, IT, planning, legal, security, accounts) showing an improving trend and can they be shown to be comparable/better than other organisations?

In addition, the four criteria that reflect results also reflect the need for information systems. For example, criteria 6 on customer results shows a need to collect various data, eg, customer satisfaction, loyalty, warranty claims, and complaints. Firms are expected to analyse and use this data in appropriate ways. Similarly, firms are expected to collect and analyse data regarding staff satisfaction, society results, as well as financial results like profit, volumes and market share.

Overall, the EFQM fundamental concepts and criteria recognise that information flows play a key role in firms. Overall, the EFQM self-assessment instrument contains a total of 50 statements, six of which refer to information systems. Three of these six EFQM questions relate to data availability (2.1, 5.3, and 9.7). The other three EFQM questions (4.2, 4.5, and 5.7) refer to the management of IS. In these three questions, the EFQM model recognises that firms should manage IT, including controlling, improving and introducing new technologies. Thus the EFQM literature could be useful in the evaluation of data availability and could also provide feedback on data management.

## **Discussion and Conclusions**

Both the Baldrige and EFQM models show that data, information and knowledge is important to firms. For example, the Baldrige self-assessment instrument contains ten statements that could be considered directly relevant to information systems. The EFQM self-assessment instrument contains six statements that could be considered directly relevant to information systems. Thus both excellence models reflect a significant role for information systems within firms.

With the objective of using one of the models for the self-assessment of Information Systems, the 10 questions in the Baldrige self-assessment instrument focus solely on data availability. Although the EFQM self-assessment instrument has only six statements aimed at information systems, these six are evenly split between data and management. This analysis indicates that the EFQM self-assessment instrument would be superior to the Baldrige self-assessment instrument for the purpose of a quick evaluation of a firm's information systems. We thus recommend that the six questions contained in Table 1 could help provide small firms with a speedy evaluation of their information systems.

**Table 1: Six EFQM questions for the evaluation of IS (sourced from EFQM 1999)**

EFQM Criteria	
Policy & Strategy 2.1	Does your organisation use widespread and appropriate data inputs to develop its strategy and business plans and does this data include the performance of internal processes, supplier performance, customer requirements and satisfaction, competitor and benchmark data?
Processes 5.3	Is there a comprehensive and reliable method for understanding customer's perceptions, needs, and expectations and the markets in which it operates?
Key Performance Results 9.7	Are the results of the support and administration activities (eg, IT, planning, legal, security, accounts) showing an improving trend and can they be shown to be comparable/better than other organisations?
Partnerships & Resources 4.2	Does your organisation ensure that all relevant information, including data on process performance, suppliers (including supplier performance), customers (including customer satisfaction) and benchmarks, is reliable, up to date, and quickly available and easily usable by appropriate personnel (including suppliers/distributors/customers where appropriate)?
Partnerships & Resources 4.5	Is there a routine method for ensuring that alternative and new technologies are developed and implemented, and the use of intellectual property and knowledge optimised in order to gain an advantage on both products and services?
Processes 5.7	Are the support ("back-room") activities (eg, accounts, IT, despatch, data processing, personnel, legal, and secretarial) documented, controlled and continuously improved to at least the same level as the main product and service activities?

Analysis based on the above six questions could be useful to a small firm. The results may be even more helpful to a firm if they had some comparative data. For example, it may help a firm if they could compare their own data with published EFQM data for similar small firms.

Although we are recommending the use of the above six statements by small firms, it is important that this instrument is proved to be valid and reliable. Business excellence

models, including the EFQM model, have a mixed record regarding validity and reliability. McAdam & Welsh (2000) claim that, although the EFQM Model has been well accepted by managers there has been little rigorous empirical research aimed at the model. For example, Eskildsen et al (2000) believe that the model should be simplified. Such results prompted Kristensen et al (2001) to develop a Danish business excellence index where they reduced the 9 topics of the EFQM to four: leadership, people, systems, and results. They used PLS analysis to argue that the EFQM's 9 criteria reflect 4 not 9 underlying constructs. Furthermore, Baxter & MacLeod (1999) focused on the leadership criteria of the European Excellence Model. They concluded that "the EFQM subcriteria seem too superficial and the measurement process imprecise". Thus the above six item instrument for IS should be tested rigorously. They may be found to be reliable and valid. Six items may prove to be too few. It seems likely that we may need a fuller instrument to reflect, for example, other aspects including IS leadership, IS strategy etc. Also, the EFQM questionnaire uses a four point scale; this may be too narrow to discriminate effectively.

## **ABSTRACT**

Family businesses are fast becoming the dominant form of business enterprise in both developing and developed economies and play a vital economic and social role in these economies. As family businesses are a primary contributor to the economic and social wellbeing of all capitalist societies, their general lack of longevity is a cause for concern. One of the main reasons (if not the single most important reason) of the high failure rate among first- and second-generation family businesses is their inability to manage the complex process of ownership and management succession from one generation to the next. Hence, the primary objective of this study is to identify the factors that impact on successful succession. The results suggest that the willingness of the successor to take over the family business and undertaking estate planning are important to the success of succession for both owner-managers and successors.

## **INTRODUCTION**

South Africa, as is the case with most developing countries, has to deal with a burgeoning unemployment problem. Recent figures (2002) indicate that up to 37% of households in South Africa survive on less than R1000 per month (Woolard 2002). Poverty and unemployment are closely linked, in that 53% of the South African population falling in the poorest quintile are unemployed, compared to 4% of the most affluent 20% of the population.

It is important for South Africa's future stability to find solutions to the unemployment problem in order to give poor South Africans some means of sustained income generation. Unfortunately, existing large corporations and the public sector have proved themselves unable to address the endemic problems of unemployment and poverty. Hence, the focus is increasingly shifting to the role the small business sector can play in solving the economic problems facing the country.

Approximately 80% of businesses in South Africa could be classified as family businesses (Ackerman 2001:325), which are mostly small to medium-sized (Maas 1999:2; Magretta 1998:114). In fact, family businesses are fast becoming the dominant form of business enterprise in both developing and developed economies and play a vital economic and social role in these economies. The influence and number of family businesses can be expected to increase substantially in the near future. This rapid growth could be attributed to the rationalising process taking place in many large corporations, together with the growing inability of the formal sector to create new jobs. Family businesses can therefore offer powerful opportunities for further economic growth in South Africa.

## **PROBLEM STATEMENT AND OBJECTIVES**

As family businesses are a primary contributor to the economic and social wellbeing of all capitalist societies, their general lack of longevity is a cause for concern. It has been estimated that, internationally, only 30% of family businesses survive to the second generation, while fewer than 14% make it beyond the third generation (Bjuggren & Sund 2001:12; Fleming 1997). In South Africa, only one in four family businesses survive into the second generation, while only one in ten makes it to the third generation (Engine of growth 1994:25; Hugo 1996:8). The social cost of this high failure rate has contributed to negative social and economic growth in South Africa.

According to several authors, the main reasons (if not the single most important reason) for the high failure rate among first- and second-generation family businesses is their inability to manage the complex process of ownership and management succession from one generation to the next (Corbetta & Montemerlo 1998:8; Fleming 1997:46; Leach 1994:147). This inability is particularly true at the time of transition between the founder and the next generation.

Against this background, it is clear how important it is to identify the factors that influence succession in family businesses and to address succession proactively, to ensure the survival of more family business so that they can play their rightful economic and social roles in the South African economy. The more successful the transition, the better the chances of the survival and long-term profitability of these businesses. A well-considered and well-planned succession will maximise the chances of finding a competent successor and will ensure a smooth leadership transition between generations (Neubauer & Lank 1998:133,157,164).

Hence, the primary objective of this study is to identify the factors that impact on successful succession. The possible influence of various factors (independent variables such as family harmony, estate planning and governance structures) on the dependent variable, namely the Perceived success of the succession process are theoretically modelled and empirically tested.

This study will not only test the existence and magnitude of these relationships, but also compare and contrast which of these factors are important for two major stakeholder groups in the succession process, namely owner-managers and successors. It is important for the continued prosperity of the family business and harmony within the family that family business leaders and all stakeholders have a sound understanding of the critical success factors for succession.

## **THEORETICAL BACKGROUND**

### **The independent variables**

Based on exhaustive literature review and qualitative interviews with family business member the following independent variables were identified (Venter 2003):

1. Willingness of the successor to take over the family business (WILLING)
2. Family harmony (HARMONY)
3. Governance processes and planning (GOVERNANCE)
4. Owner-manager's outside interests (INTEREST)
5. Internal preparation level of the successor (INTERNAL PREP)
6. Financial security of the business and owner-manager (SECURITY)
7. Trust in the successor's abilities and intentions (TRUST)
8. Relationship between owner-manager and successor (RELATION)
9. Estate planning (ESTATE)
10. External preparation level of the successor (EXTERNAL PREP)
11. Agreement to continue the business (AGREE)

### **The dependent variable**

Handler (1989:216), Sharma (1997:11) and Stempler (1988) suggest that the satisfaction of predecessor, successor, and other family members with the succession process can be used as an indication of the perceived success of the succession process. Others, such as Harvey and Evans (1995:12) and Hume (1999:22), recommend that not only the satisfaction of various stakeholders with the succession process defines a successful succession, but also the successor's ability to keep the family business healthy by means of sustained growth and continued profitability. It therefore appears that in order to ensure the success of the succession process, all the different stakeholders involved in the process (the predecessor, successor, family, network, suppliers, etc.) must be satisfied with its outcomes, and the successor should have the ability to ensure the sustainability and financial security of the family business after the succession process has been completed. This paper therefore focuses on the two main players in the succession process, namely the owner-manager and his/her successor.

## **METHODOLOGY**

A theoretical model of factors that influence successful succession (the independent variables) was tested by means of a large-scale empirical study. A questionnaire with 104 items was developed making use of a 7-point Likert-type scale. These questionnaires were

mailed to a convenience sample of 2458 respondents in 1038 small and medium-sized family businesses (employing less than 200 workers) in South Africa. A total of 332 usable questionnaires were returned.

The multivariate technique of exploratory factor analysis was used to assess the discriminant validity of the measuring instrument. After 9 iterations, 52 variables from the questionnaire were grouped into 13 distinct factors explaining a total of 67% of the variance in the data. During the exploratory factor analysis, the dependent variable (in this study being the Perceived success of the succession process) split into two variables, namely Satisfaction with the succession process and Continued profitability of the business.

In order to compare whether the owner-managers and successors have different perceptions of which factors influence the success of succession (Satisfaction with succession process and the Continued profitability of the business), the dataset was divided into two sub-samples, the first consisting of responses received from the 123 owner-managers (both retired and retiring owner-managers) and the second consisting of responses received from the 209 successors (potential or current successors). Multiple linear regression analysis was performed to assess whether the identified independent variables exert a significant influence on Satisfaction with the succession process (SATISFIED) and the Continued profitability of the business (PROFIT) for the two sub-samples of respondents separately:

For this purpose, the following null hypotheses were formulated for both the owner-manager sample and the and successor sample:

- H<sup>0a</sup> : For owner-managers, there is no relationship between the identified factors and the satisfaction with the succession process.
- H<sup>0b</sup> : For owner-managers there is no relationship between the identified factors and the continued profitability of the business.
- H<sup>0c</sup> : For successors, there is no relationship between the identified factors and the satisfaction with the succession process.
- H<sup>0d</sup> : For successors there is no relationship between the identified factors and the continued profitability of the business.

## **EMPIRICAL RESULTS**

### **Results for owner-manager sub-sample: Satisfaction**

The independent variables included in the regression analysis explain 45.0% of the variance the dependent variable SATISFIED (satisfaction with the succession process) in the owner-manager sub-sample. Three of the independent variables namely WILLING, HARMONY and TRUST exerted a significant positive influence on the dependent variable SATISFIED at the 1% confidence level. In other words, the more the owner-manager perceives the successor to be willing to take over the business, the more harmony there is within the family and the more the owner-manager trusts in the successor's abilities and intentions, the more satisfied the owner-managers will be with the succession process.

## **Results for owner-manager sub-sample: Future profitability**

In total, the independent variables explained 31.9% of the variance in the dependent variable PROFIT (the expected future profitability of the family business after succession) in the owner-manager sub-sample. Two of the dependent variables namely WILLING and EXTERNAL PREP exert a significant positive influence on the dependent variable PROFIT at the 1% confidence level and the independent variable TRUST exert a significant positive influence at the 5% level. This means that the more the owner-manager perceives the successor to be willing to take over the business, trusts the successor's abilities and intentions and the more preparation the successor receives external to the business, the more likely the business is to remain profitable after succession. The relationship between the variables ESTATE and PROFIT is, however, negative. This finding implies that the more estate planning is performed within the business, the less likely the business is expected to be profitable after succession, according to the owner-manager respondents.

The two null hypotheses ( $H^{0a}$  and  $H^{0b}$ ) are thus rejected as relationships do exist between the identified factors and the Satisfaction with the succession process and the Continued profitability of the business (the two indicators of a successful succession).

## **Results for the successor sub-sample: Satisfaction**

A full 52.9% of the variance in the dependent variable SATISFIED in the successors sub-sample can be explained by the identified independent variables. Only one independent variable namely AGREE exerts a significant influence on the dependent variable SATISFIED at the 5% confidence level. This implies that the more the successor perceives there to be an agreement among family members to continue the business, the more satisfied the successor will be with the succession process.

## **Results for the successor sub-sample: Future profitability**

The independent variables included in the regression analysis explained 27.2% of the variance in the dependent variable PROFIT in the successor sub-sample. Two of the independent variables namely ESTATE (at a 1% confidence level) and WILLING (at a 5% confidence level) exert a significant influence on the dependent variable PROFIT. In other words, the more the successor is willing to take over the business the more likely the business is of remaining profitable. Similarly to the relationship identified among owner-managers, the relationship between ESTATE and PROFIT is also negative. In other words, according to successors, the more estate planning is done the less likely the family business is of continuing profitability after succession.

The two null hypotheses ( $H^{0c}$  and  $H^{0d}$ ) are thus rejected as relationships do exist between the identified variables and the Satisfaction with the succession process and the Continued profitability of the business.

## **MANAGEMENT IMPLICATIONS**

The empirical results show that there are several factors that influence the success of the succession process in small and medium-sized family businesses. Possibly the most important of these is the willingness of the successor to take over the business. This factor

is perceived to influence both the satisfaction with the succession process, as well as the continued profitability of the business for owner-managers and successors alike. Important elements of “willingness to take over” include whether the successor is looking forward to and have a strong desire to manage the family business, finds it exciting to work in the family business, is committed to continue the family business, and believes that his or her personal development goals could be satisfied in the context of the family business.

“Eighty percent of all new small businesses fail in their first five years” (Allen, 2000:20, Why do small businesses fail, 2003:1) and it has “been proven, time and again, that the main cause of business failure is the incompetent management of a business” (Smith, 1999:28-29).

## **ABSTRACT**

The failure rate of SMEs lies between 70% and 80% (Barron, 2000:1, Moodie, 2003:9, Ryan, 2003:13). Although small businesses fail due to a variety of reasons arising from the macro, market and micro environments, a problem that is often cited as a major contributor to failure is managerial incompetence and lack of business skills (Bekker and Staude, 1988:503, Marx, van Rooyen, Bosch and Reynders, 1998:732). More than 90 percent of entrepreneurial failure is attributed to lack of abilities to perform managerial functions (Glueck, 1980:65, Limited skills in management, 1998:1). The objective of this study was to identify the management competencies possessed by small business owner-managers in the Nelson Mandela Metropole. A quantitative research design based on the positivistic paradigm was used. A judgemental sample of 242 small businesses in the Nelson Mandela Metropole was utilised. The empirical results indicated that the managerial competencies evident in successful small businesses are planning and administration, strategic action and self-management (balance).

# INTRODUCTION

The small and medium-sized enterprise (SME) sector has been described by the South African government as having enormous economic potential and because of this the government has become increasingly committed to the promotion and growth of this sector (Budget speech, 2001, South African Yearbook, 2000:257). SMEs in South Africa employ almost half of the people formally employed in the private sector and play a pivotal role in the economy by contributing to 42% of the country's gross domestic product (Levin, 1998:79, South African Yearbook, 2000:256). With the importance of the small business sector becoming increasingly apparent, the continued creation and survival of SMEs is vitally important to "the future of the South African economy and the creation of new employment opportunities" (Macleod, 1999). However, it has been estimated that the failure rate of SMEs lies between 70% and 80% (Barron, 2000:1, Moodie, 2003:9, Ryan, 2003:13) and that a substantial amount of money is being lost due to the occurrence of mistakes and problems that could otherwise have been avoided. The chances of survival and success are however greatly enhanced if future problems and challenges are anticipated, understood and addressed prior to establishing the small business or an obstacle arising.

Small businesses operate within an environment that is dynamic, turbulent and that offers great challenges. Some of these challenges present not only opportunities to SMEs but are also a major source of problems. Within the environment problems arise from the macro, market or micro environments. Issues that present a problem to SMEs in the macro environment relate to the state of the economy, crime and rapidly changing technology amongst others. The market environment presents problems such as limited market size, low demand for products/services and considerable competition. Problems relating to the functional and financial areas, as well as the inability to control growth and lack managerial competence can arise from the micro environment.

Although small businesses fail due to a variety of reasons, a problem that is often cited as a major contributor to failure is managerial incompetence and lack of business skills (Bekker and Staude, 1988:503, Marx *et al.*, 1998:732). More than 90 percent of entrepreneurial failure is attributed to lack of abilities to perform managerial functions (Glueck, 1980:65, Limited skills in management, 1998:1), while Wright (1995:75) concurs that poor management ranks among the main reasons for the failure of many small businesses. It is therefore apparent that small business owner-managers require certain managerial competencies in order to succeed (Kyambalesa, 1994:174). This will allow small business owner-managers to better manage their businesses and solve problems, resulting in improved chances for success and the ability to be a better contributor to the economy.

## OBJECTIVES OF THE STUDY

The primary objective of this study is to identify the management competencies possessed by small business owner-managers in the Nelson Mandela Metropole. Secondary objectives include establishing the existence of any significant relationships between:

- managerial competencies and selected demographic variables;
- managerial competencies and perceived success; and
- selected demographic variables and perceived success.

## **PROBLEM INVESTIGATED**

Small and medium-sized enterprises (SMEs) are having a positive impact on the South African economy through job creation and provision of employment opportunities. However, despite the economic benefits and the opportunities provided by SME initiatives, small businesses continue to be inextricably linked to high failure rates and problematic challenges. Flusche, van Beveren and Kilgore (2001:1) state that although government and economic conditions contribute to SME failure, managerial action, incompetence and inexperience has a far more significant influence on SME success. Studies have further shown that 14,5% of small businesses fail due to a lack of management competence or management experience (Flusche *et al.* 2001:1), and unless addressed, this will be a major factor contributing to the high failure rate of small business. The problem to be investigated in this study involves identifying the management competencies possessed by small business owner-managers in the Nelson Mandela Metropole based on the model of managerial competencies proposed by Hellriegel, Jackson, Slocum, Staude and Associates (2001:6), namely communication, planning and administration, teamwork, strategic-action and self-management competencies.

## **RESEARCH OBJECTIVES**

In order to investigate the managerial competencies prevalent in SME owner-managers in the Nelson Mandela Metropole, a research instrument in the form of a questionnaire was developed.

## **RESEARCH METHODOLOGY**

This research study can be described as quantitative research from a positivistic approach. This paradigm is concerned with seeking the facts and causes of a phenomenon, is associated with measurement and produces data that is both specific, precise and quantitative (Hussey and Hussey, 1997:52).

## **RESULTS**

A series of factor analyses revealed that the items measuring success loaded onto a single factor, and the 60 items pertaining to the various managerial competencies loaded onto nine different factors. These were subsequently named communication; planning and administration; financial planning; teamwork (promotion); teamwork (participation); strategic-

action; self-management (conduct); self-management (balance) and self-management (drive/adaptability).

In order to evaluate the internal reliability of the questionnaire, Cronbach Alpha coefficients were calculated. For the purpose of this study, the cut-off value of 0,70 was utilised to indicate the reliability of the measuring instruments. All Cronbach Alpha coefficients exceeded the cut-off point of 0,70 as determined by Nunally (1978). The internal reliability of the measuring instrument was thus confirmed.

**Table 1: Summary of factor analyses per category**

Factor	Number of items	Factor loadings		Cronbach alpha coefficients
		Min	Max	
Success	4	- 0,62	0,83	0,72
Communication	9	0,17	0,78	0,79
Planning and administration	11	0,39	0,71	0,81
Financial planning	3	0,75	0,84	0,79
Teamwork (promotion)	5	0,70	0,73	0,81
Teamwork (participation)	4	0,60	0,83	0,77
Strategic action	7	-0,65	-0,84	0,87
Self-management (conduct)	5	0,52	0,80	0,78
Self-management (balance)	4	0,52	0,78	0,71
Self-management (drive/adaptability)	7	0,51	0,70	0,79

Descriptive statistics relating to the sample are presented in Table 2. From the table it is evident that the majority of respondents were both owner and manager of their small business. It has further been identified that the majority of respondents are males and predominantly white. Most owner-managers have occupied this position for between three and five years and the majority of respondents do not possess a managerial qualification. The close corporation and sole trader are the most popular forms of enterprise. Many respondents indicated operating in more than one industry, namely in retail, wholesale, manufacture and service or a combination thereof. It was however identified that they operate in the service and retail industry respectively. The majority of respondents employ between one and five full-time employees. Most small businesses reported an annual turnover of less than R500 000.

Table 3 below contains a summary of the descriptive statistics for the various competencies that are considered important in managing a successful small business. It is evident from the table below that the mean scores varied for all the management competencies investigated. The self-management (conduct) competency obtained the highest mean score, whereas the planning and administration; and the communication competencies both obtained the lowest mean scores.

**Table 3: Descriptive statistics on the management competencies investigated**

Factor	Valid N	Mean	Quartiles		Std.Dev	Frequency distribution %		
			Min	Max		Disagree	Neutral	Agree
Communication	242	3,93	2,00	5,00	0,51	5,78	53,72	40,50
Planning and administration	242	3,93	2,10	5,00	0,50	3,31	59,50	37,19
Financial planning	242	4,03	1,00	5,00	0,80	11,57	44,63	43,80

\* 99% confidence level (< 0,01)

\*\* 95% confidence level (< 0,05)

It is evident that at the 99 percent confidence level a positive correlation exists between all the following competencies, namely communication, planning and administration, financial planning, strategic action, self-management (conduct), self-management (balance), self-management (drive/adaptability) and teamwork (participation) except teamwork (promotion).

Teamwork (promotion) is negatively correlated at the 95 percent confidence level with teamwork (participation) and self-management (drive/adaptability) positively correlated with financial planning at the 95 percent confidence level. A significant relationship exists between success and the following competencies at the 95 percent confidence level, namely self-management (conduct) and self-management (drive/adaptability).

The results of the analysis of variance (ANOVA) are depicted in Table 5 below. This test was undertaken to establish whether significant differences exist between the selected demographic variables on the one hand, and the management competencies investigated and perceived success, on the other hand.

<b>Annual turnover</b>												
< R 500 000					3,74	0,84						
R 500 000 to R 999 999					4,02	0,74						
R 1 000 000 to R 4 999 999					4,08	0,85						
R 5 000 000+					4,53	0,53						
No response					4,11	0,57						

It is evident from the table above that a significant difference exists at ( $p < 0,01$ ) between the selected demographic variables and the management competencies investigated.

Communication competency and the demographic variables ownership status and management qualification are significantly different. It appears that respondents who are owners exhibit superior communication skills compared to those that are not. Owner-managers who possess a management qualification exhibit the communication competency more than those that do not.

A significant difference was found between financial planning competency and the demographic variables gender, management qualification, annual turnover and nature of industry. It is evident that owner-managers who possess a management qualification undertake financial planning activities to a greater extent than those that do not have a qualification. Small businesses with a turnover greater than R5 million are more likely to do financial planning than those with a turnover of less than R5 million. The results further indicate that small businesses operating in the retail sector perform financial planning activities more than small businesses operating in the service sector.

With regard to the following competencies a significant difference exists at ( $p < 0,05$ ). It is evident that at this level teamwork (promotion) competency indicates a significant difference with nature of the industry. It is evident that respondents in the manufacturing sector promote the effectiveness and efficiency of teamwork to a greater extent than those in either the retail sector or those operating in a combination of sectors.

There also exists a significant difference between the strategic action competency and management qualification. It appears that owner-managers who possess a management qualification are more skilled at strategic planning than those who possess no managerial qualification.

A significant difference exists between self-management (balance) competency and management qualification. It is clear that owner-managers who possess a management qualification are more capable of balancing work and other life issues than those who do not possess a managerial qualification.

It is apparent that a significant difference ( $p < 0,01$ ) was established between the perceived success of a small business and term of management, gender and number of full-time employees.

**Table 7: Relationships between demographic variables and success**

		Success	
		F	P
	df		
Ownership status	2	0,6052	0,546867

Nature of industry	4	1,5805	0,180527
Number of full-time employees	1	15,9265	<b>*0,000090</b>
Annual turnover	4	1,8912	0,113024

\* 99% confidence level (< 0,01)

\*\* 95% confidence level (< 0,05)

Owner-managers who have been in business for only two years perceive themselves to be more successful than owners who have had a longer term of management. Females perceive themselves to be more successful at running a small business than do males. Owner-managers who employ more than twenty full-time employees perceive their businesses to be more successful than those employing less.

## CONCLUSIONS

This study investigated the contributions made by the SME sector to the economic growth of South Africa and the challenges faced by the SME sector. Management incompetence was revealed as a major challenge facing the small business sector. The empirical investigation conducted on small businesses in the Nelson Mandela Metropole revealed the order of importance of the managerial competencies investigated. The order of importance of the managerial competencies is thus as follows: self-management (conduct), self-management (drive/adaptability), teamwork (participation), self-management (balance), financial planning, strategic-action, teamwork (promotion), communication and planning and administration. From the above order of importance it can be deduced that the following competencies need to be improved upon: communication, planning and administration, financial planning and teamwork (participation). The empirical investigation further revealed that the managerial competencies evident in a successful small businesses are planning and administration, strategic action and self-management (balance).

From this study, it is evident that managerial competencies will, in the future, have a major impact on small business success. It is therefore crucial that the South African government and the small business sector alike take note of this challenge hindering small business success and realise that without adequate managerial competencies, the small business sector will be unable to realise its full potential. The heightened awareness of the effects of managerial incompetence could result in South Africa experiencing increased economic growth, social stability and job creation for the country as a whole.

## RECOMMENDATIONS

The empirical investigation revealed that the managerial competencies communication, planning and administration, financial planning and teamwork (participation) require improvement. Owner-managers may therefore do the following to improve on the competencies.

To improve their ability to communicate the following is recommended: involve employees more in business operations, encourage openness and sharing of information with employees

through the use of weekly or monthly meetings or discussions, utilise written communication that is clear, concise, commands attention and that does not contain terms that could not be understood and meetings should be short and to the point.

The planning and administration competencies may be improved through the implementation of the following: utilise all available resources to acquire information pertaining to any risk that the business may assume, for instance consult external experts and secondary sources, weigh-up the advantages and disadvantages of assuming a risk through drawing up lists and profit projections, develop plans and schedules on a weekly or monthly basis to achieve specific ideas and goals, divide the whole problem or idea into manageable and workable parts and assign priorities to and delegate responsibility for each task, thus aiding in achieving the completion and implementation of the plan on time.

In order to improve an owner-manager's competence in financial planning it is recommended that owner-managers utilise projected cash flow statements and other financial records when considering the purchase of assets, starting of a new project or planning for an activity.

It is lastly recommended that in order to improve teamwork (participation) within their business, owner-managers should hold open discussion groups with relevant team members in order to develop specific and clear goals together that are attainable and will thus inspire commitment from each individual member. It is further recommended that owner-managers implement monitoring systems, for example conduct monthly report-back sessions or periodic deadlines for specific tasks, to ensure tasks and goals are being reached and make employees part of decision making through asking for opinions or solutions directly from employees as well as giving employees a measure of authority and responsibility by making the employees themselves responsible for the outcome.

Dr Carol Dalglish  
Brisbane Graduate School of Business  
Queensland University of Technology.

October 2003

## **Entrepreneurial Success and Sustainability**

### **ABSTRACT**

The survival rate of small business is quite small, and the proportion of those surviving that go on to success and long term sustainability is even smaller. This paper explores the role of leadership in the sustainability of entrepreneurial enterprises and the relevance of Collin's research to the development of the appropriate skills for entrepreneurs.

It would appear that Colins's (2001) research has much to say about what it takes to build an exceptional company and sustain it over the long term. He and his team were looking for the contributing factors in long term success, not exploring leadership. They were trying to identify what it was that enabled some companies to be continuously successful through negative and positive external conditions. What her terms Level Five leadership appeared as critical.

These finding could have significant implications for the sustainability of entrepreneurial activity, as they suggest that the high profile, success driven individual, whilst able to attract attention and resources, and bring about significant change or development, may not have the attributes and behaviours necessary to grow a sustainable business. For sustainability the focus of the success is on the enterprise, not the entrepreneur, on the long-term development of the enterprise, not short terms rewards, on organisational values and standards rather than personality and charisma.

### **INTRODUCTION**

"Why some companies make the leap...and others don't" is the sub title of Jim Collin's latest book "Good to Great". (Collins 2001) This leap is a particularly relevant concern for small and entrepreneurial businesses. Starting up is one thing – actually surviving the changes that accompany rapid growth provides different challenges and can require very different skills.

The survival rate of start-up businesses is quite small, and the proportion of those surviving that go on to success and long term sustainability is even smaller. Gasse (1990) states:

“Most authors agree that one of the principal causes of small business bankruptcy is the lack of management skills. In effect, management skills are important to the survival of the new firm.” (p. 103)

This paper explores the role of leadership in the sustainability of entrepreneurial enterprises and the relevance of Collin’s research to the development of the appropriate skills for entrepreneurs.

## **From Good to Great**

Colins and his team undertook extensive research into the differences between companies that achieved sustained success over those that didn’t. His companies are largely in North America, are large, and have been in existence for at least 15 years. So how are his findings relevant to start-ups and other entrepreneurial companies? All of the successful companies were at a start-up or entrepreneurial stage at one time. What they did at this stage impacted on their ability to sustain their success over a long period of time and to a much greater degree than competitors in similar situations. Really the message is, begin as you mean to continue.

Collins (2001) identified a number of conditions necessary for sustained success. These include:

- Level 5 leadership; that is leaders who have a range of characteristics that include: self-effacement, reserve, humility and strong professional will.
  - Importance of having the ‘right people’.
  - Importance of confronting the brutal facts – without losing faith
  - The Hedgehog concept which identifies three intersecting factors: passion for what you do, the ability to become the best in the world at what you do and an awareness of what drives the economic engine.
  - A culture of discipline
  - The use of technology to accelerate and support initiatives
- 
- A recognition that greatness takes time

All of these are required to ensure sustainable success and ‘greatness’. For the purposes of this paper the role of leadership, and its implications, will be examined in more detail. Effective leadership is critical to entrepreneurial success but as a concept leadership is little defined or dealt with in the entrepreneurial literature.

## **Entrepreneurial leadership**

Cammarano (1993) Eggers (1999) and Moore & Buttner (1997) identify management and leadership as critical to entrepreneurial growth.

“Leadership plays a key role in the survival and success of entrepreneurial ventures. The focus in small firms is on the entrepreneur, who is called on to build an organisational culture (Schein 1983), develop a strategic vision (Chandler 1994) and discover and take advantage of opportunities and resources in the firm’s environment (Westley & Mintzberg 1989)” Moore & Buttner (1997)

Many authors have described the characteristics of entrepreneurs. Risk bearing (McClelland 1961, Liles 1974, Kao 1991, Timmons 1999, Jennings, Cox & Cooper 1994), innovations and use of initiative (Timmons 1999, Jennings, Cox & Cooper 1994, Schumpeter 1934), desire for responsibility (Timmons 1999), need for power (Hornaday & Aboud 1971), internal locus of control (Timmons 1999), personal value orientation [Brush 1992, Moore 1997) need for achievement (McClelland 1961, Hornaday & Aboud 1971, Liles 1974, Jennings, Cox & Cooper 1994), Need for independence (Collinss, Moore & Unwalla 1964, Scheinberg & Macmillan 1988 ).

Timmons (1999) asserts that 6 dominant themes have emerged about what entrepreneurs do and how they perform. These include: Commitment and determination; Opportunity obsession; Tolerance of risk, ambiguity and uncertainty; Creativity, self-reliance and ability to adapt; motivation to excel; and Leadership. The nature of the leadership required is not expanded upon.

A study of a sample of small business owners/directors in South East Queensland, Australia identified a range of ‘people’ issues. (Dalglish 2001) Through in-depth interviews they were asked to identify the ‘people’ issues that had impacted on their company and its growth.

Whilst the responses were diverse and reflected the diversity of industries, stages of development of the business and personality of the interviewee, a number of issues appeared to across the sample. These included:

- Recruiting for organisational fit
- Dealing with cultural change brought about by growth
- Motivating employees
- Managing the inter-actions between the entrepreneur and the growing organization.

Each of these could be seen as critical leadership tasks.

The process of transition described by the participants in the Australian research study is well recorded in the entrepreneurial literature. (Flamholtz 1986, Roberts 1987, Griner 1972, Kao 1991). Kao(1991) identifies many of the problems of rapid growth identified by the research including: communication becomes harder, inadequate human resource practices, management skills and organisational needs.

“the entrepreneur who wishes to retain decision making and power as a ‘closely held’ function may be unwilling to delegate to key managers.” (Kao p19).

What the research suggests is that the very characteristics that make entrepreneurs successful in starting up the business, may create problems as the business grows. The need to focus on detail, to be more structured, and aware of the impact of personality and

communication style, are things that may not have been nearly as important to the successful 'start-up'.

Nagel cited in Scarborough identifies the importance of leadership in the growing enterprise:

"The new leader is...the one who sees clearly the goal, shares repeatedly and forcefully the vision, provides the tools, trains and enables co-workers to manage and improve their processes, remains persistent in the face of adversity and inspires others to take an ownership position in the completion of the mission – by example." (Scarborough p649)

Kotter (1996) provides a practical definition of leadership, of what leaders do.

"...it (leadership) produces movement. Throughout the ages, individuals who have been seen as leaders have created change, sometimes for the better and sometimes not. They have done so in a variety of ways, though their actions often seem to boil down to establishing where a group of people should go, getting them lined up in that direction and committed to movement, and then energizing them to overcome the inevitable obstacles they will encounter along the way" Kotter (1996)

The question remains, do organisations that are particularly successful have leaders who exhibit different characteristics and behaviours than those that are less successful. Colins (2001) has identified some very clear leadership attributes that appear in successful companies but not in less successful ones.

## **Level 5 Leadership**

Colins (2001) describes the Level 5 Leader as someone who:

"Builds enduring greatness through a paradoxical blend of personal humility and professional will." (p 20)

Despite the many differences between the different leaders researched by Collins and his team there were two characteristics that applied to each of the 'great' leaders that did not apply to those leaders who led less successful companies. Leadership scholars have been searching for ways of defining and describing effective leadership and this has led to research into personal attributes, (Deary 1996) individual behaviours,(Bass 1996) and roles and functions (Gardner 1990) without any definitive outcomes. Collins' research was not focused on leadership but on success, and approaching it from that perspective some leadership attributes/behaviours did appear in the 'great' companies and not in the less successful companies. Also, despite individual differences, all the leaders exhibited these characteristics.

The first attribute he identified was that of professional will. This professional will is demonstrated in a number of ways:

'a clear catalyst in the transition from good to great, demonstrates an unwavering resolve to do whatever must be done to produce the best long term results – no matter how difficult, sets the standard and looks in the mirror, not out of the window, to apportion responsibility for poor results.' (p36)

The second attribute he identified was that of personal humility. This humility was demonstrated in a number of ways:

‘ through a compelling modesty, shunning public adulation, acting with quiet calm determination, relying on inspired standards rather than charisma to motivate, channeling ambition into the company not self, looks out of the window, not in the mirror to apportion credit for success – to other people, external factors and luck.’ (p36)

## **CONCLUSIONS**

The first attribute, of professional will, that Colins identifies appears to be consistent with the entrepreneurial and leadership literature. Successful entrepreneurs and leaders need determination and an ability to overcome whatever hurdles appear on the way to achieving their objectives. The entrepreneurial literature has long associated entrepreneurial personality with an internal locus of control (Timmons 1999)- that is a belief in individual ability to bring about change and a personal willingness to accept responsibility for actions taken.

The second attribute of humility is more complex. Considerable research has linked leadership with ‘charisma’ (Bass 1996, Weber 1947, Burns 1978), and contemporary literature is full of examples of successful corporate leaders who have extremely healthy egos and a taste for public celebrity. Colins makes a distinction here – he is seeking the leaders of great companies, rather than great leaders. He suggests that the charismatic, transformational, larger than life, leader may be very effective at bringing about change in an organisation, but has limited success with the building of a great organisation over time. Those leaders who court publicity are perhaps not the best examples of humility, yet humility was a characteristic of Matsushita, an entrepreneur who sustained a highly successful company throughout most of the 20<sup>th</sup> century in Japan, overcoming formidable obstacles such as the great depression and World War 2. (Kotter 1997)

### **Implications for sustainability**

There are perhaps no surprises with regard to the importance of entrepreneurs and leaders being driven and focusing on results. Previous research into both leadership and entrepreneurship would identify determination and an ability to be adaptable (Timmons 1999). However, some of the other characteristics are not as self evident, and in fact do not appear in the entrepreneurship literature. In a business culture that expects and encourages self promotion, can modesty, self effacement and humility succeed? Will these characteristics be recognised and can entrepreneurs who have these attributes persuade others to support them?

These finding could have significant implications for the sustainability of entrepreneurial activity, as they suggest that the high profile, success driven individual, whilst able to attract attention and possible resources, and bring about significant change or development, may not have the attributes and behaviours necessary to grow a sustainable business. For sustainability the focus of the success is on the enterprise, not the entrepreneur, on the long

term development of the enterprise, not short terms rewards, on organisational values and standards rather than personality and charisma.

The challenge is how to recognise those with level five potential, and how develop these attributes in those with the drive to succeed.

## **ABSTRACT**

The purpose of this paper is to discuss a range of sociological and motivational factors that influence an individual's decision to commence a new business venture. The paper is based on research data provided by university students studying an entrepreneurship degree program compared to the responses of a comparison group of non-entrepreneurial students.

In undertaking this research three characteristics have been focused on: need for achievement; risk-taking propensity; and locus of control. It appears from the responses that the entrepreneurship students exhibit these characteristics. They are more achievement oriented than the comparison group, they are much more prepared to take risks, and they are much more prepared to be in control.

It was thought that the 'entrepreneurial' students (nascent entrepreneurs) would be similar to each other in their backgrounds and views about new venture creation and that they would have been encouraged by parents, friends and teachers to start up new business ventures. And it seems that this is so.

It was not apparent that teachers had any significant impact on the desire to commence new ventures. However 'strong encouragement' or 'encouragement' to start a business from their fathers was experienced by approximately two-thirds of the entrepreneurship students compared to less than half of the comparison group experiencing this level of encouragement. Mothers of the entrepreneurial students were only slightly less encouraging. It was also apparent that the nascent entrepreneurs, as a group, strongly felt their parents were 'totally supportive' and 'provided ideas/advice and supported their ideas' whereas the predominant encouragement by parents of the comparison group was to follow the family tradition.

Of the 2003 cohort of entrepreneurial students 75% indicated that they were either strongly encouraged or encouraged by their friends to start a business venture of their own. On the other hand just over 50% of the comparison group indicated encouragement by their friends to commence a business.

In terms of parental background four out of every five entrepreneurship students have parents who have at some stage run their own business. This is compared to three out of every five students from the comparison group.

More evidence is needed to make more definite conclusions about the backgrounds and attitudes of entrepreneurial students however from this research it is possible to conclude that encouragement to commence a venture by parents and friends does have a positive impact on a person's preparedness to 'have a go'.

## **BACKGROUND**

The reasons why entrepreneurs are entrepreneurial have been the subject of much research, discussion and debate over much of the 20<sup>th</sup> Century. Most tension in the debate has been

between those who believe heredity is the major influence on the development of entrepreneurial characteristics vs those who believe the environment is the major influence. One of the major reasons why this debate continues is the belief that if ways can be found to develop entrepreneurial capacities in people then we have a key to creating more wealth and employment within an economy. The purpose of the research discussed in this paper is to contribute to that debate.

Over the last two years research into this area has been conducted at RMIT University with the following question posed:

What are some of the sociological and motivational reasons why people create new ventures?

In undertaking this research a number of matters had to be resolved.

## **Defining the entrepreneur**

There is a growing number of advocates suggesting that entrepreneurship become a 'legitimate field of academic enquiry' (Bygrave and Hofer 1991) however one of the obstacles in the way of this push has been an inability to define entrepreneurship. Shaver and Scott (1991) briefly discussed the difficulties in defining entrepreneurship and in order to avoid the definitional problem opted to describe entrepreneurship as 'new venture creation'.

As with Scott and Shaver (1991) it was decided to look at the action or outcome of the entrepreneurial action rather than attempting to define the person, hence the focus on creating new ventures.

## **Psychological approach to understanding entrepreneurial behaviour**

Shaver and Scott (1991) discussed how 'a psychological approach based on persons, process, and choice held promise for the future.' They recognized however that there was also a definitional problem surrounding a 'psychological approach' to the study of any phenomenon. In their work they chose to focus on a point of agreement between psychologists, i.e. that psychology is differentiated from other social or behavioural sciences by its focus on an analysis of the individual person. The research that is the subject of this paper also focuses on the individual person and the reasons they provide for being entrepreneurial in their behaviour.

To opt to use the word 'psychological' to describe reasons for acting in a certain way also has the potential to create the need to conduct a literature review into the whole body of psychological research, a daunting prospect indeed. Instead this research has opted to use the term 'motivational reasons' for a decision to commence a new venture rather than 'psychological reasons' for starting a new venture.

## **Entrepreneurial Characteristics**

Another issue has been the choice of entrepreneurial characteristics or capacities to examine. Research into the characteristics of entrepreneurs tends to focus on three main factors: need for achievement; locus of control; and risk-taking propensity.

In a significant paper on the subject of the antecedents of new venture creation Shaver and Scott (1991) concluded that need for achievement offered the best and most reliable opportunity to discover why people start up new ventures. They found that most research into Risk-taking Propensity involved the use of a Choice Dilemmas Questionnaire (CDQ) and raised serious methodological problems in the application of this measure. Similarly Shaver and Scott raised doubts about the major measure used to test for Locus of Control, the Internal-External Locus of Control scale (IE). Factor analyses of the use of the IE scale revealed that there are usually a multiple of factors that influence the outcomes of the test.

For the purposes of this research therefore, whilst locus of control and risk-taking propensity are addressed, the major focus has been on the reasons why people have developed a need for achievement and its association with new venture creation.

## **Focus Group**

The initial intention of this research was to convene a number of focus groups of existing, or 'practicing', entrepreneurs in order to have them reflect on the factors that influenced their career choice. However recent research by Carter (2002) into reasons why entrepreneurs make the career choices they do raised serious questions about relying on retrospective accounts of entrepreneurs. Golden (1992) also questioned the reliability of this approach in relation to retrospective accounts of managers.

As a result, the focus of this research is on nascent entrepreneurs (as was Carter's) and the reasons they provided for wanting to become entrepreneurial i.e. prospective reasons for behaviour. Carter concluded that entrepreneurs were not qualitatively different from other people who pursued career options. However Carter's research focused on ascertaining the reasons why entrepreneurs created new ventures not on the reasons why entrepreneurs developed this need in the first place.

In view of Carter's work, for the purposes of this research, it was decided to use undergraduate students in RMIT University's Bachelor of Business (Entrepreneurship) (BBE) program as the target group. In order to be admitted to this program potential students need to provide evidence that they are opportunity focused and are prepared to create an organisation to pursue the opportunity i.e. they self-select through providing evidence that they are either currently entrepreneurial or have the intention to be entrepreneurial. A total of 104 first, second and third year BBE students completed the survey instrument.

Students enrolled in RMIT's Bachelor of Business (Business Administration) (BBBA) provided the source of data for a comparison group and a total of 30 students completed the survey instrument. None of these students is undertaking any studies in entrepreneurship.

## **RESEARCH HYPOTHESES**

The following hypotheses are driving this research:

1. That nascent entrepreneurs have similar backgrounds.

2. That encouragement is a key factor in developing a need for achievement and in motivating a person to commence a new business venture.
3. That parents, teachers and peers have an impact on fostering a need for achievement and in encouraging a person to start up a new business venture.

The purpose of this paper is to examine and draw out common factors in the backgrounds and views of nascent entrepreneurs as to why they are entrepreneurial.

## METHOD

The Interpretivism method of research was used to establish the hypotheses and quantitative research methodology, using a questionnaire, has formed the basis of the process of testing these hypotheses. As described above it was decided, as did Carter (2002), to target 'nascent entrepreneurs'.

Students studying the BBE program were the target group with a comparison group selected from the BBBA program. These latter students had no exposure to entrepreneurship and entry to the program is based on a ranking based system (ENTER scores<sup>2</sup>). Entry to the Bachelor of Business (Entrepreneurship) degree program however is based on a ranking against three criteria:

1. School academic performance: as indicated through their ENTER ranking.
2. Entrepreneurial nature: as evidenced by their preparedness to start up new ventures and be involved in entrepreneurial activities.
3. Leadership and initiative: as evidenced by school, sporting and community leadership and initiative.

It is the second of these two criteria that identifies these undergraduate students as 'nascent' entrepreneurs.

The research instrument was a questionnaire that covered the following areas: Vital data (age, gender etc); Schooling; Parents; Current business activity; Work patterns, perceptions and attitudes. In all, 142 questions were posed in the questionnaire and 106 questionnaires have been completed by BBE students. Thirty students in the BBBA program, the comparison group, completed the questionnaire.

At this point no cross analysis between questions has been done. This paper reports simply on an analysis of the answers provided by the entrepreneurial students to particular questions that bear on the hypotheses being posed and a comparison of these responses to those of the comparison group.

---

<sup>2</sup> ENTER scores are the percentile rankings of students as they emerge from their final year of schooling (year112)

# RESULTS

## Entrepreneurial Nature of the student

Each successive intake of students into the RMIT BBE program was drawn from an increasingly larger group of applicants using criteria that, in part, focused on their entrepreneurial and leadership characteristics. It is to be expected then, if the selection process worked, that with each successive intake the BBE students would exhibit stronger entrepreneurial and leadership characteristics.

Data relating to need for achievement, risk-taking propensity and need for control, is analysed below.

### Need for achievement

Each successive intake of nascent entrepreneurs exhibited a greater need to achieve their goals with close to 66% of 2003 students indicating that it was completely or mostly true that once they had set themselves a goal they 'never give up'. This compares to 56% of the non-entrepreneurship or BBBA students.

**Table 1 How desperate are they to achieve their goals?**

Question: Once you set yourself a goal you never give up.

	<b>A</b> Completely true	<b>B</b> Mostly true	<b>Both A + B</b>	<b>C</b> Depends	<b>D</b> Mostly untrue	<b>E</b> Completely Untrue
BBE 2001 intake	11	33	<b>44</b>	50	0	6
BBE 2002 Intake	16	41	<b>57</b>	35	4	4
BBE 2003 intake	16	47	<b>63</b>	29	8	0

BBBA degree students	15	41	<b>56</b>	33	11	0
----------------------	----	----	-----------	----	----	---

Percentage data

### Risk taking propensity

The nascent entrepreneurs exhibited a strong tendency to be comfortable when taking financial risks with over 66% saying it was 'completely true' or 'mostly true' whereas only 20% of the non-entrepreneurship students were comfortable.

## Table 2 Are they prepared to take financial risks?

Question: You are quite comfortable taking financial risks.

	<b>A</b> Completely true	<b>B</b> Mostly true	<b>Both</b> <b>A+B</b>	<b>C</b> Depends	<b>D</b> Mostly untrue	<b>E</b> Completely Untrue
BBE 2001 intake	22	39	<b>61</b>	33	6	0
BBE 2002 Intake	20	49	<b>69</b>	24	4	2
BBE 2003 intake	22	47	<b>69</b>	28	3	0

BBBA degree students	8	12	<b>20</b>	38	35	8
----------------------	---	----	-----------	----	----	---

Percentage data

## Need for control

As evidenced in Table 3 below over 66% of the 'entrepreneurial' students indicated that it was Completely true or Mostly true that they preferred to be in control when working in a team whereas only 40% of the comparison group had the same desire.

## Table 3 To what extent do the students like being in control?

Question: When working in a team you prefer to be in control

	<b>A</b> Completely true	<b>B</b> Mostly true	<b>Both</b> <b>A+B</b>	<b>C</b> Depends	<b>D</b> Mostly untrue	<b>E</b> Completely Untrue
BBE 2001 intake	33	39	<b>72</b>	22	6	0
BBE 2002 Intake	20	49	<b>69</b>	24	6	0
BBE 2003 intake	24	39	<b>63</b>	34	3	0

BBBA degree students	8	31	<b>39</b>	42	12	8
----------------------	---	----	-----------	----	----	---

Percentage data

## Summary

Clearly on the basis of the above data, and assuming that need for achievement, risk taking propensity and need for control are indicators of an entrepreneurial personality, the nascent entrepreneurs are more entrepreneurial than the comparison group. This outcome would seem to validate the selection criteria and selection process for students into the BBE program.

## Encouragement

To what extent is encouragement a cause of the need by people to undertake an entrepreneurship degree program?

As a person moves from primary to secondary school and on to further study or work many people influence the way a person thinks and acts and, in particular, the choice of career. One question that needs to be explored, for the purpose of this research, is the extent to which family, relatives and friends encouraged and influenced the person to start a business venture (as a career choice). This research segmented the source of encouragement into teachers, fathers, mothers and friends.

### Teacher encouragement

As evidenced in the table below the greatest level of encouragement by teachers was experienced by the first intake of BBE students. Eighty two percent of these students indicated they were either strongly encouraged or encouraged to apply for the degree program. A probable reason for this was that the students were advised of the existence of the BBE program by enthusiastic teachers in schools who had heard about the course and its commencement through direct marketing by the University. Entry into the BBE program in 2001 was direct entry not through the central agency (the Victorian Tertiary Admissions Centre – VTAC). In subsequent years the program has been promoted and notified through a more general internet based promotional campaign as well as by word of mouth and entry has been centrally administered through VTAC.

The data for teacher encouragement does not demonstrate a significant difference between the last two intakes of BBE students and the comparison group indicating that the encouragement of teachers was not a substantial reason why they undertook an entrepreneurship program as against a traditional business degree program.

#### Table 4 Teacher encouragement

Question: Have any of your teachers encouraged you to, or discouraged you from, starting a business venture of your own?

	<b>A Strongly encoura ged</b>	<b>B Encoura ged</b>	<b>A and B Both</b>	<b>C Passi ve</b>	<b>D Discoura ged</b>	<b>E Strongly discouraged</b>
BBE 2001 intake	29	53	<b>82</b>	18	0	0
BBE 2002 Intake	6	27	<b>33</b>	65	2	0
BBE 2003 intake	11	19	<b>30</b>	65	5	0

BBBA degree students	0	26	<b>26</b>	67	4	4
----------------------	---	----	-----------	----	---	---

Percentage data

## Parental encouragement

It is generally acknowledged that parents have a significant influence on the career choice of their children and certainly on the choice of degree program to undertake. So it was expected that parents would also have an influence on the decision of a son or daughter to start a business. It was thought that many of them would be running businesses themselves and would like to see their son or daughter 'continue the business' or 'follow in their footsteps'.

### Father's encouragement

As evidenced in the table below, 'Strong encouragement' or 'encouragement' to start a business by their fathers has been experienced by approximately two-thirds of the entrepreneurship students however less than half of the comparison group experienced this level of encouragement. This would indicate that encouragement by fathers is a significant factor in the reason why a person decides to be an entrepreneur.

**Table 5 Father's encouragement**

Question: Did your father encourage you to, or discourage you from, starting a business venture of your own?

	<b>A Strongly encourage ment</b>	<b>B Encourage ment</b>	<b>Both A + B</b>	<b>C Passi ve</b>	<b>D Discoura ged</b>	<b>E Strongly discoura ged</b>
BBE 2001 intake	41	24	<b>63</b>	29	6	0
BBE 2002 Intake	28	38	<b>66</b>	30	4	0
BBE 2003 intake	27	41	<b>68</b>	30	3	0
BBBA degree students	19	26	<b>45</b>	52	0	4

Percentage data

As evident in Table 6 below, it seems that mothers were not as encouraging of their children as the fathers although the proportion of students who were Strongly Encouraged by their mothers was higher for both the 2002 and 2003 intakes. However encouragement by their mothers is an influencing factor in the decision by a person to become entrepreneurial. Encouragement by mothers was still significantly above the comparison group responses particularly for the first and third cohorts of BBE students.

## Table 6 Mother's Encouragement

Question: Did your mother encourage you to, or discourage you from, starting a business venture of your own?

	<b>A Strongly encoura ged</b>	<b>B Encoura ged</b>	<b>Both A and B</b>	<b>C Passiv e</b>	<b>D Discourag ed</b>	<b>E Strongly discoura ged</b>
BBE 2001 intake	28	33	<b>61</b>	28	11	0
BBE 2002 Intake	32	22	<b>54</b>	40	6	0
BBE 2003 intake	38	24	<b>62</b>	35	3	0

BBBA degree students	19	26	<b>45</b>	48	0	7
----------------------	----	----	-----------	----	---	---

Percentage data

### How were they encouraged by their parents?

This is an important follow on question that might provide some clues as to how parents might act in encouraging a sense of entrepreneurialism amongst their children.

### Nature of encouragement

Question: If either of your parents ENCOURAGED you to start a business venture can you briefly describe how your mother or father encouraged you to consider starting your own business.

	<b>Nascent entrepren eurs</b>	<b>Comparis on Group</b>
Saw the same opportunity - that there was money to be made	3	8
Follow your passions/heart	9	8
Follow the family tradition	12	23
Will invest in the business	13	8
Provided ideas/advice and supported ideas	25	8
Saw the potential in the son/daughter	6	15
Totally supportive	44	0
Coaching and teaching	4	0
Better than working for others	5	8
Provided books and resources including capital	11	0
Provided employment in their business	1	8

Number of suggestions

As evidenced from this table it is apparent that the nascent entrepreneurs, as a group, strongly felt their parents were 'totally supportive' and 'provided ideas/advice and supported their ideas'. On the other hand the predominant encouragement by parents of the comparison group was to follow the family tradition.

### Friends encouragement

It is clear from the table below that each subsequent intake of entrepreneurial students into the program indicated a stronger impact by friends on their decision to start business ventures. Of the latest cohort three out of four indicated that they were either strongly encouraged (29%) or encouraged (45%) by their friends to start a business venture of their own. On the other hand just over 50% of the comparison group indicated encouragement by their friends to commence a business.

**Table 8 Encouragement by friends**

Question: Have any of your friends encouraged you to, or discouraged you from, starting a business venture of your own?

	<b>A Strongly encouraged</b>	<b>B Encoura ged</b>	<b>Both A and B</b>	<b>C Passiv e</b>	<b>D Discourag ed</b>	<b>E Strongly discoura ged</b>
BBE 2001 intake	38	13	<b>51</b>	38	13	0
BBE 2002 Intake	31	29	<b>60</b>	35	6	0
BBE 2003 intake	29	45	<b>74</b>	16	5	5

BBBA degree students	15	38	<b>53</b>	31	8	8
----------------------	----	----	-----------	----	---	---

Percentage data

### Business background of parents

It might be expected that parents who encouraged their children to become involved in establishing business ventures may in fact themselves be involved in running businesses. Table 9 below backs this up.

**Table 9 Have parents ever run a business?**

Question: Have your parents **ever** worked for themselves or run their own business, alone or together?

	Yes	No
BBE 2001 intake	83	17
BBE 2002 Intake	74	26
BBE 2003 intake	82	18

BBBA degree students	69	31
----------------------	----	----

Percentage data

Four out of every five entrepreneurship students have parents who have at some stage run their own business. This is compared to three out of every five students from the comparison group. Clearly seeing, and perhaps experiencing, their parents running a business has had a positive impact on their decision to undertake an entrepreneurship degree program.

## Student Background/Characteristics

Are there any other common characteristics of the entrepreneurial students?

### Age

Do students who want to commence an entrepreneurial program have a particular age profile?

It was believed by the program developers that, eventually, the 'typical' average age of students (nascent entrepreneurs) undertaking the entrepreneurship degree would be mid-twenties. It was thought that if, as expected, the degree program became more popular there would be greater competition to meet all criteria and the emphasis on conducting entrepreneurial ventures (Criteria 2) would play a greater role in selecting students. It was thought that younger applicants would not have had the same opportunity to have started business ventures. Table 10 below indicates that there has been some ageing of the student cohort but more data will be required over the next few years to draw firm conclusions.

**Table 10 Age of students in first year**

	18-19	20-21	22-23	24-25	26 >
BBE 2001 intake	72	11	11	0	6
BBE 2002 Intake	54	22	6	10	8
BBE 2003 intake	61	17	6	14	3

BBBA degree students	30	30	26	7	7
----------------------	----	----	----	---	---

Percentage data

The students undertaking the (BBBA) courses are on average older. Possible reason for this is that a large proportion of Asian and international students comprise this group and they tend to have a higher age profile.

### Gender of students

Does gender influence the decision of a person to undertake an entrepreneurship program?

It has been obvious from the first intake of students into the entrepreneurship program that males made up the greatest proportion of enrolled students and over the three years the percentage of males/females have remained reasonably constant at 33% females and 66%

males. However it is the reverse in the comparison group. Over 60% of BBBA students are female almost the reverse of the BBE data.

**Table 11 Gender of students**

	Female	Male
BBE 2001 intake	28	72
BBE 2002 Intake	30	70
BBE 2003 intake	32	68

BBBA degree students	63	37
----------------------	----	----

Percentage data

### Birth Order

Does birth order influence a person's preparedness to undertake an entrepreneurship degree program?

On the basis of the data obtained (Table 12 below) it appears just over 50% of students studying business courses are latter born i.e. not first born or only children. This is more evident with the BBBA comparison group. More data will be needed here to draw valid conclusions.

**Table 12 Birth Order**

	Only	First	Second	Third	Other
BBE 2001 intake	0	33	44	11	11
BBE 2002 Intake	6	50	28	12	4
BBE 2003 intake	8	39	36	11	6

BBBA degree students	0	27	46	15	12
----------------------	---	----	----	----	----

Percentage data

### Where do students reside

Is the abode of students influential on the decision of a student to undertake a program that assists them become an entrepreneur?

The majority of students live at home with their parents. Partly this is because of the youth of the students. The data for the BBBA students is also influenced by the number of Asian international (onshore) students in the cohort and by the fact that they tended to be older. (see Table 10). It would be anticipated that as the age of the students studying the program increases (as expected)

a greater percentage of students will live away from the home and parents. Because most still live at home their recollections of encouragement are all the more valid.

**Table 13 Abode**

	Parents	Friends	On own	Other
BBE 2001 intake	56	28	11	6
BBE 2002 Intake	60	20	8	12
BBE 2003 intake	59	19	14	8

BBBA degree students	48	26	11	15
----------------------	----	----	----	----

Percentage data

The fact that a majority of entrepreneurship students still live at home may well help explain the impact of encouragement by parents on the decision of students to undertake an entrepreneurship program, i.e. they are still being encouragement and/or their recollection is of recent encouragement.

### Where did students go to school

Does going to a non-government school make a person more prepared to become an entrepreneur?

As evidenced in Table 14 below students overwhelmingly come from a private school background and this is particularly the case for the non-entrepreneurial business students 16% of whom are International students. More data is required to be able to look at the impact of schooling on the decision to undertake an entrepreneurial degree program.

**Table 14 Schooling**

	Gov	Non Gov
BBE 2001 intake	41	59
BBE 2002 Intake	40	60
BBE 2003 intake	26	74

BBBA degree students	28	72
----------------------	----	----

Percentage data

### Years before deciding to study

Is there any evidence that having some time off between school and tertiary study impacts on a person's ability to be selected into an entrepreneurship degree program i.e. the time out makes them more entrepreneurial?

The trend evidenced in Table 15 below indicates that an increasing proportion of students being admitted to the entrepreneurship program have spent one or more years working or traveling etc before applying for and being accepted into the program. It may also indicate that the selection criteria focusing on entrepreneurial nature (for admission to the BBE program) is having a greater impact on selection of students.

**Table 15 Years out of school**

	None	One	Two	Three	More
BBE 2001 intake	72	0	11	11	6
BBE 2002 Intake	38	18	12	8	24
BBE 2003 intake	37	29	13	3	18

BBBA degree students	4	26	19	30	22
----------------------	---	----	----	----	----

Percentage data

## CONCLUSION

In their paper Shaver and Scott articulate how over the years studies of the personological characteristics of entrepreneurs have resulted in them being debunked, discarded or found to be immeasurable (effectively). As a result studies of new venture creation have tended to concentrate on the external stimuli such as economic circumstances, social networks, teams, marketing, finance and public agency assistance. However none of these alone will create a new venture. 'For that we need a person in whose mind all possibilities come together, who believe that innovation is possible, and who has the motivation to persist until the job is done'. Shaver and Scott argue that to find this answer we need a truly psychological perspective on new venture creation. In this paper the focus has been on encouragement as a source of motivation on an individual to commence a business venture.

In relation to hypotheses 1 seems clear from this research that, in particular, nascent entrepreneurs do have similar backgrounds. Four out of every five entrepreneurship students have parents who have at some stage have run their own business. Males are the predominant gender of students enrolled in the BBE program and the majority still live at home with their parents. It also seems, though more data is needed to confirm this, that going to a non-government school impacts on the decision to undertake study to become entrepreneurial. In addition it seems that having some time between secondary school study and entrepreneurial study is becoming more common and influences the ability of a person to be selected into the entrepreneurship program.

It is also clear that parental encouragement (Hypotheses 2) has a clear impact on the decision of a person to undertake a degree program that results in a person becoming an entrepreneur. This is not surprising. Parents do have an impact on career choice of their children. It is also clear that friends have an influence but not so teachers.

This paper is limited to describing backgrounds and simple analysis of data arising from particular questions. Cross analysis is now required to determine and validate the preliminary findings.

## **ABSTRACT**

This paper draws on the key findings and issues to emerge from an 18-month research project funded by the East of England Development Agency and carried out by Anglia Polytechnic University<sup>1</sup>. It involved a study of need and support for small and medium sized enterprises in the Eastern region in the internationalisation of their business operations.

The aim of the project was to identify successful aspects of international business planning, resource management, international networking, market intelligence gathering and global skills and knowledge development that can be made transferable across business sectors via training, educational, development and recruitment programmes.

A number of studies into related areas have recently been completed both within the region and nationally, and we have drawn upon these reports to help inform our findings. These studies have either been quantitative or qualitative whereas this study is rather rare in that it is both quantitative and qualitative. In this way we have been able to explore the underlying issues behind international activity to provide valuable insights into the company experience. In this paper we use these insights generated by our approach to identify a set of action programmes aimed to help better design and target the efforts of the business support agencies. In this way we seek to make policy interventions more appropriate to the company experience and thus more effective in supporting SMEs in the Eastern region in their international activities.

---

# BACKGROUND

This paper draws on the key findings and issues to emerge from an 18-month research project funded by the East of England Development Agency and carried out by Anglia Polytechnic University<sup>2</sup>. It involved a study of need and support for small and medium sized enterprises in the Eastern region in the internationalisation of their business operations.

The aim of the project was to identify successful aspects of international business planning, resource management, international networking, market intelligence gathering and global skills and knowledge development that can be made transferable across business sectors via training, educational, development and recruitment programmes.

There were four key stages of activity

- A large scale telephone survey of 1200 firms throughout the eastern region to provide a map of international activity within the region. The survey involved a stratified sample across sectors and geographical location to reflect the characteristics of the six counties of the eastern region.
- Face-to-face interviews with 80 firms on their premises lasting between 1 and 2 hours with either the owner-manager or the individual responsible for international action to gain insights into why and how firms become involved in international activity, and of course, why they sometimes do not, how they manage their international activity, what problems they encounter and where they go to find solutions.
- Face-to-face interviews with many of the key players within the business support community within the region.
- Analysis and review of the quantitative and qualitative data generated by these activities to identify policy implications and recommended action programmes aimed to help better design and target the efforts of the business support agencies and educational institutions in the East of England and build economic growth through international excellence

A number of studies into related areas have recently been completed both within the region and nationally, and we have drawn upon these reports to help inform our findings. (See resources section). These studies have either been quantitative or qualitative whereas this study is rather rare in that it is both quantitative and qualitative. In this way we have been able to explore the underlying issues behind international activity to provide valuable insights into the company experience. In this paper we use these insights generated by our approach to identify a set of policy implications aimed to help better design and target the efforts of the business support agencies. In this way we seek to make policy interventions more appropriate to the company experience and thus more effective in supporting SMEs in the Eastern region in their international activities.

---

<sup>2</sup> APU would like to acknowledge the assistance of the University of Luton at the quantitative stage of the project and the assistance of the Foundation for Small and Medium Enterprise Development, University of Durham at the qualitative stage of the project.

## THE QUANTITATIVE STUDY: METHODOLOGY

The mapping of international activity throughout the eastern region was achieved through a large scale telephone survey undertaken between June 2002 and August 2002. During this period 560 internationalised and 554 non-internationalised SMEs in the eastern region were interviewed. A further sample of 101 larger companies in the region were also interviewed as a control group.

Telephone interviewing technique was used to collect data because of the rapidity of data gathering, accuracy, and efficiency. The questionnaire was designed to determine the extent and nature of international activity within the Region. While this activity was explored in terms of penetration of international activity, etc, this paper focuses on the barriers and obstacles reported by executives. The questionnaire was fully structured, with response categories defined prior to the study informed by literature relevant to internationalisation. The questionnaire was pilot tested on a small number of respondents to ensure understandability prior to the main survey.

The sample frame used was obtained from Business Link and listed known exporters and non-exporters stratified by county and broad business area (primary, secondary and tertiary). The listings were a random sample of organisations but in the final event nearly all organisations recorded as exporters were approached during the survey. A target was set of an achieved sample of 550 organisations in each of the two categories of internationalised and non-internationalised. Samples of this size typically yield results accurate to within four to five percentage points according to statistical theory. A further sample of 101 larger internationalised organisations was also included in the study for comparison (250+ employees). The final sample turned out to be 554 non-internationalised, 560 internationalised and 101 larger companies. (See diagram 1 overleaf for a mapping of firms interviewed)

### Key findings from the quantitative study

- Almost as many internationalised firms are involved in importing (61%) as exporting (77%).
- Just under half of all internationalised firms are involved in two or more forms of international activity, e.g. exporters who also import.
- The two main reasons for not becoming involved in international activity are: i) lack of international opportunities in the particular sector and ii) 'benign' conditions in the domestic market.
- The most frequent mode of export was by house or agents (35%) followed by 'own sales office' (20%) and 'direct sales' (13%). If Internet, word of mouth and through current customers are added to the direct sales category this would then increase to 30%. This changes the interpretation considerably and challenges the traditional view that intermediaries are the most appropriate route to international markets for SMEs when considering market entry.
- The majority of experienced and inexperienced internationalised businesses self generate solutions to their problems (87%). Amongst exporters, networks of suppliers were used by 23% of firms interviewed and 31% said they used business support

organisations, mainly BusinessLink and the DTI (including TPUK). Just 5% of importers had used business support organisations.

## **THE QUALITATIVE STUDY: METHODOLOGY**

In phase two of the project, 80 companies were interviewed face-to-face on their own premises between December 2002 and June 2003. The interviews, which were undertaken by senior academics within the Business School, were semi-scripted and were recorded. In all cases the person interviewed was the strategic decision maker for international activity (usually the owner-manager). Each interview lasted for about one hour.

Building on the findings from the telephone survey, the purpose of the interviews was to obtain deeper data about company behaviour in international markets including managerial traits, skills and knowledge needs, problem-solving and their views of support services. The interview schedule included a mix of open questions where the interviewee was encouraged to talk about their motivations and experiences in their international activities, and closed questions concerning specific problem areas, where they looked to for support and their opinion on the effectiveness of support provided.

The sample of companies to be interviewed was selected from the larger sample on the basis of experience of international trade, skills and knowledge and the application of these to their international activities. The key consideration was not the volume of international activity, but rather how effective the application of their experiential learning had been in contributing to turnover generated from international activities. In this respect, mode of activity, geographical location and sector were regarded as secondary considerations. On this basis, the companies to be interviewed were classified in five bands as follows:

### **A: The Curious**

Have considered international activity, but have not yet taken action. Little awareness of available support.

### **B: The Frustrated**

Have previously been, or are occasionally involved in, international activity, but are no longer actively pursuing this, often due to negative experiences. Little awareness of available support.

### **C: The Tentative**

Have limited experience of international activity, have developed some skills but have some major problems looking for solutions. Some experience of available support.

## **D: The Enthusiastic**

Have considerable experience of international activity and are keen to grow this side of their business but are experiencing barriers to that growth. Have developed a range of skills but suspect that these need to be developed. Largely aware of available support with some experience, often positive.

## **E: The Successful**

Have extensive experience of international activity with some major successes. Very high skills and knowledge development, very aware of available support with a high degree of usage. Often aware of skills and knowledge gaps and very keen to improve effectiveness in international activity.

For the purposes of analysis, as indicated above, each interview was recorded and transcribed generating in excess of 2,800 pages of transcript. In addition, following the completion of each interview, a two page summary of the key points emerging from the interview was produced providing a further 150 pages of text. Finally, three closed questions providing tick box responses using the Lickert scale were used covering the international mindset of the interviewee, specific problems experienced and support providers used.

Data from 5 of the interviews was rejected as being unsuitable for our purposes and the analysis presented below is therefore based on data collected from 75 firms. Analysis of the qualitative data from the 2,800 pages of interview transcript, 150 pages of summary text and 75 tick boxes was undertaken using a dedicated software package, N6. The software uses word or phrase recognition and the text was coded down to three levels using four key categories:

Motivation: What is the motivations and drivers for international activity?  
Process: What form does this activity take and how does it impact on the firm?  
Problems: What are the key problems encountered?  
Where do they go to find solutions to these problems?

## **Key findings from the qualitative study**

- Planning (the way in which the firm plans its involvement in foreign markets), manning (the way the firm organises or develops its resources to service foreign markets) and scanning (the way in which the firm informs itself about those markets) are the areas of skills and knowledge required by all firms active in international markets.
- The configuration of these skills, and the support designed to improve them, varies according to experience, sector and size.
- All firms benefit from strategic planning and management development.
- All firms benefit from the development of international skills (foreign languages and/or intercultural awareness). It is the development of these skills within successful firms that facilitates the transfer of business acumen from domestic to international markets.
- Firms new to international activity (the Curious and the Frustrated) are very receptive to, and appreciative of, current support provision.

- Successful firms have specific skills and knowledge needs which are not all met by current provision.
- We identify an intermediate set of firms (the Tentative) whose international activity is static, who have lost the initial enthusiasm for international activity and who need tailored support which is not currently available
- Demand Transformation: There is a need to distinguish between what companies want and what they need. They want information, money and solutions to precise, small problems. They need to learn to plan, to broaden their management mindset and build better manning and scanning skills
- Skills and knowledge development for international trade takes place via the processes of exporting, importing, inward investment and international research arrangements.
- Best practice in firms often emanates from patterns of trading involving one or all of these elements.

## **SKILLS AND KNOWLEDGE**

The method adopted for this study has been to observe and record the behaviour of companies from a wide range of sectors and of varying size, age and international experience. We did not seek to squeeze these companies into a pre-conceived analytical framework but have attempted, in our analysis, to identify the variables in their composition, culture and context which have played a significant part in their progress, or otherwise. It was not our aim to locate the companies or their personnel on a scale of educational achievement, though we are able to make some general estimates of the relationship between performance and educational qualification of key personnel.

This analysis will therefore focus in the first instance on the skills and knowledge required by companies, in normal circumstances, to sustain successful performance in a competitive international trading environment. Some of these skills (general management) may apply equally to the domestic trading environment. Others (foreign language skills) may be specific to the international environment. Very importantly, and this is something we need to research further, we will discuss the nature of the transition from domestic trading to international trading from a skills and knowledge perspective, as it emerged from our study. Do all companies make this transition successfully, or is there something about the make-up of some that helps them do it better? In order to simplify the complexity of the issues surrounding skills and knowledge development, we conclude our analysis with an identification of skills and knowledge needs across the five categories of firm interviewed.

### **Skills**

According to the Cambridge Advanced Learner's Dictionary, a skill is:

an ability to do an activity or job well, especially because you have practised it.

Planning

The Planning skill-set poses serious challenges to the typical small and medium enterprise. Most companies came into existence not as a deliberated, rational response to a set of market conditions but in response to an opportunity or a passion. To ask such an organisation to adopt a strategic planning approach to foreign markets is therefore asking them to do something foreign. All of their personal and commercial history may even militate against the suggestion. They have built their persona around the value of being pragmatic, problem and sales-oriented and commercially astute. That is, at this point, strategy is driven by sales rather than the other way round. Indulging in abstract concepts and calculations about markets and competences seems to them to be the antithesis of business success. Even if they could see the case for it, it is usually not something they would see themselves as capable of. Most, when questioned, said that their reason for starting exporting was to respond to an opportunity. When these companies approach business support agencies it is not usually to ask for advice, but to ask for support or information to help them achieve something specific they have already resolved to do. In our study we found evidence of a transformation process at work. Good advice will not simply give them what they want. It will alert them to what they need and help them find a way to obtain it.

We therefore can distinguish between what companies want and what they need. They want information, money and solutions to precise, small problems. They need to learn to plan, to broaden their management mindset and build better manning and scanning skills.

#### Manning

Most of the companies we interviewed have limited resources with which they can develop their international trade ambitions. Some, however, often as a result of sound strategic planning, develop a clear idea of how they need to develop their material and human resources to make their international activities more profitable. This often involves investing in skills which are not critical to domestic business success, such as foreign language skills.

We found a close correlation between valuing foreign language use and sustained success in international trade. Successful companies value relationships and market intelligence and these are best cultivated and exploited by use of the language of your client and market. We also discovered a complex appreciation of foreign language use by successful companies. Good managers will see occasions on which they individually, or a member of their personnel, will profitably exhibit the ability to speak or write the foreign language.

We can say much the same about other skills needed to enact international trade well. The international company has to equip itself with the skills to dispatch the goods, satisfy customs and excise requirements and ensure customer satisfaction in a more complex transaction than most which apply in a domestic environment. It is however important to note the key role played by the owner-manager in this context. He/she has to provide the leadership and informed decision-making in this challenging environment. There is a strong body of literature that suggests that owner-managers with a strong international orientation tend to be more successful in the long term as they appreciate the need for new skills more quickly. The skills he/she possesses are therefore the critical ones and they need to be in place before any of the others can be developed or effectively deployed. In this respect, manning follows on from planning, which, as a process, needs to identify skills shortages and devise a plan to redress them.

## Scanning

Much export support has traditionally leapt straight to the process of scanning, bypassing the first two stages. Information about opportunities in a foreign market can be sufficient to create an exporting opportunity which a company will seek to exploit.

In a more competitive and strategic environment where the company first needs to assess its readiness and ability to export effectively and in a sustained manner, information about the foreign markets needs to be aligned in a more structured way with the company's plans. Information is not just about one-off opportunities, it is about market conditions, national regulations and competition. The successful companies we interviewed used the internet, trade fairs and exhibitions, personal relationships and networks and visits to the foreign market regularly and effectively to improve their decision-making and adjust their business strategy. Managers we observed who were successful at international trade tended to be people able to carry out these tasks with similar confidence and ease to what they show in the domestic market. Some, but not all, of these managers may have had had previous experience of international trade. Others did not but simply felt comfortable in different environments and with foreign clients. The ability to read signals, solve problems, interpret data and understand clients in other cultures can be developed alongside or, in some case, independently of foreign language skills and some are more predisposed to it than others.

Here once again, the process of scanning needs to be seen, not just as an activity in itself, but as a part of a strategic approach towards international trade. The issue is not the obtaining of information, but the decision as to what information to look for and where to look for it. Answers to these questions should emerge from a strategic business plan. This does not preclude the possibility of a fortuitous order coming through the letterbox and proving to be the start of a successful exporting venture. The strategic plan will ask of the company and the owner-manager questions that will help him/her devise the tools and skills to take advantage of such an opportunity, to develop it and to apply it to other markets. In this way, the firm continues to behave opportunistically or entrepreneurially, but within a more strategic framework so that international activity becomes targeted rather than ad hoc.

## Knowledge

Whilst the concept of skills currently carries a great deal of significance in economic and educational strategy in the UK at the moment, it is probably correct to say that the concept of knowledge has even greater import within the context of global economic and corporate competitiveness. As a concept, it is less easily grasped than is the notion of a skill. It takes many more forms, is less easy to quantify and to isolate in its manifestations in daily life. This quality has made of it something of a holy grail in contemporary management theory. As Holden<sup>3</sup> points out, 'It can be shared, in principle, universally. (Alternatively..) it can be forgotten and not used.' The operating assumption for many theorists and corporate leaders is that much of the knowledge that makes a critical contribution to the modern organisation is tacit, i.e. we do not necessarily know we are using it in our daily decision-making. It is therefore particularly difficult to analyse and exploit as it is sometimes conscious and sometimes unconscious. According to the Cambridge Advanced Learner's Dictionary, knowledge is

---

<sup>3</sup> Holden N. Cross-cultural Management: A Knowledge Management Perspective. Financial Times Prentice hall, 2002

understanding of or information about a subject which has been obtained by experience or study, and which is either in a person's mind or possessed by people generally.

### Planning

As already acknowledged, the process of strategic planning is a rather vague, abstract concept. It involves the assembling of data from the past and observations about current trends in an attempt to prepare the company for the future. It is no surprise that these predictions often turn out to be wrong, no matter how good the data was or the intellectual ability of the planners.

Nonetheless, planning has a number of benefits. The process of planning:

- increases the familiarity of the planner with the business and the market
- it forces the planner to consider and reflect on a variety of possible scenarios
- it puts the planner into a position of informed readiness to confront emerging realities

These are all very valuable experiences for anybody who has to deal with the international environment, where political events, natural catastrophes or mergers and acquisitions can overnight change the competitive position of your company in a foreign market. Clearly, planning is a demanding process and it is no surprise that, where declared in our study, all the individuals responsible for exporting in successful companies were educated to at least A level standard, with a good number having at least a degree. Conversely, the Tentative companies, who we found generally to have stagnated in their international operations had a poor record here. The majority were educated just to GCSE level or equivalent.

### Manning

Once a business strategy has been defined, the resources and skills of the company have to be aligned with it and the target markets. This process requires a sound knowledge of both the company and its markets. When these markets are overseas, the data on them is inevitably distant and complex. The owner/manager needs to ensure the quality of the data and its application to the company's operations. Our research found that whilst the Curious and the Successful companies were attentive to this issue, once again the Tentative companies lacked commitment to it. 80% of Curious companies and 72% of successful companies possessed foreign language skills but only 23% of Tentative companies did.

The flow of knowledge about clients and the market to the company that is facilitated by foreign language skills and other examples of commitment to and experience of the foreign market becomes a critical tool in the company's attempts to sustain and improve its performance there. This knowledge is present in the individuals who work in and for the company (including distributors) and a key management task is to help facilitate the flow of this information through the management process.

### Scanning

Knowledge about foreign markets usually resides primarily in the owner/manager (or the sales manager) who goes there and liaises with clients. The quality of the data obtained will depend on the quality of the relationships he/she can build with the market. Here, as earlier, we can identify skills which help obtain that data. Equally important, however, is the flow of information from the owner/manager to other stakeholders. This process has to be managed if the data is to have meaning beyond the owner/manager. On a mundane level, the expense of sending personnel to overseas markets can be expensive but savings and benefits can be obtained if information about travel, customs or expectations are passed

on. On a more critical level, what might appear on the surface to be unimportant information to the owner/manager about a particular client can become invaluable information in the hands of the Finance Director or the Production Manager. Once again, obtaining data is only half the task. Knowing what to do with it is equally important.

## Skills and Knowledge Needs

In the discussion above we have attempted to examine some of the key issues surrounding skills and knowledge development through an examination of the key role these play in building the ability to compete effectively in international markets. In order to summarise these complex issues, in the Tables below we identify the skills and knowledge needs of the firms interviewed across the five categories.

### Table 1 Skills and Knowledge Needs: The Curious and Frustrated

<p><b>The Curious and The Frustrated</b></p> <p>Inactivity in international markets is largely due to the lack of perceived international market opportunities (no pull factor) and generally benign domestic conditions (no push factor)</p> <p>Key questions facing these two groups:</p> <p><b>Planning:</b> Do we really want to grow the business through international activity?</p> <p><b>Manning:</b> If so, do we have the skills and resources to achieve this objective? If not how do we fill the skills and resource gaps?</p> <p><b>Scanning:</b> How do we find out if there is a potential international market for our products?</p> <p><b>Skills and Knowledge needs</b></p>
--

### **Planning**

- How to build a business plan
- How to map course of actions and learn basic process
- How to anticipate the consequences of the decision to go international
- How to identify the actual costs associated with new market development
- How to evaluate company response to export opportunities

### **Manning**

- How to assess strengths and weaknesses of resources
- How to obtain extra resources, where necessary
- How to approach support agencies
- How to manage doing business in a foreign language
- How to modify products to meet market needs better
- How to process orders
- How to plan market visits and trade fair strategy

### **Scanning**

- How to find out about potential market opportunities
- How to assess competitive position in selected markets
- How to identify where and when problems with foreign languages occur
- How to identify potential partners
- How to triangulate market intelligence sources
- How to find out about market regulations that affect market development
- How to find the type of information and/or contacts to comply effectively
- How to identify and approach support agencies

## **Table 2: Skills and Knowledge Needs: The Tentative and Enthusiastic**

### **The Tentative and The Enthusiastic**

The Tentative: Little ability to self analyse. Have discovered that international trading is complex and challenging and have lost their initial enthusiasm. Perceive problems to be largely external to the firm and largely expect support agencies to solve them on their behalf.

The Enthusiastic: Understand complexity of international trading environment and perceive the critical challenge to be (in)ability to compete effectively. I.E. understand the key problems are internal rather than external. Much more receptive to support agencies than the Tentative.

Key questions facing these groups:

**Planning:** Are we committed to international activity? Do we need to revisit our business objectives? Are we being strategic enough in the way we deal with our international markets and customers? How can we develop more established guidelines and procedures?

**Manning:** How do we identify our skills gaps? How do we acquire/develop dedicated resources? How do we find and assess appropriate support?

**Scanning:** How can learn to understand the differences between markets and how to manage those differences? How do we evaluate market opportunities?

<b>Skills and Knowledge needs</b>
<p><b>Planning</b></p> <ul style="list-style-type: none"> <li>▪ How to develop more established guidelines and procedures</li> <li>▪ How to identify processes by which to evaluate current international activity</li> </ul> <p><b>Manning</b></p> <ul style="list-style-type: none"> <li>▪ How to affirm market operations and negotiate changes, if necessary</li> <li>▪ How to identify the appropriate type of market presence</li> <li>▪ How to undertake an audit of skills and resources</li> <li>▪ How to move towards a geo-centric HR strategy</li> <li>▪ How to understand the differences between markets and how to manage them</li> </ul> <p><b>Scanning</b></p> <ul style="list-style-type: none"> <li>▪ How to service the needs of current international customers</li> <li>▪ How to identify new market opportunities</li> <li>▪ How to develop a framework for new market development</li> <li>▪ How to find and assess the most appropriate type of support</li> </ul>

**Table 3: Skills and Knowledge Needs: The Successful**

<b>The Successful</b>
<p>Have a number of strengths: Internal – high level skills development; External - strong products and well established markets. Understand the key to success is their ability to manage an increasingly complex and challenging international business environment.</p> <p>Key questions facing this group:</p> <p><b>Planning:</b> How do we control the new market development process? How do we influence key stakeholders? How do we manage/influence support?</p> <p><b>Manning:</b> How do we acquire dedicated resources for key markets? How do we develop specific higher level skills?</p> <p><b>Scanning:</b> How do we service customer needs at distance? How do we ensure appropriate local presence?</p>
<b>Skills and Knowledge needs</b>

**Planning**

- How to control the new market development process
- How to influence key stakeholders
- How to develop a strategic approach to effectively establishing a local presence
- How to manage/influence support

**Manning**

- How to identify and develop specific skills
- How to build a tighter international team
- How to acquire dedicated resources for key markets
- How to assess support in the new market development process

**Scanning**

- How to develop client relationship management systems, particularly the management of client relationships at distance
- How to use cultural differences to benefit the business

## RECOMMENDED ACTION PROGRAMMES

Our objective in undertaking this project has been to help build a stock of firms in the Eastern region capable of competing effectively in international markets. We have aimed to do this through identifying successful aspects of international business planning, resource management, international networking, market intelligence gathering and global skills and knowledge development that can be made transferable across business sectors via training, educational, development and recruitment programmes.

The firms interviewed during the course of this research have provided us with a clear message as to their skills and learning needs with respect to their international activity as identified above. We now present a set of targeted policy initiatives aimed at both addressing the skills gaps identified by the firms interviewed and building upon current skills and learning to assist firms throughout the Eastern region become more effective in their international trading activities.

It is important to note that the majority of the actions suggested below would have the Curious, Frustrated, Tentative and Enthusiastic groups as their primary targets, and a clear aim of these actions would be to facilitate the transfer of knowledge from the Successful. Any action programme would however need to recognise that the Successful also have skills and knowledge requirements which need support and development. A number of firms from this group have expressed a particular interest in management development programmes of an advanced standard to improve their skills levels and the opportunity to take part in workshops with other successful firms to discuss problem issues.

- **BEST PRACTICE GUIDES**

High quality brochures focussing on examples of best practice in the region containing diagnostic tools. These could include: 'How to' guides to provide simple process understanding, written/on-line case studies from successful firms within the region, problems solving techniques and a directory of support agencies.

- **INTERNATIONAL SME MANAGER DEVELOPMENT**

Flexible courses with optional accreditation focusing on the Planning, Manning and Scanning skills needs as identified.

- **INTERNATIONAL PARTNERSHIP PROGRAMME**  
A region wide scheme facilitating international network building and market development, possibly keyed in to research and innovation projects such as the 6<sup>th</sup> Framework and Teaching Company Schemes.
- **INTERNATIONAL MENTORING PROGRAMME**  
There are two possible models here. One would bring high-quality graduates (viz STEP) into SMEs to supply resources and knowledge advantage. The other has a business-to-business dimension which could be mediated by the International Trade Advisers. A pilot scheme, GRADEX is currently running with the support of EEDA/AUEE.
- **WORKSHOP PROGRAMMES**  
To bring together small groups of managers of international SMEs to share common problems and to develop solutions. These could be devised in consultation with Trade Partners UK to ensure that provision is properly targeted to complement existing programmes. Funding for these could be sought from BusinessLink or the Learning and Skills Council.
- **TRACKER STUDY**  
A study with a five-year time frame to track 50 firms throughout the region as they undertake their international activities. This would allow rich insights into the skills and learning needs of international firms as they manage the international process, which in turn would help in the development of targeted policy interventions.
- **PASSPORT PLUS**  
The Passport to Export programme has been of benefit to many firms interviewed for this study and will continue to assist the Curious and the Frustrated to become involved in international activity. The focus for this project has been to assist the Eastern region in the objective of building a stock of world class firms capable of competing effectively in international markets. In order to help achieve this objective we would recommend the development of a 'Passport Plus' programme targeted at the Tentative and the Enthusiastic to help improve their ability to compete in international markets. If one of the regional objectives is to improve the competitiveness of firms in their international activity, and hence increase GDP within the region, our research overwhelmingly suggests that it is the Tentative and Enthusiastic groups which offer the opportunity to make the biggest impact within the Eastern region.

## **ABSTRACT**

This research explores the characteristics, particularities and determinants of SMEs operating in multiple national markets. After contrasting characteristics of large multinational types with those of SMEs identified in the literature, it has been observed that there are two categories of SMEs that operate outside their home country: international and globally oriented. The globally oriented SMEs share some characteristics with both multidomestic, global as well as transnational large multinationals, while having their own particularities. The paper proposes a definition, a conceptual framework and conditions for a sustainable value-creation of globally oriented SMEs.

## **INTRODUCTION**

In recent years, Small and Medium-Sized Enterprises (SMEs) have increased their international activities, paralleling trends in market globalization (Loveman and Sengenberger, 1990; Cecora, 2000). By 2000, SMEs contributed between 25% and 35% of world manufactured exports and accounted for a smaller share of foreign direct investment (OECD, 2002: 66) The situation of SMEs facing globalization challenges has received increasing interest from academics and professionals as attested by the number of books, conferences, and papers dedicated to the topic (Luostarinen et al., 1994; Rommel et al., 1995; Simon 1996; Zahra, Kuratko, and Jennings, 1999; McDougall and Oviatt, 2000; Audretsch, 2003; Etemad and Wright, 2003).

However, Jones (1995: 116) observed that the majority of papers and books published “describe a number of factors contributing to ‘internationalization’ rather than ‘globalization’”. Several studies have focused on the identification of the process of SMEs internationalization, rather than globalization (Oviatt and MacDougall, 1997; McDougall, Shane and Oviatt, 1994; Etemad and Wright, 2003) and the conditions that facilitate it (Etemad and Wright, 2003). However, other studies have identified an increasing number of SMEs doing business in many countries (Etemad and Wright, 1999; Julien, Joyal, and Deshaies, 1994; Julien, 2000; Simon, 1996), that is, a trend toward globalization. Despite the interest in the place of SMEs in the global marketplace, the concept of global SMEs is, with few exceptions, confused with that of international SMEs (Graham, 1999; Palich et al. 2003). This leads us to consider two categories of SMEs operating outside their home county: the international and global (Birkinshaw, Morrison, and Hulland, 1995: 638 for further discussion).

Academics and practitioners also observe that little has been done to help the managers of SMEs to move successfully from the local to the global marketplace (Agmon and Drobnick, 1994). Yet, in the new integrating global environment, Etemad and Wright (1999: 4) affirm: “entrepreneurs and emerging businesses must learn about global business to thrive alongside larger firms already in the international marketplace.” SMEs need sound conceptual frameworks that may facilitate decision making for successful actions in the global marketplace.

In the last two decades, the concept of a global multinational has been examined and re-examined in the context of large firms in numerous studies (Tallman and Fladmoe-Lindquist, 2002). Topics frequently scrutinized include typologies based on the value chain, configuration and coordination issues, role of overseas assets, and the development and diffusion of knowledge (e.g., Bartlett & Ghoshal, 1989; Porter, 1986). Some typologies have even been empirically tested and determinants of their different categories have been identified.

Despite this development however, the majority of scholars of SMEs seem uncomfortable with these typologies and are either using only the concept of “international business” or other concepts such as “world class SME” (Julien 1994), “globally oriented SME” (Nkongolo-Bakenda, 2003a), “SME under globalization” (Knight, 2000), “hidden champions” (Simon, 1996), “small and medium sized transnational corporation” (Wong and Ng, 2002; Fujita, 2003) and so forth. All SMEs operating on the international market do not have the same behavior or scope of activities (Julien, 2000). This suggests a need for clarification and classification of SME’s international strategies, and a need to identify the dimensions and driving forces of SMEs which are not only international, but are operating in multiple markets, sometimes in competition with large global and transnational firms.

This study contributes to closing this gap by identifying the major dimensions and driving forces of SME globalization. In addition to this introduction and the conclusion, the paper has five parts. The first presents states the methodology. The second offers the conceptualization of global multinationals. In the third part, empirical studies related to SMEs that have extended international activities are examined. Drawing on findings in these studies and referring to frameworks for large global multinationals, a conceptual framework for a globally oriented SME is presented in the fourth part along with related propositions. Finally, the fifth

part discusses the strategic actions that can facilitate wealth creation in these globally oriented SMEs.

## **METHODOLOGY**

This conceptual research is based on an extensive literature review pertaining to large global firms and SME's with significant international or global activities. These two groups of studies identify similarities and differences of major characteristics of global firms. Their analysis allows us to identify patterns or clusters of processes/characteristics that differentiate global SMEs from large global firms and from SMEs whose international activities are not global in scope. A framework of competitive determinants of globally oriented SMEs is developed and propositions for success are presented.

To identify papers examined on SMEs globalization, the following databases are employed: PROQUEST, ASAP expanded, JSTOR, and EBSCO on October-November 2003. We used successively the following search keywords for full texts from refereed journals: "globalization and strategy", "globalisation and strategy", "globalization and small firm", "globalization and small enterprise", "globalisation and small firm", "globalisation and small enterprise". After each search, the abstract of each paper was examined to determine if it dealt with the conceptualization of the concept of globalization. Papers related to large firms were retained only if they examined conceptually or empirically the definition of the global firm. Papers related to SMEs were retained if they were concerned with the impact of globalization on SMEs, even if the main focus was the internationalization process. From papers identified, we used a snowball process of identifying other papers referenced and for which it was possible to access to full text.

Identifying studies dedicated to globalization of large firms was facilitated by the existence of recent and extensive reviews. That is why only papers dealing with conceptualization of global firms have been chosen and examined. This facility did not exist for studies related to SMEs.

### **Conceptualization of globalization in large firms**

In the two last decades, some studies have presented typologies and prescriptions for multinational firms facing market globalization. The majority of typologies were published in the 1980s. Those most frequently mentioned in literature include Perlmutter (1969), Porter (1986), Prahalad and Doz (1987), and Bartlett and Ghoshal (1987, 1989). Two extensive literature reviews have been carried out on the typologies suggested by scholars (Zou and Cavusgil, 1996; Harzing, 2000). According to Harzing (2000: 103), "all authors implicitly or explicitly refer to a continuum of integration/coordination/globalization advantages versus differentiation/ responsiveness/localization in describing their strategies". Bartlett and Ghoshal (1987, 1989) for example distinguished four types of large international companies: multinational, global, international and transnational. Harzing (2000: 103) observed that three types of multinationals were found in every study examined, even if the labels used were different: multidomestic, global, and transnational. A multidomestic strategy combined low integration and high responsiveness whereas a global strategy combined high integration and

low responsiveness and a transnational strategy combined high integration with high responsiveness. Like Harzing (2000)'s study, other studies have identified the characteristics and empirically tested the determinants of these types of large multinationals (Roth and Morrison, 1990; Kobrin, 1991; Meng Leong and Tiong Tan, 1993; Johansson and Yip, 1994; Birkinshaw, Morrison and Hulland, 1995; Zou and Cavusgil, 2002; Wasilewski, 2002 ). The following determinants have been identified for the global type of multinational: intensity of international activities, product standardization, marketing standardization, country comparative advantage, organizational structure, managerial practices, and strategic actions. These determinants are presented in Table 1 with a few comments related to SMEs.

**Intensity of international activities:** The intensity of international activities is the first determinant identified among characteristics of global firms. It has been frequently measured by the diversity of foreign countries in which is conducted business and by the quantity of foreign sales. Some studies have used qualitative indicators to measure the diversity of foreign countries. Ohmae (1985), for example, has suggested that the firm should be able to compete successfully in the triad area (North America, Europe, and Asia) where the level of competition is high. Other studies have considered only the number of foreign countries where the firm is doing business (McNaughton, 2003).

The quantity of foreign activities has been measured by the percentage of the company's foreign sales (Johansson and Yip, 1994). However, some researchers consider that a global strategy is based not only on the export, but also on the high level of foreign investment with extensive coordination among subsidiaries (Young, 1987). Kobrin (1991), for example, considered the degree of transnational integration as the relative volume of intrafirm resource flows and assumed that "the greater the proportion of intrafirm trade of all of a MNC's international sales, the greater the degree of transnational integration". This conception of international activities of the global firm leads to the determinant of structure discussed hereafter and raises some concerns for some SMEs as they concentrate manufacturing and major managerial activities in the home country and export their products in multiple countries using different types of networks (Holmlund and Kock, 1998; Chetty and Campbell-Hunt, 2003a). For example, Holmlund and Kock (1998: 54) found that agents and own salesmen were the two far most important operational modes chosen by Finnish SMEs to export to the 15 most important markets.

**Standardization of product and market:** The second and third determinants identified for a global firm are tied together and are related to the standardization of the product and the market. The main idea behind these determinants is that global firms take advantage of relatively homogeneous needs in different countries. Thus, these firms sell relatively the same product with minor adjustments in different countries and use relatively similar promotional and advertising campaigns across countries (Baalbaki and Malhortra, 1993; Zou and Cavusgil, 2002). With respect to SMEs, the product and marketing standardization raises the question of hypercompetition between players (Harvey, Novicevic, and Kiessling, 2001). SMEs have to compete with firms with greater resource endowments. Thus, survival of these firms will depend on the possession of a proprietary product or service that large firms are missing, or on the fact that they concentrate on small market size that are not profitable for large firms.

**Country comparative advantage:** The fourth determinant is related to the comparative advantage of the country such as the sophistication of home demand, the presence of factor-creating mechanisms, the abundance of resources, the image of world-class related and

supporting industries (Dunning, 1997; 1998). Birkinshaw, Morrison, and Hlland (1995) found statistically significant the impact of the differential comparative advantage on global integration. Johansson and Yip (1994) also found strong support for their hypothesis of national impact on globalization. This suggests for example that SMEs receiving support from the government will likely be more globally oriented than those that do not receive such support (Christensen, 1991).

**Table 1: Determinants of global firms identified in literature**

Determinant	Kobrin (1991)	Johansson and Yip (1994)	Zou and Cavusgil (1995, 2002)	Birkinshaw, Morrison, and Hlland (1995)	Comments for an SME
1 Intensity of international activities	Internationalization (control)	Market drivers (industry globalization)	Global market participation		Increasing intensity of export activities by SMEs observed in recent years.
2. Product standardization		Product/service standardization (globally integrated strategy)	Product standardization	Market standardization (-)	Standardized product and marketing well adapted for a low manufacturing cost and low requirements about information. But the likelihood for a large market attracts more competition.
3. Marketing standardization	Advertising intensity	Cost drivers (industry globalization)	Uniform market program		
4. Country comparative advantage		Nationality		Country comparative advantages	Support by the home country is a key.
5. Organizational structure	Manufacturing scale (less important)	Organizational structure	Concentration of value adding activities	Scale economies	Centralized structure with production in the home country. Less opportunities for economies of scales.
6. Managerial practices		Management processes	Co-ordination of value adding activities		Flexibility, use of new organizational forms, and innovation observed is some SMEs.

7. Strategic actions	Technology intensity		Integrated competitive moves	Global competitive actions	SMEs have to find out new ways of doing business to face new competitive challenges.
----------------------	----------------------	--	------------------------------	----------------------------	--

Organizational structure: The organizational structure of a global firm, the fifth determinant, is characterized by the existence of one global head office (centralized authority), a concentration of value adding activities in some countries to take advantage of scale economies, and low costs or high quality of labour (country comparative advantage discussed earlier). Kobrin (1991: 21), for example, has measured the index of global integration as the “proportion of international sales that are intrafirm” or the relative volume of intrafirm resource flows. However, Kobrin (1991)’s findings indicated that economies of scale were not a determinant of the global integration. Nevertheless, Birkinshaw, Morrison, and Hulland (1995) have observed in a more detailed study that economies of scale were a significant driver of global integration only in three industries (out of the seven observed), namely the mining machinery and equipment, the semiconductors and related devices, and aircraft engines and parts. The two studies by Kobrin (1991) and Birkinshaw, Morrison, and Hulland (1995) have found a very strong positive relationship between technological intensity and transnational integration. With respect to SMEs, the existence of centralized direction is a natural characteristic of organization, due to relative size. Also, instead of necessarily establishing subsidiaries abroad, some SMEs prefer using partnerships with other firms (Forrest, 1990; Hara and Kanai, 1994, Kaufmann, 1995). But these partnerships need to be managed with caution as they put at risk the autonomy of an SME (Olleros and Macdonald, 1988; Larson, 1992; Oakey, 1993; Nkongolo-Bakenda, 2001).

Managerial practices: The sixth determinant of the global firm is related to innovative managerial practices such as global budgeting, global group meetings, cross-country coordination devices, global performance review, and global country coordination. Small and medium-sized firms have been found to have strengths in their close relationships with consumers, their shared vision, their low bureaucratic organization, and their high level of entrepreneurial and dynamic spirit (MacMillan, 1975; Rothwell and Zegveld, 1982; Rothwell, 1986; Nooteboom, 1994). However, conflicts may sometimes rise between the teamwork management style and a one-man orchestra style frequently adopted by some SMEs’ owner-managers.

Organizational processes: The seventh determinant of a global firm is related to strategic processes that firms undertake to face the challenges of the global marketplace. A firm’s flexibility is considered one of the most consequential factors for worldwide success or failure in the global environment. Kogut (1989) contends that the firm’s operating flexibility rests not only on exploiting differentials in factor, product, and capital markets, but also on the transfer of learning and innovations throughout the firm. Kiernan (1993) identified the following elements as being key determinants of competitive success, and therefore flexibility, in the twenty first century: organizational learning, innovation and experimentation, constructive contention, empowerment, optimized value potential, sustainability strategy, and strategic reframing. Hitt et al. (2001) and Ireland et al. (2001) have identified the following six domains as critical to a firm’s effort to create wealth in the new business environment: organizational learning, innovation, external networks, internationalisation, top-management team, and growth. Although growth may be considered as an indicator of performance, the two other remaining aspects are part the other determinants, namely, the intensity of international activities and the managerial practices of the global firm.

In addition to factors already mentioned, one should also consider environmental scanning. According to Vernon-Wortzel and Wortzel (1997), in the information age, scanning the business environment has become an important component of competitive advantage. Some studies have asserted that the strategic flexibility of a firm is dependent upon its abilities in scanning, organizational learning, networking, and innovation (Porter, 1991; Hitt, Keats, and DeMarie, 1998). Scanning deals with the search for and use of information about the business environment. Organizational learning focuses on the acquisition and use of competencies by human resources. Networking addresses the way the firm establishes inter-firm ties to increase efficiency. Innovation is related to the firm's ability to introduce or adopt new technologies, new products, and new managerial practices to keep its edge over the competition.

Scanning, organizational learning, innovation, and external networks present particular challenges for an SME with respect to the worldwide area of activities and the relatively limited resources.

### **Empirical evidence of globalization in small and medium-sized firms**

Studies on small firms facing globalization challenges are most often concerned, with few exceptions (Chetty and Campbell-Hunt, 2003a; Matlay and Fletcher, 2000), with the impact of the new environment on SMEs. As indicated by Audretsch (2002: XIII-XIV), globalization has affected SMEs by facilitating transnational activities and by increasing the firm's role related to the shift in the source of competitiveness toward knowledge-based economic activity. The main topics covered in these studies are related to SME's internationalization intensity, opportunity to decrease the time frame to export, opportunities to overcome their relatively limited resources, and their relative competitive strategies and position in the new environment. Table 2 presents concepts related to globalization in studies identified after the procedure explained above<sup>1</sup>.

Do extended international activities lead to higher profitability of SMEs?

Two studies (Lu and Beamish, 2001; Majocchi and Zucchella, 2003) that focused on internationalization intensity observed that the SME's export intensity (ratio of export sales to total sales) has a negative and linear relationship with performance unless certain conditions are met. The relationship was found to be positive when the mode of entry has been appropriate to the nature of the SME and to its product requirements. These two studies found that initial FDI (foreign direct investment) had a negative relationship with the firm's performance, but that a higher level of FDI had a positive relationship with performance. Further, the relationship between FDI and profitability was positive when FDI followed a high level of exports (Majocchi and Zucchella, 2003) or when the level of FDI was increased to five countries or more (Lu and Beamish, 2001). A positive relationship between internationalization intensity and profitability was also found higher when the scope

---

<sup>1</sup> We have limited our review to studies, which address the concept of globalization or equivalent. For an extensive review of studies on the internationalization of SMEs, see Coviello and McAuley, 1999 and Fillis, 2001.

of country diversification was oriented to global markets rather than to neighboring countries.

Also, Chetty and Campbell-Hunt (2003a) found that globally oriented firms manufactured their products in the home country and exported through direct representation when the product was highly technical. But when the product required after sale service and site-specific customization, New Zealander SMEs preferred exporting using networks of indirect representation through local distributors. Brouthers and Nakos (2004) found that SMEs preferred equity modes of entry when assets specificity was high or when the firms had internal control mechanisms. Otherwise, the firms used non-equity modes of entry. This research has also found that the use of an appropriate mode of entry with respect to asset specificity and internal control mechanisms led to higher performance. These findings could explain why Preece, Miles, and Baetz (1998) did not find a significant relationship between alliances and export intensity or global diversity of early stage technology-based firms, as they did not take into account the technical or service requirements of the product.

The knowledge and competencies of owner managers and skills and development of human resources were mentioned by the majority of respondents as one of the internal forces in a survey designed by Matlay and Fletcher (2000) to identify the driving forces affecting the globalization tendencies of small business managers. Many other studies have also identified the manager's international skills and experience as important factors of an SME in its international activities (Reuber and Fischer, 1997; Westhead, Wright, and Ucbasaran, 2001; Manolova et al., 2002).

It should be noticed that it is not just knowledge in international business that is important, but also social and professional networks acquired in different parts of the world. Such competences can also come from the personal itinerary of the manager as in the case of Chinese immigrants observed by Wong and Ng (2002). These authors have examined transnational smaller firms created by Chinese immigrants in Canada. These firms were different from traditional ethnic enterprises. According to these authors (p. 509), these firms were:

“a mixture of types of businesses including those with Asian production and North American distribution, retail chains and the traditional import-export. Their spatiality and interethnic organization often includes co-ethnic family partners in two to three geographic sites spanning national borders. Thus, transnationalism itself is an ethnic business strategy connecting Canada with places such as Hong Kong, China and Taiwan. While de facto there are strong Asian connections in terms of business associates for these transnational small businesses, they rely considerably less on co-ethnic Chinese as business contacts and as clientele when compared to non-transnational small Chinese businesses in Canada.”

-------------------------------	--	---	---

In short, findings in these studies suggest that the intensity of internationalization (in terms of export sales and number of foreign countries where the SMEs sell products) can lead to higher performance under some conditions. Among the conditions, these findings highlight the experience and skills in international business, the availability of tangible or intangible distinctive resources, and a judicious choice of mode of entry appropriate to the type of product or service to be exported. But globalization is not only exporting, it is also related to the scope and the level of competition in the markets where the firm is exporting (Ohmae, 1985).

How important are scope and level of competition for SMEs? A few studies have examined the scope of the market of SMEs in the global context. Knight (2000: 29) found that "SMEs that respond to globalization and prepare in advance to enter the foreign markets tend to enjoy better performance." Chetty and Campbell-Hunt (2003a) have compared New Zealanders SMEs using a global approach (active in multiple countries up to 60) to those using a regional approach (activities not extended far beyond Australia and New-Zealand). This research found that the globally oriented SMEs adopted one of three approaches or a combination. Some developed an innovative product with a global potential and some of these SMEs had abandoned other lines of products in order to focus energies on the global product. Other SMEs were focused on the needs of particular market segments in order to serve these markets wherever found in the world. Still others focused on a particular stage in the value chain where they developed distinctive advantages. The product manufacturing was concentrated in the home country and the firms used direct, indirect or mixed strategies to expand the markets. By contrast, regionally oriented firms had a broad line of products, used offshore and home country manufacturing strategy and expanded their markets through direct investment.

Roth (1992) identified five clusters of medium-sized firms competing in global industries. The first cluster included firms in which primary and support activities were maintained within a single country while the marketing and sales activities were located in multiple countries. The second, third, and fourth clusters were characterized by the dispersion of almost all of the activities in multiple countries, but coordinated, either globally (e.g., product and process innovation in cluster 3), regionally (e.g., product innovation, marketing, sales, finances, and accounting in cluster 4), or nationally (e.g., product and process innovation and finances in cluster 2). The fifth cluster included firms whose support activities were concentrated while the primary activities were dispersed and coordinated globally.

Julien (2000) has also identified five categories of SMEs facing globalization challenges. The first category included locally competitive SMEs operating in a very specific local market or protected from international competition because of its location. The second category included SMEs that imported inputs but targeted local or national markets. The third category was that of SMEs whose inputs were locally made, but the outputs were dedicated to foreign markets. The fourth category included SMEs importing inputs and exporting outputs to foreign markets. The fifth category was composed of SMEs importing inputs and exporting outputs to foreign markets using networks.

In conclusion, studies related to the scope of the market found that globally oriented SMEs had a specialized product that was generally but not necessarily

manufactured in the home country and sold in foreign countries through partnerships, representations and, sometimes, subsidiaries. As a result, dispersion of subsidiaries in different countries and the intra-firm flows of services generally observed in large firms are not necessarily required (Kobrin, 1994). Globally oriented SMEs use more focused strategies for their outstanding products or services and use less foreign direct investments than regionally oriented SMEs and large multinationals (Dunning, 1998). Therefore, what are the major characteristics of SMEs doing business in multiple countries that this paper calls “globally oriented SMEs” (GOSMEs)?

Attributes of GOSMEs can be deduced from results of some studies. Preece, Miles, and Baetz (1998) found significant relationships between the availability of resources and the export intensity and market diversity of the SME. Findings in a study by Matlay and Flecher (2000: 441) on international SMEs indicate that “the ability and willingness to be simultaneously active in a number of countries in different parts of the world (...) and a commitment to the transnational management in these markets” increased in proportion with their size (2% for firms with 10 employees or less and 48% for those with 250 employees or more). However, Matlay and Flecher (2000) had also observed that being global is not a matter of size, even if the larger firms were more likely to be global than the small ones. This observation was confirmed by studies in the arts and crafts sector where the size of exporter firms is generally small (Aucley, 1999; Fillis, 2002). Therefore, one can say that the size matters, but not always. Some industries require a more larger size than others (Calof, 1993; Mittelstaedt and Harben, 2003).

Fujita (2003) found that the majority of globally oriented SMEs gained their market power thanks to the ownership or the specific advantage related to their product or intangible assets such as an advanced technology, a brand name, marketing skills, and an efficient organizational structure providing flexibility. Julien, Joyal and Deshaies (1994) found that SMEs that were more likely to face globalization challenges, had an innovative and differentiated product and used new product technologies. Piscitello and Sgobbi (2003) found that firms presenting the strongest interest towards advanced communication tools, possessing Internet connections and already activated e-commerce projects, also displayed the highest motivation to expand abroad in search for new markets. It is interesting to note that studies have generally found that the adoption of technology facilitated networking and the globalization of SMEs (Fontes and Coombs, 1997; Fariselli et al., 1998; Lituchy and Rail, 2000; Tagliavini, Ravarini, and Antonelli, 2001). However, other studies such as that of Piscitello and Sgobbi (2003) have found that the use of the Internet can sometimes be incompatible with the tacit knowledge sharing that dominates SMEs’ social interactions.

Chetty and Campbell-Hunt (2003a) have identified the initiating role played by a proprietary innovation in the globalization of an SME. Wolff and Timothy (2000: 45) have observed that with an appropriate type of resource (quality rather than breadth or quantity), an SME “can execute competitive patterns also used by larger firms and perform as effectively.” These attributes seem consistent with some characteristics of globally oriented firms identified in other studies (Fujita, 2003; Nkongolo-Bakenda, 2003). Fujita (2003) found that small and medium-sized transnational firms had a restricted range of products targeting narrow market

segments. They operated in competitive industry where the technology intensity was high and tended to be relatively independent from large multinationals. Nkongolo-Bakenda(2003) observed that, among Canadian SMEs exporting to two or more foreign markets, 69% faced a standardized demand, 87% had a specialized product, 80% targeted industrial customers, and 60% faced a higher level of technological intensity. However, De Chiara and Minguzzi (2002) found that service SMEs with a higher propensity to export were more interested in customized services while those with a lower propensity to export were more interested in standardized services. These results can be explained by the size of the industry service surveyed. As observed by Chetty and Campbell-Hunt (2003a), globally oriented SMEs focus on a global niche. In the service sector, niche segments will be more likely found in customized service rather than in standardized ones. In general, it has been observed that: “service firms tend to internationalise in a different way than their manufacturing counterparts”. (Lovelock and Yip, 1996; O’Farrell and Zheng, 1998; Bell et al., 2003: 339).

To sum up, the findings above suggest that globally oriented SMEs are generally technology intensive with a standardized product (except in the service sector) dedicated to a global market niche. These firms have distinctive resources or a competitive advantage such as a proprietary technology or product to satisfy the needs of the niche wherever in the world. This international expansion is facilitated, as mentioned above, by international business competences and skills that managers have accumulated in their previous careers or incrementally in the current firm.

Another stream of studies about globally oriented SMEs has focused on born-global and born-again global firms, which do not follow the traditional incremental process of internationalization through a series of evolutionary stages (for a literature review, see Madsen and Servais, 1997). Born global are firms that compete on the global marketplace from their inception or shortly thereafter (Rennie, 1993). Born-again global are firms “that have previously focused on their domestic markets, but which suddenly embrace rapid and dedicated internationalization” (Bell, McNaughton, and Young, 2001: 174). The majority of firms going global using these processes have been found to be SMEs (Knight and Cavusghil, 1996; Bell et al., 2003). Numerous studies have found them in different countries, namely, Australia (Rennie, 1993); Australia, UK, New-Zealand (Bell, McNaughton, and Young, 2001; Bell et al., 2003); Canada (Spence, 2003; McNaughton, 2003), Sweden (Andersson and Wictor, 2003); Scotland (McAuley, 1999); Danmark and Australia (Rasmussen, Madsen, and Evangelista 2001); Norway, France and Danmark (Moen and Servais, 2002; Moen, 2002), USA, UK, New Zealand, Switzerland, Germany, Czechoslovakia, France, Brazil, Singapore, and Israel (McDougall, Shane, and Oviatt, 1994).

These studies have identified factors contributing to the success of this phenomenon. Drawing upon previous studies, Madsen and Servais (1997) asserted that the propensity and further development of born global firms are determined by the founder (past experience, ambition level, and motivation), the organization (competence, routine, and corporate governance structure) and the environment (market internationalization, high/low technology, and specialization). After analyzing instant exporters in arts and crafts sectors, McAuley (1999) identified four groups of factors influencing their rapid internationalization. These

were the product (good design, quality, price, delivery and country image), personal and psychological (business attitude, family, personality, education and training), cognitive (networks, access to know how, customer-focused, business skills) and industry (sector and global market). Andersson and Wictor (2003) have outlined the following factors in a conceptual framework: globalization trends, entrepreneur's attributes, use of networks, and industry characteristics. Despite the omission of the outstanding quality of product or service in this framework, it contains the majority of factors mentioned in numerous studies. Factors identified for born-global and born-again global seem consistent with those identified in studies previously examined for any SME doing business in multiple countries. Therefore, one can wonder what is specific to global born SMEs and what they share in common with other globally oriented SMEs.

The most commonly mentioned trends for an earlier globalization are related to advances in communications and process technology, standardization of marketing demand, increasing demand for specialized products, and knowledge accessibility by all firms (Knight and Cavusghil, 1996). Prior competencies and skills of entrepreneurs in international business are also mentioned as facilitator of born-global phenomenon as they replace the necessity to pass through the traditional internationalization stages (McDougall, Shane, and Oviatt, 1994). Furthermore, entrepreneurs of this category of firms have been found with a special mindset and vision for international market (McDougall, Shane, and Oviatt, 1994; Harveston, Kedia, and Davis, 2000; Andersson and Wictor, 2003). Networks and alliances allow managers to overcome a firm's resource limitation (McDougall, Shane, and Oviatt, 1994; Andersson and Wictor, 2003). Some industries that are technology-intensive, specialized or niche oriented, have more potential for born global firms than others (Bell et al., 2003; McNaughton, 2003). To factors retained by Andersson and Wictor (2003), it seems important to add outstanding competency related to product/service quality or to a proprietary technology that allow the SME to "have an advantage over local foreign firms" (Rennie, 1993; Knight and Cavusghil, 1996; Bell et al., 2003).

A few studies have examined this question. Moen and Servais (2002) have examined born global and gradual global SMEs in three countries. Results of their study suggest that the SMEs globalization is not influenced by the firm's year of establishment or first year of exporting activity, but rather by the presence of outstanding competitive resources, experience and skills in international business, and proactive personality of managers. Likewise, Moen (2002) found that born global SMEs in two countries possessed similar characteristics with the old global SMEs and that the newly established domestically oriented SMEs resembled SMEs that were older with a low level involvement in exports. Harveston, Kedia and Davis (2000) also found that managers of born global firms had an extensive international experience than managers of gradual globalizing firms. However, in a study of Canadian SMEs, McNaughton (2003) did not find support for the hypothesis suggesting a negative relationship between the number of geographic markets served by a firm and the length of time elapsed between its inception and the beginning of export activities. Spence (2003) identified the following initial triggers for Canadian born global and born-again global pursuing an international strategy: availability and use of networks, serendipitous encounters, and niche market existence. Entrepreneurs of these companies had global mindsets, but their internationalization process was not formalized.

In conclusion, on the attributes of global-born SMEs and other globally oriented SMEs, findings of the studies above suggest that the two categories of firms are akin in many areas such as their technology intensity basis, the intensive use of networks to export, the standardized product, the availability of proprietary technology or specific competitive advantage, and the experience of their managers in international business. The main difference between the two categories of firms lies in the fact that managers of global-born firms have acquired their experience and social ties during their career prior to the current business while managers of other globally oriented firms have acquired their experience and ties incrementally in the current firm. What strategies can lead these firms to a success in the global marketplace?

Strategies adopted by globally oriented SMEs have retained the attention of researchers as we have already seen in some studies aforementioned. In his study on SMEs enjoying a worldwide leading position in their sectors of activities, Simon (1992; 1996) found that these firms, which he called “hidden champions”, combined strategic focus with geographic diversity. They emphasized factors like customer value, blended technology and closeness to customers, relied on their own technical competences, and created mutual interdependence with their employees. Lindell and Karagozoglu (1997) found that, to meet international competition, U.S. and Scandinavian SMEs had developed external networks with customers and suppliers and internal technology strategies and quality control program. Also, they had shortened times of product development, increased the number of new products, and put more emphasis on R&D efficiency. Chetty and Campbell-Hunt (2003a) found a positive relationship between networking activities with performance. However, this relationship was stronger when networks were made with local firms in targeted foreign countries rather than with firms in the home country. These results were consistent with those found by Kaufmann (1995) and Lu and Beamish (2001). Chetty and Campbell-Hunt (2003b) asserted that business networks were the only vehicle for internationalization when the internationalization process was sudden, globally-oriented, and based on specialized product. These findings suggest that partnerships are used as means that allow globally oriented SMEs not only to supplement to their relatively limited resources, but also to focus on their core competencies and specialty (Chetty and Campbell-Hunt, 2003a).

Partnerships have also been found important for production and security purposes in globally oriented SMEs. Karlsson and Ahlstrom (1997) found that global smaller firms used leaner manufacturing systems with minor adjustments. Thus, the knowledge necessary to maintain partnerships with suppliers was located towards the top of the organization rather than at the functional level. Compared to a large firm using a lean manufacture, a global smaller firm had an advantage in the higher likelihood to involve customers in product development and in the opportunity to build unique skills thanks to the partnership with specialized and complementary organizations. Nkongolo-Bakenda (2001) has found that globally oriented SMEs used diversified networks not only to have access to required resources, but also to ensure security of their proprietary products.

Some studies have also found that globally oriented SMEs used scanning and learning practices that fit with their relatively limited resources. For example,

Nkongolo-Bakenda (2003a) observed that globally oriented SMEs preferred more frequently external but more accessible sources of information such as customer contacts, trade shows, and reviews to scan their environment.

The learning process had also received attentions of scholars interested by SMEs with extended international activities. Anderson and Boocock (2002: 5) assert, with respect to a globally oriented SME, that: “the large firm model of learning is inappropriate, the distinctive culture and communication systems of small organizations require different approaches to the acquisition, transmission and interpretation of knowledge.” These authors observed that, in international SMEs, generative learning was not the primary approach to learning, rather the dominance of tacit over explicit knowledge, and the challenge of explicit knowledge for a firm with relatively reduced resources. Likewise, Gray and Gonsalves (2002: 33) found that, for an international SME, “the key to improved customer focus and innovation may lie in the social constructive and institutional constitutive of learning.” Nkongolo-Bakenda (2003b) observed that learning activities in globally oriented SMEs followed the Nonaka (1994)’s pollination model in order to obtain explicit and tacit knowledge. The content and the learning practices to be adopted were dependent on the position, tasks, and career needs of the beneficiary.

In short, globally oriented SMEs adopt competitive strategies that fit with their nature and do not necessarily behave as global firms to face the challenges of globalization. A better understanding of successful conditions necessary for an SME to go global can be facilitated by a sketch depicting conceptual framework where differences and similarities with large global firm could be ascertained.

## **Conceptual framework for a globally oriented SME and propositions**

Empirical studies in the preceding part of this paper have indicated that there are some SMEs that are doing business simultaneously in different countries. However, these firms do not necessarily behave in the same way as the large global firms. These firms share some characteristics with large multinationals, but they also have their particular attributes. This paper has labeled them “globally oriented SME”. A “globally oriented small and medium-sized enterprise” (GOSME) is an independent (no subsidiary) company with less than 500 employees and whose market operations extend at least to two foreign countries preferably located in two (or more) of the three primary and distinct highly competitive regional markets (North America, Europe, and Asia)<sup>3</sup>. This definition focuses more on the intensity of competition faced by the SME and the scope of the market where the firm is successfully operating rather than on the location of manufacturing and source of production factors (Julien, 2000). A sustainable competitive position of the firm in different markets is the ultimate objective pursued by a firm that diversifies locations of production for resource access, market increase, efficiency, and strategic asset access (Dunning, 1998).

---

<sup>3</sup> We are aware of the limits of this definition as it uses only one dimension (the number of employees) and refers to a higher limit of 500 employees that is not universal. But it is a working definition that may be easily adjusted and is based on the definition adopted by the OECD (2002: 7) while taking into account results from the study carried out by Broosbank (1991) on this topic.

To portray similarities and differences between globally oriented SMEs and large multinationals, we present in Table 3 characteristics of GOSMEs together with statistically significant characteristics of the three types of multinationals found by Harzing (2000). It may be observed from this table that generally speaking, a GOSME is very similar to the transnational firm when considering its high level of integration. It seems very similar to the global firm when one considers its low level of responsiveness.

Finally, it is very similar to the multinational when the focus is its moderate level of interdependence. It should however be observed that the integration of activities and the interdependence in GOSMEs could be observed more between the firm and its non owned affiliates (partners) rather than between the firm and its subsidiaries. These similarities of small firms with extended foreign activities with the three types of large multinationals and their particularities favor the use of concepts specific to GOSMEs rather than those suggested for large multinationals.

Like large global firms, the success of GOSMEs is dependent on the interdependence between their activities in different markets, their worldwide learning, their international trade, the intensity of competition they face in the domestic and foreign markets, and actions they undertake to create sustainable competitive advantage. However, GOSMEs put less emphasis on economies of scales and on intra-firm flows than do large global firms and take more advantage of alliances and flexibility to compensate the low level of vertical integration and more limited resources<sup>4</sup>. Globally oriented SMEs rely on or respond to the following as drivers of global expansion: specialization, market standardization, global niche market, competitive pressure within the industry, and strategic actions to creating value.

---

<sup>4</sup> Audretsch and Thurik (2001: 298) observe that: “In the entrepreneurial economy, the multiple dimensions of flexibility replace scale economies as the organizing principle for economic activity.”

**Table 3: Comparison between characteristics of large multinationals identified by Harzing (2000) and major features of GOSMEs**

	Multid. (M)	Global (G)	Transn. (T)	Harzing (2000)	GOSMEs
Corporate organizational design					
Decentralized federation	High	Low	Low	M>T>T	Low
Network structure	Low	Low	High	T&±M>G	High
Inter-subsidiary flows	Low	Low	High	T>M&G	Low
HQ's pipeline	Low	High	Low/High	G>M&T	High
Center of Excellence	Low	Low	High	T>M&G	High
Local responsiveness					
Local production	High	Low	Medium	M>T>G	Low
Local R & D	High	Low	Medium	M>G	Low
Product modification	High	Low	High	M&T>G	Low
Adaptation of marketing	High	Low/Medium	High	T&M>G	Low
Interdependence					
Total level of interdependence	Low	High	High	G&T>M	Low
Level of HQ dependence	Low	High	Medium	G>T>M	Low
Level of subsidiary dependence	Low	Low	High	T>G	High

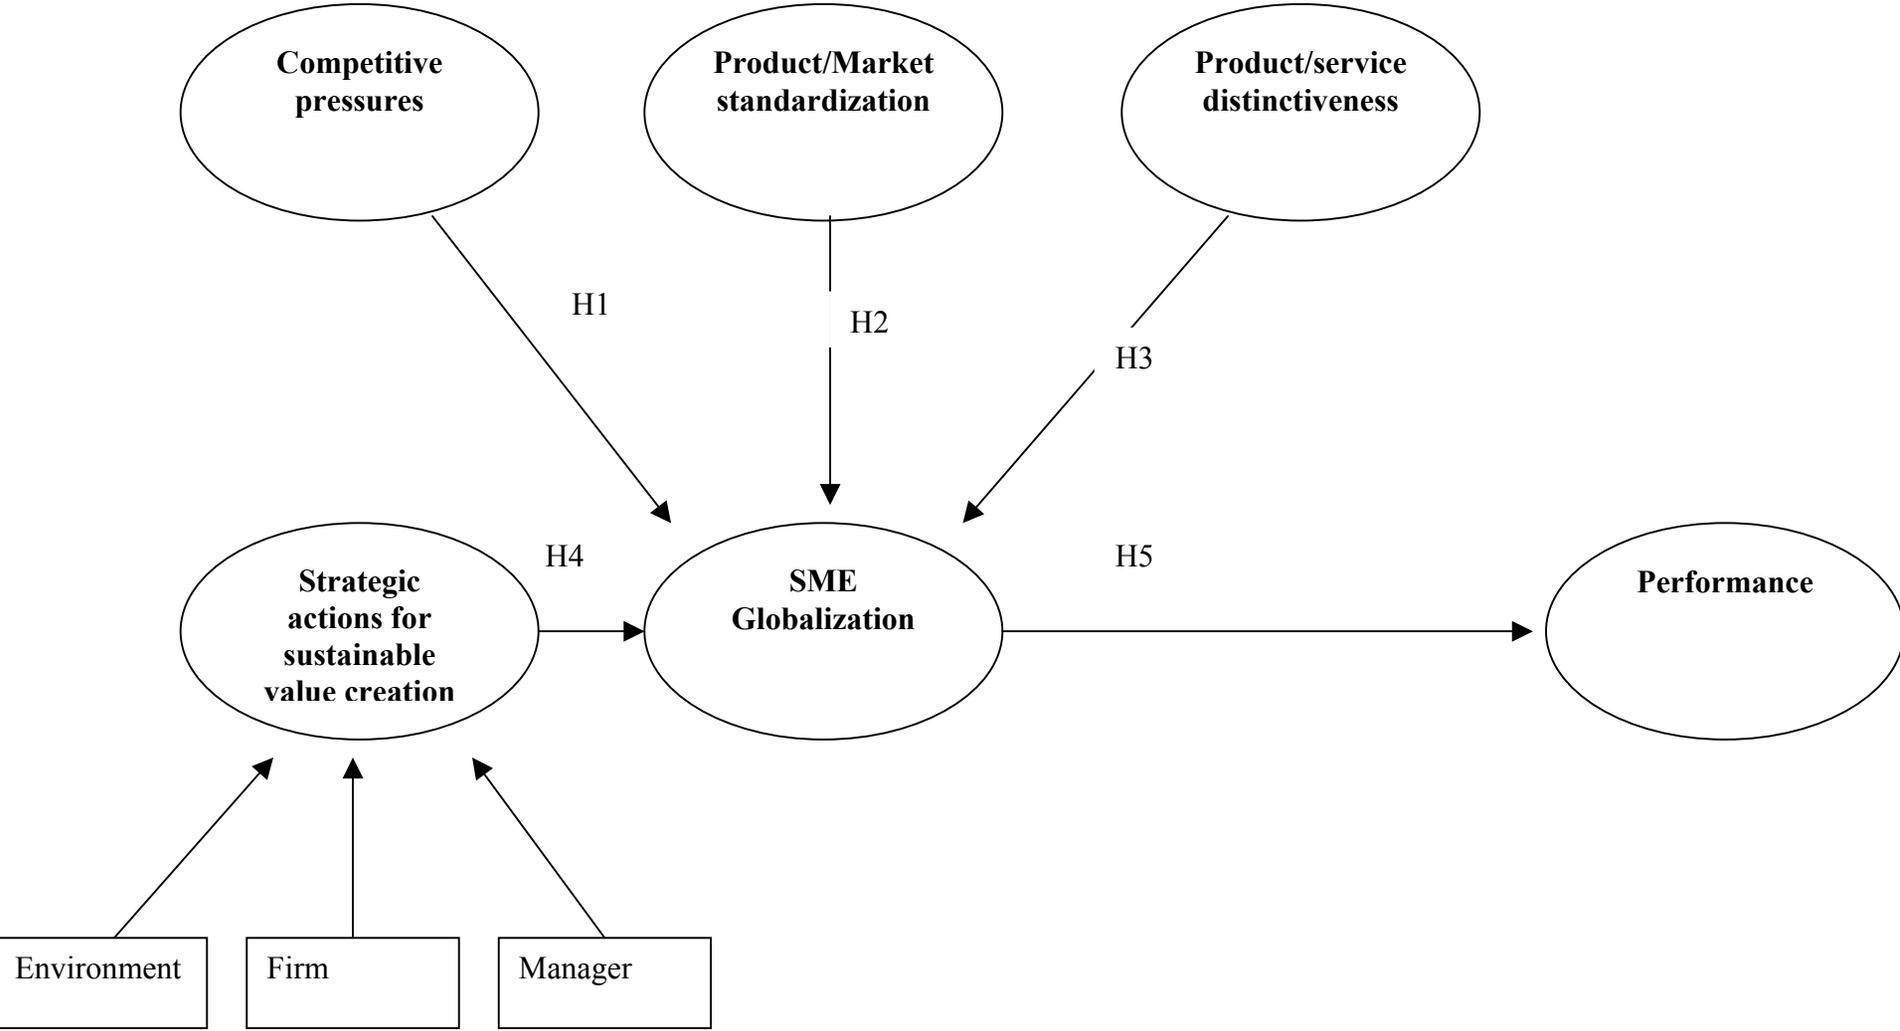

Empirical studies have also shown that, although globally oriented SMEs share some characteristics, there are also differences among them. For example, the level of technical nature of the product has led some to value the FDI mode of entry into a foreign country. Others use partnerships when they focus on customized products rather than standardized ones. But these exceptions that confirm differences should not hinder what globally oriented SMEs share.

Studies examined demonstrated that “not every small company can be or should strive to be a world market leader” (Simon, 1996: 257). Contrasting common characteristics of globally oriented SMEs with those of regionally oriented

successful SMEs can facilitate a conceptual framework building for globally oriented SMEs.

Therefore the conceptual framework for a globally oriented SME can include: product distinctiveness, market standardization, competitive action within the industry, and strategic actions to creating value (Figure 1).

**Figure 1: Framework for an SME's globalization**

Competitive pressures are related not only to the intensity of competition leading to higher quality of products, but also to the size of the market. Market standardization deals with the global scope of the market. Product distinctiveness refers to the uniqueness of the product or service that the SME offers to the global niche. Strategic actions are those that the SME can undertake to enjoy sustainable success in the global marketplace. From this conceptual framework, the following propositions can be drawn.

Proposition 1a: The higher the competition on the product/service of an SME in the marketplace, the more likely the firm will be globally oriented (Carter, Stearns, and Reynolds, 1994; Birkinshaw, Morisson, and Hulland, 1995).

Proposition 1b: The narrower the market, the more likely the SME will choose to operate in it. This relationship is moderated by the availability of a proprietary product/service that increase security of an SME against the invasion by large multinationals.

Proposition 2: The more the market demand for the product/service of an SME is standardized, the more likely the firm will be globally oriented. (Birkinshaw, Morisson, and Hulland, 1995; Baalbaki and Malhortra, 1993; Yip, 1996).

Proposition 3: The higher the product distinctiveness of an SME, the more likely the firm will be globally oriented. (Carter, Stearns, and Reynolds, 1994; Simon, 1992; 1996).

Propositions related to strategic actions for a sustainable value creation call for further explanations before their statements.

## **Wealth creation in GOSMEs**

Wealth creation has always been among the topics of studies in strategic management (Porter, 1991). Porter (1985)'s value chain framework for example has determined different areas of activities where wealth can be created. The resource-based view has identified resource attributes that result in wealth creation (Hoopes, Madsen, and Walker, 2003). However, what a firm must do to continually create wealth is the subject of ongoing debate (Porter, 1991). Indeed, this ongoing debate will not have an end because, as the environment in which the firm operates changes, previous winning strategies become common place and new innovative and creative ways to succeed have to be found (Schoemaker, 1990; Collis, 1994).

As already seen in this paper, some studies have identified strategic actions creating wealth in the global marketplace. Factors identified suggested to ensure flexibility and proactiveness through environment scanning, organizational learning, networking, innovation, and internationalization.

The SME has already been recognized for its ability to being flexible and close to customers (Frigenbam and Karnani, 1991; Nooteboom, 1994). However, in the global environment, the SMEs will face challenges different from those faced by its traditional local market.

For example, it has to scan the global market and stay informed about changes in technology and customer needs at the global level despite its limited financial and human resources. It does continuously innovate to maintain its standing in the global marketplace even if financial resources dedicated to R&D are much lower than those in large multinationals. It should prepare its human resources to face challenges of the future despite the fact that its resources cannot allow the sort of educational investments such as corporate universities as is the case in large firms (Twomey et al., 1999; Fulner Gibbs, and Goldsmith, 2000). Finally it has to make sure that all international activities do not threaten the security of the firm and the trust of customer wherever they are located. The GOSMEs should take appropriate actions fitting with their relatively limited resources and the larger global marketplace.

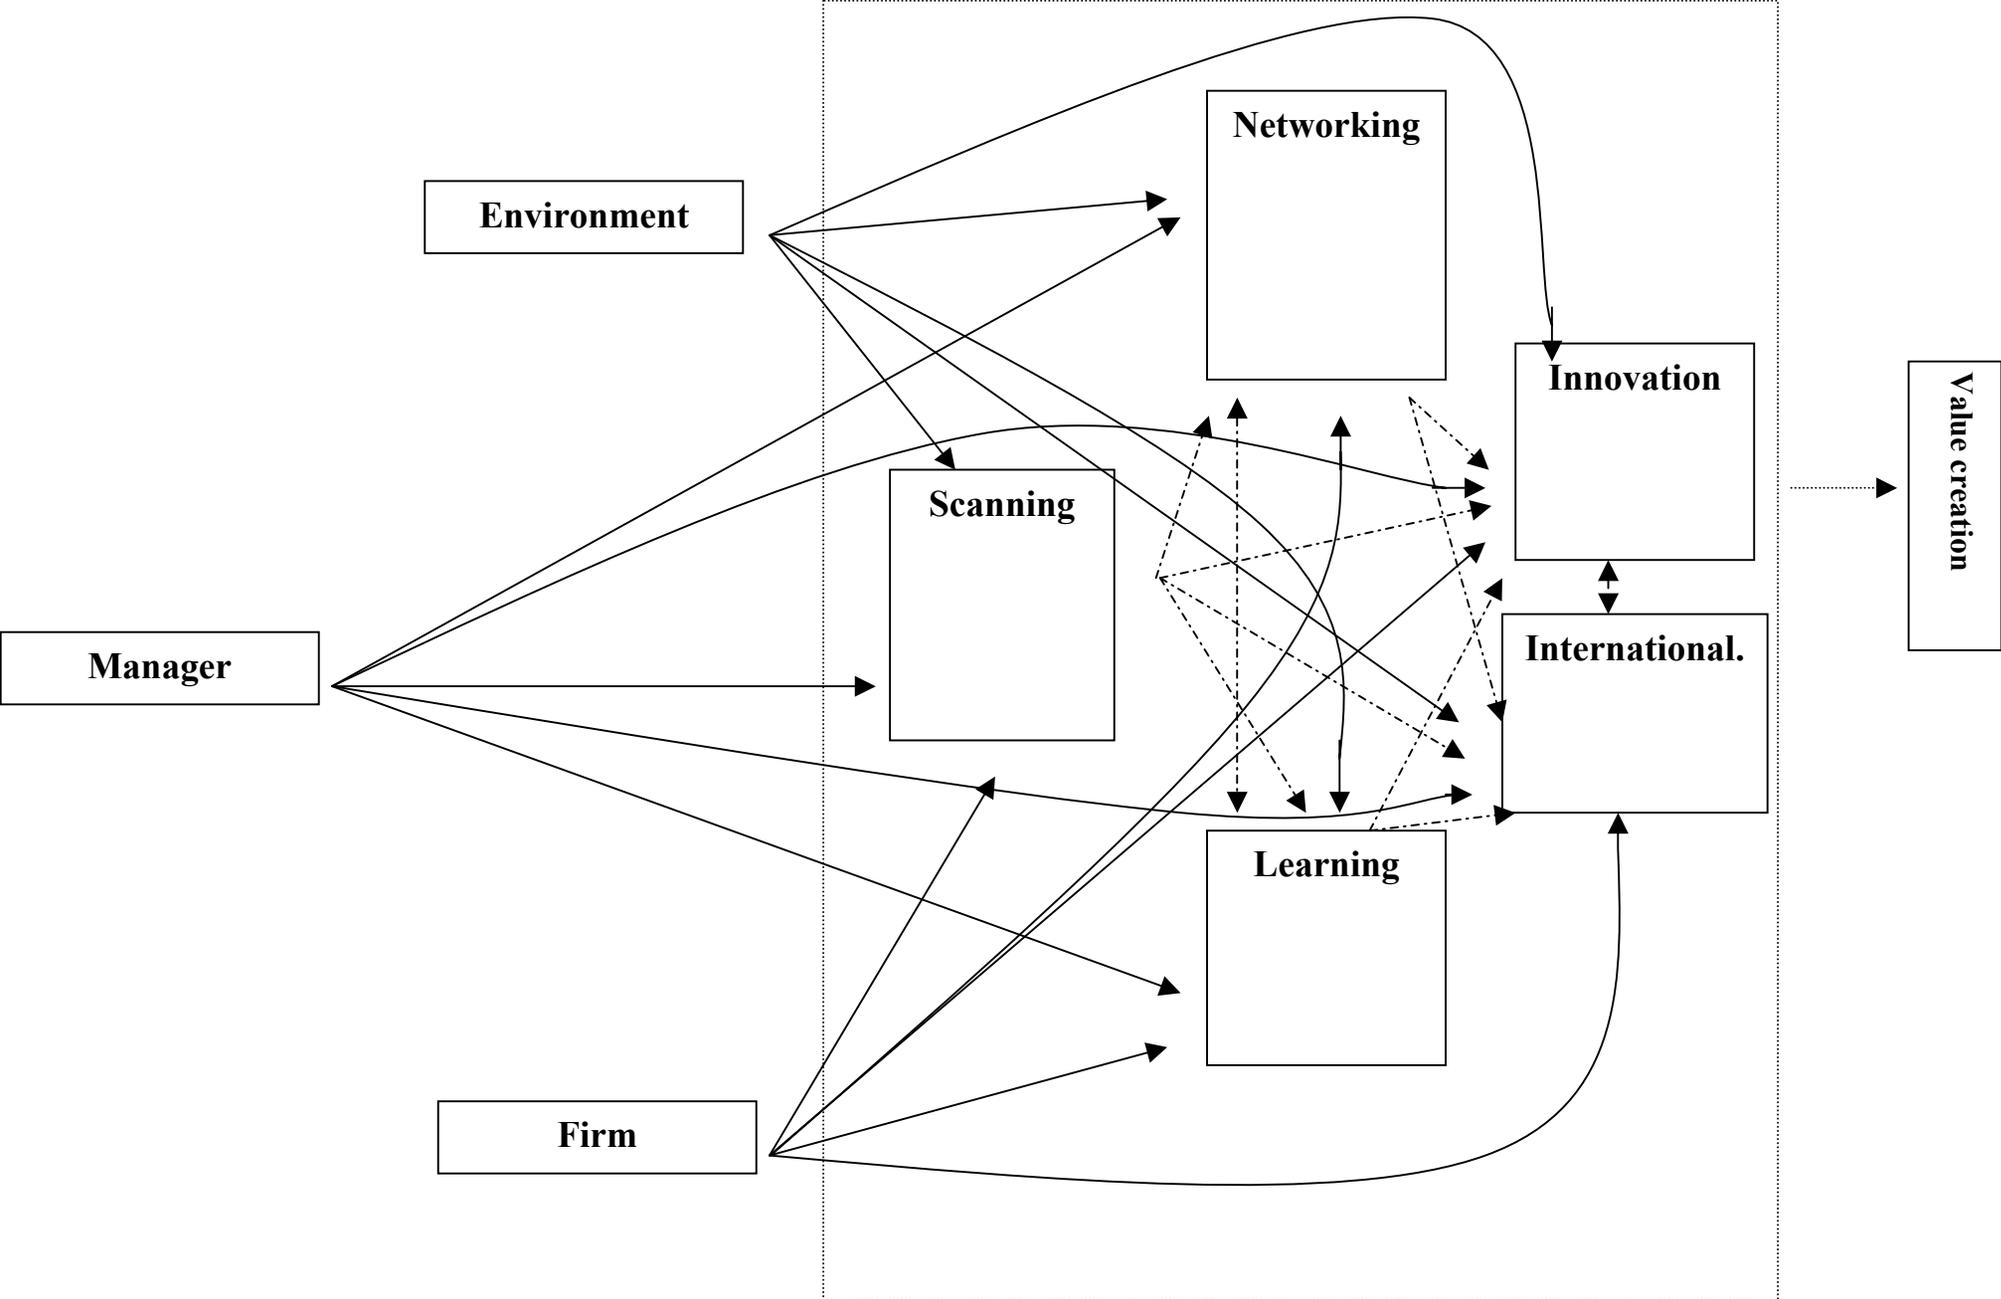

These actions will depend on the characteristics of the manager, the firm, and the environment in which it operates (Porter, 1991; Hitt and Tyler, 1991; Rajagopalan, Rasheed, and Datta, 1993; Hitt et al., 2002). Therefore, a framework to value creation in GOSMEs can be stated as follows: characteristics of the industry, the firm, and the manager's profile determine the environmental scanning, organizational learning, networking, innovation, and internationalization necessary to create successfully sustainable value in their worldwide activities (Figure 2 in annex).

Scanning, learning, networking, innovation, and internationalization are considered as mediating constructs leading to globalization and sustainable competitiveness (Wayne and Liden, 1995; Stimpert and Duhaime, 1997; Dhanaraj and Beamish, 2003). Relationships among these variables can lead to numerous propositions for wealth creation as shown in Figure 2.

Proposition 4: The higher the amount of strategic actions of an SME in scanning, learning, networking, innovation, and internationalization, the more likely the firm will be globally oriented. This hypothesis needs more comments and will be developed in the next part of this paper.

Proposition 5: GOSMEs with H1-H4 confirmed will perform better than those that did not. (Birkinshaw, Morisson, and Hulland, 1995).

**Figure 2: Conceptual Framework and relationships for a sustainable value creation**

## CONCLUSION

This paper explores whether or not an SME can be characterized as a global firm. At first glance, the examination of frameworks elaborated for large global firms could lead to a negative answer as SMEs lack some key attributes found in global large firms. However, numerous empirical studies have identified some SMEs doing business simultaneously in numerous countries, but behaving in some ways differently than large firms. Characteristics and behaviors of these globally oriented SMEs have allowed for the development of a conceptual framework for a globally oriented SME. Globally oriented SMEs face competitive pressures from local and worldwide-located firms. These firms produce standardized products for a global niche market. Successful GOSMEs are specialized and focused on a few products for which a competitive advantage exists. These firms undertake appropriate actions to sustain this competitive advantage. These actions tend to increase flexibility and continuous improvement by focusing on scanning, learning, networking and innovation.

This framework has implications for the strategies of firms planning on increasing their level of international business. For example, firms that produce non-standard products might forego globalization in favour of an enhanced locally or regionally oriented strategy. Likewise, domestically or regionally oriented firms willing to go global reduce their line of products and focus on the product or service with a huge potential of success in a global niche. The identification of drivers and requirements of SME's globalization can help managers to avoid making inappropriate decisions and enhance the potential for success in the global marketplace. Decision makers can find principles that could guide their actions toward SMEs. Researchers have propositions they may use as hypotheses in their future research.

<sup>1</sup> Paper accepted for Presentation at the 49th The International Council for Small Business 49th World Conference.

# **ABSTRACT**

The process through which women-led entrepreneurial firms plan and achieve continual growth often reflects a complex set of motivators and intentions that support this strategic path. Contemporary research has shown that women entrepreneurs recognize the precursors of growth and the importance of activities such as information seeking and planning to their strategic leadership roles. This study seeks to determine the influence of a diverse set of factors (beyond industry) that facilitate growth intentions within women-owned businesses. That is, are there influences that seem to make more of a difference, such as capital resources (economic and social), networking, and training needs in encouraging growth and expansion? In our study, we examine multiple factors including the: assembling of capital resources, use of social capital (e.g., reliance on formal and informal network for business assistance), and future training needs that influence the continual growth intentions.

This study, commissioned by a women's business center located in the Northeast section of the United States, examined 421 women-owned businesses over a three-month period. Results revealed that women entrepreneurs with high growth intentions tended to use more formal social networks and used their membership in a women's business organization to network and support their growth needs. For financing, although bank loans were more readily available to firms with higher growth intentions, private and venture capital investment still is not available. Finally, in seizing opportunities in the marketplace, the firms with higher growth intentions launched their businesses faster (in less than 6 months time) and reported they needed training in very specific areas: strategic planning and production/operations. Taken altogether, the women entrepreneurs with higher growth intentions relied on, utilized, and needed a diverse set of factors to assist them in reaching their growth objectives.

This research represents one of the few large-scale studies of established women-owned enterprises focused on continual growth and expansion. Our study offers support for the process by which formal and informal capital resources within women-owned firms can serve as critical antecedents of potential market growth and expansion. This research takes an important initial step in understanding the process of how women entrepreneurs leverage and build upon their own resources both internally and externally that may be used in the future to identify market opportunities, confront industry and environmental changes, and seek new innovations for their businesses.

## **INTRODUCTION**

### **The Role of Women Entrepreneurs in the Global Economy**

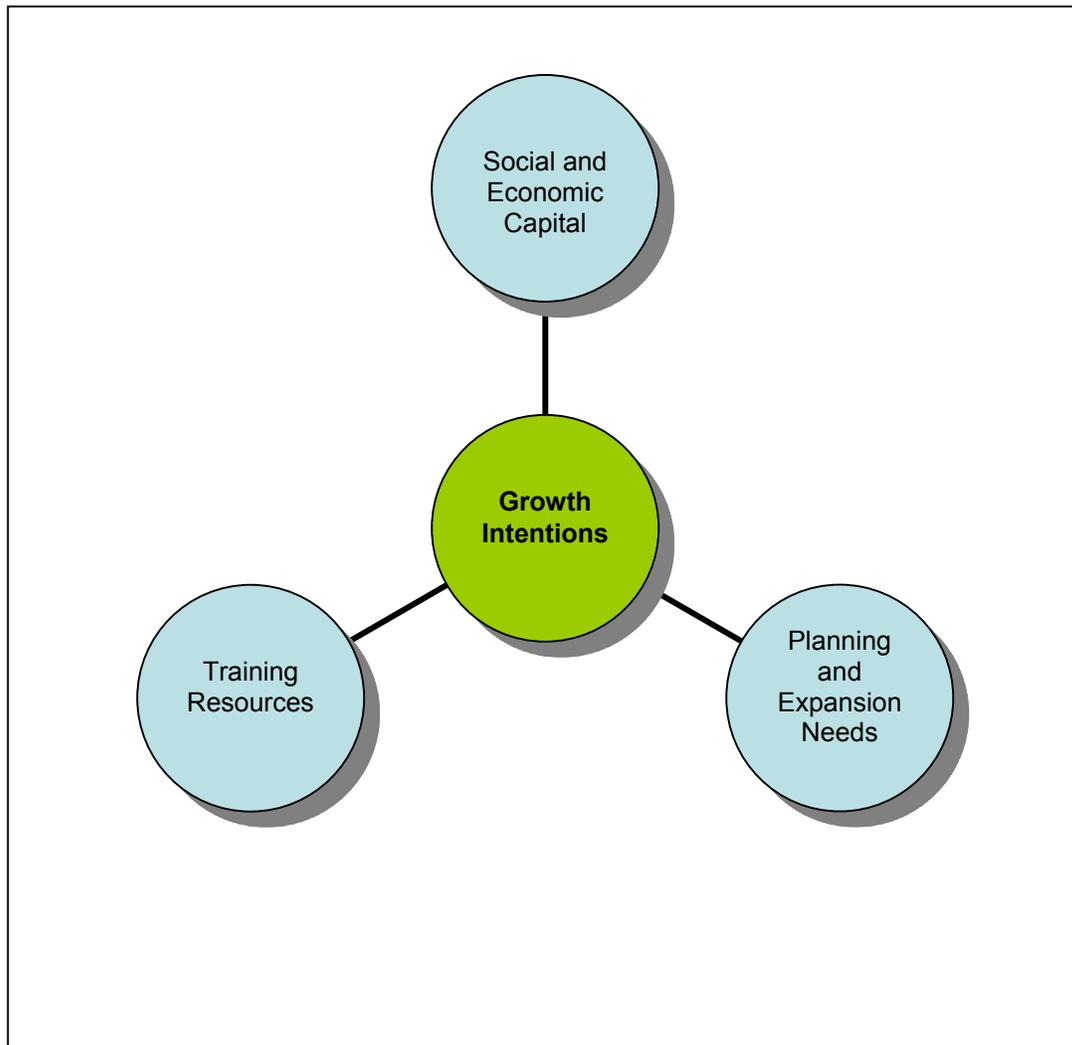

The emergence and growth of women-owned businesses have contributed to the global economy and to their surrounding communities. The presence of women around the world driving small and entrepreneurial organizations has had a tremendous impact on employment and on business environments worldwide. Women-owned firms comprise between one-quarter and one-third of all the businesses in the formal economy, and are expected to play an even larger role in informal sectors (NFWBO, 1999)

According to recent research and reports (NFWBO, 1998; OECD, 1998; United Nations, 1994; United Nations, 1995), in advanced market economies, women own 25% of all businesses and the number of women-owned businesses in Africa, Asia, Eastern Europe and Latin America are increasing rapidly. In Japan, women have established 23% of private enterprises. In Russia, women own 64% of firms employing 10 people or more. In China, women have founded 25% of the businesses since 1978. In Germany, one out of every three new businesses is founded by a woman, and these firms have created over one million new jobs. In Hungary, 40% of all new businesses since 1990 have been started by women. Similarly, in Poland, 38% of all firms are owned by women. In Mexico, 32% of women-owned businesses were formed between 1995-2000. In France, women head one out of every four firms. In Swaziland, women own 70% of micro, small and medium-sized enterprises. In Great Britain, women constitute  $\frac{1}{4}$  of all self-employed individuals (Estes, 1999; Jalbert, 1999; Jalbert, 2000). In the United States, there are 3.9 million privately held women-owned businesses, employing 9 million people, and generating \$1.17 trillion in sales (Center for Women's Business Research, 2003).

Investigators have examined the economic and social impact of women's business ownership, as well as the barriers or constraints that women might have in establishing and growing their enterprises, which can encompass such things as women entrepreneurs' access to credit and financing, technology, markets, and information (Finnegan, 2000). The number of research studies has grown tremendously since the 1980s, when scholars and policymakers first cast their attention toward women entrepreneurs (Gundry, Ben-Yoseph, & Posig, 2002; Starr, & Yudkin, 1996).

While contemporary research has shown that women entrepreneurs recognize the precursors of growth and the importance of activities such as information seeking and planning to their strategic leadership role, our study seeks to extend previous research by investigating the influence of a diverse set of factors, beyond industry type, that support the needs and growth intentions of women business owners. That is, are there influences that seem to make more of a difference, such as capital resources (economic and social), networking, and organizational assessment strategies in encouraging growth and expansion? In our study, we examine multiple factors including the: assembling of capital resources, use of social capital (e.g., reliance on formal and informal network for business assistance), and future training needs that may be needed for many of the women entrepreneurs in meeting their growth objectives for their businesses (see Figure 1).

**Figure 1**  
**Diversity of Factors Examined Within Women Entrepreneurial Firms on Growth Intentions**

## **Social Capital: The Role of Networks and Information in Women-Owned Firms**

Social capital may facilitate value creation by entrepreneurial firms (Nahapiet & Ghoshal, 1997) that arises from the combination and exchange of resources (Moran & Ghoshal, 1996). Three dimensions of social capital have been identified: structural, relational, and cognitive (Nahapiet & Ghoshal, 1997). The structural dimension of social capital includes social interaction (Granovetter, 1992; Lindenberg, 1996; and Hakansson & Snehota, 1995). The location of an entrepreneur in a social structure of interactions provides certain advantages for her. According to this perspective, entrepreneurs can use their personal contacts to obtain information or to access specific resources. The relational dimension of social capital, in contrast, refers to assets that are rooted in these relationships, such as trust and trustworthiness. Trust can act as a governance mechanism for embedded relationships (Uzzi, 1996). A recent study found that investing in the creation of social capital inside a firm eventually creates value. Informal social relations and tacit social arrangements encourage

productive resource exchange and combination and thereby promote product innovations (Tsai & Ghoshal, 1998).

In a study of the effects of different types of social capital, technology-based entrepreneurs benefited more from relational embeddedness - the freer and greater exchange of non-redundant information. Non-technology-based entrepreneurs benefited more from structural embeddedness - the extensiveness of social networks. The researchers concluded that each dimension of social capital reinforces the creation of the other dimensions in technology-based new ventures, which in turn, contributes to entrepreneurial growth aspiration (Liao & Welsch, 2003).

Researchers have pointed out that one of the most critical needs for women entrepreneurs lies in a non-technical area: the development of networks and mentors (Davis & Long, 1999). However, earlier research suggested that no significant differences existed between the success of women who used network contacts to help develop their businesses and those who did not (Carsrud, Gaglio, & Olm, 1987).

A recent study examined the network activities of entrepreneurs through three phases of establishing a firm in four countries (Greve & Salaff, 2003). It was found that entrepreneurs build and use different networks for each phase of entrepreneurship. For example, entrepreneurs tended to talk with more people during the planning than other phases. This study also found that family members were part of these networks across all phases, especially for entrepreneurs who inherited existing businesses. However, women used their family members to a larger extent than men, and even more than men when inheriting a business. Experienced entrepreneurs have the same networking patterns as novices (Greve & Salaff, 2003).

The present study seeks to uncover how women entrepreneurs leverage their own network of formal and informal contracts to position their organizations for continual growth. This study examines the type of networks women entrepreneurs seek and utilize, including: a formal network (e.g., accountants, lawyers, bankers), an informal network (e.g., reliance on family and friends, other entrepreneurs), state agency resources and centers, as well as their willingness to rely on a women's business organization for additional knowledge, expertise, and information as they develop and grow their organizations.

## **Economic Capital: Access to Financing at Start-up and Growth**

Access to capital has been a major challenge for women entrepreneurs during the last decade (NFWBO, 1999). This occurs despite the high level of start-up preparation and education of women entrepreneurs (Wanogho, 1997). In a recent study, Finnegan (2000) found that some entrepreneurs reported they had to try harder to obtain a loan or credit. Others believed that banks need to become more sensitive to the situation of new entrepreneurs, and especially women entrepreneurs, in micro and small enterprises. Other entrepreneurs in the study borrowed from family, reinvested profits, and did not draw a salary (Finnegan, 2000). Historically, the dominant source of funding has been personal savings, credit cards, home equity loans and family loans (Coleman & Carsky, 1996).

In a study of over 800 women entrepreneurs, Gundry and Welsch (2001) found that high-growth oriented firms tended to access a greater variety of sources of funding, although there

were no significant differences in the acquisition of bank loans or private investor (angel) financing. This was corroborated in a newly released NFWBO study of 1,194 women and men entrepreneurs. The study disclosed that women and men owners of fast-growing firms (defined as achieving revenue or employee growth of 30% or more over the past three years) are similar in that they have a larger appetite for capital than those who own slower-growth firms (NFWBO, 2001).

The consequences of this difficulty in accessing capital include lowered perceptions of the woman entrepreneur's credibility in business, a finding that was significant among women business owners in Eastern Europe (Ben- Yoseph & Gundry, 1994), and a difference in the viability of their businesses (Boden & Nucci, 2000). Researchers have proposed that women may have greater availability of other sources of funds, which allows them to borrow less from institutional lenders (Carter, Williams & Reynolds, 1997). Another answer may lie in the type of organizational structure selected and implemented by business owners. For example, Haynes and Helms (2000) found that bank loans tended to be more important for those owners choosing a corporate form of organizational structure. The National Foundation for Women Business owners (now called the Center for Women's Business Research) reported in 2001 that women owners of fast-growing businesses are significantly more likely to use personal credit cards to meet their capital needs than are men owners of fast-growing firms (32% compared to 21%). Also, significantly fewer women entrepreneurs of fast-growing firms had a commercial bank loan compared to men business owners (39% compared to 52%). However, the proportion of women-owned firms with bank credit increased from 46% to 52% (Bank Marketing, 1999).

An NFWBO study conducted in 1998 revealed that the single area in which women of color differed significantly from Caucasian women was access to capital. Women entrepreneurs of color were less likely to have bank credit (50% compared to 60% of Caucasian women). African-American women entrepreneurs were the least likely to borrow capital to launch their firms compared to other ethnicities (29%), compared to 37% for Asians, 45% for Native Americans, 49% for Caucasians and 51% for Hispanic women business owners. Further, African-American and Native American women business owners were more likely to have been rejected when applying for loans while starting their businesses.

In a study of 562 male and 403 female entrepreneurs in France, it was concluded that more informal sources of financing need to be used and developed. Regarding access to financing, the only overt discrimination found against women was a higher demand for collateral requirements. Most of the discrimination was the result of problems with interpersonal communication between the persons in the finance field and the women entrepreneurs (Orhan, 2001).

Since the mid-1990's, interest has turned to the venture capital arena, and a number of venture capital groups have been formed to meet the needs of women entrepreneurs. Estimates of the percentage of venture capital that goes to women-owned firms varies. VentureOne, a San Francisco research firm, estimates that women received only 12.7% of the record \$17.8 billion in venture funds disbursed in the first quarter of 2000. That is an increase from the 1.7% received in 1995, but it is still a very small share. This prompted Kay Koplowitz, Chairwoman of the National Women's Business Council, to create Springboard, a venture capital forum focusing on women entrepreneurs (Gutner, 2000).

The formation of these organizations in response to the small share of venture capital that women entrepreneurs receive should contribute to increased equity financing opportunities for women entrepreneurs. However, there may be reasons that explain in part why some women do not seek venture capital. Most venture capital firms look for high-growth, high-profit businesses. This narrows the pool of candidates among all entrepreneurs, not just women. Further, to liquidate their investment, the firm may be acquired or go public, which may not be a strategy that some entrepreneurs desire.

In the present study, interest was on determining the type and variety of capital resources that are utilized by women entrepreneurs in the growth of their businesses. For example, women-owned firms with higher growth intentions tend to rely more on debt or equity resources during the start of their business. Across multiple industries, we examine a number of methods, including personal savings, family and friends, loans from banks, personal credit cards, private investors or use of venture capital in determining the capital resources strategies used by women entrepreneurs with low and high growth intentions for their businesses.

## **Preparation and Education for Entrepreneurship: Women Entrepreneurs' Need for Training**

In a study of leading women entrepreneurs (Moore, 2000), many of the entrepreneurs profiled reported that they developed their skills, experience, and contacts while they worked for employers. Therefore, there is a growing subgroup of women business owners who are highly educated and have specific work experience related to business start-ups, and training programs need to address issues that are more sophisticated than feasibility planning and financing, and should include topics such as small business taxation and regulatory environments (Alvarez & Meyer, 1998).

In a study of the information needs of 311 women entrepreneurs (Gundry, 1997), those who were just starting their ventures requested assistance and training in implementing the business idea, identifying initial sources of financing, and advertising/promotion. The entrepreneurs who were already established had a somewhat different set of needs, including identifying financing for expansion and increasing sales. The impact of relevant business skills on the viability and success of a venture was demonstrated in a study of Israeli women entrepreneurs (Lerner, Brush, & Hisrich, 1997). The skills most closely associated with high sales revenues were obtaining financing, budgeting, and planning ahead.

Another study identified the ten most important areas for further learning needed by fast growth entrepreneurs (Sexton, et al, 1997). These were: using cash flow to make operational decisions; financing growth; increasing the value of the business; compensation for self and associates; hiring, training, and motivating for growth; succeeding in a rapidly changing world; successful selling; sales force management; management success; and problems and pitfalls of growth.

Training for entrepreneurs is provided in many contexts and formats. A recent study described a Microenterprise Training Institute (MTI), established in 1992 by a State Economic Development Agency (SEDA) in New Jersey, to train entrepreneurs in the successful running

of their businesses. In Spring 1999, the MTI curriculum went from a six-session discussion of general business concepts (old curriculum) to a seven-session curriculum focused on writing a business plan (new curriculum), and graduates had access to lenders (Cook, Belliveau, and VonSeggern, 2001).

Differences in information and assistance needs can be found across cultures as well. In an investigation of entrepreneurs in the United Kingdom (Carter & Anderson, 2001), women were concerned with getting more education in business, management and technology issues. In a study of 144 women participants in business start-up workshops in Russia, unemployed women were very motivated to start businesses if they received training in entrepreneurship (Izyumov & Razumnova, 2000). According to the researchers, the typical trainee in an entrepreneurship program is a 40-year-old woman who holds an engineering degree, and is a former employee in the state sector of the economy. Aspiring Russian women entrepreneurs were most interested in learning the fundamentals of entrepreneurship, business law, accounting and financial analysis (Izyumov & Razumnova, 2000). Alternative training models are in development in other parts of the world as well, including China where a train-the-trainer program developed by the United National Industrial Development Organization in collaboration with the All China Women's Federation was recently launched (Kao & Chiang, 2001). The International Labour Organization provides training and assistance centers in many countries around the world (Finnegan, 2000).

In the present study, we further seek to understand the future training needs of women entrepreneurs with low and high growth intentions. We investigate their training needs in terms of technology, financial management and planning, organizational management, production and operations, sales, and strategic planning. The fulfillment of many of these training needs may make a significant contribution to the overall economic health and sustainability of the business.

## **METHODOLOGY**

This study commissioned by a women's business center and conducted by a university survey center, examined 421 women-owned businesses over a three-month period in 2002. The issues examined in this survey included preparation and start-up, access to capital, use of capital, training, and management assistance and the strategies employed by these women entrepreneurs in the launch and growth of their businesses.

The sample used in the survey was a stratified random sample drawn from a list of New Hampshire (USA) women business owners provided by Marketing Systems Group of Fort Washington, Pennsylvania (USA). A total of 320 women owners or principals of New Hampshire businesses were interviewed. Potential respondents were randomized and stratified based on 2001 revenues. Larger businesses were modestly over-represented in order to draw statistically valid conclusions on a relatively small population.

Initial interviews were conducted during May-July 2002. Each selected business owner was called by a professional University Survey Center interviewer from the centrally supervised facility. Attempts were made to contact 993 New Hampshire women business owners. Forty-

two percent of the interviews were completed, 28% of the respondents were unavailable, 19% of the respondents did not meet the study criteria, and 11% refused to participate.

## Measures

### Growth Intentions

To discern between high and low growth intentions of the women entrepreneurs in our sample, we used three measures to determine growth intentions: the amount of start-up funding they needed to grow their business to where it is currently, the amount of additional funding they will need in the next five years to grow, and their level of sales revenue. As shown in Table 1, firms that had greater than \$500,000 in sales revenue had significantly higher amounts of start-up funding ( $t=3.13, p<.05$ ) and needed a significantly higher amount of additional funding to grow their business in the next 5 years ( $t=5.78, p<.05$ ). This is consistent with previous research (e.g., Hambrick and Crozier, 1985) in which high levels of financial resources are needed for rapid growth in entrepreneurial firms.

**Table 1 Differences Across Firms on Low and High Growth Intentions**

	Low Growth Intentions	High Growth Intentions
Annual Sales Revenues	Revenues < \$500,000	Revenues > \$500,000
Start-Up Funding	\$29,625.71	\$71,917.91
Future Funding Needs Over 5 Years	\$33,015.58	\$147,837.84

### Social Capital Network

Social capital was operationalized in three ways: formal capital (reliance on accountants, lawyers, bankers for assistance with the business), informal capital (reliance on family, friends, and other entrepreneurs for advice) and state, agency network (reliance on state and federal programs). We also asked participants if they used a women’s business organization for assistance in organizing and growing the business.

### Economic Capital

Women entrepreneurs were asked about the different types of financing they used to start the business. This included personal savings, bank loan, family/friends, personal credit card, and private/corporate investor or venture capital.

### Training Resource Needs

For training resource needs, women entrepreneurs were asked in what areas or topics would training or assistance be most beneficial for their company, including access to capital, finances, computers and internet technology, financial management, management (day to day running of the business, human resources), marketing (PR, advertising), strategic planning, organization skills, production, and sales.

## Planning and Expansion

Finally, women entrepreneurs were asked the type of planning before business launch (business plan, marketing plan, financial plan, etc.) as well as their plans on expansion in the future.

## DATA ANALYSIS

**Discriminant Function Analysis.** A discriminant analysis was employed to analyze which of the key areas involving financing, social capital, and training needs predict type of firm and growth intentions. According to Tabachnick and Fidell (1989), the primary objectives of a discriminant analysis are to find the dimension or dimensions along which groups differ and to find classification functions to predict group membership. For our study, the designated groups were high and low growth intentions women-led firms. Both the high and low growth intentions firms were categorized and coded into one of the two groups. The predictors were demographics of the women entrepreneur (education, age, work experience), characteristics of the firm and industry (number of full-time and part-time employees, age of business, timing of launch, funding needed over the past 5 years, industry), financing used (business loan, private or corporate investor/venture capitalist, personal credit card, family/friends, own savings), training needs (information on access to capital, computers, financial management, management, strategic planning, organizational, production, sales), social capital (formal, state/agency, and informal), and business outcomes (expansion plans as well as overall satisfaction).

## RESULTS

### Demographic Statistics

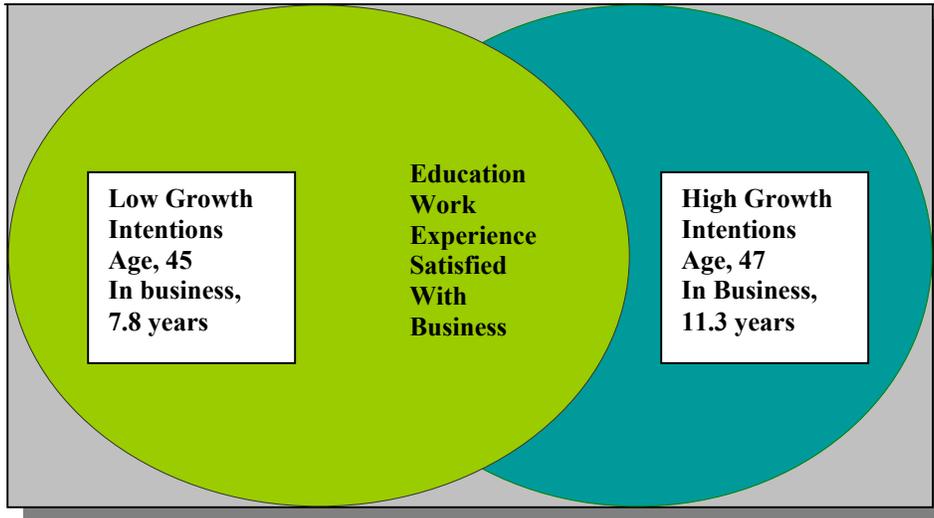

The demographic composition of these groups of women entrepreneurs is somewhat similar. Both groups are in their mid forties, with similar educational backgrounds (high school graduates) and seven years of work experience prior to starting their business (See Table 2 and Figure 2.) Both groups are equally satisfied with their businesses. The groups differ on the age of the business with the low growth intentions group in business for approximately eight years and the higher growth intentions group, eleven years. It is interesting to note that there is approximately three years difference between the age of the business and the age of the entrepreneur pointing toward definite stages of business growth.

**Table 2 Means and Canonical Correlation of Demographic Factor**

Variable	Low Growth Intentions	High Growth Intentions	Canonical Correlation
Age of Business	7.8133	11.3143	.108
Age of Entrepreneur	44.5867	47.1429	.344
Education	2.5200	2.5714	.075

Satisfaction	1.3733	1.4286	.280
Work Experience	7.0400	7.0800	.181

**Figure 2 Conceptual Model for Demographic Factor (Overlapping Similarities and Differences)**

## Social Capital

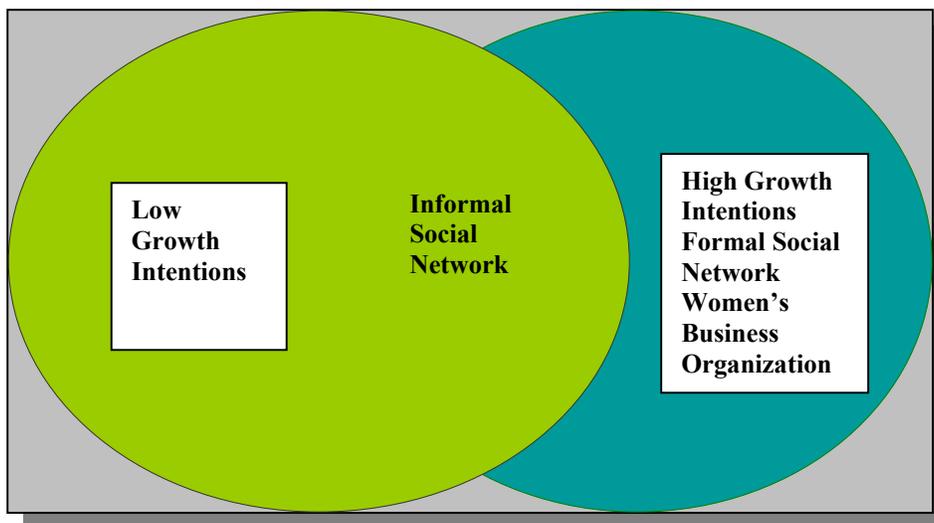

Researchers have posited that social capital may facilitate value creation by entrepreneurial firms (Nahapiet & Ghoshal, 1997). The structural dimension of social capital suggests that entrepreneurs can use their personal contacts to obtain information or to access specific resources. Researchers have pointed out that one of the most critical needs for women entrepreneurs lies in the development of networks and mentors (Davis & Long, 1999). Table 3 and Figure 3 show which types of networking were practiced by each group.

In this study, formal and informal networking and membership in business organizations was used by both groups. Higher growth intentions businesses tended to use more formal social networks and membership in a women's business organization to network. Lower growth intentions firms used the informal network more often. Neither group used the state or agency network. Since many state and agency based programs are geared toward the start-up of the business it is not surprising that neither group uses this network on an ongoing basis.

**Table 3 Means and Canonical Correlation of Social Capital Factor (Overlapping Similarities and Differences)**

Variable	Low Growth Intentions	High Growth Intentions	Canonical Correlation
Formal Social Network	1.3156	1.1714	-.104
Informal Social Network	1.3800	1.3000	-.246
State, Agency Network	1.533	1.6286	.054
Women's Business Organization	.3067	.0857	-.033

**Figure 3 Conceptual Model of Social Capital Factor (Overlapping Similarities and Differences)**

### **Economic Capital**

While procurement of capital continues to challenge the growth of women-owned businesses, progress continues to be made in this area. Traditional sources of capital for women entrepreneurs, including the use of personal credit cards (Coleman & Carsky, 1996) were used by many firms in this study. Table 4 and Figure 4 show which factors were important to high and lower growth intentions women-owned firms.

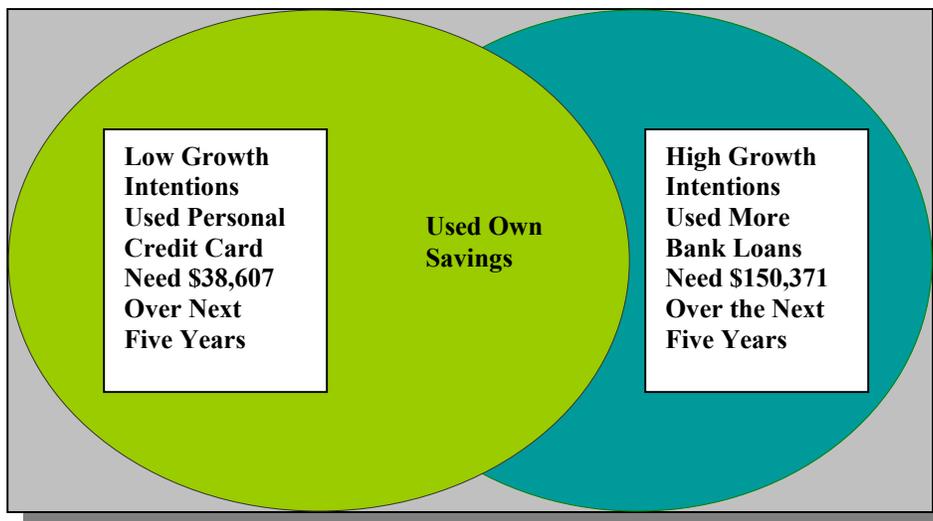

Women who had higher growth intentions were more likely to use bank loans and have a much larger appetite for capital to grow their business. As mentioned earlier, the higher growth intentions firms thought they needed about \$148,000 infused into the business to grow

over the next five years while the lower growth intentions firms set their sites considerably lower at approximately \$33,000. Lower growth intentions firms were much more likely to use personal credit cards to finance their business. Higher growth firms realized that personal credit cards were limiting and went after more bank loans. Both groups used their own savings to finance business growth. This study corroborates prior research that found that higher growth oriented firms tend to use a greater variety of sources of funding and have a greater appetite for capital (Gundry & Welsch, 2001; NFWBO, 2001), but also finely distinguishes among the sources of capital for higher and lower growth intentions firms.

**Table 4 Means and Canonical Correlation of Economic Capital Factor**

Variable	Low Growth Intentions	High Growth Intentions	Canonical Correlation
Business Loan From Bank	1.6667	1.4571	-.026
Family or Friends	1.6800	1.6857	-.112
Own Savings	1.2933	1.4286	-.092
Personal Credit Card	1.4800	1.6857	.279
Private/Corp. Investor or Venture Capital	1.9467	1.9429	.168

**Figure 4 Conceptual Model for Economic Capital Factor (Overlapping Similarities and Differences)**

It is interesting to note that neither group relied on family or friends, nor private or corporate investors for capital to build their businesses. It appears that while bank loans appear to be more readily available to higher growth oriented businesses, private and venture capital

investment still is not available, even though these women in the higher growth group have well established, thriving businesses. Research needs to continue on how to bring more opportunities in venture capital, bank credit and debt financing to women entrepreneurs. Establishing programs that bring bankers, private investors and women entrepreneurs together at key times in the early phases of growth would be beneficial.

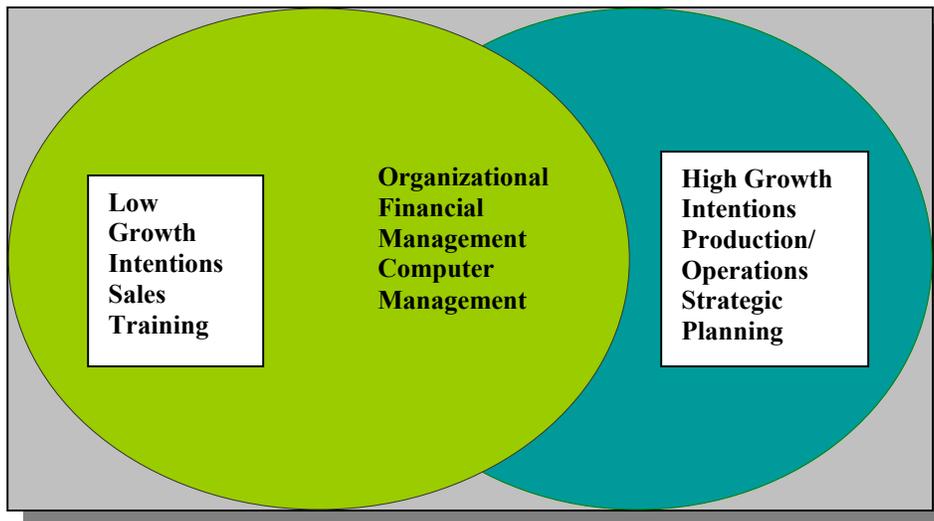

## Training Factor

Women entrepreneurs in faster growth firms reported they needed training in very specific areas: strategic planning and production/operations (See Table 5 and Figure 5). While the results show that both groups would like more training in business concepts in general, it is obvious that as the business becomes larger and as the appetite for growth becomes greater a new set of managerial skills is needed. The results show that women in higher growth intentions firms have figured out the basics of running the business, like making sales, and are looking for more information and tools that will take their business to the next level. Lower growth oriented firms are still trying to figure out the basics of how to make sales, so strategic planning and operations/production training is desired less or not at all. Sexton (1997) also recommended that training for fast growing firms should have a distinctive strategic and managerial focus.

**Table 5 Means and Canonical Correlation of Training Factor**

Variable	Low Growth Intentions	High Growth Intentions	Canonical Correlation
Computers	.0167	.0571	.002
Financial Management	.2000	.1143	-.039
Management	.1467	.1714	.149
Organizational	.0533	.0571	.115
Production/Operations	.0000	.0857	.477
Sales	.0133	.0000	-.276
Strategic Planning	.2667	.0286	-.289

**Figure 5 Conceptual Model of Training Factor (Overlapping Similarities and Differences)**

The findings from this study suggest that there is the possibility of defining some very specific skill sets needed at each stage of the business. If entrepreneurs do not get the correct training at the opportune time and stage of their businesses, they will not grow as fast as intended as those that get the proper training. Further research could probably define a very specific set of managerial skill sets for each business stage along the entrepreneurial life-cycle.

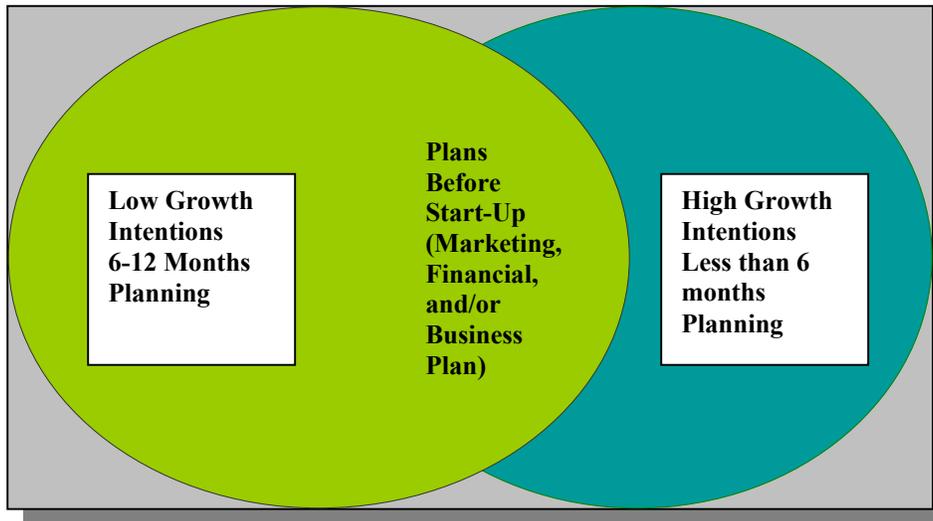

### **Planning and Expansion Factor**

While it is interesting to note that both higher growth and lower growth intentions firms conducted some type of planning before business launch (business plan, marketing plan, financial plan) and plan on expansion in the future, they differed slightly in their time of launch (see Table 6 and Figure 6). The higher growth oriented firms were launched faster – in less than 6 months time. Seizing a hot market opportunity appears to have positioned them for faster growth. The slower growth oriented firms took a bit longer to launch - 6 months to one year.

**Table 6 Means and Canonical Correlation of Planning and Expansion Factor**

Variable	Low Growth Intentions	High Growth Intentions	Canonical Correlation
Expansion	.6800	.4857	-.189
Planning	.6667	.5714	.019
Time of Launch	1.4267	1.200	-.471

**Figure 6 Conceptual Model for Planning and Expansion Factor (Overlapping Similarities and Differences)**

## **Discussion and Implications for Further Research**

This research represents one of the few large-scale studies of established women-owned enterprises focused on continual growth and expansion. Previous research has yet to incorporate a variety of diverse factors that influence the growth and sustainability of women's entrepreneurial firms. This study lends support to the idea that a certain mix of resources in economic capital (financing), social capital (networking) and training is needed across high and low growth oriented women-owned firms. The sections that follow discuss each of these resources and needs in the context of our findings, its policy implications, and directions for future research.

### **Social Capital**

Researchers have posited that social capital may facilitate value creation by entrepreneurial firms (Nahapiet & Ghoshal, 1997). The structural dimension of social capital suggests that entrepreneurs can use their personal contacts to obtain information or to access specific resources. Researchers have pointed out that one of the most critical needs for women entrepreneurs lies in the development of networks and mentors (Davis & Long, 1999).

In the present study, women entrepreneurs in high-growth oriented firms reported reliance on formal social networks and on a women's business organization, the structural dimension of social capital. Given these findings, there are some policy implications in the area of social capital and its role in increasing the performance and viability of women's entrepreneurship. A project entitled Promotion of Women Entrepreneurs (ProWomEn) was recently launched by the European Commission, in which representatives of twenty regions in EU member and associated countries come together to discuss and share policies and actions that promote the creation of businesses by women. It is this type of project that may further cultivate both the formal and informal social networks of women entrepreneurs. For example, objectives for

this project include enhancing the awareness of decision makers about the importance of promoting women entrepreneurs; identifying case studies and best practices for supporting women entrepreneurs; setting up regional networks and pilot projects; and changing education and training systems to build a culture of women's entrepreneurship (Clothier, 2001).

## **Economic Capital**

While procurement of capital continues to challenge the growth of women-owned businesses, progress continues to be made in this area. Traditional sources of capital for women entrepreneurs, including the use of personal credit cards (Coleman & Carsky, 1996) were used by the high-growth firms in this study. However, our results showed that high-growth oriented firms were more likely to have received a business loan from a bank than the lower growth oriented firms, and had higher start-up capital needs. The present study not only corroborates prior research that high-growth firms tend to use a greater variety of sources of funding and have a greater appetite for capital (Gundry & Welsch, 2001; NFWBO, 2001), but it also more finely distinguishes among the sources of capital used by women entrepreneurs of high growth oriented firms. This can be seen in the finding that these high growth firms did in fact receive bank loans, a source of funding that has been historically underrepresented among women-owned businesses in general.

Future research should focus on the continuing search for venture capital and other sources of equity financing, in addition to the increase in bank credit and debt financing. Comparison studies of women entrepreneurs who used SBA programs and those that did not would be helpful (Walker & Joyner, 1999). Of particular interest are the financing patterns across stages of the business from start-up through growth and maturation.

## **Training**

Women entrepreneurs in high-growth intentions firms reported that they needed training in specific areas: strategic planning and operations/production planning. The results showed that entrepreneurs of high growth intentions firms have a specialized set of assistance needs, compared to entrepreneurs in lower growth oriented firms. Alvarez and Meyer (1998) have suggested that there is a growing subgroup of women entrepreneurs who are highly educated, and, in the case of the present study, whose firms are older and more established, who require training programs that address issues that are more sophisticated than feasibility planning and financing. Sexton (1997) also recommended that training for fast-growing firms have a distinctive strategic and managerial focus.

This has particular relevance for public policy and the development of entrepreneurial training programs. Most such programs are directed to the start-up (if not the low growth oriented) entrepreneur, and the results of our study, building on past work in this area, demonstrate the need for the creation of entrepreneurial training programs with a more strategic, growth-oriented focus for the established business that seeks to improve and even reinvent its core competencies.

# CONCLUSION

This research represents one of the few large-scale studies of established women-owned enterprises focused on continual growth and expansion. Previous research has yet to incorporate a variety of diverse factors that contribute to the ability of women entrepreneurs to fulfill their growth strategies and sustain of their businesses. This study offers support for the process by which formal and informal capital resources and organizational strategic planning within women-owned firms can serve as critical antecedents of market growth intentions, and demonstrates how the direction of these resources and strategies can serve as motivating forces in determining market expansion. Overall, this study takes an important initial step in understanding the process of how women entrepreneurs leverage and build upon their own resources both internally and externally that may be used in the future to identify market opportunities, confront industry and environmental changes, and seek new innovations for their businesses.

## **ABSTRACT**

The purpose of this paper is to examine the existing practice in managerial strategic and tools being used and problems faced by local Small Medium Enterprises (SMEs). Most SMEs operates with limited resources. With today's arduous competition, it requires the SMEs to tune its current business practice to cope with the rapid changes in the business environment. Due to the rapid changes, it requires the SMEs managers to be equipped with new knowledge and ideas to promote effective managerial practices. In other word, SMEs need to have better trained managers, knowledgeable in managerial activities. Focus should be on the knowledge on financial management, human resource management and marketing management technique. This study empirically investigates the differences in the managerial practices of SMEs in the Malaysian Manufacturing sector. The most important findings of the study on managerial practices are that the SMEs appear to have a very limited knowledge of the overall spectrum of managerial practices.

## **INTRODUCTION**

The increasing magnitude and significance of the SMEs is a recognized feature of most nations. Malaysia is no exception. In her vision to be a fully developed and industrialised nation by the year 2020, (Hamid et al, 1993) future progress toward that end was seen to depend greatly upon the development of SMEs. The "Vision 2020" of the country recognized the importance to industrialize rapidly by capitalizing on the country's strengths and forcefully tackling the weaknesses.

In Malaysia, the majority of the manufacturing companies fall into the category of SME<sup>1</sup>. According to research conducted in 1988, there were 28,335 manufacturing companies in

---

<sup>2</sup> Before the new definition announcement made effective in January 1998.

Malaysia, of which 92.6% were SMEs, which created 40.2% of job opportunities for the whole industry (Mohd Asri, 1993).

Fundamental weaknesses in the manufacturing sector are recognised as impediments to growth by Malaysian government. Due to their size, inadequate capital, management, marketing, production capacity and low utilisation of modern technology, SMEs have exhibited a lack on inter-industry linkages, poor quality and delays in delivery to support the large industries (Government of Malaysia, 1995).

Amongst the prominent problems facing the SMEs development nationally are the shortage of skilled personnel, poor linkage development, lack of market access, inadequate finance, unintended impact of policy instruments, competitions from foreign SMEs and technological constraints (Salleh, 1990; Chee, 1986). Academics and practitioners also have advocated that among the main problem also involve lack of funds, no research and development (R&D) to upgrade quality, unattractive packaging and labeling, plus poor quality and distorted information on the demands of the international markets (Salleh, 1991; Sarkar et al, 1992; Chee, 1986; Aziz, 1981).

Apart from that, most SMEs are also too dependent on the local markets for sale of their products and only a small number have successfully marketed internationally (Salleh, 1991; Sarkar et al, 1992).

The role, importance and contribution of SMEs differ from one industry to industry and from country to country. Similar to other businesses, SMEs also face miscellaneous problems which in some instances may affect their profitability and growth. In order to cope with the constant rapid changes in business environment, having a well-versed business manager is vital to the organization. Given the above scenario, the relevant and the interesting issue for writers to consider at this stage would be: the style and strategy of management practices especially in marketing, human resource and finance to ensure the success of the SMEs sector.

The purpose of this study has been to provide some evidence regarding the SMEs' managerial practices and problems faced in the vicinity of Johore Bahru city. Researchers will focus the managerial practices namely in the area of financial, marketing and human resources management and strategic planning.

The two main objectives of this study include:

1. to identify the government support schemes in promoting the SMEs
  2. to compare and contrast the managerial practices and problems faced by SMEs
-

# **REVIEW OF LITERATURE**

## **The Definition of Small Medium Enterprises**

A wealth of literature exists on managerial issues on SMEs. The term SMEs appears to have been defined variously by different parties such as different countries, books, authors, scholars and so on. In Malaysia, The Ministry of International Trade and Industry (MITI) redefined SMEs as:

- (i) A small –scale firm is a company “with less than 50 full-time employees, and with an annual turnover of not more than RM10 million”
- (ii) A medium-scale enterprise is a company “with between 51 and 150 employees, and with an annual turnover of between RM10 million and RM25 million”.

In authors’ opinion, there has been no universally accepted definition of what an SME is and a wide range definition is used. In research works for SME, majority of SME definition based on operational definitions (see works for example Dart, Ng and Sarkar, 1990; Mohd Khairuddin, 2000).

## **The SMEs Sector in Malaysia**

According to Mohd Khairuddin (2000), the SMEs in Malaysia may be categorized into three broad sub-sectors; (1) general business, (2) manufacturing and (3) agriculture. The general business sector was involved in construction, wholesaling and retailing, transport and storage, business services and activities, and providing services such as hotel and restaurant. A major activities in the manufacturing sector consist of processing and production of raw materials such as food, textile, wood, chemicals, petroleum, rubber, plastic, metallic and non-metallic, transport equipment, electrical and electronics appliances and components. The agriculture sector was involved in rubber, paddy, oil palm, coconuts, cocoa, pepper, tobacco, livestock, timber, fish, fruits, and vegetables.

From the three sub-sector, manufacturing sector has emerged as the most important for SMEs in Malaysia, in terms of the number establishments, growth, and contributions to the gross domestic product and national income.

## **Managerial activities in SMEs**

Over the past decades, environment change such as globalization, and technological developments occurred surrounding the firm. The environment change may well pose a particular challenge to the SMEs, which limits their abilities to maintain their position against larger competitors. Gupta and Cawthon (1996) suggest it is often small business managers who require the most training. In other word, SMEs need to have better trained managers, knowledgeable in managerial activities involved in SMEs, known the environment, and have entrepreneurship characteristics (Dollinger, 1999; Zimmerer and Scarborough, 1998). Snell and Lau (1994) found differences in management competencies required for growth in small firms in comparison to larger sized businesses.

According to Dart et al (1990), they must have knowledge in financial management, human resource management and marketing management technique. While SMEs have been a popular area for research, few studies appear to have specifically examined the role of managerial training within SMEs (Winch and McDonald, 1999).

## **Financial activities**

Most SMEs need a financial resource to fund production. These resources are either in the form of debt, the cost of which is the interest paid, own saving, family saving, or in form of equity which has a cost represented by the providers required fixed or unfixed return. Study by Bates (1971) found that small firms tended to be more self-financing, had lower liquidity, rarely issued stock, had lower leverage, relied on bank financing and used more trade credit and owner's loans. Other study by Renfrew (1982) also indicated that small firms relied heavily on proprietors' equity, retained profit and trading bank finance. Recent study by Gibson (2001) suggests other five categories of small firms with regard to their dominant source of finance, namely trade credit debt, bank loan debt, related persons debt, working owner equity and other debt or equity such as venture capital, credit card or government loans. Mohd Khairuddin and Syed Azizi (2003) found that five tools of financial analysis were used for the important objectives of the firm such as sales target, market share, return on investment, net profit and growth target. However, the empirical investigations provided evidence that adequate forecast information may not be available in the most SMEs (Edwards and Turnbull, 1994).

## **Human Resource activities**

The human resource advantages within SMEs are linked in many cases to the dynamic and entrepreneurial practice of many SME managers. There was little evidence of the adoption of human resource management (HRM) by small companies (Worsfold 1999).

The development of HRM has its origins in the large manufacturing sector and much of the literature review reflects this orientation. According to Price (1994), the majority of examples of good personnel practice were found amongst relatively large employers and that these employers were clearly "improving their personnel practices as well as recognizing the need for management training". The HRM practices in small firms were very informal and normally they see very little need for formal arrangement in their practices. Furthermore, in SMEs, shorter internal lines of communication and faster response times which allow speedy problem solving and reorganization. Snell and Lau (1994) found that differences in the management competencies required for growth in small firms in comparison to larger firms. Further, many researches suggested that there is little attempt to integrate HRM practices with business strategy or performance.

## **Marketing activities**

Interest at the marketing/entrepreneurship interface of SME research began at late 1980s. This effort defines the role of the entrepreneur as "fundamental" in marketing and organizational activities, so that flexibility in marketing was important to suitably adapt its principles and practices to the activities of SMEs (Hill 2001a). Further more in recent year, the subject of market orientation has received a great deal of attention from marketing scholars

who have developed, tested and refined market orientation scales. In literature, many studies have found relationship between market orientation and the performance of the business, but what is not clear is this concept is used or appreciated by the small business owner (Blankson and Stokes, 2002).

However, Cannon (1991) and David and Klassen (1991) note that there is currently insufficient knowledge about marketing in small businesses. In this study, marketing knowledge describe decisions and issues relating to product, price, promotions and distribution (Kotler, 2003).

## **METHODOLOGY**

Given the lack of empirical research in this area especially in Malaysia, an exploratory investigation was considered the most justifiable approach (Churchill 1991). With exploratory research, the research is conducted to explore a topic or when the subject of study is relatively new, in this case, the managerial practice among SMEs in Malaysia.

The research method was adopted from the combination of quantitative and qualitative approaches as suggested by Miles and Huberman (1994). This approach begins with an initial qualitative survey and is then followed up by detailed interviews using structured questionnaire. The general managers were selected to answer the questionnaire since they are people who usually involve in the making final decision on management practice in the organization. Over half of the items used in this questionnaire were therefore specifically developed for this study based on literature in research journals, newspaper and article in magazine. And some of the specific terms were specifically adjust to facilitate the respondent answering the questionnaire.

Unfortunately in Malaysia, there is no detailed and up-to-date database about SMEs in industry, so the sampling plan was designed by using judgment and snowball sampling. A snowball sample is built from the subjects suggested by previous subjects. The major advantage of these samplings is that it substantially increases the likelihood of locating the desired characteristic in the population (Malhotra 1999).

To ascertain the managerial aspects of the SMEs, a questionnaire was designed to gather information on the financial, human resource, marketing practices and problems faced by the SMEs in the three areas of management mentioned above. a mix of close and open ended questions was used in the questionnaire. A total of 102 responses were obtained.

## **FINDINGS AND ANALYSIS**

The initial findings into the comparative study of managerial practices amongst SMEs have yielded some highly interesting results. The result of the research was summarized in a series of tables, supported by complementary evidence, quotes and examples. Table 1 shows the demographic characteristics of the respondents.

**Table 1 Respondents' profile Financial Management**

Details	Frequency	Percent
<b>Registration status:</b>	<b>N=102</b>	
Sole proprietorship	19	18.6
Private Limited	67	65.7
Partnership	16	15.7
<b>Type of ownership:</b>	<b>N= 100</b>	
State-owned	1	1.0
Own ownership	76	76.0
Subsidiaries	9	9.0
Joint-venture	13	13.0
Others	1	1.0
<b>Number of employees:</b>	<b>N = 103</b>	
Below 50	73	70.9
Between 51-100	12	11.7
More than 100	18	17.5
<b>Type of business:</b>	<b>N= 103</b>	
Construction	10	9.7
Property	2	1.9
Trade and service	20	19.4
Industrial goods	33	32.0
Plantation	2	1.9
Technology	18	17.5
Others	7	6.8

Most SME are aware and have utilized the income statement technique especially for personal use, cash flow and generally record their income statement (see Table 2). Report on sources and uses of funds and product costing is among the least understood financial techniques. These findings suggest that nowadays SMEs have realized the importance of income statement and cash flow in their areas of operation and help them to plan for the future.

In general, among the common financial problem facing the SMEs is high product cost, followed closely by high overhead costs and overdue account receivables (see Table 3). It seems to emerge that the seriousness for obtaining loans was not the main problem as indicated in the table; lack of capital (22.3%) and followed by difficulties in obtaining loans (17.5%). The above findings suggest that the SMEs are now facing a dramatic increase in high product cost, overhead cost and overdue account receivables that SMEs are facing now. This may be due to the aggressive government initiatives and bank support towards government SMEs scheme assistance.

**Table 2 Financial Management Techniques**

Techniques	Used	Not aware
Income statement for personnel use	87	16
Income statement for public use	34	69
Report on sources and uses of funds	27	76
Product costing	29	74
Cash flow	68	35
Expenditure statement	46	57
Recorded income statement	72	31

**Table 3 Financial Problems**

<b>Problems</b>	<b>Percentage</b>
Lack of capital	22.3
Poor financial records	16.5
High product costs	36.9
High overhead costs	26.2
Overdue account receivables	24.3
Difficulties in obtaining loans	17.5
Difficulties in credit	16.5
High tax rates	15.5
High interest rates	14.6

### **Human Resource Management**

The respondents in the study were asked to indicate their awareness and usage of managerial tools. The responses are presented in Table 4. As expected, the SMEs studied are generally less aware and less likely to use the human resource techniques. In addition, a comparison on the level of awareness and usage of human resource management (HRM) techniques is less than that of the financial management techniques. This is perhaps due to several reasons.

First, the area of financial management is much more already embedded once they started business because financial issues are usually perceived to be more critical than the human resource management area such issues dealing with the workers. Thus is not surprising that the level of awareness in the latter is lower. Second, it has been a regulation of the country for firms to use some of the financial management techniques (for example, balance sheet and income statement) but not in human resource management techniques.

Worker recruitment processes are common among the SMEs. They are more concerned on recruiting the right employee for the right job as indicated 43% in job need analysis, however, they would prefer at a lower percentage of employing their own family, but are less concerned with employee performance appraisal which accounted only 34%. In a sense, this suggests that the SMEs have a relatively casual attitude towards their employees, in that they are not concerned to objectively identify the better employees.

**Table 4 HRM Techniques**

<b>Technique</b>	<b>Used</b>	<b>Not aware</b>
Job need analysis	43	60
Worker recruitment process	61	42
Employee performance appraisal	34	69
Job rotation/enrichment	26	77
Management by objective	32	71
Profit sharing	14	89
Flexitime	24	79
Family worker recruitment	30	73
Foreign worker recruitment	27	76

Table 5 presents the human resource management problems as perceived by the SMEs. In the sample, less than 50% are facing worker dedication, followed by difficulty in finding good worker and poor employee motivation. Interestingly, the problems mentioned above are not significant, since only 49.5%, 36.9% and 34% are recoded respectively. In other word, Malaysian SMEs are facing fewer problems with their workers. Thus, it is possible to argue that Malaysia has employer-employee relationship, at least in the eyes of the employer. This may be because the Malaysian workers are indeed very good or that the Malaysian employers are easily pleased.

**Table 5 HRM Problems**

Problems	Percentage
Not many dedicated worker	49.5
Difficult to find good worker	36.9
Poor employee motivation	34.0
High turnover	26.2
High absenteeism	24.3
Dissatisfaction with pay	17.5
Lack of concern	16.5
Conflict	15.5
Family problems	14.6

## Marketing Management

Table 6 presents the awareness and usage levels of various marketing techniques among the SMEs. The results reveal a similar pattern to the earlier two types of managerial techniques, are not aware and are unlikely to utilize the marketing techniques, where approximately more than 64% of the SMEs are unaware of the various marketing techniques practices.

It does not appear that there is any common pattern on terms of which marketing technique is most favored among the SMEs. Approximately less than 40% SMEs has used some form of price comparisons, an informal form of marketing research and marketing plan. Among the least used technique identify has been joint-venture and sales training. There may be several possible explanations for this finding. First, most of the SMEs are family owned enterprises or own ownership as indicated in Table 1. Second, lesser utilization of sales training may be SMEs are quite satisfied with their existing sales. In addition, they may be quite confident that they can maintain their present market share without much effort. As such, these SMEs do not see any need in pursuing sales training. Accordingly, in general the SMEs are reluctance to actually adopt a formal program whereby employees are trained in various selling techniques. They also view that the skills of a salespersons can be acquired while on-the-job and learning-by-doing fashion.

**Table 6 Marketing techniques**

Techniques	Used	Not aware
Sales training	28	75
Marketing plan	35	68
Market research	37	66
Comparing Pricing	39	64
Planning Marketing technique	30	73
Joint-venture	19	84
Product development	31	72

With regards to marketing problems as presented (Table 7), price competition (62.1%) was the most common problem faced by the SMEs, followed by low profits and brand competition 39.8% and 38.8% respectively. As with other managerial problems, SMEs are less faced with the difficulty of exporting their product. This finding does not interpret that they have been successful in exporting; rather they are mainly focused on local markets. Under these circumstances it is not surprising to find less export problem reported. The study also suggests that the SMEs do not have much of a problem with the quality of their products. That is, the SMEs believe that their customers are satisfied with their products. This perception may have been formed because there are perhaps few returns and complaints from the customers.

**Table 7 Marketing Problems**

Problems	Percentage
Price competition	62.1
Low profits	39.8
Brand competition	38.8
Low sales	30.1
Poor product quality	14.6
Unable to export	9.7

### Strategic Techniques Application

Table 8 present the awareness and usage level of various strategic techniques application among the SMEs. The results reveal that a pattern similar to with other types of managerial techniques. The SMEs are less aware of, and more likely not to utilize the strategic techniques stipulated. Most noticeable unaware strategic technique was backward integration, followed by forward integration, horizontal integration and diversification and joint-venture/consortium.

**Table 8 Management Strategies**

Techniques	Used	Not aware
Market Penetration	53	50
Market development	63	40
Product development	36	67
Forward integration	13	90
Backward integration	7	96
Horizontal integration	21	82
Concentric	45	58
Horizontal diversification	18	85
Joint-venture/consortium	20	83

Interestingly, the most common strategic applied by the SMEs has been market development and followed by market penetration that is SMEs prefer market expansion of their product to grow gradually as their business prosperous.

Interesting to note here that these SMEs do not faced major problems in strategic implementation even though they do not applied most the techniques described in Table 8. The respondents have revealed that received the highest government support followed by no disturbance in company operation due to less conflict between workers and employers are willing to accept new idea form their employees. As iterated in the human resource management section, it seems those SMEs firms are enjoying a favorable employee-employer relationship.

**Table 9 Strategy Implementation Problems**

Details	Agree	Don't agree
Not enough resources	38	65
Not optimistic on strategy chosen	30	73
Workers can't accept new idea	23	80
Conflict between workers	21	82
Disturb company operation	19	84
Government policies	17	86
No support from management	13	90

## CONCLUSION

The purpose of this paper has been to provide some evidence regarding the SMEs' managerial practices and problems. With respect to the practices, the findings suggest that SMEs are generally not aware and most likely will not utilize the various managerial practices. Perhaps the most important findings of the study on managerial practices is that the SMEs appears to have a very limited knowledge of the overall spectrum of managerial practices.

# **SEXISM IN POLISH AND FRENCH TV ADVERTISING**

**ANTONINA MIKOCKA-WALUS (POLAND)

05-840 Brwinow  
POLAND**

## **ABSTRACT**

the main purpose of this article is to answer the question about the existence of sexism in Polish and French TV advertising. This issue is especially important in the context of Poland's accession to the European Union, which will take place on the 1st May 2004. From this perspective, the following consideration and analysis are objectively unique among other papers concerning advertising and images of women.

The basis of the research carried out upon this subject is the assumption that France, as a European Union country, is less sexist than Poland on legal grounds. However, the range of sexism in French TV advertising also seems important. The second assumption of this research is as follows: Poland is a sexist country for the reason that it has had a communist past and is still a "young" democracy.

The comparative research on Polish and French TV advertising was carried out for three months, on two thematically similar channels (one Polish and one French). There were 200 completely different Polish advertisements in the whole period of the research; 118 (59%) of them include some image of a woman, 82 (41 %) of them refer to men, children, animals, etc. There were 217 completely different French advertisements in the whole period of the research; 150 (69,1%) of them include some image of a woman, 67 (30,9%) of them refer to men, children, animals, etc. The collected data was divided into various groups. Thus, Polish' advertisements have 10 completely different dimensions and also mixes of them, whereas French advertisements have 13 completely different categories.

The initial assumptions concerning the existence of sexism in Polish TV advertising and the assumption that Poland is a more sexist country than France turned out to be true. The comparison between France and Poland proves that there is sexism both in Polish and French TV advertising. Sexism is only slightly noticeable in French advertising and the majority of images of women show her in an equal position to men. After the comparative analysis, one may assume that the result is positive for France, due to its European Union background and longer democratic tradition. Therefore, it is likely that Polish TV advertising will evolve from today's style to the European level after its accession to the European Union.

Possible recommendations for other countries are that the opportunity to live among different nations with open borders may do something for the socialisation of societies and that equality is the answer to many social problems and it should be understood as the possibility to govern one's life and to allow other people to decide independently about their own lives.

# INTRODUCTION

The main purpose of this article is to answer the question about the existence of sexism in Polish and French TV advertising. This issue is especially important in the context of Poland's accession to the European Union, which will take place on the 1st May 2004. From this perspective, the following consideration and analysis are objectively unique among other papers concerning advertising and images of women.

The basis of the research carried out upon this subject is the assumption that France, as a European Union country, is less sexist than Poland on legal grounds. However, the range of sexism in French TV advertising also seems important. Is sexism possible in a country where Treaties determine the equality of sexes? The second assumption of this research is as follows: Poland is a sexist country for the reason that it has had a communist past and is still a - "young" democracy; Moreover, even though the number of educated Poles has grown during the last few years, it still seems relatively small and it is likely that only the very simple and unsophisticated transfer of information in advertising is successful.

According to Maslow's pyramid, only the basic biological needs will be fulfilled when there is poverty in society. For the legal inadequacy, education shortages and poverty, sexism seems more likely to be found in Poland than in France.

The core content of this article is an analysis of Polish and French TV advertisements, collected and compared during three-month-long research. While analyzing data, several different images of women appear. Among them, some are chosen as a manifestation of sexism. This section also answers the title question of sexism in Polish and French TV advertising.

## **What is sexism?**

Sexism is a relatively new term (introduced in 1985 by J.P. Faulkender<sup>2</sup>) which has many definitions. Below are those of them that seem especially useful for further consideration in this article.

1. "Sexism is the belief that one sex is not as good, clever, etc., as the other, especially when this results in unfair treatment of women by men.
2. "Sexism is the belief that women are weaker, less intelligent, and less important than men.
3. "Sexism is a prejudice based on sex. In practice, as the term is used, its meaning goes beyond this simple definition in two ways. First, a prejudice is generally treated as an attitude or belief, while the term "sexism" generally connotes differential action and behavior toward persons which discriminates between them on the basis of their sex. Second, the term is nearly always used with respect to discrimination against females, a unitary focus that derives from the objective data of society but which unfortunately delimits the meaning of the term."

Therefore, sexism means discrimination on the basis of gender, treating one of the sexes as inferior. In the majority of societies it is more often women who are regarded as the inferior sex, and sexism is an ideology justifying women's lower status in community life, politics, and in professional work, as well as in a family life (mainly in the area of domestic duties).

## **European advertising preferences and regulations**

Consumers in different countries are accustomed to different forms of advertising. In many cases the government regulates advertising. There is also a common policy on advertising among European Union members. Advertising issues are widely defined in the European Convention on Transfrontier Television, which is the most relevant legal instrument of the Council of Europe in the broadcasting sector.

The Convention was introduced in 1989 and was the first instrument defining a number of common principles for the transfrontier circulation of television programme services at the European level. The Convention served as a basis for the preparation of the

1989 EU Directive on "Television without Frontiers", and has also been an inspiration for several countries designing their national television broadcasting legislation. As of January 1<sup>st</sup> 2001, twenty-three European States had ratified the Convention and are therefore bound by it: Austria, Bulgaria, Cyprus, Estonia, Finland, France, Germany, Hungary, Italy, Latvia, Liechtenstein, Lithuania, Malta, Norway, Poland, San Marino, Slovakia, Slovenia, Spain, Switzerland, Turkey, United Kingdom and the Holy Sea.

Article 7 of this Convention aims to protect human dignity and fundamental rights, and lays down the general responsibilities of broadcasters as regards the programme content. The article states that programmes should not be indecent or contain pornography, should not incite racial hatred and should not give violence in an unnecessarily prominent place. This being said, the Convention does not establish a system of State intervention in the content of programming. It leaves the Parties free to decide how they are to comply with such obligations, in accordance with their constitutional/legal system, as well as traditions and cultural sensitivity. Therefore, the moral opinion on how programme content should be evaluated is left to the judgement of each State.

When it comes to advertising, the general principle is that advertising should be fair and honest, not misleading or impairing children morally or physically. It should also be clearly distinguishable as such, separated from other items by optical and/or acoustic means.

As regards time-limits, the revised Convention establishes that advertising and Teleshopping spots should not exceed 20% of a given clock hour, and that all forms of advertising together should not exceed 20% of daily transmission time. Self-promotional announcements are assimilated to advertising but are not counted for the purpose of calculating the percentage of advertising time.

Tele-shopping spots are subject to the same rules as advertising spots. As regards Tele-shopping windows on general-interest channels, it is mentioned that such windows should last at least 15 minutes, there should be no more than 8 of such windows per day, and their overall duration should not exceed three hours per day.

The insertion of advertising and Tele-shopping is stipulated that it should be between programs, or during programs, under a number of conditions (so that the integrity and value of the program is not prejudiced). For instance, feature films can be interrupted once for each

complete period of 45 minutes. News, documentaries and religious or children's programs should not be interrupted if they last less than 30 minutes.

There is also a number of rules concerning advertising of particular products. For instance, the Convention forbids advertising tobacco products. Advertisements for alcohol are permitted under a number of conditions: that it does not particularly address minors, does not link consumption to physical performance, does not claim that alcohol has therapeutic qualities, nor that it presents abstinence in a negative light. Furthermore, the Convention offers Parties the possibility of restricting retransmission of programs on their territory which contain advertising for alcohol, provided they have made use of the reservations clause in Article 32 (which represents an exception to the principle of freedom of reception and retransmission contained in the Convention). Advertising for medicines and medical treatment that are only available by prescription is also prohibited.

But the differences among European countries are not limited to the legal area. There are also differences concerning which type of television advertising works best in each country. A comparative study of European countries' TV advertising revealed, for example, that French TV advertising has less product information, and also a less direct way of communication about socially-sensitive topics. Moreover, French ads rely on non-verbal and implicit communication, and present women in a more sexually alluring manner. Whereas the British tend to think of 'advertising as a humorous and entertaining part of daily life, Germans prefer a factual and sober style in advertising<sup>8</sup>. Finally, there are also differences between - countries concerning the way TV advertising shows women, which will be analyzed further.

### **Sexism in TV advertising**

Equal opportunity policies cannot overlook the media. It is a valuable tool for supporting the equality of opportunities between women and men. However, its power is often used against women: the media exploits the image of women as sex objects at every turn, thereby helping to reinforce damaging stereotypes. They agree unanimously that this partial, sexualized and often degraded image merely reflects what has become accepted by European societies. It is an important element in maintaining discrimination against women.

Television, magazines, and billboards no longer show products, but show gimmicks in order to sell their product. In general, these gimmicks seem to enforce racial stereotypes and view women in a negative way. Women are often portrayed as stupid, submissive, temperamental or else as sexual objects, which exist solely for the pleasure of men. They are as likely as men to be central characters in television commercials. However, women are still more likely than men to be seen in domestic roles.

The role of women in society has been changing throughout centuries. This evolution has resulted in the creation of a modern woman who knows her rights and duties, and who realizes that a man is her partner, not her master. A "modern" woman, also called "feminist", imagines all women with equal chances at work, in public life, in education, and in the family. Because of that, this new type of woman finds sexism intolerable and fights against it.

Who are the women portrayed in Polish TV advertising right now, just before accession to the European Union? What differences may be noticed while comparing Polish TV advertising to

French (a European Union country's)? What thesis may be assumed about the future of Polish TV advertising? And finally: is there sexism on the Polish and French TV advertising market?

## RESEARCH

The comparative research on Polish and French TV advertising was carried out for three months, on two thematically similar channels (one Polish and one French). The advertisements on Polish TVP1 were recorded every day between 7:30 p.m. and 8:15 p.m. (before and after the News). Consistently, the advertisements on France2 were recorded between 8:50 p.m. and 9:50 p.m. (before and after the News). The results of the research follow.

First of all, there are 200 completely different Polish advertisements in the whole period of the research; 118 (59%) of them include some image of a woman, 82 (41%) of them refer to men, children, animals, etc. Secondly, there are 217 completely different French advertisements in the whole period of the research; 150 (69,1%) of them include some image of a woman, 67 (30,9%) of them refer to men, children, animals, etc.

The collected data may be divided into various groups. Thus, Polish advertisements have 10 completely different dimensions and also mixes of them, whereas French advertisements have 13 completely different categories. In the tables below, all of them are listed.

**Table 1.**  
**Dimensions of a woman's image in Polish TV advertising**

<b>Women's images</b>	<b>Advertising examples</b>	<b>Total</b>	<b>%</b>
<b>Stupid</b>	Dosia, Lays, Creme Bonjours, Frugo, Mirinda, Ibuprom, Etopiryna, Dr Oetker - Slodka Chwila, Shamtu, Polar.	10	7,9

Independent But with a man	Cote d'Or, Rexona, Opel Corsa.	3	1,9
Total		156	100

While carrying out a comparative analysis, it is crucial to highlight that most dimensions are repeated in both countries' advertising. Therefore, main categories for further consideration will be: "Stupid", "Cleaner", "Independent", "Independent but with a man", "Body", "Family women", "Professional", "Sexual object". There are also some dimensions which are visible only in French TV advertising: "Pursuing pleasure", "On a diet", "Lover/Partner", "Sexy cook", "Old but still active". In addition there are two categories that are present only in Polish TV advertising: "Cook" and "Sick". The category "Sick" is certainly present somehow in French TV advertising, but the image of a sick woman is not clear. What is more, there are no really sick women in French advertising. There are only women who occasionally suffers from pain.

The "Stupid" category is common in Polish TV advertising (7,9%) and is rather rare in French TV (2,6%). Moreover, in Polish advertising it seems stronger, and the image of women is more negative, whereas in French advertisements the "Stupid" category refers to the inattentive or irregular woman, e.g. Panier de Yoplait (A woman is cleaning strawberries in the river. Suddenly the current takes the basket with fruits. The woman is chasing it and finally catches it). The only negative image in this category is present in Vegas (A rich woman is talking to a rich man about her finger, which is the only ringless one on her hands, which she needs some ring for). But it is negative when it comes to both a woman and a man. The Polish "Stupid" category shows a woman who is mentally impaired or deeply naive e.g. Dosia (Women are discussing the smell of newly washed clothes; an arrogant man is asking them about the name of a washing powder. They are not aware that this is the newest Dosia. He

knows!). The particular feature of this image is the difference between a stupid woman and a wise man, e.g. Mirinda (A man is drinking Mirinda and cannot notice that his woman is fighting against wild animals. Finally he rescues her accidentally). The "Stupid" category may be perceived as a manifestation of sexism in Polish TV advertising.

The "Cleaner" category in Polish (7 ~ 1 %) and French (5,1 %) TV advertising both refer to a similar image. However, in French advertisements this category is more often connected with the independence of the portrayed woman, e.g. Harpic (A woman is robbing a house and cleaning the toilette with Harpic. After that she has spare time to take a sunbath for a month). In Polish advertising this category contains an image of a woman whose main problem is cleaning, e.g. Lotto (A husband and a wife are discussing their needs. She wants a washing machine. She says with a dreamy voice: "If I had a washing machine, I would wash". He wants a flat. The solution of their problems is playing Lotto). What is more, in Polish TV advertising the "Cleaner" category is a part of the image of a housewife who pursues cleaning and takes care of children. This category may be associated with sexism in both Polish and French advertising, but it seems important that there are a few advertisements in which a man cleans, e.g. Cilit (A woman cannot manage to clean her bath. Instead she goes to throw out garbage and her husband cleans the bath and the kitchen with new Cilit. She comes back and asks him to bake a cake). It is still in the minority of advertisements, though.

The "Independent" category is only slightly more common in France (7,7%) than in Poland (7,1%). They are rather similar. In both countries the "Independent" category refers to a woman who does something on her own without a man's help. In Polish advertising this category contains an image of a woman on a diet, e.g. Danone Vitalinea (A woman is in a hurry and drinks Danone Vitalinea, water that cleans her body), whereas in France this type of advertising has its own category. In both countries, there are advertisements in this category involved with cleaning, but in which a woman is not shown as a cleaner, e.g. Skip (A woman is driving and men and boys are pointing at her and screaming something. It is about her skirt, which is in the car door. She leaves the car and does not care because she has washed the skirt in Skip). In Polish advertising this category is represented by younger single women, while in the French there are also independent older mothers, e.g. Polo (A woman has problems with her teenaged daughter. She has no problem while driving the new Polo). In France this category also shows a trace of sexual independence, e.g. Alfa Romeo (A woman gets excited while thinking of driving an Alfa Romeo).

The "Independent but with a man" category is the second most common dimension in Polish advertising (12,6%). In France this category practically does not exist (1,9%). The popularity of this type of image may be understood as the strong influence of Polish sexism on advertising. It is also a reflection of social stereotypes, according to which a woman may be independent only when somebody (a man) controls her. In this category a woman is portrayed as a person who wants to be attractive to men, e.g. Garnier Fructis (A woman is dancing in the disco and meets a man. The man covers the screen with his palm while having sex with the woman who washed her hair in Fructis), and whose being depends on men, e.g. Fa (A woman escapes. Fa helps her to stay cool. But a man helps her to get on board). This category always portrays women as partners (wives, lovers) of men, e.g. Ristorante (A couple eats a romantic supper on the bridge. Pizza Ristorante is so delicious that the woman cannot help that she wants the last piece for herself). In France the connection and dependence on a man is not so clear. A portrayed woman meets a former boyfriend (Rexona) or is quarrelling

with a man who kicked her beloved car (Opel Corsa). Certainly the "Independent but with a man" category is a manifestation of sexism in Polish TV advertising.

Advertisements in the "Body" category are the most numerous in French TV advertising (19,9%). It is quite difficult to interpret because there is not any clear image of a woman in it. This category contains women used as elements to advertise a product. They are usually beautiful but they do not act any particular role. Mainly the advertisements are addressed to women and for this reason they show women as using some products (cosmetics). This category is also rather common in Poland (11%). It seems certain that it should not be interpreted as sexist, for the usage of a woman's image could easily be replaced by a man's image, if only the product advertised was a man's product.

The "Family women" category is the most numerous in Polish TV advertising (28,3%). However, it is also strongly represented in France (17,3%). The "Family women" category is the most traditional woman's image. It associates a woman with looking after children, e.g. Monique Renou (A woman is bringing a basket of food from a shop. Her children and husband take it to taste), cleaning a house, e.g. Bryza (A mother is singing while washing her children's dirty clothes. Then she realises that there is Bryza and she does not have to hand wash any more. She is singing while having fun with her children), and cooking, e.g. Biedronka (A nurse is talking to her husband on the phone. It turns out that he invited friends to have dinner. Another nurse advises her to go shopping at Biedronka, where it is cheap.).

Despite the frequency of the "Family women" image, cooking can also be correlated with sex in French advertising (the "Sexy cook" category). What is more, cleaning is more often a woman's duty in Polish advertising. In France, the "Family women" category relates first of all to being a mother, e.g. Grand Mere (A woman and her adult daughter are sitting by the table. They do not talk. They decide to drink coffee Grand' Mere, which enables them to chat), whereas in Poland it is more often associated with being a housewife. However, this difference is not great and one may assume that this is just because of the three-month duration of the research. This category, while being stereotypical, does not seem to be sexist. The image of a family woman is presented positively and objectively in both countries.

The "Professional" category is present in Polish TV advertising (7,9%) as well as in French (7,7%). There is a remarkable difference between the images presented. Polish advertisements seem rather stereotypical. Women portrayed are usually nurses (Biedronka), doctors (Apap, Bref Duo Active), or teachers (Domestos, Herbal Essences), whereas in French advertising women are the part of a management board (Linux, Visa Egg, L'ARTISANAT), work in stereotypically men' positions (Microsoft) or are chefs (CIC Banques). As well in French advertising women are actresses (Mon Cheri) or nuns (Carolin). In this category sexism is visible only in Polish advertising.

The "Sexual object" category is more often present in Polish TV advertising (8,7%) than in French (3,8%). The association between a woman's image and sex is clearly visible in Coca-Cola Light (A barwoman serves her clients. She climbs the steps to take Coca-Cola. Finally she drinks it on her own. Men admire her figure), Era mms (A woman is tying a bow on her naked body. She is taking a picture and sends it as a gift to her boyfriend), and Reiffeisen

Bank (A man leaves a bank after having settle a three-month-long investment. It turns out that he could have wonderful women if he had money now) - Polish advertising. It is also noticeable in Salakis (A woman in a Miss Salakis bathingsuit is serving a man who is playing a game. She is offering him Salakis), Well (The picture of woman's lips and her bust in an underwear), Sensi Giorgio Armani (A woman is lying and moving her body with sensuality) - French advertising. The particular characteristic is that sex is more overt in French advertising (the "Independent" category, the "Sexy cook" category, the "Lover/Partner" category). This fact could be explained as a cultural difference between the Poles and the French. What is more, sex is something common in French advertising and is usually not offensive toward women, e.g. Credit Lyonnais (A couple is making love under the blankets. Suddenly a woman stops to ask about their financial situation) or Club Internet (A couple is having sex. After that a woman's stomach is getting bigger. Everything goes faster with Club Internet). Notwithstanding this opinion, the "Sexual object" category may be perceived as a manifestation of sexism in both Polish and French TV advertising.

As mentioned above, there are some categories which are not common for France and Poland. In Polish TV advertising there is the "Cook" category and the "Sick" category. The "Cook" category is not numerous (2,3%) and it relates to the traditional woman's image, portraying a woman as a "house hen". This category may somehow correspond with the French "Sexy cook" category. However, the difference involves the sexual character of French advertisements. Consistently, the "Sick" category is quite numerous (7,1%) and, as already mentioned, it exists somehow in French TV advertising. This category does not show any particular picture of a woman and is similar to the "Body" category, presenting products for women used by women.

From the psychological point of view, an interesting category is the "Lover/Partner" category which is numerous in French TV advertising (17,3%). This category refers to the "Family women" category but it consists of different images of a woman. A woman is presented as independent but in a relationship with a man (often sexual). She does not act in stereotypical wives' roles (watching stars in BMW, feeding a man in Jambon de Bayonne, a man is preparing a dinner for her in Garbit Couscous) and she behaves more like a young girlfriend than a wife, no matter how old she really is. This category says a lot about the French social situation, in which there are relationships (but not marriages) that exist legally and last (Pacs). The image of a woman in such a relationship is shown as positively as one in the "Family woman" category. However, it is more connected with a woman's independence.

One more numerous group (7,1 %) in French advertising is the "On a diet" category, which refers to the newest image of a woman. All the advertisements in this category present women as slender and sporty people, who take care of their own health. Additionally, sometimes a woman lives with a man who learns from her how to live healthily, e.g. Special Kelloggs (A woman is eating Special Kelloggs and looking at herself in the mirror with pleasure. In the mean time, her man is peeping at her with horror.). Certainly, this type of advertising is not sexist. It is similar with the "Old but still active" category and the "Pursuing pleasure" category. The first one shows a woman who lives actively and is happy. This group may be perceived as a sign of democracy and equality in advertising (because advertising is the reflection of societies, it means that an elder consumer is important for producers).

Finally, the "Pursuing pleasure" category portrays a woman who likes sweets and pleasure. This picture is the opposite of the "On a diet" category where a woman chooses a health regime. What is important here is the fact that a woman, as an independent human being, has a choice to do what she wants and to live how she wants. Thus, these images do not contain sexism.

## CONCLUSIONS

While summing up, it is television that forms peoples' opinions the most (among other media) because of the various channels it uses to transmit information (hearing, sight)ll. What is more, television influences people by involving them in watching, and for this reason it has a great impact on building stereotypes. On the other hand, television (here: advertising) may be used to fight against stereotypical thinking and may improve women's image by removing sexism (discrimination on the basis of gender) from commercials.

In this context, the initial assumptions concerning the existence of sexism in Polish TV advertising and the assumption that Poland is a more sexist country than France turned out to be true. The comparison between France and Poland proves that there is sexism both in Polish and French TV advertising. Sexism is only slightly noticeable in French advertising and the majority of images of women show her in an equal position to men. There are only a few advertisements in the "Stupid" category and in the "Independent but with a man" category, which means that a woman is not perceived as weaker or worse than a man. Moreover, the "Sexual object" category also seems less common and the "Professional" category shows a woman in many non-stereotypical roles. The same applies to the "Old but still active", "Pursuing pleasure" and "Independent" categories.

Polish TV advertising looks quite sexist. The "Stupid" category, in which there are many offensive advertisements, is numerous. Furthermore, the "Independent but with a man" category is also rather numerous and presents women as unreasonable and dependent on men. Consistently, the "Professional" category portrays only traditional women's occupations and the "Sexual object" category is strongly represented. Therefore, in comparison with French advertising, Polish advertising seems sexist. This results in a bad image of Poland as a sexist country, which seems even worse when comparing it to France, which has traditionally had a more open society regarding sex and shows it in advertising. For a discerning eye, this overt sexuality seems less sexist than Polish non-sexual advertisements.

After the comparative analysis, one may assume that the result is positive for France, due to its European Union background and longer democratic tradition. Therefore, it is likely that Polish TV advertising will evolve from today's style to the European level after its accession to the European Union. Despite this hope, the question as to why Poland (whose law is very similar to the European Union's) is still far from European standards, seems acute.

The problem of equality is going to be solved in the years ahead, but is it only a case of the legal system? It seems not, because of cultural differences which are present and visible in all of Europe, even between the European Union members. Still, there are countries where the tradition of patriarchy is strong (Spain, Portugal) and has lasted despite the legal system. The

change in people's mentality is a lengthy process, but legal changes can help it along, if they are good, complex and observed. People ought to want to live in equality, but this equality does not necessarily mean that every single woman is going to become a manager. Equality should be the possibility to govern one's life and to allow other people to decide independently about their own lives. This simple truth still seems strange in Poland, and because of that, accession to the European Union can change a lot. The opportunity to live among different nations with open borders may do something for the socialisation of Polish society. This famously stubborn group of people might *choose* to treat each other equally, and not only because they are forced to by law.

Organizations and people are important components of an industrial district. This paper explores the concurrent processes of interpersonal (relationships between individuals) and interorganizational (relationships between organizations) network development within the Auckland boat-building district. It also looks at how such networks play an integral part in developing the district. The embedded case method is used for this qualitative study.

The findings provide several examples of how interpersonal networks can be transformed into interorganizational networks and vice versa. Despite their initial reluctance to collaborate organizations learnt to maintain a balance between 'competition' and 'co-operation'. The formalization of interorganizational relations through bodies such as the Marine Industry Association and the Marine Exporters Group provided firms in the district with infrastructure and support. The latter was essential since many of the business owners were sailing enthusiasts and professional sailors rather than professional business managers.

# INTRODUCTION

Industrial districts, or specialized industries that are concentrated in geographically delimited areas (Marshall, 1950), have received substantial attention from scholars in several fields. Traditionally, the district was employed as the unit of analysis. In the 1990s, though, greater focus was placed on the firm, and earlier assumptions concerning the homogeneous nature of district firms, were increasingly questioned. Industrial districts were increasingly recognized as consisting of firms fulfilling very different roles (Alberti, 2003). Becattini (1990) provides a definition that regards the industrial district as a “socio-territorial entity which is characterized by the active presence of both a community of people and a population of firms in one naturally and historically bounded area”. With the recognition of the roles of organizations, as well as individuals, in industrial district research the development of interpersonal and interorganizational relations also became an integral part in the understanding of the development of an industrial district.

One industrial district that has emerged in recent years is the boat-building district in Auckland, New Zealand. The boat building industry in Auckland displays all the characteristics of an industrial district (see Figure 1). It has (1) highly specialized firms within the same industry, the core of the district being composed of boat builders and specialist supplier firms, such as mast makers, designers, sail makers, and winch and electronic navigational equipment manufacturers at the supplementary level; and (2) a supporting infrastructure in the form of trade associations, export promotion organization, economic development agencies, city councils, educational institutes, consultants, and government agencies.

The presence of a variety of actors, all relying on interaction and collaboration in daily activities, implies that an industrial district can be regarded as a network of interconnected relationships. The concept of the “network” is a multifaceted one. There are several ways of defining what a network entails. Two such dimensions concern (1) who the actors of the network are, and (2) the degree of formalization of the relationships between network actors. Different research streams regard network members as being either organizations or individual human beings. The former may be referred to as business networks or interorganizational networks, and can be defined as “two or more connected business relationships” (Blankenburg Holm, Eriksson and Johanson, 1999:473). Another less explored research stream concerns the networks of individual human beings, often referred to as personal, social, or interpersonal networks.

Many scholars also recognize the simultaneous existence of interorganizational and interpersonal networks (Dubini and Aldrich, 1991). Some regard interpersonal networks as a sub category of interorganizational networks (e.g. Holmlund and Kock, 1998), while others consider the interorganizational network as providing an infrastructure for the creation of interpersonal networks (e.g. Hallén, 1992). Rarely, however, are interpersonal and interorganizational networks addressed in the same studies. Consequently, the influence of interpersonal networks on interorganizational networks and vice-versa remains largely unexplored (Agndal and Nilsson, 2002).

A formal network is created for a specific purpose and its members have to grant others access to the network before they can become network members. This type of network may also be referred to as an alliance (Agndal and Axelsson, 2002) or strategic network (Jarillo, 1988), as its boundaries can be defined by its constituent members. An informal network, on the other hand, emerges and expands as relationships between its members

arise and develop through interaction. Typically, it is difficult, or even impossible, to clearly define the “spatial” and temporal boundaries of such a network. This type of network may also be referred to as a naturally emerging network (Agndal and Axelsson, 2002).

The purpose of this paper is to explore the concurrent processes of interpersonal and interorganizational network development within the development of the Auckland boat-building district. More specifically, the focus is on finding how one type of network influences the creation of another, and to take this further the development of the district as a whole. In regard to the latter three research questions can be formulated: (1) How does one type of network influence the creation of another? (2) How, and why, do firms form such networks? (3) How do these networks influence the development of the industrial district as a whole? The Auckland boat-building district is used to answer these questions and to test existing theories on networks of interconnected relationships as illustrated in Figure 1.

The remainder of this paper is divided into five sections. The following section presents a review of the literature on types of networks and networking processes. Next is a discussion on the method of research. A presentation of findings concerning networks in the Auckland boat-building district follows. The paper ends with conclusions, and finally implications.

## **Types of Networks and Networks within Industrial Districts**

By differentiating between the organization, the individual, and the degree of formality of the network we are able to identify four different types of networks including formal interorganizational networks, informal interorganizational networks, formal interpersonal networks and informal interpersonal networks.

### **Formal interorganizational networks**

A formal interorganizational network permits access only to select organizations. Such a network may be created for a specific purpose, or based on previously informal relationships, which have been transformed into formalized relationships. Formalized interorganizational networks include industry associations, special interest groups, and export groups. Other examples of formal interorganizational networks are what Jarillo (1988:32) refers to as strategic networks, or “long-term purposeful arrangements among distinct but related for-profit organizations that allow those firms in them to gain or sustain competitive advantage vis-à-vis their competitors outside the network”. Such networks are often arranged around or by a leading firm. Neergaard (1999) discusses one type of formalized or strategic network - a government-funded network for export promotion. Her study showed this type of cooperation could easily be discontinued if participants had little prior knowledge of each other.

Policy aspects of formalized interorganizational networks have raised interest amongst scholars. In several countries there are government supported networking projects with a variety of aims, for example competence development (Kraft in Sweden, see Axelsson and Larsson, 2002), export promotion (Welch et al., 1998; Chetty, 1994), setting industry standards, and organizing training programs (undisclosed to maintain anonymity).

## **Informal interorganizational networks**

Informal interorganizational networks have received significant attention by researchers in the past; in particular, research based on Industrial Marketing and Purchasing (IMP) Group frameworks of the 1980s and 1990's is prevalent. Most prominently, the A-R-A framework focuses around three dimensions of interorganizational relationships: Actors, Resources and Activities (Hakansson and Snehota, 1995). Actors are seen as embedded in contexts where they rely on the resources controlled and activities carried out by other actors. The network is seen as consisting of a focal firm's bonds to other actors such as buyers, suppliers, and competitors; ties between the resources controlled by the actors in the network; and links between the activities they carry out. Within this framework, networks are seen as evolving organically. The network itself consists of collaborative and competitive patterns that emerge as a result of business activities being conducted. The most fundamental assumption of this approach is that as trust is developed firms begin to coordinate their activities - create activity links - in such a way that lasting relationships evolve - relationships that both benefit and constrain firms. In industrial district research, a number of scholars have focused on interorganizational relations (Best, 1990; Saxenian, 1994), primarily being concerned with informal interorganizational networks, although the network term is not always employed.

## **Formal interpersonal networks**

While interorganizational networks consider the firm as the actor, in interpersonal networks the individual is the actor. The distinction between formal and informal networks also remains relevant at this actor level. Formal personal networks thus typically include sports clubs and social clubs, but also organizations tend to provide individuals with support in various issues, such as networks of female entrepreneurs, breakfast clubs or similar. In the past, guilds of skilled craftsmen or merchants were important examples of formalized interpersonal networks. These have been replaced by modern versions such as Rotary or Free Masons. To gain access to such networks, individuals have to be accepted by the other members of the network, and must subscribe to its code of conduct. To our knowledge the only piece of research on this type of network within industrial districts is by Wigren (2003). She discusses the role of the local theatre association, the church, political parties, Rotary, and a "network of young entrepreneurs" in the development of the Gnosjö industrial district in Sweden.

## **Informal interpersonal networks**

Informal interpersonal networks have been subjected to greater research efforts than have their formalized counterparts. Such studies have been conducted in sociology since the 1950s and 1960s. One of the most cited writings on networks, Granovetter's (1973) seminal article on the strength of weak ties, focused specifically on individual's friendship networks, although it is also cited as a source in much of the research on interorganizational networks. Granovetter's argument is that individuals have a variety of relationships, some of which are strong and some of which are weak. Through the relationships individuals have with others they are indirectly connected to these individuals' other relationships. According to Granovetter (1973:1361) "The strength of a tie is a (probably linear) combination of the amount of time, the emotional intensity, the intimacy (mutual confiding), and the reciprocal services which characterize the tie". He also asserts that (1973:1376), "Weak ties are more likely to link members of different small groups than are strong ones, which tend to be concentrated within particular groups".

An important distinction to make is whether the relationships are connected to the individual or connected to the individual only in their capacity as a representative of a firm (Hallén, 1992). Halinen and Törnroos (1998) refer to this as the representational role of the individual. Hallén (1992) also discusses task-orientation as an important dimension of networks. Agndal and Axelsson (2002a) discuss the importance of relationship sediments, that is, more or less dormant relationships that may be activated for business purposes, arguing that, among other factors, the origin of the relationship, its availability, and the contexts to which it grants access, are crucial factors to consider.

## The interconnectedness of networks

Table 1 is a matrix, which shows the distinction between these various types of networks.

Although the relationship between interorganizational and interpersonal relationships is important it remains largely unexplored in research. According to Hallén (1992:77) “[interpersonal networks] are an integral part of the industrial networks, which link business firms to each other, and can be seen as infrastructure to the business networks in about the same sense as telecommunications, railways and road transport systems, that is, they provide underlying preconditions and support for industrial and business activities”. Interpersonal networks, both formal and informal, are thus important for the creation of interorganizational networks. Similarly, interorganizational networks evolve from interpersonal networks.

**Table 1: A summary of interorganizational and interpersonal networks as used in this paper**

		Degree of formalization	
		Formal	Informal
Actor level	Inter-organizational	Network or organizations, which is limited in size and scope. Members, who jointly create the network grant access. It is thus planned in nature with an identifiable starting point, serving a specific purpose. Examples are: Export groups.	Network of organizational relationships, transactional and non-transactional in nature, emerging as a result of interaction between firms. It is difficult to identify network boundaries, within which any or all types of business activities are conducted. Any firm may become a member of the network through exchange with other members.
	Interpersonal	A network of individuals, which is limited in size and scope. The network is created with an identifiable starting point. It may serve business or other purposes. Examples are: breakfast clubs, sports clubs, alumni associations	Network of individuals, formed through social interaction throughout an individual's life span. Its boundaries are difficult to identify, since secondary, tertiary etc. contacts also are part of the network. Any individual may become a member of the network through social interaction. It may serve business or other purposes.

## Networking Processes within Industrial Districts

An important feature of industrial districts is the balance between competition and co-operation (Alberti, 2002; Staber, 1998). Firms might cooperate to achieve economies of scale in terms of marketing, production, and internationalization. Firms working on the same product or activity however will be competing with each other. Competitors within an industrial district are likely to form informal interpersonal relationships as they work through

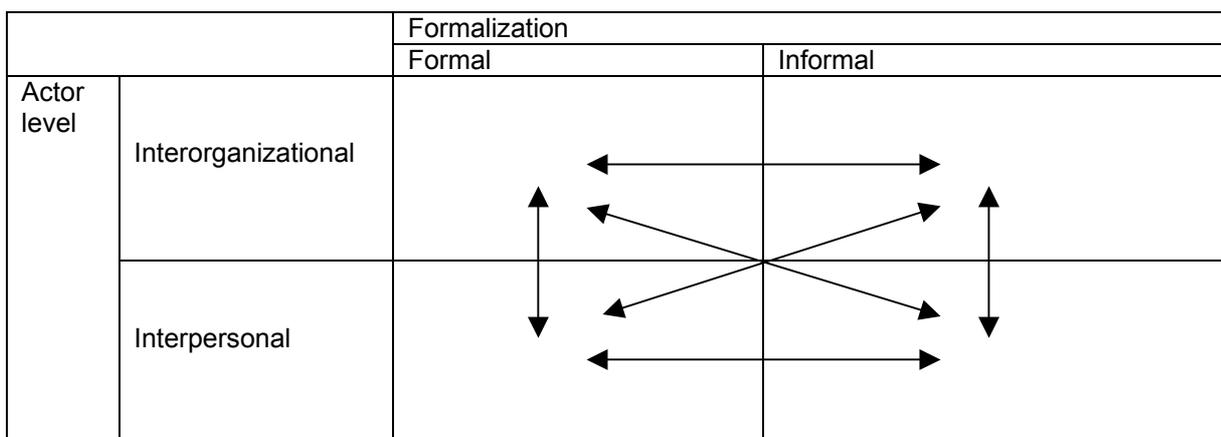

common platforms such as an industry association. Indeed, Wigren (2003) notes that business matters are often discussed when managers meet in social contexts.

The disintegration of certain industrial districts has been blamed on the closed nature of business and social relationships within such districts. Grabher (1993) attributes the decline of the German Ruhr to strong inner ties (cf. Granovetter, 1973) within that district. According to Grabher (1993) the initial strengths of the district, such as good infrastructure, close inter firm relationships, and strong support from regional institutions, stifled innovation. The region became insular and closed to new ideas, and thus fell into a trap of specialization and a consensus culture caused by a shortage of constructive conflict and creative chaos. In fact, Grabher (1993) cautions researchers to consider the negative impact of this consensus culture in their analysis of superior adaptation and coherence within successful industrial districts. In addition, Uzzi (1997:59) notes: “Over embedded networks can sometimes release intense negative emotions of spite and revenge that trap firms in self defeating cycles of behavior.”

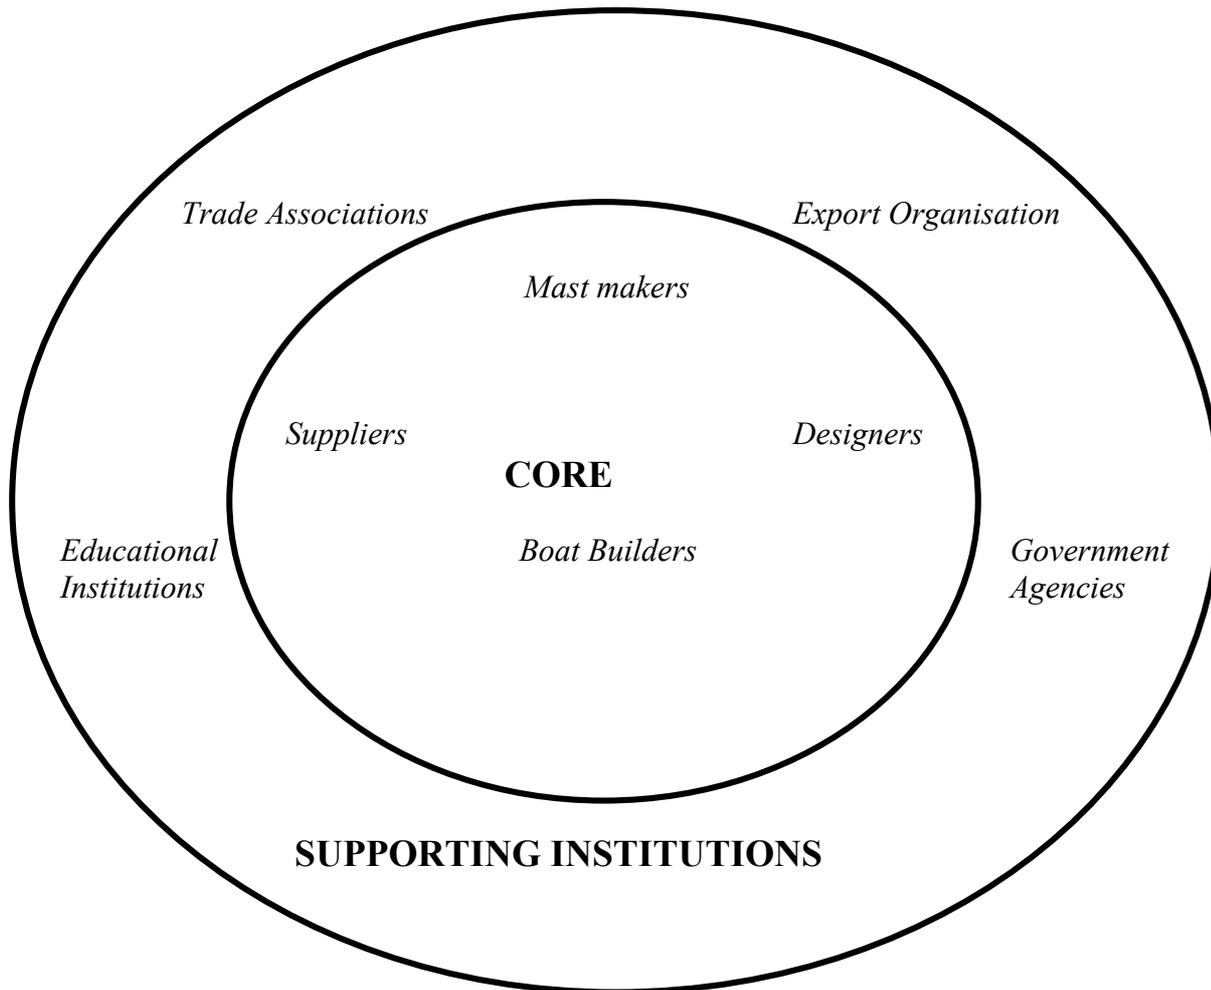

## METHOD OF RESEARCH

The single, embedded case study approach was used for this study. In designing such a study, Yin (1989) and Eisenhardt (1989) were used extensively. The embedded case method is defined as “multiple levels of analysis within a single study” (Eisenhardt, 1989:534). A historiographic or retrospectively longitudinal approach is used to examine the development of the district over time. The embedded case method uses several levels of analysis, with a range of data gathered at each level (Yin, 1989). Figure 1 shows the different levels that these companies belong to within the boat building district. The boat building district is the primary unit of analysis; the companies making up the group are the intermediate units; the CEO’s, managers and other leaders are the individual units. It is the perceptions of the latter which are of primary importance in the data analysis stage.

**Figure 1: The interconnectedness of networks**

**Figure 2: The different levels within the boat building district**

It is common in case studies to select cases that represent the extreme rather than the average. In these cases the phenomena should be “transparently observable” (Eisenhardt, 1989:537) so that the process of interest is highlighted. The boat building district is an extreme case as it is considered to be a successful industrial district in New Zealand. It won the 1999 Trade New Zealand Export Award in the ‘Co-operating to Compete’ section.

For the purpose of this study, 21 respondents<sup>1</sup> from two different levels of the district (see Figure 1) were interviewed. Ten respondents were from the core of the district, and eleven from supporting institutions of the district. The ten core firms were small to medium sized companies with five to 215 employees (see Table 2 for profile of these 10 firms). All these firms sell their products or services to international markets and have export sales ranging from 18% to 100% of total sales. All ten firms interviewed are owner-managed businesses with the founding members still actively involved in the day-to-day running of the business. Respondents were chosen largely because of their membership in the Marine Industry Association and willingness to participate in the study. For core firms the CEO’s were interviewed because they are the key decision-makers regarding the company’s

<sup>1</sup> To maintain anonymity the names of some of these organizations and respondents will not be disclosed.

involvement in the district. Before each interview the respondents were sent an email outlining the research objectives. Interviews were semi-structured using a topics list to guide discussion. All interviews, on average lasting two hours, were tape recorded and later transcribed. Data was also collected from a variety of archival sources such as company reports, brochures, promotional videos, television documentaries, existing reports on the marine industry, and magazine and newspaper articles. Information from respondents about their companies and about the district and archival resources allowed for triangulation.

**Table 2: Profile of the ten firms within the core of the district**

<b>Firm</b>	<b>CB</b>	<b>SE</b>	<b>CD</b>	<b>SI</b>	<b>SH</b>	<b>SJ</b>	<b>SD</b>	<b>SF</b>
<b>Year of Inception</b>	1975	1988	1986	1990	1981	1981	1981	1976
<b>Year Started Exporting</b>	1979	1996-97	1987	Early 1990's	1985-87	Indirect exports since 1976	Late 1980's	1993

## Discussion of Networks in the Boat Building District

This section provides examples of all four classes of networks, which can be found in the boat building industrial district.

### Formal Interorganizational Networks

Various supporting institutions play a key role in fostering the district. These institutions are: the Marine Industry Association (MIA); export promotion organization (MAREX); the government agency for exports (New Zealand Trade and Enterprise); economic development agencies; city councils; and educational institutions such as technical colleges and universities. Each of these institutions has a specific role to play. For instance, MIA focuses on training; MAREX on marketing and exports; economic development agencies on marketing and facilitation, city councils on infrastructure, and, educational institutes on different types of training and academic courses relating to the boat building industry. MIA and MAREX are key drivers in organizing the district. By taking the role of catalyst and facilitator respectively they have given the district some structure and educated members on the benefits of belonging to a district.

An example of formal interorganizational networks is that within the industry district there are sub-groups who collaborate on certain projects such as the Boat Brokers District. Each sub-group has an independent chairperson from outside the group who has equal allegiance to all members of the group. When these sub-groups form it takes time to build trust and commitment, as Peter Busfield of the MIA reports:

**Initially meetings may be 'cold and crusty', but after a while members respect and trust each other enough to solve problems and share opportunities. In the late 1980's before the MIA convinced them to form a district, boat brokers within New Zealand were 'enemies'. Now about three-quarters of New Zealand's 50 independent boat brokers are MIA and district members. Each company in the district has worked together to design particular rules relating to ethics; the way they do their business; run their banking systems, and handle clients. Working together provides economies of scale for costs like legal fees.**

The supporting institutions specifically involved in promoting exports from the boat building industry are the Marine Export Institute (MAREX) and New Zealand Trade and Enterprise, a government agency. MAREX is an industry organization that was formed as an offshoot of the Marine Industry Association (MIA) to foster marine industry exports. Although MIA, MAREX and New Zealand Trade and Enterprise play important supportive roles in developing the district, the initiatives taken by some entrepreneurial industry leaders in sowing the seeds to establish the industrial district, and to attract resources to it, should not be underestimated. Kim McDell was one of the founding members and the first chairman of MAREX. About six companies who were successfully exporting their products set up the Marine Export body. The group decided to set up MAREX for two reasons: firstly, to give the marine industry, which had been very fragmented, a united front; and secondly, to try and help other companies within the industry export their products.

According to Kim McDell while MAREX provides structure and organization for the industry it is still up to the individual companies to create their own success. In addition, he states that MAREX has achieved a good balance where it doesn't try to influence individual businesses, but helps the industry as a whole. These industry leaders continue to serve on the MIA and MAREX boards. This finding supports Feldman and Francis (2002) and

Appold (2000) that although entrepreneurs play an important role in shaping the district they have been neglected in the literature on districts.

In addition, having a common goal such as the drive to internationalize has played an important role in strengthening this district. MAREX plays a key role in disseminating information amongst its members. It organizes seminars and informal gatherings where members share information and experiences. Such frequent interaction helps relationships to form and facilitates trust and commitment which Morgan and Hunt (1994) suggest engenders cooperative behavior. In addition, it enables the parties to acquire 'mutual orientation', -knowledge about one another that they can use when communicating or trying to solve problems (cf. Johanson and Mattsson, 1987). This mutual orientation leads to the formation of rules that they conform to in future interactions. These relationships are what Grabher (1993) would call 'loosely coupled relationships', as they are not rigid, and the partners do not become locked into them. Moreover, these joint marketing efforts enable firms to identify where the real competition is because it is only when working together internationally that they realize their real competitors are offshore. By participating in international boat shows firms develop and maintain relationships with other members in the district and also share information. In addition, MIA and MAREX have a code of conduct on how business should be done - if members do not comply they are removed from the organization. This code of conduct creates peer pressure for conformity and prevents opportunistic behavior. Indeed, through membership of organizations such as MIA and MAREX opportunistic behavior as purported by Williamson (1985) is kept in check.

### **Informal interorganizational networks**

One reason for the success of the Auckland boat-building district is that members have differentiated products so they complement each other rather than face "head on competition". In addition, boat builders share suppliers and interior designers, which leads to knowledge sharing within the industry that benefits all. Some of the organizations also have customers within the district. They get to know these customers through MAREX and MIA breakfast meetings and seminars and then start to interact with each other at an informal level. They learn about the needs of their customers through interpersonal networks and use this information to improve their products. If members in the district are not capable of doing a particular type of work, or if they have too much work and cannot take on a new project, then they make referrals to each other. There are, however, times when firms will be competing for the same customer. Another benefit of being part of a district is that small businesses can collaborate on large projects that would have been impossible for them to accomplish on their own.

### **Formal interpersonal networks**

Members of the district belong to sailing clubs, various sports clubs, and social clubs. In fact, it was difficult to screen out the effects of such networks on their organizational and interpersonal networks. It is possible, however, that their informal interpersonal networks, may have emerged from these formal clubs. One such club that was mentioned frequently was the sailing club. It could also be argued that because of their sailing and business activities they have limited time to spend on other formal interpersonal networks.

## **Informal interpersonal networks**

The members of the boat-building district have built long-term relationships as many attended the same schools and/or have sailed together, in some instances from the age of ten. These long-term relationships mean they are a closely-knit group. This governs how they interact when doing business within the district. Lane Finlay of MAREX had this to say about this close network:

**[...] currently there are a lot of our business owners who had sailed together in their youth. They still recognize each other and say ‘hey remember the race against you guys in the world half ton finals’ or whatever it might have been. There is that background network because New Zealand is small and people know each other, or they know the brother of, or they know the family of, so you do have that type of thing.**

The owner managers in all the core firms in this study were avid sailors with some competing at a professional level in international yacht races. They emphasized that their success in boat building stems from their passion for sailing. Sailing allows them to critically test the products they build. Through sailing competitions they also get to know their customers, distributors and competitors, who sail in these competitions. Such informal interactions allow them to learn about the latest technology, test the latest products, and keep well informed about customer needs. The CEO of SH has this to say:

**I can’t stress enough the importance of not only working in formal channels, as I guess the government and professionals can provide, but also using networking channels. One way the company does this is through BJ [a director of the firm] spending time sailing. This allows the company to keep in touch with a wide range of people in the industry and develop informal relationships.**

## **Networking Processes within the Boat Building District**

Respondents in this study use their interorganizational and interpersonal networks to work together within the boat-building district. This networking not only benefits themselves, but also the district as a whole. The boat builders work together on some projects, share information, share technology, learn about different aspects of business from each other, and about overseas markets. As the earlier examples illustrate boat shows are a good way to create interpersonal networks and to transform them into interorganizational networks and vice versa. Despite the initial reluctance of members to co-operate they eventually saw the benefits of working together. They chose network partners carefully so they could leverage off their success. Interpersonal relationships are also valued. Even though skilled employees leave the district to work for overseas boat builders the Auckland firms turn this into a positive by using these former employees to enter and learn about new foreign markets.

As confirmed by Ellis (2000) and McDougall Shane and Oviatt (1994), such interpersonal networks permit the firm to learn about new markets, to identify new opportunities, and to enter new networks in foreign markets.

The boat-building district has not yet reached the stage of insularity as Porter (1990) reports in his study of districts. One explanation for this is the involvement of the boat builders in sailing. Through international sailing events they become aware of how other

boats are being built, and the technology used, thus they keep up with new developments in the international arena. Indeed, unlike the industrial district in the Ruhr area which became locked into a regional homogenous culture (Grabher, 1993) the link with sailing helps to 'bridge relations' by bringing in information from outside sources, often from the international environment. Using Granovetter's (1973) concept of "weak ties" it could be argued that sailing links the boat builders into other interpersonal networks that exposes them to new ideas and opportunities.

## CONCLUSION

This paper shows how interorganizational networks, interpersonal networks, and the boat-building district co-evolved. Although the boat-building district provides several examples of formal and informal interorganizational and informal interpersonal networks, we find relatively little evidence of the existence of formal interpersonal networks. Apparently, managers of firms in the district prefer to keep personal contacts informal, while they are willing to formalize organizational relationships. One explanation for this can be found in the characteristics of business founders. Many were originally sailing enthusiasts and had little formal business training. While they are used to informality in interpersonal interaction, they may prefer to rely to a greater extent on formalization when conducting business activities.

The crucial factor in the development of the Auckland boat-building district was not the social networks of the entrepreneurs, but the process by which informal interpersonal networks were transformed into informal and formal interorganizational networks. One of the reasons for the success of the district is the ability of many of the sailing enthusiasts to use their personal contacts – people who share their interests – for various business purposes. Similarly, the formalization of interorganizational relations into formal networks, in particular MIA and MAREX, provided the firms in the district with the infrastructure and support needed in light of the owners' lack of business experience. By acting as facilitators and caretakers these formal networks provided the avenue for firms to turn their interpersonal networks into interorganizational networks and vice and versa. Each type of network reinforces the other.

In addition, entrepreneurial firms in the boat-building district took a leading role in initiating and shaping the district during its early stages by encouraging the creation of informal organizational and informal interpersonal networks. An implication of this study for researchers of industrial districts is the need to explore the role entrepreneurial leaders play in developing a district. Implications for managers are that interpersonal networks should be nurtured and transformed into interorganizational networks - this being too important an issue to leave to chance. Finally, it is important for members of a district to maintain links with other networks so they can obtain new ideas and resources. This will prevent the district becoming too close knit and insular. As Grabher (1993:24) demonstrated locking out new entrants and new ideas can lead to self-destruction as – "ties that bind" become "ties that blind"

## **ABSTRACT**

Confusion still exists regarding the meaning of the organic production system. It can be defined as a holistic production system which enhances the agricultural eco-system by prohibiting the use of synthetic production mediums. It focuses on the improvement of soil fertility and the protection of the environment.

The environmental advantages by themselves are not reason enough for farmers to adopt organic practices. The financial implication of organic agriculture in comparison with conventional practices is very important. It does not matter how ecologically advantageous organic farming is, if a farming system does not show sufficient profit for the farmer to stay in business in a free market, an organic system will not be adopted. Ecological agriculture tends to have slightly lower yields, but production costs also tend to be lower during full production, due to the reduced use of purchased inputs. The net income (gross margin) from organic and conventional practices is thought to be comparable, although either can be advantageous under specific conditions.

Many South African producers are interested in the organic production practices of wine grapes. Some of the producers are already busy converting their vineyards to organic practices. An important question relating to the organic production of wine grapes, is the cost associated with the practice.

Research had been undertaken by Coetzee, of the farm Vaalpan, in the Vanrhynsdorp district, near Vredendal, South Africa. The farm is 12 hectares in extent of which 3 hectares are under the production of organic wine grapes. The purpose of the research was to compare the financial issues relating to conventional and organic practices. The results had shown that the price of the wine grapes and specially the price premium of organic wine, would determine whether the organic production of wine grapes was financially viable, as the production was lower and the production costs were higher.

## **INTRODUCTION**

The organic cultivation of food has increased significantly worldwide and South Africa is not behind in this process. The cultivation practices implemented, provide peace of mind to consumers that they are not being exposed to the residues of chemical substances. The Chill Chamber (2002) was of the opinion that sound organic practices respected the environment and promoted biodiversity and sustainability.

The focus of the research was on organic wine grape production in the Olifants River Valley. The research was compiled in co-operation with Coetzee, a viticulturist. Coetzee's farm in the vicinity of Vanrhynsdorp consists of some three hectares of vineyards that have been planted using organic methods. The farm had already been certified by the "Société Générale de Surveillance" (SGS) and during 2002 Coetzee was in his third year of producing wine grapes organically. The cultivars already established, are a 1999 planting of Shiraz (2 hectares) and a 2001 planting of Cabernet Sauvignon (1 hectare). During 2002 Coetzee also made wine from organic wine grapes and samples of the wine had been sent abroad to be tested. As Coetzee is the wine master at the Klawer wine cellar at Vanrhynsdorp, his knowledge of the wine making process will be a valuable asset. The farm's wine will be marketed abroad under the logo of the Matzikama wine cellar.

The farm's vision for the 2002/3 season is directed towards quality rather than quantity. Quality is assured by selecting small, compact and healthy bunches of grapes. The field production records are also an indication of the farmer's attitude towards quality control.

## **METHODOLOGY**

The case study research method was used in the research regarding the financial aspect of growing organic wine grapes. The ultimate aim of the study was to draw a comparison between the financial aspects applicable respectively to conventional and to organic wine grape production. A risk sensitivity analysis was done in terms of price and yield for the two production methods. The break-even production to cover the operating cost and the break-even production to cover total costs were determined.

The Computerised Budget (COMBUD) program (COMBUD, 2001/2) was used to compile enterprise budgets for both conventional and organic wine grape cultivation practices. The program was also used to perform a parametric analysis to test the sensitivity of the gross margin regarding change in price obtained per ton and yield per hectare.

An Excel spreadsheet was used for calculating the risk, and also for the calculation of the break-even production to recover the operational and total costs.

## **RESEARCH RESULTS AND DISCUSSION**

The cultivation practices follow will be discussed first. During January the farmer starts to make his own compost with garden waste and sheep manure from sheep grazing on natural pastures. It is important not to use manure from feedlots, as traces of chemicals and antibiotics can be found in such manure. In January a disc plough is also used

between the rows for green mulching. Hoes are used to remove weeds in the vine rows. No pest and disease control are used (Coetzee, 2002).

During February the farmer applies micro-organisms in the form of liquid seaweed at 50 litres per hectare. Harvesting is also done during February by using permanent and casual labourers. Compost is applied during May, at 10 cubic metres per hectare. A cover crop at 100 kilograms per hectare is also sown during May. During pruning in August only strong canes are left on the vine. Disc ploughing is again done during September and weed in the vine rows removed with a hoe. The control of downy mildew can take place during September and poorly spaced shoots are removed during October. Botrytis could also then be controlled if necessary. During December the weeds in the vine rows must again be removed with hoes. Poor developed bunches are removed in December as the farm focuses on quality rather than quantity. Mealy bug could be controlled any time during the season, with a minimum of two days before harvesting (Coetzee, 2002).

The main farming practices of conventional and organic wine grapes are presented in Table1.

**Table 1: Conventional and organic farming practices for wine grapes**

CULTIVATION PRACTICES	CONVENTIONAL	ORGANIC
IRRIGATION	Drip Irrigation	Drip Irrigation
MACHINERY NEEDED	48 kW 2 wheel tractor Trailer 12 disc mouldboard plough Mist blowers (800 – 1000 litre)	48 kW 2 wheel tractor Trailer 12 disc mouldboard plough Mist blowers (800-1000 litre)
PRUNING OF VINEYARD	Same technique for conventional and organic practices	Same technique for conventional and organic practices
COVER CROP	No cover crop was sow	Wild rye*, canola* and Russian tumble-weed are used as cover crop
FERTILISER	Easogro Starter 6.1.3 (15) 6.1.0 (19)	Make own compost
PESTS	1. Downy mildew 2. Mealy bug 3. Botrytis	1. Downy mildew 2. Mealy bug 3. Botrytis
PEST CONTROL	1. Dithane/milraz/ demildex 2. Tokuthion 3. Toreador	1. Bio-Cop 2. Shield AZ 3. Bio-Tricho (Certified: Agro-Organics)
WEED CONTROL	Round-up	Hoes are used to control weed on the vine row. Bales of wheat straw can also be placed in the vine

		rows.
ROW SPACING	2.5 m between rows 2 m in rows	2.5 m between rows 2 m in rows
METHOD OF HARVESTING	Use labourers	Use labourers
QUALITY OR QUANTITY	Focus on quantity	Focus more on quality
PRODUCT	Supplier to co-operative wine cellar	Supplier to Cederberg cellar for the making of wine from organic grapes
MARKET	Local market	International market

**\*The choice of the cover crop will be influenced by the ultimate object that you want to achieve by the use of a cover crop. For example there is a shortage of nitrogen in the soil or will a cover crop with a deep root-system be chosen to prevent the compaction of the soil.**

Source: Hough (2002)

The most significant differences between the farming practices indicated in Table 1, are that for conventional practices fertiliser was purchased and for organic practices Coetzee made his own compost. Conventional practices focussed more on quantity and organic practices focussed more on quality. The conventionally produced grapes were sold to the local market and the organic produced grapes were sold to the international market, in the form of organic wine.

During the first year of production (2000/1) one ton per hectare was harvested and six tons per hectare during the second year (2001/2), while it was estimated that once the vineyards were in full production (2002/3), the yield would be 10 tons per hectare. The establishment costs and gross margin for conventional and organic wine grapes are presented in Table 2.

**Table 2: Establishment costs and gross margin analysis for conventional and organic wine grapes (R/ha)**

Item	Conventional	Organic
Production per ha	12	10
Price per ton	4 500,00	6 000,00
Grape skins (R/t) <sup>1</sup>	0,00	0,00

- 4) Bulk sales: R7,50/litre for conventional - and R12/litre for organic wine. Cash shortage – conventional wine lower price than conventional wine grapes.

- 5) **Sales per bottle: R40/bottle for conventional - and R73/bottle for organic wine**  
**1 572 bottles wine from 2 ton grapes (conventional / organic)**  
**786 bottles wine from 1 ton grapes (750 ml bottle) (conventional / organic)**  
**589,50 litre wine from 1 ton grapes (conventional / organic)**

Source: Hough (2002)

Organic wine grapes would break even (gross margin after total allocated variable costs) with conventional wine grapes at a production of 10,51 ton/ha and a price of R6 307,12 per ton (Hough, 2002).

The gross income before marketing costs from the conventional grapes was R6 000,00 per hectare less than in the case of organic grapes. The gross income after marketing costs of conventional wine grapes (R43 200,00/ha) as a percentage of organic wine grapes (R48 000,00/ha) was 90 % or R4 800,00 per hectare less than that of organic grapes. If organic wine grapes were sold at a price premium of more than 30 %, the gross income of organic wine grapes would be R4 800,00 per hectare more than conventional wine grapes (Hough, 2002).

The difference between the pre-harvest cost of the conventionally produced grapes (R14 624,29/ha) and organic grapes (R22 704,59/ha) was R8 080,30 per hectare or 64,41 % more. The main reason for the difference can be found in the components of compost (R2 700,00/ha), guano (R1 100,00/ha) and wheat straw (R7 000,00/ha). If the use of wheat straw could be substituted by naturally growing plants that were not cultivated, then the pre-harvest cost could be reduced by R7 000,00 per hectare in terms of the next set of budgets (Hough, 2002).

The harvesting cost component between the two types of production compared favourably (R2 836,20/ha for conventional grapes versus R3 136,20/ha for organic grapes) and the main reason was that the harvesting methods were identical. It was only the cost relating to cooling down the wine grape crates (R300,00/ha) that needed to be taken into account with organic grapes, since the cooling of organic grapes was important after harvesting. The cost of permanent and casual labourers employed in the pre-harvest and during the harvesting periods was R1 800,00 per hectare or 29,30% less with conventional grapes (R6 150,00/ha) than organically produced grapes (R7 950,00/ha). The reason for the latter increase was because more labourers were needed for the organic production methods. The control of weeds as well as the spreading of wheat straw between the vines were done manually. The selection of the best bunches was an ongoing process. The final goal was that the crop of the organically produced wine grapes should be sold at a premium price.

It could be deduced from the above analysis that the organic production of wine grapes would have financial benefits for the case study farmer should the price premium paid for the organic wine grapes exceeded the price of the conventional wine grapes by 30 %. Should value be added by means of making wine from the organically produced wine grapes, the organic wine margin is R161 399,35 per hectare more than the conventional wine (the difference between R205 067,26/ha for the conventional and R366 466,61/ha for organic wine grapes).

For the risk calculation of the two practices, the expected gross farm income was calculated with acceptances regarding price and yield. The production of conventional wine grapes was 12 tons per hectare and for organic wine grapes 10 tons per hectare.

According to Truter (2002) the probability was 60 % to produce 12 tons per hectare conventionally produced wine grapes and 10 tons per hectare organically produced wine grapes. The pessimistic scenario with a probability of 25 %, was eight tons per hectare for conventional and seven tons per hectare for organic practices. The optimistic scenario with a probability of 15 %, was 16 tons per hectare for conventional wine grapes and 13 tons per hectare for organic wine grapes.

The scenarios for the probability of price, notwithstanding the production, were as follows: R4 650 per ton with a probability of 15 %, R4 500 per ton with a probability of 80 % and R4 200 per ton with a probability of 5 % (conventional); R6 500 per ton with a probability of 15 %, R6 000 per ton with a probability of 80 % and R5 700 per ton with a probability of 5 % (organic) (Truter, 2002).

The risk analysis showed that the **expected gross farm income** for conventional wine grapes was R52 287,00 and for organic wine grapes R58 782,00. The **standard deviation** for conventional practices was R11 234,54 and for organic practices R11 517,28. The **risk per rand** projected income for conventional was R0,21 against R0,20 for organic practices. The difference between risk per rand between the two farming practices had the following meaning in the case of conventional practices R52 287,00 x 0,21 per hectare, that was an amount of R10 980,27 per hectare. In the case of organic wine grapes it was R58 782,00 x 0,20 per hectare, that was an amount of R11 756,40 per hectare. For a vineyard of 10 hectare the risk existed that the gross farm income for conventional practices could be R109 802,70 higher or lower than the expected value and in the case of organic practices it could be R117 564,00 higher or lower than the expected value (Hough, 2002).

The financial analysis for the conventional and organic production of wine grapes was undertaken over a short period (one year), as the case study farmer only started planting organic vineyards in 1999. The importance of studying the financial position of organic grape producers was emphasised because a cycle of one year did not provide sufficient information to register the underlying trends regarding the profitability of the business concern.

## CONCLUSIONS

The production of organic wine grapes was financially profitable, as the gross margin was positive and the operational and total costs could be recovered by means of the existing production levels. In both of the above-mentioned practices the break-even production in ton per hectare was less than the budgeted production. It could be deduced that if the case study farmer maintained his production levels above the break-even point, the variable and total costs of the two practices under discussion - in other words conventional and organic - could be recovered. Should only risk per rand gross farm income be used as a yardstick for calculating the risk, then conventional wine grapes were subject to a higher risk at R0,21 as opposed to R0,20 for organic wine grapes.

A recommendation for further studies will be closely associated with the marketing aspect of especially organic wines, as South African producers will face strong international competitors in order to sell their products abroad. It was also recommended that the technique of risk management be studied, as there will be no guarantee that the market for organic wine grapes will remain stable in the long run. If the producers do not dispose of

the necessary management techniques to hedge their risks, this may entail serious economic consequences for such producers.

## BIOGRAPHICAL SKETCH

Name: Ella C. Hough

Date of birth: 1975-06-05

Tuition: Under-graduate: University of the Free State  
Post graduate: University of the Free State

Experience: January 1998 up to July 1998: Graduate Trainee (First National Bank)  
August 1998 up to June 2001: Agricultural Banker (Standard Bank)  
July 2001 up to May 2002: Agricultural Economist (Department of Agriculture)  
From June 2002: Lecturer – Agricultural Economist (Department of Agriculture)

Tuition specialisation: Financial management.

Interests: Organic farming practices  
Farm land valuations  
Farming systems  
Technology transfer and adoption

# **RISK MANAGEMENT OF HUMAN ASSETS IN SMALL AND MEDIUM SIZE ENTERPRISES IN SINGAPORE**

An MBA Group Dissertation\* related outcome- this paper is a summarized/abstracted version

Joint Supervisors: Professor BC Ghosh, Dean, Vancouver University's  
Singapore Operations  
And Assoc Professor Tan Wee Liang of  
Singapore Management University.

- In partial fulfillment of MBA-Financial Services of Vancouver University, Canada conducted by its Singapore Campus at Insurance and Financial Practitioners' Association of Singapore- IFPAS- based at 7, Hong Kong Street, Singapore, 059650- the address for communication . email: bcghosh@singnet.com.sg
  - Final revised paper

History has shown that more than 80% of all business failed within the first 5 years of establishment( Singapore government's own Statistics Department surveys during 1984 and 1994 confirm along this line too). There are many factors that lead to such a high failure rate but in this research; we will rather be looking at the failure of a business due to the death, disability or major medical crisis of the owners, partners, and shareholders, risks related to human assets management. We will also be looking, in particular, at how such risks can be managed by using established risk management tools which share risks, eg insurance plans. They are available widely in the West and also in Singapore and the nearby countries like Malaysia. They are established risk reduction tools, designed mainly for SMEs, though not exclusively so, and can be used to minimize risks in these situations.

Usually, when these unfortunate events occur, there are questions that the family members and the remaining business partners need to address:

1. Shall the business be dissolved or continued?
2. Will the business be sold or liquidated at a lower value?
3. Will the deceased's family members be interested and capable of running the business?

4. If the surviving partners would wish to buy over the shares of the deceased shareholder, where then the fund for such an acquisition be found?
5. similar related matters, where established risk management tools are available but often remain unused due to a lack of awareness, or more importantly, just a lack of planning for it.

The group investigated the relevant literature, only some were relevant at all, especially none available in Singapore/regional context, and it is to be noted this research is rather drawn in our regional context. It is here in this region, we felt, as financial planning professionals, that succession planning among SMEs is rather very poor, due to cultural and other reasons, including a level of awareness or rather the lack of it. We therefore planned to undertake a part randomly selected survey among business owners and also financial planning professionals, and partly conducting the same survey through a convenience based sampling. 80 business owners were administered a questionnaire and survey inputs were obtained through face-to-face interviews, and similarly with 55 financial planning professionals, but necessarily the questionnaires were different. These questionnaires were arrived at after due pre-testing and when agreed with our supervisor of the project.

The contents of those surveys and the abstracts analysis of the results are as follows:

## **BUSINESS OWNERS SURVEY**

We had decided to use a unidirectional scaling method, Likert approach so to speak, for our purposes.

After several brain storming sessions, we created a set of potential scale items that can be rated on a 0-4 scale. These items consisted of the various insurance concepts applicable in business succession planning with special to risk management instruments available in the marketplace. We narrowed down to 10 items. The 10 items are as shown below( more explanations later, all human-assets related financial risk management tools in an SME context):

1. Executive Bonus Plan (Selective Employee Benefits plan)
2. Group Life Insurance
3. Key Employee Life Valuation protection
4. Disability Income for Key Employee
5. Split Dollar
6. Business Continuation (Buy/Sell Agreement)
7. Deferred Compensation
8. Medical Expense and/or Major Medical
9. Disability Buy out
10. Stock Redemption

The rating we assigned to each of the item is as follow:

Rating	Selection by Owner about the type of business insurance or other risk management protection
0	Never heard before
1	Heard Before But Not Sure
2	Have knowledge but no action taken
3	Action taken but uncertain if it is appropriate or adequate
4	Fully understood and action taken with periodical review

The final score for the respondent on the scale is the sum of their ratings for all of the items (this is why this is sometimes called a "summated" scale).

For each individual respondent, the minimum score is 0 and the maximum score is 40 (4 X10). Average mean score should be 20, per respondent. If it is less than that, then the conclusion would be the level awareness is less than optimal.

We define the awareness level as follow:

0 to 8	Very Low
9 to 16	Low
17 to 24	Medium
25 to 32	High
33 to 40	Very High

We define the level of awareness to be low if a respondent score a rating of 16 or below, as per our interpretation of the table above- this number is critical for our analysis purposes below:

Business Owners' Survey- Continued:  
Sampling of Business Owners

A sampling size of 80 business owners is selected using the random sampling/convenience sampling method( in our case this was considered most suitable), out of which, 56 are limited companies, 12 partnerships and 12 sole-proprietorships. We did not think there was any bias in this sample, and they represented our situation well in regard to SMEs in Singapore and the region.

The samples( where applied) were selected at random without prejudices of their legal forms or industrial types as long as they fulfill the definition of Small and Medium Enterprises, by Productivity and Standards Board of Singapore( now renamed as Spring, Singapore).

Firstly, we state our main hypothesis as follow(we agreed on this basis, there was little in literature to suggest otherwise):

Null hypothesis,  $H_0: \mu \leq 16$ , The awareness level of business risk management insurance among business owners of SMEs in Singapore is below or equal to 16 on a scale of 40 points

(below 40% of 40 max per respondent-- see earlier discussion). Hence significantly lower than the number (mean >20) that would normally be expected from rational business owners.

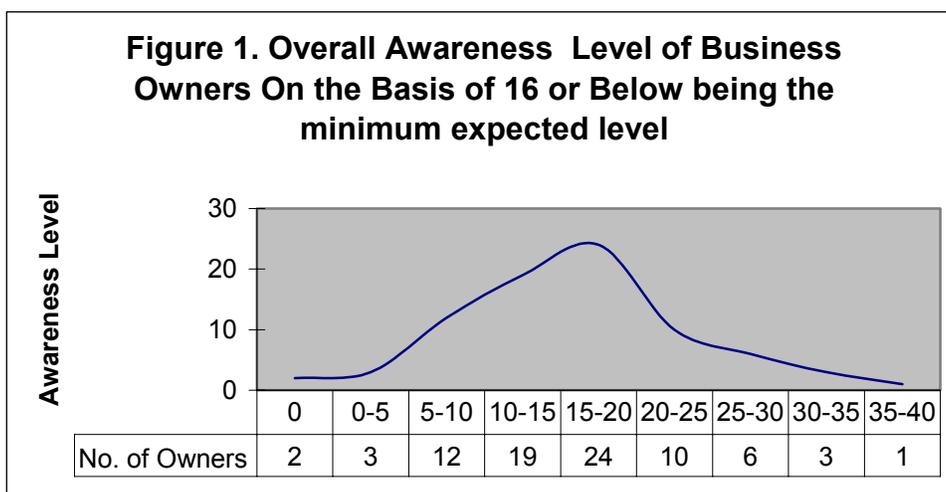

Alternate hypothesis,  $H_1: \mu > 16$ , "The awareness level of business risk management insurance among business owners of SMEs in Singapore is above 16 on a scale of 40 points (above 40%), indicating a generally acceptable level of awareness. This cut-off point admittedly, is a bit arbitrary, but based on conservative reasons that our market would probably show less than expected level of 50% awareness anyway, in respect of the awareness among our SMEs of these rather sophisticated financial risk management tools. No literature on this available according to our knowledge, but inside information within insurance companies locally supports this view.

We set the level of Significance to be 0.10

## SYNOPSIS OF RESULTS

The number of business owners involved in this survey is 80.

With a total score of 40 points, the overall average score of all business owners involved in the survey is **16.65 (41.63%)**, much less than 20. The mode and median are **15** and **16.34** respectively.

Sample size = 80    Mode = 15.0            Mean = 16.65            Median = 16.34

Standard Deviation = 7.8%

Hypothesized value = 16    Significance level = 0.10

Critical value will be  $16.00 + 1.2825(7.8/\sqrt{80}) = 17.78$ . The sample mean value, 16.65 falls within this range, and therefore, we do not reject the null hypothesis

Alternatively, using test statistic =  $(\text{Sample mean} - \text{hypothesized value}) / (\text{Sample standard deviation} / \sqrt{\text{sample size}}) = (16.65 - 16) / (7.8 / \sqrt{80}) = 0.74$ . Critical value of distribution is 1.2825 (one-tailed 10%). Since the test statistic is less than the critical value, we do not reject the null hypothesis.

Next, we will calculate the p-value, which is the probability of observing a value of the test statistic at least as extreme as the value actually observed, assuming that the null hypothesis is true.

We have found that:

Test statistic = 0.74,

Significance level = 0.10,

Critical value = 1.2825,

p-value =  $1 - 0.8864 = 0.1136$

Since the p-value obtained is greater than 0.1,  $H_0$  is not rejected.

This result is consistent with our hypothesis that In general, business owners in our context( Singapore and the adjacent region) have an insufficient level of awareness with regards to the importance of managing the risk of losing the services of the owners and/or key employees due to their death, disabilities and retirement, and suffer from an insufficient awareness of due risk management tools available.

## **FINANCIAL PLANNING ADVISORS SURVEY**

Unlike in the survey for business owners where we use a ratio measurement to determine their awareness level of business insurance using a scale from 0 to 40, the survey conducted for financial planning advisors are measured using Nominal and Ordinal measurements methods. First of all, we separate insurance advisors into two categories: those who had sold business insurance and those who had not. This is the Nominal measurement where we can find out the percentage of advisors who sold business insurance. Then for the group that sold business insurance before, we further separate the novices from the experts by categorizing them into four groups namely those who had sold to:

1. less than 6,
2. 6 to 10,
3. 11 to 15 or
4. more than 15

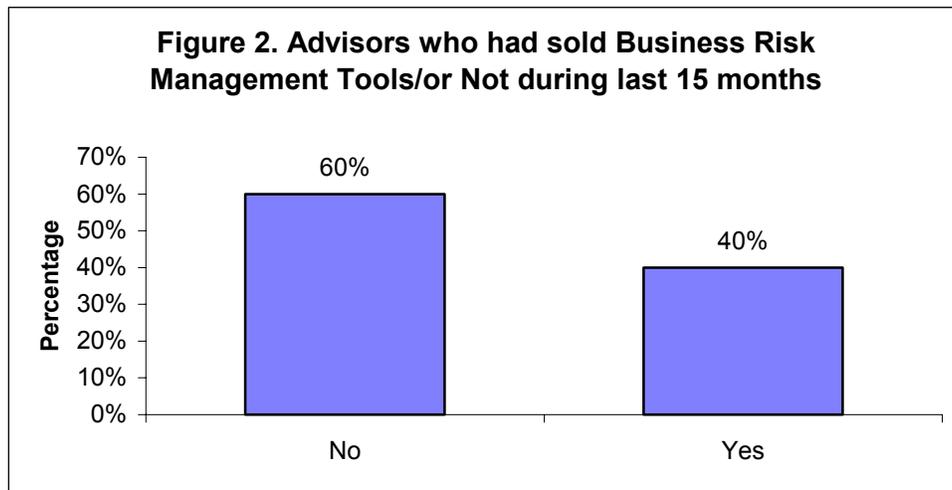

business owners and those who sold less than that, during last 15 months. After doing so, we ranked the four groups accordingly. This is the ordinal measurement method where we are interested in finding out which grouping can we find the highest number of advisor in it. From the result, we will be able to see the participation level of financial advisors in the business insurance /similar market with regard to use of available financial risk management tools.

We had also designed questions using ordinal measurement method to find out the reasons why insurance advisors are not selling to the business insurance market and the types of training they needed most if they were to enter this market.

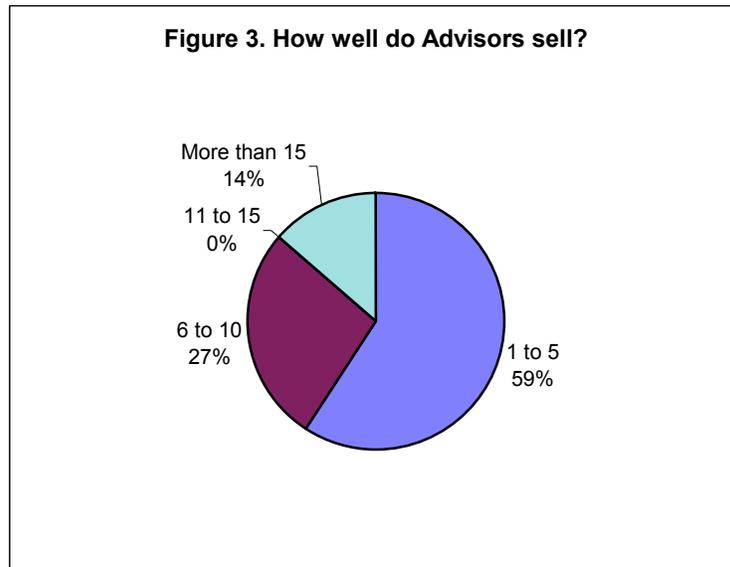

## RESULTS OF THIS SURVEY

As earlier mentioned, we selected 55 face-to-face respondents from among insurance/financial planning/ bank employed planners, again part random, but mainly introduction through our personal contact. There was no other useful way, but we believe otherwise the sample was unbiased. Face to face interview also the only effective way, but obviously consumed a lot of time on both sides, hence the number of 55 was agreed as sufficient with our supervisor.

Firstly, we shall look at the percentage of advisors who had sold at least one business insurance before( or none!).

And the level of their achievement? The pictorial below is a better way of presenting the information, we would like to believe!

In other words, the advisors who are actively involved in promoting business risk management/insurance tools available are only a handful. In our sample, only 3 out of a sample size of 55 had sold business insurance to more than 15 businesses. This works out to be only 5.45%. The rest of the advisors who have sold business risk management tools seem to have done it by coincidence rather than through their deliberate effort, as our interviews revealed.

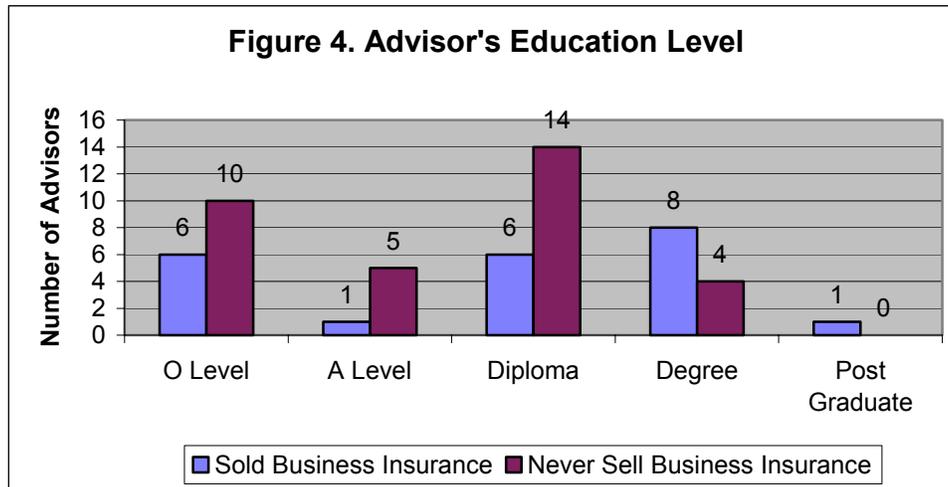

Other interesting findings from these interviewed revealed that:

The reasons quoted by insurance advisors in the order of importance are:

1. Prospecting the business risk/ insurance market is tough; owners seemed too cost conscious in the current very tough business situation. Present more than the future is the main thinking platform for SME business owners
2. Lack of mentorship and guidance from experienced advisors/corporations and
3. Inadequate and insufficient training by providers of these products eg insurance companies or banks.
4. Technical issues on tax and law not well understood by business owners.
5. Little incentive provided by providers of these products. Simpler to sell eg. personal insurance is simpler and pays the same.

What type of training these business planners generally received and how they lacked sufficient awareness training in these products:

1. On the job training with experienced advisors- mainly neglected in their opinion.
2. In-house training, some but quite insufficient
3. LUTC and other related vocational courses- some.
4. ChFC, CLU, CFP and other professional designations- some theoretical training included.
5. Others- very little mentioned.

## SUMMARY

The data and our face to face interviews revealed the following picture(s):

1. The results from the survey of business owners confirm our hypothesis that the awareness level of business owners is generally low in regard to business succession/other risk management tools relating to human assets available widely in the market place.
2. Organizations with high profit have a higher awareness level than others.
3. Organizations with more than 8 owners have a higher awareness level than others.
4. The main reason why planning advisors do not promote business risk management/insurance tools( provided generally by banks or insurance companies) is because of the difficulties faced with “prospecting the business insurance market”.
5. The most needed training by advisors who are interested to participate in promoting business insurance is “On the job training with experienced advisors”.

## CONCLUSIONS

Our findings support the following conclusions including recommendations:

SME owners and even among insurance professionals there is widespread absence of knowledge as how to use available financial techniques to control/manage financial risks inherent among key persons in whom the depends the fortunes of SMEs. Some of them cannot be eliminated, but yet can be minimized.

Related government bodies and trade associations should organize periodic workshops and seminars regarding business insurance to update and inform the business owners their knowledge about business risk management tools including relevant insurance products. Ignorance cannot be good for anyone, business owners or providers or financial planning professionals.

Insurance/banks and other companies should take the initiatives to organize their own pools of existing practitioners in the business insurance market to provide proper guidance to help those insurance advisors who are interested to participate in providing services to the business owners.

Financial planning advisors can upgrade their skills and knowledge by actively participating in related training so as to equip themselves with the proper tools to service the business insurance market competently.

Training providers, eg Insurance and Financial Practitioners' Association of Singapore, should take due note of these findings.

We daresay that this article is less related to the theory of SMEs, but based on facts gleaned from the operators of SMEs, about matters that concern them materially, yet they often seem unaware that those too could be managed. We also daresay that what we found to be true in Singapore could well be true in many other places, including today here in Jo'burg.

Co-authors: Mapatu Rhakadu, Gary Sharp & Suzette Viviers, University of Port Elizabeth

## ABSTRACT

Access to finance has been cited as one of the most prominent constraints facing SMMEs in South Africa. This study seeks to establish whether this indeed is the case and to identify the factors hindering this process.

Judgmental sampling was used in a survey conducted among small business owners/managers operating in a metropolitan area in South Africa. Data analysis relating to reported results was conducted in three stages. Firstly, an item analysis was conducted to determine which items should be used in summated scales to calculate the scores for the various factors hindering access to finance. Secondly, descriptive statistics were calculated to summarise the sample data distribution. Finally, inferential statistics were used to determine significant relationships between the factors hindering access to finance and selected demographic variables.

Results show that accessing finance is indeed a problem for many SMMEs and factors hindering this process include lack of security, poor quality business plans and lack of business knowledge. Aspects relating to the financial services sector and government support structures were also cited as constraints in accessing finance. All stakeholders need to recognize that without addressing these constraints small businesses in South Africa cannot realise their full potential.

*Keywords: Small business, finance, problems encountered, South Africa, business environment.*

# INTRODUCTION

The importance of developing the small business sector as a vehicle for job creation and equitable economic growth remains indisputable. The South African government has recognised this and SMMEs are drawing increasing attention in the economic sector. International experience has also demonstrated that SMMEs play a valuable role in enhancing productivity, driving technical change, and above all, fostering entrepreneurship (Van Eeden & Viviers 2001:3).

However, an alarmingly high percentage of SMMEs fail in South Africa. There also exists a number of structural constraints in the economy that inhibit the potential of this sector. Worldwide experience shows that small businesses in general constantly deal with a myriad of constraints. Such constraints range from the legal and regulatory environment, problems with access to markets, finance, technology and business premises, as well as a lack of technical skills, managerial expertise and business infrastructure (The state of small business in South Africa 1997:26).

The inability to obtain sufficient funds is often cited as a major obstacle experienced by many small businesses (Ryan 2003; Demirg-Kunt & Love 2001). Access to capital, which is key to economic growth and the development of the SMME sector, has been identified as being difficult for the majority of South African small businesses (Access to capital is vital 2001:13). Research conducted by Sanlam (a South African insurance company) also showed a real need for financial assistance in the small business sector (Corporate mindshift towards SME market 2002).

The problems associated with financing SMMEs have significantly hindered the role they play in the overall performance of the South African economy. Research by The World Bank on finance, found that without access to external finance firms cannot realize their full growth potential, which will eventually result in slower economic growth for the country as a whole (Beck & Demirg-Kunt 2001). If SMMEs are to develop, it is critical for them to access adequate funds and it is thus important to assist them in obtaining funds. In 2001 President Thabo Mbeki spelled out exactly how serious the government was on the issue of financing small business start-ups and said that the government remained concerned that access to capital, which is key to economic growth and the development of the small and medium enterprise sector in the economy, remains difficult for the majority. Mbeki said that there was a need to develop the capacity to make such access easier while retaining a well-managed financial sector. Accordingly the micro-finance sector would be mobilised in support of entrepreneurship and productive activities (Access to capital is vital 2001). Despite the government's attempts over the past few years to remedy the problem, access to funding continues to plague the small and medium-sized business sector (Sukuzi 2003) and conflicting views exist as to why this is (Driver, Wood, Segal and Herrington 2001:44).

# RESEARCH OBJECTIVES

The primary objective of this study was to establish whether small businesses experience problems when attempting to access finance and to identify the factors hindering this process. A secondary objective was to investigate whether relationships exist between the factors identified and selected demographic variables.

## Literature review

The failure rate among SMMEs is unacceptably high in South Africa. It is estimated that between 70% and 80% of South African start-up businesses fail within five years (Moodie 2003) and millions of rands are lost (Barron (b) 2000:1). A number of structural constraints have been cited as major reasons for the underdevelopment and the failure of the SMME sector. This includes amongst others lack of access to finance, markets, information and mentoring, business premises, business skills and poor infrastructure. Access to finance, in particular, has been identified as the key constraint in the development of SMMEs. Not being able to access finance is seen by some as the single greatest impediment to their growth and success (Banks fail to feed the SMME pipeline 2003). Literature also proposes that inadequate capital or a lack of financing is one of the main reasons for small business failure (Sukazi 2003; Marx, Van Rooyen, Bosch & Reynders 1998:732; Van Aardt, Van Aardt & Bezuidenhout 2000:191; Olivier 1998:12). This problem is seen as the most serious constraint during the formation of a new venture and also manifests itself at later stages when businesses require additional inflows of capital to support expansion and growth (Van Eeden et al 2001:4).

It thus becomes vital to identify and examine the factors that impede the provision of finance to SMMEs in South Africa. A significant contribution to the development of SMMEs can be achieved through the understanding of these factors. The most prominent of these are government support structures, the financial services sector, stringent lending criteria of banks, poor quality of business plans, lack of business skills, lack of own contribution, lack of collateral, inability to meet loan obligation, high costs to banks, nature of the business activity, discrimination and lack of mentoring.

Based on existing literature sources, the various reasons as to why access to finance is denied and the various obstacles in obtaining finance are presented in Table 1.

**Table 1: Factors hindering access to finance**

Factors	Literature sources

# METHODOLOGY

## Research design and measuring instrument

Judgmental sampling was used in a survey conducted among small business owners/managers operating in a metropolitan area in South Africa. Judgmental sampling involves that researchers use their own judgement in selecting the small businesses to act as respondents. Selection to participate in the study was however based on the firm qualifying as a small business. "Small business" is a relative concept and for the purpose of this study, firms were considered as "small businesses" if they employed fewer than 50 full-time employees. This is consistent with the criteria laid down by the National Small Business Act (National Small Business Act No. 102. 27 November 1996). The original sample size was 214, and of the questionnaires returned, 188 were usable. This resulted in a response rate of 88%.

In an effort to investigate the problem of access to finance among small businesses, a research instrument in the form of a questionnaire was developed. The questionnaire consisted of two sections. Demographical information was requested in Section A and section B consisted of 26 items relating to various factors hindering access to finance. These statements were phrased with a possible response continuum of 1 to 5, where 1 = *strongly disagree*, 2 = *disagree*, 3 = *neutral*, 4 = *agree*, 5 = *strongly agree*.

## DATA ANALYSIS

Data analysis relating to reported results was conducted in three stages:

- An item analysis, consisting of a series of factor analyses, was undertaken to determine which of the items loaded together. This was done to determine which items should be used in summated scales to calculate the scores for the various factors hindering access to finance.
- Descriptive statistics such as the mean, standard deviation and frequency distributions were calculated to summarise the sample data distribution. This was done for each individual item and subsequent summated scores relating to the factors hindering access to finance.
- Finally, inferential statistics were used to determine significant relationships between the factors hindering access to finance and selected demographic variables.

## EMPIRICAL RESULTS

### Item analyses

A series of factor analyses revealed that the 26 items relating to the factors hindering access to finance, loaded onto seven different categories. These categories were named *loan criteria (security)*; *loan criteria (knowledge)*; *mentoring (assistance)*; *mentoring (reducing risk)*; *the financial services sector*; *government support structures*; and *personal issues*.

To evaluate the internal reliability of the measuring instrument, Cronbach Alpha coefficients were calculated. A summary of the results is given in Table 2. The Cronbach Alphas for *loan criteria (security)*, *mentoring (reducing risk)*, *mentoring (assistance)* and *personal issues* could not be obtained. This was because too few items loaded onto these factors. Of the remaining factors all obtained Cronbach Alpha coefficients of greater than the cut-off point of 0.70 as determined by Nunally (1978:226). The internal reliability of these factors was thus confirmed. Interpretation and conclusions made with regard to the other factors should however be treated with caution.

**Table 2: Summary of factor analyses per category**

Factor	Number of items	Factor loadings		Cronbach Alpha
		Min	Max	
Loan criteria (security)	2	0.69	0.79	na
Loan criteria (knowledge)	5	0.73	0.78	0.83752
Mentoring (assistance)	3	0.55	0.82	na
Mentoring (reducing risk)	2	0.65	0.84	na
Financial services sector	7	0.56	0.68	0.701856
Government support structures	5	0.58	0.87	0.803433
Personal issues	2	0.90	0.90	na

## Demographic and sample characteristics

The majority of respondents (75,53%) were both the owners and the managers of their small businesses. The results show that 77,66% of the respondents were male whereas only 22,34% were female. Most owners/managers (61,70%) were white, whereas 14,36% were black, 13,83% were Asian and 7,45% were coloured. The majority of respondents (72,87%) have been in this position for more than three years and most (65,96%) of the respondents do not possess a managerial qualification. The sole trader (36,17%) and close corporation (43,09%) are the most popular forms of enterprise and many of the small businesses operate in either the retail and/or wholesale (40,96%), or service (29,79%) sectors. The majority of respondents (71,27%) employed between one and ten full-time employees, and 51,59% reported an annual turnover of between R500 000 and R1 million.

## Findings on the ability to access finance and the factors hindering access to finance

Respondents were asked if they had experienced any difficulties when attempting to obtain start-up and/or growth capital from financial institutions. The results show that 37,23% of the owners/managers had experienced difficulties in obtaining start-up capital from financial institutions, whereas nearly the same number (37,77%) had not. Many respondents (45,74%)

reported, however, that they had not recently (in the last year) experienced difficulties when attempting to obtain capital, for either expansion or normal operations purposes, from financial institutions. Others indicated that this was not applicable to them (27,66%).

The factors hindering access to finance were identified and categorized as *loan criteria (security)*; *loan criteria (knowledge)*; *mentoring (assistance)*; *mentoring (reducing risk)*; *the financial services sector*; *government support structures* and *personal issues*. Table 3 below contains a summary of the descriptive statistics of these factors. Scores on the five-point scale were recalculated into disagree (less than or equal to 2.6), neutral (between 2.6 and 3.4) and agree (above 3.4).

**Table 3: Descriptive statistics of factors influencing access to finance**

Factor	Valid N	Mean	Std.Dev.	Frequency distribution %		
				Disagree	Neutral	Agree
Loan criteria (security)	188	4.01	0.93	10.11	10.11	79.79
Loan criteria (knowledge)	188	3.73	0.85	7.45	17.55	75.00
Mentoring (assistance)	188	3.69	0.79	6.38	32.45	61.17
Mentoring (reducing risk)	188	3.53	0.87	15.96	24.47	59.57
Financial services sector	188	3.72	0.68	6.38	22.34	71.28
Government support structures	188	3.79	0.82	4.79	14.89	80.32
Personal issues	188	2.64	1.14	48.94	23.94	27.13

As indicated in Table 3, it is apparent that the mean scores varied for all the factors hindering access to finance that were investigated. The highest mean score was allocated to the factor *loan criteria (security)* (mean = 4.01). Statements were put to the respondents to establish whether the lack of own capital and security were factors that hindered them from accessing funds. The vast majority of the respondents (79,79%) agreed with these statements. Lack of own capital/money obtained a mean score of 3.91 and the lack of security obtained 4.11. The Khula Credit Guarantee Scheme was created by the Department of Trade and Industry to help SMMEs that do not have adequate security to access finance from commercial banks. Questions were put to the respondents to establish whether they had heard of Khula and if they had ever made use of this scheme. Most respondents (58,51%) indicated that they had never heard of the Khula Guarantee Scheme, whilst only 2,13% of the respondents indicated that they had made use of the scheme.

The factor *loan criteria (knowledge)* obtained a mean score of 3.73. This factor included statements about the small business owners' lack of well-written business plans, realistic financial forecast, thorough market research, business experience and skills/knowledge as factors that hinder the small business owners/managers from accessing finance. Three quarters (75%) of the respondents agreed with these statements. The respondents generally agreed that the lack of a well-written business plan was a factor hindering access to finance (mean = 3.81), as well as the lack of realistic financial forecasts (3.79), thorough market research (3.67), business experience (3.62) and business skills/knowledge (3.78).

*Mentoring (assistance)* obtained a mean of 3.69. This factor considered statements about whether the entrepreneurs had received assistance from banks/financiers or NGOs when applying for start-up financing. Most (61,17%) respondents agreed with the statements that they had not been assisted in drawing up business plans when applying for start-up capital (mean = 3.92). Respondents were generally aware of NGOs providing assistance when seeking funds, but most agreed that they had not obtained assistance from these bodies (mean = 4.29).

*Mentoring (reducing risk)* obtained a mean score of 3.53. Statements were put to the respondents to establish whether small business owners thought that mentoring would have increased their chances of obtaining finance. Many (59,57%) small business owners/managers agreed with these statements. The research shows that small business owners/managers thought that their chances of obtaining funds for start-up capital would have been enhanced if they had received more assistance from the banker or financiers (mean = 3,21) and that risks associated with business lending would be reduced by banks offering pre and post funding assistance (3.86).

*The financial services sector* obtained a mean score of 3.72. Respondents were requested to identify whether aspects relating to the financial services sector hindered access to finance. The majority (71,28%) of respondents agreed with these statements. The results show that banks are perceived as not willing to take risks (mean = 3.99). Respondents were however neutral with regard to viewing banks as not willing to provide entrepreneurs with assistance (3.21) and viewing small clients as unprofitable (3.34). The respondents further indicated that more competition among banks will improve an entrepreneur's chances of obtaining funds (3.82), improve products or services offered to small businesses (3.99), reduce bank charges for small business clients (3.93) and reduce interest rates charged on bank loans and overdrafts (3.78).

*Government support structures* as a factor hindering access to finance obtained a mean score of 3.79. This factor considered the perception of the government support structures and how the government could offer more support to small businesses. The vast majority of respondents (80,32%) agreed with these statements. The results show that respondents felt that government could offer more support by making more funds available for small business development (mean = 4.12), by providing more non-financial support to entrepreneurs seeking finance (3.92), by subsidising more small business loans (3.88) and by implementing a more effective loan guarantee scheme (3.95). Respondents were however neutral with regard to forcing banks through legislation to grant more loans to small businesses (3.07).

*Personal issues* as a factor hindering access to finance obtained a mean score of 2.64 and this score was the lowest of the five categories. Statements were put to the respondents to establish whether they had experienced hostile attitudes from banks or financiers, or had been discriminated against when applying for finance. Many respondents (48,94%) had not experienced hostile attitudes and/or discrimination when applying for finance. As a whole, the *personal issues* experienced when applying for finance got a low mean, but when considering the individual items, one could see that some small business owners were neutral (23,94%) or agreed (27,13%) with regard to experiencing hostile attitudes and discrimination when applying for finance.

## Relationships between factors hindering access to finance and selected demographic variables

The analysis of variance (ANOVA) was undertaken to determine whether significant relationships exist between selected demographical variables and three of the factors hindering access to finance. Inferential statistics were not obtained for the other factors, as the internal reliability of these factors was not confirmed. The ANOVA results are shown in Table 4.

**Table 4: Relationships between factors hindering finance and demographic variables**

Demographic variables	df	Loan criteria (knowledge)		The financial services sector		Government support structures	
		F	p	F	p	F	p
Ownership status	2	2.9698	<b>** 0.054131</b>	2.7076	<b>**0.069734</b>	2.4495	<b>**0.089548</b>
Gender	1	0.2236	0.636973	0.0039	0.950265	0.8692	0.352579
Population group	4	0.4013	0.807514	0.7195	0.579752	5.4893	<b>*0.000362</b>
Term of management	3	0.1019	0.958856	0.4259	0.734701	1.5866	0.194698
Management qualification	1	10.6029	<b>*0.001377</b>	0.367	0.848328	1.6016	0.207506
Form of enterprise	4	0.4280	0.788238	2.33771	<b>**0.054132</b>	0.5586	0.693048
Nature of industry	4	4.0604	<b>*0.003656</b>	3.7621	<b>*0.005925</b>	1.6121	0.173709
Number of employees	3	1.4505	0.230176	2.2937	<b>**0.079996</b>	0.8015	0.494710

\* p<0.05

\*\*p<0.10

From Table 4 above, it is clear that there is a significant relationship between *loan criteria (knowledge)* and the following namely, *ownership status* (p<0.10) and *management qualification* (p<0.05). Respondents who were both owners and managers agreed to a greater extent (mean = 3.76), that loan criteria (knowledge) was a factor that hindered them when accessing finance than respondents who were owners but not managers (mean = 3.42). It appears that owners/managers with a management qualification (mean = 4.04) also regard *loan criteria (knowledge)* as a hindrance more than owners/managers without a management qualification (mean = 3.57). A significant relationship (p<0.05) is evident between *loan criteria (knowledge)* and the *nature of industry*. It appears that small businesses in the service (mean = 3.88) and retail and/or wholesale industries (mean = 3.86) agreed to a greater extent that *loan criteria (knowledge)* is a factor hindering access to finance than small businesses in the manufacturing industry (mean = 3.31).

There is a significant relationship (p<0.10) between the *financial services sector* and *ownership status*. Respondents who were owners (mean = 3.86) and those who were both owners and managers (mean = 3.76) regard the financial services sector as a factor hindering access to finance more than respondents who were only managers (mean = 3.44). The *financial services sector* also shows a significant relationship with the following namely, *form of enterprise* (p<0.10), *the nature of industry* (p<0.05), *number of employees* (p<0.10) and *annual turnover* (p<0.10). It appears that close corporations perceive the financial services sector as a factor hindering access to finance (mean = 3.81); however partnerships do so to a lesser extent (mean = 3.38). Small businesses in the retail and/or wholesale industry (mean

= 3.85) also perceive the financial services sector as a factor hindering access to finance to a greater extent than small businesses in the manufacturing industry (3.43). It was found that small businesses that employ between 6 and 10 employees (mean = 3.91) regard the financial services sector as a factor that hinders them from accessing funds more so than small businesses that employ between 11 and 20 employees. Small businesses with an annual turnover of more than R5 million (mean = 3.85) regarded this factor to be hindrance when accessing funds more than small businesses earning an annual turnover of less than R500 000 (mean = 3.56). This finding corresponds with literature where it is indicated that larger firms find it easier to obtain capital from financial institutions than smaller firms.

There is also a significant relationship between *government support structures* and the following namely, *ownership status* ( $p < 0.10$ ) and *population group* ( $p < 0.05$ ). It was found that respondents who were managers (mean = 4.11) and those who are both owners and managers (mean = 3.79) agreed to a greater extent that government support structures hindered their ability to access funds, than the respondents who are only managers (mean = 3.61). It also appears that black (mean = 4.13) and Asian (mean = 4.31) small business owners regard government support structures as a factor that hinders them from accessing funds to a greater extent than whites (mean = 3.62) and coloureds (mean = 3.96). This relationship is somewhat surprising given the government's push for Black Economic Empowerment.

## **CONCLUSIONS, RECOMMENDATIONS AND MANAGERIAL IMPLICATIONS**

Based on existing secondary sources, it was found that access to finance is a constraint facing small businesses. It was also identified that government support structures, the financial services sector, stringent lending criteria of banks, poor quality of business plans, lack of collateral and lack of own contribution, inability to meet loan obligation, discrimination and lack of mentoring and assistance were factors hindering access to finance. The theoretical study provided the base on which to undertake the empirical investigation. More specifically, the following aspects were investigated, namely to establish whether small businesses experience problems when attempting to access finance and to identify the factors hindering this process.

The study revealed that many of the respondents had experienced difficulties in obtaining start-up capital from financial institutions and that there were numerous factors hindering this process.

Small businesses in South Africa are generally considered as notoriously risky, and thus banks and financiers need to demand the level of collateral that will compensate them for the risk assumed. A high percentage of the owners/managers stated that lack of security (collateral) and own contribution was a factor that hindered them from accessing finance. Furthermore, it appears that the Khula credit guarantee scheme designed to assist small businesses that do not meet the necessary collateral requirements, has been ineffective. Most of the respondents indicated that they had never heard of Khula, whilst only a few had

made use of the scheme. With regard to security (collateral) and own contribution requirements, the following recommendation could be made:

- Banks and financiers should place less emphasis on collateral and security and rather focus on the merit and viability of the business.
- The government must create more awareness of the Khula guarantee scheme and thus encourage more small businesses to make use of the scheme. Banks should also inform loan applicants of this scheme.
- Banks and financiers should evaluate the risk profile of the small businesses requiring finance, and offer mentoring and assistance to those considered high risk.

Literature showed that lack of business skills/knowledge and inability to prepare satisfactory business plans by many small businesses, had influenced their ability to access funds. Respondents stated that the lack of well-written business plans, as well as a lack of realistic financial forecasts, thorough market research, business experience and skills/knowledge were factors that hindered small businesses from accessing funds. This clearly indicates that the problem in accessing finance arises not only as a result of the lack of collateral on the part of the small businesses, but also as a result of poor quality of business plans and lack of business skills/knowledge by small business owner/managers. The empirical results further showed that most of the owners/managers had not received any assistance when applying for finance and were not aware of the NGOs that provided assistance to entrepreneurs when seeking finance. Furthermore, the many respondents felt that their chances of obtaining funds would have been enhanced if they had had more assistance from banks and financiers, and thus believe that banks and financiers can reduce the risks associated with small business lending by offering pre and post funding advice. The following recommendations with regard to providing assistance can thus be made:

- More assistance and mentoring should be provided to small business owners/managers, particularly to those who lack business experience, skills and knowledge. A fee could be charged for the mentoring and assistance.
- Small business owners/managers need to be informed on what to do, in terms of how to set up and manage a business.
- Banks and financiers should provide checklists, procedures, brochures, websites etcetera, which could assist small businesses to prepare the necessary information such as business plans, financial forecasts and market research.
- Awareness of NGOs and other institutions providing assistance should be increased.
- It is important that the mentoring and assistance programmes are consistent and sustainable.

Although the financial services sector in South Africa is well developed, it has been unable to make sufficient amounts of funds available to the majority of SMMEs. From the literature it was seen that the financial sector is inadequate in meeting the challenges posed by the demand for capital by the developing SMME sector. The results of the research also showed that the majority of the respondents regard the financial services sector as hindering them from accessing finance and regard banks as not willing to take risks. A considerable contribution could be made to the development of the SMME sector if the financial services industry changed their attitudes towards small businesses. In this regard the following recommendations are made:

- Banks and financiers must change their attitudes and be more risk accepting.
- Products and services offered to small businesses can be improved and tailored to their needs.
- More competitive bank charges and interest rates should be negotiated for small businesses.

A general view is that the South African government's stated desire to promote small businesses has not been matched by its deeds. The government's support programmes aimed at promoting small businesses in particular, the two development agencies Khula and Ntsika, have been ineffective. The majority of the respondents indicated that government support structures were indeed a factor that hindered them from accessing finance. The following recommendations are made with regard to government support structures:

- More funds should be made available for small business development.
- Non-financial support such as mentoring for entrepreneurs seeking funds should be provided.
- The government should consider subsidising more small business loans.
- A more effective loan guarantee scheme should be established.

One other factor that has been reported to be hampering the development of the South African SMME sector is personal issues such as hostile attitudes from banks and financiers, and discrimination on the basis of race and/or gender. However the results of this study show that most of the respondents did not experience the above-mentioned personal issues or were neutral about them. This is an encouraging sign but does however not suggest that personal issues are not a problem. The following are recommended with regard to personal issues:

- Banks and financiers must try to understand the sociology of previously disadvantaged entrepreneurs, mainly those who lack business experience and skills/knowledge.
- Banks and financiers must employ more friendly and competent staff that will understand the needs of small businesses.
- Banks and financiers must try to understand the socio-economic, cultural and language barriers faced by many entrepreneurs.

An analysis of variance (ANOVA) was conducted to determine the relationships between factors hindering access to finance and selected demographic variables. It was found that respondents who were both owners and managers agreed to a greater extent that *loan criteria (knowledge)* was a factor that hindered them when accessing finance than respondents who were owners but not managers. Owners are more likely to be the ones approaching the financiers and are thus more likely to experience this as a problem. It appears that owners/managers with a management qualification also regard *loan criteria (knowledge)* as a hindrance more so than owners/managers without a management qualification. This finding is somewhat surprising as one would expect owners/managers with a management qualification to experience fewer problems with regard to well-written business plans, realistic financial forecasts, market research, business experience and skills/knowledge. A significant relationship was also found between loan criteria (knowledge) and the nature of industry. It appears that small businesses in the service and retail and/or wholesale industries agreed to a greater extent that the *loan criteria (knowledge)* is a factor hindering access to finance than small businesses in the manufacturing industry.

It was found that respondents who were owners and those who were both owners and managers regard the financial services sector as a factor hindering access to finance more than respondents who were only managers.

The *financial services sector* also showed a significant relationship with the following namely, form of enterprise, the nature of industry, number of employees and annual turnover. It appears that close corporations perceive the financial services sector as a factor hindering access to finance more so than partnerships do. Small businesses in the retail and/or wholesale industry also perceive the financial services sector as a factor hindering access to finance to a greater extent than small businesses in the manufacturing industry. It was found that small businesses, which employ between 6 and 10 employees regard the financial services sector as a factor that hinders them from accessing funds more so than small businesses which employed between 11 and 20 employees. Surprisingly, small businesses with an annual turnover of more than R5 million regarded this factor to be hindrance when accessing funds more so than small businesses earning an annual turnover of less than R500 000.

There is also a significant relationship between *government support structures* and the following namely, ownership status and population group. It was found that respondents who were managers and those who are both owners and managers agreed to a greater extent that this factor hindered their ability to access funds, than the respondents who were only managers. Owners are more likely to apply for financing than managers and are thus more likely to be exposed to government support structures. It also appears that black and Asian small business owners regard this factor as hindering them from accessing funds to a greater extent than whites and coloureds. A possible explanation for this is that with the government's drive for the upliftment of previously disadvantaged persons, these persons are targeted by government support structures. Black small business owner/managers are thus possibly more likely to approach government for support and in this way more likely to experience the shortcomings of these structures.

From this study, it is evident that access to finance is indeed a problem for small businesses in South Africa. The South African government and financial services sector need to recognize that without adequate financing, small businesses cannot realise their full growth potential, and this will eventually result in slower economic growth for the country as a whole. Finally, if the South African SMME sector is to develop, it is critical that the issue of access to finance is addressed effectively by all stakeholders in the country.

## ABSTRACT

Electronic Mentoring or E-Mentoring, although becoming established in some fields, is still relatively new in the area of supporting entrepreneurs; the Small Business Service<sup>1</sup> (SBS) and South East England Development Agency<sup>2</sup> (SEEDA) were the first to test this innovative approach with entrepreneurs. Combining the core principles of mentoring with today's technology will enable E-Mentoring to offer a more cost effective approach for funded business support and increasing the availability of mentoring. This paper aims to stimulate the debate amongst academics, policy makers and entrepreneurs; it will review some of the literature on E-Mentoring and the approach to learning that entrepreneurs have hitherto traditionally taken.

**Key Words:** Entrepreneur, E-Mentoring, Electronic Mentoring, Learning Styles

---

# INTRODUCTION

This paper explores the question, “Can entrepreneurs learn through E-Mentoring?”

To address the question posed the paper will review the literature around preferred learning styles; E-Mentoring in a business environment and the results from the evidence offered from two pilot programmes. It will then endeavour to link the outcomes from the literature with the results derived from the evaluations. The first business E-Mentoring program referred to in this paper is MentorsByNet piloted in the South East of England, and a subsequent program that was trailed in the London region of the UK using a common approach. Both were independently evaluated utilising the same methodology for comparative purposes.

When using the term “entrepreneurs” in the context of this paper it refers to both mentors (entrepreneurs who have volunteered their time to assist other entrepreneurs) and mentees who have applied to take part in the programmes.

This paper argues that E-Mentoring supports the learning styles of this group of entrepreneurs, because of its immediate nature as well as the variety and flexibility of the subject matter making it timely and ‘entrepreneur-centric’.<sup>3</sup>

## The Case for Mentoring

Mentoring relationships are not new: many of us can think of examples of where an individual has influenced us in a positive way at some point in our lives. Bennis (2004), while discussing his view of the seven stages of leadership, reiterates the importance of having a mentor at various stages of a leader’s personal development, from the very first stage through to the mature stage when perhaps, the mentee becomes the mentor!

Mentors may play a number of roles such as coach, friend, and counsellor. Since the late 70’s there has been considerable debate around the value of individuals in mentoring relationships where the focus of attention is placed on the quality of the mentoring relationship (Higgins & Kram: 2001). This is emphasised by Eby (1997) who often refers to mentoring as “an intense developmental relationship”.

Stokes (2003) discusses the strongly interpersonal relationship between mentee and mentor in which a safe place exists for the mentee to explore and grow. This is further supported by Alred & Garvey (2000:146):

“A mentor is sensitive to the emotional and intellectual aspects of the mentee’s world. Offering empathy is a basis for establishing trust in the mentoring relationship, a condition for learning that goes beyond the routine and the instrumental.”

The mentor acts as a confidante and, as Clutterbuck & Megginson (1998) put it; will offer ‘help...in making significant transitions in knowledge, work or thinking’. Mentoring relationships can be highly structured or fluid in design allowing the relationship to move in any direction the mentor and mentee agree, but always in support of the mentee’s goals. In recent times mentoring has been identified as an important learning activity in a variety

---

<sup>3</sup> The authors recognise that the evidence used to support the analysis and conclusions rests on entrepreneurs who have voluntarily participated in E-mentoring programmes piloted in the United Kingdom (UK) and thus were self selecting.

of contexts (Hansford, Tennet & Ehrich: 2002), such as businesses and the more traditional learning environments.

As in all aspects of mentoring, more critical questions are now being asked about the quality and effectiveness of mentoring relationships Stokes, Garrett & Hunt (2003). Ragins, Cotton & Miller (2000) draw our attention to the dangers of so-called 'marginal mentors' and McAuley (2003) explores what he refers to as the 'ambivalence' of mentoring, employing psychoanalytic constructs such as transferences and counter transference between mentor and mentee.

Stokes et.al. (2003), raise a number of questions, specifically about e-mentoring. Firstly, can e-mentoring - as an alternative mode of mentoring – enable mentoring relationships of sufficient depth and quality so that benefits can be gained? Related to that question, we can also ask whether e-mentoring can overcome some of the difficulties experienced in traditional didactic mentoring relationships. If the answer to both questions is 'yes' then e-mentoring has a great deal to offer to the field of mentoring and coaching.

Although there appears to be no common definition assigned to this relatively new term, there is little known on the subject, as demonstrated from the literature review that follows, E-mentoring is a term rapidly gaining in popularity..

In many traditional didactic cases where mentoring programs were reported to have negative outcomes, success appeared to have been jeopardised by lack of time, lack of training; the negative attitudes of others or poor matching of mentors and mentees (Hansford et. al.:2002). We will explore how some of these problem areas can be alleviated through E-Mentoring.

## **What is E-Mentoring?**

### **A Review of E-Mentoring Literature**

While there has been a veritable explosion of online mentoring websites and opportunities within a wide variety of professions, very few academic articles to date have addressed this phenomenon Ensher, Heun & Blanchard (2003). Stokes et.al, (2003) also identified that as yet, there is relatively little empirical evidence to constitute a thorough exploration of what e-mentoring is and whether it works or not.

Perren (2002), in a piece of research commissioned by the authors during the development phase of MentorsByNet programme, identified a limited number published articles, supporting the view that few academics have sought to address this area of research to date. This looked primarily at the research of e-mentoring and its relevance to entrepreneurs.

To date any research on E-Mentoring immediately runs into a barrier over the definition: Kasprisin, Single, Single & Muller (2003) point out that, e-mentoring "...has also been popularly termed telementoring, cyber mentoring and on-line mentoring...". Perren's (2002) review identifies use of the internet, using email and list servers and non face to face methods of interaction as being key aspects of e-mentoring. Although the literature in this area is relatively sparse, some definitions are offered for e-mentoring. For example, Single & Muller (2001) define e-mentoring as:

“a relationship that is established between a more senior individual (mentor) and a lesser skilled or experienced individual (protégé), primarily using electronic communications, that is intended to develop and grow the skills, knowledge, confidence, and cultural understanding of the protégé to help him or her succeed, whilst also assisting in the development of the mentor”.

This is useful as a starting point but is, arguably, not hugely differentiated from many definitions of traditional mentoring: the same could be said of others offered in Perren's (2002) review. Gibb (1994) argued that mentoring cannot be explained through a single universal definition, an argument that can equally be applied to E-Mentoring.

After an extensive literature search Perren (2002) identified 20 papers that initially looked to be relevant to both E-Mentoring and Entrepreneurs, however further analyses reduced this to three core papers, a brief summary of each follows:

- Evans and Volery (2001) - this article looks at providing "business development services, such as training... and networking" through the internet by asking 'experts' "from around the world." Three success factors are found: 1. Internet communication is perceived as "second-best" to face-to-face; 2. So face-to-face contact is needed as a primary form of communication, internet provision is not a substitute; 3. The management of the internet site and program is a key factor".
- Stokes (2001) - this article is one of the most focused on the topic of the review as it looked at the feasibility of introducing a UK on-line tele-mentoring advisory scheme based on the Distance Learning Advisory Service in the Netherlands. Focus Groups were used to ask owner-managers what they thought about the idea. Owner – managers saw computers as a vital part of their businesses, but there was a wide range of application of computers and levels of confidence varied. Issues of trust, flexibility of delivery of support and time were repeating themes. Owner-managers also thought that face-to-face tutorship and networking with peers was important and they liked the idea of directed tutorship/mentoring rather than just brainstorming.
- Sullivan and Duffy (2000) - this article builds on Sullivan (2000) and reports some of the same issues. This summary will concentrate on the additional features of the article that look specifically at e-mentoring. A range of e-tools are suggested that could support entrepreneurs and facilitate e-mentoring including: email, email with attachments, as-synchronous electronic discussion forums (not in real time) and synchronous teleconferencing (in real time). Discussion forums could allow entrepreneurs to share and discuss concerns and mentors could make contributions. Teleconferences are normally arranged at a pre-arranged time, it is suggested that the "role of the mentor is to assist focusing the group on a topic of discussion and ensuring that all participants have the opportunity to contribute". A teleconference could also be used for a "problem clinic" where mentees bring forward their live problems for consultation either with their mentor alone or with other mentees.

Stokes et. al. (2003) are critical of Perren's review and the contributions that existing research makes to e-mentoring. The emerging view is that current research falls short of a robust evaluation of the area, largely due to the lack of data. Those who have published on the subject have tended to balance low cost and flexibility of e-mentoring schemes against the limitations that e-mentoring has when dealing with more complex interpersonal issues. As a result, there have been calls for e-mentoring to be seen as a supplement to, but not a substitute for face to face mentoring. However, the paucity of research limits the extent to which this can be claimed with confidence.

Beech & Brockbank (1999) offer another perspective when considering the issue of power and how the imbalance of power may be overcome through e-mentoring. They consider how face-to-face interactions may be distracted by visual clues, and issues related to setting, context, and atmosphere may hamper communication. They conclude that as e-mail and text based messaging are leaner communication channels that allow for more direct information transfer, it could remove contextual issues.

Stokes et. al. (2003) conclude that e-mentoring, due to the 'leanness' of text based communication, might compel the participants to focus more on the substance of the message than on the style, status etc of the person delivering it. This therefore adds an additional research question to those already contributed: can e-mentoring offer additional benefits which go beyond those offered by traditional mentoring? Stokes et. al. (cites Hawkrigge's, 2003) article, which is based on his eighteen years experience with the Open University, offers some additional ways in which text based communication might hold sway over face-to-face interaction. These advantages seem to stem from the recordable nature of the text which, unless special effort is made to record face to face sessions, is not usually used in those sorts of interactions. As the text is available, this enables all parties to make sense of the contributions by "synthesising and summarising, drawing threads together, watching for and correcting conversational drift, spotting good ideas" and so on.

It has become apparent from the literature that many authors believe E-Mentoring is a suitable means of support for the traditional physical mentoring relationships, rather than a relationship that exists solely through the use of technology. The definitions offered earlier also appear to be inappropriate to the authors, who offer the following definition:

"E-Mentoring uses technology to facilitate the development of a supportive relationship for experimentation & personal development in a safe, convenient & timely environment; helping both mentee & mentor to grow"

## **An Overview of the Practice**

Electronic mentoring has been developed based on the possibilities unique to information and communications technology. The common feature of electronic mentoring programmes is the independence from geography and time constraints for connecting mentoring participants which we will see later.

The approach for E-Mentoring in a business to business environment was originally conceived by Kevin Hunt, (one of the authors) whilst in post as Regional Director, SBS with the belief that mentoring could be made available to a greater number of entrepreneurs through an approach adapted for technology. The concept was tested against published research (see Perren: 2002). A full market analysis was also commissioned using similar approaches through the web from which two principal schemes were identified ([www.mentornet.net](http://www.mentornet.net) and [www.apesma.asn.au/mentorsonline](http://www.apesma.asn.au/mentorsonline)) from where learning was taken to aid development, . From this approach MentorsByNet<sup>4</sup> ([www.mentorsbynet.org.uk](http://www.mentorsbynet.org.uk)) was developed and the learning was shared with Business Link for London and a second, smaller pilot, was established.

---

<sup>4</sup> MentorsByNet a programme operated by Business Link Surrey and funded by SEEDA & SBS

The market analysis from both public and private organisations as well as educational institutes, throughout Europe and North America showed that the concept and value of mentoring is becoming a widely accepted practice. It was also apparent that E-mentoring is also slowly making an appearance on a variety of scenes, such as areas of social needs, but little in business.

It was therefore perceived that a more flexible and over time a relatively inexpensive approach to delivery, could open up the benefits of mentoring to a much wider audience. Many face-to-face schemes exist, but these can normally only handle relatively few in number. Thus many entrepreneurs have otherwise been excluded from face-to-face mentoring schemes due to the time, distance, social and financial constraints impinging upon them through running a small business. As already mentioned E-mentoring is in its infancy, but could, some believe, lead to a worthwhile addition to the services provided to entrepreneurs through the public funded business support organisations.

It is widely recognised that entrepreneurs such as business leaders are often in a very isolated position (among others Bennis: 2004) and the Sunday Times: 2003:19), and not all feel they can turn to their board of directors (assuming they have them) for advice or guidance while sole traders are in the same position frequently having few options as to where they can seek help.

One of the key aspects of the programme's success has been its ability to attract mentors on a voluntary basis, from the pool of existing entrepreneurs. It was recognised by many of the mentors that they benefited from the relationship, as referred to earlier by McAuley (2003). The uniqueness of the programme from the mentor's perspective was the convenience factor and that it required just small amounts of time.

The following are the core elements of the MentorsByNet program:

- The pilot supported programmes offered by intermediary business support organisations rather than going direct to market, in this instance through the Business Link Network of the SBS
- Entrepreneurs at various stages of their life were recruited as volunteer mentors and support was offered free to mentees
- All forms of technology could be used to support the process, such as web based email, instant relay chat, web cam, discussion forum, phone & texts, etc.
- Geographical location WAS NOT used as a determining factor when matching candidates to mentors.
- The pilot would support a three month mentoring relationship, ( a minimum of six months was preferred but was limited to three due to funding timescales)
- As face-to-face meetings were not considered part of the process, a process of facilitating the relationship was developed
- Online training was provided to both mentee and mentor to ensure standards were maintained
- Ongoing evaluation and feedback was sought
- Usage volumes would be captured

A follow up programme is currently underway with 6 month relationships and enhancements to the processes and technology applications, resulting from feedback and progress in take up of broadband internet connectivity in the UK.

## How do Entrepreneurs Learn?

Since the early 90's it has been thought that the capability of organisations, thus the people within from sole trader to many, that to learn is necessary for success in today's complex, challenging and constantly changing environment, Senge, (1990), Argyris (1999) and Handy (1996). With this focus on learning, much has been written about the entrepreneur or entrepreneurship, here we will take a look at a limited selection of the literature.

Much effort has gone into trying to understand the learning styles of entrepreneurs but Deakin (1999:22) feels "we do not understand how entrepreneurs learn, yet it is accepted that there is a learning experience from merely establishing a new enterprise". He goes on to conclude that being an entrepreneur is in itself a learning experience and thus the ability to learn from experience involves the concept of double loop learning: a process of examining why the problem occurred and to learn from that process (Senge:1999).

Kirby (2003) re-enforces the concept of learning by doing and reminds us of Kolb's learning cycle: concrete experience → observations and reflections → formation of abstract concepts and generalizations → testing implications of concepts in new situations, back to concrete experience. For the entrepreneur most of this learning takes place in one individual who addresses all the stages: this is referred to as experiential, Marsick & Watkins (1990) coming from an "implicit" perspective. Kirby (2003) also discusses the entrepreneurship types and considers the impact of different learning styles that may be attributed to them, for instance the 'innovator' will be more creative and will require stimulus, as opposed to the 'change agent' who may require more practical support.

The subject of "adaptive" and "generative" learning is discussed by Sullivan (2000) and introduces the notion of 'bring forward' experience rather than waiting for and learning from it. Sullivan (2000:2) also cites Williams's model of organisational learning that incorporates four common individual characteristics of learning:

1. goal directed
2. experience based
3. learning that impacts on behaviour
4. learning that impacts upon the culture of the organisation

When the characteristics are viewed with Rae's (2000:6) findings of five broad career stages we can begin to see how the needs for learning change through the life cycle and appear to be dependent upon the individual entrepreneur's stage at any given time, thus the learning is circular with previous stages being revisited when entrepreneur moves into new ventures. This is further supported with Boyatzis's theory of self directed learning, Goleman, Boyatzis & McKee (2002:110), based on the principles of open loop learning, which implies that to understand the learning styles and needs of entrepreneurs it is necessary to attune to their immediate and long term goals.

Thus learning can be viewed as a continuum, but one that shifts with events for entrepreneurs and thus has to be flexible. Based on the evaluations we can see that E-Mentoring does support this type of approach for learning and would therefore appear to be effective at coping with the changing requirements.

## RESULTS FROM 2 PILOTS

The SBS SE Team (the authors) commissioned an independent evaluation of the two pilot programmes that were being operated in the SE of England through Business Link for Surrey and London through Business Link for London. The independent evaluation was carried out by a team led by Professor David Megginson of Sheffield Hallam University. The following section contains the relevant findings.

### MentorsByNet Programme (MBN) South East England

#### Evaluation methodology

The research was carried out in two phases - in the form of pre- and post-programme e-mailed questionnaires. The questionnaires were based on the one sent out by APESMA (Australia), for comparative purposes, as well as covering additional aspects that were of interest to the sponsors of MBN and the researchers.

On both occasions questionnaires were sent out to mentees and to mentors at the same time, but differently worded.

The decision to send out both a pre- and post-questionnaire instead of just a post-programme one was founded on the desire to evaluate and compare pre-programme expectations with post-programme views grounded on experience.

A preliminary analysis of the pre-programme questionnaires was undertaken using the industry standard computer package for analysing data called SPSS. A preliminary report was produced. The data was analysed looking at both frequency of response as well as any significant correlations using the Spearman rho method.

#### Percentage of respondents - pre- and post-programme

	<b>Pre</b>	<b>% of population</b>	<b>Post</b>	<b>% of population</b>
<b>Mentee</b> (out of a possible 46)	19	41%	23	50%
<b>Mentor</b> (out of a possible 41)	19	46%	24	59%

All percentages cited in the final report were of the total number of respondents in each category (pre and post; mentee and mentor) in the survey.

Questionnaire response rates are often an issue in this type of evaluation research. Estimates of what is a 'reasonable' response rate vary but many studies cite 30% as being typical. This study had a response rate of over 50% which was gratifying. The size of the pilot means that the number of responses was modest; nonetheless conclusions can be drawn about the success of the programme.

Significant correlation between responses to different questions in the mentee and the mentor post-questionnaires

In sifting through the colossal number of inter-correlations between responses to questions we have:

1. Focussed only on correlations significant at the .01 level of probability (i.e. there is a 99% of probability that the link is more than pure chance).
2. In selecting from the still large number of significant correlations, we have started from key output variables (satisfaction, development, recommend to others) and studied which input variables (scheme features) they are linked with.

## **Emerging themes**

### Email-based mentoring

- In the pre-programme questionnaire 84% of mentees and 70% of mentors affirmed that the fact that MBN was an email-based programme encouraged them to participate. Post-programme mentee response had slightly increased to 90% while mentor response had slightly decreased to 63%.
- 65% of mentees and 71% of mentors cited issues of location and timing as reasons why the e-mentoring programme was preferred over traditional face-to-face mentoring meetings.
- Pre-programme 74% of mentee and mentors expected to supplement their email contact with other forms of communication while 48% of mentees and 79% of mentors said that they did this. This largely was in the form of telephone conversation.
- In line with the APESMA study a number of participants indicated that, while e-mentoring was convenient and flexible, it was not completely ideal. Many commented that their partnership either did or would have benefited from being supplemented by other forms of communication such as telephone (mentees 48% and mentors 67%) and face-to-face (especially in the early stages) to develop a sense of rapport and trust.
- 13% of mentee respondents and 17% of mentor respondents found no issue with this mode of conducting a mentoring relationship. Some other issues raised around email-based mentoring were its impersonal nature, time taken and continued commitment to the relationship. This, once again, is in line with the findings of the APESMA study.

## **SUMMARY OF KEY SUCCESS FACTORS**

One of the purposes of the evaluation was to identify key success factors in running e-mentoring programmes for SMEs. In reviewing the finding of this study together with the APESMA results we identified the following:

1. The importance of appropriate matching
2. The degree of desire that participants have to be involved in such a scheme in the first place
3. Establishing programme goals at the outset - mentee lead

4. Programme duration of at least 6 months
5. Pre-programme training which helps participants to manage their expectations
6. Setting a communication plan at the outset of the programme and regular contact between mentoring partners
7. Supplementing email-based communication with other modes of communication
8. Assisting mentees to sustain motivation - e.g. frequent facilitators messages of prompts and encouragement
9. Participant commitment to programmes and making the effort to give some priority to the relationship
10. Establishing a good mentoring relationship (e.g. rapport and trust)

## **Case Study Two: Business Link for London Programme**

One of the key objectives of the Business Link for London (BL4L) E-Mentoring pilot programme was to assess whether e-mentoring will add value as part of the BL4L Start-up core offering and, if appropriate, can then be established across London for BL4L and/or their partners. Other objectives of the pilot were to assess how e-mentoring provides a resource-efficient way of delivering customer satisfaction and whether it might enhance traditional business support services.

The programme was conducted over three months, involving 18 mentoring partnerships. It concluded at the end of July 2003 and a independent comprehensive evaluation was undertaken which measured areas such as perceived experience of the programme, programme outcome, satisfaction with contact frequency, and satisfaction with programme guideline notes. These are areas that the Business Link Surrey and Australian APESMA programme measured so we were able to use these schemes as benchmarks. In line with the BLS scheme but filling a gap in the APESMA survey this evaluation measured perceptions of benefits from the scheme; concern for the practical relevance of the programme; responses about focusing on the realisation of specific goals and plans; and perceptions of the benefits of the e-mentoring programme.

In the first instance, it is prudent to once again, discuss some issues that may have impacted on the Business Link for London scheme in comparison the BLS programme.

- The first issue is that of resource allocation. Whilst the BLS scheme has been used as comparative data for the Business Link for London analysis, it must be acknowledged that, due to the differences in the financial resourcing of the projects, that comparison can only ever be approximate in nature. With financial backing of a modest £22K, the Business Link for London scheme, by necessity, is small in scope and only modest scale can realistically be expected from this.
- The second issue to raise is that of the initial implementation of an Instant Messenger System (IMS) as a way for the mentees and mentors to communicate. Due to time and monetary constraints this booking system proved to be too complicated for the majority of users. This process of was therefore mothballed four weeks into the programme and may have impacted on participant's making initial contact with their mentoring partners.

Whilst there was a 'reasonable' return rate (approximately 47%) of evaluation questionnaires, compared with a typical response rate of 30%, it should nevertheless be pointed out that a significant number of scheme participants have not returned their evaluation forms. It is difficult to tell what that means in terms of the views of the scheme as this set of participants have not articulated their views, but this must temper any general conclusions that can be drawn about Business Link for London as a scheme.

One of the strengths of using survey/questionnaire research is that it enables trends to be identified in participants' responses and exposes any weak points/areas requiring change by the scheme. On the other hand, it does place some constraints on understanding 'why' certain individuals have given certain answers. An additional feature of this evaluation was that the BLS and APESMA schemes were being used as a benchmark. Therefore, there needed to be sufficient compatibility between the evaluation instruments, which limited the degree to which certain questions could be tailored to fit the Business Link for London scheme. We therefore used data from a focus group in addition.

The overall effectiveness of the Business Link for London programme can be judged by the positive responses to the post-programme questionnaire. Some of those findings were as follows:

- 75% of mentees and 57% of mentors described their e-mentoring experience as a positive one. Although this is less than the experience in the BLS programme (mentee 95% and mentor 79%) and the APESMA scheme (mentee 82% and mentor 80%) it is an indication that participants felt more than less positive about their experience.
- 89% of the mentors in the scheme and 50% of the mentees indicated that they would participate in a similar programme at some time in the future. This compares to 84% of mentors and 91% of mentees in the BLS programme.
- In line with the findings of the BLS programme over 60% of mentees and over 55% of mentors cited convenience, flexibility and ease as the major benefits of email-based mentoring while as many as 75% of mentees (and over 20% of mentors) indicated there was an element of impersonality about this type of communication. This compared with 30% of mentee and mentor responses from the BLS scheme.

Overall feedback from participants has been both broadly positive as well as explicit about the benefits as illustrated by the following:

## **Are There Policy Implications?**

It is evident from the learning from the two pilots that there are likely to be implications and great opportunities for Governments with publicly funded business support programmes to consider.

Enterprise is central to the success of any economy. The dynamism of individual entrepreneurs drives the innovation, competitiveness and growth of an economy (A Government Action Plan for Small Business: Making the UK the best place in the world to start and grow a business: 2004; Action Plan: The European Agenda for Entrepreneurship, 2004). Increasingly Governments are recognising e-channels as one of the key routes to market in a wider approach to cost effective business solutions. Assuming connectivity is in place the e-channels accessibility makes it an increasingly attractive option available to Governments.

Learning styles need to fit the needs of entrepreneurs and therefore there are implications for publicly funded business support. E-Mentoring should be considered as one of many options in a wider e-enable offer – more so in countries eager to develop cost effective means of engaging a wide audience at relatively low cost.

## CONCLUSIONS

From the reviews of both programmes and the literature, it can be seen that mentoring is generally felt to be a good approach to learning. The pilot programmes have demonstrated that entrepreneurs found this of significant benefit, the same might be said for the traditional didactic relationships, but mentoring delivered using technology was seen to provide the benefits in a more timely and convenient way.

E-mentoring for the development of entrepreneurs is still in its infancy, but the work undertaken in the UK has demonstrated that there is a huge potential for Government Bodies to effectively support and engage entrepreneurs through this medium. For evolving economies this ought to represent a cost effective and efficient approach for the provision of mentoring, which is seen as high quality business support, and one that is not dependent upon geographical boundaries.

Governments need to consider realigning their policies, which hitherto have been focused around physical delivery of programmes with a narrow focus and little flexibility. E-Mentoring could offer the opportunity for policies to become more responsive to the individuals needs within a cost effective and timely manner for entrepreneurs, who are seen as the new wealth drivers in today's economies.

So can entrepreneurs learn, effectively, through E-Mentoring? On the basis of the evidence from the evaluations of both Mentors by Net and Business Link for London pilots, we believe that E-mentoring is both an efficient and effective means of learning for entrepreneurs. It has been shown that entrepreneurs will often shift their requirements for knowledge as events change within their own business environment, thus the mentor can also shift ensuring that the learning areas remain applicable to their needs.

Furthermore, as the mentors are entrepreneurs in their own right, they also recorded positive learning outcomes from this approach, both from the relationship and the mentor training that supported them.

This can be seen from the following quotes from participants:

'I found the project rewarding in that it gave me an opportunity to improve my communication skills in imparting my knowledge and experience.'

'I think it is a worthwhile thing to do, as both parties can benefit.....'

'This has been a valuable learning experience for me.'

'Great idea, great service, helped with my isolation.'

## **Post Script**

The second phase of MentorsByNet began in October 2003 and by March 2004 has circa 300 entrepreneurs registered on the programme with circa 100 active relationships underway. The programme has seen mentors register from New Zealand, Hungary, USA, and Ireland with many UK based mentors registering from outside of the SE Region. A programme has also been started aimed specifically at the rural and farming communities.

## **ABSTRACT**

This paper reports findings on a study of the environment surrounding micro and small-scale enterprises (MSEs) in Tanzania. Results from this study reveal an existence of regulations, bureaucratic licensing structures, and a tax regime that hinder the growth of Tanzania's business starters. This environment also seems to push MSEs into illegal trading thus undermining government revenue. Based on these findings the paper develops a policy framework, suggesting several reforms to the country's tax and regulatory regime. This framework also provides relevant clues to other developing countries in addressing similar business environments.

Key words: Small Business, Business Environment, Enterprise Development,  
Tanzania, Developing Countries, Economic Development

## INTRODUCTION

The performance of enterprises is partly affected by the environment in which they operate. Various studies highlight the importance of a conducive environment to enterprise development. Hallberg (2000:9) for example, argues that a well-developed physical infrastructure that includes reliable transportation, warehousing and port facilities, and communications networks has an influence on MSEs development<sup>1</sup>. Similarly Tolentino (1995) notes that macroeconomic framework and policies directed at providing support to MSEs development are likely to determine and influence the demand for their products and service. A biased policy framework against MSEs according to Mead and Liedholm (1998) can among others, restrict access to essential inputs such as start up and working capital, machinery and equipment, and raw materials.

Tolentino (1995) and Hallberg (2000) also argue that a legal and regulatory framework which results into excessively complex registration and licensing requirements and demands tedious and costly reporting practices is likely to impose constraints on the business activities in addition to placing heavy burden on entrepreneurs and their businesses. In addition to stimulating the creation of new enterprises and fostering their viability and growth, an environment that is supportive to MSEs is likely to contribute to the effectiveness and sustainability of support programmes. A conducive and enabling policy and regulatory environment are therefore crucial to the development of MSEs.

Following the implementation of liberalisation policies in Tanzania during the last two decades, the country's business environment has witnessed various changes. Such changes among others, involve the opening of business opportunities within the private sector. Despite the implementation of these policies, there is a growing shade of opinion indicating that, in pursuit of such business opportunities, formal procedures and bureaucracy hinder enterprise development particularly at the small-scale level (Kristiansen, 2002b). While various studies (Levy, 1991; Parker *et al*, 1995; Kristiansen, 2002b) have been conducted in the past in relation to small business environment in Tanzania, most of them focused on identifying the various factors that affect the environment for small businesses. This paper however, goes beyond this level and conducts an analysis that gives careful attention to the impact of these factors to enterprise development in the country. Based on this analysis the study develops a model that suggests corrective measures to the identified constraints.

One basic premise to this study is that there are a significant number of smaller enterprises, which do not fit into the conventional enterprise recognition in Tanzania. According to the informal sector survey of 1991, small enterprises operating at that time in the informal sector alone numbered to more than 1.7 million businesses, engaging about three million persons, accounting to about 20 percent of the country's labour force (URT, 2003). Similarly unemployment at present is a significant problem the country has to deal with. Estimates indicate that there are about 700,000 new entrants into labour force every year. About 500,000 of these are school leavers with few marketable skills. The public sector currently is able to employ only about 40,000 of the new entrants into the labour

---

<sup>1</sup> So far there is no universally accepted definition of MSEs (Allal, 1999). The current practice is that individual countries are expected to come up with their respective definitions. At the time of this study no definition had been produced in Tanzania. As a result this study adopts an ILO (Allal, 1999) definition that microenterprises are characterised by 1 to 10 employees and small-scale enterprise by between 11 and 50 employees. It should however, be noted that at the time of this study authorities in Tanzania were in the process of coming up with country definitions.

market, leaving 660,000 to join the unemployed or the underemployed reserve<sup>2</sup>. Most of them end up in the MSE sector, and especially in the informal sector. In addition to jobs creation, it is also estimated that about a third of the country's GDP originates from this sector. Despite the current data on the small business sector in Tanzania being sketchy and unreliable, still the above statistics give a reflection of the role this sector plays in the country's economy

This paper is organised in seven sections. A review of the theoretical review of the study is presented in the next section followed by a description of the methodological approach to the study. Section four discusses the study findings, followed by a presentation of the likely consequences of the country's existing regulatory and tax regime. Section six presents the developed policy framework on reforming the country's regulatory and tax regime. The paper concludes with policy implications in section seven.

## **A Review of the Theory on Business Environment Analysis**

The basis for business environment analysis by this study is established by considering various theoretical contributions. One of such contributions relates to the ability to find new business opportunities in a society or the capability to innovate (Schumpeter, 1934; Leibenstein, 1966). North (1993), in search of sources of economic growth emphasises the role of institutions in societal change. Formal rules and guidelines by these institutions for example, have an effect in shaping the business environment. Furthermore, North argues that formal rules that are created and conducted by principals, agents and state bureaucracy hinder innovations and economic growth. Formal institutional rules and constraints arguably vary with contextual settings. In developing countries Kristiansen (2002b) for example, argues that interests of the elite normally have a strong dominance over the wishes of ordinary people. In Kristiansen's view the principals use their agents at different levels of state bureaucracy to enforce their rules, to limit opposing interest, and to hinder differing economic actions by non-elite groups.

North (1981) similarly notes that one of the primary objectives of institutions is to maximise the utility of the rulers by specifying a pattern of wealth and income distribution. Tax regulations and formal rules are but some of the examples to this assertion. Several recent studies underline the need to study economic theories of entrepreneurship and emphasise the wider societal setting within which the entrepreneurial endeavour emerges and evolves (Zafirovski, 1999; Kupferberg, 1998). In Tanzania a common argument maintains that heavy government involvement in the economy after independence caused major market distortions, resulting in sub-optimal allocation of economic resources and the development of an environment that was not conducive to private business development (Kristiansen, 2002b). On the other hand, while macroeconomic intervention in the economic environment through various structural adjustment programmes have been praised for creating a level playing field for MSEs, many observers believe that small businesses are still at a severe disadvantage. Despite private business entrepreneurship becoming legitimate in the eyes of the Tanzanian government, several practices that affect the business environment are still in existence. Existing evidence for example, indicates that laws and regulations have been highly restrictive to small businesses and private entrepreneurs (Toroka and Wenga, 1997; Parker *et al*, 1995; Bagachwa, 1993; Levy, 1991). This restriction can be traced back to the dominance of government institutions and parastatals between the late 1960s to late 1980s. These institutions according to

---

<sup>2</sup> Ibid.

Kristiansen (2002b) were given the power and priority in the distribution of credits and all kinds of licenses.

In a theoretical context this study takes a closer look at the elements of an enabling environment for MSEs in Tanzania. The study attempts to go beyond the neo-classical micro-foundation of structural adjustment policies by examining the thinking and acting of real entrepreneurs. The analysis by this study is partly based on the argument that business contexts are perceived differently and affect commerce variously at different stages of the entrepreneurial process.

## METHODOLOGICAL APPROACH TO THE STUDY

This study uses survey as its main methodology for data collection. The survey technique is used to allow an examination of a sample of selected MSEs and generalisation of the results to a larger population from which the smaller group was chosen (Neuman, 2000). In addition to the survey, we also review the new policy document on the development of micro, small and medium enterprises in the country. The survey was undertaken by conducting face-to-face interviews to 136 entrepreneurs in 9 sampled regions out of 25 regions, using a pre-designed questionnaire. These regions are Dar-es-Salaam, Morogoro, Mwanza, Arusha, Mbeya, Kilimanjaro, Tabora, Zanzibar urban and Zanzibar south.

The questionnaire was designed as a series of questions split into two parts. The first part focused on obtaining data relevant to MSEs characteristics. These were entrepreneur personal data (entrepreneurs' gender, age and educational level), business premises, and commercial registration. The second part of the questionnaire examined the business environment surrounding MSEs. In line with the focus of the study, entrepreneurs were specifically asked if they viewed licensing procedures, information availability and tax regulations to be a hindrance to their operations. Follow up questions were similarly asked during the interview to obtain an insight into how these factors affected their operations. Enterprises covered by the survey were classified into manufacturing, trade and services sub-sectors. They include 110 microenterprises and 26 small enterprises, of which 91 were urban based and the remaining 45 were peri-urban based<sup>3</sup>.

**Table 1: The survey sample**

ISSUES	Microenterprises (ME)				Small enterprises (SE)				Total enterprises
	M/f <sup>ψ</sup>	Services	Trading	All ME	M/f	Services	Trading	All SE	
Number	15	37	58	110	6	9	11	26	136
Urban	6	25	40	71	4	6	10	20	91(67%)
Peri-urban	9	12	18	39	2	3	1	6	45(33%)

Source: Survey data

<sup>ψ</sup> M/f stands for manufacturing

<sup>3</sup> Peri-urban area for the purpose of this study is a radius of 50 kilometres around the sampled regional towns.

Given the qualitative predominance of the questionnaire the study basically uses cross tabulation to analyse and present enterprise characteristics and the factors affecting entrepreneurship environment. The survey findings therefore, are mainly drawn from qualitative information and impression gathered from the interviews as well as the analysis of the cross-tabulated data.

## STUDY FINDINGS

The analysed data is presented in two parts. Initially general information that characterises MSEs in the country is presented. This is followed in the second part by a discussion of the identified factors thought to affect the enterprise environment. This part is also integrated with a review of the new policy document on micro, small, and medium enterprises development<sup>4</sup>.

### Enterprise Characteristics

General information on enterprise characteristics specifically focuses on entrepreneurs' gender, average age, educational background, business premises ownership, and business registration status. This information is summarised in Table 2. Results indicate that most MSEs are owned and operated by men (about 77 percent). This finding is consistent with other findings across the globe where women owned businesses were found to account for 25 to 33 percent of all businesses (Employment NOW Community Initiative, 1998). Entrepreneurs' average age is about 35 years. Most of the studied entrepreneurs do not achieve beyond the primary, secondary and vocational levels of education (88 percent). These findings are in line with a common perception that most micro and small entrepreneurs achieve an education level of no more than secondary school.

<sup>a</sup> Enterprise Category; <sup>b</sup> Entrepreneurs Average Age; <sup>c</sup> Education Level achieved by Entrepreneurs;

<sup>d</sup> Enterprise Premises Ownership; <sup>e</sup> Enterprise Commercial Registration; \* Figures in parentheses represent percentages

The categories of business undertaken by enterprises as presented in Table 1 supports a common perception that MSEs in developing countries are primarily vendors and small traders (Mead and Liedholm, 1998). Most enterprises (67 percent) operate from rented premises (Table 2). An assessment of enterprise commercial registration status reveals that most MSEs are registered (89 percent). All of the commercially unregistered

<sup>4</sup> At the time of this study this document was in its final draft form.

enterprises are micro and operate in regions (Tabora, Mwanza, Arusha, and Kilimanjaro regions) where they are considered as street vendors and therefore not required to register commercially. In these regions local government officials collect a fixed monthly levy and allow microenterprises to operate their businesses.

## **The Enterprise Environment**

Although the environment in which MSEs start up and operate is shaped by a number of influences, the assessment of the enterprise environment by this study focuses on policies, legislations and regulatory procedures.

## **The Policy Framework**

While it is not clear to what extent administrative and legislative burdens hinder business growth, Bridge *et al* (1998) find it reasonable to assume that anything that absorbs time and resources that would otherwise be devoted to business development is likely to have a deleterious effect. Bridge *et al* also argue that it is indisputable that government policies have a major impact on the trading performance of small businesses. Policies therefore seem to be important in underpinning the development of entrepreneurship as they influence the performance of MSEs in the broader economy. Furthermore, policies underpin the formation of legislation and regulations, which in turn determine governments' activities (White, 1999: 21). Existing literature also provides an overview of a variety of instruments through which government policy can influence MSE activity (Tolentino, 1995). They include monetary and credit policies, taxation, regulatory and control policies such as registration requirements and procedures, permits and licensing laws, trade and export policies, and education policy particularly promoting the development of a skilled and educated work force.

The creation of an enabling environment is therefore partly dependent upon a favourable overall policy framework, which allows the development, and promotion of enterprise and entrepreneurship respectively. The success of a policy framework in turn is dependent on the use of stable, well-designed policy instruments and mechanisms, and policy areas that combine to create an overall policy environment for MSEs. So far the Tanzanian Government has taken a number of initiatives to encourage the establishment and growth of MSEs. First, market enlargements in Tanzania as a result of the liberalisation process since the late 1980s are regarded to be the main reason for growth of small businesses during the last decade (Trulsson, 1997; Bagachwa, 1993). Secondly, the government has attempted to create a level playing field through macroeconomic intervention using various economic reform programmes and reduction of discriminatory practices against MSEs. A recent and probably significant effort by the Government is the formulation of the micro, small and medium enterprise policy document. Despite these efforts many observers find that small businesses are still at a severe disadvantage competitively (Kristiansen, 2002b). Laws, regulations, multiple taxes and bureaucracy in addition to problems in generating business ideas and picking business opportunities are still mentioned as problematic in the country (Satta, 2003).

The new policy document for small businesses development although attempts to address a significant number of key issues, lacks any policy or programme link between microenterprises development programmes such as support for self-employment and Small and Medium Enterprises (SMEs) development programmes, particularly one which promotes the graduation or growth of an enterprise from micro to small and eventually medium. In addition, though this document covers micro, small, and medium enterprises,

more emphasis appears to be on SMEs than on microenterprises. Despite being the majority (see Table 1) less weight seems to be attached to the role of the smaller MSEs in terms of job creation, service provision and productivity.

**Table 3: Main Factors Affecting Small Enterprise Environment in Tanzania**

FACTOR	(%)
Bureaucratic Licensing Procedures	94
Unfriendly Taxation Structure	93
Lack of Relevant Information to MSE Sector	91

Source: Survey data

The enterprise environment in Tanzania also exhibits significant gaps in information about the MSE sector and its potential for development. Most of the interviewed entrepreneurs (91 percent) indicated that relevant information to MSE sector development is not readily available (Table 3). Several studies point to the important role information plays in small businesses' growth. Stiglitz (1989) and Kristiansen (2002a) for example, consider information to be one of the areas where market failures are most apparent and that these failures are easily regressive, continuously marginalizing micro and small entrepreneurs. Several recent studies also identify access to information as one of the important factors behind entrepreneurial success (Kristiansen, 2002b). Among the wide-ranging demands for information in Tanzania are a broad profile of this sector, including its characteristics, problems, products and services produced; profile of owners, including aspects such as gender and age; communities involved in enterprise development; and markets in which MSEs operate. Information availability is also necessary for an appropriate identification and description of the providers of MSE development services, as well as evaluation of the performance and impact of business development services.

The gap in information seems to result from the absence in the past of any comprehensive and systematic assessment of the MSE sector dynamics. This has resulted into limited and unreliable availability of information with regard to the needs, problems, potential and opportunities to this sector. Parallel to information gaps, few recognised national or regional business associations that can represent the MSE sector exist (URT, 2003). Among other problems, the absence of these organisations makes it difficult to obtain a collective general opinion from the MSE sector on the policy environment and what should eventually be done to facilitate enterprise growth.

A number of studies in developing countries also place the acquisition of professional business skills among the necessary conditions for entrepreneurial success (Nafukho, 1998). In Tanzania however, it appears that no deliberate measures have so far been taken to promote entrepreneurial skills and competencies in training institutions. Currently only few institutions offer a few short-term programs<sup>5</sup>. Despite their wide recognition in terms of economic development contribution, small businesses also continue to be under the broader portfolio of the Ministry of Industry and Trade, which for a number of years had its main focus on industrial development.

<sup>5</sup> So far institutions involved in short term entrepreneurial skills promotion include the Small Industries Development Organisation (SIDO), College of Business Education and The University of Dar-es-Salaam

## The Framework and State of Regulations and Procedures in Tanzania

Regulations and procedures in the context of this study are taken to be tools that are used to enact legislation and pursue policy outcomes. The systems for regulatory and procedural activities in Tanzania are partly centralised and partly decentralised. Currently there are four major tiers of government operations in Tanzania, the highest being the central government in Dar-es-salaam. Below this level there are 25 regions (provinces) manned by Regional Commissioners. All central government ministries and departments are represented at the regional level. Below regions there are Districts under District Commissioners. At the lower end are wards and villages for urban and rural areas respectively.

The central government provides the overall direction of policy and the legislative basis on which development occurs. In most cases both policy and legislation are implemented through a variety of government agencies operating at central, regional and local levels. Two forms of mechanisms are used in policy implementation. At the top level there are government ministries, departments and executive agencies. These are responsible for designing and introducing policy as well as undertaking regulatory functions such as business registration, taxation, and issuing of licenses. At the lower end is the local/regional government structure which directly impacts upon the legal and regulatory framework that MSEs find themselves in. The local and regional government for example, are involved in land use and planning, provision of sites and premises for business operation such as market stalls and industrial estate, health and safety compliance, and local government taxation.

Several studies on entrepreneurship in developing countries emphasise on the bureaucratic hindrances to the establishment and growth of MSEs (Saabbarwal, 1994; Rondinelli and Karsada, 1993). A recent comparative study of ethnic entrepreneurship covering three ethnic groups in South Africa by Mitchell (2003) found that regulations and higher taxes were perceived as most problematic policy areas. In Tanzania, Kristiansen (2002b); Toroka and Wenga (1997); and Bagachwa (1993) observe that laws and regulations have been highly restrictive for MSEs. Findings from these studies note that long after the process of liberalisation started in Tanzania, many micro and small entrepreneurs find government regulations and the bureaucratic maze to be a severe hindrance for their progress. Laws and regulations feature high in the list of constraints by businesses according to the above mentioned studies. An earlier study by Levy (1991) covering Tanzania and Srilanka found that tax and regulatory burdens in Tanzania were the next heaviest constraint (after lack of access to finance) on small business expansion.

A study by Parker *et al*, (1995) that covered five African countries<sup>6</sup> concluded that between 61 and 96 percent of MSEs in Ghana, Mali and Tanzania rated taxes as one of the problems hindering the business environment. A study by Kristiansen *et al*, (1999) covering tailors and furniture makers in Tanga Region/Province note that paying (corruption) to get out of tax and license duties is common in the Tanzanian system thus undermining government revenues. Taxes are considered to be very prohibitive and the general feeling among small entrepreneurs is that they see no benefits from their payment according to this study. A fairly recent study in Tanzania also reveals that the majority of companies studied complained about the multiplicity of taxes, duties and fees (Nkya, 2002). According to this study, no less than 19 different compulsory contributions are paid to government institutions by firms. Overall, small-scale entrepreneurs saw no significant

---

<sup>6</sup> Countries covered by this study were Tanzania, Senegal, Mali, Malawi, and Ghana.

changes in the current tax policies and bureaucratic maze, as compared with the pre-reform period.

Survey results from this study reveal that bureaucratic procedures that affect the business environment for MSEs revolve around the relations between these business starters and a wide range of regulatory authorities in the country. These authorities include (a) Tanzania Revenue Authority (through VAT and Income Tax Departments), (b) licensing authority, (c) Health authorities (covering food related enterprises), (d) providers of public utilities (power, water, telephone), (e) National Social Security Fund which require all private businesses in the country with 5 or more employees to make pension contributions on behalf of their employees, and (f) Labour ministry officials (in relation to labour laws). Bureaucratic difficulties seem to be substantial with Tax and Licensing Authorities according to the survey findings.

An assessment of the tax system reveals that despite various reforms within the tax regime in the country, there are no significant changes in the current tax policies. The study found Tanzania's formal tax and regulatory requirements to be demanding. A significant number of entrepreneurs (93 percent – Table 3) raised various taxation issues that affect the growth of their businesses. One of the issues cited for example, is the current practice of estimating tax to be paid rather than basing on actual results.

Another problem with tax authorities is the practice of demanding a payment of an estimated tax amount upfront on all small businesses before setting up. In addition to having tax rates that do not distinguish between smaller and larger businesses, the tax structure itself has several different taxes to be paid by enterprises. An interview with one entrepreneur who owns a bar and guesthouse business in Dar-es-Salaam for example, reveals that he annually pays a total of 13 different types of fees and taxes. Fees according to this entrepreneur cover license fees for drinks, bar, and snacks activities separately. Other fees paid by the business include health fees for staff, inspection fees by health inspectors, and refuse collection fees. Taxes include income tax, stamp duty, hotel levy, and development levy. Income tax, stamp duty and development levy are charged separately for Guesthouse and bar activities. Related to the tax system problem is the existence of official and unofficial levies. According to most entrepreneurs the unofficial levies problems is exacerbated by too many inspection visits that are made to MSEs. These include visits by inspectors for value added tax, income tax, health, refuse collection, sign boards and business registration authorities.

The business licensing process is another area most entrepreneurs (94 percent) consider to be bureaucratic (Table 3). Generally centralisation of licensing is considered to play a major part in bureaucratising the whole process<sup>7</sup>. The practice of renewing the business license according to interviewed entrepreneurs, also increases the cost of MSEs remaining formal as it involves obtaining clearance from the same list of authorities that are involved in the initial process of granting the license. Apart from consuming entrepreneurs' time, this procedure encourages corrupt practices. Though difficult to quantify, Kristiansen *et al* (1999) consider bureaucracy to be a major contributory factor towards corruption practices in Tanzania.

The net effect of all the above discussed business environment hindrances seems to impose entry and expansion deterring costs on MSEs. They include financial costs and the opportunity cost associated with the diversion of scarce entrepreneurial time and effort.

---

<sup>7</sup> Recently the Government in recognition of the existence of complicated and bureaucratic licensing procedures established a new body (an Executive agency) to be responsible for business registration

While this study does not uncover findings that are distinctly different from previous studies in the country, an attempt is made to go beyond the assessment of the MSEs business environment, by examining the likely impact of bureaucratic regulations and unfriendly tax regime. Furthermore, the paper develops a model for mitigating these hindrances.

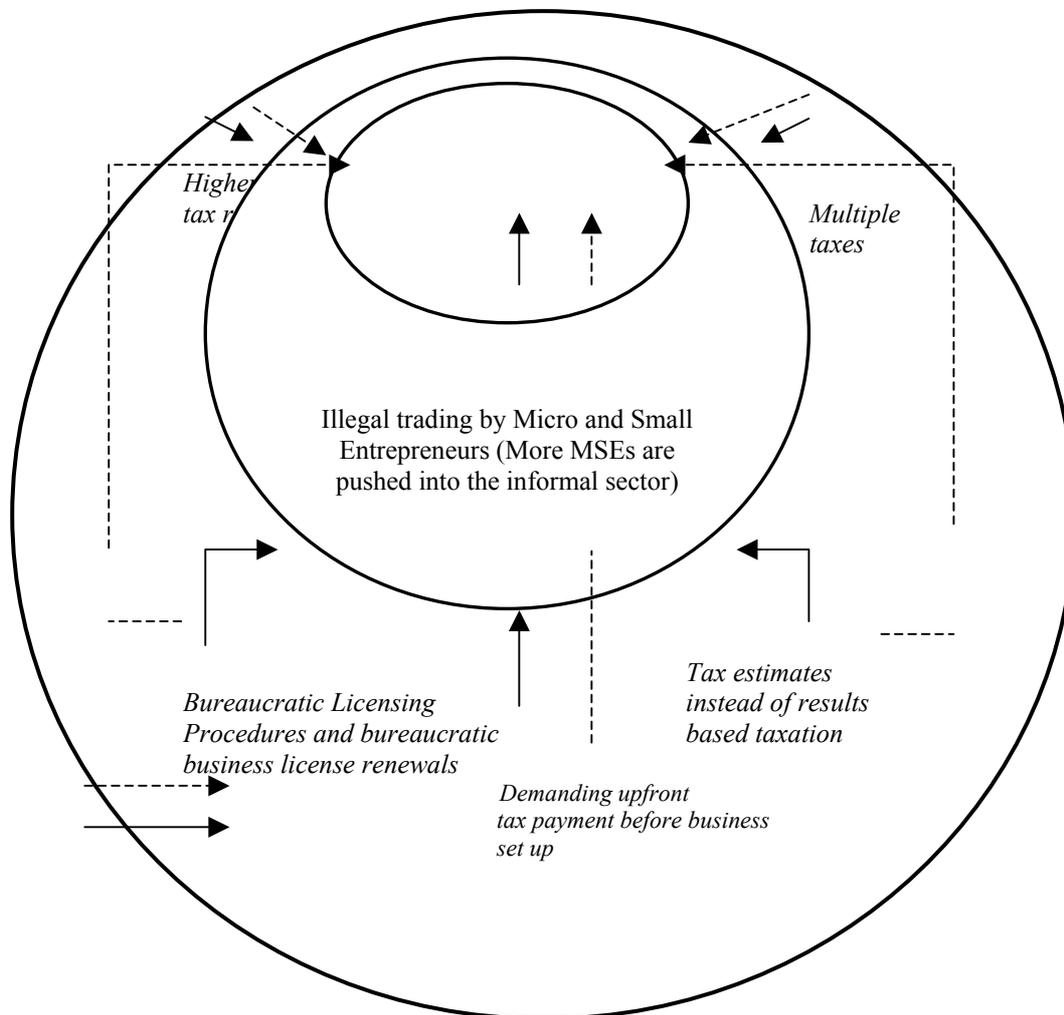

## **Likely Consequences of the Current Regulatory and Tax Regime**

Illegal business activity is viewed as the darker side of entrepreneurship (McClennahan, 1998; Baucus, 1994). A common illegal business activity related to findings from this study is the trading of legal goods and services by avoiding the payment of duties or taxes. Another one involves trading without proper licensing by authorities. Sardar (1996:51) argues that illegal business practices are deeply interwoven within political, social and economic fabric of many developing countries and consequently leads to the 'parallel economy'. De Soto (1989) similarly argues that when legality is a privilege available only to those with political and economic power, those excluded have no alternative but illegality. Given the strong apparent links between illegal business activities and entrepreneurship, and the paucity of studies in this area, there is a need to examine this relationship and explore its potential effects on government revenue (Fadahunsi and Rosa 2002). Despite the lack of a systematic entrepreneurial theoretical model of illegality in general and illegal trading in particular, illegal trade opens up increased opportunities, and potentially very profitable opportunities for opportunity seeking entrepreneurs through non payment of duties and taxes amongst others<sup>8</sup>. However, it should be noted that although most MSEs may be generating profits when operating illegally, they would still prefer to operate in a less stressful and impartial legal system. In Fadahunsi and Rosa's view, entrepreneurial advantage lies in the business itself and making it work, not its illegality. Informals according to De Soto (1989), run the risk of being penalised for not having obtained permits, paid taxes, or applied for the authorisation required by law.

**Figure 1: Likely Consequences of the Country's Regulatory and Tax Regime**

Source: Developed by author

The combination of cumbersome and punitive formal tax and licensing requirements and ubiquitous enforcement as voiced by interviewed entrepreneurs in Tanzania are thought to create substantial opportunities for government revenue losses through corrupt practices and illegal trading. Specifically, multiplicity of taxes and higher tax rates are likely to contribute significantly to the creation of an unconducive business environment for MSEs leading to illegal trading. Bureaucratic licensing and renewals of licenses (which are dependent on prior lengthy clearance processes from various authorities) are likewise likely to impose a significant burden on entrepreneurs' scarce time. Illegality on balance is seen to be more harmful than beneficial for economic development. Specifically it makes it difficult for small businesses to be productive when government regulations hamper the pooling of resources. This is also the case when taxes and tariffs distort the price of materials and products.

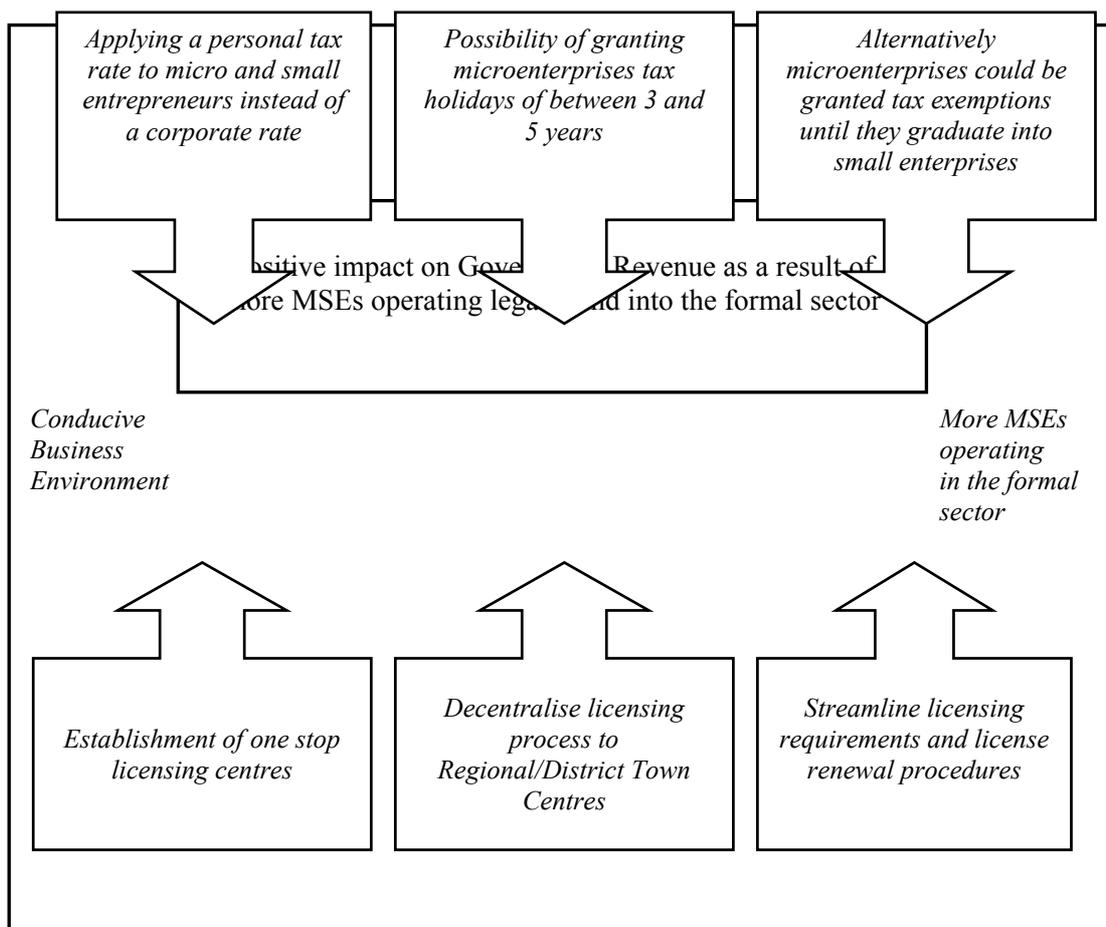

Given these findings, the paper explores the likely effects of the costs of multiplicity of taxes, higher tax rates, unfriendly tax estimation practices and bureaucratic licensing

procedures to MSEs in the country (Fig. 1). The central argument emanating from this exploration is that the current small businesses licensing procedures and tax regime is pushing micro and small entrepreneurs into illegal trading. Specifically, multiple taxes, higher tax rates, estimated tax demand instead of tax payments based on results and the practice of demanding upfront payment of taxes before business set up on the one hand and bureaucratic licensing procedures on the other, seem to push micro and small entrepreneurs into the informal sector. This in turn undermines government revenues as well as affects the development of the MSE sector due to increased uncertainty on small businesses operations.

## Policy Framework for Reforming the Regulatory and Tax Regime

Based on study findings the paper developed a policy framework for mitigating the identified hindrances to MSEs business environment (Fig. 2). The ultimate objective of the framework is to have more MSEs shifting into the formal sector and in the process boosting government revenue.

**Figure 2: Policy Framework for Reforming the Tax and Regulatory Regime in Tanzania**

Source: Developed by author

Among other things, harmonisation of various taxes charged to small businesses (to reduce multiplicity of taxes), application of separate tax rates to small enterprises from large ones, and considering charging micro and small entrepreneurs personal income tax rather than corporate tax are some of the policy issues advocated by the framework. Similarly, tax authorities in the country should consider reviewing their unfriendly approach to taxation by abolishing for example, the practice of charging a new business an estimated tax amount upfront before setting up. This is likely to provide an incentive for the establishment of more MSEs. Another relevant policy input is on [extending the current practice of granting tax holidays of between 3 and 5 years to foreign investors, to MSEs. Alternatively, microenterprises could be exempted from paying taxes until when they graduate into small enterprises. Parallel to this should be a consideration of tax rates in terms of the size of the enterprise in a progressive way.

A reduction in bureaucracy in registering businesses is likely not to be achieved by simply replacing the body that used to be responsible in the past with another one. Among others, the new body should consider decentralising the business licensing process so that it becomes less costly to businesses outside its base (Dar-es-salaam). The decentralisation process should involve the establishment of one stop licensing centres in Regional/Provinces. These centres should bring together all relevant authorities under one roof. A review of the whole process including current registration requirements in order to do away with all the outdated ones could also make a significant difference in promoting the establishment and development of MSEs in the country. Parallel to streamlining licensing procedures, the framework suggests more transparency by all relevant regulatory authorities to discourage corrupt practices.

## **CONCLUSION**

The current business environment according to findings by this study (and several previous studies) appears to constrain MSEs' potential for growth. Specifically the business environment for MSEs seems to be affected by a presence of multiple taxes, higher tax rates, unfriendly taxation practices, and bureaucratic licensing procedures. The presence of these hindrances is believed to be playing a significant role in pushing MSEs into illegal trading through unlicensed trading and avoiding paying taxes and duties. Although illegal business by MSEs might be providing livelihoods for thousands if not millions who would have no jobs without (that is it makes opportunities accessible to a much range of entrepreneurs), it undermines government revenue in addition to increasing uncertainty in MSEs operations through increased business operating hassles.

Given these findings, policy initiatives are therefore, required to improve micro and small entrepreneurs' ability to utilise their business contexts since the current policy framework seems to constrain the entrepreneurship process. Initially the paper develops a working model [Fig. 1] that explores the likely effects of the costs of an unfriendly tax regime and bureaucratic licensing procedures to the government and small businesses. The paper then builds on that working model and develops a policy framework for mitigating the identified hindrances to MSEs business environment [Fig. 2]. Clearly reforms seem to be necessary on the current tax regime and licensing procedures reforms are necessary if MSEs are to expand and contribute to economic development in the country. The ideal solution would be therefore, to remove the obstacles and convert any political incentives into legal facilities in order to free and increase the vendors' entrepreneurial energies and allow them, within the competitive process, in which they are immersed, to use their talents

to the full and serve the community more effectively. In terms of policy implications, recommendations from this model are likely to: (i) push more MSEs into the formal sector through proper licensing and payment of relevant fees and taxes; and (ii) have a positive impact on government revenue through receipt of various taxes and fees payments from MSEs.

In line with social sciences research practices of attempting to extrapolate general trends from specific data in a particular study and relate this to a broader theoretical framework, the key question for this study therefore was on how far these results can be generalised to gain wider insights into business environment and MSEs growth. Although the surveyed entrepreneurs are possibly not representative of the several thousands of business starters in the country, the policy framework developed by this study mitigates problems that were also identified by several previous studies. This to some extent makes the case for generalisation of the results in the country much stronger. This framework also provides a basis for further consideration by several developing countries that experience similar business environments.

# THE PHENOMENON OF THE SOUTH AFRICAN NECESSITY ENTREPRENEUR

Alex Maritz, Centre of Innovation and Entrepreneurship, School of Management and Entrepreneurship, UNITEC Institute of Technology, Carrington Road, Mt Albert, Auckland. (T) 64-9-815-4321 ext 8476; (F) 64-9-815 4374; email: [amaritz@unitec.ac.nz](mailto:amaritz@unitec.ac.nz)

## ABSTRACT

Economic growth and necessity entrepreneurship are closely and positively linked (Frederick, 2004); and this study explores the phenomenon of the South African necessity entrepreneur. The necessity entrepreneur is someone who never considers starting or owning a business until there is no other option (Kroll, 2003).

This paper examines South African necessity entrepreneurs (NE) in light of propositions cited in the literature that NE is associated with three factors: positively with economic growth (real GDP growth rate), positively with unemployment (unemployment rate), and negative with a generous welfare system (expenditures on social security).

The study of these factors are cited in three propositions:

- P1: There is a positive association between unemployment and NE.
- P2: There is a negative association between expenditures on social security necessity entrepreneurship.
- P3: There is a positive association between NE and economic growth.

South Africa's moderately high levels of NE (albeit low relative to other developed countries) coupled with high unemployment rates and low social security expenditure are complimentary to assumptions in proposals 1 and 2. There is also a distinct positive relationship between NE and economic growth. Research findings accept Proposals 1, 2 and 3 (in the South African context only).

As a *prior* it is also proposed that many of these entrepreneurs have unique psychological needs, such as lack of self-esteem and fear of family's survival, due to never being prepared for entrepreneurship. The relationship between NE and education is also highlighted. Policy implications are recommended towards increasing entrepreneurial behaviour, particularly amongst young adults.

## INTRODUCTION

The literature on necessity entrepreneurship is scarce and most of the work on NE is being done within the context of the GEM project. Forbes Magazine defines the Necessity

Entrepreneur (NE) is someone who never considers starting or owning a business until there is no other option (Kroll, 2003; Forbes 2003). The Global Entrepreneurship Monitor (GEM) defines the NE as a person who has started a business because he or she “has no better choices for work”. GEM distinguishes the NE from an opportunity entrepreneur (OE) who has started a business to take advantage of a business opportunity (Frederick et al, 2002). The distinction is important because it determines the primary motive for participating in the start-up, whether they are willing volunteers (OE) or feel they are forced into creating a new business (NE).

Cowling and Bygrave (2003) predict that *when unemployment rates are high, necessity entrepreneurship will be high*. They observe that their model is statistically significant, with unemployment rates exhibiting minor temporal variation between countries. Additional predictions by Cowling and Bygrave (2003) include:

*The more generous the welfare system the lower the rate of necessity entrepreneurship*. In a developed nation such as Australia or New Zealand, generous welfare benefits may result in an unemployed person choosing to enjoy 24 hours of leisure rather than work, commonly referred to as the labour-leisure trade off. This however is not apparent in the case of South Africa, where welfare systems are characteristic of developing nations, compounded by low quality of living standards.

*The higher the proportion of the adult population with pension provisions, the lower the rate of necessity entrepreneurs*. The aging population relate to the pension system when individuals become inactive in the labour market due to old age. The incentive to work is enhanced by the non-provision of state funded pensions (South Africa specific), by raising total lifetime income from work related sources.

*Where barriers to market entry by new businesses are high, the rate of necessity entrepreneurship will be low*. Entry barriers in the economic sense refer to potential obstacles that operate to discourage entry. There is little empirical evidence to support entry barriers in South Africa, however, GEM2002 identifies that South Africa ranks high in the world in market openness for new and growing firms.

This paper examines South African NEs in light of propositions cited in the literature that NE is associated with three factors: positively with economic growth (real GDP growth rate), positively with unemployment (unemployment rate), and negatively with a generous welfare system (expenditures on social security). We begin with a survey of demographic and attitudinal characteristics of South Africa’s necessity entrepreneurs compared to NEs around the “GEM world”. We then examine the correlational associations of necessity entrepreneurship with these three factors. Finally, the author makes statements about the possible outlines of a policy that directly addresses South African necessity entrepreneurs.

## **METHODOLOGY**

GEM carried out a population survey of over 12000 adult South Africans in 2003 to measure the entrepreneurial behaviour and the attitudes of the working-age population. A filter question (“Are you involved in this start-up to take advantage of a business opportunity, or because you have no better choices for work?”) allows GEM to distinguish between necessity entrepreneurs and opportunity entrepreneurs. We are thus able to compare and contrast NEs around the world based upon demographic variables such as gender, age,

ethnicity, and rural/urban location. It must however be highlighted that 'don't know' responses were most frequent amongst those without matric, black adults and living in metropolitan areas. This is further skewed by small scale NE regarding themselves as unemployed, together with those engaged in some form of self-employment as not 'starting a business'.

GEM also chose South African experts as key informants in order to probe more deeply into these dynamics. Experts included entrepreneurs, politicians, educators, government officials, investors, and other professionals in the field of entrepreneurship.

Data collected in South Africa and other GEM countries are first presented. Literature and interviews are interpreted. Finally, the author examines whether evidence exists for three propositions that arise from the literature:

- P1: When unemployment rates are high, necessity entrepreneurship will be high (Cowling and Bygrave, 2003)
- P2: The more generous the welfare system the lower the rate of necessity entrepreneurship (Cowling and Bygrave, 2003).
- P3: Necessity entrepreneurship contributes to economic growth (Frederick, 2004).

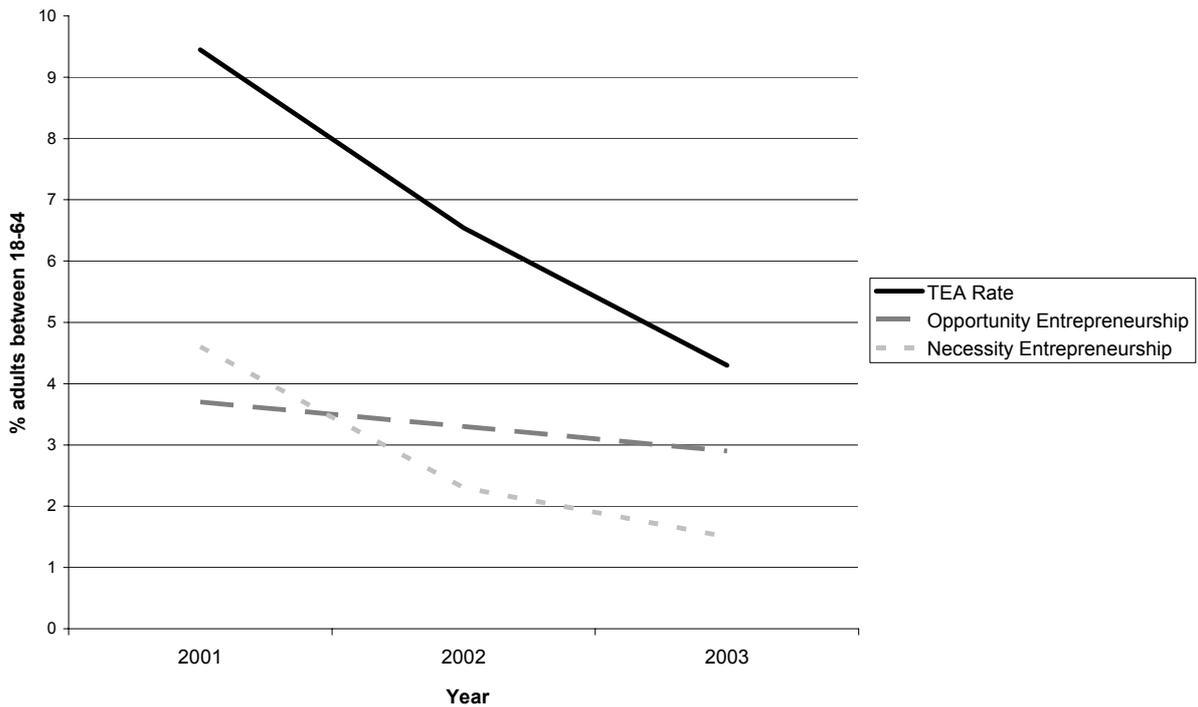

## **CHARACTERISTICS OF SOUTH AFRICAN NECESSITY ENTREPRENEURS**

GEM 2003 shows that of the 23,12 million adult South African's aged 18-64; 4,3% are entrepreneurs (2,87% opportunity entrepreneurs and 1,43% necessity entrepreneurs). That means that in 2003, South Africa had 990,784 entrepreneurs, of which 667,620 are OEs and 323,164 are NEs. Figure 1 as well shows comparable NE figures for 2001 (4,6%) and 2002 (2,3%). In other words, the NE rate has dropped threefold from 2001 to 2003. Still, there are currently more than 300 000 South Africans who never planned on being start-up entrepreneurs.

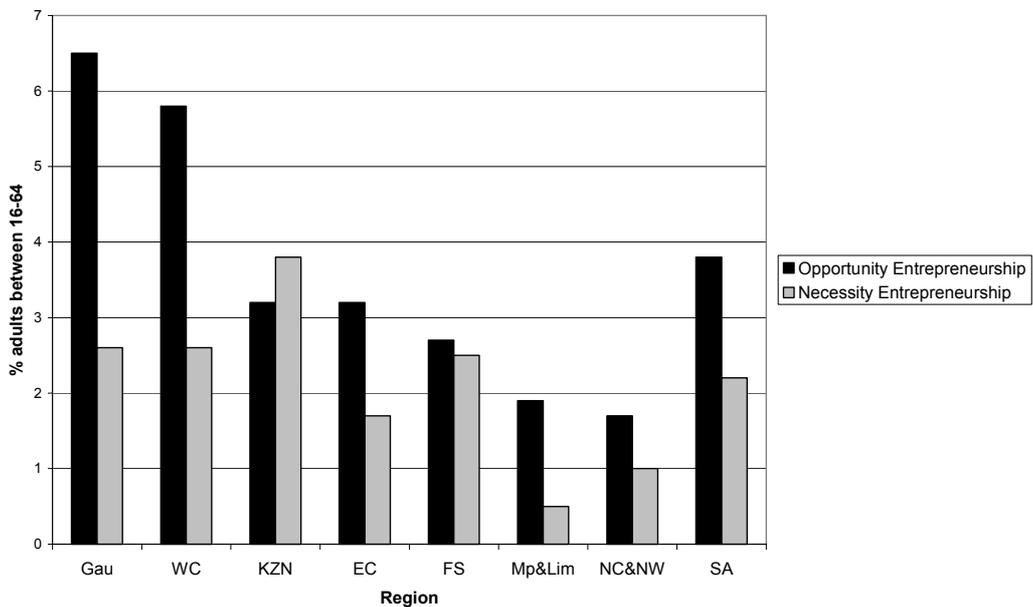

Approximately 63% of entrepreneurs in South Africa are Opportunity Entrepreneurs, with the remaining 37% being necessity entrepreneurs. Figure 2 shows the cross-regional pattern for opportunity and necessity entrepreneurship. The most striking differences between opportunity and necessity entrepreneurship within regions are in Gauteng and the Western Cape, where opportunity exceeds necessity entrepreneurship by approximately 2.5 and 2.2 times respectively. Not only are opportunity rates in Gauteng and the Western Cape much higher than necessity rates in these two regions, they are also much higher than opportunity rates in the other regions. Kwazulu-Natal is the only region in which opportunity does not exceed necessity entrepreneurship (GEM 2003).

Cognisance must be taken of South Africa's socio-economic turmoil, represented by high rates of HIV/AIDS (6<sup>th</sup> highest in the world), low level literacy rate, low GDP per capita, high level income disparity, back empowerment (reverse discrimination), crime and murder rate (2<sup>nd</sup> highest in the world), notwithstanding high unemployment rate. Khoza (2004) concluded that the reality is that it is worthless to invest in a dying work-force population (HIV/AIDS). These threats aside, South Africa experience a GDP in the top twenty nations of the world, 30% above that of Australia and New Zealand combined.

**Figure 1. TEA, NE and OE (2001, 2002, 2003)**

**Figure 2: OE and NE by Region**

Since inception, GEM data reveals that women's participation in entrepreneurship is only about two-thirds that of men. In 2003 men had significantly higher total entrepreneurial prevalence rates than women in each of the 28 countries included in GEM. On average in all GEM countries men were 1,6 times more likely to be involved in entrepreneurial activity than women were. The overall difference between entrepreneurial activity rates of men and women in South Africa is largely due to much higher opportunity rates activity rates amongst men. Men are almost twice as likely to be involved in opportunity entrepreneurship than women.

The male/female ratio differs somewhat between the countries, despite TEA male dominance throughout. Most distinguishingly though, the male dominance is not portrayed in South African Necessity Entrepreneurs, with no statistically significant difference between male and female prevalence. There is however a statistically significant difference between male and female participation in Opportunity Entrepreneurs, in that males are twice as prone to this form of entrepreneurship.

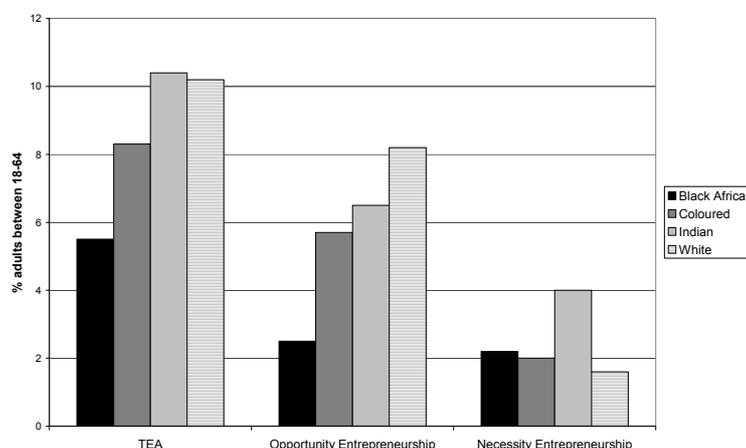

The gender proportion of South African NEs is 45,9% male and 54,1% female, significantly different for opportunity entrepreneurs. South Africa experience TEA male participation well below the GEM median. South Africa has identified the difference in TEA rates between the country and other developing countries due to much lower entrepreneurial activity rates amongst South African men between 18-44 years of age. Reynolds, Bygrave and Autio (2004) propose that a higher level of participation by women in the economic arena is associated with higher standards of living. This is however outside the ambit of this research paper, but would make interesting reading in the developing nations context.

Race and Entrepreneurial activity are strongly associated. Figure 3 shows entrepreneurial activity rates for Black Africans, Coloureds, Indians and Whites in South Africa. Although necessity-based entrepreneurial activity rates for Black Africans are higher than for Coloureds and Whites, Black Africans have much lower opportunity-based entrepreneurial activity rates than Coloureds, Indians and Whites. Consequently total entrepreneurial activity rates for Black Africans are much lower than for Coloureds, Indians or Whites (GEM 2003). Indians are however far dominant in the NE rankings, resulting on dominance of TEA.

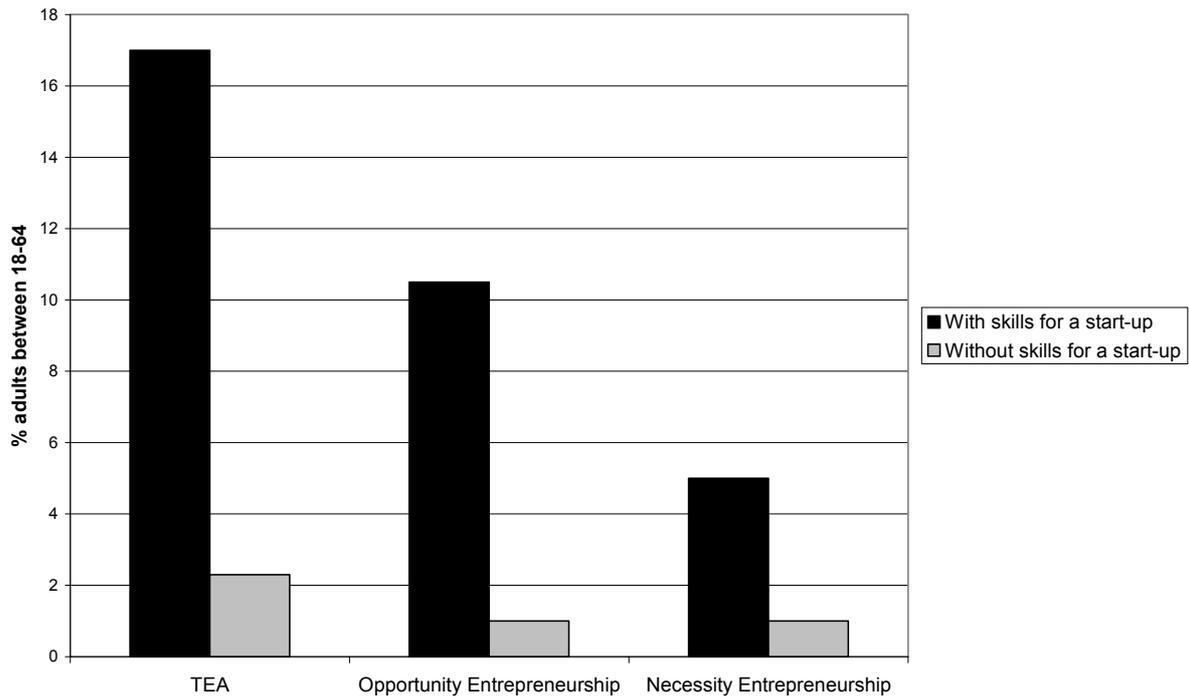

In South Africa, individuals who believe they have the skills to start a new business differ significantly between ethnic groups. Black Africans are less likely to believe they have the skills to start a new business than are Coloureds, Indians or whites (GEM 2003). Figure 4 shows self-perception of entrepreneurial skill; with individuals who believe they have the skills to start a business being seven times more likely to be involved in entrepreneurial activity than those who believe they do not have the skills.

Entrepreneurs in the informal sector (those with unregistered businesses) account for 88% of all businesses in disadvantaged communities (GEM 2002). Informal business employ an average of 0,8 people, formal business 7,2 people. Over two thirds of entrepreneurs have no matric.

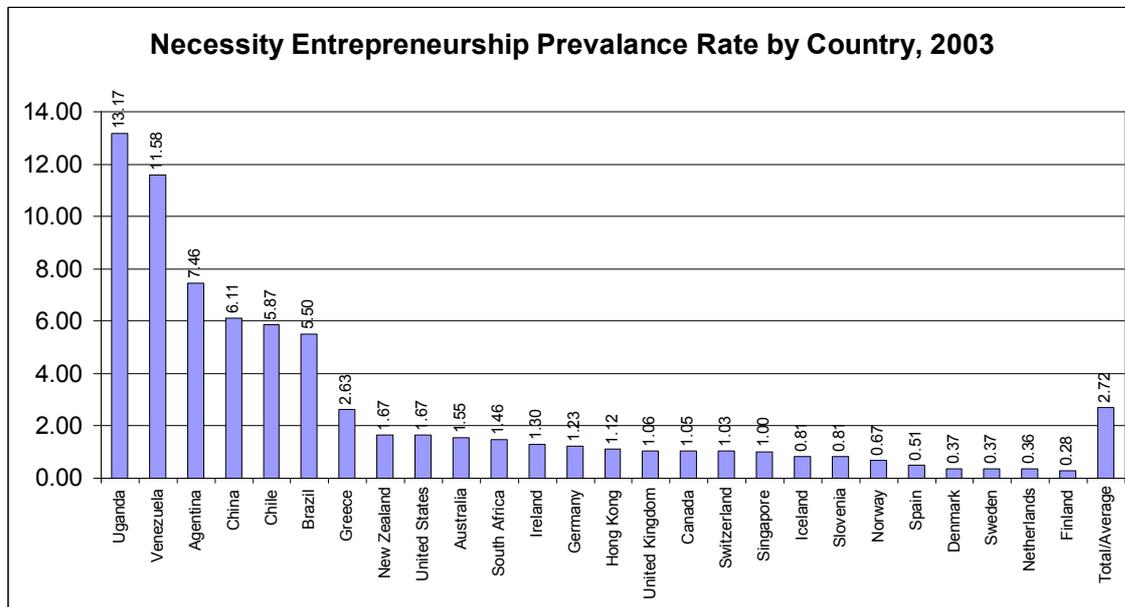

**Figure 3: TEA by Race in South Africa**

**Figure 4: Entrepreneurial Activity rates by Self Perception of Entrepreneurial Skills**

**Figure 5: NE Prevalance Rate by Country.**

In the “GEM world”, necessity entrepreneurs are on average 2.72% of the population. Figure 5 (above) shows that special case countries Uganda and Venezuela have “extreme” rates of NE. Both are churning economies in turmoil with high rates of un- and under-employment. “High” rates occur in Argentina, China, Chile and Brazil. We categorise South Africa, together with Greece, the United States, Australia, New Zealand and six other countries as having “moderate” rates of NE. Seven other GEM countries (largely social-

democratic countries of Northern Europe--Slovenia, Iceland, Norway, Spain, Sweden, Denmark, Netherlands, and Finland) had "low" rates of NE. Cognisance must however be taken that this initial grouping excludes differentiating between developing and developed nations. Countries with low per capita income have high rates of NE (GEM 2002).

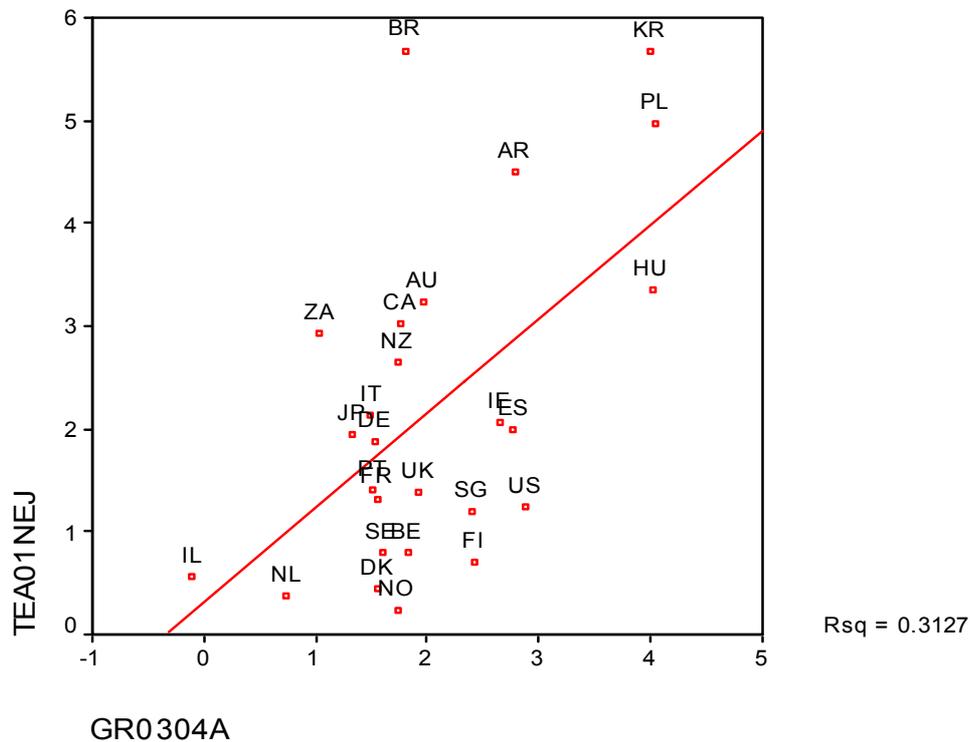

GEM provides evidence that Total Entrepreneurial Activity (TEA) is higher in developing countries compared to other countries. Lower entrepreneurial activity levels are seen in South Africa compared to other developing nations. When looking at the three tri-nations countries of South Africa, New Zealand and Australia, interesting contrasts arise.

Australia and New Zealand have significantly high NE rates, despite developed countries characteristically experiencing lower rates of NE. This is also despite low rates of unemployment, together with high social benefits. South Africa, on the other hand, experience a similar rate of NE, however, well below that of other developing nations. The South African rate is further a point of concern, taking cognisance of the high rates of unemployment, and poor levels of social benefits. The distinct difference between these is that NE is characteristically higher in developing GEM countries, not at all represented in these three tri-nations countries. Only Australia experienced a marginal increase in NE over the previous year. Whilst all three countries have NE rates well above the GEM median (1,10%), none correlate to GEM NE characteristics. Developing and struggling countries are characterised with high NE, yet developed countries such as New Zealand and Australia rate amongst the top 10 of all GEM countries with regard to NE. South Africa's very low rate of NE is surprising and does not reflect a lower prevalence of poverty in South Africa relative to other developing countries. Amongst developing nations, South Africa has the second lowest income per capita and the second highest level of income inequality (GEM 2003).

A major differentiation between the percent of NE to TEA is however evident, with a 12% rate amongst New Zealand and Australian entrepreneurs; in contrast to 34% of South African entrepreneurs. The GEM universe *proportion* of NEs amongst all entrepreneurs is on average 14,6%; substantially lower than the South African NE rate of 34,0%. Countries with high NE rates have "churning" economies, have suffered dislocation and economic turmoil, and may indicate lack of social funding, particularly in developing countries such as Brazil, China, Chile, Venezuela, Argentina, and Uganda. These countries are also high-growth developing economies (South Africa included). We believe that NE will increase significantly in nations with little or no social benefits for the unemployed, but will increase very little, if at all, in nations with strong benefits for the unemployed, such as the social-democratic welfare states of Northern Europe. Nonetheless, New Zealand has (after Greece) the highest NE activity in the developed countries, despite having a good social and welfare system. Developed countries, such as Spain, Netherlands, Germany, Finland, Denmark and UK have relatively low rates of NE activity, and are characterised by high-welfare. This corresponds to the oft-heard maxims that the more generous the welfare system, the lower the rate of NE and that when unemployment is low, NE rates will be low (Bygrave, 2003).

## **Necessity entrepreneurship link to economic growth**

**Figure 6: Graphical Representation of NE relationship to Economic Growth.**

Frederick (2004) shows that there is a strong and direct correlation between necessity entrepreneurship and economic growth. For example, the association between TEA Necessity in 2001 and the GDP Growth amongst all GEM countries three years later is a Pearson's correlation of 0.56, significant at <0.01. Frederick's study in particular examined the link in OECD countries, measuring TEA 2001-2003 with growth, by 0-5 Lag Years. The result showed a higher association between real GDP growth and NE than OE. This positive association is experienced in the South African context, together with a time lag association between TEA and economic growth. TEA Necessity in 2003 (R-square) accounts for 24% of the variance in real GDP growth for 2003, with a statistical significance of less than 0.006.

The positive relationship between entrepreneurial activity and economic growth was reinforced in the South African context. The TEA rate was found to be positively correlated with the GDP growth rate (observed or projected) for the following three years. The relationship was stronger for NE activity and increased with time lag (Hindle, 2004).

GEM 2002 identified that new firm activity has a stronger association with projected GDP growth than start-up activity. Start-ups created an estimated 185,000 jobs and new firms are estimated to have created one million jobs in South Africa between January 1999 and July 2003. Furthermore, South Africa needs a higher proportion of NE to progress beyond the start-up phase, facilitating economic growth.

### **Necessity entrepreneurship link to unemployment**

The South African unemployment rate has risen to a high of 46,7% in 2003, increasing the rate of a further increase in interest rates by the Reserve Bank (prime at 12,5%). Employment grew 0.8% in the June 2003 quarter, compared with an average quarterly

increase of 0.6% over the past four years and market expectations of 0.3% rise. The unemployment rate may now be as high as 48%, putting South Africa at the 15<sup>th</sup> highest unemployment rate in developing countries. (The rate across OECD countries is 7.1%). Even this low rate of unemployment may be skewed higher than it should be because new migrants are not able to find employment. GEM2003 indices however reflect that South Africa has one of the highest rates of NE in the OECD, which amplifies the notion that unemployment and NE are associated. South Africa has a NE rate similar to that of New Zealand, despite South Africa having a 47% unemployment rate (New Zealand unemployment at 4,2%).

Analysing the above predictions, one can only but assume that the resultant South Africa NE rate will be high. Unemployment is at an all time high, welfare systems are sparse, pension provisions are inadequate, and market openness is neutral; all resulting in a predicted high NE rate. However, South Africa has a NE rate in the top quartile of the 27 countries participating in GEM2003, despite one of the *lowest* NE rates in developing countries. Interestingly enough, South African NE represent 34,04% of all entrepreneurs, way above the all GEM median of 14,6%.

## FINDINGS

P1: When unemployment rates are high, necessity entrepreneurship will be high (Cowling and Bygrave, 2003)

P2: The more generous the welfare system the lower the rate of necessity entrepreneurship (Cowling and Bygrave, 2003).

P3: Necessity entrepreneurship contributes to economic growth (Frederick, 2004).

The *ex-post-facto* formal research from GEM (2003) indicates that South Africa Necessity Entrepreneurship is amongst the top 10 in the participating countries, with high levels of unemployment. In addition, South Africans inadequate social welfare benefits entice many unemployed persons to seeking work, apposing the labour-leisure trade-off. As such, the above propositions 1 and 2 are accepted within the South African context.

The high level of NE's however correlates positively with economic growth (Frederick, 2004), thus accepting proposal 3.

Whilst outside the ambit of this research project, the contribution of NE relative to TEA (34,04%) is of concern. This is particularly the case regarding the OE contribution of 66,28%; being close to 20% below the all GEM median. In other words, those entrepreneurs having no other choice than to commence in start-up businesses (NE) account for a contribution 20% greater than the all GEM median.

Khoza (2004) also highlights that unemployment of a South African individual does not necessarily trigger an entrepreneurial urge. Many are called to be entrepreneurs, but extremely few do succeed as entrepreneurs.

## CONCLUSION AND RECOMMENDATIONS

South Africa has a moderate level of necessity entrepreneurship in all GEM countries (GEM 2003), however dismal ratings when compared to other developing nations. In fact, South Africa has TEA levels (and corresponding NE levels) significantly lower than other GEM developing nations.

In terms of global comparison, South Africa ranks 9<sup>th</sup> in NE and 18<sup>th</sup> in OE. South Africa's entrepreneurial pool is made up of 66% OE and 34% NE, similar to developing country average, but significantly variable to global comparison.

The prediction that high unemployment levels, coupled with lack of welfare systems (Cowling and Bygrave) lead to increased entrepreneurial activity are distinct in the South African context. South Africa's high necessity entrepreneurial level is characterised by high unemployment levels, and low welfare benefits.

Since there is a direct correlation between Necessity Entrepreneurship and economic growth (Frederick, 2004), and that high growth is achieved by raising the necessity rate (GEM2002), it is imperative to develop the escalation of NE in South Africa. Secondly, within the broader dialogue around black economic empowerment, attention is shifting increasingly toward entrepreneurship. The emergence of large numbers of successful privately-owned businesses, launched and nurtured by black entrepreneurs at all levels, is being recognised as the key to pervasive and sustainable black empowerment (GEM 2002). Recommendations include Government Intervention towards assisting Necessity Entrepreneurs, with particular reference to the informal sector (unregistered businesses) necessity entrepreneurs. Such initiatives may include:

- Identifying industries and regions experiencing labour and skills shortages, and facilitating training and development in this regard.
- Accessibility to government and venture capital, within formal developed start-up networks. Possibility of reviewing the incentive structure for informal investments of this nature.
- Introduction of Business Information programmes, particularly directed at entrepreneurship networking, local business knowledge, and taxation, administrative and legislative issues.

Creating ease of information flow to start-ups, highlighting issues such as entrepreneurial capacity (skills, motivation), entrepreneurial opportunity, business churning, market replication, market creation, financial support, access to physical infrastructure and commercial infrastructure.

GEM 2003 further identify three key segments with regard to policy implications:

- The promotion of entrepreneurial activity amongst young people, especially male.
- Policy priorities include *education* and role models to develop entrepreneurial potential.
- Skills development interventions, particular reference to entrepreneurs' financial management capacity.

As opposed to business skills development, informal entrepreneurs to be supported primarily through life skills, personal management skills and technical training. Khoza (2004)

placed emphasis on retailing being a predominant form of business in the townships. He further informed that to create sustainable job opportunities in the retail sector, parallel entrepreneurs would have to play a significant role. This is in agreement with the development of applicable role models.

As a concluding remark, the importance of *education* cannot be overemphasised in an entrepreneurial context. Experts in South Africa isolate education and training as the countries main weakness with regard to the enabling environment for entrepreneurship. GEM 2003 finds that the education system could play a powerful role in increasing entrepreneurial activity amongst young adults, not only through formal teaching but also through the introduction of positive role models with an entrepreneurial background.

Further research will include the study of the relationship between education and entrepreneurial behaviour amongst all GEM participants in 2003.

# IN QUEST OF SME-CONDUCTIVE POLICY FORMULATION

## FROM A GLOBAL AND SYSTEMIC VIEW

by

**Professor. Dr. Dr.h.c. J. Hanns Pichler, M.Sc.**  
**University of Economics & Business Administration**  
**Austrian Institute for SME Research**  
**V i e n n a**

The very topic raises an ever challenging question: that is, of the role and significance, if not to say "survival" of small and medium-sized enterprises (SMEs) and related structures within an environment of forces which - particularly in the sphere of industry - an first sight tend to favour the "big" rather than the "small". This at the same time points at underlying aspects and challenges of broader socio-economic and structural dimensions with a concomitant need for appropriate formulation of more differentiated and specifically designed business policies generally.

Such challenges and related problems today are to be seen from an inseparably intertwined and multipronged point of view:

- From a more and more internationally, not the least as a strategic ingredient of development to be recognized perception of the role and exposure of SMEs in their sector-related structural significance nationally, regionally and nowadays, in fact, globally.

Then, from a closer to the skin view of developments related to on-going restructuring in our European and - when speaking of SMEs - in many ways regionally unique business environment.

I.

**Globally**, evidence of a new and growing recognition of the role of SMEs is provided by a profound reorientation in development policy over the last decades with a distinct change in strategies toward fostering sector-related diversification for more balanced long term growth and economic welfare under sustainable conditions generally.

In speaking of strategies, there is today an ever growing awareness worldwide of the role of SMEs both as a factor of sustaining economic stability and as simply indispensable a catalyst for fostering economic dynamics and welfare. Experience and recognition thereof

- \* Finally, under overriding **socio-economic** and systems-related aspects of a more comprehensive SME-specific policy formulation.

has triggered a more broadly based rethinking and change in outlook quite in contrast still to postwar decades, when sustained economic buoyancy, business dynamics and growth in considerable measure tended to blur the need for any more subtle structural considerations. Yet, underlying economic realities and the very characteristics of any SME structured business environment, in the end, were not to be neglected with impunity indefinitely.

Altogether - and not the least from an European angle - this largely has disproved more orthodox and seemingly ill conceived notions of any inherent superiority of the "big" vis-a-vis the "small", thus recognizing the specific role of SMEs in the context of a more subtle and diversified approach toward "structural development".

## II.

In geographically narrowing our focus and taking a closer look now at the specificity of the **European business environment**: a unique, richly structured and indeed highly diversified SME "landscape" emerges. A landscape with manifold facets as vividly being illustrated again and again by the "European Observatory for SMEs". Thus, in its current (sixth) issue it is being shown that SMEs (defined as up to 250 employees) within the "European Space" in a broader sense number

somewhere close to 20 mill. units, against only about 40.000, or just 0.2%, larger firms (with more than 250 employees); this makes for an average of some 50 (non-primary) business establishments per 1000 inhabitants! Furthermore, these millions of smaller - in considerable part craft dominated micro-enterprises - over the past years continuously have tended to outperform larger enterprises in terms of job creation. This at the same time demonstrates that without such relatively high employment growth and intensity on part of SMEs, the European unemployment syndrom would have been even more pronounced!

While illustrating thereby the economic and social importance of SMEs in a European context, this further implies - as stated in the 1996 "Observatory" - that over the years an estimated 1.5 million Europeans annually decide to start a business of their own; and this way, over half a decade or so, the number of (mostly small to very small) enterprises increased by about 9%, while the EU population grew by only some 2 %.

In country-specific terms it is quite typical too when, e.g., in Austria - and similarly in Germany, in Switzerland and elsewhere - nearly 99% of all non-agricultural business establishments have less than one hundred employees; and of those again close to 90% have less than 10, and just about 2% 100 or above. Moreover, in terms of sustaining employment the SME sector on the whole - due to its flexibility and adaptability - over the eighties and well into the nineties, in a period of profound industrial restructuring, was able to by and large absorb, and thereby compensate for, on-going layoffs in the larger public sector dominated industries to the tune of some 80,000 employees (or nearly 3% per cent of Austria's total work force).

While recognizing such proven strength not only structurally but also as providing a certain measure of resilience against business cycle volatilities one might take note of the fact that it is exactly in the sphere of SMEs as well where - due to their more immediate socio-economic exposure - conflicts of interest (not free at times from certain partisanship) do arise and are being fought out; conflicts implying both positive and negative repercussions as to sector-related policy formulation with concomitant institutional implications. Frequently, this indeed resembles the arena where in essentially market based systems "the

very action" is; where policy challenges and demands are being articulated in ever so manyfold nuances and facets.

Sheer existence and sustained survival of SME structures with their complexities as mirroring the very reality of economic life itself, also contradicts once widely spread "prophecies" of the ultimate demise of small businesses as a predicament under both "classical" and, of course, Marxian doctrines. Historical evidence and today's systemic transformation processes at our doorsteps in Central and Eastern Europe clearly point to the opposite; the very essence of restructuring going on there more than ever calls for speedy creation or revival of sound and diversified SME structures as simply indispensable an ingredient for any sustained recovery as one of the strategically most challenging issues.

All too easy at times, as it seems, the inherent wealth of diversity as so typical for the European business scenario merely is being taken for granted; this perhaps too, because we somehow are used to the fact that SMEs always have been or simply ought to be there anyway. Yet, for any more conscious policy considerations this, in fact, is not really so self-understood; it rather does call for continued awareness to assure that underlying resilience and adjustment capabilities constantly are being safeguarded..

Such adjustment capabilities to changing business conditions and, at times, volatile cyclical movements quite typically are characterized also by structural permeability both upward and downward: that is to say, by way of adjusting - and in today's scenario all the more relevant - to forces of regional (or even global) integration with implicit restructuring of business sizes. Such restructuring, by its very nature, is not one-sidedly to be interpreted as simply a tendency toward "concentration" only; rather, and more objectively so, it is equally to be seen as a process of opening up opportunities also "downstream" in terms of structural deepening as markets and, in particular, size of markets change.

Insights of modern industrial economics give credence to such complexities in the course of structural adjustment with, in part, new evidence as to criteria of "optimal" business sizes being induced, e.g., by technological developments. Thereby placing emphasis not so much on economies of "scale"; rather more on elements such as SME-specific diversification or differentiation rendering classical returns to "scale" no longer so valid an argument as against economies of "scope". More pointedly still, it implies conscious recognition of such complexities as, e.g., regional specifics and market differentiation, locational spread including relative density of businesses relating to given demand and supply patterns, with implications again for product/market orientation and diversification of size structures as relevant for both forward and backward linkages of respective business activities.

Any SME policy addressing such complexities finally has to do with what one might subsume under contributing to "quality of life" and to conditions of welfare in a broader sense. Endowment with diversified business structures and, thereby, with enhanced economic opportunities, productive capacities and increased potential for catering to differentiated, individualized patterns of demand finally needs to be judged with a view to such qualitative aspects. (A study to this effect conducted in Austria, e.g., depicts regional differences in relative SME density between 40 and 80 per 1000 inhabitants as clearly correlating with respectively higher or lower levels of economic welfare, incomes and purchasing power.)

### III.

Over and above mere economic considerations, relevance of SMEs, finally, is to be viewed also from a more broadly based **socio-economic** point of view; that is, SMEs be-

ing seen as a driving force of structural change on the one hand, and as a stabilizing factor for safeguarding a given economic setting with its institutional framework in the dynamics of change on the other.

For any freedom - and as such market - oriented socio-economic order as a form of life, this unequivocally implies a commitment to entrepreneurial initiative, to guaranteeing both free and autonomous pursuit of business opportunities; implies furthermore a commitment to market criteria of performance with quite legitimate a claim for adequate return under due consideration of social (including environmental) responsibility in the conduct of business as such. It also means that any such policy inescapably becomes part and parcel of shaping socio-economic conditions as conducive a framework wherein SMEs, with their diversified structures and patterns of performance, can thrive as indispensable for guaranteeing and sustaining welfare conditions for society as a whole (as no doubt constituting a policy challenge at any time anywhere).

Such policy ought not to shy away from the very "nitty gritty" either: such as, e. g., avoiding to burden SMEs in a discriminatory manner with unremunerated administrative tasks by public authorities. A more recent study to that effect in Germany demonstrates that the relative impact in terms of cost and manpower to be allocated proves up to 22 times (!) and, thus, quite disproportionately higher for SMEs as compared to larger enterprises. In a somewhat more sarcastic vein, but pointing essentially in the same direction, the US Small Business Administration some time ago pointed out that the then roughly 10 million businesses under its constituency got inundated yearly by well over 300 million forms with up to one billion pages containing more than 7 billion questions; altogether entailing unremunerated costs averaging some \$ 3,000.- or more per firm. Gracefully perhaps, a similar EU related assessment has not, as yet, been carried out!

If on the other hand - as often quite "liberally" being claimed - it is to be recognized that SMEs indeed represent the mainstay or very "trade mark" of any market oriented economy; and if it is true further, as variously being claimed, that - due to the sheer existence of more diversified SME structures - economies over and over again could prove their adaptive capabilities for both overcoming even severe policy mistakes and at the same time taking on new challenges, then it would be only consequential for any related policy to attain a certain measure of "natural" legitimacy of its own.

#### IV.

Upon closer scrutiny of such pronouncements and arguments though, one might be left wondering whether this kind of demands or recommendations not remain pretty much on the surface and, thus, tend to fall way short of recognizing more profound issues involved; whether indeed - if argued from a systems-related point of view - not more deeply probing questions as to the really crucial "building stones" of any SME-specific policy were to be addressed, as e.g.:

- **Questioning**, with a view not the least to prevailing structures, whether "classically" defined strategies of blatant "marketeeing" indeed make for adequate and sensitive enough a policy taking proper cognizance of underlying diversities and complexities?
- **Questioning** further, whether sheer prevalence of SME diversification with related institutional structures rather not might call for an equally differentiated policy; a policy which - within an essentially market based framework - just as well allows for appropriate multiplicity of cooperative (corporatist) or in various ways subsidiary forms of

business organization and relationships as a kind of "natural" ingredient, if not enrichment of any economic system pointing beyond simple supply and demand mechanisms at the very micro level?

- **Considering** finally, and without wanting to seem "heretical", whether not - and possibly quite legitimately so - to foster and thereby acknowledge also intermediate forms of business association at the meso level as a reflection or simply inescapable a feature of institutionalization for any sound SME policy recognizing, in principle:
  - for one, that competition as a coordinating "mechanism" via markets constitutes only one - but not the only - criterion or instrument governing business conduct and, depending on given sectoral or structural conditions, not necessarily is to take center stage; or in putting it more bluntly: that acceptance of an essentially competitive, market oriented economic order for SMEs equally requires an appropriate framework of institutions going along with;
  - furthermore, that cognizance of such specifics with implicit forms of institutionalization may prove more conducive to SME related business conduct than any undifferentiated plea for cut-throat competition at micro level, by emphasizing and bringing to bear economies of "scope" rather than of "scale"; or in short: considering SMEs not merely as "beautiful", but also as being "efficient" in a more comprehensive sector-specific understanding;
  - and finally, that necessary autonomy of SMEs within a spectre of larger entities is to be constantly safeguarded, not the least by way of sector-related forms of institutionalization in duly recognizing role and relevance of the SME sector as a whole from an overriding socio-economic perspective.

Any self-conscious, not to be confused with self-righteous, SME policy conceived under such auspices should - in view of the legitimate claims and issues involved - ultimately be articulated more aggressively still, as quite essential an element within the realm of economic policy formulation generally.

## **ABSTRACT**

Four case studies have been used to identify the factors critical for success within small businesses operating in the leisure/recreation industry in New Zealand. This paper focuses on what success means for these businesses and the underlying themes of how to ensure this. From this, a check list of factors was developed and refined which may prove useful to those wishing to set up a small business in this industry. This study shows the importance of performing across a wide number of areas rather than focusing on a few and performing to a high standard in them in order to compensate for the others. However, having this list is not a guarantee of success as the entrepreneur needs to be able to understand how to use it.

Keywords: Critical success factors, outdoor leisure/recreation industry, small business, measure of success.

## **INTRODUCTION**

The interest in examining the area of small businesses operating within the outdoor leisure/recreation industry is two-fold: Firstly, there appears to be an increasing number of tertiary institutions within New Zealand offering a wide range of outdoor leisure/recreation courses. These are aimed at equipping the successful student(s) with the skills to either set up a business themselves or to work in a small business for others in this area. However, the outdoor leisure/recreation industry is often poorly remunerated, the margins are minimal, the

hours are long and there is no career path or structure. These are issues which raise the following questions:

- What are the guidelines for being successful for the small business entrepreneur in this industry?
- What should these would be entrepreneurs be mindful of?

Secondly, there would appear to be a gap in the literature in this area. Relatively little has been published in the area of small business within this industry sector and even less has been researched in the area of what the measurement for success is for these businesses (Byers & Slack, 2001). This paper aims to fill that gap by addressing the following research questions:

- 1) Understand why and how small business entrepreneurs in the outdoor leisure/recreation industry started their businesses.
- 2) Understand how success is measured within these small businesses.
- 3) Understand whether these perceptions of success for a small business in the outdoor leisure/recreation industry differ from those for other small businesses in other industries.
- 4) Identify the critical success factors (CSFs) necessary to succeed for a small business in this industry.

This paper is divided into six sections including this one. The following section reviews the literature on critical success factors; it includes a definition used in this study for small business and the outdoor leisure/recreation industry. Also included is a rationale for CSFs. This is followed by the context for the study, method of research and results. The paper ends with conclusions and implications.

## **A REVIEW OF THE LITERATURE**

In this paper the definition for small business is a business employing less than five people and the term entrepreneur and small business operator will be used interchangeably to mean the same (Cameron & Massey, 1999)<sup>1</sup>. When comparing small businesses in New Zealand with small businesses in other countries, care must be taken as definitions based on size must be taken into account. A small business in the United Kingdom typically employees under 250 people (Barrow, 1993). A small business in the United States employs fewer than 200 people (Ryan, Eckert, & Ray, 1996). The challenges that face a business operating with 200 staff will be different to those that employ less than 10 staff.

---

<sup>1</sup> Overall, there appears to be no universally accepted definition of what a small business is. The reasons behind this are that small businesses can be found in all sectors of industry and commerce within New Zealand, they cannot be differentiated by legal structure, nor can they be differentiated by number of employees, assets or turnover as there is no break in the continuum between small enterprise and large corporations. The definition's of the business owners as making the majority of the decisions and funding the enterprise are also difficult to quantify, as these are qualitative judgments. Small business owners do not have all the skills necessary to run a small enterprise and so by necessity need to buy in skills (Cameron & Massey, 1999).

The definition adopted for the outdoor leisure/recreation industry is any business that provides an activity or activities conducted in an adventurous environment in an outdoor setting (Uhlendorf, 1992) which is away from the home environment (Devlin, Corbett, & Peebles, 1995). These activities may create a real or perceived risk to individuals (Holyfield, 1999), or provide sociability as well as solitude (Outdoor Recreation in America, 2002).

## **Understanding the rationale for critical success factors**

Although research has focused on the CSFs for small businesses (Ashton, 1992; Chen, 1999; Higham & Williams, 1993; Scales & Meredith, 1991; Yusuf, 1995), very little research has been undertaken in examining what success is for a small business, other than by financial measures such as return on investment (Gadenne, 1998). By having an understanding of success a better appreciation of how small business entrepreneurs measure their performance can be demonstrated.

There are a number of approaches to defining success. It can be defined by the small business entrepreneur's personal values of whether a goal to be achieved is important and thereby likely to be a measure of success (Eccles & Wigfield, 2002). Alternatively, there needs to be an element of passion which drives the small business entrepreneur to overcome obstacles and adversity toward this goal is also necessary (Smith, 1997; Stoltz, 1997). In addition, there is also a concern that success should not be measured by position and prestige (Neumann, 1975). Success can also be defined by how the small business entrepreneur has programmed themselves (Lipper, 1988). Hitchin & Hitchin (1999) note the 'careerist' approach and as an alternative the 'midlaner' approach to success which seeks a more balanced approach to life.

Within the context of the 'small business entrepreneur', success can be viewed as an internal measure based on their personal values and goals (Bailey, 1988; Hitchin & Hitchin, 1999; Lipper, 1988) that may or may not be measured externally.

In 1991, record numbers of New Zealand businesses failed (Ashton, 1992). In his study he noted that more than 2000 went into liquidation or receivership and over 2500 people were declared bankrupt. Yet despite this he comments that figures for starting a small business had increased over previous years and reflect an upward trend. Hamilton & English (1997) note that 51% of businesses started in 1988 did not survive through to 1992, however, many of these did so through a positive choice of the owner. This is in contrast to the myth that only 20% of small businesses are expected to survive their early years.

The survival rates for small business depend upon the sector that the business enters and that usually the easier it is to enter a sector the lower the survival rate (Hamilton & English, 1997). The myth of small business failure is also noted by Ryan et al. (1996) who cite statistics from the United States Small Business Administration which show a 55% failure rate within the first five years. This figure is calculated on the address of the business, if the business moves before the next census it is recorded as a failure, like-wise with a name change or merger. There is also no account of those setting up to take advantage of a fad and then closing when the fad ends. Cameron & Massey (1999) point out that a major difficulty in calculating small business failure is defining what is meant as failure and how does this failure rate compare with large organizations. They note that most studies use the 'discontinuance' definition (i.e. a firm stops trading) as this is the easiest definition to apply.

Given that the survival rates for small business are low, it is important to understand the underlying factors for this failure rate. The major contributors to this failure in small business identified in the literature are; poor management skills (a lack of or no planning with no control mechanisms), poor financial management and under capitalization (lack of initial capital, working capital and a failure to understand financial reports as well as mis-use of financial resources), a lack of business ability and poor business judgment skills (limited experience and education, failure to seek and act on advice), external factors (economic conditions such as interest rates and inflation, changes in government policy) (Cameron & Massey, 1999; Scales & Meredith, 1991). Davey (1983) notes that in the small business sector of the outdoor recreation industry in New Zealand, inadequate management skills are the major cause of failure. He also notes under capitalization, lack of knowledge and resources to obtain cheaper financing and funding sources; poor loan application processes are also causes of failure for the small business in this sector.

A business that is failing can be identified through one of four most common symptoms, these are noted by (Cameron & Massey, 1999; Hamilton & English, 1997) as:

1. Poor cash flow due to poor credit management practices.
2. A lack of working capital once fixed assets have been paid for.
3. An over-estimation of the potential market size by the owner who gears up for a higher demand which is then not realized.
4. An unexpected rapid sales growth which is managed badly by borrowing to keep up with demand so eventually the business is unable to pay suppliers.

Starting up a small business is hectic and time consuming, often those involved are having to learn new skills and end up working 18 hour days, making it difficult to know whether they are making the right decisions at the time, which can only compound the difficulties faced by the entrepreneur (Hamilton & English, 1997). Williams (1990) also notes time pressures in which the demands of the present urgent issue takes time away from future planning. This combined with an uncertainty in how to go about this planning act as a deterrent to starting the planning process, whereby the future is perceived as unpredictable and not worth the time and effort required. He comments there is also a lack in specialized knowledge of some aspects of the business. Concerning this Davey (1983) comments small businesses lack the access to specialized skills that would be present in a much larger organization such as financing and marketing. Williams (1990) builds on this by commenting that the small business operator often has distrust and hesitation in more formal and open planning methods as this entails sharing of the business idea with employees. He goes on to note the task of conceptual thinking for the busy person is often a difficult activity and there are no immediate results or feedback from this process, which also acts as a deterrent.

The most frequently cited cause for small business failure is an inability to pay debts (Hodgetts & Kuratko, 1998). The authors also cite incompetence as another major reason why small businesses fail, as owners do not understand how to run their enterprise. Other reasons cited by the authors include: Unbalanced experience contributes to failure for those owners who do not possess a well-rounded experience in the major business activities. Lack of management experience, where the owner does not know how to manage people contributes to failure. Entering a field that the owner has little or no knowledge of is another factor contributing to failure.

Higham & Williams (1993) go on to note that setting up a venture is very hard work and to keep it going is a constant battle. Cash flow emergencies are normal and so too is undertaking too much business for the cash available. They comment it takes a steady mind to make it all work.

## **Defining critical success factors**

CSFs are those management activities that will ensure a competent performance providing that the activities are performed satisfactorily (Rockart, 1979 cited in Dobbins, 2001). The CSFs are not necessary for achieving the organization's objectives and goals; rather they are a list of activities necessary for the successful delivery of those goals and objectives. The pursuance of these factors creates an environment conducive to success (Dobbins, 2001). It should also be noted that these factors are based on perceptions and may differ from one person to another (Jenster, 1986).

Chen (1999) comments in determining the CSFs for business success, no simple formula can be used to predict the successful and the not successful. Instead of guessing the winners and the losers, a number of principal critical success factors are identified that determine success. Chen (1999) suggests that these CSFs help to establish the competitive advantage of the business and ensure that this is sustainable; they are a useful approach as they focus attention on where things must go right.

The literature contains numerous factors critical to success, these are listed below:

- Establish a competitive advantage to ensure business sustainability based on special capabilities and competencies either based on organizational structure or service (Chen, 1999; Coyne, 1993; Gadenne, 1998; Hamilton & English, 1997; Ruthven, 1990; Scales & Meredith, 1991).
- Good management (ability to plan, organize, lead and control, and the suitability and personal qualities of the entrepreneur), access to adequate funding and good financial management (record keeping for tax purposes) ("Do as I do, not as I say," 1995; Gadenne, 1998; Hamilton & English, 1997; Ruthven, 1990; Scales & Meredith, 1991; Yusuf, 1995).
- Maintaining and developing employee relations with an innovative leadership approach (Gadenne, 1998).
- Having the right idea, marketing and the use of outside help (Connell et al., 2001; Cooper & Edgett, 1996; Gadenne, 1998; Hamilton & English, 1997; Ruthven, 1990; Scales & Meredith, 1991).
- Getting the right people involved with the right skills (Abetti, 2000; Connell et al., 2001; Cooper & Edgett, 1996; Hamilton & English, 1997).
- Trade and industry knowledge ("Do as I do, not as I say," 1995).
- A good business planning process which covers operational, strategic and visionary elements of the business (Abetti, 2000; Byers & Slack, 2001; Connell et al., 2001; Dervitsiottis, 1999; Gadenne, 1998; Hamilton & English, 1997; Stephenson, 1990; Williams, 1990).
- The building in of go/kill decision making processes (to identify whether a project should continue or discontinue) with a quality customer focus as the end point (Cooper & Edgett, 1996).
- The retention of organizational knowledge (Lim, Ahmed, & Zairi, 1999).

- Technical abilities (Ruthven, 1990; Scales & Meredith, 1991).
- Monitoring of critical success factors, and the management of information and information systems (Jenster, 1986).
- An ability to perform at a satisfactory level across all identified critical success factors (Connell et al., 2001).
- A focus on the few key critical success factors identified for success (Jenster, 1986).
- Having a customer focus (Cooper & Edgett, 1996; Dourado, 2001; Schultz & Kitchen, 2000).

In particular, the findings of Gadenne (1998) have implications for small business owners in that different management practices are associated with small firm performance in different industries. For service industries there is a higher importance placed on good management skills and innovative practices, whereby employees are motivated and rewarded accordingly.

In addition there has been much research by psychologists into the personality traits unique to the entrepreneur with the outcome of providing a 'checklist' critical for success (Cameron & Massey, 1999). These are:

- Motivation (Cameron & Massey, 1999; "Do as I do, not as I say," 1995; Hamilton & English, 1997; Handy, 1999; Wagoner & Harold, 1993).
- The need for independence and be in charge of one's destiny (Cameron & Massey, 1999; Hamilton & English, 1997; Handy, 1999; Wagoner & Harold, 1993).
- Commitment (Cameron & Massey, 1999; Hamilton & English, 1997; Handy, 1999; Wagoner & Harold, 1993).
- Tolerance for risk and ambiguity (Cameron & Massey, 1999; Hamilton & English, 1997; Handy, 1999; Wagoner & Harold, 1993).
- Self-confidence (Cameron & Massey, 1999; Hamilton & English, 1997; Handy, 1999; Wagoner & Harold, 1993).
- Innovativeness, flexibility and leadership (Cameron & Massey, 1999; Hamilton & English, 1997; Handy, 1999; Wagoner & Harold, 1993).
- An ability to set and achieve goals (Hamilton & English, 1997).
- An ability to recognize commercial opportunities (Hamilton & English, 1997).

Dobbin's (2001) study suggests merely having a list is not a prelude to success as managers need to be able to learn to use the CSFs and that these need to have some contextual relevance to that person. This entails some learning and instruction in the use and understanding of CSFs. He states CSFs will change depending upon the stage a project is in and also as the result of changes in technology. What is important is the process engaged in which identifies CSFs appropriate at that time for the success of the project or venture and enables the measurement of its success.

To ensure organizational learning continues, CSFs need to be documented and managed, so that there is a formal process rather than one that relies on intuition (Connell et al., 2001; Dobbins, 2001; Lim et al., 1999). CSFs are a good way to focus on what is important and necessary for success (Dobbins, 2001). There is no simple formula for success, only a number of things that you must get right (Chen, 1999).

Measures of business success are financial and dependent on the 'bottom line' (Gadenne, 1998; Goett, 1999; Jahnke, 2001; Newton, 2001). This success can also be equated with the ability of an organization to grow new business opportunities as profit centers, whilst managing all other aspects of the business profitably (Baghai, Bradshaw, Coley & White, 1999). By introducing performance measures to measure all aspects of the business, this success can be measured and evaluated. This evaluation is ultimately tied to profit (Gregory & Myers, 2002; Hart, 1993). However, Goett (1999) notes that this form of measure is not necessarily a 'healthy one'. Whereas Besser (1999) comments that a more holistic approach be taken and that this involves the community and staff satisfaction as well as the values of the entrepreneur. This alternative approach is noted by Besser (1999) and Hart (1993) who comment on the subjectiveness of non-financial measures for success and that these may be rather vague. Success in terms of these non-financial measures at the expense of long-term financial goals however is not a viable business proposition (Hart, 1993).

## **CONTEXT FOR THE STUDY**

Byers & Slack (2001) mention 54 of the world's top 500 companies are leisure organizations. They also note one of the important contributors to the rapid growth of the leisure industry for the economy in the United Kingdom is the small business sector. The leisure industry forms an important part of many of the world's industrialized nations.

Small business enterprises have an important role to play both economically and socially, as they provide a legitimate way for many to realize their aspirations (Cameron & Massey, 1999). They are also a major source of change and innovation creating new ways of earning an income and provide new tax revenues (Miner, 1997). Small businesses are essential to the existence of towns and cities and make a significant contribution to the economy (Cameron & Massey, 1999; Hamilton & English, 1997; Scales & Meredith, 1991). Not only this but more people are becoming self-employed as a means of seeking a more satisfying way of living (Cameron & Massey, 1999; Higham & Williams, 1993).

Small businesses are unique in that they behave differently within their environments and face unique size related issues (Coviello & McAuley, 1999). They operate within an uncertain environment, have little resources and are unable to influence market demand, and their size is a constraining factor (Byers & Slack, 2001). Small businesses are not mini-versions of larger business (Coviello & McAuley, 1999).

In reviewing the literature there is little doubt of the importance of the small business sector and the role that it plays in the economy (Byers & Slack, 2001; Cameron & Massey, 1999; Miner, 1997). The outdoor leisure and recreation industry is a component of the wider leisure industry and plays a significant role in New Zealand. It has become a major focus for the multi million dollar tourism industry and a significant earner of overseas currencies. It also provides a means of personal development and growth for many (Devlin et al., 1995).

Despite the recognized importance of this small business sector for the economy there is a gap in the literature (Byers & Slack, 2001; Devlin et al., 1995; Hamilton & English, 1997; Miner, 1997), as relatively little has been published in this area and even less is understood

concerning the measurement for success (Byers & Slack, 2001). Only financial measures such as return on investment have been used to quantify what success means to a small business (Gadenne, 1998). By understanding what success means, an understanding of how these businesses measure their performance can be made.

Whilst there has been much research concerning CSFs for small businesses in other industries (Ashton, 1992; Chen, 1999; Higham & Williams, 1993; Scales & Meredith, 1991; Yusuf, 1995) relatively little is known about the leisure industry and even less concerning the outdoor leisure/recreation industry.

## **METHOD OF RESEARCH**

This paper uses a multiple case study approach particularly appropriate at the beginning stages of research into a new area in order to generate ideas for further research (Graziano & Raulin, 1997). Case studies are useful to uncover unique viewpoints held by the participants (Tellis, 1997) and to discover key aspects of broader themes and patterns (Schloss & Smith, 1999). Yin (1986) and Eisenhardt's (1989) prescriptions for case research were followed in developing this study. Case selection, limit of analysis and data gathering, crafting the questions, conducting the interviews, coding of data and analysis of cases will be discussed next.

### **Case selection**

Selection of the cases was both specific and deliberate; Eisenhardt (1989) argues that this is preferable in case study research. Four cases were selected via a theoretical sampling. As such the cases for this research have been chosen for theoretical rather than statistical reasons. Participants were selected in order to uncover the characteristics of events and processes involved in running a small business in the outdoor leisure/recreation industry in New Zealand. The cases were approached in an holistic rather than embedded manner. Inferences were based on convergent evidence from a number of sources; in particular the case study interview, brochures and web pages from the case study business, and from the literature. This is to ensure that information is interpreted correctly and to provide a triangulation of multiple data sources to provide a more powerful substantiation of the findings (Yin, 1986). Confidence in the findings was further enhanced by the selection of one case to provide divergent findings (Eisenhardt, 1989), in this instance a 'not so successful case'. This approach was taken in order to test the limits of the conclusions drawn from the other cases and forced the researcher to clarify concepts (Miles & Huberman, 1994). The 'not so successful' case was identified by a financial measure of whether the business could support the business owner. All cases were selected from the same geographic area in New Zealand.

The unit of analysis was a business employing less than five people that provided activities in adventurous environments away from the home base. The following criterion was used to determine this:

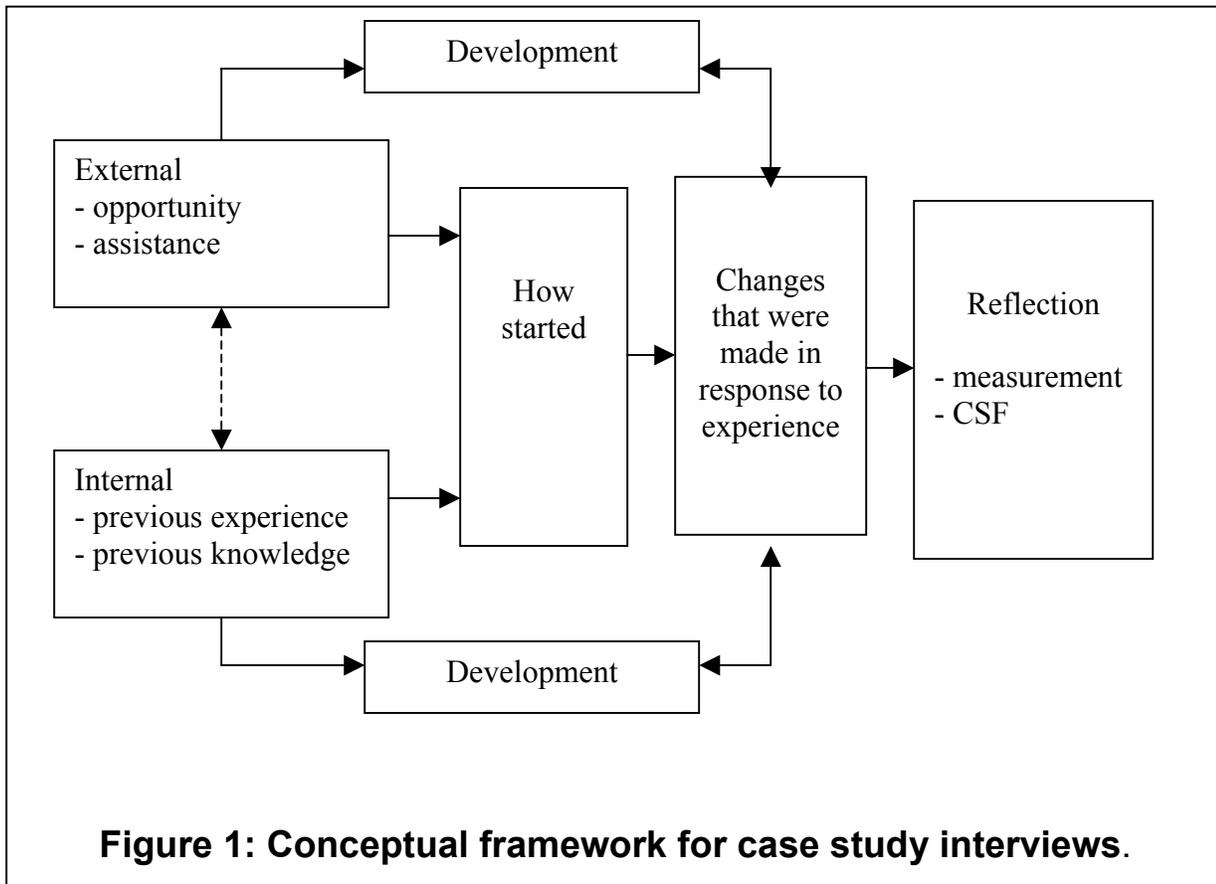

- A business that provides an activity or activities that is conducted in an adventurous environment in an outdoor setting (Uhlendorf, 1992), which is away from the home environment (Devlin et al., 1995). The activities provided may create a real or perceived risk to individuals (Holyfield, 1999), or provide sociability as well as solitude (Outdoor Recreation in America, 2002).
- The business will employ less than five people and the term entrepreneur will be used interchangeably with small business operator (Cameron & Massey, 1999).

## **LIMIT OF ANALYSIS AND DATA GATHERING**

Analysis and data gathering was determined by the research question, which was to identify the CSFs for small business in the outdoor leisure/recreation industry in New Zealand. This was achieved by researching the following areas:

- 1) Understand why and how small business entrepreneurs in the outdoor leisure/recreation industry started their businesses.
- 2) Understand how success is measured within these small businesses in the outdoor recreation/leisure industry.
- 3) Understand whether these perceptions of success for a small business in the outdoor leisure/recreation industry differ from those for other small businesses in other industries.
- 4) Identify the CSFs necessary to succeed in this industry for a small business.

A conceptual framework (see figure 1 below) was developed for the purpose of this study. The conceptual framework was based on the findings from the literature review and helped to define the boundaries and focus the research on to a specific area of the participant's (owner) business (Miles & Hubermann, 1994; Yin, 1986). This approach ensured that the researcher was not overwhelmed by data that are meaningless for the purposes of this study (Miles & Hubermann, 1994). Only the participant (owner) was interviewed and this occurred once only, thereby defining the boundary further by time. The participant (owner) chose the setting for the interview.

The conceptual framework consists of a number of 'bins', which identify the areas to be investigated (Miles & Hubermann, 1994). The arrows indicate a relationship between one 'bin' and the next. Where a two-way arrow is indicated, a relationship exists which goes both ways. In the conceptual framework shown above, an ongoing two-way relationship is indicated between 'development' and 'changes that were made in response to experience'. It was anticipated that ongoing learning occurred for the businesses as a result of their experiences which then affected their development.

## **CRAFTING THE QUESTIONS AND CONDUCTING THE INTERVIEWS**

The construct of the framework and questions reflected the background of the researcher, in that this exercise was approached mainly from a business/marketing orientation. A standardised approach was necessary, as this facilitated cross comparisons between cases (Miles & Hubermann, 1994).

The interviews were of a focussed nature, with a semi-structured approach, these followed a pre-set list of questions (Coolican, 1999; Yin, 1986). The questions were phrased in an open-ended fashion and in a logical sequence (Morse & Field, 1995). The data were captured using audio recording. A multi-method approach was used where some data were quantified and some questions that were asked were quantitative.

A list of CSFs identified from the literature review were presented to the interviewees for rating of importance. To ensure the relevance of this, interviewees were asked to firstly identify and then to rate their own list of CSFs. The interviewee's list of CSFs was used to refine the researcher's list as well as provide insights into identifying emerging themes. The list was then tabulated for comparison and to identify emerging patterns.

## **CODING OF DATA AND ANALYSIS OF CASES**

To avoid data overload, the case interview transcripts were coded. This allowed the tagging of data that was meaningful so that it could be easily identified and retrieved. Coding in this way helps in the identification of themes. A start list of codes was prepared prior to the case study interviews. The data gathered from this process was 'compressed' by reducing the main points that emerged. Each case was approached individually in the way that it was analyzed. This information was then presented in a matrix format so that comparisons in each of the areas of investigation could be compared across all four cases (Miles & Hubermann, 1994).

## **CASE SUMMARIES**

A brief description of each case is provided below. The names of each of the cases have been changed to protect their identity.

### **Case study A – Wild Adventure**

Wild Adventure was set up to empower people through outdoor experiences. In particular kayaking which makes up most of the business activity. This involves kayak guided tours and instructional courses. The business also provides abseiling, caving and tramping experiences and other similar type activities. The business is a provider of sea kayaking, team building for corporate clients, caving, easy introductory abseiling to adventure abseiling, and overseas sea kayaking adventures as well as running sea kayaking competitive two day events. Sea kayaking trips are conducted in the local area and include half day to overnight excursions. Training and coaching courses in sea kayaking are also offered, ranging from beginner type courses to the more experienced and kayak surfing.

The groups catered for are mainly the 30, 40 and 50 year olds. The business rarely caters for younger age groups as they are perceived by Wild Adventure to lack the disposable income of the older ages and are not able to take the time off work to participate while struggling to make in-roads into their chosen careers.

The business was initially started with their partner (girl friend). The partner is no longer involved but the business continues to employ one other person as a manager. The business has been in existence now for seven years, it was formed in 1995. Since then the business has gone through a number of name changes.

Decisions in the business are made jointly with the manager. At times extra instructors are employed on a contractual basis when the need arises.

## **Case study B – Outdoor Experiences**

Outdoor Experiences is aimed at providing safe and exciting outdoor experiences; it primarily focuses on servicing school groups with activities mainly consisting of kayaking, rock climbing, team building as well as some other outdoor type activities. Activities are operated at the school grounds or at the school's outdoor camps that the schools organise. Other client groups for the business include 'adventure seekers' from the tourist market who are offered day or weekend activity trips, and the corporate market for team building type activities and social events. In addition the business is involved in assisting a tertiary provider of outdoor courses in running their six-month outdoor recreation course. Other activities offered include; sea or white water kayaking, mountain biking, rock climbing and abseiling, tramping, and caving.

The business was originally started with three partners, after six months one of the partners exited the business. The business in its current format in 2003 had been trading for nearly two years and is still run in partnership by two of the original partners. The business functioned from the home of one of the business partners.

One business partner looks after the books and bookings as well as the administration and business planning, and also holds a full time job. The other partner delivers and arranges the programmes of activity, and is employed full time by the business. Additional staff are contracted in when required to meet demand at busy times of the year.

## **Case study C – Adventures Unlimited**

Adventures Unlimited was formed with a business partner, as a part time venture. The purpose of the business was to take people away (mainly women) for the weekend for low-level adventure type activities. Activities included; horse riding, tramping, and rafting. From this the business grew to offering ten-week courses in bush craft, the purpose being to empower participants to undertake this activity for themselves. To meet emerging demand, further courses were developed and offered. The business will organise anything that participants are willing to do. This part of the business operation takes three days each week of Adventures Unlimited's time, the remaining days of the week are taken up by a secondary business.

The secondary business grew out of the original business to offer safety training and risk management for primary and intermediate level school teachers, and outdoor first aid training mainly for teachers at colleges. Outdoor first aid courses are also provided for other clients on an on-going contractual base with set annual dates for the courses. The business also offers other instructional courses and is also involved in teaching skills to young people for the Duke of Edinburgh Award Scheme.

In 2003 the initial business venture has been running for 13 years, the secondary business has been operating for five years. Both businesses operate from home. Adventures

Unlimited employ a number of contractual workers as and when the need arises to meet demand.

## **Case study D – Outdoor Fun**

Outdoor Fun is aimed at introducing participants to rock climbing in a fun way that inspires them to continue with this activity. The market aimed for is wide and diverse, young to old and includes youth at risk. The business is run from home, it employs no other people, and no assistance or mentoring was sought when setting up or in running the business.

Outdoor Fun was initially set up to provide the owner with full time paid employment. After six months of trading the business could not support the owner. As a consequence of this the business now operates on a part time basis only. The business has been operating for four years.

## **IDENTIFICATION AND DISCUSSION OF THEMES**

A number of key themes emerged from the cross-case analysis, which are discussed below:

### ***Opportunity and why started***

Cases A, B and C all had similarities in that they had specific 'micro' knowledge of the opportunities available to them for the setting up and running of a business. Case A refined this further to a more specific target audience different from the first market that they originally entered. Case B had purchased an existing business with an existing client base so understood at the outset who the client was, and case C had grown their business gradually from external pressures of interested clients who wanted similar experiences. In contrast case D had identified a broad 'macro' opportunity and then a perceived gap in the market, which they targeted. Case study D commented,

“Originally I was looking at the tourist industry as a whole because I saw this as a growth industry for New Zealand and Australasia as a whole, so there was always going to be employment...being an active person I wanted to get more into the adventure side of the tourist industry.”

Case D had this to say regarding the tourism industry in Auckland,

“...at the time rock climbing was very new so the potential for growth was there and still is there. It is also a different sport which I had never done so it was a challenge for me personally as well as you know head space and the skills and all that sort of thing and also there weren't many people qualified in their fields so that steered me towards getting a qualification.”

The findings from case D reflect a lack of work on the market potential. Scales & Meridith (1991) and Ruthven (1990) note the critical factors for success include a feasibility study of the demand for the product and size of market. Cooper & Edgett (1996) comment on the

quality of the work undertaken between the successful and not so successful into market studies. Hamilton & English (1997) comment on having knowledge of the market place and customers as essential.

All of the cases started their businesses as a means of creating a more fulfilling way of living, which is the same for the majority of small business entrepreneurs in other industries (Cameron & Massey, 1999; Higham & Williams, 1993). Cases A, B and C started from a 'hobby motive' and a desire to make a living from this, which is similar to other entrepreneurs starting up a business in the leisure industry (Byers & Slack, 2001). All of the cases had not intended their businesses to be a major job creator for others, which reflects findings in studies of small businesses in other industries (Hamilton & English, 1997).

### ***Business set up***

Cases A, B and C provide more than one activity to a narrow specified target audience. Each of these cases also provides a service or innovation that is difficult to copy; the importance of this is noted by Coyne (1993). Case A offers an overseas adventure experience, case B operates a broad range of services to meet the requirements of schools' adventure camps, and case C is the only operator in the industry to offer outdoor first aid and other relevant courses on risk management and safety management to this market. This is in contrast to case D who focuses on the provision of one activity to a rather broad and undefined audience. Case D's business activity is also offered by each of the other case studies. Case D commented that they could not categorize their customers and that the service provided was for:

"Everyone and anyone. Young and old. Professionals to youth at risk."

Case A, B and C have repeat business from large clients or a means of 'back up' income which they can rely upon to provide a 'bread and butter' income. Case A noted the importance of this and commented, "Have a good capital base and have another source of income to fall back on." This was not evident with case D.

### ***Working with others***

Case A, B and C work with others in the running and development of their business including receiving advice. This is in contrast to case study D who is a sole owner/operator, employs no others, and had set up their business with no support or help from others, choosing instead to operate in isolation. Scales & Meridith (1991) and Ruthven (1990) note the use of outside help as essential.

### ***Previous knowledge and experience***

Cases A, B and C started with a similar type of background. All of the cases had attended formal courses for the purpose of improving and developing their instructional and leadership abilities. Outdoor skills in their chosen fields of operation were also developed and refined.

They all had an interest in the outdoors in one form or another, several comments from the cases reflect this.

Case B, "...getting into the outdoors stemmed from going through cub scouts and venturers...I definitely realized that the outdoors was something I was really keen on...that's why I decided to apply for the (tertiary outdoor course)."

Case C, "I absolutely fell in love with the New Zealand outdoors...I started doing courses with the Mountain Safety Council and realized that you didn't have to be gung-ho to be in the outdoors."

Cases A, B and C have finance and marketing experience and or work with a business partner that has these skills. Case D did not state whether they had these skills or experiences only an indication that they had been self-employed previously. It is interesting to note that case D attributed their position after their first six months of trading to a lack of finance and marketing. Case study D stated, "Unfortunately I had run out of funds...I was living hand to mouth and a marketing budget just wasn't in existence." Hodgetts & Kuratko (1998) state not possessing a well-rounded experience in major business activities is a contributor to failure. Other major noted causes of small business failure can also be seen to apply to case D in that poor financial management and under capitalization with poor business judgment skills were present (Cameron & Massey, 1999; Davey, 1983; Scales & Meredith, 1991). Case D commented that the, "...summer period was quite busy but then the winter period of course things dropped off and...that was pretty tough trying to survive through to the next summer." This is noted by Hamilton & English (1997) and Cameron & Massey (1999) who comment that over estimation of the potential market size that is then not realized is also a common symptom of failure.

## **Success**

Cases A, B and C differed from case D in the way that they spoke about their business. They were animated, expressive and passionate in their telling. Cases A, B and C stated that they had set out to do something that they 'really enjoyed', whilst case D had identified a 'gap in the market'. Comments from cases A,B, and C included, "Enjoying what you are doing and having the ability to do it to the best of your potential. Having participants on courses say that was the best course they have ever been on...being able to produce the best service possible and having clients recognize this".

It is interesting to note that from the interviewee's list of critical success factors, cases A, B and C had identified 'passion', whereas case D did not.

In defining success cases A, B and C all spoke about 'striving for', 'recognition' and 'reaching potential'. These are all achievement driven comments. In contrast to this case D spoke about, "Being happy with who you are".

Outcomes related to achievement behaviors are reliant upon that person's strength of will and diligence. This determines whether an act is successful and not way laid by distraction en-route. Having a 'passion' for something is critical for this focus. By internally valuing what is being done as an expression of this 'passion' can be used to indicate how high in their personal hierarchies of goals their businesses are. This could be seen to have influenced the successful case studies' behavior toward achieving their goals (Eccles & Wigfield, 2002). Success is about 'passion', this passion is used to identify dreams and pursue them through any obstacle (Stoltz, 1997; Ungerleider, 1995). Stoltz (1997) and Smith (1997) also note

success is about how a person responds to adversity, whether they give up and stop short of their goal or whether they continue. Success then can be viewed as a deep pairing of passion with motivation to achieve a goal, and this is what the successful case studies expressed (Stoltz, 1997).

Case A attributed their success to,

“A degree of hard work, perseverance. That’s one side, the other side...what we are bringing to it to make it happen because if you go into anything with anything less than a 100% attitude or a great attitude like this is going to be awesome, then that’s what it is going to be. Whatever you put into it.”

In terms of success, cases A and C thought they were successful but case studies B and D felt they had some way to go but were not unsuccessful. Consistent with the findings of Neumann (1975) none of the cases expressed success as a measure of position, prestige or money. Lipper (1988) notes success can be achieved by the way a person’s life is programmed. Success for each of the cases was based on a personal measure; this is the same for other small business operators in other industries (Bailey, 1988; Hitchin & Hitchin, 1999; Lipper, 1988). Case B commented, “What’s the point in going through life doing a job for the sake of earning money”.

Cases A and C could be viewed as having moved further toward achieving a life style which is more in tune with their own personal values and priorities and hence their definition of themselves as ‘successful’ (Hitchin & Hitchin, 1999).

### ***Words of wisdom***

Comments from cases A,B and C appear to be a reflection of what they have experienced and learnt in setting up and running their businesses. This is in contrast to case D who stated,

“You’ve got to have a go otherwise you will always say to yourself well should I have had a go.”

Comments from Cases A, B and C were;

Case A: “Have a capital base and have another source of income to fall back on. Putting all your eggs in one basket is a sure recipe for stress. Choose who you want to go into business with pretty carefully.”

Case B: “If you get an existing business then really looking into it quite in-depth before you go and make that decision. Learn to say no to people as well. You have to be hard nosed about things.”

And case D: “Make sure your business partner is someone you get on with and you work that out before you go into any financial arrangements. Make sure you test it out, the product in some way. Realize that being your own boss has a lot of plusses but it has a lot of minuses in that you do a lot more hours for free. When you are beginning a business so there is a lot

of time needed and probably to actually get involved with a mentor earlier to do your business plan and get some outside help earlier ...you probably get there quicker.”

These ‘words of wisdom’ reflect critical success factors identified in the literature; Cooper & Edgett (1996) comment on doing your ‘homework’ before launching a product. Stephenson (1990) and Williams (1990) state business planning as a key to success. Hamilton & English (1997) note having the right people involved with the necessary skills. Byers & Slack (2001) and Williams (1990) comment on the lack of time resulting in adaptive decision-making when setting up in business.

### ***Critical success factors: List of critical success factors***

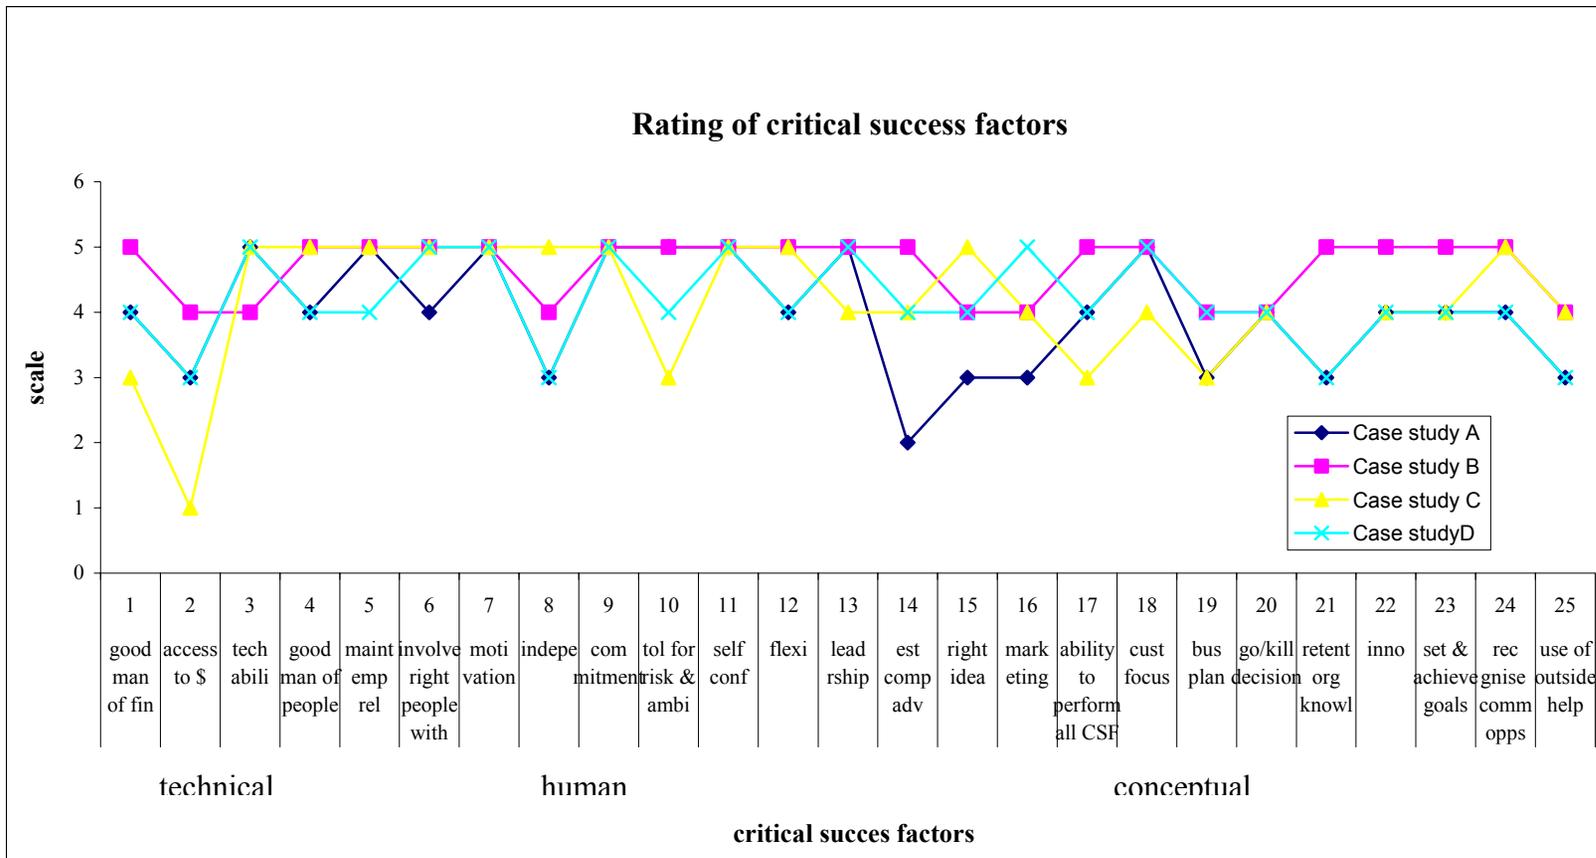

Finally the interviewees were asked to rate the researcher’s list of CSFs developed from a review of the literature. Each individual was asked to comment on the rating scale. The results from each of the cases were tabulated to allow comparison (see figure 2). The CSFs were split into three sections; these were technical, human and conceptual skills. Categorizing and ordering the CSFs into these three sections made it easier to identify emerging patterns. The CSFs were not ranked in any order and are listed in full in figure 3. This list was further refined by the interviewees. The revised list is contained in figure 4.

Additional CSFs identified by interviewees were; knowledge of the industry, passion for what you are doing, willingness to work all hours, and good customer skills.

From figure 2 a higher rating is given to human skills over conceptual and that technical ability is also ranked highly. This probably reflects the reasons why each of the cases entered into business in the first place. Byers & Slack (2001) state the reason unique to the leisure industry for starting a small business is one of turning a hobby into paid employment.

The CSFs rated consistently highly by all case studies were technical ability, motivation, commitment and self-confidence. These CSFs were the most valued.

All CSFs were scored reasonably high by most of the cases, this indicates the relevance of the CSFs listed to the cases in running a small business.

**Figure 2: Case study rating of critical success factors**

<b>Type of skill</b>	<b>Critical success factor</b>
Technical skills	Good management of finance Access to funding Technical abilities
Human skills	Good management of people Maintaining good employee relations Involving the right people with the right skills Motivation The need for independence and to be in charge of own destiny Commitment Tolerance for risk and ambiguity Self confidence Flexibility
Conceptual skills	Leadership Establish a competitive advantage Having the right idea Marketing Ability to perform across all critical success factors Customer focus Business planning The building of go/kill decision-making processes The retention of organizational knowledge Innovativeness An ability to set and achieve goals An ability to recognize commercial opportunities The use of outside help

**Figure 3: Type of skill relating to critical success factors**

<b>Type of skill</b>	<b>Critical success factor</b>
Technical skills	<ul style="list-style-type: none"> <li>Good management of finance</li> <li>Access to funding</li> <li>Technical abilities</li> </ul>

## CONCLUSIONS AND IMPLICATIONS

The research presented in this paper is from a New Zealand perspective. The research addresses identified gaps in the literature (Byers & Slack, 2001). Although there has been much research into CSFs for small businesses, this has not been researched from a leisure perspective. Nor has an understanding been developed into quantifying what success is for a small business, other than financial measures (Gadenne, 1998). This is of importance as the outdoor leisure/recreation industry has a major role to play as a primary focus for earning overseas currencies (Devlin et al., 1995).

A list of CSFs was developed from the literature and refined with the help of the case studies, this is contained in figure 4. This list may prove useful as a checklist for ensuring success. However, Chen (1999) notes no simple formula for determining the successful and the not so successful can be used. Instead the list of CSFs helps to focus attention on what should be covered in order to achieve success. Connell et al (2001) comments it is not enough to perform heroically in one or two areas to compensate for others, a satisfactory level must be performed across all. Dobbins (2001) also notes merely having a list is not a prelude to success, the list must have some relevance to the business and the entrepreneur must be able to understand how to use it.

### Results from the study indicate:

- 1) All cases had started their business as a means of having a more satisfying way of living. The successful cases were passionate about what they did and had turned their 'hobby' into a business. This was not the case for the 'not so successful' case who had approached this venture from an employment perspective rather than from something they really believed in. The implications of this are that in order to succeed 'passion' is an essential ingredient for success.

All cases had approached their business from a similar background, in that they had all gone and sought training and development in their chosen outdoor skill. To ensure success, a well-rounded background that encompassed business skills including finance and marketing was viewed as essential.

- 2) Success itself was viewed by all the cases as an internal measure rather than an external financial measure. Having stated this, the successful cases also viewed success as something to be strived for and was aspirational in nature.
- 3) The literature indicates that the measure of success determined for a small business by the owner is no different from small businesses in other industries. Cameron & Massey (1999) comment more people are becoming self-employed as a means of seeking a more satisfying way of living.

Other themes emerging from the data include:

- The successful cases all had specific knowledge relating to the market place that they had entered and all understood exactly who their clients were. This is in contrast to the 'not so successful' case that had used broader and as such less meaningful data and also had a broader less defined target audience that they promoted to. The implications of this are that market information needs to be specific and as detailed as possible so that the target audience can be easily identified, understood and reached.
- The successful cases found having a client that could be relied upon for a regular income or having a supporting income from another source was essential for survival.
- Seeking advice from others such as mentors or business partners was viewed by the successful cases as important as it provided motivation, additional skills and ensured that the business kept on track. This is in contrast to the 'not so successful' case who had worked in isolation from others.
- All cases viewed the 'human component' and 'technical abilities' of their businesses as more important than 'conceptual skills'.
- The 'words of wisdom' passed on by the cases should be noted by those wishing to set up a small business in the outdoor leisure/recreation industry.

The implications for those wishing to set up a small business in outdoor leisure/recreation industry are:

- Know your market, exactly who is your customer and what do they require.
- Be passionate about what you do.
- Have a 'well rounded' background that includes business skills as well as technical abilities in the various outdoor pursuits that form the business.
- Ensure that you have a regular source of income that can be relied upon.
- Seek advice from others in running your business venture.
- Pay heed to the 'words of wisdom', and ensure that you have competencies that cover all the CSFs. Do not rely on performing in one or two areas really well to the detriment of other areas (see figure 4).

It should be noted that due to the small number of cases these themes will need to be investigated further by selecting many more cases and replicating this study, or by using a larger sample size and conducting a quantitative survey. Having stated this, it must be remembered that this research was intended as a pilot investigation only. Even so, the themes emerging from these data may prove to be of benefit for those wishing to start up a small business in the outdoor leisure/recreation industry in New Zealand.

## **ABSTRACT**

There have been increasing attempts to examine whether the franchise industry is homogenous or heterogeneous. This paper describes a study in which the characteristics of ninety-three Australian franchise firms were examined using hierarchical cluster analysis. Distinct characteristics were found to exist within four groups which reflected the progressive stages of franchise development, namely: the beginners, the developers, the growers and the matures. The findings provide strong empirical evidence concerning franchise heterogeneity theory. Further research on franchising should note the heterogeneous nature of franchises, as they differ greatly according to their stages of development. The study confirms that franchise firms do employ different strategies, in accordance with their profiles. This needs to be recognised and further tested in the field across other samples.

## **ARTICLE TEXT**

Studies of franchises have often been conducted with an underlying assumption that they operate similarly, and are relatively homogenous in their structures and characteristics (e.g., Doherty & Quinn 1999; Frazer, McCosker & Paynter 2000). However, there is increasing recognition that franchises progress through various stages of development, and that these stages influence the way they operate and perform. Despite this growing understanding of the diversity of franchises, research on franchising often fails to

recognise the heterogeneous nature of franchises. Franchises differ greatly in the ways they do business. For example, franchises vary greatly in terms of the number of franchises generated, the length of experience of the franchisors, the price of purchasing a franchise, the ratio of franchise versus managed stores, and the degree of expansion within both local and more widespread localities. Despite the complexity of franchise composition, the data set in franchising research is largely treated as homogenous (e.g. Agrawal & Lal, 1995, Alon & McKee, 1999, Falbe & Welsh, 1998, Frazer, McCosker, & Paynter, 2000). In addition, there has been little research on the underlying characteristics of the franchise profile. This paper reports the results of a study of Australian franchising firms, which tested the heterogenous profile of franchising.

### ***Exploring Franchise Heterogeneity***

A few studies on the heterogeneous nature of franchising argued that franchise firms may be classed according to their typical features such as their structure and strategies (Callum & Graham, 1999, Carney & Gedajlovic, 1991, Castrogiovanni, Justis, & Julian, 1993, Floyd & Fenwick, 1999, Lillis, Narayana, & Gilman, 1976, Oxenfelt & Kelly, 1968-1969). These studies based the heterogeneous profile of franchising primarily on the franchising theories: the resource scarcity theory and the administrative efficiency theory. Resource scarcity theory predicts that firms of small and medium size are franchised to obtain capital and human resources and also to transfer the business risks to the franchisees (Oxenfelt & Kelly, 1968-1969). However, once the firms are established, the requirement for capital or human resources is reduced, thereby decreasing the strategic value of franchising (Caves & Murphy, 1976). As a result, firms in the initial penetration stage were found to engage heavily in franchising activity to raise capital resources as a means of achieving organisational growth. Subsequently, as the systems increasingly mature, firms would franchise fewer outlets or use a buy back policy (Hunt, 1974). The resource scarcity theory explores the use of management priorities and the strategic value of franchising at each stage of franchise development.

Alternatively, the administrative efficiency theory views franchising as a response to agency problems in business relationships. The administrative efficiency theory predicts that firms emphasise franchisee motivation and risk sharing for all stages of franchise development (Lillis, Narayana, & Gilman, 1976). A range of explanations has been tendered to support this perspective. For example, it is suggested that the managers (the agents) tend to shirk their duty to the firm (the principal) because their compensation is fixed, resulting in high monitoring costs to the firms (Rubin, 1978). Thus, firms engaged in franchising reduce the monitoring costs because the contract between the franchisor (principal) and the franchisees (the agents) is designed to keep their incentive closely aligned (Brickley & Dark, 1987, Mathewson & Winter, 1985, Rubin, 1978). On this basis, the franchisees will act in the firms' best interest because their earnings are linked to those of the franchise outlets (Lafontaine, 1992). It has also been argued that firms are likely to franchise an outlet in geographically dispersed area to reduce the costs of administrative monitoring (Brickley & Dark, 1987, Norton, 1988b, Norton, 1988a). These perspectives suggest that the motivation of the franchise firms and their expansion strategy should therefore differ at each stage of franchise development. As with the resource scarcity theory, the administrative efficiency theory acknowledged that franchise firms go through different stages of development and strategies according to changes and evolution within the environment.

Franchise firms with similar strategies and patterns may be grouped together so that their inputs, outcomes and methods are easily identified and evaluated. Carney & Gedajlovic (1991) used a configuration procedure on thirteen parameters relating to franchise ownership and derived with the five complex franchise categories: the rapid grower, the expensive conservative, the conservative, converters, the matures and the unsuccessful (see Table 1). Their findings identified heterogeneous effects of the franchising industry in which they argued that the homogenous approach on the franchise firms' data set was inappropriate. It is evident that Carney & Gedajlovic, (1991) provide an insight into heterogeneous profile of franchising, nevertheless their configuration procedure has been in question.

**Table 1 Heterogeneous Profiles in the Franchising Study**

Study	Groups	Stages of Development	Dimensions	Note
Oxenfelt and Kelly (1968-1969)	4	New Rapidly growing Established Prosperous Mature & declining	Firm age Firm size &	Conceptually constructed
(Lillis, Narayana, & Gilman, 1976)	4	Penetration Growth Maturity Late maturity	Firm age Firm size	Empirically tested
(Carney & Gedajlovic, 1991)	5	Rapid grower Expensive conservative Converters Matures Unsuccessful	Size Dispersion Growth Pricing Contractual provision Vertical integration Timing	Empirically tested
Castrogiovanni, Bennett and Combs (1995)	5	Rapid grower Expensive conservative Converters Matures Unsuccessful	Size Dispersion Growth Pricing Contractual provision Vertical integration Timing	Validate the heterogeneity profiles suggested by (Carney & Gedajlovic, 1991)
Floyd and Fenwick (1999)	3	Hatching Nesting Fledgling	Year franchising Size Years before franchising	Exploratory study with 10 franchisors

Castrogiovanni, Bennett and Combs (1995) replicated the Carney & Gedajlovic, (1991)'s study, using similar parameters, but found only partial support for the theory, clearly matching only two of the five groups: the rapid grower and the converter. Other studies of franchise heterogeneity have ranged widely in their incorporation of identifying factors. In earlier investigations researchers grouped franchise firms into four stages, based on the age and size of the franchise firms (Lillis, Narayana, & Gilman, 1976, Oxenfelt & Kelly, 1968-1969). More recently, the configuration approach identified more groups based on more parameters of franchise ownership (Carney & Gedajlovic, 1991, Combs & Ketchen, 1999). As yet, there is insufficient consolidation of the key characteristics which should be considered in categorising franchises into their developmental phase (see Table 1).

The lack of categorisation consensus may be due to weaknesses of the study methodologies. For example, Lillis, Narayana, & Gilman (1976) and Oxenfelt & Kelly (1968-1969) constructed a franchise life cycle profile based on their company age and size. Given that franchise organisations generally operate in complex environments, this simple classification approach may not be sufficient to explain franchise groups, particularly as the relationship between firm age and size may not be linear. Similarly, the configuration procedure conducted by Carney & Gedajlovic, (1991) was based on an inductive configuration using exploratory factor analysis. This statistic technique may only be appropriate for factoring parameters in to groups but not classifying cases in the data set into clusters (Hair, Anderson, Tatham, & Black, 1998). The issue of methodological weaknesses in franchise development studies highlights the need for further empirical research to validate previous findings, and to enable better understanding of the key characteristics which may impact on franchise categorisation.

Thus, existing franchising research indicates that franchise organisations can be profiled in terms of their stages of evolution (Lillis, Narayana, & Gilman, 1976, Oxenfelt & Kelly, 1968-1969). Using a more complex configuration, it is also evident that franchise organisations evolve over time and tend to adjust their business strategy accordingly (Carney & Gedajlovic, 1991). However, the features of the different stages of development, and the particular characteristics which are most distinguishable across those categories remain ill-defined and ill-proven. This study therefore seeks to further test the complex configuration generated by Carney and Gedajlovic (1991), using an Australian franchising sample.

*H: Franchisors are heterogeneous and can be classified into grouped.*

## **METHODOLOGY**

### ***Participants***

Three hundred and fifty-one Australian franchisors were invited to participate in the study. Participants were drawn from various franchise systems ranging from large retail enterprises to small educational providers. The wide variation in size and structure was actively sought to provide the sampling variety necessary to check for heterogeneity. Multinational franchise firms were omitted from the survey to reduce any possible cultural effects caused by international practices and influences. The franchisor sample was drawn from the Franchise Yearbook and Directory (Commonwealth Bank 2001), with a randomised selection process used to identify possible participants. A response rate of 27 percent was obtained ( $n = 93$ ), after two follow-ups to non-respondents. 83 percent of the respondents were male and 17 percent were female. The majority of the franchisors had been in the franchise business for 3-15 years (74 percent) and were between 41-60 years of age (68 percent). One third of the respondents had obtained higher qualifications (MBA, graduate and postgraduate qualifications). The proportion of those with no formal education was relatively small (3 percent).

Participants who were invited to participate but declined, were asked to provide feedback on their reason for non-participation. The predominant factors contributing to an unwillingness to participate in the survey related to time constraints (42 percent) and the company policy prohibiting them from being involved in any survey (11 percent). A number of participants were no longer involved in franchising (15 percent). Personal issues such as having insufficient knowledge to answer the survey questions, particularly

disliking survey participation, concern about privacy issues and lack of incentive to participate accounted for approximately 12 percent of non-responses. Overall, the contribution was obtained from franchise respondents Australia-wide. The proportion of the franchise systems and their locations appeared to adequately represent Australian franchise organisations (Frazer & McCosker, 1999).

## ***Procedure***

A survey, along with a letter of invitation to participate, was administered to each participant. Three follow-up steps were used to solicit responses. The first follow-up was performed after the closing date for the return of questionnaires. The second follow-up was sent two weeks after the first reminder letter. The remaining non-responding participants were contacted by telephone two weeks after the second reminder letter. The participants were politely asked whether they had received the prior mailing. Efforts were then made to persuade them to complete the questionnaire. Respondents who refused to participate were asked to indicate their reasons for refusal. Respondents were also invited to request feedback on the study on the first page of the questionnaire.

## ***Survey Instrument***

A survey was constructed for use in the study after initial pilot testing of the instrument with local Western Australian participants. The survey requested information relating to participant backgrounds and the franchise characteristics. Data on six dimensions relating to size, degree of dispersion, growth orientation, pricing, vertical integration, and timing were collected (Carney and Gedajlovic, 1991). Other information was also collected in the survey, but is not reported in this paper. Table 2 reports the various dimensions and the measures used, and provides an example of the questions asked.

**Table 2 Franchise Development Measures**

<b>Dimensions measures</b>	<b>Items measures</b>	<b>Examples</b>
Size	Total number of total outlets	Company outlets + Franchise outlets
	Number of franchise outlets	How many franchise outlets do you now operate?
Dispersion	Percentage of outlets located in home state	How many franchise outlets are located in the state where you first started?
Growth	Outlets established per year since inception	Total outlets/ Year since inception
	Franchised outlets established per year since first franchise	Franchise outlets/ years since first franchise
Vertical integration	Percentage of outlets franchised	$(\text{Franchise outlets} \times 100) / \text{Total outlets}$
Pricing	Average capital requirements per franchise	What is your average capital requirement per franchise?
Timing	Year since inception	When was your company founded?
	Year since establishment of first franchise	When did your company first franchise?

**Note:** Adapted from Carney, M. and Gedajlovic, E. (1991: 629)

## RESULTS

Prior to the analysis, univariate outliers were investigated through an initial data screening and multivariate outliers were examined through the use of a  $p < 0.001$  criterion for Mahalanobis Distance ( $D^2$ ). Two cases of univariate outliers detected on the company size (>250 outlets) from the sample were eliminated. The elimination of the outliers reduced the sample sizes to 91. The six franchise dimensions were used to map a likely distinctive profile of franchise organisations.

Agglomerative hierarchical cluster analysis was used to test the first research hypothesis (Everitt, 1993). Cluster analysis was performed to determine if the franchisors could be effectively segmented into unique groups according to their organisational characteristics. Ward's (1963) method<sup>1</sup> with the squared Euclidean distance was preferred as a clustering technique because it is an effective tool for identifying distinct groupings for a relatively small sample size ( $n < 200$ ) (Everitt, 1993). Results of the hierarchical clustering procedure suggested a four-cluster solution best fitted the data. The optimum number of clusters was determined by an examination of the agglomeration schedule<sup>2</sup> and the dendrogram results<sup>3</sup> as recommended by Aldenderfer & Blashfield (1984). The agglomeration schedule revealed a large increase in the agglomeration coefficient at the 87<sup>th</sup> stage, indicating a four-cluster solution was the most appropriate. Accordingly, the dendrogram clearly displayed four partitions of the graphic illustration. The confirmed results, then, suggested that there were four distinct groups among the franchisors examined in this study. Multivariate Analysis of Variance (MANOVA) was used to further test the clustering solution (Aldenderfer & Blashfield, 1984). Results of the analysis confirmed a significant effect, demonstrating that the four clusters differed in their profiles ( $F_{3, 87} = 18.21, p < 0.001$ ). Follow up Analyses of Variances (ANOVA) with post hoc procedure (Dunnett T3<sup>4</sup> multiple comparison tests) were also used to test the significance of each of these clusters. Table 3 displays the cluster structure on means, standard deviations and statistical tests of four cluster groups.

**Table 3 Characteristics of Four Franchise Groups Derived from Cluster Analysis (n= 91)**

Variables (Unit of measurement)	Franchise Groups				Mean (s.d.)	Anova F-tests	Dunnett P < 0.05
	Cluster 1 Beginners (n= 39)	Cluster 2 Developers (n= 35)	Cluster 3 Growers (n = 14)	Cluster 4 Matures (n = 3)			
Number of retail outlets (Outlets)	22.69 (20.51)	73.09 (94.36)	133.86 (61.65)	97.00 (105.16)	61.63 (76.79)	10.44***	3>1; 2>1
Percentage of franchised outlets located in the place of inception (percent)	63.77 (32.98)	60.89 (31.57)	37.43 (29.79)	52.95 (41.42)	58.25 (32.96)	2.60*	1>3

Number of outlets established per year since inception (Outlets)	1.70 (1.66)	3.92 (5.26)	7.01 (3.78)	3.28 (2.95)	3.42 (4.15)	7.07***	3>1
Franchise outlets established per year since inception (Outlets)	2.05 (1.80)	5.74 (10.28)	6.55 (3.95)	2.34 (2.82)	4.17 (6.90)	2.59*	3>1
Average capital requirement (A\$000K)	41.06 (22.31)	163.58 (59.28)	306.43 (63.20)	1000.00 (0.00)	160.62 (187.36)	452.46***	4> All others
Percentage of total outlets franchised (percent)	87.56 (19.99)	82.77 (22.11)	81.22 (24.46)	73.10 (42.54)	84.27 (22.14)	0.67	n.s.
Year since inception (years)	17.38 (14.06)	21.51 (16.59)	22.36 (13.18)	30.67 (9.24)	20.18 (14.93)	1.15	n.s.
Year since first franchise (Years)	11.54 (7.85)	12.40 (7.87)	19.36 (12.66)	19.67 (14.84)	13.34 (9.28)	3.26*	n.s.
Year between inception and first franchise (Years)	5.85 (8.14)	9.20 (15.84)	3.00 (3.01)	11.00 (15.70)	6.87 (11.62)	1.22	n.s.

Multivariate test of significance (Wilks):  $F(4, 86) = 18.72^{***}$

Note: \* $p < 0.05$ ; \*\* $p < 0.01$ ; \*\*\* $p < 0.001$ . Means are reported. Standard deviation is in parentheses

The results from Ward's (1963) clustering procedure provided support for the hypothesis. Franchise organisations were found to be heterogeneous and could be grouped on the basis of their characteristic profiles. The four distinct groups identified from the analysis were labelled as Beginners, Developers, Growers, and Matures. Analyses of the cluster characteristics enabled the identification of the particular features inherent in each group. Significant correlations within the identified groups are also reported (see Table 4).

**Table 4 Intercorrelations, means and standard deviations for franchisor profiles (n = 91)**

Variables	Dimensions	1	2	3	4	5	6	7	8	9
1. Number of retail outlets (Units)	<i>Size</i>	-								
2. Percent outlets located in the place of inception (%)	<i>Dispersion</i>	-.48**	-							
3. Number of outlets established per year since inception (Units)	<i>Growth orientation</i>	.83**	-.39**	-						
4. Franchise outlets established per year since inception (Units)		.80**	-.32**	.56**	-					
5. Average capital requirement (A\$000)	<i>Pricing</i>	.25*	-.12	.15	.03	-				
6. Percent of total outlets franchised (%)	<i>Vertical integration</i>	.04	-.14	-.02	.22*	-.16	-

Note: \* $p < 0.05$ ; \*\* $p < 0.01$

### **Cluster 1: The Beginners**

The beginners had been in franchising for a relatively short period and were the youngest franchises compared to the developers and the growers. The beginners had the highest numbers of franchised outlets located in the place of inception (64 percent), this being significantly higher when compared to the growers. The average capital requirement (A\$41K) and number of franchise outlets established (mean = 1.70 outlets) were the lowest compared to other groups. Negative associations were found between size and dispersion ( $r = -0.34, p < 0.05$ ). The beginners increased their size by expanding outside their home province. However, growth in the franchising section is a challenging strategy for the beginners. Between the period of first inception and first franchised (6 years), the beginners were mostly focused on the growth of their own branches.

### **Cluster 2: The Developers**

The developers had the second lowest mean scores for the year since inception (22 years) and year since first franchise (12 years) among the franchise groups. On average, the developers operated 73 retail outlets and charged moderately high fees (\$A164K). Even though the period between inception and first franchise of the developers was slightly shorter than the matures ( $\Delta\text{year} = 1.80$ ), their price was significantly lower ( $\Delta\text{\$A}866\text{K}, p < 0.001$ ). In addition, the developers possessed the second highest mean scores on degree of dispersion and growth strategy. Still in the developing stage, the policy of a nation-wide expansion by the developers was not quite successful, with only 39 percent of their franchise outlets located out of the home province. Within the developer cohort, firm size was negatively related to dispersion ( $r = -0.52, p < 0.01$ ) and average capital requirement ( $r = -0.36, p < 0.05$ ) and dispersion was negatively related to firm age ( $r = -0.39, p < 0.05$ ) reflecting their policy of early expansion on a competitive pricing out of their home province ( $r = -0.50, p < 0.05$ ).

### **Cluster 3: The Growers**

On average the growers had opened 7 outlets per year since their inception, and 6.55 outlets per year since they began to franchise. The increased rate of the new outlets (7 outlets) and the number of franchised outlets (6.55 outlets) was significantly higher than the beginners' new outlets (1.70 outlets) and the beginners' franchised outlets (2.05 outlets). The growers were also the largest in size and the most geographically dispersed with only 37 percent of franchised outlets located in the place of their inception. In addition, the average capital requirement of the growers was significantly lower than the matures ( $\Delta\text{\$A}694, p < 0.001$ ). The growers were also the most geographically dispersed, with only 37 percent of franchised outlets located in the place of their inception; the lowest among the franchise groups. Similar to the beginners and the developers, average capital requirement of the growers was strongly and negatively associated with franchise size ( $r = -0.50, p < 0.05$ ), company outlet growth ( $r = -0.54, p < 0.05$ ) and franchise unit expansion ( $r = -0.55, p < 0.05$ ). Mostly, the growers emphasised rapid growth via the strategy of franchising, with growth strategy positively related to an increment of franchise outlets ( $r = 0.64, p < 0.05$ ).

## **Cluster 4: The Matures**

The matures comprised the second largest retail systems (97 outlets) in the franchise groups. The average price of the matures was the highest of the four groups. The average capital requirement by the matures was \$A1million, 6.2 times higher than the study mean (\$A 160K). The matures also had the highest percentage of company-owned outlets (57 percent) compared to other groups (26 percent).

## **DISCUSSION**

It can be argued that the identified franchise groups may be adequately explained through both resource scarcity theory and agency theory. These theories contribute to a better understanding of how franchise firms strategically build their potential franchise organisational behaviour (Combs & Ketchen, 1999, Lafontaine & Kaufmann, 1994). The resource scarcity theory argues that firms franchise as a means of obtaining capital and easing managerial constraints upon their network growth, thereby transferring risk from the firm to franchisees (Oxenfelt & Kelly, 1968-1969). This is evident: the age of franchises was found to determine the franchise entry fee (Baucus, Baucus, & Human, 1993), with young, small firms significantly increasing the number of franchise outlets (Caves & Murphy, 1976, Oxenfelt & Kelly, 1968-1969). On the other hand, the results do not confirm some aspects of the resource scarcity theory. Contradicting the past literature, the type of franchise system did not determine the franchise entrant fee (Baucus, Baucus, & Human, 1993), and the relationship between firms' size and number of franchise outlets was not linearly related (Combs & Ketchen, 1999). The results suggest that while franchising may be used as a strategic tool for organisations to increase their capital or intellectual resources, the strategic evolution of franchising firms may be caused by both capital gain goals and efforts to improve performance outcomes.

Agency theory argues that as a response to the problems within the employer-employee relationship, franchising is used to minimise the monitoring cost of the firms (Rubin, 1978). The configurations profile can be partially explained from this perspective. Consistent with (Julian & Castrogiovanni, 1995), the larger franchisors sought expansion in more geographic areas than the smaller franchisors. The results also highlighted a relationship between the franchise age and the degree of geographical dispersion: older franchise firms sought expansion in more geographic areas than younger franchise firms. The findings may imply that larger and younger firms engaged in franchise businesses in the hope of reducing their agency deficiency and also to ease the administrative costs of monitoring.

Clearly, the configurations of the franchise organisational profiles seem appropriate in predicting the heterogeneous characteristics of the franchise industry. It is likely that the contradictory findings between the resource scarcity theory (for example, Oxenfelt and Kelly 1968-1969; Caves and Murphy 1976; Shane 1998) and the administrative efficiency theory explanation (for example, Brickley and Dark 1987; Lafontaine and Kaufmann 1994; Rubin 1978) are a result of sample heterogeneity. The classification of franchise firms into four groups may offer a valid explanation of the heterogeneous profile of franchising: beginners, developers, growers, and matures.

## LIMITATIONS

Some caution should be taken in generalising the results of this study. First, the limited Australian franchisors sample resulted in small group sizes for each developmental stage, particularly, as for the matures ( $n = 3$ ). Although, the franchise stages were justified as to their differences on the profiles, the small number of franchisors in the derived group may still reduce the statistical power in explaining the heterogeneous nature of the franchising industry. The generalisability of the results relating to developmental strategies may remain tentative. However, the cross investigation on the group profiles using clustering procedure does confirm and validate the franchise groups.

## CONCLUSIONS

The study provides strong empirical evidence concerning franchise heterogeneity theory. Further research on franchising should note the heterogeneous nature of franchises' data sets, as they differ greatly according to their stages of development and profiles. It is found that franchise firms do employ different strategies, in accordance with their profiles. Perhaps, the profile characteristics of the franchise firms should be controlled in a procedure analysis. This area needs to be recognised and further tested in the field across other samples.

## Endnote

---

<sup>1</sup> Ward's (1963) method calculates the means of all variables within each cluster, then calculates the squared Euclidean distances to the cluster mean of each case, and finally sums across all cases (Everitt, 1979). This method with the squared Euclidean distance has been claimed to be the most reliable method of the hierarchical cluster routine for uncovering group structures in the data set (Lassar & Kerr, 1996; Punji, & David, 1983). As a result, the Ward's (1963) technique has been increasingly employed in the area of marketing and organisational research (e.g., Lassar & Kerr, 1996; Lassar & Kerr, 1996;. Miles, Snow & Sharfman, 1993; Miles & Covin, 2000; Miller & Besser, 2000).

<sup>2</sup> The agglomeration schedule specifies the change in the agglomeration coefficient based on the sum of the within-group variance of the two clusters combined at each successive stage (Aldenderfer & Blashfield, 1984).

<sup>3</sup> A dendrogram is a graphical representation of a hierarchical procedure in which each case is arrayed on one axis, and the other axis portrays the steps in the hierarchical procedure. Starting with each case represented as a separate cluster, the dendrogram shows graphically how the clusters are combined at each step of the procedure until all are contained in a single cluster (Hair, et.al, 1998).

<sup>4</sup> The Dunnett T3 multiple comparison test was the preferred pos-hoc strategy because population variances on five out of nine variables were not assumed.

## **ABSTRACT**

World Server Network TV (WSNTV) is a global education, entertainment and media organization. WSNTV100 goals are to bring low-cost higher education and entertainment to the worldwide population, and to promote the spread of broadband internet access that will make it possible to achieve those goals.

Fiber based broadband Internet is creating a new international content and communications economy. This new initiative is creating new business and creative opportunities, and generating wealth.

Fiber-To-The-Home (FTTH) is the state-of-the-art broadband transmission. FTTH is capable of transmitting data, video, and voice at 100-1,000 Mbps

In comparison, phone modems are only capable of 0.05 Mbps, DSL only 1.5 Mbps and digital cable modem only 1.5 Mbps. All of these technologies use a shared pipe characteristic. This translates to slower speeds when more people are connected using the same pipe. With FTTH, people can easily consume and create a wide variety of multimedia content

WSN Foundation's goal is to offer free fiber with 10 billion web pages containing volumes of information, home and food to a billion families, and 7 billion in population around the world by 2025 by allocating 70% of 10 million WSN business profit and directing \$10 trillion annually from local and national governments, electing politicians and officials who promote peace and FTTH throughout the democratic political process.

- **Conclusion**

## THE FUNCTIONS OF WORLD SERVER NETWORK TV AND OVERVIEW OF FTTH

The WSN business plan is larger in scope than usual business plans that are only written for a single product or a single technology or a single industry or a single country. The WSN business plan covers multiple industries such as entertainment, education, and research in multiple countries via fiber and broadband technology.

WSN is a 50-year lifetime project of founder Victor June who has published more than 100,000 pages along with many of the WSN executives/managers. These 1,000 online books focus on Solutions for the Broadband Era. They cover Information Age global economics and international finance in 100 industries including the education, entertainment, and media businesses.

The WSN knowledge base of 100,000 pages of information and education about development of Internet business was based on 10 WSN broadband business trials over the past 10 years. The most recent trial involved using 100 Mbps Korean FTTH in a WSN model home. This Korean FTTH was deployed by Hanaro Telecom and funded by the Korean government, Sam Sung, LG, SK Telecom, AIG-American Insurance Group, and Newbridge Capital.

These 100,000 page proprietary business manuals form the basis of this business plan. It will eventually be condensed into a 1,000 page corporate standardization manuals and financial documentation for the billion dollar projects. Professionals who have experience and contacts for multi-billion aggregated deals will prepare documentation

WSN TV is a global entertainment and media organization engaged in the development, production, and distribution of television programs and movies. Business World News (<http://www.businessworldnews.com>) as Emmy award winner produced a 30-minute video about WSN TV's corporations and foundations for national and international television marketing. The objective is to educate the consumer and businesses as to why they need to demand fiber.

WSN TV took on the mission in this video to encourage the deployment of high speed fiber that is a minimum of 10 x faster than DSL/Cable and 50 x faster than 56k modem dialup to allow Information Age business to develop and thrive. Slow implementation causes a long, slow decline in traditional business that is painful. Fast implementation will allow business to be competitive on a global basis by saving time and money to deliver their digital content and information directly online.

Fiber to the home (FTTH) is the ideal fiber-optics architecture. In this architecture, fiber deployment is carried all the way to the customer home (premises).

Today it seems that everyone wants high-speed data, dependable voice service, and high-quality video. Whether these services are delivered by digital subscriber line (DSL), cable modems, or wireless architectures is insignificant as long as the service is fast and dependable.

Providing these services, however, presents a number of challenges, including how to get lines out to each customer and how to future-proof the architecture put into the ground today. This tutorial will address one possible solution, which is a fiber optics architecture called FTTH.

A technology that uses glass (or plastic) threads (fibers) to transmit [data](#). A fiber optic cable consists of a bundle of glass threads, each of which is capable of transmitting messages [modulated](#) onto light waves.

Fiber based broadband Internet is creating a new international content and communications economy. This new initiative is creating new business and creative opportunities, and generating wealth.

Fiber-To-The-Home (FTTH) is the state-of-the-art broadband transmission. FTTH is capable of transmitting data, video, and voice at 100-1,000 Mbps. While this speed is not required for all forms of Internet business, it is certainly required for uploading and multiple party accesses of large data files including multimedia entertainment and education programs.

In comparison, phone modems are only capable of 0.05 Mbps, DSL only 1.5 Mbps and digital cable modem only 1.5 Mbps. All of these technologies use a shared pipe characteristic. This translates to slower speeds when more people are connected using the same pipe. With FTTH, people can easily consume and create a wide variety of multimedia content.

Fiber was laid on the main arteries of the larger developed countries roads. However, it was not brought to the consumers home, but simply left on it's own. When it is not used, it is considered not "lit". Therefore, the term "Dark Fiber" was invented. The dark fiber backbone has been contributing to the telecom' massive bankruptcy, allowing the FTTH era to broaden through cheap auctioning by international and domestic fiber assets. This resulted in \$ 4 trillion scale loss for investors/bond holders.

These new or old corporations tried to implement a dot.com, and either went out of business or closed the dot.com because they tried to produce content without the speed of broadband. They lost over 20 trillion dollars in equity/loans in the past 7 years and will lose everything in next 20 years. These businesses have a high overhead, and are not willing to give joint ownership to the content originators. This will be their downfall.

The Main reason for the \$ 6 trillion loss, mostly comprised of retirement funds for tens of millions of small and professional investors, was due to phone and cable companies delaying broadband expansion. They were concerned about the cannibalization of their \$ 1 trillion annual phone and cable TV revenue.

This delay ruined telecom, dot.com, cable TV industry and overall economy, all of which have suffered a slow death for old business and premature death of new business. Only when the pipe-bandwidth is cheap can water-content be sold at a profit.

Current economic growth is dependent on broadband access. There are approximately 55 municipalities in the US deploying FTTH. Unfortunately, the US is not leading this economic revolution, and is falling behind other countries like Korea, Japan, Sweden, and Italy, each of which are targeting 100% FTTH deployment by 2006.

Korea achieved 100% 1.5 Mbps DSL/cable/Ethernet based broadband society in 3 years when US only penetrated 15% in the past 8 years. Korea upgraded 1.5 Mbps speed broadband to 100 Mbps FTTH with government budget allocation of \$ 500 per home. 100 Mbps FTTH deployment cost was actually lower than the 1.5 Mbps cable/DSL deployment due to removing the middlemen of cable/DSL modems and heavy cost plants.

A WSN Foundations opened FTTH Initiative model projects in Korea in Oct. 2002. Korean individuals, businesses, communities, and governments (both local and central) each made a consensus that fiber to the home is the solution to increase economic size by 10 fold in next 30 years, during the first half of 21st Century.

FTTH will cut paper/oil consumption by using online communication and encourage working, learning, playing, and shopping from the home, rather than driving cars to office buildings, schools, theaters and shops.

This will benefit our air/water quality by reducing automobile pollution, resulting in a dramatic reduction of oil consumption worldwide, and will reduce political tension in Middle East. Wars and Terrors occur in the world because of the struggle to control the earth's natural resources, such as oil and gas.

GGDP-Global Gross Domestic Product is 40 trillion dollars annually now, and will expand to 400 trillion dollars in next 30 years by FTTH. 12 trillion dollars is required for basic needs of home, food and cloth, averaging 2,000 dollars annually. Of course, OECD people spend \$15,000 per a person, but most population of Africa, South East/West Asia, China and South/Central America spend less than \$1,000 annually; \$80 monthly, barely surviving. No wonder this inequality is the root of wars, tension, and terrors.

## **THE NEED FOR FTTH INFRASTRUCTURE**

Investing in economic infrastructure creates economic booms. In the 1950's, President Dwight Eisenhower's' administration invested in the building of the Interstate Highway System. This increased commerce by facilitating the transportation of goods across the country. In the 1960's, President John Kennedy administration invested in the building of rocket ships. The technology developed that sent men to the moon created a whole new economy based on space technology and computers. In the 1990's, the US and advanced

countries invested in the building of the Internet to wire fibers to towns as part of NII- National Information Infrastructure.

The channels for communication and delivering information fostered a new economic age. But the last mile bottleneck by lack of fiber to the home reduced a \$10 trillion fiber to the town invested asset to only \$10 billion value, opening up a big opportunity for fiber to the home deplorers.

There are four great economic ages: The Hunting and Gathering Age, The Agriculture Age, The Industrial Age, and The Information Age. The latter three ages were born in technological revolutions and each increased global economic wealth more than ten times. It is forward thinking investors who reap significant benefits by recognizing major technology driven economic trends. The people who recognize the birth of opportunity that only comes every few hundred years establish the next generation of wealth.

In the Industrial Age, companies moved physical products, which contain information from factories to stores via ship, railroad, trucks, and cars. In the Information Age, companies move virtual products, which contain information from computer to computer, via the Internet without a physical medium.

The foundation of the Internet economy is the ability to send information around the world easily and quickly. The delivery of virtual products such as education and entertainment videos, graphics, and music requires high-speed Broadband Internet connections. These Broadband connections are based on fiber-optic technology.

In the early 1990's, when the Internet was first made available to the public, Internet connections were slow. Dial up modems based on copper wire technology running at speeds of up to 56 kbps allowed the transmission of only text and graphics.

When ISDN, digital cable modem, DSL, and wireless Wi-Fi came along, people were able to send small music and video files at speeds of up to 10 Mbps. Today, Fiber-to-the-Home and Ethernet transmit full-frame, feature length video and holographic virtual reality content at speeds of up to 1,000 Mbps. Wavelength division fiber cables achieve speeds on the order of Terabits per second speeds (1,000,000 Mbps).

When all people have access to FTTH and Ethernet, they will have no difficulty creating and selling virtual products from their homes and transmitting them to consumers all over the world. But areas where residents deploy gigabits per a second fiber to the home earlier than other areas will accumulate complex broadband business knowledge and lead the next economy.

In the Information Age, economic evolution favors knowledgeable people who are quick to adapt to change. First movers seize the advantage and reap the greatest rewards. These technology driven changes will create more wealth than the world has ever seen, at the same time destroying wealth based old technology.

# WSN FOUNDATION'S GOAL AND 100 INDUSTRIES BY FTTH

WSN Foundation's goal is to offer free fiber with 10 billion web pages containing volumes of information, home and food to a billion families, and 7 billion in population around the world by 2025 by allocating 70% of 10 million WSN business profit and directing \$10 trillion annually from local and national governments, electing politicians and officials who promote peace and FTTH throughout the democratic political process.

FTTH - Fiber-To-The-Home is practical broadband of 100~1,000 Mbps. 1~5 Mbps DSL/Cable/Wireless were the interim mid-band solution.

FTTH can offer bi-directional symmetrical bandwidth for both uploading for information sellers, and downloading for the information consumer. Current media, such as TV, radio, newspaper, books, and CD's are only a means of a one way consumption.

FTTH will allow average people to not only consume information, but also supply and/or sell information at the same time. They will be able to run web, email and video servers from homes. 90% of corporate, business, government and academic activities are processing information individually and collaboratively.

Communities who learned the importance of this around the world are deploying FTTH as fast as possible. A similar urgency occurred when they laid railroad, electricity, water, waste, telephone and freeways in the past.

Sweden, Korea, Japan and Italy plan to have 100% FTTH in 2006, during the next 4 years. They have all been piloting example cases of FTTH and expanding with government budgets and commercial enterprise investment.

In USA, already 55 towns/counties are piloted with FTTH with increasing penetration and signup ratio. Certain communities had a 100% signup in the case of new housing projects, with some communities having an 85% signup.

The rest of the communities who had a DSL/Cable mid-band solution had a 25% signup ratio, with an expected increase to 50% in the next year. FTTH, being 100 times faster and priced less, will erode the slow and expensive DSL/cable modem market in future.

There are currently 100 million homes in USA. This is expected to rise to 110 million homes by 2010. These homes are broken down as follows:

Urban: 40%

Small towns: 30%

Rural: 15%

New housing projects: 15%

Since Small towns, rural, and new housing project constitute a relatively small amount of homes per area, they are often overlooked by the telephone and cable companies. This amounts to 60% of homes in America.

Instead of waiting for broadband or mid-band service for the past 10 years, these communities have solved information pipe problem themselves by deploying FTTH, making DSL/cable/phone modem obsolete.

Virginia state, Bristol city municipal utility company brought fiber to home by using PON-Passive Optical Network technology which can speed the network up to 100 Mbps.

UDWDM-Ultra Density Wavelength Division Multiplexing technology can supply 1,000 Mbps speed to each home by using 1,280 channels of single fiber.

Most bankrupted international, national and regional fiber assets were auctioned off at less than 10% of the original investment in cost of investors and lenders.

These trends have made the wholesale bandwidth price affordable for retail bandwidth sellers to homes.

Advanced fiber technology will drop the bandwidth price in the future to almost zero cost. There are huge economic development differences between communities who have FTTH and those that don't.

Highly educated and experienced office or home based businesses are abandoning the slow speeds and are migrating to 100~1,000 Mbps FTTH, not only increasing income and decreasing expenses, but are also providing a better learning environment for their children. This fact will force all communities to adopt FTTH faster in order to survive and prosper in the broadband era of the Information age.

Many urban residents and businesses will re-migrate to FTTH rural, small towns and new housing development. This is a reversal trend of which 80% of rural agricultural population migrated to industrialized cities. People will be able to work and learn in these areas with the same or higher quality level as those in urban areas. This will ease concentration of the population centers, and will reduce stress, pollution, and crime, and will promote peace worldwide.

200 million people have died in the wars of the past, over 10,000 years Hunting, Agricultural, and Industrial Ages. This is enough of a lesson for both this and the next generation.

This is a few of the many reasons why WSN will proceed with the FTTH initiative, working with leading technology companies, service providers, governments, and, mostly, with community residents.

WSN's thousands of non-profit foundations will promote local FTTH initiatives, especially economic and educational disadvantaged communities and countries.

WSN participants will endorse and assist the election campaign efforts of FTTH friendly politicians and elected officials, who will, as a matter of priority, allocate \$ 10 trillion annually to aggregated budgets and assist with FTTH projects.

WSN will develop a new business with strategic alliance and outsourcing once there are 1,000 Ph.D. level educated or experienced executives, each with managers and producers for the following industries, and will have 10 billion accumulated global customers:

1. Airplane
2. Space - satellite and space travel
3. Defence

4. Automobile
5. Auto-part
6. Auto service and sale
7. Private Bank
8. Trust bank
9. Commercial bank
10. Retail bank
11. Investment bank
12. Chemical
13. Fragrance
14. Soft-drink
15. Fashion cloth
16. Home appliance
17. Shoes
18. Bags
19. Cosmetic
20. Beer
21. Underwear
22. Casual cloth
23. Detergent
24. Electronics
25. Containers
26. Packaging
27. Home maintenance material
28. Discount merchandizing
29. Department stores
30. Toys
31. Electricals
32. Silicon chips
33. Fiber Optic manufacturing
34. Grocery
35. Food processing
36. Candy manufacturing
37. Food growing
38. Oil Refinery
39. Oil exploration
40. Alternative energy
41. Pharmaceutical
42. Bio-industry
43. Health Care
44. Senior Care
45. Hospitals
46. Medical equipment
47. Drug wholesale and retail
48. Home building
49. Real Estate brokering
50. Real Estate management
51. Motorcycle
52. Bicycle
53. Fast food chain
54. Restaurant chain
55. Hotel

56. Casino
57. Film and cards
58. Tool
59. Machine
60. Engine
61. Generator
62. Metals
63. Mining
64. Mortgage financing
65. Casualty Insurance
66. Life Insurance
67. Mutual fund
68. Hedge Fund
69. Bond fund
70. Money market fund
71. Credit Card
72. Venture Capital
73. Education financing
74. Stock brokerage
75. Computers
76. Office equipment
77. Software
78. Game
79. Paper
80. Forest
81. Publishing
82. Broadcasting
83. Cable TV
84. Tax service
85. Office service
86. Phone
87. Data backbone
88. Data retail
89. Wireless
90. Ground Shipping
91. Ocean shipping
92. Air shipping
93. Airline
94. Power
95. Gas
96. Movie
97. Music
98. College education
99. High school education
100. Elementary education

## **FIBER TECHNOLOGY AND ECONOMICS**

1 Gbps (1,000 Mbps) is the needed speed to take full economic advantage of the virtual world. The top speed for Passive Optic Network (PON) technology is only about 100 Mbps.

It can be deployed for about \$1,000 per home.

Active Fiber Networks (AFN) run at about 1 Gbps. AFN's are only 20% more expensive than PON's and the speed is 10 times faster. With regular deployment of AON's, the price will soon be the same.

Cable and phone companies are caught between a rock and a hard place. They have no future if they don't deploy FTTH and no future for keeping the monopoly of voice, video and data market if they even do. If they do not deploy FTTH, they will face competition from local governments, utilities, and WSN.

Cable and phone companies restricted the deployment of FTTH because they knew their businesses would be cannibalized. This is why there is so much "dark fiber" in the US. They installed the fiber to the curb, but did not connect it to the house where people could use it.

Why are the phone and cable companies going to lose their business? Fiber based broadband allows people to distribute voice and video content through their Internet connections. There will no longer be demand for phone and cable services through slow connections.

There are approximately 1 billion households in the world. \$1 trillion is enough to wire every household with FTTH. That is only 0.16% of the world's \$600 trillion wealth. The wealth and income resulting from this information-based economy will be 10 times larger than the physical based economy.

For example, 3 billion Chinese, Indians and Africans who never consumed will be able to produce and consume education, entertainment, virtual travel and health at the same level of OECD nation citizens.

The wholesale cost per Gbps of fiber decreased from \$10 trillion to less than \$10 billion. It is now 1,000 times cheaper because ultra-high density fiber splits a single fiber into 1,280 fibers that each provides a bandwidth of 1 Gbps each. This provides a total bandwidth of 1.28 Tbps per fiber line!

WSN forecasted these trends 7 years ago and prepared to take advantage of them by selling multimedia content through high-speed fiber.

A New breed of PC has 1,000 MB memory/100 GB hard drive, costing \$1,000. The next PC will have 5,000 MB memory/1,000 GB hard drive, costing \$2,000, and will be maintainable by us using cheap and easy home based web hosting software. These home based servers PCs are appliances just like any other in the home, such as a TV or refrigerator. It can be located under kitchen sinks or in a closet. Most NOC/ web hosting companies will go out of business by FTTH. WSN will be able to buy them a cent on the dollar. WSN has found cheap and easy home based hosting software that suits. WSN will install it on PCs that connect to Internet at speed of 100 Mbps.

Members will enjoy profit sharing as either producers or marketers, because they want to make money on 100 Mbps FTTH. WSN Foundations will expand these economically viable projects to 7 billion people.

Many WSN executives/managers are creating their own multimedia financing, marketing

and producing organizations on their WSN domains. Thousands will expand their WSN domains in future. The WSN financing and marketing structure has proven well, and is now progressing to a multimedia content producing structure.

The costs of content development projects are broken down in to 10% Advertisement, 30% Marketing between producers and consumers. 40% of these costs belong to middlemen. This is why we pay such high prices for products. Costs of manufacturing are usually considerably less than the end retail cost. The money given to middlemen could easily get rid of starvation in a third world country. Broadband will lower these costs substantially by giving developed content to consumers directly.

WSN FTTH initiative can use this income to offer free fiber (free fiber is about \$1,000 per home investment, \$20 dollars monthly), free housing (\$1,000 monthly can cover decent housing and utilities around the world) and food/etc (\$970).

Free fiber can supply 20 billion web pages containing free education, entertainment, health and services. 180 billion web pages will be offered for transaction and subscription use.

## **FTTH based content business case study and FTTH industry in Korea**

WSN TV 75 Inc. opened FTTH content center in Gunpo city, Korea where first 100 Mbps FTTH project in the world was deployed in 2002. Because of bi-directional 100 Mbps speed, WSN member residents successfully installed fiber home based servers to host/market digital content without hiring/paying expensive web servers in data centers.

7,000 homes in MDU, multi-dwelling-units of Kunpo City, Korea have a 2,500 Mbps backbone, 155 Mbps fiber and 100 Mbps Ethernet connections. This speed can be upgraded to FTTG 1,000 Mbps-Gigabits Ethernet to homes.

Testimonials from Kunpo City, Korea where 100 Mbps FTTH has been available. These participants pay \$25 monthly with free local phone to greatly improve their lifestyles.

A terabytes digital content hosting based on Linux dual CPUs PC(1,000 hours of digital movies/videos) in fiber home costed \$ 100 monthly rather than \$10,000 monthly for storage and bandwidth in data center.

WSN TV 75 Inc. is testing FTTH deployment and content business in Gwangju City, Korea where 1,000 Mbps FTTH was deployed for triple play of phone, TV, Internet data service including 3D virtual reality application first in the world in 2003. This project will increase speed to homes to 10 Gbps-10,000 Mbps for teleprocesses application by 2008.

Gwangju City Photonics R&D and industry complex target to produce \$10 billion fiber optic equipments/parts-10% of \$ 100 billion FTTH market to wire 100 million homes globally by 2010. Their current investment size is \$1 billion.

## **CONCLUSION**

Many people around the world are unable to attend an College/Master/PhD program due to the impossible costs. These people are located all around the world, such as Africa,

South America, Chinese, and Indian. These countries make up 67% of the world population. Lack of education has made it impossible to make an adequate living or provide a better life for the next generation. These people are barely surviving.

There is a strong and reasonable anticipation of increasing technological advances in computer internet innovation, applications, and general accessibility. These factors, in conjunction with the use of proven value added network building techniques and methodologies that encourages proactive participation and self-motivation through revenue generation and sharing opportunities, WSN TV will be far more effective and profitable than other internet businesses. This is due to the lack of expenses in a traditional business sense

Keeping American/European and few advanced Asians wealthy by keeping nation state boundary will not solve the global problem. FTTH, free homes, and free food will. This is WSN's eventual goal.

Government officials and politicians, who are public servants, not rulers, around the world must co-operate WSN foundations' FTTH initiative, charitable and humanitarian global projects.

When all people have access to FTTH and Ethernet, they will have no difficulty creating and selling virtual products from their homes and transmitting them to consumers all over the world. But areas where residents deploy gigabits per a second fiber to the home earlier than other areas will accumulate complex broadband business knowledge and lead the next economy.

In the Information Age, economic evolution favors knowledgeable people who are quick to adapt to change. First movers seize the advantage and reap the greatest rewards. These technology driven changes will create more wealth than the world has ever seen, at the same time destroying wealth based old technology.

Fiber technology is reshaping the world economy and politics. Unlike the agriculture and industrial economies, the means of production and access to the marketplace in the information economy cannot be controlled by a small number of people because the means of production is the human mind and access to the marketplace is an Internet connection.

Success in the information economy depends on 2 ways communication and cooperation, not one way control and domination.

WSN TV knows the consequences of these irreversible economic macro-trends and planned accordingly. When these 10,000 dinosaur multi-national corporations try to dominate the world economy and politics the way they used to, they will discover that the rule of game has changed.

WSN TV is an open, peaceful, and voluntary world society, economy, and government. We will allocate our trillion-dollar grants from 10 million WSN foundations to support a new breed of Information Age politician who support our global mission of charity, education, and economic equality.

The politicians that we endorse will budget for free fiber homes and food for 7 billion people.

# **LEVEL OF ENTREPRENEURSHIP IN THE INFORMAL RETAIL SECTOR OF SOUTH AFRICA**

**Professor JH Martins, Bureau of Market Research,  
University of South Africa**

**Professor AA Ligthelm, Bureau of Market Research, University of South  
Africa**

**Theo van Wijk Building, Preller Street, Muckleneuk Ridge, Pretoria, South  
Africa, 0003**

**Tel: 27 12 429 3137, Fax: 27 12 429 3170, [martijh@unisa.ac.za](mailto:martijh@unisa.ac.za) &  
[www.unisa.ac.za/dept/bmr](http://www.unisa.ac.za/dept/bmr)**

## **INTRODUCTION**

The informal sector constitutes an important part of the South African economy. Its emergence is largely attributed to the divergence between the growth in especially the urban population and employment growth in the formal economy. Job creation in the formal sector frequently trails growth in the labour force. The shortage of productive employment opportunities in the formal sector, therefore, compels people to fend for themselves.

In most countries, including South Africa, the majority of informal businesses are located in the trade sector. A business census conducted in selected township areas of South Africa confirmed that almost 70 % of all informal businesses were located in the trade and commerce sector (World Bank, 1993). This article focuses specifically on informal businesses in this sector.

## **OBJECTIVE AND OUTLINE**

The objective of the paper is to construct a profile of informal retail outlets in township areas in order to establish their functioning and dynamics within the informal sector. Aspects such as the informal retail entrepreneur, the interaction of informal retailers with their customers and suppliers as well as aspects such as capital needs and sources, employment, turnover and assortment of merchandise as well as constraints encountered will be addressed. Their particular role within the broader retail environment will also become evident from the study.

The paper is organised into the following sections. Section 3 sets a definition of the informal sector as well as the different types of businesses included in the survey. Section 4 puts the informal retail trade in a macroeconomic perspective. Sections 5 and 6 contain a brief exposition of the survey methodology and main findings of the research respectively. Section

7 summarises the discussion and draws a few conclusions especially with reference to the level of entrepreneurship in the informal retail sector.

## **DEFINITIONS**

This paper focuses on the informal sector and particularly on a subset of the sector consisting of hawker tables, spaza shops and township general dealers. The following provides concise definitions on these concepts.

### **THE INFORMAL SECTOR**

It is widely acknowledged that no single definition of the informal sector exists, nor is one anticipated (Naidoo, 2002). In economic literature, the term informal sector did not refer to a homogeneous group of businesses but was meant to identify a subset of economic activity in order to describe a domain similar with, say, rural or urban sector, merely to focus and demarcate research activities in order to facilitate policy development. Just as in the case of urban or rural sector, one needs to disaggregate the informal sector in order to draw meaningful conclusions (Sethuraman, 1997).

The International Labour Organisation's (ILO) International Conference of Labour Statisticians (ICLS) describes the informal sector for purposes of collecting statistics on the sector (ILO, 1993). The resolution states that the informal sector may be broadly characterised as consisting of units engaged in the production of goods and services with the primary objective of generating employment and incomes to the persons concerned. These units typically operate at a low level of organisation, with little or no division between labour and capital as factors of production and on a small scale. Labour relations – where they exist – are based mostly on casual employment, kinship or personal and social relations rather than contractual arrangements with formal guarantees (ILO, 1993). Charmes (2000: 62) defines the informal sector as consisting of enterprises of informal employers employing employees on a continuous basis, whose employment is below (in terms of number of jobs) thresholds set by statistical practices of legislation in the country (thresholds of 5 or 10 jobs being the most frequently used), or have not registered these employees or are not registered (eg as companies or for tax purposes). Where countries opt for an employment size criterion, cognisance should be taken of the possible overlapping between formal and informal enterprises.

On the basis of the above, informal enterprises portray, inter alia, the following characteristics:

- As far as legal identity is concerned, informal enterprises do not have corporate status.
- They do not maintain a complete set of accounting books.
- From a production destination point of view, at least some portion of production output is destined for the market.
- Enterprises are nonregistered units in terms of taxes, labour or any other regulatory frameworks.

Generally, the majority of people in developing countries (and to some extent, those in transition countries) resort to the informal sector as the only means of survival (Tansel, 2000: 10).

Although the above description can be regarded as very general, it provides some perspective on the nature of enterprises considered to be part of the informal sector.

## **RETAIL BUSINESSES**

This paper embraces the retail activities of hawkers, spazas and township general dealers. These entities may be depicted as follows:

- (a) Hawker tables or street vendors operate from a temporary or permanent structure on a street or at a taxi rank or train station.
- (b) Spazas or tuck shops are defined as businesses operating in a section of an occupied residential home or in any other structure on a stand zoned or used for residential purposes and where people permanently live.
- (c) Township general dealers are stand-alone businesses with a brick and mortar superstructure often located in a business area but may also be located in residential sections of townships. They carry a wider product range than spazas and have more fixtures and fittings allowing self-service to clients.

The businesses practice of all the above entities entails ordinary retailing, ie the buying of consumer goods from manufacturers, wholesalers, producers or even super-/hypermarkets and the selling of goods at a profit margin to clients.

## **THE RETAIL SECTOR IN SOUTH AFRICA**

A perspective on retail sales in South Africa would create a clear picture of the status of retail sales channelled through the informal retail sector.

Table 1 shows the relationship of retail sales to consumption expenditure in 2003. Total consumption expenditure (ie expenditure of households on goods and services) amounted to R761,9 billion in 2003, of which 60,6 % (R461,6 billion) was spent on goods and 39,4 % (R300,3 billion) on services. Potential retail sales (ie expenditure on goods minus expenditure on personal transport equipment such as cars, tyres, petrol, paraffin and household fuel and power that are not classified as retail items by Stats SA) amounted to R377,7 billion. Of this R235,2 billion or 62,3 % was channelled through formal retail outlets such as Pick 'n Pay, Checkers, Spar and other retail outlets. More than a third 37,7 % or R142,5 billion) was channelled through the following outlets:

- informal retail outlets such as spazas, hawkers and township general dealers
- nonstore retailers such as mail order services and vending machines
- nonretail establishments such as wholesalers and agricultural and manufacturing outlets
- e-commerce/e-tailing services

It is estimated that approximately 10 % of potential retail trade, amounting to approximately R38 billion, was channelled through informal outlets in 2003 (Martins, 2001; Martins, 2002 & Martins, 2003). A substantial portion of these sales can be attributed to spazas, hawkers and township general dealers.

**Table 1 Relationship between retail sales and private consumption expenditure, 2003**

	<b>2003 BMR estimate</b>
	<b>Rbillion</b>
1. Total private consumption expenditure (2+3)	761,9
2. Expenditure on services	300,3
3. Private consumption expenditure on goods	461,6
4. Private consumption expenditure on personal transport equipment and fuel and power <sup>1)</sup>	83,9
5. Potential retail sales (3-4)	377,7
6. Retail sales by formal sector	235,2
7. Retail sales other than by formal retail outlets (5-6)	142,5
	<b>%</b>
8. Services as % of consumption expenditure	39,4
9. Potential retail sales as % of private consumption expenditure	49,6
10. Formal retail sales as % of potential retail sales	62,3
11. Other than formal retail sales as % of potential retail sales	37,7

1) Not regarded by Statistics South Africa as retail expenditure items.

Source: Tustin, 2003: 16

## **SURVEY METHODOLOGY**

A national survey was conducted among a sample of 481 informal retailers during July to September 2003. The sample was selected from a list of 14 200 informal businesses. The database consists of a street-by-street business census of all points of purchase in township areas as well as at train and taxi ranks in and outside township areas. The following areas were, inter alia, included in the survey: Soweto, Mamelodi, Daveyton, Mdantsane, Umlazi, Kayelitsha, Michells Plain and KaNyamazane

## **RESULTS**

This section reports on the most important findings of the informal business survey. The results are portrayed by type of business distinguishing between hawker tables, spazas and township general dealers.

## THE INFORMAL RETAIL OWNER

Most people in the economic and political world agree on one point: promoting entrepreneurial spirit is the key to creating jobs and improving competitiveness and economic growth (Antipolis, 2000: 17). Entrepreneurship combines innovation (ie risktaking and the provision of 'new' goods and services) and individual initiative, resulting in organisational renewal (ie the improvement of existing and/or the establishment of new businesses) (Cross, 1995: 4 & RCE, 2002: 2).

Some characteristics of owners are depicted below to establish a profile of the entrepreneur in the informal retail sector of South Africa by type of business.

### Educational level

Table 2 shows the educational level of business owners by type of business. Educational level is positively correlated with the level of business sophistication where hawker tables are regarded as the less sophisticated and general dealers the more advanced business type. More than half (53,7 %) the hawkers had a primary school qualification or no formal schooling. This corresponding percentage is 30,5 % for spazas and only 10,1 % for general dealers. At the higher end of the qualification spectrum, 56,5 % of general dealer owners reported a matric or a tertiary qualification while only 19,0 % of hawkers had attained this relatively higher level of qualification.

**Table 2 Educational level of business owners**

Educational level	Hawker/ street vendor	Spaza/ tuck shop	General dealer in township
	%	%	%
No formal schooling	13,7	2,2	0,0
Primary (Grade 1-7)	40,0	28,3	10,1
Secondary (Grade 8-11)	27,4	33,3	33,3
Matric (Grade 12)	15,8	27,9	36,2
Tertiary (Postmatric)	3,2	8,3	20,3
<b>Total</b>	<b>100,0</b>	<b>100,0</b>	<b>100,0</b>

### Engagement in business

More than eight in every ten business owners (83,8 %) were engaged in their businesses on a full-time basis. Almost all the hawkers (95,7 %) were involved on a full-time basis compared to only 70,1 % of the owners of general dealers. The percentage of spaza owners (83,1 %) correlates closely with the 84,4 % of a national spaza survey in 2000 (Ligthelm, 2002:15).

### Business training

Nine in every ten respondents confirmed that they have no formal business training. No less than 96,8 % of hawkers do not have any formal business training. This percentage declines

to 91,1 % for spazas. Two in every ten owners/managers of general dealers (18,8 %) confirmed formal business training.

As was expected in the light of the above, the majority (68,7 %) of respondents answered in the affirmative when asked whether they need formal business training. The type of training needs expressed by respondents is shown in table 3. The majority of respondents expressed a need for training in business management (73,8 %), bookkeeping (58,5 %) and marketing (57,1 %). Sales were highlighted by hawkers as of particular importance (64,9 %).

**Table 3 Business training needs as expressed by respondents by type of business**

Training need	Hawker/ street vendor	Spaza/ tuck shop	General dealer in township
	%	%	%
Management	70,2	73,4	83,3
Bookkeeping	61,4	58,5	53,3
Marketing	61,4	54,8	63,3
Sales	64,9	43,6	36,7
Computer skills	15,8	31,4	40,0
Credit control	21,1	17,6	16,7
Customer/human relations	3,5	7,4	10,0
Labour relations	1,8	6,9	10,0
Literacy/numeracy training	0,0	0,0	6,7

### Engagement prior to starting the business

Table 4 confirms limited appropriate exposure to business management experience among respondents prior to them starting their businesses. Unemployment occupied the most important status immediately before the business was started (38,6 % of respondents) particularly among hawkers and to a lesser extent among spazas. Engagement as a shop assistant/sales person was the most important position held by owners of general dealers prior to starting their businesses (30,9 %). This limited and/or inappropriate exposure of respondents to business management experience make it imperative that training and education in business management should be regarded as an urgent requirement to improve the sustainability of informal retailers.

**Table 4 Engagement of respondents immediately prior to starting business**

Employment	Hawker/ street vendor	Spaza/ tuck shop	General dealer in township
	%	%	%
Unemployed	55,3	36,8	23,5
Shop assistant/sales person	11,7	13,2	30,9
Housewife	12,8	9,7	7,4
Office worker	1,1	8,4	5,9

Retired	2,1	5,8	5,9
Other	17,0	26,1	26,5
<b>Total</b>	<b>100,0</b>	<b>100,0</b>	<b>100,0</b>

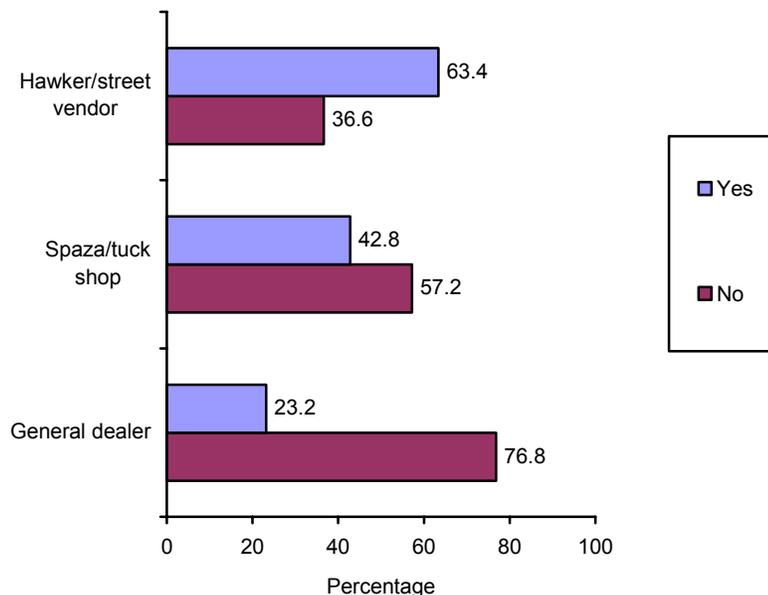

## Business as career path

The reply to the question ‘Will you accept a job in the formal sector if offered today?’ can be regarded as indicative of the extent to which informal business owners/managers regard their businesses as a career path or only as a stop-gap to counter unemployment and poverty temporarily.

Figure 1 confirms a considerably higher level of stability and permanency among owners of general dealer shops compared to hawkers. Only two in every ten (23,2 %) owners of general dealers indicated that they would accept a job in the formal sector if offered today. In contrast, just more than six in every ten hawkers (63,4 %) would leave their businesses if alternative employment opportunities materialised in the formal economy. The corresponding figure for spaza owners amounted to 42,8 %, which correlates closely with the 41,1 % of spaza owners in a national survey in 2000 (Ligthelm, 2002: 53).

The above clearly shows that hawking is regarded by the majority of hawkers purely as a survival strategy while the owners of the more sophisticated businesses regard themselves as permanently in the market place.

**Figure 1 Attractiveness of employment in the formal sector**

## Summary

Although informal retailers are often depicted in literature as survivalist enterprises operating at bare survival level (Rogerson, 1996 & Ruiters et al 1994), the above evidence shows clear signs of small retailers becoming a permanent phenomenon on the South African economic

scene. It is interesting to note that several respondents indicated that they owned more than one informal retail business. This points to some entrepreneurial spirit amongst owners to establish more than one business to augment their income.

## **RETAIL BUSINESS OWNERS AND THEIR HOUSEHOLDS**

Informal retail businesses are strongly integrated with the households of the owners and are often described as a subset of household activities. The well-being of households often depends on the success and profitability of the businesses, particularly in the case of hawkers. Nine in every ten (87,4 %) workers in hawker businesses and 79,2 % of workers in spazas emanate from the owners' families or household. The percentage for general dealers dropped to 54,7 %.

The household size of respondents (including him-/herself) amounted to an average of 4,8. This finding is indicative of the number of South Africans dependent on income from small retail businesses. The household size of respondents by type of business varied from 4,7 in the case of spaza owners to 5,1 for the owners of spazas and general dealers. Based on an estimate of approximately 250 000 informal outlets (Woodward, 1999: 38) a total of 1,25 million people owned their existence from informal retail business activities.

A further indication of the dependence of informal business owners and their households on their business income is conferred by the fact that no less than three in every four (73,1 %) hawkers confirmed that no household member (including the owner) earned an income outside the business. This figure is just more than half in the case of both spaza retailers (57,4 %) and owners of general dealers (53,6 %).

## **GENERAL BUSINESS CHARACTERISTICS**

### **Reasons for starting business**

Table 5 shows the reasons for starting a business. These reasons differ substantially by type of business and can be related to the potential long-term sustainability of the different types of businesses.

The survey results show that more than eight in every ten hawkers (82,6 %) started their businesses as a result of unemployment. This percentage amounted to 48,7 % for spazas and only 32,8 % for general dealers. Unemployment as motivational factor for starting a business often suggests that a business is established without the identification of a lucrative business opportunity, and therefore presupposes a high potential for business failure. The above points to substantially greater stability among general dealers and spazas compared to hawkers with regard to sustainability.

The finding that almost half (48,7 %) the spazas were established as a result of owners being unemployed, closely correlates with the survey results of a national spaza survey in 2000. This survey found that 52,1 % of spaza owners were unemployed when they started their own businesses (Ligthelm, 2002:13).

It is encouraging that just more than a third (35,8 %) of general dealer owners joined a family business, which is evidence of some form of business culture present in the African communities. The figure for spazas is 15,7 %, confirming a degree of continuity in spaza activities. As could be expected, family business succession is almost nonexistent in hawker trade (2,2 %).

The emergence of entrepreneurship in the informal retail trade can be inferred largely from the extent to which informal retailers seized a business opportunity. Only one in every seven (14,9 %) general dealers were established by owners identifying a lucrative business opportunity while one in ten (9,9 %) spaza owners and almost no (2,2 %) hawkers saw a good opportunity for business. It seems therefore that the minority of informal retailers are motivated to enter the retail trade through their entrepreneurial spirit rather than a mere need for survival.

**Table 5 Reasons for starting a business by business type**

Reasons	Hawker/ street vendor	Spaza/ tuck shop	General dealer in township
	%	%	%
Unemployed	82,6	48,7	32,8
To increase income	7,6	23,1	13,4
Joined family business	2,2	15,7	35,8
Seize business opportunity	2,2	9,9	14,9
To work from home	3,3	2,2	1,5
Other	2,2	0,3	1,5

### Age of business

The period that the various types of businesses had been in operation largely supports the findings discussed above. The age of a business reflects its market experience and affects its ability to grow and trade up to the next size class. Market experience and size are also important variables that determine business access to financial resources.

Table 6 confirms a far higher level of business maturity among general dealers than among spazas and especially hawkers. Almost two in every three general dealers (63,7 %) had been in operation longer than five years. The corresponding percentages for spazas and hawkers are 36,0 % and 19,0 % respectively. At the other end of the scale, almost one in every three hawker tables (31,5 %) had been operating for less than one year compared to 5,7 % of township general dealers and 13,6 % of spazas. Once again, these findings are an indication of the fact that hawking seems to be a survival activity while other retailers portray a higher degree of career path development as business people.

**Table 6 Period that institution had been in operation by type of business**

Age	Hawker/ street vendor	Spaza/ tuck shop	General dealer in township
	%	%	%
Less than 6 months	14,7	2,5	1,4
6 months and longer but less than 1 year	16,8	11,1	4,3
1 year and longer but less than 2 years	21,1	12,7	1,4
2 years and longer but less than 3 years	16,8	17,5	13,0
3 years and longer but less than 5 years	11,6	20,1	15,9
5 years and longer but less than 7 years	3,2	11,5	7,2
7 years and longer	15,8	24,5	56,5
<b>Total</b>	<b>100,0</b>	<b>100,0</b>	<b>100,0</b>

### Assortment of merchandise

The information below shows the response to the question: 'Indicate the five most important products for your business in terms of monthly turnover (sales)'. Respondents were also requested to rank them in order of importance. The indices show the relative importance of the products. The most important product is expressed as an index of 100. A product with an index of say 50 would therefore contribute only half that was contributed by the most important product.

The following five products were reported as the most important contributors to business turnover:

	Index
(a) Hawkers	
- Sweets	100
- Fruit and vegetables	82
- Cigarettes and tobacco	59
- Soft drinks	18
- Bread	14

Sweets were reported as the most important product sold by hawkers followed by fruit and vegetables. This was followed by cigarettes and tobacco that was about 60 % as important as sweets with regard to total turnover.

	<b>Index</b>
(b) Spazas	
- Soft drinks	100
- Bread	97
- Cigarettes and tobacco	67
- Milk	46
- Sweets and chocolates	46

Soft drinks and bread contributed almost the same amount to spaza turnover followed by cigarettes and tobacco, which contributed two thirds that of the first mentioned two products. Milk and sweets were both only half as important as soft drinks and bread with regard to business turnover. It is, however, important to note that some seasonal variation is experienced in the sales patterns of informal retailers. Sales of confectionary peak around school days but decline in summer to the expense of fruit and vegetables.

	<b>Index</b>
(c) General dealers	
- Soft drinks	100
- Bread	76
- Sugar	61
- Maize meal	56
- Cigarettes and tobacco	47

The most important products identified by general dealers confirmed a more diversified merchandise for general dealers than for the other two types of retailers. As was the case with spazas, soft drinks and bread occupied first and second position with regard to business turnover.

## **PHYSICAL CHARACTERISTICS AND INFRASTRUCTURE**

Efficient service delivery, good infrastructure and safety and security are some of the leading factors that contribute to a productive business climate and influence an entrepreneur's decision to establish a business in a certain area. This section highlights some of these locational factors.

### **Location of business**

As indicated in section 2 the sample frame was representative of all types of areas. Informal retailers are highly concentrated in areas convenient to their clients. Spazas, by definition, are concentrated in residential areas (93,9 %) and hawkers in areas of high pedestrian volumes (21,1 % at taxi ranks/train stations and 53,7 % on the street) while the majority of general dealers are also established close to the residences of customers, often in demarcated business areas.

## Shop accommodation

The type of shop accommodation differs substantially by type of business – from more permanent in the case of general dealers to temporary in the case of hawkers (table 7). Spazas are overwhelmingly located on residential properties, either inside or outside the dwellings (82,6 %). Hawkers occupied a substantial variety of structures but primarily do business on the street (71,3 %) while general dealers tend to conduct business from buildings other than their homes (66,2 %). General dealers operating their businesses from an outside building on the same property (17,6 %) represented businesses graduated from small spaza shops to larger businesses portraying the characteristics of general dealers (see definition in section 3). Relocation to a demarcated business area may jeopardise the profitability of the business due to a potential loss of customers and hence the continuation of business on the same residential property often in a larger superstructure. The majority of the small retail businesses are aimed at the convenience level.

**Table 7 Type of accommodation by type of business**

Type of accommodation	Hawker/ street vendor	Spaza/ tuck shop	General dealer in township
	%	%	%
Inside main house	0,0	51,1	0,0
Outside building on same property	0,0	31,5	17,6
Building other than home	0,0	7,3	66,2
Metal container	4,3	5,4	0,0
Shack	7,4	4,1	0,0
Fixed stall in market	5,3	0,0	0,0
On street	71,3	0,0	0,0
Other	11,7	0,6	16,2
<b>Total</b>	<b>100,0</b>	<b>100,0</b>	<b>100,0</b>

Hawkers were also requested to express their locational preference in terms of the following two alternatives:

- freedom of choice of location; or
- centralised location/facilities provided by government

Just more than seven in every ten (71,6 %) expressed the view that they prefer freedom of locational choice for their businesses. A mere 28,4 % would prefer government-provided facilities. This is an extremely important finding in view of government's express intention to supply more permanent facilities to hawkers.

A follow-up question to hawkers enquired on their willingness to pay rent. Just more than eight in every ten respondents who preferred government facilities indicated that they are prepared to pay rent. Those that confirmed their willingness to pay were requested to indicate what the maximum amount is that they were prepared to pay for rent per month. Two in every three hawkers (64,9 %) indicated that the maximum rent they are prepared to pay amounted to less than R20 per month. This amount would never be sufficient to compensate

for the investment to provide even limited facilities such as water and sanitation. A R20 per month rent would, in economic terms, justify only an investment of a few hundred rand per hawker stand. Any attempts to supply hawker facilities would therefore imply a huge subsidy.

## **Water and electricity**

With the exception of hawkers, a substantial percentage of the other businesses confirmed the availability of water and electricity on the stand on which the business is operated. All the general dealers have access to water and electricity. Almost nine in every ten spaza owners/managers confirmed the availability of tap water (85,9 %) and electricity (97,5 %) on their stands. The availability of tap water (7,7 %) and electricity (15,2 %) is extremely low among hawker businesses. However, the majority indicated that these services are not applicable to their businesses due to their mobility and type of business accommodation often on streets.

## **EMPLOYMENT**

Recent policy stances of government highlight the notion that small business development can become an important source of employment and income generation. However, average employment of informal retailers is very limited and often eroded due to a high degree of business mortality.

The average employment of informal retailers stood at 2,5 employees per business. Average employment by type of business reveals the following averages:

- hawkers 1,6 employees
- spazas 2,4 employees
- general dealers 3,8 employees

The gender composition is fairly evenly distributed between males (47,8 %) and females (52,2 %). However, spazas and general dealers employed slightly more females while males predominate in the case of hawkers (58,2 % male). Almost three in every four informal retail employees were involved in the business on a full-time basis.

## **FINANCIAL ISSUES**

### **Start-up capital**

As indicated in section 6.3.1, unemployment was advanced as one of the principal reasons for starting informal retail businesses. As a result, available start-up capital is limited. The average start-up investment on businesses amounted to R3 607 ranging from R1 593 for hawkers to R9 554 for general dealers. Spaza/tuck shops were launched with an initial amount of R3 232. This is 25 % less than the start-up investment of R4 058 for spazas found in a national spaza survey in 2000 (Ligthelm, 2002: 21).

## Sources of capital

Survey findings indicate that the majority of retailers source their start-up capital requirements from their own private savings or savings of other household members. Private savings dominate in all categories (spazas 79,5 %, hawkers 84,8 % and general dealers 82,5 %). Other important sources of capital were stokvels (11,9 % on average) and loans from relatives (of particular importance with general dealers (12,3 %)). Retrenchment payments also formed an important source, especially with regard to spazas (13,3 %). Loans from banks represented a relatively important source for general dealers (8,8 %). Only one general dealer reported financial assistance from a government institution. It was also reported that social grants paid by government play a role in financing small businesses, especially hawkers.

The question that arises from the above response is whether the limited use of external capital arises from a lack of access to external financial resources or whether it is purely a matter of not needing debt capital for starting a business. In a survey among small and medium enterprises (SMEs) in Johannesburg in 1999, the World Bank (Chandra, 2000: 37) concluded as follows regarding access to capital markets: 'The majority of firms that do not use bank finances are not necessarily limited by lack of access to capital. On average, poor business conditions that preempt the need for capital investment seem to be a far more critical explanation than limited access to capital markets'. A GEM (3003:5) survey among businesses in South Africa also reported that a lack of financial support is widely viewed as the main problem facing entrepreneurs in South Africa. A thorough cross-country analysis, however, reveals that:

- Compared to other countries, South Africa does not stand out as having a financial system reluctant to support entrepreneurs.
- Internationally, formal financial institutions appear to provide findings to a small minority of entrepreneurs. Entrepreneur's savings and their ability to access informal investment from friends, family and colleagues appear to be far more important sources of start-up finance.

## TURNOVER AND EXPENDITURE

The average monthly turnover of businesses ranged from a high of R15 168 for general dealers to R3 459 for hawkers and R10 593 for spaza retailers.

Respondents were requested to estimate the running costs of their businesses for the preceding month by expenditure item. A word of caution is relevant here. Although respondents were requested to estimate the operational costs of the business such as telephone, transport and water and electricity, it was not always possible to distinguish between household costs and business costs. In the case of spazas, where the business is located on the same premises, it was not possible to divide the cost of electricity between residential and business use. Operating costs therefore also include an element of household expenditure. 'Purchase of merchandise' constitutes the most important expenditure item, accounting for the following percentages of total turnover:

- hawkers : 69,9 %
- spazas :72,6 %
- general dealers : 77,8 %

'Purchase of merchandise' is followed by salary and benefits of owners and employees. Salary and benefits of owners together with remuneration of employees amounted to the following:

- hawkers : 7,4 % of turnover
- spazas : 7,5 % of turnover
- general dealers: 10,5 % of turnover

Considering an employment size of 1,6 for hawkers, 2,4 for spazas and 3,8 for general dealers (full-time and part-time), the labour remuneration constituted a meagre portion of total cost.

A comparison of running costs with turnover shows the following surplus of income over running costs:

- hawkers : 16,7 % of turnover
- spazas : 12,2 % of turnover
- general dealers: 3,0 % of turnover

General dealers confirmed in the survey that they were more severely affected by competition than spazas and hawkers. One could reasonably assume that this could result in a smaller mark-up and hence a lower surplus.

## **CONSTRAINTS ENCOUNTERED BY INFORMAL RETAILERS**

Respondents were requested to indicate the three most serious problems that they experience. The types of problems do not differ substantially by business type. Shortage of merchandise and finance emerged as the primary problem of all three business types, mentioned by just more than half the respondents. This was followed by the high crime rate mentioned by 44,7 % of general dealers and by almost a third of the other two categories. Unavailable and expensive transport was singled out by spazas (39,9 %) and especially hawkers (45,2 %). General dealers (31,9 %) perceived the level of competition as a serious problem.

Some additional questions were posed to respondents regarding the level of crime in their areas. Approximately one in every four respondents were victims of crime during the twelve months preceding the interview. The type of crime to which respondents were exposed differs somewhat by business type. Eight in every ten spaza and general dealer owners were victims of break-ins and property theft. Just more than half the hawkers experienced this type of crime. Physical attacks were the second most important category of crime experienced by general dealers (31,3 %) and spazas (21,2 %). The different nature of hawker businesses exposed them not only to physical attacks (37,5 %) but also to vandalism (37,5%). Theft by employees was mentioned as the fourth most important crime category experienced by all three business types.

The above clearly confirms that lawlessness and disrespect for the property and person of fellow inhabitants seriously jeopardise business profitability and the sustainability of the informal retailer. Surveys in Johannesburg and Pretoria among SMMEs confirmed that business owners regarded the establishment of a crime-free environment as one of the most important functions to be performed by government institutions (Tustin, 2001 & Ligthelm, 2001).

## **SUMMARY**

The picture emerging from the foregoing analysis depicts a continuum of informal retailers ranging from fairly developed businesses to enterprises purely established for household survival purposes. The majority of businesses were established in a nonlucrative business environment and are therefore operating at a bare survival level.

This continuum of fairly established to survivalist businesses largely correlates with business types identified in this study. Township general dealers seem to be far more established than hawkers. Spaza shops occupy more or less a middle position. Far more owners of general dealers than hawkers perceived their businesses as long-term endeavours

The relative stability by type of business is also confirmed by the survival rate of various types of businesses. The percentages of retailers in operation for longer than five years ranged from 19,0 % for hawkers to 63,7 % for general dealers. The fact that limited alternative career opportunities exist in the economy compels the survivalists to stay in the market, often with limited levels of profits for quite a number of years.

The reality of the informal retailer as an important delivery channel of goods and services to consumers, creates important linkages between manufacturers/wholesalers and informal retailers. Manufacturers and wholesalers have also realised that the informal retail market holds an important share of the retail market in South Africa. This share is estimated at approximately R38 billion in 2003). The linkage between formal and informal sectors contributes considerably to the survival potential of small informal retailers due to the availability of merchandise at more affordable prices, which, in essence, allows them to continue with their trading businesses. This linkage is manifested in various ways through, inter alia, increased product delivery to informal retailers, promotion sales available to them and even the availability of manufacturing/wholesale credit to especially township general dealers.

In operating their businesses, informal retailers encounter serious problems that impact negatively on their profitability. These problems range from market realities such as severe competition among informal retailers to a hostile external environment. Paramount in this regard is the high level of crime. Break-ins, property theft, vandalism and physical attacks on owners and employees can be devastating to a small informal retailer. Crime not only impacts negatively on profitability but can even jeopardise the existence of such businesses that are dependent on small turnovers and profit margins.

The question still remains: To what extent can small retailers be regarded as entrepreneurs or only as microbusiness owners. Timmons (1999: 27) maintains that entrepreneurship has evolved beyond the classic startup notion to include companies and organisations of all types, in all stages. Entrepreneurship is a way of thinking, reasoning and acting that is opportunity obsessed, holistic in approach and leadership balanced. Entrepreneurship often result in the dynamic growth of a business. Entrepreneurs generate business growth through skills such as creativity, innovation, risktaking and the identification of opportunities. In addition, business management skills such as financial marketing, operational and human resource management are imperative for business success.

Survey results show, inter alia, relatively low educational skills, almost no formal business training prior to starting the business, unemployment as a major factor for starting business rather than the seizure of lucrative opportunities, and small average employment and investment. It seems, therefore, that the informal retail sector contributes considerably towards the generation of income to thousands of business owners but, in the majority of cases, lacks the growth dynamics characterised by successful entrepreneurship.

# **CASE STUDY - SUBMISSION ON THE TRADE & INVESTMENT DEVELOPMENT PROGRAMME FOR SMALL, MEDIUM AND MICRO ENTERPRISE**

## **ABSTRACT**

As part of the 1996 European Programme for Reconstruction and Development in the Republic of South Africa, the Delegation signed a Financing Agreement in July 1997 establishing the Trade and Investment Development Programme (TIDP) for Small, Medium and Micro Enterprises (SMMEs). The programme subsequently commenced implementation in October 1998 and this pilot phase has been successfully completed in line with the Financing Agreement which ended on the 19th February 2004.

### ***Overall Objective***

To contribute to the creation of a dynamic and successful Small, Medium and Micro Enterprise sector by facilitating an improvement in its national and international competitiveness, specifically for emerging entrepreneurs.

### ***Programme Purpose***

The programme purpose is to contribute to the creation of a dynamic and successful Small, Medium and Micro enterprise sector in South Africa by facilitating and its improvement in the national and international competitiveness. This is to be achieved through the provision of institutional and functional assistance in the development of relevant oriented human resource skills, production/marketing skills and the transfer of appropriate technology.

### ***Beneficiaries and Parties involved***

The entire SMME sector will benefit as a consequence of the overall improvement in the national and international competitiveness resulting from the links between the three components chosen and the institutional support given to the provision of services to the sector.

The expected beneficiaries being:-

Previously disadvantaged small and micro enterprises (mainly craft sector) who during the lifetime of the project have received training in the basic principles of international competitiveness for export.

Product specific groups of small to medium sized enterprises who during the lifetime of the project received hands on integrated technical assistance in all aspects of export development (mainly Auto-component suppliers).

Small and medium sized enterprises within specific product sectors who during the lifetime of the project received opportunities for upgrading technology through a programme of international partnerships instrument (mainly Auto-components Suppliers, Textiles and Clothing, Information Communication Technology (ICT), Chemicals and Plastics, Footware and Leather).

Through this case study we would like to review the TIDP, focusing mainly on the following sub-headings:

- Relevance and quality of design;
- Efficiency of implementation;
- Effectiveness;
- Impact;
- Potential sustainability.

## **GLOBALISATION AND ITS IMPACT ON ENTREPRENEURSHIP AND SMALL BUSINESS DEVELOPMENT IN SOUTH AFRICA – A SUCCESS CASE STUDY- THE NTSIKA'S TRADE AND INVESTMENT DEVELOPMENT PROGRAMME FOR SMMES' COMPETITIVENESS**

by Lefa Mallane - Chief Executive Officer

As part of the 1996 European Programme for Reconstruction and Development in the Republic of South Africa" the Delegation signed a Financing Agreement in July 1997 establishing the Trade and Investment Development Programme (TIDP) for Small, Medium and Micro Enterprises (SMME's). The programme subsequently commenced implementation in October 1998 and this pilot phase has been successfully completed inline with the Financing Agreement which ended on the 19th February 2004.

### **The expected beneficiaries being:**

Previously disadvantaged small and micro enterprises (mainly craft sector) who during the lifetime of the project have received training in the basic principles of international competitiveness for export.

Product specific groups of small to medium sized enterprises who during the lifetime of the project received hands on integrated technical assistance in all aspects of export development (mainly Auto-component suppliers).

Small and medium sized enterprises within specific product sectors who during the lifetime of the project received opportunities for upgrading technology through a programme of

international partnerships instrument (mainly Auto-component Suppliers, Textiles and Clothing, Information Communication Technology ICT, Chemicals and Plastics, Footwear and Leather).

Through this article we would like to continue the review of the TIDP forecasting mainly on the following sub-headings:

Relevance and quality of design; Efficiency of implementation to date; Efficiency of implementation to date; Effectiveness to date and Potential sustainability.

### **Relevance and quality of design.**

The overall objective of the Trade and Investment Development Programme (TIDP) is to facilitate an increase in small, medium and micro enterprises (SMME) output, employment and exports. It seeks to achieve this by improving the international competitiveness of SMMEs by providing export orientated human resource, production and marketing skills. The objectives of the TIDP are relevant to the SMME development strategy presented in the 'National Strategy for the Development and

### **DRAFT**

Promotion of Small Business' (DTI, 1995). The concept was also consistent with the Declaration of Intent' (1995) between South Africa (SA) and the EC which identified SMMEs as a priority area.

### **Efficiency of implementation to date.**

The Oct'02 monitoring mission reported that implementation had been delayed. By Oct'02 project activities were running behind schedule and only €3.8m had been spent, 44% of the €8.9m total. Causes of delay include the time taken to appoint the Project Management Unit (PMU), unfamiliarity with the complex and lengthy EU procedures, inadequate integration of the project into Ntsika, and the time taken to identify and establish the capacity of intermediary organisations (IOs) and service providers.

The speed of delivery of project activities has increased under the third and fourth annual work plan (AWP) and in many cases the original activity targets have been exceeded. As at Oct'3 the following results were achieved, in what is referred to as three tracks,

**Track 1:** 21 international competitiveness seminars; 1,784 entrepreneurs attended seminars; 34 export orientation courses delivered to 311 entrepreneurs; and intermediary organizations contracted to deliver training.

**Track 2:** 150 company audit completed; 123 SMME integrated technical assistance contracts completed and 27 intermediary organizations contracted to deliver the audits and integrated technical assistance.

**Track 3:** 38 overseas and domestic trade shows and fairs attended with groups on entrepreneurs. The delivery of project activities appears to be now well managed and

interviews with IO's and entrepreneurs indicate that the quality the service provided under the project are of good quality.

### **Effectiveness to date.**

The October 2003 EU Monitoring Mission reported that with the completion of AWP3 and part of AWP4 the effectiveness of the programme has improved since the Oct'02 report. A total of 150 enterprises (78 in Oct'02) have received company audits and a further 123 (52 in Oct'02) have benefited from specific technical support contracts. A total of 12 SMMEs have been visited during the two monitoring missions and most had clearly benefited from the TIDP and were either directly or indirectly exporting. These entrepreneurs had a positive view of the nature and quality of support provided by the TIDP. A positive side effect of the TIDP is awareness that increasingly SMMEs need to be internationally competitive on the domestic market, even if they don't export, due to trade liberalisation.

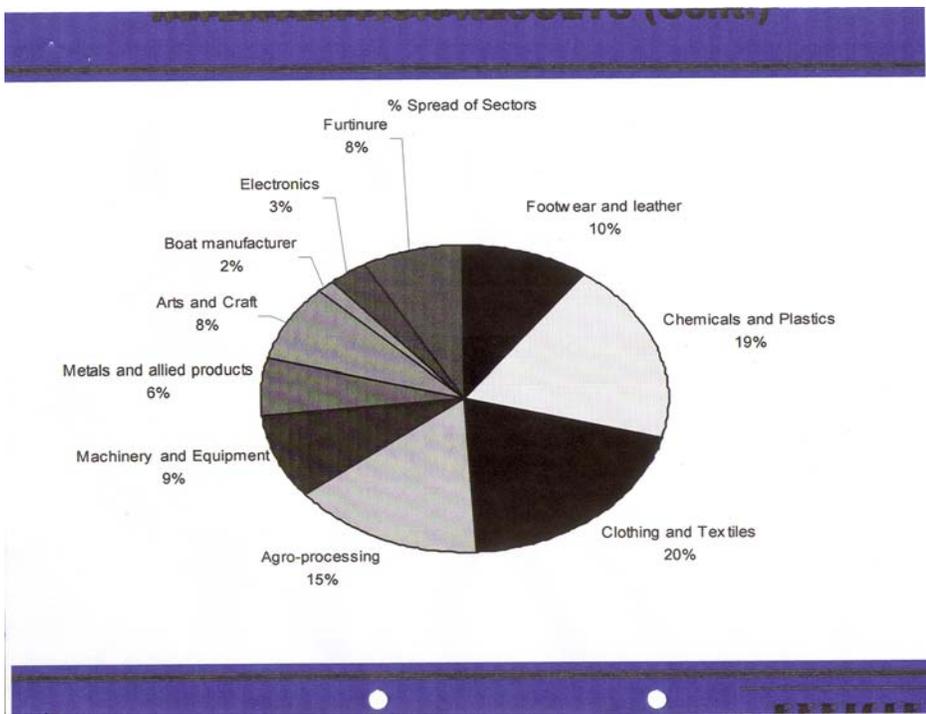

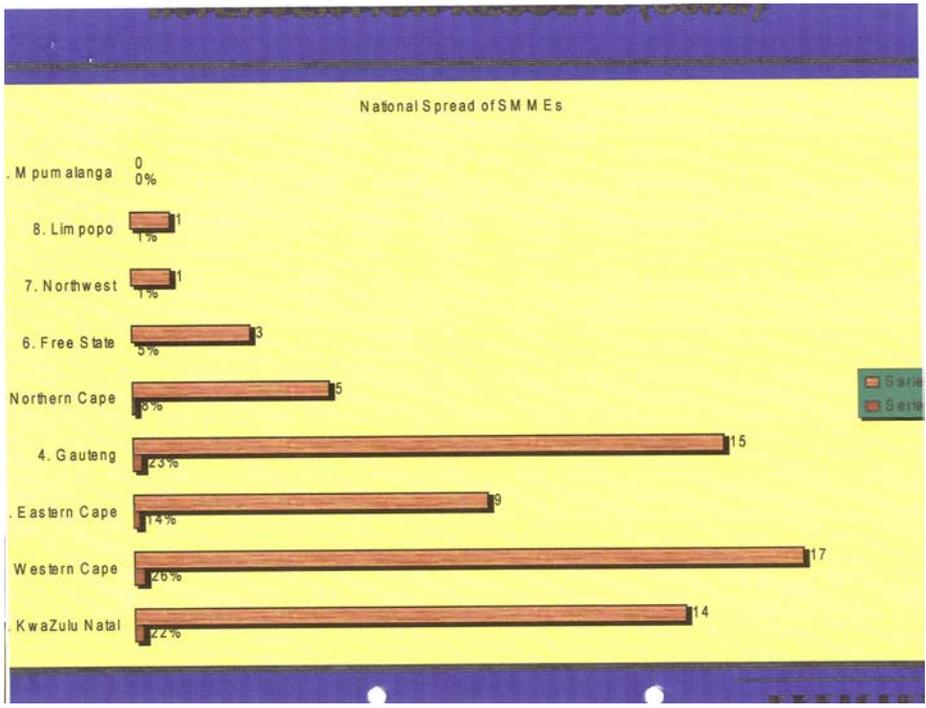

### **Impact to date**

Ntsika is currently in the process of developing an integrated database of SMME performance. Evaluation studies to assess the impact of each track have also been programmed under AWP4. An evaluation of Track 2: Product and Market Development has been completed. The study was of 65 enterprises from Track 2 found that 77% had recorded good business growth, 60% of these were not exporting and those that were, experienced small export growth. 15% experienced high export growth and 60% of these did not attribute growth to the TIDP.

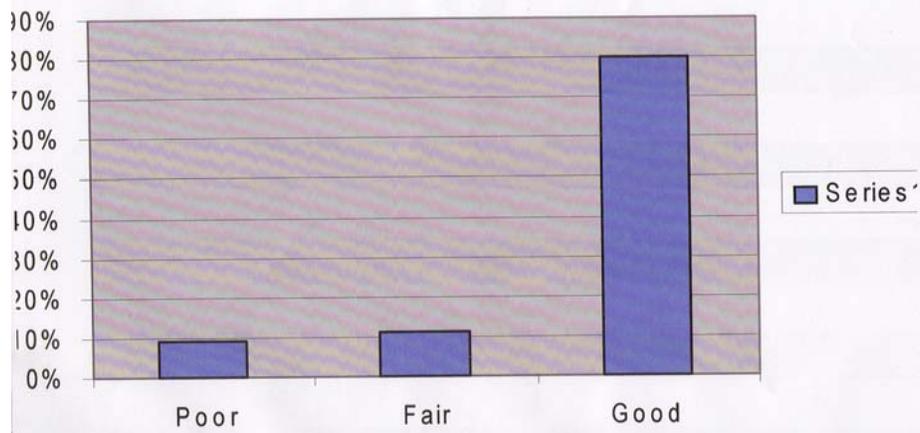

A comparable magnitude of impact was reported by Trade Point Pretoria (a TIDP 10) who estimate that 10-15% of Track 1 enterprises go on to export their outputs. The impact has been reduced by external factors recently due to the appreciation of the Rand which has made it increasingly difficult for SMMEs to export.

### **In Conclusion**

Ntsika receives R50m per year from the DTI and other sources, R28m for operating costs and R22m for project expenditure. TIDP expenditure under AWP4 is R25m, 33% of Ntsika's R75m turnover. In terms of sustainability, the important question is whether Ntsika will be able to secure the additional funding required to maintain the current level of activities and expenditure when the TIDP ends in Feb'04. However, in Ntsika has embedded the project into its existing management and institutional structure and has successfully strengthened its quality management procedures and established the TIDP as an integral part of Ntsika's core mandate and management structure. The dti has taken cognizance of the importance of the programme for the contribution to the creation of a dynamic and successful Small, Medium and Micro Enterprise sector by facilitating and improvement in its national and international competitiveness, specifically for emerging entrepreneurs.

## ABSTRACT

Sustainable Tourism Development has increasingly been the subject of study for over a decade. Even though governments and NGOs in developed and less developed countries are devising policies to stimulate sustained tourism activities as an income-generating sector, actions are still slow, mostly unknown and not well enforced. Traditionally establishing and promoting sustainable tourism has surged from initiatives from the private sector and interested citizens groups. Entrepreneurs, on the other hand, have mostly shown interests in building hotels, promoting activities involved in tourism development and reaping short-term benefits. There is a need for systematic planning and for establishing sustainable strategies across countries that provide long-term benefits to communities, countries, and the population as a whole.

This paper focuses on the impact sustainable tourism has on the economy, the level of awareness of the concept, the problems related to this lack of understanding, and the evaluation of the potential long-term benefits of adhering to the concept. Success stories across countries are analyzed and existent programs within the Caribbean perspective are examined. Anecdotal evidence is revised as well as historical, social and economical contexts within which sustainable tourism exists in any economy with its pros and cons. Empirical analysis focuses on a survey sent to hotel owners in Puerto Rico, on interviews and reports from tourism groups and hotel owners in the Dominican Republic, and in-depth interviews to tourism experts. Findings indicate that small firms face the challenges of a tourism economy roughly; they do not implement their businesses considering sustainability concerns. Most hotel owners and agents do not understand the concept of sustainability even though many pronounce adherence to eco-tourism. The paper concludes with directions for future policymaking and this study can contribute to research in entrepreneurship.

<sup>1</sup> The author thanks and recognizes the initial input of MBA student **Vanessa Marty-Altiery**, e-mail: [vanessa\\_marty@yahoo.com](mailto:vanessa_marty@yahoo.com)) of the Graduate school of Business Administration who implemented the initial survey and provided early literature on the subject. Likewise, recognition is given to graduate assistant, **Shirley Rodríguez Mari** for varied activities, including updating literature. The author profoundly thanks and recognizes the contribution of **Ryan A. Mann**, email: [rasmann6@yahoo.com](mailto:rasmann6@yahoo.com), Master student in Environmental Engineering at Humboldt State University who provided technical opinions on the subject.

**Key words:** Sustainability, environmental conservation and protection, community-based tourism, Ecotourism, ecological footprints

## INTRODUCTION

Tourism activities have become one of the worlds most rapidly growing and competitive industry. Statistics provided by the World Tourism Organization (WTO), the UNESCO, as well as those of particular governments and organizations reinforce opinions on tourism being a major income generating activity, a contributor to economic growth, in terms of the employment provided, and a source of foreign exchange both for developing (Centro America and the Caribbean) and developed countries (Spain, China and the United States). Even though the activity has proved to be relevant, the lack of control and laws enforcing resource usage, and the unwillingness of entrepreneurs to pass on opportunities, have often brought on problems that have gone beyond the control of the interested sectors, i.e. the countries, communities and the society and culture where the activities take place. Eagles, Haynes and McCool (2003) effectively indicate that the link between tourism and protecting the environment is as old as history, even though relatively complex and antagonist. Nonetheless, with education the juxtaposition as well as the multi sector support and long-term benefits will out weight short-term gains and anxieties.

From the standpoint of small, medium size (SMEs) as well as large organizations, tourism related activities have become a source of opportunities that have gone from local to global investment (the case of international firms investing in the Caribbean and multinational managing locally constructed infrastructure, i.e., the Hilton Hotels). Involvements in ST have provided local businesses and people mean to become self-sustainable. Yet, this same entrepreneurial activity has often been exploited so much that degradation of the environment has emerged, cultures have become degraded, negative social problems and cultural transformations have materialized. Problems with energy scarcity, among others, have intensified. Not least, other problems including deterioration of infrastructure including roads damaged from overuse, lower quality of life that often has profoundly affected locals, including rise in construction costs and diminished basic services. Ignoring sustainable tourism (ST)<sup>2</sup> as well as the opportunities that lie ahead due to applying its concepts could be costly (take the case of depleted mines, quick extraction of oil reserves without naming countries).

Within this framework, an examination of the laws, education, and environmental protection programs created in some countries demonstrate that adherence to sustenance programs. Concerted actions from all sectors will benefit the economy, quality of life, and even political stability on the region, and effect measured by investors and community interests have found in tourism, environmental conservation and its related activities (cultural, entertainment tours, mountain climbing, rafting, sales of arts and crafts, native cuisine, among others) their self-employment and sustenance. Studies have shown that sustainable programs cannot exist either without the support of communities<sup>3</sup> (Laitakari 2003, Torres 2004, Canada Jamaica

---

<sup>2</sup> ST is synonymous to sustainable tourism.

<sup>3</sup> Most studies and agreements of sustainability, including the Sustainable Model for Arctic Tourism (SMART) includes this principle. Proceedings from the Artic Ecotourism Conference, 2002.

2004, Barnaby & McDonald, 2003) nor without studies that analyze the effect of human consumption of goods and services. It is proved that the environment has limited capacity to supply these inputs, thus it is the community's responsibility to do it. On an entrepreneurial angle, studies by Perez (2001), as well as numerous publications illustrate that because of financial constraints, credit availability and risks factor, tourism is seen as a major investment activity for local entrepreneurs and the young adults.

This paper focuses first on analyzing the economic impact of responsible sustainable tourism, conservation and eco tourism practices have in countries and communities. Likewise, emphasis is placed on evaluating the benefits the linkages between tourism and bio-cultural diversity, emphasizing the roll that a well planned and sustained tourism industry with its inherent activities provide to, firms, countries and communities. Second, the paper revises studies on the pros and cons of sustainable or responsible tourism, and evaluates the tourism practices, including problems, in different countries<sup>4</sup>. Third, the study analyzes results of the survey and interviews implemented in Puerto Rico and Dominican Republic. Fourth, based on the results of the study, the revision of successful cases, and the position of the author, sustainable tourism strategies are recommended with emphasis in the Caribbean context. Lastly, policy recommendations will be delineated based on the constraints and environment within which business operate. The grounds under which these papers are based are:

- A) Countries that adhere to sound practices of sustainability have shown tremendous improvement in economic terms, in quality of life, and the effect appears to be sustained through longer periods in comparison to countries that opt for the opposite actions.
- B) If responsible sectors, including government, community groups and environmental experts can enact and implement protective laws and disseminate their contents, local communities, investors, and visitors will embrace them.
- C) Tourism activities should involve community support, the establishment of support loans, supervised licenses, taxation and entrance fees that encourage locals to invest at lower risks levels. In the long-term, local participation and the income generated by these activities will assist in the replacement of investments in infrastructure as well as the maintenance of sites that will be depleted because of usage.
- D) If local communities and entrepreneurs are educated and laws clearly specified, the margins of errors accepted in the protection of country resources will diminish. Thus, potential erosion of source of income will be avoided.
- E) Likewise, if private foundations are established aside the control of governmental politics, long-term directives from established and proven organizations can be delineated, grants could be sought and alliances conducive to reinforce sustenance can be created.
- F) If studies on environmental impact and assessment are correctly implemented before constructing sites, and ecological footprints studies are done, environmental protection and responsible practices will emerge. With the presentation of these queries, I will proceed to defend my position.

---

# SCOPE

Definitions are presented initially to establish a common ground. This section is followed by arguments and analysis seeking to defend the authors' position. The paper contains three major sections: Section one presents the introduction, including objectives and the premises underlying the study. Section two and main body of the report, embraces background, definitions of the terms used, related literature review, economic impact of tourism and the search for sustainability, impact of poorly implementing laws and education, existent supporting programs, laws and organizations protecting the environment, and a description of the supporting programs protecting the environment and organizations to which Caribbean hotels and inns belong to. Section three illustrates the sustainability benefits, and countries' best practices including the entrepreneurial and firm perspective. Most importantly, results from local and regional study findings are presented as well as the methodology underlying this study, its results, analysis, conclusions and recommendations.

## BODY OF THE REPORT

### Part two.

#### **What is sustainable tourism and how it contrasts with ecotourism or plain tourism?**

Sustainable tourism consists and depends on the existence and efficient management and conservation of quality natural environments which themselves (Koeman, 2003, Neto 2003, Henna & Wells 2004) depend on human environments, resources and cultures. The World Tourism Organization (WTO, 2002)<sup>5</sup> defines it as the development that meets the needs of present tourists and host regions while protecting and enhancing opportunity for the future. In addition, WTO, experts generally recognize that sustainable tourism leads the management of resources towards economic, social and aesthetic needs that necessitate to be fulfilled while preserving cultural integrity, essential ecological processes, biological diversity, and life support systems. Thus, sustainability aims to improve standards and quality of life, safeguard culture and resources while satisfying the ever-increasing demand for tourism services. Even though the concept is often equated to eco-tourism, it means more. It involves thoughtfulness of and to host people, to communities, cultures, customs, lifestyles, and social and economic systems.

For clarification purposes, the public perceives a common interchangeability between the terms; often what is known is ecotourism and tourism. Thus, tourism is understood as the practice of travel for pleasure (American Heritage Dictionary of the English Language, 2000)<sup>6</sup> while eco-tourism (Srinivas, 2003) is a nature-based type of tourism that involves responsible travel to natural areas where flora, fauna and cultural heritage are the main attraction, while sustaining the well being of local persons (Srinivas, 1999, 2003). Moreover, the sustainability

---

<sup>5</sup> The definitions provided are now under revision according to the 2004 accord publication.

<sup>6</sup> Definition was extracted from [www.yourdictionary.com](http://www.yourdictionary.com).

concept is based on optimization and non-degradation of resources and embraces all segments of the industry as well as on implementing directives and criterion that aims at reducing negative environmental impacts, particularly the use of non-renewable resources.

Summing up, sustainable tourism (ST) is not plain tourism nor eco tourism; it embraces numerous facets and studies: McElroy & Albuquerque, 1998) saw results in terms of economic impact (contribution to GDP and employment), social impact (visitors per host population), or on environmental pressure and impacts of any decision (hotel rooms per unit of land area). Ultimately, any sustainable philosophy has to include analyzing how to improve local economic and sustainable development, use the lowest possible consumption of non-renewable resources, while sustaining the well being of local people, and stimulating local ownership. Thus, ST should enhance the material life of local communities, without causing a loss of traditional employment systems, acculturation (Koeman, 2003) or social disruption (Eagles, 2003). For the benefit of sustainability, countries and entrepreneurs, as well as policy makers should understand the difference between eco-tourism and sustainable tourism and pursue it. In theory, governments seek growth and prosperity for their countries including employment creation and entrepreneurs aim at achieving personal goals of wealth or self-sustenance. Taking advantages of opportunities created in the tourism industry, understanding and implementing sustainable tourism strategies will be the means to their ends. Sustainability in essence calls for economic and development opportunities as well as the impact of tourism growth on sustainable development, transportation, cultural and environmental, social and economic aspects.

Sustainable tourism embraces all segments of the industry, establishes guidelines and criteria while reducing environmental impacts, specially the use of non-renewable resources, establishing benchmarks. Studies by the WTO (2002:17) reported on of good practices in sustainable development of ecotourism based on 55 case studies from 39 countries. Other guidelines are offered in the 1995 agenda 21 for sustainable practices in tourism (WT forum on economic development, 1999; United Nations, 1992). These practices published by WTO, CAST, UN can be used as guidelines for creating equilibrium between nature and long-term gains and as theoretical and practical guide (Frangialli, 1998) for manage developers and governments. Likewise, an ethic code on tourism was also published in 1999, an excellent guide for all. Among the most relevant agreements, practices and publications, the most common suggestions are:

- Tourism offers considerable employment opportunities for unskilled labor, rural to urban migrants and lower-income women.
- There are considerable linkages with the informal sector, which could generate positive multiplier effects to poorer groups that rely on that sector for their livelihoods.
- Tourism tends to be heavily based upon the preservation of natural capital such as, wildlife and scenery and cultural heritage, which are often assets that some of the poor have, even if they have no financial resources.

- Economic footprint<sup>7</sup> studies have to be implemented if the world's people want to continue with quality living conditions (Wackernagel, Mathis & Rees, 2003). Ensure that nature's productivity isn't used more quickly than it can be renewed, and that waste isn't discharged more quickly than nature can absorb it.
- For any sustainable program to work the local community should be involved (Quebec,2002) to diminish the risks of any investment, to promote and preserve local cultures, lifestyles and values while ensuring quality and safety in all business operations.

## **Economic impact of tourism and the search for sustainability**

Studies published by the Convention on Biological Diversity (2003); inform that in terms of economic benefits, tourism constitutes an opportunity for economic development, diversification and growth. In developing countries, according to the same study, the industry constitutes 1.5% of the world GNP while worldwide ST signifies a 6% contribution to GDP, and 11.4% of consumer spending (Info-sheets Ecotourism, 2003). In Puerto Rico, tourism has contributed respectively to 4% of the Gross National Product (Planning Board 2001, 2002 and the Tourism Company 1999-2002) and the sector occupied the 4<sup>th</sup> position in income generation within the service sector in 2002. The numbers have not grown as expected since the island offers expensive tourism, if compared to other islands. Other countries inform of higher growth. Studies by Henna and Wells (2003) showed and increase in the marine tourism is enormous. Around 100 million tourists visit the Caribbean annually, contributing between 40 to 70 per cent of the GNP of some countries in the region. To understand the impact, take the following example. It is estimated that only divers from the US spend an estimated \$286 million a year in the Caribbean and Hawaii. Statistics show that tourism visitor's expenditures worldwide reached more than US \$400 billions in 2002 and will increase to near US\$2 trillions in 2020 (Cateora et al, 1999). The same source specifies that tourism industry generate close to 212 million jobs either directly or indirectly. Furthermore, the former reports World Trade Forum (WTF) which projects that for 2005 the employment generation will increase to 338 million jobs and will generate US \$7 trillions. United Nations (April, 2003) based on the significance of tourism and the potentiality that local firms desire credit has declared 2005 the year of the micro credit. The Organization of American States (OAS, 1997) indicates that the future of tourism depends on the development of a harmonious way with the environment and culture.

The sector presents a significant potential for obtaining funds and realizing benefits while conserving agro-industry, cultural heritage, biological diversity and sustainable use of its components (Srinivas, 2004), particularly when local communities are directly involved with operators and in many projects. Reports by the World Tourism Organization, illustrate that the tourism industry generates substantial economic benefits to both host countries and tourists' home countries. Tourism represents 31.1 per cent of the Gross Domestic Product of the Caribbean region and provides three million jobs approximately (Caribbean Alliance for Sustainable Tourism, CAST, 2003). Ostensibly, tourism is a source of income, employment and wealth in many countries beyond the Caribbean (Denmark, China, Spain, France, the

---

<sup>7</sup> The ecological footprint is an accounting tool for ecological resources. Categories of human consumption are translated into areas of productive land required to provide resources and assimilate waste products. The ecological footprint is a measure of how sustainable our life-styles are. "Ecological Footprints" are a tool for measuring and communicating the environmental impacts of human activity on the environment, and the sustainability of that activity.

United Kingdom, Australia and Africa. As the economy becomes more global, airlines form larger alliances, the trend to increased tourism and ecotourism will prolong with foremost impact on developed, and less developed countries. From the standpoint of investment and entrepreneurship, this is very important. Entrepreneurs need to ensure the balance between the tourism developments and the ecosystem.

### **Impact of poorly implementing laws on sustainable development and education programs on sustainability: pros and cons: general and entrepreneurial perspective.**

Increased travel, will no doubt convey negative impacts to the environment in spite despite the economic significance tourism represents. Developing countries high levels of unemployment, lower income levels, as well as the need to survive, have impelled locals to enter quick tourism programs including building unplanned inns, hotels and “paradores”. Often this implies expanding owners’ home to obtain some income. Similarly, small stores are located anywhere; investors establish souvenirs shops sell effects, including seashells, arts and crafts built from protected species. These actions propelled by a need for self-support, lack of education and access to financing, instills taking advantage of what is available. This imminent situation purports unplanned projects that often abuse the environment.

On the ecological side, contractors remove sand from beaches ludicrously. Licenses are granted to build apartments and hotels too close to the beaches or on the sand, corals are damaged (Weil and Ramirez, 2004)<sup>8</sup> and, boats and divers extract forbidden materials while animals fall prey of hunters. The deterioration that boats, divers, and catchers do to the reefs is intense. A multiplicity of factors including eutrophication, bleaching, anchoring, and increasing coastal construction increase the need to establish counteracting stress sources. Examples of these problems exist in all the Caribbean islands. Moreover, the population is often inhibited from accessing or visiting their beaches thus making them feel more rejection towards tourism (public access closure, an event that is happening in Dominican Republic and Puerto Rico, with hotels and apartments constructed by individuals in political or economic favor).

Dilapidated facilities. In search for richness, large numbers of facilities are built, but when the economy downturns, the same sites are left to disintegrate uncared thus provoking unwanted and damaging effects to the ambiance. Even worse, often because of greed, lack of national pride or plain stupidity actions are taken that damage the environment, like predating protected species, or burying toxics in the land or oceans. A report written by a columnist (Torres, 2004) quoting the supervisor of the Caribbean National Forest precisely attests to the environmental damage caused by garbage and the potential cost of cleaning it.<sup>9</sup> Specialists have reported ample abuse to protected areas, mangles, corals, protected turtles, including incoming from waste diverted and thrown into waters.

---

<sup>8</sup> The author’s conclusions were presented at a conference held in Mayagüez, PR April 13, 2004 and published on the University website and the “El Nuevo Día” newspaper April w4, 2004.

<sup>9</sup> An article written by Rolando Hugo Pabón, “el Nuevo Día” a reputable newspaper in Puerto Rico. April 21, 2004.

In the socioeconomic side, most countries tax incentives are designed to attract foreign investors with little space for locals, creating an unbalance in investment. Mostly what tend to exist are tax credits and low costs loans for buyers settling in protected areas; this is positive for firms and localism since it encourages turning old and often dilapidated historical homes into bed and breakfast, with unparalleled results. Examples exist in France, United States, Spain, Puerto Rico, and in some other islands in the Caribbean.

From an entrepreneurial angle, while small inns require smaller investment and risks than most enterprises, locals can only finance their businesses either via banks or by privately enabling their participation in the economy. This investment style provides only self-employment and inhibits the capability of growing. On the negative side, structures with or without permits often discharge wastes into the ocean, do not use natural energy system allows tenants to use more energy and water than necessary in detriment of locals needs. Moreover, offer of low salaries to local workers at slave hours with the ensuing negative social effects, including social ills with its ominous consequences. This goes on because of non-existent labor laws and government insufficient sources of employment that force laborers to accept what they can. Not least, outsourcing services often do not embrace locals over foreign under equal circumstances.

Even though investments in tourism provide large profits and attract foreign investors, income is mostly repatriated rather than being reinvested in the community. In the Eastern Caribbean, for instance, it has been estimated that only 18 cents of every tourist dollar remains in the islands. In Dominican Republic, the average monthly salary was RD 3000 pesos per month in 2003 (equivalent to less than \$100.00 dollars down from about \$150 in 2002. In Puerto Rico, minimum salaries are guaranteed yet in other islands; often employers pay low salaries, no retirement benefits nor insurance.

Damage to the ecosystem. On the negative side, the rapid growth of the tourism in the Caribbean substantiates a destructive (Heilprin, 2004) impact to the ecosystem (ex. sandy beaches and blue water), a tremendous threat. Some areas have shown already environmental and socio-cultural impact in many regions. Coral reefs, which are particularly vulnerable to human and machine impact, are damaged or extracted; reefs in more than 50 countries have suffered some form of tourist damage (McElroy, 1999). A counterbalance will be requiring technical feasibility studies. WTO (2003) reports a problem case that turned into an exemplary solution case, the implemented in the island of Barbados. Damages to their ecosystem were so profound that they had to reattach physically damaged corals to their original location with adhesives, a system proven technically and biologically feasible<sup>10</sup>. Definitely, although an individual diver or snorkeler may have minimum impact compared to other forms of reef damage, the cumulative effect of divers on a reef could be considerable. McElroy (1999) in his studies defending coral protection found that large-scale beach resorts and marinas could disturb wetland habitats; destabilize beach vegetation and cause coastal erosion. Moreover, he stated, "When reef and sand mining are added, low-lying communities become more vulnerable to storm surges from the sea and to salt water intrusion".

---

<sup>10</sup> Information is extracted on report from the Ministry of the Environment Energy and Natural Resources of Barbados. University of the West Indies, Cave Hill Campus.

Neto (2003) reported that there are two main areas of environmental impact of tourism: first, pressure on natural resources and second damage to ecosystem. In coastal areas, such as the Caribbean, tourism development includes hotel, airport, and road construction; however, with the development of these activities their people need to be concern about beach erosion, water pollution, land and social degradation. In the particular case of the Caribbean, studies by the UNESCO have shown that in spite of the economic downturns, the exchange value of the euro and dollar has benefited the region amply. Tourism reached its peak in 2004. Reports and statistics by government and private entities estimate major growth. The negative social impact of increased tourism increases the need to institute more strict laws, disseminate, and educate and alert the population on its implementation of sustainable programs.

Tourism provides Third World and cash-starved developing countries a market for their sandy beaches and coral reefs to sun-seeking visitors, the enormous growth in the volume of tourists have changed people's activities and influenced their culture. Actions like windsurfing, snorkeling, sport fishing, whale-watching, sailing and scuba diving provide locals with potential incomes when building and renting premises, and providing basic services to visiting groups in a small scale. Ultimately, these activities cause strong damage to the environment. Even boats driven on diesel should be substituted by bio-diesel. Erosion and deterioration of infrastructure is intense and irreplaceable. Entrance fees, taxes, and high fees to enter renowned places are inexistent in most emerging countries. Besides, developing countries do not have sufficient fees nor possess the income to restore their historical sites. Emerging nations should following examples from China and Vietnam Tourism Bureau, which have established high cost for their visas as an income alternative.

Commonly no assessment and impact analysis including the benefits of long-term sustainability versus short-term profitability of any project exist. When and uncontrolled industry like tourism growth rapidly occur some kind of damage to ecosystem like pollution by untreated sewage, solid waste, contamination of marine waters and coastal areas, high energy consumption (hotels and transportation), air and noise pollution, damage of the wildlife habitats. One clear state example of it is the tour boat operators in the Caribbean that feed sharks to ensure that they remain in tourist areas. Another example is the whale watching boat crews around the world that pursues whales and dolphins and even encourages petting, which tends to alter the animal's feeding and behavior (Mastny 2001). The ecosystem impact is considerable.

## **Supporting programs, laws and organizations protecting the environment**

On the matter of laws, it is not relevant just to enact laws, but to make sure interested sectors and the population knows and respects them. In the particular case of Puerto Rico, laws exist but not too many. In particular, Law 340 was created in 1998<sup>11</sup> to protect and stimulate eco tourism, though it is quite unknown. This law seeks to promote sustainable tourism activities including environmental protection. Power to implement laws is starting now. Similarly, in Dominican Republic laws on the matter exist since 1942<sup>12</sup>. Even though law 67 enacted in 1974 is more self-explanatory and complete.

---

<sup>11</sup> In Lex-Juris, Puerto Rico, Law 340 from 1998. See at <http://www.lexjuris.com/LEXLEX/ILEY1998/lex98340.htm>

<sup>12</sup> Translated from "la historia y la biodiversidad bajo amenaza" protecting Del Este Park. At [ellistindiario.com](http://ellistindiario.com), a major Dominican Republic Newspaper.

In general, most Caribbean Islands follow UN (2003) and UNESCO's guidelines in ecotourism principles. The problem lies with governmental implementation and lack of hired trained technicians. There is a broad lack of knowledge of the law, its breath and less how to implement it. Abuses to the environment are common and often from those who are supposed to protect natural resources and its citizenship. The same happens in most islands in the Caribbean. Fortunately, a new wave of young have started to study environmental sciences, have opened their eyes to the damaging effects that old habits have on the environment and even better are returning home to invest cautiously considering culture and resources. If the trend continues, the future looks promising. Organizations like the Environmental Division of the Caribbean Hotel Association (CAST) and other groups exist for the same purpose. Yet, their actions are mostly geared at certification, not much more. No propensity is seen into building environmentally friendly hotels that use less energy, use solar systems, opens up into the environment, recycles water, installs tourist controlled water systems and electricity.

In the Caribbean, laws are not enacted adequately and policies are not delineated towards conservation, regardless of the government in power. Since no development foundation tends to exist, laws should be created and provide for their formation; once this is established proceeds should be invested in the communities whereas the actions take place. As such, deterioration to infrastructure and social ills can be prevented through planned systems and education. The Tourism Foundation of the city of New York provides a significant example. The organization commission for tourism has created guidelines for a turnaround that in spite of economical downturns and crisis of Sept 11<sup>th</sup>, has reestablished the city as the tourism Mecca of the USA. Criminality, citizen's interest, business participations and private and governmental actions brought the city back to life and even increased its attractiveness. Utilization of limited resources in an unsound manner kills the hen that lays the eggs.

Studies by Neto (2003) found that sustainable tourism aims to go beyond the increased community participation goal of ecotourism. Sustainability should include: Improving access to the economic benefits of tourism by expanding employment and business opportunities for the poor and providing adequate training. They should also introducing measures to deal with the social and environmental impact of tourism development, and establish policy reform by enhancing the participation of the poor and locals in planning, development and management of tourism activities pertinent to them.

In the continental USA, this situation was seen with laws oriented at protecting Indian rights. Indians rights were recognized and control of resources was passed on to them. Whichever opinion one might have of the effect of these actions an economic control in their society, their economy and quality of life improved. This appears to be the case of local tribes in Alaska and Canada.

As world resources become scarcer and peoples of diverse cultures and customs scavenge the world, groups and people will become more interested in the environment and with it, many organizations will be created. This natural process will stimulate private citizens to entice governments and countries to establish laws about environmental protection and education programs (Elides, 2003). Organizations have surged around the islands and worldwide with this intent. Caribbean Hotel Association Environmental Committee, The Caribbean Alliance for Sustainable Tourism (CAST), Green Globe 21, International Hotel Environment Initiative (IHEI), United Nations, Caribbean Epidemiology Center, Governing

Council, World Tourism Organization, and United States Agency for International Development and United Nations Environment Program and INSULA, are some of them.

According to studies published by the Caribbean Alliance for Sustainable Tourism (CAST, January 22, 2003), "The Caribbean is the region that holds the highest number of Green Globe certified hotels worldwide". The countries that are certified by Green Globe are Jamaica, Barbados, Aruba, St. Lucia, Dominican Republic, Antigua, Bahamas and Riviera Maya. Locally, even though (CAST) main office of CAST is in Puerto Rico, this city is not certified by any organization. Recently, though, the local government started talking about the issue of sustainability.

In the case of Dominican Republic, Jamaica, Barbados, and Cuba the situation differs. Cuba has created laws and within it, the Tourism Bureau has developed communities whereas well-sustained development exists. In the center of Dominican Republic, environmental laws and credits have promoted building hotels in the area of Jarabacoa , Constanza, Jarabacoa near the Duarte Peak, and in the Samaná Península a few environmentally friendly hotels exist without TV, with controlled water systems and solar light. Jamaica, and Cuba efforts in this direction are starting to show fruit.

## **Benefits of sustainable tourism.**

Sustainability teaching necessarily has to be community based to obtain the respect and participation of the community and the preservation of values and culture, including paying local taxes and buying local goods and services. Quality tourism and eco tourism programs benefits residents since travel business requires employing and training local peoples, buying local supplies, and use local services. In addition, if networks are created among stakeholders & include planning, good host safety issues, and policies, residents will learn how to deal with foreign expectations even if they differ from their own. Moreover, it is important to notice that communities measure tourism success not by sheer numbers of visitors, but by length of stay, money spent, and quality of experience.

Summarizing. From an economic perspective, there are many benefits for sustained tourism. Tourism revenues raise local perceived value of assets because travelers seek out businesses that emphasize the character of the locale in terms of architecture, cuisine, heritage, aesthetics, and ecology. Stakeholders anticipate development pressures and businesses cooperate to sustain natural habitats, heritage sites, scenic appeal, and local culture. In the environmentally sustainable concept, travelers are aware of and favor businesses that minimize pollution, waste, energy consumption, water usage, landscaping chemicals, and unnecessary nighttime lighting (as is the case of Tikal's eco-tourist hotels in Central America). Travelers and foreign visitors learn how to help sustain local character while deepening their own travel experiences. Also, visitors learn about and observe local etiquette, including using at least a few courtesy words in the local language. Satisfied, excited visitors bring new knowledge home and send friends off to experience the same thing - which provides continuing business for the destination.

### **Section three. Example of good sustainable practices**

Costa Rica is an excellent example where sustainable tourism has been implemented for over 15 years. People are very proud of their resources and care for them, government has legislated to protect the environment and has commonly established competitive and approved costs of services. The ambiance and security offered by the country has positioned them in an envious competitive setting when compared to others in the region. Likewise, is the case of Galapagos Islands, in Ecuador, of Machu-Pichu in Peru, Belize, and Cartagena de Indias in Colombia<sup>13</sup>. Since laws were enacted and recognition was provided by worldwide-recognized organizations like the UNESCO, locals, including tour agencies, guides (mostly) and police, have been continuously educated into how to protect their resources and tender optimum service. Additionally, there are programs and instructions for visits to sites, schedules for opening and closing the sites, how to dispose of garbage, etc, with few exceptions, thus control of all aspects is predetermined. Moreover, advertising has been centralized and control of activities has been relegated to associations authorized to implement laws and policies.

In Cuba, considering the internal and external economic constraints, sustainable tourism practices have been promoted effectively attracting large number of visitors and income. Places like Old Havana, Sierra del Rosario, Las terrazas, Viñales Valley and Varadero, have been developed and are sustained with strong consideration to the environment. In Puerto Rico and the Dominican Republic as well as in Barbados, even though limited efforts exist, certain areas are promoted and established under sustainable criteria. In the particular case of Puerto Rico, the island is initiating the implementation of running the Blue Flag pilot phase (CAST, 2003), implying that the Caribbean beach criteria are being tested and implemented at selected pilot beaches in the region. Hence, the National park “El Yunque” has built a hotel on sustainability. A community in the center of the island is also developed within sustainable guidelines. Likewise, certain groups including “manatees” protection programs have been in existence for over 10 years with excellent results.

Several other countries are running excellent sustainable programs including Jamaica, Dominican Republic, Barbados, and the Bahamas<sup>14</sup>. In Barbados coral reefs (Miller, 2003) protection is a main goal. In the Dominican Republic, hotels in the center of the island already follow WTO directives in a limited manner. Tree planting, reefs and whale protection as well as hotels construction are strictly supervised. The problem of enforcing laws lies with the governments in power and vested interests. In Jamaica, programs have been implemented with limited results (Canada/Jamaica, 2004). However, an effort is underway to integrate all sectors in the aim to sustainability and to seek collaboration between ministries.

In Puerto Rico, successful strategies are seen around the El Yunque Rain Forest there is also a reputable hotel based in sustainability. Likewise, in the center of the island, a few solar homes are operating efficiently. There is hope that these examples can replicate exponentially. Yet, precisely this is what is sought after, sustainability that includes information on history, activities involving cultural programs as well as visits to natural sites.

---

<sup>13</sup> The experiences presented are based on the author’s observation and travels as well as on material read in general publications.

<sup>14</sup> Caribbean Blue Flag beach cover 4 major aspects: Water Quality, Environmental Education and Information, Environmental Management, Safety and Services

Examples are not common but some excellent ones exist. In other islands, per example the center of the Dominican Republic

A growing demand exists for sound environmental management from tourist, locals, and even some governments. A leading US diving magazine for example found that the most important criterion for choosing a diving holiday was the quality of the diving which far out- weighed other factors including price. Henna and Wells (2003) reported of a 1991 survey at Bonaire Marine Park in the Netherlands Antilles, one of the top Caribbean reef diving sites, and found that over 90 per cent of visiting divers were willing to pay a park management fee. As a result, a fee of \$10 per visitor was introduced a year later. Calculate the income with about 18,000 divers visiting per year. Results from these strategies have been extraordinary and the demonstrated concern for the area, its image, and reputation has grown tremendously as well as the influx of tourists. These concerted strategies and actions encourage foreign and local investment, to take advantage of opportunities, diminish risks, and increases the probability of funding via ventures, international agencies and banks, while increasing the potentiality of larger and more secure income sources of income.

### **Section three. Local study findings: methodology, results and analysis**

The study was designed first based on a revision of secondary data including renowned organizations reports, existent laws, newspapers articles and peer reviewed publications, among others. Second, a primary search for information was designed focusing on a survey, phone and direct interviews to hotel owners, experts on sustainability and tourism. The study was based on the pre-emptive premise that though hotel activities are implemented in an excellent manner in the Caribbean region, hotels and developers do not understand nor implement the concept of sustainability.

Initial sample selection was at random. Later a judgmental sample was used while the population was selected conveniently. Respondent's owners were chosen based on the premises location and nearness to natural habitats. Results of the study was based mostly on his survey designed and faxed to 25 well-established hotels in Puerto Rico, and in 8 phone interviews in Dominican Republic. Hotels were selected at random based on location and nearness to natural resources. Thirteen firms among hotels and "Paradores" or Inns responded. Questions were clarified by phone while urging hotels to provide prompt and accurate replies. Hotels were located island wide providing a representative sample of the population. Responses were verified and counterchecked by phone.

A) Responses regarding the meaning of sustainable tourism were negative.

Neither of the respondents could explain what the concept meant nor how this could be implemented. However, all owners and administrators responded that they ensured that their customer's wishes were satisfied and, that, in addition, they did practice limited ecotourism. Probe of their achievement is repeated visits from the same clients throughout many years and extensive word of mouth advertising. In addition, knowledge of sustainability was found to be weak at government levels as well; this could be due to government directors being changed frequently with little impact and no follow up activities. This lack of knowledge hamper the dissemination and potential creation of activities oriented towards this aim. Why this lack of interest on such a common subject? Potentially, a reply could rest on the fact that

hotel developer's aim mostly at providing basic services; small investors finance operations privately and that investment in advertising is low. Lately websites are used extensively.

Interviews and visits to hotels in the Dominican Republic showed a general knowledge of the subject but limited implementation. Maybe awareness exists because of the urgent need the population has to generate income and because most hotels owners interviewed are located outside metro areas. As a result and due to limited size of businesses and the investment factor, safe sustainable activities have been formed. To reverse the trend, it is recommended though that educational programs be established to increase the knowledge of sustainability, to motivate locals to care more for its resources.

B) Overall, results show that most "paradores" owners have small premises. On the average 15% had less than 10 employees, 23% between 10-25, 39% between 25-50 employees and 23% more than 50 employees. It appears that other small Inns owners encompass the same demographics. In terms of the profile, most owners tend to be around 36-45 years of age (30%) with 23% being 56 years old and older. Apparently, older entrepreneurs have entered the hotel industry as a second career or to provide employment for their children and relatives. Very few owners (15%) tend to be between the 18-34 ranges. A potential explanation is the lack of capital and proven experience. Investments by a younger age group could be positive. Potentially this sector is prone to acquire more education and to take risks.

In terms of education, the majority of interviewed (39%) had university degree followed by 23% possessing associate degrees. This is consonant to any studies done in the Island (Hamilton, 2003) whereas a generally well-educated entrepreneurial population exists. Contrary to these findings, in other islands in the Caribbean, at "Paradores" and Inns levels education is lower. Higher levels are found at higher investments sectors and in manufacturing. Results indicating high levels of education, could mean that a well develop sustainable program with precise guidelines could be understood.

C) Regarding motivation to initiate their ventures, first (61.5%) started their hotels because of a need for personal accomplishments, and second to be their own boss (38.5%). Economic situation (8%) as well as freedom and independence (23%) brought lower responses. Apparently, there is a different trend elsewhere. Informal studies in DR and other islands in the Caribbean have shown that businesses are formed mostly for economic reasons and independence jointly to personal accomplishments.

D) Findings also show that average initial investment in "Paradores" and Inns were smaller than US\$100,000 (31%) and between US\$100-150,000 (31%). In addition, the average annual billing of the ventures was over US\$1 million. Of course, none of these businesses could not be built today with that amount, it would cost much more. In comparison to other islands, local costs of investment in facilities are terribly high and the income exorbitant in terms of the services provided. Most Inns in the Caribbean are made of a combination of wood and cement, the owner typically resides in-house and income is not stable thus, increasing investment risks. To counterbalance the non-sustainability concepts, in general, local and foreign tourists prefer major hotels with air conditioning and all services. As such, natural ventilation, water controls and hourly controlled energy provisions are difficult to implement.

E) Opinions on entrepreneurs and SMEs perception of risks as well as the problems confronted were also requested. Owners confront mostly environmental risks like hurricanes and floods; though these are preventable, commonly owners report losses to Federal Emergency Agencies (including FEMA) since they obviate insurance because of its high costs. Other problems often confronted include problems with enforced government laws and directives, health issues, personnel costs, licenses and permits and accessing funds (Hamilton, 2002, 2003). A lesser though rather important problem is infrastructure development, finding reliable employees and advertising and promotion costs. Most owners rely on word of mouth and on references for customers to attract clients. Lately, with the advent of the web technology, a large number is using this media. In addition, during the last few years the government initiated advertising campaigns to support the sector.

## CONCLUSIONS

Summarizing. The profile of entrepreneurs tied to the tourism industry in Puerto Rico does not differ significantly with those of other Caribbean islands in terms of their profile, knowledge, interests and aims. Differences are minor and could easily be diminished with efforts from local leaders and the entrepreneurs. The business practices, risks and challenges faced by local firms as well as others in the Caribbean do not differ significantly from the existent for SMEs in other islands, except on the size of investment and access to capital. Problems are related to difficulties in hiring reliable personnel and infrastructure costs. The level of awareness of sustainability is low thus requiring varied actions. Examining the Caribbean perspective place Puerto Rico at a disadvantage in terms of adoption and implementation of sustenance. The case of Dominican Republic is less profound. In response to the queries posited in the study, literature on the subject and good practices from other countries, endow answers. Furthermore, government directives, understanding of sustainability and conservation, in the other hand differ substantially across island countries; in Puerto Rico less involvement in the issues is seen. Furthermore, countries involved in sustainable practices have shown improvement in all aspects, a fact that needs to be illustrated even more in the Caribbean context. Data examined suggests that rather than reinvent the wheel, examination of current practices, guidelines, as well as technology delineated by renown organizations should be examined, transferred and adopted by countries as they see fit. Already there are ample recognized practices to be followed. If good practices guidelines are provided and adopted, including Green Code 21, WTO, UNESCO, NGOs, UN, and sustainable practices could be accomplished in the long-term.

Not having well enacted laws (lexjuris, 1998) indicate the need to revise and delineate laws following international and global standards. Moreover, the problems of sustainability existent in Puerto Rico are not profoundly different to those occurring elsewhere in the Caribbean. Recycling policies, coral protection, replanting, and solar applications, are at a low level of implementation; enforcing this directives and requiring studies in environmental impact are initial steps (Lowry, 1998). Even though the aforementioned studies are required in Puerto Rico, they are not well implemented. What to this researcher does not exist is footprint analysis, nor consistent follow up of directives to protect land, air and environment nor credits for firms that enter sustainable programs. Alliances based on competitive honesty should be established to benefit all islands. All around, there is a general agreement that education on

the subject will increase dissemination of culture and augment local pride. Increased desire to inform more about their culture, heritage and environment preservation will protect more their own resources. More information will also allow small owners to recognize how to exercise their rights, access credit and demand the protection due under their constitution.

## LIMITATIONS AND RECOMMENDATIONS

1) Limitations for this study mainly rest on the size of the sample, however, the author strongly believes that an increase in sample size would not bring different results. A constraint of economical nature did have an impact in the study; if economical means and time would exist; travel to other destinations would have increased direct observation and an increase on the number of good practice cases presented. Nevertheless, the abundance of secondary sources in the manner of reports provide practical input to the study and shies away theory from practice<sup>15</sup>. On sustainability, we recommend that Caribbean islands governments and pro-environment groups follow directives and sustainability guidelines from prominent organizations like UNESCO, World Tourism Organization, Caribbean Tourism organizations, CAST, The World Charter on Sustained Tourism 1995 of Lanzarote in developing sustainable guidelines, global code of ethics and education programs.

2) The profile and high educational background of the island's entrepreneurs/owners suggest implementing some education programs on the subject of sustainability, environmental conservation, as well as guidance on practices of sustainable tourism is not unattainable. Educational programs, should consider directives of the WTO, which suggest that SMEs education should include studies on benefits of good practices on sustainability. In the particular case of other islands, knowledge of nature, compromise, and willpower exist and the educational levels instill capacity for increasing educational programs emphasis long-term benefits versus costs. The same recommendations provided above stand.

3) Since there is a strong perception that the conceptual difference across islands can be due to the type of tourism orientation, then, since some Caribbean islands tourism is oriented to Europeans, (Puerto Rico, is oriented to continentals USA tourists (80%), evidence from countries where sustainable tourism activities are practiced could be implemented because of their potential transferability. Illustrative countries in the Caribbean and elsewhere where good practices exist and have implemented the philosophy of sustainability have shown remarkable success and an increase in quality of life. These include Barbados, Costa Rica, Belize, Peru, Australia, New Zealand, Canada and Nordic countries in the EU. Other islands still exhibit limited success.

4) Since there is unawareness of existing laws in general, a revision of the value of existing laws as well as dissemination programs have to be established. Likewise, these laws should include incentive programs oriented not only to attract foreign investments, but also to provide tax credit for local entrepreneurs. Per example, following these directives and to

---

<sup>15</sup> The author wishes to clarify that most of the example provided of good practices, except for the cases in Cuba surge from direct personal observation acquired through her travels and reinforced with reports

stimulate entrepreneurship, the UN has established 2005 as the year of the Micro credit. Due to the flagrant deterioration of infrastructure and damages that tourism and its related activities create, taxes and dues will need to be levied and transferred to the communities and affected areas. This will encourage locals to evaluate cost versus benefits provided by the sector.

5) Directives should require studies in the form of ecological footprint studies, tourism Penetration Index, and assessment and impact studies, for any project, including highways. This will inhibit granting construction permits and damage to ecosystem. The studies will increase awareness of the economical costs to the environment, of not enforcing laws, or of doing studies<sup>16</sup>. Likewise, certifications should be reviewed yearly and implementations required. Not least, clearly delineated policies regarding waste disposal, responsibility for damages caused have to be implemented.

6) Foundations and organizations should be founded outside government directives and implemented with inclusion of community members, environmental leaders, groups and citizens, should be established to delineate long term strategies. These entities could prepare proposals and gather funds, which in turn could be used to provide conferences, seminars, educational programs, and small loans to assist sectors in need. An exemplary example is the one published on Namibia by the UN dept of Economic and Social Affairs NACOBTA (1999), a group to which 40 enterprises directly belong to.

7) Contractual clauses should be included in loans granted to investment groups, including hotels. These clauses should be included in their contracts including requiring collateral for taking care of any damage they might cause to the environment, for the disposal of abandoned premises, and for fund to care of employees, who in accordance to local laws are employed long terms without the benefits due. Likewise, studies on tourism destinations should be adequately used to correct mistakes and provide more differentiated and sought after services.

8) The main source of income in most Caribbean islands come from the ocean, its corals, and fauna, thus guidelines protecting its corals has to be regulated and people educated on how to implement them. Likewise, whale watching and hunting needs specific rules should be regulated so that income needs of most investors can cause a postponement of country to personal needs. In the same direction, responsible labor directives should enforce the provision of lawful salaries and benefits to those locally employed. Following the same guidelines, outsourcing and contracting cannot, under any circumstance, inhibit local participation. Programs should include educating all sectors against the deteriorating state of reefs and the environment, as well as many other factors including, i.e., corals protection, fishery, whale watching, care of caves, closure of public beaches, mangles, using boats in endangered areas, unwanted garbage disposal, et al.

9) To ensure local advantage over other islands, owners should be aware of the need to become more competitive, improve and personalize services and offer competitive prices. Eventually these actions will attract repeat customers and provide success. Increased education and awareness that natural resources are of nonrenewable nature that once taken

---

<sup>16</sup> Ecological footprints measures studies are recommended strongly since these analyze inputs in terms of land required to sustain and produce these inputs and compared this to the land available within a region or across the world.

care of will provide sustenance in the long run has to be instilled. Moreover, as foreign or locals perceive a larger pride in the provision of services and care for their resources, they will involve themselves more in the culture, will appreciate what they see and respect those they interact with.

Decisively, the trend is to initiate directives from local community groups that are environmentally prone. However, since the health of any responsible tourists is significantly dependent on the health of ecosystems. Thus, locals including dive guides are beginning to see that their prosperity is linked to the careful management of reefs. As studies by Henna and Wells (2003) found, there are organizations<sup>17</sup> oriented at tourism awareness; her studies found that the major difficulty in attaining sustainability consists in waking up national governments to the fact that tourism is a major source of income and employment that cannot be allowed to speed out of control. This author is of the opinion that a balance has to exist between income and impact on nature. Of course, political and vested interests often enlarge the gap between theory and practice.

The existent lack of concerted actions and unawareness of the importance of protecting resources will eventually cause a downward trend in tourism. Thus, Caribbean islands as well as many countries urgently need to examine directives provided by international organizations and certifying agencies. It is common knowledge that as communications across the globe improves, safety in travel is stressed, and competition among industries and countries grow, the world consumers will be more selective in their choices. As such, most will seek more value for their money and, and demand more “natural” destinations. In terms of policy recommendations, this author believes that it is the role of government to incorporate environmental code of ethics and conduct, as well as guidelines on how to preserve their environment based on long-term strategies continuously revised. In view of the fact that SMEs and small venture entrepreneurs typically lack start up capital, alliances should be established and networks systems implemented with local and worldwide universities to which businesses could access for information and training when in doubt, for technical assistance, impact studies, advertising and general support.

Given the economic significance of SMEs, and the self-employment and cultural transmission the sector provides, care should be given to reinforce the sector. In the case of local entrepreneurs, they, like foreign firms, need to become proactive, seek information, demand on receiving services, they can and have a right to obtain. Moreover, worldwide, organizations and researchers on sustainability and entrepreneurial roles have recommended that countries in the process of development and developed countries adhere to sustainable agreements. This accords should emphasize that sustainable tourism development should move beyond environmental protection to protect the countries values, mores, culture, and heritage. Since sustainable tourism should be initiated with the help of broad-based community-inputs, local groups should maintain inner participation an indirect control of tourism development. Borrowing from the United Nations 2003 report, tourism should provide quality employment to its community residents and a linkage between the local businesses.

If a code of practice is established for tourism at all levels, either national, regional, or local, based on internationally accepted standards then all environmental problems including waste

---

<sup>17</sup> Groups such as *Tourismus mit Einsicht* (Tourism with Insight) in Germany, and Tourism Concern in the UK protect nature.

in waters, damaged ecosystems and menace to endangered species will occur. Even though the responsibility to introduce measures to deal with the social and environmental impact of tourism development rests in all, specially the educated and young, this author believes and strongly recommends that since the increasing growth of tourism is a reality, ceteris paribus, then government, private investor groups, entrepreneurs of any size and citizens need to plan ahead to protect resources and their future. Tourists themselves should not only enjoy growth in world tourism but, more importantly, the activities of ST should maximize economic benefits of the local population and increase the living standards of host communities. Tourism is definitely as a steadfast path to opulence, particularly in small island nations in the Caribbean.

## ABSTRACT

Small and medium size firms (SMEs) compete in an unstable environment shaped by multiple constraints including large multinationals with economies of scale, consumers diminishing income and changing tastes, a volatile economy and the inherent habits of owners and entrepreneurs. Firms established in countries in process of development, face not only heavy competition but also a profound variety of issues.

This study explores and examines the manner in which local businesses have chosen to compete, their investment in and attitudes toward the use of applied technology. This exploratory study is developed to identify the demographic traits of owners utilizing technology, how this usage determines their success or if, on the contrary, differences are due to other factors. Specifically, the study centers in firms established in the Western side of the island; hypothesis are proved based on information provided in reports, successful cases, and on results from a survey administered to 82 small business owners. Findings suggest that a relevant number of firm owners, in spite of capital and resource limitations, use technological applications of some nature, though usage varies according to their area of service. Overall, results support the proposition that owners who use more applied technology and offer differentiated innovative services reach a larger number of customers, diminish costs, and attain higher sales and overall performance than others. The study also indicates that the success achieved by firms resides in creative applications and innovative services rather than investment in technology. Finally, the paper concludes with a discussion of outcomes generated by the findings and guidelines for future research.

**Key words:** Information technology, innovation, productivity, E-commerce, value added, and effectiveness

---

<sup>1</sup> The author acknowledges the significant input provided by former student, **Viviana Rivera**. Her initiative working with the subject while taking my course in Small Business provided initial input for this paper. The first survey is entirely her work, even though training and supervision was provided. Her original work was written in Spanish. Email: [vivi\\_pr@hotmail.com](mailto:vivi_pr@hotmail.com). Special thanks are extended to **Shirley Rodriguez**, Graduate Assistant and MBA student at the College of Business, who provided invaluable help in processing the second survey and gathering information.

# INTRODUCTION

Small and medium sized enterprises (SMEs) compete in a worldwide sphere against large multinational companies that possess large advantages including access to capital, economies of scale, higher R &D investment in products, services, human capital and technology. The manner in which business is conducted worldwide, including communications, quick transactions and lower costs of production have been changed totally. Nowadays, most business activities are oriented at reducing to zero the time taken to acquire, learn, use information, make decisions and innovate (Mackenna, 1997). Developing innovative and competitive strategies to compete is a challenge for SMEs as well as a priority for local governments, considering the economic significance the sector provides. Even though SMEs are often thought as laggards in developing, acquiring or offering innovative products and services, many studies provide opposite results. Precisely because of the downsizing, phenomena in which large firms have become involved, small venture capitalists and SMEs are the source of services required by major enterprises through outsourcing.

In spite of contrary opinions affirming that SMEs lack a technological mind frame, A significant number of firms have penetrated the technological market and placed themselves at an advantage via web advertising, and alliances with larger organizations. Acquiring this technology have allowed owners to communicate and inform their clients, advertise their products and services and buy products or distribute them. Example of the success obtained in these ventures is booksellers in the web, including Amazon. Even though most research on innovation is tied to major firms, not SMEs, actually most of the known large firms today started relatively small, i.e. Microsoft, Eli-Lilly, Walmart, JC Penney, McDonalds. Publications, also, demonstrate the increase of young nascent firms offering services only via websites. Research completed by Chandy, Prabhu and Antia (2003) confirmed that as firms become dominant and stronger in their market position, they become wedded to the status quo and become reluctant to embrace radically new products because of risks (Schumpeter 1942, Henderson 1993). To compete with larger firms small and medium sized firms need to device and review their strategies often and to innovate in the offer of product and offer differentiated services.

Studies specify that there are not specific measures of the impact investments in investment in technology (IT) have neither on productivity nor on sales. The contradicting results that ensue has created indecision for SMEs who yet have not understood the benefits TI investments could offer them. Pronouncements about the lack of knowledge in productivity, or benefits of TI, or on the pros and cons of adopting technology by SMEs, induced the formulation of the premises underlying this paper. The following research questions are the basis for the formulated premises: Why are large companies investing so heavily in IT if it doesn't add to productivity? Why SMEs do not follow examples from larger firms and invest in TA in spite of not knowing the cost benefit impact? Why some firms that initiated small have grown potentially due to investment in R&D and technology? Why observation of emerging firms and their success has not inspired traditional SMEs owners? Would it be that entrepreneur traits and risks determine investment and penetrating new markets and enter new ways of doing business?

Even though new small and medium size enterprises (SMEs) are adopting different technologies and technology-oriented processes, including the Internet and e-commerce, the growth in adoption is not proportional to the number of businesses registered. Systematic research into how companies are adopting the "new technology" as well as the

benefits of it is non-existent within the island context. In other countries, including USA, research on the effect TI has on productivity is not conclusive. The structure of SMEs, wherever they are located, provides advantages in terms of innovation, flexibility, decision making and access to resources; this flexibility is not often utilized nor recognized by owners. This extends to and includes easy flow of communication and the potentiality of a quicker decision-making process, and differentiation in terms of the products sold or services offered. Moreover, it appears that the cost and size of investment in technology will depend on the type of business and expected benefits. In the particular case of Puerto Rico, statistics provided by the Small Business Administration (2004) confirm that the growth in technological applications (TA) is still lower than expected. Apparently only between 30-40% of local SMEs have invested or adopted some kind of technology. The non-existence of studies evaluating the impact neither of technology nor of the number of firms using technology and TA applications within the Island context, has stirred this incipient researcher to implement this study.

Within this framework, this study focuses and seeks to explore first, how SMEs invest in technology and innovative processes; second, to investigate the benefits SMEs feel originate from technological investments, innovations and third, to evaluate how local firms have chosen to compete and invest in technology and related services as well as the creativity, in order to excel in their industry. The fourth goal is to examine cases of firms whose TI have proved to be the cause of success and relate findings to local firms. Fifth goal, to examine and evaluate the results of a survey administered to local firms while comparing how results from this study resemble empirical studies and literature. Sixth, the study aims to analyze if the demographic traits of local firms relates somewhat to the use of technology either in pure or applied form and if it is related to firm's growth and productivity. Ultimately, limitations and recommendations will be presented oriented at inducing local SMEs to adopt at least some type of technological applications consonant with world trends.

The premises underlying this study are:

- 1) SMEs or Pymes that utilize technology or technological applications obtain higher productivity than those not utilizing technology.
- 2) SMEs technological applications relate to the type of industry in which they operate and
- 3) Most SMEs do not utilize technological applications for lack of education on the subject, apprehension on adopting new tools, and because of lack of financial capital.

## **Literature review:**

**Trends.** There is an escalating demand for organizations to become more efficient and effective. Reaching this efficiency goal is seen mostly in the adoption of technological innovation in products and services. Most technology offered today focuses on reducing to zero the time it takes to obtain and use information, to learn in new ways, to initiate actions deploy resources, innovate and take action (Jones & Kochtanek, 2002). SMEs are known to suffer from size constraints, shortages of resources including human capabilities, it appears that this problem makes it difficult for them to compete in industries characterized by intense competition and frequent technological obsolescence. However, these difficulties are superseded by the flexibility, ease on decision-making, and innovativeness they can offer. In addition, the line of products or services offer will be determinant into the type of technology required. Knowledge has become the most important production and service factor in the global economy (CERFE, 1999). Thus, the same document indicates, nature of a typical small business with many hats to cover inhibits learning and R&D, in

this instance, the importance of employee skills and human capital selection as intellectual investment is key to success. Moreover, innovation, taking advantage of downsizing to grasp new opportunities and networking are the skills most sought after in creative entrepreneurs or business owners.

Regardless, it is known that a new breed of small companies are establishing innovative systems to reach their customers while offering differentiated products in niche markets through the adoption of web technologies. Others have improved access to markets and new clients by creating or acquiring specific databases (SBA sponsored web programs and federal contracts), creating alliances, adapting new products, and producing for markets not served by others, especially in emerging countries. In the case of Puerto Rico, a significant number of the new niche marketers have designed effective web pages and made the Internet their way of business. Firms in this category include<sup>2</sup> food, booksellers, writers, tour productions, small hotels, artisans and painters. While some firms are technology prone most are not. SMEs receive a large quantity of brochures, seminar invitations, and consultancy report often not understandable to them. Moreover, SMEs are often counseled to invest in a variety of standardized programs (Bitran, Bitran, 1998), including management of daily accounting transactions, inventory management, data bases and payment programs which often are not efficiently utilized. Is this waste and ill investment the cause for shying away from further investment?

### **Challenges for SMEs adopting technologies.**

To tackle the challenges that technological adoptions posit for SMEs, makes it forceful for owners, consultants, as well as loan grantors if proper considerations is given to evaluate business needs and counsel on how to make critical decisions on TA, based on cost benefit analysis. Traditional SMEs tend to be ill informed on most issues specially technology, devote their time to day to day operations, and tend to be satisfied with what they have achieved. However, nascent entrepreneurs and owners that are proactive and willing to learn seek new opportunities. The rise of Silicon Valley in the US, of Science Parks in Taiwan and other countries and the enormous growth in Chinese economy contradict the affirmation somewhat. Could it be potentially that there are different types of entrepreneurs and their traits determine how they decide on growth?

Currently, efforts should be directed at offering grants, conferences, workshops and overall net support toward emergent businessperson. It appears that traditional SMES are apprehensive to adopting technology, and have not recognized the immense potential that technological adoption of technologies could have to better their lives, those of their people and communities. Initiatives appear to be underway from private groups including Retailing Associations, Chambers of Commerce and the public or government sector, among them the Small Business Administration (SBA), Minority Business Enterprises (MBDC) to create, back-up and offer loans programs for SMEs who wish to operate with a technological development component (Israel, Honda, Grucci, 2002)<sup>3</sup>. These initiatives comprise launching popular web- based technologies in both developed and less developed countries and any other product or services created within the defined parameters. Program of this nature, if approved, could be an excellent avenue and an illustrative case

---

<sup>2</sup> Web addresses like go2pueertorico.com and, puertoricowow.com and Caribbean islands.com show some of these direct sellers.

<sup>3</sup> The authors were hired to delineate the parameters for a pilot program oriented at financing SMEs investment in TA. This program is a joint effort between SBA and regional technology consultants. Direct loans will be oriented to technology based small business concerns.

to be followed. Apparently the main problem for not acquiring any TA is the lack of R&D; thus, (Cobham, 1999, QEHWPS025) and owners perception that it involves high cost in terms of value perceived. In an individual base investment in technology is perceived as costly.

Studies by World Information Technology and Services Alliances (WITSA) financed by the International Data Corporation in Romania, explain that “global IT is valued at almost \$2 trillion and is growing at a rate substantially higher than the world’s GDP” (Avram, 2001:1). The same study shows that even in a deteriorating economy the effect of spending in technology is muffled if these investments are responsibly evaluated. On the opposite side, the US National Bureau of Economic Research (9a) has demonstrated that small firms are less likely to use advanced technologies such as computer controlled tools and also, because the sector accounts for a disproportionate share of job losses and job gains (Albagli, 1997). Nevertheless, though in essence this loss in job is partly true, it is not so entirely. The challenges for SMEs trying to compete in the global economy rest in many areas; they claim lack of time to devote to tasks of implementing TI, lack of use of consultants (too expensive), short range management and planning perspectives, lack of understanding the benefits IT provide, no formal or planning or control procedures, and lack of financial resources to finance technology, R&D or environmental scanning. How SMEs respond to challenges, including investment will depend on their willingness to realize that unless actions are taken now, their smallness and lack of vision might be their demise. Reaction to these challenges will depend on how owners confront risks, changes and their creativity. In spite of any ostensible feeling of risk or insecurity, what is real is that access to and investment in applications in new technological transformations is becoming critical for (Albagli, 1997, Avram, 2001) businesses, i.e. accessing new sources of resources, buying products more competitively, obtaining standardized programs to run their accounting and personnel data, selling directly on the internet, and automated loan programs provide a few examples.

It is this author’s opinion that observing the growth of some countries’ firms and how they compete indicates that survival to existent firms will be increasingly dependent on how firms’ adopt technologies, especially in our global economy; also, SMEs non-adoption of technologies is mostly due to apprehension of new knowledge. Common knowledge exists about how SMEs are reticent to invest. In the island, this reticence permeates in small firms. Medium sized are changing slowly similar to firms in some countries in the EU. Local firms adopting TA include books and art dealers, real state brokers, hotels and Inns (Lituchy, 2000)<sup>4</sup> ethnic food producers, juice makers based on native products and arts and crafts have profited the most from technology utilization. Worldwide, firms in agricultural transformation, service providers, outsourcers and suppliers of products to multinationals as well as travel discounters and retailers like those in clothes and cosmetics have grown and become effective because of technological development and adoptions. Take the case of Japan’s clothing industry; laser technology has made it competitive.

## **Technological highway, consumer trends and SMEs**

Many reasons demonstrate SMEs need to enter the technological highway: from the consumer angle, there are more educated consumers who use the web and internet as a communicating tool, lack of spare time to shop thus increasing direct acquisitions via web

---

<sup>4</sup> This author is professor of Management at Concordia University; his study is based on the used and benefits of web technology for Inns and small hotels in Canada.

or catalogs, the increasing desire to operate under anonymity. From firm owner's angle, the cost of hiring humans to serve the needs of consumers is increasing, changes in profitability and competitiveness are more profound, well selected technology and applications packages can increase substantially the effectiveness of communication, record keeping while reducing costs. Examples include how large multinationals and franchise chains can keep track of their business units in any transaction through satellites and databases. Moreover, as consumers become global so should firms. Technological investments, allows firms to reach consumers anywhere in the globe and satisfy them. Furthermore, the way in which individuals live and work has undergone significant change due to innovations with information and communication technologies (Lefebvre, E. & Lefebvre L, 1992; Figueira, 2000, and Kip, 2004).

Contrary to studies signaling non-investment in technology, Guerra (2004), Mercadal<sup>5</sup> (2003) and Guederiaga Mendiola<sup>6</sup>, (2004) indicate that, in the future most SMEs seeking to compete will have to invest in technological innovations to become members of the global society. Mercadal (2003) relates to the role of Pymes in Spanish society, a sector that has become 99.9% of the entrepreneurial nets. On the other hand, Guederiaga expresses, "the new economy is forcing firms to undergo a radical transformation that is eased by access to information provided by the Internet". The impact as he sees it is in cost reduction of bank transactions whereas a typical transaction is \$1.25 if done at a traditional bank, 0.54 if done via an ATM yet only 0.02 by Internet.

Recognition of the growing magnitude of SMEs and the role they play in job creation, technological development, governments in economies where competitiveness and other characteristics do not exist need to find avenues to develop or reinforce them. The apparent growth of some businesses even in time of political and economic instability indicates the need to search for some explanations on why this growth occurs. Investigating the type of investment, perceived value, and decision-making pattern businesses enter regarding technology investment and applications could be an avenue. In spite of the value tied to investing in different technology either for production, communicating, keeping record of transactions or gathering R&D research, still the numbers of SMES adopting technology is relatively small and significant differences are found in least develop countries. The low adoption levels could be due to not obtaining enough information on the benefits and measurement of TI or it could simply be that most literature focuses on larger production companies whose definition and production requires large R&D and computer investments. Distancing from larger firms studies and directing analysis to smaller firms could help focus on benefits that the right investment in technology or in applied technology (IT) will generate.

## **Definitions and success cases.**

Before proceeding with further review of literature, this author perceives that a few definitions should be introduced to present arguments based on a common ground. E-commerce is defined as the buying and selling of information, products and services via computer networks (Kalakota & Whinston, 1997:3) while the Internet is the means via which most businesses are run. As a tool, the Internet instills growth; it allows firms provide information about their products, reach and establish new markets, improve their image, establish frequent interactions with consumers (Lituchy, 2000), and belong to networks of suppliers. Information technology (IT) on the other hand consists in evaluating

---

<sup>5</sup> Mr. Mercadal is counsel delegate to the Penteo group and publishes in " Ideas Empresariales".

<sup>6</sup>Mr. Guederiaga Mendiola is Director General to Bank Bilbao Vizcaya (BBVA), Spain. "Ideas Empresariales".

technology with the client and business in mind (Ghassan, Zahir, Baldwin, and Jones, 2002)<sup>7</sup>. Investing in IT is also recognized to contribute to the success of the organization only if the appropriate method is applied to the organizational context.

Examples of the success achieved by either individuals or countries that have invested in technology abound. In India, awareness and adoption of IT technologies are on the increase, to the point that 35% of NASA workers in 2003 were coming from there. Another example is Hotmail, the site created by an Indian, Sabeer Bhatia who later sold it Microsoft (El Panal.com news, 2003) with an enormous gain. The growth in exports by many countries including New Zealand (kiwis) and Chile's (Chilean Foundation) are evident examples of access to information, diffusion of innovation that started in small companies. Others have gone from rags to riches with technology. Take the case of cosmetics guru Estee Lauder, who invented creams at home and later perfected them technologically to create an empire valued at over 5 billion dollars.

### **Significance of SMEs, attitude toward investing or adopting technological innovations**

Statistically and in real terms, SMEs are decisively recognized to be the main force of economic growth & job creation in the United States (Birch 1987<sup>8</sup> & US President Report to the Nation, 2003), the European Union, the rest of the world, and Puerto Rico. The sectors importance has been acknowledged in many developed countries, but also in developing and emerging economies like those comprising Latin American other Caribbean islands. Per example, in the European Union, their policy making statutes provides a platform for the assessment of actual innovation performance as well as for development of policies to stimulate and support innovation (CORDIS, 2002). They see the small business sector as a key source of future competitiveness, employment and economic source of growth for their regions.

The small business sector represents 99% of the 23.3 million registered businesses in the United States (Small Business Administration (SBA, 2003). In the continental USA, statistics in which Puerto Rico's SMEs are included (OR Small Business Development Center data presented in a Conference April, 2004 by its chief) minority owned SMEs or Pymes (based on the Small Business Administration 2003 report) in 1997 comprised 3.25 million, generated \$495 billion in revenues and employed over 4 million workers, an increase of 168% over 1987 data. Extracting from the same statistical sources, Hispanics investments, and the group to which Puerto Rico belongs to, increase 232% Asians 180% and blacks 108%. Most relevant this business orientation require used of technology for two reasons: a large percentage of businesses are in export and one of five was home based (HBB). A further significance is that this aforementioned sector comprises employment to more than 25 million people, includes all professions and areas of services, and more importantly, 34% of the businesses established belong to women. All around, women's founded businesses appear to be on the increase locally, in the rest of the Caribbean and worldwide, as previous studies from this author have shown (Hamilton, L, 2002, 2003). Women-owned investments in USA generated 3.1 trillion in revenues, an

---

<sup>7</sup> The authors are members of the Department of Information Systems and Computing, Brunel University, Uxbridge, UK.

<sup>8</sup> Dr. Birch's book on Job Creation in America revolutionized the main frame and instilled deeper studies into SMEs contribution to the economy. Previous thoughts dismissed the sector as job creators; the role belongs to large firms.

increase of 209% since 1997<sup>9</sup>. Women-owned firms, in addition, employed over 23.8 million employees, an increase of 262% since 1987; this numbers are expected to augment further as societal ills, including divorce increases. More significantly, as the educational level of women versus men keeps going on the trend shows more home-based firms, to create a balance between child rearing, sustenance and professional growth. *Ceteris paribus*, technology will be the means to achieve this expected growth.

In Asia, notwithstanding of most business being government owned, in the latest years, private sector investments have been allowed with the sector providing employment to more than 50% of the working force and contributes to 50% of the GDP (Turpin, 2000, Men Ming, 2004). In Spain, the sector is said to generate over 70% of job and contributes to 65% of GDP (Faces, 1999 as reported in a study by Dans, 2001). Moreover, in Puerto Rico, there are over 100,000 Pymes, and they are believed to generate over 63% of local jobs; the sector contributes about 48% of GDP (Hamilton, 2003 quoting government statistics). In addition, OECD (1995) statistics reports SMEs significance as a sector creating more than 95 % of the total employment. In most countries, the sector is the main source of newly created jobs, especially in advanced technology sectors, and functions are tied to SMEs. This challenges the idea that in any economic situation, but especially in a downward economy whereas downsizing prevails, SMEs continue being the engine of economic growth and performance (Birch, 1987)<sup>10</sup>.

In spite of the significance in job formation and contribution to the economy, some analysts agree that the majority of SMEs, still tend to be less informed about the potential of IT to improve competitiveness (OECD 1995), especially in traditional sectors. The sector tends to usually have low IT utilization, due to factors such as lack of resources, of information concerning these investments, of the level of skilled workforce, managerial abilities, as well as difficulties to adapt technologies to their organizational needs (Correa 1994, OECD 1995). Thus, investment in technology or in applied technology infrastructure is important for SMEs to enable them to acquire scientific and technological information faster.

Typically entrepreneurs or business owners are too busy with their day-to-day operations, accessing information about their markets online will keep them updated and indirectly facilitate decision-making and take advantage of opportunities. Studies by the National Bureau of Economics Research (paper 9a)<sup>11</sup> has demonstrated that small firms are less likely to use advanced technologies such as computer controlled tools and also the sector account for a large share of job losses and gains (Albagli, 1997:21). Moreover, (Avram, 2001) in a study commissioned by World Information Technology and Services Alliance (WITSA) via International Data Corp found that global IT is valued at more than 2 trillion; also that the amount is growing faster than worldwide GDP. The study also indicates that when spending in technology increases, even in the face of deteriorating economic conditions, the effect remains the same.

## **Pros and cons of adopting technologies:**

The benefits and challenges for firms involved in investment in technology are many. L Rovere Lebre (1996) informs that information diffusion in Latin American need to be

---

<sup>9</sup> Marti, C (April, 2004) provided the statistical data quoted, in a conference in April 29. She is the chief of the MBDC in Puerto Rico; results are based on SBA statistics for 2003.

<sup>10</sup> This statement is borrowed and attributed to Dr. David' Birch (1987) and his studies published in his renowned book: Job Creation in America.

<sup>11</sup> In Science and Technology Insights in SMEs, a study in Small Business and Job Creation: Dissecting the myth and reassessing the facts, (1994). National Bureau of Economic Research, Working paper 4492.

increased due to the precarious telecommunications infrastructure of Latin American countries. She found that the smaller the average size of firms, the higher relative cost of equipment and the lack of sound user-supplier relationships. On her empirical study on SMEs in Latin America, she established also that usually firms do not have the means to assess costs and benefits linked to IT. Correa (1994) contributed to the idea by adding that in developed countries, awareness about possibilities of applications in production increases with the intensity of investment in technology.

Studies by (Cabbar, 2002) state that, since 1995, information and communication technologies (ICTs) have started to drive the economy while producing profound and effective impact in our social life, as well. The study recognizes the vast potential of technologies in improving the lives of all people. As a result, some new initiatives concerning the development of Internet based economy have being launched especially in developed countries, like; USA, Japan and Canada. Moreover, E-Commerce statistics, up to 2000s have shown that the percentage of "Business to Consumer in terms of turnover capacity is about 80 % of the total E-Commerce, in the world. Growth of information and communication technologies has accelerated the Internet based economy on global scale. On the other hand, the reported growth has led the digital divide, measured on the basis of usage statistics of ICTs and Internet.

Overall, productivity has slowed significantly since the early 1970s and measured productivity growth has fallen, especially in the service sectors, which account for 80% of IT investment. Lebre (1996) in her examination of studies by OECD found that, technological diffusion makes easier to build relationships between SMEs and their users and suppliers. The Small Business Survival guide (2000) goes as far as to recommend establishing LAN systems which because of relatively low costs can enable staff to share communication and resources; client services network operating systems can be effectively created too. Moreover, belonging and connecting to networks like universities and libraries have benefited SMES; likewise, belonging to technology transfer centers, banks, clients, suppliers and consulting firms that stimulate the innovation process (OECD 1993) could be rather productive. SMEs adoption of technology though still low, has progressed tremendously in comparison to previous years. Meanwhile, in the UK, studies by Oftel (2000) have reported that 49% of SMEs are connected to some system. The penetration is expected to increase in the near future.

In a study done in Spain in 1999, it was found that about 5.4% medium sized firms used the Internet, 30% used Internet, web 13.6% local nets 24% modem 34.8% and mobile 56%. In a study on the benefits of e-commerce (Daniels, Wilson & Myers, 2002) referring to their previous studies, established that Internet is a cluster of innovations, and companies choose which of these to use and in whichever manner pleases them. Empirical studies implemented by Brynjolfsson, Eric, Yang, Shinkyu (1996) on a sample of 38 service sector firms established that there was no correlation between IT and return on investment and that some top performers invest heavily in IT, while others do not. Moreover, Daniels, Wilson and Myers (2000) in their study in the UK on the adoption of e-commerce found that small and medium sized firms investments are reshaping customer and supplier relationships, streamlining processes and often restructuring whole industries. In addition, some reports from IDC (2000) shows that the total value of e-commerce around the world will exceed \$400 billion dollars by 2002. Even though it is believed that large companies are the regular users of technology, a large number of small and medium sized companies are finding specific niches in the Internet. A reason might be that as income level increases, people demand more services; investment in IT is a response to the overall transformation of the economy.

Studies published by Brynjolfsson and Hitt (1995) reports that the contribution of IT to output is as high in the service sector as in the manufacturing sector. However, given that their study used firm-level data, results suggest that the productivity "slowdown" in the service sector may be due to ill measurement of output in aggregate datasets. Moreover, as computer prices fall, more internet and service centers appear, many firms and customers that could not afford computers become able to access services and also to purchase computers.

On the benefits of Internet and web technology, Jones and Kochtanek (2002) inform that these technologies are becoming an integral part of most firms. Even though some entrepreneurs believe that expenditure in any technology is regarded as costly and risky, studies by Jones, Beynon and Muir (2002) & Jones N. & Kochtanek T. (2002), report that investment in new technology should be examined for its business value and benefit to the organization the same way any other investment would be. The problem rests on the amount of the investment. In general, firms can now find packages that well serve their businesses for a mere fraction of what it cost just five years ago. Virtually any investment initiative has an associated cost, be it in terms of hardware, software, staff and services. Ward (1996) highlighted results of a study of twenty organizations based on random sampling; respondents were asked how they ensured that benefits claimed in the use of technology were realized; only one firm could demonstrate a clear, documented process. Observing the growth of Walmart worldwide indicates the value of commitment to well defined strategies; but, above all, well selected state of the art technology suiting the needs of the organization. Wal-Mart started small and has become the world's largest retailer. The issue here is not to for SMES to invest in technology or its applications, but to seek counseling towards the investment that better suits their entrepreneur and firm's needs.

## **METHODOLOGY, SAMPLE, INSTRUMENT AND SAMPLE PROCEDURE**

Information on which this study is based is extracted from a thorough review of literature and secondary information from newspapers, journals, and articles about local as well as foreign entities. Primary data for this paper originate from a information obtained in two stages: first from a survey administered to 40 small business owners located in the Western Side of Puerto Rico. The sample selection for this section was randomly selected, even though we ensured all firms selected were within Small Business Administration (SBA) guidelines<sup>12</sup>. Only owners could fill the questionnaire; 31 questionnaires were delivered and administered person-to-person and 9 via fax. The first survey was extracted from a population of 266 firms registered in the Chamber of Commerce at Mayaguez.

The second survey was obtained in a convenience manner and administered by students. A number of 42 businesses located across the island, participated. In addition, 11 of the 42 firms taking part in this second survey were from outside municipalities, including 5 from large metropolitan areas. The only requirement for participation in both sections was that the firm's owners be native, was in business for 3 years, and the owners willingly participated. No firm had more than 500 employees, following SBA guidelines of the size of a small business. Results were clarified and confirmed by phone in both instances.

---

<sup>12</sup> This study uses SMEs as firms with less than 500 employees, according to the definition by the Small Business Administration,.

Statistical methods most utilized were simple descriptive statistics and percentages. An attempt was made to provide correlation analysis; however, the size of the sample and the number of incomplete answers made the analysis insignificant. Excel and Minitab programs were used. Both questionnaires were structured and contained 20 similar questions (17 closed questions and 3 open), including demographics. In the first survey, 82.5% of the firms responded; in the second, there was 100% response rate. This high response rate occurred because of the administration manner used and training provided to avoid non-responses.

## **RESULTS AND ANALYSIS OF THE SURVEYS**

The objective of this study was established early based on the premise of finding out how SMEs adopted, profited and experienced the use of technology and its applications. The study aimed at using descriptive statistics regarding traits of owners and their businesses, seeking to relate adoption and profile and how they influence technological adoptions. With this intention, statistics were examined in both surveys. To clear up any doubts, the two surveys were implemented to determine if in a six months span attitudes towards technology acquisition or implementation could have changed. Sampled firms were different in each survey.

### **First survey results**

#### **Traits of owners and firms**

The majority of respondents came from firms selling products (58%) while 42% of the participants are from the service sector. The average firms employed 22 persons. Extreme values of the sample went from 1-275 employees. The mode was 20 and the standard deviation was 47. Regarding the years of operation, the average Pymes has been in operation for 25 years. Following the defined parameter for participation, the firm with lowest years of operating had 3 years. Regarding the sex of firm owners, 85% of those owners interviewed were men versus 15% women-owned. This pattern follows previous studies on differences in ownership and risks across gender published by this author previously (Hamilton, 2003).

Age of firm's owners extended from 30 to over 60 years old. Thus, 43% of owners were 20-29 years of age. This is a deviation from previous studies where most owners were older. Twenty 21% of owners were within similar age categories, 30-39 and 50-59. The rest of owners fell in the over 60 category. Relating to educational levels, more than 49% of the respondents had finished their Bachelor while 27% did not finished their university studies (see the appendage page for details and comparative tables). These high levels of education could potentially indicate a propensity for technology adoption.

### **Second survey**

#### **Traits of owners and firms**

A majority of firms in this second section are in services (52%), 17% in small manufacturing of products, while 29% in retail and 2% in the non-profit sector. Regarding education, 57% obtained university degree, 17% post-graduate degree, and 17% took

some college courses. The remaining 9% had high school and technical courses. Regarding sex, 85% of the owners are male-owned versus 15% women-owned businesses. In terms of the years operating the firm, 52% of the firms have been in business over 20 years, 14% were between 16-20 years and the others are between 4-10 years. Forty three percent (43%) had 6-10 employees, 31% more than 20, 12% had 11 to 15 employees while the others 16-20. Most firms have over 6 employees; this is a relatively good size to implement some technology. Regarding age, 59% was beyond 50 years of age, rather mature to change ways. Twenty-eight percent (28%) of owners were between 41-49 years of age, and the rest was under 40. It is perceived that younger owners tend to be better prospects for adopting changes including technological applications.

Overall, usage of applications acquired by the firms indicates that 42% of firm's owners used technology for payroll, 24% for inventory, 17% for accounting, 9% in production, and only 8% used Internet. Furthermore, to the question how they implemented technology, 58% used it mostly to control inventory. What is significant is that even though this study was implemented 6 months later, Internet usage rather than increase diminished. This occurs in spite of ample reports describing the level of technology usage by multinational firms in the island and the impact they have found in productivity of employees and in sales.

## **Usage of technological applications**

While in the first survey most firms using TA sold products (58) in the second the majority offered services (52%). Regarding usage of TA, firms in either services or products have adopted similar levels of technological applications or investments with the exception of the category of inventory and operational tools. Results from the first survey and second survey are presented in sequence and compares firms selling goods versus those in services. Fifty eight percent (58%) of firms selling goods use technological applications for inventory, 53% for employee's payroll, 63% for accounting records, only 5% as working tools and 63% use the internet. In the case of service firms, 7% use technological applications for inventory, 50% for employees payroll, 64% for accounting records, only 50% as working tools and 79% use the internet. Percentage differences can be interpreted in inventory, as working tool and a less significant in the usage of Internet. The second survey showed a similar pattern.

To the question what were their plans in terms of increasing technological adoptions, only 37% of firm's owners offering goods responded affirmatively. They reported plans to increase inventory systems by 37% and Internet by 32%. Regarding service firms only 24% expressed plans to increase computer technology specifically, billing and better record keeping. Responding to which technological application they used more frequently, internet was the application used most often by both sectors; 64% of Pymes use it. Splitting usage, 51% use internet to reach clients and suppliers as well as to interact with contacts. Interestingly, only 9% use the Internet to make a sale. Decidedly, success to SMEs depends on sales, trend is to at least create awareness via internet and the response is meager. Of hope is that in the second survey firms appear to have plans to increase to a larger dimension their use of the internet.

## **Contrasting both studies shows**

(see inserted results below) shows that while in the first study (Fig.1) 64% of firms used technology (this study was administered in June 03) in the second survey (administered Dec 03) the amount increased significantly to 71% (Fig.2).

Regarding the type of technology used by firms affirming usage of technology, in the first study (Fig. 3) 41% used email, 24% for web pages, 7% for sales and 24% for customer service provision. In the second study, the use of technology in the form of email and sales applications increased to 48% and 11%, respectively (Fig.4). Particularly, the 4% difference aimed at technology in managing sales is significant since it goes direct to customers' service improvements.

Usage of external resource as hire hand for technological applications stayed about the same. Forty two percent (42%) responded yes to outsourcing technological in the first study (Fig 5) versus 43% in the second study (Fig 6). This could imply that most applications are implemented in-house or that no outsourcing occurs. It is, however, significant that over 50% of SMES does not use any technological applications, not even emails. This contrasts trends of increased usage of technology, as well as the increase of home-based firms, most of which will need some technology to operate. In the particular case of Puerto Rico, reports from banks and other lending institutions, including SBA and the MBDC, report low levels of technology adoption.

The reasons provided for not using technological applications vary. The first study respondents indicated that (52%) did not perceive technology to be necessary and 16% responded that they (Fig.7) did not have the experience with technology, educated personnel, nor the financial resources to acquire technology. Meanwhile, the second survey (Fig 8) the number of respondents not considering technological applications increased to 60%. Twenty (20%) did not adopt technology because of lack of experience, 7% did not have financial means, and 13% thought their employees were not educated enough. What is worrisome is that in a technological oriented world where the usage of technological applications (TA) appears to be on the increase, the perceived lack of need to use it has increased. A consolation is that financial conditions are not cited as a reason for not using TA.

## **Technological applications and productivity**

In terms of the effect that technological applications have on business productivity and sales, responses from the first survey indicate that (Fig.9) 39% and 42% respectively were not able to identify any positive effect in productivity (Fig. 10). Owners reported an increase in sales in the first study was 32% versus 31% in the second study. This is significant since almost 1/3 of those interviewed appear to have measure effectiveness of TA. Potentially these firms could be used as good practice cases provided owners are willing to do so. Furthermore, 16% of the respondents could not measure any impact since investment in technology was done at the beginning of their business. In the second study, only 14% indicated the same response. While in the first study 13% did not ever measure any effect, a response almost equal to the second study (14%). Summarizing, we could take positively that over 30% in both studies were able to measure some impact in sales and thus effectiveness. This contradicts some studies purporting to not being able to measure the effects of technology.

Trying to evaluate future plans regarding technological applications, demonstrate that, in general, in both surveys 60% of firms provided positive responses regarding plans to increase some type of adoption. This is definitively a positive step toward increased competitiveness.

Lastly, opinions on owner's convictions on the benefits of technological applications were requested. In general, responses leaned on the positive values of technology and its importance to firm's growth. 76% believed totally that technology increased productivity and is important to business for its growth. Interestingly, cost is not tightly related to the adoption of technology since only 18% responded to in total agreement.

## Opinion of the use of technology applications

Criteria	Totally agree	Disagree	No opinion or neutral	Agree
Do you believe that technological applications increase productivity?	76%	7%	0%	17%
Do you believe that technology is important for any business?	43%	6%	14%	37%
Do you believe that technology is important for some kind of business?	47%	6%	12%	35%
Do you believe that technology has a high cost for business?	18%	42%	25%	15%
Do you believe that technology help in the business growth?	34%	9%	26%	31%

Prepared by author from both survey results.

## SUMMARIZING

General results from this study brought better responses than expected. In general, firms selling products used more technology or applications than firms offering services. Firms do use some technological applications though each uses them differently. Applications and their adoption process appear to differ according to the areas of business firms are in. While some firms believe applications increased sales, a significant number of firms did not belief applications made any significant difference in sales or efficiency. In addition, about 2/5 of firms did use external resources. In spite of the growing trends in technological applications and computer usage around the world, technology adoption is still low in Puerto Rico. Owners tied not using technological applications to lack of experience and not having instructed personnel. This suggests the need to hire computer able personnel.

Results coincide with studies done elsewhere, including the one implemented by Renate Lebre (1999) in the European Union. From her study commissioned by STAR (Special Telecommunications Action for Regional Development) she reported that evaluating programs existing in different countries, revealed that the demand for new investment in technology (IT) services was lower than expected, especially in the case of SMEs. In the United States, (Correa 1994) found a growing concern to incorporate more persons into the 'Information Society'.

Likewise, the increasing growth of large companies many of which, like Walmart, Sam and others are associated to technology acquisition or applications should instill in small business owners the need for more education or diffusion policies for SMEs. In the case of Puerto Rico, an island of over 8 million people, with a significant high level of education, the low propensity to adopt technology calls for a combination of policies like those indicated for SMEs in developed countries in the EU. The OECD (1995) called for actions oriented at improving the infrastructure and policies to stimulate technology usage. Findings from this study addresses the idea that organizations need to create specific measures to increase awareness of the benefits of using some TA to increase effectiveness, reduce costs of transactions, better record keeping and above all, to reach consumers everywhere.

## CONCLUSIONS

Based on the findings of this exploratory study, some relevant observations can be made. Also, implications as to why a majority of local owners do not use invest in technology or use technological applications are provided. Results from both surveys, review of literature and empirical study significantly declare that most SMEs tend not to invest in technology though they should. Results from this studies as well as the interview held are similar. Having identified the traits of firms and owners as well as how some local owners feel about technological applications and adoption of some technology, evidence that some SMEs owners are not interested in directing efforts at seeking new information, with its pros and cons. The distribution of responses across firms indicates a larger propensity for younger owners to adopt technology while older owners are separating themselves from incorporating new ways. Responses specify owner's perceived lack of need or interest to invest in technology, as well as lack of financial means to acquire any. This aforementioned response signals a potentiality to establish education policies and stimulus loans for owners to acquire proper technology.

Even though the number of firms that use TA is not large, it is within the expected premises of the study and resembles findings from other countries. Responses of why TA are not used, brought typical answers specially those of financial nature and non-skilled personnel; this point out the constant problem faced by SMEs hiring either family or employees to be paid minimum wages. Overall, results from this study do not defer significantly to other studies in either of the queries answered. Nevertheless, since local SMEs operate in a competitive world, limited skills of technologies that could help to increase creativity and differentiated services is almost unprecedented. Competitiveness is increasing everywhere and only entrepreneurs ready to face challenges will survive.

A justification for not using technology of some nature could be due to the non existence of abundant evidence affirming that technological applications contribute to SMEs profits (Dans, 2001), a phenomena well known by Pymes owners. A significant number of firms pointed out to a very low percentage of their investments used to reach new customers or for marketing. This is worrisome. Howard (2001) suggests referring to the theory of capital structure that small firms do not possess equity nor the capital required to invest in TA. Potentially, an explanation rests on their definition of success, and the stability obtained with their business.

The study is based on the premise that SMEs or Pymes that utilize technology or technological applications obtain higher productivity than those not utilizing technology, it

is proved. Direct responses from owners who acquire TA after being established some time confirm that using applications improved sales and productivity. In the case of firms studied, larger firms also obtained more sales, and reached a larger size. This is exemplified by firms like HP and Walmart. Local firms including Pitusa, Amal pharmacy, Campo Fresco, and niche firms have performed successfully adopting technological applications. The second premise states that technological applications relate to the type of industry in which they operate; this was also confirmed by this study and in literature while the the third premise was not confirmed. This premise specified that owners who do not utilize technological applications due to lack of education, apprehension on adopting new tools, and because of lack of financial capital. In this study some firm's owners exhibited higher levels of education and still did not use TA. Partly, adoption of new technology could due to apprehension on adopting new tools, but not for lack of capital.

Moreover, research shows little evidence proving that adoption of technology significantly increased productivity in the 1970s and 1980s; today, though it is recognized that technology has improved the position of many firms, there are no specific reports on productivity and the investment. Results aptly characterized by Robert Solow's quip that "you can see the computer age everywhere but in the productivity statistics," Other studies have fueled a controversial debate, primarily because they have failed to document substantial productivity improvements attributable to information technology investments. If we want SMEs to increase adopting technology and due to owners limited time and traditional decision making and planning practices, somewhere along the lines statistics across industries should be published referring to benchmarks that measure the impact of technology on organizational performance.

## **RECOMMENDATIONS**

Results from this study support the main proposition establishing that firms that utilize technology or technological applications obtain higher productivity than those not utilizing technology. Since there is little convincing research to dissuade undecided business owners to adopt technology, examples from established firms well grounded in technology should be used to instill positivism on owners negative beliefs while aiming at increasing competitiveness of their firms.

Consonant with the aim of this study, seeking to explore how businesses have chosen to compete, their investment in attitudes toward the use of applied technology, this study proved that, in the context of business owners and entrepreneurs in Puerto Rico, traditional owners do not seek to change their ways. On the contrary, they are satisfied the way things are. Efforts, thus, should be directed at reinforcing and facilitating nascent entrepreneurs, venture investors, and minority groups, including women who are willing to immerse themselves in new ways of doing business. To these sectors the recommendations provided here are aimed at. In addition, since this exploratory study was also developed seeking to identify the demographic traits of owners utilizing technology, how technology usage determines their success, findings suggests that more educated owners and younger ones are more technology prone. Moreover, owners who used some technology were able to identify a positive effect on sales and productivity. Even though this study in general complies with its aims there are some limitations. This come from owners desire to not expose the lack of and obsolescence of their equipment on the subject of TA. In addition, readers could interpret that having only 82 responses cannot provide for positive conclusions on such a delicate matter. On the contrary, the response

rate was high and government officials in charge of lending policies have confirmed similar results on technology acquisitions. Even though the sample is small; increasing the sample would not have provided better results.

Consistent with research findings, some recommendations are presented and aimed at business owners, policy makers and researchers. Since technological applications and investment in technology was found to be low in this study, a similar finding in SMEs in other countries, it is necessary to establish an integrated commission from different sectors, including owners, agencies, private and public sector to elucidate priorities in the services wanted. A study should be prepared to identify and classify SMEs according to their interest in adopting or not technologies or whatever services.

Organizations should be established and orient its efforts at increasing awareness on the adoption of technology by creating SMEs support networks and knowledge transfer groups, education courses, alliances, to establish science parks, internet sites, and offer peer support. In addition, specific activities should be designed and aimed at showing direct benefit of TA usage, including how to access clients, search for new markets, or suppliers or just to be informed on new trends interrelated to the market SMEs owners belong to. Furthermore, well-funded internet shops located near business centers including ECommerce or EBusiness services should be established. Not least, development of technically well develop infrastructure to provide the well needed services including orientations on new databases should be provided.

Private and public sector should establish set aside funds and incentives programs for Pymes to implement R&D and TA adoption. This can be done via government programs or through associations and aim at different activities: fund research, invest in TA or TI, initiate workforce training programs and policies in TA applications among others. These programs need to be promoted and include the offer of extension courses provided by universities on the usage and acquisition of the right technology. Since SMEs seek short term value on their investments, owners should be educated on the values of technology adoption versus creation. Education should include a potential change in the mental framework of traditional entrepreneurs from passive to more proactive.

On the government side, policies aiming at granting tax credits to firms using technology or transforming technology should be established. These actions could ensure that firm's owners make the transition from adoption to effective usage. Since informal conversations and opinions of well-bred networks tie the low adoption to apprehension of machines, lack of skilled personnel, and to avoiding new knowledge, different tactics should be instilled. Peer teaching could be used to generate interest, success cases can be presented and skilled R&D prone personnel can be recruited. Not least, incubator center can be established to provide support not only to currently established SMEs, but also for emergent firms and incoming investors. Decidedly, specific actions have to be delineated and support offered if all sectors aim to integrate management techniques and interactive programs that provide positive results and ensures an avenue to enhance SMEs competitiveness.

To conclude, future studies should be more realistic in assessing the real needs SMEs have, and orient them accordingly. Studies should aim at determining in which direction empirical studies should go in order to provide realistic counseling according to the real needs of SMES. Not least, consonant with gripes often heard from SMEs, including not receiving attention timely to solve problems, studies should include an inventory of real SMEs needs across countries and proceed to disseminate this information timely. This

could facilitate the provision of funds to solve present not future needs of those we aim to assist.

# DOMESTIC SAVING MOBILISATION AND SMALL BUSINESS CREATION: THE CASE OF CAMEROON

*By*

Lema C. Forje

## ABSTRACT

The positive result of a network between financial institutional development and economic growth is an acceptable issue. Such a network is necessary for developing economies as it encourages the sharing of information and the channelling of finances from savers to investors. Given the insufficient number of well established financial institutions in Cameroon and perhaps in other developing countries, borrowers such as small businesspersons are to a large extent forced to rely on group generated savings existing in the country popularly known as “Njangi/Tontine” (N/T) which is culturally based and has existed in the culture for hundreds of years. Such small financial houses lend money only to group members – thus excess demand and excess supply exist within the saving mobilising groups. However, empirical studies on N/T suggest that it relaxes the financial constraints of willing investors by making finances easily available thereby facilitating small business creation (Ardener *et al*). More so, complete reliance on foreign micro financial capital for economic development is unrealistic because such institutions can withdraw at any time their economy is precarious. The ability to generate your own money “*is an independent way of life. It stands for something essential to our freedoms*” (Theodore O. Enema in Kaplan 1979: pp vii). Also, as Fokam (1998) claims “donation does not take into consideration contingent existing processes that can help (or be develop) to assure perpetuity.” Each country has the primary responsibility for its own development in general. Other nations can only stretch a helping hand. The views emphasize the link between the resource allocation function of the financial sector and long term economic growth. The result of this research suggests that improvement in the function of such voluntary savings will promote the activities of small businesspersons.

Cameroon has a culture of savings mobilisation where people form small groups of 10 and above usually based on ethnicity, profession, neighbourhood and friendship and encourage members to save weekly or monthly, and the accumulated sum is made available as loans to members. This practice is common throughout the country. It is common for a Cameroonian to belong to at least one or two N/T groups. Some N/T groups can generate between 1,000,000–100,000,000 francs CFA (£1000-£100,000) fortnightly or monthly in their various groups on average.

The paper reveals the reasons for not lending these monies to non-group members, and concludes that it is due to lack of entrepreneurial knowledge, and the high level of insecurity that exist in the country. It is therefore suggested that group members should

be given basic education on business knowledge to empower them to take the risk that entrepreneurship requires. It further suggests that since government controls almost all institutions in the country, it should put in place a mechanism for fighting corruption, and a functional justice system to ensure security.

## INTRODUCTION

The positive result of a network between financial institutional development and economic growth is an acceptable issue. Such a network is necessary for developing economies as it encourages the sharing of information and the channelling of finances from savers to investors. Given the insufficient number of well established financial institutions in Cameroon and perhaps in other developing countries, borrowers such as small businesspersons are to a large extent forced to rely on group generated savings existing in the country popularly known as “Njangi/Tontine” (N/T) which is culturally based and has existed in the culture for hundreds of years. Such small financial houses lend money only to group members – thus excess demand and excess supply exist within the saving mobilising groups. However, empirical studies on N/T suggest that it relaxes the financial constraints of willing investors by making finances easily available thereby facilitating small business creation (Ardener *et al*). The view emphasizes the link between the resource allocation function of the financial sector and long term economic growth. The result of this research suggests that improvement in the function of such voluntary savings will promote the activities of small businesspersons.

Cameroon has a culture of savings mobilisation where people form small groups of 10 and above usually based on ethnicity, profession, neighbourhood and friendship and encourage members to save weekly or monthly, and the accumulated sum is made available as loans to members. This practice is common throughout the country. It is common for a Cameroonian to belong to at least one or two N/T groups. Some N/T groups can generate between 1,000,000–100,000,000 francs CFA (£1000-£100,000) fortnightly or monthly in their various groups on average.

The paper reveals the reasons for not lending these monies to non-group members, and concludes that it is due to lack of entrepreneurial knowledge, and the high level of insecurity that exists in the country. It is therefore suggested that group members should be given basic education on business knowledge to empower them to take the risk that entrepreneurship requires. It further suggests that since government controls almost all institutions in the country, it should put in place a mechanism for fighting corruption, and a functional justice system to ensure security.

Informal voluntary saving mobilization and credit facilities dominate the financial market. Research revealed that an estimated 70% of the total money supply in the country is held outside the banks. Njangi/Tontine is of crucial importance to both men and women in the country as it provides them with finances to meet both consumption and investment. Research revealed that all big entrepreneurs in the country belong to one or more Njangi/Tontine groups. Belonging to a Njangi/Tontine group encourages people to engage in income generating activity in order to generate money to meet their N/T obligation and not be seen as an outcast in the society. It also acts as a social group, and in fact forms the contour of many social groups in the country. The high level of poverty in Africa in general and Cameroon in particular, is a cause for concern. There is a

need to use all available knowledge for the fight against this deep rooted and perennial poverty.

Cameroonians formed groups based on family relation and contributed money to group members on a rotating basis to help sort out their financial needs. The contributions were primarily used for payments of dowries and petty trading. The system was an extension of the communal labour, which existed and still exists, in the society today. As time went on, they started putting aside which did not rotate and called it "Nsundab". This stock pile was to remain in the groups for people to borrow and multiply. This was the birth of the saving and lending concept in Cameroon. This practice dates back hundreds of years, and it is what is now popularly called N/T. Thus the concept of saving for economic development is not new to many Cameroonians. Voluntary saving as against forced saving has always existed in the society. People realised that cooperation was the only way to overcome the individual problems they were facing in all areas of life. The Njangi/Tontine financial groups, which generated money for dowries, have now been extended to generate money for use as capital for entrepreneurial activities. There is a great need to encourage such savings in order to facilitate small businesses, provide jobs and improve the living standard of Cameroonians.

Following the World Bank Report (1988-92), Cameroon is classified amongst the most poverty-ridden countries in the world. Cameroon had a negative growth rate in GDP and the situation has since worsened. The Structural Adjustment Programme (SAP) led to massive lay off of civil servants by the Cameroon Public Service followed by a salary cut of 70% in 1993 and two months of unpaid salaries, (July-August 1993). There also was a 100 percent devaluation of the CFA francs in 1994 with the serious consequences of rising prices and higher cost of living which further aggravated the situation. The people are hampered by lack of finance to create sustainable income generating activities to ameliorate their state of poverty. To combat this, the people have to save, no matter how small an amount in order to make investment possible. Mobilising domestic savings will empower the people with finances to start sustainable small businesses and face the challenges of poverty.

### **The Role of Domestic Savings in a poverty ridden nation:**

Savings are foundations of capital formation, and economic growth. Investment that ensures economic growth needs capital. Sustainable capital accumulation can only take place within a nation if people are sensitised, and encouraged to save for future consumption and development through investments. Such investments cannot be carried out using foreign donations alone. Citizens must be the key participants, and if possible initiators. Malcolin *et.al.* (1983) suggest "foreigners can be, and are inevitably involved as well, but they cannot be the whole story".

In 1985, out of 12 million Cameroonians, only 4 million were actively involved in economic income generating activities, and of these 70% and 22% were involved in the primary and secondary sectors respectively. Only 8% were involved in the tertiary sector, and out of the 8%, 73% of the investors were foreigners (Moroney ed. 1996). This implies that 73% of profit, which could have been ploughed back in form of new investments, was repatriated to foreign countries. Under such conditions, the host country cannot talk of economic development, without the requisite capital outlay.

Local social conditions could be seen to play an important role in the formation of what can be defined as "innovation prone" and "innovation adverse societies" (Andres

Rodriguez 1999). More than 70% of the Cameroon population live in the rural areas with income below the government minimum wage. Thus the management costs of the classical financial structures are too high for the rural population to pay. Travelling to areas where these structures are located is costly. Thus the people's endeavour to mobilise savings voluntarily using the culturally existing system is an embracing endeavour. For the people to be conscious of the fact that their destiny is in their own hands and that the best and most durable solutions to their poverty problem can only come from them is important. What is required is for policy makers to draw the peoples' attention to the immense business opportunities and resources imbedded in their culture.

It was revealed that some abandoned resources are again finding their way into use through innovation and investments using money borrowed from Njangi/Tontine houses by some members. Domestic Savings would encourage the people to invest and discover the business opportunities which are imbedded in the culture of the society and have remain hidden.

A research project by Fokam (the President of CCEI bank), concluded that "the classical economic which holds that the poor are unable to carry out any investments does not seem to be just". The poor do invest but on a very low scale due to lack of funds. Their meagre savings, which are their primary, and only source of finance, is very low (Forje 1998). Low savings in Africa is not due to lack of knowledge about savings, because the concept of savings has existed in Cameroon and other African countries for a long time. Many forms of savings exist within the African culture, but these are mainly habitual (eg, Njangis/Tontine.) Policies have not been oriented toward encouraging increased savings and investments in income generating activities. The macro-saving, borrowing and lending institutions existing in the society have constantly been failing, thus creating the feeling of insecurity. For this reason, the classical financial structures meant to instigate and promote economic development have proved to be inappropriate due to costs and insecurity.

## **PROBLEM**

Although great strides have been made towards savings mobilisation in Cameroon by Njangi/Tontine houses, many small business investors lack finances to carry out sustainable income generating activities capable of fighting poverty. The problem is that since not everybody has an entrepreneurial spirit, some N/T houses experience excess demand for loans whereas other houses have excess supply of money. This is as a result of loans only being available to group members. Although almost every Cameroonian belongs to at least one Njangi/Tontine house, the level of savings is not the same in all groups. Groups having excess supply are not willing to lend to non group members. The result is that the money accumulates and stagnates. Since the money is expected to be available at any time a member needs a loan, it is very often held in current bank accounts, which of course do not generate interest but instead suffer from constant bank charges since they cannot be used by the bank as loans to potential investors. It is widely agreed that open economies generally grow faster than closed economies, (Development co-operation with the least developed countries: Fighting Poverty, European Community 2001). Although the Njangi/Tontine members do encourage group members to invest, and even sometimes levy fines on the interest earned by those who do not make an effort to borrow, people are still not willing to

borrow if they lack entrepreneurial spirit and skills. The main problem therefore is how to encourage the Njangi/Tontine members to lend their capital to non-group members.

## **OBJECTIVE**

The all-embracing objective of sustainable development is to provide a sound economic, social and environmental base for both present and future generations. The Brundtland Commission describes sustainable development as “development that meets the needs of the present without compromising the ability of future generations to meet their own needs”, (OECD Policy Brief nr. 8. 1998). Sustainable development could be seen to have four dimensions: economic, cultural, social and environmental. Sustainability in natural science characterises the management of natural resources in a way consistent with the preservation of its productive capacity. In social science, sustainability implies a focus on much more than economic growth and material welfare alone. In this paper, the concept embraces equity concerns, cultural and social cohesion, as well as the need to address threats to global “commons”.

The objective of this study is therefore to investigate the reasons for N/T members not being willing to lend money to non-members, and make suggestion the possibilities available to ensure loan repayment so that the accumulated savings can be put into circulation, or income generating activities.

## **METHODOLOGY**

The paper is based on observation and interviews carried out in Cameroon. Some 150 Njangi/Tontine groups made up of 10-15 members were interviewed all over the country. The groups interviewed generate between 1,000,000–100,000,000 francs CFA (£1000-£100,000) every fortnight or monthly as contributed by individual members. In view of such a huge amount of money generated fortnightly or monthly, two problems are vital here:

Analysis is based on the contingency and system theories, which suggest that appropriate managerial behaviour in a given situation is contingent to a wide variety of claimants, (creativity, innovation, good accounting systems etc). Fremont and Rosenzweig (1973) state that, 'appropriate behaviour cannot always be generalized or extrapolated from other situations". By adapting to the society's cultural system of financial institutional development, the resource base could be improved upon and expanded.

- Money piles up in some Njangi/Tontine houses and there is a lack of finance for small business start-ups;
- How to get Njangi/Tontine groups with excess money supply to lend to willing investors who are non-members and are in need of money for investment.

A careful analysis of the N/T composition and guiding principles would highlight key points that policy needs to consider to make it possible for N/T members to be encouraged to lend their accumulated savings to non members.

# GROUP COMPOSITION AND GUIDING PRINCIPLES

Composition of members ranges from ethnic groups, same profession, neighbourhood etc. New members are introduced and if there is no objection from other members, he/she is admitted. It could be either sex or both; it all depends on those concerned. The level of contribution is determined by the resources of members. The organisational pattern is very informal with few executives responsible for record keeping. In times of financial difficulties, members can suspend their Njangi/Tontine and share out the monies and restart when their situations improve. Ardener and Burman 1995 also observed this aspect of suspension and restart.

The Njangi/Tontine is highly based on trust. The fear of becoming an outcast from your group means more to group members than going to prison. Thus, members face “emotional incentives as well as material ones” (Casson 1997 Dis.: pp7). The engine of trust is popularly known as “Fumlah” (a secret cult) system. Members trust each other and together they face the outsiders as a team. Group Members do not trust the outsiders, and therefore do not interact with them financially. Instead, they try to motivate members to create small businesses, so as to use the money generated. The only criteria for a loan are to be a member and pay your contribution when on time. Once a member fulfils all these criteria, the loan is immediately disbursed to him/her.

Table 1 illustrates the disciplinary system.

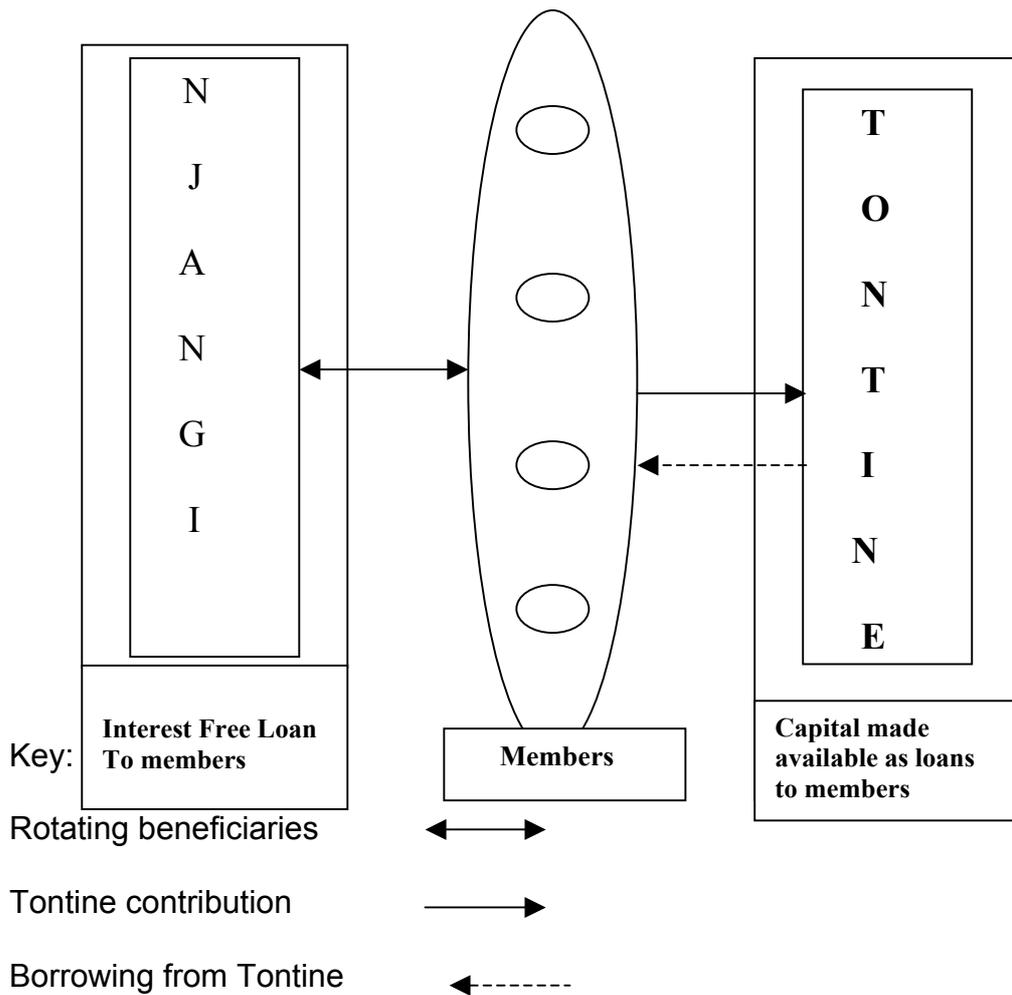

**Table 1 Guiding Principle and Disciplinary Mechanism**

<b>Trust</b>	<b>Sanctions</b>	<b>Moral based</b>  - Rhetoric and Social bonding
<b>Default</b>	<b>Defective</b>  Property right	<b>Naivety</b>  Outcast in society
High Trust	Legality	Sense of belonging
High Default	Jungle law	High trust

Source: Idea from Casson 1997 Dis: with modifications

According to the interview result: “It is strictly governed by emotion and of course some jungle law.” The nature of jungle law was not disclosed. As often the case, in a society where injustice is prevalent, there is the temptation for people to take the law into their own hands, and apply whatever defensive mechanism as self-defence. However, the sense of belonging enables group members to build up confidence in each other and acquire reputation which they are anxious not to lose. Thus, the flexibility of the system depends highly on compliance with an unwritten understanding. The composition of the sustainable N/T group is in most cases highly ethnocratic. Diagram 1 illustrates the functioning of N/T.

## Diagram.1 The functioning of Njangi/Tontine

The Njangi is the rotating accumulated sum given to an individual member at each sitting. The Tontine is the accumulative savings at every sitting available for lending.

## DATA ANALYSIS

Examining diagram 1 from the point of a small business, we find a flaw; a situation where the small businesspersons are themselves consumers of their own products as the bulk of savings is only restricted to members' borrowing. This creates problem because their market is very small. Their restrictive borrowing principles hinder money circulation as well as deprive knowledgeable investors of capital for investment. The push on group members to borrow by penalising them in the form of a reduction in interest earned creates a distinct bias toward saving and leads to a high propensity to consume, an act which eventually slows down the economic development of a country.

The question, why do you not lend out these monies to non-members who have good investment opportunities, but choose to bank it in current accounts or keep them in homes brought the following answer:

“We do regret the fact that the savings generated is very often not put into more profitable use. The system makes it impossible for us to do otherwise. We do not get the support we expect from the government in terms of security and encouragement. It should also be pointed out that we do not save these monies because we have too much of it. We are interested in doing business, and that is why we restrict our own level of consumption in order to save. We do not save because we have excess money. It is a sacrifice. But the system seems not to appreciate and encourage us. The government itself is unable to provide potential small businesspersons and entrepreneurs with the money they need as start up capital. Many families are suffering as a result of the Structural Adjustment Programme (SAP) which rendered many people jobless, and the drastic salary cut of 70% in 1993-94. We know that many people need capital to start small businesses. As long as we find government policies unfavourable to us, we cannot lend our monies to non-group members. We do encourage our members to go into small businesses and some are responding positively, we hope many will follow.

We can only trust our own members because we can discipline them in our own ways. A non member will borrow the money, and may never repay. Sometimes he/she can give collateral turn around and report you for theft or stigmatise you as ‘opposition’, and you, the lender, would be intimidated or even thrown into prison. in cases where the outside entrepreneur has a relative or friend high up in the political hierarchy and that will be the end of the money.”

Interview results indicated that from approximately 2250 people interviewed, 1800 (80%) had never been to a formal bank to transact money in any form. This stresses the importance of N/T in the country and calls for sound assurance and safety policies from the government.

It was disclosed that the amount generated varies between groups, and the demand for loans in some Njangi/Tontine groups is lower than the savings accumulated due to low propensity to invest in sustainable small business activities by group members. As in many developing societies, “borrowing for productive activities is of short term, whereas longer term borrowing takes place to meet social obligations” (Timilsina P.P. 1992). Very often, borrowing is for weddings and other ceremonies and not investments. However, the groups are not concerned about what the loans area for. All that is important is the repayment of the loan, plus interest. The problem is the accumulated savings piling up, which sometimes exposes members to burglary attacks. Data from the Njangi/Tontine groups indicated that the contribution rate can be extremely high for the urban groups and low for the rural groups. Given that people in the rural area depend only on the sales of agricultural products, the level of group savings, of between £100 - £150 per month in such areas was seen to be very impressive. This amount is capable of creating small income generating activities.

Examining this view from the concept of rationality, the money generating groups are constrained by forces in their environment. Rationality concept suggests that an entrepreneur chooses the alternative action that maximises his wealth. We see that if we are to predict the Njangi/Tontine member’s behaviour, the knowledge that they are rational, is only a small part of the information that we require. Their intention to be rational leads to particular behaviour only in the context of conditions in which their behaviour takes place, (see Simon 1982). Conditions of their environment are to be seen as given. On the basis of this reasoning, we see that the problem of a group of

small business entrepreneurs is lack of ability to generate business ideas when there are following the many opportunities available.

Entrepreneurs by definition are people who coordinate resources, and make things happen based on judgemental decisions. As resource mobilisers for investment, they should think strategically and not emotionally. By taking strategic decision to generate business alternatives, they can change some of the obstacles that constrain business undertaking in the society. Entrepreneurs cannot expect to function in a problem free society. Such a society will never be, despite their assumed important role in society in terms of economic development. Entrepreneurship is getting the bull by the horn. Research revealed that the degree of corruption in the country is high (see report international).

Again, examining the views presented and analysing them from the perspective of risk aversion and a rational decision point, one would say it is rational for money not to be lent to non members. They are bound by the forces in their environment. Rationality concept suggests that an entrepreneur chooses an alternative action that maximises his wealth. The problem is that to be rational, they must make decisions that lead to particular behaviour which is only prevalent in the context of the conditions in which their behaviour takes place (see Simon 1982). Their decision base seldom considers other economic variables.

It is certain that the members have to adopt precautionary measures to safeguard their generated resources because, "initiatives in commerce or in manufacturing at first (represents) essentially a defensive strategy" (Bull A. and Corner 1993 P: pp86). The rationality concept also suggests objectivity. The problem here is that of risk of non repayment which is more of a policy matter, therefore motivating the thought of uncertainty. Although by definition, entrepreneurs are risk takers, risks are of different categories: risks that require government policy action and those that require the entrepreneurs' action. Lack of good policies leave the saving generators with three choices: (i) keep the money in a safe at home (ii) put the accumulated savings in a bank current account since the money must be available when needed by members (iii) lend to non members using collateral and (iv) lend to non members through private well established money institution.

The saving mobilisers as small businesspersons are constrained by risk and uncertainty, and as such their level of rationality is bounded. They have very little information on how their potential debtors will behave, given that the justice system is corrupt. According to the theory of the firm, the given objective is to maximise profit (Simon 1982), and this can be done in a variety of ways, it is only a matter of decision. The depositors in N/T houses "expect the deposits to maintain their value (to be redeemable at par)" (White 1991 p 208) as such mediators who are likely to eventually not repay the loan or repay with reduced valued money are likely to be rejected.

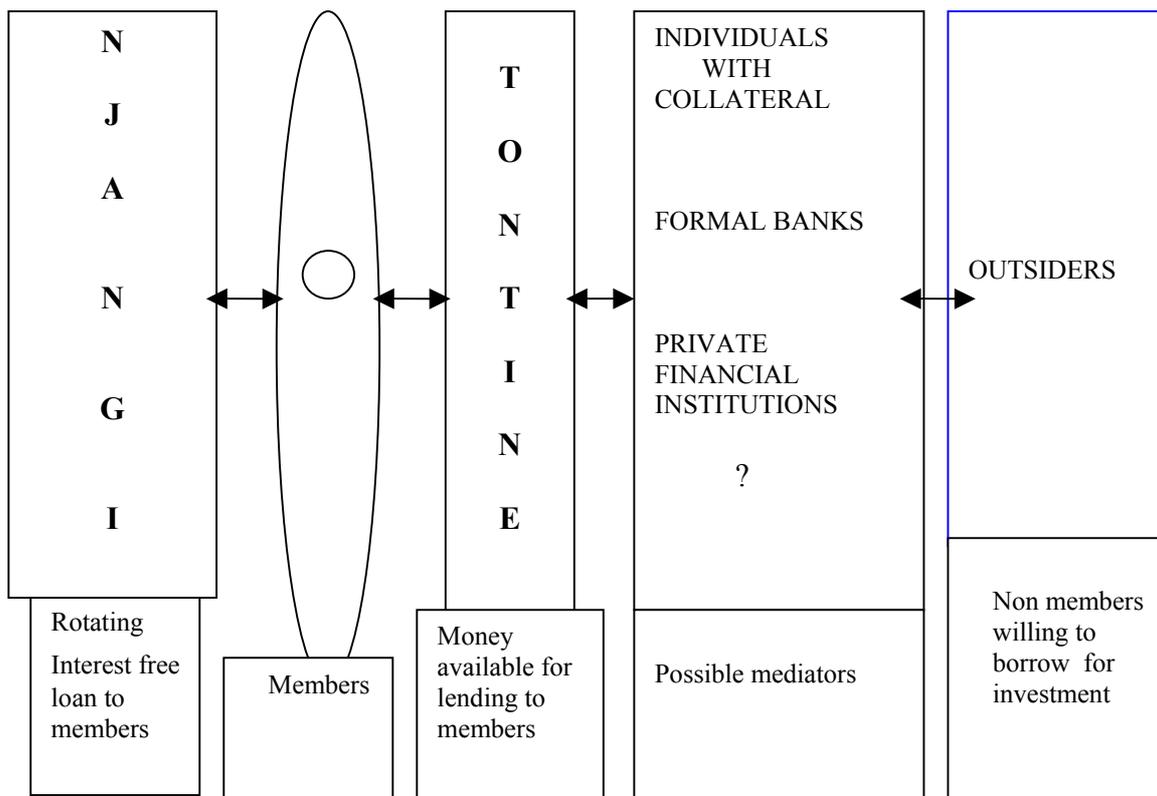

Savings mobilisers need safety regulation "Depositories engage primarily in two activities: taking in deposits and extending credit" (White (1991). This applies to all money mobilising institutions, banks, Credit Unions as well as N/T. Thus sound, safety and assurance policies for N/T groups are imperative because following the interview result, more than 70% of small businesses operating in Cameroon get finances from such groups. N/T houses are special; their voluntary saving ability along with their ubiquity in use and importance as household assets provides an argument for safety

regulation. White (1991) argues that depositories are special; their liabilities make them different, and are treated by the public differently.

Looking at the savings mobilises' decision of not lending monies to non members from the point of bounded rationality, the possible three mediators available to them are: Individuals with collateral; Formal banks and private institutions, which have to be closely examined and their consequences analysed.

The key question here is: how can the Njangi/Tontine members be motivated to grant loans to outsiders? Diagram. 2 suggests a model with possible mediators.

**Diagram 2 The possibility of using conduits**

The problem is: which of the conduits can be selected as trustworthy to ensure the repayment of loan disbursed? Examining the credibility of each mediator, the result is as follows:

**Individuals having collateral** were found to be unacceptable by the group members for the reason that they found them to be very deceitful. Members revealed that there have been instances where collateral is accepted, and the owner turned around and reported theft or blackmail; the system being corrupt, justice was given in favour of the claimant and the Njangi/Tontine members lost their monies. Members are therefore very sceptical in accepting collateral.

Formal banks were rejected on the grounds that, banks operating in the country seem to have lost their credibility in terms of trust and services. It was revealed that between 1989 and 1998, 4 major banks went bankrupt. Many customers lost their monies and some were paid their principal savings with no interest after two years. Although there has

never been a bank run, there were times when the banks were instructed by the government to serve a customer with not more than £25 at a time. It was also mentioned that ever since the restriction, the government did not come out with any statement explaining the reasons for that restriction. N/T members were therefore sceptical about using the banks as a mediator. In their opinion, although they are sometimes forced to put monies in current bank accounts, they do so at a very high risk. According to the members:

“It is the banks’ behaviour that has helped to strengthen the functioning of Njangi/Tontines in the country. We try to encourage members to borrow by penalising those who do not borrow by levying a 10% fine on their interest earned.”

Penalising members is immediately seen as a poor strategy because it is likely to create a distinct bias against saving and motivate a high propensity to consume money. Not everybody can operate a business. Saving is already a business in its own right.

However, concerning private financial institutions, two institutions were suggested, Credit Union and Mutuelles Communautaire de Croissance micro banks (MC2). The choice of Credit Unions was immediately rejected by 130 groups (87%) on the basis that they function just like N/T but are better organised and on a larger scale. MC2 as a conduit was widely accepted, thus its brief history is required here. In the mid 1990s, a new micro banking system was innovated by CCEI bank (now called First Afrilands Banks) which is also the parent bank of MC2. Its operation is strictly based in the rural areas of the country. It is a micro-bank with a focus on development in the rural areas.

Its objective is to mobilize a community's financial resources and use it for the development of the community in question. It is a self-help bank, created by members of a community. The MC2 bank is not established in a manner, which the initiators would tend, to bring their private interests to bear on operation and management. The people of the community control operation and management because the micro-bank is their collective effort. The micro bank capital is generated by the people of the community where the bank is to operate. The annual interest generated is divided into two, 50% is kept aside for community development projects and 50% goes to the individual benefactor and of this, 25% is retained as savings. The MC2 symbol conjures up Einstein's formula of a joint action of rural population, coupled with the integration of sociocultural ancestral values into modern management, (Fokam 1998). According to the President of the CCEI Bank, founder of MC2, Fokam (1998) the organization of the micro-bank is based on the principles that: “the survival of a community lies in its cultural values; and its ability to generate self-help activities.”

MC2 can be seen as a complement to the saving culture, which exists in the society in a scientific and technologically oriented age. The MC2 builds on the principles of N/T culture, but is linked to foreign banks through its parent bank. The micro-banks also give loans only to their customers. It is also restricted to the members of the community in which the micro-bank operates. To qualify for a loan, members of the community have to buy shares and operate an account with the bank.

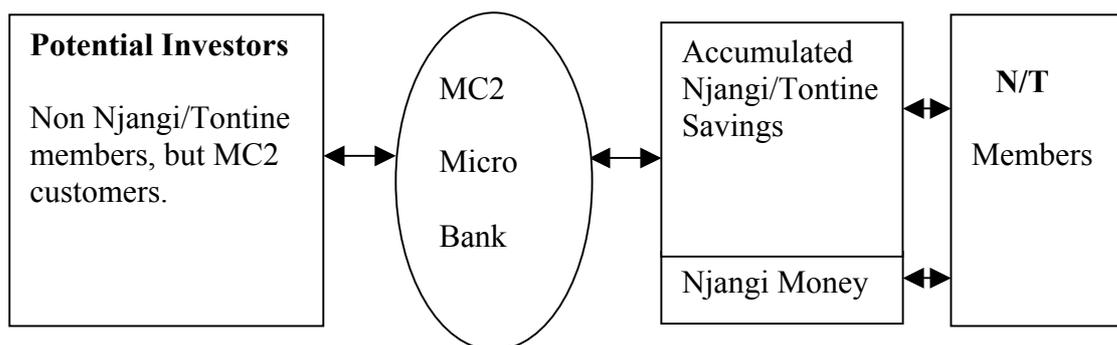

The advantages of using the MC2 bank, is that it has a larger customer base, it is local and encourages people of the same community to mobilise capital for larger long-term business undertakings. Rich members of a community living in Diasporas can indirectly contribute to the development of their communities by saving through their relatives. Using this channel large amount of money can be made available to potential investors

who are non-Njangi/Tontine members, but are members of the MC2 micro bank. The MC2 amalgamates small Njangi/Tontines group monies and make them available to potential small/medium size business investors. Cooperation is the only sustainable way to overcome individual limitation, (Bernard 1979ed.; Yunusa 1998). The acceptance and creation of an MC2 bank is an indication of a community's determination to fight their state of penury and to move forward in creating sustainable income generating activities aimed at improving the quality of life of the people.

The MC2 micro-bank was accepted as a mediator by 110 Njangi/Tontine groups, out of 150 groups interviewed, an acceptance rate of 73%. To many groups, it is a form of collective investment, and it was seen to pose very little problem compared to the other mediators examined, and partly because most group formations are based on ethnicity. The few groups left out were those from areas where the MC2 is not yet in operation.

Assuming that policies which ensure fair justice and good governance are made, the Njangi/Tontine system will gradually take on the dimension as illustrated in diagram 3. This second dimension, "Nwahkain and Nyo", implies that the MC2 is going to pull the money from the Tontine group and give it to potential investors in need of capital for investment and not to swallow, as the Nwahkain and Nyo game originally suggests.

### Diagram 3 "Nwahkain and Nyo" System

In this model, Njangi/Tontine members who need capital for investment can still borrow, and then the rest can be saved in MC2 banks where it can still be accessed as well as being available for other potential investors.

The Njangi/Tontine groups also make a difference by having other positive effects on the functioning of the developing economies. They do not only mobilise capital from a pool, which extends beyond the resources of a single family or individuals, but they encourage savings, as well as expose t potential investors who can be earmarked for training courses on small business management. By so doing, the Njangi/Tontine groups and the MC2 bank perform the Leibenstein entrepreneurial function of overcoming individual limitations in important factor and production markets, (see Leff 1978: Hirschman 1958). At the start of a nation's economic development, small businesses play a vital role, due to there being less capital and a high skill demand. For this role to be sustainable, it is important that people are sensitised to generate finances which can then be used to initiate small businesses locally. Complete reliance on foreign capital for economic development is unrealistic because foreign donors can at any time withdraw their finance, making the economy precarious. The ability to generate your own money "is an independent way of life. It stands for something essential to our freedoms" (Theodore O. Enema in Kaplan 1979:ppvii). It is worth mentioning a Cameroon maxim, which says,

“Begged water cannot prepare a meal. To prepare a good and sufficient meal, you have to fetch your own water.” The Njangi/Tontine groups and the MC2 could possibly fetch water for Cameroonians to prepare decent meals. More so, as Fokam (1998) claims, “donation does not take into consideration existing process that can help (or develop) to assure perpetuity.” Generally each country has the primary responsibility for its own development. Other nations can only offer a helping hand. In (1701) Donaldson J. argued that begging should be banned and beggars housed in workhouses.

However, before concluding, it is worth summarising the key players, and the negative and positive consequences of their behaviour. Table 2 presents the summary.

**Table 2: Negative behaviour and its consequences.**

Key players	Action	Consequences
Saving Mobilisers.	Protect their money. (put in safes at home)	Money tied up in homes, unsatisfied demand for loan to potential small business people; high unemployment rate, intense poverty.
Government	Poor policies and Governance.	Low economic growth; high unemployment rate; insecure environment; high crime level;
Judiciary	Unjust.	Insecurity; savings piled up in houses with no lending going on; lack of capital to create small businesses; high rate of unemployment; and high crime rate.
Potential investors	No capital for investments	No investments, state of poverty worsens.
Banks	Handicapped	Empty coffers; stagnated economy.

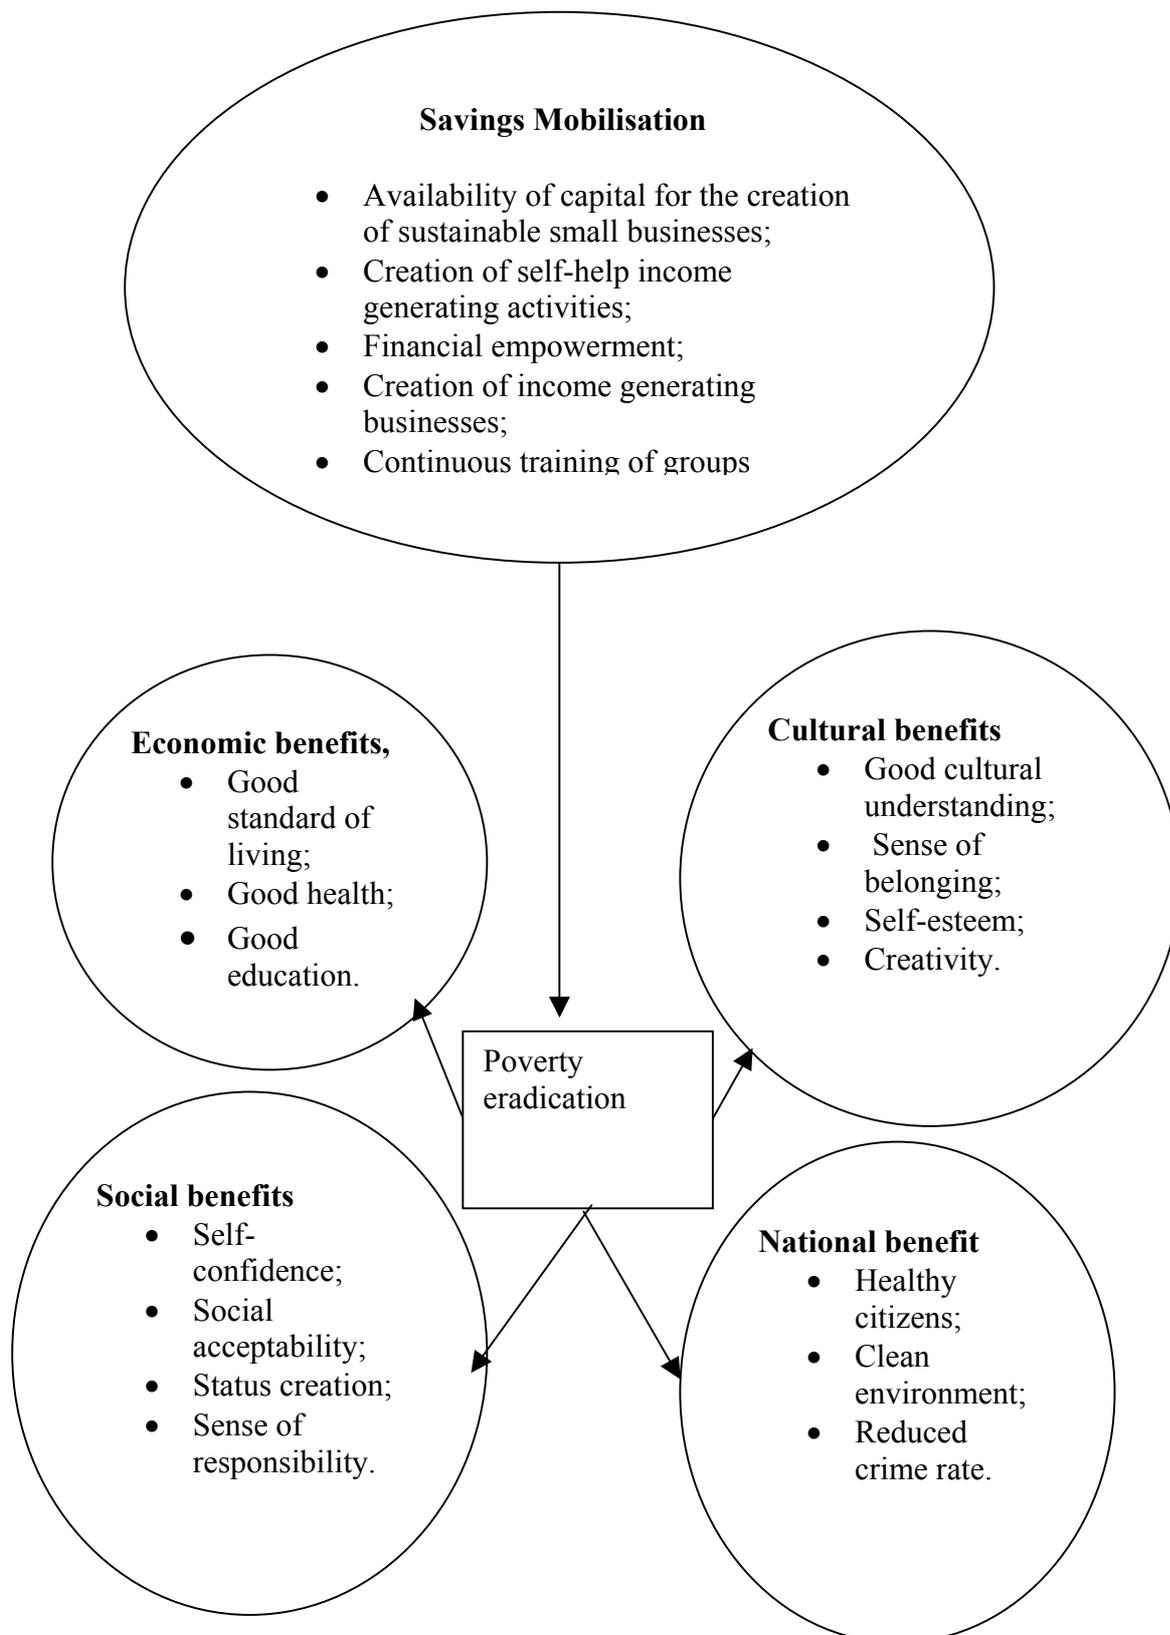

**Table 3 Positive Reactions that can emerge from good policies in the country.**

Key Players	Action	Consequences
Government	Good regulations and policies that insure security. Saving mobilisers motivated to lend money to outside investors.	Creation of income generating activities, economic growth, attraction of foreign investors.
Judiciary	Good Justice	Security and credibility enforced and economic growth picks up.
Saving mobilisers	Lend monies to willing investors	Earn good return on their money, more savings mobilisation
Potential investors	Encourage more investments	Savings will increase, and more money available for more investments.
Banks	High saving rate.	Money available for lending Creativity and investment in job creating activities; economic growth.
Society at large	People engage in many income generating activities.	Financially viable, low rate of poverty.
Researchers	Conducive environment for fruitful researches.	Technological and scientific learning, trying to understand what is going on, innovation and economic growth.

Presently, 85% of the small businesses operating in the country are financed by Njangi/Tontine money, despite its high interest rate (30-60%) compared to 18% bank interest. Entrepreneurs and small businesspersons still prefer it to formal banks because there is no administrative red tape or other charges. This is an indication that there is a problem which calls for policy adjustment. Considering the function of savings in terms of economic growth, it is imperative for good policies to be put in place to motivate savings, and putting them into circulation.

Table 2 suggests motivating policies which are likely to encourage: (i) free circulation of money; (ii) joint venture businesses and (iii) networking among entrepreneurs, small or big. Insecurity and lack of trust is devastating to economic development in the country. With a fair justice system, “the network becomes like a family dynasty-it unites different generations both the living and the dead” (Casson 1999, Dis.: pp 11). Saving mobilisers are likely to contribute to society by providing finances to revitalise business people and encourage potential businesspersons to start businesses. Diagram 4 illustrates the role of the Njangi/Tontine role in Cameroon society.

**Diagram 4 The role of N/T in Cameroon Society.**

Most African countries have depended on external help for too long. Help can only be meaningful if it is in addition to self-help. One cannot keep planning a budget based on other nations' pockets. Amartyr Sen (1981) notes: "by analysing poverty from income distribution, our concern becomes one of narrowing the differences between those at the bottom and better off in each stratification dimension" Poverty in all its realistic definition has to be fought, not from a few charity donors visions, but aimed at eliminating the escalating class of the poor. Poverty is a relative term that reflects the system of accumulation, distribution and management of a nations' wealth.

The rural labour force in Cameroon is growing rapidly, while employment opportunities are dwindling. Land, as the only resource available to the rural masses, is fast becoming inadequate. This calls for the creation of non-farm employment opportunities if deepening rural poverty and massive immigration to the urban areas is to be avoided. A short research carried out on women in micro-enterprises revealed the need to provide people with finances and the necessary knowledge to enable them engage in nonfarm employment opportunities, (Lema Forje 1998).

Without capital to finance the discovery of natural resources, they remain hidden and go to waste. Value has to be added to natural resources or else they have no meaning to a society. This value added comes about through investments. People at the grassroots are financially incapacitated, and this prevents them from exploring the huge wealth of material that exists in nature, and their environment for their common good, and to reduce their level of poverty. The President of the Cameroon Chamber of Commerce elaborated on this issue during a conference on the Islamic Development Bank and Cameroon businesspeople (Cameroon Tribune 11<sup>th</sup> February 1999). By encouraging Njangi/Tontine groups to lend monies to non group member investors, such savings are employed in income generating activities. Thus, the idea of "making things happen" which is a pure Schumpeterian entrepreneurship idea becomes effective. N/T is seen to make available capital which is necessary to transform innovativeness and alertness into opportunities for actual investment and production decisions, (Leff 1978: Kirzner 1973)

N/T also offers a cheaper, more efficient and sustainable financial resource to people in rural areas than formal banks. N/T takes the relatively small savings of large numbers of individuals, aggregate them and makes funds available for small and larger – scale enterprises, (see Stiglitz, 1989). This is socially desirable, because it will enable the creation of employment opportunities.

## **CONCLUSION**

The research has revealed and discussed the system of saving mobilisation in Cameroon. Their operating systems have also been examined and analysed. The role of the newly innovated micro bank, MC2 'Nwahkaine-Nyo' which is likely to create a new dimension in the Njangi/Tontine system, model has been discussed. It is hoped that the government will develop policies that encourage more savings in the country to enable a speed up of income generating activities.

The Njangi/Tontine groups remain a powerful source of saving mobilisation in Cameroon. The people's ability to save voluntarily is a strength within the Cameroon economy and should not go unnoticed by policy makers. It is important to assess the groups' behaviour from the point of a *"gradual change...from that of an economic unit whose principal aim*

*was that of survival to that of a unit able to some extent to assess economic alternatives and make decisions on the basis of that assessment”* (Bull 1993:pp5). Voluntary savings are a mark of self-determined entrepreneurial spirit in all its senses. A government cannot develop a nation alone; development in all forms needs to be participatory. Voluntary savings are an indication that the people are willing to participate in their country’s development, considering the hard time they face. Such voluntary saving practices are rare. Many government sponsored businesses have failed. Thillairajahs, S. (1994) describes state-financed African DFIs as having a 100% failure rate. There is the invariable assertion that the rich, or a chain of bureaucracy rather than the poor, very often captures any subsidy that is offered.

It is therefore imperative for the government to put in place policies that encourage more savings, and enable money circulation in the society. functional disciplinary machinery to fight the corruption so endemic in the society.

## **RECOMMENDATIONS**

The government has to ensure good governance in the country in order to encourage more savings.

The creation of more MC2 banks in the country should be encouraged, since it is likely to serve people in the rural areas better than formal banks. Its existence should also be given good publicity through the use of TV and radio.

The judiciary has to be functionally unbiased and incorrupt.

Policies to educate society on the importance of savings and investments are imperative.

# **RICH NETWORKING, COMPANY CHARACTERISTICS AND INNOVATION: SOME CONVINCING RESULTS**

**Pierre-André Julien, Richard Lachance and Martin Morin<sup>1</sup>**

## **ABSTRACT**

Contrary to neo-classical theory, under which the sole objective of all firms in an economy is to maximize profits, we now know that not only does development depend on networking, but network quality is also a major element in regional dynamism. Network quality is a function of the strengths and weaknesses, markets and strategies of member firms. Among other things, the firms that are most effective in terms of innovation and complex production tend to have connections with more “remote” or weak signal sources that change rapidly according to their needs and competencies.

As yet, very little empirical research has been done to measure the true scope of this approach. This paper reports the results of a complex study of networking involving 110 small and medium-sized enterprises (SMEs) in a region that has been in decline for the past forty years, but has recently experienced an upturn in job creation and the presence of high-growth SMEs. The study shows that the largest manufacturing SMEs, those that export the most, work in the most technology-oriented sectors or produce the most highly-processed goods – i.e. those that are the most innovative – maintain networks that are “remote” from traditional business behaviour, rather like weak signal networks.

## **INTRODUCTION**

Networks have always existed, even if most researchers did not discover them, or did not begin to ascribe importance to their role in business development, until a few decades ago. The ignorance of the research community is due largely to the impact of the old economic theory stating that companies work in isolation and compete on markets with varying levels of ferocity. However, more modern theories of industrial economy, such as that which regards firms as contractual cores (Jensen and Meckling, 1976), or that of Richardson (1972) and especially Powell (1990), according to which most firms function in conjunction with other firms upstream, downstream or transversally, have shown that a firm’s development is by no means independent of its links with other firms and other players that provide resources and information, and hence ideas and opportunities for development. In short, entrepreneurship is a collective phenomenon far removed from the image projected by the classical and neo-classical economists.

---

<sup>1</sup> The authors are respectively Director and Researcher with the Bombardier Chair in the Management of Technological Change in SMEs at the Small Business Research Institute, Université du Québec à Trois-Rivières.

Since these early observations, a great deal of work has been done on business networking by geographers, economists and sociologists alike, showing that the long-term development of organizations is fostered if not explained to a large extent by the quality of their contacts with sources of new ideas and additional resources. Some researchers have identified different types of networks, while others have measured their impacts. Their findings, interesting though they may be, are nevertheless limited. Although we are able to identify various information networks and their impacts on territorial development (Maillat, Quévit and L. Senn, 1993; Johannisson, 2000), we still know very little about their microeconomic importance – for example, by type of firm, type of market and survival strategy. Indeed, researchers' findings on networks are comparable in many respects to their findings on technology watch, which have established different levels of watch but have not managed to link them to business performance (Raymond, and al., 2001).

The purpose of this paper is to establish links between the various sources of information and the markets and behaviours of SMEs in a region that has declined over time, based on source dynamics, source quality and the needs of the firms. The study also had an operational objective, namely to play a role in restoring the dynamism of La Mauricie, a core region of industrial Québec (Canada) whose economy had long been dependent on natural resource processing and cheap energy, due to the presence of a large river and extensive forests. These resources attracted significant foreign investments, especially in the pulp and paper industry, where seven large mills were created in the 1920s/1930s, and in the aluminium processing (one mill) and heavy chemicals (several plants) sectors, all of which required large quantities of cheap energy. In addition to this, the region also had a number of textile and garment factories dating back to the first industrial revolution. Towards the end of the 1960s, heavy chemicals were gradually replaced by oil-based chemicals, which required a deep-water harbour that the region was unable to provide because of the rapids and dams on its river. The traditional factories also began to close down, unable to survive competition from low-wage countries. Lastly, three pulp and paper mills were closed down and the number of jobs available in the remaining mills declined significantly as a result of new and more efficient machinery, growing competition from abroad and the longer distances to be travelled to obtain timber resources. The aluminium sector was similarly affected, and ultimately a region that, until then, had offered some of the best conditions of employment in Québec suddenly went into a steep decline. Not only that, but the large firms, by taking the best human and other resources (potential entrepreneurs hired as foremen, skilled workers, low-risk financing, consulting firms, etc.), had considerably hindered the development of small businesses.

In the last decade, approximately 4,618 of the region's 22,942 jobs (24%) were lost between 1990 and 1999 as a result of 214 business closures, including one very large firm. The job losses were primarily in the garment and textile (-50%), pulp and paper (-31%) and medical/measurement instrument (-29%) sectors. The food and drink and furniture sectors also lost out significantly (-40% and -47% respectively) through closures, but gained some new firms too (+42% and +67%), suggesting that the economy was beginning to turn around. The most effective sectors in terms of job creation were the machinery (+28%), metal products (+26%), wood (+25%) and mineral products, metal products, primary metals and transportation equipment (roughly +15% each) sectors. Small and medium-sized enterprises (SMEs) – new ventures and growth firms – were the principal source of the new jobs (Julien, Lachance and Morin, 2002).

In short, local entrepreneurship began to emerge, especially in smaller areas such as Grand-Mère and Louiseville. The number of high-growth manufacturing SMEs (gazelles) also began to rise. For example, data show that the share of manufacturing SMEs having between 10 and 200 employees in 1990 and at least doubling their workforce between 1990 and 1996 and 1996-2001 increased from 4.9% to 13.2% in the Shawinigan-Grand-Mère region and from 5.1% to 8.9% in the Trois-Rivières, although it declined somewhat in the Louiseville-Maskinongé region, from 16.5% to 11.1% (Julien, 2004).

However, the upward trend is still very fragile, and these newly created firms must now turn to networking if they are to consolidate their gains. It was for this reason that we decided to investigate the region's current networking practices. This paper will begin by reviewing the variables explaining the benefits of networking, and will then go on to discuss the research methodologies used, present the findings and discuss a typology showing the links between network choices and business characteristics. Because the research also had an operational goal – that of helping to develop networks in the region – the conclusion examines some of its impacts in this respect.

## **THE PROBLEM SITUATION**

Basically, networks are links between individuals who may work alone but are more usually members of enterprises, associations or private, semi-private or public agencies. The links constitute sources of different information (OECD, 1993). The individuals in the network are linked to other sources, thus forming complex chains able to provide a wide range of information that is completed by formal, informal or impersonal auxiliary sources.

We know that entrepreneurs and their staff mostly tend to use informal sources and networks based on inter-personal contacts, and to complete them with other, more formal sources (Johnson and Kuen, 1987; Brush, 1992; Julien, 1995), naturally applying the theory of the philosopher Habermas (1981), who explained that inter-personal exchanges trigger action during the communication process, thus facilitating change.

Businesses have varying numbers of networks, which may or may not be interlinked, depending on the experience of management, executives and key employees. For example, many SMEs use their employees' networks to find new staff (Fabi and Garand, 2003) and their executives' networks to support government grant applications (Johannisson, 1995; Julien and Lachance, 1999). All these networks are composed primarily of players from the region, including some with connections to other interlocutors at the national or even international level, although some entrepreneurs may also have their own direct contacts outside their regions or abroad. The networks overlap to varying degrees, and they also evolve and are reconfigured as new members are added and new goals established.

Within the region, networks are basically inter-player communication structures composed of a series of physical and virtual information exchange mechanisms. They represent an expression of the shared conventions and collective mindset in a given society (Billaudot, 1999). They are also an expression of the regional community, and form the basis of social capital development (Bourdieu, 1980; Lin, 1999). Varied, dynamic, good quality networks will

be conducive to entrepreneurship and innovation. On the other hand, those that are limited to the region and founded on habit and aversion to risk will generate conformism.

When networks are dynamic, they offer an excellent means of systematically promoting the circulation of explicit and tacit information on a given area. Among other things, they enable information to be identified and then adjusted to the needs of entrepreneurs, thus accelerating their learning, helping them face up to change and generating enthusiasm. Networks fulfil a vital role for businesses by reducing the uncertainty and ambiguity of information used in decisions. This is especially true in that information provided by networks has already been sorted to some extent, since the members know one another, and has also been partially analyzed and measured in different ways by reasonably attentive and reasonably expert observers before being adjusted to suit the interlocutor's needs (Julien, 1996). People tend to retain information relevant to their fields, interests and past or future intentions, while remaining open to the needs of their friends or partners, who are often selected on the basis of the same criteria.

Network membership generates two types of information, namely information that is effective immediately or in the near future<sup>2</sup>, and supplementary "potential" information that facilitates decisions by providing additional resources or escape routes where necessary. Birley (1985) accurately describes this latter type as "reassurance". When adjusted to suit the entrepreneur's needs, effective information and potential information is easier to understand and more likely to lead to action - unless, of course, the network is conservative, and hinders rather than encourages dynamism.

Businesses have access to several different kinds of information sharing networks. Some firms keep networking to a strict minimum, while others are members of voluntary and strategic networks that extend far beyond so-called "natural" connections. Also available are "power" (or political) networks that help firms acquire monopolies, obtain special State assistance or, to use Adam Smith's 1776 expression, "deceive the public". Even socio-economic networks are not immune to this kind of misuse.

Natural networks, such as networks of friends and relatives, workplace networks, social club networks and so on, are known as social networks or embedded networks, and help their members to understand conventions, measure reputations and forge links with economic networks (Proulx, 1989; Johannisson, 2000). They may be ad-hoc or more specific, for example based on geographical proximity, as in the case of a technopark network. They may be created for short-term purposes, such as for an industrial fair or scientific conference, or they may be built voluntarily or gradually to meet more complex information needs. These latter networks are described as "strategic", and are developed to support dynamism, for example in an industrial district or science park, where the firms are dependent on one another to some extent, or to support training and complex information.

From an economic standpoint, there are distinctions between personal and business networks and between transaction and information networks. Personal networks are usually composed of staff members, executives or key employees, close or more distant family members, friends or former schoolmates, specific customers, specific members of

---

<sup>2</sup> I.e. information for decision-making purposes; this information is rarely completed due to lack of time and resources, giving competitors time to act first.

entrepreneurship associations, and so on – in other words, people with whom there is a strong emotional connection and hence a high level of trust when discussing the firm's development. Generally, such networks have nine members, at least in northern countries, with the number rising to fourteen in more southerly countries (Birley, and al., 1991; Julien, 1995; Drakopoulos Dodd and Patra, 2002), illustrating the varying impact of culture on entrepreneurship, especially with regard to developing countries and informal enterprises (Sverrison, 1997; Davies, 2001). A personal network may be partly organized as a board or quasi-board of directors, or be called into play as needed, for example to test new ideas or obtain opinions or feelings about changes in the firm's environment.

Business networks are composed of stakeholders in the firm's various transactions, either upstream or downstream. Upstream are suppliers of raw materials, parts or finished products, equipment suppliers, financial institutions and so on. If well connected, they are able to provide prospective information as well as structural short-term information. Raw material and equipment suppliers, for example, can give advice on stock levels to help the firm take advantage of lower prices or avoid anticipated price hikes, or could suggest keeping a given piece of equipment for longer than planned because a new and better technology is due to be released in the near future. Downstream are customers and intermediaries such as transportation contractors and distribution sector firms (wholesalers, advertisers, etc.). These latter can be extremely valuable, not only in helping market products, but also by providing information to trigger changes in products or distribution methods, or to help develop markets. For example, if truckers are on the lookout for changes in the firms to which they deliver goods, they can help their employers to broaden their markets, prevent incursions by competitors or make changes to distribution systems in order to be more competitive. Their advice is beneficial to both the producer and the transporter.

Another kind of network is the information network, which usually comprises consulting firms, training organizations, the advisory branches of financial institutions, research centres, various government assistance agencies and exhibition contacts. Networks such as these may simply provide general information, such as audit and accounting services or quality system certification, or they may be much more active, actually stimulating change by providing firms with new information that enables them to innovate and stand out from their competitors.

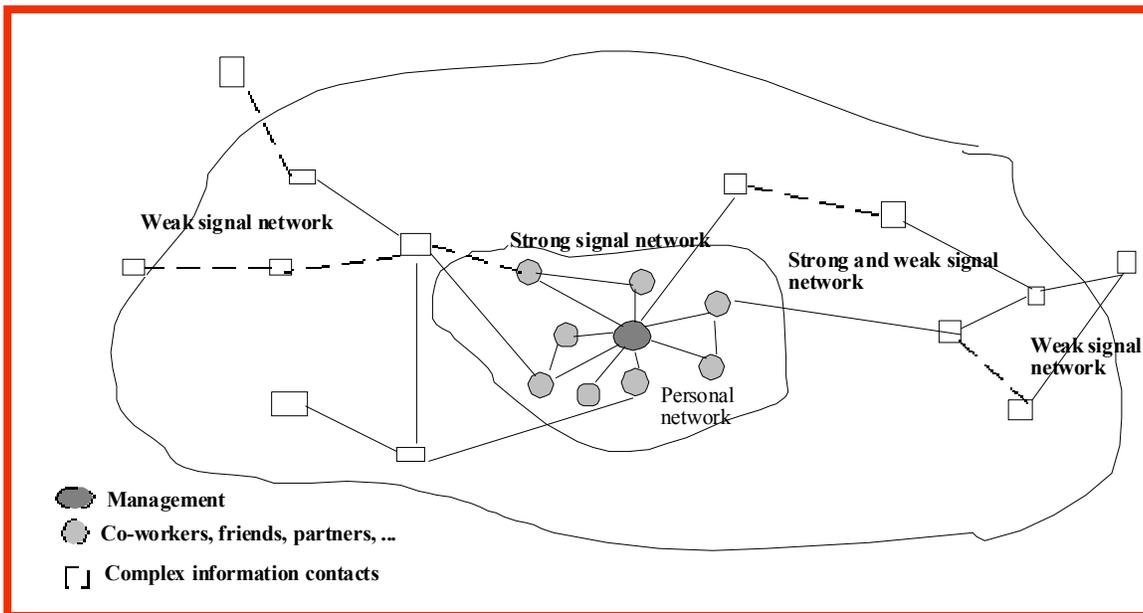

Obviously, members of business or information networks may also become members of personal networks and hence be consulted more frequently, depending on the quality of their information and the level of trust developed. Discussions with information network members may be regular or sporadic, again depending on the quality and extent of the information offered and shared.

Sociologists (Langlois, Granovetter, 1973; Krackhard, 1992) have drawn a distinction between strong tie networks and weak tie networks. The former are the result of frequent contacts with close collaborators, generating a high level of knowledge and mutual trust. The latter tend to be more "distant" from the firm's natural environment or sector, involving people who are encountered sporadically or only once. For Granovetter (1982; 1995), strong ties usually produce a more intense relationship between the interlocutors, promoting closeness and transitivity between sources, thus leading to more repetition and hence less new information. Strong ties tend to create closed zones, reproduce the same mental representations and provide overlapping information, while weak ties act as bridges to other

networks for specific, one-off, new (and usually partial) information (Sundbo, 1998). These studies assert that innovation is derived principally from weak ties; strong ties tend to promote conformity within the group, unless it accepts deviance. In other words, friends and close acquaintances tend to resemble one another and their contacts rarely lead to innovation, whereas contacts with new people lead to rejection or questions that, in turn, generate development.

From the economic standpoint, and in light of the information bias discussed earlier, we believe it is preferable to use the terms “strong signal” and “weak signal” networks. Generally speaking, strong tie networks provide information that is easy to understand – in other words, based on strong signals - whereas weak tie networks usually provide weaker, more sporadic signals that require more effort to be understood (Julien, Andriambelason and Ramangalahy, 2003). Weak signals must be interpreted. They often need to be repeated due to inattention and lack of trust; either that, or confirmation must be obtained from other sources. For Caron-Fasan (2001), the notion of weak signal is closely linked to limited duration and retention difficulties, especially as weak signals tend to be buried and scattered in a host of other information and “background noise” (Leska, 2001). Weak signals come from organizations that are “removed” from traditional business fields, such as research centres and universities (Friedkin, 1980; Woodward, 1988), but also from chance meetings. They may also be found in tacit internal information – for example, information from machine operators or sales agents. To penetrate a weak signal network, entrepreneurs must usually act through intermediaries who are members of strong signal networks, as shown in Figure 1, which illustrates the relationship between different types of network links.

**Figure 1. Diagram of Entrepreneurs’ Principal Networks**

Source: Adapted from Johannisson (1995)

However, the richest networks combine strong signals (because their members are used to working together) and weak signals (because of differences in the members' knowledge and know-how). Such networks include alliances with other dynamic firms to support research and development, for example (Gulati, 1991). Another highly effective form of networking is membership of a network enterprise, usually comprising one major order-giver and different levels of sub-contractors (Aliouat, 1996). Their purpose is to create shared synergy or a group learning system that enables the network to stand out from its competitors. An example would be the Bombardier Chair network (Julien, and al., 2003).

Network structures differ in terms of types of contacts, the positions of members, the level of proximity, and their size, density, diversity or quality. Contacts may be primary, i.e. direct contacts between members, or secondary, i.e. indirect, through intermediaries who are members of the network. These indirect contacts lend credence to secondary information, even though its source is unknown to the recipient, because of the recipient's trust in the intermediary. The intermediary can also recommend ways of approaching the information source to derive maximum benefit from the desired information. In many networks, contacts are established along a chain of people who know each other well, so that the information obtained is as precise as possible and answers the question asked. It is these secondary contacts that are the principal benefit of a network structure, since they reduce the time required to remove obstacles to innovation by providing firms with mechanisms for action.

Shan, Walker and Kogut (1994) found a positive link between the number of relations in a network, their position within the network, and innovation. However, there are still many fuzzy areas and many questions to be answered, among other things because of the way networks tend to complement one another and the fact that information gathering is a cumulative process that depends to a large extent on the firm's ability to absorb the data obtained.

A good primary network therefore need not necessarily be large, since one of its roles is to provide contacts with other networks. Based on the principle of least difficulty (Bok and Toulouse, ... ), a network that is too big generates too much "noise", or misunderstanding, due to the members' lack of reciprocal knowledge. Valency<sup>3</sup>, i.e. the ability to contribute, obtain and absorb subtle, appropriate information in a network, is determined by the number of members and the level of attraction or repulsion. If there are too many members, contacts will be tenuous and the information available will be of poor quality because the members do not know one another well and are therefore unable to adjust the data to one another's needs. Conversely, if there are too few members, the information will be insufficiently varied and synergy will be lacking. Friedman (1978) calculated that the optimal number of members (along a bell curve) is approximately 15, and that larger groups will tend to break down into subgroups of roughly that number, to limit noise and allow for the creation of effective partnerships.

The number of members is not the only defining factor, however; there is also the question of diversity and multiplexity. A network composed of people who share similar ideas is not particularly rich, since it will not usually generate many new or complex ideas, or may simply provide the same information over and over again. Repetition is not necessarily a bad thing, especially for entrepreneurs who may be distracted. However, Burt (1995), with his theory of

---

<sup>3</sup> In chemistry, valency is the number of atoms able to interconnect. In psychology, it is the subject's attraction to (positive valency) or repulsion from (negative valency) others.

structural holes, i.e. missing links between potential interlocutors, stated that the more holes there are, the less the information will tend to repeat, and the newer and richer it will be as a result.

Either way, a good network should be composed of different types of members contributing different ideas - although diversity without depth, i.e. without frequent discussion, prevents the members from getting to know one another properly, with the result that they are unable to adjust their answers to their interlocutors' needs (Degenne and Fossé, 1994; Human and Provan, 1997). Network quality is measured by the members' ability to provide rich information, i.e. information that is timely, new, decoded and adjusted (Darf and Lengel, 1984; Weick, 1993). The more diverse a network (Aldrich and Zimmer, 1986), the more its information comes from experts as opposed to peers (Rueff, 2001), the greater the number of information channels (Nonaka, 1994) and the more capable the entrepreneurial team of absorbing the information (Cohen and Levinthal, 1990), then the higher the quality of the network.

Like the information itself, which differs according to needs and absorption capacity, quality differs according to the strengths and weaknesses of the firms, the type of market and the firm's strategy. A very small firm operating in a niche such as customized furniture or antique reproductions does not need as complex an information network as a biotechnology firm, and a capacity subcontracting SME can, to some extent, use its order-giver's information networks, whereas a haute couture firm needs worldwide connections to forecast future colours, fabrics and fashion trends.

## **METHODOLOGY**

The population of regional firms used for the research was obtained from the 1999 directory of a financial assessment firm (i.e. the Scott directory, published every year, in which manufacturing firms register voluntarily). For the Mauricie region of Québec, Canada, the directory contained 532 manufacturing firms for the year in question. Ninety-two firms that were not members of regional networks were eliminated; these included the large paper mills, metal product and chemical product manufacturers, along with some small and medium-sized companies whose decision-making authorities were located outside the Mauricie region. This left 440 firms, plus a further 100 firms identified by the Francheville local development centre (LDC) within the Francheville regional county municipality (RCM)<sup>4</sup> that were not in the original Scott database (mostly recently created small firms). We therefore mailed a total of 540 questionnaires, 34 of which were returned unopened because the firms no longer existed. The total survey population therefore comprised 506 firms.

The questionnaire was composed of 21 questions divided into three sections. The first section examined the entrepreneur's management experience and membership of associations, while the second addressed the firm's development (sales, profits, exports, strengths and problems), and the last was concerned with the entrepreneur's networking

---

<sup>4</sup> A regional county municipality is a grouping of villages and cities within a fairly small area, with a total population that is usually under 100,000 inhabitants. The RCMs were created by the Québec government to oversee shared services and plan local development. Québec has 95 RCMs, excluding the large cities.

activities (number and type of people, time devoted to networking, satisfaction level, etc.). The questionnaire was addressed to the firms' owner-managers.

We sent out reminders, along with additional copies of the questionnaire, to 167 firms that did not respond to the first mailing. In all, 110 firms submitted responses, for a total of 22% of the original population of 506 firms. Table 1 shows the distribution of respondents by size and geographical location.

There was one notable difference in response rates by size of the firm, in that we received responses from only 12% of firms having fewer than five employees, compared with 26% to 28% for the larger firms. Thus, if the under-five-employee group is excluded from the population, the overall response rate is over one-quarter (27%). The low response rate for the smaller size group is somewhat surprising; it seems reasonable to think they would be more interested in joining regional networks and hence more interested in answering the questionnaire. Perhaps, in reality, they are indifferent to the issue of networks, or do not feel involved. In any case, although their reluctance to respond did not compromise overall representativeness, it is clear that the sample is more representative of the population of firms having five or more employees. The results presented here therefore apply this population only.

**Table 1. Representation of Respondents: Size and Geographical Location**

	All Sizes			5 Employees and Over Only		
	Population	Respondents	%	Population	Respondents	%
<b><u>By size:</u></b>						
1 to 4 employees	175	21	12%	-	-	-
5 to 9	103	27	26%	103	27	26%
10 to 19	92	26	28%	92	26	28%
20 to 59	80	21	26%	80	21	26%
60 to 600	46	13	28%	46	13	28%
Total	496	108	22%	321	87	27%
<b><u>By RCM:</u></b>						
Haute-Mauricie	8	2	25%	4	1	25%
Mékinac	47	13	28%	29	11	38%
Centre-Mauricie	78	17	22%	49	14	29%
Maskinongé	81	16	20%	64	13	20%
Francheville	292	62	21%	175	48	27%
Total	506	110	22%	321	87	27%

With regard to geographical location, the Mékinac RCM provided the highest response rate, with 28% of respondents if the very small firms are included and 38% if they are excluded. The Maskinongé RCM contributed only 13 respondents (20%), instead of the 17 it should have provided (27%). Response rates in the other RCMs were close to the mean. The Francheville RCM, which contains the region's largest city (Trois-Rivières), accounted for 292 of the 506 firms in the sample, i.e. slightly over half, and also provided slightly over half the respondents.

The principal results from the survey are presented in three sections. The first section describes the principal networking practices of the respondent firms, i.e. the main people contacted, the time devoted to networking, creation of new contacts and overall satisfaction with networking activities. The second section presents an “orientation indicator” for owner-managers’ contacts based on distance from or proximity to the firm. The purpose of this is to operationalize the notion of weak and strong ties discussed earlier. We will explain in detail how the indicator is calculated in the “General Results” section. Also in the second section are the results of comparing the indicator against the size, industrial sector, type of product, strengths and difficulties of respondent firms.

The third and last section contains a typological analysis of the information sources used by the sample firms. As a result, we were able to classify each firm into a specific behavioural group (or type). Our hope was to identify some qualitative, as opposed to quantitative, differences between the groups (i.e. different behaviours or associations); it was this that made the analysis more interesting than a unidimensional scale would have been. The groups presented were classified according to the types of contacts the owner-managers said they maintained for discussion of their firms’ development.

We also present the group profiles, differentiating between behaviours according to certain general characteristics, including membership of associations, types of people contacted, and the level of expertise and difficulties declared by respondents.

## **GENERAL RESULTS**

The general results concerning networking practices show that two-thirds of respondents had discussed various aspects of their firms’ development with at least five different people in the six months preceding the survey. Some 20% talked to between six and ten people, 9% with between 11 and 20 people, and 5% with more than 21 people. Three-quarters (72%) also said they spent less than five hours a week on this activity, with 23% spending between six and ten hours, and 5% spending more than 11 hours.

The principal people involved in the discussions were more or less the same as those mentioned in the scientific literature (Johnson and Kuen, 1987; Fann and Smeltzer, 1989; Bruschi, 1992; Julien, 1995), namely personal friends (75%), customers (72%), suppliers (71%), other entrepreneurs (69%) and consultants or professionals (65%). Other, less commonly used interlocutors included financial institutions (49%), government agencies (35%), industrial associations (24%) and competitors (21%). If we look at the total number of people consulted by the 110 respondents on issues relating to business development, other entrepreneurs rank first (113 people, or an average of one per entrepreneur), followed by friends (107 or nearly one per entrepreneur), customers (105 or an average of 0.95 per entrepreneur), suppliers (101 or 0.91) and consultants or professionals (99 or 0.90).

Most of the contacts were with people the entrepreneurs already knew, and can be described as strong ties providing strong signals. Some 30% of respondents said they had not talked to any new people, 46% estimated the number of new people at only 10%, 10% estimated the number of new people at 25%, and only 13% said more than half their contacts were new

people. The new contacts were not always sustained over time; 75% of respondents said they kept in contact with only a few people, and only 29% kept in contact with most of their new acquaintances. It is therefore reasonable to state that single meetings resulted from weak ties and provided weak signals, whereas recurrent meetings gradually evolved into stronger ties providing stronger signals.

Overall, the respondents said the time and energy spent on maintaining and developing networks was “fairly” (60%) or “very” (22%) advantageous to their firms. Only 19% thought it was “not very” advantageous, suggesting that, in these cases, the networks were slow to develop.

One of the aspects of networking of particular interest to us was the notion of strong and weak ties, or the contact’s proximity to or distance from the firm. To establish proximity and distance of contacts, which we refer to as the orientation indicator, we weighted the different types of ties mentioned by respondents. Taking the theoretical elements shown in Figure 1, we ascribed a weighting of 1 to the entrepreneur’s personal contacts (co-workers from prior employment, personal friends, key employees, etc.), a weighting of 2 to the firm’s business contacts (customers, suppliers, financial institutions, etc.), a weighting of 3 to other indirect contacts close to the firm or the entrepreneur (other entrepreneurs, industrial associations), and a weighting of 4 to indirect contacts further removed from the entrepreneur (competitors, consultants or professionals, government or public agencies, universities, research centres, etc.). The weighted total of all declared contacts became the orientation indicator. The higher the indicator, the further *removed* the contacts from the entrepreneur or the firm (e.g. government agencies), the more likely they are to be weak ties providing weak signals. Conversely, the lower the indicator, the *closer* the contacts to the entrepreneur or the firm, the more likely they are to be strong ties providing generally strong signals.

We compared the firms’ level of networking satisfaction with the orientation indicator and other survey variables. For example, we asked the firms if they had made profits or increased their sales in the last year, and if they expected to do so in the coming year. The results of these comparisons were significant.

The most significant finding to emerge from our assessment of networking activities was the fact that the more satisfied respondents were with their networking efforts, the more likely they were to have increased or anticipate an increase in their sales, the more their firms’ profits had increased, and the higher their orientation indicator. In other words, the people they had consulted were further “removed” from the firm, and constituted weaker ties than the firm’s regular business contacts. Our findings in this respect are shown in Table 2 below.

**Table 2. Some Findings Relating to Networking Satisfaction**

Satisfaction with networking activities	n	Increased sales	Increased profits	Anticipated increase in sales	Contact orientation indicator
Not very	19	3.0	4.0	3.5	4.0
Fairly	61	3.1	3.9	3.5	5.3
Very	22	3.8	4.5	4.1	6.7
Overall	102	3.3	4.0	3.6	5.3
Linearity* (sign.)		.000	.031	.000	.001

\* Significant according to the Mantel-Haenszel linearity test.

These results suggest that a network of contacts directed towards weaker links will help the firm achieve positive operating results. As we said earlier, the idea of “remoteness” is easier for business people to understand than the notion of “weak signals”, and yet the two are highly consistent, because in both cases the sources are less familiar with the entrepreneur, the firm and probably the industry itself. Table 3 also shows that the more employees the firm has, the more it is likely to turn to remote (weaker signal) sources.

**Table 3. Contact Orientations by Size, Industrial Sector, Type of Products and Exporting**

<b>Size</b> (Number of Employees)	<b>n</b>	<b>Mean Orientation Indicator</b>
1 to 4	18	4.25
5 to 9	23	4.50
10 to 19	25	5.41
20 to 59	18	5.79
60 and +	12	6.62
<b>Industrial Sectors</b>		
Chemistry	2	3.17
Rubber/plastic	3	3.62
Mineral products	7	3.82
Medical instruments	3	6.93
Electric/Electronic	5	9.22
<b>Type of Product and Exporting</b>		
Lightly processed materials	24	4.04
Technology products	10	8.33
Exporters	35	6.44

As well as size, industrial sector was also a factor in determining the orientation indicator. For example, the electric/electronics sector obtained by far the highest score, at 9.22. Generally speaking, firms producing lightly processed goods had lower orientation indicators, meaning their information sources were closer to the entrepreneur or firm, than those producing technology items (4.04 as opposed to 8.33). Exporting firms had higher than average orientation indicators (6.44).

We also compared the strengths and difficulties mentioned by respondents against the types of people contacted<sup>5</sup>. We found that contacts and sources varied according to the firm’s strengths or perceived difficulties, suggesting that technology watch or networking is tied in with the firm’s prior or current needs. For example, if a firm’s strengths lie in certain practices or areas, this may be explained by its contacts with certain sources, or on the contrary, if its strengths are sufficient, sources may actually be abandoned as they lose their utility. However, if a firm experiences certain difficulties, this may be due to the fact that it is unaware

<sup>5</sup> Table 6 presents a full list of the strengths and difficulties proposed in the questionnaire.

of information sources that could help it, or it could explain why the firm uses certain sources rather than others, in the hope that they will help it solve its problems.

The analysis shows that firms with strengths or difficulties related to partnerships or strategic alliances are more likely than others to consult competitors, consultants, professionals or public and government agencies. Similarly, firms that have introduced or are finding it difficult to introduce advanced production methods are more likely to be in contact with consultants and professionals. On the other hand, those with good R&D skills are more likely to have strong ties with customers, other entrepreneurs and consultants, while those with R&D problems tend not to have sufficient contact with their customers, but have more contact than average with financial institutions, other entrepreneurs and (especially) public agencies. Firms that have solved the problem of obtaining skilled labour tend to work more with consultants and professionals, while those that have not tend to work less with their customers and more than average with government agencies. In the case of workforce training, firms that feel they are strong in this area make more use of sources such as other entrepreneurs and consultants, while those that have problems tend to have less contact with their competitors and more with government agencies. Lastly, firms that feel they have good total quality skills tend to consult other entrepreneurs, competitors, consultants and (especially) industrial associations, while those that are weaker in this area have no particular sources of information, except perhaps other entrepreneurs.

## **A TYPOLOGICAL ANALYSIS**

A typological analysis is a method that seeks to identify types of behaviour within a population. It involves first establishing a classification and then counting the number of matching firms. Or, as we did, the classification variables can be used in a statistical process. We performed a hierarchical typological analysis using SPSS software (Wald's method), based on the contacts respondents said they maintained to discuss their firms' development. Each contact was ascribed a value of nil (0), a few (1) or several (2). We retained a four-group classification.

Table 4 shows that the 57 group 1 firms discussed their development only with their customers, suppliers or competitors (although no more so than the other firms), and rarely with other types of contacts. In other words, slightly over half the sample (60%) discussed development with a very limited circle of people.

**Table 4. Typological Analysis of Four Groups of People by Importance of Different Information Sources**

		<b>Groups</b> (Number of firms per group)			
<b>People Contacted</b>	<b>Number</b>	<b>1</b> (57 )	<b>2</b> (18)	<b>3</b> (11)	<b>4</b> (12)
Customers	None	13	3	3	9
	A few	43	13	7	2
	Several	1	2	1	1
Suppliers	None	19	0	2	9
	A few	36	15	9	3
	Several	2	3	0	0
Competitors	None	47	16	2	12
	A few	10	2	9	0
	Several	0	0	0	0
Consultants	None	32	0	0	3
Professionals	A few	24	18	10	7
	Several	1	0	1	2
Industrial Associations	None	51	15	0	9
	A few	6	3	9	3
	Several	0	0	2	0
Financial Institutions	None	49	0	0	1
	A few	8	18	11	10
	Several	0	0	0	1
Public and Government Agencies	None	49	15	0	0
	A few	7	3	11	11
	Several	1	0	0	1

The 12 group 4 owner-managers only rarely discussed development with their closer contacts, preferring consultants, professionals and (especially) financial institutions and government or public agencies. Group 2 comprised 18 firms and was characterized by the use of consultants, financial institutions and suppliers, but not competitors or government agencies.

Group 3 comprised 11 firms that consulted customers, suppliers, consultants and financial institutions to the same extent as the other sample firms, but tended to concentrate more on competitors, industrial associations and government agencies. Groups 2 and 3 therefore have somewhat different profiles, while groups 1 and 4 have opposite profiles.

Table 5 shows some other characteristics of the four groups, based on other variables.

**Table 5 Some Characteristics of the Four Groups**

Characteristics of Groups	Groups (Number of firms per group)			
	1 (57)	2 (18)	3 (11)	4 (12)
Number of people contacted	5.3	8.3	17.7	9.5
Respondent's origin				Outside Mauricie
Satisfaction with contact network	Not very	Fairly	Very	Fairly
Product features	Lightly processed materials		Complex technologies	Complex technologies
Exporting situation	Non-exporter		Exporter	Exporter
Membership of different types of associations	Development, management development	Business	Business, development, management development, professional	

The first group (group 1) contacts fewer people, is less satisfied with its network of contacts, produces lightly processed goods and does not export. Group 2 discusses development with the average number of people identified in the survey (8.3) and is fairly satisfied with its networking activities. The other two groups, especially group 3, with 18 interlocutors, consult more people, thus exhibiting a greater desire to discuss business development than the other groups. They are either fairly satisfied or very satisfied with their contacts. They produce goods with a high technology content and all of them export their production.

A further distinguishing feature is the owner-manager's membership of various associations. Respondents were asked to identify up to four associations of which they were members; 28% did not identify any associations, 24% identified one, a further 24% identified two, 10% identified three and 15% identified four. Thus, only one-quarter of the sample owner-managers were members of more than two associations or groups. The owner-managers of the larger firms tended to be members of more associations. Of the 79 respondents who were members of at least one association, one-third (33%) were also on the councils or boards of the associations concerned. This percentage increased proportionally to the number of associations; only 9% of the respondents who were members of one association were also on its board, compared with 35%, 46% and 56% respectively for those who were members of two, three or four associations.

The most popular associations were sector-based (35% of respondents mentioned at least one of these), followed by associations directly related to the firm's specific business (34%). Business development associations were less popular (15%), as were those of a more personal nature, such as professional associations (10%), clubs (8%), social clubs (8%) and leisure associations (4%). Table 5 below shows that the group 1 firms are less likely to be members of development associations (e.g. technopoles) and management development associations (e.g. business managers' groups), while group 3 firms are more likely to be members of these types of associations, and of professional (e.g. engineers' order) and business associations (e.g. chambers of commerce). Group 3 contains the 26 firms that said

they did not belong to any associations. Group 2 members are more likely to belong to business associations, while group 4 has no distinguishing features in this respect (i.e. it is situated within the mean for all types of associations).

**Table 6. Differences Between the Groups by Skills and Difficulties.**

	Groups (Number of firms in the group)				Groups (Number of firms in the group)			
	Stated Skills				Stated difficulties			
	1 (57)	2 (18)	3 (11)	4 (12)	1 (57)	2 (18)	3 (11)	4 (12)
<b>Proposed Fields</b>								
Managerial staff	34	15	10	6	5	1	0	2
Technical staff	27	12	9	5	5	1	0	2
Search for skilled labour	6	5	1	1	32	11	8	9
Training of skilled labour	14	11	2	4	16	6	5	4
Human resource management	17	10	6	5	7	2	2	2
Financing and capital sources	19	15	7	4	9	2	3	5
Quality certification	14	8	5	4	7	2	3	2
Advanced production methods	12	11	6	4	7	0	1	2
Research and development	13	8	4	4	10	1	2	2
Research centres, universities	4	2	5	2	14	4	2	5
Management strategies and methods	18	13	8	6	9	1	0	2
Partnerships, strategic alliances	12	8	8	3	9	4	3	4
E-commerce, Internet	12	7	4	1	11	4	5	6
Product marketing	11	8	3	1	10	2	1	7
Exporting	17	7	4	4	10	5	5	5
Distribution and transportation	7	6	2	3	8	4	5	4
Government aid programs	17	12	4	6	7	2	2	2
Government stakeholders	5	3	4	3	15	6	3	6
Contact network	3	4	3	0	8	2	3	5
Consultants and professionals	15	7	3	6	10	4	1	1

As we said earlier, contacts and information sources vary according to the strengths and perceived difficulties of the firms. These differences are clearly visible in the results of our typographical analysis. For example, Table 6 shows that the 57 firms in group 1 declared fewer than average skills in the “management strategies and methods” and “partnership and strategic alliance” categories.

The 18 group 2 firms declared more strengths or skills than all the other firms, including skills in the managerial staff, skilled labour search, skilled labour training, financing, production methods, e-commerce and government aid program categories. The group 3 firms, for their part, declared more skills in the technical staff, managerial staff, research centres and universities and partnership/strategic alliance categories, while the group 4 firms did not stand

out in any particular category, but did report difficulties in the e-commerce, marketing and network categories.

If we look at the characteristics of the four groups of firms, we see that the group 1 firms differ significantly from the other three groups. According to their profile, they could be described as “local” or “traditional” (Julien and Chicha, 1982; Rizzoni, 1988; Marchini, 1988), while the firms in the other groups, better described as “emerging” (Marchini, 1988) and probably more involved in international competition (Huppert 1981), exhibit somewhat more dynamic profiles.

Firms in group 1 produce slightly processed goods, do not export, are in contact with fewer people, are less likely to be members of associations and tend to turn primarily to traditional business sources. They make less use of consultants and public or government agencies. They also admit to having very little expertise in terms of management strategies and methods, partnerships and strategic alliances. However, they are also less satisfied with their contact network, suggesting a desire or a need to improve and a certain awareness of the benefits and gains to be obtained from networking, even though they may not have had the time or know-how to proceed.

The profiles of the other three groups are less clear. However, group 2 firms appear to differ from group 4 firms, and especially from group 3 firms. Although group 2 contains only a handful of technology-oriented and export-oriented firms, they can hardly be described as “craft” firms in the sense given to the term by Filey and Aldag (1978) or Stanworth and Curran (1976). In fact, their profile suggests that these firms are the ones that believe they have the largest number of strengths or skills, although the number of reported difficulties the same as for the other groups. Like the other groups, they maintain contacts with their suppliers, consultants and financial institutions, but their owner-managers are more likely to belong to professional and business associations. They appear to be well established – more so than the firms in the other groups.

The group 3 firms, as we saw earlier, consult more people than firms in the other groups (twice as many as group 4 and three times as many as group 1). They produce complex technological goods and all of them export. They are also more likely to belong to professional and business associations. They exhibit the highest level of networking satisfaction of all the groups, and also declare greater than average expertise with regard to technical staff, managerial staff, relations with research centres and universities, partnerships and strategic alliances. Their profile is therefore dynamic and technology-oriented.

The profile of group 4 firms is atypical compared to the other three groups. They are less likely to consult traditional business contacts such as customers and suppliers, and tend to concentrate more on remoter contacts such as government agencies and services. They have no special areas of expertise, but tend to experience difficulties with e-commerce, marketing and contact networks. With regard to this latter problem, group 4 is the group that, proportionally speaking, contains the highest number of owner-managers not originally from the Mauricie region. This suggests they may be more inclined to use government and public services because their personal networks are less well developed.

## CONCLUSION

These results throw additional light on the “black box” and on the use made by firms of networks and other information sources, showing that their networking needs differ according to the business sector, size and strategy of the firm, and its strengths and difficulties. However, a firm’s networks are not static; they evolve through chance meetings and to meet new needs generated by problems. They also evolve over time, as the firms make choices from among chance meetings, either to strengthen their existing networks or to prevent the occurrence of anticipated problems.

Relatives, friends and close acquaintances become network elements known as *strong ties* or *strong signals*. Many authors have shown that strong ties are extremely important in supporting business development. However, if a firm is to develop more quickly, it must also work with “remote” or *weak tie* networks that provide *weak signals*, at least in the early days. Weak signals are difficult to decode, because they are unusual and often incomplete. However, they are the most important signals for discovering new opportunities and supporting innovation. It is for this reason that the more dynamic regions are characterized by a significant number of *weak ties*.

Overall, our findings show that *weak tie* networks are practically non-existent in the Mauricie region, or are used by only a small percentage of the firms surveyed. However, our study also had an operational focus. Accordingly, the findings were used to convince stakeholders that better networking was needed, since the firms with the best networks were the most effective in many respects. In other words, they served to open the door for further action.

We are currently engaged in an experimental intervention in the furniture industry. We began by telephoning the 110 firms that responded to the survey questionnaire, to see if they were willing and available to participate in a new network tailored to their specific skills and difficulties. As our findings showed, the sample firms, especially those in the furniture sector (which has been particularly dynamic in the last ten years), were especially concerned about the problem of labour (recruitment and training). We put the seven interested firms into contact with some regional economic stakeholders and an agency specialized in labour training in the furniture sector. The purpose of this new network was to review the various training programs currently available and to tailor them as far as possible to the specific needs of the individual firms, while reviewing certain qualification criteria (subsidies, target clientele, in-firm training, etc.). Following half-a-dozen meetings held over a six-month period, a number of parameters were established, reflecting the firms’ needs, and the network is continuing its activities.

If practices such as this can be developed, the resulting new networks will not only help solve the problems of many of the region’s firms, thus supporting their development, but will also help institute cooperative practices by giving firms new reasons to work with other economic players or extend their networks for new projects. They should also help increase innovation and extend markets in the Mauricie region, thus allowing it to face up to the new knowledge economy.

## **ABSTRACT**

In the present globalization context, above-all in regions and in those industrial sectors especially exposed, increased productivity and the need to innovate are prerequisites to the survival and competitiveness of SMEs. It is no longer possible for the various intervening parties (governmental and industrial) to remain isolated. The efforts of all concerned must be combined and coordinated. This paper briefly presents a project in which different partners were regrouped. The ultimate purpose of this project is to bring 60 plastic sector SMEs to a world-class level. This paper focuses specifically on the role and contribution of researchers of the Small Business Research Institute.

The Canadian Association of Plastic Industries (Quebec section) brought together a group of partners (government agencies, regional economic organizations, scientific institutions, expert firms and SMEs) for the purpose of evaluating 60 plastic sector SMEs from 5 regions on their productivity as well as their capacity to use innovation as an economic growth vehicle. The purpose of this evaluation is a series of recommendations leading to a two-year ongoing improvement plan. The researchers' role is to supply the expert firms with complementary tools enhancing the expertise they already possess in order that a complete audit be made. The firms must analyze 9 dimensions (ex: management, R&D, innovation) made up of a total of 75 variables. Moreover the researchers' role is to evaluate the diagnosis made by the expert firms. This paper presents the methodology used as well as the comparative results of 11 SMEs' evaluations performed by 8 expert firms. These results show that performance varies considerably from one firm to another. Finally, the measures taken to reduce the inconsistencies between firms are presented.

## **The CPIA Project**

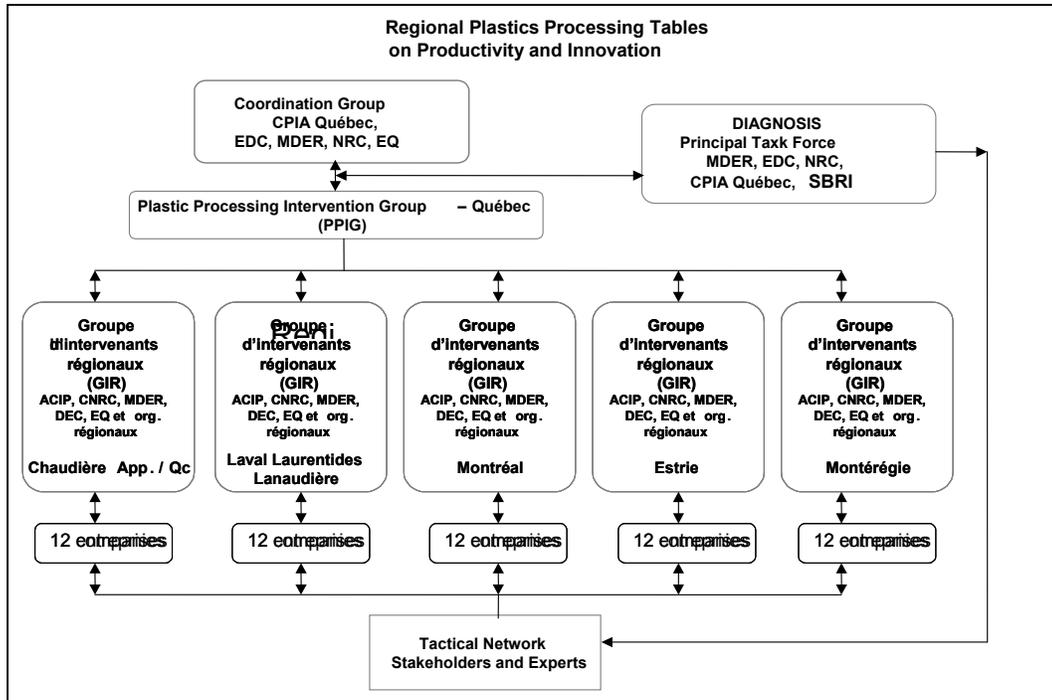

Québec has a total of 300 firms in its plastics sector. The Québec section of the Canadian Plastics Industry Association (CPIA) serves as their umbrella association. Its mission is to promote the prosperity and international competitiveness of the Canadian plastics industry in an environmentally and socially responsible way. The Association is highly dynamic, and was named Association of the Year in Québec in 2003 by the Canadian Society of Association Executives (CSAE). To achieve its mission, it has attracted, assembled and mobilized a range of stakeholders who have helped ensure the success of its projects.

The CPIA'S principal financial partner is Economic Development Canada, in collaboration with certain government departments and agencies, including Québec's Ministère des Finances and Ministère de l'Économie et de la Recherche (MFER), Emploi Québec, the Agence d'efficacité énergétique du Québec, the Business Development Bank of Canada (BDC), the Industrial Research Assistance Program (NRC/IRAP) and Exports and Development Canada. It also works with various scientific research institutes such as the Centre de recherche industrielle du Québec (CRIQ), the Institut de développement de produits du Québec, the Centre francophone de recherche sur l'informatisation des organisations (CEFRIO) and the Institut de commerce électronique, as well as regional economic development agencies such as Action PME Beauce and Chaudière-Appalaches Exportation, and other corporations and organizations including Hydro-Québec and the World Trade Centre (WTC).

CPIA also works in partnership with seven private consulting firms in the productivity sector and with researchers from the Small Business Research Institute (SBRI) and its Business Performance Research Laboratory at the Université du Québec à Trois-Rivières (UQTR).

The purpose of this long list of agencies and organizations is to illustrate the quantity, variety and diversity of CPIA's project partners, which have contributed funding, expertise and commitment to its undertakings over the years. Among its numerous activities, CPIA has developed a project aimed at increasing the productivity of 60 of its member companies by 20%, and enhancing their ability to use innovation as a motor of economic growth, thus reducing the gap with other industrialized countries. The project known as the "Regional Productivity and Innovation Tables", is the subject of the research described in this paper, and its structure is shown in diagram form in Figure 1 below.

**Figure 1: Structure of the Regional Productivity and Innovation Tables**

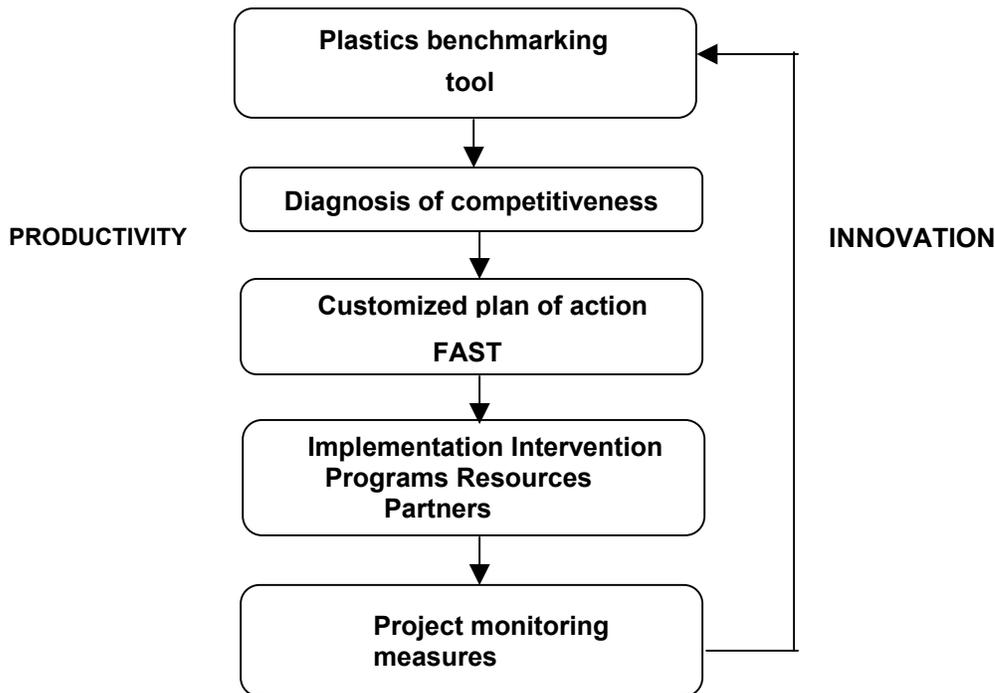

Research and excellence are the motors of growth for firms hoping to achieve world class. To support their growth, plastics industry firms must therefore engage in a process that will help them incorporate value systematically into every level of their organization. The CPIA approach helps steer this ongoing process towards its ultimate objective.

The specific goals of the CPIA's project are:

- To prepare and implement a customized plan of action for each firm over two years, involving the maximum number of available resources to achieve the best possible results;
- To provide industrial decision-makers in the plastics sector with a structured, integrated approach;
- To speed up the acquisition of best practices in productivity and industrial innovation;
- To foster discussion and develop a culture based on shared experience and knowledge;
- To establish industrial business models tailored to the culture in Québec.

Figure 2 shows the intervention approach used to achieve these goals.

**Figure 2: Intervention Approach – Regional Productivity and Innovation Tables in the Plastics Sector**

### **The Role of the Small Business Research Institute Researchers**

The Canadian Plastics Industry Association (CPIA) asked the Small Business Research Institute (SBRI) to develop a productivity-innovation audit, lay down guidelines for its content and identify the conditions of application. The audit would then be performed by seven consulting firms identified in advance by the CPIA.

To derive maximum benefit from a world class integrated value-added approach, firms must be able to understand, structure and plan their activities. The first step in this process is a productivity-innovation audit performed by consultants, culminating in a series of organizational and operational recommendations. The recommendations are then structured to form an intervention plan that serves to support ongoing improvements in the firm. Specific actions are proposed to support the firm’s growth, as part of a joint plan of action.

The audit must be presented in such a way that the subject firms can clearly identify their strengths and weaknesses, and then draw up a plan of action aimed at improving their competitive capacity and achieving their strategic objectives. It must also include as accurate an assessment as possible of the firm’s current business processes and highlight any elements to be improved. Lastly, it needs to identify possible solutions and opportunities for improvement.

The final goal established by CPIA was to improve the productivity of its member firms by 20%, and enhance their ability to use innovation as a motor of economic growth.

## Productivity and Innovation

CPIA contacted the SBRI partly because of the expertise of its researchers in the field of added value production and innovation audits, and partly because of its experience with similar business audits (Julien, Lachance, Drolet and de Ciurarra 2003; Lagacé, Trépanier and Lachance, 2003; Lagacé, 2003).

In a chapter of a book detailing the ten years of existence of the Bombardier Recreational Products Chair<sup>1</sup> (Julien, Lachance, Drolet and de Ciurarra 2003), Pierre-André Julien, the Chair's director, described the audit method developed by the Chair's researchers as a multidisciplinary analysis that:

*“... goes further by allowing for a systematic process of change leading to continuous improvements (Kasul and Motwany, 1995; Gunaserakan, Okko, Martikainen and Yli-Olli, 1996). This was the goal we set ourselves for the audit technique developed by the Bombardier Chair. We called the audit a “characterization study”. It is used to characterize firms on the basis of certain organizational and operational factors, and then to set up a strategic ongoing improvement plan. The short-term goal is to help firms apply the just-in-time principles sometimes required by order-givers, while the longer-term goal is to bring them gradually to a so-called world class level of production.”*

An analysis grid was developed from the audit methodology, to be used by CPIA's consulting firms for their audits. The grid was adjusted and enriched, with special attention to analysis tools in the innovation component. Current research into innovation did not appear to fully explain the factors that drove SMEs to innovate. Accordingly, the SBRI developed an *innovation audit* that can be used to identify a firm's innovative potential (Lagacé, 2003; Lagacé, Trépanier and Lachance, 2003), and also to help firms support their innovation activities. In short, the goal was to build a tool that could be used to review innovation and accurately identify the aspects and elements with potential for improvement, establish how far innovation is present in the firm's everyday activities, and characterize the internal and external resources used by the firm, its contacts and the extent to which innovation forms part of the firm's various functions. A further goal was to see whether innovation had led to synergy between the functions and how far the firms were able to monitor and maintain their innovative activities, and to identify the critical conditions that encouraged or discouraged innovation (e.g. an order-giver's support for its suppliers).

---

<sup>1</sup> The Chair was a network organization composed of 31 firms, all of which were subcontractors of the core firm. They each had an annual turnover of between \$10 and \$90 million (CAN), and between 125 and 500 employees. Many of the firms were direct competitors. The network was supported by an academic chair comprising 11 researchers from a range of disciplines (economics of technological change in SMEs, human resource management, new technology management, SME information systems, total quality systems, maintenance and just-in-time, financial management, corporate financing, economics of transportation, logistics, theory of organizations and international management, implementation of just-in-time and value-added systems, management of manufacturing technology implementation) whose role was to help the subcontracting SMEs develop and extend their collaborative activities both among themselves and with the core firm.

## **THE PROPOSED METHODOLOGY**

The seven consulting firms selected by CPIA to perform the productivity/innovation audits in its member firms were recognized for their expertise and experience in SME improvement projects. However, they were of different sizes and did not necessarily have the same level of expertise in every field (e.g. production, finance, human resources management). As Raymond showed (Raymond, Blili and El Alami, 2004) there still is a gap between consulting firms and SME's). So, the proposed intervention framework was in the form of a book of specifications detailing a number of elements, including the intervention methodology and an analysis grid showing the factors to be examined.

The analysis grid was composed of nine major components, all of them basically enterprise functions, describing a series of 20 dimensions broken down into 75 elements. Appendix 1 gives a list of the components, dimensions and elements covered by the audit. The nine components were:

- Organization
- Management
- Sales, marketing and exports
- Finances
- Electronics
- Human resources
- Manufacturing and production
- Research & development and engineering
- Innovation

### **Evaluation of the Consultants' Audits**

We developed a number of criteria that we then used to assess the consultants' audits. Clearly, the consultants' reports differed widely in terms of their form, since each firm had its own way of presenting its findings to client firms. In some ways this was their "competitive advantage", the factor that distinguished them from their competitors. We examined the way each consultant had carried out its principal mandate, as described in the book of specifications. To do this, we retained three principal aspects of the report content, namely (1) the presence and quality of descriptions of each of the 75 elements in the proposed grid; (2) the presence and quality of analyses of these elements; and (3) the presence and quality of recommendations for a given element.

The evaluation was performed independently by two assessors, whose results were then compared. First, the assessors read and reviewed the report, indicating on the grid of nine components, 20 dimensions and 75 elements the extent to which a given element was relevant to the subject firm, and if so, whether the consultant had described the situation of that element in the subject firm. They then judged the quality of the relevant element descriptions.

The process was repeated for the element analysis. Even if an element was considered relevant to the subject firm and had been properly described in the report, it did not necessarily need to be analyzed in detail if the description itself was sufficient. The assessors therefore judged whether or not each element had been analyzed (according to relevance), and if so, the quality of that analysis. They then decided whether or not a recommendation was required in respect of the element, and if so, they judged the quality of the consultant's recommendation. By proceeding in this way, the evaluation was certain to be objective, since it was basically a judgment of the description, analysis and recommendations relevant to a given firm. The results of the evaluations for each criterion were compiled as follows:

1. The number of elements described as a ratio of the number of elements considered relevant:  $(n_{\text{ED}} / n_{\text{EP}}) = (\% \mathbf{D})$  as shown in the following tables

2. The quality of the descriptions:

Each element was ascribed a score of 0 to 10 =  $(\% \mathbf{QD})$  as shown in the following tables

3. The number of elements analyzed as a ratio of the number of elements described:  $(n_{\text{ED}} / n_{\text{EA}}) = (\% \mathbf{A})$  as shown in the following tables

4. The quality of the analysis for each element analyzed:

Each analysis was ascribed a score of 0 to 10 =  $(\% \mathbf{QA})$  as shown in the following tables

5. The number of recommendations made as a ratio of the number of recommendations required:  $(n_{\text{RF}} / n_{\text{RR}}) = (\% \mathbf{RF})$  as shown in the following tables

6. The quality of the recommendations made:

Each recommendation was ascribed a score of 0 to 10 =  $(\% \mathbf{QR})$  as shown in the following tables

Table 1 shows the results of the audit evaluation for firm no. 4, produced by one of the consultants. It presents the results for each of the nine components from the analysis grid, based on the six criteria described earlier. For example, for the Management component, the assessors concluded that the consultant had described only 83% of the elements considered relevant (%D) for firm no. 4, and the quality of their description was judged to be 76% (%QD). The assessors felt the consultant had analyzed all the elements requiring analysis (%A = 100%), but judged the quality of the analyses to be only 73% (%QA). Again, the assessors felt recommendations were required for all the analyses performed (%RR) and the expert had in fact done this (%RF = 100%). However, the quality of the recommendations was only 74% (%QR). The average quality of the Management component assessment was therefore 84.3%, i.e.  $(\% \mathbf{D}) + (\% \mathbf{QD}) + (\% \mathbf{A}) + (\% \mathbf{QA}) + (\% \mathbf{RF}) + (\% \mathbf{QR})$  divided by 600<sup>2</sup>.

---

<sup>2</sup> The required recommendation column (%RR) is not used to calculate the quality factor for the component. The results presented in the various columns of the table do not include decimals, although decimals were taken into account when calculating the mean.

**Table 1. Evaluation Results: Firm No. 4**

Firm No.: 4  
 Audit Evaluation

Innovation	50	75	100	70				49.2%	
Mean <sup>1</sup>	90.0%	68.0%	100.0%	72.0%	48.0%	80.0%	74.0%	69.1%	61.8%
Consultant's method							76.3%		

<sup>1</sup>: The mean is based on overall results for the components, not for the elements

The table also shows that the consultant did not describe or analyze any of the elements for the Finances and Electronics components (0% in each case), and its audit of the Innovation component was incomplete (mean of 49.2%).

### Utility for the Firm and Value of the Consultant's Methodology

The audit evaluation method focused on two aspects of the results, namely the utility of the audit for the subject firm and the quality of the methodology used by the consultant. In the case of firm no. 4, in Table 1, the utility result is shown in the **Utility** column (61.8%), while the methodology quality result is shown in the **Consultant's method** row (76.3%). The mean for these two results (69.1) is also shown in the **Mean** row. Although the same data were used to calculate both means, the results are different because, in calculating the methodology quality mean, only the results of the work actually performed by the consultant were taken into account. For example, the consultant that audited firm no. 4 was not penalized for its failure to consider the Finances and Electronics components, or for its incomplete diagnosis of the Innovation component. Our goal was to produce an overall evaluation of the consultant based on the areas or components it examined. However, the missing elements were taken into account when calculating the utility result, because the assessors felt the firm would have benefited from a complete analysis of all the components.

Overall, in the audits assessed, some consultants that had examined all the relevant components obtained fairly average results, whereas in others – for example, in the case of firm no. 4 shown in Table 1 – the consultant's methodology results were very good even though it had not examined certain components. Thanks to this distinction, we were able to recommend improvements for all seven of the consultants involved in the study.

## Comparative Assessment

We were aware before the project began that the consulting firms had widely differing skills, and that not all of them were experienced in every field. What was less clear was how important these disparities were and how they would affect the quality and utility of the audits.

Table 2 presents the evaluation results for all nine components in the ten audits (means from Table 1). A given consulting firm may be responsible for several audits with widely different results. Table 2 also presents the overall mean for each firm, along with the standard deviation.

**Table 2. Summary of Audit Evaluation Results**

Components	Firm Numbers									
	1	5	6	8	9	10	11	3	4	7
Organization	90.0%	88.0%	41.2%	95.0%	53.3%	73.2%	60.0%	79.3%	88.0%	34.2%
Management	83.5%	87.2%	52.5%	73.0%	50.2%	68.3%	28.5%	85.8%	84.3%	31.1%
Sales/Marketing	86.3%	87.8%	18.3%	90.2%	75.3%	87.7%		78.3%	87.8%	35.3%
Finances	53.3%	60.0%	41.7%	95.0%	40.0%	92.5%		88.3%	0.0%	33.3%
Elect. Affairs.	48.5%	88.7%	53.5%	81.0%	61.2%	83.5%	0.0%	85.3%	0.0%	89.2%
HRM	56.2%	79.0%	32.8%	89.7%	41.3%	73.8%	30.2%	93.3%	72.8%	30.5%
Manufact/prod R-D	76.3%	81.3%	36.7%	86.8%	58.0%	78.5%	50.2%	84.8%	86.8%	84.2%
Engineering	85.0%	57.3%	36.8%	89.8%	38.3%	86.0%	16.7%	81.7%	87.3%	0.0%
Innovation	90.8%	75.0%	41.7%	82.8%	58.3%	67.7%	0.0%	79.9%	49.2%	0.0%
Mean	74.4%	78.3%	39.5%	87.0%	52.9%	79.0%	26.5%	84.1%	61.8%	37.5%
Std. deviation	17.0%	12.1%	10.5%	7.1%	12.0%	8.9%	23.1%	4.8%	37.2%	31.2%

In the Firm 11 audit, there are no results for the Sales/Marketing and Finance components, and the scores for both Electronics and Innovation are zero. In this particular case, the firm in question was a production plant run by a parent company located elsewhere. The Sales/Marketing and Finance components were therefore not taken into account because the firm had no control over them. However, Electronics and Innovation were both retained, but received zero scores because the consultants chose not to examine them even though, in the assessors' view, they should have done so.

The results vary significantly between audits and between components, thus allowing us to assess the strengths and weaknesses of the consultants. Two consultants stood out for the excellence of their overall audit results (8: 87.0% and 3: 84.1%). They both achieved low standard deviations (8: 7.1% and 3: 4.8%), suggesting constancy of expertise for in the component areas. This proves that it was possible for the consultants to satisfy the evaluation criteria. Three other consultants obtained good results, with overall means in excess of 70% (1, 5 and 10). Audit 10 exhibits no clear weaknesses, with a standard deviation of 8.9%, but the consultant responsible for audit 1 (74.4%) appeared to be weaker in the *Finance* (53.3%) and *HRM* (56.2) components. The consultant responsible for audit 5 (78.3%) was weaker in the *R-D / Engineering* (57.3%) component. The audits of firms 9 and 4 were somewhat less impressive (52.9% and 61.8%). The consultant responsible for audit 4 was the weaker of the two, with a standard deviation of 37.2%. Lastly, three of the results

were much weaker than the rest (6: 39.5%, 11: 26.5% and 7: 37.5%). Numbers 6 and 11 were weak in every area, with standard deviations of 10.5% and 23.1% respectively, while the consultant responsible for audit 7 achieved excellent results in the Electronics (89.2%) and Manufacturing/Production (84.2%) components. In short, the results presented in Table 2 clearly illustrate the disparities between the consulting firms and the areas in which improvements are needed.

## Perceptions of Subject Firms

We gave the subject firms an opportunity to complete an evaluation questionnaire expressing their level of satisfaction with the consultants' reports. The three aspects used as basic criteria by the assessors, namely (1) description quality, (2) analysis quality, and (3) quality of recommendations for each of the nine components, were included in the questionnaires. A fourth question concerning overall satisfaction was added. Nine of the ten subject firms responded, and the results are presented in Table 3. The assessors' scores are not the same as those shown in the preceding tables, since we retained only the three elements on which the subject firms expressed an opinion, i.e. (% QD) + (% QA) + (% QR) when calculating the mean. We therefore did not consider the (% D), (% A) and (% RF) evaluations.

**Table 3: Comparison of Assessors' Results and Subject Satisfaction.**

<b>Firm Number:</b>	<b>1</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>8</b>	<b>9</b>	<b>10</b>	<b>11</b>
<b>Assessors' scores</b>	54.8	58.5	41.7	49.6	68.9	76.3	48.9	56.0	54.4
<b>Subject satisfaction</b>	58.1	75.8	54.6	72.0	46.0	74.9	47.0	71.7	55.0
<b>Deviation</b>	3.3	17.3	12.9	22.4	-23	-1.4	-1.9	15.7	0.6
<b>Overall satisfaction</b>	42.8	71.4	14.2	42.8	71.4	71.4	42.8	71.4	57.1

We concentrated on the deviations between the assessors' scores and the subject firms' scores. In four cases, the two scores were fairly similar (1, 8, 9 and 11). In four other cases the subjects' scores were higher than the assessors' scores (3, 4, 5 and 10), with a significant deviation of 22.4% in the case of firm no. 5. The assessors' score (68.9%) was higher than the subject's score (46.0%) in only one case – firm number 6 – and the deviation was a substantial 23 points. When we expressed our surprise at this result, the subject firm told us it had given the consultant a series of past reports from previous consulting interventions. The consultant had then used these reports in its audit. The assessors had based their score on the evaluation criteria, which produced an average result, while the firm felt the consultant had not contributed much "new" material in addition to that found in the reports provided, and hence gave a much lower score.

The results for overall satisfaction differed from the evaluations based on description, analysis and recommendation quality. This was probably because the subject firms, in their overall evaluation, considered other elements not suggested by us, such as the way in which the intervention was conducted, the consultant's approach, the relevance and quality of the action plan, and so on. For example, firm no. 4, which assigned a score of 14.2% for overall satisfaction, made the following comment in the Remarks section: "Apart from the TRG, we

did not learn anything new. The recommendations were the same as in our business plan and are already described in our budgets for the next three years.” Firm no. 9, which assigned an overall satisfaction score of 42.8%, said “more time should have been spent on the diagnosis of the firm and its problems”.

## **Improvement Measures for Consultants**

The results of the evaluations were presented in individual meetings to the team and to CPIA’s sponsors, to the subject firms and, lastly, to the consultants themselves. CPIA management met individually with the consultants whose evaluations were especially unsatisfactory, asking for parts of the mandate to be repeated. Generally speaking, the sponsors, mostly government agencies managing business assistance programs, were not at all surprised by the disparity in the results. They had already suspected that this was the case, and were satisfied by our demonstration. The subject firms, too, were not overly surprised. However, like the CPIA management, they were somewhat concerned by the highly divergent quality/price ratios. The consultants, for their part, could only acknowledge the validity of the results. They had understood and agreed to the evaluation methodology, and accepted the results as part of an ongoing improvement process, with a view to obtaining CPIA accreditation in the future.

The purpose of the pilot project described above, involving ten firms, was to make the necessary adjustments before proceeding with audits of the other 50 participating SMEs. After discussions and exchanges with the players, it was therefore agreed that certain adjustments would be made. First, the SBRI researchers involved in the project undertook to provide the consultants with more tools, to facilitate their work and standardize the audit procedure. The three principal tools were (1) a pre-audit carried out by the SBRI laboratory, to help the consultants establish their intervention strategy before beginning work with the subject firm; (2) a series of pre-determined performance indicators for each of the nine components in the analysis grid; and (3) a detailed evaluation scale for each of the 75 elements in the grid.

## **Pre-Audit**

Every participating firm will be asked to complete a questionnaire specific to the plastics industry, providing information on most of the components in the grid. There are three principal reasons for this. First, we feel it is a good way of involving the firm in its own audit. Second, it gives the consultant a significant amount of information before going into the field, allowing it to form a general picture of the firm and establish its intervention strategy. And third, the information obtained from the questionnaire will be incorporated into the SBRI’s database and used to compare the subject firms with other plastics sector firms in Québec not involved in the sector-based tables, and with firms from other sectors. The questionnaire also includes a section developed specifically for the plastics sector (machinery, equipment, processes, etc.).

## Performance Indicators

A summary sheet will be prepared for each component (see the model in Appendix 2), including a series of performance indicators. For example, the following indicators, among others, could be used to assess the working climate element of the human resources component: number of voluntary separations at managerial level, number of voluntary separations at shop floor level, first-year retention rate, absence rate, number of grievances and conflicts. The summary sheet will enable the consultants to collect the same information on all the firms. In addition, they will be asked to summarize the strengths and weaknesses of the firms for each component, using the summary sheets, and then to make recommendations and devise a continuous improvement plan.

## Evaluation Scale

The evaluation scale will be a diagnostic tool used by all the consultants in their audits of all 48 participating firms. It will include explicit scales describing the elements in the proposed analysis grid. It will also be extremely precise, so that the consultants can produce analysis reports, an overall profile of all the participating firms and inter-firm comparisons.

A five-point scale will be used for each element, with each point in the scale representing a level of practice (0, 1, 2, 3, 4) that reflects the firm's position with regard to a given element. For example, a scale such as that shown below, adapted from a typology developed by researchers from the SBRI (Julien, Joyal, Deshaies, and Ramangalahy, 1997), could be used to assess the firm's exporting activities.

**Component:** Sales and Marketing  
**Dimension:** Exports  
**Element:** Management's Commitment to Exporting

---

0 : Firm does not intend to export in the short term.

1 : Firm intends to export, is currently gathering information.

2 : Firm is an opportunistic exporter: exporting responsibility is centralized, usually under the authority of the owner-manager, there is no distribution network (firm deals directly with clients), no export advertising, no specific goals. Firm relies on differentiation (e.g. technically superior products).

3 : Firm is a transitional exporter: markets are being developed gradually, targeting wholesalers and retailers. Advertisements are placed in catalogues and leaflets, participation in trade fairs.

4 : Firm is a professional exporter: its growth depends on exporting. Internal and external delegation of exporting responsibility. Diversified network of intermediaries (agents, representatives, wholesalers, etc.) playing a major role in advertising.

Using the scales, the consultants will be able to score or grade the firms for each element. The element scores will then be transferred to a grid that will be processed to identify the best business practices along with the strengths and weaknesses of all the subject firms. At the

end of the exercise, the 60 or so participating firms will be able to use the grid to compare their performance with that of other participants (the firms will be ranked for each element).

**ABSTRACT**

Corporations invest in R&D to derive new knowledge for product and process innovations. However, SMEs are often limited in resources. They may rely on sources other than R&D investment to acquire the knowledge needed in product and process innovations. But SMEs' knowledge absorptive capacity determines how much they can assimilate and utilize the knowledge from the outside sources. The purpose of this study was to examine the relationship between knowledge acquisition, knowledge absorptive capacity, and product innovation performance in SMES. In addition, we postulated that the depth and breadth of an SME owner's and its R&D staff's technical experiences constitute the firm's knowledge absorptive capacity. The small and medium sized companies in Taiwan's bicycle industry were used as the target of our empirical investigation because product innovation is a constant practice in the bicycle industry. The methods of in-depth interview and questionnaire survey were used to collect data. The results from 49 companies (a return rate of 39.8%) show that the absorptive capacity of the companies is best explained by the depth and the breadth of their owners' technical and industrial experiences. In turn, the absorptive capacity and the level of knowledge acquisition activities of the companies affect their product innovation performance. Theoretical implications and suggestions for future research were discussed at the end of this paper.

## **INTRODUCTION**

R&D activities can generate new knowledge needed for product and process innovations. However, with limited funding and resources, small and medium enterprises (SMEs) rely less on RD investment to generate new knowledge for their innovations (Nootboom, 1993; George, Zahra, Wheatley & Khan, 2001). They instead acquire knowledge from external sources for ideas of improvement. After acquiring new knowledge, an organization's knowledge absorptive capacity sets a boundary condition for what it can understand, assimilate, and eventually apply from the knowledge onto its product or process innovations. Knowledge and information acquired externally may be tacit or complicated (Cohen & Levinthal, 1990). A company with a higher level of knowledge absorptive capacity can recognize the value of the knowledge and then exploit the uses of that knowledge to a fuller extent (Stock, Greis & Fischer, 2001). Rather than relying on their R&D activities to develop its absorptive capacity for new knowledge, SMEs' knowledge absorptive capacity may reside more on their owners and critical R&D staff. Thus, rather than investment in R&D, the personal experiences of the owner and of the R&D staff may be a better indicator of knowledge absorptive capacity of an SME. In this study, we argue that the knowledge absorptive capacity influences the level of learning achieved by an organization, and then affects the level of innovation performance attained by the organization. In addition to knowledge absorptive capacity, we suggest that the amount of knowledge acquisition activity and the diversity of the knowledge sources will jointly have an impact on an SME's product innovation.

### **Knowledge absorptive capacity and SME owner's prior technical experiences**

Knowledge absorptive capacity of an organization was treated as an unknown black box in the past. They are often measured by indirect indicators. For example, Tsai (2001) used the number of patents as the indicator of an organization's knowledge absorptive capacity. Cohen & Levinthal (1990) used R&D spending as an indicator of knowledge absorptive capacity. However, psychologists have been examining human learning process for a century and found that experiences can stimulate learning. For example, Hebb (1949) and Berry and Diene (1993) argued that animals, including humans, develop their cognitive capabilities through their experiences. From Cohen and Levinthal (1990)'s definition, "knowledge absorptive capacity" of an organization is its ability to understand and assimilate new knowledge and apply it onto new product development. Prior knowledge of an organization's personnel is the basis as well as a limit on the assimilation, transformation, and incorporation of new knowledge into the knowledge structure already exist in their mind. Therefore, the prior knowledge and experiences are critical in the

development of an organization's knowledge absorptive capacity. In addition to prior knowledge, Cohen and Levinthal argued that the diversity in knowledge background and experiences of organizational personnel facilitates organizational learning for the diversity leads to better deciphering and understanding of the new knowledge or information. The diversity broadens the novel association of new knowledge and aid in creating linkages between old and new knowledge and enhances interpretation and understanding of new knowledge (Daft & Weick, 1984). Because the owners and the R&D staff in an SME are the main actors performing information collecting and transmitting activities (e.g., Chen, 1994), we hypothesize that SMEs rely less on R&D investment but more on their personnel for gaining their knowledge absorptive capacity. Our first two research hypotheses are:

*H1: The depth of the technical experiences of the owner and the R&D staff contributes positively to the knowledge absorptive capacity of an SME.*

*H2: The breadth of the technical experiences of the owner and the R&D staff contributes positively to the knowledge absorptive capacity of an SME.*

## **Knowledge acquisition activities and product innovation performance**

Organizations often face many environmental uncertainties and must adapt to these uncertainties by acquiring knowledge and information from the environment (Galbraith, 1973). As a result, the ability to acquire and process information effectively increases the performance of a company. Studies have shown that the top managers of high performance organizations tend to engage in more information collection and processing than the managers of low performance organizations (Daft, Sormunen & Parks, 1998). Ancona and Caldwell's (1990) study on product development teams indeed found that the increased knowledge collection activities led to better performance in product innovation. Thus, we predict that increased knowledge collection activities contribute positively on product innovation performance. Our third hypothesize is:

*Hypothesis 3: A higher level of knowledge acquisition activities leads to better product innovation performance of an SME.*

## **Diversity of knowledge sources in knowledge acquisition and product innovation**

SMEs often acquire knowledge from sources external to their organizations, assimilate the knowledge, and then apply it onto product or process innovation. Cohen & Levinthal (1989) divided the knowledge available from external sources into two categories: those provided by the industry itself and those derived from basic sciences and technology research

performed by academia or research institutes outside the industry. Their study shows that the knowledge from basic research is more influential to product innovation performance than the knowledge from industry. Although knowledge collected from an organization's industry and its materials and equipment suppliers tends to be more market-related (Cohen & Levinthal, 1990), an organization requires not only the market-related knowledge but also the knowledge from sources outside their industries in order to improve their innovation performance. Henderson & Clark (1990) pointed out that product or process innovation usually comprises a change in core concept or in the component architecture of a product or process. The driving force for such change originates from getting new knowledge that differs from existing knowledge already possessed by an organization. We argue that a greater diversity in the knowledge acquired leads to better innovation performance.

Jones & Craven's (2001) case study on a small and medium business in Birmingham showed that the use of diversified organizational routines, such as literature scan, customer contact, trade shows, competitors, customer input, supplier input, and reverse engineering for collecting external information and knowledge leads to better organizational learning. Since different channels of information and knowledge provide information and knowledge different in nature, it is necessary for an organization to have sufficiently diversified source of knowledge. When an organization is exposed to more diversified sources of knowledge, it will be able to exploit and evaluate new knowledge better.

George et al. (2001) emphasized the effects of alliance on absorptive capacity and innovation performance. They found that alliances in bio-technology firms, including horizontal, vertical, generative, and attractive alliances, provide these firms access to different resources of new knowledge. In addition, horizontal alliances affect positively patent innovation capability, whereas vertical alliances positively influence innovation performance. Consequently, firms with diversified knowledge sources would have better innovation performance. Hence, we suggest that

*Hypothesis 4: A greater diversity of knowledge sources in knowledge acquisition leads to better product innovation performance of an SME.*

### ***Interaction of knowledge absorptive capacity and knowledge acquisition activities on product innovation performance***

Knowledge from different sources requires different levels of absorptive capacity. For example, the knowledge from basic researches relates less directly to product manufacturing and is more difficult to understand; hence, it requires a higher level of absorptive capacity (Cohen & Levinthal, 1990). Stock, Greis & Fisher (2001) conducted observations on the computer modem industry over a 24-year period to examine the

relationship between absorptive capacity and product innovation. Their results show that the relationship between absorptive capacity and product innovation is in an “inverted-U” shape, which suggests that a higher level of knowledge absorptive capacity will lead to a higher level of product innovation performance. However, the effect of knowledge absorptive capacity will diminish as the product innovation performance increases over a certain level. We suggest an alternative explanation for this finding. We argue that although knowledge absorptive capacity is important to organizational learning, knowledge acquisition activities are no less important than the knowledge absorptive capacity to innovation activities. A firm with a sufficient amount of knowledge collection will need a level of knowledge absorptive capacity parallel to the amount of knowledge acquired in order to assimilate and then apply the new knowledge to product innovation. A firm with an inadequate level of absorptive capacity to the amount of knowledge acquired will not be able to assimilate and apply the knowledge. As a result, innovation requires both sufficient knowledge acquisition and an adequate level of knowledge absorptive capacity. In other words, there is an interaction effect from knowledge absorptive capacity and amount of knowledge acquired.

Brown and Eisenhardt's (1995) stressed the effect of information and knowledge collection through internal and external organizational communications on the innovation performance. On the other hand, Cohen & Levinthal (1990) emphasized the process of how organizations make sense of, assimilate, transform, and utilization of new knowledge onto product innovation. Neither Brown & Eisenhardt's nor Cohen & Levinthal's research paid enough attention to the possible interaction between knowledge absorptive capacity and knowledge acquisition activities. We suggest that these two factors have an interactive effect on product innovation performance.

*Hypothesis 5: With a higher level of knowledge absorptive capacity, knowledge acquisition activities have a stronger positive effect on the product innovation performance of an SME.*

## **METHOD**

Prior to the data collection, R&D personnel of 3 bicycle companies and Industrial Technology Research Institute, a semi-official agency that provides technical assistance to the bicycle industries, were interviewed to obtain information about the processes of the organizational learning and of the product innovation in the bicycle industry. The information they provided served as the basis for the design of the measurement indices for the studied variables.

## ***Participants***

One hundred and twenty-two bike companies with 70 employees or above were the target population of this study. These firms were drawn from the 2003 directory of Taiwan Bicycle Exporters' Association and participants of the annual Innovative Bicycle Parts and Accessories Competition in Taiwan in 2001 and 2002. The questionnaire was addressed to R&D manager or chief executive officer of the firm. Forty-nine firms responded to the questionnaire (return rate, 39.8%). The data show that 84% of Taiwan bike companies have been established for more than 16 years, mostly between 16 and 20 years. Half of the bike companies (51.02%) have less than 100 employees. About 71% of the firms have a capital of less than NT\$6,000,000. Most of the firms (61.22%) have less than 10 RD staff. The RD investment was mostly (75.52%) less than 6% of their annual budget in the past five year.

## ***Measurement of Variables***

**Absorptive capacity.** Rather than using R&D expenditure divided by sales as the index of absorptive capacity (Cohen and Levithal, 1990), we measured a firm's absorptive capacity by 24 items which cover four indices proposed by Zahra & George (2002): knowledge acquisition (7 items), knowledge assimilation (3 items), knowledge transformation (11 items) and knowledge utilization (3 items). The respondents were asked to rate each item by 5-point rating scale according to their firm's behavior in the past five years (1998-2003). The sum of these four indices represents the company's level of absorptive capacity. The higher the scores, the higher the absorptive capacity a company possesses.

**Diversity of knowledge sources** refers to the total number of knowledge sources that a company used to collect knowledge. Eight different knowledge sources a bicycle firm may consult with were identified from the interviews with project managers from Industrial Technology Research Institute of Taiwan, project managers from Taiwan Bicycle Industrial R&D Center, competitors in the industry, material or equipment suppliers, researchers in academic institutions, and customers of bicycle companies. A knowledge source that received a rating in extent of use equal to or higher than 3 was assigned a weight of "1". A rating less than 3 was assigned a weight of "0." The weights of the eight knowledge sources were then summed to derive the measure of diversity of knowledge sources used in knowledge acquisition activities.

**Knowledge acquisition activity.** A firm's knowledge acquisition activities were measured by two indices: the *extent* of usage of a knowledge source and the *importance* of knowledge source used in knowledge acquisition. Respondents were asked to evaluate,

on a 5-point rating scale, the *importance or relevance* of each of the eight knowledge sources to them. They then use a 5-point rating scale to rate *the extent* the firm used the knowledge source.

The results from factor analysis suggest that these eight knowledge sources can be classified into two categories: knowledge provided by basic science and technology research conducted outside the industry and knowledge supplied by the various different actors in the industry. Knowledge sources from basic research include knowledge provided by Taiwan's Industrial Technology Research Institute, the Taiwan Bicycle Industrial R&D Center, and universities and other academic institutions. Knowledge sources from the bicycle industry include knowledge supplied by competitors, material or equipment suppliers, alliances, and customers. The extent of use of each knowledge source and the importance of the knowledge source were then multiplied together to derive the amount of usage of the knowledge source in knowledge acquisition. A measure of the amount of knowledge sources used was calculated separately for knowledge acquisition from basic researches and from the industry. The two amounts of knowledge sources used were then added together. We then standardized the measures of diversity of knowledge sources used and amount of knowledge sources used into T scores. The sum of these two T-scores was the final measure of knowledge acquisition activity.

**Technical and industrial experiences.** Enterprise owner's and R&D staff's breadth and depth of technical and industrial experiences were measured separately. The depth of technical and industrial experience refers to the time a owner (or the R&D staff) has been involved in the bicycle related occupations. The breadth of technical and industrial experience refers to be the different types of jobs the owner (or the R&D staff) has had so far. The types of jobs were into classified into four categories: research, marketing, manufacture, and others. Enterprise owner's breadth of experiences was measured by the number of categories they have been involved. R&D staff's breadth of experiences was measured by 5-point rating scales.

**Product Innovation performance.** Seven 5-point rating items were derived from the interview to estimate a bicycle firm's extent of product innovation in the past five years. In these items, the respondents were asked to evaluate the achievement of their innovation project according to the goals they set in the beginning.

**Control variables.** In addition to organizational learning, a firm's product innovation may vary with the firm's size, its number of R&D staff, and the amount of its R&D investment. Thus, these 3 variables were used as the control variables in our study. The size of the firm was estimated by its number of employees. The R&D staff was defined as those who are responsible for a firm's product improvement and innovation. The amount of R&D

investment was estimated by the ratio a firm's annual RD spending to its annual budget in the past 5 years (1998-2002).

### ***Reliability and Validity of the Measures***

The questionnaire was reviewed by both R&D staff from Taiwan's Industrial Technology Research Institute and a university professor specialized in bicycle mechanics. The construct validity of the questionnaire was examined by factor analysis. The observed factors structures of data from 49 bicycle companies correspond to the variables intended for the items to measure and explained about 55 to 81% of the total variances of the variables. The internal consistency coefficients of items in a scale range between 0.69 and 0.86 as measured by Cronbach's  $\alpha$ .

### ***Statistical Analysis***

To investigate the contribution of knowledge acquisition activity, and absorptive capacity to SME's product innovation, hierarchical regression analysis was used. That is, relevant control variables (number of employees, number of R&D staff, or R&D investment) were entered into the regression first, followed by the respective organizational learning variables to estimate the additional contribution of these organizational learning variables to SME's product innovation. In all regression analyses, T-scored were used instead of raw scores.

## **RESULTS**

The sizes of Taiwan bicycle companies vary greatly. Their number of employees differ from 55 to 510. Their numbers of R&D staff differ from 2 to 40. Their ratios of the R&D investment to annual budget vary from 1% to 15%. Most bicycle company owners have about 20 years of technical experiences, whereas the average length of technical experiences of their R&D staff is only 8 years (Table 1).

The simple correlations between the variables suggest that SME's product innovation performance is significantly correlated to organizational learning variables such as diversity of knowledge (  $r = 0.62$  ), amount of knowledge acquisition (  $r = 0.55$  ), and R&D investment (  $r = 0.48$  ). Enterprise owners' depth and breadth of technical experiences are the two variables most significantly related to the organizational learning (Table 2).

### **Relationship between Technical Experiences and Absorptive Capacity**

To examine the contribution of owner and technical staff's technical experiences to SME's absorptive capacity, owner and technical staff's breadth and depth of experiences were entered into the regression model after the amount of R&D investment and the number of R&D staff. Because the number of employees did not correlated with absorptive capacity ( $r = .02$ ), it was excluded from the model 1 in the regression analysis (Table 3). There was a 41% increment in the total variances explained when the 4 variables related to technical experiences were added to the regression model (Model 2 of Table 3). The total variances explained, including the 33% by the two control variables, were 74% ( $F_{6/42} = 19.44, p < .001$ ). Other than R&D investment ( $\beta = .38$ ), owners' depth ( $\beta = .36$ ) and breadth ( $\beta = .22$ ) of

**Table 3: Technical Experiences as Predictors of Knowledge Absorptive Capacity.**

Predictors	Model 1	Model 2
	$\beta$	$\beta$
R&D investment	0.36**	0.38**
Number of R&D staff	0.35*	0.12
Owner's depth of experiences		0.36**
Owner's breadth of experiences		0.22*
R&D staff's depth of experiences		-0.01
R&D staff's breadth of experiences		0.03
$R^2$	0.33	0.74
$\Delta R^2$		0.41
F	11.11	19.44

\*  $p < 0.05$ ; \*\*  $p < 0.01$ ; \*\*\*  $p < 0.001$

technical experience are two factors most important to a SME's absorptive capacity. R&D staff's depth and breadth of technical experience become insignificant once their owner's technical experiences have entered the regression. Apparently, owners play the most critical role in SME's absorptive capacity.

### **Contribution of Knowledge Acquisition to SME's Product Innovation Performance**

Because the number of R&D staff was not related to product innovation ( $r = .12$ ), it was not included in the regression analysis. Table 4 indicates that R&D investment ( $\beta = .44$ ) and number of employees ( $\beta = .27$ ) together account for about 30% of the total variance in product innovation. Inclusion of two knowledge acquisition variables, amount of knowledge acquisition and diversity of knowledge added another 30% of variances explained. The total amount of variance explained amounts to 61%,  $F(4/44) = 19.62, p < .001$ . The diversity of knowledge ( $\beta = .42$ ) and the amount of knowledge acquisition ( $\beta = .35$ ) appear

**Table 4: Contribution of Knowledge Acquisition to Product Innovation Performance**

Predictors	Model 1	Model 2
	$\beta$	$\beta$
R&D investment	0.44**	0.23*
Number of employees	0.27*	0.05
Amount of knowledge collection activities		0.35**
Diversity of sources of knowledge acquired		0.42***
$R^2$	0.30	0.61
$\Delta R^2$		0.31
F	9.71	19.62

\*  $p < 0.05$  \*\*  $p < 0.01$  \*\*\*  $p < 0.001$

more important to predict SME's product innovation than the direct RD investment ( $\beta = .22$ ). Furthermore, when the sources of knowledge were divided into those released from the basic sciences and those from the related industries, Table 5 shows that knowledge from basic sciences ( $\beta = .39$ ), rather than knowledge from the related industries ( $\beta = .23$ ), is significant predictor of SME's product innovation. Thus, the importance of basic science knowledge to SME cannot be underestimated.

### ***Contribution of Knowledge Acquisition and Absorptive Capacity to Product Innovation***

When knowledge acquisition and knowledge absorptive capacity were added to the regression model after the number of employees and R&D investment, these two organizational learning variables accounted for another 16% of additional variances in product innovation (model 2 of Table 6). The total variances explained amounted to 41%,  $F(4/44) = 19.62, p < .001$ . Knowledge acquisition ( $\beta = .42$ ) and knowledge absorptive

**Table 5: Knowledge Sources as Predicators of Product Innovation Performance**

<b>Predictor</b>	<b>Model 1</b>	<b>Model 2</b>
	<b><math>\beta</math></b>	<b><math>\beta</math></b>
<b>R&amp;D investment</b>	0.44**	0.28*
<b>Number of employees</b>	0.27*	0.09
<b>Knowledge from basic sciences</b>		0.39**
<b>Knowledge from Industry</b>		0.23

<b><math>\Delta R^2</math></b>		0.20
<b>F</b>	9.71	10.83

\*  $p < 0.05$     \*\*  $p < 0.01$     \*\*\*  $p < 0.001$

capacity ( $\beta = .30$ ) both are significant predictors of SME's product innovation. However, inclusion of their interaction term only accounted for another 4% of the residual variances as shown by the model 3 in Table 6. Thus, our prediction that knowledge absorptive capacity and knowledge acquisition will interact in product innovation was not supported. Absorptive capacity and knowledge acquisition seem to function independently on SME's product innovation.

### ***Relative Importance of Organizational Learning Variables to Product Innovation performance***

To examine the relative importance of organizational learning variables to SME's

**Table 6: Stepwise Regression Analysis of the Contributions of Organizational Learning Variables to Product Innovation Performance**

Predictors	Model 1	Model 2	Model 3
	$\beta$	$\beta$	$\beta$
R&D investment	0.44**	0.27*	0.18
Number of employees	0.27*	0.18	0.08
Knowledge absorptive capacity		0.30*	0.22*
Knowledge acquisition		0.42**	0.29*
Knowledge absorptive capacity* knowledge acquisition			-0.22
$R^2$	0.30	0.46	0.50
$\Delta R^2$		0.16	0.04
F	9.71	12.33	15.45

\*  $p < 0.05$  ; \*\*  $p < 0.01$  ; \*\*\*  $p < 0.001$

product innovation, two measures of knowledge acquisition, four measures of a firm's technical experiences, and the firm's number of employee's and R&D investment were subject to stepwise regression analysis. As Table 7 shows, diversity of knowledge sources ( $\beta = .46$ ) and knowledge from basic sciences ( $\beta = .40$ ) are the two most important predictors of SME's product innovation in Taiwan. These two variables alone explained 41% of total variances in product innovation, followed by R&D investment ( $\beta = .35$ ), owners' depth ( $\beta = .28$ ) and breadth ( $\beta = .26$ ) of technical experiences. The results again confirm our hypothesis that owner' technical experiences plays a more critical role in SME's production innovation than their technical staffs. The results also shed lights on the fact that although direct R&D investment is critical, diversity of knowledge source is even more important for

**Table 7: Contributions of Organizational Learning Variables to Product Innovation Performance**

Predictors	R <sup>2</sup>	ΔR <sup>2</sup>	β	F
Diversity of knowledge source	0.41	0.37	0.46**	38.12
Knowledge Basic science	0.48	0.04	0.40*	25.78
R&D investment	0.52	0.07	0.35*	20.31
Owner's depth of experiences	0.57	0.04	0.28*	17.68
Owner's breadth of experiences		0.05	0.26*	13.25
R&D staff's depth of experiences				
R&D staff's breadth of experiences				
Knowledge from Industry				
Number of R&D staff				

\*  $p < 0.05$  ; \*\*  $p < 0.01$  ; \*\*\*  $p < 0.001$

SME's product innovation. In addition, knowledge released from basic sciences is more important for product innovation than knowledge released from the industry. The last finding may be contrary to most people's intuition that small to medium enterprises, due to its limitation in R&D budget, should concentrate more on items ready to market.

## DISCUSSIONS AND CONCLUSION

The purpose of this study was to investigate the contributions of organizational learning, in terms of knowledge acquisition and knowledge absorptive capacity, on SME's product innovation. Because for an SME firm, not only its R&D staff, but also its owner play a major role in acquiring new knowledge, we postulated that the prior technical experiences of the owner and the R&D staff would constitute the core of its absorptive capacity. The data from 49 companies of Taiwan's bicycle industry showed that, in addition to the R&D investment, the depth and the breadth of owner's prior technical experiences contribute significantly to SME's knowledge absorptive capacity. On the other hand, the depth and the breadth of R&D staff's technical knowledge and experiences and the number of R&D staff do not have any effect on knowledge absorptive capacity. The results suggest that the organizational learning of the bicycle companies in Taiwan depends heavily on their owners' prior technical experiences. An owner's prior technical knowledge and experiences affects the organization's knowledge absorptive capacity. R&D investment, a decision mostly made solely by the owner in SME, is still a force contributing to a company's knowledge absorptive capacity. The number of R&D staff and R&D staff's depth and breadth of prior technical experiences did not contributed significantly to SME's

absorptive capacity suggest that that the owner leads in directing the R&D activities and the R&D staff serve only an operational function in R&D activities. Thus, we can conclude that unlike the owners of large enterprises, the owner of SME plays a key role in developing his/her company's knowledge absorptive capacity.

The study also showed that though both the R&D investment and the size of company (number of employees) have a positive effect on innovation performance, this effect disappears after the variances of knowledge absorptive capacity and knowledge acquisition were accounted for. It is likely that, in SMEs, not RD investment or organizational size but knowledge acquisition and knowledge absorptive capacity determine a company's innovation performance. Furthermore although the study found a positive effect of knowledge acquisition activities on SME's product innovation, it also discovered that only collecting knowledge from basic sciences have a positive effect on product innovation performance. Activities for collecting knowledge from industry have no effect on innovation performance. Knowledge from industry concerns mainly market and commercial activities such as the actions of competitors, the changes in customer preferences, and the fluctuations in product demands. This kind of knowledge contributes less to technical breakthrough required for innovation. On the other hand, basic knowledge from sciences and technology research provides ideas for technical breakthrough and problem solving in innovation. It is apparent that even for SMEs, collecting know-how from basic sciences and technology research is more important to their product innovation than looking for information and knowledge from their industries.

The study failed to confirm the hypothesis for an interaction effect of absorptive capacity and knowledge acquisition on innovation performance. It is likely that knowledge absorptive capacity and knowledge acquisition activities have only independent effects on product innovation performance. Or, perhaps the small sample size of this study has prevented the interaction effect to reach statistical significance. Because this interaction addresses the important issue of whether higher level of absorptive capacity will be needed when there is more knowledge acquired by an organization to produce organizational learning, future studies should re-examine this interaction with a greater number of subjects.

The results of this study carry a significant implication for developing theories to account for SMEs' organizational learning and innovation. Past literature suggests that R&D investment determines the level of knowledge absorptive capacity an organization can possibly achieve. However, to SMEs, enterprise owner's prior technical knowledge and experiences serves as another important force contributing to the absorptive capacity. In large enterprises in which the ownership and management are separated, knowledge management process is standardized, and the large scale of organization may diminish an owner's direct influence on organization's absorptive capacity. Theories developed to account for the organizational learning may suit large enterprises better, but not SMEs. The characteristics of owner should be included as a major factor in the theories concerning SMEs' learning process. Further, even though the size and the experiences of R&D personnel have been found to contribute positively to a big organization's knowledge absorptive capacity; SME's owner probably is more important than R&D staff to constitute an SME's knowledge absorptive capacity. The learning theories built for SMEs should address more the effects from enterprise owner rather than those from R&D staff.

The finding of attenuated effect of R&D investment's on SMEs' innovation performance after the influence of knowledge acquisition and absorptive capacity were accounted for bears an interesting implication to SMEs' innovation management. For most SMEs, the shortage in funding and resources prevent them from investing heavily in R&D work. To enhance their innovation performance, the SMEs can work to acquire knowledge and to increase their knowledge absorptive capacity from sources other than R&D investment. The general process of organizational learning rather than investment in R&D should be the focus of the theories built to account for the SMEs' innovation management.

Theories of organizational innovation used to argue that information and knowledge imported from sources outside an organization facilitates the generation of new ideas and enhances product innovation. The lack of effect on absorptive capacity from collecting information from industries and the manifestation of a positive effect from collecting information from basic researches suggest that organizational learning theories should be revised to place a greater emphasis on the role of information collection from basic sciences if they want to better account for the innovation process in SMEs.

## **ABSTRACT**

The Drexel University- Baiada Center- Incubator provides mentoring services for resident and other entrepreneurs. The Mentors (M's) are mainly retired, successful CEO'S. To facilitate the provision of services, a mentoring structure comprised of three components has been utilized.

- A) Primary Mentors - Direct one on one continuous services to individual Entrepreneur and start-up Companies.
- B) Pro – Mentors - Extended Network to provide specialized services to Entrepreneur's as required e.g. Legal Accounting, Finance.
- C) Operational Mentors - Daily operations that addresses new requests for Mentor's help including new potential Entrepreneurs. They also participate in all aspects of BAIADA Center Programs and Academic program in Lebow College of Business

For each Entrepreneur (E's), the primary Mentor is the Project Manager who coordinates the services of the network, M's and other specialists as required. In fact a self-organizing and directed matrix organization is created to provide specific bundles of services in a timely manner.

A website has been established to facilitate communications and provision of services. The program has been highly successful.

Now, a WEB BASED COMMUNITY is being designed and implemented to extend mentor services to an expanded market of Entrepreneurs. Non- Resident Entrepreneurial companies including faculty, alumni and the community at large to facilitate the matching of mentor services to needs.

The Entrepreneurial ventures are classified as –

- I. Start-up – Business concept preparation of business plan
- II. Early implementation of company operation, 'cash flow' (TAP)
- III. Growth oriented – successful entrepreneurial companies.
- IV. Exit Strategies.

The classification scheme is proven helpful in assigning M's and monitoring E's progress, with an eye for identifying need for changes in the E relationship. The ultimate goal is to link with other incubators around the globe and extend the Entrepreneur community served by the Mentor program. It is anticipated that the entrepreneur community will facilitate the launching and landing of Entrepreneur's plans for global operation.

## **INTRODUCTION**

Drexel University for long has been a pioneer in the field of Entrepreneurship and Technology. Its programs are well regarded in the US as ones that foster Entrepreneurship and Technology focus. The creation of Baiada Center for Entrepreneurship in Technology was a watershed event in the development of Drexel University as a nationwide leader in technology and entrepreneurship.

In March 2001, the Baiada Center opened the doors of its state-of-the-art entrepreneurial environment at 3225 Arch Street on the Drexel Campus in Philadelphia. The Laurence A. Baiada Center of Entrepreneurship in technology is a full-service entrepreneurial program run by the Lebow College of Business for the Drexel University Community. The Center provides an innovative and unique approach to entrepreneurial development, offering inter-disciplinary academic instructions, real world resources and a physical environment for accelerated business creation. The goal is to link research, coursework and entrepreneurial thinking with practical guidance for budding entrepreneurs (Figure 1)

The new Baiada Center space has been conceived in direct response to student input as a unique, full-service work, mentoring and collaboration space for the entrepreneurial community at Drexel.

An architectural reflection of Drexel's commitment to entrepreneurial innovation, the Baiada Center contains:

Significant incubation space for student teams creating businesses while at Drexel, including:

- Mentoring Space which can accommodate more than 20 student entrepreneurial teams (E's) at 12-14 flexible shared work stations with private "lockers" for each team
- Entrepreneurial Space, awarded based on exceptional merit, which can accommodate up to eight student entrepreneurial teams at private, dedicated workstations
- The Wedge, a presentation room designed to house the Baiada Center's ongoing workshops and presentations, entrepreneurial classes, and other public events

- The Cyber café, a central café designed to create a community social space for entrepreneurs at Drexel University
- Mentoring rooms for students meeting with mentors, pitching their ideas to investors, or holding teamwork sessions

The Center is a home for the Office of Technology Commercialization of Drexel, bringing Drexel's resources and guidance in the commercialization of new technologies to the wide spectrum of talent at Drexel -- from Drexel student teams with promising business ventures to Drexel researchers developing new technologies, to students and researchers creating new uses for advances in the biosciences.

The Center is a Total Facility - Literally a Mall of Services for the ambitious Entrepreneurs.

The Mentors (M's) are mainly retired, successful CEO'S. To facilitate the provision of services, a mentoring structure comprised of three components has been utilized (See Figure 2). We shall further discuss about these three components later in the paper

A – Primary mentors

B – Pro Mentors

C – Operational Mentors

The Center fosters inventive spirit of the entrepreneur. It brings students from different academic disciplines together in a collaborative environment where inspired ideas become promising enterprises. The deep interdisciplinary nature of the Baiada Center distinguishes it from other university entrepreneurship program. The deans of each of the schools and colleges across the Drexel campus have had a hand in the ongoing development of the entrepreneurship program. Students from every academic discipline are encouraged to participate through interactive workshops, entrepreneurial courses, an annual business plan competition and entrepreneur conference. In addition to academic programs and research opportunities, the E's are connected with the business community to develop mutually beneficial synergies through networking events and extended network of the mentors.

Seasoned entrepreneurs, business professionals, faculty and administrators make up the Baiada Center's management team and mentor program (Figure 4). This unique partnership provides students with potential partners in the business and investment community, as well as a wealth of knowledge and resources from the academic community. The Center and experienced mentors are continuously increasing their resources, enabling them to provide a significant package of services to entrepreneurial teams that demonstrate sustained promise and real progress in the creation of successful ventures as well as supporting and nurturing an entrepreneurial zest for those with “fire in the belly and gleam in their eyes”. A web Platform has been designed to facilitate the flow of useful information, resources and smoothen the communication process between the Entrepreneurs and the expanding network of Mentors, available for crucial support and guidance.

## **Classification of Entrepreneurs (E's)**

The Entrepreneurial ventures are classified as –

### **I. Start-up Business Concept - Preparation of business plan**

The Center encourages university students to conceptualize their innovative ideas, and encourages them to convert them into business plan. It provides support, resources and training in fine-tuning their business plan. Every Year the business plan Competition hosted by the Center encourages business plans from budding Entrepreneurs.

### **II. Early implementation of company operation, 'cash flow'(TAP)**

The Center has resources/ facilities to aid the specific needs of newly established start-ups.

### **III. Growth oriented – successful entrepreneurial companies.**

The Center provides support/guidance/mentoring services to growth oriented ventures such as legal services, access to specialized organizations of professionals, specific guidance in financial issues, assistance in going public, etc.

### **IV. Exit Strategies.**

Entrepreneurial Ventures very often face a need for radical change. The Center and experienced mentors provide guidance and support services to identify such situations and avoid or work through them, if possible.

The Entrepreneurs are first listed. Of this list the Potential applications for service are sorted. The BAIADA Center then assists the E's for the Business Plan preparation. Various workshops are conducted to smoothen the process. This is followed by Stage II i.e. Implementation of Business Plan – Organizing and Funding, Stage III i.e. Initial operations turn around tap (TAP), Growth and profitability. The final stage is EXIT. The classification scheme has proven helpful in assigning M's and monitoring E's progress at each stage (Figure 3)

## **Activities**

### *Workshops*

The Baiada Center's Entrepreneurial Workshop Series supports teams through seminars and workshops on the various facets and skills needed at developing a business plan and growing their network of resources. Workshops are conducted twice a month. Following are some of the examples of the kind of the workshops conducted at the Baiada center to guide the potential entrepreneurs. These workshops draw on the talents and expertise of business executives and successful entrepreneurs and offers insights into the skills and talents needed though the various stages of Entrepreneurship.

The Mentors, having an experience at dealing with the most common dilemmas and questions of the Entrepreneurs, help and participate in the design and conduct of these workshops.

The Workshops Series conducted so far support teams on various aspects of idea generation and development, conducting feasibility studies, developing a business plan, etc; drawing on the resources of Drexel, the Tri-State business community and the broader Drexel Network of entrepreneurial business leaders.

A brief description of sampling workshops held in the last two years:

- Lies investors and Start-ups tell themselves to avoid marketing
- Presented by Sandra Holtzman, Holtzman Communication LLC, NY this presentation shared unique perspectives on how to get to market efficiently, professionally and with minimum impact on limited funds. Attendees gained an understanding of the value of marketing, branding and positioning – a marketing blueprint for launching a company and solutions or the most common obstacles to success, including their resistance to marketing.
- A Day in the life of an Entrepreneur – What do Entrepreneurs do all day? Aimed at motivating budding entrepreneurs and fostering a sense of Entrepreneurship amongst Drexel students.
- How to create a killer business plan – Turning Ideas into Reality
- Presented by Mike Holton, VP, Managed Solution, Merrill Lynch, PA and Marc Lederman., Partner- New Spring Ventures, PA with Wayne Kimmel, MD- Eastern Technology Fund, PA.
- Having a great business idea without a solid business plan is like trying to hike without an itinerary or a map. The workshop helped students to learn the art of developing a business plan from these leading experts.
- Building a Customer-facing organization – It doesn't get any better than this.
- Presented by Mark Loschiavo, Director, Baiada Center and President, First Serve Technologies. Angela Blackburn, Customer Contact Center Consultant.
- It has been said that it costs five times more to acquire new customers than keep an existing one. It aimed at teaching attendees the strategies to avoid falling into the trap of customer dissatisfaction and build an organization that delights its customers.
- Finance 101 for Start-ups and Entrepreneurs – Buddy, Can you spare a dime?
- Presented by Tom Bonney, President, CMF Associates.
- This workshop aimed at giving introductory financial acumen to start-ups, particularly in the field of cash and accounts receivables management. The workshop was specially conducted to benefit those with a non-managerial background.
- Harvesting Value, Exit strategies and the IPO process- What is your exit strategy
- Presented by David Reed, Director, Investec.

- When reviewing business plans, investors want to know from the very beginning about the exit strategy. A weak or non-existing exit strategy could be a crucial factor in securing funding. The workshop gives valuable insights about harvesting value in a company and making appropriate VC pitching.
- Forget VC funding – go out and sell
- Presented by Bob Cooper, President, Ricochet Inc.
- The workshop aimed at providing the valuable skills of pitching for capital and financing, through non-traditional sources. It was helpful in giving new insights into capital and start-up financing.
- Approaching the Investor runway
- Presented by Dan McKinney, Executive VP, T. Williams Consulting
- All start-ups require capital. The workshop provided valuable tips about approaching potential investors and communicating the passion and drive the Entrepreneur carries about his business idea.
- The Legal Aspects of Entrepreneurship
- Presented by William D. Kennedy and John Pauciulo, Partner(s), Litigation Department, White & Williams.
- The workshop was very helpful in giving a background on the legal aspects confronting new start-ups and the dos and don'ts involved.

### *Pitch a VC Event*

This event gives the E's an opportunity to make Business pitches to panel VC's and Angel Investors

### *Forums*

Forums are evening events that are presented to existing E's and Start up communities to help them in their Business Plans. Forums are conducted monthly and topics are parallel to the listing above

### **Mentor Program**

In Business environment, mentors are considered as a 'Role models for potential entrepreneurs'. Mentors understand the "world of work". They guide budding entrepreneurs in their venture by offering right direction, feedback, and hints while at the same time allowing entrepreneurs to take complete responsibility of their own actions; a mentor focus on providing facilitation to the learning process rather than telling entrepreneurs what they should know. Incubation is defined as the process where emerging businesses—entrepreneurial ventures—have the opportunity to develop in a nurturing and supportive environment. Many "incubator" models are collaborative efforts that are supported and underwritten by a combination of governmental agencies, state and local governments, other successful entrepreneurs and, yes, academic institutions.

Business mentoring occurs throughout today's business environment, both formally and informally, and across sectors.

At the Baiada Center, Mentoring is an extended, confidential relationship between the Mentors and the prospective Entrepreneurs who share a common goal of their business learning and corporate success of their ventures. We believe that a strong, committed relationship between an amateur entrepreneur and experienced business people can make the difference between success and failure, between growth and stagnation. Many Entrepreneurs have attributed their own successes to the presence of a supportive person who took a personal interest in them and the growth of their business.

Our mentors are seasoned and well qualified professionals from diverse fields who have either started their own businesses, networked in the business world, and are willing to share their knowledge and expertise with the Entrepreneurs and the student community at Drexel. They undergo a selection and interview process and then become a part of the committed services provided by Baiada center. Mentors provide assistance, guidance, and personal encouragement primarily to new entrepreneurs in start-up phase or to entrepreneurs who are growing an existing business. They offer the "big picture" perspective, a result of years of experience and expertise. Overall, mentors bring their expertise to the entrepreneur to help them implement a strategy and achieve objectives - a critical process in creating a successful business.

These Mentors have now become a part of a broader entrepreneurial initiative at Drexel. Mentors are now contributing towards the spread of Entrepreneurial spirit at various colleges at Drexel. The Mentors participate in the critique of business presentations at the MBA program, and provide motivation and support to the aspiring entrepreneurs to conceive their business ideas, and shape up a business plan. Entrepreneurial studies have emerged with a great deal of excitement, with interest and resources focused on establishing and conducting programs and creating a new academic venture. At Drexel, a task force is set-up to further the development of the Incubator and Mentoring program: Mr. Mark Loschaivo, Director of Baiada Center, Mr. Milton Silver, Director, Mentoring Program and Mr. Herb Lipton, Co-Chair, Business Community. A sampling of other participants includes representatives of LORE (Loosely Organized Retired Executives), Ben Franklin Partnership, City of Philadelphia, State of Pennsylvania, venture capitalists, students and other universities faculty members.

## **Mentoring: A Historical Perspective**

The Mentoring Program for the Entrepreneurs at the Baiada Center is in place since about nine months now. The program involves 10 budding young entrepreneurs housed at the Baiada Center and a network of 15 Mentors. The mentoring program varies with mentors and entrepreneurs agreeing their own time commitments at the start of their relationship. The Mentoring Program works on three levels:

- Primary mentors - One – To – One:
- The Mentors and Entrepreneurial Teams are matched on the basis of their mutual interest and requirements. Whether they meet the entrepreneur face-to-face, or are available by arrangement on the telephone or e-mail is up to the individuals concerned.
- Pro- Mentors - Network Pool of Resources:
- The Entrepreneurs have access to the vast Mentor network and resources, for specialized inquiries and concerns such as legal opinions apart from their One-to-One Mentors.

- Operational Mentors - Daily Operations:
- An experienced Mentor resides at the Center for immediate assistance and guidance to the Entrepreneurs. They also participate in all aspects of BAIDA Center Programs and Academic program in Lebow College of Business

The Entrepreneurs are preliminarily matched with appropriate Mentors based on their business plan, and immediate growth requirements. The relationship is on one-to-one and daily operational base. The Mentors and Entrepreneurs decide to meet at their convenience and the Mentors are always available for crucial operational issues and concerns of the Entrepreneurs. The Center has designed a Web platform, exclusively to facilitate the flow of information and resources and smooth the communication process between the Entrepreneurs and the Mentors. Seamless transition and cross-functionality amongst the Mentor Network is being tested now. The matching of E's to M's is a dynamic evolving process. Through periodic meetings between the Mentor network and the Entrepreneurs, constant reassessment and reassigning based on the changing requirements of the Entrepreneur is achieved.

The E's are free to choose their own one-to-one Mentor based on their current dilemmas and also have access to the vast network of Mentors for some specific one-time counseling requirement.

The results have been impressive. Some thrust areas in this field which are being researched further are the recruiting and selection of Mentors, their training, matching them to entrepreneurs, enhancing their relationships, replacing and sequencing this chain of mentors, ensuring a seamless transition, evaluating the effectiveness of such programs and various other strategic issues.

### **Significant Developments:**

- Online Web Community of Mentors and Entrepreneurs worldwide: The Center hopes to connect the wide area of resources worldwide, in the field of Entrepreneurship and Mentoring in Incubators, in the near future. This online community will help in forming a link between the young entrepreneurs, and Mentors, globally and would thus extend the reach of the highly successful Mentor program at Baiada. It shall enhance the role and scope of the Mentor Program to the students, faculty and community at large, globally.
- Academic CIE Programs and the Certificate Programs: The Drexel Career Integrated Education (CIE) Programs and the Certificate Programs give a practical edge to the theoretical concepts strengthened by the workshops and forums. It helps students to gain corporate experience in solving real world business problems and issues.
- Strategic Leadership: The workshop/forums cultivate leadership values in Entrepreneurs. A Boot Camp is organized for faculty to understand the change management procedures aimed at providing support to Entrepreneurial learning. A range of learning and training sessions are enhanced through simulations
- Research: In addition, the BAIADA Center is conducting Research to better understand the changes in the organizational development and provide the necessary changes in the management leadership as an entrepreneurial venture moves through the various stages. The lessons learnt from the research then become a part of the trend simulation design. Further, our research faculty gathers more data and learns about

entrepreneur problems and poses the hypothesis to identify the problem that would be studied in the research.

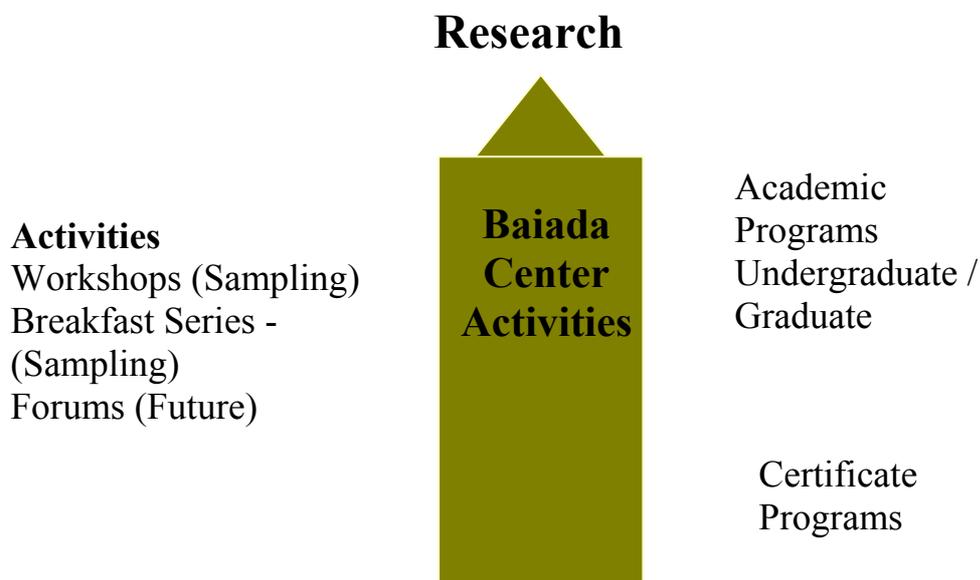

When mentors assign entrepreneurs to tackle their critical innovations, they instinctively work to match the requirements of the job with the capabilities of the individuals they charge to do it. In evaluating whether an entrepreneur is capable of successfully executing a job, mentors will look for the requisite knowledge, judgment, skill, perspective, and energy. Mentors will also assess the entrepreneur's values.

### **Future Plans / Vision Ahead**

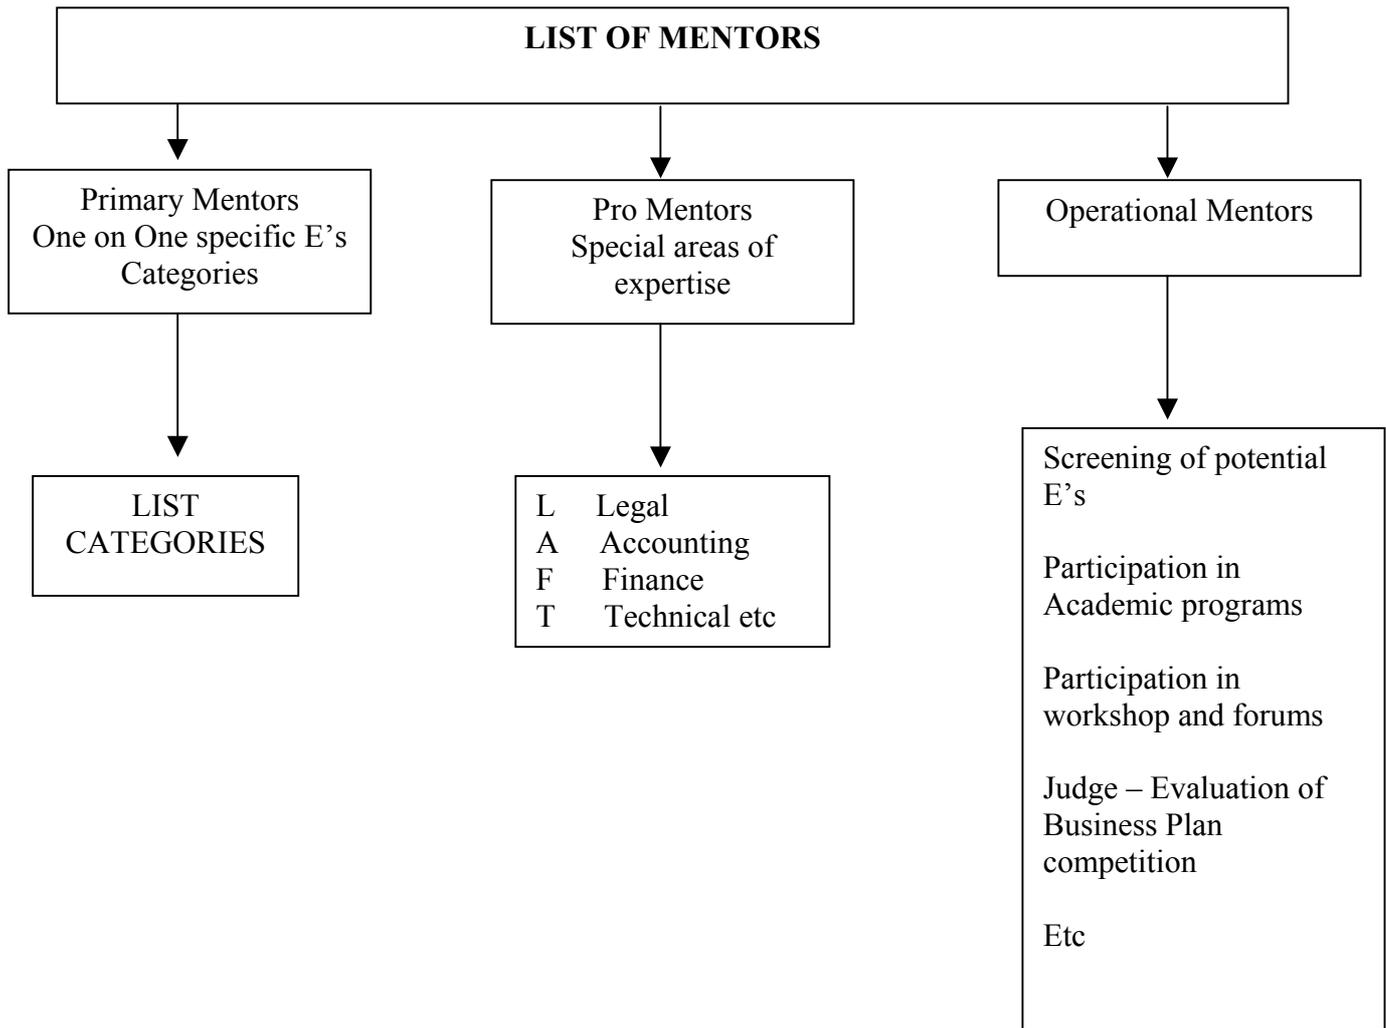

- Online Web Community of Mentors and Entrepreneurs worldwide: A Web Platform has been designed to facilitate the flow of useful information, resources and smoothen the communicating process between the Entrepreneurs and the expanding network of Mentors, available for crucial support and guidance
- Extending scope of the Mentor Program to the students, faculty and community at large
- Research Center – Behavioral Simulation
- The BAIADA Center – A Soft Landing and/or Launch Platform for Global Business

# **MANAGING RELATIONSHIP PROBLEMS - STRATEGIES FOR SMALL AND MEDIUM ANCILLARY INDUSTRIES**

**Vishnuprasad Nagadevara**  
**Indian Institute of Management Bangalore**

## **ABSTRACT**

Often, an ancillary industry operates in a monopolistic situation but remains at the mercy of the client company because the client happens to be the monopoly buyer and dictates from a position of strength. The client company is averse to leverage its monopoly position because the ancillary is the only supplier. Thus, the client and the ancillary operate from a monopoly situation, yet unable to take advantage of the situation. Each develops its own strategy to make the best out of its negotiating position and bargaining power. The main determinant of bargaining power between two depends on the extent to which the relationship is crucial to its existence. Small units that are able to diversify in terms of products and customers are in a better position than those, which are captive to a particular client. This paper analyses the relationship strategies with respect to factors such as price determination, quality, regularity of orders etc.

## **INTRODUCTION**

The industrial policy statement of the Government of India defines an ancillary industry undertaking as "An industrial undertaking which is engaged or is proposed to be engaged in the manufacture or production of parts, components, sub-assemblies, tooling or intermediates, or the rendering of services and the undertaking supplies or renders or proposes to supply or render not less than 50 per cent of its production or services, as the case may be, to one or more other industrial undertakings and whose investment in fixed assets in plant and machinery whether held on ownership terms or on lease or on hire-purchase, does not exceed Rs 10 million". Thus the ancillary industrial undertaking is usually small or medium enterprise (SME) due to the limit of Rs. 10 million imposed on the investment. It also happens to be supplying a major portion of its production of a given part or a component to the client company. At the same time, it is the only supplier or one of the few designated suppliers of the specific part or component to the client company.

Often, the ancillary industry operates in a monopolistic situation since it is the only supplier to the "client or parent" company. Even though it operates as a monopoly, it remains at the mercy of the client company because the client happens to be the monopoly buyer and much larger in size and dictates from a position of strength. At the same time, the client company is averse to leverage its monopoly buying situation because of the fact that the ancillary is the only supplier or one of the few designated suppliers for the particular item or service, and it is

not easy, if not impossible, to switch over or develop a new supplier in the short run. In other words, the client and the ancillary operate from a monopoly situation, but are unable to take advantage of the situation. It is very common to have friction between the two, but the very need for survival makes them to come to an understanding. Each develops its own strategy to make the best out of its negotiating position. Another important aspect of the relationship between large client company and the small ancillary supplier is their bargaining power vis-à-vis each other. The main determinant of bargaining power between two depends on the extent to which the relationship with one is crucial to the existence and viability of the other. Small units, which are able to diversify both in terms of products and customers, find themselves in a better position than those, which are tied and captive to a particular client. There are different reasons for the development of ancillaries. Also, there is a varying degree of involvement of the parent/client company. Companies such as Ashok Leyland and TELCO rendered considerable assistance in terms of technology, training as well as implementation of appropriate systems in the ancillary industries. The integration appears to be much higher with respect to these ancillaries. Similarly, Unilever PLC creates strong relationships with the suppliers in whichever country they are operating. It offers financial support, help in up gradation of equipment, and provide training. Often, direct technology transfers were made of machinery as well as formulations. They also provide help in quality assurance and expertise in analytical skills. While the suppliers derived benefits in terms of financial support and technical knowledge, Unilever benefited by the fact that the supply lines were set up quickly and easily without high costs [4].

Occasionally, the client company assists the ancillaries to survive in the face of certain demise. In the case of Indian Telephone Industries (ITI), the client company went into a massive technology up gradation and the ancillaries faced a certain closure. The parent company helped these ancillaries to form a consortium and transferred the technology for the manufacture of certain components and instruments. Ultimately, these were able to supply components not only to ITI but also to other companies.

Another important factor in determining the relationship between the SME supplier and the client is the extent of financial linkages between the two. The extent of financial linkages varies widely from company to company.

There are certain principles enunciated to maintain the relationships between the suppliers and the client companies. They should attempt to integrate their activities in their attempts to improve quality [3]. It was also suggested that the suppliers and the client companies should be motivated to initiate opportunities for product and process innovations.

Both the SME supplier and the client company need to maintain a symbiotic relationship, even though there are a number of points where the interests of the two conflict with each other. "While customers are seeking more collaborative relations through supply chain management, the supplier behavior may only be instrumental compliance rather than cultural change premised on deep-seated values [1]. The SME supplier may only be responding to a relationship of unequal power and the reality of supply chain management may be very different from the theoretical concepts of integration and collaboration". The SME supplier and the client company evolve different strategies and procedures to take maximum advantage of the relationship and minimize the irritants. Most often, it is the large client company that is in a position to dictate terms, and consequently, the smaller ancillary unit will

have to evolve appropriate strategy so as to survive and make enough profits. The SME supplier needs to manage the relationship with the client company and at the same time derive the maximum from the relationship, making it a win-win situation.

Developing a healthy relationship with the suppliers is critical to the effective functioning of the firms [2]<sup>1</sup>. Over the past few years, many large firms substantially reduced the number of their suppliers. This trend obviously means that there are certain suppliers who are exclusive to the client company. The primary reason is that the corporations are becoming leaner, and the procurement function is becoming more centralized. As outsourcing of operations is becoming more and more common, more opportunities to partner with suppliers are arising. Maintaining this partnership and managing the relationship is becoming increasingly important for several reasons such as,

- Declining market prices
- Rising competitive intensity
- Advanced technology enablers
- Reverse marketing strategies and
- Strategic positioning

It is not uncommon to have some suppliers exclusive to their client companies. Managing these relationships is becoming increasingly important in order to reduce the prices, rise the competitive intensity, use of advanced technology enablers, strategic positioning etc. A number of companies such as Eastman Kodak, Ford Motor Company, JC Penny and Levi Strauss etc. have demonstrated that considerable savings can be achieved by managing relationships with the suppliers [2]. It was found that the average length of relationship between suppliers and client companies in the Japanese automotive industry was 22 years. In addition, the client company purchased about half of the production of the supplier firm. The supplier firms are limited to 2 to 4 units. A well-managed relationship reduced the uncertainty and cost of the supplier. Even in terms of development efforts, about 26 percent of such efforts were devoted to a single client company [5].

The major irritants in the relationship between the SME supplier and the client company are

1. Price determination
2. Regularity of orders
3. Systems and procedures within the company
4. Quality control systems
5. Payment terms

The SME suppliers evolve various strategies to manage the relationship with respect to each of the above. Obviously, the strategies depend on the stage of relationship as well as the extent of interdependence. This paper attempts to highlight various strategies adopted by SME suppliers to manage their relationship with the client companies. The research method used is the case method where a number of SME suppliers were studied and the strategies and practices followed by them were collated. The effectiveness of these strategies and practices are analyzed with respect to the survival as well as the success or failure of the

---

<sup>1</sup> This part of the paper draws extensively from Prof Jagadish Sheth's paper {2}

relationship management of SME supplier. Initially, the sample of SME suppliers is limited to manufacturing sector.

This study is carried in two stages namely Exploratory Study and In-depth Study. A limited number of SME suppliers are interviewed in detail on various aspects of the relationship management. This information is used to identify the parameters that govern the relationship between the SME supplier and the client company. Based on the results of the Exploratory Study, a detailed questionnaire is prepared and a larger sample of SME suppliers is being studied using the questionnaire. This paper presents the findings based on the Exploratory Study.

The results of the exploratory study are discussed under the following heads:

- Initiative to start the SME
- Modality of price determination
- Regularity of orders
- Quality
- Payment terms and
- Business intelligence

### **Initiative to start the SME**

A majority of the SMEs studied were started on their own initiative. One of the entrepreneurs had received training from Small Industries Service Institute (SISI) and decided to start his own unit. A large order from a public sector company helped in the initial stages. But the SME supplier started supplying to two other private companies and at present most of its production goes to these private companies and very little is supplied to the public sector company.

The public sector companies were performing very well during the eighties and many entrepreneurs were encouraged by these companies to start SME units and become ancillaries to these public sector companies. Two units in the sample have started primarily to supply the same component to a particular public sector company. The client company originally had a large monopoly supplier and they have helped in promoting 5 SME units to break the monopoly of the supplier. Two of these 5 units are included in our sample. One of these two units has diversified into other components and also started supplying to other client companies. Over a period of time, this unit has stopped supplying to the public sector, which has originally promoted the unit. This unit is expanding and thriving well due to its diversification efforts. At the same time the other unit remained completely with the public sector client company. This public sector client company is on the verge of closure now and consequently, the SME unit is also facing the prospect of closure.

As mentioned earlier, a majority of the units in the sample were started by their own initiative. One of them has started by developing a new product based on their study of the requirements of Indian Railways, which is owned completely by the Government of India. Subsequently, this unit has diversified into many other products. This unit operates either in a monopoly or a duopoly situation with respect to many products and components that are supplied to the Indian Railways. This unit has provided an excellent example of managing the

relations with a government organization and thriving well and expanding and diversifying into many other products, but mainly remaining as a preferred supplier to Indian Railways.

One of the important factors of the SMEs in managing their relationship with the client company is the fact that they are started by their own initiative and there by not emotionally or economically linked to the client company. Even those, which are started through external encouragement by the client company, tend to perform better when they reduce their dependence on the client company. In other words, it is important to the SME suppliers to be driven by their own strengths rather than be dictated by the requirements of the client company. It is important for the SME supplier to identify its core competence and establish the relationship with the client company accordingly.

## **Price Determination**

The SME suppliers and the client companies establish different methodologies for determining the price of the component or the product supplied by the SME units. There is a clear distinction between the public sector companies and the private sector companies in the methodologies followed in price determination. The public sector companies invariably follow the competitive tendering process. The process that is generally followed is that the requirements are indicated to the SME suppliers and each is asked to quote their best prices. The SME quoting the lowest price is selected. Some of the public sector companies tend to split the order between units with the lowest quotation and the next lowest, provided the second unit is willing to supply at the same price as the lowest quotation. In a sense, this provides work for both the units. But, at the same time, neither unit will have the advantage of the economies of scale. The underlying objective of splitting the order is to make sure that none of the SME units will get the advantage of a monopoly supplier rather than providing opportunity to both the units. In case one of the suppliers fails to supply either in the required quantities or of required quality, the other supplier will receive additional orders, but at the lowest quoted price only.

The private companies appear to follow a different procedure in determining the price. The mechanism that they follow could be termed as “cooperative” pricing. Generally, the SME supplier is asked to quote his or her best price and this is followed by negotiations. The client company takes into account the final price that they receive for their product and the costing of component at the SME supplier. The objective is to make sure that the SME supplier does receive a remunerative price. At the same time neither the SME supplier nor the Client Company can take advantage of the monopoly position. As a matter of fact, the client company some times gets involved in carrying out a costing exercise on behalf of the SME supplier.

Because of the uncertainty involved with the tendering process, the SMEs tend to annualize most of the tooling and designing cost involved with a new products on the very first order. Since it is a new product, they are sure of the first order and the pricing is done such a way that at least 50 percent of the tooling and designing cost is built into their quotation. The main reason for this is that the SME supplier is not sure of repeat orders. On the other hand, where there is cooperative pricing, the SMEs are generally ensured of repeat orders and consequently they spread the cost of tooling and designing over a longer period. This helps both the SME supplier as well as the client company.

An interesting strategy is followed by the SME supplier to the Indian Railways. The Indian Railways maintains a very high level of transparency with respect to their tenders calling for quotations. In addition, they regularly publish information about the successful bid. The information includes the name of the firm, which was awarded the supply contract, the final price as well as the quantity to be supplied. The SME supplier in our sample maintains a very detailed database on the various components that it is interested. Based on the information from the database, the SME decides whether to quote for a particular component or not and also how much to quote. They also take into account the possible competitors and the incentives that they have such as excise duty rebate or sales tax rebate.

One of the public sector companies is in the process of setting up a special committee, which will actually do the costing for their SME vendors so that appropriate pricing mechanisms can be worked out.

The most important strategy for maintaining relationship on the pricing aspect is the cooperative pricing where both the SME supplier and the company client have sufficient understanding of the costs of the supplier and the price received by the company client for the final product. Even in such cases, the pricing mechanism worked out is dependent on the long-term commitment between the two in terms of continuity of the relationship. In other words, the pricing mechanism depends on the likelihood of regularity of future orders from the client.

## **Regularity of the orders**

An important factor in the management of the relationship between the client company and the SME supplier is the regularity of the orders. Generally, when the relationship reaches a very high level, the operations of the two get seamlessly integrated and each has access to the production plans of the others. Obviously, such an access is limited only to that part of the production plans which impact the other partner. Unfortunately, such a level integration did not occur in any of our sample units.

The extent of information exchange with respect to the regularity of orders varied widely between the public sector and private sector client companies. One of the private sector companies has provided annual targets to its SME supplier. These annual targets are converted into monthly schedules. The SME supplier regularly informs the client about their production schedules, details of operations, capacities available etc. Using this information, the client company revises the schedule of monthly supplies from the SME supplier. At the same time the SME supplier makes sure that the annual targets are fulfilled and there is not too much of variation in the monthly schedules. As a matter of fact, since the annual targets are known, the SME supplier builds it into its own monthly schedules and fine-tunes it to suit the monthly requirements of the client company. Spare capacity, if any, is used to manufacture for other companies. Even this information is shared with the client company.

Another SME supplier makes regular forecasts of the clients requirements based on their market intelligence. Production schedules are made based on this forecast, and they manage to affect the supply within 10 to 14 days. In that sense, the SME supplier actually initiates a production schedule proactively based on his own forecast of the client company's requirement.

The situation with respect to the public sector company clients is very different. The SME supplier is not given any targets or annual requirements. The requirements are announced through tender notifications. Even these notifications do not have any regularity or periodicity. There is no long-term commitment from the client company. It is always the lowest quotation that gets the order for supply. The SME suppliers tend to manage the irregularity in the orders by managing the work force. The production capacity is more or less fixed and cannot be adjusted to suit the wide variation in the orders. On the other hand, the number of workers can be adjusted based on the quantum of the orders. Thus, some of SME suppliers maintain a small group of workers on a permanent basis. This work force is just sufficient to meet the minimum production requirements. As and when there is a need to increase the production because of fresh orders, or higher quantities to be delivered, additional workers are hired on a temporary basis. While this minimizes the running cost for the SME supplier, it results in lowering the quality of the output. It is not easy to get trained workers on a temporary basis at a short notice and invariably the SME ends up hiring untrained casual workers. Consequently the quality suffers. There are a few SME suppliers who manage the irregularity in orders in a different way. These units maintain a large enough work force, but they pay them low monthly wages. These workers are compensated by additional bonus paid to them based on weekly or monthly production levels. Here again, the quality suffers because a well-trained worker is unlikely to stay on at lower wages and uncertain bonuses.

Even though the ideal process to manage the production schedules between the SME supplier and the client company is to share as much information as possible, this does not happen in practice. As a result, the SME suppliers resort to different strategies, which impact the quality.

## **Quality**

Many SME suppliers look at quality as something imposed on them from outside. At the same time there are a few which encourage quality from within. The SME suppliers who depend on outside intervention for quality generally leave it to the client companies. The client companies insist on a particular source for raw material and the SME suppliers have to procure the raw material from the sources certified by the client company. The client companies even designate the laboratories where the raw materials have to be tested with respect to certain parameters. There are few client companies, which have obtained ISO 9000 certification, which, in general is expected to have an impact on the processes of the SME supplier. But, many of these SME suppliers felt no such impact. These units appear to leave the quality aspect to be dictated by the client companies. With the result, the components supplied by them are checked one hundred percent at the inward receipts of the client company leading to additional costs to both the SME suppliers and the client companies.

The few SME suppliers who encourage quality from within have a different experience. Some of them have already gone for ISO 9000 certification. The decision to go for ISO 9000 certification is sometimes on their own other times based on the insistence of the client company. One of the SME suppliers operates three different units. They had obtained the ISO certification for only one of the three units. Even though the other two units officially do not have the certification, all the procedures and process involved in ISO 9000 are put in place in the other two units also.

One of the SME suppliers who regularly supply the components to the Indian Railways makes frequent visits to the operating sheds and workshops of the Indian Railways where these components are used. They obtain feedback on their components directly from the operators. In addition, these visits also help in evaluating the requirements of new components as well as the improvements in the existing components. When these new or improved components are designed and developed by the SME, they are in a position to offer these to the concerned operating shed or the workshop. Owing to the decentralized nature of the decision-making in the Indian Railways, the workshops can place the orders on the SME directly, taking advantage of the fact that this is a new component. Since the information on various components are pooled into a central database in the Indian Railways, the component becomes part of the central database and when the other operating sheds or workshops float a tender for these components, the SME supplier has the first mover advantage. This particular SME makes it a point to get the raw material from the same source as the Indian Railways. Even though this strategy entails much higher cost for the procurement of raw material, the quality is assured which in turn ensures regular orders from the Indian Railways. The SME supplier purchases large quantities of the raw material at one time to take advantage of the discounts on larger volumes. They feel that these discounts more than offset the increased inventory carrying costs.

Another SME keeps upgrading its machines to make sure that the quality is maintained. This also helps in low down time of the machines. The client company, which is a private sector company is fully aware of this and takes this into account in determining the price, order quantities as well as the delivery schedules. As a matter of fact, the client company recently brought in major modifications in the design of its own products and consequently, there are major changes in the nature of the components. The design group from the client company started working closely with the SME supplier in redesigning the components and retooling. In the process the client company is also carrying out the costing exercise so that the pricing can be done appropriately. The client company is even suggesting that the SME should acquire a few CNC machines and that the investment can be made a part of the costing exercise. This is the same client company, which shares the annual targets and monthly production schedules with the supplier.

One of the client companies, which has ISO 9000 certification, is insisting that the SME suppliers should also obtain ISO certification. The client company is offering to setup a team to do the costing exercise for the SME suppliers and use the data in negotiating the prices, provided the SME supplier obtains ISO certification. Some of the SME suppliers feel that this is enough of an incentive to obtain ISO certification. They also feel that they can get orders from more client companies on the basis of the certification.

## **Payment Terms**

The SME suppliers normally deliver the parts or the components to the client company and also send the bills for payment at the same time. The client company is expected to make the payment as soon as possible after the components are tested for quality. But, the payment terms appear to be more in favor of the client company. There are occasions where payment takes anywhere from 45 to 180 days after the components are accepted by the client company. The payments are sometimes held up on flimsy grounds. No advance is paid by the client companies while placing the order. Even the client companies from the private

sector do not make any advance payments. Some of the client companies even insist of bank guaranties while placing order. On the other hand, the SME supplier does not get any credit from the suppliers of raw materials. This coupled with delays in payments, results in heavy working capital requirements.

The delays in payment by all the client companies involved in this study indicates that the payment to the SME supplier is linked to the receipt of payments by the client company. The client companies seem to affect the payment to the SME suppliers only after they receive the payments for their products. In other words it is the SME suppliers who are in effect subsidizing the working capital requirements of the client company. In this connection, it is interesting to note that the average time taken for payment is less in the case of public sector companies as compared to the private sector companies. This aspect needs to be studied further in the second stage of the study.

## **CONCLUSIONS**

This exploratory study has provided valuable insights into the management of the relationship between SME suppliers and the client companies, which are much larger in size. Some of the SME suppliers involved in this study are on the verge of closing down where as there are others which are not only performing well but are in the process of expanding. Some of the factors, which contribute to the success of the SME suppliers, are worth noting, especially from the point of view of the relationship management.

The entrepreneurs who have started the SME units on their own initiative appear to have better chances of success. Those who had set up the units based on the encouragement from the client company tend to be successful only if they quickly diversify into other related products or take-up forward or backward integration. Those who have managed to increase their client base have managed to reduce the risk successfully. The risk is much higher when the SME supplier is completely tied to a single client for a single product. Those who are tied to a single client, but either had diversified into different products or managed forward or backward integration have been able to cope with the risk more successfully.

The cooperative pricing strategies appear to benefit both the client company as well as the SME supplier. The competitive pricing strategy of the client company is supposed to result in the best price for the client company. But, in reality, it is resulting in the supply of a lower quality components or the lowest tenderer defaulting on the supply. In such a case the client company has to resort to negotiating with the next lowest tenderer thereby paying a much higher price.

Similarly, the management of the relationship is successful when the information regarding the production planning of the client company is shared with the SME supplier and the capacity availability of the SME supplier is shared with the client company. Such exchange of information results in better performance for the SME supplier and the client company.

Quality is one of the most important aspects of the relationship. The relationship is at its best when the quality initiative comes from within the SME supplier. It is possible for the client company to enforce the quality requirements either by insisting on certification (such as ISO 9000) or procurement of raw materials from a pre-specified source or testing at designated laboratories. Ultimately, the quality aspect has to be internalized within the SME unit. The investments that the SME supplier has to make for better quality will naturally reflect in the pricing negotiations. The cooperative pricing strategy, which will take into account, the costing exercises carried out jointly by the SME supplier and the client company provide enough incentive for maintaining higher quality.

The major irritant in the management of relationship is the payment issue. The client companies appear to take advantage of their position of strength and delay the payments until they receive their own payments. In effect, the client companies are using the SME supplier to finance at least part of their working capital.

The most important lacuna in the management of relationship between the SME supplier and the client company is the lack of sharing of business intelligence. Each of the partners is left to themselves to obtain their own business intelligence. In this era of competition where the effectiveness of the company is predominantly governed by information and information technology, sharing business intelligence could contribute to the operational effectiveness of both the supplier and the client company. Such a sharing would ultimately lead to a better understanding and relationship and eliminate many irritants between the two partners.

## **INTRODUCTION**

Burgeoning literature on workplace learning, organisational learning and the 'learning organisation' is evidence of growing interest in workplaces as learning environments. The importance of learning is primarily attributed to rapid and continuous change in the organisation's external environment (Gardiner, Leat & Sadler-Smith, 2001). Some commentators believe that organisations that learn faster will be able to adapt quicker and thus avoid the economic evolutionary weeding out process (Schein, 1993). According to De Geus (1988: 71), learning is important, not only for organisational survival, but also because "the ability to learn faster than your competitors may be the only sustainable competitive advantage".

Small firms represent a significant part of the workplace-learning context in New Zealand (Cameron & Massey, 1999). Almost 99 percent of New Zealand enterprises employ 49 or fewer full time equivalents, and these firms account for approximately 54 percent of people employed in enterprises (Statistics New Zealand, 2002). This has important implications for New Zealand's national prosperity and competitiveness. How learning is orchestrated in such organisations is a matter of major interest (Gibb, 1997; Sadler-Smith et al. 2000).

Small business researchers (e.g. Chaston, Badger & Sadler-Smith, 2001; Gibb, 1997; Field, 1998; Hill & Stewart, 2000; Kerr & McDougall, 1999) agree that formal training is generally not suited to small firms for a variety of reasons. These include cost, time and perceived lack of relevancy (Gibb, 1997). Informal workplace learning is deemed the preferred approach. The importance of learning for competitive performance of small firms, and strong preference for informal workplace learning in this sector, suggests that managers in small firms could play an important role in fostering informal workplace learning (Sadler-Smith et al. 2000; Hendry, Arthur & Jones, 1995).

In New Zealand (NZ), studies of manufacturing practices (Australian Manufacturing Council, 1994; Ministry of Commerce, 1999; Knuckey et al. 2002) show that employee practices, including employee development, are underdeveloped. Thus, although the discourses of Human Resource Management, the 'learning organisation' and 'knowledge management' suggest that learning is a central concern in the workplace (Evans & Rainbird, 2002), these NZ studies indicate that the potential of workplaces as sites for learning are not being fully realised. These concerns need to be investigated from a

perspective that is broader than training to further understand learning processes in small firms, and to suggest practice that might, if addressed, improve both managerial performance and the quantity and quality of workplace learning.

Despite the importance of small business sectors to national economies, and wide recognition of the need to leverage learning for competitive advantage, field research on informal workplace learning in small firms has not been forthcoming. This paper reports selected findings of mail survey research examining employee perceptions of (1) their sources and methods of informal work-related learning; and (2) the extent to which managers create conditions in the work environment favourable to learning and enact behaviours in one-on-one settings that are likely to foster learning.

Factors such as the relative mix of learning sources and approaches to fostering employee learning are likely to vary across industry sectors. Therefore, this study used a single-industry sector design to control for potential industry sector effects. The choice of the manufacturing sector was influenced primarily by its importance to the national economy, and the prevalence of larger-size firms within this sector, compared to other sectors. For the current study, a manufacturing firm is defined as small if it has 10-49 full time equivalent employees.

## **METHOD**

The mail survey questionnaire comprised six sections (A-F). This paper reports aggregate results and results by selected demographic variables of Sections A, B and E. Section A measured respondents' perceptions of conditions in their work environments, thought to be favourable for an integration of learning and work (Ellstrom, 2001), using eleven positively and two negatively stated propositions. Section B used seven positively stated propositions, which focus on behaviours that managers enact in one-on-one settings which are likely to foster learning, to measure respondents' perceptions of their supervisor's proximate support for learning. In both sections A and B of the questionnaire, responses were recorded on a seven-point Likert-type scale (7 = strongly agree; 1 = strongly disagree). Negatively stated propositions were reverse scored. Section E measured employees' perceptions of the usefulness of three sources and four methods of learning on a five-point interval scale (5 = extremely useful; 1 = not at all useful). Section F collected general information about the respondent in seven areas: sex, ethnicity, employment status, tenure, nature of work, education level and age.

Questionnaire testing, for the most part, followed the protocols recommended by Dillman (2000). The process started with knowledgeable colleagues, with diverse expertise, reviewing the draft questionnaire. Their feedback led to significant improvements in questionnaire content and layout. This was followed by interviews, using the retrospective technique (see Dillman, 2000), with nine respondents from two manufacturing firms of different employee size to evaluate cognitive and motivational qualities. Overall, feedback from the respondents indicated that questionnaire items were clearly worded and easily understood.

The sampling procedure used for the mail survey was a combination of systematic sampling on the one hand, and judgemental sampling on the other. Lists containing contact (and other) details of small manufacturing firms located in the lower North Island, were purchased from a supplier of business details. Using these lists as the sampling

frame, a systematic sampling procedure (see Zikmund, 2000) was employed to randomly select firms that would be invited to participate in the study. One hundred and twenty firms were selected from the sampling frame and pre-notice letters were mailed to owner/managers of these firms. The letter provided notice that the recipient would be receiving a telephone call to request help with an important study. The owner/managers of thirty-one firms agreed to allow their staff to participate in the study. Within these firms, sample members were selected using judgement sampling (see Zikmund, 2000). All employees in the operating cores of these firms, such as machine operators, maintenance staff, supervisors, foremen, production managers, production planners and research and development staff, were invited to complete the questionnaire.

Three methods of survey implementation were used. Giving questionnaires to an assembled group of staff to complete was the most efficient method of survey implementation. Following Dillman, (2000), a protocol for group administration of the questionnaires was developed to keep the questionnaire completion environment the same for all groups and individuals. The in-person drop-off/pick-up method of survey administration involved visiting managers at their firms to drop-off questionnaires and to agree on suitable times to pick-up completed questionnaires. Some managers preferred to have the questionnaires delivered and returned by mail. This method was also used for other reasons, mostly related to firm location and resource constraints.

Using these three methods, four hundred and sixty four (464) useable questionnaires were received from employees in the thirty-one participating firms. The survey data was analysed using descriptive statistics. Aggregate results as well as results for selected demographic groups are reported here. In regard to the results for demographic groups, independent samples t-tests were used to determine if there are significant differences between the groups.

## **RESULTS**

This section of the paper presents and discusses selected results of the descriptive analysis. It includes an examination of results shown by: (1) nature of work; and (2) education level.

### ***Work Environment Characteristics***

In this study, one research question asked: Are managers perceived as creating conditions in the work environment favourable to learning? To help answer this question, Section A of the questionnaire measured respondents' perceptions of characteristics of work environments that have been found to have positive or negative effects on individuals' learning. These work environment characteristics include both factors that are proximate to the daily work of employees (such as task variety) and those that are distant, or associated with the organisation as a whole (such as rewards for learning). Of the thirteen items included in this section of the questionnaire, items A1-A6 were deemed to be proximate factors, and items A7-A13 distant factors. Results of reliability analysis indicate that the degree to which these items are homogenous and reflect the same construct is satisfactory. The Cronbach's alpha of proximate factors is .7576, and distant factors has an alpha of .7761

Table 1 provides descriptive statistics for questionnaire items A1-A6.

**Table 1 – Descriptive Statistics: Proximate Factors**

	A1	A2	A3	A4	A5	A6
Responses	464	462	461	460	458	450
Mean	5.5	5.4	4.7	5.4	5.1	5.0
Std deviation	1.26	1.23	1.49	1.23	1.48	1.61

Table 2 depicts frequency distributions of the response key values (1-7) for these items.

**Table 2 – Frequency Distributions of Response Key Values**

	1	2	3	4	5	6	7
A1	4	14	25	27	91	222	81
A2	4	12	30	32	106	219	59
A3	9	51	44	51	152	126	28
A4	3	15	22	39	98	220	63
A5	13	24	39	48	110	174	50
A6*	5	39	60	51	65	160	70

Notes: 1= strongly disagree; 7 = strongly agree. \*Reverse scored.

Data in tables 1 and 2 indicate weak disagreement with the (negatively stated) proposition, *there is no coaching or informal training available* (A6:  $\bar{x} = 5.0$  when reverse scored). There was weak agreement ( $\bar{x} < 5.0$ ) with the proposition, *people are given opportunities to choose their own methods of working* (A3:  $\bar{x} = 4.1$ ). By comparison, there was stronger agreement ( $\bar{x} > 5$ ) with the other four propositions. These propositions are: *people are given opportunities to learn a number of different tasks* (A1:  $\bar{x} = 5.5$ ); *people are given opportunities to take on challenging tasks* (A2:  $\bar{x} = 5.4$ ); *people are given opportunities to use their skills and abilities* (A4:  $\bar{x} = 5.4$ ); and *if you need training it is arranged for you* (A5:  $\bar{x} = 5.1$ ).

These findings suggest that the learning potential of the work systems in the small firms studied is constrained mostly by limited scope for employee action (A3), and enhanced mainly by task variety (A1). The finding that employees perceive that they have access to a wide range of work activities, is consistent with the view often encountered in the small business literature - that managers and employees in small firms are often multi-skilled, because small firms rely on fewer personnel resources for multiple activities (see, for example, Cameron & Massey, 1999; Ghobadian & Galleary, 1997). The findings also suggest respondents perceive that there are limited opportunities to access training (A5 and A6). Other researchers have also encountered an apparent lack of opportunities to access training in small businesses. For example, based on findings of their empirical research, Hill and Stewart (2000) conclude, "in many small organizations training does not take place at all" (p.108).

Table 3 provides descriptive statistics for questionnaire items A7-A13.

**Table 3 – Descriptive Statistics: Distant Factors**

	A7	A8	A9	A10	A11	A12	A13
Responses	460	458	459	459	460	456	463
Mean	5.4	5.3	4.9	4.8	4.8	3.9	4.6
Std deviation	1.3	1.3	1.43	1.43	1.6	1.61	1.56

Table 4 depicts frequency distributions of the response key values (1-7) for these items.

**Table 4 – Frequency Distributions of Response Key Values**

	1	2	3	4	5	6	7
A7	5	16	29	38	77	234	61
A8	3	22	30	48	94	217	44
A9	10	28	40	75	120	148	38
A10	18	15	44	97	118	134	33
A11*	11	36	71	61	82	148	51
A12	33	86	60	112	72	84	9
A13	16	45	52	87	95	141	27

Notes: 1= strongly disagree; 7 = strongly agree. \*Reverse scored.

Data in tables 3 and 4 indicate weak disagreement ( $\bar{x} = 4.8$ , when reverse scored) with the (negatively stated) proposition, *there is little encouragement to learn new skills* (A11). There was weak agreement ( $\bar{x} < 5$ ) with four propositions. These are: *people feel encouraged to experiment to learn new ways of doing old tasks* (A9:  $\bar{x} = 4.9$ ); *our ideas for change are welcomed by management* (A10:  $\bar{x} = 4.8$ ); *managers often share their learning experiences with employees* (A13:  $\bar{x} = 4.6$ ); and *people who learn new skills are rewarded* (A12:  $\bar{x} = 3.9$ ). By comparison, there was stronger agreement ( $\bar{x} > 5$ ) with just two of the propositions. These propositions are: *managers tolerate mistakes when someone is learning a new task or skill* (A7,  $\bar{x} = 5.4$ ); and *people often take time to figure out ways to improve how work is done* (A8:  $\bar{x} = 5.3$ ).

The findings pertaining to encouragement to learn (A11) and rewards for learning (A12), suggest the respondents perceive that there is a lack of incentives to learn. Research linking goal setting and rewards to performance provides strong evidence that under the proper conditions, specific goals and contingent incentives do affect behaviour (Skinner, 1971). Similarly, establishing learning goals and making available rewards for learning are widely acknowledged by learning theorists (e.g. Ellstrom, 2001; Knowles, 1990) as being important in facilitating learning. Management can thus make important contributions to fostering employees' informal workplace learning by ensuring that rewards (and sanctions) are consistent with learning agendas. Apart from respondents apparently experiencing insufficient incentives, the findings also suggest managers are perceived by respondents to not provide modelling influences (A13). As Tannebaum (1997), and others, have observed, managers who wish to encourage learning at and through work should serve as role models.

The relatively low means scores for A9 and A10, compared to A 7 and A8, suggest conditions in the work environments of the small firms studied may be more conducive to

an adaptive mode of learning than to a developmental (or innovative) mode of learning. According to Ellstrom (2001), in the adaptive mode of learning the learner has to evaluate the outcomes and make minor corrections in the way the methods were used to solve the problem at hand. This would, for example, apply to a work setting where the workers have a responsibility for continuous improvements of formalised work procedures. By contrast, in developmental learning, the learner has to engage in a more active process of knowledge-based problem solving through experimentation. This mode of learning becomes necessary when we encounter novel or unfamiliar situations for which no rules or procedural knowledge (know-how) are available from previous experience. This mode of learning also occurs when individuals and groups within an organisation begin to question established definitions of problems or objectives and to act to transform institutionalised ideologies, routines, structures or practices. Although both modes of learning distinguished here are deemed necessary and assumed to be complementary, according to Ellstrom, individuals and organisations tend to get caught in an adaptive mode of learning.

### ***Supervisors' Proximate Support for Learning***

Another research question asked: Do managers enact behaviours in one-on-one settings that are likely to foster subordinates' learning? To help answer this question, Section B of the questionnaire measured the respondents' perceptions of supervisors' proximate support for learning. The positively worded propositions in this section focus on behaviours managers enact in one-on-one settings that are likely to foster learning. Results of reliability analysis indicate that the degree to which Section B items are homogenous and reflect the same construct is very satisfactory. The Cronbach's alpha of Supervisors' Proximate Support for Learning is .9077. Table 5 provides descriptive statistics for questionnaire items B1-B7.

**Table 5 – Descriptive Statistics: Supervisors' Proximate Support for Learning**

	B1	B2	B3	B4	B5	B6	B7
Responses	463	458	458	462	460	459	463
Mean	4.6	4.4	4.8	5.6	5.3	5.0	5.2
Std deviation	1.72	1.67	1.6	1.3	1.44	1.52	1.47

Table 6 shows frequency distributions of response key values for the seven items (B1-B7).

**Table 6 – Frequency Distributions of Response Key Values**

	1	2	3	4	5	6	7
B1	24	64	28	59	104	141	39
B2	20	66	47	68	99	127	29
B3	18	45	34	59	100	165	33
B4	7	18	12	34	70	228	88
B5	10	25	22	45	82	206	65
B6	14	30	29	64	94	171	52
B7	10	29	27	44	87	203	59

Notes: 1= strongly disagree; 7 = strongly agree.

The data in Tables 5 and 6 indicates comparatively weak agreement ( $\bar{x} \leq 5$ ) with four propositions. These four propositions, that collectively imply a proactive stance to fostering employee learning, are: *meets me to discuss my performance* (B1:  $\bar{x} = 4.6$ ); *asks me what I feel I need to learn to do my job more effectively* (B2:  $\bar{x} = 4.5$ ); *provides constructive feedback on my performance* (B3:  $\bar{x} = 4.8$ ); and *provides on the job training when I need it* (B6:  $\bar{x} = 5.0$ ). By comparison, the data indicates stronger agreement with the other three propositions. These propositions are: *is available to talk about problems* (B4:  $\bar{x} = 5.6$ ); *works with me to solve problems* (B5:  $\bar{x} = 5.3$ ); and *arranges help from others when something comes up that I do not know how to handle* (B7:  $\bar{x} = 5.2$ ).

Section B findings suggest that, in general, managers may not be effectively enacting their staff development role. Empirical research into factors that enhance or inhibit workplace learning (e.g. Sambrook & Stewart, 2000; Tannenbaum, 1997) has identified the key role of managers. Similarly, it is argued that managers should play an important role as facilitators of learning in the small firm context (Sadler-Smith et al., 2000; Hendry, Arthur & Jones, 1995). But the comparatively low mean scores, for items B1-B3 and B6, suggest managers are perceived not to be adopting a proactive stance in fostering their subordinates' learning, and that they are providing only low levels of learning support. These findings also suggest that the potential to learn through feedback on performance from social sources, specifically immediate supervisors, is not being fully realised in the small firms studied (B3).

### **Sources and Methods of Learning**

In this study, one research question asked: To what sources and methods of learning do employees attribute development of their work-related knowledge and skills? To help answer this question, Section E of the questionnaire measured the respondents' perceptions of the usefulness of three sources (E1-E3) and four methods (E4-E7) of learning. Table 7 provides descriptive statistics for questionnaire items E1-E7.

**Table 7 – Descriptive Statistics: Sources and Methods of Learning**

	E1	E2	E3	E4	E5	E6	E7
Responses	440	434	445	419	428	441	416
Mean	3.6	3.2	3.8	3.7	3.5	3.9	3.6
Std Dev	1.00	1.05	0.92	0.82	1.03	0.89	1.07

Table 8 shows frequency distributions of response key values for the seven items (E1-E7).

**Table 8 – Frequency Distributions of Response Key Values**

	1	2	3	4	5
E1	13	36	149	148	94
E2	23	80	160	120	51
E3	8	22	136	178	101
E4	3	13	151	173	79
E5	12	51	151	128	86
E6	8	12	102	193	126
E7	17	46	130	133	90

Notes: 1= not at all useful; 5 = extremely useful.

Data in tables 7 and 8 indicates the respondents perceived their work mates (E3:  $\bar{x} = 3.8$ ) were the most useful source of learning. And respondents perceived their immediate supervisor (E1) as a more useful source of learning ( $\bar{x} = 3.6$ ) than other managers in their organisation (E2:  $\bar{x} = 3.2$ ). The respondents' perceptions of usefulness of various methods of learning are also captured in tables 7 and 8. The data shows that learning by observation (E6:  $\bar{x} = 3.9$ ) was perceived as the primary method of learning. Learning by direct experiences, of both everyday work activities (E4:  $\bar{x} = 3.8$ ) and trial and error (E7:  $\bar{x} = 3.6$ ), was perceived as more useful as a method of learning than learning by on-the-job training (E5:  $\bar{x} = 3.5$ )

Thus, although managers were perceived as making significant contributions to their subordinates' learning, the respondents attributed more of their learning to work mates, than to their supervisor or other managers in the organisation. Following Bandura (1997), the importance attributed to work mates as a source of learning is consistent with the finding of the current study that respondents attributed development of their work-related knowledge and skills primarily to learning by observation. Bandura contends that most human behaviour is learned observationally through modelling, and that observational learning is governed by four component process: (1) attentional processes; (2) retention processes; (3) motor reproduction processes; and (4) motivational processes. According to Bandura:

“Among the various attentional determinants, associational patterns are clearly of major importance. The people with whom one regularly associates, either through preference or imposition, delimit the types of behavior that will be repeatedly observed and hence learned most thoroughly” (p.24)

In small manufacturing firms, factors such as physical workplace arrangements and spans of management are likely to provide more opportunities for interactions between co-workers, than opportunities that exist for interactions between employees and their immediate supervisors.

Findings pertaining to methods of learning (E4-E7) suggest the learning environments in the small firms studied are inquiry based, rather than transmission based. Thus, the process of acquiring work-related knowledge and skills in these firms seems predominantly informal, self-directed and involves primarily natural learning processes. The findings also suggest that most work-related knowledge and skills that respondents acquired in their organisations are tacit. In a manufacturing environment, a great deal of behaviour patterns that employees need to learn, probably do not lend themselves readily to verbal coding. The findings suggest respondents acquire this tacit knowledge and skills primarily through observation of knowledge embedded in actions of models (E6), and through direct experiences, of everyday work activities (E4) and trial and error (E7). These findings are consistent with Bandura's (1997) assertion that “human thought, affect, and behavior can be markedly influenced by observation, as well as by direct experience” (p. vii).

### ***Nature of Work (Managerial/Non-managerial)***

This sub-section presents and discusses results of sections A, B and E for 116 respondents whose work is of a managerial or supervisory nature (managers), and 296 respondents who perform production, maintenance or service work (non-managers). Mean scores for questionnaire items in sections A, B and E are in table 9.

**Table 9 – Mean Scores of Questionnaire Items by Nature of Work**

Section A: Learning Opportunities and Support for Learning													
	A1	A2	A3	A4	A5	A6	A7	A8	A9	A10	A11	A12	A13

Non-managers	4.59	4.43	4.80	5.60	5.26	5.02	5.29						
Section E: Sources and Methods of Learning													
	E1	E2	E3	E4	E5	E6	E7						
Managers	3.58	3.18	3.50	3.88	3.39	4.01	3.54						
Non-managers	3.62	3.25	3.86	3.72	3.59	3.93	3.52						

Notes: A2, A12, E3 mean differences are significant at  $p < .05$ .

The results suggest managers perceived most (Section A) work environment characteristics more favourably. The t-test showed a statistically significant difference in mean scores for items A2 (*people are given opportunities to take on challenging tasks*) and A12 (*people who learn new skills are reward*). The statistically significant difference in mean scores for item A2 could be explained with reference to the job characteristics model (see Hackman & Oldham, 1980). In this model, managerial work would rate higher on core job dimensions such as skill variety and autonomy, than production, maintenance and service work. Thus, in a manufacturing environment, managerial work should provide more opportunities to take on challenging tasks than production work does. As noted earlier, there is also a statistically significant difference in mean scores for A12. This suggests that the reward systems may be biased, and that non-manager respondents, in particular, view links between performance (in knowledge and skill acquisition) and organisational rewards, as weak. Expectancy theory (Vroom, 1964) suggests such weak performance-reward links would have negative effects on employees' motivation to learn at and through work. In regard to Section B, mean differences for the items are small. None are statistically significant. Items B4 (*is available to talk about problems*) and B2 (*asks me what I feel I need to learn to do my job more effectively*) have the highest and lowest mean scores respectively for both managers and non-managers. Section E results show both groups of respondents perceive learning by observation (E6) as the most useful method of learning. Both groups also attribute much of their informal workplace learning to everyday work activities (E4). The groups differ markedly in their perceptions of the usefulness of work mates (E3) as sources of learning. The mean differences are statistically significant.

## Education

This sub-section presents and discusses results of sections A, B and E for 270 respondents with some college or 7<sup>th</sup> form education (College) and 161 respondents with trade certificates, diplomas or degrees (Post-College). Mean scores for questionnaire items in sections A, B and E are in table 10.

**Table 10 – Mean Scores of Questionnaire Items by Level of Education**

Section A: Learning Opportunities and Support for Learning													
	A1	A2	A3	A4	A5	A6	A7	A8	A9	A10	A11	A12	A13
College	5.67	5.48	4.69	5.49	5.18	4.93	5.42	5.42	4.96	4.81	4.76	3.89	4.65
Post-College	5.29	5.33	4.63	5.38	4.81	5.04	5.46	5.00	4.73	4.70	4.75	3.84	4.48
Section B: Supervisors' Support for Learning													
	B1	B2	B3	B4	B5	B6	B7						
College	4.67	4.54	4.85	5.58	5.32	5.18	5.33						
Post-College	4.51	4.29	4.71	5.62	5.30	4.84	5.06						
Section E: Sources and Methods of Learning													
	E1	E2	E3	E4	E5	E6	E7						
Managers	3.66	3.35	3.81	3.76	3.69	3.98	3.59						
Non-managers	3.59	2.93	3.67	3.73	3.29	3.89	3.53						

Notes: A1, A5, A8, B6, E2 and E5 mean differences are significant at  $p < .05$ .

The results suggest that respondents with post-college education perceived most (Section A) work environment characteristics less favourably. This group also perceived their immediate supervisors' level of proximate support for learning less favourably. These differences could, in part, be due to potential differences in levels of growth need strengths of members of the two groups (Alderfer, 1972). On the whole, growth needs – an intrinsic desire for personal development – may be stronger in respondents with post-school education. This group's overall less favourable assessment of workplace learning environments, may be related to factors such as frustration of growth needs or unmet expectations of organisational support for learning.

Section E results show both groups of respondents perceive learning by observation (E6) as the most useful method of learning. Both groups also attribute much of their informal workplace learning to everyday work activities (E4) and work mates (E3). The two groups differ markedly in perceptions of the usefulness of other managers (E2) and on-the-job training (E5). The mean differences are statistically significant.

## CONCLUSIONS AND IMPLICATIONS

Section A results suggest that: (1) the respondents perceive that opportunities to access training, including on-the-job training, are limited; (2) the learning potential of the work systems is constrained mostly by limited employee scope for action (autonomy), and enhanced mainly by wide task variety; (3) the respondents perceive that there is a lack of incentives to learn; (4) managers are perceived to not provide learning leadership and modelling influences; and (5) conditions in the work environments seem to be more conducive to an adaptive mode of learning, than to a developmental (or innovative) mode of learning. On the whole, managers tend to view (section A) work environment characteristics more positively than non-managers do. Similarly, respondents with 7<sup>th</sup> form or just some college education view (section A) work environment characteristics more positively than respondents with post-college education do. Section B results suggest that: (1) immediate supervisors are providing only low levels of support for their subordinates' learning; (2) immediate supervisors are not proactive in fostering their subordinates' learning; and (3) the potential to learn through feedback from social sources, specifically immediate supervisors, is not being fully realised. Respondents with 7<sup>th</sup> form or just some college education view their supervisors' proximate support for learning more positively than respondents with post-college education do. Section E results suggest that employees attribute development of their work-related knowledge and skills primarily to natural learning processes, such as observational learning and learning through everyday work activities, rather than to on-the-job training. On the whole, respondents perceive work mates as a more useful source of learning than managers.

Overall, the results highlight the importance of examining characteristics of work environments and ensuring that these characteristics support informal workplace learning. To enhance learning in the small firms studied, managers need to attend to those factors in the work environments that appear to be stifling learning. These factors include lack of: (1) incentives to learn; (2) access to information from social sources necessary for learning; and (3) employee freedom to determine how work should be performed. The results suggest that many managers in the organisations studied do not view fostering employee learning as a priority managerial action or lack the required knowledge, skills and personal attributes to effectively perform their employee learning and development role. They may need practical advice and behavioural guidelines to help them strengthen informal learning at work. What's more, performance of their learning and development role should be managed.

## ABSTRACT

The paper shows how the new institutional economics can be used to address microfinance in the developing countries, especially to analyze problems related to uncertain property rights. Microfinance, as a system of promoting savings and providing a basis for lending to the poor, is an important and growing aspect of the economies of many developing countries. Most of the enterprises taking advantage of microfinance are small and medium sized enterprises (SMEs) and family businesses. Microfinance takes many forms in the developing countries, which is particularly true of arrangements for securing solidarity and discipline, which take advantage of the system of informal assistance that often characterizes these communities. Moreover the new institutional economics provides useful tools for analyzing incomplete information, weak infrastructure, unreliable judicial systems and high transaction costs, all of which are common problems facing microfinance in the developing world. The new institutional economics has specialized in problems related to agency, property rights, and transaction costs, which are all relevant to developing countries. The lack of registration of assets, and thereby the lack of creditworthiness of their owners and inability to increase capital through borrowing, is directly related to property rights. A great deal of economic activity in the developing countries is carried out extralegally, outside the official economy, and one consequence of this is that assets, for instance real estate, are not registered and therefore cannot serve as security for loans. Better organization of property rights is a prerequisite for the growth of microfinance, but any reform of existing formal rules in any society must take account of its informal rules. One of the most important issues in the developing countries is to ensure the proper registration of assets, thereby creating a secure basis for lending activities suitable for the banking sector, which will strengthen the SMEs and family business in these countries.

**Keywords:** Microfinance, new institutional economics, property rights

## INTRODUCTION

Section 2 of this paper contains a short description of microfinance in the developing countries, which suffer from the unequal world distribution of income and are characterized

by weak infrastructure and poor coordination of effort by all sectors, private and public. Section 3 discusses why the new institutional economics (NIE) provides a useful approach for studying microfinance, particularly by applying theories of transaction costs, agency, and property rights. Microfinance, for instance, is plagued by high transaction costs. Section 4 discusses the problems of property rights in the developing countries as regards microfinance, where poorly defined property rights obstruct the creation of capital. The final section concludes.

## **MICROFINANCE INSTITUTIONS IN THE DEVELOPING COUNTRIES**

Microfinance organizations, which specialize in lending to poor entrepreneurs, tend to be small, high cost, and engaged in risky lending where security is lacking. (Morduch, 1997).<sup>1</sup> 80% of the world's population have no access to banking services (Robinson, 1998). The distribution of income among the nations of the world is very unequal; of the six billion people in the world, 1.2 billion subsist on less than one dollar a day, and 10 million children died in 1999 from preventable diseases (World Bank, 2001). In 2000, the gross national income (GNI) at purchasing power parity (PPP) per capita in the world was \$7,410. In low-income countries (40% of the world's population) the GNI in PPP per capita was \$1,980, but for high-income countries (15% of the world's population) it was \$ 27,770 (World Bank, 2002). Economic growth in the developing countries is uneven but often very slow. Out of 95 developing countries, 28 actually experienced a decline in gross domestic product (GDP) per capita between 1964 and 1999 (United Nations, 2000). There were 1.3 billion inhabitants on Earth in 1900, and this number is projected to increase from today's six billion to eight billion in 2030. Future difficulties in providing access to food, water and shelter will therefore be tremendous (Einarsson, 2001). Although progress in biogenetic sciences will greatly assist in the supply of food, increased capital, particularly human capital, in the form of education and knowledge, and social capital, in the form of relationships among people contributing to economic development, is a prerequisite for success. The activities of entrepreneurs are very important in this context.

The evidence shows that microfinance<sup>2</sup> can give good results, e.g. in the case of the Grameen Bank in Bangladesh. The bank is operated as a member-based financial organization. Groups of five members are formed, where each owns less than half an acre of land and saves a specific amount every week. Loans granted by the bank are repaid in 50 weeks and 5% of each loan is paid into a special fund. All the members of the group are liable for the loan, and attendance is mandatory at weekly meetings of the group and at a special development center consisting of 5-8 groups (Johnson & Rogly, 1997). The Grameen Bank has over two million members; 94% of the borrowers are women, who have proven a three times better credit risk than men (Khandker, 1998). The high proportion of microfinance loans to women as entrepreneurs underscores the importance of this form of lending for women's rights in the developing countries. Increased

---

<sup>1</sup> For numerous reasons, including corruption, the policy of aid to the poor in the form of subsidized loans has not given the intended results for numerous reasons. Such loans do not guarantee access to credit, and their impact on interest rates discourages saving (Adams, 1998).

<sup>2</sup> One of the earliest forms of microfinance is described by the Danish writer, Karen Blixen. In her book, *Shades in the Grass*, Blixen describes how villagers outside the city of Nairobi in Kenya each put 1.000 rupees into a pot, from which loans could be taken for a specified time for as long as the pot lasted. Sometimes there was a wait for the money to trickle back, and occasionally the register of borrowers preserved in the pot would be consulted and borrowers asked to speed up their repayment so that new loans could be granted.

participation of women in the economy, together with their increased education, is one of the most effective means of bringing about progress in the developing world. Microfinance has another advantage. Poor people rely on an informal system of communal assistance, and regular group meetings in member-based financial organizations contribute to social capital (Rosenweig, 1998 and Anderson, Locker & Nugent, 2002).

A prerequisite for effective lending to entrepreneurs in the developing countries is saving. The poor people in the developing countries are quite capable of saving (Getubig, Gibbons & Remenyi, 2000) but one of the main problems of microfinance is the lack of a solid infrastructure capable of ensuring secure savings. Other factors, such as education, health care, a good justice system, efficient communications and transparent government are also of great importance. The methodology of microfinance has also been used with good results in the developed countries (Ashe, 2000, Copisarow, 2000 and Burrus, 2002). Virtually all enterprises which obtain credit through microfinance institutions are small and medium sized, in most cases microscopic. Also, the most common form of enterprise is the family business, where a family or families pool their efforts to start a business and take out a loan to do so. This is a traditional form of activities of entrepreneurs.

## **THE APPLICATION OF NEW INSTITUTIONAL ECONOMICS TO MICROFINANCE**

New Institutional Economics (NIE) addresses, *inter alia*, imperfect information and different perceptions by individuals of their environment. Institutions represent the formal and informal rules that impose constraints on individual behavior (North, 1990). Organizations, which include enterprises, are sets of actors who co-operate in production. Transaction costs are the opportunity costs of gaining control of resources. Property rights are defined as the rights of individuals to use resources (Eggertsson, 1990). Property rights can consist in the informal rights to the disposal of tangible objects or intellectual work, or they can ensue from agreements or legislation. Institutions in any economy influence transaction costs, which means that the framework underpinning the rights of individuals to the disposal of property affects outcomes in the economy. NIE addresses phenomena, such as organizations and behavior as well as cultural differences in behavior between individual countries and ethnic groups. Research in the new institutional economics emphasizes transaction costs, agency, and property rights, all of which are relevant for developing countries.

Transaction costs are divided into three types of costs, market transaction costs, managerial transaction costs and political transaction costs. Market transaction costs, i.e. the cost of using the market, can be divided into search and information costs, bargaining and decision costs and supervision and enforcement costs. Managerial transaction costs are the costs of setting up, maintaining, changing and running an organization. Political transaction costs are the costs of setting up, maintaining and changing the formal and informal organization of a system, which include the costs of establishing the legal framework (Furubotn & Richter, 1997). Transaction cost economics explains what transactions are conducted across markets and what transactions are conducted within organizations. Transaction cost economics is based on two principles of human behaviour:

bounded rationality and opportunism.<sup>3</sup> Transaction cost economics can also be used to explain different forms of organization such as peer groups and simple hierarchies (Douma & Schreuder, 2002). Small enterprises are normally organized in a very simple hierarchy, i.e. a group of employees with one manager, which is the normal form of microfinance organizations and their customers.

Transaction costs arise because of incomplete information. One person may know more than another in any given transaction, e.g. the seller of a product may know more about a product than the buyer (asymmetric information). Another reason for imbalance in information is that formal, written rules of law and contracts are often modified or elaborated by unwritten, informal rules of usage. Communities with weak institutions, as in the developing countries, have fewer possibilities and less confidence in the market, which reduces specialization and prevents economies of scale. In a developed environment, enterprises have a system for resolving disputes without intervention by the courts, which is usually an expensive recourse. Such a solution can only exist in a secure environment where the parties involved can trust each other, but trust is obviously an important factor in economic transactions (Clague, 1997).<sup>4</sup>

Agency theory distinguishes between a positive theory of agency and the theory of principal and agent. The positive theory of agency looks at organizations as a nexus of contracts. It explains why organizational forms are the way they are. The theory of principal and agent is the main element of the contemporary agency theory. This theory takes account of risk. In its simplest form, a relationship exists between a single principal and a single agent. The agent carries out a task for the principal and incurs some cost. The outcome is dependent on the effort he makes (Douma & Schreuder, 2002).

Microfinance is frequently implemented in the form of group lending, where relations within the group are based on certain rules. In a sense, the groups have agreed on common ownership of financial resources where the rights of disposal are restricted. Relations within the groups and the relations of lender and borrower is the subject of the agency theory. Loans granted to the developing countries by international organizations, such as the World Bank, and earmarked for specific projects fit well within the framework of NIE, that is to say within the context of contractual relations in agency theory. Under NIE, lending of this kind might be considered unfeasible because it is impossible to exclude opportunistic behavior on the part of the governments taking the loans.<sup>5</sup> A comparable situation in the context of microfinance would arise if a lender and a borrower were to contract over the use of a loan, e.g. for the establishment of a small enterprise, but owing to the high costs of monitoring, supervision by the lender would be difficult.

---

<sup>3</sup> Bounded rationality implies that people are limited in their ability to make complex decisions that require analyzing extensive data. The rational choice model, however, does not recognize such limits on decision making. Opportunism arises because human beings will try to exploit a situation to their own advantage (Williamson O.E., 1985).

<sup>4</sup> A study of the coffee trade in Tanzania finds that the liberalization of the coffee trade in Tanzania resulted in reduced costs (as expected), but surprisingly the transaction cost of financing activities, which had formerly been based on linked informal transactions, increased. This demonstrates that the impact of changed business procedures must be examined closely in order to secure effective implementation (Winter-Nelson & Temu, 2002).

<sup>5</sup>For instance, a government might not use the proceeds of the loan for their intended purpose, and the World Bank would have no opportunity for active surveillance or intervention. In a worst-case scenario of this kind, governments might deliberately take loans from international organizations with the premeditated intent of using the funds for purposes other than those provided for in the loan agreement (Toye, 1995).

## THE PROBLEMS OF PROPERTY RIGHTS IN MICROFINANCE

In property rights theory a distinction is made between absolute and relative property rights. The first case involves private property rights and the second involves rights to contract. All must observe absolute property rights, which involve the rights to objects. The right to control in this analysis also extends to all rights, including the right to natural resources. Anyone who controls something must be subject to some rule of order, whether it is a national constitution, legislation or a contract. Because individuals may be expected to behave in a rational manner, it is possible to anticipate how a certain structure of property rights will affect the use of a natural resource or its disposal in a community. Relative property rights exist when there are certain undertakings or obligations attached, either under contract or under law, e.g. credit-debt relations as in microfinance. Relative property rights, in their widest sense, extend to rights arising out of a personal relationship, e.g. a business relationship or political relationship. A business relationship can make contracting parties so dependent upon one another that they are locked into a kind of contractual relationship. Thus, it can happen that a relationship which was formerly characterized by competition between a source of supply and a source of demand in a market develops into a monopoly (Furubotn & Richter, 1997).

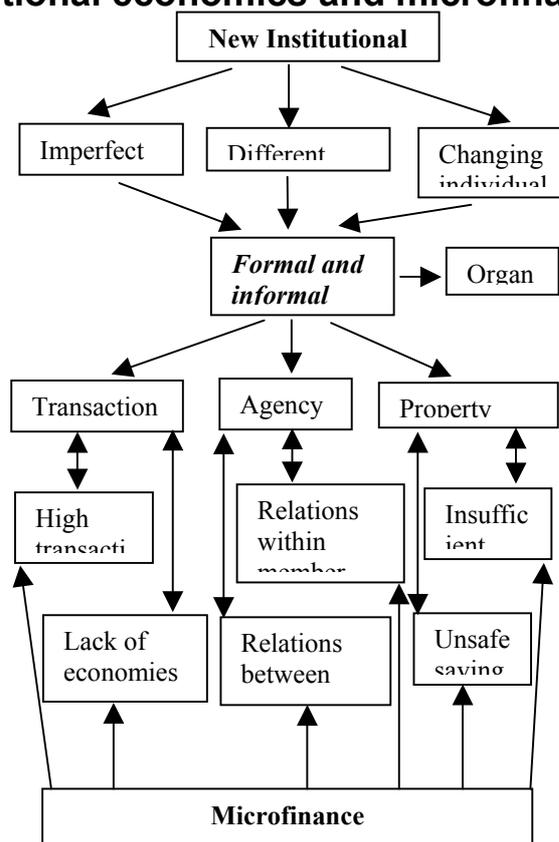

In many parts of the world, extensive economic activity takes place outside the domestic legal order, and NIE is particularly suitable for analyzing many aspects of such extralegal activities, especially the structure of property rights. Independent economic activity which is not documented anywhere by public authorities forms a part of the system of informal rules that exist in any community. Activities outside the scope of formal rules involve high transaction costs and prevent the formation of capital because assets cannot be used as collateral since their ownership is not formally registered. The informal rules which are common in microfinance, and vary from culture to culture, have a direct relation to the methodology of NIE, where institutions are arrangements of human behavior which include both formal and informal rules. If changes are made to the formal side of microfinance it is important for the changes to be consistent with the informal rules. It is a general principle that if no account is taken of informal rules in the course of reform, it is likely that the reforms will fail.

In the context of NIE, the views of Hernando de Soto regarding secure titles to property are very interesting. He claims that the primary problem of the developing countries is that assets are not registered and therefore not creditworthy, and that this is the same problem that the industrial states faced 150-200 years ago (de Soto, 2000). The problem of the developing countries is primarily that they have no possibility of obtaining credit based on assets which are substantial but unregistered. This problem is compounded by the lack of rules and the great migrations from rural areas to urban areas, where a large part of economic activities is extralegal. The implementation of microfinance in the developing countries is fraught with difficulties because it is complicated to pledge assets to secure loans when ownership cannot be proven officially and definitively; at the same time, however, the importance of real estate as security for loans is growing (Gelos & Werner 2002). The analysis above relates directly to microfinance, as the difficulty of lending to the poor is due precisely to the lack of security, which in many cases is not that there are no assets to pledge, but that these assets are to a greater or lesser degree unregistered and the title to them is not even clear. This applies not only to real estate but also to movable properties which are important for poor people in the developing countries.

Proper administrative procedures for establishing property rights are extremely important, and slow, inefficient administrative procedures, e.g. registration of companies, assets and operating licenses, are a great impediment to progress. This results in higher transaction costs. Of equal importance is the legislative framework and the will of the authorities to protect and encourage saving, as reflected in measures taken to preserve the integrity of financial systems and the strength of currencies. The lack of a strong framework for saving in the developing countries, which is an integral part of microfinance, is related to inefficient property rights which include problematic external regulation and supervision. In the developed countries, the sale of real estate is regarded as a relatively simple act, although it involves a complex process which is hundreds of years old; this process and infrastructure is lacking in many developing countries.

A western entrepreneur will normally obtain capital for his enterprise through loans which are provided through the banking sector. This encapsulates the difference between the entrepreneur in the developed countries and his counterpart in the developing countries. A western entrepreneur with a project can frequently obtain a loan, for which he will usually post security, e.g. in the form of his own home or property belonging to his close family. This avenue is closed to the entrepreneur in the developing countries, even if he owns a piece of real estate, because the property is not registered to his (or anyone else's) name in any definitive manner. Banks in the developing countries do not have the same access to debtors' assets, as do banks in the developed countries. The adaptation of new ideas that recognize existing informal rules can change matters quickly; for instance, the registration of real estate or movable properties in order to make them suitable as security would transform the possibilities for obtaining credit in the developing countries. The importance of getting a grip on extralegal property rights is clearly revealed by de Soto, who points out that "the recognition and integration of extralegal property rights was a key element in the United States becoming the most important market economy and producer of capital in the world" (de Soto, 2000, p. 148). Fig. 1 shows the relation between the conceptual framework of NIE and some elements of microfinance.

**Fig. 1: The new institutional economics and microfinance**

Within the discipline of NIE there has been much discussion of the importance of property rights for the effective utilization of various types of resources, including common pool resources. (Pejovic, 1998). Property rights also govern the exchange relationships that an entrepreneur intends to establish through microcredit. If he plans to set up a small enterprise, e.g. a manufacturing plant, to sell his products on the local market, the arrangements regarding marketing makes a great deal of difference. Unclear property rights are an obstacle to economic growth and improved living standards and microfinance, as a part of development policy, must aim at creating and implementing efficient property rights (North, 1995). The prerequisite for economic progress is technology, which can be divided into production technologies and social technologies. One of the principal problems impeding economic progress in poor countries is their inability to apply social technologies necessary for progress, such as well designed and secure property rights. Appropriate structure of social institutions is a prerequisite for prosperity and an inadequate institutional environment combined with the inability of government to reform the environment is the major obstacle to economic progress (Eggertsson, 2002). The problems of microfinance, which we have discussed in connection with property rights, are largely caused by inappropriate institutional environments.

## **CONCLUSION**

The success of member-based financial institutions, such as the Grameen Bank in Bangladesh, has demonstrated the importance of microfinance for entrepreneurs, particularly for women, small and medium sized enterprises and family businesses. Microfinance, both in the form of lending and saving, represents only a small part of what has to change in the developing countries in order to improve their living conditions, but other matters are also important, especially more education, improved infrastructure and better health care. One advantage of microfinance through its positive effect on human capital and social capital.

The new institutional economics offer numerous possibilities for analyzing the problems of microfinance, such as the complicated agency relationships between lenders and borrowers. The absence of formal property rights is one of the principle problems of developing countries and one of the most important contributions of NIE to microfinance is the analysis of uncertain property rights. This includes activities that are outside the official system (extralegal) and the problem of unregistered assets which cannot be used to secure loans. Property rights are poorly specified in most less developed countries, and the situation is comparable to the situation one or two centuries ago in many industrial countries. A clear definition of property rights is very important for ensuring better collaterals for loans to entrepreneurs through microfinance institutions.

One of the principal reasons for the limited success of the industrial states in promoting development in low-income countries is the "limited understanding of the relation between formal and informal institutions" (Eggertsson, 1996, p. 22). Further analysis of microfinance as a part of the framework of NIE calls, among other things, for a better understanding of why appropriate social institutions for supporting the arrangement are lacking in many countries.

## **ABSTRACT**

Factoring has been described as an “oasis in a cash desert” (Riordan, 1997). In particular it can be useful for small to medium sized businesses (SMEs) that are expanding rapidly and need to convert debtors into cash quickly enough to pay creditors and sustain growth. However, cash-flow problems still exist for New Zealand SMEs, so this promise appears not to have been realised to the extent expected by its advocates.

A literature review confirmed that factoring can benefit SMEs cash-flow and debtor management. Yet arguments that it is underutilised or improperly used may stem from misunderstandings and perceptual blocks held by stakeholders making the cash management decisions (i.e. SME owner/operators, business advisors and factoring companies.)

An inductive research project was undertaken which: (1) investigated factoring utilisation; (2) analysed patterns and themes with respect to perceptions in the marketplace and; (3) developed a factoring perception model.

The study presents an investigation into stakeholder understanding and perceptions. Content analysis was applied to the semi structured interviews undertaken and relationships were identified. Specifically, there was general agreement in the marketplace that factoring is underutilised, poorly understood and suffers from a poor image.

From the findings, a factoring maximisation model was developed, demonstrating how perceptions should be changed in order to boost factoring’s effectiveness in the New Zealand marketplace. These findings are useful in guiding factoring companies engaged in promoting factoring in the marketplace, and highlighting the deficiencies in SME owner/operators and business advisors understanding of factoring which is limiting the ability to maximise their cash-flow financing decisions.

## **INTRODUCTION**

When factoring was first introduced to New Zealand more than a decade ago there was great expectation that it would offer a significant solution to the perennial small business problem of cash-flow deficiencies. Factoring has been described as an “oasis in a cash desert” (Riordan, 1997) and “a flexible friend” (Carty, 1995). It is claimed that factoring is useful for rapidly growing New Zealand small to medium sized enterprises (NZ SMEs) that have difficulty converting debtors into cash quickly enough to meet their needs. However, this promise does not seem to have been realised to the extent expected by its proponents. This may be due to the stigma sometimes attached to factoring as a source of last resort financing as well as the lack of understanding in the marketplace of how factoring actually works and the perceived high costs associated with this service.

Cash-flow deficiencies, commonly associated with the ‘finance gap’, are restraining SME performance. It is, therefore, essential that relevant and timely information be made available on all cash-flow funding options. Research on factoring as a NZ SME cash management tool, would address a present void in market knowledge. Research that addresses stakeholder understanding and perception as to the role of factoring in NZ SMEs may advance its overall recognition as a cash management tool and raise the profile of factoring which presently appears to be underutilised.

The aim of this study was to elicit the market’s perceptions of factoring and determine how these perceptions may be influencing the phenomena of its apparent underutilisation in New Zealand.

To this end the study set the following objectives:

1. To ascertain whether factoring fulfils an effective role in NZ SME cash management.
2. To seek market opinion as to whether factoring is underutilised by NZ SMEs.
3. To identify the level to which factoring is understood by the identified stakeholder groups (business advisors, SME owner/operators and factoring companies).
4. To identify where there are the congruencies and variances in perceptions about factoring between the identified stakeholder groups (business advisors, SME owner/operators and factoring companies).
5. To devise a model for factoring maximisation in New Zealand that offers recommendations to address any perception disparities.

## **FACTORING AS A FUNDING OPTION**

Factoring is a term used to describe a range of working capital financing facilities open to business enterprises. These facilities provide avenues by which to (1) release cash which is tied up in trade debtors and (2) enhance debtor ledger management (Henderson, 1996). In simple terms, the factoring process involves a business handing over its invoices to a factoring company and in return receives 80 - 90% of the face value of the invoice immediately and the balance when the debts are paid to the factor – less charges incurred for the service (Hattaway, 1999). In effect, injecting cash into the enterprise and removing the burden of collecting account receivables; a task that many business owner/operators have in the past been unwilling or unable to devote adequate time and effort to (de Vries, 2003).

There are a number of variations to the theme of financing through factoring and it can be tailored to suit differing client needs (Berryman, 2000). This gives credence to its standing as a flexible tool (Carty, 1995), but also muddies the water with respect to the market fully understanding factoring. Traditionally there are three prominent categories of factoring:

- *Full-service recourse factoring* where the factoring company provides complete debtor administration in which they purchase the debts and undertake the collection process with their team of experienced specialist credit controllers; though they do not accept liability for any bad debts.
- *Invoice discounting (Non-disclosed factoring)* is a relationship where the debtors are unaware of the factoring arrangement. In essence the SME retains control of their debtor ledger but have the option to draw funds against debtors, then pay a financial charge for this service.
- *Non-recourse factoring* in which the factoring company offer 100% protection against bad debts, hence, safeguarding businesses against loss of income. Fees tend to be significantly higher and in New Zealand, this mode of factoring has traditionally been limited to export (Hattaway, 1999).

Like most other forms of financing factoring companies require security. It is common for factor financing to be secured by (1) a debenture that is first ranking over the debtor's assets and (2) personal guarantees of the shareholders (Berryman, 2000; Walters, 2000). However, the level of security underpinning a borrowing facility is viewed as being well below the expectations of banks.

## **Effectiveness of Factoring**

Within the financial marketplace there is considerable debate between business advisors (as stakeholders in a client firms cash management decisions) and finance companies as to the role of factoring. Robinson (1993) suggests that factoring should not be considered as an advance of money by a financier in the traditional sense. He argues that factoring is not a lending facility in the true sense where funds are borrowed for a specific capital outlay or other short-to-medium term need and require repayment (with interest) over a prescribed term. Furthermore it cannot be considered as an equity-based approach as it does not require that SME owner/operators to relinquish ownership or control of part of the existing company to the external fund provider (e.g. selling shares). Factoring in effect releases a firm's own cash which would otherwise be tied up in accounts receivable. Hence, it can be claimed that it does not directly compete with, but complements other forms of business finance as the circumstance in which it could be used may be quite different. Never-the-less, commonalities between the various market offerings do exist.

Internationally factoring has gained some notoriety. Soufani (2001) contends that factoring is a financing option that supports the working capital of firms, while Summers and Wilson (2000) note that a factor's credit management is more efficient than that of smaller firms because they are able to invest in specialised personnel and procedures. Factoring's effectiveness is often a function of the stage of development and growth of the business, where the role of factoring is particularly evident in the early developmental stage of a business life cycle and that the respective roles of other forms of financing (e.g. overdraft, term loans) come into play at later stages of growth (Soufani, 2001; Perrin, 1998). There are high-profile areas where factoring has become a key tool and that the demography of the businesses that use factoring are broadening and deepening in the UK (Perrin, 1998). With 80% of the UK corporate business transactions based on credit (Summers & Wilson,

2000) this potential market for factoring is not to be underestimated. Worldwide, in fact, factoring volume is estimated at US\$600 billion (McNabb, 2002).

The significant variances in factoring costs both historically and between countries (e.g. Soufani, 2001; Robinson, 1993) may be limiting its overall acceptance and effectiveness. Spragins (1990) argues that in some cases the accumulative cost of US factoring fees could be five times as much as interest charges, but does concede that factors provide services banks don't. This argument may be rather extreme, but the cost of factoring is customarily comparable or higher than bank overdraft rates. In addition there are setup costs and the debtor ledger administration fee - a percentage which is based on variables such as average invoice number and size. A further drawback of most full factoring arrangements is that if debts are unpaid after 90 days the factor asks for its money back. Jarvis and Gillie (1998) contend that SMEs and their business advisors (predominantly accountants and bankers) perceive the cost of factoring as too high, thus, will traditionally not consider it as an option. Therefore, customarily the popularity of factoring tends to have a direct correlation with availability of overdraft facilities offered by banks. As overdraft finance terms toughen the use of factoring increases and vice versa (Miller, 1995).

Factoring companies contend that it is a facility that avails itself to large or small businesses, yet Summers and Wilson (2000) suggest that smaller firms are more likely to use factoring companies. They argue that factors may not specifically find smaller firms more attractive as factoring clients, but these firms are less attractive for other forms of finance such as bank loans. A common denominator is that factoring suits SMEs growing so fast that their banks can't keep pace (Goldman, 1979). In essence factoring can be viewed as a financing option that suits young undercapitalised businesses that have high profit margins so that they can absorb the factoring fees (Parks & Gallop, 1999). Robinson (1993) claims that the characteristics of businesses which suit factoring as a finance option are those that have: (1) sales on credit and not cash, (2) manufacturers or wholesalers with continuous trading with established customers, (3) no unusual selling terms or conditions, (4) no unusual purchasing terms and (5) businesses that demonstrate sound management and profitable trading. Cooper (1998) in contrast, outlines unsuitable businesses as: (1) those that sell on consignment or with the right of return, (2) high technology companies, (3) certain types of service industries, (4) professional corporations, (5) companies like building contractors and (6) industries in which the gross profit percentage is very narrow and turnover is very slow.

Factoring is generally perceived as having had a history of bad press, thus often being relegated to the financing option of last resort for SMEs. Many of the detractors (including accountants, business commentators, bankers, and business operators) have inferred that factoring is, in fact, the desperate effort of certain firms to get a cash injection into their failing businesses when other avenues have been exhausted (Berryman, 2000; Kennedy, 2000; Hattaway, 1999; Cooper, 1998; Jarvis & Gillie, 1998). During the 1980s factoring gained a 'cowboy' image internationally (Cooper, 1998) because many factors lacked professionalism or appropriate financial structures. As a consequence, SME owner/operators felt that employing a factor exposed them to unfavourable reactions from their customers (Jarvis & Gillie, 1998). They perceived that the message factoring sent (as a last ditch financing option) and the manner in which some accounts receivable were handled were detrimental to their customer relationships.

The negative view held towards factoring by the marketplace may be rather unfortunate as there are numerous international and local cases supporting factoring as the favoured

financing option (e.g. McNabb, 2000; Perrin, 1998). But perception often overshadows reality. Viewing factoring pragmatically from a cash management perspective, factoring can increase SME liquidity - especially in the early years of business operation (Robinson, 1993). The business can expand as sales grow because of the release of the debtor funds that factoring allows. Factoring is arguably the only form of working capital designed to grow with the business needs (Kennedy, 2000). Borrowing is against a SMEs growing turnover rather than against bricks and mortar assets which stay very static in value (Berryman, 2000). McNabb (2002) would suggest that one of biggest benefits is the ability to pay creditors immediately, which can earn considerable discount for early settlement.

From a debtor management perspective, there is evidence linking weak credit control with poor collection (de Vries, 2003) and poor businesses performance (e.g. Jarvis & Gillie, 1998). Customarily SME owner/operators do not consider debt collecting to be a part of their core business (Hattaway, 1999) and hence do not give it due attention. With late payment being cited as a major contributor to the high SME failure rates (Howie, 2003; Kennedy, 2002; Mian & Smith, 1992), their inability to manage debtors is problematic. Benefits therefore exist in contracting this task to factoring companies with professional credit management systems.

## **METHODOLOGY**

In attempting to isolate factors influencing the identified phenomena: under-utilisation of factoring in New Zealand, this study identified the two following constructs:

*When stakeholders poorly understand a form of financing then it is less likely to be considered as a cash management tool. Conversely forms of finance that are well understood are more likely to be considered.*

*When stakeholders hold negative or differing perceptions with respect to a particular form of financing then it is less likely to be considered as a SME cash management tool. Conversely if stakeholders hold congruent and positive perceptions about a form of financing then it is more likely to be considered with greater frequency.*

It has been the objective of this study to explore the understanding of factoring and the areas of congruence and variance between stakeholder perceptions with respect to the role of factoring as a cash management tool. Of special interest will be variances that may limit its appropriate use within the SME sector in New Zealand and hence reinforcing a belief that it is the least desirable option of financing.

The triangulation approach was employed (e.g. Taylor & Bogdan, 1998) in which similar data was collected from the three New Zealand stakeholders groups involved in cash management decisions. Views were solicited which gave an insight into factoring knowledge and attitudes. Of specific relevance were misunderstandings, negative views or variance in stakeholder perceptions of factoring as a SME cash management tool. The sample consisted of: three SME owner/operators using factoring, three factoring companies and eleven business advisors (accountants and bankers).

The inductive research design utilised in-depth, semi-structured interviews as the means of data collection. The advantages of this method (Ticehurst & Veal, 1999) included: The ability to understand and explain the personal experiences of individuals associated with

factoring; that tacit knowledge or hunches can play a role in understanding the attitudes towards factoring; the research allowed a focus on people's understanding and interpretations; and that it allowed the researcher to experience factoring issues from a perspective of participants involved with the cash management decisions.

The factoring companies and business advisors were randomly selected from the metropolitan regions of Auckland, Christchurch and Wellington using the New Zealand Yellow Pages directory. The SME users of factoring were identified through: existing business contacts and introductions from business advisors previously contacted during the study.

The collected data was evaluated in a manner that met the needs of quantifying the constructs that (1) understanding and (2) congruencies and variances in stakeholder perceptions influence the level of utilisation of factoring as a SME cash management tool. Interviews were recorded on audio tape and thereafter transcribed word-for-word by the researcher. Content analysis was used as the textual investigation method (e.g. Silverman, 1993). Four sections were established in applying the content analysis approach to analysing the collected data; understanding of the factoring process, perceptions of factoring as a cash management tool, perceptions of the situations under which factoring would be used and perceptions of the role of factoring in NZ SMEs. Each section was then further divided into a number of categories in which data could be classified and organised (responses, words and phrases) into recognisable patterns for each stakeholder group.

## **Limitations**

The study was not without limitations regarding to methodology and size. Firstly, the aim of this study was to uncover *patterns* in stakeholders' understanding and perceptions of factoring as a cash management tool. Thus the study does not offer direct observation of the phenomena that can be statistically evaluated and reported. Secondly, the sampling frame encompasses businesses and professional organisations that have an involvement (directly or indirectly) with SME financing decisions at some level. However it was not an all-inclusive sample. For example, it did not include SMEs that have had no contact with factoring services, thus limiting any discussion of the SME sector as a whole. Furthermore, the study does not attempt to be 'all encompassing' with a total sample size of 17 informants from the Auckland, Wellington and Christchurch regions only. Finally, the methodology does not account for the existence of other constructs which may influence the results, e.g. varying level of influence of different stakeholders on the cash management decisions.

Within these limitations, the study may be viewed as a fact finding mission that reveals issues that will then require further in depth empirical investigation as opposed to offering definitive answers to the questions of under-utilisation of factoring by NZ SMEs.

## **RESULTS**

### **Understanding of Factoring**

1. *The workings of factoring:* All stakeholders interviewed had an appreciation that factoring offered an immediacy of cash, but understanding of how it worked varied. When

asked to explain the service, factoring companies descriptions were clear and concise whilst accountants appeared to be familiar with the factoring concept but only had a basic understanding of how it worked. Accountants used broad explanations such as “selling receivables at a discount to factoring agents, whose job is to recover the debt,” and “Buying invoices off clients at a discount.” to describe factoring. Account managers for banks had slightly more detailed explanations but still did not have a clear or complete understanding. SME users of factoring appeared to understand their particular arrangement only.

*2. Costs of factoring:* Factoring companies were again clear and concise in explaining the setup, borrowing and administration fees associated with various factoring services. They acknowledged that costs can vary considerably but down-played the argument that it is an overly expensive form of financing. Accountants and bankers were unsure of the costs associated with factoring, but were in general agreement that the costs are high, “Lender of last resort because costs are too high” was a typical comment. Few business advisors could recall an example of specific factoring costs and eight out of the eleven respondents did not know whether there is considerable variation in factoring costs within the market. SME users of factoring were quite clear on what their particular costs were and understood that fee structures could change over time. One respondent stated, “Once you have built up a relationship then figures alter (reduce) and different product ranges can be advanced which are more customised to the individual.”

## **Perceptions of Factoring**

*1. Reputation of factoring:* When asked whether factoring had a respectable or cowboy image, the factoring companies contended that there are mixed views in the marketplace. With New Zealand being a small and new factoring market, a respondent suggested that it suffers from the ‘small community syndrome’, which infers a reluctance to accept something new or different. However, factoring companies did concede that 10 - 20 years ago factoring companies did not do their job well and hence the service gained a poor reputation. They argue that the industry is now driven by reputable and well run organisations. That some of the largest finance companies in the world are now involved with factoring and would not be interested in offering such a service if it were not a legitimate and viable financing option. Hence, they believe that it is now better received; especially with increased education of the market. As one respondent stated, “Maybe we are finally seeing the end of the doubters.”

SMEs using factoring stated that they have no concerns over its reputation believing it is very professional, though they concede that few businesses understand how it works. Accountants were unsure as to the reputation of factoring - offering varying comments such as “People look at factoring from time to time but shy away from it,” and “tool of desperation;” through to “there are professional organisations out there,” and “a tool for growth.” Two of the three bankers suggested that the market views factoring as a inferior financing option. One such banker commenting, “From a banker’s perspective there is a stigma attached to it - rightly or wrongly.” Both accountants and bankers suggested that there may be two tiers of factoring companies in the marketplace. “Some may be dodgy,” stated an accountant. Evidence from accountants and bankers would suggest that the accretion of factoring companies that we are “seeing the end of the doubters” might be far from the reality.

2. *Image of factoring:* All stakeholder groups were of the opinion that factoring was considered to be the last choice finance. Factoring companies argued that “people don’t know it exists or don’t understand it”. They do admit that they are in the business of relieving cash-flow problems and therefore get some last resort desperation calls; but stress that factoring will not ‘stave off the wolves’ for companies in extreme difficulty or fundamentally unsound. Instead they prefer to do business with growing firms – stating, “We are after clients with quality products and services who have got potential to grow the business.” Bankers and the majority of accountants were adamant that it was finance of last choice and were unequivocal in that view.

Factoring companies believed that there was sometimes confusion among their client’s customers as to why an organisation would use factoring. One commented, “There can be a perception that they are in trouble.” However, they argued that a competently managed transition of the debtor ledger from the client to the factor, with full and clear explanations to customers, presented few problems. They commented that the worst payers are generally the ones that react badly. Accountants were generally not sure about customer reaction to a factor collecting accounts receivable, while bankers believe it may send a message to the market that a company may not be as strong as they perceived. Furthermore it was suggested that it creates another burden for a customer’s accounts clerk. “Processing an invoice from one firm and having to pay another is perceived as a burden they can do without,” and “it’s open to more mistakes.”

3. *Professional debtor management:* Factoring companies all concurred that debtor management was a very useful aspect of the factoring service and suggested that the bulk of factoring in the New Zealand market is ‘full factoring’. They viewed this as beneficial for SMEs who are generally considered to be hesitant, ineffective or too busy to collect money. The SME operators themselves believed that factors were much more professional than they could be and that they could focus on building client relationships rather than money issues. Accountants were evenly split as to whether it was a useful tool, suggesting that there are more effective ways of collecting accounts receivable. One accountant raised concerns about factors operating from outside New Zealand, commenting “All the management has been done from Australia and it has been difficult to get responses and information from them.” Bankers were generally not in favour of factors managing the debtor ledger, arguing their lack of commitment. “The trouble is that they don’t manage it – they wipe their hands of bad debts which come back to the client.”

4. *Difference between factoring and loan finance:* Factoring companies stated that loans and overdrafts are not true forms of cash-flow finance because they do not ensure that borrowing facilities keep pace with growing turnover. They argue that factoring is the true dynamic growth tool. “With factoring the more turnover - the more money you can borrow,” and go on to suggest “With factoring you can’t overtrade.” Accountants, on the other hand, were less clear about the differences. Some suggesting little difference, while others stated the main distinction as the higher costs associated with factoring. Comments were made with regard to different risk criteria, suggesting banks are more conservative than factors.

Bankers viewed factoring as an opposition product in some respects, but not a serious threat. They saw it more as a means of reducing short-term cash-flow problems and as a product that needed less security from the lender. One bank confirmed that it had recently introduced a form of factoring service for some of its larger business clients, while another bank stated that some of the financial products they already had worked in similar ways to

factoring in any case. SME users of factoring commented on its ability to grow with sales. They also believed that overdraft criteria were far more difficult to meet.

*5. Drawbacks of factoring:* Factoring companies understandably believe there are no real drawbacks to factoring as long as it is used correctly and clients' understand that accounts receivable are still their debt. Accountants reiterated that high costs are a major drawback and that the practice of factors operating client accounts from off shore was impractical. Bankers suggested that a danger exists if clients spend the cash generated from the improved cash-flow on non-revenue generating expenditure; believing that some business owners "can't help themselves" in spending business funds. They also see factoring as a double edged sword (immediate cash versus charge-backs) and argue that once you are trapped in the factoring cycle it is hard to get out later. In contrast, the SME users saw few drawbacks. However, this may be a situational response, as once an SME owner/operator is committed to using a particular financial service they will generally be positive about that decision.

*6. Factoring's value:* Factoring companies contend that factoring should be used to reduce the SME finance gap in growth situations. One account manager stated "We are after clients with quality products and services who have got potential to grow the business," though the manager did qualify this statement by saying "I'm not going to turn away companies with cash-flow problems – that's what we do." SME users also saw it as useful growth tool. One owner/operator commented on the perennial SME cash-flow problem "You can double your turnover and find you've got no cash," suggesting factoring was viewed as a tool that avoided such situations. Accountants were unsure as to when factoring should be used. With only two of the eight have experience with clients using factoring and in one case a bad experience, this is perhaps not unexpected. Generally accountants did see it as a tool for bridging the finance gap and fostering growth, though they were somewhat cautious in their endorsement. They suggested that growing firms can fall over if not managed carefully and responsibly and that firms need to give care and thought to the process of matching borrowing with the level of business activity. Three accountants saw it as simply a last resort means of dealing with cash-flow problems. Bankers also considered it to be simply a tool for cash-flow problems and in most cases a 'last ditch resort'. One banker commented that it could be helpful for firms dealing with seasonal cash-flow issues.

*7. Appropriate industry sector:* Factoring companies were ferriferous in arguing that most industries could use factoring; as long as they did not involve progress claims or stage payments as commonly found in the construction and software industries. Accountants had no clear opinion, while bankers believed most industries could use factoring, especially when undercapitalisation was common. SME users could see the merits for factoring in their particular industry and went on to propose that most invoice based businesses could use factoring. Stakeholders generally agreed that irrespective of the type of industry; users of factoring would need simple, well maintained and provable debtor ledgers with as few troublesome payers as possible.

*8. Factoring's 'fit' for small or big business:* There was considerable variance in opinion between stakeholders as to whether factoring was more suited to large businesses or SMEs. Factoring companies suggested the majority of their clients are SMEs, but were careful not to dismiss the potential for large clients. One manager stated that "The bulk of our clients have less than 20 staff." Accountants had no clear view on the appropriate fit, as their opinions were evenly spread between small businesses, medium businesses, large businesses and no opinion at all. Bankers suggested it was a tool for larger

businesses, while SME users believed both large and small businesses could benefit from factoring.

*9. Factoring utilisation by NZ SMEs:* All stakeholders interviewed were of the view that factoring is underutilised by NZ SMEs. Factoring companies suggested that there is huge scope to grow factoring - if the negative image can be removed. Interestingly, even though business advisors were sceptical about many aspects of factoring they still believed it was under-utilised. One banker did argue that market forces would suggest "If people felt that there were real benefits they would use it more," but still conceded "If anything, it is under-utilised". SME users of factoring contended that it is underutilised mainly because it is poorly understood and that people think it is a debt recovery tool. All stakeholders were adamant that banks, with their traditional overdraft facilities and term loans, were the first port of call for SME owner/operators needing cash injections.

*10. SMEs understanding of factoring:* All respondents conceded that SME owner/operators had little knowledge of factoring. Factoring companies argued that New Zealand is an immature market and people don't know it exists or can't grasp the concept of factoring. Business advisors maintain that SMEs adhere to the tried and proven (i.e. overdrafts and loans) and are by and large poorly informed of differing financial options. SME users concur that there is simply a lack of understanding 'out there' in the market place.

There is also a belief among the SME users and factoring companies sampled that business advisors have limited knowledge on factoring. A factoring accounts manager was quite frank, "Banks don't understand it and accountants don't understand it." SME users commented that they felt that business advisors did not make an effort to understand factoring. The business advisors themselves had mixed views about their knowledge levels. Half of the accountants interviewed suggested that advisors know little about factoring but would find out if required; two stated that advisors know the basics and two were not sure on the level of understanding in the marketplace. The bankers admitted to having limited understanding of factoring and suggested other business advisors would be the same.

## **Discussion**

The study indicates that marketplace understanding of factoring is limited among business advisors and SME operators. Business advisors negative views appear to reflect this lack of understanding (further in depth research would be required to validate this relationship), but a further issue is the poor image associated with the early years of factoring's introduction into New Zealand.

Whilst factoring companies, who wish to promote factoring, argue the benefits of cash releasing capability, synergies with growth companies, prevention of overtrading and professional debtor management, the market has been very slow to embrace these claims. Business advisors argue that it is a finance option of last choice as there are significant drawbacks, particularly that cost structures are too high. Interestingly, however, even with the divergence in perception over factoring's role, all stakeholders believed that factoring was underutilised; which would suggest that there is potential for greater use of factoring services if negative perceptions can be altered.

## CONCLUSIONS AND RECOMMENDATIONS

The introduction contended that factoring offered a solution to the perennial SME problem of cash-flow deficiencies, yet has met with limited support in New Zealand. Therefore this study set out to investigate how market knowledge of factoring and perceptions influenced its use in New Zealand by identifying factoring's role in NZ SME cash management, the level of understanding within the marketplace and the perceptions held by stakeholders. To this end the study reports on the five objectives identified in the research aims.

*Objective 1: To ascertain whether factoring fulfils an effective role in NZ SME cash management.* The findings of the literature review acknowledged that the inherent cash management weaknesses within the SME sector can be, in certain cases, lessened through factoring. Growing SMEs suffer from cash-flow deficiencies which are compounded by under capitalisation, gearing, overtrading and poor debtor management practices. At best these businesses under perform and at worst face failure. Factoring in effect releases cash that is otherwise tied up in debtors, which can then be used to generate further revenue under appropriate business conditions. With increasing revenue, cash streams will grow as the business grows thus avoiding overtrading. Secondly, factoring offers a professional debtor management service, which relieves SME owner/operators of the often vaunted accounts administration burden. The indications are that factoring has a role to play in SME cash management. As to whether it is as good as factoring companies claim cannot be substantiated by this research, thus the whole area of how factoring can most effectively benefit SMEs requires greater research.

*Objective 2: To seek market opinion as to whether factoring is underutilised by NZ SMEs.* When factoring was introduced into New Zealand it was described as an "oasis in the desert"; yet this promise has not been realised to the extent that proponents of the service expected. In fact all stakeholder groups questioned, believed that factoring was underutilised, which would suggest that there is untapped potential for factoring services in New Zealand. Factoring companies believe there is huge scope to grow in New Zealand if perceptions can be changed. Certainly factoring is not suited to all enterprises or all situations but the perception is that there is a market for this service.

*Objective 3: To identify the level to which factoring is understood by the identified stakeholder groups.* The stakeholder analysis indicated that marketplace understanding of factoring was limited. Factoring companies understood their product implicitly (naturally enough) but were conscious of the poor market penetration of knowledge on factoring. A basic understanding of the factoring concept was evident in discussions with business advisors, but SME owner/operators only became aware of factoring and what it offered as a financial tool when it was introduced – typically as a last choice option. The study further indicated that there was little knowledge of the factoring's cost structures in the marketplace, with business advisors only being aware that costs were high. Whilst factoring companies affirmed benefits such as instant cash, prevention of overtrading and professional debtor management; business advisors' negative views appear to reflect the lack of understanding and the poor image that surrounds factoring, arguing factoring is the finance of last choice as it has significant drawbacks and high cost. These findings support the construct 'When stakeholders poorly understand a form of financing then it is less likely to be considered as a cash management tool.' Therefore, it is argued that the disparity in knowledge among stakeholder groups requires addressing.

*Objective 4: To identify where there are the congruencies and variances in perceptions about factoring between the identified stakeholder groups.* Where there were congruencies in stakeholder perceptions of factoring, they tended to be beliefs that held factoring in an unfavourable light, i.e. last choice option whilst banks were first choice finance, image problems and being poorly understood by both SMEs and their business advisors. With respect to issues espousing the benefits of factoring, i.e. assistance to growth, debtor management, and overall effectiveness, there were significant variances with factoring company's naturally positive whilst business advisors and to a lesser extent SME users were more critical.

The overall mix of perceptions tended to marginalise factoring as a financing option and reinforce the strong traditional culture of SMEs supporting bank financing as the 'natural' first preference. This supports the construct 'When stakeholders hold negative or differing perceptions with respect to a particular form of financing then it is less likely to be considered as a SME cash management tool'.

The study argues that underutilisation appears to be linked to the market's lack of knowledge about factoring which consequently reflects in poor perceptions of its image, business value and cost structures. Perceptions that will need changing through behaviour modification, education, an informed market and relationship building; in essence, creating a cultural shift with greater knowledge in the marketplace to make informed cash management decisions which maximise factoring effectiveness but minimise its inappropriate application.

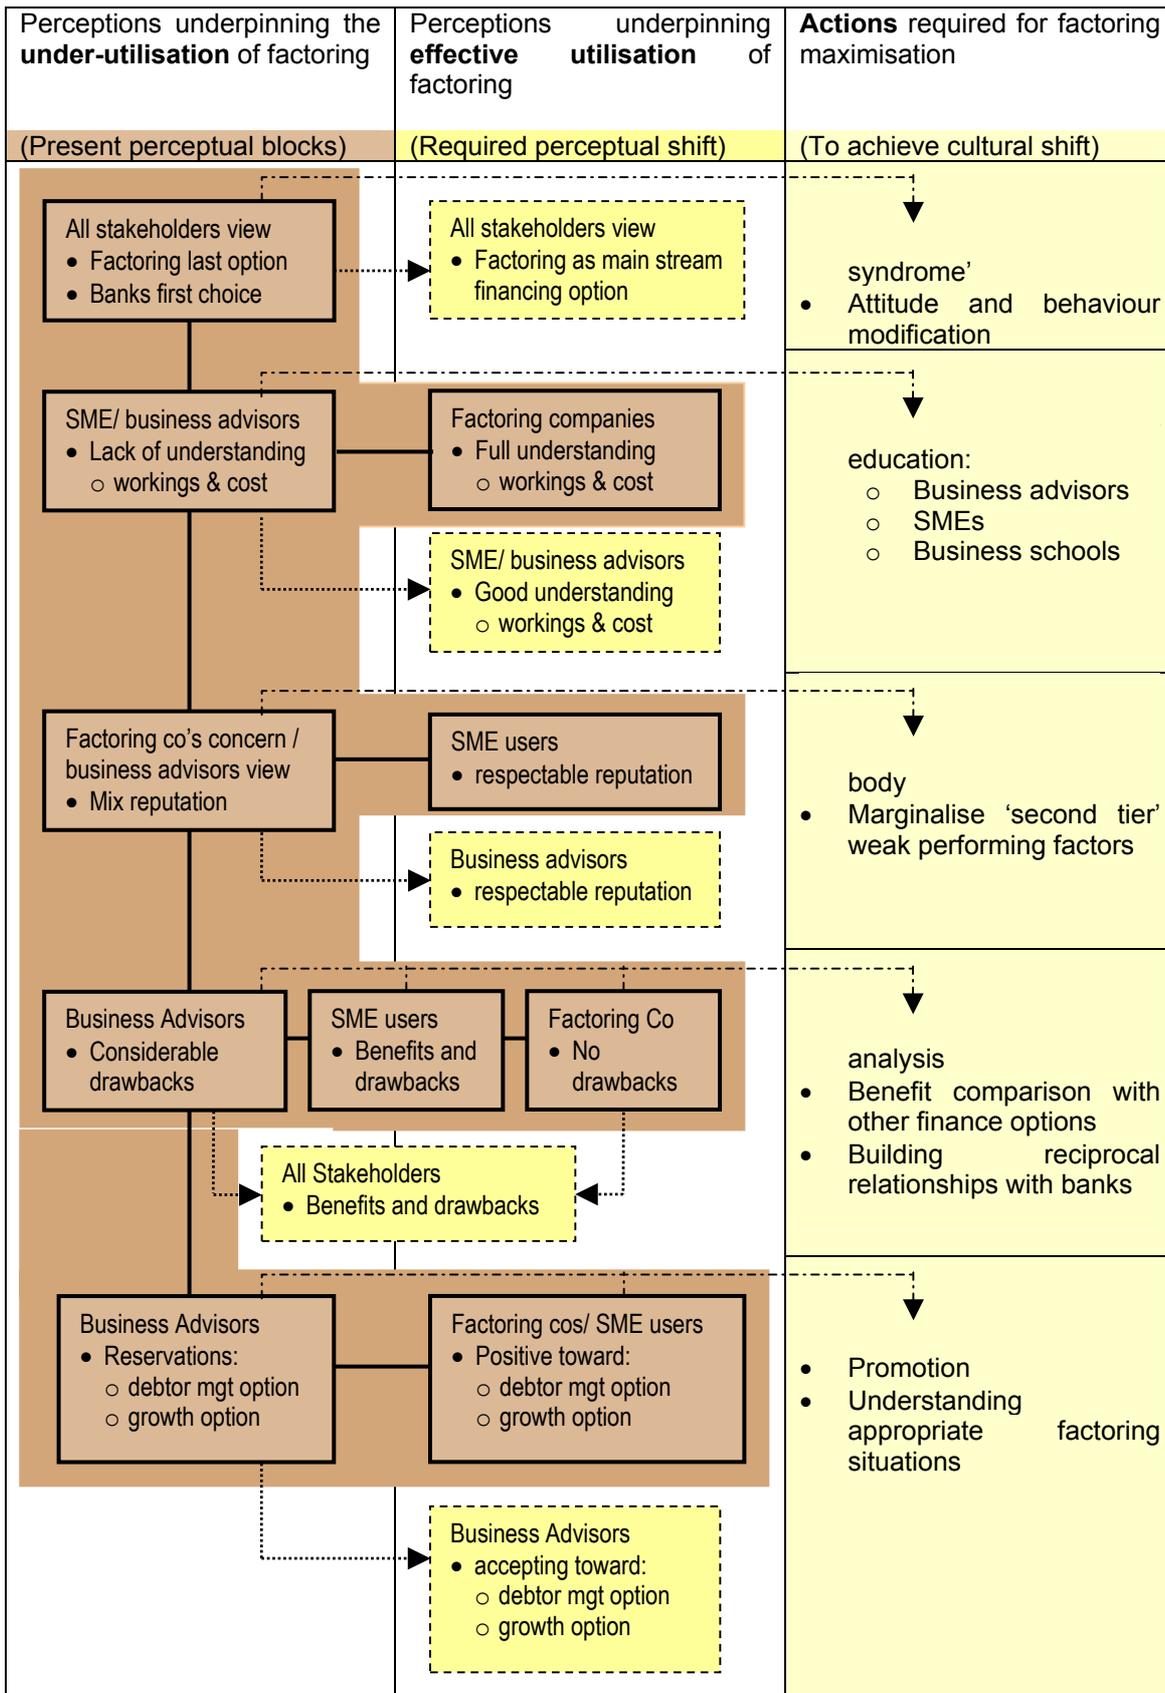

Objective 5: To devise a model for factoring maximisation in New Zealand that offers recommendations to address any perception disparities. A model of stakeholder perceptions has been developed to explain the perception disparities and identify possible remedies (figure 1). The model delineates a theory that perceptual blocks underpin the underutilisation of factoring (dark shading), identifies the perceptual shifts required and stakeholder action needed to achieve perceptual change (light shading); thereby maximising the benefits factoring can offer NZ SME cash management.

The factoring maximisation model identifies factoring as a finance option of last choice, as SMEs prefer visiting their banks for overdraft and loans. Therefore, if factoring is to increase in prominence a shift is needed in 'financial culture' which encourages the market to consider all financial options. This would require a willingness of business advisors to accept and understand a greater range of financing alternatives and for SMEs to be far more rigorous in investigating all financing options. The fledgling factoring industry will need to take a prominent role in facilitating any attitude and behaviour modification in the market place; specifically marketing activities which create greater awareness and build relationships with all stakeholder groups. There is an argument to suggest that New Zealand suffers from the 'small town syndrome' where firms may be innovative in designing new products and services but hold steadfastly to conservative financing practices; none-the-less the study identified that all interviewees accept that factoring is underutilised in this country. This anomaly needs to be seized upon, as it would suggest that the market may be receptive to positive promotion of factoring and disposed to shifting from traditional financing habits if the benefits can be proven through independent in-depth research.

The factoring maximisation model identifies that factoring, as a financing option, is not well understood by SME owner/operators or their business advisors. However, factoring company's tradition of writing articles on factoring and distributing brochures alone will not

create the knowledge levels required to achieve a cultural shift in financing habits. To this end factoring companies need stronger ties with the business advisors that support SME owner/operators. Even though they argue that they promote factoring to the market place - a far more pro-active approach is required. Resources must be directed at educating accountants, who presently lack knowledge on factoring and consequently do not suggest it to SME clients. In fact, accountants quite likely dismiss any client interest in factoring out-of-hand, without clearly evaluating its suitability. As one manager of a factoring company stated, "Accountants can be our best friends or worst enemies," so the challenge is to make them their best friends. Business schools, at the coal face of education, also need to be encouraged to include learning outcomes on factoring in the finance papers they deliver to accounting and business students. (e.g. provision for factoring in course literature or availability of guest speakers). Finally, factoring companies require working relationships with a sceptical banking industry. If factoring companies can build some kind of reciprocal relationships (e.g. linking the benefits of factoring and banking services) this may remove the stigma of bankers viewing them as fringe finance providers, to whom they should only send troublesome clients.

A further concern is the belief that the factoring industry image is damaged by 'second tier' factoring companies that may not have adequate systems or controls to scrutinise and manage clients effectively. The factoring industry as a whole could benefit from monitoring and managing the activities of all firms through a professional body which promotes ethical and professional guidelines. Also with the significant variance in opinion between stakeholder groups as to the drawbacks of factoring and the circumstances in which factoring should be used, the industry require greater critical analysis that a professional body could provide. Certainly factoring is not for everyone or suitable in all business situations and this study does not argue that it should. However, a well informed and educated market, which operates with reputable factoring companies, will ensure informed decisions are made regarding cash-flow and debtor management. Therefore the factoring industry must be proactive with strategies that position themselves favourably in main stream financing.

**Figure 1: Factoring Maximisation Model**

This study adds to the body of knowledge on NZ SME cash management, nevertheless, this study creates more questions and highlights that the area of factoring remains relatively bereft of empirical research. The study did not identify the level of influence of each stakeholder group in cash management decisions and argues that the implied relationship between understanding and positive perception requires further investigation. Research could also be undertaken with a wider sample frame including: SME non-users of factoring, other financial institutions and accountants specifically identified as having experience with factoring. Furthermore, to examine claims of factoring companies, as to how good factoring really is, longitudinal studies of SMEs using factoring should also be carried out with cost-benefit comparisons between the various financing options.

Factoring is a useful tool among the many available for NZ SME cash management, but this study has identified anomalies which have created a perceived environment of underutilisation. The challenge for stakeholders in the SME sector is to understand and embrace all financial services to maximise cash management decisions. Research into factoring is a step in that direction.

Keywords: Entrepreneurship, Small Business, Ethics, Integrity

## **ABSTRACT**

This paper presents an analysis of the most pressing ethical issues small businesses face today and outlines a framework for resolving those issues to maintain personal and business integrity. We use a stakeholder management framework adapted for small businesses and provide survey data to identify relevant ethical issues. To pinpoint troublesome ethical issues for small companies, small business personnel across the U.S. were asked the following question: "What is the most difficult ethical issue that you have faced in your work?" Responses from 455 survey participants identify the kinds of issues that challenge the integrity of small business owners in the U.S. The set of issues mentioned most often is related to customers and competitors. The second most common category is concerned with the way a company treats its employees, including decisions about layoffs, workplace discrimination, fairness in promotions, and the like. The third category is related to the obligations of employees to their employers, focusing on the actions of personnel that may not align with the interest of their companies. Management processes and relationships came fourth. Management relationship issues can be especially disturbing because they reflect the moral fiber or culture of the firm, including weaknesses in managerial actions and commitments. Other findings are also explored.

## **INTRODUCTION**

The highly-publicized corporate scandals and ethical disasters of the last few years suggest it is time to examine integrity issues confronting small business. The seeds of corporate misdeeds are sown when individuals compromise their personal integrity. Fortunately, many small firms strive to achieve the highest standards of truthfulness, fairness, and trustworthiness in their business relationships. This paper presents an analysis of the most pressing ethical issues small businesses face today and outlines a framework for resolving those issues to maintain personal and business integrity.

## **The Nature of Integrity**

Stories in the news media concerning insider trading, fraud, and bribery usually involve large corporations. However, in the less publicized day-to-day activities of small businesses, decision makers face ethical dilemmas and temptations to compromise principles for the sake of business or personal advantage. This strikes at the heart of integrity.

## **What is Integrity?**

The seeds of corporate misdeeds are sown when individuals compromise their personal integrity—that is, they do not live up to what they believe is the right and proper thing to do, or respond to what Max DePree, chairman emeritus of Herman Miller Inc., calls “a fine sense of ones obligations” (DePree, p. 85).

The entrepreneurial experience is far more fulfilling when the understood purpose of the business, at its core, is to create products or services that offer value to interested customers. In other words, it’s as much about *what to do* as it is *who to be*. In line with this perspective, relationships are critical and integrity is essential to success. Financial performance is important, but it is not the only goal of interest. In fact, excessive focus on financial gain can quickly lead to distortions in business behavior. It certainly is the root cause of many of the ethical failings of companies.\

Of course, lapses in integrity at large, high-profile corporations are readily noticed, but the problem obviously does not end there. Small business owners and managers confront situations every day that require them to sort out what is right and best to do from what is wrong. In these situations, it is important to decide which course of action will preserve the integrity of the company and safeguard its reputation, which can be especially difficult when doing the right thing runs counter to the immediate financial interests of the business.

Fortunately, many small firms strive to achieve the highest standards of truthfulness, fairness, and trustworthiness in their business relationships. Although unethical practices receive extensive attention in the news media, many entrepreneurs and other leaders are people of principle whose integrity regulates their quest for profits.

## **Doing the Right Thing**

The notion of integrity is very much related to ethics. Ethical issues involve questions of right and wrong. Such questions go far beyond what is legal or illegal. Many situations call for decisions regarding what is honest, fair, and respectful.

Individuals who face ethical issues are sometimes tempted to place self-interest and personal financial gain ahead of the reasonable and legitimate interests of others. While self-interest is a legitimate force in human life, it can, when left unchecked, lead to behavior that is obviously unfair or harmful to others. To act with integrity, an individual must consider the welfare of others.

In the short run, at least, honesty does not always pay monetarily—in fact, doing the right thing can be downright costly. In other situations, honesty may boost business profits. But most people who show integrity in their business lives do not weigh the economic benefits to decide how honest and forthright they can afford to be. Instead, they live by the highest of standards simply because it's the right thing to do.

## Troublesome Integrity Issues

### Key Issues

In order to pinpoint the types of ethical issues that are most troublesome for small companies, small business owners nationwide were asked the following question: “What is the most difficult ethical issue that you have faced in your work?” As might be expected, the question yielded a wide variety of responses, which have been grouped into the categories shown in Table 1.

**TABLE 1**  
***Self-Reported Ethical Issues Facing Small Firms***

<b>Issue</b>	<b>Number of Respondents</b>	<b>Percentage of Total</b>
<i>Relationships with customers, clients, and competitors</i> (relationships with outside parties in the marketplace)	111	27%
<i>Human resource decisions</i> (decisions relating to employment and promotion)	106	26%
<i>Employee obligations to employer</i> (employee responsibilities and actions that in some way conflict with the best interests of the employer)	90	22%
<i>Management processes and relationships</i> (superior-subordinate relationships)	63	15%
<i>Governmental obligations and relationships</i> (compliance with government requirements and reporting to government agencies)	40	10%

These responses provide a general idea of the kinds of issues that challenge the integrity of small business owners. As you can see in the table, the set of issues mentioned most often are related to customers and competitors (27% of the respondents). However, the second most common category is concerned with the way a company treats its employees, including decisions about layoffs, workplace discrimination, fairness in promotions, and the like (26% of the respondents). The fact that this set of issues

received almost as many responses as the first should not be surprising, given the challenges of the current economic climate. In fact, it is telling that this category was near the bottom of the list (8% of the respondents) when entrepreneurs responded to the same survey nearly a decade earlier (Longenecker, McKinney, and Moore, 1995). Times have changed.

The third category is related to the obligations of employees to their employers, focusing on the actions of personnel that may not align with the interest of their companies. Management processes and relationships came fourth. Management relationship issues can be especially disturbing because they reflect the moral fiber or culture of the firm, including weaknesses in managerial actions and commitments.

## **A Framework for Integrity**

**A Mix of Obligations.** The results of the current survey reveal that entrepreneurs must consider the interests of a number of groups when making decisions—owners (or stockholders), customers, employees, and others. The individuals in these groups are sometimes referred to as stakeholders, indicating that they have a “stake” in the operation of the business. In essence, stakeholders are those who can affect, or are affected by, the performance of the company.

The interests of various stakeholder groups are different and sometimes conflict; thus, decisions can be very difficult to make. And since there is often no obviously right or wrong position to take, managing the process can be extremely complicated.

One executive observed that running a business is sometimes like playing the part of a juggler. Laura Nash recorded his description (Nash, 1993, p. 61):

*I am given four balls to balance: the customer's, the employees', the community's, and the stockholders' by which I mean profit. It's never made clear to me how I am to keep them all going, but I know for certain that there is one that I'd better not drop, and that's profit.*

**Integrity and Owners.** The Nobel Prize-winning economist, Milton Friedman, outlines the responsibilities of businesses to society in very focused terms. According to Friedman (1963, p. 133),

*There is only one social responsibility of business—to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, which is to say, engages in open and free competition without deception or fraud.*

For the most part, Friedman is arguing that businesses should be expected simply to serve customers and earn profits; any use of the firm's resources beyond this is justified only if it enhances the firm's value. Though we believe there is room for entrepreneurs to adopt a broader view of their responsibilities, it is undeniable that an owner has a clear and legitimate right to benefit from the financial performance of the company.

**Integrity and Customers.** What do you call a business without customers? *Bankrupt!* Customers are obviously one of the most important stakeholder groups that a company must please. They also stand at the center of the purpose of the business, which has implications for integrity. Entrepreneurs who take customers seriously and treat them as individuals about whom they care are apt to have more of them. And those they care about are likely to return again and again for repeat business.

Marc Katz sets the example for an appropriate view of customers. In 1978, with a partner and an instinct to buy a building where many other restaurants had failed, Katz began offering the first complete and authentic deli menu in Austin, Texas. Katz Deli thrives because customers love the quality food, and Marc and his staff love their customers. Marc treats his guests as valued friends and family; in fact, he makes people feel as if they were visiting his home, where he has prepared a party for them. His driving motivation is not one of profit, however, even though the deli is an undeniable success. It is an expression of integrity to provide a quality dining experience with a genuine attitude of service (Bryant, 2002).

Katz Deli illustrates how a business can treat customers with respect and build strong relationships with them. But there is always a temptation to take advantage of customers, or to be less than honest with them. When making marketing decisions, a business owner is confronted with a variety of ethical questions. For example, advertising content must sell the product or service but also tell “the truth, the whole truth, and nothing but the truth.” Salespeople must walk a fine line between persuasion and deception. In some businesses, a salesperson might obtain contracts more easily by offering improper inducements to buyers or by joining with competitors to rig bids. This is clearly illegal, but it does happen.

**Integrity and Employees.** The level of integrity in a firm is also reflected in the amount of respect given to employees. Through management decisions, an owner affects employees’ personal and family lives. Issues of fairness, honesty, and impartiality surface in decisions and practices regarding hiring, promotions, salary increases, dismissals, layoffs, and work assignments. Employees are also concerned with concerns related to privacy, safety, and health, and these should not be ignored.

In communicating with employees, an owner may be truthful, vague, misleading, or totally dishonest. Some entrepreneurs treat outsiders with great courtesy but display demeaning behavior or attitudes toward subordinates, whom they regard as mere pawns in the game of business. Showing proper appreciation for subordinates as human beings and as valuable members of the team is an essential ingredient of managerial integrity. It is also deserved, since people are the most important resource of the firm.

**Integrity and the Community.** Some regard social responsibility as a price of freedom to operate independently in a free economic system. They believe that the public has certain social expectations regarding business behavior, not all of which are required by law. Accordingly, they regard some social expenditures as proper even when they are costly. We must simply recognize that opinions differ as to the extent to which businesses are obligated to engage in a variety of socially desirable activities.

In any case, companies have been accepting increased responsibility to the communities where they do business. This starts with creating jobs and adding to local tax revenues, but many small businesses have also increased their generosity. Entrepreneurs often feel a sense of duty to give back to the community in return for the local support they enjoy, and they usually benefit from increased goodwill as a result. Of course, the response of small businesses varies. Some emphasize environmentalism, minority contracting, and economic development, while others focus their attention on volunteerism, philanthropy, and day care for employees’ dependents. Still others give only minimal attention to peripheral social issues.

Given that small business owners have some awareness of their broader obligations, how do they compare with big business CEOs in their view of social responsibility? The evidence is limited, but entrepreneurs who head small, growth-oriented companies seem to be more narrowly focused on profits and, therefore, are less socially sensitive than are CEOs of large corporations. A study by Aupperle, Simmons, and Acar (1990) compared small business entrepreneurs with large business CEOs and concluded the following:

*The entrepreneurial CEOs were found to be more economically driven and less socially oriented than their large-firm counterparts. Apparently, [corporate social responsibility] is a luxury many small growth firms believe they cannot afford. Survival may be the first priority.*

In defense of small firm owners, we note that they are usually spending their own money rather than corporate funds. It is, of course, easier to be generous when spending someone else's money. Furthermore, small business philanthropy often takes the form of personal contributions by business owners.

Entrepreneurs must reconcile their social obligations with the need to earn profits. Meeting the expectations of society can be expensive. Small firms must sometimes purchase new equipment or make costly changes in operations in order to protect the environment. For example, auto repair shops incur additional costs when they dispose of hazardous waste, such as used oil and filters. It is evident that acting in the public interest often requires the payment of money, which reduces profits. There are limits to what particular businesses can afford to do.

Fortunately, many types of socially responsible action can be consistent with a firm's long-term profit objective. Some degree of goodwill is earned by socially responsible behavior. A firm that consistently fulfills its social obligations makes itself a desirable member of the community and may attract customers because of that image. Conversely, a firm that scorns its social responsibilities may find itself the target of restrictive legislation and discover that its customers and employees lack loyalty to the business. Researchers Melissa Baucus and David Baucus of Utah State University compared the long-term performance of 67 corporations convicted of corporate wrongdoing with the performance of 188 other firms (see Elsass, 1998, pp.87-88). They found that the law-abiding firms experienced a significantly higher return on assets and on sales. To some extent, therefore, socially responsible practices may have a positive impact on profits.

Recognizing a social obligation does not change a profit-seeking business into a charitable organization. Earning a profit is absolutely essential. Without profits, a firm will not long be in a position to recognize its social responsibilities. This takes us back to the juggler, who recognizes that it is essential not to drop the "profit ball." Ensuring this is necessary for survival; however, it is also an expression of integrity toward the owners of the business.

**Integrity and Government.** Government at all levels exists for a reason, though there is room to debate whether it has too much power or too little. Government intervenes directly in the economy, for example, when it establishes laws to ensure healthy competition. But its reach is extended into other business matters as well—workplace safety, equal employment opportunities, fair pay, clean air, safe products, and so on. Entrepreneurs must comply with these laws and regulations if they are to maintain integrity, and avoid spending time behind bars.

One glaring example of unethical behavior by small firm management is fraudulent reporting of income and expenses for income tax purposes. This conduct includes

*skimming*—that is, concealing some income—as well as improperly claiming personal expenses as business expenses. We do not suggest that all or even most small firms engage in such practices. However, tax evasion does occur within small firms, and the practice is widespread enough to be recognized as a general problem.

The Internal Revenue Service regularly uncovers cases of income tax fraud. For example, the John E. Long family, the largest promoter of country folk art shows in the nation, was forced to pay millions in back taxes, and four members of the family were given prison terms for tax law violations. The Longs did not record the cash they collected for admission to their shows. Instead, they deposited into corporate accounts only checks received from such sources as booth rentals and magazine sales. Unfortunately for the Longs, the IRS discovered 2,000 unreported deposits that members of the family made into 37 different accounts. The Longs had reported that their business was losing money when, in fact, it was doing very well (Novack, 1994).

## **Ethical Challenges in Entrepreneurial Firms**

### **Pressures to Act Unethically**

Employees of small firms can face pressure from various sources to act in ways that conflict with their own sense of what is right and wrong. For example, a salesperson may feel pressured to compromise personal ethical standards in order to make a sale. Or an office employee may feel pressured by his or her boss to act unethically, perhaps by destroying documents. Such situations are guaranteed to produce an organizational culture that fails to promote integrity.

Fortunately, most employees of small firms do not face such pressures. In the current nationwide survey of individuals holding managerial and professional positions in small firms, respondents reported feeling the following degrees of pressure to act unethically:

No pressure	72.3%
Slight pressure	24.1%
Extreme pressure	3.6%

While it is encouraging to note that nearly three-fourths of the respondents reported an absence of pressure to compromise personal standards, the fact that more than one-fourth of the respondents experienced either slight or extreme pressure is disturbing. The level of a person's standards of integrity is, of course, related to that individual's perception of pressure to act unethically. That is, a person with low ethical standards would probably encounter few situations that violated his or her standards. However, a person with high ethical standards would find more situations that violated his or her personal norms. The ideal is to develop a business environment in which the best ethical practices are consistently and uniformly encouraged.

### **Vulnerability of Small Business**

Walking the straight and narrow may be more difficult and costly on Main Street than it is on Wall Street. That is, small, privately held firms that are not part of the corporate world epitomized by Wall Street may face greater pressures than large businesses do to act unethically. For example, a lack of resources may make it difficult for owners of a small firm to resist extortion by public officials (Allen, 1988, p. R1).

*Professor William Baxter of the Stanford Law School notes that for such owners, delayed building permits or failed sanitation inspections can be “life-threatening events” that make them cave in to bribe demands. By contrast, he adds, “the local manager of Burger King is in a much better position” to tell these people to get lost.*

Because a small firm is at a disadvantage relative to larger competitors that have superior resources, the firm’s owner may be tempted to rationalize bribery as a way of offsetting what seems to be a competitive disadvantage and securing an even playing field.

Nick Molina, referring to the early days of his company Let’s Talk Cellular & Wireless, said, “Sometimes when you’re backed up against the wall, your instincts take over, and you do what you have to do to survive” (see Allen, 1988). When Molina sought to obtain space in the all-important Dadeland Mall in Miami, the leasing agent told him that his company needed to be “established” to be considered. So Molina manipulated financial reports to make his six-month-old firm look as though it had been in business for two years. Entrepreneurs in such difficult positions often try to rationalize their behavior by distinguishing between posturing (putting their “best foot forward”) and lying.

The temptation for entrepreneurs to compromise ethical standards as they strive to earn profits is evident in the results of a study of entrepreneurial ethics (Longenecker, McKinney, & Moore, 1988). In this research, entrepreneurs’ views about various ethical issues were compared with those of other business managers and professionals. Participants were presented with 16 situations (or vignettes), each describing a business decision with ethical overtones. They were asked to rate the degree to which they found each action compatible with their personal ethical views. Here is one of the vignettes: “An owner of a small firm obtained a free copy of a copyrighted computer software program from a business friend rather than spending \$500 to obtain his own program from the software dealer.”

For the most part, the participants in this study, including entrepreneurs, expressed a moral stance; that is, they condemned decisions that were ethically questionable as well as those that were clearly illegal. For all situations, the average response of entrepreneurs and others indicated some degree of disapproval. For nine of the sixteen vignettes, the responses of entrepreneurs did not differ much from those of others. However, this was not the case with the remaining seven vignettes. In five cases, the entrepreneurs appeared significantly less moral (less disapproving of questionable conduct) than the other respondents ( $p < 0.05$ ). Each of these situations involved an opportunity to gain financially by taking a profit from someone else’s pocket. For example, entrepreneurs were less severe in their condemnation of collusive bidding and duplicating copyrighted computer software without paying the manufacturer for its use.

Obviously, a special temptation exists for entrepreneurs who are strongly driven to earn profits. However, this finding must be kept in perspective. Even though the entrepreneurs appeared less moral than the other business respondents in their reactions to five ethical issues, the majority of the entrepreneurs were actually *more* moral in their responses to two other issues that had no immediate impact on profit ( $p < 0.05$ ). One of these involved an engineer’s decision to keep quiet about a safety hazard that his employer had declined to correct.

Evidence shows, then, that most entrepreneurs exercise great integrity, but some are particularly vulnerable with regard to ethical issues that directly affect profits. While business pressures do not justify unethical behavior, they help explain the context in which

the decisions are made. Decision making about ethical issues often calls for difficult choices on the part of the entrepreneur.

## **The Potential Advantage of Integrity**

The price of integrity is high, but the potential payoff is incalculable. For example, it is impossible to compute the value of a clear conscience. The entrepreneur who makes honorable decisions, even when it comes to the smallest of details, can take satisfaction in knowing that he or she did the right thing, even if things do not turn out as planned. The entrepreneur needs to be committed to doing the right thing even if it costs him or her dearly.

But some are convinced that integrity yields other important benefits as well. In their book, *Becoming a Person of Influence*, John Maxwell and Jim Dornan conclude that integrity is crucial to business success. They cite notable research to make their point. For example, in a recent survey of 1,300 senior executives, 71 percent considered integrity to be the personal quality that is most necessary to success in business (Maxwell & Dornan, 1997). Though an entrepreneur may lack personal integrity and still achieve financial success, he or she must swim against a very swift current to do so.

Others are even more certain that integrity pays (Siglin, 2001). In a study of 207 American firms, John Kotter and James Heskett, professors at the Harvard Business School, found that the more a company focuses on the needs of the shareholders alone, the lower its performance. Kotter and Heskett concluded that firms perform better when their cultures emphasize the interests of all stakeholders—that is, customers, employees, stockholders, and so on. Over the 11-year period of the study, those companies that looked beyond the balance sheet “increased revenues by an average of 682 percent versus 166 percent for those companies that didn’t, expanded their work forces by 282 percent versus 36 percent, grew their stock prices by 901 percent versus 74 percent, and improved their net incomes by 756 percent versus 1 percent.” While these results are impressive, they do not guarantee that doing the right thing will *always* lead to positive results for a company. However, these findings do suggest that integrity in business does not rule out financial success—in fact, doing the right thing may actually boost the company’s performance.

## **Building a Business with Integrity**

The goal of an entrepreneur with integrity is to have a business that operates honorably in all areas. This goal is not reached automatically, however. To build a business with integrity, management must provide the kinds of leadership, culture, and instruction that support appropriate patterns of thought and behavior.

## **Establishing a Foundation of Strong Values**

The business practices that a firm’s leaders or employees view as right or wrong reflect their underlying values. An individual’s beliefs affect what that individual does on the job and how she or he acts toward customers and others. Of course, people sometimes engage in verbal posturing, speaking more ethically than they act. Thus, actual behavior provides the best clues to a person’s underlying system of basic values. Behavior may reflect the level a person’s commitment to honesty, respect, and truthfulness—that is, to integrity in all of its dimensions.

Strongly held values sometimes require tough choices. The most ethical and the most economical actions may differ, since taking the “right” course of action can be expensive. In such cases, an entrepreneur who has strong, widely recognized moral values will still do the right thing simply because it is the right thing to do.

Values that serve as a foundation for integrity in business are based on personal views of the universe and the role of humankind in that universe. Such values, therefore, are part of basic philosophical and/or religious convictions. In the United States, Judeo-Christian values have traditionally served as the general body of beliefs underlying business behavior, although there are plenty of examples of honorable behavior based on principles derived from other religions. Since religious and/or philosophical values are reflected in the business practices of firms of all sizes, a leader’s personal commitment to certain basic values is an important determinant of a small firm’s commitment to integrity in business.

A long-time observer of high-tech startups has commented on the significance of an entrepreneur’s personal values (Moore, 1998):

*I can tell you, even with the smallest high-technology companies, the product had to be good, the market had to be good, the people had to be good. But the one thing that was checked out most extensively by venture capitalists was the integrity of the management team. And if integrity wasn’t there, it didn’t matter how good the product was, how good the market was—they weren’t funded.*

## **Leading with Integrity**

Entrepreneurs who care about ethical performance in their firms can use their influence as leaders and owners to urge and even insist that everyone in their firms display honesty and integrity in all operations. Ethical values are established by leaders in all organizations, and those at lower levels take their cues regarding proper behavior from the statements and conduct of top-level management.

In a small organization, the influence of a leader is more pronounced than it is in a large corporation, where leadership can become diffused. This fact is recognized by J.C. Huizenga, who started a public school management company in 1995 called Heritage Academies, which has been ranked as one of the fastest growing companies in the country by *Inc* (Huizenga, 2002, p. 1).

*The executive of a small company must often face moral challenges more directly, because he or she has more direct contact with customers, suppliers, and employees than an executive in a large corporation who may have a management team to deliberate with. The consequences of his or her choices often affect the business more significantly because of the size of the issue relative to the size of the company.*

In a large corporation, the chief executive has to exercise great care to make sure that her or his precepts are shared by those in the many and varied divisions and subsidiaries. Some corporate CEOs have professed great shock on discovering behavior at lower levels that conflicted sharply with their own espoused principles.

Leaders of large corporations are also responsible to stockholders, most of whom focus a great deal of attention on corporate profits. The management team is under pressure to

deliver an increase in earnings per share year after year. The position of an entrepreneur is typically much simpler.

## **Developing a Supportive Culture**

Integrity in a business requires a supportive organizational culture. Ideally, every manager and employee should instinctively resolve every ethical issue by simply doing the “right” thing. According to Shaun O’Malley, chairman emeritus of Price Waterhouse, an ethical culture requires an environment in which employees at every level are confident that the firm is fully committed to honorable conduct. To a considerable degree, strong leadership helps build this understanding. As a small business grows, however, personal interactions between the owner and employees occur less and less, creating a need to articulate and reinforce principles of integrity in ways that supplement the personal example of the entrepreneur.

The idealism and principles espoused by Rutledge & Company, a merchant bank in Greenwich, Connecticut, are reflected by a conference-room portrait that reminds employees “how to behave.” The portrait of an early business partner, V. P. “Bake” Baker (a “wonderfully principled man”) encourages today’s employees to follow “Bake” principles such as these:

1. Do the right thing. Right and wrong are powerful concepts. A handshake with a person who tries to do the right thing is more comforting than a ton of legal documents signed by a bad guy.
2. Stick to your principles. Hire people who want to live by them, teach them thoroughly, and insist on total commitment.
3. Principles are not for sale.

## **CONCLUSION**

To operate with integrity, entrepreneurs must reconcile the diverse interests of a number of stakeholder groups—owners, customers, employees, and others—when making decisions. The interests of stakeholder groups vary and sometimes conflict, which makes decision-making very difficult. And since there is often no obviously right or wrong position to take, managing the process can be very complicated.

# **TECHNOLOGICAL INNOVATION OF VENTURE FIRMS IN PARTNERSHIP WITH I-U-G NETWORKS**

**Choi, Yong-Ho**  
**(Professor of Economics, Kyungpook National University)**

**Hwang, Woo-Ik**  
**(Researcher, Daegu Technopark Foundation)**

## **ABSTRACT**

In modern times, the technological innovation paradigms have changed, characterized by the importance of openness and cooperation for technological innovation. That is, the strengthening of a linkage relation between the manufacturing industry and research institutes for technological innovation, and a rapid increase in network & technological cooperation.

This study aims to show that venture firms could sustain suitable activities on the basis of technological force and flexible production form against the change of this technological innovation paradigm, and also it seeks to analyze the relation between technological innovation performance of venture firms and Industry-University-Government (I-U-G) networks, and then proposes a suggestive point of policy. This study is based on empirical research; on the basis of the analytical results of questionnaires collected from 324 venture firms with theoretical research. Through this empirical research, our results suggest that the component parts of I-U-G networks for venture firms are other firms, universities, research institutes, government & its related agencies, associations, and civil service organizations.

Through interrelation analysis and regression, one between I-U-G networks of venture firms and technological innovation performance, it is found that networking with government and its related agencies and the one with civil producer organizations have a positive influence on process innovation, and also networking with government & its related agencies has a positive influence on product innovation.

Through the results of this study, we can know that support from government and its related agencies has an effective influence on innovation of venture firms, so continuous reform and complementary measures of government policy are needed. In addition, I-U-G's linkage support measures for technological innovation of firms by universities and research institutes should be strengthened.

## **INTRODUCTION**

With the coming of the knowledge-based economy, the industrial environment has changed rapidly. In process of that time, the venture industry which is based on a technological power and a flexible production method has been brought to the fore as a new industrial model.

While the bringing-up of the venture industry, as a strategy for technological innovation and regional industry development, has added its importance, many-sided studies on the revitalization of establishing Industry-University-Government(I-U-G) networks to improve the performance of venture firms have been tried. A study on I-U-G networks for venture firms can be classified into 3 fields as an object of study; Production networks of Silicon Valley in the U.S., Daedeok region in Korea, and I-U-G networks of Korean Technopark (Kwon O-Hyeok, 1999; Shin Dong-Ho, 2000; Choi & Hwang, 2003). They have suggested, in their theses, that I-U-G networks of venture firms could have a big influence on the innovation performance of firms. However, these existing studies both home and abroad seem to be insufficient in empirical investigation concerning the influence of I-U-G networks on technological innovation performance of firms. Thus, the researcher would perform a theoretical & empirical study concerning the economic meaning of venture firms, the characteristics of technological innovation, and the influence of I-U-G networks on technological innovation. By making clear the characteristics of I-U-G networks of venture firms, this study could present a direction for the construction of I-U-G networks to improve technological innovation performance of venture firms.

The object of study in this research was venture firms at the main venture complexes around the country, and a method of study depended both on an empirical analysis through questionnaire survey and on a theoretical study through literature investigation.

## **THEORETICAL BACKGROUND**

### **The Meaning of Venture Firms**

The idea of the words "venture firm" has been used widely, but there is little difference in its concept according to scholars or a purpose of study. Lee Jang-Woo (1997) defined it as an adventurous small & medium enterprise (SME) making a challenge to undertaking with new ideas and technology. On the other hand, these words, "innovative firm" and "high-tech small firm" have been widely used in Western countries (Park Yong-Kyu et al, 2001: 19). As the notion of "venture firms", the researcher in this study would define it, in a broad sense, as, "a firm which is characterized by high-risk and high-performance and established on the basis of new technology", which takes on a comprehensive meaning of technology foundation, adventurous investment, and newborn enterprise.

The character of venture firms is in response to the coming of a knowledge-based economy and to the change of the technology innovation paradigms. That is, venture firms have a differential character compared with capital-led large firms or general small ones.

First, venture firms, as research and development (R&D)-type ones, have promoted technological innovation activities over all industries through innovative technology development, and created a new high value-added industry. Second, they, in terms of technology development, pursue the product competitiveness through merchandisation of new technology, and show a strong tendency of stressing a specialty and an exclusive technical power. Third, their production systems have a tendency of having elastic production systems rapidly corresponding to the changing demands of market and to the invention of new technology. And in the production process, most venture firms have placed an order with outside suppliers and then hold only patent rights for a technology. That is, a variety of industrial networks among related enterprises form a basis for survival & development of venture firms.

## **The Meaning of Technological Innovation**

Technological innovation means a series of processes of producing, marketing and selling a new product or service through new combinations of production means such as process, market, material and organization (Schumpeter, 1961).

When looking at the change of technological innovation paradigm, it is found that a traditional technological innovation model is the process of sequential innovation, while being based on R&D activities, which an idea is developed into a prototype, designed as a product, and then is continued into mass production, while it is called 'linear model' in which each stage of innovation leads into the next stage. On the other hand, today's technology innovation model is a 'system model' in which innovation is regarded as a compound and cumulative process of self-reinforcing feedback loops. The change of this

technological innovation paradigm can be arranged as follows (Cho Hyun-Dae, 2001: 3-58).

First, there is a shortening of the R&D and technology period. As the competition of technology innovation has been intensified, firms want to attain a sure performance from R&D investment rapidly, and they are pressured to produce goods more quickly.

Second, the influence of scientific research on technological innovation has increased gradually, and then developed into direct relations between them.

Third, it is an increasing importance of openness and cooperation in technological innovation. Many various sources of knowledge · technology for new technological innovation exist on the outside more than on the inside, so for approach to external knowledge · technology and its practical use, the importance of the heightening of openness and, of mutual cooperation with external sources of knowledge have increased.

Fourth, it's the strengthening of linkage for technological innovation between the industrial world and universities. Through the manpower cultivation and the composition of technological innovation network, interactions between science systems and enterprises have become close over time.

Fifth, it's a rapid increase of network & technological cooperation. Due to increasing cost & risk for technological innovation, firms have converted, for research development and technological innovation, from internal-oriented (self-development of technology) into external-oriented (external cooperation and outsourcing), and they have specialized all the more in research development and technological innovation.

This technological innovation can be classified into process innovation and product innovation according to what the object is for technological innovation; the former is concerned with the introduction of product or new factors for operation of development, the latter with the introduction or development of new product by a venture firm concerned (Knight, 1967; Na Kwon-Jung et al., 2001: 123)

## **The Meaning of I-U-G Networks**

The researcher would look about the concept, meaning, and importance of I-U-G networks for improving the performance of innovation for venture firms. Network concept, because it is ambiguous, has been used in a broad sense.

Modern institutional economics, including the new institution school, has proposed a network form as middle form or an independent one which makes up for both extremes of market and hierarchy. That is, it is network, a structure of relationships, that various social actors keep an interactional relationship on the basis of each participant's roles and understanding. It seems that, while traditional economical activities have been mediated and managed through 'cooperation via hierarchy' in the inside of firms or through 'competition via markets', 'mediation and control' in economic transactions through networks shows new organizational aspects of today's economy activities (Castells, 1997; Lagendijk, 1997; Cho Myeong-Rae, 1998: 31).

Economic significance of I-U-G networks concerning the performance of a firm can be confirmed with a dynamic capabilities theory which stresses 'dynamic capabilities' by which firms could create and change new special sources for them or a new firm, as a continuous source for competitive advantage (Teece et al., 1997; Tidd et al., 1997; Song Wi-Jin, 1998: 528). Resources that an enterprise has are not restricted only within the inside of that enterprise. Not only financial resource and facilities, knowledge foundation and operational systems needed for business, but also networks with innovative main bodies including external suppliers, consumer firms, universities and institutes, can be sources of intangible property. Thus, dynamic capabilities include not only internal resources but also forming a network with external main bodies for innovation and then securing insufficient properties and resources. Especially, in case of a venture firm which internal resources to use are not enough, securing external resources may be very significant.

Factors or nodes constituting I-U-G networks for venture firms are possible to estimate according to several standards; basically, there are government, venture firms, universities, research bodies, and financial agencies (Baek Jeong-Yeop, 2000: 38-39). In this study, the types of networks would be classified according to the characteristic of node, and especially enterprise network and enterprise external would be considered priorities. More concretely, the network between venture firms and general firms, universities, research institutes, government and its related agencies, associations, and private suppliers.

Sample of networking between venture firms and other firms may be networks among venture firms, between venture firms and SMEs, and between the ones and large enterprises. The reason that networks between venture firms and other firms are needed is that a cooperative production following the specialization of production process in the production system of enterprise will increase. As for the objects of cooperation, there are production & supply through specialization, joint use of equipment, joint R&D, and joint receiving of an order & marketing (Lee Kong-Rae-Shim Sang-Wan, 1999: 99)

Networks between venture firms, universities, and research institutes strengthens a complementary capability in basic science of enterprise as a pressure of technological innovation in each industry with the development of new knowledge and the intense world competition has increased, so it is expected that it could raise the performance of technological innovation for enterprises. The industrial world needs the cooperation of university and research institutes for the utilization of study infra of university and public research institutes and for the acquisition of technological knowledge which enterprise institutes have not, for securing excellent manpower, and for the maximization of research capacity of an enterprise (Kim Sung-Soo, 2000: 5).

As networks between venture firms and government & its related agencies, there are networks between venture firms and central government, local government, and government financed enterprise-supporting agencies. Through this network, enterprises could benefit from financial support, administrative support, technological support, and receiving technology & business information, which could also have an influence on the performance of enterprises.

Networks between venture firms and associations mean the one with autonomous organizations in the industry world which encourages the cooperation among same or different categories of business. Through participation of associations, for venture firms, such effects as exchange of business & technology information, formation of human networks, strengthening of joint purchasing and marketing, manpower employment, financial supply, and digging-out of joint policies could be expected.

Networks between venture firms and private producer service organizations mean the one with enterprise-supporting service organizations giving financial, legal, and accounting-related services needed for business activities of venture firms. It's expected that convenience in private service utilization for venture firms could have an influence on the performance of enterprises by helping their business activities.

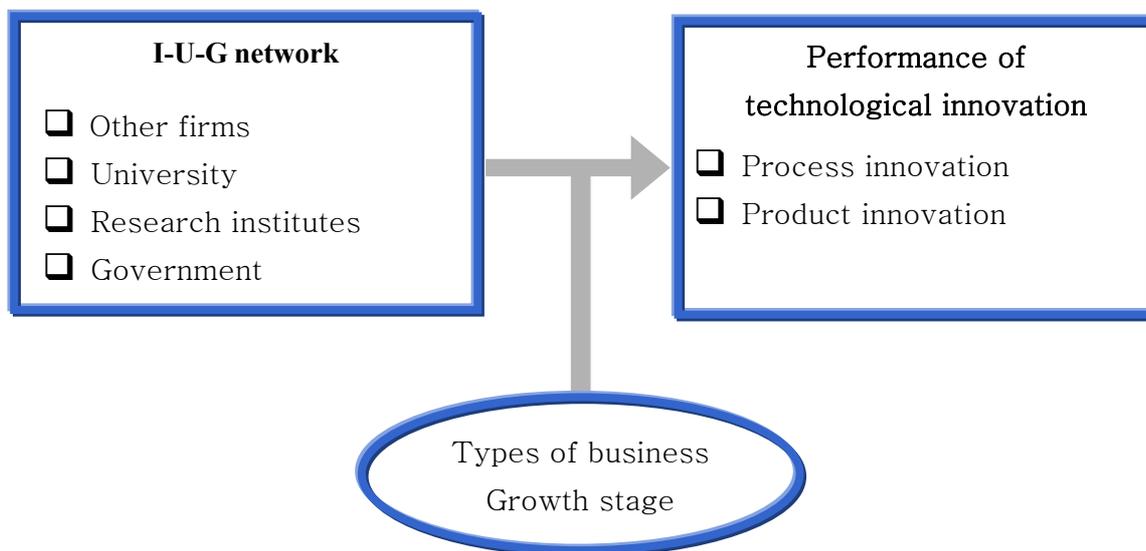

## **EMPIRICAL RESEARCH**

### **The Characteristics of Empirical Research Model & Sample**

#### **Empirical Research Model**

In the above theoretical discussion, the researcher showed that venture firms have the characteristics of technological innovation-type enterprise, looked into that securing external resources through I-U-G networks from the viewpoint of venture firms become a

strategy to improve business performance. On the basis of a discussion like this, this paper would look empirically about the characteristics of technological innovation for venture firms, of I-U-G networks, and about the relationship between I-U-G networks and business performance. First of all, the performance of venture firms would be examined concerning analysis of factors and characteristics in terms of technological innovation, and then concerning the types of I-U-G networks. That is, making venture firms located in the venture complex an object, the analysis of feasibility and confidence of the variables about technological innovation and I-U-G networks was conducted. Second, the characteristics of the samples with frequency analysis and technology statistics centering around these variables were investigated. In addition, a relation between I-U-G networks and enterprise' performance, a main concern for this study, were looked into through interrelation & multi-regression analysis. The above-mentioned discussion can be arranged with setting-up of a research analysis frame in Figure 1.

**<Figure 1> Research analysis frame**

To clarify the results in analysis of the characteristics of I-U-G networks for venture firms in this study, the researcher defined the types of business and a growth stage as follows.

First of all, the types of business of venture firms have been classified with a variety of standards according to the objectives of study, but in this study they would be limited to the manufacture & IT service businesses on the basis of the Korean Standard Industrial Classificatory Table.

Second, a growth stage of venture firms can also be classified according to a variety of standards. In this study their growth stage could be classified into 4 stages; the initial stage, early growth stage, high growth stage, and maturity stage.

Third, I-U-G networks of venture firms were examined on the basis of the existing literatures concerning the networks with other firms, university, research institutes, government & its related agencies, associations, and private service organizations. Fourth, in analysis of the performance of innovation for venture firms located in the venture complexes, technological innovation power was measured with a technological superiority through a comparison of technological level for a similar product.

## **Material Collection & Sample Firms' Characteristics**

The characteristics of I-U-G networks of main venture firms in several venture complexes were surveyed by use of a structured questionnaire, and the means of material collection depended on postal & visit survey, telephone interview and e-mail. With classifying the answered contents by the types of business and growth stages, the researcher utilized a five-point scale standard for the questions which needed a comparison of average values in the answered questionnaire.

The survey was conducted during the period from Mar. 20 ~ May 10, 2002, and as the object areas of investigation, Teheran Valley in Seoul, a representative area for Korean venture firms, and Daedeok valley in Daejeon were selected preferentially, and in addition to them, venture firms located in Daegu and Kwangju metropolitan cities, Kyungsan, and Pohang were also selected.

The numbers of effective questionnaires used for final analysis were 324 copies, and among them, venture firms of manufacturing business accounted for 58% with 188 copies. Service-related venture firms such as software development and the Internet services, accounted for 42% with 136 copies.

General characteristics of sample firms included a high rate of IT firms, high weight of early growth rate in the growth stage, a small number of employees, high rate of starting business recently, and high rate of investment for R&D compared with sales. It seems that these characteristics have well reflected a special character of venture firms, newborn research development-oriented ones.

## **Analysis of technological innovation performance of venture firms**

To look into the level of technological innovation as the performance of venture firms located in the complexes, the researcher compared with technological level of other firms by use of a measuring tool which could show the level of technological innovation. From the results of factor-analysis of main elements by use of a vertical turning method according to the varimax method for a feasibility study of variables, the two factors as

shown in <Table 1> were extracted. Factor 1 has loaded high the 4 items of technological element related with the reform of process. Thus, it means the concept of process innovative power related with technological innovation in the process. In addition, the factor 2 has loaded high the 3 items of descriptive elements related with the development of new product. Thus, it means the concept of product innovative power related with technology for product development. Cronbach's alpha values for the above items obtained show a high reliance level with .8233 for the factor 1 and .6179 for the factor 2.

**<Table 1> Analysis of the factors about the performance of technological innovation of venture firms**

Items	Factor 1 (Process innovation power)	Factor 2 (Product innovation power)	Reliability (Alpha)
Increased productivity	<b>.848</b>	.177	<b>.8233</b>
Introduction of new process	<b>.800</b>	.191	
Decreased ratio of inferior product	<b>.774</b>	.114	
Technology level for reform of production process	<b>.694</b>	.373	
Technology level for development of production process	.212	<b>.834</b>	<b>.6179</b>
Number of patent application & registered items	.068	<b>.717</b>	
Technology level for betterment of existing products	.341	<b>.687</b>	
Eigenvalues	2.605	1.901	
% of Variance	37.217	27.162	
Cumulative %	37.217	64.379	

Source: Questionnaire survey

Descriptive statistics of technological innovation performance factors, as a performance indicator of venture firms are shown in <Table 2>. The performance of process & product innovation, measured with the level of technology innovation, was over the average with 3.50 and 3.86, respectively.

**<Table 2> Descriptive statistics of the performance of venture firms in the complexes**

Variables		Frequency	Mean	Standard deviation
Performance of	Process innovation	288	3.50	.69
	Product innovation	317	3.86	.69

### Analysis of I-U-G Networks of Venture Firms

The analysis results of factors concerning I-U-G networks of venture firms are shown in <Table 3>. In factor 1, it is found that 6 items meaning cooperative network with an association in several items including 'joint purchasing and a marketing' are loaded high. So the factor 1 means a cooperative network concept with association. In factor 2, 6 items including 'acquisition of technology & business information from university' meaning a cooperative network with universities is loaded high. So the factor 2 means a cooperative network with university. In factor 3, 5 items including 'acquisition of a technology & business information from research institutes' meaning a cooperative network with research institutes' is loaded high. So the factor 3 means the concept of a cooperative network with them. In factor 4, 4 items including 'cooperation in financial support with government & its related agencies' meaning a cooperative network with them is loaded high. So the factor 4 means the concept of a cooperative network with them. In factor 5, 4 items including 'support in legal, accounting & tax service from private service organizations' is loaded high. So the factor means the concept of a cooperative network with them. Finally, in factor 6, 5 items including 'joint receiving order and marketing with other firms' meaning cooperative network with them are loaded high. So the factor 6 means the concept of a cooperative network with them.

Cronbach's alpha values of the above items obtained to look into reliability of variables show high reliability with .7893 for factor 1, .9062 for factor 2, .9254 for factor 3, .9006 for factor 4, .9224 for factor 5, and .8527 for factor 6.

**<Table 3> Analysis of the factors about I-U-G cooperation of venture firms**

To examine the general characteristics of I-U-G networks for venture firms, the researcher looked into the descriptive statistics. I-U-G networks, measured with the level of I-U-G networks construction for venture firms, show that it is very vulnerable with less than the average generally as shown in <Table 4>. Network level with universities was 2.76, the highest, that with other firms was 2.68, that with private producer service organizations was 2.63.

**<Table 4> Descriptive statistics of I-U-G network of venture firms in the complexes**

Variables	Frequency	Mean	Standard deviation
Network with other firms	300	2.68	.79
with university	297	2.76	.92
with research institute	297	2.48	.95
with government agency	307	2.55	.85
with association	293	2.32	.80
with private producer service organization	304	2.63	.79

<Table 5> shows the results of analysis of a difference by the type of business and the stage of growth in I-U-G network factors of venture firms. There is a significant difference according to the type of business between networks with universities and that with research institutes. It seems to be caused from the results that network levels between venture firms and universities was higher for manufacture business with 2.93 than that for the IT business with 2.54, and that the one between venture firms and research institutes was higher for manufacture business with 2.59 than for IT business. These results have reflected that the characteristics by the type of business cause a difference in the formation of I-U-G networks.

difference in the formation of I-U-G networks.

**<Table 5>**

**Analysis of a difference in I-U-G networks by the characteristics of venture firms**

Type of business	Mean/ Standard deviation	Other firms	University	Research institute	Government agency	Association	Private service organization
Manufacturing	mean	2.64	2.93	2.59	2.60	2.25	2.61
	standard deviation	.78	.86	.91	.85	.75	.78
IT service	mean	2.75	2.54	2.34	2.49	2.40	2.67
	standard deviation	.80	.96	.99	.86	.85	.79
t value		-1.173	3.644***	2.223**	1.163	-1.554	-.712

Note: \* p<.10, \*\* p<.05, \*\*\* p<.01

From analysis of a difference by the stages of growth, it's found that there was a significant difference in networks with government & its related agencies, with an association, and

with private service organizations. Networks with government & its related agencies has been strengthened with growth of the firms concerned, so did that with associations. Networks with private service organizations also has been strengthened in its construction from early stages after starting business to the stage of high growth, but it has been weakened in the stage of maturity. For networks with other firms, universities, and research institutes, there is no significant difference by the stages of growth.

**<Table 6> Analysis of a difference in I-U-G network by the stages of growth of venture firms**

Growth stage	Mean/ Standard Deviation	Other firms	University	Research institute	Governme nt agency	Association	Private service organizatio n
Starting business one	Mean	2.56	2.65	2.29	2.28	2.22	2.49

### **Analysis of a relation between I-U-G networks and firms' performance**

To examine a relation between I-U-G networks factors of venture firms and the performance factors of technological innovation, the researcher performed an interrelation analysis. As shown in <Table 7>, the results of analysis show that there is no a significant interrelationship statistically between them or there is very weak interrelationship.

There was a weak positive interrelationship between process innovation and networks with government & its related agencies, and so did that between product innovation and network with universities, and government & its related agencies. This result suggests that for process and product innovation, network with universities and government & its related agencies could have a positive influence on technological innovation of venture firms.

**<Table 7> Analysis of the interrelationship between technological innovation and I-U-G networks**

Items		Process Innovation	Product Innovation	Other Firms	University	Research Institute	Gov't Agency	Association	Private Service Organization
Performance of Firm	Process Innovation	1.000							
	Product Innovation	.451***	1.000						
I-U-G Network	Other Firms	-.011	.029	1.000					
	University	.100	.106*	.392***	1.000				
	Research Institute	.049	.071	.469***	.612***	1.000			
	Government Agency	.116*	.120**	.225***	.418***	.478***	1.000		
	Association	-.062	.019	.387***	.401***	.458***	.539***	1.000	
	Private Service Organization	.069	.015	.356***	.331***	.383***	.469***	.565***	1.000

Note: \* p<.10, \*\* p<.05, \*\*\* p<.01

To verify the influence of I-U-G network factors of venture firms on the performance of technological innovation, multiple regression analysis was performed while regarding process & product innovation power as dependant variables, and I-U-G networks as an independent variable.

The results of regression analysis are shown in <Table 8>. It shows that in relation of process innovative power with I-U-G networks, the networks with government & its related agencies and private service organizations have a positive significant influence. And it's found that a factor having the greatest effect of process innovative power was networks with private service organizations ( $\beta=.131$ ). Among performance variables, in relation of product innovative power with I-U-G networks, networks with government & its related agencies has a positive significant influence on it.

Summing up, it seems that networks between venture firms and government & its related agencies, and private service organizations has a significant influence on process

innovation power, and for process innovative power, networks with government & its related agencies is a significant factor.

**<Table 8> Regression analysis between the performance of venture firms and I-U-G networks**

Dependent variables	Process innovation power		Product innovation power	
	BETA	t value	BETA	t value
Other firms	-.066	-1.021	.052	.831
University	.087	1.331	.077	1.236

Adjusted R <sup>2</sup>	.033		.030	
F	2.284**		2.281**	

Note: \* p<.10, \*\* p<.05, \*\*\* p<.01

## CONCLUSION

The purpose of this study was to look into the necessity of I-U-G networks for improvement of technological innovation's performance by firms, by analyzing technological innovation and I-U-G networks making venture firms in the main complexes. From the results of analysis, it is found that as the types of I-U-G networks for venture firms there were networks with other firms, with universities, research institutes, associations, and private producer service organizations.

The results of analysis of I-U-G networks level for venture firms in the complexes showed that I-U-G networks of venture firms was very vulnerable overall. To examine the influence of I-U-G networks on the technological innovation's performance for venture firms, regression analysis was performed. From the analysis, it was found that networks with government & its related agencies and private service organizations have a positive, significant influence on the process innovative power, and in addition, networks with government & its related agencies has on product innovative power. These results suggest that while the construction of networks between venture firms and government & its related agencies has been strengthened, it could have a positive influence on the process & product innovation.

Through this analysis, it's found that in the region where the foundation of I-U-G networks is vulnerable, the necessity of newly forming or encouraging I-U-G networks is proposed as a matter of policy. As a representative example of a policy like this, consider an I-U-G cooperative promotion project such as the construction of Technopark. Policy tasks for the promotion of I-U-G networks can be proposed as follows;

First of all, the preparation of a firm cooperation program to strengthen networks among firms is preferentially needed, with the formation of symbiotic culture through the construction of networks for joint receiving order & marketing among firms, joint utilization of equipment, joint R&D, and exchange of technology & business information.

Second, for the expansion of practical solidarity between venture firms and universities, expansion of participation by universities in I-U-G cooperative projects in terms of finance, manpower for research and facility support is needed. And positive development and carrying out of a program through which venture firms could easily perform the acquisition of technology & business information, business consultation, research development, practical use of equipment, educational training, supplement of the personnel could be other basic activities (work) to strengthen the network.

Third, to strengthen weak networks between venture firms and research institutes, networks with research institutes in the I-U-G cooperation project should be also strengthened so that cooperation with research institutes can be smoothly performed.

Fourth, to strengthen a weak network between venture firms and government & its related agencies, financial support for I-U-G cooperation work by government should be also strengthened, with the preparation of long-term I-U-G cooperation project policy. Especially, the fact that networks of venture firms with government & its related agencies has a close relationship with the performance of technological innovation suggests that firm-supporting policy by government & its related agencies would have to preferentially consider the demands of firms.

Fifth, it's found that networks of venture firms with associations and cooperatives are very vulnerable. So the setting of activity direction, by associations and cooperatives, toward giving help for venture firms is strongly needed. In addition, government should play a participatory role such as a facilitator in joint purchasing & marketing, developing of policy, and exchange activities of business & technology information so that associations' activities could perform a positive function for firms' business.

Sixth, it seems that, to strength networks of venture firms with private producer service organizations, attracting or cultivating a producer service organization at local cities or expanding a support-program, which firms can utilize in a moderate price, is needed.

# **THE IMPACT OF ENTREPRENEURSHIP EDUCATION ON CAREER INTENTIONS AND ASPIRATIONS OF TERTIARY STUDENTS IN GHANA**

**Wilberforce A. Owusu-Ansah**

**Graduate Business School, Dublin Institute of Technology, Ireland  
Submitted at the 49th World Conference of the International Council for  
Small Business, 20<sup>th</sup> to 23<sup>rd</sup> June 2004, Johannesburg, South Africa**

## **ABSTRACT**

Growth in entrepreneurship education has accelerated dramatically over the last two decades in both developed and developing countries. This growth is reflected in the inauguration of numerous international inter-collegiate business plans competitions, new entrepreneurship curricula and programmes and endowed professorships in entrepreneurship. The dilemma is for the field to stay on the 'cutting edge'. But more importantly the outcomes of entrepreneurship education must be known. Some entrepreneurship education has been introduced at the tertiary level of the Ghanaian educational system over the last eight years. However, the types of entrepreneurship education offered to business students are different from what are available to the science/engineering students. This paper assesses the impact of entrepreneurship education on student career intentions and aspirations at tertiary level in Ghana. Tentative evidence suggests that not only does entrepreneurship education impact on the career intentions and aspirations of undergraduate students but also influences their career intentions and aspirations towards self-employment. Besides, types of entrepreneurship education's pedagogy and curricula affect the degree of career aspirations towards self-employment. Evidence from the study indicated that the business students exposed to entrepreneurship education were more likely than the science/engineering to include self-employment in their career aspirations. Apparently other empirical findings from the survey further appear to indicate that the growth and investment in entrepreneurship education in Ghana is well founded. However, it is evident that a harmonisation of the curricula offered to business, science and engineering students as well as improving logistics, is imperative if entrepreneurship education could encourage more Ghanaian students to recognise self-employment as a career option.

## **INTRODUCTION**

Evidence in the literature indicates that growth in entrepreneurship education has accelerated dramatically over the last two decades throughout the world (Robinson and Hayes, 1991; Faris, 1999; Brown, 1999; Lord, 1999; Charney and Libecap, 2000; Solomon et al. 2002). This growth is reflected in the inauguration of numerous international inter-collegiate business plans competitions, new entrepreneurship curricula and programmes and endowed

professorships in entrepreneurship. The dilemma is for the field to stay on the 'cutting edge'. To continue to be a vibrant member of the academic community, pedagogies must reflect the changing times. But more importantly the outcomes of entrepreneurship education must be known, though approaches to entrepreneurship education have varied across colleges and universities, from offering single courses in new business development or business plan preparation to integrated curricula that include marketing, finance, competitive analysis, and business plan development (Charney and Libecap, 2000). It is argued that core entrepreneurial skills and competencies are essential for the pursuit of effective entrepreneurial behaviour, individually, collectively and in the society (Gibb, 1998; Kirby, 2003). Entrepreneurship educational programmes have been introduced at some Ghanaian tertiary educational institutions in an attempt to reverse graduate unemployment trend by giving the needed training in entrepreneurial skills to tertiary students to establish and manage their own businesses and to consider self-employment as a career option. The study is borne out of the need to evaluate the outcome of the entrepreneurship education and initiatives recently introduced at third level institutions in Ghana in order to investigate the impact on career intentions and aspirations of tertiary students.

## **BACKGROUND**

The tertiary educational system in Ghana in the past trained students for legal and administrative positions with little regard to prepare students to consider self-employment as a career option (Afenyadu et al. 2001; Oketch and Otieno, 1999). The rationale was that the public sector positions needed to be filled up following the departure of colonial leaders. This colonially-inspired tertiary education has not served Ghana well as it has contributed to a widespread unemployment (see GLSS, 1998). Graduate unemployment and underemployment in Ghana appears to have been a major problem for quite sometime now, in spite of government supported effort to train and motivate unemployed graduates for self-employment (Graphic, 2002; Dwomo-Fokuo, 2001). Recently, questions have been asked in Ghana as to which capabilities are being developed in graduates by the higher education process in general (Afenyadu et al., 2001; Afenyadu, 1998). In addition, more direct questions have also been asked about whether Ghanaian higher education influences graduates towards careers in direct wealth creation sectors of the economy as opposed to those in the public sector (NBSSI, 2001). Fundamentally, there is a growing interest within the Ghanaian educational system regarding how effectively programme offerings equip graduates with the range of desirable skills and competencies required in the marketplace.

Consequently, there is awareness that reforms in educational sector are essential to make curricula to reflect the national needs rather than the previous education that served the interest of the colonial administration. The National Coordinating Committee on Technical and Vocational Education and Training (NACET) was established in 1990 to coordinate activities across diverse agencies and a number of structural and curricula changes have already taken place at the tertiary level. First, educational reforms that reflect national character and needs have been implemented at the primary and secondary levels over the last two decades with some success (Sowa, 1993). A key component of the reform was to shorten pre-university education from 17 years to 12 years and a structural reform of the various curricula. Second, reforms in the tertiary educational sector were launched in 1991 and entrepreneurship

educational programmes, first introduced in the mid-1990s, are now available at some universities and polytechnics. Other agencies like the National Board for Small-Scale Industries (NBSSI) have designed training courses and programmes to create awareness, assist and motivate undergraduates, especially agriculture engineering, engineering and biochemistry students to consider self-employment as a career option (NBSSI, 2001). In order to meet the challenges emanating from questions and queries regarding the relevance of tertiary education in Ghana, attempts have been made to improve the calibre of university graduates produced, through training in entrepreneurial skills to enable them establish and manage their own business as well as reduce graduate unemployment.

Entrepreneurship education is still at its infancy in Ghana and the curricula, programmes and organisation is devoid of uniformity. University of Ghana was the first to introduce an entrepreneurship programme as a course in 1996 and it is available to business students only. Equally, the Kwame Nkrumah University of Science and Technology (KNUST) is also the only university in Ghana to offer entrepreneurship education to science and engineering students. However the entrepreneurship courses offered in both institutions differ; whereas it is an elective and part of undergraduate degree studies at the University of Ghana and run over a full semester, at the KNUST, entrepreneurship education is outside the formal degree programme. NBSSI organises, on behalf of the KNUST, a three-to-eight day intensive 'Entrepreneurship Awareness' and 'Start Your Business' seminar and workshops for the science and engineering degree students. The 3-8-day ad hoc entrepreneurship seminars and workshops offered at KNUST is shorter compared to a semester-long offer to business students at the University of Ghana. A comparison of the respective impacts of the entrepreneurship education programmes in the two institutions, with a varied exposure, on students' career intentions will further an understanding of the outcomes of entrepreneurship education.

In summary, with the Ghanaian tertiary education in transition to make it more responsive to national goals of accelerated employment and wealth creation, investment in entrepreneurship education is growing and that makes an investigation into the outcomes of such initiatives a researchable agenda. It is against this background that this study seeks to evaluate the outcomes of the entrepreneurship educational efforts in the two universities in Ghana by exploring the impact of entrepreneurship education on career intentions and aspirations of students at the tertiary educational level. This way the justification for the growth and investment in entrepreneurship education is verified.

## **PREVIOUS STUDIES**

Not much research studies have been conducted in Ghana into the outcomes of entrepreneurship education. The primary aim of this study is to conduct research into the impact of tertiary entrepreneurship educational programmes and initiatives in Ghana on student career intentions and aspirations. The first step in the research process was a review of the literature on entrepreneurship, career choice and entrepreneurial careers. A number of studies dealing with the issue of education for entrepreneurship (Scott and Twomey 1988; Sexton and Bowman 1987, 1988; Brown, 1990; Robinson and Haynes, 1991; Lord, 1999),

career choice (Levesque et al., 2002; Simon et al., 2000; Carter et al., 2002; Dyer, 1994; Kolvereid, 1996) and entrepreneurial careers (Dyer and Gibb, 1994; Miller, 1963; Solomon et al. 2002) were found. The conclusion reached was that further exploratory research on the topic could be invaluable. Ronstadt (1985) argues that most people, even entrepreneurs, do not think of entrepreneurship as a career. Only a minority of all future entrepreneurs will know when they attend college that they will probably pursue entrepreneurship as a major life goal. Of those who are considering entrepreneurship while at college, it is envisaged that only a small minority will start immediately after graduating. Another small minority will wait but anticipate an entrepreneurial career by explicitly choosing to work for someone else in a position or industry, which will prepare him or her for future venture(s). However, the vast majority that become entrepreneurs will go to work for someone else without anticipating an entrepreneurial career. Ronstadt (1985) stresses the importance of sensitising students to the fact that entrepreneurship is a possible career option they will face or consider in the future.

Several research studies in USA, Europe and Asia indicate that students' attitude towards enterprise and small business are positive (Karr, 1985; Brockhaus and Horowitz, 1986; Scott and Twomey, 1988; Lord, 1999). Jackson and Vitberg (1987) reported that business college graduates and students are increasingly disenchanted with career prospects as organizational employees. Consequently, more and more students view the possibility of starting and operating their own business as a viable alternative to being employed in an established company (Duffy and Stevenson, 1984). Other surveys support this view. Karr (1985) reveals that 46% of college students consider a 'business of one's own' an excellent way to get ahead. In a University of Pittsburgh survey of 1000 MBA students from top business schools in the U.S., 44% responded that they wanted to become an independent entrepreneur. In contrast only 34% wished to be a high-ranking corporate manager (Sandholtz, 1990). Scott and Twomey (1988), based on data collected from English students, reported that 25% had a business idea and that 41% aspired to self-employment. Figures by Harrison and Hart (1989) revealed that over 51% of a sample of Northern Ireland students expressed a positive desire to run their own business. Hills and Welsh (1986) in a survey of almost 2,000 students found that 80% expressed an interest in taking one or more courses in entrepreneurship. Brenner et al. (1991) found in their study of 237 graduates in the U.S. that business graduates generally perceived business ownership in a positive light. However, the survey revealed an inconsistency between the graduates' attitudes towards owning and operating their own business and their intentions toward pursuing such a career. When they were given complete freedom of choice, 55% preferred operating their own business. An interesting point was that when they were asked their most likely choice considering their actual situation and constraints upon their options only 5% indicated that they would probably choose to operate their own business.

Weihe and Reich (1993) in their international study of entrepreneurial interest among business students found that 34.3% of those questioned had an unreserved interest in self-employment. The study found the highest number of students already self-employed, 6%, was in America. Brown (1990) reports that between 2% and 2.5% of Japanese graduates start their own businesses within a short time after graduation. Fleming (1992) in a study of Irish graduates, who participated in entrepreneurship initiatives and programmes while at college, found that a comparatively high proportion (45%) of the sample reported that the course taken had a positive effect on their subsequent career decision. The study also found that 5% of the respondents had initiated a start-up venture within five years of graduation. A

follow-up study of the Irish graduate cohorts who participated in entrepreneurship initiatives and programmes, found that 28.4% had initiated own businesses a decade after graduation (Owusu-Ansah and Fleming, 2001). Lord (1999) found in the United States that 22% of the national MBA class of 1998 indicated that they planned to initiate ventures within five years of graduating. However, it has been suggested that it is too early to know whether the graduate MBAs will indeed, become successful entrepreneurs.

In spite of the relationship demonstrated between level of education and business ownership, it has been argued that formal education in general does not encourage entrepreneurship. Rather, it prepares students for the corporate domain (Timmons, 1994), promotes a 'take-a-job' mentality (Kourilsky, 1995) and suppresses creativity and entrepreneurship (Chamard, 1989; Plaschka and Welsch, 1990). In Ghana in particular Robertson (1984) reported that higher education inhibits entrepreneurship development in Ghana. Lord (1999) also reports that a 1997 study at Babson College showed that of 30 entrepreneurs with just a high school education, 70% had successful launches versus none of the eight who had graduate degrees. In an explanation, Professor Katz of St. Louis University believes that such training will pay off. Katz's thinking is that 'business school graduates know what's happening to the money. There will be very few crashes and burns' (Lord, 1999). Some graduates are also believed to be taking up positions in small companies in 'intrapreneurial roles'. It is clear from the evidence of a number of studies in the literature that the preferred career of a considerable number of students and graduates is towards business ownership. However, many students and graduates perceive several obstacles that militate against business start-ups, such as lack of experience, or lack of finance, which block the path toward their preferred choice. The problem of this inconsistency may lie in the present business curricula, which have until recently, focused almost entirely on the needs of aspiring middle and functional managers rather than the needs of aspiring entrepreneurs.

Traditionally universities and colleges have not prepared students for self-employment as a career option, resulting in the loss of many potential entrepreneurs. As a result of this educational bias to large businesses and lack of information on self-employment as a career option, many universities and colleges are now offering topics and courses related to entrepreneurship and small business. To foster entrepreneurship, specialised courses have become increasingly common in tertiary institutions (Solomon and Fernald, 1991) and enterprise education has been promoted to encourage entrepreneurial behaviour (Donckels, 1991; Gasse, 1985). Reviews of the literature on enterprise and entrepreneurship education (Dainow, 1986; Gorman, 1997) and of particular entrepreneurship support programmes (McMullan et al., 2002) provide some evidence that these programmes are successful in encouraging entrepreneurs to start businesses or improve the performance of businesses.

## **RESEARCH OBJECTIVES**

The objective of this paper is to assess the impact of entrepreneurship education on career intentions and aspirations of tertiary students who have been exposed to different types of entrepreneurship education in Ghana. To achieve this, the following sub-objectives were formulated in the development of the research instruments.

- To investigate the influence of entrepreneurship education on career intentions and aspirations.
- To examine the influence of entrepreneurship education on attitudes towards business start-ups.
- To ascertain the influence of entrepreneurship education on perceptions of desirability and feasibility of self-employment.

## THE STUDY DESIGN

The study was designed to ensure that the results were meaningful and to compare the business and science/engineering degree students' career intentions and aspirations as a result of a varied exposure to an entrepreneurship education. A sample of four hundred Business and Science/ Engineering students were randomly selected, with two hundred each from the University of Ghana and the Kwame Nkrumah University of Science and Technology. Four hundred questionnaires were mailed to students sampled in November 2001 and were asked to return completed questionnaires in an enclosed envelope by December 2001. Table 1 illustrates the main characteristics of the survey sample.

**Table 1 Student Survey Sample**

	Male		Female		Total	
	n	%	n	%	n	%
Business	104	52	96	48	200	100
Science/ Engineering	160	80	40	20	200	100
Total	264	66	136	34	400	100

To meet the objectives of the research, information covering three key areas was investigated. First, information on students' career intentions and aspirations and the relative extent of influence of entrepreneurship education was collected by questionnaire. Second, information was collected on students' attitudes to starting own business and the perceived factors that discourage or militate against starting own business. Finally, the questionnaire further explored students' personal profiles and family backgrounds. It is expected that more of the business respondents who apparently have had more exposure to entrepreneurship concepts and practices as a result of a structured programme would include self-employment in their career intentions and aspirations than their science and engineering counterparts with ad hoc and unstructured programmes. The survey questionnaire consisted of 29 questions and 100 variables. Most of the questions in the survey questionnaire were closed questions with checklists and Likert rating scales where the respondents were offered a choice of alternative replies. Questions were designed to be easy and quick to answer by students. The closed questions could be divided into questions of facts and questions of perception. The closed questions were arrived at via a process of pilot test using initially a wider framework of open questions. The layout and sequence of the questions were designed to facilitate ease of response.

The questionnaire had three sections (A-C). Questions in Section A examined career intentions before and after entrepreneurship education, the effect of entrepreneurship education on career intentions and aspirations. Section B explores respondents' attitudes towards starting a business as well as factors considered as discouraging or militating against starting a business. The attitudes explored include motivation to start own business and activity towards the realisation, whether some respondents have business ideas and the probability that they would start business in the future. The final part of section B explores perceived barriers to set-up in order to understand the respondents' perceptions of the influence of entrepreneurship education on perceptions of desirability and feasibility. The final section (C) of the questionnaire looks at the personal profile and family background of the respondents. In this last set of questions, the respondents' personal details including gender, age and marital status were explored. Parents' occupation and the family influence were investigated. The final open question was designed to gather opinions, suggestions and comments in general with regard to the research and areas of further study. A total of 400 questionnaires were mailed to the survey sample in November 2001. A total of 113 valid responses were received. The valid data were coded and results were analysed using an SPSS computer package.

## FINDINGS

This section presents an analysis of findings of the survey which explored the influences of entrepreneurship education on respondents' career intentions and aspirations, attitudes and perceptions of desirability and feasibility of self-employment.

**Table 2: Personal Details of Respondents**

	Business Degree		Science/ Engineering		Total	
	n	%	n	%	n	%
Male	32	52.5	41	78.8	73	64.6
Female	29	47.5	11	21.2	40	35.4
Total	61	100	52	100	113	100

Table 2 outlines an analysis of the personal details of the respondents. Whereas 52.5% (n=32) of the business degree respondents were males and the remainder females 47.5% (n=29), the corresponding figures for the science/ engineering degree respondents were overwhelming 78.8% (n=41) males and 21.2% (n=11) females. Apparently, the personal details of the respondents (64.5% males vs. 35.4% females) compared favourably with the survey sample (66% vs. 34%) (See Tables 1 and 2). The gender profiles also compare to the tertiary student population of the disciplines the respondents were sampled from.

**Table 3: Age of Respondents**

	Business Degree		Science/ Engineering		Total	
	n	%	n	%	n	%
20- 21 years	5	8.2	3	5.8	8	7.1
22-23 years	16	26.2	15	28.8	31	27.4
24 years	8	13.1	7	13.5	15	13.3
25 years or more	32	52.5	27	51.9	59	52.2
Total	61	100	52	100	113	100
Mean Age	<b>26.1 years</b>		<b>25.8 years</b>		<b>26 years</b>	

Table 3 presents the age characteristics of student survey respondents. Interestingly whereas 34.4% (n=21) of the business degree respondents were aged between 20 and 23 years, a corresponding figure for the science/ engineering degree respondents was 34.6%. The majority of the business and the science/ engineering degree respondents, 52.5% (n=32) and 51.9% (n=27) respectively, were aged 25 or more. Indication is that the age characteristics of both groups were similar, as verified by their mean ages of 26.1 and 25.8 years.

The mean ages of the respondents are high but it has to be interpreted with caution. An explanation is that Ghana had a long pre-university education until a new education reform was introduced and implemented in 1987. It appears the two systems co-exist as far as university admission intake is concerned. For instance, Ghana had 17 years of pre-university education in the past, consisting of a ten-year primary education, with an entry qualification examination option (Common Entrance Examination) to secondary school after seven years. It was followed by seven years of secondary education, five years towards a leaving certificate and two remaining towards an 'Advanced Level'. However, under the educational reform, pre-university education has been effectively reduced to 12 years, consisting of six years of primary education to be followed by three-year junior secondary school and another three years of senior secondary education. Apparently the products from the two pre-university educational systems continue to be educated together.

**Table 4: Career Intentions and Aspirations Prior to Entrepreneurship Course**

	Business Degree		Science/ Engineering		Total	
	n	%	n	%	n	%
Further studies	15	24.6	25	48.1	40	35.4
Employment	18	29.5	10	19.2	28	24.8
Employment & Part-time business	10	16.4	5	9.6	15	13.3
Self-employment	7	<b>11.5</b>	3	<b>5.8</b>	10	<b>8.8</b>
None/ Not stated	11	18.0	9	17.3	20	17.7

Total	61	100	52	100	113	100
-------	----	-----	----	-----	-----	-----

Table 4 outlines the students' career aspirations before exposure to entrepreneurship programme. Interestingly nearly half 48.1% (n=25) of the science/ engineering degree respondents initially intended to further their studies compared to 24.6% (n=15) of the business degree respondents. Besides, whereas 19.2% (n=10) of the science/ engineering respondents initially aspired to enter into employment, nearly a third, 29.5% (n=18) of the business degree respondents had similar career intentions. Similarly, a further 9.6% (n=10) of the science/ engineering degree respondents intended to go into employment of others and still have self-employment on part-time basis, the corresponding figure for the business degree respondents was 16.4% (n=10). Quite revealing is that whereas only 5.8% (n=3) of the science/ engineering degree respondents initially intended to become self-employed, a similar figure for the business degree respondents was 11.5% (n=7) and as a group 8.8% (n=10) gave self-employment as their career intentions and aspirations before the entrepreneurship course.

**Table 5: Effect of Entrepreneurship Education on Career Intentions**

	Business Degree		Science/ Engineering		Total	
	n	%	n	%	n	%
Very important effect	34	55.8	26	50.0	60	53.1
Important effect	20	32.8	10	19.3	30	26.5
Fairly important effect	6	9.8	6	11.5	12	10.6
Little effect	-	-	4	7.7	4	3.5
No effect	1	1.6	6	11.5	7	6.2
Total	61	100	52	100	113	100
Weighted Average Score	4.4		3.9		4.2	

Table 5 presents the respondents' perception of the effect of the entrepreneurship programme on their career intentions and aspirations. An overwhelming 88.6% (n=54) of the business degree respondents indicated that entrepreneurship programme has either an important or a very important effect on career intentions compared to 69.3% (n=36) of the science/ engineering respondents who gave similar evaluation. Interestingly whereas 19.2% (n=10) of the science/ engineering degree respondents felt that the entrepreneurship programme has little or no effect on career intentions, only one (1.6%) business degree respondent shared the view. Evidently both the business degree and their science/engineering degree counterparts perceived entrepreneurship programme to have had important influence on career intentions and aspirations. What is however, distinctive is a nearly 20% point difference (19.3%) between the business degree and the science/engineering degree respondents on their respective evaluation of effect of entrepreneurship education on their career intentions and aspirations. The weighted average scores of 4.4 and 3.9 respectively for the business degree and the science/ engineering

degree respondents respectively further substantiates the relative perceptions of the effect of the entrepreneurship education on their career intentions and aspirations.

**Table 6: Immediate Career Intentions and Aspirations after Graduation**

	Business Degree		Science/ Engineering		Total	
	n	%	n	%	n	%
Further studies	25	40.9	26	50.0	51	45.1
Employment	4	6.6	9	17.3	13	11.5
Employment & Part-time business	12	19.7	8	15.4	20	17.7
Self-employment	20	<b>32.8</b>	9	<b>17.3</b>	29	<b>25.7</b>
Total	61	100	52	100	113	100

It was decided to explore the immediate career intentions and aspirations of students that is one-two years after graduation following exposure to entrepreneurship education and the results outlined in Table 6. Whereas 40.9% (n=25) of the business degree respondents intended to further their education, the corresponding figure for the science/ engineering degree respondents was 50% (n=26). Besides, 26.3% (n=16) of the business degree respondents aspire to employment and still engage in business on a part-time basis compared to 32.7% (n=17) of the science/ engineering degree respondents.

What is perhaps the most interesting finding is the number of respondents who gave self-employment as their immediate career intentions and aspirations. Nearly a third, 32.8% (n=20) of the business degree respondents aspire to self-employment compared to 17.3% (n=9) of the science/ engineering degree respondents, which represents a sharp increase from 11.5% and 5.8% respectively for the business degree and the science/ engineering degree respondents before exposure to entrepreneurship programmes. Evidently it appears more of the business degree respondents than the science/ engineering degree counterparts have self-employment as immediate career aspirations. It is little surprising that the more business degree respondents had self-employment career aspirations than their science/ engineering degree counterparts given their academic degree programmes and differential exposure to entrepreneurship programme (structured programme versus ad hoc seminars and workshop).

The indication, however, is that the Ghanaian entrepreneurship programme which aims to provide awareness to the entrepreneurship process and to encourage tertiary students to consider self-employment as a career option appear to have a positive impact on the respondents. It is particularly instructive of the apparent shift and increase in career intentions and aspirations of both the business and science and engineering respondents following exposure to entrepreneurship education; whereas 11.5% of the business degree respondents had career intentions and aspirations in self-employment prior to exposure, after the exposure to an entrepreneurship education, the figure nearly trebled to 32.8%. Similarly whereas only 5.8% of the science/ engineering degree respondents had self-employment career intentions and aspirations prior to exposure to entrepreneurship programme, the figure

rose three times to 17.3% after the entrepreneurship programme. For the entire survey respondents the pre and post entrepreneurship education exposure resulted in a major change and increase in self-employment career aspirations from 8.8% to 25.7%.

### Attitudes Towards Starting Own Business

This section presents information on the attitudes of respondents towards starting a business and the perceived skills to undertake such ventures.

**Table 7: Motivation to Start Own Business**

	Business Degree		Science/ Engineering		Total	
	n	%	n	%	n	%
To a very large extent	34	55.7	20	38.5	54	47.8
To a large extent	17	27.9	17	32.7	34	30.1
To a certain extent	10	16.4	9	17.3	19	16.8
To a small extent	-	-	5	9.6	5	4.4
To no extent	-	-	1	1.9	1	0.9
Total	61	100	52	100	113	100
Weighted Average Score	4.4		4.1		4.2	

The survey respondents were asked to report on a five-point scale the extent to which they felt motivated towards starting own business. Table 7 outlines the results. An overwhelming 83.6% (n=51) of the business degree respondents felt motivated to either a large or a very large extent to start own business with the corresponding figure for the science/ engineering degree respondents a resounding 71.2% (n=37). Interestingly, whereas 11.5% (n=6) of the science/engineering respondents felt a small extent or no motivation at all towards a business start-up, none of the business degree respondents had similar attitude.

Evidently both groups of the respondents felt highly motivated to start own business with a near 10% point higher between the business and the science/ engineering degree respondents. The weighted average score of 4.4 and 4.1 on a five-point scale respectively for the business and the science/ engineering degree respondents confirm the relative levels of motivations. Evidently the entrepreneurship programmes appear to motivate the respondents towards career intentions and aspiration in entrepreneurship. The differential exposure to the entrepreneurship course of both groups is evident from the findings especially from their respective weighted scores (4.4 vs. 4.1).

**Table 8: Do You Have Necessary Skills to Start Own Business?**

	Business Degree		Science/ Engineering		Total	
	n	%	n	%	n	%
Yes	56	91.8	42	80.8	98	86.7
No	5	8.2	10	19.2	15	13.3
Total	61	100	52	100	113	100

In order to explore the effect of entrepreneurship education on students' perceived ability to initiate and develop a new venture, respondents were asked to indicate whether or not they have the necessary skills to start own business. The results are presented in Table 8. An overwhelming 91.8% (n=56) of the business degree respondents affirmed that they possessed the necessary skills to start own business compared to 80.8% (n=42) of the science/ engineering degree respondents. Besides, 19.2% of the science/ engineering degree respondents compared to 8.2% (n=5) of the business degree respondents were of the opinions that they did not have the necessary skills to initiate and develop their own businesses. Evidently, both groups appear confident in their skills to run own business following exposure to entrepreneurship education and initiatives.

**Table 9: Probability of Own Business in Future**

	Business Degree		Science/ Engineering		Total	
	n	%	n	%	n	%
Highly Probable	40	65.6	30	57.7	70	61.9
Probable	19	31.1	15	28.9	34	30.1
Some probability	2	3.3	5	9.6	7	6.2
Improbable	-	-	1	1.9	1	0.9
No probability	-	-	1	1.9	1	0.9
Total	61	100	52	100	113	100
Weighted Average Score	4.6		4.4		4.5	

Continuing further with the investigation, students were asked the probability that they would start own business in future. The results are outlined in Table 9. Interestingly 96.7% (n=59) of the business degree respondents indicated that a future business set-up was either probable or highly probable compared to 86.6% (n=45) of the science/ engineering degree respondents. It is instructive that 92% of the survey respondents perceive future business ownership as probable or highly probable. The finding is revealing as it lends itself to many deductions. It is possible that the reported high predisposition as well as overwhelming perception of desirability of business set-ups is partly attributable to the exposure to entrepreneurship education.

However, it appears socio-cultural environment may also be a factor. Business ownership appears culturally embraced and supported by many irrespective of academic background. Interest in business ownership varies from well-established formal businesses to informal ones including petty trading. Anecdotal evidence reveals that the majority of Ghanaians have been involved in business activities particularly in the informal sector. Children of all ages have been commissioned by their parents and guardians to sell items including foodstuffs and vegetable in most rural Ghana and in some instances in semi-urban areas, while others have been involved in street hawking in urban areas to augment family incomes. At any rate, it appears that it was the wish of the majority of the respondents (92%), including those who

gave career intentions and aspirations other than self-employment, to start own businesses in future. Evidently, a positive relationship appears to exist between exposure to entrepreneurship education and attitude towards business start-ups as the weighted average score of 4.6 and 4.4 respectively for the business degree and the science/ engineering degree respondents on a five-point scale substantiates the finding. It would be interesting to examine the effect of entrepreneurship education on the respondents' perceptions of desirability and feasibility of self-employment.

## Perceptions of Desirability and Feasibility of Self-Employment

This final section examines the respondents' perception of desirability and feasibility of self-employment.

**Table 10: Perceived Barriers to Business Start-ups**

	Business Degree		Science/ Engineering		Total	
	n	%	n	%	n	%
Finance	33	54.1	26	50.0	59	52.2
Business Ideas	6	9.8	2	3.8	8	7.1
How to Explore Business Opportunities	12	19.7	9	17.3	21	18.6
Business & Management Skills	9	14.8	14	26.9	23	20.3
Business Advice	1	1.6	1	1.9	2	1.8
Total	61	100	52	100	113	100

The survey respondents were asked to indicate their perceived barriers to business start-ups and the findings are outlined in Table 10. The majority of the respondents, 52.2% perceived finance as a barrier to business start-ups in Ghana. Thus, whereas 54.1% (n=33) of the business degree respondents perceived finance as a barrier to business start-up, 50.0% (n=26) of the science/ engineering respondents mentioned finance as the main obstacle. Lack of business and management skills was perceived by 26.9% (n=14) of the science/ engineering respondents compared to 14.8% (n=9) of the business degree respondents as a barrier to business start-up and perception. Besides, whereas 19.7% (n=12) of the business degree respondents were of the opinion that a lack of know-how to start business as a barrier to business start-ups, a similar 17.3 % ( n=9) of the science/ engineering degree respondents held similar opinion. Evidently finance appears to represent the greatest barrier to self-employment career option to the majority of the survey respondents. Another revelation about the Ghanaian student finding is the perceived lack of business and management skills where a noticeable over 12% point difference (14.8% vs. 26.9%) between the perceptions of the business degree students and their science/ engineering counterparts.

**Table 11: Effect of Entrepreneurship Education on Business Start-Ups**

	Business Degree		Science/ Engineering		Total	
	n	%	n	%	n	%
Facilitates self-employment career option	20	32.8	9	17.3	29	25.7
Knowledge & skills acquired to own business	9	14.8	12	23.1	21	18.6
Course practicality & indispensability	4	6.6	4	7.7	8	7.1
Exposures to entrepreneurship process	8	13.1	2	3.8	10	8.8
Motivates towards self-employment	14	22.9	11	21.1	25	22.1
Inspires awareness of business opportunities	5	8.2	4	7.7	9	8.0
Self-confidence	1	1.6	3	5.8	4	3.5
Not stated		-	7	13.5	7	6.2
Total	61	100	52	100	113	100

In order to explore further the effect of entrepreneurship education on desirability and feasibility of self-employment, the survey respondents were asked to indicate their perceived effect of entrepreneurship education exposure on business start up. Many and varied reasons were assigned by the respondents and the results are outlined in Table 11. Whereas 32.8% (n=20) of the business degree respondents indicated that the entrepreneurship programme ‘facilitates self-employment career option, a comparable figure for the science/ engineering degree counterparts was only 17.3% (n=9). Interestingly another 22.9% (n=14) of the business degree and 21.1% (n=11) of the science/ engineering degree respondents respectively perceived the programme as motivating them towards self-employment.

What was evident is that motivation towards self-employment was the second most mentioned effect of entrepreneurship education by both groups. Moreover, nearly 15% (14.8% or n=9) of business degree respondents and 23.1% (n=12) of the science/ engineering degree respondents respectively perceived the entrepreneurship course to equip students with knowledge and skills to start own business. Evidently the respondents’ perceptions of the effect of entrepreneurship education on business start-up are both positive and revealing. The other effects of the entrepreneurship education the respondents reported included inspiring awareness of business opportunity, exposure to entrepreneurship process and building self-confidence. Finally respondents’ perceived the entrepreneurship education as practical and indispensable to a business start-up. A deduction from the findings is that entrepreneurship education influences the survey respondents’ perceptions of desirability and feasibility of self-employment. This finding is instructive against the background that entrepreneurship programme in Ghana is relatively recent and taught for a short duration. In addition, the programmes are beset with a many technical problems including few up-to-date

entrepreneurship textbooks, few qualified lecturers and mentors as well as little interaction between students and established entrepreneurs.

## **DISCUSSION AND CONCLUSION**

The resolve to carry out this research evolves from the belief that unemployment and under-employment among Ghanaian graduates from the tertiary educational institutions remain unacceptably high in Ghana and needs redressing. This is due to fewer avenues for job opportunities. It also stems from the belief that tertiary level academic training prepares students for white-collar jobs which are non-existent while self-employment is perceived as a preserve of the illiterate and semi-literate. Entrepreneurship educational programmes are now available at some of the tertiary educational institutions in Ghana as an attempt to reverse the unemployment trend by providing the necessary training in entrepreneurial skills to students to establish and manage their own businesses and to consider self-employment as a career option on completion of their studies. The study is thus borne out of the need to evaluate the outcomes of entrepreneurship education and initiatives recently introduced at the third level educational institutions in Ghana to encourage students to consider self-employment as a career option. The study examines the impact of entrepreneurship education on student career intentions and aspirations at the tertiary level in Ghana. Tentative evidence from the current study suggests that the Ghanaian entrepreneurship education appears to positively influence student career aspirations towards self-employment. This was evident throughout the analysis. For instance, nearly 80% of the entire student survey respondents felt the programme had influenced their career intentions and aspirations to a large or very large extent. Besides, there was a noticeable shift and increase in the respondents' career intentions and aspirations in self-employment from a prior to exposure to entrepreneurship education level of 8.8% to more than a quarter, 25.7% after exposure to entrepreneurship concepts and practices.

The impact of the ad hoc entrepreneurship educational seminars and workshops offered to the science and engineering students was evident throughout the survey findings presented. For instance, when respondents were asked to evaluate the effect of entrepreneurship education on their career intentions and aspirations on a five-point scale whereas the business degree respondents scored 4.4 that of the science/ engineering counterparts was 3.9. Further findings substantiate this position; as more business students' respondents had career aspirations in self-employment than their science/ engineering counterparts (32.8% vs. 17.3%). Again, in all instances more business students reported high motivation towards business set-ups (4.4 vs. 4.1); were more confident in their skills to start own business (91.8% vs. 80.8%); and were more probable to own business in future (4.6 vs. 4.4). It was little surprising that over a quarter (26.9%) of the science and engineering respondents reported compared to 14% of their business degree counterparts reported that they lacked business and management skills to manage own business. It was instructive that though the entrepreneurship education offered to the science and engineering students is unstructured and ad hoc, yet it appears effective in equipping and encouraging the science and engineering respondents to consider self-employment as a career option. Obviously it would be more effective if it is incorporated into the degree programme as available to the business degree respondents.

What appears revealing is the tendency for the respondents to have joint career aspirations of entering into employment and running their own business on part-time basis. The finding was evident among both the business and the science/ engineering students. This finding is unique and may be subjected to many interpretations. In the first place, it appears to suggest reluctance on the part of students to take risk. It could also well be a calculated risk taking strategy through diversification. Apparently, the joint career intentions and aspirations represent a strategy of generating capital to finance not only the part-time business but also for an eventual future 'spin-off' to self-employment. This probably appears more plausible as finance emerged from the study, as well as from observation and anecdotes, as a major barrier to business set-up in Ghana. Finance was perceived by 52.2% of the survey respondents as a barrier to business start-ups in Ghana and this corroborates the earlier empirical findings in the literature (Owusu-Ansah and Fleming, 2001; Owusu-Ansah, 2004). At any rate, this joint career intentions and aspirations require further investigation in Ghana. Besides, the technical and logistics bottlenecks appear to negatively affect the delivery and outcomes of the entrepreneurship programmes as nearly one-fifth of the survey respondents indicated that they lacked business and management skills (20.3% ) and know-how to start their own businesses (18.6% ) after the exposure to the entrepreneurship course. This finding reinforces the anecdotal evidence that the entrepreneurship education in Ghana was beset with many and varied problems ranging from educational material, mentors, organisation and logistics. To ensure that entrepreneurship education achieves its objective fully, efforts must be made to address them.

The survey findings were revealing regarding the respondents' attitude towards business set-up. An overwhelming 77.9% of the survey respondents indicated they were motivated to a large or a very large extent to initiate business start-ups. Indication was also that 86.7% of the survey respondents felt equipped with skills and competencies to initiate and run own business. However, it is the findings from a question on a probability of future businesses start-up that substantiated further respondents' attitude towards business start-ups; 92% of the survey respondents indicated that it was highly probable or probable that they would initiate own business in future. The evidence from the study appears to indicate that an entrepreneurship education is perceived to provide knowledge and skills to business start-up, creates awareness about the existing business opportunities and raises self-confidence and self belief to enter into self-employment. It thus appears to have engendered in the respondents a high perception of desirability and feasibility of business start-up or self-employment, which were hitherto low among graduates from tertiary educational institutions. At any rate, it is obvious that an entrepreneurship education is indispensable in Ghana if the chronic graduate unemployment could be reduced to some extent.

The survey evidence appears to contradict an earlier study (Robertson, 1984) that reported that higher education inhibits entrepreneurship development in Ghana. The prevailing political environment in the late 1970s when Robertson's study was carried out apparently influenced the research findings as Ghana was governed by a military Marxist junta which was anti-capitalist and anti-market economy. In fact, business ownership was discouraged by the then military junta (Armed Forces Revolutionary Council (AFRC) as entrepreneurs were considered as not deserving anything they earn and were considered criminals. A case in point is a prominent Ghanaian industrialist Joshua Siaw who had a tax evasion charge placed on him resulting in a confiscation of his multi-million dollar Brewery Company in 1979 by the then AFRC government. It is now emerged that the industrialist paid all the special and sales

taxes under laws at that time (Ghanaian Chronicle, 2002). There were many entrepreneurs who suffered from the political victimisation of the junta. This probably explains a seeming apathy and reluctance of highly educated individuals at that time from engaging in business start-ups rather than acquired higher education per se.

In conclusion, evidence from the study indicates that entrepreneurship education positively impacts on career intentions and aspirations of the Ghanaian respondents. It also motivates and equips students with the necessary skills and confidence as well as aids in engendering the perceptions of desirability and feasibility of self-employment as a career option. This is reassuring for the budding Ghanaian entrepreneurship education and it appears that the interest, investment and growth is well founded, but it is also obvious that many potential entrepreneurs are being excluded from participation in entrepreneurship educational programmes in Ghana, as they are not available to all tertiary students. It is recommended that the entrepreneurship programmes be offered to all the tertiary undergraduate students in Ghana. Besides, it was evident that the Ghanaian entrepreneurship education requires harmonisation of the curricula offered to the business, science and engineering students as well as improving upon logistics, if the entrepreneurship education could encourage more Ghanaian students to recognise self-employment as a career option. Finally, it is imperative that the duration and intensity of the entrepreneurship education is increased to realise a maximum impact on tertiary students' career intentions and aspirations.

## Key Words:

Entrepreneurship, Personality, Motivation, Marketing, Production, Financial Assistance, Policy

## ABSTRACT

This study deals with the socio-economic profile and the role of entrepreneurship, which has been evaluated mainly on the basis of performance of the entrepreneurs. The study is confined to small scale industries in two major industrialized states of India i.e. Punjab and Haryana. Keeping in view the changing business environment, this study has implications for promotion of industrial entrepreneurship in India. The family background of entrepreneurs influences their occupational choice. The business families supply more entrepreneurs than any other type. The persons from business families are directly or indirectly exposed to family a business which makes them familiar with the business practices. An overall analysis of growth and development of entrepreneurship in India indicates that in the different states, the number of SSI units is increasing manifold. The main aim of this study is to examine the performance, policy perspective of the Government and the problems faced in the promotion of SSI units in the state of Punjab and Haryana.

## INTRODUCTION

In a developing country like India, Small Scale Industries play a significant role in economic development of the country. These industries by and large represent a stage in economic transition from traditional to modern high tech industries. The variation in transitional nature of this process is reflected in the diversity of these industrial units. Besides playing an economic role for the country's economic development, small scale industries also play social and political role in employment creation, balanced regional development and promoting further economic growth.

Development of entrepreneurship in the small scale industry is the only alternative to the problems that need immediate solutions viz., dispersal of industrial activity, cope with the

unemployment problem, a more equitable distribution of the national income and mobilisation of local resources and the capital.

The overall analysis of growth and development of entrepreneurship in India indicates that in the different states, the number of SSI units is increasing manifold. Their contribution in overall production, employment, investment and exports has a multiplier impact on the different sectors. There is a shift in the policy perspective of the Government as to the promotion of entrepreneurship in the country. The risky projects are being promoted and financed by venture funds. With the advent of an era of liberalisation and globalisation, the small-scale entrepreneurs are facing an acute competition. With the coming in force of the WTO agreement on 1.4.2001, the SSI units will have to face the uphill task and the challenge from MNC and other large-scale industries.

The aim of this is to examine the performance, policy perspective of the Government and the problems faced in the promotion of SSI units in the state of Punjab and Haryana. This study will help the policy makers, researchers, Government financial institutions and all those concerned with the development of industrial entrepreneurship in the country to build a policy perspective in this regard.

This region does not enjoy any locational advantage in terms of raw material and markets for most of its industries. The industries, which have developed in recent years, are mostly dependent on outside resources for the supply of materials and the disposal of the output. As far as the disposal of products manufactured by these very industries is concerned, dependence on outside markets is quite substantial. Products in which the region has come to specialise include among others hosiery, textiles, sports goods, bicycle and bicycle parts, hand tools, agricultural implements, machine tools and scientific instruments. A large share of the all India output of most of the products originates in the Punjab and Haryana, Naturally, bulk of this output has to be sold in markets outside two states. The export of these products is also taking place in the states of Punjab and Haryana.

The heavy reliance on outside markets and raw material supplies constitutes a significant feature of the industrialisation process in the region. Like Japan, Punjab did not start with any locational advantage. The engineering industries employ the largest number of persons in the modern small-scale industries. The state is situated far away from the sources of steel and other raw materials. And till late, even the markets for finished products are far away located.

The performance of small-scale industrial units must be judged by the contribution they make to the development of the nation. The growth of SSI units may also be measured in terms of the increased employment, fixed assets, investment, production, turnover, profits, market share, etc. Each of these measures has its own merits and demerits. Irrespective of this, it has not been found possible to gather information on some of these variables in case of SSI units.

## **OBJECTIVES AND RESEARCH METHODOLOGY**

The aim of this study is to examine the performance, policy perspective of the Government and the problems faced in the promotion of SSI units in the state of Punjab and Haryana. The study is based on both the primary and the secondary data. The primary information

has been collected on the basis of questionnaire and the secondary data has been collected from the various government and the company records.

The Growth and Performance of six types of Small Scale Industries has been taken for study i.e. Hosiery, Textile and Handloom, Cycle Parts, Rice Processing Units, Surgical and Scientific Instruments, Hand Tools and Cutting Tools, Sports and Leather Goods in the two states of Punjab and Haryana.

In this study the units with High Growth rate turnover have been identified as those units whose growth is more than 20% on the basis of five years average performance and annual turnover. Those units whose growth was less than 20% on the above mentioned basis have been identified as units with Low Growth rate turnover. Out of total 160 units taken as sample in the two states of Punjab and Haryana, 141 units had provided required information on the basis of which high growth rate and low growth rate units have been identified. Rest 19 units did not provide the required information restricting the researcher to confine his research on this subject to 141 units. A comparative study of these two types of units have been conducted here on the various parameters like organisational and individual factors, personality, motivation, marketing, financial and production performance.

## **ORGANISATIONAL BEHAVIOUR AND INDIVIDUAL FACTORS:**

Organisation is a vehicle through which goals are sought to be achieved in any business enterprise. The organisation of a unit binds the economic activities undertaken by the entrepreneur. The development of an organization is inevitable part of the economic activities of entrepreneurs. The behavioural factors like attitude, personality and motivation behind setting of an entrepreneurial unit are also very important in the growth of any organisation. The individual factors and socio-economic indicators like age, education, religion, prior occupation and business experience also play a role in shaping the destiny of a small enterprise. In this section an analysis of these factors has been carried out in case of high growth and low growth units.

## **FORM OF ORGANIZATION:**

As per Table1, 58 units out of total 141 units have been identified as High Growth rate turnover units and 83 units as Low Growth rate turnover units. Of the 58 high growth turnover units, 29 (50%) units fall under sole proprietorship form of organization, 24 (41.38%) were of partnership nature and only 5 (8.62%) were of private limited form of organization. On the other hand in the low growth turnover categories position was as follows: 17 (20.48%) out of total 83 such units were of sole proprietorship 59 (71.08%) were of partnership and 7(8.43%) were of private limited form of organization. The  $X^2$  for these was 10.640 and 55.036 respectively for two categories of entrepreneurs indicating significant variation. The standard error for various forms of organization was 3.679, 3.527 and 0.040 respectively which indicated significant difference in the case of first two categories while insignificant in the case of third type of entrepreneurs.

X <sup>2</sup>	10.640		55.036		

Source: Compiled on the basis of questionnaire administered to SSI units of Punjab and Haryana.

**TYPE OF UNITS:**

As per Table 2, 16 (27.59%) units out of total 58 units under the first category of high growth turnover were capital intensive and 42 (72.41%) units were of labour intensive nature. In the second category of units i.e. of low growth rate turn over 34 (40.96%) were capital intensive and 49 (59.04%) were labour intensive. The X<sup>2</sup> for the two categories of entrepreneurs was 11.560 and 9.400, which pointed out significant variations in the case of two types of units. The standard error was 1.633 and 1.6333 for two types of units, which does not show any significant difference.

**TABLE 2  
NATURE OF UNIT-WISE PERFORMANCE OF SSI UNITS**

HIGH GROWTH			LOW GROWTH		
	N	%	N	%	SE
Capital Intensive	16	27.59	34	40.96	1.633
Labour Intensive	42	72.41	49	59.04	1.633
X <sup>2</sup>	11.560		9.400		

**AGE GROUP:**

As per Table 3, 6 (10.34%), out of total 58 entrepreneur under the first category were in the age group of 18-30 years, 18 (31.03%) were in the age group of 31-40 years 27 (46.55%) were in the age group of 41-50 years, 6(10.34%) were in the age group of 51-60 and only one entrepreneurs was above 60 years of age. In the second category of entrepreneur under low growth rate turnover, 7 (8.43%), 34(40.96%) 36 (43.37%) 4 (4.82%) and only 2 (2.241%) were in the various age groups as mentioned above respectively. The X<sup>2</sup> for various categories of the entrepreneurs was 14.800 and 68.867 respectively indicating significant variation. The standard error for various age groups was 0.386, 1.203, 0.374, 1.257 and 0.279 respectively which shows no significant difference.

X <sup>2</sup>	14.800		68.867		

Source: Compiled on the basis of questionnaire administered to SSI units of Punjab and Haryana.

**RELIGION:**

As per Table 4, the 44 (75.86%) entrepreneur in the first category of entrepreneurs followed Hindu religion whereas 14 (24.14%) were Sikhs. In the second category 63 (75.90%) were Hindus and 20 (24.10%) were Sikhs. The X<sup>2</sup> was 3.240 and 22.277 respectively for two categories of entrepreneurs, which pointed out significant variations as to the above factors. The standard error was 0.005 and 0.005, which indicated insignificant difference in two categories of entrepreneur.

**EDUCATION:**

As per Table 5, 6 (10.34%), out of total 58 entrepreneurs under high growth rate turnover were under Matric, 4 (6.90%) held Matric certificate, 12 (20.67%) hold ITI/Engg. Diploma, 20 (34.48%) were graduate, 13 (22.41%) were CA/MBA/BE and 3 (5.17%) were postgraduate. The X<sup>2</sup> for this category of entrepreneurs was 40.896 which pointed out significant variation whereas in the second category of entrepreneurs with low growth rate turnover 12 (14.46%) were under matric 3 (3.61%) were matric 8(9.64%) held ITI/Engg.Diploma, 32 (38.55%) were graduate, 20 (24.10%) were CA/MBA/BE with professional qualification and 8 (9.64%) were of post graduate qualification. The X<sup>2</sup> for the second category of entrepreneur was 58.096, which indicated significant variation. The standard error for various variables for the two categories of entrepreneurs was 0.721, 0.885, 2.254, 0.493, 0.233 and 0.974 respectively pointing out insignificant difference in the case of categories at sr. Number 1, 2, 4, 5 and 6 revealed significant difference while for variable at serial Number 3 indicated insignificant variations.

**FATHER'S OCCUPATION:**

As per Table 6, of the 43(74.14%) out of 58 entrepreneurs under high growth category had their own ancestral business, 2 (3.45%) were from agricultural background, 13 (22.41%) were from service background. In the second category of entrepreneur with low growth turnover 59 (71.08%) out of 83 entrepreneurs, had own business, 8(9.64%) were from agricultural background, 11 (9.64%) were from service and 5 (6.02%) were from business and agricultural background. The X<sup>2</sup> for these two categories was 20.600 and 16.700 respectively pointing out significant variation in the two categories of entrepreneurs, while standard error for various categories of occupation was 0.400, 1.409, 2.096 and 1.903 respectively except the service category where the standard error was 2.096, however, no significant difference was found in other categories.

## PRIOR OCCUPATION:

As per Table 7, 32 (55.17%) entrepreneurs in the first category reported that they were unemployed before they took up first venture and 26 (44.83%) replied that they were employed before starting their unit.

In the second category of low growth turnover, 46 (55.42%) entrepreneurs said that they were not employed before establishing the present set up while 37 (44.58%) said that they were in job before they started the present business. The  $X^2$  for two categories of entrepreneurs was 0.400 and 0.976 respectively showing insignificant variation. The standard error for their previous occupation was 0.029 and 0.029, which indicates that there was no significant difference.

**TABLE 7**  
**PRIOR OCCUPATION OF THE ENTREPRENEURS**

HIGH GROWTH			LOW GROWTH		
	N	%	N	%	SE
No	32	55.17	46	55.42	0.029
Yes	26	44.83	37	44.58	0.029
$X^2$	0.040		0.976		

## PERSONALITY FACTORS:

As per Table 8, the 11 (18.97%) entrepreneurs under the high growth turnover stated that they did not have any firm plan to start their own enterprise whereas 47 (81.03%) entrepreneurs under same category replied in positive as they had firm plan for starting their own unit. In the second category of low growth rate turnover 26 (31.33%) entrepreneurs replied in negative and 57 (69.67%) said they had firm plan to establish their own units since childhood. The  $X^2$  for these two categories was 9.000 and 11.578 respectively which pointed out significant variation in both the categories of entrepreneurs. The standard error for their firm plan was 1.641 and 1.641 respectively again indicating no significant difference.

## PERSONALITY FACTORS: FIRM PLAN SINCE CHILDHOOD

As per Table 9, risk-taking ability is the essential feature of entrepreneurship. The information collected in this regard indicated that 10 (17.24%) entrepreneurs under high growth rate turnover stated that they did not take any risk while establishing their set ups

whereas 48 (82.76%) revealed that they took risk in the setting up their ventures. On the other hand 30 (36.14%) entrepreneurs of low growth rate turnover explained that they did not take any risk while 53 (63.86%) entrepreneurs stated that they took risk to establish their sets up. The  $X^2$  for these two categories of entrepreneurs was 14.440 and 6.373 respectively pointing out significant variation. The standard error was found to be 2.450 and 2.450 respectively, which again indicated significant difference.

### **PERSONALITY FACTORS: COURAGE AND OPTIMISM**

As per Table10, the 58 entrepreneurs under high growth turnover, stated that they did not have any courage and optimism for starting their ventures, whereas 44 (75.86%) replied in positive as they had enough courage and were optimistic as to their set-ups.

In the second category out of 83 entrepreneurs, 13 (15.66%) replied in negative as they did not have any courage/optimism for starting the present business while 70 (84.34%) entrepreneurs under the same category stated that they have all courage and were optimistic about establishing their units. The  $X^2$  was 3.240 and 39.145 respectively showing significant variations in the two categories of entrepreneurs. The standard error was 1.259 and 1.259, which pointed out no significant difference.

### **PERSONALITY FACTORS: CAREFUL SCRUTINY AND PLANNING**

As per Table 11, out of total 58 entrepreneurs under the first category of high growth turnover, 13 (22.41%) stated that they did not go for careful scrutiny and planning in order to establish their set ups while 45 (77.59%) replied that they had gone for careful scrutiny and planning before setting up their establishments.

On the other hand 14 (16.87%) entrepreneurs out of the total 83 under the second category stated that they did not go for careful scrutiny and planning for the establishment of their plants whereas rest of 69 (83.13%) entrepreneurs under the same category replied in positive. The  $X^2$  for two categories of entrepreneurs was 36.446 and 40.346, which indicated significant variation of the two categories of entrepreneurs. The standard error was 0.823 and 0.823, which indicated no significant difference.

### **RESTLESS URGE TO CREATE SOMETHING NEW:**

As per Table12, the 7 (12.07%) entrepreneurs with high growth turnover stated that they did not have any restless urge to create something new, while 51 (87.93%) entrepreneurs under the same category said they had restless urge for creating some thing new. The 9 (10.84%) entrepreneurs with low growth rate turnover stated that they did not have any urge to create something new while 74 (89.16%) entrepreneurs said that they had urge for creating something new. The  $X^2$  for these categories of entrepreneurs was 11.560 and 17.653, which indicated significant variation as to the two categories of entrepreneurs. The standard error in this regard was 0.227 and 0.227 respectively which shows no significant difference.

### **MOTIVATION FACTORS – URGE TO DO INDEPENDENT JOB:**

As per Table13, the 14 (24.14%) entrepreneurs under the first category with high growth rate turnover stated that they did not have any urge for doing independent job while 44 (75.88%) stated that they had strong urge for doing an independent job. Besides, 32 (38.55%) entrepreneurs with low growth rate turnover stated that they never had any urge for doing an independent job while 51 (61.45%) replied in positive as they had strong urge for some independent work. The  $X^2$  for these two categories of entrepreneur was 14.440

and 4.349 respectively pointing out significant variations in the case of both the types of entrepreneurs on this aspect of urge to do some independent job and standard error was 1.796 and 1.796 respectively which shows no significant difference as to the above factors.

**MOTIVATION FACTORS – BUSINESS EXPERIENCE IN THE SAME LINE:**

As per Table 14, the 20 (34.48%) entrepreneurs under the high growth turnover stated that they were not motivated to establish the present unit due to business experience in the same line and 38 (65.52%) entrepreneurs under the same category replied in positive as they were motivated due to their previous experience in the same business line.

In the second category of entrepreneurs with low growth rate turnover, 30 (36.14%) replied in negative while 53 (63.86%) stated that they were motivated to establish their own units due to the fact that they had previous experience in the same business line. The X<sup>2</sup> was 0.040 and 6.373 respectively as to the two categories of entrepreneurs showing significant variations in the case of second category of entrepreneur on the above factor whereas the standard error was 0.203 and 0.203 respectively which indicated no significant difference.

**MANAGEMENT OF UNIT BY SELF OR BY OUTSIDE MANAGERS:**

As per Table 15, in the first category of entrepreneurs only 4(6.90%) stated that their units were managed by employed Managers whereas 54(93.10%) entrepreneurs under the same category stated that they were managing their units themselves. On the other hand in the second category of entrepreneurs, only 2(2.41%) units were managed by Managers while 81(97.59%) units were managed by the entrepreneurs themselves. The X<sup>2</sup> for two categories of entrepreneurs was 68.390 and 75.193 as to the stated factor indicating

significant variation. The standard error was 1.300 and 1.300, which indicated no significant difference.

### **MARKETING MANAGEMENT:**

The products are produced by the SSI units for sale in the different markets. The same amount of skill is desired in marketing of an article as in the choice of a product. Hence marketing is another criterion of measuring the performance of entrepreneurs. The products of SSI sector are sold to various Government outlets and Private outlets. Besides this, the other important areas for SSI units are fixation of prices, product standardization, and adoption of quality mark, marketing research and sales promotion in order to market the products. In this section an analysis of marketing functions has been discussed in case of high growth and low growth units.

### **PRODUCT STANDARDIZATION:**

A question was asked to the respondent about the standardization of products. As per Table 16, out of total 58 entrepreneurs under the first category of entrepreneur under high growth rate turnover, 14 (24.14%) stated that their products were not standardised, whereas 44(75.86%) entrepreneurs replied in positive as their products were standardised. In the second category of entrepreneurs under the low growth rate turnover, 23 (27.71%) replied in negative and 60 (72.29%) replied in positive as they said their products were standardised. The X<sup>2</sup> was 1.960 and 16.494 respectively showing significant variation for the second category of entrepreneurs. The standard error was 0.474 and 0.474 respectively for two variables, which shows no significant difference.

## INTRODUCTION OF NEW PRODUCTS:

A survey was conducted to know about the future plans as to the introduction of the new products. As per Table 17, the 19 (32.76%) entrepreneur under first category of high growth turnover revealed that they did not have any future plan as to the introduction of new products while 39 (67.24%) entrepreneurs stated that they had firm future plan for the introduction of new products. In the second category out of total 83 entrepreneurs, 39 (46.99%) replied in negative while 44 (53.01%) replied in positive as they had firm plan for the introduction of new products. The  $X^2$  was 10.696 and 12.832 of the two categories of entrepreneurs indicating significant variation. The standard error was 1.690 and 1.690, which indicated no significant difference on the issue of introduction of new products.

## CHANGE IN MARKETING ARRANGEMENTS:

A survey was conducted to know about the marketing arrangement made by the entrepreneurs. As per Table 18, the 24 (41.38%) entrepreneurs under the first category stated that they did not change their marketing arrangements while 34 (58.62%) entrepreneurs under the same category pointed out that they brought changes in their marketing system. In the second category, 40 (48.19%) entrepreneurs stated that they were not able to bring any change in marketing arrangements, while 43 (51.81%) replied in positive as they had brought changes in their marketing system. The  $X^2$  was 1.960 and 1.250 indicating insignificant variation whereas standard error was 0.799 and 0.799, which indicated no significant difference in the two categories of entrepreneurs on this issue.

## **CUSTOMERS SATISFACTION AS TO THE QUALITY OF THE PRODUCTS:**

A survey was undertaken to know about the satisfaction level of customers. As per Table 19, the 1 (1.72%) entrepreneur under the first category stated that the consumers were not satisfied with the quality of products whereas 57 (98.28%) entrepreneurs under the same category claimed that the consumers were highly satisfied with the quality of products produced by them. In the second category, 6 (7.24%) entrepreneurs informed that their customers were not satisfied with the quality of products whereas 77 (92.77%) replied in positive as their customers were satisfied as to the quality. The  $X^2$  was 9.000 and 60.735 indicating significant variation in the two categories of entrepreneurs whereas standard error was 1.482 and 1.482 respectively which shows no significant difference.

## **EFFECTIVENESS OF MARKETING RESEARCH:**

Respondents were directly approached to know about the role of marketing research. As per Table 20, the 8 (13.79%) entrepreneurs under first category with high growth turnover stated that marketing research was not helpful or effective in the determination of quality of the products whereas 50 (86.21%) entrepreneurs were of the views that marketing research was highly effective and helpful for quality determination of the products. In the other category of low growth rate turnover, 16 (20.48%) entrepreneurs were of the opinion that marketing research was not effective for determining the quality of the product while 67 (79.52%) gave positive opinion on the issue. The  $X^2$  was 6.760 and 4.800 showing significant variations while standard error was 1.024 and 1.024 respectively showing no significant difference.

## PRICING POLICY:

Whether the entrepreneurs follow the market price or they themselves fix the prices of their products, a question was asked in this regard. As per Table 21, the 16 (27.59%) entrepreneurs under the first category stated that they did not follow market price for the fixation of prices of their products while 42 (72.41%) entrepreneurs under the same category were of the views that they were fixing prices of their products on the basis of prevailing market price. In the second category, 77 (92.77%) entrepreneurs stated that they did not follow market price for the fixation of prices of their products whereas 6 (7.23%) entrepreneurs replied that they always considered market prices as guiding factor for the fixation of prices of their products. The  $X^2$  for the two categories of entrepreneurs was 1.000 and 10.133 respectively while standard error was 0.627 and 0.627 respectively which shows no significant difference.

## ADOPTION OF SALES PROMOTION TECHNIQUES:

To know about the sales promotion techniques adopted by the SSI units, a question was asked to the respondents in this regard. As per Table 22, the 30(51.72%) entrepreneurs under the first category stated that they did not adopt any sales promotion technique for selling their products whereas 28(48.28%) entrepreneurs under the same category claimed that they have been adopting sales promotion techniques for the above purpose. On the other side, 47(56.63%) entrepreneurs under the second category with low growth rate turnover revealed that they had not used any sales promotion techniques while 36(43.37%) said they had always used various sales promotion techniques for selling their products. The  $X^2$  for the two categories of entrepreneurs was 0.360 and 1.458 respectively showing insignificant variation whereas standard error was 0.576 and 0.576, which indicated no significant difference.

## HEAVY DEMAND FOR THE PRODUCT

Whether heavy demand for the products was a motivating factor, a question was asked in this regard to the entrepreneurs of SSI units. As per Table 23, the 13 (22.41%) entrepreneurs under the high growth rate turnover category said that they were not motivated due to heavy demand of the product while 45 (77.59%) replied in positive as they were motivated due to heavy demand of the products. In the second category of entrepreneurs under low growth rate turnover category, 23 (27.71%) entrepreneurs stated they were not motivated for producing a particular product due to its heavy demand whereas 60 (72.29%) entrepreneurs said that they were motivated to produce a particular product due to its heavy demand. The  $X^2$  was 40.892 and 16.494 indicating significant variation.

Yes	43	76.79	60	72.29	0.710
$X^2$	40.892		16.494		

## HIGH PROFIT MARGIN:

Whether the entrepreneur was motivated by high profit margin, a question was asked to the respondent. As per Table 24, out of 58 entrepreneurs under the first category 17 (29.31%) replied that they were not motivated to establish their own units due to high profit margin factor while 41 (70.69%) stated that they were highly motivated due to this factor. The 41 (49.40%) entrepreneurs under the second category replied in negative while 42 (50.60%) replied in positive as they were motivated by high profit margin factor. The  $X^2$  was 1.000 and 0.400 indicating insignificant variation whereas standard error was 2.386 and 2.386 respectively which indicated significance difference in the two categories of entrepreneurs on this particular aspect.

## PRODUCTION MANAGEMENT:

The Production management includes the function of production planning and control. The transformation of raw material into finished goods in a shortest period of time has been an important function of an entrepreneur. The management of productive activity is

the process which includes the different facets of the development of entrepreneurship. The expansion, modernization, diversification and optimum capacity utilization lead to the growth of an organisation. What is the role of above factors in the growth and performance of SSI units has been examined here in detail.

### EXPANSION OF THE UNITS:

To know about the state of expansion, respondents were contacted in this regard. As per Table 25, the 5 (8.62%) entrepreneurs under the first category replied that they did not expand their units due to various reasons whereas 53 (91.38%) entrepreneurs stated that they expanded their units since their inception. On the other hand 16 (19.28%) entrepreneurs under the second category stated that they did not expand their units whereas 67 (80.72%) claimed they were able to expand their units. The  $X^2$  was 39.440 and 31.337, which indicated significant variations as to the above factor while standard error was 1.749 and 1.749 respectively which indicates no significant difference in the two categories of entrepreneurs on this particular aspect.

### EFFECTIVENESS OF EXPANSION:

As per Table 26, the 1 (1.72%) entrepreneur under the first category replied that expansion was not effective, 52 (89.66%) revealed that the expansion was effective while 5 (8.62%) entrepreneurs did not reply on this issue. In the second category, out of 83 entrepreneurs 3 (3.61%) stated that the expansion was not effective whereas 64 (77.11%) entrepreneurs replied in positive, while 16 (19.28%) did not say anything on this issue. The  $X^2$  was 9.800 and 55.537 respectively for the two categories of entrepreneurs indicating significant variations in both the categories of entrepreneurs. The standard error was 0.666 and 1.920 respectively which indicated no significant difference in the two variables.

### **EXPANSION/DIVERSIFICATION MADE AND INSTALLATION OF IMPROVED MACHINERY:**

What was the mode of expansion, a question was asked and as per Table 27, the 6 (10.34%) entrepreneurs under the first category pointed out that neither they have expanded/diversified nor they have installed any improved machinery, 51 (87.93%) replied in positive as they had diversified and installed improved machinery 1 (1.72%) entrepreneur did not respond on this issue. On the other side, 7 (8.43%) entrepreneurs under the second category stated that they have not diversified or installed any improved machinery while 61 (73.49%) stated that they were able to install new/improved machinery and also diversify their activities. The 15 (18.07%) entrepreneurs did not reply on the issue. The  $X^2$  was 38.692 and 42.882 indicated significant variations. The standard error was 0.386 and 2.087 showing insignificant difference as to the first category and significant as to the second category.

### **REASONS OF UNDER-UTILIZATION OF CAPACITY:**

What were the reasons for under-utilization of capacity, a question was asked in this regard. As per Table 28, the 8 (13.74%) entrepreneurs under the first category did not have any problem as far as full capacity utilization of the plant was concerned, 3 (5.17%) entrepreneurs of the same category said that under utilization was due to finance and power problem, 7 (12.07%) stated that it was because of marketing and power problems, 9 (15.52%) attributed it to labour and power problem, 13 (22.41%) revealed that under-utilization was due to recession, 2 (3.45%) stated that it was because of labour/raw material problem and 16 (27.59%) did not reply on this issue.

In the second category of entrepreneurs under the low growth rate turnover, 18 (21.69%) entrepreneurs did not have any problem as to full utilization of plant capacity. The 18 (21.69%) respondents stated that the capacity of the plant was underutilized due to finance and power problems, 10 (12.05%) respondents pointed out that it was due to marketing and power problems, 12 (14.46%) replied that under-utilization was due to labour/power problem, 6 (7.23%) revealed it was due to recession, 8 (9.64%) of them pointed out that under-utilization was because of labour/raw material and 11 (13.25%)

entrepreneurs did not reply on the subject. The  $X^2$  was 3.000 and 10.667 respectively for two categories of entrepreneurs showing significant variation whereas standard error was 1.190, 2.711, 0.004, 0.174, 2.598 and 2.598 respectively. The standard error at Serial Number 2, 5 and 6 shows significant difference and at serial Number 1, 3, 4 indicated insignificant difference.

### **FUTURE PLAN AS TO EXPANSION:**

To know about the expansion plan, a question was asked to survey respondents and as per Table 29, out of 58 entrepreneurs under the first category, 16 (27.59%) respondents stated that they did not have any future plan for expansion of their plants while 42 (72.41%) replied in positive as they pointed out that they had plan for the expansion of their plants. In the second category of entrepreneur under the low growth rate turnover 28 (33.73%) entrepreneurs replied in negative, while 55 (66.27%) replied in positive as they had firm plans for expansion of their units. The  $X^2$  was 1.000 and 8.783 respectively for two categories of entrepreneurs pointing out significant variation in the second category of entrepreneurs whereas standard error was 0.774 and 0.774, which shows no significant difference in the two categories of entrepreneurs on this issue.

## **POLICY PERSPECTIVE AND THE ATTITUDE OF GOVERNMENT AGENCIES TOWARDS THE SSI UNITS:**

The supply of entrepreneurs is a function of the right type of industrial climate provided by the various promotional institutions and the Government policy frame work. The Government incentives in the forms of tax exemptions provision of infrastructure in the form of Industrial sheds, cheap power etc. also play an important role in giving a boost to the SSI units. The attitude of Government agencies is also an important consideration in the growth and performance of SSI units. An attempt has been made here to know about the perception of the entrepreneurs as to the Government Policy and support systems for SSI units.

## **GOVERNMENT ATTITUDE TOWARDS PROMOTION OF SMALL SCALE UNITS:**

As per Table 30, the 55 (94.83%) entrepreneurs with high growth rate turnover stated that they were not motivated to establish their own units due to Government attitude/policy, whereas only 3 (5.17%) entrepreneurs were motivated due to Government attitude and policies. On the other side 82 (98.80%) entrepreneurs under the second category stated that they were not motivated due to Government policies while 1 (1.20%) entrepreneur stated that he was motivated by Government attitude/policies. The  $X^2$  was 17.640 and 23.695 showing significant variation for the two categories of entrepreneurs on the said aspect while standard error was 1.398 and 1.398 respectively which shows no significant difference.

## **ALLOTMENT OF INDUSTRIAL SHEDS:**

As per Table 31, out of 58 entrepreneurs under high growth rate turnover, 45 (77.59%) of them replied that they were not motivated and were not allotted any industrial sheds for establishing their own units while 13 (22.41%) of them stated that they were allotted industrial sheds and were motivated for starting their own units. In the second category of entrepreneurs of low growth rate turnover 72 (86.75%) replied in negative and 11 (13.25%) replied in positive. The  $X^2$  was 9.000 and 44.831 respectively for two categories of entrepreneurs pointing out significant variations on the factor mentioned above. The standard error was 1.424 and 1.424 respectively which indicated no significant difference.

**ATTITUDE AND FUNCTIONING OF GOVERNMENT AGENCIES:  
5.3.4.3**

As per Table 32, the 22(37.93%) entrepreneurs under the first category stated that the attitude of Government agencies was encouraging, 28(48.28%) of them stated that it was discouraging while 8(13.79%) replied that it was indifferent. In the second category 33(39.76%) entrepreneurs said the attitude of Government agencies was encouraging, 34(40.96%) stated the attitude was discouraging and 16 (19.28%) claimed the attitude was indifferent. The X<sup>2</sup> was 0.080 and 7.398 respectively which pointed out an insignificant difference for the first category and the significant variation as to the second category. The standard error was 0.219, 0.862 and 0.956 respectively which indicated no significant difference.

**LABOUR MANAGEMENT IN SSI UNITS:**

In India, small-scale industries adopt labour intensive technology. The growth and expansion of production capacity depends on the careful selection of personnel and the

optimum utilization of work force. Wherever the labour content is high some discontent is also found among the work force. The SSI units face the problems from Labour side and which has a bearing on the performance of any organisation, hence it is of great interest to point out the causes of labour trouble and methods being employed to solve their problems. In the case of high growth and low growth unit a modest attempt has been made in this regard.

### The Reasons of labour problems faced by SSI units:

To know about the causes of labour problems faced by SSI units, a question was asked to the respondents in this connection. As per Table33, 51(87.93%) entrepreneurs under the first category stated that they did not have any labour problem while 1(1.72%) entrepreneur faced labour problems due to finance, 2(3.45%) of them had it due to retrenchment, 1(1.72%) stated that it was due to salary advance, 3(5.17%) respondents stated that it was due to absenteeism. On the other side in the second category of entrepreneurs, 70(84.34%) did not have any labour problems, 2(2.41%) of them had it due to shortage of funds, 7(8.43%) of them had it due to retrenchment, 2(2.41%) said that it was due to salary advance and 2(2.41%) due to absenteeism. The  $X^2$  was 38.720 and 40.750 for the two categories of entrepreneurs, which indicated a significant variation while standard error was 0.601, 0.279, 1.191, 0.279, and 0.872 and in no case there was any significant difference.

### METHODS OF SOLVING LABOUR PROBLEMS:

To know about the methods of solving the labour problems, a question on this issue was raised to surveyed respondents. As per Table34, 2(3.45%) entrepreneurs did not have any labour problem in the first category, 47(81.03%) solve their labour problems through arbitration, 6(10.34%) entrepreneurs stated that it was through courts, 1(1.72%) of them pointed out that it was through trade unions, 1(1.72%) of them stated that they solved it through other methods and 1(1.72%) of them was of the view that they solve it through arbitration and courts. In the second category of entrepreneurs 6(7.23%) respondents did not have any labour problems, 55(66.27%) respondents have been solving their labour problems through arbitration, 9(10.84%) of them took the help of courts, 2(2.41%) of them

solved it through trade unions, 5(6.02%) respondents took the help of other methods, 5(6.02%) of them solved it through arbitration and court and only 1(1.20%) respondents used to solve it through courts and trade unions. The  $X^2$  was 21.160 and 186.627 respectively shows significant variation. The standard error was 0.955, 1.928, 0.095, 0.279, 1.245, 1.245 and 0.837, which show insignificant difference as to the above factor in the two categories of entrepreneurs.

### **FINANCIAL MANAGEMENT:**

The surplus cash and inadequacy of the financial resources hampers the smooth working of SSI units. The Financial management is a function of procurement of funds and effective deployment of funds. The SSI units largely rely on the friends, relatives/family's members for the starting of the enterprise and later on they try to obtain loans from banks and other financial institutions. The adequacy and timely availability of loans from the Banks and Financial Institutions help in smooth running of their enterprises. An attempt has been made here to examine the performance of high/low growth units and the perception of the entrepreneurs in this regard has been noted down.

### **FINANCIAL ASSISTANCE RECEIVED FROM PARENTS:**

To know about the financial support rendered by the parents of the entrepreneurs in establishing their units, a survey was conducted. As per Table 35, the 4 (6.90%) entrepreneurs under the first category stated that they did not receive any help from their parents, while 54 (93.10%) of them under the same category replied in positive as their parents were highly helpful to them financially at the time of setting up of their units.

In the second category out of total 83 entrepreneurs 5 (6.02) revealed that they did not receive any financial help from their parents, while 78 (93.98%) of them replied in positive as they had received sufficient financial help from their parents for establishing their units. The  $X^2$  was 64.205 and 64.205 indicating significant variations in the second categories of entrepreneurs whereas standard error was 0.210 and 0.210 respectively which shows no significant difference.

**FINANCIAL HELP RECEIVED FROM FAMILY MEMBERS AND RELATIVES:**

As per Table36, the 21 (36.21%) entrepreneurs under the first category of entrepreneurs stated that they did not receive any financial help from their families and other relatives whereas 37 (63.79%) entrepreneurs replied in positive as they received sufficient financial help from their relatives as well as family members.

The 54 (65.06%) entrepreneurs under the second category stated that they did not receive any financial help from their family members while 29 (34.94%) of them stated that their family members were quite helpful to them. The X<sup>2</sup> was 0.040, which shows insignificant variation.

**HELP RECEIVED FROM FRIENDS:**

As per Table37, the 36 (62.07%) entrepreneurs out of total 58 entrepreneurs under the first category stated that they did not receive any financial help from their friends while 22 (37.93%) entrepreneurs under the same category replied in positive as their friends were financially helpful to them. In the second category 46 (55.42%) replied in negative while 37 (44.58%) received help from their friends. The X<sup>2</sup> for the two categories was 1.960 and 0.976 respectively showing insignificant variations and standard error was 0.788 and 0.788 respectively which indicates no significant difference.

**AVAILABILITY OF LOAN IN TIME:**

As per Table38, 38 (22.41%) entrepreneurs stated that the required loans was not made available to them in time while 45 (77.59%) entrepreneur under the same category replied in positive as their loans was made available to them in time. In the second category, 22 (26.51%) entrepreneurs replied in negative whereas 61 (73.49%) entrepreneurs said that the loan was made available to them in time. The X<sup>2</sup> was 11.560 and 18.325 respectively pointing out significant variation in the two categories of entrepreneurs and standard error was 0.555 which indicated insignificant difference.

**ATTITUDE OF FINANCIAL AGENCIES:**

To know about the attitude of financial agencies a question was asked to the respondent. As per Table39, the 44 (75.86%) entrepreneurs under first category claimed that the attitude of financial agencies was quite helpful, 11 (18.97%) stated the attitude was indifferent and 3 (5.17%) said that the attitude was not forthcoming. In the second category of entrepreneurs 60 (72.29%) said that the attitude of the financial agencies was helpful, 17 (20.48%) stated it was indifferent and 6 (7.23%) said the attitude was not forthcoming. The X<sup>2</sup> was 58.867 indicating significant variation in the case of second category of entrepreneurs while standard error was 0.474, 0.221 and 0.492 respectively which shows no significant difference

## CONCLUSIONS:

To sum up an overall analysis of growth of small scale industries under study point out that the various industries viz. Hosiery, Handlooms and Textiles, Sports Goods, Surgical and Scientific Instruments, Cycle and Cycle parts, Rice Processing Units and Cutting and Hand tools product, industry has experienced formidable growth during the five years period under study. The classification of industries under more than one crore annual turnover and less than one crore annual turnover and High Growth vs. Low Growth point out that entire production of SSI units suffers from lack of various managerial problems. An analysis of marketing performance of SSI units indicates that SSI units suffer from lack of marketing culture and lack of any scientific marketing practice to be employed for marketing of the products. The financial management indicates that these units suffer from lack of finance and heavy overhead burden leading to the resource crunch. The Research and Development activities in case of SSI units have been nil. On the whole SSI units in Punjab and Haryana hardly employ any suitable management technique in scientific management of the units. The glaring lapses observed in their functioning outweigh their achievements. There is a need to adopt strategic management approach to the management of SSI units in Punjab and Haryana.

# THE PROXIMITY LAW OF SMALL BUSINESS MANAGEMENT: BETWEEN CLOSENESS AND CLOSURE

Olivier TORRES  
Assistant professor University of Montpellier  
Associated researcher E.M. LYON

*“A small business is not a little big business”* This is almost certainly the most commonly quoted sentence in introductory chapters to books and articles on the management of SMEs. Over time, the postulate of the SME as an entity governed by specific laws of management has established itself as a genuine paradigm structuring research in the field, giving legitimacy to the creation of scientific journals and research associations like the ICSB (*International Council for Small Business*) in the English-speaking world or the AIREPME (*Association Internationale de Recherche en Entrepreneuriat et PME*, International Association for Research in Entrepreneurship and SMEs) in French-speaking countries.

This theory of the specificity of SMEs has now been widely accepted. It nevertheless has one major drawback. It does not precisely define the specificity of SMEs. If SMEs are specific, it must also be admitted that large companies are, too. Using the same term, *specificity*, to define two such fundamentally different realities is clearly unsatisfactory. The two types of specificity thus need to be qualified and given a more precise term.

The theory that we put forward is that the specificity of the management of SMEs is proximity. We use the term *proximity* as an ambivalent concept that refers us to both what unites us and brings us together (*closeness*), as well as what shuts us in and isolates us (*closure*). Proximity refers to the classic concepts of family<sup>1</sup>, friendship and neighbours, as well as to more modern concepts such as “link” and “social capital”. All these concepts have the particularity of revealing the same ambivalence between closeness and closure.

As regards *family proximity*, Bridge, O'Neill and Cromie (1998:129) note that a “family business can produce a permanent, solid family atmosphere and *esprit de corps*, which can often encourage both a closeness among staff and long-lasting relationships with customers, suppliers and other contacts”. The family can also, however, become a very closed circle and the source of clan-like management techniques, particularly in terms of human resource management (giving positions of responsibility exclusively to members of the family) or of setting objectives (a refusal to accept growth as a means of maintaining family control of the business). Denieul (1992) mentions this type of phenomenon several times. The family business is often seen as “the universe of continuity, certitude and trust, as opposed to the faceless company which is exposed to the dangers of chance and subjected to the unpredictable decisions made by associates”: “If he is not a member of your family, you can expect him to be capable of doing anything to you, good or bad. A

---

<sup>1</sup> It should be noted that originally the word proximity, from the Latin *proximitas* and *proximus*, was used in the 15<sup>th</sup> and 16<sup>th</sup> centuries in its legal meaning of family relations in deeds of inheritance (Le Boulch, 2001).

member of your family will try to do his best and to develop, with all the benefits coming back to the family, through my sister's children. The metaphor of the closed circuit ("will come back") and autonomy sanctioned by being a member of the family structure should be noted". Once again, this is the closeness/closure ambivalence.

The same can be said for friendship. Firstly, "sociologists have especially noted that the value of friendship increases as the closeness of the family declines" (Bell, 1981 in Yager, 1998). This means that friendship is a strong link for proximity that can sometimes replace family ties. But this friendship can also become a form of exclusion and closure. "The two-person nature of the Great Friend Approach is implicit. So all-encompassing and exclusive a relationship would be hard to sustain in a three-way (triad) or a group (network) setting. Such an idealized and intimate friendship thus cancels out other friends or friendships. The Great Friend relationship is hence as exclusive and as binding emotionally as marriage is legally" (Yager, 1998). Friendship is a type of proximity that can insidiously become a form of exclusivity.

As regards neighbours, a neighbour is someone who occupies the closest place, someone at a relatively short distance and someone we frequent. But in legal terms, a neighbourhood is often understood to be a place of potential nuisance and disorder. A neighbour is thus also someone who can disrupt daily life, someone with whom we are in disagreement and someone separated from us by some kind of enclosure. The term neighbourhood thus also refers to the ambiguity of proximity, between closeness and closure.

The concepts of links and social capital are more recent. They both have their foundations in sociology (Granovetter, 1973; Bourdieu, 1980). Regarding links, although many authors have highlighted their function as a means of making contact (*the link that links*), it is also important to note the negative dimension of the *link that binds*<sup>2</sup> (Laplantine, 2003), sometimes until there is total suffocation (Poussin, 2003). This ambivalence can also be seen in terms such as *bound*, giving "*bound up with*", meaning *connected* or *linked to*, as well as *boundary*, meaning a limitation. Similarly, although *bond* is a synonym for *link*, it also suggests *bondage* (slavery and submission).

The same can be said for social capital, which Bourdieu defines as "the sum of the resources, actual or virtual, that accrue to an individual or a group by virtue of possessing a durable network of more or less institutionalized relationships of mutual acquaintance and recognition". Although social capital is often seen to be a strength, it can also be a weakness, especially when it leads to phenomena of withdrawal and imprisonment. The title of the article by Grabher (1993), written to contrast that of Granovetter, "The weakness of strong ties: the lock-in of regional development in the Ruhr Area" is quite explicit on this subject. This article "describe the troublesome attempts to transform the close interfirm linkages into loosely coupled networks" (Grabher, 1993: 256). He identifies a threefold "lock-in" of regional development : functional lock-in, cognitive lock-in, political lock-in. If the

---

<sup>2</sup> According to Laplantine (2003: 186): "The French language of the 12<sup>th</sup> century used the word "lien" to designate a *lead* (for a dog) and, a little later, in the Gascon language, the term meant *chain*". It is thus easy to understand a "link" is something that links, but also something that ties. Once again, this is the ambivalence of proximity.

social capital is too strong, it can even lead to *corporatiste*<sup>3</sup> phenomena as we have shown in the Californian Mondavi's failure to set up his business in the small village of Aniane in France (Torrès, 2004). "The relation between positive and "negative" social capital can be viewed in a similar light. Capital (except financial capital) is timebound. The social capital of groups and regions that is considered negative from society's standpoint came into being once upon a time as a rational solution intended to safeguard and strengthen the group's interests (...) By creating strong networks, actors/groups have shut others out from the resources and markets to which they have access" (Westlund and Bolton, 2003: 81). All these concepts reveal the ambivalence of the concept of proximity.

Of all the works on proximity, the psychology of space described by Moles and Rohmer (1978) gives an ideal summary of this ambiguity by introducing two concepts, that of proxemics<sup>4</sup> and that of partition. They propose a subjective and "egocentered" conception of space which corresponds to the "Here and Now" point of view of the individual in a given situation (living space), perceived as being the centre of the world: "Me, Here and Now, I am the centre of the world and everything is organised in relation to me in a discovery that is a function of my audacity. A world that is focused on Me is only peopled with beings and events to the extent that I perceive them. This is what is known as proxemics, with the importance of beings, things and events necessarily diminishing with distance to the extent that their perception itself diminishes" (Moles and Rohmer, 1978).

This is how Abraham Moles and Elisabeth Rohmer define the notion of proxemics. According to them, "fundamentally and axiomatically, what is close is more important than what is far, all things being equal, be it an event, an object, a phenomenon or a being." (Fig 1-a). The Law of proxemics appears as a principle of organisation that creates a hierarchy in the degree of importance of the actions and reflections of the individual<sup>5</sup>.

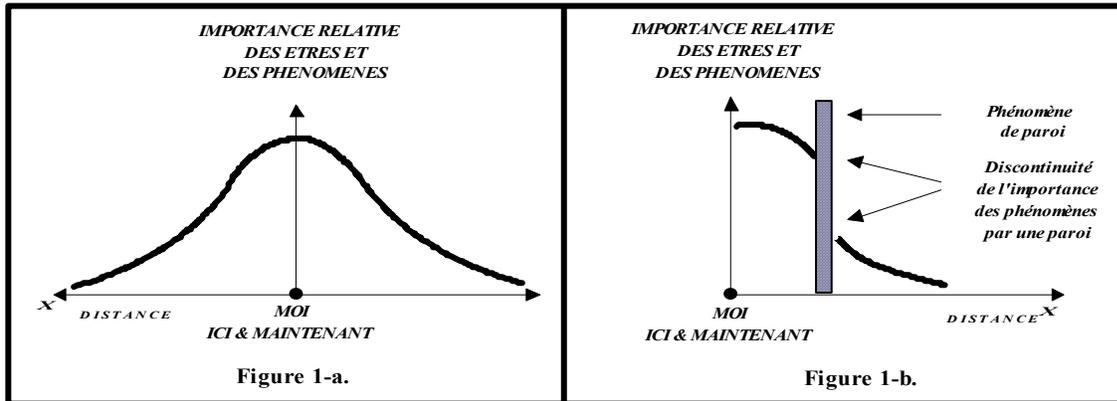

But if, for one reason or another, a deviation from this fundamental law of psychological continuity occurs – be it a discontinuity or a sudden variation –, then, another phenomenon emerges: the idea of an partition conceived as a dividing line, which necessarily reduces the importance of the phenomena lying beyond this singular point compared to the phenomena situated before this point (Fig 1-b). The partition weakens the outside compared to the inside. It effectively creates an opposition between the outside and the inside (Schwach, 1993). Thanks to the phenomenon of partition, Moles and Rohmer introduce the notion of proximity by studying what is close, and no longer what is far. They also highlight the ambiguity of proximity, which means both a preference for what is close (proxemics) and closure or isolation (partition).

---

<sup>3</sup> *Corporatisme* is both a preference granted to oneself and one's own (peers, relatives and friends), and a form of protection against others (those on the outside and strangers).

<sup>4</sup> Here, we do not use the term "proxemics" in the sense of E. Hall (1981), referring to the study of perception and the use of space by Man.

<sup>5</sup> This idea of growing function can be seen again in Campbell (1978): "feelings of inequity are a function of the perceived closeness".

**Figure 1. – The proxemics Law (a) and the partition phenomenon (b) by Moles and Rohmer**

For those interested in the management of small-sized companies (Small Entreprises and Very Small Entreprises), the value of this axiomatic is twofold: on the one hand, it is founded in psychology (Moles, 1976; Schwach, 1993), which is a particularly appropriate field for understanding the strategic and organisational behaviour of small-sized companies<sup>6</sup> (Gervais, 1978; Parent, 1978). On the other hand, it is also based on the centrality of a single point of reference (the *Me, Here and Now*). This last aspect is perfectly suited to the situation of SMEs, as it is generally recognised that one of their specificities is the important role given to the director-owner, a central reference point *par excellence* (Marchesnay, 1991; D'Amboise, 1993; Julien, 1998). This is reminiscent of the famous expression from Gumpert and Boyd (1984), “*The business is the ‘ego’*”. Moles and Rohmer’s egocentered conception of space seems very apt for explaining the mechanisms that govern how a highly personalised management system functions.

The remainder of this article will aim to demonstrate to what extent the effects of proxemics and the effects of partition make it possible to explain in a unified and coherent manner a considerable number of existing results. The aim of this article is to propose a general theorisation for the smallness of companies based on the concept of proximity.

## **Management of SMEs and closeness: the role of the effects of proxemics**

It is in this sense that proximity management, as we see it, is not confined to simple metric measurement. It is the choice-making principle for owner-managers. All other things being equal, the SME manager will opt for what is both geographically and temporally closer to him. This preference for proximity, and the management style that results from it, is a strategic and organisational construction enabling the SME manager to keep control of his firm and its development.

<sup>6</sup> In terms of spatial decisions, Koenig and Joffre (1985: 194) note that “the satisfactions of a psychological nature in the choice of a particular site are more important in individual companies than in large companies, where power is more spread out and where there is greater rationalisation”. It is precisely this aspect that makes Deshaies (1998) say that in SMEs, it is preferable to talk of *reasons* for localisation (in reference to the entrepreneur) than of *factors* of localisation: “The entrepreneur becomes the obligatory source of information. You should start with him, rather than with a uniform space as in traditional localisation theories. Instead of drawing up a list of theoretical postulates concerning space, you should replace them with a set of hypotheses on the representations, attitudes and behaviour of entrepreneurs”. We believe that Moles and Rohmer’s Proxemics Law is the response to this desire.

If we accept the concept of SMEs as described by the GREPME (Julien, 1994; 2000), we have already demonstrated that all the characteristics of the specificity of SME management can be expressed as a particular form of proximity (Torrès, 2004).

<b>From management SPECIFICITY... (according to P.A. Julien)</b>	<b>...to PROXIMITY management (according to O. Torrès)</b>
Centralized management	<i>Hierarchical proximity</i>
Low level of specialisation	<i>Intrafunctional proximity</i>
Simple and informal information systems	<i>Proximity information systems</i>
Implicit short term strategy	<i>Temporal proximity</i>
Close market, either geographically or psychologically	<i>Spatial proximity</i>

**Table 1. – From specific management of SMEs to proximity management**

Hierarchical, intrafunctional, temporal and spatial proximity (to name but four) make up a coherent framework producing the conditions required for action and reflection within a centralised and non-specialised organisation, which consists of simple internal and external information systems and which favours informal and intuitive strategies. The concept of SME defined by Julien can be understood as a *proximity mix* (Table 2).

This reformulation enables us to move from a descriptive approach (a mere listing of characteristics) to an explanatory approach (highlighting a superior principle). The latter combines all the features of SMEs around a federating mechanism (proximity) and transforms this mechanism into the essential requirement for the standard operation of an SME. In other words, our perspective is that of a specific management style for SMEs that obeys a *proximity principle* (Torrès, 1999, 2003).

Several theoretical advances in the field of SME management reveal the existence of hierarchical mechanisms of this type, based on proximity:

- ***In the choice of country for export:*** attacking international markets seems to be governed by a proximity principle, as shown by the Swedish school in Uppsala in its concept of psychic distance (Johanson and Wiedersheim-Paul, 1975; Johanson et Vahlne, 1977). Similarly, the 6-stage exportation model developed by Bilkey and Tesar is based on proximity: “firms at early export stages should focus on psychologically close countries and firms at later stages should focus on psychologically more distant countries” (Bilkey and Tesar, 1977: 95). As Joffre (1987) remarks, “we often insist on the geographical rigidity of small- and medium-sized companies. The presence of small-sized companies decreases as the commercial distance increases, with exportation on a large scale remaining the specialty of large companies”. Similarly, the concepts of “glocalisation” (Johanisson, 1994; Torrès, 2002) and “internationalising milieus” (Torrès, 1999; Fourcade and Torrès, 2001) have made proximity an active principle in the export strategies adopted by SMEs.

- ***In the choice of successor-buyer:*** despite the fact that “in the minds of company directors, the alternatives are neither exclusive nor part of an unchanging order” (Haddadj and D’Andria, 2001), the director of an SE who wants to make over his company is often subjected to what we could refer to as an “*organisation into a hierarchy of his choice of successor*”: a preference for the family, then the employees, clients or suppliers and finally for a third party. In this way, “when choosing a buyer, company directors often adopt a system of concentric circles, starting with the closest contacts and relations and progressively widening their search” (Bah, 2002). This organisation into a hierarchy can be broken down into three segments: the *internal segment* (the director’s heirs and close family, the executives or all or part of the employees in the company), then the *immediate segment* (the clients, suppliers, colleagues, accountant and so on) and finally the *external segment*, which corresponds to a market open to unknown third parties. According to Bah (2002), the first two segments make up the “closed” market that operates essentially in a trust-based manner and by “word of mouth”. Only the third segment is a truly “open” market, although it has a bad reputation as companies that are on the market are often seen as “lame ducks” by potential buyers. We thus find ourselves returning to the classic problem of asymmetry of information and the well-known article, “The Market of Lemons” by Akerlof.

- ***In strategic choices:*** Ansoff’s product/market model also provides an implicit organisation into a hierarchy for the way in which companies develop. Development axes must first of all be established within a single sector, within a single activity in the company. Once this axis has become saturated, it then becomes possible to envisage diversification, either in terms of profession or in terms of mission. Total diversification is a last resort solution, as it is the most subject to risk. “Bearing in mind that synergy gives companies the advantage of a higher consolidated return on investment than any group can hope for, at first sight it could seem that diversification should be made according to the principle of maximum synergy. That is, preferring changes that are the least different from the normal experience and internal resources of the company” (Ansoff, 1989: 132). This model brings us back to an implicit order, which goes from horizontal growth (“the most normal, the most common and the most habitual type of growth for companies”, [Parent, 1978]), to vertical and finally to conglomeral growth. The smaller the size, the more the company has a vested interest in remaining within its field, as Penrose developed quite clearly in his theory of interstices. Who cannot see, here too, that these strategic principles are further proof of a proximity rule that indicates that a company’s growth must go from what is closest (its niche or its interstice) to what is most distant and most subject to risk (diversification). The stagist models of growth can be interpreted as being part of a proxemic design.

- ***In recruitment choices:*** generally speaking, the smaller a company, the more it tends to prefer proximity in its management of human resources. In a survey conducted recently in France on the management of human resources in small companies, Chassard (2003) demonstrates that acquaintances and word of mouth are the top responses, well ahead of temping agencies or recruitment agencies. Directors of small companies do not like intermediaries and prefer to make use of their own lists of contacts when they must take on new staff. This type of behaviour is perfectly rational, as a recommendation from someone you know is a vote of confidence. It is for this reason that when directors of SMEs hire someone new, they prefer to start with their spouse, then turn to their family in general or circle of friends. Looking on the job market, which is much more anonymous, is only a

last resort. Family, friends and an immediate circle of acquaintances are thus a strategic resource when the director says that he uses them as his main source for recruitment purposes (Torrès, 2003). It is the very importance of these proximity human resources that made Letowski (2003) say that the concept of Human Resources is meaningless in very small companies, unless “non staff” human resources are taken into account, such as spouse, children, associates, peers and so on.

**- In the choice of means of financing:** many empirical validations of Myers' hierarchy theory (1984) for financial choices as applied to the field of SMEs stipulate that the growth of SMEs is essentially financed by self-financing, then by bank loans, rather than by issuing share capital (opening the capital) (Norton, 1991; St-Pierre and Baudouin, 1995; Mahérault, 1999). Similarly, Belletante's concept of “*financial territory*” (1991) or Crevoisier's concept of “*proximity capital*”<sup>7</sup> (1997) support our theory of a hierarchical principle of proximity in financing. This *financial proxemic* also makes it possible to explain why SMEs prefer short term financing to long term (temporal financial proximity), or why, according to Hirigoyen (1984), SMEs pay more attention to maintaining the profitability of a company in the short term than to future profitability<sup>8</sup>. This once again reminds us of the concept of proximity in the relations the director-owner has with his banking partners. Effectively, “the results of certain surveys show that directors tend to do business with only a few financial institutions (sometimes only one). It is more profitable to develop a good relationship with a banker, who ends up understanding the personality of the owner-director and accepts his own, personal way of making decisions” (St-Pierre and Baudouin, 1995). Binks and Ennew (1997) go even further, recommending *participative behavior* between SMEs and their bank: “Clearly, perfect information is an unobtainable goal, but a *close working relationship* between bank and business can significantly improve information availability”. Later, they add: “While collateral may be one mechanism for reducing the adverse effects of information asymmetries, the development of a *close working relationship* is an alternative. An effective banking relationship, by its nature, must involve two parties. For bank and businesses to invest time and effort in developing and maintaining such relationships requires that there are discernible benefits from so doing. (...) Further analysis suggests that more participative relationship types are associated with benefits to the firm in the form of better financing conditions and better quality of service and benefits to the bank in the form of more favourable customer assessments of bank service” (Binks and Ennew, 1997: 90).

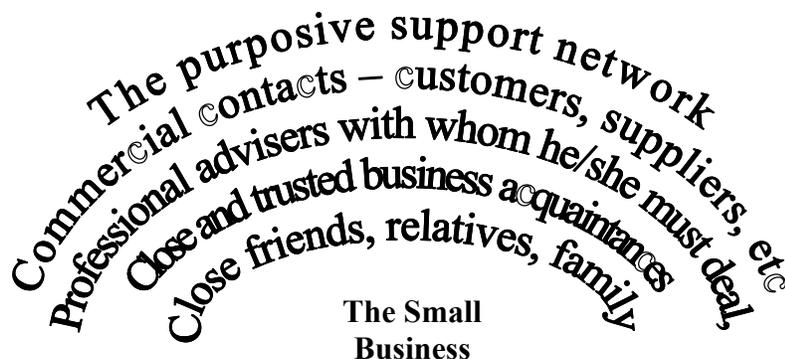

**- In the choice of support networks and backing:** Gibb's “layers” theory (1988) once again bears witness to the hierarchical proxemic relationships between the various spheres that make up the director of an SME's support network. According to Gibb (1988), “a small business will be subject to many influences. It is not however always obvious what these influences will be or what will be the interplay between the different influences”. “The

---

<sup>7</sup> As further proof of the link between proximity and financing in SMEs, Corpataux (2003) showed in his doctoral thesis to what extent the draining of the regional financing circuit in Switzerland mainly had an impact on SMEs. In his opinion, “the result is that from now on, SMEs can grow in two ways. Either they enter the stock market, with all the technical problems that that entails for small organisations, or they sell out to large, international groups. In the 1990s, for example, all the brand names from the clock-making sector were taken over by large groups” (Corpataux, 2003: 116).

<sup>8</sup> Hirigoyen (1984) wisely states that directors of SMEs turn their companies into *expense centres* rather than *profit centres*.

relative strengths of the influences of different groups of people are indicated in a diagram produced by Gibb to indicate the layers of small business support networks. One implication of this is that the closer, and more personal, layers will always have a much stronger influence than the outer, and more official, layers” (Bridge, O’Neill, Cromie, 1998). Gibb considers that the influence of the support network is organised into a hierarchy in relation to proximity and thus draws the following conclusions: “If friends when consulted are negative in their advice then it will be far more influential than any positive input from government agencies”. These opinions and influences are not all equal, but are organised into a hierarchy on the basis of weighting that increases in relation to the closeness of the link with the owner-director.

**Figure 2. - The “layers” theory (source: A. Gibb, 1988).**

These six examples show that the effects of proximity create a hierarchy of strategic decisions that privilege that which is close to the detriment of that which is distant<sup>9</sup>. The proximity principle is, in our opinion, a response that is adapted to the principles of limited rationality and the asymmetry of information. Proximity is a vote of confidence. This type of behaviour, which privileges proximity, is perfectly rational because anything recommended by a close friend or family member, or business relationship with an acquaintance, is trustworthy. Here, proximity plays the role of guarantee as well as a reducer of uncertainty. It reduces the asymmetry of information and broadens the rationality. This recalls Akerlof, who advises someone selling a car in good condition to sell it to someone who trusts him – in other words, someone he knows. Proximity is the most natural response, and the least costly, to the problem of the asymmetry of information.

But this proximity strategy, which privileges the family and the familiar, nevertheless has its limitations, the biggest risk being that of isolation and imprisonment. And it is precisely this that highlights the concept of the partition effect.

<sup>9</sup> There are several counter-examples to this proxemic concept. Studies on INV (International New Ventures), companies that grow rapidly or start-ups, on capital-risk and so on show that certain small-sized companies diverge completely from this conception. It is these companies that we have qualified as managerial SMEs as they tend to be managed like miniature versions of large companies (Torrès, 1998). This type of company is the opposite of the standard SME, and is the illustration of denaturation phenomena (dilution of specificities) (Torrès, 1997).

## Management of SME and *closure*: the role of the partition effect.

One of the theoretical bases that make it possible to explain the isolation of SMEs can be explained through the theory of links and social networks.

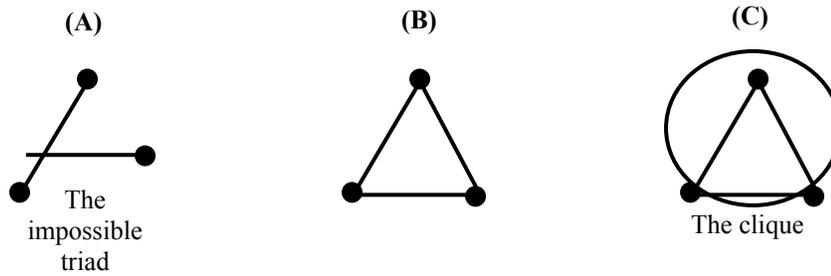

As early as 1973 in his founding article, “*the strength of weak ties*”, Granovetter provided the basic hypotheses for a general theory of social networks by proposing a distinction that has now become a classic, between strong links and weak links. According to Granovetter, the strength or weakness of a link is a combination of the amount of time, emotional intensity, intimacy (mutual trust) and reciprocal services that characterise the link. This explains why, in general, individuals only have a small number of strong links (rarely more than a dozen). By absence of link, he means not only a total absence of link, but also the links that are not very important such as vague acquaintances (people living on the same street, for example, or the link that you have with your newsagent). There is an absence of link when the interaction between two individuals remains negligible even if they know each other’s name.

From these few definitions, Granovetter develops a number of principles that govern the constitution of social networks and their evolution. He thus considers that the stronger the link between two individuals, the more these individuals will tend to resemble each other. To such an extent that when there are strong links that join A to B and A to C, there is a high probability that B and C will resemble each other too. This is the principle of the transitivity of strong links. Granovetter then continues his analysis by considering that if A has strong links with B and C, in time it would become almost impossible for B and C to have no link between them. Diagramme (A) illustrates this impossible triangle. Over time, the triad tends to be completed so that it resembles diagramme (B)<sup>10</sup>.

The problem with strong links, however, is that they tend to lead to enclosure. “For example, if we spread a rumour to all our closest friends and then they, in turn, do the same thing, there will be many who will hear the rumour twice, or even three times, because individuals linked by strong links often have the same friends. If, on the other hand, the motivation of these individuals to spread the information decreases each time the rumour is told, then there would be a higher probability that it would remain enclosed in a few clans if it is transmitted by strong links than if it were transmitted by weak links: it would not be able to bridge the gaps”. In this type of case, Granovetter speaks of the *suffocation effect* that we have represented as a circle that encloses the triad of strong links in diagramme (C). Strong links, and particularly if you work on the basis of a small number of individuals, tend, over time, to form cliques or closed circles that function as a closed circuit where exchanges become unnecessary. This means that a network composed of strong links tends to be walled off (clusterable). As Davis (1970: 844) says in his analysis, “groups tend to form levels (like floors of a building) and within levels all relationships are mutual positive or mutual non-positive; within levels, clusters or cliques occur (like rooms on a particular floor of a building) such that (by definition) within clusters all pairs are mutual positive, and between clusters all pairs are mutual non-positive”.

---

<sup>10</sup> By analysing 742 sociograms, Davis (1970) demonstrates with great precision that triad B is the most common, and that triad A is, on the contrary, one of the least common.

However, it can be considered that the smaller the size, the more the number of interpersonal relationships is reduced. Smallness thus creates the conditions for strengthening the links between those involved. Directors know their staff personally, as well as their clients, suppliers, banker and so on. The smaller the company, the more probable it is that the links between the different active members of the company will be frequent, intense or even intimate. Smallness strengthens links because they are less in number. This provides us with an explanation of the double dimension of proximity: smallness increases the strength of links but also increases the risk of enclosure. It is thus easier to understand Michael Piore, who, in the inaugural speech for the 3<sup>rd</sup> Congrès International Francophone PME (International French language Congress for SMEs, CIFPME) at Trois Rivières in Canada in 1996, said, “the problem for SMEs is not that they are small, but that they are isolated (Torrès, 1997).

This isolation has already been mentioned many times in the literature on SMEs. For example, in the article, “The loneliness of the small-business owner” by Gumpert and Boyd (1984), “the authors explore the silent partnership between loneliness and the small-business owner”: “As a consequence, entrepreneurs often lack colleagues with whom to share experiences, explore ideas, and commiserate. Among respondents to our survey, 68% reported that they had no confidant with whom they could share their deep concerns. Also owners become more and more sequestered as demands on their time isolate them from others”. According to the authors, “on the one hand, loneliness reflects objective or environmental factors, such as the special nature of a small business and value conflicts between owners and those close to them – chiefly family and friends. On the other, it is also subject to internal or subjective pressures including the need to project a strong image and a proclivity for individual achievement rather than group dynamics.” (Gumpert and Boyd, 1984: 19). This isolation is even promoted in certain cases: “I’m not competing with anyone here. In corporate life, I was competing with everybody. If one of my decisions didn’t work out, you’d better believe there were six others guys in the company saying it was my fault. In my own business, the only competition is outside” (...) “Solo activities are satisfying for the immediate feedback on performance and the sense of control they provide” (Gumpert and Boyd, 1984: 22).

Nevertheless, isolation is a handicap that the authors highlight quite clearly: “Without input from peers, friends, or family, entrepreneurs are unlikely to consider all relevant options and risks in their decision making. Reducing loneliness should improve financial results.” (...) “In view of our findings, we think it essential that entrepreneurs also enter into group

activities with family and friends; the energy and determination they show in the marketplace must be directed toward emotionally satisfying relationships as well”.

The isolation of the director of an SME can certainly be put into perspective, as shown by Curran and Blackburn (2001: 6), who write, “a high proportion of small firms, perhaps approaching 40 per cent, have two or more owner-managers/partners/directors. (...) Enterprises linked through cross-ownership may operate significantly differently to enterprises that have no such linkages”. This perspective nevertheless raises two points worth mentioning: on the one hand, it should be noted that 60% of companies are still managed by just one person, which is still a majority, and, on the other, that there is nothing that proves that the partners are genuinely active and not just *sleeping partners*. As Gumpert and Boyd (1984: 20) note, “Ironically, the presence of partners does not necessarily change this pattern. In fact, it can make things worse. Our first survey showed that more than two-thirds of the respondents who began with partners eventually split up. Conflict among principals was the chief reason. Understandably, therefore, these owners approach the idea of a subsequent partnership reluctantly”. The model of the isolated owner-director, “with his nose to the grindstone”, seems to us to still have considerable validity.

It is for this reason that the concept of the microcosm effect developed by Mahé de Boislandelle not only seems to us to be pertinent, but also a useful means of explaining the isolation and enclosure effects in SMEs.

The Microcosm effect is defined by the fact that the director of an SME generally focuses his attention on the immediate, in terms of both time, that is, the short term, and space, that is, whatever is closest to him either physically or psychologically. The Microcosm effect results from the director’s high level of involvement in the organisation, the affective intensity of his relationships, the urgency perceived and the number of activities for which he is responsible. The Microcosm effect can also be seen in the relationships that the company develops with its environment. From an external point of view, the company’s image is affected by the director’s relational capital, which often plays a key role through his public, professional, social or political appearances. The Microcosm effect is similar to the concept of *environmental proximity* that Gueguen (2001) defines as an ensemble of external factors, perceived by the director, that emanate from key players who are close in terms of geographical and psychological distance, that are the subject of frequent and informal interactions and that have an incidence on how the company functions. It could be said that this is the ensemble of strong links.

The Microcosm effect also illustrates the fact that smallness in size often leads to an increase in the frequency of events liable to disturb the director’s decisional activities. This can be explained by centralisation, which leads to further burdening the decisional agenda with short term problems. Drucker-Godard (2000) thus demonstrates, in his study into directors’ day-to-day management of priorities, that to a certain extent centralisation is often represented by a strong emphasis on the short term and the operational. Small size thus exposes the owner-director more easily to daily disturbances and, as a result, prevents him from spending time thinking about strategy and looking at things objectively.

Directors of SEs often reason in the short term, preferring solutions that will work quickly to those of a more strategic nature whose positive effects are less immediate (over-estimation of the “Now” compared to the future). Similarly, their field of action is often limited to the environment closest to them, because it is at this level that directors think they have the most room for manoeuvre and that they have the highest level of control over the consequences of their actions (over-estimation of the “Here” compared to the “Elsewhere”). This Microcosm effect is strengthened by the single establishment nature of small-sized companies, which favours the pregnancy of a point “Here”.

The unity of place in SEs and VSEs suggests a strong correlation between organised space and physical space and allows directors to appropriate their companies to a great extent. The smallness of companies accentuates the *domestication* of their management practices and shows that they have created a “home away from home”, a place of privacy *par excellence* where directors fully exercise their control, which makes personalised management possible. This partition (enclosure) effect also makes it possible to explain why certain directors of small companies seem to be allergic to the principle of giving details of how they operate. The 35 hours law in France<sup>11</sup> was seen by some bosses as a real intrusion by the State into the internal operations of the company. Similarly, as Charpentier and Lepley (2002) state, small companies are characterised by the absence of institutions representing the staff. “The trade’s union representative is often reviled, particularly because he would introduce exogenous procedures to the micro-organisation” (Lepley, 2002). Smallness gives the functioning of the company a domestic nature where norms come directly from the authority of the company director, and are more rarely subjected to the principle of an external third party. Smallness thus reinforces the enclosures that separate what is inside from what is outside, which explains the high degree of isolation in which many SEs and VSEs function.

This isolation limits perception of external events and reinforces the weight of internal elements, thus multiplying the proxemic effects and, more particularly, the role and importance of the director, who thus becomes the kingpin on which the entire management system depends. It is this aspect that makes many specialists in the field of SMEs say that the management of SEs is highly personalised, thus leading to *acute proxemics*. This concept of “*acute proxemics*” results in a reduction of the director’s field of vision because of his tendency to *systematically* over-evaluate all that is close and to under-estimate all that is distant.

These partition effects can be perfectly illustrated by the classic theories of SMEs. If we return to the six points mentioned above in relation to proximity (succession, growth, recruitment, financing and internationalisation and support networks), several theories have dealt with this phenomenon. For questions of succession, especially in family-owned companies, opening the capital to someone who is not in the family is often difficult, not to say impossible. Small, family-run companies are a perfect illustration of the ambivalence between proxemics (priority given to blood relations) and the risk of enclosure (the term “clan” is often used). In terms of strategy, certain authors mention the theory of limited growth, or a refusal of growth, when talking about small companies. More generally speaking, the result of the difficulties associated with recruitment in SMEs is often the risk

---

<sup>11</sup> As part of the law on the reduction of work time, the legal duration of the working week was decreased from 39 hours to 35 hours in France.

of exposing the director to a work overload and thus to both fatigue and solitude. In a study by Chassard (2003), three quarters of those questioned declared that when they have too much work, they manage on their own, as best they can. It is this isolation, and the over-work that results from it, that explains why directors of SMEs sometimes find it difficult to formalise their own needs. In terms of financing, many authors, such as Stiglitz and Weiss (1981), have developed the theory of the rationing of credit. Others have insisted on the inaccessible nature of the capitals markets: "Essentially, the capital-structure decision must be regarded as *residual* in that the owner of the small business does not have the choices available to larger firms with access to public capital markets. The small business finances where it can, always attempting to minimize the cost of that capital, but it is constrained by its limited access" (Osteryoung, Newman and Davies, 2001: 263). Similarly, according to Barton and Matthews (1989), although owner-directors prefer to finance their companies with internal financing rather than with external capital (loans or shares), it is to maintain the control of their company, the decisions that they must make as well as of day-to-day management. They thus prevent all investors from participating in these decisions by initially privileging internal financing. In terms of international development, crossing a national border, added to the linguistic and cultural differences that entails, are often seen as obstacles that are difficult to get round for small, and very small, companies. Bilkey and Tesar's exportation model (1977), based on proximity, also stresses the idea of "perceived barriers". Finally, regarding the support network, Gumpert and Boyd (1984) demonstrate how the director can find himself totally isolated. In Gumpert and Boyd's opinion, solitude represents a wall that separates the director very definitely from the rest of the world.

## **Conclusion:**

It seems possible to summarise management of SMEs in terms of proximity management, on the condition that both dimensions of the term "proximity" be taken into account. That is, the proxemic effect (the priority given to what is closest) and the partition effect (the risk of enclosure or isolation). It is for this reason that we consider that the management of SMEs is situated somewhere between closeness and closure. Our modelisation of the management of SMEs demonstrates the interest of synthesising, in a single framework, both the advantages and disadvantages of SME management.

Taking the "proximity" factor into account when discussing the management of SMEs is part of a broader research trend that grants greater importance to relational aspects than to transactional aspects. In our opinion, the wall separates two spheres, one governed by relations, the other by transactions. It is precisely the importance and quality of these relations that are one of the key points of the analysis of the specificities of SMEs. Fuller even states that relations and personalisation are at the very heart of the specificity of the management of SMEs (Fuller, 2003, Fuller and Lewis, 2003). "Small businesses embody the personalities of their owners, and their ways of doing business with stakeholders are largely personal. The human "touch" and personal networks create the opportunity for enterprises with little market or financial power to stay more in control of their future" (Fuller, 2003). For Fuller, the futures of small business are deeply connected with the futures of the value of 'the personal' in society. These remarks coincide with those made by Gibb (1997: 18), "Managing relationships with the stakeholder networks (external and internal) is the very essence of management of the small company. A day spent with any owner-manager will reveal the numerous contacts, internal and external, that are integrated

into the web of the business activity. Networking and the “know-who” that goes along with it is the very essence of entrepreneurial activity and small business management and is fundamentally related to the survival and growth of the business. It is critical to the firm’s transactions costs, the development of trust and its credibility with its ‘community’. Later, he adds, “The very essence of small company management is the personal day-to-day handling of transactional and other relationships with networks of customers, suppliers, bankers, accountants, solicitors, agents, marketing channels, workers and regulatory authorities as well as (more intimately) acquaintances, friends and family” (Gibb, 1997: 18).

Our proxemic theory explains not only the importance of a hierarchy of relations in the management of SMEs, but also the tendency that SME directors have to remove themselves from the logic of the market. Resorting to the job market, the capitals market, the consultancy market and so on are often last resort solutions. Directors of SMEs do not like anonymous transactions. Whenever possible, they replace them with interpersonal relations based on links of proximity.

## **ABSTRACT**

Traditional theory based understandings of the use of external financing sources by business entities are most commonly informed by variations of agency theoretic approaches including the pecking order framework. This traditional understanding is that as firms become larger and more successful they are better able to overcome information asymmetry problems and also are likely to benefit from the tax advantages of debt over equity. Consequently they rely more on external debt.

This paper reports results (from the analysis of a large Australian database) that explore differences in the equity and debt structure of small firms. Initially the paper provides descriptive detail of financial structure groupings that identify four principal groups with significantly different core financing (the bank loan debt group; the related persons debt group; the short term debt group and the working owner equity group). Results are presented of analysis that seeks to identify associations with a range of variables likely to be associated with a firm's membership of one of the financial structure groups. Included are size measures, age, asset tangibility, industry, profitability, liquidity, growth, risk, business practices, and, owners' characteristics.

Expectations from theory are that, for most of these variables, higher (better performed) values would be associated with the bank loan debt group. The results, however, indicate that the larger, better performing firms are in the short term debt group. This implies that small firms may not take advantage of the information asymmetry advantages they gain through size and performance to increase external medium to long term borrowing. Rather they seem more likely to use the benefits of their size and performance to develop stronger short term relationships with product and service suppliers (through trade credit) and finance providers (through short term and overdraft bank borrowings). These results are most closely associated with the pecking order framework approach to understanding small firm financial structures, although the strength of the reliance on short term sources is greater than that expected from traditional considerations of that framework.

# The Importance of Short Term Financing Sources in Small Firms

## INTRODUCTION

To fund any firm's operations (including the production of goods and/or the provision of services), financial resources are required (Vickers, 1970). These financial resources are acquired either: a) in the form of debt, the cost of which is the interest paid; b) in the form of equity which has a cost represented by the providers required rate of return (Reid, 1996); or c) in most cases as a mix of both debt and equity. For publicly traded firms, equity is most commonly acquired through public share markets and is generally separated into external equity (direct contributions by shareholders) and internal equity (accrued profits and cash flows not yet distributed to shareholders). Debt may also be acquired in a number of ways, with a major distinction usually made in respect of maturity (i.e. the distinction between short-term and long-term debt) and debt source. The latter (public firm debt sources) are identified by Denis and Mihov (2003) as being primarily (i) bank, (ii) non-bank private lenders (generally institutional lenders that provide debt that has qualities associated with both bank and low grade public debt), and (iii) public debt offers such as debentures (see Bolton and Freixas, 2000). The final mixture of funds acquired from both debt and equity constitutes the firm's capital structure (Peirson *et al.*, 2002).

There appear to be two major differences from these large firm circumstances when considering the financial resources of small firms. Both are associated with the dominance of personal shareholdings. First, equity funding is not accessible through organised markets and most privately held firms need to rely on a single owner or small informal groups to provide equity funding. Second, the debt sources available to privately held firms are not as expansive because public debt is generally not available. Also small firms' source of non-bank lenders is likely to be family and friends rather than institutional lenders (Cosh and Hughes, 1994; Storey, 1994). Where institutional fund sources are used they differ from the debt of large firms in that they often have to be supported by guarantees or collateral from the owners' personal wealth (Avery *et al.*, 1998; Cosh and Hughes, 1994).

The research reported in this paper is based on the analysis of a comprehensive data set and was concerned with the categorisation of firms into groups defined by dominant funding sources and associations between those groups and a range of potential influencing variables. There was also a secondary purpose that was concerned with the potential of using group membership as an alternate to attempting to understand financial structure in small enterprises by focusing only on one dimension of funding such as a leverage ratio and then treating all firms as an homogenous group (as, for example, in Cassar and Holmes, 2003; Lopez-Gracia and Aybar-Arias, 2000; Chittenden *et al.*, 1996; Hall *et al.*, 2000; and Michaelas *et al.*, 1999).

Results of the analysis have confirmed the presence of financial structure groups as well as identifying associations with most potential influencing variables. The focus on financial structure groups also appears to provide significant insights into financial structure that are not captured by traditional single measures. The major finding of the study is confirmation that the financial structure outcomes in small firms are influenced by different factors than

those that influence large firms. These differences include the absence of a separation between ownership and control, the dominance in decision making of the owner managers' attitudes favouring independence and control aversion, and the use of other personal wealth assets by owners to support borrowing.

## **Expectations Regarding Capital Structure of Publicly Traded Firms**

Theories of capital structure as they apply to large publicly traded firms can be categorised as the agency theoretic framework, the static trade-off model, and the pecking-order hypothesis (Booth *et al.*, 2001). Each of these theoretical frameworks offers a range of logical explanations about the capital structure of large publicly traded firms. While there is obviously a potential influence generated by taxation benefits and distress trade-offs as suggested in the static trade-off model (Chirinko and Singha, 2000), this seems to be significantly eroded where an imputation or flow through taxation system exists (as it does, for example, in Australia). The other two explanations both rely on agency relationships, but differ in the focus of those relationships. The agency theoretic framework focuses on both: (a) the type of monitoring and debt choice influences generated by managements' desire to favour equity holders (Cassar and Holmes, 2003); and, (b) the debt consequences of potential perquisite consumption problems arising from free cash flow circumstances and managerial investment in firms (Novaes, 2003). The pecking-order hypothesis in its explanation uses the recognition that agency costs change for different funding sources and that the firm first uses sources with the lowest agency cost (Frank and Goyal, 2003).

Influences on capital structure that emerge from these various theories and that have been the subject of empirical research include size, age, governance, asset tangibility, industry, taxation, profitability, liquidity, growth, risk, and business practices. However, analysis of the results often suggests that the interaction of theoretical explanations and potential influencing variables related to capital structure does not depict a clear relationship (Booth *et al.*, 2001; Graham and Harvey, 2001). While evidence exists to suggest all of the influences discussed were associated with differing capital structures it was often not clear which was the more common direction of the relationship. Consistent with the confusion concerning associations with influencing variables, it appears that no one theory dominates, but that each contributes in different ways to an understanding of capital structure (Hovakimian *et al.*, 2001; Frank and Goyal, 2003). However, agency explanations, while not dominant, could potentially be most useful. As indicated above, it seems to be the agency aspects of the pecking-order hypothesis that are important, and even from a static trade-off perspective it seems that the agency considerations related to distress costs are of greatest importance.

## **Expectations Regarding Financial Structure of Privately Held Firms**

As is the case for large firms, each of the theoretical explanations for financial structure in privately held firms had a logical focus that helped to understand the overall situation, but none seemed complete (Reid, 2003). However, given the limited explanatory capacity of the static trade-off approach and the agency focus of the other theories it might be that an overall explanatory framework seems best developed from an agency theory perspective of the pecking-order hypothesis framework. Also analysed were potential influences on financial structure that emerge from these various theories. Potential influences include those identified in the discussion of large firms (size, age, governance, asset tangibility, industry, taxation, profitability, liquidity, growth, risk, and business practices) plus an influence related to owner characteristics.

An important aspect that emerged from the review of financial structure theories and influencing variables was that, while each of the theoretical perspectives contribute to understanding financial structures, the influences that create the frictions are different for small privately held firms when compared to large publicly traded firms (Berger and Udell, 1998; Cosh and Hughes, 1994). The management perquisite control aspect of debt that is important in explaining large firm capital structure is not important for small firms because, for the majority of small firms, there is no separation of ownership and control (Ang, 1992). While the agency conflict between equity holders and debt holders still exists, the monitoring and control reactions of funds providers are different. The magnitude of agency costs is likely to be higher because of greater information asymmetry problems. However the fund provider response can be directed to owner collateral and guarantee mechanisms rather than being restricted to firm based covenants (Berger and Udell, 1998). Also the acceptance or otherwise of debt options by small firms will be heavily influenced by the owner/managers' attitude to control and independence as well as being associated with the owners' personal wealth (Avery *et al.*, 1998). These same attitudes are likely to be a stronger influence in defining pecking orders than the information asymmetry, risk exposure and signalling capacity that are used to explain pecking order in large firms. Also more important than for large firms is the influence of position in the business life cycle, and also the possible reliance on funding sources outside the institutional market.

These differences also bring into question the appropriateness of a simple dichotomous measure such as leverage (even if explored from different dimensions) to capture the underlying complexity of the financial structure of small firms. The preceding discussion suggests that many small firms will have a financial structure dominated by the owner's equity contributions although some will move toward a greater reliance on debt. However debt is likely to be sourced from non-bank private sources and be of a short-term nature. There is not likely to be a clear substitution of debt for equity as is implied in the leverage construct usually used as a dependent variable in large firms.

## **DATA**

The analysis in this study utilizes results from the Business Growth and Performance Survey (BGPS) developed by the Australian Bureau of Statistics (ABS) on behalf of the Australian Federal Government's Office of Small Business. The survey collected data for the first time in respect of the 1994-95 financial year, which was "the first of a planned five year annual series" (ABS, 1998, p.32). However, only four years data was collected, although questions in the first survey about prior year activity does enable use of up to six years data for three main variables (employment, exports, and sales). The principal purpose of the surveys was "to provide estimates on the growth and performance of Australian employing businesses and to identify selected economic and structural characteristics of these businesses" (ABS, 1998, p.32). Data from the BGPS has already been used in finance and performance related research by McMahon (2001), Gibson and Cassar (2002), and, Cassar and Holmes (2003), among others.

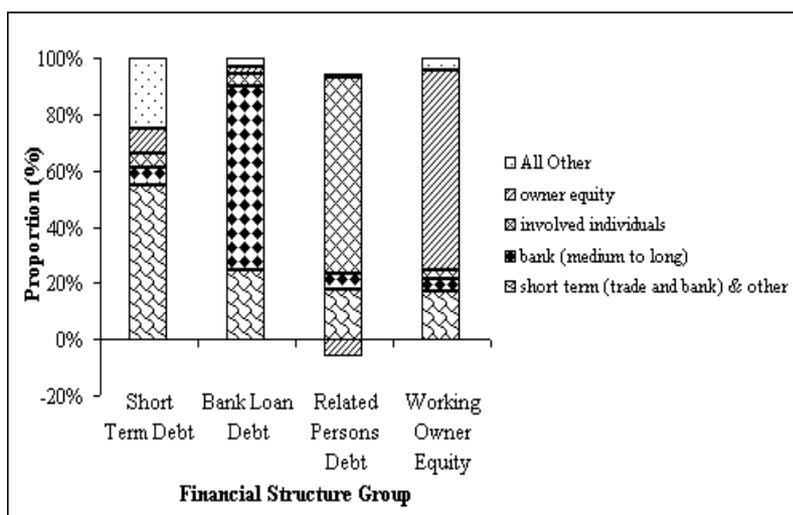

The availability of such a database is a significant advance in understanding issues associated with small firm finance. As Berger and Udell (1998, p.617) suggest the informational opacity that makes the study of small firm finance of interest has also been a contributing factor to the difficulties of such study. Included amongst such difficulties are circumstances such as the absence of trade in securities, the absence of publicly available financial details, and the generally private nature of contracts. Also, unlike the study of

large firm finance issues, there are often no major data sets available. The BGPS overcomes some of these difficulties by utilising a major data set that has a large number of firms, is longitudinal, and provides aggregate financial details for up to four consecutive years. It does not overcome the difficulties created by the absence of trade in ownership stakes or the capacity to identify the private nature of contracts. It also raises some additional difficulties associated directly with the recorded data.

One of the initial difficulties associated with using the BGPS data as the basis of analysis was to determine which of the available years should be used. In the end, only two years data were used because of significant differences in the wording of the questions (in the first two surveys compared with the last two) relating to the proportions of funds from various sources used in the business. Specifically there was no information gathered about the separation of funds from bank and other financial sources into short term and long-term sources in the earlier surveys.

The specific source of the data used in the analysis was the Business Longitudinal Survey (BLS) Confidentialised Unit Record File (CURF), made available by the Australian Bureau of Statistics (ABS). As described more fully in the documentation accompanying the CURF (ABS, 2000, p.3), included in the scope of the survey were all non government business units in the Australian economy except for businesses not registered as group employers (non employing businesses) and certain ANZSIC industry subdivisions (primarily agriculture, education and community services). Across the four years of data, available records exist in the CURF for 9,732 firms. There were 5,530 firms active and available for the cross sectional analysis of the 1997-98 results reported in this paper.

## RESULTS

**Figure 1 - Group Funding Proportions**

The first stage of the study was to use cluster analysis on computed fund proportions to ascertain if groupings of distinguishable financial structures could be identified. Cluster analysis is an analytical technique for developing meaningful sub groups of individuals or objects (Hair *et al.*, 1998, p.15). K-means clustering was used, as it is the most appropriate procedure when there are a large number of cases (SPSS Inc. 1998). In prior research in Australia, Kotey (1999) had identified three clusters, while Gibson (2002), using the same database that is used in this study but a different set of sample parameters, had settled on five. Accordingly, cluster analysis processes specifying from 3 to 6 clusters were applied and a visual inspection of results was used to determine the most informative structure. A four-cluster solution seemed appropriate as a consistent basis of classification. The cluster groups and their relative major funding proportions are indicated in Figure 1.

The first group is described as *Short Term Debt* because it is the combination of trade creditors, bank loans (short term and overdraft), and other debt that dominates the fund sources (collectively around 55%). This is the largest group and represents around 45% of all firms. The second group is described as *Bank Loan Debt* in which the largest proportion of funds (approximately 66%) is in the form of bank loans (medium to long term). Around 15% of firms in the sample are in this group. The next group reflects the reliance on shareholder loans in small business and is based on loans from involved individuals (around 79%), hence the label *Related Persons Debt*. There is also a very low level of negative equity in the firms in this group. This is the smallest group with only around 8% of the sample in the group. The final group is described as *Working Owner Equity* because of the strong reliance on that source of funds (just over 70%). This is the second largest group with just over 30% of all firms in this group.

To provide comparability with more traditional measures of capital and financial structure (for example, leverage), group averages for different interpretations of these traditional measures were determined and are presented in Table 1. Considering initially the aggregate results: debt (defined using the complete financial structure base that is central to this study and which includes short-term trade credit) is just under 67% of total funding. However, traditional leverage measures do not always include trade creditors as a short-term funding source. Consequently various interpretations of traditional debt based proportions using total funding without trade creditors are also provided. Total bank debt (around 30% in aggregate) is separated into long-term and short-term. Also shown separately is total debt (around 58%). This is lower than the financial structure base because of the omission of the trade credit proportion from both the numerator and denominator. Finally, because of the potential importance of owner influences in small firm financial structure outcomes, the sources have been presented from an external (to the owner) perspective that indicates an aggregate external funding of about 56%.

**Table 1 - Aggregate Financial Structure Summaries by Groups**

	<i>Short-term Debt</i>	<i>Bank Loan Debt</i>	<i>Related Persons Debt</i>	<i>Working Owner Equity</i>	<i>Aggregate</i>
<u>Financial Structure Base</u>	74.39	96.95	107.80	27.65	66.45
<u>Traditional Base<sup>a</sup></u>					
Long-term Bank Debt	8.93	75.97	7.36	4.91	19.13
Short-term Bank Debt	18.37	9.61	5.99	4.09	10.86
Total Bank Debt	27.30	85.57	13.35	9.00	29.99
Total All Debt	63.39	96.46	109.02	19.30	58.07
<u>External<sup>b</sup></u>					
Short-term external sources	42.88	21.82	18.72	14.02	28.69
Long-term External Sources	27.97	69.28	7.73	8.72	27.12
Total External Sources	70.85	91.10	26.45	22.74	55.81

a - excludes trade credit from the denominator

b - external sources exclude provisions, loans from parent companies, loans from involved individuals, working owner equity, non working owner equity (family and non family) and equity from parent company

The group-by-group means reported in Table 1 highlight the important disparity between the financial structure patterns evident in the four identified groups. From a traditional leverage perspective (total all debt), the two major financial structure groups range from around 64% (*short-term debt* group) to about 20% (*working owner equity* group). The other groups have even higher leverage ratios with the *related persons debt* group actually having a leverage ratio of over 100%. Using the distinction between internal and external sources as a potentially more appropriate indicator of small firm financial structure reveals similar disparities with the *related persons debt* and *working owner equity* groups using only around 26% and 23% respectively of externally sourced funds while the other two groups are completely opposite, relying on high levels (between 70% and 91%) of external funds.

These results are significant because they give a first indication of the nature of the differences in financial structure outcomes in the small to medium sized firm sector. To the extent that debt proportions (leverage ratios) are used to reflect financial structure, there is a group of firms that will have high proportions because of the existence of related persons debt. When focusing only on bank debt or external debt these firms drop to the lower end of the range of proportions. Different associations with influencing variables might be expected depending on the ratio chosen.

The results also show that there is a group (the *short-term debt* group) that, as its name implies, has the highest levels of both short-term debt and short-term external sources, but is not highest in respect of traditional leverage measures.

Analysis of group membership at both the single variable and multiple variable levels was used to identify associations with influencing variables. Single variable analysis involving categorical variables used Chi square measures of association. For the single variable analysis of continuous independent variables a parametric ANOVA test was used. The main multiple variable analysis technique used was that of multiple discriminant analysis.

However, an alternative approach was considered useful because of the number of identified categorical variables that appeared to be statistically significant but had to be omitted from the multiple discriminant analysis procedure because they did not satisfy the assumptions of that technique regarding independent variables. Multiple logistic regression was used as the alternative approach.

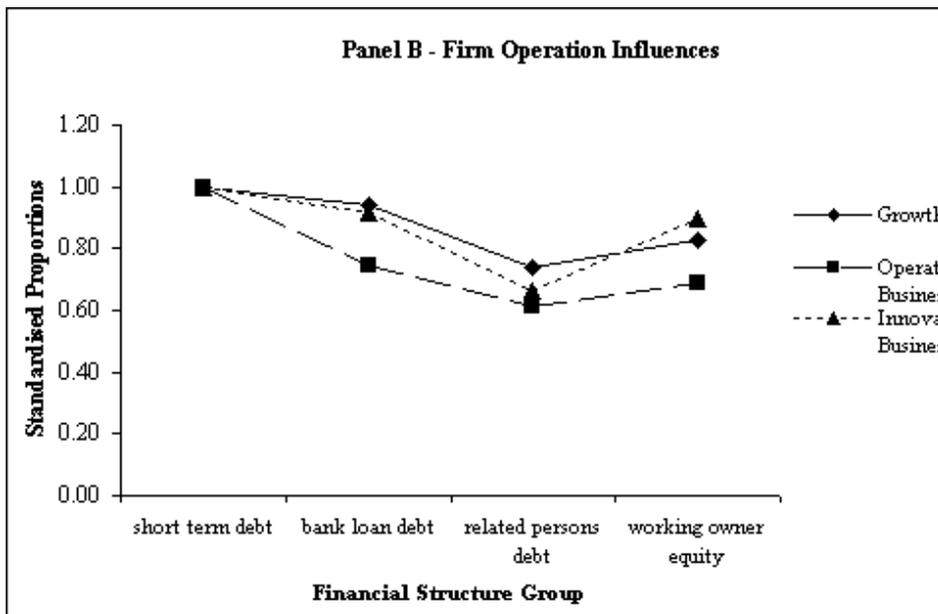

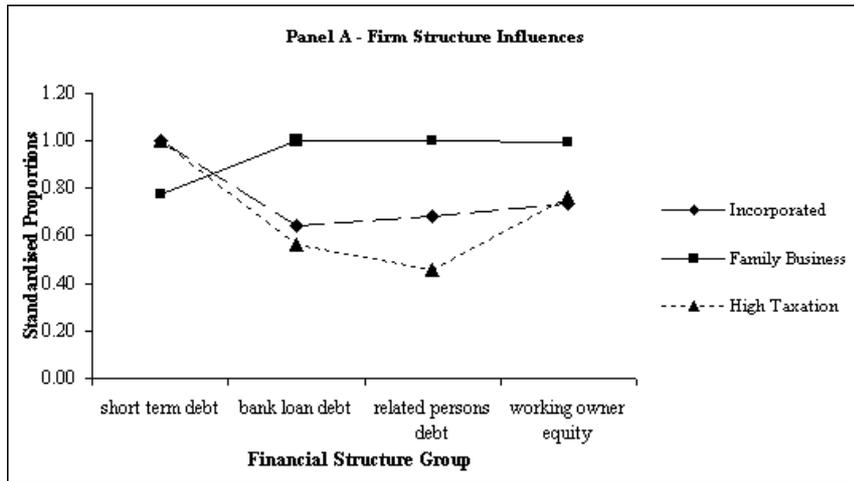

From the single variable analysis using a statistical significance of  $p < 0.001$ , financial structure group membership was associated with structural influences that include all of the alternate size variables (sales, employees and assets), age (measured as a continuous variable), several categorical measures of governance, asset tangibility measures including capital expenditure on tangible assets, the estimated tax range of the owners, and depreciation as a tax shield. From an operational influences perspective, the single variable analysis also identifies associations with profitability (both as an absolute and a relative measure), liquidity, growth intentions (but not past growth of either sales or employees), risk (but only when using a default risk proxy and not when using an operating risk measure), operating and innovative business practices, and owner characteristics related to human capital (experience and education).

A summary of the major associations at the single variable analysis is contained in the following figures. Figure 2 focuses on variables with continuous measures and is separated, to aid interpretation, into firm structure influences (Panel A) and firm operating influences (Panel B). The graphs in these panels compare the standardised means of the variables across the groups. The standardised means set the reported value at one for the group with the highest mean, and then computes the reported value for the other groups by dividing the mean of each group by the mean of the group with the highest mean.

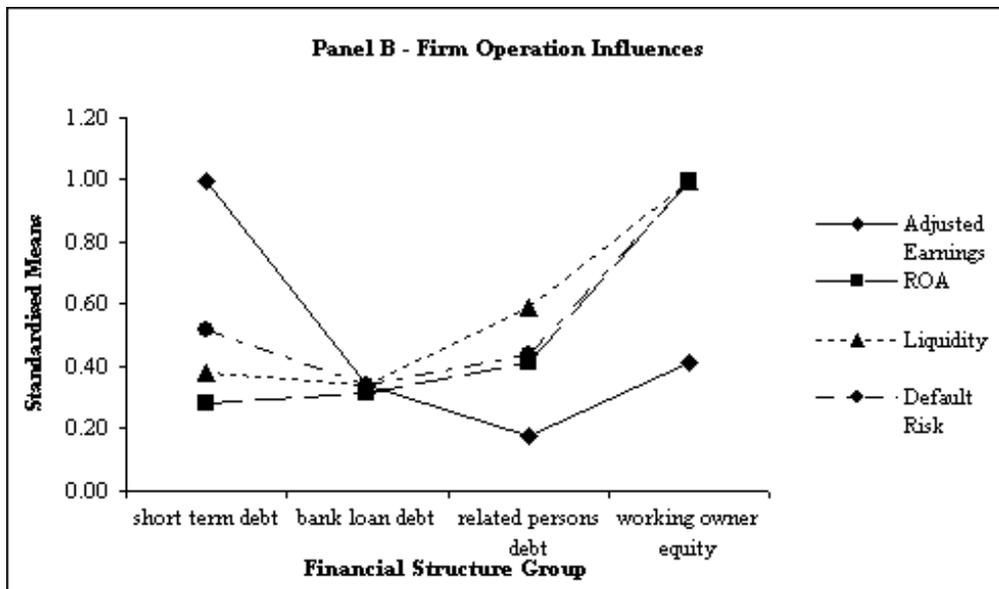

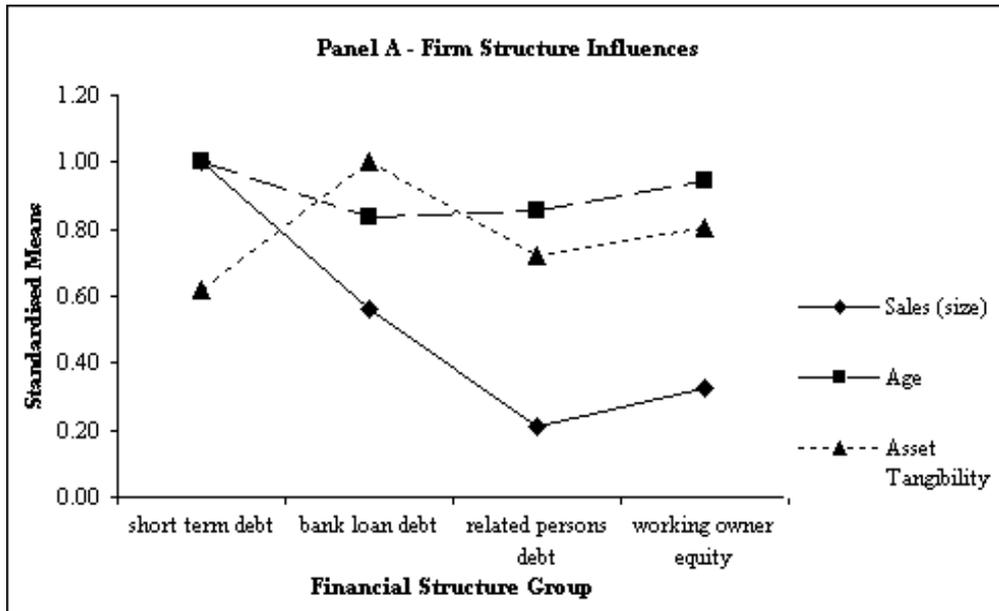

Figure 3 focuses on categorical variables and is also split into firm structure influences (Panel A) and firm operating influences (Panel B). The graphs in these panels compare the standardised proportions calculated in a similar manner to that used to determine the standardised means.

Analysis of the results summarized in Figures 2 and 3 also provides the basis of a profile of each group.

Firms in the *short-term debt* group are the largest firms and have, by a significant margin, the highest average sales (and, although not shown in Figure 2, the highest average employment and total assets). They are also the oldest firms (although the age difference is not large across groups) and despite having higher absolute levels of capital expenditure (not graphed) they have the lowest asset tangibility proportion. Firms in the *short-term debt* group also have the largest average earnings when adjusted for owners' remuneration and interest although they have (with the *bank loan debt* group) the lowest return on assets and also have lower liquidity and default risk measures. They are also more likely to be incorporated and be in the higher taxation bracket but are least likely to be regarded as family businesses. This group also has the highest proportion with a positive growth intention and are more likely to engage in both operating and innovative business practices. Although not shown in either Figure 2 or Figure 3, results of analysis by industry indicate that the *short term debt* group is a more prominent group within the wholesale trade sector and also well represented in the mining and manufacturing sector, but is not prominent in the accommodation, cafes and restaurants sector.

**Figure 3 - Categorical Measure Influencing Variables and Groups**

**Figure 2 – Continuous Measure Influencing Variables and Group**

The *bank loan debt* group is associated, as anticipated, with the highest asset tangibility (and, although not shown, the strongest depreciation tax shield and higher levels of capital expenditure), but has no other dominant association. Firms in the group share lower return on asset values (with firms in the *short-term debt* group), and have the lowest average of all groups with respect to liquidity and default risk. There appears to be some industry effect with stronger representation in the retail trade, accommodation cafes and restaurants, transport and storage, and cultural and personal services sectors. It is under represented in the wholesale trade sector.

The *related persons debt* group tends to consist of the smallest and lowest profit firms and therefore have the lowest proportion in the highest taxation category. Firms in this group also have lower proportions of firms with growth intentions and lower proportions of firms that engage in both operating business practices and innovative business practices. There is a slightly higher representation of this cluster in the accommodation, café and restaurants and property and business services industry sector.

Finally the *working owner equity* group seems to be more strongly associated with higher relative profits (return on assets) but are only second ranked with respect to absolute earnings. Firms in the group have the strongest liquidity but also have the highest levels of default risk. Apart from having a high proportion of firms that regard themselves as a family business, firms in the group are mostly second ranked for other categorical measures. They also tend to be smaller (but not the smallest) firms in terms of size measures. Finally the group it is more represented in the construction, the property and business services, and the cultural and personal services industry sectors.

Reinforcing these group relationships were the results of the multiple variable analysis. Discriminant analysis results confirm the existence of the different financial structure groups and suggest the existence of predictive discriminating functions. The major discriminating variables are in respect of liquidity (using the logarithm transformation of the working capital ratio), tangibility (an arcsine based transformation of tangible to total assets structure), size (the logarithm transformation of sales), risk (measured by an Altman (1968) Z score based estimate of default risk) and owner characteristics (using owners' years of experience). Multiple logistic regression results confirm, for most variables, the results identified in the single variable analysis especially with respect to the omission of growth and operating risk variables.

## DISCUSSION

A major implication of the results discussed above is that, while there are statistically significant associations, many are not as anticipated by extant theory. The agency theoretic approach, for example, generally predicts that larger and more profitable and liquid firms use those advantages to overcome information asymmetry problems and hence carry higher levels of long term bank debt or at least greater levels of external funding (from the owner perspective). However, the results of this study did not support these predictions. The larger, more profitable and more liquid firms were not the greatest users of long term debt or external fund sources but they were the greatest users of either short term funding sources or working owner equity. These results support the importance of *short-term debt* as a major funding source in small firms that is not evident in large firms.

From a theoretical perspective, it is the pecking-order hypothesis that seems to be best supported by the results. Older and more profitable firms are associated with groups that use less external debt, supporting the expectation that firms in the small firm sector are likely to use surplus cash flows to minimise or reduce their reliance on external finance. This is consistent with the influence of owner attitudes to independence and control aversion.

These results also highlight the inappropriateness of using continuous measures of dichotomous relationships to reflect financial structure in small firms. The presence of related persons debt in a significant number of such firms is the first confounding issue if these types of measures are used. Recognising loans from involved individuals as debt is likely to blur true relationships because, as shown in the single variable results, the *related persons debt* group has characteristics that are more closely aligned to the *working owner equity* group than to the other debt based groups. It is therefore essential that the use of a continuous measure be based on external funding rather than the more generic debt focus of much past research. Even the use of an external source measure does not avoid further

complications created by the presence of such a large number of firms in the *short-term debt* group. While these firms do tend to have more institutional debt and external funding than the *working owner equity* group, they do not have as much as the *bank loan debt* group, yet it is this *short-term debt* group that is associated with size and performance measures generally associated with higher debt levels. The funding relationship does not have the linear relationship that is assumed in many prior research studies.

There are a number of implications for researchers that follow from this study. As indicated above, care needs to be taken when trying to use a simple continuous variable such as leverage to capture a complex non-linear relationship. Greater emphasis needs to be placed on the influences of short term funding sources and the recognition that, with the exception of those associated with the pecking-order framework, agency cost considerations do not appear to be important in understanding the financial structure of small firms. Importance seems more appropriately directed toward the independence and control aversion approaches of owner/managers. Also important is an improved understanding of the changes that occur over time and why they occur.

It is also important to identify that traditional measures of growth and risk do not seem to capture those constructs well. However there are growth (intentions) and risk (default) variables that do reflect associations with financial structure. More work is needed to improve the development of variables that accurately reflect these dimensions of small firms. Also, while the theoretical arguments for the influences of owner attitudes to independence and control have been highlighted in this paper, measuring such attributes was achieved through weak proxies and there needs to be a greater endeavour to develop variables that more accurately capture these dimensions.

From a public policy perspective the implications of the findings in this study are that financial requirements are neither homogenous nor static. To the extent that policy makers seek to address financial problems in the small enterprise sector they need to be aware of the different needs of different groups that are not always identifiable by demographic variables such as industry and age. If firms with positive performance outcomes such as earnings and liquidity are the focus of policy support, they are more likely to be located in groups that rely primarily on short-term debt or owner equity. The constant policy focus on the relationship between institutional long-term debt providers and small firms may be inappropriate. A more appropriate focus may be on supporting access to the fund sources preferred and used by successful small firms such as trade credit and bank overdrafts.

## **CONCLUSIONS**

This research presents an analysis of possible financial structure relationships. It is clear that there are distinct categories based around certain dominant funding sources. These are short-term debt, bank loan debt, related persons debt, and working owner equity. Firm membership in these groups is associated with many simple demographic or performance variables. There are strong associations with industry, profitability, tangibility, size, age, governance, liquidity, growth intentions, default risk, business practices and owners' characteristics but no clear association with past growth or operating risk measures. Some of these results could be influenced by poor specification of the variables used in the study. Consequently, the true underlying relationship may not necessarily be reflected in the results, which paves the way for more detailed study. Notwithstanding these possible limitations, the results clearly identify different finance structures in small firms and support

the agency aspects of the pecking-order framework as the most useful theoretical explanations for those differences.

The results have identified a need to change the focus of research and policy development that is concerned with the financial structure and financing activities of small firms. Small firms need to be understood from a perspective that recognizes diversity in financing activities, a diversity that cannot be captured by a simple approach based on the substitution of debt for equity. The identification of clearly different financial structure groups is a significant contribution to that improved understanding.

Republic of Korea**

## **ABSTRACT**

Research was conducted to document the processes and activities used by Korean small and medium size businesses (less than 200 employees) transferring not fully developed (incomplete) technology from Korean National Research Institutes and Universities. A conceptual model of the technology transfer process was built from a literature review and a preliminary survey. This model was tested by in depth interviews of Korean small and medium size machinery firms transferring incomplete technology from public research institutes and universities. It was determined that the model of the external technology transfer process used by the Korean firms followed five distinctive stages: Awareness, Evaluation, Contract, Formal Transfer, and Application. There were some differences from the conceptual model conceived from the literature review. It was learned that the role of the National Research Institutes and Universities changed during the process from a technology educator in the Formal Transfer stage to a co-developer in the Application stage. The National Research Institutes and Universities also performed a technology consultant role when the firms tried to apply the technology to specific products. The small business' role changed from selector to learner to applier. Learning occurred most during the Evaluation, Formal Transfer, and Application stages; while knowledge creating occurred most during the Evaluation and Application stages. The time required for the complete transfer process was twice the original estimated time for transfer with the most time required for Evaluation and Application. The firms consider technology transfer as being successful if a satisfactory prototype was developed and sufficient technological knowledge was obtained. Firms felt that their absorptive capacity was the most important factor for a successful technology transfer. Recommendations include utilization of the authors' technology transfer model by the National Institutes and Universities in planning technology transfer to small and medium size businesses.

## **INTRODUCTION**

Interest in outsourcing technology is increasing due to today's business environment and some implementation successes. Outsourcing can provide increase technology diversity for a firm to achieve its business strategies. Even though external technology may have features that interest users, technology is often not readily transferable and may not be easily integrated into the user's mainstream business.

Until recently, many Korean corporations and R&D laboratories had undertaken external technology acquisition efforts on an ad hoc basis, often without strategic planning and appropriate transfer management. One of the most important tasks in external technology acquisition is to successfully integrate the new technology into the mainstream practice of the corporation and to ensure organizational learning and improvement for its next business stage. The primary focus in external technology acquisition is not in finding and acquiring the technology but in successfully nurturing and exploiting it after it has been acquired. Many aspects of technology transfer have been studied (Parente, 1994). Most of the studies have focused on the reasons for outsourcing and on the acquisition methodologies. Although much is known about the types of external sources and transferring mechanisms, few studies address the user's internal process for absorbing and applying the external technology. In order to reveal all aspects of technology transfer, the user's internal activities demand further study. Managing the technology transfer process unavoidably requires a better understanding of the activities within the process.

## **LITERATURE REVIEW**

Studies of the flow of external technology within a user's organization and of factors affecting the user's next steps in the process are rare. Many studies of external technology transfer are taken from specific case studies or mathematical modeling. The focus is mainly on the reasons for outsourcing, the merits and disadvantages of external technology, and the various transfer or cooperation mechanisms. Detailed interaction mechanisms are not mentioned in these studies because researchers have neglected to consider the internal activities of the receiving firm. Previous studies on external technology are well summarized by Lucien. Several studies stressed the importance of receiving a firm's internal activities to the successful transfer and utilization of external technology (Cohen, 1995). Some studies focused on the roles that internal R&D plays in the effective transfer (Cohen, 1990). Other studies stressed the successful utilization of external technologies after transfer (Chatterji, 1997). Some authors showed empirical evidence that external technology acquisition was more successful when it was combined

with internal R&D (Faulkner, 1995). Even though these studies stressed the importance of internal R&D involvement, the detailed mechanisms of interaction were not analyzed. A couple of studies have examined external and internal sources of technology at the same time and have tried to show the relationship between these two innovation sources (Kurokawa, 1997). In their studies, the authors treated the internal technology source as a fixed unit rather than a flexible unit that changes according to the type of external source and the transferring status. The authors show decision criteria by which a firm decides to buy technology from external sources or to develop it by itself, and the situations and conditions that best allow the two sources to be integrated (Kurokawa, 1997). Trott showed a firm's inward technology transfer process using four perceptual processes in his case study on the chemical industry: awareness, association, assimilation, and application. This is one of the rare attempts to reveal the interaction mechanisms within a user's organization. This technology transfer activity, adoption of new technology and integration into the user's mainstream business, was an organization learning process. Many studies have been done on the organizational learning or knowledge-creating process, even though there has not, until now, been one complete theory (Argyris, 1994; Kim, 1993). Many of these authors stress that organizational learning is a critical element for survival in the rapidly changing business environment. As the business environment becomes more turbulent and more complex, the need for organizational learning accelerates and must be rapidly adjusted to the changing environment. Various models and processes for organizational learning and knowledge-creation were suggested in these studies. Previous studies of the organizational learning were well summarized by Neilson. Argyris suggested two types of learning models in the workplace: single-loop learning and double-loop learning. He explained, "double-loop learning asks questions not only about objective facts but also the reasons and motives behind those factors; while, single-loop learning asks a one-dimensional question about objective facts to elicit a one-dimensional answer." Schroeder and Congden studied five manufacturing cases that adopted the same technology under Argyris's learning model, and concluded that double-loop learning was more efficient when adjusting to a major new technology. Kim suggested an integrated model for individual and organizational learning under the framework of Kofman's learning cycle for individuals (observe, assess, design, and implement), Draft and Weick's model on the learning process of an organization (scanning, interpretation, and learning), and Argyris's single and double-loop learning. Kim also argued, "the learning process is fundamentally different at the organizational level, even though the meaning of the term "learning" remains essentially the same as in the individual case." Several authors tried to connect the organizational learning with the external technology acquisition or alliance (Steensma, 1996). Steensma suggested an interplay model between the level of collaborative interdependence and dominant learning modes for user's technological competency development. Levinson and Asahi suggested four steps for inter-organizational learning in alliance (aware and identify, transfer and interpret, use, and

institutionalize) and explained the factors that affect the learning (culture, structure, technology, and absorptive capacity). Even though these authors effectively explained organizational learning and knowledge creation, most studies were done conceptually and lacked empirical evidence for their arguments.

## **RESEARCH DESIGN**

The purpose of this study is to analyze how not fully developed (incomplete) technology<sup>1</sup> is transferred into and incorporated into a user's organization. By studying the procedures and processes used in multiple cases that involve acquiring external technologies, it will be shown how the user's internal activities are affected by the external technology and vice versa. Following the literature review, twenty nine (29) firms who had transfer technology from a Korean public research institute were surveyed. The brief written survey was used to collect preliminary information on the technology transfer process. This data was analyzed and used to prepare for indepth personal interviews conducted over a month period following the year in which the firms had participated in the technology transfer program sponsored by the Korean Ministry of Science and Technology<sup>2</sup>. A total of nine (9) firms in the machinery field were interviewed in-depth to find out detailed contents of the technology transfer activities between the firms and the public laboratory. These firms were located in Korea and were not concentrated in a particular geographical area. All firms were small and a medium-sized firm, i.e., total employees does not exceed two hundred (200), according to the guidelines established by the Korean government. All firms interviewed transferred technology from either a Korean national research institute or a Korean university. The institutes and universities developed the transferred technology originally without any specific firm's usage. The selected interviewees were those who had participated in the firm's technology transfer process; most of the interviewees were CEOs (Chief Executive Officer).

## **RESULT OF STUDY**

### **Stages of Technology Transfer Process.**

---

<sup>1</sup> Technology that fundamental principals are known, but additional developments are needed to be used for a certain commercial purpose

<sup>2</sup> Central government organization in Rep. of Korea which is mainly in charge of science and technology development of national level ([www.most.go.kr](http://www.most.go.kr))

Based on the literature review and the preliminary survey, it was proposed that the total process of each firm's technology transfer and application could be classified into the following distinct stages: 1) the Awareness stage, 2) the Evaluation stage, 3) the Contract stage, 4) the Formal Transfer stage, and 5) the Application stage. The five distinct stages could be confirmed through in depth personal interviews to determine details of each stage. Each stage has specific activities that were carried out and events that were held to be important were: to become aware, evaluate, make a contract, transfer formally, and apply external technology during a certain time period.

In the Awareness stage, the user firm becomes aware of the existence of the external knowledge. It becomes aware of which organization has the technology and generally the content of the technology. Such awareness may occur unexpectedly or intentionally. Some firms say that they became aware of the existence of technology as they collaborate with the source organization on other projects. Some firms obtain information by chance while attending technology exhibitions, symposia, or seminars. Other firms say that they had sought specific technologies to solve urgent problems, such as those related to quality improvement or production cost reduction. The Awareness stage could last a relatively long time if the potential user firm has no immediate plans to utilize the external technology even though it knows of its existence. When the demand for applying a technology is high, the time spent in the Awareness stage on one technology is relatively short. There were three (3) such firms in the study that had an urgent need for specific technologies. These firms began the evaluation as soon as the existence of technology became known. In one case, the firm had a very urgent need for technology that could solve a defect in a product. The firm was contacting various sources and searching for various solutions for the problem. Most of the time spent in the Awareness stage was looking for and comparing various technologies.

If a firm has interest in using a technology, whether it has become aware of it by chance or intentionally, the user firm will begin to formulate a plan for possible application of the technology. In some cases, the user firm already has a clear target application, which stemmed from the user firm's own assessment of a specific future benefit, an urgent market demand, a need to respond to a competitor, or a suggestion by the technology source. When a potential user firm senses that it can achieve an intended target by applying external technology, the Evaluation stage begins. In this stage, more detailed data and information on the technology are required to make an in-depth assessment of whether or not the technology has the potential capacity with further development to provide the desired needs when applied to the target application. At this stage, the potential user firm tries to catalogue the potential capabilities of the technology for application to the target as clearly as possible. It attempts to carry out all aspects of the new product development process to the extent possible including whether the technology

is applicable, whether the application will be easy or not, and whether there is a market for the new product. The user firm also tries to estimate the costs and the amount of time that will be necessary to execute the whole technology transfer and utilization process. The capabilities of the external technology, the impact on the target, and the budget are all interrelated. Where possible, adjustments are made in the analysis at this stage of these three items until the potential user firm arrives at a conclusion that the technology is feasible for the target application. The user firm also tries to check the source organization's other technological capabilities in case assistance is needed for further development or modification during application. If the potential user firm does believe that the incomplete technology is questionable for the target application, it tries to research other technologies or sources.

Negotiations related to technology transfer start when the potential user firm concludes that the external technology and its source organization can provide valuable benefit for the intended target. If a technology receives a favorable assessment by the user firm after review of further information, the source organization and the firm negotiate the terms and conditions for transferring the technology. In the Contract stage, the source and the user agree on a plan for technology transfer and utilization. During negotiations, firms must often balance minimizing technology transfer fees with maximizing support from the technology source. Firms report that negotiations with public research institutes are generally not as difficult as negotiations with private companies. Usually public research institutes welcome the commercialization of their technologies<sup>3</sup>. They also expect a continued cooperative relationship with user firms with whom they have agreed to supply their technology.

External knowledge transfer begins full-scale once all parties involved have formally agreed to the contract. In the formal transfer stage, the source provides its technology to the user as contracted. Various teaching and learning techniques and media are used as the source organization teaches the user firm, and vice versa. Methods include holding seminars, dispatching source and user personnel to each other, and providing technological documents and drawings. The most frequently used method is dispatching technological personnel for one or two months to each other's sites. During this stage, the user also tries to forecast possible problems in applying the new technology and ways to solve such problems. The user firm also tries to set criteria that will allow the new product's performance to be evaluated.

---

<sup>3</sup> It is recommended by national technology policy of Rep. of Korea, that the public research institute and researcher can get some portion of Royalty if their technology is transferred to private firm and commercialized.

In the Application stage, the transferred technology is applied to the user firm's intended target application. During this stage, the transferred knowledge is modified, developed further, and combined with the user firm's other knowledge in order to achieve the target.

Each stage happens sequentially. Within certain stages, activities are reported many times while other activities occur only once during the whole process. For example, in the Evaluation stage some activities may be repeated many times. The user firm surveys and checks an external technology based on what is known about the technology. If the user thinks that the technology cannot meet the firm's needs, it may give up on the idea of transferring that specific technology. If the user still thinks the technology can provide enough performance, it goes back to the source for a more in-depth study of the external technology until a decision can be made on whether or not to purchase the technology. This additional study may help the potential user firm increase its awareness and understanding of the external technology whether it purchases the technology or not. Generally, the Contract stage and formal technology transfer stage occur once during the whole process. In the Application stage, trial and error is used to help close the gap between the externally transferred technology and the intended target application. Developing a prototype, testing, finding problems, and solving them are a process that occurs continuously and repeatedly until the final target is achieved during the Application stage.

### **External technology transfer model.**

During the Awareness stage, the existence of potentially useful external technology is generally made known and introduced to a firm's CEO, in the case of small firms, and by executive members in medium-sized firms<sup>4</sup>. Executive members are personnel whose positions are lower than CEO but above middle manager. The executive members include CTO (Chief Technology Officer), the head of marketing, and the head of the finance or production division. Although learning and knowledge creation occurs during this stage, it is limited. In most cases, there is no systematic way of carrying out the Awareness stage; however, most firms feel that there is no way to improve on carrying out this stage.

Activities involved in the Evaluation stage are generally carried out by CEOs in small firms and executive members in medium-sized firms. This stage allows firms to understand more about the external technology and the source organization. The most important action in this stage is deciding whether or not the external technology can meet the requirements for achieving the objectives. Many things are surveyed and checked during this stage: the applicability of the technology to the intended product; the costs and benefits of the transfer and production; the time required for mass production; intellectual

---

<sup>4</sup> Total employees of firm is between one hundred to two hundred.

property issues; the degree of risk in investing. The source organization and the user firm have equally important roles at this stage. Choosing a proper target is the user firm's responsibility. Providing proper information on the technology in order to enable a decision is the source organization's responsibility. Source organization typically acquired patents on their technology. Likewise, the institute has a duty to open its technology information to qualified small and medium size firms if a firm desires it because the technology is developed by public funds. Technological ability is the most important feature assessed during consideration and decision-making activities. Learning and knowledge creation also occur at the evaluation stage. The content of knowledge is similar to that of the Awareness stage: knowledge is gained on the technology itself, on the target, and on the methodology for using the technology. Although the knowledge in this stage is similar to the Awareness stage, the user firm usually has a deeper and broader knowledge base after this stage. In some cases, the user learns most of the technology developed at this stage, and only a few pieces of knowledge remain to be learned during the formal transfer stage. Most firms feel that they do not need to improve their methods of surveying and evaluating through the Evaluation stage.

In the formal transfer stage, personnel from both the source organization and the user firm participate in the transfer. Ten persons for both entities is a typical participation in each technology transfer project. Compared to the Awareness or Evaluation stage, the working group's participation is more active. In this stage, the source's role is more significant compared to its role during other stages. Most of the actions that occur during this stage involve learning from the source organization. Learning happens through various styles and channels. The most common method involves sending a user firm's technology personnel to a source organization's lab to observe and study demonstrations and attend lectures on related theories. Sometimes personnel from the source visit the user's facilities and provide instruction on the technology and related areas. Conducting seminars or workshops is a method commonly used to provide instruction. Written documents as well as drawings and software are also delivered to the user firm. The most important concern at this stage is to learn as much as possible from the source organization. Firms undergo such a learning process, as they have always done before, without considering the effectiveness or the efficiency of the methodology they are using. At the end of this stage, a user firm knows not only the technology to be transferred but also the source organization's related technological abilities.

The Application is the critical stage of the whole transfer process. Producing a prototype based on the transferred technology, analyzing and testing the prototype, and modifying and remaking the prototype carries out the application for a new product carries out the application for a new product. This process of trial and error occurs repeatedly until the user firm obtains a satisfactory result. The ability of the external knowledge is actually

proven at this stage even though it is screened first at the Evaluation stage. Most learning and knowledge creation occurs during this stage. When a user firm encounters a problem during the Application stage, the technology is re-examined to ensure a correct understanding of the technology. If there is an apparent lack of understanding of the technology, further learning is made to acquire a better understanding. If the user firm cannot solve the problem even though it understands the technology correctly, it looks for other technological knowledge that will help solve the problem. These feedback processes are very similar to the single-loop and double-loop learning processes of Argyris. Meeting unexpected problems and trying to solve them are actions that occur most frequently at this stage. The source organization's role often changes to co-developer or consultant at the stage.

The model for the process of transferring technology from Korean public research institutes and universities to small and medium size Korean machinery firms developed in this study is shown in Figure 1. The user firm is expected to conclude certain outcomes when completing each stage.

It was shown that distinctive stages also existed during technology transfer in the cases of the Korean machinery firms. This study verified Trott's result of the existence of distinctive stages in the technology transfer process. In the case of small and medium-sized Korean firms, the technology transfer process can be classified in five distinctive stages according to the types of activities and the purpose of the activities within the stages: Awareness, Evaluation, Contract, Formal Transfer, and Application. Most stages had similar features to that of Trott. The exception was the addition of the Contract stage. This is a distinctive stage necessary for negotiation, deciding terms and conditions, and securing a contract. This stage was not recognized in the Trott study since it looked only at internal technology transfer. The lack of a Contract stage in Trott's study may be explained by the difference between inter-organizational (formal) transfer and intra-organizational (informal) transfer. The cases in this study were formal technology transfers from external sources while Trott's cases were not. The specific activities of each firm within each stage were described in detail in this study. This study documented how each specific activity was connected with other activities throughout the entire process for each firm.

Three groups of diverse actions that occurred frequently during the process were shown: judging the usefulness or potential value of the external technology, selecting the target, and applying the transferred technology. The role-changing pattern of source and user during the whole process was also shown. The source's role changed from technology teacher, at the formal transfer stage, to co-developer, during the Application stage, to consultant, at the end of Application stage. The user's role changed from a selector, at the

Evaluation stage, to a learner, at the formal transfer stage, to an applier, at the Application stage.

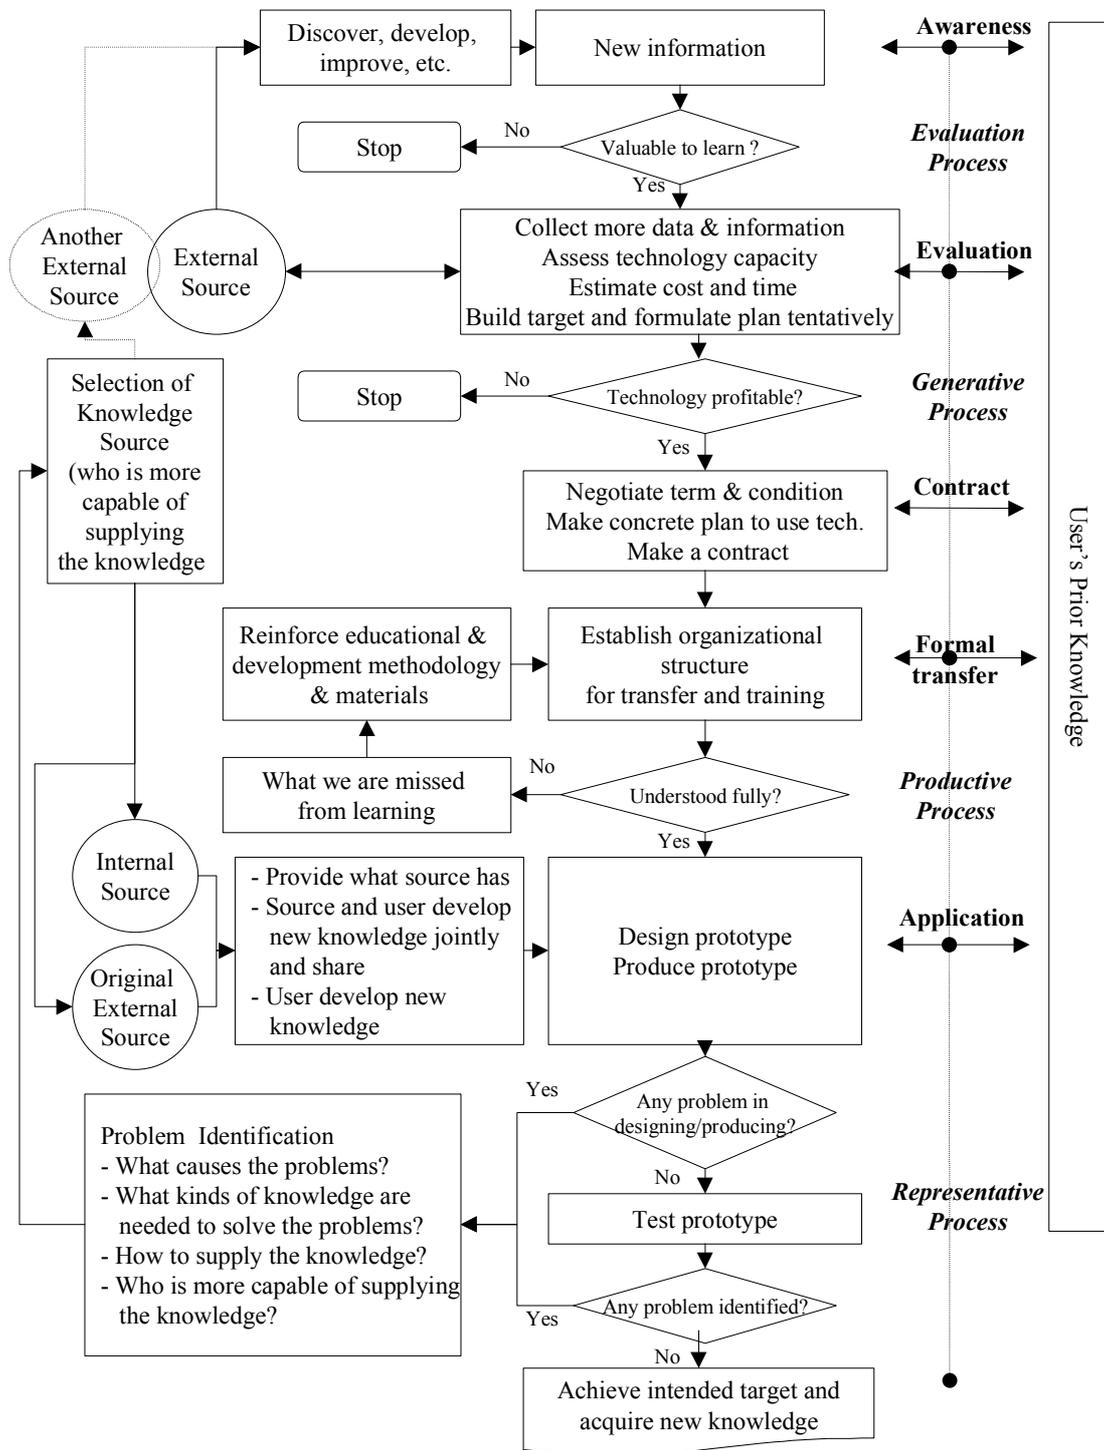

Figure 1. External technology transfer model

The types of knowledge the user obtained through learning or creation within specific stages were revealed. Learning for the user occurred most during Evaluation, formal transfer, and the application, while creating by the user occurred most during Evaluation

and application. It was revealed that approximately two years were required for public research institutes' technologies to be transferred to the user and utilized to achieve a satisfactory prototype. Most of this time was spent evaluating the technology and potential profitability (average four months) and applying the external technology to the user's specific purpose (average ten months). The user's criteria for a successful technology transfer were shown to be the production of a satisfactory prototype and the acquisition of enough technological knowledge to continue the business development plan. A successful technology transfer was dependent upon user's persistence and prior knowledge. The study revealed that, although eager to obtain the technology transferred, all nine firms were unable to meet the technology transfer budget and time goals. Thus, more than one year was required beyond the planned completion date. The final costs exceeded the initial estimate by three to four times. Each of the firms recognized the need to better understand the technology transfer process. This exploratory study provides analytical structures that the source and the user employed to achieve their goals and performed specific activities required to transfer external knowledge into the user's organization. The structure built in this study can further enable research to deepen and broaden the knowledge of technology transfer.

## CONCLUSION

In order to manage the technology transfer process better and to significantly improve the process, it is necessary to have a better understanding of not only the stages but also the general activities within the stages. Through this exploratory study of small and medium-sized Korean firms in the machinery field, several aspects of the technology transfer process were shown:

Table 1. Comparison of Trott's classification and the classification in this study

Trott	This study	Outcomes of each stage (this study)
- Awareness: Scans for and discovers what information on technology is available.	- Awareness: Become aware of the existence of external knowledge (unexpectedly or intentionally).	Awareness: Knowledge on the owner of external technology, General knowledge on the content of the external technology and usages, Knowing whether the technology is available to the user
- Association: Recognizes the value of the technology for the organization.	- Evaluation: Collect more detailed data and information on the technology, Assess technology capacity and build target to use the technology, Estimate costs and times needed for technology transfer and utilization, Formulate a plan to use the technology.	Evaluation: Knowledge on the detailed content of the external technology, Knowledge on the capacity of the external technology, Estimated cost and time to transfer the technology and to use it for user's purpose, Estimated benefit that the technology can provide to user, Tentative target to which the external technology is applied, Tentative plan to transfer and to use the technology.
	- Contract: Make a concrete plan for technology transfer and utilization, Negotiate terms and conditions, Make	Contract: Determined terms and conditions for the technology transfer, Concrete plan to transfer and to use the technology. Formal transfer: Full knowledge on the content of external technology, Technological materials provide from source such as drawing, document,

<p>- Assimilation : Communicates ideas and Creates genuine business opportunities - Application: Applies the technology for a competitive edge.</p>	<p>contract. - Formal transfer: Provide technology as contracted, Forecast possible problems and ways to solve, Set criteria to evaluate new product's performance. - Application: Apply transferred technology for the user's intended target, Modify and develop further and combine transferred technology with other knowledge, Acquire additionally necessary knowledge.</p>	<p>sample, etc, User side's educated and trained personnel on the technology, Anticipation of possible problems that would happen during the application and tentative solutions for the problems, Understanding on partner's job style and ways of cooperation. Application : Satisfactory prototype(s), Justified full knowledge on the content of external technology, Other miscellaneous knowledge necessary for the target, New knowledge that was not transferred from source originally but developed during the application, Knowledge on the partner's technological capacity on other fields but related (or have potential to be related) to source's business area</p>
---	---	---

It was shown that distinctive stages existed during technology transfer in the cases of the Korean machinery firms. For the small and medium-sized Korean firms, the technology transfer process can be classified in five distinctive stages according to the types of activities and the purpose of the activities within the stages: Awareness, Evaluation, Contract, Formal Transfer, and Application

The source's role changed from technology teacher, at the formal transfer stage, to co-developer, during the Application stage, to examiner, at the end of Application stage. The user's role changed from a selector, at the Evaluation stage, to a learner, at the formal transfer stage, to an applier, at the Application stage.

The technology transfer process was surveyed for the point of organizational learning and knowledge creation. Learning occurred most during Evaluation, formal transfer, and the application, while creating occurred most during Evaluation and application. It was also shown how the user firm learned and created the technological knowledge during the technology transfer process. Each firm had a clear target application to develop a commercial product, such as oil coupler, solid ball and portable fume collector, etc., in the course of technology transfer. Table 1 is the comparison of Trott's classification and the classification of this study.

This exploratory study provides a model which the source and the user employed to achieve their goals and performed specific activities required to transfer external knowledge into the user's organization. The structure built in this study can further enable research to deepen and broaden the knowledge of technology transfer.

## **Social Support Theory:**

A New Framework for Exploring Gender Differences in Business Owner Networks

## **ABSTRACT**

Historically, studies of small firm networks have concentrated on collecting quantitative data on the size, shape and other structural dimensions of business owner networks. As a consequence, little is known or understood about the contents of networks or the processes of interactions by which such networks are created. There is also a scarcity of empirical evidence about the types of networks in which women business owners are

embedded or how they make use of their networks for business purposes. One reason for this may be that to date, entrepreneurship research has predominantly defined women's experiences in relation to men. Consequently, what is known about small business owner networks has been shaped by the perceptions and experiences of men. This paper argues that to advance knowledge about small firm networks and considers the impact of gender, research should also consider the network experiences of women business owners. To engage in such research, this paper proposes a conceptual model of business owner networking which is informed by social support theory. In particular we argue that as social support theory refocuses research on entrepreneurial social networks from structure to content, it may be better suited to and reflective of women business owners' networking experiences. Having proposed this conceptual model, the paper concludes with recommendations for a research agenda for exploring and creating an understanding of the impact, which gender and social capital may have on business ownership.

*Key words: female entrepreneurs, social networks, social capital, social support*

## INTRODUCTION

Research that has sought to explore the relationship between social capital and business ownership is at an early stage of development. Consequently, there is no agreed understanding of how to define or measure a business owner's social capital (Davidson and Honig, 2003). However, borrowing from established sociological theory, it can be argued that social networks constitute a major component of an individual's social capital (Baron and Markman, 2000; Mitchell, 1969). Since the 1990s, entrepreneurship and small business research has been interested in exploring the relationship between networks and the survival and success of small firms and it is now generally accepted that networks are particularly useful for small firms because they afford access to resources that small firms cannot easily access through market mechanisms (Curran *et al.*, 1993; Granovetter, 1985; 1992). Despite significant research interest in business owner networks, it has more recently been suggested that like much of the small business management process, gender differences may exist both in the types of networks in which business owners are embedded and their use of these networks for business purposes (Shaw *et al.*, 2001). However, research about the gender differences of owner-manager networks is at an early stage and initial findings are inconclusive (Carter, 2000). For example, survey-based research from the US suggests that women business owner's networks differ significantly from those of men regarding activity levels, density and with whom they network (Aldrich *et al.*, 1989); however similar UK research has found fewer gender differences in these respects (Cromie and Birley, 1992). There is also little agreement about the types of individuals who are found to contribute to owner-manager networks. For example, Moulton (2000) suggests that both men and women are more likely to network with persons of their own gender whereas Aldrich *et al.* (1989) argue that while the networks of women business owners are not as extensive as those of men, the networks of both male and female business owners tend to consist mostly of men. Finally, Ibarra (1997) found that women tend to have two types of networks, one for friendship and emotional support and another for advice and information. The former consisted primarily of women, the latter primarily of men.

Notwithstanding these contrasting findings, research suggests that women business owners face particular challenges when establishing and accessing networks (Moore and Buttner, 1997). Brush (1997) suggests that one reason for this may be that women are

less welcome in social networks. Considered alongside suggestions that women are likely to have stronger communication and interpersonal skills which should enable them to network effectively (Wilkinson, 2001), this suggests that it as a consequence of social structures which are deeply rooted within institutional and traditional business and social practices, women business owners may be prevented from accessing networks. At present, however, a scarcity of empirical evidence about the types of networks in which women business owners are embedded or and what assistance or support they seek through their networks has restricted comprehensive explanations which may account for gender differences in business owner networks. This lack of empirical data about women business owners' networks and their experiences of networking raises an interesting question: *do women business owners perceive gender-based differences in both the types of networks in which they are embedded and the type of support that they can access?*

## **BUSINESS OWNERSHIP, SOCIAL CAPITAL AND NETWORKS**

According to Weiler and Bernasek (2001), the long-term persistence of network-based advantages, for example, preferential treatment in the timing and delivery of orders, may make women business owners consistently less successful. This is echoed by Brush *et al.*, (2002) who posit that social structures and the way women socialise may influence the social capital endowments with which they start their business. Further, the ability of women business owners to penetrate entrenched male networks may be limited and be reflected in the fact that women-owned businesses are consistently younger than those owned by men (Carter *et al.*, 2002). However, social structures tend to be invisible, unless they are thought about consciously (Stets and Burke, *forthcoming*). A final aspect influencing the extent of women business owners' networks may be found in the different actions and decisions that women make with regard to networking just because they are women, thus imposing a self-restriction on their networks (Aldrich *et al.*, 1989).

Thus, extant research seems to raise more questions than it answers and suggests that there is a pressing need to investigate women business owners' networks particularly if the contribution, which women-owned businesses make to economic and social development is to be encouraged and supported. At present, female participation in self-employment and business ownership varies by country with marked differences between the US and Europe. For example, recent US-based studies have shown that not only are women now starting new businesses faster than men, they also constitute around 38% of all owners small firms, (Carter, 2000) while European figures suggest that the female rate of business ownership has remained static over long periods. In Denmark, for example, women's share of new business ownership has remained constant at about 30% of all new businesses since monitoring of this began in 1999, but is now declining (Hancock and Bager, 2004). It is thus likely that national differences in industry structure may influences founding rates. Such differences in national rates of women's business ownership suggest a number of implications. The higher proportion of women-owned businesses in the US where affirmative action is supported by government suggests that when a more level playing field is created, more women become involved in business ownership. A second implication is that when, despite increasing participation in the labour market, European figures reveal that women's business ownership has either remained static or has declined over the past five years, this may be because women's participation in business ownership is restricted by gender-based influences including the types of networks in which they are embedded. Supporting this is the argument that the types of networks within which business owners are embedded will be influenced by their human capital, including their

educational, employment and managerial experiences (Madsen *et al.*, 2003). Taken further, it can be argued that the ability to create and manage a small business will be influenced by an individual's social capital which includes social, cultural, educational and managerial experiences, and can be affected by social structures and the range of opportunities which the labour market offers to acquire these experiences.

Building upon the argument that, to date, small business research has defined women's business ownership experiences in relation to that of men, it can further be argued that there is a need to address the gender blindness and gender bias which has dominated small business network research. This is supported by Greer and Greene (2003), who argue that feminist theory may help reduce or even eliminate such bias. Particular to our interests in small firm networks, we propose to reframe social network research from a woman's perspective by developing a conceptual model of business owner networks, which is informed by social support theory. Our reason for this is that while social network theory recognises that conceptually networks are comprised of structural and interactional dimensions (Mitchell, 1969; Granovetter, 1973; Powell, 1990), most research has focused on the structural and quantifiable interactional dimensions of business-owner networks. These dimensions essentially 'count' such aspects as the number of contacts, how frequently they are used and the diversity of the occupations of those involved in a business owner's network. Although such research has found some gender variation in business owner networks (Aldrich *et al.*, 1989), the contents of such networks – that is the meanings which individuals attach to the relationships in which they interact – may reveal substantial gender differences. As social support theory encourages exploration of both the structure of business owner networks and the contents and interactions by which such networks are created, its application to small firm research has the potential to generate a comprehensive understanding of such networks which may provide clearer insights into the impact which gender may have on business owner networks. As Nielson (1990) suggests, the application of social support theory to business owner network research offers the potential to explore business owner networks in a different way and to look at the familiar differently.

## **THEORETICAL FRAMEWORK**

To address this research gap and consider the impact, which gender and social capital may have on business owner networks, we recognise that gender is a social structure that is generally accepted without questioning. For example, gender is taken for granted as a means of organising all aspects of our society, including families and work. This infers that research on women, including women business owners, is often carried out on premises derived from research on men and as such, may lead to gender-biased results. While gender-neutral research can be impossible to achieve, we argue that by building on a feminist essentialist approach, research can recognise and account for gender differences in both theory and method. According to Greer and Greene (2003), there have been sparse efforts to use feminist theory in entrepreneurship research and they are critical of current efforts for the lack of integration between studies of women in the labour force and entrepreneurship research and the lack of focus on one perspective within feminist theory. We seek to address these criticisms by taking a social support approach within the feminist essentialist perspective. This perspective perceives gender as a variable emphasizing how women's experiences are different from those of men. Where traditional research disregards gender, often generalizing between the sexes without taking account of possible differences, feminist essentialist research starts from the recognition that

possible differences exist between men and women in terms of situation, experiences and discrimination and recognizes that these must be taken into account.

In the following sections, we first consider the relationship between social capital and social networks arguing that social capital is a major component of social network analysis. We then suggest that by incorporating elements of social support theory in network studies of women business owners, a more comprehensive understanding of such networks can be acquired. Finally, we discuss the advantages, disadvantages and challenges to future research of such an approach.

### ***The Relationship between Social Capital and Social Network Theory***

Social capital is not a new concept – its earliest use dates back as early as last century (Borgatti et al., 1998). Despite this, social capital has been described as a growth area in organisational network research (Borgatti and Foster, 2003) and is rapidly becoming a core concept in entrepreneurship research. In recent years, research has turned its focus from social networks to social capital, arguing that social capital is the value of a network's form and content (Burt, 1997). However, disagreement continues to exist concerning how to define and measure social capital (Hospers and van Lochem, 2002). Despite these definitional ambiguities, most definitions stress the relationship between social capital and social networks. For example, Burt (2000) suggests that when social networks contribute to entrepreneurial goals, they constitute social capital. Likwis, Borgatti and Foster (2003) argue that social capital equals the value of network connections. Social capital has also been described as the tangible and intangible resources acquired through social networks (Gabbay and Leenders, 1999; Greve and Salaf, 2003) and as being comprised of a number of variables including social networks. Developing this final point, Baron and Markman (2000) suggest that social capital consists of social networks and the support gained from these.

To overcome these definitional difficulties, social network theory may offer an appropriate analytical framework for identifying social capital at an individual level and considering the impact, which such capital will have on individual actions and behaviours. This is supported by Burt (1997:355) who defines the social capital value of a network as '*a function of both form and content*' and also by Bourdieu who proposes that social capital is '*the aggregate of the actual or potential resources which are linked to possession of a durable network of more or less institutionalized relationships of mutual acquaintance and recognition*' (1986:248). An individual's social capital is further determined by the size of their relationship network, the sum of its cumulated resources (both cultural and economic), and how successfully (quickly) the individual can set them in motion. Considered alongside the concept of a social network which Mitchell (1969) conceived of as possessing both structural and interactional dimensions, these descriptions of social capital lend support to the suggestion that by analysing the social network within which a business owner is embedded, much can be learnt about their social capital.

Mitchell (1969) defined the content of social networks as a way of describing the meanings which people attach to relationships and the understandings they have about the implications which their involvement in particular relationships have for their actions and behaviours in respect to those relationships. For example, if a person defines a relationship as a 'friendship', they will engage in activities and behaviours, which they perceive to be appropriate to those of a 'friend'. As the contents of relationships are not directly observable, Mitchell suggested that the meanings, which individuals attach to relationships, could be interpreted in terms of their information, communication or

normative contents. Identification of these contents is complicated by what Mitchell referred to as the 'multiplexity' of relationships. Multiplex relationships are comprised of more than one content and within any single relationship, a number of contents will typically exist. While recent discussion of the content of social networks (for example, see Blackburn *et al.*, 1990; Szarka, 1990) has sparked debate over whether, for example, economic networks can be distinguished from those comprised of information and normative contents, Mitchell (1969) was explicit that while social networks are comprised of a variety of contents, this did not imply that each content represented a conceptually distinct network. Drawing on the work of Kapferer (1969), Mitchell argued that within multiplex relationships, the interactions between social actors are comprised of a variety of contents. For example, the same two people may share an employer-employee relationship comprised of an economic content and also a friend-friend relationship containing normative expressions. As a consequence, the behaviour of individuals vis-à-vis multiplex relationships cannot be understood unless *all* of the contents of which they are comprised are identified. Mitchell defended this by explaining that where relationships contain more contents, each one impinges on the interactions by which the other contents are created. Using the same example, this suggests that when an employer-employee also engages in a friend-friend relationship, their interactions in the former may condition those in the latter.

Mitchell's description of a social network suggests that individuals will seek a variety of support from their networks. Taken further, this suggests that the milieu in which network interactions are played out influences the type of outcomes obtained from network interactions. For example, the same friends might share certain revelations over a cup of coffee in an environment which they regard as 'safe' yet under different circumstances, for example during a meeting at work, they would not be comfortable sharing such confidences. Social network theory suggests then that individuals are embedded within and connected to one another by networks of overlapping relationships which are comprised of different, often multiple, contents and varying strengths (Granovetter, 1985; 1992; Szarka, 1990). Accepting this, social network theory argues that social action and behaviour can be understood as a compound of the positions that individuals hold within social networks and the interactions that they share. Described like this, and given the difficulties inherent in analysing and measuring social capital, we argue that social support theory offers an appropriate analytical framework within which to position research which seeks to analyse and understand the impact of social capital on business ownership. Particular to our interest in gender, social capital and business ownership, this argument is supported by More and Buttner (1997) whose research found that women are restricted in their access to networks, hold less central positions and use their networks as sounding boards rather than for resource acquisition. However, while these gender differences may be explained by the types of support, both tangible and intangible, which are contained within business owner networks, the scarcity of small business network research which has sought to explore both the structure and interactions of business owner networks or to consider the impact which gender has on such social networks restricts a comprehensive understanding of the extent of and reasons for these differences.

Social support theory may assist in addressing this research gap. A comparison of Mitchell's perception of social network characteristics and those of social support theory reveals obvious overlaps in the structural elements analyzed. Therefore using social support qualities to help analyze the content of social networks seems both relevant and natural. Some social support researchers have likewise seen the advantage of combining their research with social network theory (Wellman and Hiscott 1985). Despite the shared characteristics between social network theory and social support theory, few social

network researchers have implemented social support constructs in their research and none refer to these constructs as derived from social support theory.

### ***The Relationship between Social Network and Social Support Theory***

Early research conceptualized social support as '*a generalized resource available from an individual's network of friends and acquaintances (the social network) that helped one to deal with everyday problems or more serious crises*' (Walker *et al.*, 1993:71). The subject was addressed from a structural point of view, very much the same way as social networks have hitherto been analysed. The structural elements of social support that were applied included network size, density and frequency of interaction, indeed according to Schwarzer and Leppin (1988:334) '*sometimes all of these aspects are considered as 'support'*'.

However, more recently researchers have realized that the composition of the social network is as essential as the presence of a dyadic tie. Different relationships provide different types of support. This means that a business owner has to maintain relationships with different types of individuals in order to cover all needs. In other words, family, friends and acquaintances provide certain types of support while colleagues and other associates provide different types of support. Within the social support perspective, a network is thus perceived as a complex and unique entity but contrary to the social network perspective, focus is on the specific resources provided by specific individuals in specific contexts. Thus, social support theory picks up where social network theory leaves off: operationalizing the content of social networks. Hitherto, social support theory has primarily addressed how various types of support affect an individual's psychological wellbeing. However, these concepts can be easily transferred to a business context, e.g. imagine how the social support given by an individual's close and extended network influences the handling of stressful periods or crises that arise during the process of new venture foundation. Founding and running a new business may readily be perceived as an event with many conflicting demands for which the entrepreneur or business owner seeks support from his or her network to handle. Further, entrepreneurship research has shown that relations of kinship, friendship and previous work relations may be important players in the up-start phases of new venture creation and members of these groups may even participate in founding teams (Ruef *et al.*, 2003).

However, most research on social support has so far focused on identifying how power and status in network relationships reflect on the social support obtained through a comparison of the social support obtained via three types of kinship relations (parent-adult child, siblings and extended kin) and those obtained through relationships with friends, neighbours, and co-workers (Walker *et al.*, 1993). Translated into a business context, Bian (1997) found that achieving success in business transactions may be related to attaining status in the social structure of the business segment concerned. In another study, comparing the contacts of men and women, Lin *et al.*, (1981) found that men were much more likely to reach higher status contacts than women. In general they found that support tends to flow through equals/peers, which means that women may thus be disadvantaged as regards access to business resources (either tangible resources or information) because as yet there are fewer women among the entrepreneurs and business owners to include in their social networks. Interestingly, women are just as aware as men if not more of the need to develop and use networks (McGuire, 2002).

Some of the contents of the interactional dimensions proposed by Mitchell (1969), overlap with those suggested by social support theory. According to a literature review by Wan *et*

al (1996) social support research has consistently distinguished between four types of support: *emotional, informational, companionship and tangible*. So far, social support research has found that it is highly unlikely that any one member of an individual's network provides all the four types of support. According to Wellman and Hiscott (1985), most ties convey only one or a few kinds of support and those that provide emotional support are unlikely to provide any other type of support. Emotional as well as companionship support are primarily found through strong ties, whereas tangible and information support are accessed through weak ties (Walker *et al.*, 1993). In other words, the strength of the tie and type of support provided are highly correlated.

**Emotional support** is associated with sharing life experiences. This type of support conveys that an individual is valued for his or her own worth and experiences and is accepted. Behaviours expressing *esteem, affect, trust, concern* and *listening* constitute emotional support. Emotional support helps enhance an individual's self-esteem. According to Campbell and Lee (1990) among others, women are more likely than men to provide emotional support. Wellman and Wortley (1989) found that it is also most likely that kin rather than friends provide emotional support since a certain amount of intimacy is needed in order to share what they call 'life experiences'. Such support is therefore sought from what is called "alters" in social network theory (Ruef *et al.*, 2003). A number of studies have further shown that kin and friends differ in the type of support given, thus friends are more likely to give companionship support (Essock-Vitale and McGuire, 1985; O'Connell, 1984; Warren 1981).

**Companionship support** serves to help distract persons from their problems or to facilitate 'positive affective moods' (Wan *et al.*, 1996). Activities such as spending time with others in leisure and recreational activities are subsumed under this category (Schwarzer and Leppin, 1988). According to Wan *et al.*, (1996), such activities reduce stress and provide affiliation and contact with others. Wellman and Wortley (1989) found that providers of companionship support are primarily close friends, colleagues and neighbours. Spending time in leisure and recreational activities with friends, colleagues or neighbours, e.g. exercising or watching a movie may provide a relaxed context in which individuals undertake networking activities that provide support (Wellman and Wortley, 1989).

**Tangible (or material) support** refers to the provision of financial aid, material resources and needed services, indeed all the various types of physical resources needed for running a business. Any behaviour providing money, labour or any kind of direct resolution of a problem can serve this function. Although the knowledge about the sources and forms of finance available to and used by entrepreneurs is extensive, little research has focused on how social networks influence on the access to tangible support, particularly seed-stage financing (Shane and Cable, 2002). However, entrepreneurs may have difficulty in identifying business angels and therefore primarily elicit tangible support from kin or banks (Neergaard *et al.*, 2003). Much evidence has also been offered that points to venture capitalists as providing informational support such as direction and advice in conjunction with their tangible support.

**Informational support** concerns the provision of knowledge that might help an individual to increase their efficiency in responding or generating solutions to a problem (Cross, 2000). It may also bolster an individual's belief in own capacity to handle challenges. Associated with this are thus behaviours that provide *feedback, advice, suggestions* and *direction* (Wan *et al.*, 1996). Wellman and Walker (1990) found that individuals with similar status are more likely to exchange small services such as

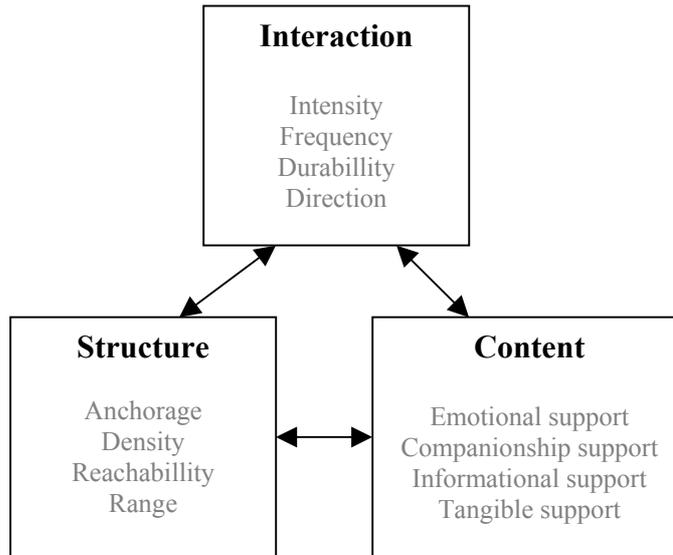

information. In a social network context this means that women and men with the same status should be more likely to exchange information with each other and unlikely to exchange information with individuals of their own sex with a different status. This could explain why some social network theory has shown that men and women entrepreneurs have similar networks and that these consist mainly of men (Aldrich *et al.*, 1989). Following the line of thinking provided in Wan *et al.* (1996), women may be more likely to reach out to men for information and tangible/material support because men are perceived as higher status individuals and in a better position to benefit the female entrepreneur's interests. This is also supported by Ibarra's (1997) findings.

## ***Proposed Research Framework***

Taken as a whole, social support theory provides meaning to the content dimension of Mitchell's framework, meaning that can be operationalized. Further, the structuring of support into four sub-categories may assist in understanding the contradictions in extant findings, e.g. that some researchers find no differences between the networks of men and women and other find that differences exist. These discrepancies may arise because men and women attach different meanings to their relationships and their understanding of the implications that their involvement in these relationships may differ (O'Connell, 2001). Further, recent organisational research has found that while female managers are typically involved in both personal and professional networks, male managers tend only to be involved in professional networks (Moore and Buttner, 1997). These findings thus imply that both the range of support available and the context in which it is provided may differ depending on the gender dimension. The question is, however, how gender differences arise and whether they have a positive or negative impact.

Thus, a tentative research framework incorporating the existing social network dimensions and social support theory is provided in Figure 1. The arrows indicate that each of these dimensions probably influence the other two, but the proposed research has to address the strength and type of such influence and how it is exercised. According to Mitchell (1969), content is a component of the interaction dimension, but where all the other components can be measured quantitatively, it is questionable whether the content dimension can be sufficiently elucidated through such measures. Figure 1 depicts the content dimension as a separate dimension, rather than being an element in the interaction dimension. The reason is that whereas anchorage, density, reachability and range, intensity, frequency, durability and direction can all be measured in quantitative terms, it may be difficult to quantify the content dimension.

**Figure 1: Social Network Research Framework**

In the content dimension we would be interested in identifying who provides esteem, affect, trust, concern, and listens to the ideas of the entrepreneur; what activities are undertaken in order to distract the entrepreneur from the problems encountered and with whom these activities are undertaken; who provides professional feedback, advice, suggestions and direction; who provides financial assistance, material resources and services; and finally, for all of these, what is the context in which the exchange takes place. Further we venture to research the interactional and structural dimensions in relation to the content dimension, since there may be a link e.g. between the frequency of contact and the amount of trust invested in an individual.

## **RESEARCH METHODOLOGY**

In order to achieve the above, a three-stage research strategy is proposed. First, we need to undertake in-depth interviews with an equal number of male and female entrepreneurs in order to increase our understanding of the four support dimensions. The interviews will be conducted using the critical incident technique (Flanagan, 1956), since critical incidences and the circumstances surrounding them are usually recalled with greater clarity than everyday occurrences. Therefore, it is more likely that an entrepreneur will be able to recall, who provided a certain type of support for e.g. the critical event of founding a venture. The interviews are expected to yield information about how best to phrase questions in a survey in order to avoid misinterpretation.

The second stage involves developing a questionnaire that incorporates the structure, content and interaction thus enabling us to explore and capture the multidimensionality of networking. Since particular identifiable characteristics of population members are germane to the subject of inquiry (gender) and a particular subgroup (women) is of special interest, we need to break down the population into subgroups and take a sample from each of these. Stratified random sampling requires that the individuals can be subdivided into mutually exclusive and collectively exhaustive groups, which is the case with gender. Thus, stratum A is females; stratum B is males. Since we expect female business owners to give similar answers and male business owners to give similar

answers to other males, but the group of males to show an overall difference from the group of females there is a distinct advantage in stratifying the sample by gender. Further, we will apply disproportionate sampling, which allows us to 'oversample' a small but important stratum in order to ensure that we have some representation of the 'rare species' of women business owners – even to the extent where we include all of them. Dividing the population into strata means that the sample is more likely to be representative, and that the sample mean is likely to be closer to the population mean. Given the limited population size, a threshold sample size of minimum 30 usable responses for each stratum is needed in each country in order to enable meaningful statistical analysis and relevant comparisons. When the exact size of the population is known, we will be able to calculate precisely the sample size needed to minimise the margin of error. Following the stratified sampling procedure, we will then proceed to select the sample systematically from the Yellow Pages taking into account the that we may have to select a larger sample from the female stratum in order to compensate for this being a smaller population.

Third, the findings from the survey will be further elucidated through another round of in-depth interviews. This is particularly important since surveys often yield results that are not readily explicated. The three-step strategy should further enable us to obtain a holistic picture of networking behaviour.

## DISCUSSION

What can social support theory contribute to entrepreneurship research? First and foremost, it refocuses research on entrepreneurial social networks from structure to content and hence helps elucidate the essence of networking. The premise is that individuals forge networks to elicit support, particularly in dire straits. Good support networks help them solve problems, regardless of the circumstances. Thus, social support theory provides meaning to the content dimension of Mitchell's framework; meaning that can be operationalized. The only research so far that seems to incorporate some aspects of social support theory is that of Aldrich *et al.* (1997:1) who studied "the ability of men and women entrepreneurs to mobilize *the support and resources* needed for the survival and growth of new businesses" [emphasis added]. Arguing that women experience their personal reality differently to men, they studied the process of acquiring resources such as legal, financial or accounting advice or business loans and financing, as well as expert advice from individuals in the same line of work. However, they did not find substantial evidence that women's networking behaviour and the support gained differed from that of men. In the light of the proposed framework it is clear that their research was partial, in as much as they focused singularly on the tangible and informational dimensions disregarding the influence of emotional and companionship support. Although these two dimensions may influence how individuals perceive the opportunity and possibility of founding a new venture we know next to nothing of their importance for men and women respectively. What role does emotional support play at the idea stage? Who enhances the entrepreneur's self-esteem in times of doubt by saying 'of course you have the capability to bring this off? What discussions take place with friends whilst jogging in the park? Business ideas may indeed be developed through informal discussion with good friends or colleagues in informal settings. So far, the contextual aspects of entrepreneurial networking behaviour have played a minor role in research frameworks. By adopting the proposed three-stage research strategy, we aim to create a holistic understanding of networking behaviour.

## CONCLUSION

This research will be aimed at exposing the situations in which women network and how their networking behaviour can be distinguished from that of men. Extant research has not yet been able to prove beyond doubt that differences exist in the networking behaviour of men and women. Reframing social network theory by incorporating social support theory may provide a promising framework for uncovering such gender differences. If the proposed research provides evidence that gender differences are identifiable through the incorporation of insights from another field, this has implications for future research, e.g. the networking behaviour of ethnic minorities may need to be addressed using a substantially different framework. In other words, the same size does not fit all.

Of course, it would not do to be blind to the pitfalls of trying to integrate a framework from another field, despite the apparent overlaps and possible advantages. But if we do not venture into untested fields we may not make any progress in broadening our understanding.

## ABSTRACT

Giving sense to information is a vital activity in most organizations. The SMEs competitive strategy results from this sense making by the entrepreneur and a few of his key staff. Among these are boundary spanners and gatekeepers; but within the high performing SMEs we notice other individuals who link, synthesize, interpret and adapt information much more efficiently. We call this person an "information catalyst". In some path dependant way these individuals play a major role in helping to reduce the equivocality of cues in fragmented information of weak signals for instance, they create space for, and thus enable, innovative initiatives.

Based on a case study of nine organizations we have discovered the existence of such catalysts in the better performing ones. In this article we identify factors that enhance their activity. By identifying path dependant information process determinants and variables this study sheds light on an important piece of the puzzle. We can thus demonstrate how information is transformed into knowledge and innovations in SMEs.

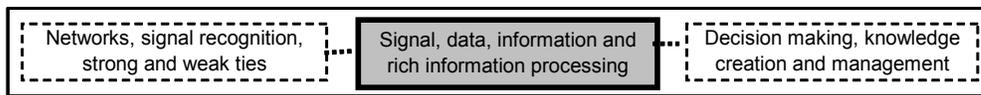

## INTRODUCTION

Information processing by individuals within organizations extends from the capture and processing of strong and weak signals to decision making based on information. The scope of this subject includes the *environment* or sources of information signals, networks that convey the signals to the entrepreneur and the organization's boundary spanners. It includes the *individual* in an organizational context; he receives, exchanges, processes and transforms information. It also includes the *organization* itself which generates data through systems and information, through individuals, favors or hinders information exchange and uses rich information in its decision and sense making processes and amplifies and disseminates information which has been transformed into knowledge by individuals. Many perspectives

attempt to explain parts of information processing by individuals. From a cognitive<sup>1</sup> perspective some pruning is required in order to identify the process' building blocks. In this paper, we scale down and simplify the analysis of information processing by the individual by eliminating elements such as networks from the environment. We can also eliminate from the organization elements such as knowledge creation which are independent of the individual's direct relationship with information processing. We emphasize the individual as the unit of analysis.

This paper is about signals, data, information and rich information processing and their transformation by the individual, not signal detection by using strong or weak ties, not information networks, decision making or knowledge creation in organizations. This is illustrated in the shaded section of Figure 1.

**Figure 1: Scope of research**

Our objective is to better understand how the individual's information processing and his cognitive framework are interdependent. We attempt synthesis through model building. Johnson-Laird (1983; ix, 3, 4) discusses multiple approaches and synthesis: "the mind is too complicated to be seen clearly, or to be studied with advantage, from the perspective of a single discipline. The scientific understanding of cognition depends on a synthesis..." and he goes on discussing models "...like clocks, small scale models of reality need neither be wholly accurate nor correspond completely with what they model in order to be useful... There are no complete mental models for any empirical phenomena. What must be emphasized, however, is that one does not necessarily increase the usefulness of a model by adding information to it beyond a certain level...to understand a phenomenon is to have a working model of it." The idea here is to strike a balance; modeling is also a form of vicarious learning (Gioia and Manz, 1985).

We briefly recall definitions of key related elements which are relevant by their inclusion in the scope of our research, as in the case of *information* and *information richness*, *strong* and *weak signals* and elements which are also relevant by their exclusion from our research as in the case of *knowledge*<sup>2</sup> which is sometimes wrongly equated with *rich information*. We explore weak signals as they are less well understood. We relate these definitions to each other from an information processing perspective and review definitions of *cognitive schemas* and *scripts* from the individual's cognitive framework perspective. They are essential

<sup>1</sup> Not to be mistaken with a cognitivist approach. According to Von Krogh, Ichijo and Nonaka (2000; p.265) the cognitivists share tacit information by holding shared and complete representations without any doubt about the correspondence of these representation to reality. The constructionists have a different point of view. Every individual has unique, personal information, much of which is tacit. In order to share that information each individual must justify such information. Sense making which helps construct the reality of the organization, is identified with the latter.

<sup>2</sup> In defining the scope of our study, Knowledge, Rich Information and Information itself had to be clearly defined in order for us to obtain a cohesive unit of analysis; by removing knowledge we had to consider what we were eliminating.

elements that determine the level of information processing by the individual in our model. We synthesize and present extant research relevant to information processing by the individual. We also present our model and discuss its implications. Our conceptual framework is built on two groups of related constructs. The first group is made up of seven information variables; they are seven units of performance of the individuals' information processing and are directly related to the individuals' cognitive information schemas. The second group is made up of seven information determinants from the individual's immediate environment; they determine the level of performance of the individual's information processing.

Finally the methodology and results of our study are presented followed by a discussion of the findings. We conclude by indicating some general observations and further areas of research on the process of information processing by the individual.

## **SOME DEFINITIONS RECALLED AND EXTANT RESEARCH**

### ***Knowledge***

Davenport, De Long and Beers (1998) define knowledge as "...information combined with experience, context, interpretation, and reflection. It is a high-value form of information that is ready to apply to decisions and actions. While knowledge and information may be difficult to distinguish at times, both are more valuable and involve more human participation than raw data..." Knowledge is rich information in an action oriented context. It relies on experience to provide expertise and sense making for stable interpretations of equivocal data about environmental change. This definition requires further clarification of information richness.

### ***Information and information richness***

*Information* is that which alters mental representations (Daft and Macintosh; 1981). Daft and Lengel (1986) define *information richness* "...as the ability of information to change understanding within a time interval." Communication transactions that can overcome different frames of reference or clarify ambiguous issues to change understanding in a timely manner are considered rich. Rich media, such as face to face discussion, enable people to interpret data and make sense of ambiguous information such as rich information laden weak signals. Equivocality is integrated through extensive discussions concerning such ambiguous information cues to arrive at a common interpretation of the environment.

Nonaka and Takeuchi (1995) distinguish two philosophical dimensions which relate to information. The first, an ontological dimension, is a dialogical process of exchange between the individual who synthesizes information and thus creates knowledge and the group as knowledge amplifier and disseminator, and the second, an epistemological dimension, inspired by Polanyi's (1966)<sup>3</sup> work, distinguishes between tacit and explicit knowledge.

---

<sup>3</sup> Polanyi and Nonaka and Takeuchi do not define tacit information exactly the same way. Polanyi's tacit dimension refers to innate intelligence, perception and reasoning as opposed to Nonaka's which refers to memory and experience which can be made explicit through socialization.

Whereas information reduces uncertainty, rich information helps make sense of ambiguous situations. It is conceptually closer to knowledge than to data.

## **Signals**

Blanco and Lesca (2002) define weak signals as anticipatory, qualitative, ambiguous and fragmentary, of various formats originating from very diverse sources. These sources can be from within or from outside the organization. Further explanations are given in Table 1.

According to Ansoff (1975) information that is required to anticipate unpredictable changes can be assimilated to weak signals. Blanco and Lesca (2002) relate weak signals to early warnings from a business intelligence perspective and equate weak signals with early warning signals.

According to Porter (1980) early warning signals can be defined as any action by a competitor that provides direct or indirect indications about its intentions, its motivation, its objectives or its internal situation. However, early warning signals can also concern the technological, political, economical or social environments (Bright, 1970).

It is in keeping with these definitions to categorize messages external to the organization such as market cues, environmental and early warning signals (competitive or otherwise) and messages emanating from within the organization such as assumption surfacing (Finney and Mitroff, 1986) and tacit knowledge externalization as either strong or weak signals. Strong signals are the opposite of weak signals, so if we define strong signals as:

- Unambiguous, usually complete and clear but new information-poor message than we should define weak signals as:
- Ambiguous, fragmentary and unclear but innovative and new information-rich message.

**Table 1: Characteristics of Weak Signals**

<b>Characteristics</b>	<b>Explanations</b>
Anticipatory	Weak signals are related to future potential events that may affect the organization's survival; so a piece of information has no intrinsic relevance as it is not related to immediate decisions.
Qualitative	Weak signals do not consist of numbers or in extrapolations as they concern events that have not occurred yet; factual or quantitative data are not available.
Ambiguous	Weak signals can be interpreted in various ways, which makes them difficult to understand and use.
Fragmentary	Weak signals present themselves in the form of fragments, each of which are insignificant and suspect.

Various formats and sources	Weak signals can be picked up in any shape or form, such as bits of conversation, fragments of electronic data, messages from conferences, discussions with customers and suppliers.
-----------------------------	--

Adapted from Blanco, S. and Lesca, H. (2002), *Business Intelligence: Integrating Knowledge into the Selection of Early Warning Signals*, Working Papers, Université Pierre Mendès France, Grenoble.

## **Data**

*Data* are a collection of facts, measurements and statistics, they are transactional in nature (i.e. banking transactions) they represent a unit of analysis. *Information* is defined as that which alters a mental representation. To qualify as information, data must effect a change in the individual's understanding of reality. From this perspective, information is defined as organized or processed data, (Turban and Aronson, 2001; 349) indicating trends, reducing uncertainty (Galbraith, 1973, 1995; Weick, 1979, 1995) as in the decision making process. *Rich information* is timely information, when strategically needed. *Knowledge* goes further; it allows the making of predictions, causal associations, or prescriptive decisions about what to do (Bohn, 1994), knowledge is information that is contextual, relevant and actionable. Information is used by cognitive schemata and scripts, two knowledge structures which are critical to information processing by the individual.

## **Schemata and scripts**

“Because of the limited capacity of individuals to deal with information, information that can be embedded into existing, heavily organized, and interconnected knowledge structures has greater weight. Information demanding attention, that is, salient information, will be incorporated into organized knowledge structures and long-term memory if it seems relevant to those structures. If the information is too discrepant, it will be discounted and forgotten.” (Kiesler and Sproull, 1982; p. 556) Organization members do not actively process all informational cues anew in order to decide how to behave. Rather, they frequently can depend on personal and consensual schemas to understand (and sometimes fill gaps in existing scripts) and respond to organizational situations with relatively little active information processing. Implicit theories concerning the importance of information signals form part of such schemata (Gioia and Manz, 1985).

Gioia (1986) defines schemata as a built-up repertoire of tacit knowledge that is used to impose structure upon, and impart meaning to, otherwise ambiguous social and situational information to facilitate understanding. Well established schemata enable one to process information essentially unconsciously if a good match between current context and existing schema is obtained, thus freeing cognitive capacity to handle other more pressing or more novel demands. Gioia and Poole (1984) describe cognitive scripts as schematic knowledge structures, held in memory, that specify behavior or event sequences appropriate for specific situations.

Information-processing models are organized in such abstract structures and these knowledge structures are the constructs against which new information is tested for relevance. Schemata simplify information processing and storage, but, in the process introduce biases. Such

associative thinking leads to information expectations that are both well organized and resistant to new evidence. In this fashion schema-based expectations affect judgment and memory, and also filter the use of new information in weak signals. Motivational processes such as external, vicarious or self-applied reinforcements can provide incentives to enact an information-processing related script. In this sense an organization might be viewed as “a culture composed of a complex set of interrelated scripts that influence one another in both supportive and contrary ways” (Gioia and Manz, 1985).

We can hypothesize that in ill structured, novel and complex new information situations such as information provided by weak signals or rich information requiring sensemaking, the individual in organizations tends to use more trial and error type *heuristic* approaches to information processing (Daft and Lengel, 1986; Simon, 1976; 1991; Tversky and Khaneman, 1974; 1982) whereas in structured information situations such as problem solving or uncertainty reduction situations the individual tends to use more pattern type *algorithmic* (Daft and Lengel, 1986; Simon, 1976; 1991) approaches to information-processing. We can also hypothesize that by determining the individual's implicit theories about information acquisition and use the organizational culture shapes and motivates the level of the individual's *information alertness* and therefore his receptivity to information rich weak signals. Information alertness can thus be socially constructed and motivated.

Extant research on information processing by the individual can be classified into two groups:

- Information processing variables which are elements of the individual's information processing performance framed by cognitive information schemata, and
- Information processing determinants, environmental factors which determine the level of information processing by the individual

The processing variables are:

- Heuristic information processing (Daft and Lengel, 1986; Simon, 1976, 1991; Tversky and Khaneman, 1982);
- Algorithmic information processing (Daft et Lengel, 1986; Simon, 1976, 1991);
- Weak signal processing (Ansoff, 1975; Julien, 2000; Lesca and Blanco, 2002);
- Strong signal processing (Ansoff, 1975; Julien, 2000; Lesca and Blanco, 2002);
- Use of tacit information (Brockman and Anthony, 1998 ; Nonaka, 1991, 1994; Nonaka and Takeuchi, 1995; Polanyi, 1962, 1966);
- Use of archived information (Choo, 1996, 1998a, 1998b; Cohen and Levinthal, 1990; Walsh and Ungson, 1991);
- Use of feedback loops (Choo, 1996, 1998a, 1998b; Cohen and Levinthal, 1990).

The processing determinants are:

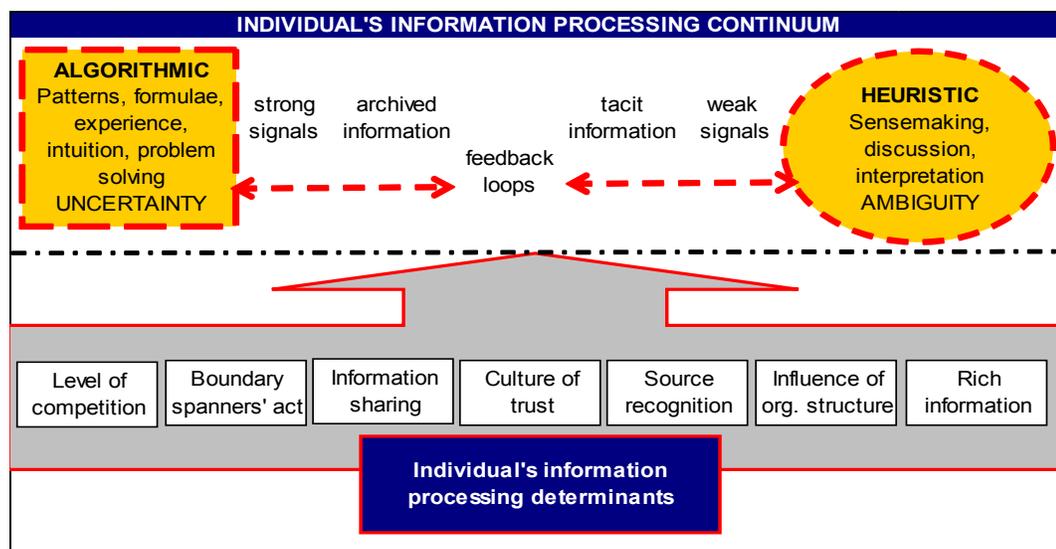

- The level of competition in the industry (Porter, 1980);
- The level of activity of Boundary Spanners (Dollinger, 1984; Tushman and Scanlan, 1981a, 1981b);

- The level of information sharing by individuals (Cohen and Levinthal, 1990; Davenport, 1997; Davenport and Prusak, 1998; Kramer and Tyler, 1996);
- The existence of an information culture (trust and collaboration) (Ballé, 2001; Davenport, 1997; Johnson-Laird, 1983; Stinchcomb, 1990);
- The recognition of information sources (Choo, 1998a, 1998b; Davenport, 1997; Davenport and Prusak, 1998);
- The organizational structure (Galbraith, 1977, 1995);
- The use of rich information (Daft and Lengel, 1984; Davenport and Prusak, 1998; Davenport, Eccles and Prusak, 1992).

## SCOPE OF THE MODEL

Based on this literature and then on these variables and determinants we present the model in Figure 2. We built it by grounding existing theory in field data during an action research project in 2000 and 2001 within SME GD+ a subsidiary of a large gas distributor, GD.

**Figure 2: How individuals process information In an organizational context**

This model shows the individual's information processing continuum between algorithmic and heuristic information treatment. For example, engineers and accountants use established scripts<sup>4</sup> and patterns of the algorithmic end of the model's continuum in their work to process information. Artists and musicians who create and innovate use trial and error or heuristic type of information processing at the other end of the model's continuum. Entrepreneurs in interpreting constructing and enacting their environment, also use a heuristic type of information processing for sense making.

<sup>4</sup> Based on their cognitive information schemata

A causal relationship exists between determinants and variables as it does between the individual's environment and his information schemata. This is indicated by the arrow in the figure. This relationship impacts the level of performance of each variable in a contingent way. This is indicated by the dotted line separating variables and determinants in the figure.

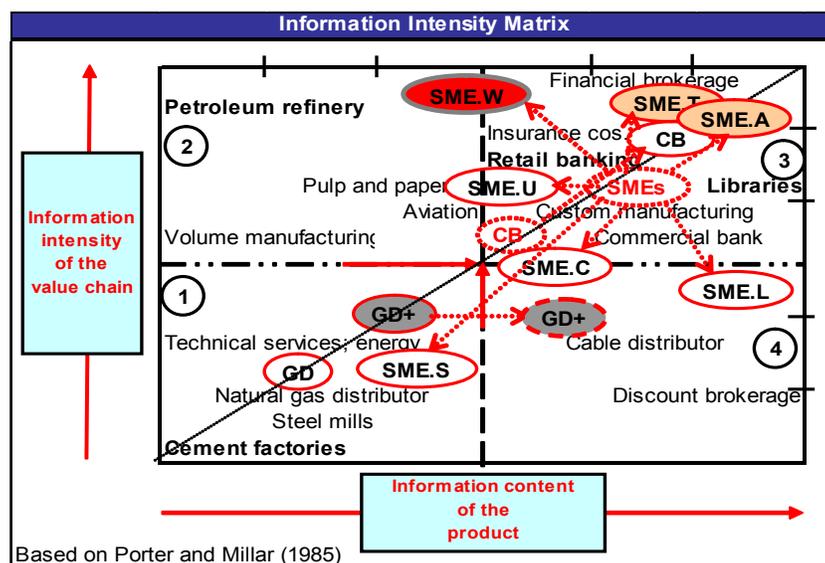

## METHODOLOGY

The conceptual framework is operationalized by measuring the level of performance of information processing by individuals. In order to measure the level of information processing performance of individuals, the level of intensity of each of the seven variables and determinants are measured on a scale of 1 to 5. This measure has to occur before an aggregate result can be obtained for entire organizations.

In order to test and validate our model we use in depth interviews for data gathering from a sample of nine organizations. Interviews were conducted from December 2001 to September 2002 and lasted on the average over 90 minutes with lower and upper limits of 60 to 120 minutes. Where applicable, a plant tour was taken with further research related discussions.

The nine organizations' selection process is based on a priori perceptions of the firm's level of information intensity based on Porter and Millar's (1985) information intensity matrix in Figure 3. The matrix measures the information intensity content of the value chain on one axis and the information intensity content of the firm's product on the other axis. High information content and information value added knowledge management firms such as consultants, are in the right hand corner of quadrant 3 and low information content with little information value added firms such as commodity manufacturing firms, are in the lower left hand corner of quadrant 1.

**Figure 3: Information Intensity Matrix**

The nine organizations consist of a variety of perceived information intensity levels along the diagonal of the information intensity matrix. In ascending order: two organizations that showed interest and participated in the research, a large regulated energy distributor and a mid-sized commercial bank, five manufacturing SMEs and two service SMEs. The SMEs were selected from a database of the SME Research Institute of the Université du Québec à Trois-Rivières each with about 60 to 300 employees.

The sampling strategy consists of covering quadrants 1 and 3 along the matrix's diagonal in order to generate a variety of information processors, cultures and structures in organizations of different sizes. This allows contrasting and thus a finer grain appraising of the impact of our model's process variables and determinants.

Letters in the identification tags of the matrix such as GD stand for the regulated energy distributor; CB for commercial bank and the seven SMEs are labeled as such with suffixes: C, L, U, S, A, T and W.<sup>5</sup> We have also included as a reference point the unregulated subsidiary of the energy distributor (GD+), with its tag shaded in dark grey. This organization is where we staged tests for our methodology in the fall of 2001 and for which we have withheld results due to possible contamination or biases related to initial questionnaire trials and other preliminary field work such as observation and action research.

We met with total of 55 individuals from the sampled organizations. They were selected on the basis of their information roles in sales, marketing and purchasing or their high information processing functions in credit, R&D and pricing. A careful selection had to be made to obtain representatives from strategic, functional and operational levels combined with our criteria. A variety of incumbents were targeted:

- At the energy distributor (GD) a sample of eight strategic (Vice President and Directors), functional (Managers) and operational individuals (Supervisors and Representatives) in marketing (high information processing and pricing) and sales (boundary spanners with customers) were interviewed.
- At the commercial bank (CB) a sample of 12 strategic (Executive Vice Presidents and Vice Presidents), functional (functional Vice Presidents and Directors) and operational individuals (Supervisors and Representatives) in credit (high information processing and pricing) and sales (boundary spanners with customers) were interviewed.
- At the seven SMEs individuals consisting of the entrepreneur and his functional managers represented the organization's boundary spanners and the R&D, engineering or estimating head represented the high information processing pricing function.

An interview guideline was drawn up based on the seven process determinants and process variables in our model that we wanted to measure. Innovation and marketing complaints were used as triggers to establish a dialogue and a level of trust necessary for the exchange of rich information.

---

<sup>5</sup> SME.C, SME.L, etc.

The analysis of results consists of an initial review of notes taken during the interviews and listening to the recordings of the interviews while reviewing their typed presentations and noting the salient facts of the interviews. A second phase consists of four successive codifications of data to develop information; decimals were eliminated through a forced choice process using developed measures.<sup>6</sup> A summation of results is developed for each participant firm and a graphic analysis is built to generate new knowledge. Analysis based on this double review, the rating, the recording of salient facts, the four codifications and the comparison to our notes, form the basis of our results.

## RESULTS

The perceptions that provided the basis for the sample selection proved fairly accurate as measured by the displacement of each firm's ID tag from the matrix's diagonal line where we initially positioned them. The rankings did not change much, with the exception of the commercial bank. In Figure 3 the displacement of ID tags from their initial perceived positions which are identified with dotted lines is indicated by dotted arrows.

We hypothesized that the SMEs would prove to be more efficient information processors as evidenced by their initial positioning in the matrix and this is more or less what happened. We did not expect the high level of performance by the bank (CB). The energy distributor (GD) met our expectations. The two service SMEs (A and T) scored well as their products are information intensive. SME.W which is used as a benchmark for their best practices within the sample is highlighted in grey in table 2.

The ranking of the variables and determinants is presented in table 3. The process determinant which enhances information alertness is a trust building culture, a factor on which all surveyed organizations fared below the overall average (3.1), this process determinant is ranked last. This factor with the weak signal processing variable, are the major all-around weaknesses in organizations in our survey with a score of 2.8.

The overall high score level on the 'organizational structure' determinant reflects an information processing hierarchy where information, albeit filtered, flows mostly to the highest position with or without concomitant information sharing. This factor is the best understood of the determinants and is ranked in first place in conjunction with the algorithmic processing variable. The latter is attributable to individuals' propensity to use established procedures, policies, experience, intuitive patterns based on their cognitive schemata in order to reduce uncertainty.

---

<sup>6</sup>An example of the five measures developed for the variable "Processing weak signals" is attached for reference.

**Table 2: Summary of results**

SUMMARY OF RESULTS									
Likert scale( 1 = none, 5 = extensive)	GD	CB	SME.C	SME.U	SME.W	SME.L	SME.T	SME.A	SME.S
Number of interview s = 55	8	12	4	5	6	4	4	7	5
Process determinants

<b>Average of process variables</b>	<b>2.86</b>	<b>3.86</b>	<b>3.29</b>	<b>2.86</b>	<b>4.29</b>	<b>3.57</b>	<b>3.00</b>	<b>3.57</b>	<b>3.43</b>

Competition and boundary spanning activities are factors that evolve proportionately to one another. The higher the competition the more boundary spanners or boundary spanning activities one would expect. This is true for all the surveyed organizations with the exception of the regulated energy distributor (GD) where we have low competition associated with relatively high boundary spanning activities. Boundary spanning activities for GD take the form of a necessary minimum of industrial technological scanning and R&D. For example, in SME.U the entrepreneur and his organization are in reactive ‘order taking’ mode. SME.U’s major vulnerability is the lack of sales proactivity while serving a dominant customer which keeps plant loadings at high levels. This vulnerability is also reflected in three information processing factors with ratings of 2.0

**Table 3: Ranking of process variables and determinants**

PROCESS VARIABLES AND DETERMINANTS		
Likert scale( 1 = none, 5 = extensive)	Average	Rank
Number of interview s = 55	55

<b>Average of process variables</b>	<b>3.4</b>	

# DISCUSSION

## *Best practice*

Some 'best practice' related findings at SME.W are:

- A culture of information alertness and sharing within the organization which influences the implicit theories and values that individuals have about information processing
  - a. Timely and accurate information is provided to users on the production floor as well as to the management team;
  - b. Problem solving is used to reduce uncertainties on customer orders including product ecology and ergonomics;
  - c. Sensemaking through intensive communications of rich information is used to integrate ambiguity on R&D projects;
  - d. A no nonsense approach is used to communicate information: no information asymmetries exist within the management team;
  - e. Quality of information is important and information arbitrage is not tolerated within the organization and seldom if ever practiced with customers;
  - f. An ongoing product quality and process improvement program externalizes tacit knowledge.
- Proactive use of weak signals with customers, the commercial and technology environment
  - g. Weak signal sources are used to tap into rich technical and commercial information through ongoing relationships with institutions of higher learning;
  - h. Firm reputation and product quality are considered as high value intangible assets and are used both proactively (weak signal, spoken testimonials) and reactively (weak signal, word of mouth reputation) to attract customers;
  - i. All feasible bids are evaluated irrespective of plant loadings, they are considered a good source of competitive information and provide a trigger for rich information exchange.
- Information source recognition and reciprocity to encourage information sharing
  - a. Members of the top management team are all involved with customers in different ways;
  - b. Rich information laden symbols such as plant capabilities, product know-how and product and process R&D are the sources of pride;
  - c. Extensive documentation of information in both electronic and hard copy form are made available on intranet or through archiving;
  - d. The ability to continuously insert rich information by the individual into strategy formation to take advantage of nascent opportunities;
  - e. Autonomy is encouraged within the management team and within high information impact groups such as engineering, R&D and quality control, creating trust and intense communications by individuals;
  - f. Heuristic and algorithmic information processing are recognized and used invariably

- The quick paced environment requires fast resolution of ambiguity and top management is continuously involved in integrating ambiguity through sensemaking and sometimes improvisation exercises;
- Uncertainty is reduced by individual managers and by individuals in high information impact groups either intuitively or by problem solving approaches and communicated at regular management meetings.

### ***Information catalyst***

In our interviews we have encountered six exceptional individuals whom we call *information-catalysts*<sup>7</sup>. These individuals treat uncertainty and ambiguity with relative ease and effectively process rich information along an implicit algorithmic – heuristic continuum. They know what the customer wants from a commercial standpoint to the point that they will recommend alternative and novel product solutions. They are very well appraised (and apprised) of their organization's capabilities to satisfy customers' expectations. They are the organization's information nexus and are charged most of the time with the preparation of quotations for competitive submissions. In a manufacturing environment their functions are R&D or job estimation related and, as such, they determine the organization's gross margin. In the commercial bank they are the credit officers of the company. In SMEs they complement the entrepreneur and organization boundary spanners as the third leg of the SME's vital information processors.

The SME's information alertness is determined by these three information processors and to a larger extent by the *information-catalyst's* propensity to share information. It is important for the organization to recognize this special ability of the *information-catalyst* by reinforcing his role as a rich information disseminator and by using his special ability to insert such rich information into product or process innovations and strategy formation to generate nascent opportunities; this is what SME.W does so well.

Other findings led to the following observations:

- The organization's culture shapes the individual's information alertness through the individual's implicit theories on information processing
- Alert, proactive individuals process information along an implicit algorithmic – heuristic continuum
- Most individuals have difficulty recognizing weak signals, or distinguishing competitive information from channel noise
- Some individuals cannot change mental models which no longer accommodate or explain competitive occurrences in the environment
- Some individuals do not realize their own cognitive shortcomings blindsiding them to competitive information
- A few individuals don't even listen for signals from their customers or suppliers.

---

<sup>7</sup> We note that Von Krogh, Ichijo and Nonaka (2000; p. 150) also use the term *catalyst* for the knowledge creation activist.

## CONCLUSION

In conclusion, we highlight a few variables which we feel measure an organization's information alertness:

- The level of competition in the organization's industry requires information alertness towards customers, suppliers, competitors and technological substitutes to name but a few targets. This is the role of strategic intelligence where information provides competitive advantage.
- As stated above, the organization's culture shapes the individual's information alertness through the individual's implicit theories on information processing.
- An efficient way to recognize important information sources is by information reciprocity. The major sources of information in the SMEs we surveyed are the *entrepreneur*, *information boundary spanners* and the *information-catalyst*.
- Information sharing, especially by the information-catalyst, with other members of the organization has a leveraged effect on innovations and the information alertness of the organization.
- The most important aspect and the most difficult to measure is the ability of the *entrepreneur*, the *boundary spanners* and the *information-catalyst* to continuously insert rich information into the decision making process to either innovate or to take advantage of nascent opportunities.

Practical benchmark applications will further strengthen the model through refinements of its determinants. Comparing information behavior between information intensive and information poor organizations, such as, consultants and commodity manufacturing for instance raises interesting areas of new investigation.

## Processing weak signals

1. Lack of all elements which typify the sensemaking characteristics of ambiguous and changing environments (a communication and exchange of information logic) and elements related to weak signal detection (strategic environment scanning), no visible interest in and processing of anticipatory, qualitative, ambiguous, fragmentary information of various formats and sources; lack of innovations.
2. Lack of most elements which typify the sensemaking characteristics of ambiguous and changing environments (a communication and exchange of information logic) and elements favourable to weak signal detection: no visible interest in and processing of anticipatory, qualitative, ambiguous, fragmentary information of various formats and sources; so-called innovations are imitations.
3. Some elements which typify the sensemaking characteristics of ambiguous and changing environments are present (lack of an information culture) with some elements favourable to weak signal detection: sporadic processing of anticipatory, qualitative, ambiguous, fragmentary information of various formats and sources; few innovations.
4. Most elements which typify the sensemaking characteristics of ambiguous and changing environments are present (there exists a logic of information communication and an information culture) with elements favourable to weak signal detection (information networks and environment scanning): explicit processing of anticipatory, qualitative, ambiguous, fragmentary information of various formats and sources; innovations are disseminated and rapidly implemented.
5. Strategic mix of elements which typify the sensemaking characteristics of ambiguous and changing environments with elements favourable to weak signal detection: concerted and proactive processing of anticipatory, qualitative, ambiguous, fragmentary information of various formats and sources; innovations are created, disseminated and implemented rapidly.

# **THE GOOD, THE BAD AND THE UGLY: AN IDENTIFICATION AND CLASSIFICATION OF THE BARRIERS TO E-LEARNING ON AN UNDERGRADUATE E-LEARNING ENTERPRISE DEGREE.**

**By Mr Paul Jones, Dr Christopher Miller, Dr Gary Packham, Dr Brychan Thomas and Mrs Amanda Jones. Welsh Enterprise Institute, Business School, University of Glamorgan, Pontypridd, Trefforest, CF37 1DL. Contact: Mr Paul Jones +44 1443 654128 wpjones1@glam.ac.uk**

## **ABSTRACT**

This paper examines and evaluates the existence of barriers to learning on an online BA in Enterprise and the impact they have on student retention. Strategies to overcome and diminish these barriers are presented. The BA Enterprise is offered by E-College Wales (ECW), a project designed by the University of Glamorgan aimed at creating and improving entrepreneurial and managerial capacity in the European Union Objective One Areas of Wales. This elearning programme has been created with the aim of aiding individuals and communities to generate their own economic development solutions, through the tools of entrepreneurship and promotion. The BA Enterprise programme commenced in September 2001 with approximately 400 students. This programme had an open entry policy attracting a diverse population of applicants in terms of experience, age and prior qualifications. The academic literature has identified the existence of a number of barriers to e-learning including technology, the student experience, course delivery and on-line miscommunication. Research has provided preliminary classifications of these factors as student, situational and educational system factors. The combination and influence of these factors is impacting upon student retention and withdrawal rates on all e-learning providers. This study examines the existence of barriers to e-learning experienced on the E-College Wales BA Enterprise programme during the 2001/02 academic year. The study found that e-learning enterprise students are subject to a variety of barriers including HE, e-learning and enterprise related factors. Key strategies to diminish their influence are proposed including induction, accreditation of prior learning and experience and flexible course design.

## **E-College Wales**

ECW is a project initiated and designed by the University of Glamorgan aimed at creating and improving entrepreneurial and managerial capacity in the European Union Objective One Areas of Wales. The University of Glamorgan and Further Education colleges located throughout Wales supported the project. The project was piloted with the BA Enterprise degree, which was initiated in September 2001. The course was supported via the online Blackboard Virtual Learning environment (VLE). This comprised interlinked communication and content area. The VLE communication area supported both synchronous and asynchronous communication media enabling interaction between students and module tutors. This paper examines the retention issues within the program

and identifies whether the causes of withdrawal correlate with the existing academic literature.

## **The Reasons for Withdrawal on Higher Educational Programmes**

The Higher Education sector faces a two-fold enrollment problem: firstly getting students to enroll and secondly retaining them on their courses (Wetzel, O'Toole and Peterson, 1999). Retention remains a critical issue as identified within the Dearing Report, 1997. The Select Committee on Education and Employment (2001) identified that one in six of students entering British Universities would not complete their qualification. Yorke and Thomas (2003) posit withdrawal and non-completion is viewed as inefficiency, which must be controlled and minimized within HE providers. Furthermore, Bennet (2003) identifies problems caused by student withdrawal as creating financial problems for Universities through lost fee income, lecturer time wastage, disruption of remaining student group and possible drop in student morale. Hence the introduction of league tables to monitor and gauge the effectiveness of University performance. Despite this trend, Yorke and Thomas (2003) note that the UK HE sector retains a tendency of full time student participation although the increasing trend is for students to work part time to fund their studies. This implies that the HE sector is not meeting the changing needs of the student and retention remains an issue. Tinto (1982, 1987) posits that there is no one stop solution to student retention and "the key to successful student retention lies with the institution, in its faculty and staff, not in any one formulae". Tinto suggests that retention involves 2 commitments from the student namely to achieve a qualification and secondly to achieve that award at a particular institution. These are described as goal and institutional commitments and their interrelation will directly influence the retention level. Tinto also recognised the need for the student to achieve social and academic integration to ensure successful completion. Social integration is a measure of the student's satisfaction within the colleges' social and institutional framework. Whilst academic integration evaluates the match between the colleges academic program and the individuals own motivation and academic ability. Wetzel, O'Toole and Peterson (1999) criticise this framework as simplistic and lacking consideration of financial variables. Bennet (2003) identifies 2 classification of student withdrawal as compulsory or voluntary. Compulsory withdrawal includes illness, finance, caring for a family member and failing the course. Voluntary withdrawal is a conscious decision to withdraw due to dissatisfaction with factors related to the course.

Dunwoody and Frank (1995); Yorke and Thomas (2003) identified topics influencing student retention in HE as: academic preparedness, the academic experience (also Medway and Penney, 1994) (poor teaching, learning and assessment), institutional expectations and commitment, academic and social match, finance (also Porter, 1989) and employment, family support and commitments and institutional support services. In terms of significance Callender's (1999) survey of 1000 students identified that financial hardship was the dominant cause of withdrawal. By contrast, Davies (2000) study identified that drop out rates varied between 3 and 56% across different courses, despite similar student circumstances. Davies concluded that financial or personal problems are only significant when the students have a low opinion of the course.

Yorke and Thomas (2003) and Martinez (2001) identify several key factors in reducing student withdrawals as a student centred approach, good teaching, pre entry and early engagement with students, curriculum related issues such as assessment and effectiveness of induction, satisfaction with courses, personal tutoring, effective recruitment and supporting student finance. Yorke and Thomas (2003) suggests that factors likely to have a positive impact on retention and students experience includes a

supportive institutional climate, student support (also Dunwoody and Frank, 1995), formative assessment, development of social interaction via learning activities and flexibility to meet student needs.

Wetzel, O'Toole and Peterson's (1999) research empathises with Tinto's earlier research in recognising the importance of academic and social integration. Interestingly they identify that financial considerations have limited significance, rather students are driven by success and progress and this correlates positively with programme completion. They posit that courses require greater flexibility in meeting student needs and there might be a case for limiting the quantity of modules studied and increasing course length.

Research investigating barriers to e-learning is emerging. The literature suggests three main categorisations as student or dispositional, situational and institutional factors (Diaz, 2002; Rezabek, 1999; Garland, 1993). Student or dispositional factors, recognises levels of educational preparation, attitude, motivational and persistence attributes. Situational factors occur within an individual's general life and include transportation, age, time constraints and family responsibilities. Educational or institutional system examines the educational standards and qualities of the course and the impact of pastoral support for the student. These can include issues related to admissions, registration, scheduling of courses, financial aid and support services. Therefore we can conclude that e-learning retention is a complex and multi faceted issue. For e-learning courses to improve rates of retention, time and effort must be given to prepare students for the learning experience (Alexander 2001) and ensure the course is flexible with suitable assessment requirements.

## **The necessity for enterprise education**

Enterprise education is a key activity to ensure the development of both the enterprise and its employees. The justification for enterprise education for the business is necessity. Running a small business professionally isn't a just a good idea, its a perquisite for business survival (Ehrenfeld, 1995). Garavan and O'Connell (1994) suggest that there is a positive relationship between enterprise education and business start-ups. Whilst Coulsen-Thomas (1999) suggests businesses would benefit from positive steps to encourage and build entrepreneurial qualities. Research indicates that skills deficiencies exist in smaller enterprises in areas such as strategy, planning, marketing and sales (Welsh, 1996). Scott et al., (1996) and Greig (1997) - identifies a lack of formal vocational training culture within SMEs. Gibb (1998) suggests that the dominant mode of learning in SMEs is experiential, namely learning by doing. This includes learning from customers and suppliers, also from problem solving and opportunity taking and learning by error. Anderson, Boocock and Graham (2001) concur with this suggesting informal unplanned education via social and business networks.

In terms of individual's development of enterprise skills, Binks (1996) posits that many graduates were poorly prepared for employment post Higher Education and that there was insufficient provision for enterprise education. Westhead (1997) noted that few SMEs employed graduates whilst Fletcher (1999) noted that fewer UK graduates started their own business than their counterparts in the USA and Japan. Petermen and Kennedy (2003) posit that existing formal education does not encourage entrepreneurship but prepares individuals for work in corporations. Shurry et al. (2001) suggests that there is a general mistrust of entrepreneurs in the UK. Carter and Collinson (1999) identifies there are a latent population of graduates, interested in starting their own businesses who require training to encourage and inform the process of business start up. They suggest that such training programmes should focus on younger graduates and concentrate on

reducing barriers such as ideas generation, finance (also Shurry et al. 2001) and expertise. Further barriers are recognised by Galloway and Brown (2002) as graduates suffering from debt (also SBS, 2002), lack of funds (DTI, 2001), limited experience, regulation, taxation (Michaelis et al, 2001) alternative personal priorities and fear of failure (HM Treasury, 2001). Continuing negative attitudes to entrepreneurship form a significant barrier to business start up (Roberston et al. 2003)

By contrast, Watkins and Watkins (1984) and Robertson et al. (2003) reported that the typical entrepreneur are in their mid thirties, white and male. This indicates that female entrepreneurs and ethnic groups are disenfranchised from business start up. Ball and Shank (1995) identify 3 prerequisites for small business education to occur; firstly potential participants must recognise a need for enterprise education, secondly, they must know of the programmes existence and lastly that these courses match potential users needs.

## **The development of Enterprise Education**

Enterprise Education has seen a growth in provision since the 1980s in schools, vocational colleges and Higher Educational institutions (Peterman and Kennedy 2003). Furthermore, the individuals involved in Enterprise Education have increased to include owner managers, students, pupils, graduates, women, unemployed and other disadvantaged groups (Caird, 1990; Curran and Stanworth 1989). Galloway and Brown (2002) report on the increase on growth of Entrepreneurial education in UK universities such as Strathclyde and Stirling. This suggests that this increased provision will enable graduate start-ups, which given the knowledge and capabilities of the owner-managers are more likely to be survive and be successful (Galloway and Brown 2002). Garavan and O’Cinneide (1994) posits a high level of entrepreneurial education enables higher levels of enterprise growth. However, Galloway and Brown’s (2002) study indicated that the return in HE entrepreneurial education is likely to be long term rather than immediate. Despite the development of enterprise education Kolvereid and Moen (1997) and Garavan and O’Cinneide (1994) state that there is a lack of research investigating the phenomena. Furthermore, Garaven and O’Cinneide (1994) claim existing research has a tendency to be exploratory in nature.

Whilst enterprise literature considers the deterrents to initial business start up in depth, there is limited appreciation of the causes of withdrawal from such programmes. Moreover the development of Enterprise Education programmes via e-learning is an emergent phenomena and remains unexplored within the academic literature. This study investigates reasons for student withdrawal on an online Enterprise Education undergraduate programme. These barriers to online Enterprise Education are evaluated and contrasted against the extant literature.

## **METHODOLOGY**

The research methodology comprised both quantitative and qualitative research encompassing 71 students from two partner colleges (Coleg Sir Gar and Coleg Morgannwg) within the ECW project. Initially a detailed analysis of the demographic breakdown of the student cohort and completion, withdrawal and deferral information was undertaken. Thereafter the study used in depth content analysis of student feedback to identify reasons for withdrawal. A semi structured questionnaire was developed to identify prime motivations for student withdrawal. Withdrawn students were contacted via

telephone and the questionnaire was completed in a 15-minute interview with each respondent. In total, 35 former students (85%) completed the questionnaire, whilst six (15%) respondents declined or were unobtainable. The aim of the questionnaire was to investigate the prime causes for student withdrawal. The initial question established the date of withdrawal from the programme, whilst the second question asked the respondents to explain their rationale for leaving the course. This was an open-ended question designed to fully explore the key reasons behind the withdrawal decision

## FINDINGS

This section analyses the student data in terms of gender, age, result, occupation and entry qualifications.

### Student Results

Seventy-one students enrolled for the first year of the programme within both partner colleges. As can be seen from Table 1, 22 (31%) students successfully completed the first year, 41 (52%) withdrew and 7 (26%) deferred to the next academic year. Forty-four (62%) students were male and 27 (38%) female, the oldest being 67 and the youngest 25. The average age of the group was 43 with a standard deviation of 9.9. A group frequency analysis revealed that the most populace group was 31-40 (38%) followed by the 41-50 (28%). Overall 55% (39 out of 71) of the year group were 41 years of age or over. Male students were predominantly in the 31- 40 (45%) age bracket whereas females were principally in the 41-50 (41%) group. Male students accounted for 74% of the 31-40 age group and 65% of the 51-60 age classification whilst females accounted for 55% of the 41-50 age group.

**Table 1: Classification of Student withdrawal factors**

Age Groups	Group Demographics			Completion data			Withdrawal data		
	All Group	Male	Female	Over all	Male	Female	Withdrawn	Male	Female
21 - 30	5	2	3	0	0	0	4	2	2
31 - 40	27	20	7	8	7	1	15	11	4
41 - 50	20	9	11	7	3	4	10	4	6
51 - 60	17	11	6	7	3	4	10	8	2
61 - 70	2	2	0	0	0	0	2	2	0
Totals	71	44	27	22	13	9	41	27	14

Overall, 33% of female and 30% of male students were successful. Further analysis revealed that 67% of 51-60 aged female students were successful. The most successful male age group was the 31-40 category, with a 35% success rate. The least successful age groups were the male 51-60 category with a 27% success rate and the female 31-40 group (14%). Eighty-eight percent of successful females were 41 year olds or above in contrast to 46% of males in this age category. In total, 66% percent of withdrawn students were male and 34% female. Within each gender 61% of all male students and 52% of female students withdrew. The most prevalent age groups for student withdrawal were

51-60, with a 59% rate, followed by 31-40 (56%). The 51-60 male age group suffered a high withdrawal rate with a 73% dropout rate. Similarly the female 31-40 (57%) and 41-50 (55%) categories endured high withdrawal rates.

## Employment Data

Twenty-nine students were self-employed (41%), 15 worked within the public sector (21%), 17 were in private sector (24%) and 10 (14%) were not in employment. Self-employed students witnessed a 31% completion rate and a 66% withdrawal rate. Public sector students recorded a reasonable completion record (40%) and a high withdrawal rate 47%. The worst completion record was displayed in the private sector employment group with only an 18% completion record and 59% withdrawal record. In terms of entrepreneurial activity it can be seen that 46% of self employed student withdrew from the course.

Sector	All Pop	%	Passed	% of Passed	% of Sector	W/D	% of Withdrawn	% of Sector
Self Employed	29	41	9	41	31	19	46	66
Public sector employment	15	21	6	27	40	7	17	47
Unemployed/Not Working	10	14	3	14	30	5	12	50
Private sector employment	17	24	4	18	24	10	24	59
	71		22	100		41	100	

## Educational Profile

Forty percent of students possessed no prior HE qualifications, 20% were graduates and 5% possessed a Masters degree. Forty six percent of students had achieved O levels or equivalent qualifications and 49% attained A levels. When these statistics are analysed in terms of completion against prior qualifications it revealed that of the 20 students with a prior HE qualification only 20% successfully completed the year and 80% withdrew. Of the 22 successful students only 4 (18%) possessed a prior degree. Typically successful students were lacking in prior HE attainment with only 41% of students having gained a previous qualification.

Total Students	Graduates	Masters Degree	HE qualification	No HE Qualification	O levels	A levels
71	20	5	31	40	33	35
%	28	7	44	56	46	49

## Questionnaire Results

The semi-structured interviews with 35 students revealed 11 factors of withdrawal cited on 69 occasions (see Table 8). Nine prime causes were identified occurring on 4 or more occasions. The average number of withdrawal factors per student was two, with 17 students identifying two causes.

<b>Table 8: Reasons for Student Withdrawals</b>		
Factor	Frequency of Occurrence	As a % of all Respondents (35)
<i>Prime Causes</i>		
Lack of Time	13	37
Job or Business Changed/increasing pressure of work	12	34
Nature of the Course	9	26
Personnel Issues	8	23
Amount of Coursework	7	20
Technical Problems	6	17
IT skills	4	11
Did not require further qualification	4	11
Confusion/lack understanding	4	11
<i>Other Causes</i>		
Inflexibility in course design	1	3
Withdrawn by College	1	3
	69	

#### *Lack of Time*

Thirteen students (37%) cited time as a prime cause of their withdrawal. Of this number, 5 ran their own business and 2 held high-level positions in the public sector. All of these individuals identified that they did not initially appreciate the amount of time the course would entail and also underestimated the demands of their current posts. As identified in the previous section there was a realisation that the coursework was onerous and required reduction. Again this factor can be identified as a contributory factor towards their withdrawal decision.

#### *Job or Business Changed – increasing pressure of work*

This was the second most frequently identified cause of withdrawal cited by 34% of respondents. These were students who suffered a change in their working circumstances. Four of this group withdrew due to having to relocate due to new employment whilst 6 cited a change in their existing working circumstances caused by launching their own business or extra responsibility within their current post. Nine out of twelve students who cited this factor either ran their own business or were employed within the private sector where time is a critical factor. Four students identified this factor as the sole reason for their withdrawal whilst 3 students recognised it as 1 of the 2 factors behind their withdrawal.

#### *Nature of the course*

Nine students identified that they did not think that this was the right course for them. This was a contributory factor behind student's withdrawal as 5 candidates identified it as one of the two reasons which caused their final withdrawal. These students were from a diversity of backgrounds and quoted a variety of reasons including a lack of enjoyment of the subject matter and the method of learning not suiting their learning style. Comments included "I needed a vocational course which equipped me with the relevant business skills in a short time scale" and "lacking interest in subject matter", "not meeting my

*needs*, “*lacked applicability to my current job*” and “*preferred the chalk and talk and intimacy of an actual lecture*”. One student complained about the distance that he had to travel to attend support sessions in a partner college and a feeling of isolation.

### *Technical Problems*

Six students identified technical problems as a cause of their withdrawal. Technical issues severely affected the launch of the course and included virtual learning environment (VLE) reliability and connection issues. Two students identified it as the sole cause, whilst two others identified it as one of two reasons for withdrawal

### *T Skills*

Four students identified their IT skills as a reason for their withdrawal from the programme. These students identified several other factors that contributed to their withdrawal; they were all self-employed males in excess of 54 years of age.

### *Confusion/ Lack of understanding could be course related factor*

Four students identified a lack of understanding and confusion as a factor contributing towards their withdrawal. This was one of a number of factors, which caused the students to withdraw from the programme. Student comments included that they did not understand what they needed to do and felt confused about using the technology.

### *Personal Issues*

Eight students (23%) quoted personal issues as reasons for withdrawal. These personal issues were a significant factor (such as illness, divorce or family issues) in the decision to withdraw accounting for the sole reason for 3 students.

### *Amount of Coursework*

Seven students criticised the amount of coursework, which involved weekly tasks and assignment work. Three students withdrew stating that they could not cope with the number of assignments. Four students identified that they were unable to complete the weekly tasks due to lack of time and withdrew or stopped participating early on in the course. Five students identified it as one out of the two reasons for their withdrawal. This can be seen as a contributory factor rather than a prime reason for student withdrawal.

### *Did not require further qualification*

This factor was identified by four students and was a contributory factor to withdrawal interacting with several others. When students understood the demands of the programme in terms of workload and time those with first degrees typically withdrew stating they did not need a further first degree.

### *Other Causes*

Two other factors were identified on one occasion namely withdrawn by supporting college and inflexibility in course design.

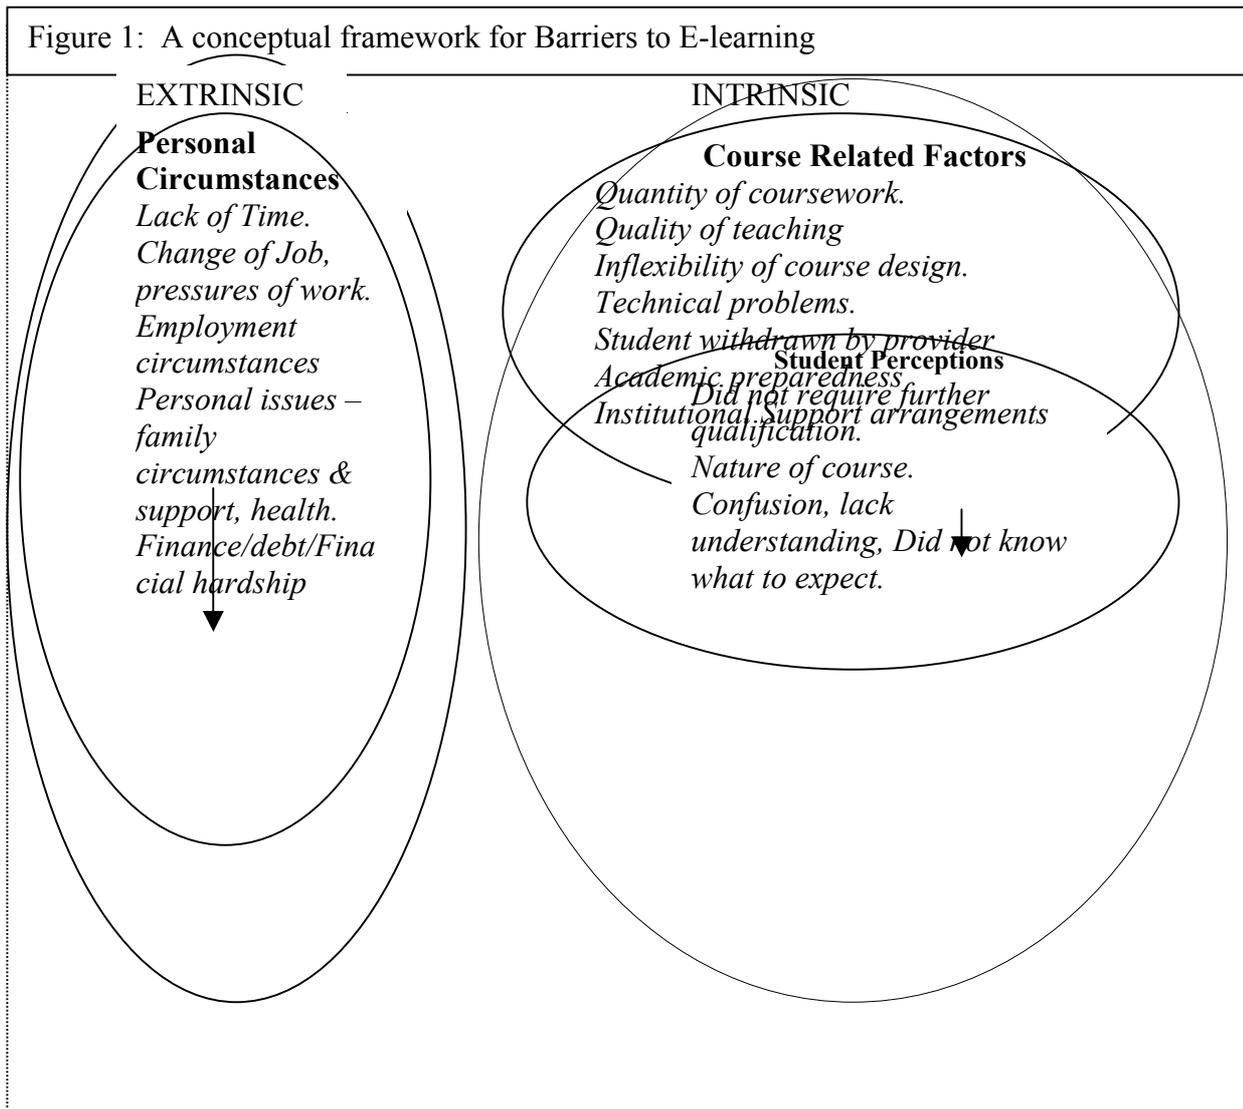

## CONCLUSIONS

This study classifies reasons for withdrawal on this undergraduate enterprise e-learning programme and correlates these causes with the extant literature suggesting strategies to manage and overcome them. Students who withdrew from the course were influenced by a variety of barriers to online Enterprise education including HE, e-learning and Entrepreneurial related factors. These factors will negatively impact on students to make a compulsory or voluntary withdrawal decision. There is considerable interrelation between these factors. For example a key barrier to withdrawal has been identified as time (Jones et al 2003). Both the HE and entrepreneurial literatures recognises the influence of this factor. The study found that successful students were typically non HE qualified, self employed and aged between 31 and 60. Female students were marginally more successful than their male counterparts with older males particularly likely to withdraw. The lack of success of students with prior HE qualifications could be attributed mainly to their motivation. Students with existing undergraduate and postgraduate awards were discouraged from pursuing the qualifications due to its extensive demands in terms of commitment and time. Several identifying they wanted to achieve specific vocational business skills rather than another degree thus de-motivating them from continuing with another long educational programme.

Our study of withdrawn students identified the existence of nine prime causes of withdrawal, which can be categorised in two ways. Figure 1 presents a framework to explain these relationships.

The factors impacting on the e-learning enterprise students can be classified as extrinsic or intrinsic. Intrinsic factors (see Figure 1) are internal and course related, which the course provider can influence and extrinsic, which are external to the course and more difficult to control. Within these two categories we can identify sub classifications namely personal circumstances (PC), course related factors (CRF) and student perceptions (SP). The nine factors of student withdrawal identified within this study can be positioned within these classifications. The personal circumstances category is an extrinsic classification and are external to the programme such as a change of employment and family and health related problems. These variables are far more difficult to influence and control, a critical consideration being their initial identification and coping strategy. The Intrinsic or internal course related element contains two sub categories namely SP and CRF. The CRF group identifies any withdrawal decision related to a course component such as technical problems, assessment, reliability of the VLE, course structure and type of and quantity of assessment. The SP group identifies problems related to the students understanding of the course and how it could benefit them.

Figure 1: A conceptual framework for Barriers to E-learning

## COMPULSORY or VOLUNTARY WITHDRAWAL DECISION

Figure 2 provides an analysis of the student results using an extension of the conceptual framework. Individual students are charted by withdrawal factor. Coleg Morgannwg students are identified via a PP code in the range 1-27 and Coleg Sir Gar students with a C suffix in the range 1 - 44. The student's code is placed in the set associated with their withdrawal decision. For example, PP3 identifies a Coleg Morgannwg student who withdrew due to lack of time, which this study classifies as a personal circumstance factor. If a student withdrew due to a number of causes their coding appears in the relative subset. For example, C22 identifies a student who withdrew due to the nature of the course and the quantity of coursework. Therefore their coding appears in the intersect between the course related and perceptions sets.

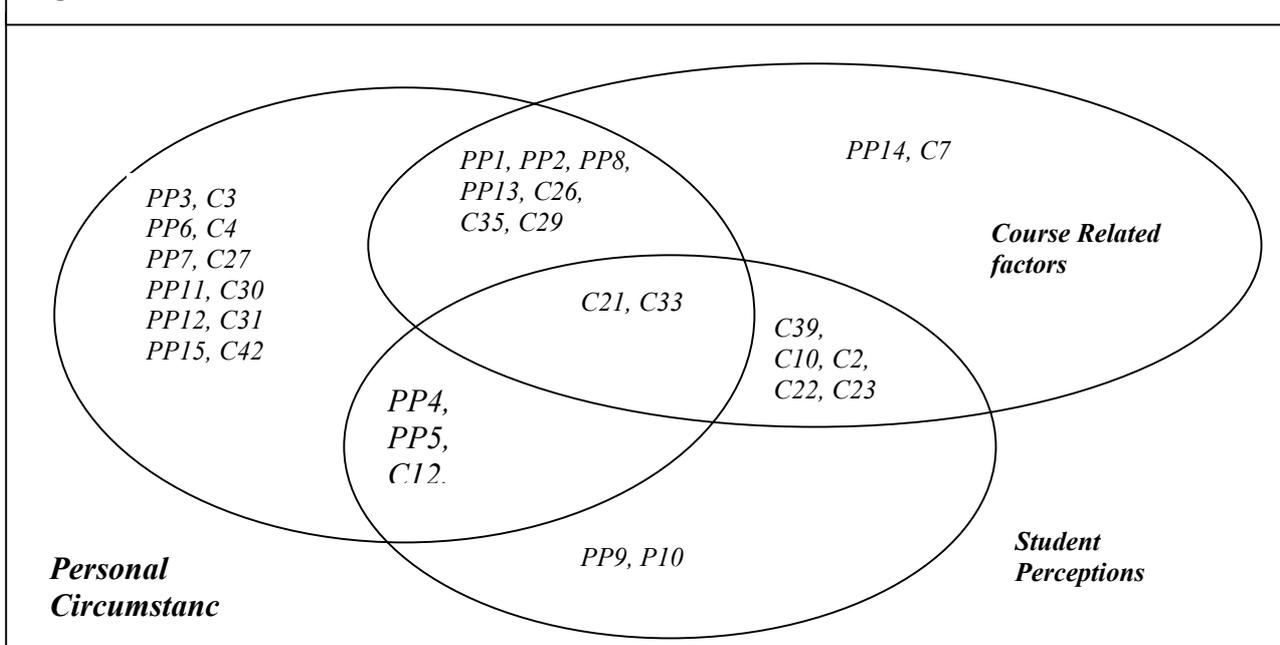

In summary, an enterprise student's withdrawal decision can be seen to have several influences such as HE, e-learning or entrepreneurial related factors. As Figure 1 identifies some of these factors are interrelated. HE factors can include the academic experience, institutional expectations, family support and commitment, college support arrangements. Therefore in our conceptual framework, HE factors can impact on PC, SRFs and CRF. This would apply to any traditional or e-learning related programme. E-learning courses are impacted by HE and e-learning specific barriers. The e-learning barriers are those

factors that directly influence and potentially detract from the student experience such as limited IT skills, technical problems and learning style associated with the media. Finally there are entrepreneurial related barriers to enterprise education. These will only impact on the individuals who are owner managers or employees of an SME. In this study this would involve 41% of the students in self-employment and 24% in private sector employment. Specifically these would involve 2 factors identified within this study namely limited time and increased pressure of work. These individuals would have to cope with these entrepreneurial related pressures in addition to the e-learning and HE factors. Therefore in conclusion barriers to online enterprise education can be seen to be multi layered and interrelated. The critical success factor is to identify and alleviate their influence both their negatively impact on the student experience.

Therefore specific policies to improve retention on enterprise related programmes should include effective recruitment and selection policy. This process should identify candidate applicability for the programme of study and identify their specific training needs. These would include identification of IT skills and a provision for training if required. In addition student would require thorough training in the use of the Virtual Learning Environment (VLE) prior to the commencement of the course. These might involve a face-to-face induction and production of high quality technical manuals explaining the use of the VLE as a support mechanism for students. Moreover it is important that Entrepreneurial students receive accreditation for any prior qualifications or experiences via a process of accreditation of prior learning (APL) and experiential learning. These systems would allow the course to be customised to suit the needs of the learner and avoid duplication of existing knowledge.

This paper will assist e-learning enterprise education providers in identifying and managing barriers to e-learning for enterprise education and creating strategies and systems to reduce their impact and by association improve student retention.

## **ABSTRACT**

In many parts of the world the population pyramid is becoming top-heavy. This creates a worrisome situation where the ratio for worker/pensioner is high and growing dramatically in favour of the approaching troop of pensioners, particularly in Europe. When glancing at other parts of the world as Africa and Asia this problem is not to be found. The reason for this problem is the fact that policies practised today are founded in the fact that the working force is to outnumber retired workers in able to function. If we by some means could counteract these opposing poles and bring them all together we can keep on living almost as before even in the future to come.

This study investigates the possibility to keep the retiring population of senior management for a longer time in the market, with their profession as foundation for doing so. We look at self-employed and persons with top management positions and focus on what can be done for them. They possess a lot of knowledge and experiences that could be of use for new and young entrepreneurs, and that could help them from failing and instead guide and develop these new entrepreneurs to success. There is a need among new and young entrepreneurs to have a mentor, as many of them are afraid of failing. The reality is this: nearly half of those who start their own business actually fail.

There are barriers for the investigated group because senior management has a tendency not to let the grip go from their company when succession is to be realized. When senior management leaves their profession they change to a new stage in life and face problems with emotional bonds that have to be conquered. A way to do that is to become a mentor, which concerns their earlier identity. To find out if it is of interest for senior management to become mentors after retirement we constructed a questionnaire, consisting 61 questions, going out to 1269 respondents, with a response rate of 32%.

According to the survey there is an unambiguous result. Senior management is interested in working with mentorship after retirement. This is not all; senior management was unanimous about mentoring even before retirement. The results have in this perspective found a promising way to keep senior management active longer in the market and help

new and young entrepreneurs to success by decreasing the risk of failing. These two components together will contribute to society and force back the unjust ratio of worker/pensioner to become more equally balanced.

For governmental and other supporting agencies the results indicate new directions for cost effective business development programmes to SMEs and entrepreneurial firms.

## **INTRODUCTION**

Today's healthcare has resulted in longer life spans in those parts of the world, which can pay for the medical technology. In Sweden, as in many other parts of the western world, this luxury has become a problematic issue resulting in a large numbers of pensioners, which need to be provided for.

The reason for not having this situation earlier is due to the fact that before the 1930:s medical technology did not have a positive impact on an individual's recovery when a person was sick [Falk & Nilsson, 1999]. But when penicillin and other antibiotics were invented, a new era began and healthcare had a positive influence on people's health [ibid]. Since this point in time people live longer.

Many of the upcoming pensioners are self-employed as well as holding top-management positions. In the near future these roles are to be passed on to the next generation involving troublesome emotions due to the transfer and entering a new stage in life.

At the same time as the older generation exit the market, a younger generation enters. These people will face problems similar to the problems the exit-generation has already experienced. Furthermore not only does the competition today contain the local and the domestic market it also includes the rest of the world.

Exporters in the western world countries have historically been Swedish exporters biggest competitors and the competition will increase further when fast growing countries as China, containing a population over a billion, enter the world market more seriously.

### **Problem and purpose**

To be able to deal with increasing competition it is of great importance to make better use of the existing knowledge in society. Therefore it is of great interest to see what can be done in an effort to keep the knowledge of retired people in business. The retiring workforce has received and accumulated a huge amount of knowledge and experience throughout their careers. This knowledge and experience should be used. Pensioners would be an asset in any branch and profession. There are different methods and solutions contingent on earlier occupation. At the same time there are new entrepreneurs at the market, entrepreneurs that might fail their business without competent assistance. There are theoretical arguments that suggest support for new ventures should be provided on a mentoring basis, for the reason that mentoring should have an impact on the management ability and confidence of such new firm starts [Deakins *et al*, 1998] and probably save many new entrepreneurs from failing. There is a possibility that retiring entrepreneurs i.e. self-employed and persons with top management positions would find it of great interest to mentoring these new entrepreneurs.

According to mentioned aspects this paper will focus on how to make better use of the self-employed and persons with top management positions, which are soon to be retired and according to this see if there is an interest from their side to become mentors for new and young entrepreneurs.

## **Future workforce**

The amount of births, and when they arrive in a woman's life, are of great interest because it reveals how large the coming workforce will be and when it will arrive. Females wait longer in life for having their first child in the western world. In Sweden an average female have their first child at the age of 28,6 years, in Europe 27,8 and in the USA 24,9 [United Nations, 2003]. In the world approximately 31% of the population are 0-14 years, in USA 22% and Europe 17%.

Trends have been changing about giving birth since the 1970: s. The birth ratio has decreased in Europe from 2,38 child per female to 1,45 [European Commission, 2000]. Europe is in an uncomfortable situation, as it requires a birth ratio of 2,1 per female to avoid a reduction of people [SCB, 2003]. But Europe is not alone as the same trends are to be found in the rest of the world as well. In the USA the ratio has dropped from 2,48 to 2,07 and in Japan from 2,1 to 1,46 [European Commission, 2000]. The fact that less children are being born and that females wait to a later stage in life to give birth results in generations being decreased and postponed and in that way only increases the gap between future workforce and pensioners.

As long as the birth-ratio around the world decreases, leaders of today must realise that females need support and not obstacles when it comes to giving birth and the start of a family. When facing these statistics it does not seem to improve, indeed it is getting worse.

## **Retired workforce**

European workers of today finance much of yesterday's workers living. The politics of today are founded on the fact that the workforce is larger than the number of retired workers. The current worker/pensioner ratio in Europe has fallen to about three workers for each pensioner, and it seems to fall further to about three workers for every two pensioners within 30 years [Economist, 2003]. Europe differs from many parts of the world. In Africa and Asia there are about 10 workers for every person over the age of 65 [European Commission, 2000].

The attitude towards work seems to be that you shall not work for longer time than you have to. Swedish people do not want to work longer than to the age of 65 [SIFO, 2003]. According to the same study, 78% do not feel that they have been affected to retire later than the age of 65 because of lack of working labour. Instead the actual retirement is in the age of 62 and seems to be falling even more [SCB, 2002].

People of today do not face the fact that it will not be possible for workers to pay for the increasing amount of pensioners. This situation is problematic, as the attitudes do not seem to be changing in favour for working later in life.

## **Business transfers**

In the corporate area approximately 20% of the self-employed entrepreneurs in Europe are over 55 years old [European Commission, 2002]. Small and medium enterprises (SMEs) are facing business transfers.

In Sweden 99.2% of all private companies are small, with less than 50 employees. Privately owned companies employ 63% or 2.6 million Swedes. A fourth of every self-employed in Sweden was born in the baby boom in 1940, and in Sweden a person is granted a pension at the age of 65. When these entrepreneurs now go to pension it will directly lead to 180 000 company transfers [SIFO, 2003].

Business transfers are very often triggered by the entrepreneurs retirement. In Germany and Austria more than 40% of the transfers are due to pension. Approximately 33% of the enterprises in Europe will transfer ownership in the next 10 years (ranging from 25-40% depending on the Member State), a figure that corresponds to an average of at least 610 000 SMEs to be transferred each year. [European Commission, 2002].

It is a lot of enterprises that face succession; these companies need to be provided for. To be able to keep these enterprises running, new entrepreneurs must be encouraged to take over where old entrepreneurs left off. Otherwise many companies will go to their grave since there are no successors.

It is not easy to find someone that wants to and can take over a business. According an interview in the local morning paper called "Nerikes Allehanda" in the city of Orebro a self-employed in the steel-industry claims that he wants to get well paid for his lifetime achievement and want his company to be running in the future to come. But it is not only to put the money on the table and take over the business. You have to learn about material qualities, customers and suppliers. They order steel from all over the world, it is a complicated business and he concludes that he will have to walk hand in hand with a buyer for a long time.

## **New entrepreneurs**

It is a demanding mission to start a new business. This is a matter, which many times work as a barrier for new ventures. The total entrepreneurial activity, i.e. share of the population who either are actively engaged in the start-up process or managing a business, in 2002, was low in the European Union (EU) with only 6% and even lower in Sweden with 4% [GEM, 2002].

This should be compared to the United States of America (USA) with almost 11% [GEM, 2002]. The interest in the EU to be self-employed instead for an employee has decreased to 45% and in Sweden to 32% but the interest in the USA has increased to 67% [EOS GALLUP EUROPE, 2002].

According to table 1 below, Swedish people do not, in general, consider starting a business; more do however in the rest of the EU and in the USA. The same survey also reveals what scares potentially new entrepreneurs the most and that is the possibility of going bankrupt, uncertain income and a risk of losing ones property. What is positive is

that more than half (55%) of the EU respondents are willing to take classes on how to set up and manage a business. [EOS GALLUP EUROPE, 2002]

**Table 1. Individuals taking steps to start a business, 2002, in% [EOS GALLUP EUROPE, 2002]**

	Never came to mind	his/her Is thinking about it	Gave up	Currently taking steps to start
<b>European Union</b>	59	11	9	2
<b>United States</b>	41	20	4	10
<b>Sweden</b>	73	9	3	2

Potentially new entrepreneurs have good reason to be afraid, as business insolvencies in the Europe have increased with 10.7% in 2002, compared to the previous year. The situation in Sweden as well with an increase of 5.2% the same period, but in the USA the bankruptcies fell and had a decline of 3,9% [CERU, 2003]. Bankruptcies do not only strike SMEs, also large companies as the retail chain K-Mart, Philipp Holzmann in the construction sector and the Frankfurt bank Gontard & Metallbank amongst a lot of other companies went bankrupt in 2002. Only 55% of the new enterprises who set off their business in Sweden 1998, survived and were still running three years after start [SCB/ITPS, 2003a]. However there are people who conquer the barriers and start their own business and in Sweden there was an increase of 5.4%, in 2002, in the establishment of new enterprises. Then again the newly registered companies, excluding existing enterprises that expand, have decreased 15% in Sweden 2002. [SCB/ITPS, 2003b]. The same survey reveals that only 20% of the newly started companies have received support when they started their business.

## **METHODOLOGY**

Our targets are self-employed and persons with top management positions in Sweden. As a result of this we developed cooperation with StyrelseAkademien in Sweden. StyrelseAkademien is an association for board members in Sweden. The members of this association have the background we are looking for. Their association is wide spread over Sweden, concentrated to seven regions in both large and small cities. We did not get access to all their members but we got access to their members in five of the regions.

We decided to use an online questionnaire, which is very effective; however it has two major weaknesses. Firstly it demands that respondents have access to and computer/Internet use knowledge. We assumed the target population was likely to have access and knowledge as a result and condition of their profession. Secondly Internet correspondence, in contrast to ordinary tangible mail correspondence for answering the questionnaire, is less likely to be answered. It is however much cheaper, faster and more effective than tangible correspondence.

To be able to receive a high participation rate from the respondents, the chairman of the board of each region in StyrelseAkademien helped us by sending an email, with the link to the questionnaire on the Internet, expressing the importance that they answer the survey.

After two weeks we followed up with a similar email from the headboard to remind those who had not yet answered. The total population with email in the five regions is 1 269 persons and the total amount members for all seven regions are approximately 1 800 persons. After the survey had been closed we had a response rate of 32% from 1 269 respondents.

**Table 2. Facts about the respondents**

	All respondents	Self-employed	Top management positions
<i>Share of the total amount respondents (n=406 respondents) in%</i>	100	39	61
<b>Gender</b>			
<b>Woman</b>	25	26	24
<b>Man</b>	75	74	76
<b>Age</b>			
< 23	0	0	0
24 - 33	3	2	1
34 - 43	16	5	11
44 - 53	35	13	23
54 - 63	40	14	25
64 - 73	6	4	2
> 74	0	0	0

Table 2 shows some background variables of the respondents, almost a fourth of these being females. The age is structured in accordance with which decade the respondents were born, for example the interval 24 – 33 were born in the 1970:s et cetera. Other interesting facts are that more than 70% of the respondents have had the profession as self-employed or top management position for more than 10 years. The respondents come from different company-sizes were 37% are micro- (0-9 employees), 24% small- (10-49 employees), 18% medium- (50-249 employees) and 22% from large (≥250 employees) companies. They all come from a wide array of sectors of industry.

## **EMPIRICAL DATA AND DISCUSSION**

### **Succession**

When working in a profession for many years the profession becomes a part of a persons soul and expresses the identity of that person. When working, every person one-day has to face the fact that someone else is to replace him or her after retirement. This is troublesome for every person involved and for that reason succession is of great importance, as a motivator for becoming a mentor.

The goal for any succession plan should be to provide the road map for a business to continue as a successful operation in the event of its leaders departure, whether that departure is planned or completely unexpected due to a life-threatening experience, such as for example a heart attack. It is of no less importance for senior agents to have a

succession plan than for major corporations. With business succession planning, the trust, respect, and goodwill that has been cultivated with clients is being passed on. [Crews C. & Halperin L., 2003]

Top management succession is a challenge for everyone involved. Succession of top management positions has a tendency to be very demanding. A substantial quantity of the succession literature concentrates on the resistance of the entrepreneur to let the business pass on to the next generation. Entrepreneurs have a tendency to hang on to their creation even when they officially have left their top management positions [Handler 1994, Dyer 1986]. Another cause of resistance for succession is linked to the fear of a vanished identity, where the main cause for resistance lies in the lack of appreciation, recognition and love felt by the person who is to be retired [Hubler, 2002].

When the self-employed are to realize succession for their company, it is of a high and complex nature and frequently incredibly severe, concerning issues of technical, organisational, psychological character [Kets de Vries, 1996]. These issues have been described as the ultimate test [Gersick *et al*, 1997]. Although the technical and organisational issues have a tendency to be the ones in centre of attention, it is regularly the psychological ones that are the most troublesome, due to the fact that they have an effect on deep psychological needs such as belonging, control and identity. Succession must not be understood as a single occurrence [Gersick *et al* 1997 & Handler 1994]. Instead, succession is a long procedure that exists over time, beginning long before than the heirs even enter the business [Handler 1994:134].

This might explain the fact that 43% of the self-employed respondents in our investigation aged 54 years or more have not started to think about succession at all. In accordance with Gersick *et al* (1997) & Handler (1994), 46% of the self-employed respondents express the feeling that emotional bonds are the most challenging issues to handle with succession before organisational (28%) and technical (26%) tasks. Regarding emotional bonds, our survey made it clear that it is people in the age of 54 – 63 who find it most demanding; the older you get the harder it gets. Another issue most of the self-employed respondents declare is that taxation in Sweden, is, in itself, a bothersome issue. As one of the self-employed respondents express it:

*“Small entrepreneurs are discriminated for the reason that they have to pay the same tax as salary-earners, however nobody shares the risk inherent with self-employment. In many cases we stand outside of the welfare-system, which many Swedish people appreciate, but which seldom benefits those who run a small business.”*

At the same time 23% of the self-employed respondents announce that they have the intention to be a part of and influence actions concerning the company even after change of ownership. One respondent proclaims:

*“I burn for the vision that exists in the company and I estimate that I can contribute a lot, but the age factor will result in a lower rate of work and to a lesser extent”.*

It is 37% of the self-employed respondents that agree just about completely or more that their company is a lifetime achievement and that it is hard to set free the control over the company (33%). But it seems that it is harder for females to loose the grip. When leaving a company for retirement this can result in a loss of identity (33%) and their belonging (31%). Results become more correlated when focusing those over 63 years of age; those

who are to be retired in a near future. In this group, 63% agree just about completely or more that they will lose belonging when they do not head a company.

As we can see, the self-employed respondents are not homogeneous with regard to deep psychological needs such as belonging, control and identity when running a company. However the figures are strong when looking at the age-structure of the respondents. The survey reveals that those who are soon off to pension at a larger scale considers a loss of belonging, but not a loss of the identity in it self, which is the same in all age-structures.

## **Mentoring**

Mentoring is understood as a journey that describes a unique relationship between mentor and student teacher [Awaya *et al*, 2003]. There are many other definitions regarding mentoring: "The process in which an experienced veteran helps to shape or guide a newcomer...true mentoring is an extended, confidential relationship between two people who have a mutual personal growth and corporate success as common goal...a protected relationship in which learning and experimentation can occur, potential skills can be developed, and in which results can be measured in terms of competencies gained" [Sullivan, 2000]. There are theoretical arguments suggesting that support for new ventures should be provided on a mentoring basis, where mentorship should have an impact on the management ability and confidence of such new start-up [Deakins *et al*, 1998]. It is also considered that mentoring is of crucial importance to the survival and growth of SMEs [Sullivan, 2000], and that provision of new firm support can yield positive and worthwhile returns to the public sector investment [Deakins *et al*, 1998].

In Scandinavia, mentoring programs, where the involved offer their services free of charge to new and young entrepreneurs, are soon to be found in Sweden at Almi Business Partner; in Finland at Yrityskummit ry and in Denmark with the "Sparring med erfaring" project. Other countries in Europe that offer similar services are ECTI and EGEE in France, SES in Germany and the "Saturno" project in Italy. In the USA there is the SBAs Scoring program.

Finding or becoming a mentor may seem like a huge responsibility, but it is actually rather easy [Call, 2003]. The mentor plays five key roles (1) coach, (2) co-ordinator, (3) supporter, (4) monitor and (5) organiser, where the roles are changing dependent on the needs of the protégé [Clutterbuck, 1991]. Assigned relationships through formal programmes have, however, been found to be problematical [Kram, 1986]. There is a need to be careful in matching the mentor with the protégé, so as to try to match the mentors to clients based on the mentors sector experience [Deakins *et al*, 1997] et cetera.

Results from our survey reveal that after their retirement 97% of all respondents are willing to act as mentors, for new and young enterprises. Among the respondents only 22% agree just about completely or more that money is a big issue when becoming a mentor, but on the other hand, almost half (47%) of the respondents want to get paid for their provided service. Those who are most interested to get paid are males between 44-53 years of age.

The reasons for acting as mentor are: the possibility to share their knowledge and experiences (99%), meet new people (93%) and that it is a challenge (90%). Other reasons for becoming a mentor are according to the respondents:

*"Do something that are of value for other persons and the society"*

*“To get my own youth-inspired ideas”*

The respondents are of the opinion that if they would start mentoring after retirement this would not be on a full-time basis (see table 3 & 4), instead they want to do it for 10-20 hours a week (46%) and less than 10 hours a week (42%). Those who could consider mentoring 30 hours a week or more are those at the age of 44 years or older, but they are only a few %. Females do not want to mentor as many hours as males and would prefer mentoring ten hours a week, or less. Other appealing facts that were revealed can be presented as two of the respondents proclaims:

*“Knowledge and experiences can avoid a lot of mistakes. I would rather see the next generation make new mistakes than repeat mine”*

*“It is too long time to wait for retirement. There is a need for younger mentors than the ones who are about to get retired”.*

**Table 3. Hours a week the respondents want to fulfil after retirement, based on gender and position**

Background 1/2						
Hours a week		All respondents	Male	Female	Self-employed	Top position
	< 10	42%	39%	54%	43%	41%
	10-20	46%	49%	35%	46%	46%
	20-30	9%	10%	7%	9%	9%
	30-40	2%	2%	1%	1%	3%
	> 40	1%	0%	3%	1%	0%
	n=326					

**Table 4. Hours a week the respondents could imagine them self to fulfil after retirement, based on age**

Background 2/2						
Hours a week		Age 24-33	Age 34-43	Age 44-53	Age 54-63	Age 64-73
	< 10	30%	46%	39%	41%	63%
	10-20	60%	50%	46%	44%	32%
	20-30	10%	4%	10%	12%	5%
	30-40	0%	0%	3%	3%	0%
	> 40	0%	0%	2%	0%	0%
	n=326					

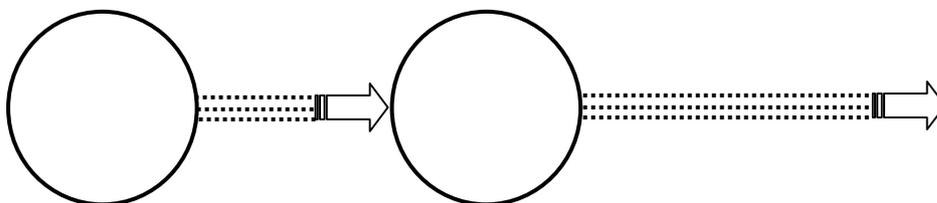

According to our study there is a great interest for becoming a mentor before retirement as well (93%) and doing this for the same amount of hours and reasons as after retirement.

According to Kram (1986) and Deakins *et al* (1997) mentioned above it is of importance for mentors to make the mentorship as smooth as possible. The respondents express a need for a working plan to follow (54%), courses about mentorship (52%), to be able to choose for themselves which clients they would like to be mentoring (81%) and that they should be able to meet the client on a regular basis (91%). If these needs were not to be satisfied there would be a possibility that the mentorship would be problematic according to Deakins *et al* (1997), and if satisfied mentoring could be just as easy as Call (2003) proclaims. Other aspects that do not seem to matter are the total amount of employees in the clients company (50%); if the business has come to a start (33%) and the sort of branch the clients have their business in (45%). This is something that is in some contrast to Deakins *et al* (1997) that claiming that matching the mentors to clients based on the mentors sector experience is of importance.

As the survey reveals, there is a possibility to keep retired persons, with the background as self-employed or holding top management positions, in the society for a longer period of time than to retirement. This means that they would stay longer in their active life and at the same time contribute to society and to the new entrepreneurs. Mentorship does not necessarily have to wait until after retirement since people with this background would be more than happy to become mentors even before their retirement. Such efforts would give contributions to the new entrepreneurs as well as to society in general.

There are three possible outcomes after the final succession when the entrepreneur is off to pension. Figure 1 is the first of them and shows the worst outcome for society and the Gross Domestic Product (GDP). This is when the entrepreneur vanishes from the market totally.

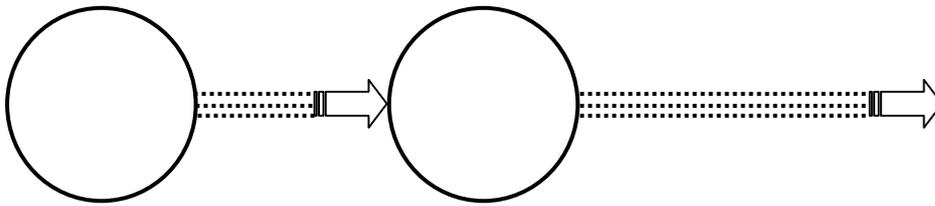

**Figure1. Model over effects to GDP when vanish from the market after expected retirement**

As the model reveals the entrepreneur in this case go to full retirement. An act like this is not pleasant from a macro economic aspect due to the fact that they will no longer contribute by earning a salary by active labour; but instead live on a pension. Going from work force to non work force. Further on, a lot of knowledge goes off to pension, which is troublesome because it could be of more value if the entrepreneur passed on his accumulated knowledge.

Second, many times the entrepreneur has a hard time cutting off their relations to their old company; resulting in prolonged interference, which can be seen in figure 2.

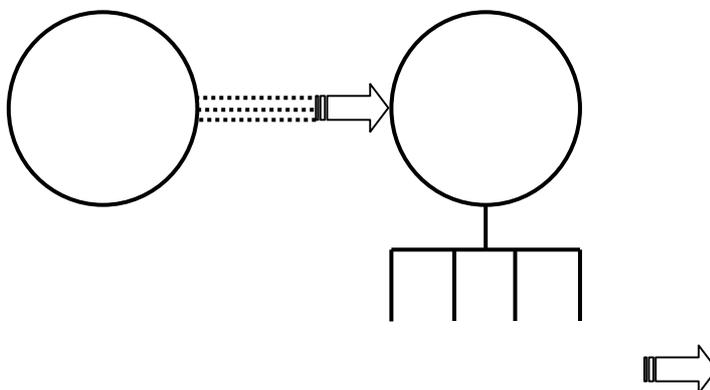

**Figure 2. Model over effects to GDP when helping old company after expected retirement**

In this scenario the entrepreneurs choose to stay in the market and not go off to full retirement. Instead, he helps his old company out in some way; usually as the chairman of the board. When such an action is realised, knowledge will remain in the old company. But this can still lead to a lot of problems, such as conflicts between the old entrepreneur and the successor. The old entrepreneur will still have some salary for the labour but most importantly makes his knowledge, experiences and contacts available to the successor and the company, which will help the company manage better and generates a higher GDP to society.

Finally the entrepreneur is still in the market but decides to share his knowledge to other persons he did not previously know.

**Figure 3. Model over effects to GDP when becoming a mentor to new and young entrepreneurs after expected retirement**

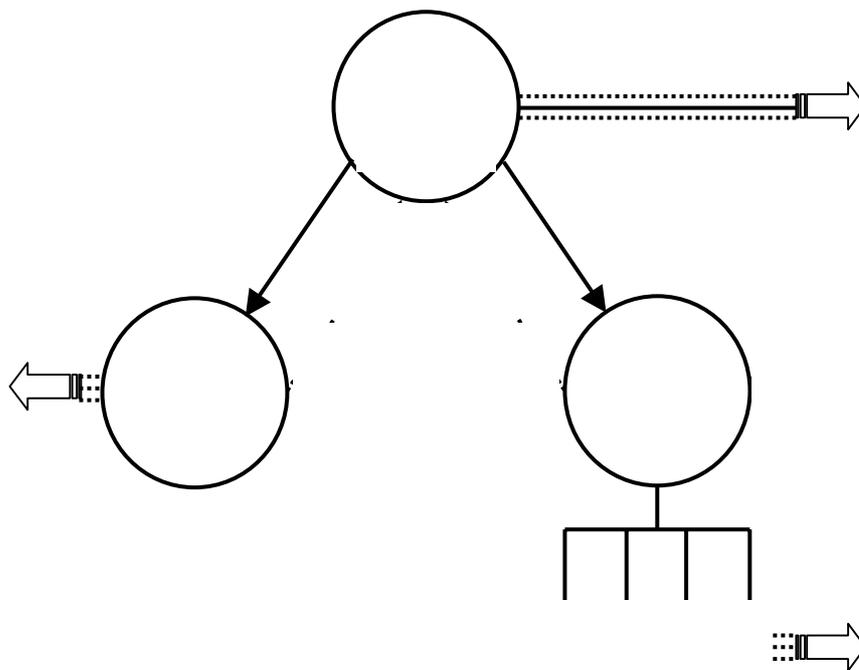

When doing this, he does not only help one company but helps a lot of new and young entrepreneurs that with guidelines can manage better and receive success, if not could cause failure. When the new and young entrepreneur has a mentorship with a person with great knowledge and experience of handling a business this gives him an advantage to other new starters. During the mentorship the adept gets access to the mentors network and support. All this together will result in an easier way to plan and implement strategies and know what to do if something does not work out as planned. For this reason,

mentorship will decrease the risk for liquidation and help the company stay in the market, generating, in aggregate, a higher GDP to society.

When we put all these effects together it could look like figure 4 below, which summarise the effects with mentorship after retirement.

**Figure 4 Summarized model over contributed effects with mentorship after expected retirement**

## CONCLUSION

The present time holds good opportunity for mentorship and young entrepreneurs. The reason for this being, there are many self-employed and persons with top management positions that will retire, and are interested in mentoring an adept. Many of the new entrepreneurs are afraid of failing and the reality is that nearly half of those who start their own business actually fail. In Sweden and EU, the share of the population who either is actively engaged in the start-up process or managing a business is very low. It is apparent therefore that entrepreneurial activity could be increased if new and young entrepreneurs would get the opportunity to have a mentor. They would, by all means, take a chance due to the fact that many are willing to participate in activities, which would help them to better manage and develop their business.

If we arrange for new/young entrepreneurs to start a mentorship on a larger scale, we can turn threats into possibilities, a situation where companies may survive with good guidance. This will by all means create a better climate for our entrepreneurs, mentors and society as a whole.

## **ABSTRACT**

This study aimed at investigating and profiling cases of successful Kenyan entrepreneurs who started and have been managing their enterprises for over 5 years. It examined how these entrepreneurs have steered their firms to success through many challenges that make many enterprises (at least 50%) fail to celebrate their first anniversary, especially in the developing countries. Specifically, the study examined entrepreneurial characteristics, factors that influence growth, and the problems and challenges facing entrepreneurs. The study involved tracing the biographies and exploring coping mechanisms adapted by these entrepreneurs; as well as looking at how they have taken advantage of opportunities to develop their firms to high levels of growth and expansion. The study documented survival techniques used by the respondents in such liberalized and highly competitive market. Sampled entrepreneurs were asked to express the extent to which they did apply the following key influencers to business growth: management techniques, marketing strategies, financial resources and personal motivation.

The Case Study approach was the main method for the study. Observations and face-to-face interviews were the main tools for data collection. The population of the study comprised of all successful indigenous entrepreneurs who had operated their business for over 5 years and had shown tremendous growth, innovation and creativity. Snowballing was the main sampling technique coupled with purposive approach. Lists provided by the following organizations were used: The Kenya Industrial Estates (KIE), Kenya Association of Manufacturers (KAM), and the Kenya National Chamber of Commerce and Industry (KNCCI). The theoretical base that underpinned the study was a combination of the concepts from the psychological and classical schools of thought of entrepreneurship.

Findings indicated that most Kenyan entrepreneurs exhibited typical characteristics of other entrepreneurs elsewhere. They rated themselves as being at least strong on the following characteristics: drive and energy level, setting challenging but realistic goals, commitment, moderate risk taking, and persistent problem solving and competing against self-imposed standards. At least 50% of the respondents were driven into business by the opportunity in the market; this was followed by poverty as another major influence to starting the business. Major factors of success included hard work, honesty and self-confidence besides having a vision.

# INTRODUCTION

## Background

The place of entrepreneurship in an economy, and especially in a developing nation, cannot be overemphasized. It has been found to play a key role in creating employment, offering unlimited opportunities to the citizens and helping them generating income for themselves. It is often said that, the Western World (and indeed most industrialised countries in the world) were built by entrepreneurial individuals (Price, 2001). People who took enormous risks by innovating in areas where most said it could not be done, worked long hours over extended periods of time, and even suffered personal problems, all for the excitement of developing a product or building an enterprise. Entrepreneurs have been known to mobilize otherwise idle resources to create employment, alleviate poverty through the distribution of incomes and assist the disadvantaged members of the community. They have also assisted in the promotion of the national and regional socio-economic linkages for development. Entrepreneurs have been found to promote a more flexible, innovative and creative competitive economic structure. Entrepreneurship has also opened opportunities for the unemployed including graduates of the school system as well as the re-trenched/retired employees.

Various studies have shown that entrepreneurs are the major players in the development and successful management of enterprises in an economy. Armed only with viable business ideas coupled with limited resources, they have been noted to achieve tremendous heights in creating and operating enterprises successfully. These are people, according to Professor Ian C. Macmillan, a guru of entrepreneurship at the Wharton School, who behave like possessed men and women once they experience a flash of understanding known as 'entrepreneurial insight'. According to O'Reilly (2001), "They have seen in their mind's eye, a better mousetrap, the great unmet need, the changing tide, and the big opportunity. Because they see it clearly, they feel they know exactly what must be done to prevail." (p 26). O'Reilly goes further to give examples of people like Ken Olsen who, due to entrepreneurial insight, enabled him to grasp a way to make computers much cheaply as compared to IBM. Other examples from other fields include Ted Turner founder of Cable News Networks (CNN), Bill Gates of Microsoft Computer Company, Kiichiro Toyoda the founder of the Toyota Motor Corporation and John D. Rockefeller (Sr.) among others.

As noted above, entrepreneurs can play a major role of being 'catalysts' in any economy. This is more pronounced in developing countries; which are usually more affected by unemployment, poverty and low standards of living among other challenges. As compared to the Western Countries (and the South East Asian countries), most countries in the developing world, including Africa, are said to lack behind in entrepreneurial activities. This is evident as one may note from the current initiatives such as, the New Partnership for African Development (Nepad) which is aimed at uplifting the African countries from underdevelopment among other challenges. Countries that have a high concentration of entrepreneurs appear to also have a high concentration of people who are high achievers. These countries no doubt, are industrializing at a much faster rate than the rest of the World. The United States of America, Japan, Germany, India, South Korea, and South Africa to

name a few are among such countries. The entrepreneurial culture appears to be well established in these countries according to the GEM report of 2003; this is also coupled with role models who are accomplished entrepreneurs.

This study aimed at surveying for authentic Kenyan entrepreneurs who have steadily steered their firms to greater levels of success. They included individuals who started their businesses from 'ground zero' and have successfully operated them in responding and adapting to challenges and opportunities of economic reform and globalization. Such entrepreneurs act as role models in the community and provide some sense of inspiration to the up-coming entrepreneurs. Such entrepreneurs are expected to eventually form the critical mass for the development of an entrepreneurial culture.

The Kenyan Government has been in the forefront in promoting and encouraging the entrepreneurial culture through various legislations and support mechanisms. This it has done more progressively for the last 30 years through various legislations such as the Sessional Papers No. 1 of 1986 on Economic Management for Renewed Growth, Sessional Paper No. 2 of 1992 on Small Enterprise and Jua Kali Development in Kenya, and the Sessional Paper of 1996 on Industrial Transformation to the year 2020 to name a few. The Sessional Paper No. 2 of 1992 acted as a watershed, as it set out a comprehensive policy framework to enhance and develop the enterprise culture through a multi-dimensional approach. This paper outlined strategies of how the micro-and small-enterprises could be strengthened so as to transition to medium and large size enterprises. It also outlined the role of the private sector and non-governmental organizations in developing a suitable environment for the enterprise culture.

## **Theoretical Framework**

This study was based on a synthesis of entrepreneurship theories and models that have been developed over time, to explain the rise of entrepreneurship development. Cunningham and Lischeron (1991) classified these models under six broad categories of schools of thought of entrepreneurship. They are: Assessing Personal Qualities (the Great Person and Psychological Characteristics), Recognizing Opportunities (Classical school), Acting and Managing (the Management and Classical schools), and those involved in Re-assessing and Adapting (the Intrapreneurship School). These schools view the concept of entrepreneurship from different perspectives as they define a wide array of entrepreneurship activities such as creation, founding, adapting, and managing a business venture. Table 1, illustrates a summary of the concepts represented by these schools in terms of definitions, focus, measures, behaviours and skills.

Though this study combined the concepts presented by various schools of thought as shown in Table 1, the researchers were informed largely by both the psychological and classical schools of thought. These approaches have been widely applied in defining and explaining the 'entrepreneurial phenomena'.

**Table 1: Entrepreneurship Models and Schools of Thought**

<b>Entrepreneurial Model/Schools</b>	<b>Definition and Focus</b>	<b>Measures</b>	<b>Behaviours and skills</b>
“Great Person” School	<ul style="list-style-type: none"> <li>• Extra-ordinary achievers</li> <li>• Has intuitive ability born with (sixth sense)</li> </ul>	<ul style="list-style-type: none"> <li>• Personal principles, histories and experiences</li> <li>• Described/featured widely in the media</li> </ul>	<ul style="list-style-type: none"> <li>• Intuition, vigour, energy, persistence and self-esteem</li> </ul>
Psychological characteristics School	<ul style="list-style-type: none"> <li>• Entrepreneurs have unique values, attitudes, and needs that drive them</li> </ul>	<ul style="list-style-type: none"> <li>• Locus of control, and need for achievement</li> <li>• Behaviour is according to the values as one satisfies the needs</li> </ul>	<ul style="list-style-type: none"> <li>• Personal values, risk taking, and need for achievement</li> </ul>
Classical School	<ul style="list-style-type: none"> <li>• Innovation and creative are central characteristics</li> <li>• Bearing risk and uncertainty</li> </ul>	<ul style="list-style-type: none"> <li>• Decision making</li> <li>• Ability to see opportunities and take action</li> </ul>	<ul style="list-style-type: none"> <li>• Innovation, creativity, and discovery</li> </ul>
Management School	<ul style="list-style-type: none"> <li>• Entrepreneurs create value by recognizing opportunities, organize resources, own, manage and assume risks</li> </ul>	<ul style="list-style-type: none"> <li>• Expertise, technical knowledge and plans</li> </ul>	<ul style="list-style-type: none"> <li>• Production planning, people organizing, capitalization, and budgeting.</li> </ul>
Leadership School	<ul style="list-style-type: none"> <li>• Entrepreneurs are leaders of people.</li> <li>• “Social architects” as they promote and protect values</li> </ul>	<ul style="list-style-type: none"> <li>• Attitudes, styles of management</li> <li>• Level of team spirit</li> </ul>	<ul style="list-style-type: none"> <li>• Motivating, directing and leading</li> </ul>
Intrapreneurship School	<ul style="list-style-type: none"> <li>• Pulling together resources to promote innovation in an organization</li> <li>• Development of independent units to create, market, and expand services</li> </ul>	<ul style="list-style-type: none"> <li>• Decision making and level of flexibility</li> </ul>	<ul style="list-style-type: none"> <li>• Alertness to opportunities, maximizing decisions</li> </ul>

Source: Cunningham and Lischeron (1991)

Both the Psychological and Classical Schools of thought theories and concepts guided this study in identifying and profiling successful Kenyan entrepreneurs. The Psychological School of entrepreneurship believes that certain personality characteristics are key in the development of entrepreneurs. These include: need for achievement, locus of control, risk-taking, tolerance of ambiguity, and type A behaviour (Begley and Boyd 1987; Brockhouse and Horwitz 1986). The need for achievement (*n Ach*) is a personality identified by McClelland when he found that individuals with high levels of *n Ach* had a strong desire to solve problems, receive feedback, and enjoyed setting targets and achieving them.

Under the Classical School of Entrepreneurship, entrepreneurs are viewed as individuals who undertake/develop ventures which have elements of risk; those that require some creativity and innovativeness. Schumpeter (1934), agreed with this notion by stating that the key ingredient of entrepreneurship lies in innovativeness of the individual and not ownership of a venture. He went further to define entrepreneurship as “Carrying out of new combinations of firm organization – new products, new services, new sources of raw material, new methods of production, new markets, new forms of organization.” (P4, Dollinger 2001). The Classical school’s main thesis is that innovation, creativity and discovery are the key factors underlying the development of entrepreneurship. One example of a creative and innovative behaviour is seen in Steve Jacobs, one of the co-founders of Apple Computers; being full of energy and being innovative, he is said to have motivated the others to be creative and launch into a new industry.

These schools of thought are seen as offering unique viewpoints to explain and illustrate how the sampled entrepreneurs have reached where they are and the type of adaptive mechanisms they have employed to maintain the lead.

## **Statement of the Problem**
