Lack of sufficient empirically developed Case Studies of successful entrepreneurs is one of the major problems affecting both academicians (as learning materials) and practitioners (as role models) in the developing countries including Kenya. Hence this study attempted to provide Case Studies of ‘who is who’ between authentic and successful medium and large-scale entrepreneurs in the country. These comprised of those who have demonstrated innovative and creative skills in business for at least 5 years – having experienced steady growth and expansion in all those years.

## **Why this study?**

Researching and profiling of cases representing successful local entrepreneurs in Kenya has been long overdue; given that the country is now moving towards creating an enterprising culture. Moreover, various courses on entrepreneurship are now being taught at different levels in the school and college system with limited relevant learning materials. Non-Kenyan Cases in entrepreneurship which, do not often represent the exact environment, are being used in a number of entrepreneurship classes. Most do not capture the Kenyan business environment as it is currently. Hence appropriate Case Studies need to be developed so as to form the basis for effective training by providing suitable local learning materials, examples and lessons. The study has also generated literature for future studies in the area of the

African Entrepreneur. Case studies of successful indigenous entrepreneurs will serve as role models to be emulated by other entrepreneurs. They will also provide the much needed literature on local micro and small enterprises for use by practitioners, learners, academicians and small businessmen and women, and other stakeholders in the sector. In addition, success stories will be used as bench marks in terms for evaluating success for aspiring young entrepreneurs and college graduates including those from other tertiary institutions..

Overall, case studies will be useful tools in business training and counselling sessions - these have been found to be appropriate for adult learners. Cases provide real life experiences and actual problems encountered in the field (Marvis and Leiniger, 1991). Use of cases has been found to enhance skill and knowledge acquisition as learners are fully engaged in discussing real issues and decision-making situations.

Cases and Profiles of successful entrepreneurs can play an influencing and motivating role effectively, especially for those intending or engaged in entrepreneurial activities. They provide practical and inspirational information about: commitment, creativity, and perseverance, hard work, assuming risks, organization and management of business ventures are brought out in cases. They also give insight into the application of sound management principles and bring out significance and feasibility of combining a small business career, family obligations, and individual goals. Last but not least, cases were to expose the abundant business opportunities that are available to individuals across the sectors for viable entrepreneurship.

## **Objectives and Purpose of the Study**

The purpose of this study was to develop authentic Case Studies and Profiles of successful Kenyan entrepreneurs at what is often known as the 'missing middle' or medium and large Enterprises. Those who have changed things and are continuing to do so in the entrepreneurial 'map' of Kenya. It aimed at surveying a selected number of successful entrepreneurs operating in Nairobi and spread across all sub-sectors of the economy; those engaged in best practices in innovation, creativity and business management.

## **Specific Objectives**

The study aimed at:

1. Determining the characteristics of successful Kenyan entrepreneurs.
2. Determining factors influencing the growth or success of medium and large enterprises.
3. Ascertaining problems and challenges faced by these enterprises and their coping mechanisms.
4. Compiling case studies of successful Kenyan entrepreneurs

The cases developed from this study form part of the needed literature on the typologies of the Kenyan entrepreneur for use by scholars and students engaged in the discipline. They provide the knowledge, practical tools and techniques that have been used for success. Hence the findings shed more light on level of the entrepreneurial culture in the country.

# LITERATURE REVIEW

Who are entrepreneurs? These are individuals who are prepared to take enormous but, calculated risks, innovate in areas where most say that it cannot be done, work long hours over extended periods of time and even suffer personal problems all for the excitement of building an enterprise (Price, 2001). They are also said to have a passion and bring a singular concentrated focus to their projects- often starting with nothing more than an idea and go on to bring together 'teams' that have the ability to use limited resources and create successful businesses. Entrepreneurs are also said to be smart at putting together all the ideas and resources and moving to make profits as quickly as possible. They are known to scan the environment for viable business opportunities, and to take the initiative to create something of value for gain (Kibas, 2000). Two types of entrepreneurs have also been identified – craft and opportunistic entrepreneurs. Whereas craft entrepreneurs rely on their own acquired skills of creating/fabricating products, the opportunistic entrepreneurs engage themselves in business through identifying viable opportunities.

Entrepreneurship on the other hand, is a process, which involves the creation of an innovative economic organization for the purpose of gain or growth under conditions of risk and uncertainty (Dollinger, 2001). Vanderwerf and Brush (1989) after reviewing twenty-five definitions concluded that, entrepreneurship is a business activity consisting of some intersection of the following behaviours: creativity, innovation, general management, risk bearing and intention to realize high levels of growth. It is a continuous process of creating something different that has value to the users (Hisrich and Peters, 1992). The process is dynamic and leads to creation of wealth and economic empowerment to the individual.

Entrepreneurship plays a major role in the economies of countries that have a developed entrepreneurial culture. For instance, Price (2001) notes that for an enterprising nation like the USA, "... Entrepreneurs' firms are critical to the health of America's economy; they create two out of every three jobs and are twice innovative as large companies. The entrepreneur has also become increasingly important in restoring the competitive position of many US companies in the global market place." (p7).

Few studies, if any, in Kenya have focused on developing profiles of successful cases of entrepreneurs. The closest have looked at characteristics of micro and small enterprises, gender issues and impact of various interventions on the development of the Small and Micro Enterprise Sector. According to Bwisa (1997), most research on entrepreneurship in Africa (including Kenya) has tended to look at it unfavourably due to low level of efficiency in their operation. He points out that, though many firms had the capacity to increase outputs without additional investments, most suffered from high mortality and poor profitability. This was said to be due to lack of relevant entrepreneurial culture and skills, which manifested themselves in different ways. For instance, when the firms grew to some level, the owners tended to loose managerial control; they also tended to lack foresight to recruit and develop efficient teams of workers. He however, hastens to acknowledge that there are exceptional owner-managers (entrepreneurs) who have excelled in entrepreneurial activities.

Further, Bwisa points out that, the origin of the successful entrepreneurs has various sources. There are those who have grown from the informal sector (*Jua Kali*) i.e graduated from

operating under harsh environments of hawking and petty trade into the formal sector; others were employees of large expatriate Asian/Foreign-run enterprises; while others were former politicians and civil servants. Shirley and Muzyka (1997) gave a wider perspective of the origin of entrepreneurs in the Western World. They pointed out that entrepreneurs in society emerge largely as a result of various forces and variables over time. They stated that the supply of entrepreneurs is influenced in part by genetic powers (such as need to achieve), by family (history in business), background and early business experiences, and the economic (*and socio-political*) environment.

Talk about entrepreneurs, both positive and negative, tends to revolve around high fliers like Bill Gates and Richard Branson or, in New Zealand's case, entrepreneurs such as retail giant Stephen Tindall. Yet, in many countries including Kenya, there are equally successful entrepreneurs shaping and contributing immensely to the economies of these nations. Many of the businesses are started and owned by entrepreneurial people who may, for various reasons, never reach the heights of Bill Gates and others, but nevertheless contribute significantly to their communities and to their countries.

This study aimed at filling the knowledge gap as regards the emergence of authentic Kenyan entrepreneurs; who have been successful in starting and steadily steering their firms to high growth and expansion. The output of the study being authentic Case Studies and Entrepreneurship Profiles which are based on empirical study.

## **RESEARCH METHODOLOGY**

### **Research Design**

This study was mainly based on the Case study methodology in conjunction with the exploratory approaches; these involved qualitative techniques as stated by Cooper and Schindler (2001). As a unique type of study, the methodology incorporated two phases of data collection and analysis before cases were developed. These included, preliminary identification of potential respondents using various sources, followed by selection of respondents and finally focusing on the sample for detailed data collection.

The qualitative approaches were used to enable the researchers gain a clear perception of the dynamics that go into operating an enterprise; and to document the intricacies that have brought about the success of sampled entrepreneurs. Descriptive methodology combined with the case study approach were utilized to enhance the findings of the study; this was also Profiles of success stories were prepared from the data. done to capture the true historical and contemporary events that have shaped the lives of the respondents. The aim was to arrive at findings that are seen to be paramount and representative of a true and full picture of the constructs under investigation (Jacobsen, 2003)

The design focused on a holistic view of the sampled entrepreneurs to be studied through document review, case histories, observations and interviews. Both secondary and primary sources were used for data collection. Secondary sources included visiting and conducting

journalistic investigations from the various sources (including organizations) and also published information regarding the entrepreneurs.

Primary data involved direct interaction with the sampled entrepreneurs to conduct face-to-face interviews with them. This was done in all cases at the client's premises. It also included making observations and further reading of literature about them.

## Population

The population for the study comprised of all successful Kenyan entrepreneurs who have been in business for over 5 years and have achieved great strides in innovation, creativity and growth among others. They comprised a wide spectrum of individuals who have been identified as successful entrepreneurs in the country. The study took note of the spread of the correspondents geographically and across the various sectors and levels of operation in terms of volume of business, capitalization, and number of employees.

Membership from various trade and manufacturing associations were surveyed in order to arrive at the population of interest. The associations visited included, The Kenya Manufacturers Association (KAM), the Kenya National Chamber of Commerce and Industry (KNCCI), the Kenya Institute of Management (KIM), the Kenya Industrial Estate (KIE), and the Federation of Kenya Employers (FKE). The population of interest comprised of those entrepreneurs who have been consistent and persistent towards achievement of excellence.

## Sample Frame - Case Studies and client Profiles

To be able to have representative cases, the sampling frame took cognizance of the sectors (manufacturing, trading, and service) and the classification of businesses in the country by number of employees. This classification categorized enterprises into: micro- and small-enterprises with less than 19 employees, medium enterprises with between 20 and 49 workers, and large enterprises with over 50 employees (GoK/World Bank, 1996). The total number of final respondents is expected to be 12 entrepreneurs made up of one (1) from each sector and level of business. However, due to uneven spread of respondents across the sub-sectors, the total number identified were identified 24 were interviewed. Table 2 gives a summary of the initial number of respondents that were to be sampled:

**Table 2: Sample Frame of respondents**

<b>Sectors</b> -----	Manufacturing	Trading	Service	Totals
<b>Level of enterprise</b>				
Medium enterprises	5	5	5	15
Large enterprises	5	5	5	15
	10	10	10	30

Profiles of only 18 successful entrepreneurs have been documented from the summaries and analysis made. These cases came from various sub-sectors including: service, manufacturing and trade. The study included at least 20% successful women entrepreneurs.

## **Sampling Process**

Purposive sampling in combination with stratification and snowballing strategies formed the main technique employed. The sectors and regions formed the strata from which samples of entrepreneurs who meet the given criteria were drawn. Lists of all possible entrepreneurs was drawn based on the secondary search from the Kenya Association of Manufacturers (KAM), the Kenya Industrial Estates (KIE), the Kenya National Chamber of Commerce and Industry (KNCCI) and other relevant sources. From these records, respondents who met the following general criteria were purposively sampled:

- i) Were (or have in the immediate past operated) operating what is termed a 'unique' enterprise of their own which they started and have been in existence for over 5 years
- ii) The enterprise having grown in assets, volume of sales and profits, and employees over at least 10 times since inception.
- iii) Be within any of the following sectors – Manufacturing, Trade, Service or any other closely related to these.

Due to the complexity of the study and the multiple variables to be examined for each respondent, two phases of sampling and evaluation was be used: Phase I - which used secondary data mainly and Phase II, the final sampling, which incorporated snowballing technique to arrive at the number of respondents for interviews and detailed profiling.

In Phase I the researchers identified organizations and professional institutions with members operating enterprises. From these organizations, and based on the information provided, lists were then drawn of possible respondents with the help of these institutions. Appointments were then made in advance before the visits and interviews. Phase II involved visiting the identified respondents and conducting interviews and making observations. The general criteria for sampling included examining:

- i) Growth in Profiles of success stories was prepared from the data. employment as measured by number of jobs created
- ii) Increase in monthly sales in terms of value in shillings
- iii) Increase in number of assets in value
- iv) Great increase in capital employed
- v) Major diversification in terms of new products and or services offered
- vi) Increase in number of branches/locations/new businesses
- vii) Creativity and innovation in terms of uniqueness features in business operations
- viii) Exceptional Improvement in general business management – marketing, financial records etc

## **Data Collection and analysis**

As an exploratory investigation, the approaches used in collecting data from the various relevant sources as stated by Cooper and Schindler (2001) included: interviews and document analysis. Data was collected within the context of their natural occurrence. Personal in-depth interviews by the researchers were held with the sampled respondents. These were conversational in nature and aimed at capturing the true picture of their history and perception of the enterprises. On-site observations were also used; these were participant in nature in order to perceive firsthand, what the entrepreneurs and their

employees experienced in the business setting. Documents were also analyzed to evaluate historical as well as current records, reports and others that were related and relevant to the sampled entrepreneurs.

The main tool used in collecting data was the Interview Guide. It comprised semi-structured open-ended questions to capture the bio-data and other details of the entrepreneur. The items in the guide covered major events in their lives, philosophy, goals, achievements, education, training, and family business history (where it was relevant). Part two of the guide was used to assess the extent to which the respondents possessed certain key Personal Entrepreneurial Characteristics (PECs) associated with successful entrepreneurs and venture capitalists (Dingee et al 2001). Two researchers assisted by a research assistant were involved in collecting the field data (including interviews) and analyzing it. The Graduate Research Assistant assisted in the summary, keeping the records of collected data from the sampled respondents and processing it.

The primary data from the interviews and secondary sources was analyzed by use of content analysis and descriptive statistics; they were then harmonized and summarized in form of overall findings and detailed case studies. Use of the SPSS tool enhanced data processing by providing relevant tables for analysis. A summary of the cross-cutting characteristics was also prepared followed by detailed cases of the respondents.

## **STUDY RESULTS AND FINDINGS**

### **Overall findings**

The study aimed at developing authentic case studies and profiles of successful Kenyan entrepreneurs. A total of 24 entrepreneurs were identified and interviewed; out of whom 18 profiles were analyzed for detailed profiling. They comprised 17 (70.8%) males and 7 (29.2%) females and were spread across the following sub-sectors: manufacturing, trade and service. The main objective of the study was to identify dominant characteristics and traits that are often identified with successful entrepreneurs and also distinguish them from non-entrepreneurs (or ordinary business people). These were mainly personality-based predictors of success as entrepreneurs.

The case studies discussed in this paper describe entrepreneurs who have successfully steered their firms to success. The study focuses on the personal characteristics the entrepreneurs expressed, the events that led to venture creation, their up-bringing, brief history of the enterprises, major challenges and their future goals among others.

### **Entrepreneurs Background and Characteristics**

The findings in this study are analyzed under: family background, education and training, employment record and history of the enterprise. This is in agreement with what Hirsch and Peters (1992) stated when they posited that there are a number of aspects, which tend to differentiate an entrepreneur from the general populace and managers. These include: Family background, education and work history.

### *Family background*

As regards the birth order, the largest number, 9(37.5%) respondents were the 2<sup>nd</sup> borns followed by 4<sup>th</sup> borns represented by 6 respondents. Family size varied between 1 and 19 siblings with the majority, 20 (83.4%) of the respondents falling between 1 and 9 siblings in the family. Most respondents grew up in average neighborhoods. A few had at least one parent in formal employment, others had business parents and the rest came from farming (and agricultural) backgrounds. The home environment for most (65.6%) respondents was competitive – with parents demanded more from their children in terms of performance. In a number of cases, respondents indicated their fathers tended to have exerted more influence on the upbringing and later careers; these parents expected their children to work hard and be winners. As regards upbringing, 15(62.5%) of the respondents grew up in a rural setting while 9(37.5%) grew up in urban settings.

The modal range of the respondents was within the 46-50 years-age bracket where 25% of the respondents were found. Most respondents however, were between age 36 and 60 years old. As regards marital status, the majority, 23 (95.8%) were married. The common age at marriage was between 23 and 28 where the majority 17 (70.8%) were found. The family size varied between 1 and 6 children; while the majority of respondents, 17 (70.8%) had between 2 and 4 children.

### *Education and Training*

For the level of education and training, 12 (50%) respondents had a college degree 33.3% with the 1<sup>st</sup> degree and 16.7% with a masters' degrees. Seven (29.2%) respondents had diplomas in relevant fields for their line of business whereas only 5 (20.8%) had up to high school education. Out of the total number of respondents, 17(70.8%) attended public schools and 7 (29.2%) were educated in private schools.

All the respondents had undergone some form of relevant training – either and or both technical and business training. Nine ((37.5%) had undertaken both technical and business training. Twenty (83.3%) of the respondents had been employed; fifteen (62.5%) had worked for over 2 years and some having risen to the level of senior managers before going into self-employment. For personal values, most respondents believed and practiced hard work, integrity, and creativity among others.

### *Personal Entrepreneurship Characteristics (PECs)*

On the Likert scale on Personal Entrepreneurial Characteristics (from 1=Very weak to 5=Very strong), the respondents scored means ranging from 4.21 (for Setting challenging but realistic goals) to 4.88 (for Taking initiative and seeking personal responsibility). This indicates that most of them appear to possess a high level of entrepreneurial characteristics and traits. The majority (at least 75%) of respondents rated the following characteristics as being very strong: Self-confidence, Long-term involvement, Learning from failure, and Taking initiative and seeking personal responsibility. These are often associated with successful entrepreneurs.

For further understanding, the following PECS were analyzed: drive and energy level, self-confidence and believe in oneself to achieve goals, setting challenging but realistic goals, long-term commitment, using money as a performance measure, persistent problem solving, taking moderate risks, learning from failure, using criticism positively, taking initiative and seeking personal responsibility, making good use of resources, and competing against self-imposed standards.

a) Drive and energy level

Table 3 summarizes the ability to work for long hours for sustained periods with less than normal sleep; 54.2% rated themselves very strong, 37.5% strong and 8.3 % was average.

**Table 3. Drive and energy level.**

Rating	Distribution	
	Frequency	%
Average	2	8.3
Strong	9	37.5
Very Strong	13	54.2
<b>Total</b>	<b>24</b>	<b>100.0</b>

**Mean=4.46**

b) Self-confidence

As regards self-confidence, belief in oneself and ability to achieve own goals. All the respondents rated themselves as at least strong with 18 (75.0%) rating themselves very strong and 25.0% strong. The mean rating was fairly high at 4.75. Table 4 analyses the ability to set challenging but realistic goals; 8 (33.3%) rated very strong, 13 (54.2%) rated strong and 3 (12.5%) rated average.

**Table 4. Setting challenging but realistic goals.**

Rating	Distribution	
	Frequency	%
Average	3	12.5
Strong	13	54.2
Very Strong	8	33.3
<b>Total</b>	<b>24</b>	<b>100.0</b>

**Mean=4.21**

c) Commitment to the enterprise

Long-term commitment to the enterprise was rated as at least being strong by 23(95.8%) respondents. This is seen in the ability of the entrepreneur to be totally dedicated to projects that was reach completion in five to seven years and to work towards distant goals. 75.0% of the respondents rated themselves very strong whereas 20.8% strong and only 4.2% as average. Table 5 gives the summary of long-term involvement.

**Table 5. Long-term involvement.**

Rating	Distribution	
	Frequency	%
Average	1	4.2
Strong	5	20.8
Very Strong	18	75.0
<b>Total</b>	<b>24</b>	<b>100.0</b>

**Mean=4.71**

d) Use of money as a performance measure

Most entrepreneurs have been found to consider money as a means to an end – achievement. As regards the respondents in this study, 17(70.8%) rated themselves as very strong, 4(16.7%) as average and 3(12.5%) as strong. Table 6 gives the summary.

**Table 6. Using money as a performance measure.**

Rating	Distribution	
	Frequency	%
Average	4	16.7
Strong	3	12.5
Very Strong	17	70.8
<b>Total</b>	<b>24</b>	<b>100.0</b>

**Mean=4.54**

e) Problem solving

Entrepreneurs are said to have persistent problem solving skills. Table 7 shows how the entrepreneurs rated themselves on their ability to solve a problem towards completion of tasks; 15(62.5 %) rated themselves very strong, 8(33.3%) as strong and only 1(4.2) % was average.

**Table 7. Persistent problem solving.**

Rating	Distribution	
	Frequency	%
Average	1	4.2
Strong	8	33.3
Very Strong	15	62.5
<b>Total</b>	<b>24</b>	<b>100.0</b>

**Mean=4.58**

f) Risk taking

The propensity to take moderate risks is seen as one of the key characteristics that distinguish entrepreneurs from ordinary people. From Table 8, it is noted that 23(95.8%) respondents rated themselves as at least strong; only 1(4.2 %) rated average.

**Table 8. Taking moderate risk.**

Rating	Distribution	
	Frequency	%
Average	1	4.2
Strong	8	33.3
Very Strong	15	62.5
<b>Total</b>	<b>24</b>	<b>100.0</b>

**Mean=4.58**

g) Learning from failure

As regards learning from failure, 22(91.7%) respondents indicated that they were at least strong. Failure is not seen as the end of the road but as tuition. As for the use of criticism, 22(91.7%) respondents also rated themselves as at least strong. Most of them indicated that they went out of their way to seek comments from their employees as well as other clients. All the 24(100%) respondents indicated that they seized opportunities and put themselves in situations where they were personally responsible for success or failure; they took initiative to get things going.

h) Making use of resources

Table 9 shows the rating on the ability of the entrepreneur to make good use of resources; ability to identify and use expertise and assistant that is relevant to the accomplishment of ones own goals, 16(66.7%) rated very strong, 6(25.0%) strong and 2(8.3%) average.

**Table 9. Making good use of resources.**

Rating	Distribution	
	Frequency	%
Average	2	8.3
Strong	6	25.0
Very Strong	16	66.7
<b>Total</b>	<b>24</b>	<b>100.0</b>

**Mean=4.58**

l) competing against self-imposed standards

Table 10 analyses the ability of the entrepreneur to establish ones' own standard of performance and compete against it. From the responses, 17(70.8%) respondents rated

themselves as very strong, 6(25.0%) strong and only 1(4.2%) as average. Thus 23 (95.8%) of the respondents appear to set their own standards and compete to achieve them.

**Table 10. Competing against self-imposed standard.**

Rating	Distribution	
	Frequency	%
Average	1	4.2
Strong	6	25.0
Very Strong	17	70.8
<b>Total</b>	<b>24</b>	<b>100.0</b>

**Mean=4.67**

## The Enterprise

### *History of the enterprise*

All the enterprises visited had been in existence for at-least 5 years; some had however, been in existence for over 15 years. Half (50%) of the respondents indicated that the current enterprises were not the first ones. They had operated other businesses before. For eleven (45.8%) respondents, this was their first enterprise. Fifteen (62.5%) of all the respondents started enterprises in the sectors in which they had relevant skills.

### *Reasons for starting the business*

Various reasons were given for starting the business. From Table 11, it is noted that half (50.0%) of the respondents said that they were driven by an opportunity in the market, 16.7% wanted to be boss of their own, and 3(12.5%) were driven by the need to face a challenge and be able to start an enterprise besides the need for money.

**Table 11. Reason of starting business**

Reasons	Distribution	
	Frequency	%
It was existing	1	4.2
To face challenge	3	12.5
Opportunity in the market	12	50.0
Be boss of his/her business	4	16.7
Need for money	3	12.5
Unemployment	1	4.2
<b>Total</b>	<b>24</b>	<b>100.0</b>

### *Major influences on the entrepreneur*

Table 12 gives a summary of the responses on the major influencing factors. Eleven (45.8%) respondents stated that they were driven by “poverty” to establish their own business, and 7 (29.2%) said they were influenced by their fathers.

**Table 12. Who influenced you into starting your own business**

<b>Rating</b>	<b>Distribution</b>	
	<b>Frequency</b>	<b>%</b>
Influenced by father to enter into business	7	29.2
Influenced by Mother to enter into business.	1	4.2
Influenced by both parents	1	4.2
Poverty acted as the drive in starting business.	11	45.8
Strong desire to be boss to yourself	1	4.2
Brother	1	4.2
Grandfather	2	8.3
<b>Total</b>	<b>24</b>	<b>100.0</b>

### *Challenges at start-up*

As regards the challenges faced by the respondents, Tables 13 analyses the challenges at business start-up stage. Lack of capital appears to have been a major challenge as stated by 12(50.0%) respondents; 4(16.7%) said lack of modern technology and 3 (12.5%) respondents gave lack of skills for management staff as obstacles at business start-up stage.

**Table 13. Challenges faced at start**

<b>Rating</b>	<b>Distribution</b>	
	<b>Frequency</b>	<b>%</b>
Lack capital	12	50.0
Managing staff	3	12.5
Competition & Liberation	2	8.3
Marketing	1	4.2
Lack of modern technology	4	16.7
Poor infrastructure	2	8.3
<b>Total</b>	<b>24</b>	<b>100.0</b>

### *Current Challenges*

Current challenges faced by the entrepreneurs included: competition from imports, which was leading with 7(29.2%) respondents, poor infrastructure 6(25.0%) respondents and an under-performing economy (20.8%) among others. Table 14 gives the current challenges that face the entrepreneurs.

**Table 14. Current challenges**

<b>Rating</b>	<b>Distribution</b>	
	<b>Frequency</b>	<b>%</b>
Under performing economy and low purchasing power	5	20.8
High interest rate and taxation	1	4.2
Insecurity	4	16.7
Competition from imports	7	29.2
Poor infrastructure	6	25.0
High duty in raw materials	1	4.2
<b>Total</b>	<b>24</b>	<b>100.0</b>

*Use of free time*

As regards the use of 'free' time, 9 ( 37.5%) respondents indicated that they are involved in sports and games, followed by 4 (16.7%) who spend their time traveling. The other large number, 9 (37.5%), of respondents spend time with their families, community work and reading for pleasure. Table 15 shows the distribution of how "free" time is spend. Closely related to use of time, is the lifestyle of respondents. Most respondents, 13 (54.2%), have the ability to work for long hours for sustained periods with less than normal sleep.

**Table 15. How do you spend your free time?**

<b>Rating</b>	<b>Distribution</b>	
	<b>Frequency</b>	<b>%</b>
With family and friends	3	12.5
Community work	3	12.5
Traveling	4	16.7
In sports and games such as golf, squash etc	9	37.5
No free time	2	8.3
Reading books like bible	3	12.5
<b>Total</b>	<b>24</b>	<b>100.0</b>

*Major success factors*

Success indicators are generally associated with growth, expansion, capitalization, profitability, and diversification in products among others. Respondents in this study attributed success largely to hard work, honesty and confidence (45.8%). The other factors include: vision of the founder (20.8%), knowledge of business (16.7%), and interest in the business (8.3%) among others. Table 16 gives a summary of what it takes to start and operate a business successfully.

**Table 16. Major success factors**

<b>Rating</b>	<b>Distribution</b>	
	<b>Frequency</b>	<b>%</b>
Hard work, honest and confidence	11	45.8
Team work	2	8.3
Knowledge of business	4	16.7
Interest	2	8.3
Vision	5	20.8
<b>Total</b>	<b>24</b>	<b>100.0</b>

As regards other businesses started by the respondents, nine (37.5%) of them were surviving and reported to be doing well whereas 7 (29.2%) had collapsed due to a number of factors.

#### *Business Plans*

Business plans are seen as essential tools to guide an enterprise. In this study, it was noted that slightly over half, 14 (58.3%), of the respondents had business plans at the start of the enterprises Ten (41.7%) respondents did not have business plans, but developed them when they were already in business.

## **DISCUSSION AND CONCLUSION**

This study aimed at determining the characteristics of Kenyan entrepreneurs who have been in business for over 5 years and made major expansion and growth through innovation and creativity. Entrepreneurs who have taken calculated risks to invest in new ventures, displayed high levels of drive and energy and managed their ventures successfully.

As regards their up-bringing, most entrepreneurs grew up in competitive environments; parents, especially the fathers, demanded a lot more from them in terms of hard work, productivity and aiming to be winners. This to a large extent explains why they have succeeded in their ventures. As regards marital status, most entrepreneurs stated that they were married and had supportive families. This is often said to be one of the major sources of motivation for the entrepreneur to succeed. Spouses, children and relatives do often play an active role in providing encouragement and “free or highly subsidized” labour in the enterprise – thus minimizing the cost of operations. The modal age of the entrepreneurs was between 46 and 50 years; this indicated that they were right in their mid-life careers and now settled in self-employment. It is significant to note that almost all the respondents had worked as employees elsewhere before starting their own businesses – a sign of commitment for success.

The major challenge faced by entrepreneurs at the start of the enterprise was found to be lack of adequate working capital – both at start-up and growth stages. Capital to purchase sufficient stock to satisfy the clients’ demands and also to meet operating expenses is not sufficient. Since most (75%) enterprises start using own capita from private savings (family

and friends), this is usually not sufficient for the enterprise to operate at optimum level. This is often mentioned by both business start-ups and existing enterprises. As the enterprise grows, strategic financial sources need to be identified, pursued and secured. The other challenge that was common is competition from similar products/services or close substitutes. With globalization and liberalization, competition was found in all sub-sectors covered in this study. This includes, security services, health services, manufacturing, and training and education services among others. From the findings it was noted that most of the entrepreneurs interviewed had developed coping mechanisms to overcome these challenges.

Such coping mechanisms included the following which were given as advice to up-coming entrepreneurs:

- Be and stay focused on a viable business idea (s)
- Ensure that there is effective demand for the products/services being offered
- Be customer-oriented in all transactions i.e. aim at satisfying the customer on a continuous basis.
- Stay a head of competition by being innovative and creative – continuously providing new (or re-packed and value added) products and services
- Incorporate flexibility and uniqueness in the enterprise – always looking at what the customers want and being able to change to meet their needs.
- Prepare a succession plan right from the start and not to wait until the business matures.
- Involve spouses and the immediate members of the family all along – as they provide a lot of support (emotional and financial).

In conclusion, as observed in the findings, it is noted that the dominant entrepreneurs' behaviours, of the respondents, were closely associated with both the Psychological Characteristics and the Classical Schools of thought. They displayed strong internal locus of control in decision making, unique attitudes towards the enterprise, innovativeness in handling the processes in the business, creativity in coming up with new products and services, taking calculated risks where others could have feared to tread and by being action oriented. These findings are in agreement with findings from other similar studies in other parts of the world regarding characteristics of successful entrepreneurs. This confirms that, the typology of the Kenyan entrepreneur compares positively with other typologies if given enabling environments.

# EXPORT PARTICIPATION OF SMALL AND MEDIUM MANUFACTURING ENTERPRISES IN SOUTH AFRICA

*By Vusi Gumede\**

## ABSTRACT

This paper presents results of an assessment of export participation of small and medium manufacturing Enterprises in South Africa. The basic premise is that enterprise linkages, export marketing, and sunk costs significantly affect the propensities to export and intensities of exporting of small and medium manufacturing in South Africa. The hypothesis tested was that small and medium manufacturing enterprises break through into foreign markets with relative ease when involved in linkages because that facilitates information flows thereby mitigating international marketing burden on shoulders of individual enterprise units. A theoretical perspective adopted is that small and medium enterprises involved in enterprise linkages and have intermediaries are in a better position to deal with sunk costs as far as entering and exiting international markets is concerned. Empirical results, using survey data, confirm this.

## INTRODUCTION

The role of the manufacturing sector worldwide and in South Africa remains particularly important. For instance, 1 out of 4 units produced in the South African economy originates from the manufacturing sector. More than half of exports are manufactured. It is also estimated that 25% of economically active population is employed in the manufacturing sector in South Africa. From the international trade perspective, it is estimated that at least 80% of global export trade is comprised of manufactured products.

Juxtaposing these figures within the context of small and medium enterprise sector reveals that most of manufacturing activities are by small and medium enterprises. At least 90% of manufacturing sector is small and medium in terms of enterprise size classes in South Africa. There are more than 160 000 small and medium manufacturing enterprises, approximately 10% of total small and medium enterprises in South Africa. These small enterprises contribute about half of employment, two quarters of gross domestic product and 1 out of 5 units exported is produced in the small and medium sector in South Africa<sup>1</sup>. Notwithstanding the

<sup>1</sup> Own calculations based on various issues of Statistics South Africa data, the South African Reserve Bank Quarterly Bulletins, South African Industry data, State of Small Business in South Africa data, Eurostat, National Manufacturing Advisory Center surveys, etc. These figures are simply an indication. There are some problems with data.

recent decline<sup>2</sup> of manufacturing sector's contribution to most economic variables, the fundamental importance of the manufacturing sector remains uncontested.

This paper explores export propensities and intensities<sup>3</sup> of small and medium manufacturing enterprises in South Africa. There are many reasons that justify a study on these issues. For example, exports broadly contribute to productivity growth and increase the exposure of enterprises to competition, thereby precipitating technology accumulation. In addition, exports ought to encourage employment, sustain the external balance and promote economic growth by generating foreign exchange. As such studies on external trade related issues<sup>4</sup> are important, especially when such studies attempt to answer key trade & industrial policy questions that have not been sufficiently addressed before.

## EXPORT PARTICIPATION LITERATURE & AN EMPIRICAL MODEL

Pioneered by Balwin and Krugman (1989) and Dixit (1989), the importance of start-up costs has gained prominence in recent analytical literature [e.g. Roberts and Tybout (1997), Clerides, *et al.* (1998), Bernard and Jensen (1999), Das *et al.* (2000) and Tybout (2000)]. The so-called export hysteresis framework postulates that enterprises are faced, over and above other factors, by sunk costs (including costs of packaging, upgrading of product quality, establishing export market channels, and accumulating information on demand sources). In effect, export market participation is largely influenced by these factors. There are no studies that have assessed export-marketing factors in South Africa, especially within the context of small and medium enterprises<sup>5</sup>.

In short, there are four key assumptions made on the model: the foreign and domestic markets for each enterprise's product are monopolistically competitive; producers are heterogeneous in terms of their marginal production costs and the foreign demand schedules they face for their products; plants are risk neutral and maximize the expected discounted sum of real profits and marginal costs do not respond to output shocks.

The model begins with static optimization and proceeds to dynamic optimization as proposed by Dixit (1989). The operating profit function associated with demand and cost functions of the enterprise are derived taking into account macro variables, denoted by ( $m_t$ ), and an enterprise specific stochastic intercept ( $x_{it}^1$ ):

$$q_{it} = -\eta_i p_{it} - \Psi_i m_t + x_{it}^1 \quad (1)$$

---

<sup>2</sup> Refer to Bell and Madula (2001) for a detailed examination of the behavior of the South African manufacturing industry. Bell and Madula (p. 4) emphasize that "any account of South African manufacturing in the period 1970-2000 must seek to explain" the deterioration of SA's manufacturing since early 1970s.

<sup>3</sup> As defined in Philp (1998:80), the propensity to export refers to the probability of either exporter or non-exporter whilst the intensity of exporting refers to the proportion of export sales to total sales.

<sup>4</sup> I have, for example, attempted to address trade elasticities issues (see, Gumede, 2000b and Gumede, 2003b) and also attempted to address export propensities of small manufacturing enterprises (see, Gumede *et al.* 2002 and Gumede, 2004).

<sup>5</sup> Rankin (2002b), Edwards (2002) and Gumede, *et al.* (2002) are the closest recent studies that have made an attempt to examine some aspects of the export behavior of South African manufacturing firms, also using survey data.

Where  $q_{it}$  is the log of the  $i^{th}$  enterprise's exports in year  $t$ ,  $\eta_i > 1$  is the elasticity of foreign demand the enterprise faces,  $p_{it}$  is the log of the enterprise's real price of exports in the domestic currency, and the random variable  $x^1_{it}$  captures factors that shift the enterprise specific demand curve. Equation 2 specifies the logarithm of marginal costs.  $x^2_{it}$  is a random variable that evolves overtime. Macroeconomic variables also appear in the marginal cost equation because of their effect on imported input prices and real wages.

$$c_{it} = \Psi_2 m_t + x^2_{it} / (1 - \eta_i) \quad (2)$$

The static profit maximization condition below yields optimal  $q_{it}$  choice among exporting enterprises. This is informed by the assumption that enterprises facing entry costs when initiating foreign sales can change the volume of their exports without incurring adjustment costs thereafter.

$$q_{it} = \eta_i \log [1 - 1/\eta_i] + x^1_{it} - [\eta_i/1 - \eta_i] x^2_{it} + (\Psi_1 - \eta_i \Psi_2) m_t \quad (3)$$

Given equations 1 to 3, the log of current export revenue ( $R$ ) and the log of current operating export profits ( $\pi$ ) are linear in  $x_{it} = (x^1_{it}, x^2_{it})$  and  $m_t$ :

$$\ln[R(x_{it} m_t)] = \pi_{oi} + \ln(\eta_i) + \{\Psi_1 + (1 - \eta_i) \Psi_2\} m_t + x^1_{it} + x^2_{it}, \quad (4)$$

$$\ln[\pi(x_{it} m_t)] = \pi_{oi} + \{\Psi_1 + (1 - \eta_i) \Psi_2\} m_t + x^1_{it} + x^2_{it}, \quad (5)$$

Where  $\pi_{oi} = [(\eta_i - 1/\eta_i) - \ln(\eta_i - 1/\eta_i)]$

In a dynamic optimization framework, the fact that enterprises incur fixed costs,  $\Gamma_F + \varepsilon_{1it}$ , each period they maintain presence in export markets is taken into account. Also, if the  $i^{th}$  enterprise did not export in period  $t-1$  it must pay some additional start-up costs,  $\Gamma_S + \varepsilon_{1it} - \varepsilon_{2it}$ , in order to establish distribution channels, learn bureaucratic procedures, and adapt its products and packaging for foreign markets.  $\varepsilon$  denotes errors, which can be transitory optimization errors when choosing  $q$  or could be variations in fixed and sunk costs.

$$u(\cdot) = \begin{cases} \pi_i(x^1_{it}, x^2_{it}, m_t) - \Gamma_F + \varepsilon_{1it} & \text{if } y_{it} = 1 \text{ and } y_{it-1} = 1 \\ \pi_i(x^1_{it}, x^2_{it}, m_t) - \Gamma_F - \Gamma_S + \varepsilon_{2it} & \text{if } y_{it} = 1 \text{ and } y_{it-1} = 0 \end{cases} \quad (6)$$

After solving the above equations and taking into account regulatory conditions, equation 7 below gives the optimal exporting status:

$$f_t(m_t, x_t, y_{t-1}, \varepsilon_t, \theta) = \max_{y_t \in \{0, 1\}} [u(m_t, x_t, y_{t-1}, y_t, \varepsilon_t, \theta) + \delta EV_t(m_t, x_t, y_t, \varepsilon_t, \theta)] \quad (7)$$

Given the parameter  $\theta$  and distributional assumptions for the exogenous random variables  $(m_t, x_{it}, \varepsilon_t)$ , equations 4 and 7 determine optimal export revenues for the  $i^{th}$  enterprise as a function of a vector of macro variables  $(m_t)$ , the previous exporting status  $(y_{t-1})$ , marginal costs and demand shifters  $(x^1_{it}, x^2_{it})$  and transitory shocks  $(\varepsilon_{1it}, \varepsilon_{2it})$ . Hence, aggregating over enterprises, equations 4 and 7 provide a framework for evaluating the impact of sunk costs, heterogeneity and history in affecting dynamics of exports at an industry level. There are

other important issues that need to be taken into account regarding the model presented here. In particular, it is almost impossible, computationally, to obtain estimates of all parameters from a simple estimator, given the number of parameters involved and the need for several layers of numerical integration. In order to handle this complexity, studies have proceeded in two stages of estimations. The first stage involves solving the model and the second stage entails taking the results of a complex dynamic model and construct a function for estimation. At this juncture, this part of the paper is limited to export propensities and intensities, within the context of sunk costs hysteresis<sup>6</sup>.

## EXPORT PARTICIPATION RESULTS

The preliminary results of small and medium manufacturing's export participation are based on the realized sample (of the National Enterprise Survey) for small and medium manufacturing enterprises that equals 66% of the total response rate (55%). In total, 1200 small and medium manufacturing enterprises were targeted for interviews from a list comprising thousands of small and medium manufacturing enterprises.

Empirical analyses focus on 941 small and medium manufacturing enterprises in South Africa, of which 415 are exporting<sup>7</sup>. The main criterion used in this paper in classifying enterprises in terms of size classes is the equivalent of full-time employees.

Table 1 below is an extract from South Africa's National Small Business Act (1996) which gives guidelines for definitions and classifications of enterprises by size class.

**Table 1: Extract from the schedule to the National Small Business Act (1996)**

Column 1	Column 2	Column 3	Column 4	Column 5
<b>Sector or Sub-sectors</b> In accordance with the Standard Industrial Classification (SIC)	<b>Size - Class</b>	<b>Total full-time equivalent of paid employees</b> Less than	<b>Total annual turnover</b> Less than	<b>Total gross asset value (fixed property excluded)</b> Less than
Manufacturing	Medium	200	R 25.00 m	R 7.50 m
	Small	50	R 6.00 m	R 1.75 m
	Very small	20	R 2.00 m	R 0.60 m
	Micro	5	R 0.15 m	R 0.10 m

The next table captures the specific characteristics of the data, with emphasis on variables used in the analysis. The enterprises surveyed are relatively old, although almost half of very small manufacturing enterprises are younger than 3 years (hereafter called infants). A surprising number is 38 (median) years of age of micro manufacturing enterprises. The micro

<sup>6</sup> Other aspects of this research will, in future, propose theoretical and empirical underpinnings of export participation of small and medium enterprises.

<sup>7</sup> An Appendix gives further generic characteristics of the National Enterprise Survey data

manufacturing enterprises this paper is dealing with seem very established and doing well, in contrary to the norm. For instance 40% of micro manufacturing enterprises are exporting.

**Table 2: Specific Characteristics of Manufacturing by Size-class**

	Micro	Very small	Small	Medium	SMM <sup>8</sup>
<i>Observations</i>	100	322	209	178	809

<u>Sunk costs, information &amp; links</u>			<i>Percentage Shares</i>		
Sunk costs	17	14	10	17	14
Information	87	85	91	93	82
Linkages	22	11	14	46	19

The main variables of interest are sunk costs, information and linkages. Many enterprises have access to information. There are few enterprises that have cited the inability to penetrate export markets (a proxy for sunk costs). For instance, only 1 out of 10 small enterprises said that they were unable to penetrate export markets. It would seem that penetrating export markets is not a problem for many enterprises, the problem is maintaining higher export intensities. As suggested in literature, smaller enterprises export but haphazardly emanating from unsolicited export orders. The challenge is to remain in an export market and increase the proportion of output that is exported.

Correlation and regression analyses provide some deeper insight into factors that influence the probability of being an exporter and the intensity of exporting for small and medium manufacturing enterprises in South Africa. There are many factors that influence the probabilities to export and the intensities of exporting.

These factors range from macroeconomic conditions to enterprise and/or managerial factors. For instance, factors perceived as macroeconomic constraints (e.g. high interest rates) and enterprise characteristics (e.g. profitability) as well as managerial characteristics (e.g. outlook) impact on the probability to export. However, this paper asks questions relating to export marketing, information gaps, and entry and exit costs to international markets. This does not imply that other factors are not critical. Results in table 3 suggest that although factors such as lack of access to finance affect the operations of an enterprise, it is systematic factors relating to export marketing that effectively constrain successful exporting of small and

<sup>8</sup> SMM refers to small and medium manufacturing (including micro and very small).

medium manufacturing enterprises. The correlation table presented below shows that, amongst other factors, linkages and access to information increase the probability of being an exporter and also increase the intensity to export.

**Table 3: Correlation Analysis (small and medium manufacturing)**

Lack of working capital	0.0061 [0.8633]	-0.0618 [0.3660]
Lack of export finance	-0.0072 [0.8409]	-0.0161 [0.8145]

There are many unsystematic<sup>9</sup> factors that affect the probability and intensity of exporting. It does seem however that the most significant factors (as shown by stars) are the ones that this study is premised upon. There are other variables that have signs that are not expected but most of those are not significant.

There is a smaller number of factors affecting the intensity of exports compared to the number of factors affecting the propensity to export. Similar factors (i.e. access to information and business linkages) affect both the propensity and the intensity of exporting. The probability to export is also affected by other factors such as macro economic factors and enterprise perceptions. The intensity of exporting, in addition to access to information and business linkages, is negatively and significantly affected by sunk costs. Perhaps the main problem for small manufacturers is to maintain exporting rather than breaking into foreign markets.

I now turn to logit analysis and regressions. Logit estimates are ratios. They represent a chance of being one of the two results, in this case exporter or non-exporter. As a rule of thumb, anything equaling one refers to equal chance whilst above one is a chance and below one is half a chance.

---

<sup>9</sup> The distinction is made between factors that are within the control (unsystematic) and those outside the control of an enterprise (systematic). The focus for the paper is on the later.

**Table 4: Logistic Regression (1=exporter and 0=non-exporter)**

<i>Observations</i>	809
R-squared	10.94
Size class (very small)	0.4124** [-5.255]
Age	1.0102** [2.823]
Constrained by competition in SA	0.6167* [-2.542]
Constrained by access to borrowed finance	1.7741* [2.529]
Constrained by corporate tax	0.5934** [-3.126]
Has linkages	2.5228** [4.775]
Has access to information	1.8698* [2.432]

Table 4 presents a model that proved robust and gave significant results. Amongst other factors that were significant are linkages and access to information. Others are significant but the probabilities are minimal. For linkages and information, the chance of being an exporter is 2 times larger than for age as an example. Corporate tax, competition and smaller enterprise size reduce the chance of being an exporter, but by very negligible proportions.

The regression of the intensity of exporting, for exporters only, shows that the same factors as above also play a role in export-output ratios. Typical constraints such as lack of access to finance and macro economic variables impact negatively on the intensity of exporting.

**Table 5: Regression Analysis (Export Intensity)**

Export Intensity (if exporting)	
<i>Observations</i>	193
R-squared	20.48
Constant	-0.0074 [-0.121]
Infant	0.2120** [4.158]
Constrained by social uncertainty	0.0817** [2.564]
Constrained by Industry outlook	-0.1038** [-3.110]
Constrained by unstable exchange rate	-0.0627* [-1.888]
Constrained by access to own finance	-0.0812* [-1.948]
Constrained to access to borrowed finance	0.0888* [1.750]
Number of full-time employees	0.0007** [2.168]
Access to information	0.1307**

Linkages	[2.330] 0.058
Sunk costs	[0.191] -0.1219** [-3.031]

Of critical relevance to the analysis is the negative impact of sunk costs. The point made above that sunk costs reduce the intensity of exporting also surfaced in this regression. In fact, a sunk costs variable is among few factors that are highly significant in their influence of export-output ratios of small and medium manufacturing enterprises in South Africa.

## CONCLUDING REMARKS

This paper presented export propensities and intensities of small and medium manufacturing enterprises. It can be concluded that export-marketing factors are very important for small and medium manufacturing that export or intend to export. The main implication is that export-marketing intelligence is crucial for small and medium enterprises, especially those participating on export markets or intend to. Findings suggest that enterprise linkages and intermediaries minimize sunk costs.

## APPENDIX: SURVEY DATA

### Survey<sup>10</sup> data on Small and Medium Manufacturing in South Africa

The table 1 below shows the population and realized sample for small and medium manufacturing enterprises. Except for North West Province, all other provinces are represented in the small and medium manufacturing part of the survey. The realized sample for small and medium manufacturing enterprises equals 66% of the total response rate (55%). In total, 1200 small and medium manufacturing enterprises were targeted for interviews from a list comprising thousands of small and medium manufacturing enterprises. 941 small and medium manufacturing enterprises responded.

**Table 1: Population and realized sample<sup>11</sup>**

	<i>Population of Small and Medium Manufacturing</i>						<i>Realized Sample</i>
	PE/E		Jhb/ER/Pt		Nelsprui		
	L	Blm/Kim/Welk a	DBN/PMB t	CPT			
Food & beverages	60	54	495	142	35	236	101
Wood, pulp & paper	43	7	474	151	18	194	119
Chemicals	84	33	945	319	18	320	121
Auto	40	10	285	74	6	64	93
Clothing & textiles	45	15	547	380	7	345	116
Fabricated metals	108	41	1299	300	46	254	102
Furniture	8	9	194	68	10	86	86
Machinery	68	50	1462	244	22	314	110
Printing & publishing	25	14	708	111	6	187	93

Table 2 below gives generic characteristics of the data. The data covered a wide range of sector categories, sectors, size classes and provinces.

<sup>10</sup> The survey (National Enterprise Survey) was conducted during late 1999 and early 2000.

<sup>11</sup> PE/EL: Port Elizabeth & East London, Blm/Kim/Welk: Bloemfontein & Kimberly & Welkom, Jhb/ER/Pta: Johannesburg & East Rand & Pretoria, DBN/PMB: Durban & Peter Maritzburg, and CPT: Cape Town.

**Table 2: Characteristics of the data**

	Micro (100)	Very Small (322)	Small (209)	Medium (178)	Large (132)	Total (941)	Exporters (415)
Resource-intensive (220)	12	15	20	26	34	19	20
Food & beverage (101)	7	7	12	17	21	11	12
Wood, pulp & paper (119)	5	8	8	9	13	8	8
Scale-intensive (214)	15	20	19	19	20	19	19
Chemicals (121)	13	16	15	13	12	5	15
Auto assembly & parts (93)	2	4	4	6	8	14	4
Labour-intensive (304)	43	33	35	41	28	36	35
Clothing & textiles (116)	11	11	13	22	17	14	13
Fabricated metal (102)	29	18	18	16	9	18	18
Furniture (86)	3	4	4	3	2	4	4
Knowledge-intensive (203)	30	32	26	14	18	26	26
Elec. Machinery & other (110)	17	20	18	11	14	17	21
Printing & publishing (93)	14	11	8	3	4	9	5
<i>Total (941)</i>	<i>100</i>	<i>100</i>	<i>100</i>	<i>100</i>	<i>100</i>	<i>100</i>	<i>100</i>
Eastern Cape (81)	3	4	6	7	9	5	5
Gauteng (402)	64	63	52	39	36	54	50
KwaZulu-Natal (192)	19	16	16	23	24	18	20
Western Cape (201)	12	16	24	28	20	20	21
Other provinces (65)	2	1	2	3	11	3	4
<i>Total (941)</i>	<i>100</i>	<i>100</i>	<i>100</i>	<i>100</i>	<i>100</i>	<i>100</i>	<i>100</i>
<b>Exporting (415)</b>	<b>40</b>	<b>26</b>	<b>42</b>	<b>61</b>	<b>80</b>	<b>43</b>	<b>100</b>

The total numbers<sup>12</sup> are shown in brackets and percentage shares of enterprises sum up to 100%. The size class distribution is dominated by very small enterprises, followed by small enterprises. There are more labour intensive manufacturing enterprises (36% of the total) than other sector categories. Resource intensive enterprises seem to be largely large in size, compared to knowledge intensive sectors which seem to be predominantly small. Scale intensive and labour intensive enterprises are widely distributed in terms of size classes.

43% of manufacturing enterprises in this survey come from Gauteng Province. Interestingly, it appears that Gauteng has more of smaller size class enterprises. This is the direct opposite of the Eastern Cape Province's size class spread. Another observation from data is that half of Gauteng enterprises are exporting.

Table 3 presents characteristics of exporting small manufacturing enterprises. Some of their properties have already been mentioned above. The turnover of small manufacturing is in line with the one prescribed by the Act (1996), except for the micro. As said before, the micro enterprises in this study seem fairly advanced. For most small and medium manufacturing enterprises here, total turnover is a million rand more than the guidelines given by the Act. Regarding export earnings, although many small manufacturers export but the rand value of their total exports is low. Again, against the norm, micro manufacturing enterprises have higher export earnings than small and medium enterprises.

<sup>12</sup> Note that the application of weights per calculation may result to slightly different numbers because observations are given equal weights.

**Table 3: Exporting small and medium manufacturing enterprises**

		Micro	Very small	Small	Medium	SMM
<i>Observations (only exporters)</i>		41	75	84	109	809
		<i>Million Rand</i>				
Turnover	Mean	84.1	11.4	11.1	43	35.8
	Median	30	3.2	7	26	11
	Standard Deviation	149	36	32	59	78.3
Export Earnings	Mean	9.3	1	1.7	6.8	4.7
	Median	3	0.2	0.5	2	0.9
	Standard Deviation	14	3	4	14	10.7
		<i>Percentage shares</i>				
Export intensities	Mean	18	15	16	18	16
	Median	10	7	7	8	8
	Standard Deviation	21	24	22	23	22
		<i>Percentage shares</i>				
Destination of export	Africa	57	71	56	57	64
	EU	30	20	24	29	21
	Asia	3	3	8	8	6
	Australia	7	2	6	4	3
	Other	3	4	6	2	6
	Total	100	100	100	100	100

Table 3 further shows that most of small and medium manufacturing enterprises export to Africa, followed by the European Union. This is not surprising given that most studies on this subject find that small enterprises largely export to markets that are in transition (see for instance, Smallbone *et al* 1999). It is also reasonable to suppose that proximity plays a role here.

The next table examines exporting small and medium enterprises with linkages, with access to information and faced with sunk costs. Almost all exporting small and medium manufacturing have access to information.

**Table 4: Export marketing factors**

	Micro	Very small	Small	Medium	SMM
<i>Observations (only exporters)</i>	41	75	84	109	809
	<i>Percentage shares</i>				
Access to information	94	87	96	93	92
Sunk costs	15	15	11	17	14
Linkages	22	11	14	46	19
	<i>Percentage shares</i>				
<u>South African linkages</u>	<i>Percentage shares</i>				
Yes	53	43	52	71	57
No	38	24	40	54	34
	<i>Percentage shares</i>				
<u>Foreign linkages</u>	<i>Percentage shares</i>				
Yes	87	73	61	82	79
No	33	24	41	57	35

Similar to information, linkages play an important role for exporting. Table 4 shows that 1 out of 5 exporting small and medium manufacturing enterprise has a linkage, either in South Africa or overseas. There is a further break down of linkages in the table. It seems that most exporting enterprises have overseas linkages.

# COULD THE LACK OF FORMAL OR INFORMAL TRAINING BE A POSSIBLE REASON FOR THE LOW JOB CREATION IN SMMEs IN DAVEYTON AND SOWETO? AN EXPLORATORY STUDY

## ABSTRACT

*The SMME sector is widely regarded as the driving force in economic growth and job creation in both developed and developing countries. The South African government has recognised the sectors importance in achieving national objectives and is committed to its growth. But, yet it is felt by many that SMMEs are failing at the vital role of creating jobs for the unemployed.*

*The objective of this paper is to investigate the possible reasons why job creation has not been successful in SMMEs in selected township areas in South Africa, with a focus on the formal or informal training undergone by the manager or owner and his/her staff members. The research will be conducted by investigating how long the selected SMMEs have been in business, whether the owners feel that there has been any growth in job creation or if they have in fact created any jobs through opening their own business. The formal or informal training undergone by the manager or owner and organisation's staff members will also be investigated.*

## INTRODUCTION

Only 37% of all school leavers succeeded in securing jobs once they left school, with the figure dropping to 29% for African first-time work seekers, according to Mark Orkin the chief executive of the (HSRC) Human Sciences Research Council (Pela 2004:28). According to Orkin, what is needed is large-scale investment in education and training institutions, research and development facilities, networking activity among employers through formal associations, as well as partnerships between higher education institutions and industry. This statement, based on research conducted by the HSRC illustrates the important role that education plays in the creation of work in South Africa.

It is estimated that the South African economy has shed more than a million jobs since 1990 (Msomi 2000:1). According to the department of labour the official unemployment rate for South Africa in February 2002 was 28 percent. In 2003, this figure rose to 30.5 percent (Statistics South Africa).

To compound this problem, the demand for semi-skilled labour in South Africa and the rest of the world has shown a consistent drastic decline in the last decade (Comiteau, Crumely, Gibson & James 2000:24).

## **THE IMPORTANT ROLE PLAYED BY SMMEs IN SOUTH AFRICA**

The important contribution that SMMEs (small, micro and medium sized enterprises) can make to employment and income generation is increasingly being recognised around the world. In South Africa, this contribution is increasingly being more important, due to the fact that the non-agricultural formal sectors shed more than a million jobs between 1990 and 2001. This phenomenon, coupled with a high population growth rate, has resulted in the high unemployment rate in South Africa. The main causes for the growing unemployment rate include factors such as the low employment elasticity of the South African economy, as well as the high rate of labour force growth (Ligtelm & Cant 2003:41).

Research conducted recently by the University of Cape Town's Centre for Innovation and Entrepreneurship as part of the 2002 Global Entrepreneurships Monitor project, shows that formal entrepreneurs (defined as those with registered businesses) employ an average of 7.2 people as compared with 0.8 people employed by their informal or unregistered counterparts (Herrington 2003:1). Considering that formal registered businesses make up only 12 percent of privately owned business activity in disadvantaged areas, it can be seen that while informal unregistered businesses remain enormously important in generating income, they do not play a large enough role in the creation of employment for others.

The South African government recognises the importance of this sector in achieving the country's national objectives and is committed to its growth (Budget Speech 2001). This commitment can be illustrated by the formation of bodies such as CHAMSA (Chambers of Commerce and Industry of South Africa) and BUSA (Business Unity South Africa). CHAMSA's biggest challenge will be to promote SMME's by helping owners overcome problems such as funding, as well as to deliver support services to blue-chip organisations (Anon 2003:1).

## **OBJECTIVE OF THE STUDY**

The main objective of this paper is to determine the reasons why jobs are not being created by SMMEs in the Daveyton and Soweto regions of Gauteng, South Africa. The study will place a special focus on the role played by formal and informal training undergone by managers or owners of the organisations, as well as the staff members of these organisations.

An awareness of the impact of the reasons identified by the study will enable SMMEs (both existing and planned) to be forewarned and proactive in their decision-making and planning for organisational growth.

The results of the study may also enhance the design of course material or syllabuses for managers, owners and staff members to ensure that SMMEs are fully aware of the factors that may affect their organisations sustained success, and ability to create jobs.

## **POSSIBLE REASONS FOR THE LACK OF JOB CREATION**

Small, micro and medium sized organisations form an integral part of the national economy, and are influenced by various factors. In this context, the problems that SMMEs experience in conducting a successful business can be grouped in to various categories (Ligtelm & Cant 2003:42), which include:

- Economy based problems that are associated with national economic factors related to the state of the economy, such as specific stages in the business life cycle and the exchange value of the national currency.
- Industry-based problems that are associated with the industry in which the organisation operates, and may include factors such as the degree of competition, demand and supply factors as well as barriers to entry or exit the industry.
- Organisation-based problems that refer to internal factors such as the availability of resources such as finances and managerial skills.

Similar studies conducted by Everett and Watson (1998) and by Peterson, Kozmetsky and Ridgeway (1983) found that organisation-based problems were associated with the majority of small business failure in the SMMEs investigated. Based on the findings of the above, by focusing this study on the above group of factors, possible reasons as to the lack of job creation in SMMEs in Daveyton and Soweto in Gauteng, South Africa can be identified.

## **RESEARCH DESIGN**

In order to fully understand the possible reasons for the lack of job creation in SMMEs, with a special focus on the formal or informal education received, an empirical survey by means of a structured questionnaire was conducted in Daveyton and Soweto in Gauteng, South Africa. In the absence of a comprehensive sample frame of SMMEs in these regions, a judgemental sampling procedure was used according to specified criteria. The requirements for the sample was that the business:

- Operated from a demarcated business area
- Occupied a permanent structure
- Employed fewer than 50 full-time employees
- Covered one of the following economic sectors: retail organisations, service organisations, consultancies, wholesale organisations or other

These criteria ensured the inclusion of managers or owners with a reasonable understanding of variables such as minimum wages and the specifications of the Employment Equity Act. In total 135 businesses were interviewed in these areas occupied by previously disadvantaged individuals.

## **Analysis of the data collected**

The analysis in this paper is based on statistical procedures. Descriptive data are presented by means of frequency tables.

**Table 1: How long has your organisation been in business?**

<b>Number of years in business</b>	<b>Frequency</b>	<b>Percentage</b>
Less than one year	19	14%
One to two years	60	44%
Two to three years	21	16%
Three to five years	12	9%
More than five years	23	17%
<b>Total</b>	<b>135</b>	<b>100%</b>

Table 1 above shows that the majority of respondents (44%) indicated that their businesses had been in operation for one to two years, while only 9% indicated that they had been in operation for three to five years.

**Table 2: Have any jobs been created by your organisation since it was started/since you took over the business?**

<b>Have any jobs been created?</b>	<b>Frequency</b>	<b>Percentage</b>
Yes	99	73%
No	36	27%
<b>Total</b>	<b>135</b>	<b>100%</b>

Table 2 shows that 73% of the respondents indicated that their organisations had created jobs since the organisation was started or had been taken over, while 27% indicated that no jobs had been created.

**Table 3: If YES, how many jobs have been created?**

Number of jobs created	Frequency	Percentage
1	36	37%
2	16	16%
3	35	35%
4	12	12%
>10	0	0%
<b>Total</b>	<b>99</b>	<b>100%</b>

From the results in Table 3 above it can be seen that 88% of the respondents who stated that their organisations had created jobs, indicated that only 1 to 3 jobs had been created, while none of the respondents indicated that more than 10 jobs had been created.

**Table 4: If NO, why were no jobs created?**

Reasons indicated	Frequency	Percentage
Will increase long term costs	3	8%
Tough to survive	9	25%
Market up and down	6	17%
Economy is dead	11	31%
Business too small	7	19%
<b>Total</b>	<b>36</b>	<b>100%</b>

Table 4 shows that the majority of respondents who indicated that their organisations had not created jobs, indicated a dead economy as the main reason.

**Table 5: What qualifications do you as manager or owner have?**

Qualifications	Frequency	Percentage
No matric	13	9%
Matric	76	57%
Tertiary	4	3%
Postgraduate	12	9%
Other (certificates, diplomas etc)	30	22%
<b>Total</b>	<b>135</b>	<b>100%</b>

From Table 5 above, it can be seen that a majority of respondents have a matric qualification only, while only 3% of respondents indicated that they have a tertiary qualification.

**Table 6: What is the average qualification of your staff members?**

<b>Qualifications</b>	<b>Frequency</b>	<b>Percentage</b>
No matric	47	35%
Matric	67	50%
Tertiary	18	13%
Postgraduate	3	2%
Other	0	0%
<b>Total</b>	<b>135</b>	<b>100%</b>

From Table 6, it is clear that half of the respondents indicated that the average qualification of their employees is a matric certificate, while only 2% of the respondents indicated that their staff members have a postgraduate qualification.

**Table 7: Do you feel that training is necessary for your business to be successful?**

<b>Necessity of training</b>	<b>Frequency</b>	<b>Percentage</b>
Yes	89	66%
No	24	18%
Unsure	22	16%
<b>Total</b>	<b>135</b>	<b>100%</b>

Table 7 shows that 66% of respondents indicated that training is necessary for a business to be successful, while 16% of respondents were unsure if training was in fact necessary for a business to be successful.

**Table 8: If YES, why?**

<b>Reason indicated</b>	<b>Frequency</b>	<b>Percentage</b>
Good for growth	13	15%
Must keep aware of new procedures	11	12%
Only way to stay in touch with the latest business developments	32	36%
Skills age-need new ones	16	18%
Business methods change	17	19
<b>Total</b>	<b>89</b>	<b>100%</b>

Table 8 above indicates that 36% of the respondents that indicated that training was necessary for a business to be successful, stated that training was necessary in order to stay in touch with the latest business developments. 12% of the respondents indicated that training was necessary to keep aware of new business procedures.

**Table 9: If NO, why?**

Reason indicated	Frequency	Percentage
Need experience	7	29%
Can learn on the job	11	46%
Skills are more important than a qualification	6	25%
<b>Total</b>	<b>24</b>	<b>100%</b>

Table 9 above indicates that almost half (46%) of the respondents that indicated that training was not necessary for the success of a business due to the fact that employees could learn on the job. 25% of respondents indicated that training was not necessary for the success of a business as skills are more important than a qualification.

**Table 10: Have you undergone formal managerial training?**

Undergone training or not	Answer indicated	Percentage
Yes	53	39%
No	82	61%
<b>Total</b>	<b>135</b>	<b>100%</b>

From Table 10 it is clear that 61% of the respondents indicated that they had not undergone formal managerial training, while 39% of the respondents indicated that they had in fact undergone formal managerial training.

**Table 11: If YES, what type of training have you undergone?**

Type of training undergone	Number	Percentage
Diploma or certificate courses	18	34%
Various short courses	16	30%
In-house training	16	30%
University courses	3	6%
<b>Total</b>	<b>53</b>	<b>100%</b>

The majority of respondents (60%) indicated that they had undergone formal managerial training in the form of various short courses and in-house training.

**Table 12: If NO, why not?**

Reason indicated	Number	Percentage
No time	51	62%
No opportunity	23	28%
Training not needed	8	10%
<b>Total</b>	<b>82</b>	<b>100%</b>

From Table 12 above it can be seen that 62% of the respondents who indicated that they had not undergone formal managerial training, stated that the reason for this was a lack of time. 10% of the respondents that indicated that they had not undergone formal managerial training, indicated that training was not needed.

## SUMMARY

The research conducted amongst the sample population, consisting of relatively small yet sophisticated businesses in Daveyton and Soweto in Gauteng, emphasised that:

- 73% of respondents indicated that their organisations had created jobs, but that 88% of these businesses only created between 1 and 3 jobs
- The majority of respondents indicated that their highest qualification was a matric certificate
- The majority of respondents (61%) had not undergone formal managerial training

### ABSTRACT

In a longitudinal sample of  $N=97$  Zimbabwean business owners, we examine causal reciprocal determinisms between individual psychological strategy process characteristics *comprehensive planning*, *critical point planning*, *reactive*, *opportunistic* on the one hand and business performance on the other hand. First analyses indicate that comprehensive planning strategy characteristics increase business success; in turn, business success strengthens the owners' comprehensive planning strategy characteristics. For reactive strategy characteristics, the reciprocal determinism is negative. Reactive strategy characteristics lead to lower business performance and low performance increases the owners' reactive strategy characteristics. Finally, opportunistic strategy characteristics have no relationship with business performance.

<sup>1</sup> We gratefully acknowledge the funding of this research through the Deutsche Forschungsgemeinschaft (German Research Foundation, project: FR 638/13-2). We also want to thank David Harrison, Admire Chirowodza, and Mufaro Chinyanga from Human Resources (Pvt.) Ltd., Harare, who were of great help in the collection of the data and Klaus Martin Nickel, Jens Unger, and Simone Rief who also helped collecting data.

This paper presents results of a longitudinal field study on small scale business owners in Zimbabwe, Southern Africa. We focus on reciprocal determinisms (Bandura, 1978) between business owners' action strategy process characteristics on the one hand, and business performance on the other hand. Strategy process characteristics are action templates (van Gelderen, Frese, & Thurik, 2000) that determine the manner in which entrepreneurial activities are carried out. The contribution of our psychological perspective to entrepreneurship research is threefold:

First, the longitudinal study design allows for causal analyses of business performance determinants, which are rare in entrepreneurship research (Rauch & Frese, 2000).

Second, we investigate reciprocal determinisms between strategy process characteristics and business performance (cf. van Gelderen, et al., 2000): Business performance is not only the criterion but should also cause intra-individual self-regulation. Owners regulate their strategy process characteristics in response to their business performance. In the field of psychology, the existence of reciprocal determinisms and self-regulation is widely acknowledged (e.g., Bandura, 1997; Carver & Scheier, 1998; Frese & Zapf, 1994; Hacker, 1986; Locke & Latham, 2002). In entrepreneurship research, however, reciprocal determinisms have not yet been integrated into the theoretical framework (except for being implicit to the line of arguments by van Gelderen et al., 2000).

Finally, we emphasize the importance of the founder/owner/managers<sup>2</sup> in small enterprises where subordinate decision makers and the organizational structure are less important than in medium sized and large businesses (cf. Miller & Toulouse, 1986). As main actors in their business, owners make all important decisions, overlook the finances, manage human resources, and maintain customer relationships. Founders, in particular, determine strategies, culture, and business goals at an early stage of the business development and set the course for future success (Frese, van Gelderen, & Ombach, 2000; Schein, 1983).

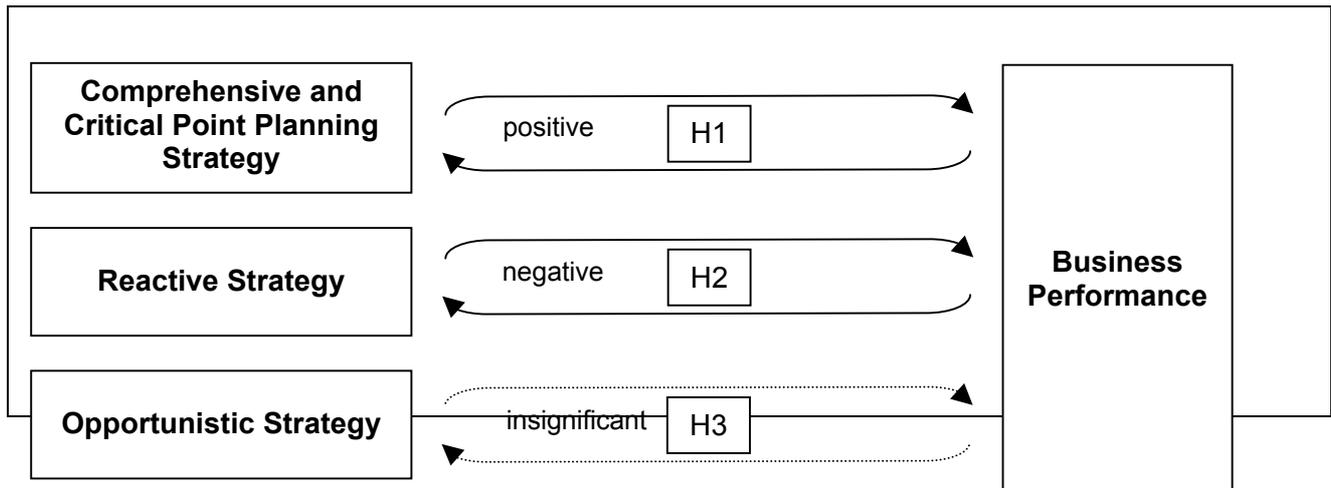

## The Theoretical Model

Our theoretical model of entrepreneurial business performance (Figure 1) proposes reciprocal determinisms between strategy process characteristics and business performance (cf. Bandura, 1978). A comprehensive psychological approach to entrepreneurial performance should incorporate self-regulatory processes. Self-regulation refers to reciprocal determinisms where intra-individual factors influence actions and extra-individual action outcomes operate as feedback signals that cause intra-individual regulation processes (cf. Carver & Scheier 1982; Frese & Zapf, 1994; Hacker, 1986; Locke & Latham, 2002). Applied to the entrepreneurial context, self-regulation entails that the business owners' strategy process characteristics influence business performance; performance, in turn, impacts on the owners' strategy process characteristics. Hence, we assume reciprocally determined causal relationships between comprehensive planning/ critical point planning/ reactive strategy process characteristics of the owner on the one hand and business performance on the other hand (Figure 1, H1 and H2). Opportunistic strategy process characteristics, however, are not expected to impact on performance, nor should performance influence opportunistic strategy process characteristics (Figure 1, H3).

In the following, we will set forth our theoretical arguments in detail and develop our hypotheses referring to the performance model shown in Figure 1.

---

<sup>2</sup> All in one person, for simplification referred to as owners in the following.

**Figure 1: A Model of Reciprocal Determination between Strategy Process Characteristics and Business Performance.**

### **Psychological Strategy Process Characteristics**

Psychological strategy research focuses on the strategy process, on how strategy contents are developed and implemented (Olson & Bokor, 1995). Strategy characteristics are general action templates that are employed after a rudimentary analysis of the situation (cf. Bem, 1983; Frese, Stuart, & Hannover, 1987). Frese et al., (2000) distinguished four types of strategy process characteristics: Comprehensive planning, critical-point planning, opportunistic, and reactive strategy process characteristics<sup>3</sup>.

*Comprehensive planning strategy characteristics* imply a strong goal orientation, extensive long-term and top-down planning, a broad knowledge base, high proactiveness, as well as a relatively low situational responsiveness. Also inherent to comprehensive planning strategy characteristics are a comprehensive mental model of the task process and a detailed signal knowledge (Frese & Zapf, 1994; Hacker, 1986) that enables one to anticipate future problems and opportunities (cf. Kirzner, 1997). Individuals who employ comprehensive planning strategy characteristics do not only scan the environment for opportunities that fit their goals and long-term plan, they also develop back-up plans for projected worst case scenarios. However, situational responsiveness in the form of goal adaptation is relatively low. Being goal oriented and long-term planning means to commit personal (time and energy) as well as financial investments. Such investments lead to a reluctance to change the goal and/ or basic structures of a plan. The resulting low responsiveness might backfire in situations where goal adaptation in response to external environmental change would be necessary. Nonetheless, comprehensive planning structures the situation proactively, generates knowledge, and allows one to interpret the situation adequately.

When using a *critical point planning* strategy, individuals merely plan out the most immediate and crucial issues for the goal accomplishment (Zempel, 1994). They only engage in further planning, when the first, critical hurdles are taken. Thus, critical point

<sup>3</sup> For increased readability strategy process characteristics are referred to as strategy characteristics in the following.

planning is an iterative, localized form of planning (Sonnentag, 1998) where persons 'cross the bridge when they come to it'. Compared to comprehensive planning, critical point planning strategy characteristics imply similar goal orientation while the planning is less long-term, the knowledge base is less sophisticated, and proactiveness is lower (Frese et al., 2000). As a result, critical point planning strategy characteristics allow for higher situational responsiveness and are more parsimonious in terms of personal and financial investments than comprehensive planning strategy characteristics.

Scanning the environment proactively for opportunities and acting immediately upon them are the distinguishing aspects of *opportunistic strategy characteristics*. While an opportunistic strategy is proactive in the sense of searching and recognizing opportunities, proactiveness is low in long-term pre-planning, back-up planning, and actively influencing the environment. Individuals using an opportunistic strategy only engage in rudimentary short-term planning, they easily abandon a goal if better opportunities arise, they have a moderate to narrow knowledge base, and they are highly responsive to the situation (Frese et al., 2000). The opportunistic strategy's advantages lie in the exploitation of all available opportunities, in economical planning, and in flexible responsiveness to market demands. However, the downside is that individuals using an opportunistic strategy dissipate their energies, might lose sight of their goals, do not follow through on a strategy, and might not put enough time and effort into long-term business development.

In contrast to the strategy characteristics described above, *reactive strategy characteristics* do not imply a proactive stance. Individuals employing reactive strategies do not attempt to influence their circumstances but are driven by the situation. The person is not goal oriented, does not plan ahead, possesses a limited knowledge base, and is mainly directed by situational demands (Frese et al., 2000). Employing a reactive strategy means to, for example, merely copy competitors' products, to introduce change only if inevitable or suggested by influential others (e.g., support organizations, customers, suppliers).

Psychological strategy characteristics are independent of the strategy content. They are action templates (van Gelderen et al., 2000) that are applied in various situations and help the human mind to overcome its limited processing capacity (Frese & Zapf, 1994; Kahneman, 1973). Therefore, strategy content can be implemented employing any one type of strategy characteristics. If the strategy content was, for example, to diversify the product range, a comprehensive planning strategy would entail an in-depth analysis of the enterprise's core competencies and resources, of the market and of marketing possibilities, of competitors' activities, of machinery and supplies availabilities, as well as of long-term financing. A business owner whose strategy is characterized by critical point planning would focus on the most critical and immediate aspects for the goal attainment (e.g., market research and financing). With opportunistic strategy characteristics, the owner would snap at any chance of diversification. A product that seems attractive would be introduced without market analysis; machinery would be bought immediately if on offer at a good price without beforehand assuring a viable source for raw materials. Finally, employing reactive strategy characteristics, the owner would wait and only embark on new products if they had been introduced successfully by competitors or if customers specifically ask for them.

### **Strategy Process Characteristics and Business Performance**

Psychological action theory suggests that, independent of the strategy content, active strategies have a positive impact while reactive/ inactive strategies are detrimental for business performance (cf. Frese & Zapf, 1994). By employing a proactive strategy

(comprehensive, critical point, and opportunistic strategy characteristics) one inevitably accumulates positive as well as negative experiences and learns about various perspectives on the strategy content. As a result, more information is integrated into the cognitive representation and one reaches a deeper understanding of the situation as a whole (cf. Kirzner, 1997). Identifying important feedback cues becomes easier and realistic goal setting, effective problem solving, as well as successful decision making is facilitated.

Scanning a wide variety of potentially important aspects of the business environment (e.g., customers, suppliers, competitors) fosters competitive strategy adjustment (Beal, 2000). Consequently, CEOs of small to medium sized companies are more successful if they scan their environment proactively (Daft, Sormunen, & Parks, 1988). However, scanning the environment and recognizing opportunities does not automatically lead to success. Opportunities must be developed (Ardichvili, Cardozo, & Ray, 2003) and action steps must be planned in advance. If preplanning has been neglected, the individual must catch up on planning during the action itself. Especially in complex or problem situations, this means an additional burden for the human cognitive processing capacity (Frese, Krauss, Grabarkiewicz, Escher, Heers, Luneng, & Friedrich, 2003; Frese & Zapf, 1994). Moreover, thorough planning includes back-up plans on the basis of anticipated throwbacks. Therefore, planning helps business owners to deal with insecurities inherent to their tasks and to make maximal use of available resources (Rauch & Frese, 1998). Planning is also useful for the realization of goals (Gollwitzer & Brandstaetter, 1997) because it helps to stay focused on the important goals and their subordinate targets. Finally, the efforts of a thorough plan is a manifestation of goal commitment which strengthens the relationship between goals and performance (Locke & Latham, 2002). In line with the above arguments, a longitudinal Dutch study by van Gelderen et al. (2000) found empirical evidence that comprehensive/ critical point planning strategy characteristics are positively related with business success.

According to psychological action theory, an action strategy is a sequence of means to achieve a goal which must be individually regulated in order to be effective (Frese & Zapf, 1994; Hacker, 1986; Miller, Galanter, & Pribram, 1960). Thus, strategy characteristics are not static. Theoretically, there are two distinguishable influence paths from business performance to comprehensive/ critical point planning strategy characteristic: (A) The more successful business owner are, the more will their business expand (in e.g., turnover, customers, employees, suppliers) and require sounder managerial decisions. Hence, the business owners must 'rise to the challenge' and employ more long-term oriented and planning business strategies. When business expansion demands a more managerial planning, individuals are capable of increasing their planning strategy characteristics even when planning had not been integrated in their previous action template. (B) Positive experience leads to an increase in strategy characteristics that had previously been successful. Success is a salient feedback cue that provides information on useful and appropriate business practices (cf. Bandura, 1969). Extra-individual feedback signals lead to intra-individual self-regulation that results in an adjustment of the strategy characteristics (cf. Frese & Zapf, 1994; Hacker, 1986). Thus, business owners regulated their action templates in response to (A) situational requirements and (B) performance feedback cues. Accordingly, van Gelderen et al. (2000) found Dutch owners who successfully employed critical point planning strategy characteristics to adopt comprehensive planning strategy characteristics in the long run. Therefore, we expect business success and comprehensive/ critical point planning strategy characteristics to be reciprocally determined and to follow the dynamics of an upward spiral (cf. Lindsley, Brass, & Thomas, 1995): Planning (comprehensive, critical point) strategy characteristics improve business performance and business performance increases the use of planning strategy

characteristics (Figure 1, H1).

Hypothesis 1: Comprehensive/ critical point planning strategy characteristics of the owners have a positive influence on business performance and high business performance increases the owners' comprehensive/ critical point planning strategy characteristics.

Reactive strategy characteristics entail neither planning, nor proactiveness, nor goal commitment. The lack of planning means that business owners cannot anticipate future trends in their trade, develop insufficient cognitive representations of the situation, cannot interpret feedback cues adequately, and cannot transfer their experiences into ready-made responses to problematic situations (Frese & Zapf, 1994). Individuals employing a reactive strategy have to start the decision making process from scratch every time they face a new decision or problem. Time and again, a multiplicity of available information must be integrated into the cognitive representation. The extensive need for information integration then results in cognitive overload and poorer decision making (Hacker, 1986; Hockey, 1996). Furthermore, reactive strategy characteristics imply passive adaptations that do not attempt to shape the environment. The owners do not scan their environment for opportunities but react passively to general trends, copy what others do, or adopt strategy contents that the environment imposes upon them. Thus, others will take the lead before reactive owners initiate the necessary steps (cf. Liebermann & Montgomery, 1998). Finally, the goals of reactive owners are neither self-developed nor intrinsic. Therefore, they develop only weak goal commitment which is detrimental to business performance (cf. Locke & Latham, 2002). In correspondence with the above arguments, research suggests that owners employing a reactive strategy are late movers who miss out on market opportunities (Liebermann & Montgomery, 1998). Reactive strategy characteristics were negatively related with business success in North America (Doty, Glick, & Huber, 1993), as well as for Dutch (van Gelderen et al., 2000) and Namibian (Frese, Brantjes, & Hoorn, 2002) small business owners.

As for planning strategy characteristics, we assume reciprocal determinism for the relationship between reactive strategy characteristics and business performance (Figure 1, H2): Low business performance poses an immediate threat to the owner. Threatening experiences elicit emotional (stress, anxiety) cognitive (narrowed attention, decreased information processing capacity, perpetuation of action strategies), and behavioral (performance decrease when action templates are inappropriate) consequences for the individual (Staw, Sandelands, & Dutton, 1981; cf. also Frese & Zapf, 1994). Hence, the business owners' experience of failure results in personal distress (emotional). The emotional effects cause the owner to process information in an emergency mode (cognitive) where additional cognitive strain is minimized. Averting danger turns into the primary task and the owner becomes less likely to engage in planning, proactive actions nor to venture into unknown areas (behavior). Reactive strategy characteristics, which have caused lower performance in the first place, are intensified, performance decreases further and a rigidity cycle (cf. Staw et al., 1981) or downward spiral (cf. Lindsley et al., 1995) is ignited. Accordingly, van Gelderen et al. (2000) found the relationship between reactive strategy characteristics and business performance to match a downward spiral in their Dutch sample.

Hypothesis 2: Reactive strategy characteristics of the owners have a negative influence on business performance and low business performance increases the owners reactive strategy characteristics.

Opportunistic strategy characteristics are defined by high proactiveness, low planning, and low goal orientation. The consequences of opportunistic strategy characteristics are ambivalent: On the one hand, business benefits from the owner's opportunity alertness (high proactiveness) that is realized flexibly (low planning, low goal commitment) because hardly any resources had been invested into long-term planning (Frese et al., 2000). On the other hand, business suffers because opportunities are not developed comprehensively (Ardichvili et al., 2003) and goals are easily abandoned (low goal commitment), especially when difficulties arise (low back-up planning). Moreover, interfering opportunities can distract the owners' attention and result in goal conflict. Conflicting goals cause incompatible action tendencies and have a negative impact on success (Locke, Smith, Erez, Chah, & Schafer, 1994). Empirical findings reflect the above arguments' ambivalence: Opportunistic business conduct was associated with lower goal orientation and long-term business success in Nigeria (Wilfert, 1992) while it had no effect on success in The Netherlands (van Gelderen et al., 2000). We assume that advantages (opportunity alertness, flexibility) and disadvantages (lack of planning, conflicting goals) of opportunistic strategy characteristics result in an insignificant effect on business performance (Figure 1, H3).

The reverse effect of performance on opportunistic strategy characteristics should also be inexistent (Figure 1, H3): First, opportunistic strategy characteristics do not contribute to success. Therefore, performance related feedback cues do neither reinforce nor weaken opportunistic strategy characteristics. Second, a successful, expanding business demands self-regulation towards more planning, not opportunistic strategy characteristics (cf. Hypothesis 1). Third, if performance is low, failure poses a threat that restricts one's information processing capacities (Staw et al. 1981; cf. also Frese & Zapf, 1994). Thus, unsuccessful owners will perceive less opportunities and their strategy characteristics become more rigid (Staw et al., 1981), not more opportunistic (cf. Hypothesis 2). The above arguments appear to suggest that business owners strategy characteristics should generally not be opportunistic. Yet, empirical data shows that small business owners' strategy characteristics are frequently opportunistic (Frese et al., 2002; van Gelderen et al., 2000). This seeming contradiction's explanation is the low planning activity of owners who employ opportunistic strategy characteristics from the business start-up. Since the very beginning these owners employ strategy characteristics that do not entail systematic planning. Therefore, they cannot develop a sophisticated cognitive representation of the business environment and do not learn about important feedback signals (Hacker, 1986). Consequently, owners cannot interpret the feedback provided by business performance adequately and cannot regulate their strategy characteristics accordingly.

Hypothesis 3: Opportunistic strategy characteristics of the owners have no influence on business performance and business performance has no influence on the owners' opportunistic strategy characteristics.

## **Studying Small Scale Enterprises in Zimbabwe**

We chose Zimbabwe as study site for practical, methodological, and theoretical reasons: First, a prospering small business sector facilitates sustainable growth in developing countries: It creates employment (Krauss, Frese, & Friedrich, 2004; Livingstone, 1996; Mead, 1994; Mead & Liedholm, 1998), fosters industrialization (Kiggundu, 1988), and supports upward social mobility (Koo, 1976). With our research, we want to contribute to the fragmentary knowledge on factors influencing small business performance in Africa. Second, samples of African business owners provide a wider variance than Western samples. Business entry barriers are comparatively low and many start a business

because they have no other income (cf. Krauss et al., 2004). At the same time, there are also enterprises that are on par with Western businesses regarding proficiency, professionalism, and entrepreneurial motives. Samples with a wider variance allow for stronger correlations (Cohen and Cohen, 1983). Therefore, African samples are favorable to finding general laws that might not become salient in more homogenous samples. Third, the Zimbabwean study site allows to examine the generalizability of US-American and European results on strategy process characteristics with other cultures and economic environments.

## **METHOD**

### **Sample**

We applied a behavioral definition of entrepreneurs (Gartner, 1989) and sampled business owners who had started their enterprise themselves and were responsible for the day-to-day management (Rauch & Frese, 2000). The longitudinal sample consisted of  $N=97$  Black Zimbabwean participants who had at least one and up to fifty employees at the first measurement time (T1).

The T1 sample ( $N=122$ ) was drawn between September 1998 and April 1999. Many Zimbabwean businesses do not appear in any listing nor do they have phone lines. Therefore, we used a random walk procedure for sampling: The interviewers called on the business site in person and carried out an interview on the spot or made a later appointment if the owner was preoccupied. Typical businesses sampled with the random walk procedure included mechanics, scrap metal merchants, furniture manufacturers, bottle stores, tailors, welders, hairdressers, and others who provide for the immediate local market. To include up-market businesses and those located in urban office buildings (e.g., commodity brokers, travel agencies, advertising agencies, and telecommunication companies), we contacted businesses listed in business directories at random. The response rate was 70%.

One year after the first data collection, the second measurement wave (T2) was carried out from May 2000 to April 2001. Out of  $N=122$  owners interviewed at T1 we could re-interview  $N=104$  participants. Seven of the  $N=104$  re-interviewed participants had given up their business. Thus, the T2 sample size was  $N=97$ .

### **Procedure**

The main measurement instrument was a structured interview throughout which confidentiality was repeatedly assured. Where appropriate, interviewers used prompts to clarify participants' answers. Interview answers were written down as verbatim as possible and typed subsequently. It was not possible to use tape recordings as the noise level was too high at most business sites. The interviews were carried out by the first author, by German graduate students, and by local interviewers (who were especially helpful with participants who could not speak English well).

The interviewers were trained thoroughly (2 – 10 days, depending on their prior knowledge). The training included interviewing techniques, taking notes for the protocols,

the handling of questionnaires, and the rating of participants' answers. After performing role-plays, interviewers practiced in vivo accompanied by an experienced interviewer.

Each interview was rated by two raters, one of them always being the interviewer. Ratings were done on the basis of typed protocols and an elaborate coding scheme that provided rating anchors. Throughout the study, close supervision and consultative meetings minimized rating biases. Ratings were either 5-point Likert assessments (e.g. opportunistic strategy characteristics low/ high), factual (e.g., number of employees), or nominal (e.g., the business was self-established or not).

In addition to the interview, the participants filled out a questionnaire on growth goal orientation and risk-taking orientation. Directly after the interview, when the impressions of the owners and their businesses were still vivid, the interviewers filled out the interviewer evaluation form that captured the interviewers' personal impressions of the participants and their businesses.

## **Operationalization**

**Business Performance.** Our business performance measures are self-reported interview data. For self-reported performance data, interview measures are superior to questionnaires because they allow for the clarification of discrepancies between the appearance of the business and the participants' answers. In order to get a differentiated picture, we used business performance measures that are related to business size (number of employees) and to business growth (growth scale consisting of growth in sales, customers, and profits). The *number of employees* at T1 and T2 was a single item interview measure. The *business growth* scales included interview items where we asked participants to indicate percentages of increase, decrease, or stagnation in profit, customers, and sales compared to the previous year. Since the number of employees and the growth measure of business performance depict different performance aspects that are not inevitably interrelated, we did not collapse them (Meyer & Gupta, 1994).

**Strategy Process Characteristics.** *Comprehensive planning, critical point planning, reactive, and opportunistic strategy characteristics* at T1 and T2 were measured with an in-depth interview-based analysis of how business owners want to reach their goals. We first asked participants to rank common business goal areas developed in prior studies (e.g. new marketing strategy, expanding, making more profit). Then we asked participants to describe the two most important goal areas in detail and to exactly tell us what their objectives in these areas were. This led to a description of operational subgoals. The next step was to ask the participants how they wanted to go about achieving each of the subgoals and what they had already accomplished. We used prompts extensively (e.g., What do you mean by ....? Can you give me an example for ...?). A general prompt was to repeat what the participant had said. We carefully avoided leading words like 'plan' or 'active'. The strategy section of the interview took up to 40 minutes.

The interviewer and an independent second rater subsequently assesses the strategy characteristics of the two most important super-ordinate goal areas. Thus, we have two double ratings for each type of strategy characteristics. We employed a coding scheme with 5-point Likert scales and rating anchors. The anchor for high comprehensive planning strategy characteristics was: 'Everything is planned out in detail, all necessary steps including some substeps are described.' Critical point planning strategy characteristics: 'One important/ crucial point is described in detail, everything else is left vague; however high goal orientation, keeps goal in mind.' Reactive strategy characteristics: 'Goes from one issue/ problem to the other; does not produce changes, but waits for them to happen

and then reacts, no goal orientation.’ Opportunistic strategy characteristics: ‘Does not plan in advance, but actively looks for business chances and exploits them; easily deviates from goals’.

Alternatively, we could have used questionnaires to measure the strategy characteristics. However, questionnaires using Likert items can only lead to the exact information that the items address. For strategy characteristics of business owners, this would not have been appropriate. The measure must be flexible enough to account for the individual strategy content (what exactly does the owner want to reach with what particular strategy) and the specific circumstances of each business (e.g., the industry). Questionnaires using open questions are problematic because the answers are often not detailed enough to rate strategy characteristics and the interviewer has no possibility to ask further questions. The latter is a serious issue for our Zimbabwean participants, most of whom speak English well but are not proficient in the literary language.

## RESULTS AND DISCUSSION

This paper presents first findings from a longitudinal field study on small business performance in Zimbabwe. Our preliminary results contribute to entrepreneurship research by (A) providing evidence on reciprocal determinisms between business owners’ strategy process characteristics and business performance (cf. Bandura, 1978; Lindsley et al., 1995) and (B) examining findings from Western samples in a different cultural and economic environment (cf. Doty et al., 1993; Frese et al., 2000; Frese et al., 2002; van Gelderen et al., 2000).

First, we found direct contemporaneous effects of the owners’ strategy characteristics on business performance (Table 1). Therefore, the impact of our psychological predictors on changes in business performance is relatively immediate and must have occurred within one year — some time between the first and the second measurement (Dwyer, 1983). Highly structured, proactive, and goal committed comprehensive planning strategy characteristics resulted in positive changes in the business’ number of employees (Table1,  $r=.23$ ,  $p<.05$ ) as well as in its growth (Table1,  $r=.33$ ,  $p<.01$ ). This confirms previous findings in a culturally and economically different environment (van Gelderen et al., 2000) and suggests ubiquitous importance of comprehensive planning strategy characteristics in the entrepreneurial process. Critical point planning strategies, influenced change in the number of employees marginally (Table1,  $r=.20$ ,  $p<.10$ ), but had no significant relationship with business growth (Table1,  $r=.03$ , n.s.). Critical point planning strategy characteristics cover fewer business aspects, are less long-term, and less strictly top-down organized than comprehensive planning strategy characteristics (Frese et al. 2000). Thus, owners who employ critical point planning strategy characteristics develop a less sophisticated mental representation of the entrepreneurial task as well as of feedback signals in the environment than owners using comprehensive planning strategy characteristics (cf. Frese & Zapf, 1994; Hacker, 1986). Therefore, critical point planning strategy characteristics facilitate a positive business performance development, yet not to the same extent as comprehensive planning strategy characteristics. Van Gelderen et al. (2000) argued that critical point strategy process characteristics are most useful in early phase of the business development: “In this phase, the founder is bombarded with the need to make quick decisions under a high degree of uncertainty. Thus the most economic form of planning – the critical point strategy – is the most effective one in this phase (p.175).” Our participants had on average been operating their business five to six years when we first

interviewed them. In this later stage of business development, a critical point planning strategy might not reach far enough and owners should preferably adopt a more comprehensive planning strategy. Reactive strategy characteristics imply the passive adaptation to external demands and were expected to obstruct business performance (cf. Doty et al., 1993; Frese et al., 2000; Frese et al., 2002). All relationships between reactive strategy characteristics and performance were negative. However, only the negative impact on business growth was (marginally) significant (Table 1,  $r = -.20$ ,  $p < .10$ ). An explanation could be that copying a successful business idea (that someone else had planned out systematically) keeps business performance from decreasing dramatically within our time lag of one year. Yet in the longer run, reactive strategy characteristics should lead to considerably lower success than any of the other three strategy process characteristics and, eventually, result in failure. Opportunistic strategy characteristics had, expectedly, no direct effect on either of our performance measures (Table 1; cf. Locke et al., 1994; van Gelderen et al., 2000). On the one hand, business owners benefit from opportunistic strategy characteristics in so far as they proactively recognize and tackle many opportunities. On the other hand, the little planning entailed in opportunistic strategy characteristics is a disadvantage. Low planning means that the identified opportunities are not developed adequately (cf. Ardichvili et al., 2003). The owners juggle a multiplicity of rudimentarily developed opportunities without focusing on any one sufficiently to turn them into success. Thus, the combination of high proactiveness and little planning activities does neither promote nor obstruct entrepreneurial task accomplishment.

**Table 1**  
**The Effect of Strategy Characteristics on Business Performance**  
**(contemporaneous analyses controlling for business performance T1)**

Predictor Variables T2	Number of Employees T2	Business Growth T2
Comprehensive planning strategy	$r = .23^*$	$r = .33^{**}$
Critical point planning strategy	$r = .20^\dagger$	$r = .03$
Reactive strategy	$r = -.17$	$r = -.20^\dagger$
Opportunistic strategy	$r = .00$	$r = .02$

$^\dagger p < .10$ . \*  $p < .05$ . \*\*  $p < .01$ .

Second, we established reverse lagged effects: The effect of business performance on strategy characteristics is less immediate than the contemporaneous impact of psychological variables on business performance because it requires the adequate interpretation of feedback information (Carver & Scheier, 1998). Before feedback information can lead to self-regulation, it must accumulate and be interpreted — both of which takes time. From T1 to T2, an increase in the number of employees led to more comprehensive planning (Table 2,  $r = .40$ ,  $p < .01$ ) and less reactive strategy characteristics (Table 2,  $r = -.25$ ,  $p < .05$ ; cf. van Gelderen et al., 2000). Hence, a growth in the number of employees constitutes a situation that demands strategy characteristics that are more comprehensive planning and less reactive on the part of the owner. Highly successful owners become more comprehensive planning and little successful owners become more reactive. The latter effect is due to the cognitive consequences of stressful threatening experiences such as low business performance. The owners react with less long term planning (cf. Frese & Zapf, 1994), narrowed attention, and lowered cognitive processing capacities (Staw et al. 1981). As a result, feedback cues are overlooked or misinterpreted, owners make the wrong decisions, and business performance decreases even further.

Critical point planning characteristics were not influenced by either of the performance variables (Table 2). As described above, critical point planning strategy characteristics should be most important in the business start-up phase where economic planning and quick decisions are important (van Gelderen et al., 2000). Our participants, however, are at a stage of business development where enterprise expansion demands concurrent consideration of the whole spectrum of business aspects, not just the most critical and pressing issues. Opportunistic strategy characteristics were not influenced by neither of the performance measures. The feedback information provided by business performance does not suggest to adopt more or less opportunistic strategy characteristics. Highly successful owners become more comprehensive planning and unsuccessful owners become more rigid and reactive (cf. Staw et al., 1981).

See Table 2

The effects of business performance on strategy characteristics were only significant from the performance measure number of employees, not from business growth. Thus, the change in strategy characteristics was caused by a growing workforce, not by a thriving business as such (additional growth in customers, profits, sales). When the owner of a grocery store, for example, opens a second branch and hires new employees to run the shop, the situation becomes more complex and requires a more planning strategy (Frese & Zapf, 1994). When the owner, for comparison, sells double the amount of groceries in the old shop, the situation does not necessarily become more complex and strategy characteristics need not inevitably become more planning.

Third, we found reciprocal determinisms between psychological variables and business performance that suggest upward spirals (Lindsley et al., 1995). The effect of performance on comprehensive planning strategy characteristics (Table 1) roughly matches the one from comprehensive planning strategy characteristics on performance (Table 2). Owners high on planning strategy characteristics are not only more successful than others; their business success also increases those psychological variables that contributed to success in the first place. Similar results were found in a Dutch sample by van Gelderen et al. (2000). Therefore, reciprocal determination of planning strategy characteristics and performance can be generalized across cultural and economic environments. Reciprocal determinism can only be detected by longitudinal analyses. However, only few studies in the area of entrepreneurship research are designed longitudinally (Rauch & Frese, 2000).

We also expected reciprocal determinism between reactive strategy characteristics and business performance (van Gelderen et al., 2000). Reactive strategy characteristics influenced change in the performance measure business growth (marginal) negatively (Table 1) and, in turn, the performance measure number of employees had an effect on reactive strategy characteristics (Table 2). Hence, we did not find truly reciprocal determinism where the same performance measure that was influenced by reactive strategy characteristics influenced the strategy characteristics reversely. Yet, all effects point to a downward spiral (Lindsley et al., 1995). Reactive strategy characteristics cause a decrease in business performance (business growth); low performance (number of employees) then leads to emotional distress, cognitive rigidity, and non-proactive behavior which decreases performance even further (Staw et al., 1981). For critical point planning strategy characteristics, our data indicates no reciprocal determination. Critical point planning strategy characteristics influenced the number of employees marginally (Table 1) and the reverse effects from business performance were not significant (Table 2). The results on the critical point planning strategy characteristics in our sample of long standing business owners tie in with findings in samples of nascent entrepreneurs by van Gelderen

et al. (2000). In their sample of nascent business owners, van Gelderen et al. (2000) showed that critical point planning strategy characteristics were only in the early phase of the business development related with business success. In a later phase, owners who had successfully practiced critical point planning strategy characteristics earlier, adopted comprehensive planning strategy characteristics. As in the present study, critical point planning strategy characteristics were not influenced by business success in an advanced phase of business development (van Gelderen et al., 2000). Hence, our Zimbabwean entrepreneurs were probably in a phase of their business development where critical point planning strategy characteristics are less appropriate than in earlier phases. Businesses in an advanced phase of development probably demanded more comprehensive planning than critical point planning strategy characteristics.

### **Strengths and Limitations**

The ipsative interview procedure for the strategy characteristics certainly is an issue. The interviewers kept asking for more details on the participants strategy characteristics until they felt they had enough information to give the owners a high rating on one of the four strategy process characteristics. An advantage of the ipsative measurement is that the interviewers compare strategy characteristics consciously during the interview. This is reasonable in interview field-research because it mimics the practical situation where one has to make decisions between alternative characteristics (cf. Baron, 1996). The owners' descriptions of their strategies never completely corresponded with our operationalization of, for example, comprehensive planning strategy characteristics. A strategy might be mainly characterized by comprehensive planning, but there are virtually always some strategy aspects that also involve critical point planning, opportunistic, or even reactive characteristics. Reversely, owners who mainly employ reactive strategy characteristics occasionally also engage in planning. Thus, it was important for our research to clearly identify the most prevalent type of strategy characteristics in order to find significant causalities between strategy characteristics and performance. However, the disadvantage is that our measurement of the strategy characteristics are not statistically independent. Consequently, relationships between the non-planning and non-proactive reactive strategy characteristics and the other three types of strategy characteristics were highly negative (cf. Closs, 1996).

## **IMPLICATIONS FOR FUTURE RESEARCH**

The present study examined reciprocal determinisms between strategy characteristics and success in a sample of business owners who had established their enterprise on average five to six years prior to the first measurement time. Thus, the reciprocal determinisms described above represent the entrepreneurial process in an advanced stage of the business development. In order to fully understand the reciprocal determinisms, future research should investigate nascent entrepreneurs in their starting phase and accompany them throughout the business life cycle. In the middle-term, reciprocal determinisms should become stronger and upward/ downward spirals should emerge. In the long run, however, ceiling effects, which limit the spiral process, are likely to occur and reciprocal determinisms should become weaker (Lindsley et al., 1995).

## CONCLUSION

Our longitudinal approach enabled us to investigate reciprocal causalities in the entrepreneurial processes that emphasize the importance of the individual, the person of the business owner. We, first, established reciprocal determination between the owners' strategy characteristics and business performance: Comprehensive planning strategy characteristics increase business success. In turn, business success strengthens the owners' comprehensive planning strategy characteristics. Thus, we found a positive reciprocal determinism that suggests the existence of an upward spiral. For reactive strategy characteristics, however, the reciprocal determinism is negative. Reactive strategy characteristics lead to lower business performance and low performance then increases the owners' reactive strategy characteristics even further. Moreover, the causal effects involving strategy characteristics appear across cultures and economic environments (cf. van Gelderen et al., 2000).

Furthermore, the impact of comprehensive planning strategy characteristics on business performance was the strongest and the most consistent influence across performance measures. Thus, entrepreneurship support programs should concentrate on enhancing the comprehensive planning strategy characteristics of small business owners. Psychological training methods can help business owners to improve their planning abilities, to strengthen their goal commitment, and to increase as well as focus their proactiveness. In the longer run, business success will, in turn, foster the development of more comprehensive planning strategy characteristics.

Last but not least, we want to call attention to the imperative of longitudinal research designs and the necessity of behavior proximal research constructs such as strategy characteristics (cf. Kanfer, 1992) in order to investigate individual influence factors of entrepreneurial performance.

# NEW VENTURES AND INDUSTRIAL CLUSTERING: A CASE STUDY OF TAIWAN

Meng-chun Liu, Tain-Jy Chen and Ming-Wen Hu<sup>\*</sup>

The main purpose of this paper is to investigate the role of industrial clusters in the formation and development of new ventures as well as entrepreneurship. We take Taiwan as an example; the empirical works are conducted first by a look at the contingency table of incumbents and new firms' regional distribution to see their geographic linkage. Then a Tobit regression was performed to decide the determinants of Taiwan's manufacturing new ventures. Our empirical results show that industrial clustering and R&D intensity are important facilitators of new ventures. The policy implication from our results is that promotion of the spatial agglomeration of firms is a useful means of nurturing startups.

This study further suggests that inter-firm linkages play a critical role within an industrial cluster, indicating that government support for the incubation of new businesses should be targeted towards the building of networks. In order to assist in matching local networks to the global production system, the aggressive promotion of spatial agglomeration is necessary in order to facilitate mutual learning and knowledge spillovers. Developing countries in particular may need to design policies aimed at leveraging the capabilities of multinationals in establishing both local and cross-border networks for learning.

*Key Words:* New Ventures, Clustering, Spatial Proximity, Inter-Firm Networks, Entrepreneurship.

## INTRODUCTION

New venture is the center of economic progress, especially for developing countries lacking natural endowments. Drawing on Hoang and Antoncic (2003) recent review of (social) network-based research in entrepreneurship, we synonymize entrepreneurial activity with new venture creation. There are many definitions for an entrepreneur, even more for the concept of entrepreneurship. Ranging from defining entrepreneurship simply as the creation of new enterprises (Low, 2001) to regarding entrepreneurship as a spirit to deploy the resources in pursuit of an opportunity, independent of the origin or ownership of such resources (Johannisson, 1998). While Bygrave and Hofer (1991: 14) defined the

entrepreneurial process as “involving all the functions, activities, and action associated with the perceiving of opportunities and the creation of organisations to pursue them”. Hébert and Link (1989) define the entrepreneur as someone who specializes in taking responsibility for and making judgmental decisions that affect the location, the form, and the use of goods, resources, or institutions. In any event, entrepreneurs are dynamic and willing to launch new ventures and to take necessary risks. Because of asymmetric information and lack of knowledge, an economy is normally characterized by hidden profit opportunities that have not yet been uncovered. Entrepreneurs are capable of identifying these opportunities and engaging in proper activities to realise the gains.

Although the personal characteristics of individuals are important constituents of entrepreneurship, some environmental factors have been identified as necessary for the incubation of new ventures, including political, economic and cultural factors. In recent years, some studies have noted that external networks can represent an alternative mode of organisation that enables entrepreneurial growth. It was argued that spatial proximity and long-term relations between firms are very important in improving market competitiveness within a region, in which important roles are played by social, reputation, cooperative, knowledge, innovative and technology networks (Lechner and Dowling, 2003).

Apparently, the external networks embodied in the industrial clusters provide the firms in the region with a close supplier-chain relationship, common technologies and customers, and a labor market pooling. Industrial clusters can also be a practical means of linking neighborhood firms to the regional and even global economy. Industrial clusters may effectively reduce the barriers of market entry and further incubate new ventures. A few studies have indicated that an industrial cluster stimulates market entry into a region in which a number of firms have accumulated. This is because an industrial cluster is connected with suppliers of intermediate inputs, and is capable of creating knowledge spillover effects (Marshall, 1890). Industrial clustering effectively reduces the market entry barriers and drives a high rate of market entrance, which in turn, is associated with a high rate of innovation, which improves productivity.

The main purpose of this paper is to investigate the role of industrial clusters in the formation and development of new ventures as well as entrepreneurship. Taiwan, once regarded as a newly industrialized economy, has long been known for its abundant entrepreneurship resources. The empirical evidence for this study is to be obtained from a case study of the manufacturing industry in Taiwan. The remainder of this paper is arranged as follows. Brief literature review surrounding industrial clusters and entrepreneurship is presented in Section 2. In Section 3, we introduce the measurement of industrial clusters, and suggest the need for a content analysis of industrial clusters in order to better understand the relationship between new ventures and industrial clustering. This section also presents a general picture, in the form of a case study of industrial clustering in Taiwanese manufacturing industries for the year 1992 and 1994. We then look at the patterns of market entry over the periods from 1992-95 and 1992-97. Section 4 employs a quantitative model to examine the role of industrial clustering in reducing market entry barriers and incubating new ventures. The empirical results are presented in Section 5. The findings of this study are summarised in the concluding section.

## LITERATURE REVIEW

There are many advantages for a new venture to launch within an industrial cluster. Within an industrial cluster, collective economic actors who are closely connected to one another possess shared technological narratives, affluent mutual trust and a willingness to cooperate (Solvell and Zander 1998: 409). Organisations involved in research and development (R&D), such as universities and government-sponsored research institutes, function as an intermediary source of new technology (Lundvall 1992: 13-14). As noted by Schumpeter (1934), innovation underlines entrepreneurship, and all of the above factors are conducive to innovation. Industrial clustering also stimulates competition and emulation between individuals in their entrepreneurial achievements. Competition between classmates is often observed in the locations that are famous for industrial clustering, such as the Silicon Valley in the US and Hamamatsu in Japan, with achievements by alumni also being capable of inspiring younger graduates to embark on the course of entrepreneurial activities.

Some factors underscore the inter-firm network embodied in regional clusters. First of all, drawing on Lechner and Dowling's (2000) study of the biotechnology cluster in Munich, Germany, we note that regional culture influences corporate culture in terms of both cooperation and competition. Given the time and energy constraints, spatial proximity is critical to building trust between firms over time, which mainly stems from frequent interactions and face-to-face contact. Thus, it is argued that a network of entrepreneurial firms is regionally embedded, and the successful development of the industrial cluster will determine the competitiveness of firms within the cluster.

Lechner and Dowling (2003) also emphasize the importance of external relations to the growth of entrepreneurial firms by examining the case of the IT cluster in Munich, Germany. As noted in Lechner and Dowling (2003), inter-firm networks do not work in a virtual space in which spatial proximity is unimportant. Both spatial proximity and long-term relations determine the quality of the relationship and the competitive advantage of firms, which are derived from close relations. Generally, the network relationship of firms enables them to enjoy advantages in terms of social networks, cooperative networks, marketing networks and knowledge-innovation networks.

The nature of collectiveness of the cluster provides the firms within the cluster with some advantages. As in the earlier studies, the emergence of industrial clusters is recognised here as shaping and driving the competitiveness of firms within clusters at both national and global levels. This may be attributable to agglomeration externalities, three types of which are classified by Glaeser et al., (1992). The first type is Marshall-Arrow-Romer externality which highlights industrial specialisation within a region. Each firm in the cluster enjoys the benefit from saving investment costs by specialising within a narrow area of the value-added chain. Similar firms within the clusters find ways to differentiate themselves by locating unique market niches that have not been filled by other firms. Small firms can join together to fill a large contract that none of them could undertake alone, and as such, these small businesses can be more competitive and successful in the long run by becoming a part of a dynamic cluster which fosters competition, collaboration and innovation amongst the participants.

The second type is Porter externality, which arises from regional specialisation and the

differentiation of products. This effect stems mainly from local rivalry between firms, which further fosters the rapid diffusion of knowledge and adoption of new ideas. In addition, the development of industrial clusters may lead to simultaneous competition and collaboration in offering innovative products and services, and to further establish a sustainable competitive advantage in the dimensions of technology, workforce, production methods, delivery time, quality, and resource procurement.

The third type of externality is diversity externality, which is stimulated by the interchange of ideas between various types of activities within the region. As noted in Jovanovic and Rob (1989), new ideas can be derived from heterogeneous knowledge across firms and people.

Industrial agglomeration externalities enable firms within a cluster to enjoy higher growth and competitiveness, and these three types of externality have pointed to some important dimensions in the competitiveness of industrial clusters. This is because firms within a region can share a common dependence on research, innovation, knowledge and regional industry-specific assets.

An industrial cluster also reduces the risks for business ventures. Labour pooling is an important feature of industrial clustering since it cuts the costs of hiring and discharging workers. Pooling of skilled workers also makes the mobilisation of managerial resources much easier. Industrial clusters are often supported by a venture capital industry which finances the start-ups and helps innovators to realise their gains by organising proper production processes. Moreover, industrial clustering provides industry-specific information, particularly that which is pertinent to technology, and which thus prevents an entrepreneur from making huge mistakes. An industrial cluster also represents a learning region which spawns innovation. Chell and Baines (2000) indicated that 'weak tie' networking is part of fundamental entrepreneurial behavior, since the interchange of entrepreneurial contact, knowledge and confidence are necessary in the pursuit of opportunities through the mobilization of resources, which include raising capital, labour and effort, for ventures with uncertainties.

Hoang and Antoncic (2003: 178) summarize the key findings around networks as determinants of new ventures formation. They are fund-raising benefits for new ventures; interorganizational linkages within emerging industry signal that spur new venture formations; and early legitimating activities affected persistence of entrepreneurial activity. In short, new ventures may be regarded as the inherent underpinning of network activity. In the following section, in order to examine this assumption, we measure the degree of spatial agglomeration for each manufacturing industry, along with the market entry rate.

## **NEW VENTURES AND INDUSTRIAL CLUSTERING FOR TAIWANESE MANUFACTURING INDUSTRIES**

### **Measurement of New Ventures for Taiwanese Manufacturing Industries**

According to Wennekers and Thurik (1999: 34), new entry is the act of launching a new venture. Drawing also from Geroski (1995: 431), who presents a 'stylized result' that *high rates of entry are often associated with high rates of innovation and increases in efficiency* in his brief survey

of recent empirical work on entry, we regard start-ups as new ventures. Table 1 summarizes the patterns of market entry in each Taiwanese manufacturing sector over two periods 1992-95 and 1992-97, in terms firm size and the industrial distribution of new entrants.

Based on early studies, two types of innovation stand out from a microeconomic perspective, 'entrepreneurial innovation' and 'managed innovation'. The emergence of entrepreneurial innovation relies mainly on the economic opportunities brought about by new technologies and scientific development. In this case, the entry of small, dynamic and rapidly growing firms is responsible for such innovation. In contrast to the case of entrepreneurial innovation, managed innovation is made by existing firms in the market and, as argued by Schumpeter (1942), this type of innovation tends to be dominated by large firms with a monopoly in the market. In some sectors, such as petroleum & coal products and leather & fur products, some large startup firms are not clearly associated with industrial sectors with capital-intensity. The large shares of entry firms in three industry sectors, fabricated metal products, machinery & equipments, and electrical & electronic machinery may demonstrate that these booming industrial sectors attract large share of new entry firms and absorb larger share of employees. There is also clear evidence that the startup firms tend to be SMEs in a significant share. Parts of new-entry firms make R&D investments in their correspondingly established years. Such new-entry firms,

especially associated with small in size, may be regarded as entrepreneurial innovation firms. As is apparent from Table 1, some sectors deeply attract the entries of entrepreneurial firms. These industrial sectors not only include high-tech industries, such as electrical & electronic machinery, chemical materials, and chemical products, but also include traditional and heavy industries, such as leather & fur products, and rubber products, indicating that the entry of entrepreneurial firms cannot be simply attributed to the industrial characteristics in R&D intensity.

## Measurement of Industrial Clusters for Taiwanese Manufacturing Industries

This subsection set outs to measure the level of spatial concentration of Taiwanese manufacturing industries at town level for 1992 and 1994. The geographical agglomeration index comprises of the intra-industry distribution of employment by plants, as the geographical Herfindahl index. The geographical agglomeration index is defined as follows:

$$GH = \sum x^2$$

where  $GH$  denotes the geographical Herfindahl index,  $x$  is locational share of employment for each industry. In the case of perfect agglomeration,  $GH$  approaches 1.

Based on the geographical Herfindahl index, we calculate the level of  $GH$  at town level and the 2-digit Chinese Standard of Industrial Classifications (CSIC) codes for 21 manufacturing industries. In contact to Table 1, Table 2 gives data on the industrial geographical agglomeration, number of incumbent firms for 1992 and 1994, and the entry rates of large firms and SMEs for 1992-95 and 1994-1997. In regard to industrial agglomeration, petroleum & coal products industry reaches an extraordinary high level in 1992. Against the background that Taiwan's energy consumption mainly relies on the imports, the firms of such industry generally gather together in some harbor regions. Next to petroleum & coal products industry, non-metallic mineral products, basic metal, transport equipments, and chemical material are significantly higher than other sectors in terms of geographical agglomeration indicator. Table 2 shows that the entry-rates across industries for 1992-95 and 1994-1997 range from 15.7% and 19.1% (wood & bamboo products) to 56.4% and 53% (electrical & electronic machinery), and the average of entry rates achieves at 37.4% and 35.1%. Apart from petroleum & coal products industry, wearing apparel & accessories, and electrical & electronic machinery drive a comparatively high entry rate of large firms.

**Table 2 Industrial Spatial Agglomeration and Entry Rates in Taiwanese Manufacturing Sector**

Industrial Sectors	GH* Indicators (1992)	1992-95 Total Firm	GH* Indicators (1994)	1994-97 Total Firm
Food Manufacturing	0.0107	20.7	0.0102	20.0

## Spatial Distribution of New ventures and Incumbents

The above sections underline the role of spatial agglomeration in new firm formation rate. In addition, variances in market entry rates may be explained by industrial concentration, market growth/market room, scale disadvantage, and R&D investments. However, the above research does not yet make sure whether new firm start-ups are significantly correlation with their incumbents in terms of the geographical deployment. This section aims to provide more specific evidence to underline the industrial agglomeration effect in driving new firm formation.

We perform a comparative approach to two types of industries in terms of locational choices of new firm start-ups. According to the degree of correlation of new firm start-ups with their incumbents in terms of spatial distribution, we intend to identify two types of industries. The first type of industries denotes such industrial sector that the new firms intend to locate their production bases close to their incumbent counterparts. The others are regarded as the second type of industries. Based on the networking attributions of industrial clusters, if other condition is given, new firms should be attracted to locate themselves into the clusters in order to share a common dependence on research, innovation, knowledge and regional industry-specific assets, demonstrating the evolution process of industrial clusters. The comparison of two types of industrial clusters in their entry rates may underpin the argument that the spatial agglomeration effect of firms can effectively drive new firm formation.

Two-stage approach is utilized to examine the hypothesis. First of all, test for independence and Pearson correlation index are performed to identify some specific industrial sectors of Taiwan, in which new firms are similar to their incumbents in spatial distributions cross 336 towns. The  $\chi^2$  test procedure is used to test the hypothesis of independence of new firms and their incumbents in spatial distributions. The observed distributions are presented in Table 3, which is known as a contingency table.

**Table 3 2 x 336 Contingency Table of Probabilities for an industrial sector**

	Region 1	...Region j...	Region 336	Total
New Firms	$\pi_{1.1}$	... $\pi_{1j...}$	$\pi_{1.336}$	$\pi_{1.}$
Incumbents	$\pi_{2.1}$	... $\pi_{2j...}$	$\pi_{2.336}$	$\pi_{2.}$
Total	$\pi_{.1}$	... $\pi_{.j...}$	$\pi_{.336}$	1

In the contingency table test,  $\chi^2$  is employed in a goodness-of-fit test for the 93 manufacturing industries. The null hypothesis is that new firms are independent from their incumbents in terms of spatial distribution. Let  $\pi_{ij}$  denote the underlying bivariate probability distribution of firm group  $i$  in region  $j$ . The firm group is new firms if  $i=1$ , and firm group the incumbents if  $i=2$ . Let  $\pi_i$  and  $\pi_j$  similarly denote the marginal probability distribution of firm group  $i$  and region  $j$ . It should be noted that the measures for spatial distributions of incumbents are based on the numbers of employees. The null hypothesis of statistical independence may be stated precisely:

$$H_0: \pi_{ij} = \pi_i \cdot \pi_j$$

The Chi-square statistics for examining the null hypothesis is

$$\chi^2 = \sum_i \sum_j \frac{(\pi_{ij} - \pi_i \pi_j)^2}{\pi_i \pi_j} n,$$

where  $n$  is the sum of the number new firms and the incumbents.

Furthermore, the Pearson correlation indexes are utilized to confirm the positive correlation between new firms and incumbents in their spatial distributions. According to both Chi-square statistics and the Pearson correlation indexes, we can choose some industries as the first group, of which Chi-square statistics are significant at 5% and Pearson correlation indexes are positive.

In the second stage, we examine if the first group of industrial sectors are higher than the second group in the market entry rates for the two periods. Table 4 shows that in the first period of 1992-95, the first group and the second group are consist of 24 and 69 industrial sectors, respectively. Their average market entry rates for four years are 0.57 and 0.40, respectively. The first group is significantly higher than second group at the significance of 10%. Over the second period of 1995-97, number of industrial sectors in first group increases up to 29, and the number of second group decrease to 64. Their average of market entry rates for three years reaches 0.40 and 0.25. The average market entry of first group is significantly higher than that of second group at the significance of 5%. The empirical evidence from Taiwan's manufacturing sector indicates that spatial agglomeration of incumbents, new firm formation, and locational choice are of high interdependence.

**Table 4 Average Entry Rates for 1992-95 and 1995-97**

Period	Group	Number of	Average Entry Rate	St.d	t-value <sup>a</sup>
--------	-------	-----------	--------------------	------	----------------------

Industrial Sectors					
1992-95	1	24	0.57	0.61	1.95
	2	39	0.40	0.25	
1995-97	1	29	0.40	0.49	2.23
	2	34	0.25	0.18	

Source: calculated by authors.

Note: The t-values are corresponding to the null hypothesis that the average entry rate of group 1 sectors is larger or equal to that of group 2 sectors.

In brief, the empirical evidence from Taiwan's manufacturing industrial sectors generally supports the above arguments that the significant role played by the industrial agglomeration reduces entry barriers. Industrial clusters facilitate the information diffusion of markets and technologies and also benefit firms in the labor market pooling. These advantages from industrial clusters help new entry firms in overcoming entry barriers and also attract firm to access the industrial clusters. The determinants of new-firm entry rate for each industrial sector cannot be totally explored by Table 4. The next section applies a quantitative approach to this issue.

## DETERMINANTS OF MARKET ENTRY FOR TAIWANESE MANUFACTURING INDUSTRIES

In this section, we utilise the data bank of manufacturing plant Census Survey at 3 digital CSIC codes for 93 industries to empirically examine the factors affecting firms' market entry decisions over two periods of 1992-95 and 1992-97. *Entryr*, the dependent variable in this empirical model, is the entry ratio of number of startup firms to the number of incumbents for each manufacturing sector. Considering that the dependent variable is a censored number in nature, we employ a Tobit regression in this study. The empirical models are set as follows:

$$Entryr = F_1(GH, KL, CR4, IRD, IEX, MES, MARR, INDS). \quad (1)$$

$$Entryr = F_2(GH, KL, CR4, IRD, IEX, MES, MAGR, INDS). \quad (2)$$

The explanatory variables used in the above model are: the geographical agglomeration index (*GH*), capital to labors ratio (*KL*), Industrial Concentration (*CR4*), industrial R&D intensity (*IRD*), industrial export intensity (*IEX*), scale disadvantage ratio (*SDR*), market room (*MARR*), market growth (*MAGR*), and industrial scale (*INDS*). The explanatory variables used in the above model and the hypothetical impacts on *Entryr* are explained as follows:

### Geographical agglomeration index (GH)

GH, the geographical Herfindahl index, is used to measure the extent of industrial agglomeration for each industrial sector. Firms within industrial clusters share a common dependence on innovation, knowledge and regionally industrial assets. The spatial agglomeration also facilitates the interchange of entrepreneurial contact, knowledge and confidence, which are necessary in pursuing market and innovative opportunities. And due to the networking relationship embodied on industrial clusters built on their common background can generate reputation networks, which automatically lead to trust-based business relationship. Based on the above research on entrepreneurship, networking and industrial clustering, this paper utilizes the level of industrial clustering simply as a proxy for network strength. We assume that an industry associated with higher spatial agglomeration will have stronger network ties, leading to a higher rate of market entry. Thus, the geographical agglomeration an

industry is, the higher market entry rate it has. Therefore, we hypothesize that the GH variable has a positive impact on the Entry variable.

### **Capital Intensity (KL)**

Capital Intensity (**KL**) is the ratio of book value of fixed capital stock to labor compensation in an industry. Most literature generally regard capital-labor ratio as a type of market entry barriers (Dunne and Robers, 1991; Rosenbaum and Lamort, 1992). This is because capital goods, such as machinery and factories are characterized by their natural indivisibility and inflexibility. Morrison (1997) argued that capital actually has a quasi-fixity nature, and that where a firm's production technology is more capital-intensive, it may suffer from higher sunk costs in natures. We expect that industry with higher capital labor ratio will place greater entry barriers and therefore hypothesize that the KL variable will have a negative impact on Entry variable.

### **Industrial Concentration (CR4)**

Concentration is defined as the share of the four largest firms measured for 1992 as a proxy for the degree of industrial concentration. Where an industry has a higher concentration, this suggests that it is more likely to be dominated by a few firms. In contrast, firms within the industry with a lower CR4 value have much less monopolistic power and are therefore more likely to engage in keen competition. Chen, Chuang and Yang (2002) used between 1991-1996 Taiwan's Consensus Databank to examine the entry and exit of manufacturing firms. They suggest that the increase in industrial concentration ratio over the period lead to the decline in market entry. However, based on Jeong and Masson's (1990) research on Korea's market entry, high concentration may lead to expectation of either cooperation or of retaliation for new entry firms, indicating that the effect of CR4 is uncertain on market entry. Based on the above studies, the coefficient of CR4 is not sure in the entry equation.

### **Industrial R&D intensity (IRD)**

IRD is designed to measure the extent of opportunity innovation. R&D intensity is used as a proxy for the knowledge stock of an industry. An industry with high R&D intensity may have a large room for new entry firms to differentiate their products. There is also situation where technological break through uplifting scale limits of production hence enhances entry. Such is so called entry-facilitating effect (Mukhopadhyay, 1985). Early studies, such as Orr (1974), provided some empirical evidence to suggest that a high intensity of R&D symbolizes the entry barrier in an industry. By contrast, Geoski (1995) observes a positive correlation between the rate of innovation and the rate of entry to an industry. As pointed out by Marsili (2002), whether innovation in technologies of high or increasing opportunities is associated with entrepreneurial activities is dependent on the nature of knowledge. Without any solid stock of technologies, Taiwan's industries heavily rely on the transferred technological from overseas, and the innovation activities also focus on product engineering and continuous processes, characterized by low technological entry barriers in knowledge and scale. Accordingly, we expect that industries with higher R&D intensity will have lower entry barriers and therefore hypothesize that the IRD variable will have a positive impact on *Entry* variables.

## **Industrial Export Intensity (IEX)**

This study also examine whether industries with high export orientation tend to drive the new-firm entry. The empirical result seems to counter the presumption in based on some early studies. Utilizing Taiwanese firm data for 1986 and the frontier production function, Aw and Batra (1998) suggest that the productivity-export correlation differs significantly across firms depending on their investment in technology. In addition, Aw and Hwang (1995) suggested the existence of a significant linkage between firm-level productivity and exporting activities, and developed an empirical model to shed light to the value-added differences between export-oriented and domestic market-oriented firms in the electronics industry in Taiwan, confirming the importance of learning mechanism from export markets. Both studies may suggest that export markets enable to attract the new firm entry because of strong learning effects in improving productivity and technological diffusion. However, in comparison with the learning effect of export markets, the keen competitive pressure may yields to market deterrent effects, especially for small new-firms. Thus, the effect of export markets on market entrants should not be clear.

## **Minimum Effective Scale (MES)**

MES measures the ratio of the average size of largest 50% firms to average firm size in terms of number of employees. In certain industries, these scale economies are a barrier to entry since it is unlikely that multiple businesses can all attain the minimum efficient scale to be commercially viable. In most of the manufacturing sector, scale economies are unlikely to be as pronounced relative to market demand and thus, absent policy-induced constraints, such economic barriers to entry are likely to relatively modest, and some in cases, relatively low. This variable is designed to measure the entry barrier resulted from their production scales. MES, like capital intensity, included in the entry equation proxies for entry barriers. We presume that the coefficient of MES is negative in the entry equation.

## **Market Growth (MAGR) and Market Room (MARR)**

MAGR is measured as the change in value of shipments over the period of 1992-95 (1994-97) divided by shipments in the initial year, 1992 (1994). As in Rosenbaum and Lamort (1992), an industry experiencing growth usually benefit for potential firms to make market entry. Moreover, MARR is defined as the ratio of MAGR/MES, that the increase in the number of minimum efficient scaled-sized plants, which could occur due to growth in the market. Such variable is measured as the value of market growth over minimum efficient scale at the initial years 1992 and 1994. Both variables can describe the inducement conditions of an industry. We expect that both variables MARR are positive on the market entry ratios.

## **Industrial Scale (INDS)**

INDS refers to the scale of an industry in terms of number of employees. A larger scale industry may provide new entry firms with more market share for their survivals. In addition, this paper measures for an industry's scale in number of employees. We may expect that an industry with comparatively high value of INDS can enjoy the advantage

in labor pooling and also benefit the new entry firms in saving the cost of looking for the suitable labor. Accordingly, we presume that the coefficient of INDS is positive in the entry equation. This variable takes natural logarithm.

We summarize our hypothesis of the impact of each explanatory variable, and provide the corresponding summary statistics of these variables in Table 5.

**Table 5 Variable definitions**

	Definition	Expected sign	1992-95 Mean (Std. Dev.)	1994-97 Mean (Std. Dev.)
<i>GH</i>	Herfindhal index for geographical agglomeration	+	0.062 (0.070)	0.695 (0.097)
<i>KL</i>	Capital-labor ratio, measured by the fixed capital stock over total labor compensation	-	4.978 (2.935)	4.831 (3.001)
<i>CR4</i>	Industrial concentration	?	0.304 (0.238)	0.305 (0.233)
<i>IRD</i>	Industrial R&D intensity	+	0.038 (0.029)	
<i>IEX</i>	Industrial export intensity	?	2.340 (1.752)

## EMPIRICAL RESULTS

Entry equation is estimated using structural variables, including inducements entry barriers and geographical agglomeration, as explanatory variables. Tobit estimates for Equation (1) and (2) are generated for the 1992-95 and 1992-97 samples, respectively. The empirical results are presented in Table 6, showing that in the case, LR  $\chi^2$  reaches significance at the 5 per cent level and the explanatory variables of both models have significantly high explanatory power. There are 93 observations in the sample. The empirical results may demonstrate two kinds of perspectives related to market entry: namely entry barriers and inducement conditions. However, as is emphasized in Caves (1998), there are also chances that entry 'barriers' may become entry gateways for lucky entrants.

### – Entry Deterrent or facilitating factors

The hypothesis of entry barriers is examined in this study. Table 6 presents that the coefficient on *GH* (industrial geographical agglomeration) is statistically significant positive at the 5% level in the entry equation. That is, an industry characterized by spatial agglomeration has comparatively high market entry ratio. The evidence may confirm the presumption that industrial spatial agglomeration will reduce the entry barriers because the formation of industrial cluster can drive the formation of production

networking and then enhances the diffusion of local knowledge. In other word, the development of industrial clusters not only benefit local incumbent firms in production

*Table 6 Empirical Results- the Tobit Estimations*

**Note:** \*: significant levels at 10% and \*\* 5%.

specialization, knowledge sharing, and labor market pooling, which also benefit the potential firm entry in reducing entry barriers.

**Table 6 also shows that the capital intensity is included in the equation as a**

**proxy for sunk costs.** The variable is statistically significant. The negative coefficient of *KL* indicates that industries with more capital intensity have the lower ratio of firm entry. And Table 6 also shows that the industrial concentration (*CR4*) has certain positive influence on the market entry. Similar to Jeong and Masson (1990) on the Korean case, and Masson and Shaanan (1986) and Rosenbaum and Lamort (1992) on the case of the U.S., the empirical result for Taiwan's case supports the argument of signals of expected "cartel stability" or "accommodation," but seems not support the argument of strategic entry deterrence of high concentration industries. More than that, this empirical evidence may also underline Taiwan's policy reform in 1990s. Since 1990s, the policy reforms have been heading for internationalization and liberalization by reducing institutional barriers of entry to concentrated markets, which used to be monopolized by state-own enterprises.

Some early studies, such as Bunch and Smiley (1992), regard R&D intensity as market deterrents. This is because the access to the industry with R&D intensity has comparatively high capital and technological requirements, and the incumbents in such industries have high likelihood in use the strategy of market deter to their potential

competitors. However, in the empirical result of this paper, the coefficient of *IRD*, measured by the ratio of R&D employee number to total employees is statistically positive upon market entry ratio. The empirical results is similar to some early studies, including Chen, Chung & Yang (2002), which stress that industries with higher R&D intensity comparatively have a broad room for driving new-firm entry. As in the case of other NIEs, Taiwan lacks a solid technological knowledge base, but we can expect that entrepreneurs in Taiwan will generally demonstrate an ability to adapt. The task for entrepreneurs in identifying market opportunities can be classified into 'ordinary' and 'extraordinary' discoveries. Ordinary discoveries involve making the discovery whilst keeping the system largely unchanged. This kind of entrepreneurial activity merely exploits market opportunities and can be referred to as 'adaptive entrepreneurship'. In contrast to adaptive entrepreneurship, extraordinary discoveries involve the uncovering of hidden opportunities in the market by entrepreneurs, leading to a change in the system. Obviously, such 'extraordinary entrepreneurship' comes close to the Schumpeterian idea of entrepreneurship.

Table 6 demonstrates that the coefficient of *IEX* in the entry equation is negative. This study lacks statistically significant evidence to explore whether an industry associated with high export orientation tends to yield market deterrent effect. This empirical result is also similar to Chen, *et. al.*, (2002), in which the coefficient of industrial export propensity is negative at marginal significance.

The coefficient of *MES* in the entry equation is statistically negative at 5%, indicating that *MES* is important in determining firm's entry rate. The minimum efficient scale varies substantially across industries. Entrepreneurs need to start a new firm usually at a suboptimal scale (Audretsch, 1999). The starting scale is usually linkage to *MES* in order to avoid the scale disadvantage.

## – Inducement Conditions

Market growth (*MARG*) is defined as the change in value of shipments over the period divided by shipments in the initial year if a market experience positive growth, there should be incentives for the potential firms to entry. In Table 6, the coefficient on market growth is significantly positive at 1% in the entry equation, indicating that the empirical result is consistent with the presumption. Market room (*MARR*) is the percentage increase in the number of minimum efficient scale-sized firms that could take place due to growth in the market. The increase in market growth referring the future potential has to be tempered with the size of firm to fit in such markets. In Table 6, the coefficient on *MARR* is significantly positive in the entry equation, confirming the presumption.

Finally, one of structural characteristics of industries, *INDS*, is measured by the industrial scale in terms of numbers of employees. As the presumption of this paper, the coefficient of *INDS* is positive on market entry rate. Taking this in the context of networking, we may argue that the influence of an industrial scale upon market entrants mainly depend their networking relationship rather than the absolute scale. In this paper, *GH*, the industrial spatial agglomerations, refers to the networking relationship of firms. As in Chell and Baines (2000), the advantage of firm owner-manager's networking is to draw upon information, advice and assistance from a large, diverse pool. Accordingly, given the extent of networking relationship, an industry with more industrial scale leads to have higher market entry.

In summary, the empirical evidence from Taiwan's manufacturing industrial sectors is generally in line with other early studies for identifying entry barriers and inducement conditions. The important contribution of this study is to highlight the significant role played by the industrial agglomeration in reducing entry barriers. An industrial cluster cannot be simply regarded as the spatial agglomeration of firms, but the formation of inter-firm business networking. Industrial clusters facilitate the information diffusion of markets and technologies and also benefit firms in the labor market pooling. These advantages from industrial clusters also help new entry firms in overcoming entry barriers. There are some important policy implications related to entrepreneurship behind this work, especially for new industrializing countries in the age of the knowledge-based economy.

## **CONCLUSIONS**

The purpose of this paper is twofold. First of all, drawing on Chell and Baines (2000) which stress on networking relationship on fundamental entrepreneurial behavior, and Lechner and Dowling (2000; 2003) which underlines the spatial proximity of industrial clusters as firms' network relationship in essence, this study presumes that firms' spatial proximity should be positive on new ventures. We use the Taiwan's manufacturing industry database to examine the determinants of industrial market entry over two periods of 1992-95 and 1992-97. The determinants are grouped into sets, namely entry barriers and industrial inducement conditions.

In this study, the entry barriers characterized by capital intensity, R&D intensity, export propensity, scale disadvantage, industrial concentration and spatial agglomeration, and the industrial inducement condition includes market growth, market room, and industrial scale. Generally, the empirical results are in line with the early studies. The more interesting result is that the role played by an industrial cluster can effectively reduce entry barrier, indicating that industrial clusters not only enhance the firms' productivities, but also promote new ventures. More preciously, clusters may induce entry in two forms, which are new start-ups by entrepreneurs and diversification by existing firms. There is no telling which form is more important in driving the industry dynamics, but the factors that give rise to each form of entry may be different.

Secondly, it is well accepted that industrial clusters cannot simply be regarded as firms' spatial agglomeration, but the inter-firm linkage relationship should be emphasized. A successful industrial cluster is able to facilitate the diffusion of technological and market information across clustering firms, effectively to reduce the transactional costs, and further to drive new ventures.

From the empirical results, an industry R&D intensity have high market entry rate in Taiwan, demonstrating that even lacking a solid technological knowledge base, entrepreneurial activity in Taiwan may gradually shift from merely exploit of market opportunities, adaptive entrepreneurship, to extraordinary entrepreneurship referring to the discovery of hidden opportunities in the market. Innovation is an important means of competition leading to constructive destruction; thus, when innovation ceases, competition degenerates into a price war. The main feature of modern industrial clusters may therefore be a shift from

cost-saving competition to innovation competition, particularly in this era of globalizations of production and even international R&D investment. In the age of the knowledge-based economy, innovation actually stands out at the center of market competition.

This study especially emphasizes that the inter-firm linkage should play a critical role in an industrial cluster. Some policy implications result from this research is that support of new venturing should focus on emerging networks linking firms rather than on individual firms. And if local systems are to match the global organizing of economic activity, aggressive use of proximity to promote mutual learning and joint knowledge creation through business-social-network exchange should be necessary. In the era of production globalization, the policies should be designed by developing countries to leverage multinationals' foreign affiliates in an industrial cluster to establish both local and cross-border industrial linkages.

Selwyn Jonges graduated in Business Administration at the Vrije Universiteit Amsterdam

**Acknowledgements:** Rick Veldhuis helped with data collection. Sander Wennekers gave comments on an earlier version of this paper.

Autonomy is a primary motive for a large majority of small business starters. However, as an explanation of why people want their own (autonomous) business it is largely circular. Therefore we focus on an explanation of the autonomy motive itself. As the current literature of autonomy as a startup motive is limited as well as weakly developed, we provide a theoretical and empirical exposition of autonomy as a startup motive. Specifically, it is questioned why small business starters want autonomy. In answering this question a distinction is made between proximal and distal reasons for wanting autonomy. The motivation for autonomy can be an end in itself (proximal). The small business starter is then motivated by the decisional freedoms and responsibilities with regard to the what, how, and when aspects of work. Autonomy can also be instrumental for the fulfillment of other motives (distal). We discern the following distal autonomy motives: resistance towards bosses or rules, self-congruence/self-endorsement, and power/ control. Our framework is confirmed studying a sample of 167 nascent entrepreneurs motivated by autonomy. The findings suggest that beneath the surface of small business starters striving for autonomy, they differ in their relative emphasis on the underlying sources of the autonomy motive.

“Both [entrepreneurs] articulated goals of personal independence and fulfillment. For White, independence meant security in that he was in control of his destiny; for Dean, it

meant the freedom to accept challenges and do what interested and enthused him” (Pitt, 1998, p. 392)

## **INTRODUCTION**

The economic importance of small businesses in general and newly started businesses in particular is widely acknowledged nowadays. Research has shown that the small business sector has a large share in creating growth, innovation, and employment, with the share of newly founded businesses being especially large (Audretsch and Thurik, 2001; Carree and Thurik, 2003). This can be considered an example of Adam Smith’s invisible hand operating. How important growth, innovation, and employment may be important from a macro point of view, they are not what motivates the large majority of business starters themselves. A minority may have growth and innovation ambitions, as is established by research on nascent entrepreneurship. For example, van Gelderen, Bosma, and Thurik (2003) find that of those people who are in the process of setting up a business, 82% has no growth motivation and prefers to stay small. However, even those who have firm growth as a goal have their motives for wishing so, which are not necessarily influenced by macro-economic considerations.

What does motivate people to set up their own business has been studied extensively. One answer that prominently and consistently emerges in this type of research is that the business starter wants autonomy (also labeled as independence or freedom; Blais en Toulouse, 1990; Shane, Kolvereid en Westhead, 1991; Birley en Westhead, 1994; Gatewood, Shaver, and Gartner, 1995; Kolvereid, 1996; Feldman en Bolino, 2000; Carter, Gartner, Shaver, and Gatewood, 2003). People start businesses (amongst others) in order to be autonomous, and in many cases success of their firm is instrumental for achieving that goal. In spite of its empirically proven importance, the research that is currently available on autonomy as a startup motive is scarce. It seems to be taken for granted that small business starters want autonomy. However, the observation that small business starters want autonomy does not amount to very much. There is an element of circularity in people wanting to have an autonomous (independent) business because they want autonomy (independence). The logical next step thus becomes to focus on the explanation of the autonomy motive itself. The question why business starters want autonomy will be the research question of this paper. We will explore this question both theoretically and empirically.

### **The concept of autonomy**

#### **Autonomy as a startup motive**

The existing literature on autonomy as a startup motive is not only small, it is also weakly developed. First, research on startup motives generally assumes that startup motives exist independent of each other. For example, Gatewood et al. (1995) find that “identification of a market need” is the most offered reason for getting into business. Although the discovery of an opportunity has motivating properties, without considering why someone would like to fill this market need not much knowledge about career reasons is gained. Because of the circularity mentioned above inherent in people wanting an autonomous business because they want autonomy, it becomes important to investigate the role of other startup motives in relation to autonomy. This is even more important as almost all small business

starters attach great importance to autonomy<sup>1</sup>. In fact, even a control group of non-business starters values autonomy as much as nascent entrepreneurs do (Carter et al., 2003).

Second, few efforts have been made to link autonomy to a theoretical framework. The typical approach has been to categorize empirically by means of factor analysis. In these cases a number of ad-hoc sampled items originally designated to represent different theoretical startup reasons are post-hoc labeled as autonomy. For example, Blais and Toulouse (1990) report on a 14-country study of startup motives. Factor analysis generates "need for independence" as the factor with the largest explained variance. Items originally referring to an 'independence' conceptualization of autonomy belong to the factor: (e.g., control own time; own approach to work; work with people I choose; be my own boss; lead, rather than being led). However, the same factor also includes items that theoretically were labeled as "escape" (avoid unreasonable boss), and as "accommodation" (greater flexibility in life; work with people I like).

Studies that use open response formats fare better in terms of consistency, but still define categories on an ad-hoc basis. For example, Kolvereid (1996) classifies the responses of MBA alumni for choosing either for an entrepreneurial career or for organizational employment. Of those who prefer self employment 40% lists autonomy as the prime reason. Responses such as freedom, independence, being one's own boss, and choosing one's own methods are listed as autonomy. Examples of other categories distinguished by Kolvereid are authority (15%, items such as being boss, control, responsibility), self-actualization (12%, realize dream, creative need, create something), and challenge (19%, challenging, exciting, inspiring, motivating). However, it may well be that these are motives that all require a certain degree of autonomy in order to be fulfilled. Whether Kolvereid's categorization is correct from a theoretical point of view, and whether we can arrive at a conceptualization and subsequent operationalization of autonomy that will cause (e.g. factor) analyses to generate homogeneous factors, will be investigated in this paper.

## **A motivational definition of autonomy**

Our conceptualization of autonomy rests on the treatment of the subject by philosophers. They first point to the Greek roots of the term. Autonomy is derived from two words: self (autos) and rule or law (nomos). While the Greeks discussed autonomy with respect to the relationships between states, in the 18th century the term starts to refer to individuals (Lindley, 1986). Autonomy becomes an important theme for political philosophers as they discuss the relationship between the state and the individual. According to the large majority of the (Western) political philosophers, the state should not interfere with the autonomy of the individual (providing 'negative freedom'), and according to some, the state should even enlarge the autonomy of the individual (providing 'positive freedom', for example by providing education and jobs). Although individual differences in opinion exist on details (Dworkin, 1988), broad consensus is that autonomy means that individuals make their own choices independent of others (Metaal, 1992). People who value autonomy strive for a state of independent self determination. In this paper we will consider the three elements of this definition (independent, self, determination) as motivational sources of autonomy. Based on this conceptualization of autonomy we expect small business starters to differ individually in their respective emphasis on independence

---

<sup>1</sup> Autonomy is part of psychological conceptions of entrepreneurial orientation. EO distinguishes entrepreneurs from small business owners. However, since nearly all small business owners consider autonomy to be important, it can not be a discriminating factor.

('others do not determine what I will do'), on self-congruence ('I want to do my own things'), and power to decide ('I want to be the one that sets the rules').

These three motives all require a certain degree of autonomy in order to be fulfilled at work, implying that autonomy is instrumental for their realization. Using the distinction between 'distal' and 'proximal' motivators (Kanfer, 1990; 1994), they can be denoted distal motives for starting a business. Distal motives guide the establishment of an individual's behavioral intentions and choice between alternative courses of action. Distal constructs have indirect impact on behavior and performance (Kanfer, 1990; 1994). With respect to sources of autonomy that are more proximal to work behavior, we will elaborate on a conceptualization of autonomy that concerns task characteristics of a work situation (Hackman and Oldham, 1975). Breugh (1999) distinguishes three so-called 'decisional freedoms' with respect to the what, how, and when aspects of work. He labels these as criteria, method, and scheduling autonomy. These aspects of autonomy are proximal motivators as they are sources of motivation located in the work itself. They are motivational constructs that control the initiation and execution of actions during engagement with the task.

For purpose of conceptual clarity, we will shortly distinguish motives from traits, goals, needs, and values. Following Winter, Stewart, John, Klohnen, en Duncan (1998), we regard a motive as a construct that explains what goals people strive for (in this case, a work situation that offers autonomy), while a trait explains how someone typically behaves. So a motive is an answer to the question 'Why?' and a trait to the question 'How?'. Consider as an example the affiliation motive and the trait of extraversion vs. introversion. Whether someone is high in affiliation motivation is conceptually independent of whether (s)he tries to fulfill this motive in a more extraverted or more introverted manner. In fact, while at first sight extraversion might appear to be related with affiliation, it might as well be that introverts are higher in affiliation motivation, as they have more difficulty establishing contact with other people.

While motives are conceptually distinct from traits, they are conceptually related to goals, needs, and values. The relation between motives, goals and needs is one of specificity. If given priority, motives can be translated into goals, and goals can induce intentional acts (Emmons, 1995). Starting a business can be regarded as intentional behavior. In this case the autonomy motive has been translated into a goal (having one's own business), which has induced particular courses of action (setting up a business). Needs on the other hand can give rise to motives, and in a following paragraph we will discuss the different needs from which the autonomy motive may derive. Values are related to motives in the sense that values have a motivational base (Schwartz and Bilsky, 1987). Values have a quality of "oughtness" in the sense that they specify how individual's beliefs about how he or she "should" or "ought" to behave (Meglino and Ravin, 1998). We will return to this issue when explaining the underlying sources of the autonomy motive.

Our motivational definition of autonomy differs from conceptualizations of autonomy as an ability. The latter is emphasized by philosophers (Haworth, 1986; Benn, 1988; Berofsky, 1995; Young, 1996) who state that a certain degree of rationality and competence are necessary conditions for exercising autonomy. As a consequence, small children and mentally handicapped are not considered being capable of autonomous behavior. Also psychologists have written about autonomy as ability. Two opposing strands of research can be discerned (Metaal, 1992). In clinical and in developmental psychology, theory and research are directed towards the promotion of autonomy. For example, in his well known life-cycle theory, Erickson (1950) states that autonomy is the central issue of the second

life phase (1,5 till 4 years old), in which the foundations are laid for later autonomous functioning. The fallibility of human rationality on the other hand has been proven repeatedly in cognitive psychology (e.g., Nisbett and Ross, 1980; Fiske and Taylor, 1984), and social psychology has brought forth some famous experiments showing the conformity (e.g., Asch, 1956, 1958) and blind obedience (e.g., Milgram, 1963) of people. The issue of autonomy as a competence will be left aside for now.

## **Determinants of autonomy**

On account of the literature we have introduced three distal sources of autonomy (resisting rules/bosses, self-expression/self-endorsement, power/control), and one proximal source (the decisional freedom to decide with regard to the what, how, and when aspects of work). The primary point that this paper tries to make is that the freedoms associated with autonomy can be instrumental for the fulfillment of other motives. Therefore, we will focus on these sources of autonomy for which autonomy is instrumental. For literature on autonomy as a work characteristic we refer to Greenhaus, Callanan and Godschalk (2000). Since behavior is a function of both personal and situational determinants, we will discuss autonomy as a startup motive on the individual level as a psychological motivational construct; on the societal level as a cultural norm; and on the situational level as particular experiences or circumstances can cause someone to want more autonomy.

**Independence: resisting constraints.** One of the earliest articulators of need theory, Murray (1938) discussed autonomy in the context of rebelliousness. Murray viewed autonomy as one of several psychological needs that concerned human power, and contrasted autonomy with deference and dominance. People with a strong need for autonomy insist on not being dominated by other persons, avoid influence from others, and show impulsive, obnoxious, and irresponsible behavior (Metaal, 1992). A later motivational theory that emphasizes resistance towards restrictions is reactance theory (Brehm, 1966; Brehm and Brehm, 1981). This theory states that when people perceive that their behavioral freedom is threatened to be reduced or eliminated, they will experience so called reactance effects. This is a state of motivational arousal that leads them to protect or restore their freedom. As a result, the behavior under threat will be more often engaged in and perceived as more valuable. Also, aggression against the prohibitor may occur (Brehm and Brehm, 1981).

In the workplace, reactance effects have been studied under the heading of organizational frustration. Frustration caused by constraints in the work situation that block individuals from achieving valued work goals or attaining effective performance (Fox and Spector, 1999). As a consequence, counterproductive behavior within the organization may occur. Another consequence can be turnover, if the employee tries to become elsewhere employed or self-employed. In fact, when studied as a psychological disposition variable, reactance has been found to be related to entrepreneurial career interests (Buboltz, Woller, and Pepper, 1999). On the positive side, it should be noted that resisting constraints and restraints can facilitate personal development and fulfillment, and can be a healthy expression of a need for freedom.

**The self: congruence and actualization.** Two researchers that have written extensively on autonomy are Richard Ryan and Ed Deci. In their opinion, any theory of personality should include a notion of self, as it is the self that regulates environmental and interpersonal forces (Deci and Ryan, 1991; Ryan, 1993). These contextual and personal factors can function either to support autonomy or to control behavior (Deci and Ryan, 1987). There can be all kinds of controlling forces: internal to the self (e.g., drives or ego involvements),

or from outside the self (e.g., social pressure). Autonomy according to Ryan and Deci means that one acts in accordance with self-endorsed values, needs, and intentions, rather than in response to controlling factors (Ryan, Kuhl, and Deci, 1997)<sup>2</sup>. Thus, "autonomy refers not to independence but rather to volition – the sense that one's behavior emanates from and is endorsed by oneself" (Kasser & Ryan, 1999, p.937). Thus, autonomous behavior does not imply that one necessarily likes what one is doing - if one endorses a particular obligation or duty, there is still choice. Autonomy as a motivational construct was originally proposed by DeCharms (1968), who stated that people have a primary motivational propensity to be origins of behavior and that they constantly struggle against being confined and constrained by external forces. The prime example of autonomy is the concept of intrinsic motivation. Intrinsic motivation means that one acts for its own sake, because one likes what one is doing. Playful behavior, creative acts, and personality expression are all considered instances of intrinsically motivated and self-endorsed behavior, which are ultimately considered expressions of a generalized need for personal growth (Deci and Ryan, 2000).

Determination: power and control. The wish to be the one who is at the steering wheel and making the decisions can be subsumed under several motivational theories. The first set of theories revolves around need for power. Winter (1973) considered people high on need for power to desire influence, impact, and control. Power striving often centers on a need for dominance, reputation, status, or position (Reeve, 2001). High-need-for-power individuals tend to gravitate towards leadership positions and influential occupations (Reeve, 2001). Need for power is the prime ingredient of the Leadership Motive Pattern developed by McClelland (1975), which has been found to be predictive of leader behavior and effectiveness in small, entrepreneurial organizations (House and Aditya, 1997). However, need for power theories emphasize social influence and impact on others, while the determination aspect of autonomy merely refers to the power to make decisions, whether other people are involved or not. A set of motivation theories that touches on the determination aspect of autonomy are control theories. In these theories control beliefs direct and energize behavior. Two types of control beliefs make up perceived control: efficacy beliefs and outcome beliefs (Reeve, 2001; Skinner, 1996). An efficacy belief is a judgment of whether one is capable to perform a particular behavior; an outcome belief is a judgment whether this behavior will cause a particular outcome. While motivation can arise when efficacy and outcome expectations are high, these theories do not explain why people want control. To this end, desire for control is sometimes explained by competence or effectance motivation (White, 1959), a desire to interact effectively with the environment, to produce desired effects and to prevent undesired effects.

Our discussions above serve to show that the elements of independent self determination - resisting restraints, self-congruence and self-endorsement, and power/control - are treated distinct in motivation theories. In practice, they are likely to occur simultaneously, but empirical work has shown that these constructs can produce independent or even opposite effects in certain situations. For example, Patrick, Skinner and Connell (1993) found perceived control and self-determination to have independent effects on behavior and emotions of children in the classroom. Koestner, Gingras, Abutaa, Losier, DiDio and Gagne (1999) found individuals high on reactance ("reactive autonomy") to differ from individuals high on need for self-determination ("reflective autonomy") in their reactions to expert advice.

---

<sup>2</sup> Deci and Ryan (1985) call their overall theory "self determination theory". In this paper we will avoid this terminology because we want to distinguish between the self-congruence and the power-to-determine aspects of autonomy

Situational determinants of autonomy. The psychological theories discussed above describe personal motivational sources of autonomy. At the same time, autonomy can be reinforced as a cultural norm. Autonomy as a cultural value means that people are socially expected to behave and think independently, and that obedient and following behavior are regarded with suspicion and contempt. Autonomy as a cultural value is interesting in the context of entrepreneurship, because over the last decades autonomy has become an ever more important value in Western societies (Abramson and Inglehart, 1995; Heelas, Lasch, and Morris, 1996; Inglehart, 1990; 1997). Autonomy as a cultural norm can be considered as part of a broader syndrome of behavior called individualism (Hofstede, 1980, 1991; Triandis, 1995). All distal autonomy sources are part of this syndrome, but also other features link conceptually with entrepreneurship, such as the ability to innovate and the importance of being successful (need for achievement). Thus, individualization processes should increase the perceived attractiveness of self-employment. As individualists strongly prefer working environments in which rewards are distributed individualistically (Triandis, 1989), and in which they can express their individuality, the popularity of self-employment will only increase.

Psychology points to the various antecedent motivational sources of autonomy, and sociology points to the influence of collective norms. We should not lose sight of the fact, however, that in many cases the wish for autonomy is determined by the characteristics of the particular situation the business starter was in before starting his business. A particular boss or particular rules can cause someone to start his own business without having a generalized aversion to bosses or rules. Similarly, limited possibilities for personal expression and limited power and influence can cause someone to want more autonomy without necessarily having a generalized need for self-endorsement or for power.

In our empirical section, we try to determine if indeed business starters want autonomy for instrumental reasons. By an open response format, we investigate the relative prevalence of the various distal and proximal sources of autonomy. Our hypothesis is that there are two types of motives: One proximal motive associated with task characteristics (decisional freedom), and three distal motives for which autonomy is instrumental (to avoid a boss or restrictions; to act in a self-endorsed and self-congruent manner; and to be in charge).

## **METHOD AND RESULTS**

### **Sample**

Our sample consists of 167 persons who were nascent entrepreneurs in 1998 (interviews were conducted in 2001). Nascent entrepreneurs are people who are busy setting up a business. We chose to use a sample of nascent entrepreneurs because we wanted to conduct a study for all people who try to start a business, not only those people who currently run a business. Our sample is free from survivor bias in the sense that it includes people whose business is not currently operational. Of our sample, 60% had succeeded in setting up a business and was still in business, 10% had succeeded in setting up a business but was already out of business, and 30% had not succeeded in setting up a business. The sample was collected in 1998 by randomly calling phone numbers. The person who answered the phone was asked: are you currently, alone or with others, setting up a business? If the person answered affirmatively, two exclusions were made. First, it is essential to be active in setting up a business. If he or she is only dreaming about starting up a business, he or she was considered a potential entrepreneur instead of

a nascent entrepreneur. Second, someone who set up a business that is already operational, even though in a start-up phase, must be considered an entrepreneur instead of a nascent entrepreneur. In this manner, a random and representative sample of 517 nascent entrepreneurs was created. Because the sample of 517 nascent entrepreneurs had been studied in four waves of previous research, a multitude of data was available on every person.

For this study, we felt that a sample out of the complete sample would suffice. During follow ups since the start of the project, 33 persons had stated that they did not want to be contacted anymore. In the fall of 2001 the remaining 484 persons were contacted three times by telephone. In total 193 persons were interviewed (24 persons refused to participate). The final sample consisted of 167 persons who stated that autonomy was important to them (in the context of starting one's own business). In terms of non-response, participants showed no difference with the remaining sample in terms of age, education, business success (getting started/abandoning the startup effort), and business ambitions. There was a significant difference in age however: participants were on average 37 years old, non-participants 35 years old.

Disadvantage of this procedure is that people needed to remember in 2001 why they wanted to start a business in 1998. Whether people were able to come up with an account was tested and confirmed in a pilot study (n=20). Still, perception of relevant motives etc. might have changed in the meantime. On the other hand, it might also be possible that people offer more accurate information looking backwards because of having a helicopter view instead of being in the middle of it. Table 1 gives some sample characteristics.

## **Table I Sample characteristics (N=167)**

### **Procedures and classifications**

Data was collected using semi-structured interviews. The research question, why people want autonomy, was approached in two manners: indirect questions using an open response format, and direct questions using 4-point-scales. Pilot studies showed that a direct approach using open questions was not viable. In these pilots, respondents were first asked what autonomy meant to them. Then they were asked why they wanted the particular aspects they just mentioned. The large majority of respondents was not able to answer the question. They typically either did not answer the question at all, or they repeated their answer to the first question (e.g., Q: what does autonomy mean to you? A: that you can make your own decisions. Q: why do you find that important? A: because then you can make your own decisions). Besides the fact that autonomy for many people is an end in itself, we believe its high level of abstraction causes the difficulty which respondents had with this question. Indirect evidence (not asking about autonomy directly) was obtained by asking the respondents to tell the story of their startup effort: How it started, what happened, and how it ended up. The respondents were also asked about their motives for setting up a business, their goals and the advantages of self-employment as compared to organizational employment. Up to this point the interviewee did not know that the phone interview was about autonomy. Then, the respondents were asked whether autonomy was important to them (in the context of starting one's own business). If not, the interview was discontinued.

If autonomy was considered to be important (as stated above, this was the case for 167 out of 193 persons), they were asked what autonomy meant to them. This question functioned as a second indirect measure of the sources of the autonomy motive. Table 2

gives an overview of their answers. Row 1 gives the frequency of the answer “freedom” without reference to a work aspect. Proximal motivational sources of autonomy are decisional freedoms with respect to the what, how, and when aspects of work (Breugh, 1999) (rows 2 and 3 in Table 2). Compared to previous research on autonomy in the workplace, which typically is conducted with employees, business starters emphasize one more aspect: responsibility for decisions and results (row 4 in Table 2). For the expression of the distal motivational sources reference was made to autonomy as being instrumental to the fulfillment of other motives (rows 5, 6 and 7 in Table 2: to avoid a boss or restrictions; to express one's personality and creativity; to be in charge). Still some other meanings were expressed (row 8), notably the instrumentality of autonomy for the appropriation of income. The validity of our research framework is supported by the limited frequencies of meanings outside the framework. Respondents could give as many meanings as they liked.

## **Table 2 Meaning of autonomy to respondents**

Using the total of the indirect questions, respondents were coded as to whether they emphasized a distal source of autonomy. For example, people would be scored for the power motive if someone would indicate that he or she started a business because he or she felt a lack of decision power in his or her previous job. Answers to the question what autonomy meant to the respondents were also used as a basis for classification. Answers reflecting proximal autonomy were distinguished from answers reflecting distal autonomy by means of the particular terminology used in giving the description of autonomy (e.g., “that you can make your own decisions” would be scored as an proximal aspect, while “that you are at the steering wheel” would be scored as a distal power/control motive). The avoid boss/rules motive was scored for 71 persons (43%), the self endorsement/congruence motive for 55 persons (33%), and the power/control motive for 57 persons (34%). Note that people can score on more or less than one motive. In fact, 14 persons (8% of sample) scored on all three motives, 63 persons (43%) scored on two motives, 72 persons (38%) scored on one motive, and 18 persons (11%) scored on none of these motives.

In the third part of the interview the strength of the distal sources for wishing autonomy was quantified. For example with respect to the avoid boss/rules motive the respondents were asked: "one reason to consider autonomy important could be that you dislike working under a boss or to work under externally imposed rules. To what extent does this apply to you". Then a 4-point scale (not important, neutral, important, very important) format was read out to the respondent. A question about the value attached to autonomy as an end in itself (row 1 in Table 2) was added to this list of motives. Table 3 gives the means and standard deviations of the motive scores derived from the 4-point-scales.

## **Table 3 Frequency distributions of the distal motive scores**

The frequency distributions show that the avoid boss/rules motive is not present for half of the sample, while being important or very important to nearly the other half. The other motive sources are generally considered important. Chi-square analysis shows that the open question-categorizations and the 4-point-scale scores are significantly associated: avoid boss/rules chi-sq 28.13,  $p < .01$ , endorsement/expression chi-sq. 11.91,  $p < .01$ , decision control/power chi-sq 8.64,  $p < .05$ . When looking at the 4-point-scale correlations, it can be seen that the power motive correlates negatively with the boss/rule avoidance motive ( $r = -.30^{**}$ ). This is also the case with the open format results (chi-sq 11.90,  $p < .001$ ). This result is interesting as it indicates that it does not necessarily mean that people want

decision power themselves when they dislike being ordered, and vice versa. Using the open response format motive scores as dummy variables, we checked for associations with other variables in the nascent entrepreneurship dataset. The power motive was positively associated with being male (chi-sq 6.76,  $p < .01$ ), with being higher educated (chi-sq 4.58,  $p < .05$ ), and with the amount of intended startup-capital (t-value 2.19,  $p < .05$ ). The self endorsement/expression motive was positively associated with starting out in retail/trade (chi-sq 11.23,  $p < .01$ ), and negatively with starting out in business services (chi-sq 4.44,  $p < .05$ ). There was no association of any of the three motives with eventual success in setting up a business.

## DISCUSSION

One of the most important drivers for self-employment is that people want to run a business themselves instead of working for someone else. A large majority of small business starters like to be responsible, to decide on strategy, to decide on working methods, and to regulate their own time. This is called autonomy. Still, our exploratory research indicates that small business starters differ in their relative emphasis on reasons why they like autonomy. Many like autonomy for the sake of autonomy itself. However, at the same time, the operational aspects of autonomy are necessary conditions for the fulfillment of other motives. People like the freedom associated with autonomy, but they also need freedom as a necessary condition for the fulfillment of other motives. Some are motivated by negative freedom, in the sense that they generally dislike or are currently experiencing a difficult boss or unpleasant rules. Others emphasize the fact that self-employment offers the opportunity to work in accordance with one's goals, values, and attitudes. Still others emphasize the opportunities that self-employment offers for being in charge, for directing, and for leading instead of being lead. Our empirical work shows that these are the main underlying sources of the autonomy motive. They are conceptually associated and often simultaneously present; still when interviewing small business starters about how they got into starting a business it is often easily noticeable that the interviewees emphasis mainly one or two of these sources. So Kolvereid (1996) was indeed correct in distinguishing autonomy, authority, self-realization, and challenge. He has left implicit, however, that these motives might have specific underlying relationships.

An obvious next step is to develop a questionnaire for each motive source in order to conduct a confirmatory factor analysis that might corroborate the motive source pattern that was distinguished and found in our study. Furthermore future research should establish whether the presence of more or stronger motive sources strengthens the autonomy motive as a whole, or whether one must think of the emphasis on motive sources as profiles (Law, Wong, and Mobley, 1998). For the moment, our research only points at the presence of different sources of the autonomy motive. This already has a number of implications.

For people who train small business owners, it is important to know what aspect a trainee who is motivated by autonomy emphasizes. Trainees can claim to be motivated by autonomy as an end in itself while at the same time instrumental, distal sources are operating. These sources bring along their paradoxes and pitfalls. Persons who resist bosses and rules now must be a boss and set rules themselves. Their resistance of constraints and restraints might make it difficult for them to deal with the pressures of customers and suppliers. People who want to express their personality and creativity in their work might be so busy and occupied that there will be little space left for personality

and creativity expression. Moreover, their focus on self endorsement and congruence might make it difficult for them to deal with controlling forces and circumstances that small businesses are often confronted with. People who want autonomy because of the power and control it brings them may find that as a small business owner they often have very little control, if only because they have to deal with several types of uncertainty. A focus on power and control might also make it difficult to empower employees and to retain a relaxed attitude. Trainers and educators in the small business field can make their clients and students aware of these tensions and help them to find appropriate ways of coping.

From a research perspective the differential impact of the multiple sources of the autonomy motive is interesting as it illustrates that distal constructs are not irrelevant to studying small business owners. The study of distal constructs such as personality traits is generally considered to be outmoded in entrepreneurship research (Delmar, 2000), and has been replaced by more proximal constructs such as attitudes or behavior (Rauch and Frese, 2000). However, this research shows that while on the proximal level all may appear the same, distal influences may still be relevant. For researchers who study small business motives using questionnaires, the implication is that they should either operationalize autonomy only in a proximal sense without regard to underlying motive sources (e.g., items such as "regulate own time" or "making one's own decisions"), or take all distal motive sources into account and offer items that reflect these autonomy motive sources.

For policy makers, one of the routes of achieving an entrepreneurial society is to motivate individuals to become entrepreneurs (EC, 2003). We have highlighted the fact that autonomy is an extremely important driver for small business starters, and we have discussed literature that has found that autonomy as a cultural value is becoming ever more important in Western societies. So a lack of need for autonomy is not the bottleneck - it is rather the question why many people in principle would like to start a business but will never succeed in realizing. One issue involved are the paradoxes and pitfalls involved with the various autonomy sources discussed above. Starting or running a business means that a line is drawn - within bounds it is now the small business owner who is autonomous. However, drawing a boundary will not make the outside world go away - on the contrary. Autonomous small business starters and owners deal with customers, suppliers, competitors, etcetera on a continuous basis, and in doing so need to balance their autonomy wishes with the demands imposed on them by the business environment. Freedom and constraints of freedom are at the heart of the entrepreneurial motivation and practice. The study of how autonomy driven small business starters and owners manage to attain and retain a state of autonomy is therefore an important line of future research, along with a study of the factors that threaten the experience of autonomy.

### **Exhibit 1: Psychological correlates of individualization**

• The belief that everyone is a unique individual
• The importance of authenticity
• The importance of individual expression, of expressing one's unique personality
• Identity and self are defined without reference to social context but rather as an independent entity
• Emphasis on personal rights and needs as opposed to obligations and social norms
• Own goals and preferences are more important than those of the group
• The importance attached to freedom of choice
• Independent development of personality, attitudes and opinions
• Truth is based on personal experience instead of on authority figures
• Therefore, innovative behavior, experimentation with opinions as well as with self image
• A hedonistic orientation
• Importance of being successful, as one is responsible himself for what one makes of life
• A certain sense of loneliness as ties with groups are loose
• Therefore, an emphasis on special friendships and romance

**Table 1 Sample characteristics (N=167)**

## **ABSTRACT**

This paper provides new insights about where SMEs can find new business opportunities. The aim of this paper is to present the sources of opportunities and organise these sources into a model which can assist SMEs in finding opportunities. It examines the different sources of opportunities at all the relevant environmental levels. The paper concludes with a proposed model that provides a comprehensive and integrative framework for exploring business opportunities.

## **INTRODUCTION**

SMEs (small and medium enterprises) all over the world play a significant role in the economic development and growth, both in terms of contribution to gross domestic product (GDP) and proportion of the labour force employed in their host countries. Yet, those same SMEs are faced with an increasingly challenging external environment. Chen and Hambrick (1995) explain that small firms pose some advantages over larger firms, such as their ability to seek out protected market niches that are too small or not important enough for larger firms (Porter, 1980), that they are seen as quicker due to structural simplicity, streamlined operations and the limiting amount of competitive moves (Chen & Hambrick, 1995), a lack of structural inertia (Hannan & Freeman, 1984), entrepreneurial and risk orientated leadership (Hitt, Hoskinsson & Harrison, 1991) and innovativeness. This may lead to small firms possessing competitive advantages over larger firms in some cases. However, without the ability to identify new business opportunities, it is unlikely that any of these advantages may lead to sustained competitive advantage.

Timmons (2002) suggests that "in a free enterprise system, opportunities are spawned when there are changing circumstances, chaos, confusion, inconsistencies, lags or leads, knowledge and information gaps, and a variety of other vacuums in an industry or market" (p. 81). Clearly, opportunities exist in several forms that seem difficult to follow because

many of the forms seem rather complex and vague. Therefore, a comprehensive framework that legitimates the sources of opportunities would be of useful for SMEs searching for opportunities. This idea is supported by Drucker (1985) who says that successful innovations are the results from a deliberate search for opportunities. In his work he only addresses sources of opportunities which are typically discovered by entrepreneurial firms, that is innovative opportunities. To maximize the number of opportunities all kinds of business opportunities should be studied because innovative opportunities exclude a variety of productive opportunities. As Gummer (1986) implies, not only entrepreneurial firms would benefit from examining sources of opportunities, this could benefit any type of business, especially small businesses. Consequently, there is a necessity to create a framework or model targeting a variety of business opportunities for all kinds of firms.

This paper provides new insights about where SMEs can find new business opportunities. The aim of this paper is therefore to present the sources of opportunities and organise these sources into a model which can assist SMEs in finding opportunities. It examines the different sources of opportunities at all the relevant environmental levels. The paper concludes with a proposed model that provides a comprehensive and integrative framework for exploring business opportunities.

## **DEFINING OPPORTUNITIES**

Hean, Maw and Boon (2002) describe an opportunity as a “future situation that the decision makers deem personally desirable and feasible (that is within their control and competence)” (p. 125). Firms seize opportunities to reach a goal (Seifert & Patalano, 2001). Although opportunities exist for individuals, non-profit organisations, business firms (organisational level), and governments, this paper only deals with opportunities aimed at business firms. These opportunities are known as business opportunities.

Caffey (1998) describes a business opportunity as “any package of goods or service that enables the purchaser to begin a business and in which the seller represents that it will provide a marketing plan or sales plan, that a market exists for the product or service, and that the venture will be profitable” (p. 148). This definition is too restrictive since it excludes all business opportunities that are not involved into setting up new ventures. However, Caffey’s definition is important because it identifies three critical elements that need to be present for opportunities to be characterised as business opportunities. Firstly, it requires that profits be generated. Secondly, it notes that in order for an opportunity to be a business opportunity, the firm concerned has to provide goods and/or services. Finally, a relevant market for the firm’s products and services has to exist. Timmons (2002) adds dimensions such as attractiveness, durability, timeliness and the creation of value to this definition. Barney (2001) introduces two more dimensions to the definition of business opportunities. He does not only include opportunities directly associated with selling products and services, but also opportunities created through strategic action and opportunities created within a firm by improving internal processes.

This leads us to define business opportunities as:

*attractive, durable and timely chances for a firm to improve its competitive position and performance, in order to generate profit given that a relevant market exists or can be created for a firm’s products and/or services.*

This definition points out that an opportunity does not necessarily have to lead to a competitive advantage (Shrivastava, 1994). Instead, every chance a firm has to improve on its position and performance, also marginally improvements, are in the true sense opportunities. Because opportunity seeking has traditionally been viewed as characteristic of entrepreneurial behaviour, the literature has only been concerned with identifying innovative opportunities. Metaphorically speaking, business opportunities can be perceived as an umbrella covering a variety of opportunities such as marketing and entrepreneurial opportunities. This implies that entrepreneurial opportunities are less inclusive than business opportunities. This is backed up by Kirzner (1997) who states that entrepreneurial opportunities differ from the larger set of all opportunities because the former requires the discovery of new means-ends relationships, whereas the larger set of opportunities involves optimisation within existing means-ends frameworks. Consequently, it is useful to also analyse the sources of entrepreneurial opportunities since these sources are an important kind of business opportunities.

## **CREATING A POSITIVE ENVIRONMENT FOR THE IDENTIFICATION OF OPPORTUNITIES**

When a firm intends to increase the number of opportunities generated within that firm, it should consider three main issues. These are: who are likely to find new opportunities; the importance of designing a management system and infrastructure that can support potential entrepreneurial employees in finding and exploiting more opportunities; and where employees can find new opportunities. The first two issues are discussed briefly in this section. The third issue is the topic of the rest of the paper.

Research has shown that everybody can find new opportunities because the discovery of opportunities is situation-specific (Shane, 2000). However, to discover new opportunities in a particular field, it is necessary to have a minimum level of technical knowledge within that area (Shane, 2000; Tan, 1998). Unfortunately, for firms who want to hire employees that are more likely to find new opportunities, these empirical findings only provide a sketchy picture of which people to employ. Therefore, Hargadon and Sutton (2000) suggest that firms who specialise in innovation hire people with varied skills, interests and backgrounds. This is based on the assumption that greater diversity promotes creative and innovative ideas (Esty, 1988). Various researchers suggest that such potential employees are identified by measuring them against a list of typical characteristics, such as resourcefulness, creativity, visionary, optimistic, being an independent thinker, hard worker, an innovator, a risk taker, often a leader and finally, someone who can recognise and take advantage of opportunities (Min, 1999).

Even if the firm has managed to locate employees who have the ability to find new opportunities, the firm's management system and infrastructure must be constructed so it can enhance the innovative abilities of their employees (Hornsby, Naffziger, Kuratko & Montagno, 1993). Stevenson and Gumpert (1985) point out that the strategic orientation of the firm should be driven by the perception of opportunities. They also emphasise action-oriented behaviour as favourable, and stress that a flat management structure with multiple informal networks are likely to enhance entrepreneurial behaviour. The firm must provide enough resources for and support to the employees (Quinn, 1999). This also involves time available for the employees to incubate their ideas (Hornsby, Naffziger, Kuratko & Montagno, 1993). Barringer and Bluedorn (1999) argue that it is important to have a high level of employee involvement at all levels and that the control system should

reward creative behaviour. Other authors suggest streamlined procedures, delegated and challenging tasks, encouragement of small innovations, proper rewards (Quinn, 1990), top management's active involvement (Radnor & Robinson, 2000), allowing employees to fail, job autonomy, flexibility (Tan, 1998), and providing employees with multiple mentors (Krueger, 2000). Once the firm has put the right employees and environment in place to facilitate the identification of opportunities, it can investigate the sources of opportunities. This is done in the subsequent section.

## **SOURCES OF OPPORTUNITIES**

This section identifies how individuals or groups can find new opportunities which may ultimately improve its competitive position and performance. The sources of opportunities discussed in this section aims to create awareness of where potential opportunities may be discovered. Opportunities are found on two levels, namely the macro environmental, and the industry and firm level (Drucker, 1985). Most of the sources of opportunities can be organised into one of the two categories described above, but a few exceptions exist. These are termed universal sources of opportunities, which exist at both levels. To prevent repetition, these sources of opportunities will be presented separately; whereafter the macro, and industry and firm levels will be examined.

### **Universal sources of opportunities**

Five different sources of opportunities can be labelled as universal sources of opportunities. These sources of opportunities are found at both the macro environmental level and within an industry and firm. These sources of opportunities are new knowledge, technology, unexpected occurrences, incongruities and old ideas and are presented next.

Drucker (1985) describes **new knowledge** as the "superstar of entrepreneurship". Innovations inspired by this source of opportunity can result in the creation of new goods and services, the introduction of methods of production, the utilisation of new sources of supply, the restructuring of industries, and the creation of new markets and regions (Schumpeter, 1934). Innovations based on new knowledge do not need to be scientific or technical, for example new knowledge about how to organise a firm better may be just as valuable as a technical innovation. Drucker (1985) proposes that new knowledge involves the greatest opportunities since these opportunities are likely to entail innovations attached to earning (Grammar?) the most money and gaining the most publicity. On the other hand, these innovations also have the longest lead times, are capricious, hard to manage, volatile and involve considerable uncertainty. New knowledge is never based on one factor, but on the convergence of several kinds, mostly independently invented. Further, inventions based on new knowledge require careful analysis of all the necessary factors required to bring forth the innovation. These are social or economic factors, perceptual factors and the knowledge itself (Drucker, 1986). The purpose of the analysis is to identify factors that are not yet available for the new invention, and thereby explore whether these missing factors can be produced. If all the knowledge is not available, then the innovation is premature and will fail (Drucker, 1986).

Dess, Ireland, Zahra, Floyd, Janney and Lane (2003) recommend that three types of new knowledge are products of the interaction between the enterprise and acquisitive learning and experimental learning. Firstly, technical knowledge facilitates the enterprise with knowledge about the properties of specific activities, which may be used to refine products

and processes. Secondly, integrative knowledge is a “product of how the firm has learned to creatively and uniquely combine its idiosyncratic resources and capabilities to create value” (p.357). Thirdly, exploitive knowledge is the skill of uncovering new ways of creating value by effectively applying the firm’s technical and integrative knowledge set. Zahra, Nielsen and Bogner (1999) advise firms to capitalise on the three types of knowledge mentioned above in pursuit of competitive advantage. In combination, the benefits from these three types of knowledge can significantly strengthen the firm’s market and financial position.

Shane (2000) suggests that **technological change** is the basic cause of opportunity. Those firms who are not fast enough to respond to new changes will experience problems. A typical example is in the case of disruptive technology (Bower and Christensen, 1995). Here the technology will change the rules of the game, in which often result in the incumbent firms losing in the competition because they are not able to adapt to the changes. Consequently, for those firms, often small, start-ups, low cost providers, the disruptive technology represents an opportunity (Utterback, 1994). Though technological changes do not have to involve as drastic consequences as being disruptive to cause opportunities to arise. In fact, small and simple ideas may in many instances transform into great opportunities. If a firm introduces technological innovations, this represents an opportunity in itself. New products with unique features will strengthen both a firm’s strategic position and performance.

It is also advisable to revise **old ideas**. Hargadon and Sutton (2000) revealed that the best innovators systematically use old ideas as the raw materials to find new ideas. They recommend firms to take one idea which is commonplace in one area and move it to a context where it isn’t common at all, which is referred to as knowledge brokering. To exploit this source of opportunity, Hargadon and Sutton (2000) advise firms to systemise the process of playing around with and passing around old ideas in the organisation so that they can be applied to less obvious contexts, and thereby discovering new opportunities. When using old ideas to find new opportunities, the firm could either take a proactive or reactive approach. An example of the latter is a firm who takes another firm’s products or services, and introduce competing and substituting products and services. An example of a proactive approach in terms of copying others’ ideas, would be a firm that adopt other firms’ products or services and develop these products and services further so that the copying firm can launch an improved and superior version of what the other firms are offering.

Based on empirical research, Franklin (2003) demonstrates that innovations that take advantage of random events clearly generated more successfully ideas than ideas created by following trends, mental inventions constructed, need-, and solution spotting and finally market research. Drucker (1985) classifies this source of opportunity as **unexpected occurrences**. He suggests that this source of opportunity is often showed as problems/failures or successes in firm reports. Thus, unexpected occurrences are easily recognisable and highly practical for enterprises as deviations occurs frequently in most firms’ accounts. Drucker (1986) states that to benefit from this source of opportunity, substantial knowledge and expertise within the business are required. He continues to explain that he believes that such a task suits large enterprises best because these large firms often understand what he describes as the “big picture” better than small firms. Unexpected occurrences can be exploited by those acting quick and correctly. An easy approach to begin with is to exploit the deviations in the firm’s accounts since many opportunities may not be too complicated. In fact, Drucker (1985) suggests that the most successful innovations actually are simple, but focused, meaning that all firms have a fair

chance of discovering significant opportunities, both small and large firms.

An **incongruity** is defined as “a discrepancy, a dissonance, between what is and what ought to be, or between what is and what everybody assumes it to be” (Drucker, 1986, p. 72). They are described as qualitative rather than quantitative because incongruities do not manifest themselves in the firm’s accounts. Four sub-sets of opportunities related to incongruities exist (Drucker, 1986). First, incongruities may exist in the *economic realities*. In other words, when industries experienced increased demand for their products and services, it is natural for the firms to expect performance to improve. However, in some cases this does not happen, and even worse, the performance may decrease. Such a situation may indicate that there exist incongruities between micro level behaviour and macro level outcomes. To illustrate this, we explain how an industry with cyclical demand that requires heavily investments may only be profitable at peak points in the industry cycle, which indicates that there may exist superior business models that are more profitable (Eckhardt & Shane, 2003). The second kind of incongruities are those who exist *between reality and the commonly assumptions about the reality*. The result is that expected events end up in observed surprises. Here the opportunity exists in simply doing what other people have failed to because of cognitive errors (Eckhardt & Shane, 2003). The third kind of incongruities exists between *perceived and actual customer values and expectations*. Here “firms fail to recognise that latent demand exists for only minor modifications to existing products or for an overlooked demographic group” (Eckhardt & Shane, 2003, p. 345). The logic behind this incongruity is that producers and suppliers often misconceive what their customers actually buy (Drucker, 1986), meaning that firms estimate the true value of their products and services higher than their customers. The final incongruity exists within the *rhythm or logic of a process*. Eckhardt and Shane (2003, p. 345) suggest that in this case, “opportunities exist for improving key steps in industry routines that have been perpetuated without question.” However, this incongruity is in most cases only available to people within the industry or service. Therefore, the opportunity exists if the invention can be transferred to the focal industry (Eckhardt & Shane, 2003). Many firms may perceive incongruities as threats since the incongruities easily can lead to misinterpretation of the realities, and consequently, wrong investments, business models, products and services are introduced. However, for those firms that actually understand the underlying incongruities, this represent a great opportunity which can strengthen both the firm’s competitive position and performance This is based on the assumption that the one firm is the first to recognize the incongruity and react to it, while the other firms may have difficulties in copying the first firm since these other firm may not understand why changes are being carried out.

In summary, the universal sources of opportunities discussed above are new knowledge, technology, the revising of old ideas, unexpected occurrences and four kinds of incongruities. These sources were said to exist at both the macro environmental level and at the industry and firm level. Finally, it was suggested that all these sources represent vital areas that firms should explore to find new opportunities.

## **Macro environmental sources of opportunities**

According to Drucker (1986) macro environmental sources of opportunities are external to the firm in the way that a firm has no or little chance of influencing them. Such sources are government actions, demographics, geographies, perceptual and sociological changes and finally consumer economics, though it may be argued that the firm in some instances can affect the consumer perception.

Stevenson and Gumpert (1985) suggest political action and regulatory standards as a source of opportunity. This is what Eckhardt and Shane (2003) describe as **government action**. This action appears in three broad categories, political, legal and economic actions. Saloner, Shepard and Podolny (2001) provide examples from the macroeconomic environment where the government intervenes: taxes and subsidies, international trade rules, regulations, price controls, antitrust laws and information provision. Clearly these external factors represent opportunities, for example imagine a government deciding to increase subsidises to families with children under three. Firms aiming at selling goods to small children families will find that these families currently can afford more exclusive products and are able to purchase more products. Consequently, the increase in demand provides these firms to harvest from the opportunity.

Drucker (1985) suggests **demographic changes** to be the most reliable source of opportunity outside the firm or industry because demographic events have known lead times. Eckhardt and Shane (2003) illustrate this by describing the aging of the baby boomers to cause new opportunities. Firms aware of this aging follow the distribution of age and will act proactively by reallocating resources from products and services aimed at children to tailor products and services for the elderly. Still, although managers have known for a long time that demographics are of severe importance, the conviction is that population statistics change very slowly. Drucker (1985) argues that this is not the case for this century. He also suggests that innovations exploiting demographical changes are amongst the most “rewarding and least risky entrepreneurial pursuits” (Drucker, 1985, p. 70). Therefore, managers should examine how demographics affect their business so that opportunities can be discovered.

**Geographies** can also be categorised as a source of opportunity because there are many opportunities to be found within this area. Czinkota and Ronkainen (1990) suggest a variety of reasons why firms should internationalise. Firstly, international sales may be a source of higher profit margins or of more added-on profits. A second stimulus emanates either from unique products or from a technological advantage. A firm may produce goods or services that are not widely available from international competitors or may have made technological advances in a specialized field. Another motivation could be if the firm hold exclusive information about foreign customers, marketplaces or market situations that is not widely shared by other firms. Finally, Czinkota and Ronkainen (1990) suggest that firms may wish to go abroad to obtain tax benefits or utilise economies of scale.

**Change in perception** of current or potential new customers is by Drucker (1985) suggested as a source of opportunity. He argues that when such a change takes place, the facts do not change. Instead people’s meaning change, for example moving from seeing a glass as half empty towards perceive it as half full. By studying sociology, such as fashions and trends, firms can try to discover opportunities arisen from this source. Complementary to this Stevenson and Gumpert (1985) emphasise social values as one of the sources for opportunities. They say, “social values define new styles and standards of living” (Stevenson & Gumpert, 1985, p. 87). It is not necessarily economics that dictate such changes, and in many cases it does not have anything to do with economics. For example, due to the extermination of rhinos, people in general do not buy souvenirs or other articles made of rhinos, even though it is available. When firms experience unexpected success or failure, this can in many cases be an indication of a change in perception and meaning (Drucker, 1986).

Stevenson and Gumpert (1985) suggest **consumer economics** as a source of opportunity. It alters both the ability and willingness to pay for new products and services.

For example, during economic periods of prosperity, consumers typically increase their demand for luxury goods. Though it is unclear whether consumer economics is a source in itself because consumer economics highly correlates with the overall economy. This implies that it may be more accurate to display overall economy as a source of opportunity instead of consumer economics. Since the effects from both sources are similar when it comes to the opportunity consequences for the firm, it is enough to only represent this cause and effect relationship through one of the sources of opportunities. For that purpose consumer economics has been selected since its description is more targeted towards what is the opportunity for the firm than just using the term overall economy.

In summary, the sources of opportunities discussed above are government actions, demographic changes, geographies, changes in perception and consumer economics. These sources of opportunities are all part of the macro environmental level and it was recommended that firms examine all of them, even though some may seem irrelevant for the firm.

## **Industry and firm level sources of opportunities**

Six sources of opportunities exist purely at the industry and firm level. According to Drucker (1986), two of these sources of opportunities are process needs and industry changes. The result of Hills and Shrader (1998) empirical study suggests that customers are an important source of opportunities for the majority of business firms. Love and Gunasekaran (1999) indirectly propose suppliers as a source of opportunities by discussing the importance of cutting costs and improving quality through collaboration with suppliers. The two final sources of opportunities at this level are rivalry-related and internal-directed sources of opportunities.

**Industry changes** entail opportunities to arise due to the requirements of reallocating resources to respond to the new industry structure (Drucker, 1985). Such changes within an industry are commonly perceived as threats by incumbent firms, which frequently respond conservatively to structural changes by defending what they already have with traditional tools like for example lowering prices or increasing marketing instead of adjusting their business model towards the new situation (Utterback, 1994). However, "new opportunities rarely fit the way the industry has always approached the market, defined it, or organised to serve it" (Drucker, 1985, p. 70). As a result, incumbent firms frequently fail to prevent newcomers to establish as in the case of disruptive technology. While the insiders often neglect the new opportunities and do not reorganise their business, industry changes are often highly visible and predictable for outsiders, and consequently it represents an indisputable source of opportunity. Barney (2001) explains that the kinds of opportunities a firm can expect to discover at the industrial level depend on the industry structure and life stage. In his book, Barney provides a list of opportunities depending on the nature of the industry. For example, firms operating in emerging industries may try to benefit from first-mover advantages to gain technological leadership, pre-empt strategically valuable assets or create high customer switching costs. Therefore, firms that understand the nature of the industry they operate within, or moving towards, are more likely to take advantage of this knowledge and discover new opportunities.

Opportunities related to **process needs** start out with the job to be done, focusing on the task rather than taking a situational orientation. "It perfects a process that already exists, replacing a link that is weak, redesigns an existing old process around newly available knowledge. Sometimes it makes possible a process by supplying the missing link" (Drucker, 1986, p. 85). Typically for process needs, everybody in the firm are aware of the

need to improve the process, but seldom anyone reacts to this need. Hence, when someone solve the problem and presents the new innovation, everybody instantly accept the innovation as being obvious and as a result, it becomes the standard. Such an invention is the discovery of common platforms, which means to share common production processes and components (Robertson & Ulrich, 1998). It facilitates firms with the ability to tailor products to the needs of different market segments and customers. In addition, it lowers the risk since investments per product decreases. Moreover, it enables firms to reduce development cost and time. Finally, by sharing components across products allows companies to stock fewer parts in their production and service parts inventories, which translates into better service levels and/or lower service costs (Roberson & Ulrich, 1998).

**Suppliers** present a source of opportunity in the sense that they can provide the company with vital inputs such as technical advices, expertise about raw materials and they can gather information which would not have been easily accessible for the firm alone (Wright, 1999). In addition, a firm's performance depends on the quality of the supplier's materials, the supplier's capacity and ability to deliver (Monczka, Trent & Callahan, 1993). Consequently, every possibility that contributes towards joint performance to increase should be initiated. Batson (2002) recommends that co-operation between suppliers and customers, like for example customer-supplier partnerships, can result in drastically cost reductions within the value chain. Reduced costs may cause the firms strategically position to improve, and thus the performance is likely to increase or at least maintain (Barney, 2001).

The traditional marketing approach perceives **customers** as a source of opportunity. Both Flores (1993) and Thomke (2002) highlight the importance of listening to the customer and respond to their needs. Usually customers cannot identify solutions to their problems, but they can identify their problem, which is the firm's opportunity (Havener & Thorpe, 1994). However, the firm often has to identify where the opportunities are without facing specific complaints, suggestions or requests from the customers. To uncover such opportunities, a frequently used tool is data-mining. By better understanding the needs of their customers, firms can predict customers' behaviour, reveal unhidden preferences and adjust products and prices towards the customers' requirements (Peacock, 1998). In other instances, the firm is aware of the opportunity, but face difficulties exploiting it.

**Rivalry-related** sources of opportunities target all opportunities which arise as a result of the interrelationship between the firm and its rivals where the latter involves competitors, substitutes, suppliers and customers (Porter, 1980). Such a focus opens up a wide variety of opportunities since every industry possess its own particular features. Not any industries are equal, which means that it is not possible to produce a complete list that shows all opportunities which this source holds. It is important to describe the difference between this source of opportunities and industrial change. The latter only deals with new opportunities arising because of the new situation that occurs, while rivalry-related sources of opportunities advocate that firms do not necessarily have to wait for industries to change to find opportunities. Through examination and action, the firm can generate many opportunities by themselves. Firms in typical demand-side increasing returns industries can benefit greatly if they manage to reach a critical mass of customers (Saloner, Shepard & Podolny, 2001). Such achievement may be obtained through lock-in strategies, like for example signing long-term contracts or introduce loyalty programs (Shapiro & Varian, 1998). In other words, firms with the capability to implement such strategies should exploit this opportunity to increase their performance and competitive position.

While rivalry-related sources of opportunities has an external focus on creating new

opportunities, **internal-directed** sources of opportunities should be examined to discover whether there are areas of improvements within the firm. Every chance that arises within the firm to improve its internal processes relates to the internal-directed source of opportunity and should be exploited. Internal-directed sources of opportunities often involve opportunities that are often obvious for many managers because there is a specific problem to be solved. However, what this source of opportunity tries to signal is that firms should always attempt to adapt to best practises (Heyes and Wheelwright, 1984), and take a kaizen approach (Wright, 1999). Translated, Kaizen means continuous improvement, and is what internal-directed sources try to signal, that things can always be done better.

In summary, a variety of sources of opportunities exist within the industry and firm level. These are industry changes, suppliers, customers, process needs, rivalry-related and internal-directed sources of opportunities. The three latter sources may appear most difficult to understand. Therefore, these are briefly repeated. Process needs refers to the task of solving specific problem, which often leads firms to discover new opportunities (Drucker, 1985). Rivalry-related and internal-directed sources of opportunities targets all opportunities which the firm can create itself, like forming a tacit collusion or acquire a competitor so that competition decreases (Barney, 2001), and thereby strengthen the competitive position and the firm's performance. While rivalry-sources of opportunities aim at opportunities within the interrelationship between the firm and its rivals, the internal-directed sources of opportunities deal with operational areas within the firm that can be improved. To simplify the process of finding new opportunities, and making it easier to keep control of the different sources of opportunities, the next section introduces an opportunity-source model based on the findings in this chapter. This model is purely conceptual and should ideally be tested empirically in future.

## **THE OPPORTUNITY-SOURCE MODEL**

Having gained a thorough understanding of the different sources of opportunities, the next step is to develop a framework that organise the opportunity-seeking process in firms. The opportunity-source model consists of two different levels, the macro environmental and the industry and firm level. Government action, demographics, geographies, change in perception and sociology, and consumer economics are inserted within the macro environment while industry change, process needs, suppliers, customers, rivalry-related and internal-directed sources of opportunities are included at the industry- and firm level. In addition, five sources of opportunities exist at all levels, namely new knowledge, unexpected occurrences, incongruities, old ideas and technology which are illustrated through the vertical columns.

Together, all the sources of opportunities offer multiple perspectives on where to find new opportunities. This paper adopts Drucker's (1985) advice on how to interpret the different sources of opportunities by taking a metaphorical perspective. Each source symbolises a window exposing an area of where opportunities can be found. By looking through the different windows, some of the same opportunities can be seen from more than one window. However, the angle is always different, and each window shows its own unique scenery, making it purposeful to look out of all the windows if one wants to know which opportunities that are hiding outside. Such an approach is desirable since new opportunities are likely to appear when one think in new and creative ways, which is the case if a firm explores sources of opportunities that are not typically studied in that industry. As a result, firms should explore all the different sources of opportunities and not

just those sources that at first glance seem relevant to the firm.

**Figure one: The opportunity-source model: where opportunities are**

<b><u>Macro environmental sources of opportunities</u></b>	<b>New Knowledge</b>	<b>Unexpected occurrences</b>	<b>Incongruities</b>	<b>Old Ideas</b>	<b>Technology</b>
➤ Geographies					
➤ Politics, legislation & economics					
➤ Demographics					
➤ Sociology / change in perception					
➤ Consumer economics					
<b><u>Industry and firm level sources of opportunities</u></b>					
➤ Industry changes					
➤ Process Needs					
➤ Supply side (Suppliers)					
➤ Demand side (Customers)					
➤ Rivalry arena (Firm action)					
➤ Internal processes (Firm action)					

When examining the different sources of opportunities, in certain cases it may seem obvious that some of the sources of opportunities will reveal the same opportunities. For example, many opportunities that are created in the mind of the individual are sprung out from old ideas. It can involve technological issues, marketing issues, supply chain issues and so forth. In a similar vein, new knowledge is also a basic source of opportunity that are likely to reveal opportunities that can be discovered by other sources of opportunities. However, less obvious relationships between the different sources may exist.

If a firm wants to cut costs, it can take an internal focus and examine internal-directed sources of opportunities. Then the opportunity may lay in downsizing or improving operational processes (Wright, 1999). The same firm may also cut costs in a variety of other ways. By exploring the rivalry-related sources of opportunities, the firm may find that a vertical integration can reduce the costs (Malburg, 2000), at least in the short term. By relocating to areas that offer cheaper labour costs, cost may be reduced, which demonstrates that geographies can be studied for the purpose of cutting costs. Customers can also serve as an important source towards cutting costs as they may be able to identify parts of the product or service that provides minimal customer value, but that represent a substantial cost for the firm. These approaches show that not one source are the “right” or most important source to examine. In the example above, the firm had an objective it wanted to achieve, and thereby explored different sources of opportunities to find solutions on how to solve the problem. However, in many instances, the firm may instead just want to browse through the sources to see if any new ideas occur that can turn out to become great opportunities.

Such a pictorially description has three clear advantages. Firstly, firms will experience that many of the same elements will arise under the different sources, thus creating awareness that an opportunity should be explored from different angles, which raises the possibility of discovering new and unique opportunities. For example, it is likely that ideas generated by exploring technological issues also can be identified when revising old ideas, or that industry changes and rivalry-related sources of opportunities will cause the same opportunities to arise. Secondly, when searching for and discussing new opportunities, it is

easier to work with a simplified picture rather than endless pages of descriptive text, making the model a valuable complementary working tool. Thirdly, the opportunity-source model also serves as a creativity tool towards finding new opportunities. As several techniques exist to assist firms in generating new ideas (Crawford, 1997), the employment of the opportunity-model as a creativity tool relates closest to the Delphi technique (Brown, 1968; Helmer, 1966a; Helmer, 1966b). This demands for several contributors to take part in the pursuit towards finding new opportunities with the opportunity-source model. The first stage involves that each participant individually exploit all the sources of opportunities suggested by the model. They should note down their findings as key words in the model attached with a separate sheet containing a detailed description of how they interpret the sources and what the following opportunities involve. As all contributors are expected to follow this procedure, the next step is then to pass the suggestions to another participant. The receiver then starts off by interpreting the model as it is presented by the sender, and examine these suggested opportunities and sources from their own perception just based on the key words in the model. As a result, some of the interpretations will be dissimilar to what the sender intended, and thereby more ideas will be generated. Only when the receiver does not recognise more opportunities, they can read the attached descriptions of the sources and opportunities. If a gap between the sender's and the receiver's interpretations are identified, the receiver should try to add in their own viewpoints on the ideas already initiated by the sender. At the stage where no more ideas can be generated by either examining the model or the attached descriptions, the work should be passed on to a third participant which repeat the whole procedure described above. The employment of the opportunity-source model ends when no participants manage to generate new ideas. At that stage, the firm will possess a comprehensive list of suggested opportunities the firm can exploit. Evidently, the model serves as a creativity tool directly related to where opportunities can be found, making it a highly targeted tool towards finding new opportunities.

Moving from an interpretation stage of the opportunity-source model, its benefits and how it can be applied as a creativity tool, it remains to illustrate how the firm should explore the different opportunity sources. As an example, assume that a law firm wants to explore how demographics can represent an opportunity for them. The first step would be to gather demographical data, which are often public available or can be purchased if more specific information is required. Such demographics can be wealth, income, household expenditures, segmentation, gender and age distribution, crime, health, immigration and migration, cultural diversity, unemployment rate and the educational level. Having gathered the data, the law firms may find it very interesting to discover that the divorce rate has dramatically increased during the last months since this represents an important niche for the firm. A second opportunity may be to set up a consultancy department dealing with immigration issues if the firm expects the number of immigrants to increase. Thirdly, as the amount of immigrants increase, it may be advisable to employ staff with the same language skills and cultural background as the immigrants to differentiate the firm's services, and thus leverage customer satisfaction. These three examples both illustrate how demographics can be used to find new opportunities and that all the cause and relationships based on just demographics hide a great portion of opportunities. The same procedure should be applied to all the other sources of opportunities as well, to maximise the possibility of finding new opportunities. When the firm has identified all the opportunities, it has to decide which one to exploit, and how to do so. In the case of the law firm, it may be as simple as increasing the marketing concerning these services, adjust the capacity accordingly and employ the required staff, but this is highly situational, and in many cases the solution may be far less obvious.

In summary, the opportunity-source model provides firms with a vigorous tool towards finding new opportunities as it can be described as both a creativity tool towards finding new opportunities and a perspicuous illustration summarising all the sources of opportunities in one model. Still, before employing the model, it is important to be aware of which limitations it holds, which will be discussed in the next section.

## LIMITATIONS AND FUTURE RESEARCH

Even though the opportunity-source model can assist firms in finding opportunities, it has its limitations. Firstly, it does not include any information about cognitive mechanisms like for example why some people and not others recognise and create new opportunities, how people perceive opportunities differently (Baron, 1998), and how opportunities are identified and evaluated (Kaish & Gilad, 1991; Keh, Foo & Lim, 2002). This means that the model guide firms into where to search for opportunities, but not how people should think to recognise the opportunities.

Secondly, the employment of the opportunity-source model is only a first step towards exploiting new opportunities. Since the exploitation of opportunities cause change, for the outcome to be successful, it is required that the firm has the ability to implement such changes (Wright, 1999). For example, the firm needs an organisational culture supporting the exploitation of new ideas (Jarve, 1996; McCosh, Smart, Barrar & Lloyd, 1998; Searle & Ball, 2003). In addition, as recommended by Barringer and Bluedorn (1999), innovation also requires that the firm's strategic management practises support the exploitation of opportunities. Carnall (1999) therefore suggests that firms implementing major changes need to take an organizational-wide approach to successfully carry out the changes.

Thirdly, the model may not include all kinds of sources of opportunities. It is a first step towards systematising the sources of opportunities making them more visible, and creating awareness of where one can search for new opportunities. Depending on which perspective to adopt, it can be argued that employees are a source of opportunity equivalent to customers and suppliers (DeSimone, Hatsopoulos, O'Brian, Harris, & Holt, 1995). Other related sources of opportunities are trade associations, consulting firms, patents, franchises, Internet and so forth. The reason why none of these entities have been included is that the model aims at assisting firms in finding opportunities on their own, and not through a third being.

Fourthly, in addition to including more sources, it may be practical to include sub-categories of sources of opportunities into the model such as the four kinds of incongruities, all different kinds of demographics, technological areas where sources may be and so forth.

Furthermore, it may be purposeful to combine the opportunity-source model with general suggestions on how to find more opportunities from a strategic perspective. Baghai, Coley and White (1999) suggest seven strategies that may assist firm into finding more opportunities. That is to introduce existing products to existing customers and/or new customers, to sell new products and services, to develop new delivery systems, to expand into new geographical areas, to reshape the industry structure and finally to enter into new competitive arenas. By including such strategies into the model, it increases its comprehensiveness and the usefulness of the model may be leveraged.

Lastly, the model in itself has not been empirically tested. Closely related, Hills and Shrader (1999) studied what are the most employed sources of entrepreneurial opportunities. The results showed that solving specific problems and customers were clearly the most recognised sources of opportunities. The same research also indicated that technology is an important source of entrepreneurial opportunity, but that it is only selectively important towards firms operating in typical technological industries (Hills & Shrader, 1999). Other research has recommended that the solving of problems is a frequently employed source of opportunity (Bhide, 1994) which is described above as process needs. Hargadon and Sutton (2000) found that old ideas make up the basis when the most successful entrepreneurs find new opportunities. Finally, through his research, Markides (1997) examined a series of companies which have succeeded in attacking established industry leaders without the help of a radical technological innovation. He concluded that through strategic innovation, these firms managed to change the rules of the game instead of trying to play the game better, which is an important insight when employing the different sources of opportunities above.

The limitations discussed above guide the areas of future research which should be explored. Research should be conducted to not examine what are the sources of innovative opportunities as most prior research has explored, but instead study the sources of business opportunities. Such an approach may be both exploratory, so that new opportunities can be discovered, and confirmatory to see that the sources suggested in this article are valid and relevant sources. When conducting such research, the majority of the interviewees should be selected from innovative and opportunity driven firms since these firms usually are the experts in finding opportunities. Consequently, the learning outcome would be greatest by studying such firms.

Future research may also empirically test and retest the opportunity-source model to reveal the practical usefulness of it. By testing the model, adjustments can be done so that it becomes more approachable. Moreover, such a study may also reveal elements which should be included to improve the model.

A closely related approach to the opportunity-source model has already been tested by DuPont when they attempted to identify new business opportunities. The emphasis for DuPont was to create businesses that were new to the company and not simply line extensions. To do so, they developed a matrix comprising of a) macro trends and associated implied issues, and business/product needs implications b) major, transformational technologies or technology trends and c) potentially attractive markets along with associated market drivers. The result proved to be highly successful as DuPont managed to discover a huge amount of opportunities (O'Brian, 1999). This advocates that the opportunity-source model is in fact practical useful.

A final step possible to initiate is to insert the model into a broader context including areas as cognitive processes, strategic innovation and the underlying elements within each source of opportunities as mentioned above. Such an approach would totally revitalise the model, in other words, using an old model/idea to create a new and improved model.

## **CONCLUSIONS**

This article represents a unique contribution towards identifying and systemising the sources of business opportunities, which is described as the underlying dimensions where

the opportunities occur. It provides firms with new insight about where they can look to find new business opportunities. The findings reveal that sources of business opportunities exist at three separate levels, namely the macro-, industry - and firm level. Within the specific levels, it is proposed that the macro level comprise of geographies, government action, demographics, changes in consumer perception and consumer economics sources of business opportunities, while the industry and firm level are suggested to consist of industry changes, process needs, suppliers, customers, rivalry-related and internal-directed sources of business opportunities. In addition, five sources of business opportunities are found to exist at all levels; namely new knowledge, unexpected occurrences, incongruities and old ideas. As all these sources have its own distinctive features that can provide firms with the ability to find new and unique opportunities, it is proposed that firms should examine all the sources of opportunities and not just those apparently seeming most relevant. This article also present an entirely new creativity tool designed to assist firms in finding new opportunities. The tool, named the opportunity-source model, summarises all the different sources of business opportunities into one figure, thus offering a perspicuous picture of how the different sources of opportunities are organised. It is suggested that firm should take an approach closely related to the Delphi technique, described in the article, to get the most out of the model. Be applying this approach, the firm will find themselves with the possession of a powerful and targeted tool to assist them in finding new opportunities. Finally, recommendations for future research are that the model should be empirically tested and emphasis should be placed upon exploring whether there are sources of business opportunities that are not included in the opportunity-source model.

## **ABSTRACT**

This paper investigates the strategy-making practices of SMEs (small and medium enterprises) and relates it to firm performance. It does so by firstly investigating the existing literature on strategy-making in SMEs. It uses the literature to develop a typology of strategy-making processes that is useful for an empirical investigation into the strategy-making practices of SMEs. It then describes the results of the empirical study of the strategy-making practices of SMEs in New Zealand. These results were obtained through a survey of 477 managers/owners of SMEs. Two approaches to strategy-making are found to correlate with high performance, namely the adaptive participative and internal participative approaches.

## **INTRODUCTION**

Research into strategy-making in SMEs has been haphazard, often descriptive and lacks a strong theoretical framework. Since strategic management is an applied field of business, its survival and growth depends not only on its theoretical sophistication and the rigour of its methodology, but also on its relevance to practitioners. Although studies such as that of Pekar and Abraham (1995) show that firms that are sophisticated users of strategic management are more successful than firms that have not yet acquired strategic management skills, practitioners often do not perceive such relevance (Heracleous & DeVoge, 1998). Popular belief holds that SMEs are unsophisticated users of strategic management, moreover, that they do not make strategy at all.

This perception may be a question of misinterpretation of terminology because of the preoccupation of business schools with rational approaches to strategy-making. These rational approaches to strategy-making propagate a deliberate, formal and step-by-step process (Mintzberg, Ahlstrand & Lampel, 1998). Such a view of strategy-making is

limiting, and therefore researchers of strategy and performance relationships, especially those in small or entrepreneurial firms, are suggesting one or more of three approaches of strategy-making, namely stable (planned) and slowly evolving, dynamic (adaptive) and rapidly changing and a combination of both that is more dynamic than planned, but more static than emerging (entrepreneurial) (Schwartz & Teach, 2000). Another two approaches that are identified in large firms may, however, also be relevant to SMEs. These are the symbolic (Hart, 1992) and participative (Dess, Lumpkin & Covin, 1997) approaches to strategy-making.

This paper investigates the strategy-making practices of SMEs and relates it to firm performance. It does so by firstly investigating the existing literature on strategy-making in SMEs. It uses the literature to create an understanding of the five strategy-making processes that may be useful for an empirical investigation into the strategy-making practices of SMEs. It then describes the partial results of the empirical study of the strategy-making practices of SMEs in New Zealand. These results were obtained through a survey of 477 managers/owners of SMEs. Lastly it offers a discussion of and conclusions from the results.

## **THEORY DEVELOPMENT AND HYPOTHESES**

This section of the paper presents the background that supports the empirical study. Firstly, it introduces five approaches to strategy-making that SMEs may employ. Secondly, it investigates how these approaches may be related to performance in SMEs. Lastly, it introduces three hypotheses that will be tested empirically.

### **Defining strategy-making**

Strategy-making is usually viewed as a rational process which is typical of the approach that is taught in business schools. Mintzberg, Ahlstrand and Lampel (1998) explain that this approach is prescriptive and advocate deliberate, formal processes that are initiated by management. A change from the single, rational approach to strategy-making can be found in the strand of strategic management literature that investigates approaches to strategy-making that firms follow. In 1973 Henry Mintzberg wrote an article called "Strategy making in three modes" which describes how strategies can be made in an entrepreneurial, planning (rational) or adaptive manner. It introduces the idea of different ways for a firm to make strategy. These ways or approaches can be used on their own or in various combinations with each other. This work of Mintzberg is the first significant reference that uses the term strategy-making although no definitive definition of the term is given. Mintzberg (1973) and subsequent authors such as Miller and Friesen (1977, 1978) and Dess, Lumpkin and Covin (1997) use the term "strategy-making" as one would use the term "decision-making", that is, to refer to a process that is undertaken by an individual or firm. Mintzberg (1973) compares strategy-making in business to policy-making in government where the outcome of the process is an implementable policy. An important aspect of strategy-making that arises from Mintzberg's (1973, 1978) works is that it can be viewed as different modes or approaches. The entrepreneurial, planned (also "rational" or "deliberate") and adaptive (also "emergent") views are just three approaches to the strategy-making process that are promulgated in the strategic management literature. Other authors describe additional approaches to strategy-making, such as the participative and symbolic approaches mentioned before.

Several issues contribute to a definition of strategy-making. Firstly, it is a broad concept that may be defined as being similar to strategic management, but which includes various approaches to strategy-making, beyond just the rational view. Strategy-making is thus a broader concept than strategy formulation or planning. Secondly, the approach to strategy-making may differ between firms. Hart and Banbury (1994) explain that “strategy-making is typically portrayed in “either/or” terms” (p. 251). An example of this is either rational or incremental processes. Lastly, it can be viewed as a process that takes place in a firm, but is strongly linked to the content and context aspects of strategic management as evident from Mintzberg’s (1973) interpretation, namely that strategy-making is the manner in which firms make important decisions (process) that lead to strategies (content) within a certain environment (context) (Mintzberg, 1973). Dess, Lumpkin and Covin (1997) provide a definition that addresses these aspects and define strategy-making as

*an organisational level process that encompasses the range of activities firms engage in to formulate and enact their strategic mission and goals .... [and that] include analysis, planning, decision making, strategic management, and many aspects of the [firm’s] culture, shared value system and corporate vision (p. 679).*

A set of approaches to strategy-making process, such as those by Mintzberg (1973), that is presented as complementary to each other is called a typology (Meyer, Tsui & Hinings, 1993) of strategy-making processes. A bewildering array of such typologies (conceptually derived) or taxonomies (empirically derived) of strategy-making processes have been developed over the past 40 years. This proliferation of typologies has produced several problems to researchers in this area. According to Hart (1991) the ‘lack of methodological consistency and confusion over typologies that focus on similar phenomena from different points of view’ (p. 99) is the most significant of these problems. Other issues include that limited attempts have been made to validate these typologies empirically or to test their effectiveness in a business setting. This paper uses the typology of Verreynne and Monin (2004) in which strategy-making processes are conceptualised as either rational, adaptive, entrepreneurial, participative, symbolic, or combinations thereof. This author is therefore in agreement with authors such as Hart (1992) and Mintzberg (1973) who state that these modes are not seen as mutually exclusive, and that firms may in fact be combining two or more modes at different stages of its development, or even at the same time, either in different parts of the firm, or simultaneously. Further clarification of the typology is provided in the subsequent two sections. Firstly, the dimensions of strategy-making processes will be described and used to provide a conceptualisation of their prevalence in the chosen modes of strategy-making. Secondly, the dimensions of the five modes of strategy-making will be presented.

## **Dimensions of strategy-making process**

Strategy-making research tends to focus on opposites such as deliberate versus emergent strategy or induced versus autonomous behaviour. These opposites represent some of the underlying dimensions of most strategy-making processes (Hart, 1991). Several such dimensions have been identified, namely emergent versus deliberate strategies (Mintzberg & Waters, 1985), induced versus autonomous behaviour (Hart, 1991), vision (Hart, 1992), involvement or political versus ideologically driven (Mintzberg, Ahlstrand & Lampel, 1998), vision (Hart, 1992) and an entrepreneurial dimension (Dess, Lumpkin & Covin, 1997, Khandwalla, 1976/77). The emergent and deliberate; induced and autonomous; and political and ideological dimensions can all be placed on the opposite sides of a continuum. This section provides a brief overview of these dimensions.

Burgelman (1983) and Hart (1991) identify the difference between strategy-making processes that are induced by top-management versus those processes that present autonomous strategic behaviour by employees. Top-down behaviour implies that strategy-making is the result of the use of structure or systems to induce employees to behave in a way that is consistent with the strategy expectations of top management. Bottom-up or autonomous behaviour suggests that employees introduce improvements, business opportunities or ideas and attempt to convince managers to support these ideas (Hart, 1991).

Mintzberg and Waters (1985), on the other hand, distinguish between deliberate and emergent strategies. Deliberate strategies are strategies that are purposeful or dictated from the top, whilst emergent strategies are patterns that realise as strategies, either despite of, or in the absence of, top management intentions. Deliberate strategies form part of the formal processes of the firm and although it does not have to be carried out by top-management, it is dictated by top management and therefore top-down or induced behaviour. Emergent strategies are patterns of behaviour that realise as strategies and therefore part of the informal processes. This view posits that managers can consciously control this process, but the process can also be bottom-up driven, emergent or incremental. These patterns can therefore result from the behaviour of any employee, and may include the actions of top-managers. However, unless emergent strategies are guided by a vision (top-down), they are usually formed through autonomous (bottom-up) behaviour. Induced and autonomous behaviour and deliberate and emergent strategies seem to be similar concepts but can be distinguished in terms of two aspects, namely the ability of top-managers to guide or to harvest emergent strategies.

Various authors identify vision as a dimension of strategy-making processes in firms (Chaffee, 1985; Covin and Slevin, 1991). They describe vision as being more concerned with the broad objectives that have to be attained than the specific strategies needed to achieve these objectives. This is similar to the umbrella strategy defined by Mintzberg and Waters (1985). This vision is then translated into targets, which the members of the firm aspire to. The vision provides a frame of reference to employees and other stakeholders to understand the firm and its intentions (Hart, 1992). Vision, as it is used in this paper, refers to this frame of reference that exists in firms in the absence of a deliberate, top-down strategy-making process and not to the short statement called a vision that can sometimes be found at the beginning of a strategic plan. These two concepts may, however, be the same when carefully crafted and instilled throughout the firm.

Mintzberg (1987) identifies the perspective and ploy dimensions of strategy. A ploy can be likened to the political dimension of the strategy-making process whereas a perspective refers to the ideological or cultural dimension of a strategy-making process. Shrivastava (1986) defines ideology as referring 'to those aspects of idea systems that obscure interests served by ideas and facilitate the establishment and maintenance of domination' (p. 365). Some authors equate an ideological dimension of strategy-making to the existence of a clear and compelling vision and mission in the firm (Hart, 1992). In this case the vision provides 'meaning to the [firm's] activities and provides a sense of identity for employees.... [and therefore] defines the basic philosophy and values of the firm (Hart, 1992, p. 336). On the other side of this continuum, the political dimension can be found. This dimension refers to the involvement of the firm with its internal and external stakeholders during the strategy-making process (Richardson, 1994). Khandwalla (1976/77) identifies two dimensions that inform the political dimension of strategy-making, namely participative management and coercion. Participative management is described as the ability of a firm to utilise its human resources to ensure survival and growth, a

dimension that is mostly internally directed. He further explains that whereas 'participation and peer pressure are the means by which commitment and compliance are sought in highly participative managements, fear and dominance are the primary mechanisms by which compliance is secured in coercively oriented managements' (p. 24).

A number of other dimensions are identified. These include risk-taking (Khandwalla, 1976/77) which indicates a propensity for entrepreneurship. Mintzberg (1973) adds two further dimensions (characteristics) of modes of strategy-making to this discussion, namely time horizon (short or long term) and a proactive/reactive orientation. The next section explains the relevance of these dimensions to the different strategy-making processes identified in the previous section.

## **Types of strategy-making processes**

The various modes of strategy-making processes each display a mix of the dimensions of strategy-making. This section provides a brief explanation of how these dimensions apply to the modes of strategy-making.

- ***Rational strategy-making***

The rational mode of strategy-making assumes that strategic decision-making takes place in a number of steps, usually the analysis of the environments, formulation and evaluation of alternatives and the choice of one or more of these alternatives for implementation (e.g., Ansoff, 1965). This approach has also been termed a mechanistic perspective (Farjoun, 2002), a design or planning mode (Mintzberg, 1973), and deliberate strategy (Mintzberg & Waters, 1982). The rational mode uses tools such as the SWOT analysis to develop strategy. It is important to strategy teaching, research and practice because of its well developed concepts, theories and models. The following dimensions of the rational approach to strategy-making can be identified, namely:

- *Induced behaviour*: consciousness of strategies is an investigation into the explicitness of corporate strategy and the commitment of managers (Miller & Friesen, 1978);
- *Deliberate strategies*: strategy-making takes place in a number of steps in which formulation is clearly followed by implementation through detailed plans, that is a rational, orderly and integrated process (Mintzberg, 1973);
- *Vision*: futurity of decisions is an examination of how far ahead the firm thinks when making decisions (Miller & Friesen, 1978);
- *Politics*: rationality does not allow for the influence of internal politics;
- *Ideology*: there is a recognition that the beliefs and preferences of the managers who formally lead the firm, may influence the outcomes of decisions; and
- *Other issues*: analysts play an important role in strategy-making and a variety of factors are taken into account during decision-making; and organisational structure follows strategy (Ansoff, 1987; Miller & Friesen, 1978).

- ***Adaptive strategy-making***

Various authors have alluded to strategy-making processes that are more adaptive or emergent in nature. Cyert and March (1963) portray strategy-making as reactive and incremental. Mintzberg (1973) first coined the term adaptive mode, but it has also been referred to as an organic perspective of strategy (Farjoun, 2002) and incremental strategy (Quinn, 1980). Whereas agreement seems to exist on the make-up of the rational mode of strategy-making, the other four modes that are presented in this paper are less clear and

can benefit from rigorous empirical testing. Adaptive strategy-making exhibits dimensions such as:

- *Autonomous behaviour*: there is an absence of direction from upper levels of management (Mintzberg, 1973);
- *Emergent strategies*: strategy formulation and implementation cannot be separated; experimentation and learning lead to the development of new strategies (Hart, 1992); decisions are made in incremental steps (Quinn, 1980); and decisions are disjointed (Mintzberg, 1973);
- *Vision*: in certain views of adaptive strategy-making (Miller & Friesen, 1978), such as logical incrementalism, a clear vision provides the framework for employees to act in;
- *Politics*: involvement of stakeholders such as employees, customers, suppliers, and government in the strategy-making process (Hart, 1992); strategy is driven by political forces (Mintzberg, 1973; Mintzberg & Waters, 1982));
- *Ideology*: a common set of beliefs may be the driver of adaptive strategy-making in some firms (Quinn, 1980);
- *Other issues*: strategy-making is reactive rather than pro-active (Mintzberg, 1973); and it can be seen as an informal managerial process (Bourgeois & Brodwin, 1984).

- ***Entrepreneurial strategy-making***

The approach that is thought to exhibit the most similarities with strategy-making in SMEs is entrepreneurial strategy-making (see next section). Entrepreneurial strategy-making as an approach to strategy-making has been under-investigated in the literature. The authors who are particularly prolific researchers in this area are Mintzberg (1973, 1990) and authors such as Dess, Lumpkin and Covin (1997). Most of the research in this area is conceptual in nature (Mintzberg, 1973) and where it has been tested empirically (Dess, Lumpkin & Covin, 1997), the research is exploratory and the sample small. Furthermore, entrepreneurial strategy-making has not been studied in the firms where Mintzberg (1973) first suggested that it would fit best, namely SMEs. This type of research may be very important to SMEs who have been accused of neglecting strategic planning (Robinson & Pearce, 1983), probably because they do not engage in rational strategy-making. It may also be able to provide answers to performance differences in SMEs that employ different approaches to strategy-making. The dimensions or behaviours of entrepreneurial strategy-making are identified as:

- *Induced behaviour*: strategy-making authority lies with one powerful individual who takes decisive action (Mintzberg, 1973);
- *Emergent strategies*: extensive use of emergent strategies to detail the umbrella strategy; learning and experimentation (Dess, Lumpkin & Covin, 1997);
- *Vision*: the use of a clear vision or umbrella strategy to guide the firm (Hart, 1992; Mintzberg & Waters, 1982);
- *Politics*: little opportunity for participation or influence of decisions through politics since power lies with the entrepreneur/CEO;
- *Ideology*: culture is driven by the vision of the entrepreneur;
- *Other issues*: flexibility or adaptiveness to change the strategic direction of the firm; risk-taking; innovation; active search for opportunities (Miller & Friesen, 1978); and a growth orientation (Mintzberg, 1973).

- **Participative strategy-making**

Participative approaches to strategy-making process have only received attention in the literature in the last few years (Hart, 1991). Even so, whilst employee participation has received much attention (Crane, 1976; Parnell, Bell & Taylor, 1992; Parnell, Carraher & Holt, 2002; Sashkin, 1976; Wooldridge & Floyd, 1990), little refers to the explicit role of employees in the strategy-making process. Participation in the strategy-making process can be undertaken by employees, managers (Wooldridge & Floyd, 1990), shareholders or corporate boards (Cutting & Kouzmin, 2000), or other stakeholders. Participation can further be viewed as either political or relational (Hillman & Hitt, 1999). As explained before, the political view espoused that coercion takes place, whilst the relational view explains on the influence that one party has on another. The following dimensions of participative strategy-making can be identified:

- *Induced behaviour*: top management involves firm members in decision-making (Bourgeois & Brodwin, 1984); middle managers act as intermediaries who disseminate information and influence results (Wooldridge & Floyd, 1990);
- *Emergent strategies*: a continuous process in which the input of stakeholders in the process adjust the direction incrementally (Bechtold, 1997; Pettigrew, 1977);
- *Vision*: does not play a role in dictating the mode;
- *Politics*: the use of power to affect the outcome of the strategy-making process (Pettigrew, 1977); internal participation in the strategy-making process (Dess, Lumpkin & Covin, 1997); and
- *Ideology*: culture does not impact on strategy-making directly, but rather through how different types of cultures will either result in a political or relational environment (Parnell, Carraher & Holt, 2002).

- **Symbolic strategy-making**

The symbolic mode of strategy-making mainly takes its cue from the ideological dimension of strategy-making processes. As stated before it implies that top managers create a compelling vision and clear corporate mission. The vision is translated into specific targets. The vision leads to a specific culture in the firm. Symbols and emotions are central to this process as are a strategy driven by a vision, rapid growth, dynamism and radical change (Hart, 1991, 1992). Bourgeois and Brodwin (1984) explain that their cultural mode takes the participative aspects of the collaborative mode to other levels in the firm. The vision of the CEO provides the framework for strategy-making, whereafter employees participate in designing their own work procedures to fit into the framework. The most important dimensions of symbolic strategy-making are as follows:

- *Autonomous behaviour*: shared 'frames of reference' influence the outcomes of the process (Daniels & Bailey, 1999);
- *Deliberate strategies*: the strategy-making process is limited, firms are committed to past strategies (Dess, Lumpkin & Covin, 1997; Miller & Friesen, 1978);
- *Vision*: the organisational vision drives the culture of the firm (Lumpkin & Dess, 1995);
- *Politics*: participation may play an *ad hoc* role in some cases but this is not typical; and
- *Ideology*: symbols, emotions and values are central to the process (Daniels & Bailey, Hart, 1992).

The preceding discussion leads this study to state the following hypotheses:

*Hypothesis 1: The (H1a) rational; (H1b) adaptive; (H1c) entrepreneurial; (H1d) participative; and (H1e) symbolic strategy-making processes are important modes of strategy-making that a SME may exhibit.*

In the following section strategy-making in SMEs is investigated and compared to the planned, adaptive, entrepreneurial, participative and symbolic approaches to strategy-making as well as performance.

## **STRATEGY-MAKING IN SMEs**

Dean, Brown and Bamford (1998) argue that it is important to investigate whether models that were developed for large firms can be generalised to small firms. That is because it is possible that the correlates of performance differ between large and small firms (Castrogiovanni & Justis, 2002). The research into strategy-making in SMEs has furthermore been haphazard, often descriptive and lacks a strong theoretical framework<sup>1</sup>. This section aims to provide support for the preceding statement by summarising the research on strategy-making in SMEs, and the likelihood that some approaches to strategy-making process may improve performance in the firms that employ it. It concludes with a summary of the dimensions or characteristics of strategy-making in SMEs from the existing research on the topic. The dimensions identified in this section will also be compared to those of the modes of strategy-making from the preceding section.

The nature of strategy-making in SMEs cannot be investigated without alluding to the disagreement in the literature about whether it takes place at all. Most studies that investigate strategy-making behaviour in SMEs agree that these firms do not engage in 'traditional' strategic planning (Ogunmokun, Shaw & FitzRoy, 1999, 1999). The lack of strategic planning in small businesses is attributed to a variety of factors, including a lack of time and know-how. Robinson and Pearce (1983) point out that it is highly personalised and influenced by the owner or manager who may get locked up in operational issues and consequently neglects strategic management. But they find no significant difference between the performance of small banks that engaged in strategic planning and those who did not. A study undertaken by Orpern (1985) in 58 small businesses finds that there is no significant correlation between any of the performance measures used and long-range planning. Results like this may influence the motivation of the firm to engage in formal planning. This notion is supported by Ogunmokun, et al. (1999) who find in a study of 48 small Australian businesses that another factor may also play a roll in the lack of motivation to plan, namely the rewards that were expected from doing planning.

Storey (1994) explains that growing firms tend to plan more, but is not able to explain whether it is the growth that leads to planning, or the planning that leads to growth. Entrepreneurial or new ventures that need outside finance have to create a business plan for financing purposes. These plans are not perceived as anything but a tool to acquire finance (Anderson & Atkins, 2001), but there is empirical evidence that suggests that the extent and quality of these plans is a critical factor in the success of new ventures (Frank, Plaschka & Roessler, 1989). However, SMEs may also choose to engage in strategy-

---

<sup>1</sup> Note that this study recognises that the research undertaken in the US and Canadian SMEs is not necessarily applicable to NZ SMEs that are much smaller (500 versus 100 employees).

making to outperform firms that do not employ any strategy-making practices. In these firms, owners or managers do not make a distinction between strategy formulation and implementation (Beaver & Jennings, 2000) which indicates that either an adaptive, symbolic or an entrepreneurial process is used. According to Frost (2003) it can be argued that a small firm's commitment to strategy-making is crucial and that SMEs can improve their performance significantly through strategy-making. This argument does not dictate the manner in which strategy-making occurs, since this will be influenced by various factors such as firm size, age and the nature of the firm environment.

From the preceding discussion it is clear that SMEs, just like large firms, place differing emphasis on strategy-making and may employ different modes of strategy-making. Researchers are also not able to provide a definitive answer on the question of what the likelihood is that strategy-making will lead to improved firm performance (e.g., Orpern, 1985). Although such a relationship can be hypothesised, strong empirical evidence still has to be found. The characteristics or dimensions of strategy-making in SMEs are subsequently investigated.

Strategy-making processes in smaller firms can be described as special and frequently unique (Beaver & Jennings, 2000; Cooper, 1979). Robinson and Pearce (1983) characterise strategic planning in small firms as informal, unstructured, irregular, incomprehensive, short term and reactive. Competitive advantage arises as a result of the specific operating circumstances of the firm. Strategy-making in SMEs, according to Beaver and Jennings (2000), is an adaptive process, which manipulates limited resources for immediate advantage. This means that efforts do not focus on changing the environment, but rather on adapting quickly to it through suitable tactics. Strategy-making is therefore practised instinctively and informally. Sexton and Van Auken (1985) describe planning behaviour in SMEs as unstructured, irregular, incomprehensive, incremental, sporadic and reactive. McCarthy and Leavy (1998/99) conduct an in-depth, longitudinal study of nine SMEs with fewer than 120 employees from different industries. They find that there were two distinct types of owners/entrepreneurs in these businesses, and that they make strategy in different ways. The charismatic owner makes strategy in a visionary, idealistic and intuitive manner. The pragmatic owner makes strategy in a rational, planned and analytical manner. The pragmatic owner's thinking is conservative; they are concerned about the economy and driven by skills and knowledge.

Anderson and Atkins (2001) further suggest that small firms can use one or more of the following approaches to strategy-making, namely robustness (similar to the umbrella strategy of Mintzberg and Waters, 1985, or entrepreneurial strategy-making of Mintzberg, 1973); flexibility (adaptive strategy); the 'butterfly' strategy (experimentation followed by learning); and the 'lottery' strategy (experimentation alone). In a study by Chen and Hambrick (1995) it is explained that smaller businesses initiated competitive challenges more actively, were speedier and more secretive in executing their challenges. Miller and Toulouse (1986) find that successful Canadian SMEs have specific strategies that coordinate, unify and motivate middle managers, longer planning time horizons and more detailed decision analysis. It is however noteworthy that SME in a Canadian context, means 500 or less employees. Spillan and Ziemnowicz (2003) study 40 small Guatemalan retail firms through in-depth interviews. The largest firm in their sample had 37 employees. Most of these firms participate in a variety of strategic management activities, but mostly in an informal manner. A strong commitment to pro-active strategy-making was found in 26 of these firms.

SMEs may or may not engage in strategy-making, and if they do, they may have different approaches to it. The following dimensions or behaviours of strategy-making in SMEs represent a summary of the preceding discussion:

- *Induced behaviour*: highly personalised and influenced by the owner/manager;
- *Emergent strategies*: frequent use of emergent (adaptive and reactive) strategy, experimentation and learning;
- *Vision*: umbrella strategies or a vision set the general direction;
- *Politics and ideology*: no research that comments on these dimensions could be found;
- *Other dimensions*: informal, unstructured, irregular, and incomprehensive; sporadic and short term strategy, but where longer time horizons are employed, firms are likely to be more successful; no distinction between formulation and implementation of strategies.

**Table 1: Comparing strategy-making in SMEs to the other modes of strategy-making**

	Rational	Adaptive	Entrepreneurial	Participative	Symbolic	SMEs
<b>Top-down</b>	High	Low	High	Medium to low	Medium to low	High
<b>Bottom-up</b>	Low	High	Low	Medium to high	Medium to high	Low
<b>Deliberate</b>	High	Low	Low	Medium to low	Medium to high	Low
<b>Emergent</b>	Low	High	High	Medium to high	Medium to low	High
<b>Vision</b>	Medium	High	High	Low	High	High
<b>Political</b>	Low	High	Low	High	Low	
<b>Ideological</b>	Medium	Low	Medium	Variable	High	
<b>Other dimensions</b>	Long term	Reactive Short term	Risk-taking Pro-activeness Long term			Short term

When investigating the dimensions of the various modes of strategy-making and those in SMEs as exposed in table 1, it becomes abundantly clear that similarities exist between two of these modes and strategy-making in SMEs. Whilst the adaptive mode exhibits three similar dimensions (deliberate, emergent and vision) to strategy-making in SMEs, only one difference between entrepreneurial strategy-making and strategy-making in SMEs is found, namely the time horizon of the strategy-making process. In entrepreneurial strategy-making it is long-term orientated, but in SMEs it is short-term orientated. This section therefore proposes that SMEs will employ an entrepreneurial mode, although an adaptive mode is also possible. However, the preceding discussion made it clear that only the rational, entrepreneurial and participative modes will be related to high performance in SMEs. From the previous discussion, it can thus be hypothesized that:

*Hypothesis 2: The (H2a) rational; (H2b) entrepreneurial; and (H2c) participative modes of strategy-making will be related to high performance in SMEs.*

*Hypothesis 3: The (H3a) adaptive; and (H3b) symbolic modes of strategy-making will not be related to high performance in SMEs.*

## RESEARCH METHOD

In the first phase of the empirical study, exploratory factor analysis was used to determine the underlying dimensions of strategy-making, and therefore to test hypothesis one. In the second phase correlations and moderated regression were employed to examine the relationship between the dependent variable, performance, and the modes of strategy-making, therefore to test hypotheses two and three. This section describes the research method employed in this study.

### Defining SMEs in New Zealand

A general definition for a SME in New Zealand will include the following dimensions: personal ownership and management; few, if any, specialist managerial staff; not being part of a larger business enterprise (Ministry of Commerce, 2000); and fewer than 100 full time equivalent employees (FTEs) (0-5 micro, 6—49 small and 50-99 medium enterprise) (Cameron & Massey, 1999). Cameron and Massey (1999, p.5) give one of the few comprehensive definitions of SMEs in New Zealand, namely 'a business that is independently managed by the owners, who own most of the shares, provide most of the finance and make most of the principal decisions'. Firms with fewer than 100 employees account for 99.5% of all the enterprises in New Zealand, employ 76% of the workforce that is currently employed (Statistics New Zealand, 2002) and account for 55% of the total output in the economy.

### Sample

Postal questionnaires were sent to 2000 owners or managers of SMEs in New Zealand. Information on these firms came from the Kompass database and respondents were selected randomly by employing the functions of the database. A follow-up letter was sent to all non-responding firms. Responses were received from 504 firms. The total usable responses were 477 or 23.85% of the original sample.

The firms that responded to the survey represented a broad cross-section of firms from various industries, firm sizes and ages. The average firm size was 23 employees and the average firm age 33 years. On average managers or owners have been managing the firm for 14 years. Participants indicated that more than 90% of their firms were in the growth or maturity stages of the industry life cycle. It is therefore clear that the focus of this study is not start-up firms. 55% of firms fell in the manufacturing (31%), wholesale (14%) or construction (10%) industry sectors, with sectors such as communication, consultation, property and business services, and retail presenting 5% or more of the participants.

### Research instrument

*Type of strategy-making* was measured with the Hart (1991) scale as modified by Dess, Lumpkin and Covin (1997). Hart's (1991) scale was developed to test for the five strategy-making modes as described earlier in this paper. It consists of 25 items and is scored on a 5 point Likert scale, ranging from 1 'Strongly disagree' to 5 'Strongly agree'. The scale is based on two dimensions that Hart (1991) argues as 'central to [conceptualising] and understanding strategy-making processes: (1) top management 'intentionality,' and (2) [organisational] actor "autonomy"' (p. 104). The dependent variable, *performance*, was

measured by using the financial performance scale developed by Covin and Slevin (1989) and Gupta and Govindarajan (1984). Respondents had to indicate the importance of ten financial measures, namely sales level, sales growth rate, cash flow, return on shareholder equity, gross profit margin, net profit margin from operations, profit to sales ratio, return on investment, ability to fund business growth from profits, and overall firm performance, to the firm. Thereafter they were asked to indicate their satisfaction with the firm's performance for the same ten performance measures. The 'satisfaction' scores were multiplied by the 'importance' scores and aggregated in order to compute a weighted average performance index for each firm.

The scales that were included in the final instrument received acceptable levels of reliability in previous studies. As indicated in table 2, the scales that are used in this study have generally received acceptable levels of reliability in previous studies (Cronbach's coefficient alpha of 0.70 or above). Furthermore, the overall alphas for both scales in this study was >0.70. The individual alpha of the simplicity subscale was, however, lower. This result is similar to the findings of Hart (1991). Factor analysis was undertaken for the purpose of assessing the construct validity, data reduction and to establish the dimensionality of the scale. The various subscales were relatively independent of each other. The results of the factor analysis can be found in table 3 and is discussed in the next section.

**Table 2: Alpha levels of the scales utilised in the measurement instrument**

Section	Scale	Number of items	Mean	Standard deviation	Cronbach Alpha	Alphas from previous studies
E	<b>Strategy-making</b>	<b>25</b>	<b>88.58</b>	<b>9.46</b>	<b>.79</b>	
	Entrepreneurial	7	24.52	4.30	.79	.75
	Simplicity (symbolic/rational)	8	28.74	3.81	.60	.64
	Adaptive	4	13.98	2.78	.69	.74
	Participative	12	44.67	5.90	.81	(Hart, 1991)
F	<b>Performance</b>	<b>20</b>	<b>74.62</b>	<b>10.27</b>	<b>.89</b>	.88 (Covin & Slevin, 1989)

## RESULTS

An examination of the descriptive statistics of the strategy-making scale shows that questions representing dimensions such as teamwork, cooperation, top-down behaviour, clear values, processes that suit the business and equality, exhibited the highest means. A CEO that places his/her mark on every initiative, failure avoidance and conflict suppression exhibited the lowest means. This section reports the results of the two phases of the data-analysis.

### Phase 1: Factor analysis

Exploratory factor analysis was used to identify underlying dimensions of strategy-making in the respondent firms. This test was sufficient to investigate hypothesis one of the study. The factorability of the data was assessed using the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy (Kaiser, 1974) and Bartlett's Test of Sphericity (Bartlett, 1954). The KMO should have a minimum value of .50 and Bartlett's test of Sphericity should be significant at  $p < 0.05$ . The strategy-making scale had a KMO of .89 and a  $p$ -value of 0.00. These results indicate that the data are highly factorable.

Four factors were identified using a promax rotation, since the scree test indicated a significant gap between factors four and five. In addition, these factors explained the greatest amount of variance. The results of these four factors are reported in table 3. All but one of the variables had significant factor loadings ( $\geq 0.30$ ) (Hair, et al., 1998). The interpretation and labeling of the dimensions presented by the different questions were straightforward when compared to the modes of strategy-making processes identified in the preceding literature. The first factor, 'Participative SMP (strategy-making process)' includes dimensions such as similar values, set practices, input from employees in decisions, equality, cooperation, teamwork, consensus and a negative conflict suppression. Participative SMP in this context was therefore considered as internally directed participation. The second factor, 'Entrepreneurial SMP' includes dimensions such as risk-taking, a dynamic process, and experimentation. This is consistent with previous definitions of an entrepreneurial SMP (e.g., Dess, Lumpkin & Covin, 1997). The third factor 'Adaptive SMP' includes dimensions such as adaptation, ongoing process, and listening and involving stakeholders. Adaptive SMP in this context was therefore externally directed participation and adaptation. The fourth factor was termed 'Simplistic SMP' (compare Dess, Lumpkin & Covin, 1997). This factor includes dimensions such as a blueprint of strategies exist, top down behaviour, an internal process, set practices and the CEO takes decisions. It can therefore be considered to be a simplified combination of the rational and symbolic modes which were described in the literature review.

**Table 3: Factor analysis, using promax rotation**

Variable	Factor 1 Participative SMP	Factor 2 Entrepreneurial SMP	Factor 3 Adaptive SMP	Factor 4 Simplistic SMP
Blueprint				0.331
Top down				0.438
Adapt			0.480	
Ongoing			0.541	
Stakeholder listen			0.583	
Stakeholder involve			0.607	
Internal process				0.428
Values	0.625			
Set practices	0.457			0.454
Analysis level	0.359	0.336		
Input decision	0.516	0.422		
Risk-taking		0.737		
Equality	0.575	0.307		
Dynamic		0.587		
Conflict suppress	-0.426			
Roles defined				
Cooperation	0.702			
All views	0.624			
Teamwork	0.687			
Avoid failure				0.337
Experiment	0.338	0.345		
Long-term	0.507			
Suit business	0.562			
Consensus	0.418	0.381		
CEO decide				0.428

To summarise, hypotheses 1a and 1e are rejected, but support was found for hypotheses 1b, c, and d. Another mode of strategy-making, namely simplistic strategy-making, was identified and is explained as a simplified combination of the rational and symbolic modes of strategy-making.

## Phase 2: Correlations and regressions

In phase 2, hypotheses two and three were examined, these refer to the relationships between the modes of strategy-making and performance. First, Pearson's product moment correlations were undertaken to investigate whether such relationships exist. The correlation measures 'how well the relationship between two interval variables can be described by a straight line' (Page & Meyer, 2000, p. 154). The correlations investigated in this study are two-tailed. This is because direction (causation) cannot be established by using this test. Table 4 presents the descriptive statistics and Pearson correlations for the variables.

**Table 4: Means and correlations of constructs**

	Mean	SD	Correlations			
			Performance	Participation	Entrepreneurial	Adaptive
Performance	139.92	38.62				
Participation	.00	.90	.269***			
Entrepreneurial	.00	.82	.046	.117*		
Adaptive	.00	.79	.232***	.135**	.116*	
Simplistic	.00	.80	.169***	.049	-.118**	-.004
Sample Size = 477 firms						
*Correlation is significant at the 0.05 level (2-tailed).						
** Correlation is significant at the 0.01 level (2-tailed).						
*** Correlation is significant at the 0.001 level (2-tailed).						

There are several results from the correlation matrix (Table 4) that are important. Firstly, significant relationships ( $p < 0.001$ ) were found between performance and the participative, adaptive and simplistic modes of strategy-making. No such relationship was, however, found between performance and the entrepreneurial mode of strategy-making. The latter result is consistent with the findings of Dess, Lumpkin and Covin (1997). Secondly, although the relationship between performance and the participative, adaptive and simplistic modes of strategy-making was significant, and the effect size was large at  $n=477$ , the correlation between simplistic strategy-making and performance cannot be considered to be meaningful at .169. The correlations therefore do not support hypotheses 2a and 2b, and to accept hypothesis 3b.

Further investigation of hypotheses 2c and 3a is undertaken by means of regression analysis. The performance index and the factor scores were used for this test. Two such regression analyses were undertaken, one each for participative SMP and adaptive SMP with the dependent variable performance. Regression analysis provides a means of examining the magnitude and direction of the relationship between the dependent and independent variables (Hair, et al., 1998). The results displayed in table 5 indicate a significant positive relationship in both cases. The minimum  $R^2$  that can be found statistically significant with a power of .80, a significance level of 0.01 and  $n=477$ , is 0.03 (Hair, et al., 1998). The results in table 5 are therefore significant and hypothesis 2c is accepted and hypothesis 3a rejected.

**Table 5: Regression analysis**

Independent Variables	Performance (dependent variable)			
	b	R <sup>2</sup>	p	Regression
Participative SMP	.232	.054	0.000	Y=139.925+11.48x
Adaptive SMP	.269	.072	0.000	Y=139.925+11.22x

To summarise, hypotheses 2c and 3b are accepted, and hypotheses 2a, 2b and 3a are rejected. The meaning of these results is discussed in the subsequent section.

## DISCUSSION AND CONCLUSIONS

This paper identifies five approaches to strategy-making that may be of relevance to SMEs. These are the rational, adaptive, entrepreneurial, participative and symbolic modes of strategy-making. One mode of strategy-making, namely entrepreneurial strategy-making, was identified in the literature section of this paper as the approach that shows the most similarities with the dimensions of strategy-making in SMEs, although dimensions of the adaptive and participative approaches to strategy-making also reoccurred as a theme. An investigation of the literature on the possible relationship between all five of these approaches to strategy-making and high performance in previous studies suggests that the rational, entrepreneurial and participative approaches are more likely to be associated with high performance in SMEs. The results of an empirical study of 477 SMEs in New Zealand only provided partial support for these suggestions.

Firstly, factor-analysis indicated that the rational and symbolic modes of strategy-making are not independent constructs that exist in these firms. Similar to the results of Dess, Lumpkin and Covin (1997) another mode, namely the simplistic mode of strategy-making, was found. This mode exhibits some dimensions of both the rational and symbolic modes of strategy-making, but in such a manner that it indicates a very limited, simplified approach which is largely driven by the owner/manager of the firm and is based on the previous strategy of the firm. This simplistic mode exhibits little/no analysis of the environment or possible future strategies. As expected, this approach did not correlate strongly with performance.

Secondly, factor-analysis found the adaptive, entrepreneurial and participative approaches to strategy-making to be valid modes of strategy-making in New Zealand SMEs. These three modes exhibit similar, although not identical, dimensions to those found in the literature review. The entrepreneurial mode is one driven by risk-taking, experimentation and dynamic behaviour. The adaptive mode shows that its adaptive behaviour is driven by the firm's responsiveness to its stakeholders. The firms that exhibit this mode therefore adapt to suggestions from for example, customers and suppliers, and this then becomes the strategy of the firm. This paper therefore deems the name "adaptive participative mode" as more descriptive of this mode of strategy-making. The participative mode shows a very idyllic picture of a firm in which a large amount of cooperation, teamwork and values drive the strategy-making process. This indicates a slight deviation from the suggested participation mode of strategy-making from the literature review. Rather than being driven by coercive politics, this mode is driven by values or culture. This result is surprising and differs from the suggestion of Mintzberg, et al. (1998) that suggests that participation is usually coupled with political behaviour. This paper suggests that this may be a result of the small size of the firms included in this study and terms this approach the "internal participative mode".

Lastly, the correlation and regression analyses suggested that only two of the proposed modes of strategy-making can be associated with high performance. These are the internal and adaptive participative modes of strategy-making. A relationship between the adaptive participative mode and performance has not been suggested in the literature before. It may, however, be that this is a result of the willingness of the SMEs to listen to their stakeholders and to take their suggestions on board to improve their businesses, something that may be very valuable to a SME. Although a relationship between performance and participative strategy-making was hypothesized, the participative mode was somewhat different as explained before. In this case it is therefore suggested that a strong culture, emphasis on team-work and a long-term orientation may underlie the success of this mode of strategy-making.

The results of this study have several implications for both researchers and practitioners. Firstly, it provides an empirically derived taxonomy for the future investigation of strategy-making in SMEs to researchers. This taxonomy consists of the adaptive participative, entrepreneurial, internally participative and simplistic modes of strategy-making. Secondly, it suggests to practitioners that the pre-occupation of academics with rational mode of strategy-making may not necessarily be relevant to owners/managers of SMEs. Instead, these firms should choose to concentrate on exploiting the advantages that stem from their small size, such as a close relationship with stakeholders; the ability to generate a positive organisational culture and employ this in the strategy-making process; the ability to communicate and work well as a team; and the ability to adapt quickly to changes in the environment. Lastly, it is important to note that these results are viewed in isolation from the contextual factors that may impact on it, such as firm size, organisational structure, industry life cycle and hostility of the environment. This information was collected and will be explored in future papers.

# NEW FAMILY CONCEPTIONS AND THE IMPACT IN THE CONCEPT OF FAMILY BUSINESS

Hilka Vier Machado  
[hilkavier@yahoo.com](mailto:hilkavier@yahoo.com)

Most of the studies about family business were developed considering the patriarchal family as panorama of investigation. Then, a similar logic of performance was found in the patriarchal family and in some companies, obeying the same distribution of power and status, because it is difficult to establish separation between these two roles. This is the stage of several studies in the context of the family business. However, cultural, economical and social transformations have been taking to a new demography, as well as to different family arrangements, which probably have also extended in the ambit of the companies. In this sense, to give some examples, first it is important to mention the case of families constituted by just one of the parents and secondly, several marriages give family another structure. From these changes emerges the following question: What is, in fact, the concept of family business? The aim of this paper is to point new horizons for the concept of family business. So, this study tried to search in the Sociology and Anthropology the elements that have been provoking transformations in the contemporary family structures and how they have implications to well understand family business.

## INTRODUCTION

The organizations are living in the social, political and economical dynamics where they act, and simultaneously influence the environment and need to adapt to changes. Therefore, to study them it is necessary to consider the reality where they exist.

In that perspective, to conceive a family company, it is indispensable to have the notion of what is the family in the contemporary world. It is from the family arrangements that the notion of family organizations can emerge. This organisation's type maintains an interaction with the family, as Chua et al (2003, p.331) point out: " for a business to be sustainable as a family firm in the highly competitive global market of the twenty-first century, there must be a synergistic and symbiotic relationship between the family and the business. The business must perform in a way that creates value for the family and the family must add value to the business in a manner that is impossible without family involvement ".

The current social structure, from the point of view of family configurations, is more complex than it was two decades ago, when the notion of patriarchal family was the same that the structure of that socialisation nucleus. The transformations that happened in the contemporary western family, with the decline of the patriarchal family (CASTELLS, 1999), caused impacts in family companies. In fact, now it is possible to exist a type of family company which starts from a family with only one parent, where mother and daughter, for instance, work together. In spite of this fact, a considerable number of studies has been developed, focalizing family company and patriarchal family. It is important to point out that this type of family structure didn't stop existing, but it doesn't correspond, integrally, to the

family representation. In this sense, the increase of the complexity is not only about the difficulty in understanding the new family arrangements, but also because of different types of structures that coexist in a same culture.

Although some studies already consider the family transformations and adopt an extended optics than the related to the patriarchal family (CAMPBELL, 2002; DANES and OLSON, 2003; GILDING, 2000; GALBRAITH, 2003), it is necessary to have a discussion regarding the transformations in the family and the notion of family business, so that the studies and the statistics of that segment reveal a conformity with the social reality.

Therefore, the aim of this paper is to present a reflection about the report of the transformations in the family structure and the impact in the concept of family business. For the attainment of that purpose, some considerations about the transformations in the contemporary family are exposed and, soon after, the possible reports between those changes and the perception and administration of family companies are discussed.

## **The family and recent transformations**

In agreement with the definition of the Oxford dictionary, family " is a group consisting of parents and their children ", or, in a wider sense, also including close relatives (1989, p.437). This concept corresponds to the notion of nuclear family or extended family in a traditional perspective, but the family, from the 90's have another dimension. For Todd (1985), the family concept is inserted in a wider ideological system, at the same time that develops and reproduces a system of own values. However, Belardinelli (2003) points out that in the contemporary society, religion, politics, law, morality and the family become separate systems.

According to Castells (1999, p.169), the main transformation that is happening in the family is the end of the patriarchy, which " is characterized by the authority, imposed institutionally by the men on women and children in the family's ambit. This system, according to the author, is rooted in the civilization, because of its historical and cultural perpetuity, determining relationships that extrapolate the limits of the family.

One of the main features, in the perspective of Castells (1999), that determined that change is women's insert in the job market. From the 80's, at the same time that the economy was spreading, the women's inclination to work was generalized. Another factor is due to technological transformations, providing controls on human reproduction. In third place, according to the author, is the feminist movement, with impact in the sphere of work and in the elimination of any oppression way or inequality of power. Beyond those things, the author mentions the diffusion of an idea of global culture, in which the notion of a new feminine identity is inserted.

That context of transformations is followed by new ways of conceiving the family life, including, besides all that, "the gay families" (CASTELLS, 1999, p.172). This movement creates a crisis of the patriarchal family, which is about the " weakness of the family model based on the continuous authority/domination exercised by the man, as head of the couple, on the whole family " (CASTELLS, 1999, p. 173). The dissolution of the marriages brings the formation of bachelors' homes or homes with just one of the parents, then the patriarchal authority on the family is interrupted. The author also says that the formation's postponement of couples, derived from the difficulty of marriage's compatibility with work and prived life, as well as the formation of relationships without legalized marriage contributes to weaken the patriarchal authority, institutional and psychologically.

Finally, discussing the transformations the author points out that " those tendencies indicate the end of the family as we know it up to now: not just the nuclear family, but the one based on the patriarchal domain, which has been prevailing for ages". (CASTELLS,1999, P. 174)

In the same way, Gomes and Paiva (2003) discussing about the marriage and family in the XXI century, refer to a new configuration of the marriage concept, because: " the families are being constituted in a wider way, including the new partners (mother's husband/father's wife) and the children and the stepbrothers. Substantially, the father loses the traditional illustration and function based on the great number of families constituted only by the maternal images (p.5).

To Fonseca (2002), there is not an homogeneous and hegemonic model when we try to understand the predominant family forms in the current society. The author affirms that the current model is an extension of the family ideal commended in the modernity, which emphasized the romantic love, the ideal marriage and the affection as bases of the family life. By the time that those values were incorporated to the matrimonial life, the relationships became open to negotiation, allowing the legitimation of family ways that were not socially accepted, for instance the one of partners from the same sex, to whom it was given an important space in this new context, where the affection is the true base of the relationship.

Besides, the impact of those changes happens, for instance, in the increase of the number of children born out of the marriage, establishing a disconnection among elements that historically were interlinked: couple, marriage and family. If in old times the tradition was transmitted by family values, from one generation to another, with emphasis in the consanguineous family, in the contemporary social relationships the emphasis is in the present, in the welfare of the moment, with low emphasis to the solidity or to the past.

Dias and Lopes (2003) consider that in the traditional conceptions of family the identities of men, women, parents and children were based on the structure of dominant patriarchal power, but that same structure was modified gradually, although it has not disappeared. The family that appears in the eighties is more equalitarian, and its members are seen as equals, with similar rights, in spite of their sexual and age differences. New roles have been insert in the family scenery, for instance the one of the stepfather or stepmother (FONSECA, 2002). On the other hand, Belardinelli (2003) comments that the increase of the individualism in the family's relationships contributes a lot to a decrease of trust among its members.

Those alterations in the family structures reveal that what is about to happen " is not the disappearance of the family, but your deep diversification and the change of your system of power ", as the patriarchal family represents a minority in the social context of several places (CASTELLS, 1999, p.259).

Considering the alterations in the contemporary family, even the consanguineous family can be understood from different perspectives, such as:

- a) the consanguineous, that corresponds to the legal, nuclear family, not specifically the patriarchal family. It can be constituted by two people, for instance, father and son.

- b) multiple, when several consanguineous marriages divide and multiply the base nucleus. The succession right becomes diffuse and dispersed in different groups;
- c) consanguineous-discontinues, when grandparents look after and educate grandchildren as children, assuming the paternity formally. That situation can be determined by the parents' death or even by a legal determination;
- d) consanguineous-disperses, when there are children out of the marriage. That situation, in the Brazilian legislation, interferes in the succession right, because every son is a legitimate inheritor.

So, the family notion involves a complexity nowadays, as different forms coexist in the same culture, representing a differentiated composition when comparing to the traditional and patriarchal nuclear family. There are different members, redefinition of family roles, and also new distribution of power.

In a simplified way, the discussed points contribute to the nowadays family notion and starting from that synthesis of the main transformations, it's necessary to understand the implications of all this in the family companies.

## **Family and family company in the contemporary context**

Amman (in VERSTRAETE, 2000) remarks the difficulty in defining family business. In a traditional perspective, the family company is considered like this if the control of the property is in an individual's hands or with the members of the same family. Join to those points, the management of the company and the proprietor's will of transmitting the company for the next generation can also configure a company as family. In general, the studies on family companies (WESTHEAD and COWLING, 1998) consider that the property, the administration and the succession or the intention of passing the stick define a company as family.

When looking for a definition of family company starting from the family concept, it is verified that the complexity of the family arrangements, presents at the present time, contemplates directly in that family business concept. For instance, when studying family companies, Chua and Christman (1999) found diversified proprietors, such as:

- a) an individual;
- b) two people linked by blood ties;
- c) two people linked by the marriage;
- d) nuclear family;
- e) more than a nuclear family;
- f) extended family;

That reality presented by the authors show how the family transformations exercise an impact in understanding family business, because traditionally the nuclear family is the one that used to prevail and, most of the time, it was the patriarch of the family who represented the main role. If we consider the family company as the one that has the family in the control and administration of the property, this understanding becomes possible from the moment that the family is clearly defined. Therefore, from the juridical point of view, the family is a juridical institution, and for the study of family companies this is a scientific subject that cannot be neglected, because the principal obstacles for the definition of family company are related to the different cultural conceptions of family, as

Stewart (2003) points out and to the difficulty in defining what the family is in fact (DYER, 2003).

Allouche and Amann (1999) make questions about the understanding of family company's concept they consider this kind of company:

- a) when the involvement happens with a nuclear family or a concept of extended family;
- b) when there are blood ties between the company owners or when they are married.

It is possible that this kind of doubt had not interfered in the way of think the family business two decades ago, however, nowadays, the number of companies that are initiate and driven by couples is more and more larger and as far as consanguineous situations as marriage are also considered to understand family business (DYER, 2003). In the same way, the involvement of the nuclear family or of the extended family becomes an important subject for the family business, mainly if the extended family is seen as the one which is also formed by successive marriages.

Another feature that Gilding (2000) and Bernardinelli (2003) pointed as important is the increase of the individualism in the family relationships in these days, which creates an impact on the way of negotiation and communication inside family business.

Taking into account the transformations in the family structure, discussed in the previous section, it was important to try a more detailed analysis to discuss the association of those changes with family companies, specifically in the items presented in the sequence.

## **Family's size**

One of the transformations in the contemporary family is the size of the families, reduced because of the small number of children. Situations as the women's entrance in the job market, the levels' reduction of income or even the prevalence of the individualism might have contributed to the reduction of family's size.

From the point of view of the family company it is verified, obviously, that the number of potentials successors was also reduced. According to Malinen (2001) the bigger the family is the more interested the potential successors are. Nowadays, are not rare cases where family business have just one successor and this one decide to sell the enterprise because he or she have not the intention to go on with the business.

On the other hand, if we consider the extended family the one derived from successive marriages, it is not difficult to find situations in which the family company is the working place for the first marriage children, as well as the one of the second marriage, enlarging the family involvement excessively in the company.

The ambiguity of those situations illustrates the increase of family business' complexity. In other words, the family was reduced in many cases, but at the same time enlarged in other. In the ambit of the family company that transformation causes an impact directly in the succession's processes of power and communication's distribution.

## **Distance between generations**

Another differentiated aspect in the current family arrangements is the distance's increase of age between generations, as a consequence of the fact that people have children when they are in more advanced age than it used to happen in previous generations. The principal factor that determines that decision is, certainly, the job market.

When the impact of that demographic transformation is analyzed in the family company, it is verified that the children born when their parents were 30 years old or plus, these group will face the job market when the parents are close to 60 years old, in other words, close of the retirement. The conviviality between successor and the father or mother becomes shorter and the distance of age is larger, which can interfere in the transition process and continuity of those organizations, as the conflict between generations is one of the delicate questions of succession (MALINEN, 2001).

It is also important to point out that the youths get in the job market with more advanced age and that the conviviality between generations presents modified, mainly with the intensification of the coexistence between grandparents and grandchildren, much larger than between parents and children in several situations.

## **Family's composition and Power's distribution**

As it was previously discussed, Castells (1999) points that the new distribution of power is one of the main aspects of the family transformation, derived of patriarchal structure's collapse. Therefore, changes happened in the family features of the contemporary western societies, such as the individual autonomy and the equality between genders and they affect the family organizations (GILDING, 2000).

In spite of that, the focus of many family studies are still predominantly centered in the entrepreneur as a paternal illustration, although the alterations in the family indicate the need to include the gender perspective in their agenda (BROCKHAUS, 1994; DUMAS in SHARMAN, 1996 and GOFFEE, 1996).

Recent researches indicate that there are resistances in family business to accept women in the succession of these companies (STAVROU, 1999; VIDIGAL, 2000) and that they are only considered possible successors when there are not successors of the masculine sex, and the women's performance in family companies is sometimes allowed only in an invisible way (CURIMBABA, 2002; ROWE and HONG, 2000). Restrictions of cultural order limit the women's entrance in the succession of family companies, just as Vidigal (2000, p.68) found among Brazilian family companies, of Italian immigrants, where there is the "habit of not allowing the daughters to become partners of the company."

Rodrigues (1991, p.37) points out that the family company, most of the time is still "business for men." There is a difference between the social reality and the successors' social representation, which it is in general associated to the masculine image. In a study, developed with 549 Canadian families, Gasse (apud VERY and RAYTCHEVA, 2002) verified that 39,7% of the people involved in those companies judged that the sons were the most competent people to assume the companies, and only 9,6% pointed the daughters. Before them, there were the partners (20,6%) and even people that were not part of the company (16,9%). Besides, as the studies on the family companies are, in most

of cases, about organizations created and managed by men (HANDLER apud CADIEUX et al, 2000), the contributions concerning the succession's process of companies created and managed by women are rare (CADIEUX et al, 2000).

The successors' preparation, which was in general centered in children and parents' relationship, today has multiple relationships as possibilities, involving: mother and daughter (s); mother and son (s); father and son (s); father and daughter (s). Considering the different natures of these relationships, the possibilities should be included in the researches, in order to better understand the contemporary family companies (GOFFEE, 1996). In this perspective, Dyer (2003) points out the importance of studies that characterize family relationships like: father-son, father-daughter, mother-son, mother-daughter, uncle-nephew, and so forth. The author still points out the importance of developing studies on family groups, because for him a group of a father and his four sons would likely behave differently than a group of four sisters who are managing a business together.

In this way, qualitative studies can supply elements that facilitate the understanding of the new social reality in those companies. That phenomenon's vision contributes to a concept of family company that is more adapted to the contemporary family dynamics and the distribution of effective power in the group. An example is the study conducted by Campbell (2002), in companies where mothers and daughters act. She pointed as positive points in the successors' preparation the following ones:

- learning easiness, when the mother is the mentor;
- the respect to the mother's role, because she represents the source of force and wisdom;
- interdependence and mutual support;
- the daughter feels like an allied one and not a subordinate.

Those results found by Campbell (2002) contribute to reinforce the recommendations of Dyer (2003), but don't coincide with studies developed between father and successors children, where the conflict is frequent (MALINEN, 2001).

Another point related to transformations in families is presented by Galbraith (2003), investigating the relationship between divorce and financial performance, the author identified what he usually calls "in spouse " and " out spouse ", to characterize the current wife and the previous, demonstrating that the loyalty was established in a shared way among employees and the two members of the family (previous and current). In spite of the predominant focus on cases of entrepreneurs' divorce, the study constitutes an exclusive contribution to illustrate how the dissolution of the marriage interferes in the process of administration of the family business.

Although there are not many examples, it is possible to notice that there is a new dimension of family company, defined starting from the transformations that are happening in the family, discussed previously. For that reason, the family notion while primary nucleus of the individuals' socialization does not correspond to a group situation that spreads in a collectivity. What really exist are different group forms that settle down as family and seek their own legitimation, in other words, it is not possible to think about an unique form of the family. It implicates directly in the conception of family company as that resultant of the multiples possible family arrangements. On one hand, that reality indicates that there is a real need to reformulate concepts and premises that usually guide the study

of family organizations, on another hand, it reinforces the need of a studies' field to analyse that type of companies.

Finally, if previously there was a difficulty in understanding the family business concept, because this one used to vary in agreement with the culture, the challenge of the moment is inside the same culture, where different family arrangements coexist. Perhaps, from the point of view of the family business, it is necessary to establish a demography of family companies, which includes, for instance enterprising couples, women and men entrepreneur with their respective nuclear or extended families.

## **FINAL REMARKS**

In general, when the metaphor of the "family" is applied in a company, the family notion seems clear between its members, paradoxically, that notion for the family business comes in a more complex way.

When we discuss the transformations in the family structure, starting from family's sociological, anthropological and psychological approaches, it is verified that a new dimension of this emerges mainly in the western world. There is not only a family notion, but multiple arrangements that constitute possibilities of family representations. Transposing the reflection to the field of family business, it was verified that an enlarged focus of the phenomenon is necessary, which considers the new possibilities of family arrangements, presented in organizations. Indeed, there is not a conception of family company, but multiple possibilities.

Although the number of studies that approach companies not only considering patriarchal family is still small, it can be already noticed that the types of relationships between their members and the possibilities of family succession are different from the ones that the literature usually approaches for family companies, most of time delineated based on the patriarchal structure.

So, the discussion about family transformations and family business is necessary as the social representations about family in the atmosphere of businesses are still intensely related to the logic of the patriarchal family, and this one represents a small part of the family structures nowadays.

On the other hand, there is no doubt that this social scenery still brings as consequence a complexity level larger in the concept of family company, whose generalization has already as obstacle the fact of existing different family arrangements in agreement with the culture. In these days, in the same culture there are many different groups coexisting, which composes a new family idea. Though, this reality contributes to become studies dynamic, and that emerges from the need of reformulating concepts to explain the phenomenon in a different context.

Some studies were mentioned to try to make the concept of family company more flexible. It was still verified that the acceptance of the marriage or of the consanguineous family, pointed by Dyer (2003), represents a progress for the field pointing out, however, that even on the consanguineous family different arrangements can exist.

Finally, longitudinal studies could contribute to better understand the impact of changes in family related to the enterprise, mainly about the composition and distribution of power.

## INTRODUCTION

The Ministry of Women's Affairs (MWA) influences New Zealand government policy on issues concerning women with the objective of improving their economic autonomy. Women make an increasingly significant contribution to the workforce and their general wellbeing has a direct impact on the country's economic growth. Economic and social policy integrates across government agencies to improve female's equity. Women meet their aspirations for a balance between work, family and community commitments through entrepreneurship within small and medium sized enterprises (SMEs). Many of these women have had minimal education and seek support from mentors to understand in particular more about business systems, marketing, and management issues.

Business in the Community Ltd (BITC) is the largest mentor organisation in New Zealand. Currently only corporate sponsors fund it. Mentor organisations such as BITC act as an intermediary between government agencies and the business to assist all parties meet their objectives. BITC's database of their SME client businesses has been used for this research.

With economic and welfare objectives at stake, local and central government use considerable resources to provide access to mentor and other services. These organisations are accountable to the aims of government and to the business owners to assist them start, survive and grow.

## LITERATURE

### **Assisting Female Entrepreneurs and Managers**

New Zealand was the first country in the world when in 1893 it granted all women the vote and a chance to influence society. Female representation has been higher in New Zealand than in other countries with similar sorts of electoral systems. Out of over 180 countries, New Zealand is one of only twelve currently headed by a woman. It is ranked fourteenth equal in the world for female representation in Parliament. Women have led both major political parties, National and Labour. Women hold four key constitutional positions, Governor-General, Prime-Minister, General Attorney and Chief Justice (MWA,2002).

The Centre for Women and Leadership established in 1998 promotes leadership opportunities. It focuses on women in management and business, women in self-employment, women as directors, women in the workforce, and women as leaders in central and local government, and in community organizations (DESA, 1998). The number of women in senior positions has increased from 25 percent in 1993 to 40 percent (MWA, 2003b).

After the 1984 election government shifted its focus from intervention to identifying points of market failure. Government policies or programmes could not be seen to interfere with initiatives being taken in the market. Government distanced itself from the financial sector which was left entirely in the hands of the market.

During the 1990s government increased its presence through supplying services such as training to SME owners. Industry New Zealand offers programmes such as its Investment Ready Scheme, BIZ Training and enterprise awards aimed at improving business access to appropriate forms of finance. BIZ programmes specifically target female and Maori business owners.

The Ministry of Women's Affairs (MWA) opened in 1986, is the government's primary provider of gender-specific advice. Its purpose is to contribute to and support the achievement of the government's goals for women of equity by taking into consideration the differences in women's and men's lives and recognising that different approaches may be needed to achieve equality of outcomes for men and women.

MWA in its Directory (MWA, 2001) identifies contacts and addresses for government, national and local organisations for Maori and women's groups.

The MWA is currently carrying out extensive consultation on the development of an Action Plan for New Zealand women. Broad programme areas proposed by MWA include economic growth through female entrepreneurship. This work is still in progress.

Women are 47 percent of all employees, earning 84.3 percent of the hourly earnings of men. The pay gaps for Maori and Pasifika women compared with men are larger still. Together with various government departments MWA initiated Te Ara Kaipakihi, *Your Business Journey*, to focus on the needs of Maori business women in particular and to foster self employment (MWA, 2003a).

Approximately 54 percent of New Zealand's Official Development Assistance (NZODA) is "fully gender integrated" although it intends to achieve a 50/50 male/female ratio. Specific female-focused activities include support for organisations and activities that encourage women's economic and business development.

New Zealand Trade and Enterprise believes in a strong enterprise culture among New Zealanders. It intends to foster an entrepreneurial spirit since it realises this is vital in achieving the government's target of returning this country's real per capita income to the top half of the OECD. It provides funds for initiatives, and through the promotion of programmes such as the Ernst & Young Entrepreneur of the Year Award.

Industry New Zealand assists entrepreneurs by funding entrepreneurial clusters with the objective of helping people grow their businesses into significant revenue earners for the country. The new board replacing the merger of Industry New Zealand and Trade New

Zealand plans to promote the development of technology and creative industries in particular (Staff, 2003).

Academic and government interest in SMEs and entrepreneurship has increased since they realised that the means of achieving economic growth is through them and not large corporations. This has led to alliances and the creation of 16 business incubators. The benefits from linking the entrepreneurs, academic staff and mentors with each other is recognised (GEM, 2002).

Independent mentor organisations such as BITC mobilise resources, business skills, experience and information of successful businesses for the benefit of struggling and growing enterprises. The free assistance they offer SMEs stimulates business, improves survival and growth and contributes to employment generation in New Zealand.

Women acknowledge that mentors and role models are crucial to their confidence in pursuing non-traditional career options (Staff, 2003). Women in Business, Women in Technology and the Association of Women Scientists are some of the organisations that assist female entrepreneurs with resourcing and encouragement.

Carter and Rosa (1998, in Massey & Lewis, 2003) believe women could benefit from a training programme targeting the weaker position of women in terms of their attitude and experience. However, some women are dismissive of gender targeting. and quite a few women avoid women-only services and organisations (Still & Timms 2000, in Massey & Lewis, 2003).

A number of organisations provide micro-finance to women. They are primarily non-government and/or membership based. Some sources are specifically for women and are detailed in publications. They offer guidance and suggestions. The Ministry of Economic Development is currently reviewing SME access to finance. If gender issues become apparent they will be addressed (Massey & Lewis, 2003).

There has been little research by agencies and the academic community on gender-specific finance requirements for female entrepreneurs in business. Research undertaken has approached women as a minority or disadvantaged group in self-employment and focus has been on alleviation rather than development strategies. This focus influences studies to evaluate whether assistance is effective or efficient. Research is dated and insufficient to be able to provide targeted financial assistance through policy development to assist women in business (Massey & Lewis, 2003).

Industry New Zealand's *Business and Enterprise Culture Project* (Bonnaire, Kalafatelis, Anso, & Waldron, 2002) was commissioned to determine public opinion on business, business enterprise and entrepreneurial activity. Its objective is to create a positive and supportive environment in order to increase the level of entrepreneurial activity. Conclusions in the report indicate that generally business and the economy is not of interest to most New Zealanders or that the interest taken in business is usually with a negative attitude, except for socially-oriented businesses. Few respondents realised what brought about economic success.

Industry New Zealand and other agencies will focus their initiatives on three segments that were found to exist targeting them with specific objectives through key messages to achieve primary benefits. Through their own actions and others working in the area, including the media and other opinion formers, they are determined to affect a positive change in New Zealand's business enterprise culture. They have set short-term and long

term targets to improve awareness and knowledge, improve attitudes and finally improve behaviours such as increased participation in business.

## **Female Entrepreneurs and Managers**

Female entrepreneurs make up 5 percent of the female population (GEM, 2002). Between the ages of 18-24 they are rated more entrepreneurial than their male counterparts (Staff, 2003). However, females have a lower ego, or desire to make a difference, according to the GEM report (2002) and have a lower sense of perception of their ability to start a business (55 percent), than men (71 percent).

Kirkwood & Brown (2001) found that females employ considerably fewer staff in their businesses than men. In part they attribute this to lower sales. Females have sales of less than \$50,000 in 19 percent of business compared with 7 percent of men. Only 19 percent of females had sales exceeding \$1 million, compared with 39 percent of men.

Carter & Allen (1997, in Massey & Lewis, 2003, p.13) found when researching size determinants of female owned businesses that a "lack of financial resources, more than any deliberate or socially induced choice on the part of female, appears to be the primary deterrent to growth". Fay and Williams (1993a & 1993b, in Massey & Lewis, 2003) found that females might lack the skills and knowledge on how to approach the banks for loans or understand the needs of lenders and investors. Business plans are an essential component of loan applications yet few only 39 percent of businesses wrote one (Massey & Lewis, 2003).

The GEM report comments generally on entrepreneurial activity and states that it has identified New Zealand as having one of the highest rates of total entrepreneurial activity in the OECD. However its productivity is 24 out of 29 countries and new business often fails to grow, expand and create new wealth. Business owners seek a rounded lifestyle. They are weak at measuring performance and evidence also points to risk aversion, both here and overseas, possibly as a consequence of 11 September (GEM, 2002).

"Pull" motivation appears to be the dominant reasons for starting a business. The pull is associated with "having a dream" or wanting to "be my own boss" (Jodyanne Kirkwood & Brown, 2001, p.22). "Pull" factors are typically associated with "entrepreneurs who want to create and innovate, to build something of recognised value around perceived opportunities". Frederick (2003) believes these people are the real entrepreneurs.

Kirkwood (2003) studied habitual entrepreneurs, those who after starting a first business, may purchase, set up or participate in the start-up of another business. Habitual entrepreneurs "see" business opportunities (2003, p.27). Both women and men mainly founded their own businesses. She found women had on average slightly fewer total businesses (3.5), than men (4). Fewer women had merged their business with another (16 percent) compared with men (26 percent). More women had sold a previous business (63 percent) compared to men (58 percent). Kirkwood (2003) suggests that since the majority of female businesses are in the service sector this could be a cause for lower sales volumes as against men being in manufacturing which is labour intensive and more able to get higher dollar sales.

Access to finance and banking by 22 percent of females was similarly identified in the Kirkwood & Brown (2001) survey. This reasonably low figure may result from savings providing finance at the start-up stage since 48 percent of respondents in their survey indicate they used their own savings. Haynes & Haynes (1993, in Massey & Lewis, 2003, p.13) found "there was a higher probability that women would borrow from family and

friends and use non-traditional or non-institutional lenders". As an example of this, an angel fund provided by a charity in Christchurch offers women access to interest free start-up money (Harvey, 2003).

## **RESEARCH SAMPLE**

A questionnaire with two postings sent to all BITC's 5327 client businesses resulted in 1207 valid responses, a response rate of over 25 percent. Respondents are small and medium businesses throughout New Zealand who applied to BITC to join their mentor assistance programme during the period from December 2000 to February 2002. They are a self-selected and have prior expectations of the service (Chalmers, 2002).

BITC has 22 branches throughout the country and its database is representative of regional proportions of SMEs in New Zealand, defined by the number of people employed (Commerce, 2000). The current research sample figures conform with national statistics of 84 percent of businesses employing five or fewer full-time people and 96 percent of businesses employing fewer than 20. As well, national statistics show females make up 38 percent of entrepreneurs (GEM, 2002), a figure which is matched in this research. This sample reasonably approximates national statistics on female entrepreneurs in New Zealand.

## **SURVEY RESULTS**

### **Manager-Owner Descriptors**

Females make up 38 percent and men 62 percent of BITC's clients. Both are primarily aged 41-50 (females 33 percent and males 39 percent). Second rankings show 30 percent of females being 31-41 and 26 percent of males in 51-60 category. Third ranks are almost equal in the 51-61 category (females 25 percent and males 26 percent).

The majority of BITCs business owners have only secondary school qualifications - females (28 percent) and males (31 percent). There are three female and four male business owners with only primary qualifications. A diploma qualification is second ranked for females at 20 percent (13 percent for males) as against a Trade Certificate for females (7 percent) and for males (23.4 percent). Third ranked for females is a professional certificate (18 percent, 11 percent for males) and for males a degree (14 percent). Females hold an equal 14 percent, but a fourth rank. More females (11 percent) hold a post-graduate certificate than males (7 percent).

Over 71 percent of females owners work full time in their business as compared with 84 percent males.

Females (34 percent) have owned another business as compared with 45 percent of males.

The majority of females and males had more than 5 years (47-48 percent) experience as an employee. Their experience as an employee in another business for all periods is remarkably close, including the percentage for no experience, both at 29 percent.

The prime reason for going into business is a desire for independence (females 46 percent, males 43 percent). Both males and females show personal ambition as a second rank (26 percent). Third rank is exploiting a commercial opportunity (females 7 percent) and avoiding unemployment (7 percent) for men. Combining avoiding unemployment and job dissatisfaction accounts for 5 percent of females and 8 percent of males. The combined scores for desire to innovate and exploit a commercial opportunity are females 13 percent and males 7 percent.

## **Business Descriptors**

BITC's client businesses are situated in the largest North Island city, Auckland (females 21 percent, males 22 percent), with the largest South Island city, Christchurch second (females 17 percent, males 15 percent). Wellington, the capital city, ranks third (females 10 percent, and males 7 percent equal with North Shore and Hamilton, satellite cities of Auckland). Businesses of females and males spread reasonably evenly throughout the remainder of the regions of New Zealand, but trend downwards in line with the population.

Females (38 percent) predominantly operate their businesses in their local area, a marginal second rank for males (26 percent). Operating nationally is second ranked for females (23 percent) and first ranked for males (27 percent). International operations are a third rank of almost equal percentages, females 17 percent and males 18 percent.

Most females (34 percent) and males (22 percent) identify their business activities as being within the wholesale, retail and hospitality sectors. However, second ranked for females is community, social and personal services (23 percent) and for males is manufacturing (22 percent). The third ranked industry for females is manufacturing (16 percent), and for males building and construction (14 percent). Both have a fourth ranked of business services, finance, insurance and real estate (females 11 percent, males 13 percent).

## **Business Form, Age, and Growth**

The main form of ownership is sole proprietor (females 38 percent, second ranked for males at 23 percent). Most businesses take the form of private company for males (58 percent), second ranked for females (35 percent). Partnerships are third ranked for females (23 percent) and males (17 percent).

More females (25 percent) than males (17 percent) have owned their current business for up to 1-2 years. In the 3-5 year period ownership is identical for females and males (29 percent). Ownership for over five years show females at 41 percent and males at 50 percent.

Generally, females (39 percent) did not employ any staff or had only 1-4 employees (38 percent) although 12 percent did employ between 5-9 staff. The majority of males (46 percent) employed 1-4 staff. Only 26 percent had no staff and 18 percent had between 21-30 staff.

The majority of females (54 percent) and males (49 percent) did not envisage employing staff within the next 12 months. However, females (26 percent) and males (27 percent) did consider a one-member staff increase was likely. A two staff member increase was possibility (females 10 percent and males 11 percent) and greater than two were almost equal possibilities for both females (8 percent) and males (11 percent).

## **Management Issues and Needs**

Lack of market knowledge was the first ranked business impediment (females 25 percent and males 23 percent). Lack of finance/difficult bankers ranked an equal second (females and males 20 percent). Lack of management expertise is third ranked for females (12 percent) whereas lack of right mix of employee skills is third ranked for males (15 percent). This is fourth ranked for females (9 percent), and ranks equally with inadequate business systems, and lack of innovation – new markets. The latter is fourth ranked for males (10 percent).

Advice from mentor's experience was the prime reason to approach the mentor organisation (females 44 percent and males 49 percent). Both females and males ranked second the importance of the mentor acting as a sounding board (34 percent equally).

Owner-managers identified whether obtaining assistance from the mentor organisation helped them bring about positive changes to their business. Although these responses are specific to this mentor organisation it is interesting to note that the perceptions of both females and males were almost identical.

1. Opportunity to reflect on business development (females 59 percent, males 56 percent).
2. Opportunity to reflect on management issues (51 percent for both).
3. Better understanding of the business (48 percent females, 45 percent males).
4. Implemented new processes or systems (37 percent females and 34 percent males).
5. Developed business or marketing plans (35 percent females, 34 percent males).
6. Improved turnover (32 percent females and males)
7. Improved financial management (27 percent females, 28 percent males)
8. Increased profitability (28 percent females, 27 percent males)
9. Encouraged them to undertake training (females 25 percent, males 17 percent)
10. Networked with other businesses (22 percent females, 19 percent males)
11. Improved use of technology (16 percent females, 19 percent males)
12. Joined an industry association or chamber of commerce (12 percent females and males)
13. Improved access to suppliers (10 percent females, males 12 percent)
14. Accessed finance - bank or grants (9 percent females, 10 percent males)
15. Changed location (6 percent both female and males)
16. Improved relationship with council (4 percent females, 5 percent males)
17. Started exporting (4 percent both females and males).

## **DISCUSSION AND CONCLUSIONS**

New Zealand's culture has continued to move towards proactively supporting women since the opportunities provided through their right to vote and have a say in the nation.

Legislation continues to specifically address their social and equity needs. The key constitutional positions held by women provide role models of female capability and leadership. In ten years the affirmative movement has gone a long way towards closing the gap in the number of females employed in senior positions.

The increased attention and assistance being given to SMEs is on the whole non gender-specific. From the data collected in this research there is high significance in the closeness of female and male percentages and rankings to most questions asked. The reasons for this would be the focus of further study. It is highly likely that social changes, the role of women in society, and the legal support provided have contributed to enabling female entrepreneurs.

Fewer female entrepreneurs set up as a company and are more likely to operate as a sole trader in their local area. This links closely to the predominant differences in service sector involvement and in particular female involvement in community and social services and hospitality.

The low and almost matched percentages of anticipated staff increases for females and males revealed in this research appear to endorse Frederick's (2003) assertion that on the whole New Zealand's entrepreneurs lack the urgency to grow and create wealth and instead favour a balanced lifestyle.

This research sample is weighted towards the "pull" factors for starting a business (Jodyanne Kirkwood & Brown, 2001). These entrepreneurs want to be independent, they have personal ambition and seek to exploit an opportunity. Push factors such as negative work conditions were of low significance in this survey and are not the main motivators for starting up a business.

Eight percent more female than male owners are under the age of forty and thirteen percent fewer females are full time workers. This indicates that younger women could be combining family commitments with their business.

Seventy percent of female owners and seventy nine percent of male owners had been in business for more than three years. They were proactive in seeking assistance from the mentor organisation and equally rated being keen to hear advice from a mentor's experience. It is not surprising that both male and female owners rate their business impediments of market knowledge and finance/difficult bankers almost identically. These impediments indicate a cycle stage of their business and could imply a desire to grow it, or save it from new entrants to their market and falling sales. This could be a further area for study.

Most impediments for the business owners were not significantly different. The greatest gender distinction in impediments were noticeable in the third rankings. Females lacked management expertise a 4 percent difference, whereas males lacked the right mix of employee skills, a 5 percent difference.

The labour intensive nature of the service sector compared with the capital intensive manufacturing sector is referred to by Kirkwood (2003). She sees female entrepreneurs' involvement in services as against manufacturing as being responsible for females' lower sales volumes. The six percent difference between females and males in manufacturing is not as high as could be anticipated from her analysis. The main distinction between males and females is in community and social services where there is a 15 per cent difference.

This certainly provides a reason for the high zero employment figures for females and low their sales. They would be more involved in low paid, individual services such as cleaning.

Little research has been carried out on gender-specific requirements for female entrepreneurs in business. Of particular interest is the almost identical responses given for all mentor assistance categories. This research shows that the mentor assistance was equally beneficial for male and female entrepreneurs in almost all categories surveyed but especially in management and marketing which were the areas that both genders identified as the major impediments to their businesses.

The action plans of Industry New Zealand to bring about a positive business culture in the country, of the MWA to encourage women's entrepreneurship, incubators associated with universities, Industry New Zealand clusters, and assistance agencies for businesses all point to the building of a supportive environment for female entrepreneurship.

Gaps are closing in the female/male statistics, but they are still there. Some women do not feel the need to be targeted for special treatment and are happy with their access to non-gender specific assistance. Women are succeeding academically and politically and the independence business offers is enticing for female entrepreneurs. Systems which integrate advice, support, mentoring, and training in specific areas to develop these women and meet their needs will enable an intending female entrepreneur to maximise her potential.

## ABSTRACT

*The growth in the importance of non-standard forms of employment at the labour markets has, for its part, complicated the question of work/personal life interface. The emerging situation at the labour markets concerns also those working in their own businesses and in family businesses. This group has to large extent, been largely if not fully forgotten in in the public policy and governmental policy discussions dealing with work/personal life interface. The same concern is true also for research within work/family -interface. Research done in the field of work/family balance within business activities, specifically within family business, has been scarce. The underlying assumption seems to be that work and family balance is seen as related only to paid employment relationships, thus being a policy targeted specifically towards employers, and secondly, mainly to women. It could be argued that in family business the work/life balance question concerns every member of the family, and cannot thus be targeted towards women only, even if the question itself remains gendered. In addition, in family businesses work and family cannot be separated as in the case of employees since the same people are functioning both at work and at home. The family/work relationship could be assumed to cause frictions or problems, when the issues of family vis à vis business become confronted with each other. However, the general assumption does not necessarily have to hold true.*

*In the following paper, we will present an overall view to the discussion and some of the main empirical results obtained. The research analyses the unexplored field of how and in what way balancing of work/family in family businesses is realized. The study is based on a nationally representative survey among Finnish family businesses, the focus has been to study how and in what ways the work and family are combined. Secondly, the aim was to explore the dynamics between family activities and business activities. Results suggest that issues related to work/family interaction are mainly well organized in Finnish family businesses. There was no evidence of treatment of business and family as opposites, nor as conflicting, but reckognised as being part of the same continuum. In this study the*

*situation is described as a scale of balance where the coexistence of business and family prevails.*

## **INTRODUCTION**

Even if the idea and meaning of a family firm varies both culturally and economically, it should be noted that worldwide, three-quarters of all companies are family firms (for example Reynolds, Bygrave, and Cox 2002). The importance of families as the cornerstone of the economies has thus been acknowledged, also at the policy level. At the European level, the recent “Green Paper on Entrepreneurship” by the European supranational EU Commission, launched in spring 2003, takes up the key issue of family businesses as a vital element in economies. The importance and significance of family businesses to national economies as a major source of growth and employment and as an incubator for new business ideas has gradually been understood (for example Kets de Vries 1996) also in business studies and research. Economy is not only about big businesses but also, and in many cases more vitally, about economic activities rooted at the family life and originating from family-based business activities. Of the small and medium-sized firms, family businesses are a dominating form of entrepreneurship worldwide and the economic structure of many nations remains dominated by family firms (Chrisman, Chua, and Sharma 2003). Their domestic ownership makes their importance to national economies especially pronounced. It can be assumed, that crises originating from the family might have strong impact on the business within family enterprises.

General academic interest towards family businesses is recent but rapidly growing (Brockhaus 1994). Still most of the writing regarding the family business comes from Anglo-Saxon culture, particularly from USA (PRIMA 2002). And yet, in many studies, the family and its vital role in the family business has not been fully acknowledged until recently. Researchers have given different roles and positions for the family in the family business, ranging from *operational* definitions to *embeddedness* definitions, where the business is an integral part of the family activities. We do not aim to adopt one perspective over another beforehand, but aim to analyze, whether these two systems, family systems and business systems, are seen as separate, competing or necessary for each other. Our specific interest lies in the question of how work in the own business – as being different to paid employment – is combined with family activities in the family businesses.

The need to find a balance between work and family, and the growing need for increased flexibility has achieved a lot of attention in publicity, mass media and both national and supranational economic, governmental and working life programs during the recent years. “The Year of The Family”, launched originally by UN in 1994 emphasized the importance of family also in the economic issues in a broad sense. In US, the Office of Work/Life Programs (OWLP) has for a longer time developed and issued policy and guidance programs that deal with work/life and wellness issues that enable US Federal employees to balance both their work and family responsibilities (OPM 2003). Similarly, many corporations have developed alternative work arrangements, family care absence and leave arrangements, created through a time bank, for example, that create flexibility in time and place of employment such as flextime, job sharing, work at home, part time work and compressed workweeks, to attract the attention of workers. All these models are targeted for employees, and pursuing better and more flexible integration of working life and family life. In Europe, similar programs both at the corporation level and at the national

level can be found, effective either through legislation or through individual corporation culture adjustments.

The change in corporation culture has not taken place easily: the need to create flexibility by balancing the employment and caring responsibilities has been notified relatively slowly in the working life practices (Felstead, Jewson, Phizacklea, and Walters 2002). Overall, models such as described above put emphasis on the idea of nuclear family, on effectiveness of the labour renewal at home, and on the role of women in this labour renewal process. Even legislation that puts specific emphasis on equality, most often targets women employees. Employers, when self being in a position of integration of work and family, are supposed to manage it without other mechanisms than the ones offered by the legislation universally to all citizens.

## **The Invisibility of Entrepreneurship in Work/life Studies**

As mentioned above, presently the research of the interaction of work, family and personal life focuses mostly on paid work, problems related to that, and possibilities to increase flexibility in the organizational and in the work-place solutions. One obvious explanation for this is the fact that vast majority of the work force is still in paid employment contracts. However, as the working life is changing, there is growing need to acknowledge and explore these new situations, where employees no longer are in paid employment, but are to be found in a variety of contracts such as self-employed, contract employees, subcontracting, etc. What we find extremely interesting is that the majority of the studies concerning the combination of work and family have been geared either towards employees and their possibilities for balance, their reactions and attitudes, or alternatively, towards family-friendly policies and practices of large organizations and corporations.

Research done within the field of work/life balance within business activities, specifically within family business, has been scarce, and the topic has been nonexistent in the public policy and governmental policy discussions, where the dominance of discussion has fell into the domains of work-life balance programs and their implementation. Even if there has been a call for research related to the family and business interface (Hoy, and Verser 1994), large survey data and policy measurements are still missing for family businesses. In similar vein, the visibility among researchers on work/life interface is lacking. The lack of interest – both theoretically and politically – and/or knowledge, to the lives of those who are not within the policy programs of large corporations, but who juggle with everyday life of business activities render the research into one field only.

We argue that the underlying assumption is that work and family balance is seen as related only to employees, thus being a policy targeted towards employers, and secondly, mainly to women. However, in family businesses work and family cannot be separated as in the case of employees since the same people are functioning both at work and at home (Cromie, Adams, Dunn, and Reid 1998). The questions of work/life activities are strongly gendered, both at the individual level (work-personal life integration), and at the organizational, and socio-political level (family-friendly policies and culture). It could be argued that in family business the work/life balance question concerns every member of the family, and should not thus be targeted towards women only, as it often is at the company level policy practices, if not in documents (Hearn, Kovalainen, and Tallberg 2002).

In research about combining work and family paid employees are the most common research subject, which has partially ruled out from the theoretical standpoints the questions that are relevant when combining work and family in an entrepreneur family. The questions concerning combining work and family are different within entrepreneur families than they are in employee families. On one hand, they are very concrete questions such as the possibilities and costs of parental leave and transfer of business activities from one generation to another. On the other hand, they have implications for the possibilities of developing and growing the business, and possible individual choices between the family and the business. The question of combining work and family has its own special significance when a family business is concerned, when spouses, or even different generations are involved in the business activity. How are work and family combined when work and family meet both at home and at a family business? Family and business are not separate worlds that have significance to each other only on special occasions, and not separate in time and place as in the case of employee families.

## **Work and Family as Life Spheres**

Both time budget studies and surveys on the attitudes towards the importance of work in life give evidence to the idea that entrepreneurs place work before family more often than employees (Cromie, Adams, Dunn, and Reid 1998; Reid, Dunn, Cromie, and Adams 1998). What is interesting is that a “family-business family” might actually spend more time together than an “employee family” who are working regular hours, and their work is intertwined with the time they spend together. A business family may spend inordinate amounts of time together, in fact; whereas an employee family’s is together only during leisure time. In family businesses, the time becomes practically interwoven in comparison to employee families.

At the more general level, it has been noted that work/life balance is partly a phenomenon of the modern society where work is detached to a separate life sphere. Paid work is acknowledged as one of the most effective ways to prevent social marginalization and injustice; on the other hand long hours and stressful work have detrimental impact on employee’s physical and mental health and family life (Felstead, Jewson, Phizacklea, and Walters 2002). The significance of work and family as life spheres has been mainly researched within time and quality of working life studies. A family as a sphere of life has been studied mainly within family studies. The work has gained more significance in today’s society in building one’s identity as familial relationships have been replaced by working skills (Sennett 1998). The discrepancy between values and reality is visible in the results of the studies concerning the value systems in modern society: Even though people value family more than anything else in their lives, family has to give way to work. Work and family can also be seen as compatible but in recent years they have become rivals, they are seen as competing with each other (Russel Hochschild 1997).

Combining work and family has been seen as a source of conflict for the entrepreneur but in several studies it has been shown that the role of the family can actually be very positive for the business (Dyer, and Handler 1994). Since the entrepreneurial career and work are demanding balancing of the needs in both areas is not easy (Baines, and Wheelock 2000). Therefore, the argument most often is that the immanent conflict between family and business lies at the heart of family businesses’ problems (Kets de Vries 1996). The problem is often considered to be psychological in nature and the solution to the conflict therefore comes from the sense of duty towards the business existing within the family (Donnelley 1964). Another argument most often existing in the family business literature is

that the family business is seen as a very good way for combining work and family flexibly (Dyer, and Handler 1994). Members of the family are not just part of the family, they are also individuals, having separate, yet interwoven past, present and perhaps even future. In the case of divorce, the family business is often targeted in many ways and at various levels. Again, when compared to employee families, the assumed effect of the divorce usually is at the personal level only, not at work at all.

The gender is present in a family business research in many ways: Work and family balance is more often mentioned when women entrepreneurs are being studied. Women are more likely to mention a work-family balance as a reason to start a business (Baines, and Wheelock 2000; Javefors Grauers 1999; Kovalainen 1995). A family business can be seen as a meeting point of the traditionally masculine public sphere and the traditionally feminine private sphere; and this relationship should be made visible (Javefors Grauers 1999; Karlsson Stider 2000). It could be assumed that the impact of gender does not sum up in a comparison between women and men but internal dynamics of family business has an impact on what position the gender as a predictor of attitudes gets in combining work and family. Also, assumptions of the ways gendering takes place within the family and at work, does have impact: In Finland for example men seldom take parental leave, even if they are entitled to it through legislation. The work family interface thus in fact affects more women than men, and only few corporations encourage men to participate family life in their family policies. Gender does become visible in several ways: in gendered patterns of behaviour, in gendered policy instruments, but also in the ways families solve their work/family interface.

## **In What Ways Has the Family Impacted on Family Business Studies?**

It is crucial to acknowledge that family businesses are not a homogeneous group (Birley 2001), similar everywhere, irrespective of the cultural and societal differences between countries. A dominant view has prevailed in family business literature that family businesses differ from other businesses regarding the impact of the family (Baines, and Wheelock 2000). Family businesses have similar features only if families have similar features. It is not, however, sensible to assume that families would be more homogeneous than businesses when it comes to structure, culture and nature of activities (Coffee 1996). The changes in the family structure in the Western societies put under consideration the question if family businesses are at all different from other businesses. Do we even unnecessarily make a distinction between these two, in order to emphasise the rational nature of the business logic and irrational, emotional nature of the family logic? We will come back to this question in the end of our paper. Empirically, the difference between the family activities and business activities exists, and there is no reason to expect that they would be similar or even resemble each other, even if the rethorics often parallels in business and in family.

It is clear that a family has an impact on the business activity but it is important to ponder if this impact is analytically distinctive enough a feature to have an influence of its own. A family is certainly not a feature that would define the business activity deterministically and create a homogeneous business group, as sometimes believed. The family as a social base of the business cannot as such diminish or change the significance of the business competence in business. But in a family business the role of the family has to be pondered in many ways in different phases of business. This study will focus on ways the family and business activities are seen in relation to each other in a nation-wide survey done in Finland.

## RESEARCH

The fact that attention has to be paid to the definition of a family business and the generalizability of results has repeatedly been emphasized in recent international family business studies. A national sample has rarely been used in family business studies, and where small local samples have been collected the generalizability is limited (Winter, Fitzgerald, Heck, Haynes, and Danes 1998). The data for this study was gathered within a national research project on family businesses. The data used in this paper consists of a representative sample of Finnish small and medium sized enterprises and thus fulfills all those criteria set to national data sets. The data analyzed in this study consists only of the family businesses.

The firm was defined as a family business if the answer to any of the following questions was positive: 1. Do you think your business is a family business? 2. Has anyone of your immediate family or relatives (spouse, children, parents, siblings or their children) ownership in the business or has anyone of them invested their money on the business for example as a loan? 3. Does anyone of them work in the firm as a paid employee? The firm was not regarded as a family business if a) it was a question of a one person firm, that is the respondent acts alone but defines himself/herself as a family business b) it was a question of "we are a big family" thinking, that is there is no family connection between owners and employees.

A family business is generally defined by some combination of characterizing features such as the subjective view of an owner-manager, the presence of a family, ownership, management and generations. In this study the definition was based on the subjective view and the presence of a family. Tight definitions that are based on ownership, management and generations are not necessarily useful when trying to understand the business/family perspective defined primarily by the owner-manager (PRIMA 2002), therefore the tightest criteria were not used in this family business study. A broad definition is used here since when studying this area it is enough that a business has some features of a family business. Instead of the definition the aim is to focus on how the family is actually perceived at work.

The 26 attitude statements regarding the interaction between family and business were analysed. The attitude statements covered a variety of issues concerning the family business activities. These statements were originally grouped in six question areas: Business and family matters, Division of labor and skills, Business goals and development, Communication and human relations, Remuneration and commitment, and Ownership. The analysis of the data was exploratory, as the attitude patterns were not tested beforehand, and no formal hypothesis were set. Multimethod analysis (factor analysis, cluster analysis, crosstabs and chi-square tests) was used to analyse the data. Relationships with the most interesting background variables were also explored.

## RESULTS

Even though the starting point of the study was exploratory, the results were following neatly the theoretical dimensions discussed earlier. The variables were grouped in the analysis in three dimensions: the business logic, the family logic and the dilemmas of the

family business. On the basis of the descriptive statistics and further analysis, it can be argued that there is a strong agreement in Finnish family businesses about issues related to combining business and family. Our study also reinforces the outlook that combining work and family has an impact on the success of the business. And when things go badly for the business a conflict with the family can arise as well.

There is a strong agreement of the overall nature of the business logic in family businesses. The dimensions related the business logic are business goals that is the way business is run, the importance of professionalism and the share and the spread of ownership & power. It falls rather naturally that family businesses cannot afford to differ from other businesses of similar size and sector when it comes to business principles and practices. According to Kelly, Athanassis, and Crittenden (2000) the most harmonious family businesses are those with clear and unanimous vision. The results concerning the Finnish family businesses strengthen this result.

These are very relevant and interesting findings as they challenge the view that family businesses have specific problems in these areas, due to the family. Especially ownership has often found to cause troubles in international family business studies. Family businesses are often small since along with growth the ownership base often has to be broadened in order to secure the access to capital. Family businesses in general want to keep the ownership within the family (Cromie, Adams, Dunn, and Reid 1998). Ownership is probably more personified in family businesses so reacting between ownership and economic situation is quicker and more direct: The willingness to change the ownership when things go badly shows the importance of ownership relations.

As for the family logic, in the research sample dimensions related to human relations & contradictions and trust are in order. Only emotions seem to complicate the business activity somewhat as a significant part of the respondents feel that the feelings are involved too often in the business activity. Strong feelings and the externalization of feelings are indeed found to be typical for family businesses (Kets de Vries 1996). Feelings can make it more difficult to evaluate relatives' words or actions objectively (Tagiuri, and Davis 1996). Except for the item of feelings, our results challenge the outlook that human relations would complicate the family business activities. On the other hand, the idea of trust and good communication as strengths of a family business (for example Kets de Vries 1996; Lansberg 1983) is confirmed in our results.

Other problems of a family business most often mentioned in research literature related to the monetary issues are the unfair rewarding system and the unbalanced relationship between contribution and compensation: most often there is a question of overcompensation or undercompensation (Kets de Vries 1996) The view about fairness seems to differ within the family and the business (Lansberg 1983). Our results do not give much emphasis on this dilemma, as most of the family businesses do not see these issues as problems – contrary to what a lot of previous literature suggests.

In this study, biggest differences among the family businesses are caused by dimensions related to relatives vs. outsiders and work & leisure time. The first dilemma of the family businesses includes attitudes towards employing relatives and the need for stronger external expert involvement. Nepotism and lack of professionalism are often said to be the most difficult problems of a family business but there have been studies that have found not much evidence of this (for example Poutziouris, and Chittenden 1996). In this study the respondents found the management (in part, their own) of the business to be professional.

However, a significant part of the respondents is willing to give work to all willing relatives and an equally significant part recognizes a need for more outside involvement.

Work & leisure time, related to the family logic, revealed to represent the second dilemma of the Finnish family businesses. In many studies most family businesses have placed business before family (Cromie, Adams, Dunn, and Reid 1998; Reid, Dunn, Cromie, and Adams 1998); although Finnish respondents have typically put family first more often (Birley 2001, PRIMA 2002). There is some evidence of a systematic business orientation in this study: First, this becomes visible in reporting the use of time since the majority of the family businesses recognize lack of leisure time. Secondly, this becomes visible in reporting the overwhelming nature of business, as a substantial portion of the respondents experience arguments on business matters at home or even feel that business is their entire life. This supports the view that family, work and leisure time are interrelated in family businesses. This complexity does not however naturally mean complicated nature of the relationship, on the contrary, the swift dynamics between different 'ends' of the continuum refers to the strength of the family businesses in Finland.

## **DISCUSSION AND CONCLUSIONS**

Considering the empirical results in our study from the national survey on Finnish family businesses and the analysis presented above we can conclude that the issues related to balancing work and family are mainly well functioning and conveniently organized without bigger contradictions in Finnish family businesses. This result is interesting for several reasons. First, it suggests that family businesses are basically effective and rational in their activities: the family does not seem to present a big problem, 'irrationality', source for endless problems or even a threat to business activity – contrary to the claims often made in the research literature. The family is often argued to be both a resource and a restraint for the business (Miller, Fitzgerald, Winter, and Paul 1999). It is sometimes seen as a separate and contradictory element in the business because of its logic of activity is seen as compromising and deviating from rationality that business has to be run. In this study there was not much evidence of the negative impacts of the family towards the business. In the following we closer analyse the reasons for the assumptions such as the one described earlier.

The assumption of the distance between family and business may stem from the stereotypical idea of business activities being strongly attached to rational, logical, and autonomous decision making processes where issues such as emotionality, feelings etc. have no place, while family is often seen strongly attached to private sphere, 'emotional haven' in the ruthless world, incapable of functioning according to the business logic. This basic assumption is most often reflected in the research literature, reflecting only the strong division created in the thinking of the economic realm represented by the business, and emotional realm represented by the family. Our empirical results do not, however, give support to these stereotypical images of the distinctiveness and oppositional nature of families and businesses.

The role of the family has been found also elsewhere to be a more significant factor for the success of the business than many so called traditional elements (Dyer, and Handler 1994). The commitment of the family to the business activities can be a huge resource in the process of founding growing business. Having a family has proved to increase

enjoying work and the positive impacts are bigger than negative. In family businesses there is an emotional element involved in the activities, which is lacking from other businesses (Reid, Dunn, Cromie, and Adams 1998); and an effective management style is based on understanding human relations, not on denying them (Donnelley 1964). The results put the question of the role of the family in the family business into consideration. It has implications for the role of the family in other kinds of businesses as well, as we have shown earlier in the discussion in this paper.

Second, the empirical results challenge the view of the family as an opposite to the business. We suggest, based on our empirical findings, that not only theoretically but also empirically family and business are intertwined and should be placed in a continuum rather than treated as separate and opposites to each other. In the family business literature a dominating theme has been the idea of two separate fields: business and family (for example Karlsson Stider 2000). The assumptions concerning the two systems, family and business, are often presented as fully contradictory, which is then seen to lead to an easy conflict. The systemic approach that proposes setting clear boundaries is not always possible but rather there is a spillover effect from one system to another (Miller, Fitzgerald, Winter, and Paul 1999). The two dimensions, work and family, are intertwined though they are analytically often kept separate (Coffee 1996).

We suggest that the dimensions found in our data-analysis mean that family and business could be set to a family/business continuum interlinked and intertwined with each other. In the analysis it became evident that some of the family businesses are more attached to the business logic and some of them to the family logic. The situation can be described as a scale of balance where at the other end weighs the business logic and at the other end the family logic. In the scale different elements can be seen as separate dimensions but they form a dynamic entity. We suggest furthermore that it is probable that no family business stays statically in one place at the continuum but moves dynamically over time. The family and the business are intertwined, which does not exclude the idea that they can also be conflicting regarding some factors. It is therefore not very fruitful for future research to think the business and the family as “two entirely separate worlds”.

A question could be asked whether business and family are really seen as opposite elements in an individual's life or is there an entity of life where a continuum exists instead of separate elements. The difference between family and business might be partly produced and reproduced by the research and not through the reality prevailing in the respondents' life. An alternative to the system approach could be the field theory where individuals have positions in field and they are trying to maintain a dynamic balance (Miller, Fitzgerald, Winter, and Paul 1999). Family and business have overlapping fields among which there is competition on resources. The family business is an interesting research subject precisely because of the dynamic interaction of business and family in a continuum that is not based on unchanging balance, but on the variation of the importance of family and business in the continuum.

# **PUBLIC POLICY, PRIVATE REALITIES: AN ASSESSMENT OF THE CONTRIBUTION OF THE WASHINGTON CONSENSUS TO SMALL BUSINESS DEVELOPMENT IN ZAMBIA**

**Sean Willis, Managing Director, Terrapinn Limited**

## **ABSTRACT**

This paper examines the role of government and public policy as it affects small business in Zambia.

Zambia's privatisation programme, as part of its broader macroeconomic reform programme, should have created an environment much more conducive to small business growth and proliferation as a large part of the economy moved out of state control. This paper seeks to examine to what extent this has been the case.

Using a combination of desk top and interview-based research, the paper examines recent Zambian political and economic history, considers some of the outcomes, and looks in some detail at the current regulatory environment for small business. In doing so it touches on the informal economy, formal and informal employment, and costs of borrowing.

The conclusion of this paper is that the recent reforms are a necessary but insufficient precondition for the establishment of a small business-friendly environment in Zambia, and that small business remains hampered by a relatively unfriendly regulatory regime, as well as a range of other challenges including high interest rates.

Recommendations concentrate on some realistic and quite specific policy options available to the Zambian government to create a more enabling environment for small business growth and proliferation.

## **ACKNOWLEDGEMENTS**

Much of the data used here from the World Bank's 'Doing Business in 2004' report was prepared by the World Bank for initial use in another paper presented by Dr Silane Mwenechanya of the Zambian Business Forum to the Zambian Investment and Business Advisory Council.

## INTRODUCTION

This paper examines the impact of macroeconomic policy (in particular the implementation of the Washington Consensus<sup>1</sup>) on the environment for small business in Zambia.

Zambia is an important case study because it is a developing country with high unemployment, a country where a thriving small business sector could make a dramatic difference to the lives of those who live there. It is also important because in 1991 it began to quite vigorously implement most, if not all of the macroeconomic requirements of the Washington Consensus. However, it has conspicuously failed to experience the growth that was anticipated, not least in the arena of small and medium business.

This has been deeply disappointing to many. Zambia's privatisation programme, as part of its broader macroeconomic reform programme, should have created an environment much more conducive to small business growth and proliferation as a large part of the economy moved out of state control and foreign direct investment flowed in.

## THE STORY SO FAR

Let us begin with a brief background to some of the global and Zambian developments that have brought us to the current situation.

In 1989 an economist named John Wilkinson outlined a set of economic policies which were believed to be a formula for promoting growth. Although Wilkinson has said that he was specifically addressing the situation in Latin America,<sup>1</sup> his ideas became widely accepted amongst the highly influential foreign donor community (notably the World Bank and IMF) as being appropriate to the developing world more generally.

In Zambia they were to have a powerful impact, as the following outline of recent political and economic developments in Zambia illustrates.

From October 1964 when Zambia gained independence from Britain until 1991 it was governed by the United National Independence Party (UNIP) led by Dr Kenneth Kaunda. Zambia's political environment was initially pluralist, changing in 1972 into a one party state. In late 1990 in response to a range of pressures President Kaunda accepted the re-introduction of multi-party politics. The Movement for Multiparty Democracy (MMD) won those elections by a landslide and in October 1991 formed a new government led by Frederick Chiluba.

The economy that they inherited faced a number of challenges. UNIP had subscribed to a state led development model, financed mainly by revenues from copper (and also cobalt)

---

<sup>1</sup> The 'Washington consensus' were a set of policies designed in the early 1990's which were believed to be the formula for promoting economic growth in the developing world. These policies called for free trade, fiscal austerity, and reduced government intervention in the economy. Source: online dictionary <http://www.onelook.com>

exports and, crucially, World Bank and IMF loans secured against expected future revenues. (It must be noted that at least initially this was entirely in line with much of the development orthodoxy of the time).

As a result many social and economic indicators showed remarkable improvements in the years immediately after independence. However, the copper price has steadily declined in real terms since 1970.<sup>2</sup> The effects of this were exacerbated by the increase in oil price in 1973. In many ways these two shocks precipitated what became long term socio-economic decline.

Zambian annual per capita income had dropped from US\$700 at independence to US\$290 in 1989. While Zambia's performance on social indicators such as school enrolment and infant mortality was good in the 1960s and 1970s, "economic decline saw improvements falter".<sup>2</sup> Primary school enrolment rates dropped after 1985.<sup>3</sup> Infant mortality (which had fallen from 147 per 1000 live births in 1969 to 79 in 1977-8), actually rose to 107 during 1987-91; and a higher percentage of children under 5 years of age were stunted or wasted in 1990/91 than in 1970/71.<sup>4</sup>

In 1991 over 250 State Owned Enterprises made up over 80% of GDP (as against fourteen SOEs making up some 14% of GDP at independence).<sup>5</sup> Zambia's external debt had risen from US\$623 million in 1970 to over US\$ 7 billion in 1990.<sup>6</sup> GDP was around two-thirds of the level of the late 1960s.<sup>7</sup> The rate of inflation was over 90%.<sup>8</sup> Scheduled debt servicing used up some 61% of export earnings.<sup>9</sup> To all intents and purposes the state was bankrupt and government's role in providing social services had been weakened and sidelined.

The answer was the imposition of a set of Washington Consensus reforms. This was supported both internally and externally in Zambia. Internally in that the new MMD government's view on the private sector was quite different to that of its predecessor. It noted that "the government restricts itself to rehabilitate and build socio-economic infrastructure with a small public sector in the midst of a basically private enterprise economy".<sup>10</sup> Privatisation in particular was envisaged to be extensive, the MMD noting that "the government will not engage in business"<sup>11</sup>.

This might seem surprising since the MMD grew out of the Zambia Congress of Trade Unions of which Frederick Chiluba was Chairman General from 1974 to 1991.<sup>12</sup> However, the ZCTU was dissatisfied with the manifest failings of state ownership, which was seen to impact negatively on workers health and safety as well as more general economic decline. The failure of state ownership and direction of the economy had been apparent for some time. Simwinga argues that as early as 1977 there were indications that government would, in the interests of national development, tread "more of a capitalist path of development than it has done since 1968"<sup>13</sup> while in 1989 Turok reported that

*the system is presently not inducing the development of the productive forces which is leading to stagnation in the state sector and hence to a questioning of the state's leading role in the economy and of its legitimacy generally.*<sup>14</sup>

---

<sup>2</sup> Though it shows recent signs of picking up as demand from China increases.

Also, when the MMD was officially launched in December 1990 it received support from Zambia's small private sector, which was keen to see more of the economy under private sector management and ownership.

The MMD was thus able to articulate and push for a policy of privatisation both despite and because of its strong labour credentials. Having said that, it must be noted that international pressure was a factor of some significance. For example, the IMF's Rights Accumulation Programme<sup>15</sup> attached the following conditionality:

- (i) ceilings on reserve money and domestic credit creation;
- (ii) compliance with various fiscal indicators, including reduction in debt arrears; and,
- (iii) policy changes to liberalise the foreign exchange and credit markets.<sup>16</sup>

(The programme, which enabled Zambia to reschedule its debts to the IMF<sup>17</sup>, commenced in April 1991 – *before* the MMD accession to power – was a result of the resumption of regular relations with the World Bank<sup>3</sup> in March.)

The reform programme that the MMD embarked on had four main components: privatisation; macroeconomic stabilisation; agricultural reform; and reform of trade and industrial policy.<sup>18</sup> Within this framework, austerity measures introduced included cost sharing for medical and education services; privatisation of nearly every state owned company (notable exceptions thus far include Zamtel, Zesco and ZNBC<sup>4</sup>); restriction of money supply through a cash budgeting system (whereby government only made payments if it had the cash available); liberalisation of trade; "stringent" revenue collection; and the introduction of Value Added Tax (VAT).<sup>19</sup> (It must be noted that the reduction in the size of the public sector has focused more on the state owned enterprise sector than the civil service.)

This gives us an idea of some of the broad changes that Zambia has undergone since 1991. What is crucial to consider is its impact on the environment for small business. As we shall elucidate, the impacts have not been as positive as many would have hoped.

## **BUT SOMETHING WENT WRONG**

This process of macroeconomic stabilisation and liberalisation was designed to stimulate growth and development. Shifting the economy from public to private management was intended to make it more efficient and lead to growth.

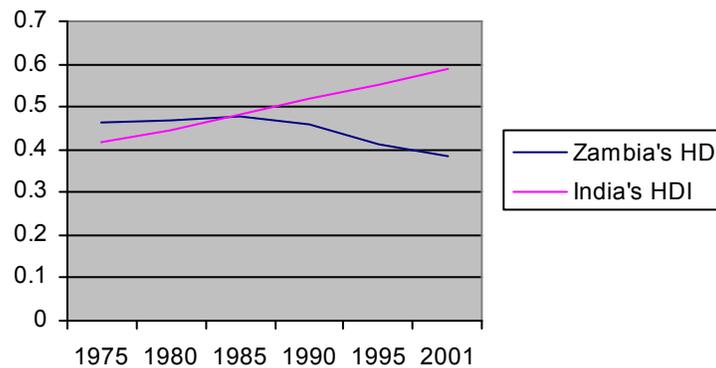

In fact it hasn't. Very few of Zambia's economic or social indicators have shown much improvement since 1991. Zambia's Human Development Index, for example, showed its most marked decline *after* 1990 as the following graph indicates.

---

<sup>3</sup> A Structural Adjustment Programme was first in fact attempted in Zambia during 1983-1985. However, in May 1987 in response to extreme political discontent and food riots in Lusaka and the Copperbelt at the end of 1986 (most specifically in response to dramatic increases in the price of maize) the agreement was abandoned.

<sup>4</sup> The state telecommunications company, electricity utility, and broadcasting company respectively.

**Figure 1: Zambia's Human Development Index trend (India used as comparator)**

Source: UNDP Human Development Indicators 2003, Table 2, Human development index trends, pp 243-244

Since 1991 Zambia has also seen a significant decline in the number of formal sector jobs. This is disconcerting as it may point to a decline in conditions for small business (though, as we discuss shortly, many may be operating in the informal sector).

Today there are some 470,000 formal jobs in Zambia. Some 10.9 per cent of total labour force of 4.3 million (in a population of 10.3 million) is formally employed.<sup>20</sup> This is a significant decline on the situation in 1991 when there were roughly 544,000 jobs, meaning that 17 per cent of the labour force of 3.2 million<sup>21</sup> was formally employed.

In part this is due to privatisation. In early 2003 a study produced by the Zambian Privatisation Agency noted that Zambia's privatisation programme has resulted in the loss of more than 105,000 formal sector jobs over ten years.<sup>22</sup> Although, one would have hoped that this would have been offset by an increase in private sector employment this does not seem to have been the case. To use the railway privatisation as an example, those who have been involved from a union perspective have noted that, almost without exception, those workers who have been retrenched are now not working and in a situation of poverty.<sup>5</sup>

As Table 1 shows, the overwhelming majority of the labour force (75.5%) is informally employed, mostly in the agricultural sector. Clearly this hides very high levels of under- and un-employment (an official unemployment figure of 14.5% must be dismissed as being laughably inaccurate). Having said that, it would be a "mistake, however, to believe that all informal sector operators are underemployed. Some do have gainful employment, and the big challenge is to expand that group of informal sector entrepreneurs."<sup>23</sup>

<sup>5</sup> Personal interview with Kelly Kazika, General Secretary, Zambia Railway Workers Union, Lusaka, Thursday 11<sup>th</sup> December 2003

**Table 1: 1998 Employment Structure**

	Number	% of total labour force	% of total employed	% of total informal sector employed
Size of labour force	4,712,500	100.0%		
Unemployed	681,500	14.5%		
Total employed	4,032,00	85.5%	100.0%	
--- of which:				
Formal sector employment	465,00	10.0%	11.5%	
Informal sector employment	3,566,00	75.5%	88.5%	100.0%
--- of which:				
<input type="checkbox"/> Informal sector agriculture	2,807,00	59.6%	69.6%	79.0%
<input type="checkbox"/> Informal sector non-agriculture	795,00	16.9%	19.7%	21.0%

Source: Ministry of Finance and Economic Development, cited by Jacaranda Consult<sup>24</sup>

What is significant about these figures is that despite some three quarters (75.5%) of Zambia's labour force being informally employed, World Bank data indicates that half (48.9%) of Zambia's national income comes from the informal economy.<sup>25</sup> This disparity would seem to indicate that a significant level of economic activity is taking place in the informal sector.

Of course we are assuming that most small business owners, presuming that they are engaged in legitimate enterprise, would wish to operate formally. The reason for this assumption is that operating formally is a *sine qua non* for those wishing to supply goods or services to large companies; obtain bank loans; achieve formal debt recovery, to mention just some of the host of other benefits to the entrepreneur.

However, it is common cause that the costs of regulation (especially inappropriate regulation) are disproportionately high for small businesses because of their limited administrative resources and uncertain cash flows. Likewise, regulations that are difficult and expensive to comply with typically cause many small businesses to respond by keeping out of the formal economy.

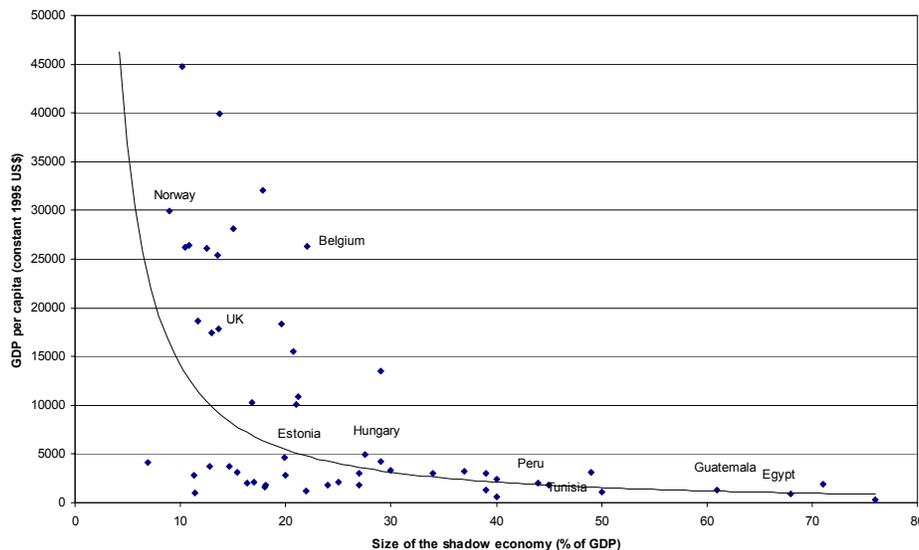

We are therefore obliged to conclude that at least one reason such a large sector of the Zambian economy remains informal is that the policy environment is creating barriers to entry into the informal economy – in short, it's cheaper to remain informal. Of course this means that the environment is not conducive to the growth and proliferation of small businesses.

However, a real problem is that having a large sector of one's economy in the informal sector implies a range of social and economic costs. The World Bank's *Doing Business in 2004* report argues that in the informal economy workers have no protection, they enjoy no social benefits, cannot use pension plans and school funds for their children, and they have no paid vacations or maternity leave.<sup>26</sup> Of importance to small business, entrepreneurs live in fear of the taxman and the police and thus keep their operations below efficient production size, thus reducing the number of productive jobs and severely diminishing the opportunities for lifting people out of poverty.<sup>27</sup> Likewise, businesses that do not pay taxes reduce the resources available to government for the delivery of social services and infrastructure. Companies in the informal economy also tend to apply little or no product quality control, with potential negative consequences for consumers.

Despite all of the problems associated with operating in the informal sector, and despite the regulatory barriers to moving into the formal sector, surveys show that in Africa micro and small enterprises employ more than 40% of all new entrants to the labour force.<sup>28</sup> Research also indicated that under optimal circumstances just around 5% of these enterprises grow to employ 10 or more people.<sup>29</sup> These figures would seem to indicate that significant potential for job creation exists if barriers could be removed.

That a large informal economy tends to have significant developmental costs is illustrated by the chart below, which links size of the informal sector (shadow economy) to economic development.

**Figure 1: GDP per capita and the size of the shadow economy<sup>30</sup>**

Bad regulation therefore actually acts as a barrier to development by keeping a large proportion of the population out of the formal economy. That this is so is highlighted by considering the counterfactual, namely that if one removes these obstacles to moving into the formal sector, the benefits can be remarkable. Peruvian economist Hernando de Soto reported that

*[W]e...cut dramatically the costs of the red tape to enrol small businesses. By 1994 Peru had the world's highest growth rate of about 13% per annum. It was a huge shock... All we had to do was make sure the costs of operating legally were below those of surviving in the extralegal sector, facilitate the paperwork for legislation, make a strong effort to communicate the advantages of the programme, and then watch hundreds of thousands of entrepreneurs happily quit the underground.<sup>31</sup>*

One of the goals of the current Zambian administration is to increase the number of jobs to one million. At a 13% growth rate (assuming that the number of jobs increased at the same rate as GDP), this would be achieved in a period of five years. (If it could be sustained for ten years, it would double again the number of jobs to 1.8 million).

As a comparator, at the current growth rate of around 3%, again assuming the increase in number of jobs is the same as the increase in GDP, it will take twenty three years to increase the number of jobs in the country from 500,000 to one million.

Thus indications are that, despite the admitted gains in macroeconomic stability, the environment for small business in Zambia remains a retardant to growth. Let us now turn to look at the environment for small business.

## SO WHAT IS THE ENVIRONMENT LIKE TODAY?

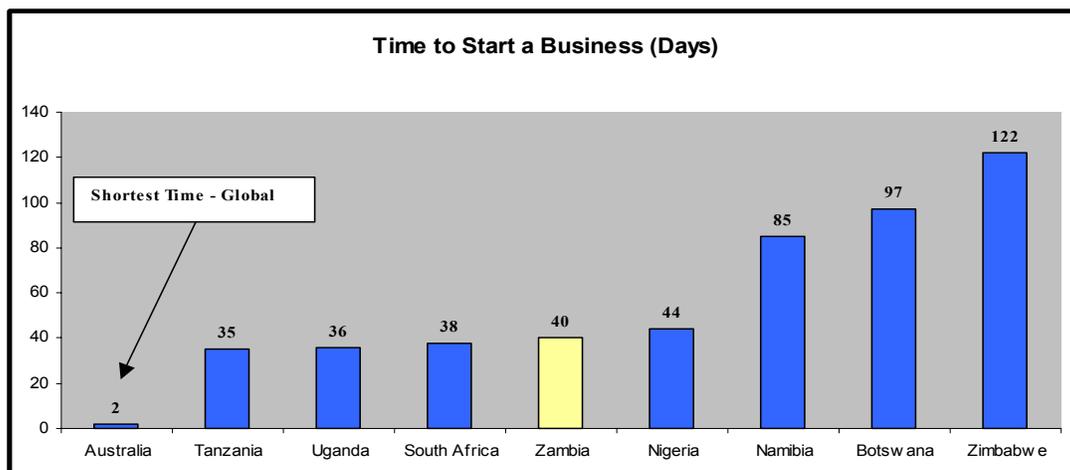

One of the more useful recent sources of information is the World Bank's "Doing Business in 2004" survey.<sup>32</sup> We begin with the costs of starting a business, and examine some of entry regulations. On the surface, it seems that starting a business in Zambia is relatively easy, as Table 1 illustrates.

**Table 1, Zambia entry regulations**

Number of procedures	6
Time (days)	40
Cost (as a % of income per capita)	24.1
Minimum capital (as a% of income per capita)	137.8

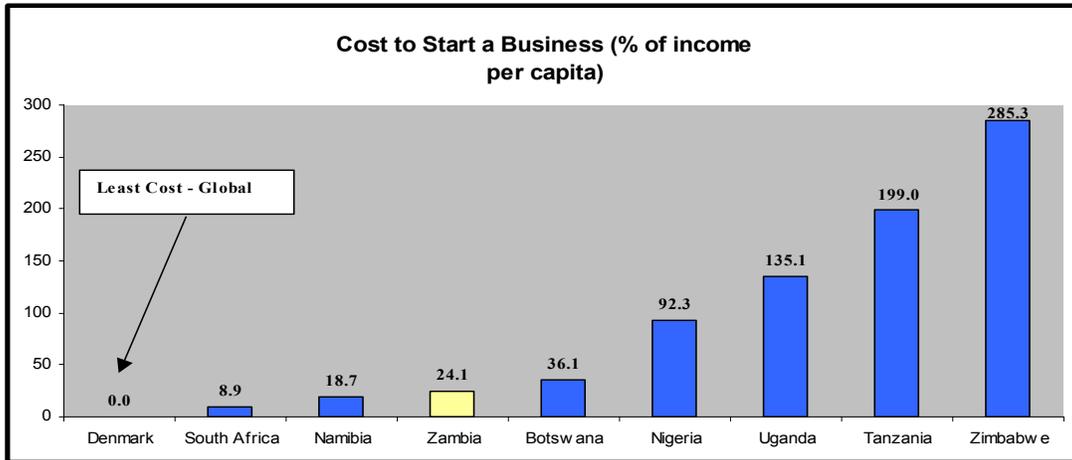

Source: Doing Business in 2004 Zambia Country Profile

When benchmarking the time and costs of starting a business in Zambia against its neighbours it also seems that the hurdles are not unduly insurmountable.

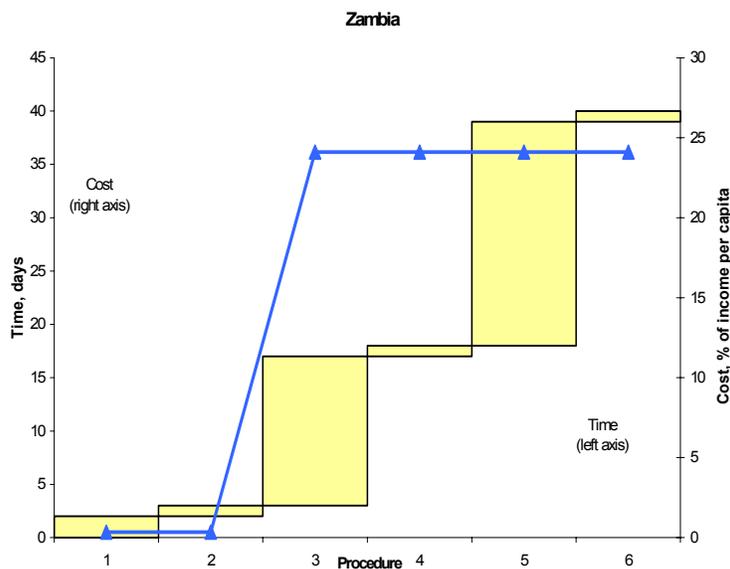

Source: Doing Business in 2004 Zambia Country Profile

Source: Doing Business in 2004 Zambia Country Profile

However, the following chart illustrates that there is room for improvement.

### Zambia business entry regulations

1. Obtain pre-approval of name
2. Open a bank account
3. Register company
4. Register with ZRA
5. Register for VAT
6. Register with social security

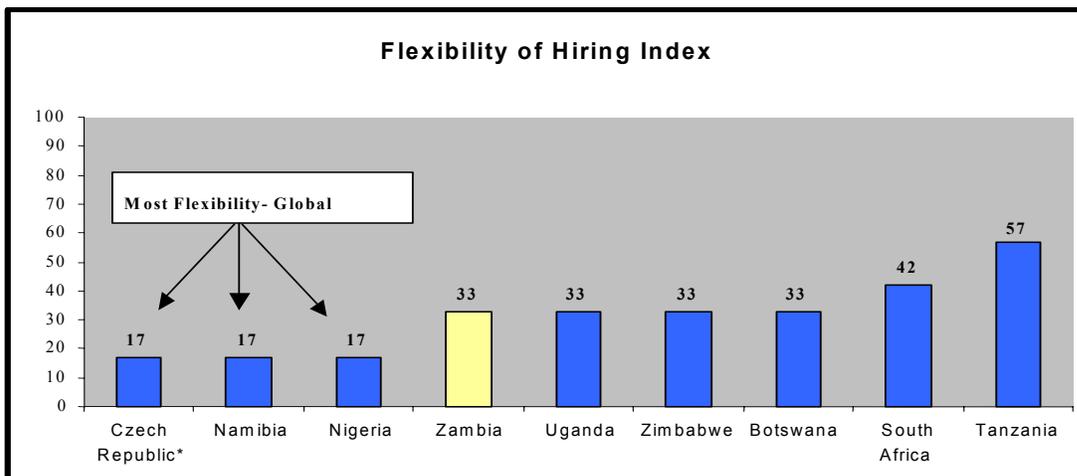

Source: Doing Business in 2004 Zambia Country Profile

This shows quite clearly that two of the most time consuming and expensive elements of starting a business are company registration (procedure 3 above) and VAT registration (procedure 5 above). Simply by concentrating on these two aspects of the entry regulations many informal businesses could possibly be encouraged to move into the formal sector, with the attendant social and economic benefits that this move entails.

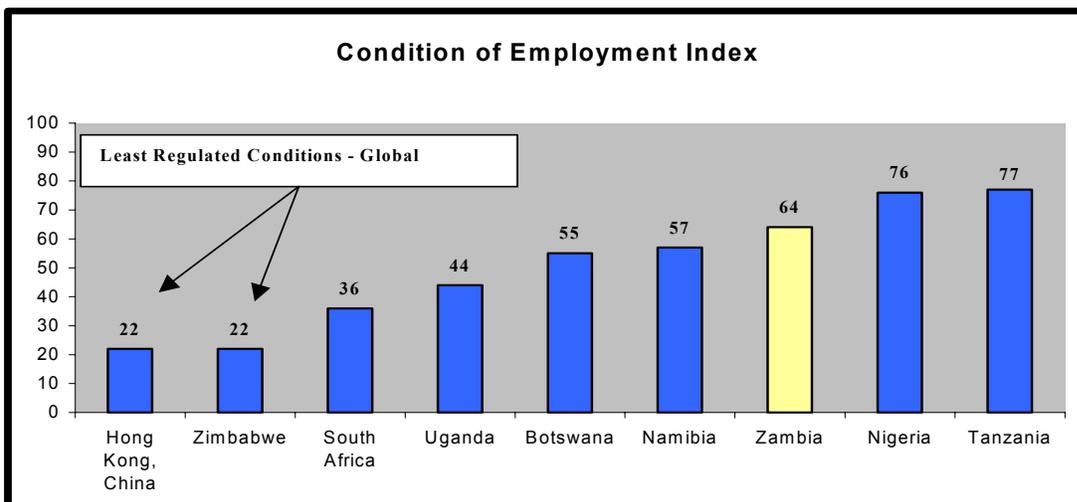

This is important. The evidence shows that "burdensome entry regulations do not increase the quality of products, make work safer, or reduce pollution. They hold back private investment, push more people into the informal economy, increase consumer prices and fuel corruption."<sup>33</sup>

## Hiring and firing workers: employment regulations

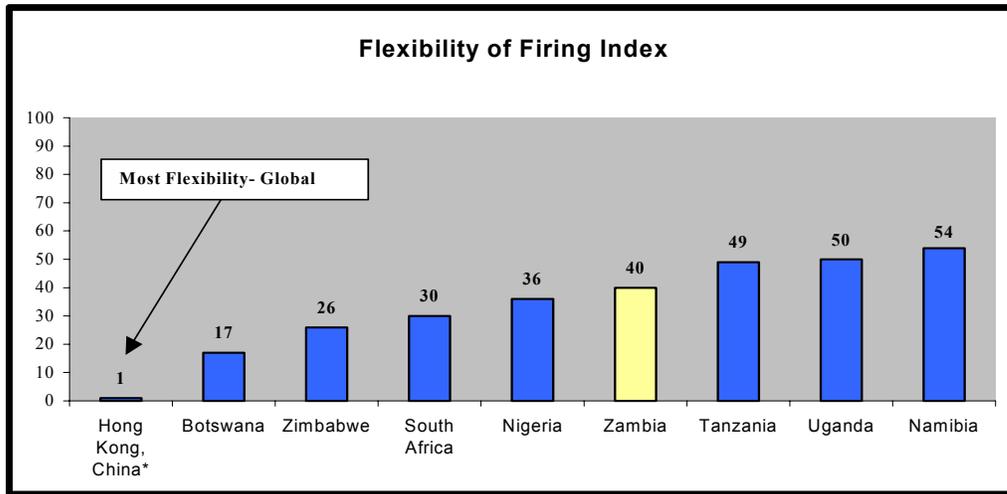

Another important contributor to the costs of doing business in any country is employment regulation. Workers rights, and in particular rights of those people dismissed from employment has, been a politically significant issue in Zambia, particularly jobs lost due to privatisation or foreign companies closing down. However, the World Bank argues that disadvantages of "strict regulatory intervention" include: less job creation; longer unemployment spells (and the related skill obsolescence of workers); reduced investment in R&D investment; and smaller company size. "And with fewer job opportunities in the formal economy, the expansion of an unofficial sector becomes inevitable."<sup>34</sup>

## HIRING & FIRING WORKERS – ZAMBIA

Flexibility of Hiring		
Part-time contracts	Part-time employment is prohibited	No
	Part-time workers are not exempt from mandatory benefits of full-time workers	Yes
	It is not easier or less costly to terminate part-time workers than full-time workers	Yes
Fixed-term contracts	Fixed-term contracts are only allowed for fixed-term tasks	No
	What is the maximum duration of fixed-term contracts (in months)?	0
Conditions of Employment		
Hours of work	What is the mandatory minimum daily rest?	0
	What is the maximum number of hours in a workweek?	48
	What is the premium for overtime work?	0.5
	There are restrictions on night work	No
	There are restrictions on "weekly holiday" work	Yes
Leave	Days of annual leave with pay in manufacturing?	24
	Paid time off for holidays is mandatory	Yes
Minimum Wage	There a mandatory minimum wage	Yes
	Conditions of employment in the constitution	Yes, mentioned generally
Flexibility of Firing		
Grounds for firing	It is unfair to terminate the employment contract without Cause	Yes
	The law establishes a public policy list of "fair" grounds for dismissal	No
	Redundancy is not considered a "fair" ground for dismissal	No
Firing procedures	The employer must notify a third party before dismissing one redundant employee	Yes
	The employer needs the approval of a third party to dismiss one redundant worker	No
	The employer must notify a third party prior to a collective dismissal	Yes
	The employer needs the approval of a third party prior to a collective dismissal	No
	The law mandates retraining or replacement prior to dismissal	Yes
	There are priority rules applying to dismissal or lay-offs	Yes
	There are priority rules applying to re-employment	No
Notice and severance Payment	Legally mandated notice period (in weeks) after twenty years	4
	Severance pay as number of months for which full wages are payable after covered employment of twenty years.	40
Right to job security in the constitution	Right to job security in the constitution	No

Source: Doing Business in 2004 Zambia Country Profile

## Enforcing a contract: court efficiency

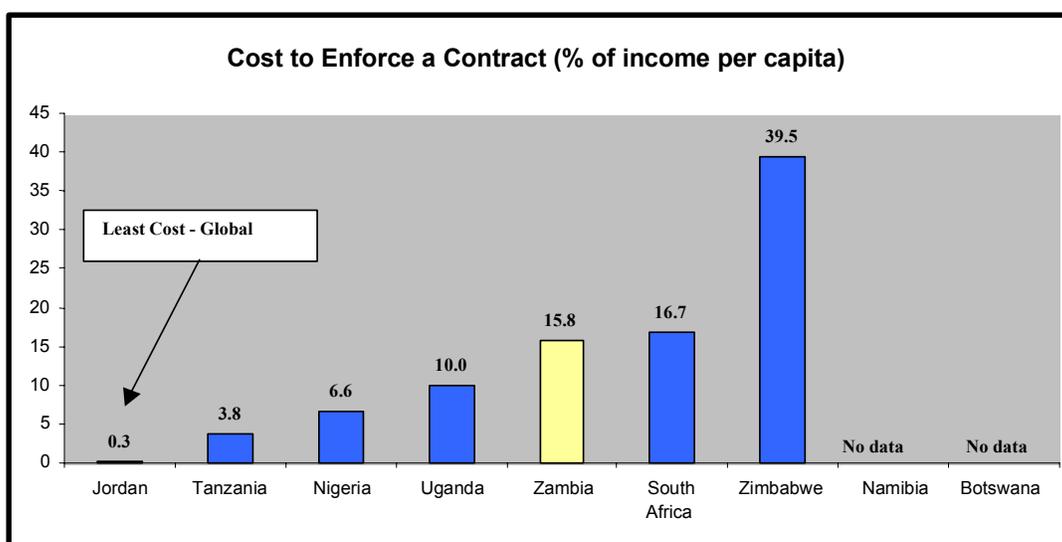

Clearly court efficiency is another important element of the costs of doing business in any country. Without swift and cost-effective contract enforcement, businessmen and women tend to only do business with people they know and trust, shying away from potentially lucrative and job-creating business opportunities.

So how does Zambia stack up? The table and two charts below indicate that while the cost of contract enforcement seems reasonable, the *length of time* it involves is significant.

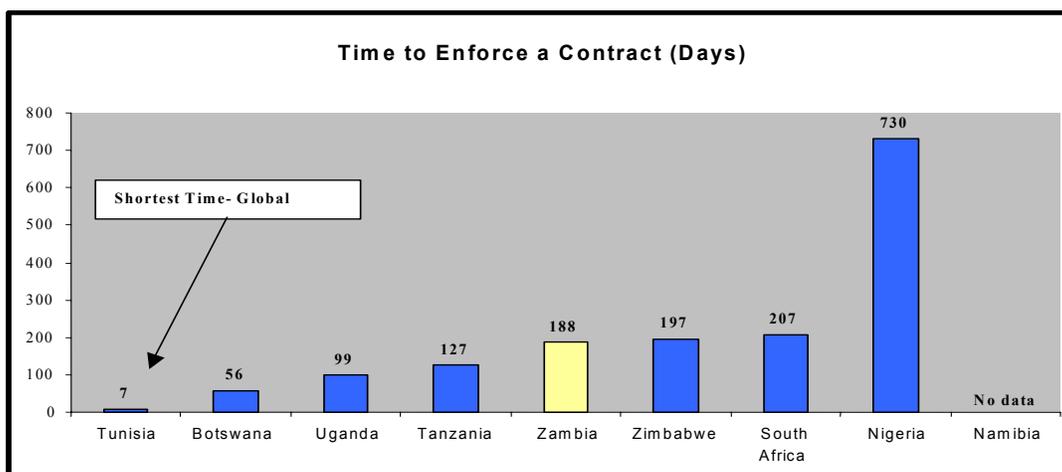

**Table 2, Zambian contract enforcement**

Number of procedures	16
Duration (in days)	188
Cost (as a % of per capita GNI)	15.8%

Source: Doing Business in 2004 Zambia Country Profile

Source: Doing Business in 2004 Zambia Country Profile

Source: Doing Business in 2004 Zambia Country Profile

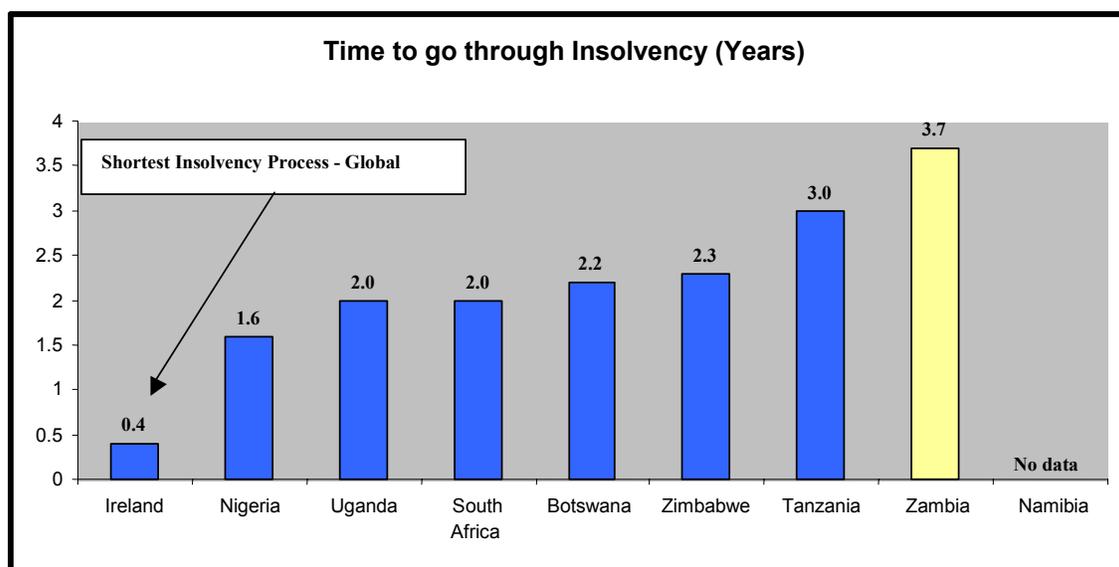

## Getting credit: creditor rights and credit information

One of the key ways in which business expands, and thus creates new jobs, is through borrowing. Incidentally this is a key area where macroeconomic policy links to microeconomic policy. If interest rates are high or unstable, it makes borrowing very expensive, so business becomes less inclined to borrow. One of the key institutions in any effective environment for this is credit registries. Zambia does not have a credit registry, which means that it is harder to borrow, particularly for individuals and small businesses with limited collateral.

## Closing a business: bankruptcy

One of the less pleasant but no less important aspects of business regulation concerns corporate bankruptcy. It is important that this process happens swiftly and efficiently, allowing for both prompt repayment settlements for creditors, and possibly an opportunity for entrepreneurs to try again.

The following chart illustrates that in Zambia it takes a significant amount of time to go through insolvency.

Source: Doing Business in 2004 Zambia Country Profile

The administrative costs of doing business outlined above are encapsulated well by the table below which show that in terms of simply running a business, some governments require too much of the owner or manager's time.

**Table 3: Percentage of senior management’s time is spent with officials negotiating or obtaining licenses, regulations, permits or tax assessments?**

Lesotho	24.56 %
Tanzania	14.4 %
Mozambique	14.12 %
Zambia	13.92 %
Zimbabwe	9.76 %
Mauritius	9.58 %
Malawi	7.89 %
South Africa	7.63 %
Namibia	7.56 %
Botswana	5.82 %
Swaziland	3.41 %

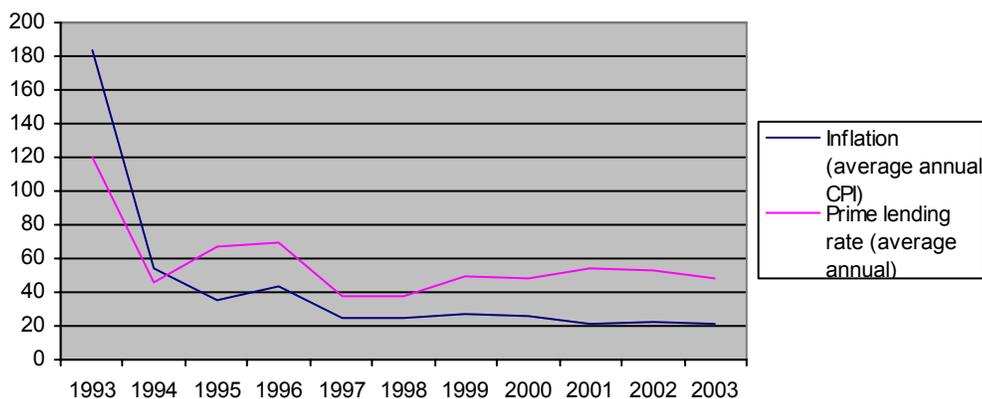

Source: World Economic Forum, Africa Competitiveness Report 2000/01

In Zambia, a little over one working day in seven of senior management’s time is spent dealing with government officials (their colleagues in South Africa and Malawi by comparison spend one working day in thirteen on government liaison). This makes it very difficult for businessmen to concentrate on their business.

### Cost of borrowing

In Zambia, despite the implementation of many of the macroeconomic reforms, the cost of capital remains high. Despite a reduction in the overall inflation rate to 17.2% in December of 2003 (down from 26.7% in December the previous year)<sup>35</sup>, interest rates remain high at 38% for the average lending base rate and 45.6% for the average lending rate (though these are down from 42.5% and 50% at the end of 2002).<sup>36</sup>

The following figure captures the high costs of borrowing in relation to the rate of inflation.

Source: Stanbic Bank

### Dataset:

	1993	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003
Inflation (CPI - annual average)	183.3	54.6	34.9	43.1	24.4	24.5	26.8	25.9	21.7	22.2	21.5
Prime lending rate (annual average)	119.6	45.8	66.7	69	37.2	37.4	49.22	47.9	54.35	53.14	48.33

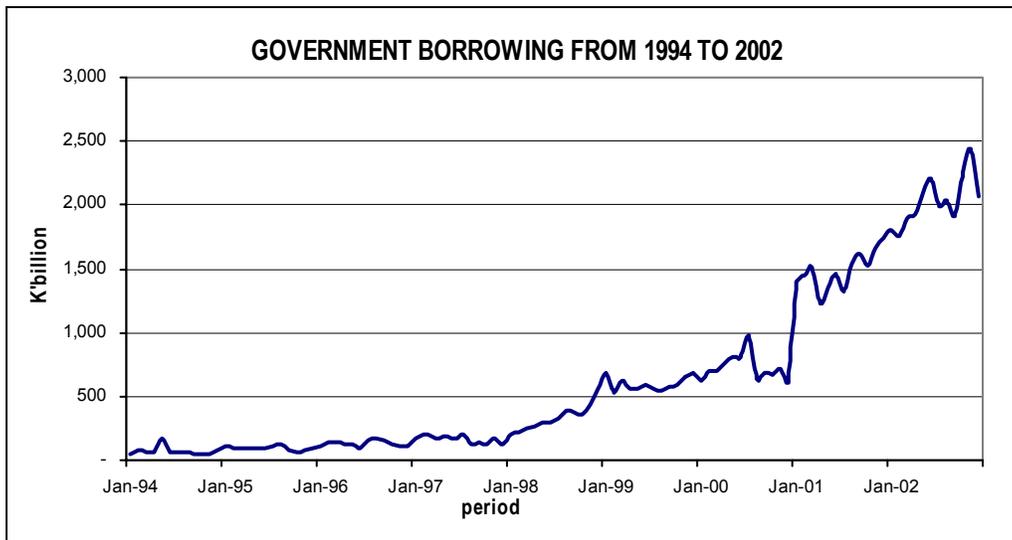

Research points to two primary causes for this: high levels of government borrowing, and the Statutory Reserve Ratio requirements on commercial lenders. As figure 2 illustrates government borrowing remains high, which is contributing to the high costs of lending and seems to have 'crowded out' private sector borrowing.<sup>37</sup> Continued budget overruns and the apparent "recurring inability of the government to adhere to budgeted projections"<sup>38</sup> has had significant adverse consequences for Zambia: in 2003 the IMF withheld financial support due to overruns (of some 19%<sup>39</sup>) which also puts adverse pressure on inflation, interest rates and currency. An important consequence was that Zambia missed a completion point under the Highly Indebted Poor Country (HIPC) which would have "helped to reduce its unsustainable external debt stock of US\$6.5 billion by US\$3.8 billion."<sup>40</sup> (The HIPC completion point has been postponed to the end of 2004 and President Mwanawasa's administration has publicly committed to meeting it). A local banking analyst noted that "Domestic borrowing to finance the fiscal deficit is of fundamental concern. The stock of domestic debt rose by nearly 29%. In 2003 domestic debt amounted to 5% of GDP against the budgeted 1.5%."<sup>41</sup>

A second contributor to the high costs of borrowing seems to be the Bank of Zambia's Statutory Reserve Ratio requirement on commercial lenders.<sup>42</sup> The Bank of Zambia enforces minimum

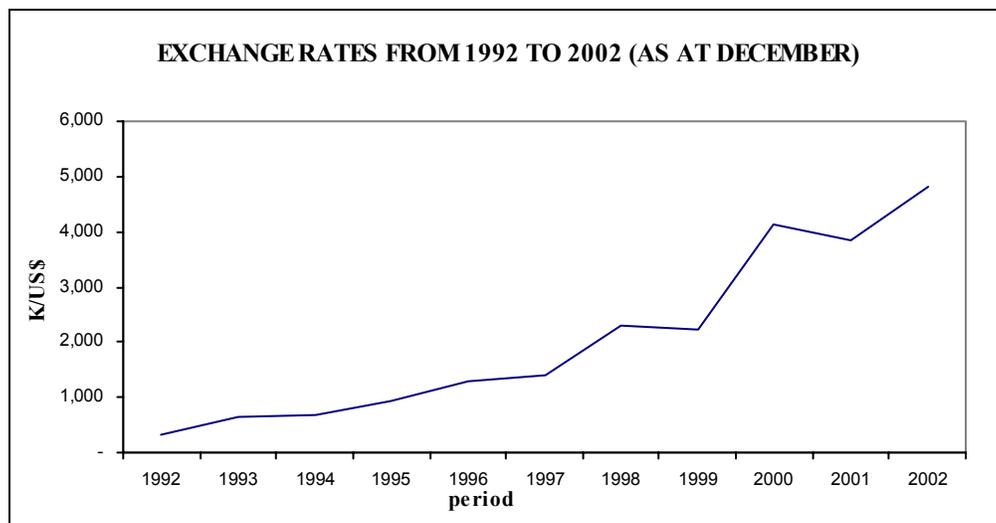

*Liquidity Ratios at 35% of the total public liabilities or deposits that must be held in liquid form; and, Reserve Ratios at 14.0% of both the total Kwacha and foreign denominated public liabilities that must be kept in a sterile account with BOZ. The study established that CBs not only consistently met the Statutory Reserve ratios but, maintained their core liquid assets with BOZ at levels that were appreciably higher than the regulatory level of 35%. This was partly as a result of the attractiveness of the interest rates offered on government securities that are risk free and involve very little administrative costs as opposed to commercial lending.*<sup>43</sup>

However, "in practice...these regulatory ratios effectively lead to the "quarantine" of more than 42% of CB deposits that are placed in both sterile and interest earning accounts at BOZ. This leaves CBs with an insufficient amount of deposits that they can retain for lending to private borrowers."<sup>44</sup>

A positive recent development is that this has been reduced from 17.5% to 14%<sup>45</sup>, which was done "with a view to improving availability of loanable funds in the banking system".<sup>46</sup> Thus although the situation is improving, in real terms borrowing remains unaffordable to most businesses.

Source: Bank of Zambia, cited in ZAMTIE 2003<sup>48</sup>

## CONCLUSION

There are many other factors not covered in this report which contribute to the challenging environment for small business in Zambia. Education and, more precisely, relative paucity of skilled people are a factor, as is AIDS, which is affecting work forces and the teacher corps. This paper has barely touched on the agricultural sector Tax compliance costs have not been discussed fully (though fortunately the small business sector received tax relief on the 2004 budget with the introduction of a “presumptive tax of 3% on small companies with a turnover of K200 million per year or less, thus exempting them from company tax. This measure was introduced to reduce tax administration costs.”<sup>49</sup>) To borrow a Bushism, it is important not to ‘misunderestimate’ the impact of these factors on the costs of doing business and in particular how heavily they weigh on small business.

Nevertheless, it is very clear that the regulatory environment is a factor of some significance. Hernando de Soto's anecdote about Peru was illuminating. It is particularly significant because of all the factors impacting on the environment for small business, regulatory costs are arguably the easiest to change and have a rapid impact.

We are forced to conclude that the macroeconomic reforms are a necessary but insufficient contributor to an environment conducive to small business growth, and that the relative absence of business-friendly (especially small business – friendly) regulation in Zambia, underpinned by principles of RBP, has been a significant factor affecting the environment for small business, and thereby on employment and pro-poor growth.

## A WAY FORWARD?

Zambia faces a choice. It has made some courageous and necessary steps, yet in many ways is still paying the price for nearly three decades of state-led development. It can build on successes and move towards a genuinely business-friendly regulatory environment or it can retreat and try again to regulate and direct development.

Unfortunately, recent trends indicate that the country is pursuing the latter option. Three pieces of legislation are particularly concerning: the Investment Act, the Labour Act, and the Hospitality Bill. These propose to increasingly regulate businesses with a foreign shareholding (which would affect at least half of all operating companies in Zambia) and dramatically increase the rights of contract and casual labourers. This legislation, while protecting existing workers, will almost certainly impact negatively on the numbers of people hired and result in smaller company size, and, as the World Bank notes, "with fewer job opportunities in the formal economy, the expansion of an unofficial sector becomes inevitable."<sup>50</sup>

Yet there are also encouraging signs: a business coalition, the Zambian Business Forum has been formed and is engaging government regularly on issues affecting the private sector. Also the Minister of Commerce, Trade and Industry Dipak Patel has launched a comprehensive Private Sector Development Plan which includes reforms on many of the subjects touched on in this paper and more. However, there remains substantial opposition within the Cabinet and the MMD. Those who are passionate about private enterprise and small business will observe future developments with great interest.

---

# **FORGING NEW LINKS FOR NEPAD SMMES. ADVANCEMENT WITH FRENCH BUSINESS PROSPECT & DEVELOPMENT AND WITH FRENCH-EUROPEAN ADMINISTRATIVE REGIONS ABROAD.**

**Emmanuel. F .ARGO  
International Consultant.  
Specializing in Corporate Strategy  
and Small Business Development.**

Chairperson, ladies and gentlemen,

It is an honour and a privilege for me to have been invited for the first time before this esteemed gathering to share this conference and make a contribution in this marvellous season in South Africa that I started to appreciate from over 10 years.

I do wish to extend my warm congratulations to your country for been chosen for the Soccer World Cup 2010

And not enough young to be a Champion de France player in the next Soccer World Cup. Alas!

Chairperson,

I am here essentially with you, to focus both on southern-African Small Business in NEPAD (New Partnership for Africa's Development) and private sector business opportunities in France and its French-European administrative regions abroad.

I am delighted to see that representatives from institutions, enterprises, business decisions-makers, Academics are present

Forging new links for NEPAD SMMES. And a key component of that is of course mutual interests.

Why? Because we are going to link in business especially, Anglophone, Lusophone, countries with partners in France. It is quite normal, as obviously in different cultures that SMMES sector is playing a critical role in penetrating new markets and expanding the economy in creative and innovative ways.

Between France and southern Africa, there is an enormous potential.

- First, France as an investment destination offers its mainland and trans-border market and infrastructure projects in a new enlargement Europe of 25 countries.
- Second, given its gateways; and bridges abroad, France offers access to facilitate greater trade with Brazil and in a largest South America / Mercosur area

The republic of France has a population of 60 million inhabitants. The country is divided into 26 regions. All of these regions are administrated by France and apply European Union legislation.

The European Union includes a number of regions which, geographically, distant are close in terms of the exercise of rights and obligations and are very important in terms of territorial integrity.

This is the case with most remote French-European administrative regions overseas, such as Guadeloupe, Martinique, Guyane and La Réunion.

As an inherent part of the European Union and by in terms of the Treaty of Amsterdam, their distinctive characteristics qualify them for additional special treatment notably in economic, commercial and business sectors.

For myself, this terms will reassure business partners and pave the way for developing secure markets NEPAD Small Business based in the European.

Ladies and Gentlemen,

In France, the Small business sector is very diverse, with differentiation between various categories; there is a main distinction between:

Small . Medium . Micro - enterprises.

91.6 % of the 2 300 000 French companies are very small enterprises ( less than 10 employees. )

1 200 000 of them having no wage-earners.

SMEs 10 – 499 wage-earners represent 8.3% of the French companies and big companies only 0.1%.

However, their weight on the economy differ strongly:

46% of the jobs are in SMEs, 35% in big companies, and only 19% in very small companies.

SMEs managers are on average in 40 employee- companies, mainly in the three sectors:

Industry, services and business.

So the companies can be manage by :

- the “ homo-economicus ” interested in the economic and financial results of the company;

- the “ homo-politicus ” seeks to reinforce his/her power in the company, or at least to conserve it;

- the “ pater familias ” wants to help his children taking back his patrimony.

Participation and profit-sharing received by employees in 2002 amounted to 1% and 3% respectively in small companies in comparison with 61% and 36% in medium-size and big companies.

As regards Foreign Trade, there are more than 7927 Enterprises all over the country, which have imported goods and services.

*SMALL- enterprises.*

Is the basis of the pyramidal established businesses. They are usually managed by owner or directly controlled by owner- community, with a staff between 19 and 249\*.

They generally operate from business premises call “ Zones artisanales ”. They are likely tax-registered and meet other formal registration requirements as such, business licence, VAT registration and with a minimum inco or shareholding , 1824 have imported in the year 2002.

### *MEDIUM- enterprises.*

The staff is generally between 250 and 1999, rarely beyond.

“ Société à Responsabilité Limitée ”, Limited company, Limited liability Company or Company limited by shares, cooperative society are also established businesses more formal , more complex than the Small category and 469 have imported.

They have to face more constraints, as subject to special fiscal laws, obliged to keep accounting records They operate from semi- or industrial premises.

### **MICRO- enterprises**

These are companies, the owner, his or her close family with a maximum of two or three paid employees. They are a very small business with a limited capital base and also with a minimum of fiscal constraints. The decisions are more flexible.

During 2002. 5634 Micro-enterprises imported goods and services.

As in Southern Africa, Small Business sector plays an important role in economic and social development.

At government level, a Secretary of State is responsible for this sector.

It is not my role here, to oppose big and small business. But it is there that for small enterprises have enhance innovation, productivity and stimulated internationally the French economy and its reputation abroad.

In this context, may we talk about Development through Small Enterprises and partnership.

Various remarks which I have recently overheard spring to mind, and in particular the following question :Is there a future for Southern African Small Enterprises and business ? Can they really develop ?

Where the replies to this question have been polite and generally positive, there has been no attempt to position SMMEs within clearly defined time limits.

Elsewhere, others have suggested that this particular business sector is not even at the start of the world development race.

For my own part, I may be allowed to challenge this rather pessimistic view of Southern African Small business.

This I propos with the support of reliable private decision- makers to promote strategies and international partnership abroad.

### **Which can secure.**

In all of our countries, States and Institutions are very close- -weather we are individual or national targets groups - to support Small Business.

In order to extend the facilities and capacities of Small business sector , NEPAD is very active.

There has been substantial and important interaction in policy-making from the last G8 Summit where close attention was given to the NEPAD under the auspices of the French presidency at Evian .

Initiated by Professor Weiseman Nkhulu, Chairperson of the NEPAD Steering Committee, this conference has taken place at the highest levels, where to facilitate and attract private investment including for Small Business.

Recently after the inauguration of President Thabo Mbeki, during a bilateral meeting with Minister of Foreign Affairs Madame Nkosazana Dlamini-Zuma, French Foreign Affairs Minister Michel Barnier has hailed NEPAD's intentions to bring development and stability in the African continent

I have for myself, to pay my respects to the African diplomats in France who play a noble role in the promotion of NEPAD

For this reason, Chairperson, could you allow me to thank in particular, Madame Thuthukile Skweyiya former Ambassador of South Africa in France for what she done, as well Mister Enrico Kemp, currently Chargé d'Affaires at the South African Embassy in Paris

The significance of this interaction is welcome, as it is for developing and supporting Small Business in private economic and adequate structures close to each of us.

I believe there was real vision there . Part of NEPAD's vision is also to enable African SMMEs "to manage the challenge of globalisation and to adapt progressively to new conditions of international Trade."

This challenge of trying to adapt to economic change and bring about sustainable development is not new in Africa.

It is a challenge that most of shared in the Lomé Convention, long before Cotonou Agreement was signed.

The NEPAD, with the aim of promoting integration of the Small Business into the world economy, and thereby contribution to sustainable business development is a necessary mechanism.

I am not oblivious to the pitfalls and difficulties that already exist or may occur in your projects and decisions.

They cannot drive on a linear process. That is the reason we can together share the solutions, because improved market access is not just an issue of tariffs and sometimes quotas, but also non tariffs measures and capacity is required in both the public and the private sector. And not often exclude external expertises to make the best use of the opportunities provided of offered.

### **What can secure our reciprocal interests ?**

One legal aspect among others could be considers: credit-guarantee schemes, subcontracting within a wealthy and diversified experience.

All of us know, the power and contribution of the Small Business sector in our respective countries, is the dynamo for growth, improved income distribution, job creation including management personnel and also pride.

That is the reason, despite the fact of policy-making, it is important to ensure that the initiative is strongly support also by Small Business persons themselves that Enterprises take advantage of these huge economic opportunities.

**Access into a French continental mainland market and new enlargement Europe.  
Just to illustrate:**

It is already the case for Southern African fruits or agricultural products sold during the winter season in Europe.

You might also extend there, other businesses or franchising all over France. The idea can be potentially replicable for Small business in various sectors.

It also can be the same process of business opportunities from France where NEPAD joint venture business and partnership can also reach the 10 new E.U members states countries.

**Access into foreign markets via French-European administrative regions abroad.**

Is France fortunate to have French-European overseas regions? These regions offer commercial bridges and other part of the world for example:

To the three economic zones of the Atlantic with Guadeloupe, Martinique in the Caribbean, Guyane and Saint Pierre et Miquelon;

to the Indian Ocean with la Réunion and Mayotte;

to the Pacific with New Caledonia, Wallis and Futuna and French Polynesia.

If these racially and culturally and diverse regions are not very visible within the public arena in France, they are a great advantage in building up globalisation of different kind, which is not restricted to their local markets and economies.

From them, it should be organising and facilitating dialogue between Southern African Small business and enterprises interested to access via these cross borders and huge markets like Brazil or the L.A.C. ( 33, Latin America and Caribbean countries . Last 3<sup>rd</sup> Summit in Guadalajara/ Mexico 28 May 2004 with 25 European countries )

How can we follow up ?

Many trade agreements exist between Europe and Africa. The best known is the former A.C.P ( Africa. Caribbean. Pacific. ) Lomé Convention, transformed into Cotonou Agreement.

This is an oldest and most used opportunity, where in the current case via these French-European regions, commercial exchanges and business can also be done.

During this conference, we will have the possibility to meet, with the support of the Chairperson of the Conference, Dr Baloyi, and other experts, the main institutions which promote sustainable development in Southern Africa .

We are going to see how on both sides, enterprises can rely on adequate services and a supportive existing environment to compete in these external markets.

This project has to be put in place also, within the education sector so that universities, business schools, technikons and people upgrading there skills could recognised the benefits of having a career within the international small business sector.

These services will put Small business on a more equal footing , and , as such, it is a powerful instrument to fight exclusion in a rapidly globalizing market and to propose realistic and productive solutions.

**On non exhaustive basis, what it will be discussing here ?**

We can envisage starting projects, by focussing on programmes such as:

Trade capacities, particularly in the following sectors.

Agro-processing, agribusiness, textiles & clothing.

Business and franchise services.

Small builders contractors.

Transport –sector: Taxis, and Tours operators for the next Soccer World Cup in South Africa.

Co-ordination on flexible private networks and strategic business partners.

Package advices and solutions to:

- international obstacles
  - upgrade skill level/ French-European Business schools, Institutes, Universities & Technikons.
- Training in top Business companies.

Together, lets build an efficient network and achieve a leap in Small business performance and market impact.

I wish us all a very successful conference.

Thank you for your patience and your kind attention.

**Emmanuel. F. ARGO.**

International Consultant specializing in

Corporate Strategy and Small Business Development

# VALUE FOR MONEY SOFT SUPPORTS FOR SMES

**Joe English, Director of Resources, Plato Ireland**  
**Partnership Court, The Ramparts, Dundalk, Ireland**  
**Tel: +353 42 932 7169 Fax: +353 42 932 7101**  
**E-Mail: [joe.english@plato.ie](mailto:joe.english@plato.ie) Web: [www.plato.ie](http://www.plato.ie)**

## EXECUTIVE SUMMARY

Many countries provide direct financial support by way of grants and low cost loans to small companies, but increasingly many state organisations are moving to replace direct financial assistance with targeted 'soft – support'. This paper reviews the current practice of soft support provision to Small and Medium sized Enterprises (SMEs) in Ireland, with specific reference to the provision of non-directive mentoring and advice, and focuses specifically on a high value for money programme.

Soft supports, for the purpose of this paper, are any non-direct financial support offered to a company by a state backed agency. Typically this support will fall under one of the three main categories of Training, Mentoring and Advice, and will either be provided free of charge or at a greatly subsidised fee. This paper reviews the support provided by the Plato programme over its ten years of operation in Ireland. This programme provides non-directive mentoring and support directly to the owner/manager of SMEs via a network of volunteer large company senior managers and consultants. By drawing upon the goodwill of volunteer mentors, the programme is extremely cost effective and is consequently able to provide very focused support to a huge number of owner managers at very little cost to the participants and the state agencies that fund the programme. The 'bang for the buck' is extremely high.

The paper briefly outlines the history and operation of the programme over the past ten years of successful provision of high-quality low-cost support. For example, the paper will detail the support delivered to over 2000 SMEs to-date, how 12 staff can deliver focused management support to 650 SMEs in one year alone, how high-quality training can be made available to owner/managers for \$30 per day and how 108 hours of management development training can be delivered for less than \$1,000 per year.

The paper will also provide a roadmap, implementation project plan and budget prediction to business support organisations that wish to develop and implement a low-cost/high-quality SME training and development network in their region.

- 3 PLATO’s Place within Enterprise Support**
  
- 4 Summary**

## **The Irish Economy and Enterprise Development - Background**

There are a number of factors that have contributed to Ireland's economic success over the last decades. These include favourable government policies, low business tax rates, geographic location and a well-educated and highly skilled workforce. These key drivers have positioned Ireland to receive large-scale international investment and allowed the Irish economy to achieve extraordinary growth since the 1960's. From a predominantly farming and textile based economy Ireland has emerged as a world leading manufacturer and exporter of software, pharmaceuticals and ICT equipment. Much of the engine of this growth has come through the decisions of multinational corporations to establish European and worldwide manufacturing operations in Ireland – products as diverse as Microsoft Windows™, Intel Pentium™ chips and Pfizer Viagra™ are routinely shipped in vast quantities from state of the art manufacturing facilities in Ireland to a world-wide customer base.

Alongside the large foreign owned manufacturing operations a significant number of indigenous SMEs were established to provide manufacturing and service supports to their larger neighbours. This practice was actively encouraged at government level through the establishment of the Department of Enterprise sponsored National Linkage Programme in 1995 which provided a frame work for the direct co-operation between large multinational companies and their SME neighbours. A significant recent element in the transformation of the Irish economic landscape has been the growth of the indigenous SME sector. In the past ten years alone the number of SMEs in Ireland has seen an almost 50% growth, from 140,000 companies to 207,000 in 2002. Many of these companies were formed either as a direct sub-contracting spin-off or as sub-suppliers to large multinational organisations. While multinational companies continue to form an important part of the industrial landscape the indigenous sector is stronger and more competitive. SMEs now form the core of the economy.

One of the core objectives for national industrial policy over the next decade involves a shift in development agency assistance from 'capacity' support for employment creation and fixed asset investment to 'capability' support in the areas of human resource development, research & development, marketing and market development. (Enterprise 2010 – New Strategies for the Promotion of Enterprise in Ireland in the 21<sup>st</sup> century Forfas 2000). This effectively means a shift from direct 'grant giving' to the provision of soft supports. Furthermore the National Economic and Social Council (NESC) (NESC 1993) suggested that state support for individual companies in intangible areas such as management, marketing, innovation, technology and design would be ineffective unless it was integrated within a wider programme of support which included interventions at the intermediate level of the industry, sector or region. This supported a main provision of the Culliton report that advocated industrial policy should aim to develop clusters of related industries, building upon the sources of competitive advantage.

One long-standing business support initiative that successfully addresses the changing priorities in government funded SME supports is the Plato programme. This programme harnesses the resources and talents of the multinational companies and marries them to the needs and experiences of the individual SME owner/manager to deliver high quality, low cost business support across a wide network of progressive and dynamic small companies.

The next chapter details the operation of the network.

## **PLATO – Business Support Network**

Through a unique partnership with large "parent" companies, Plato provides SMEs with facilitated group learning, specialist expertise and advice, networking opportunities, business development training, and cross border activities. In large companies there is a huge, relatively untapped, supply of management expertise and business experience that could be very useful to SMEs, but is rarely used. Since its formation in 1988, PLATO has been working very successfully to harness this critical business development resource for the benefit of the owner manager of growth oriented SMEs. PLATO networks have now been established in over ten European countries, and the number of regions continues to grow. In one country alone over 4000 small companies have benefited from membership of the PLATO network.

### **The Plato Approach**

Plato is the business support forum for owner managers of small and medium enterprises (SMEs) facing the challenges of today's business world. The PLATO approach is based on regional small business networks that are established to facilitate the development of managerial competence in SMEs. The networks are based on group learning, owner-managers learning by interaction with one another and large well-established companies. The two-year SME development programme is aimed at helping owner managers develop the broad range of management skills, business linkages and strategic vision necessary to develop their companies.

It is based on a network principle whereby large locally based companies (mostly local branches of multi-national corporations), known as parent companies, help and support small companies in their local area. The small companies work together in groups over a two-year period utilising their shared pool of knowledge, skill and experience. In essence the concept is based on a pooling of expertise of and for SME owner managers through structured networking combined with the specialist knowledge gained from the "parenting" with large companies.

### **History and Development of Plato**

The PLATO programme was developed in 1988 in Belgium as an initiative to strengthen and deepen the managerial expertise of the local SME population. In this programme large companies were invited to provide voluntary specialist support to SMEs in all aspects of management and business development. This support could be provided collectively or on an individual basis. Most chose to provide the support on a collective basis, and consequently groups of SMEs were formed. More than 800 SMEs in Kempen have benefited from participation in the PLATO project since 1988 and they have been enthusiastic about the results.

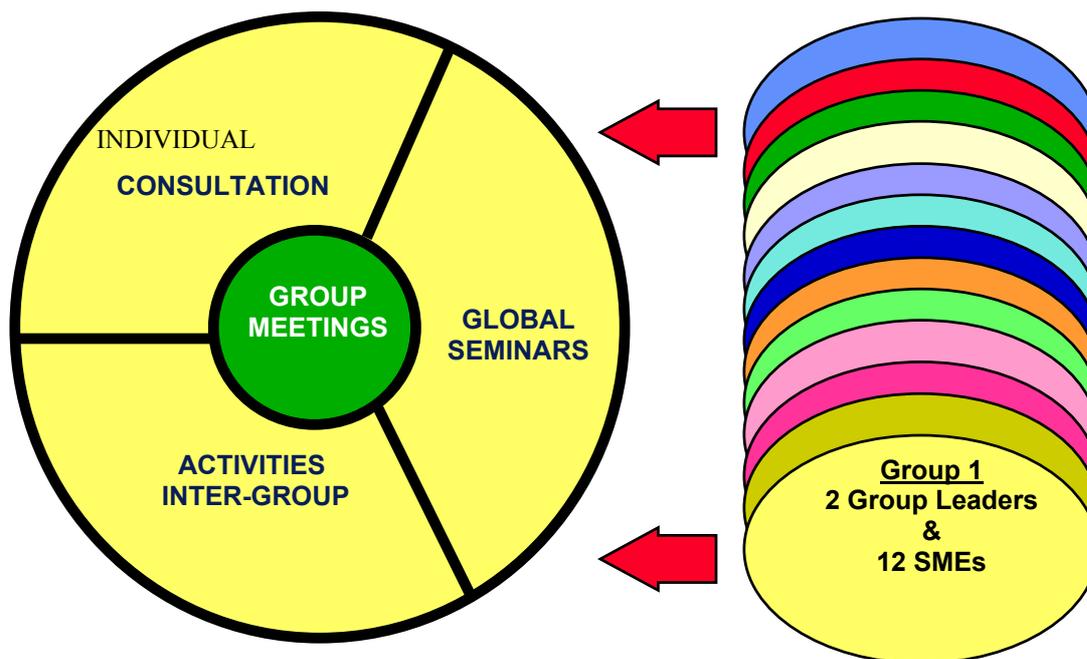

The process was refined and systemised to the point where it could be exported to other regions of Belgium, and indeed to neighbouring countries. Since its inception in 1988 Plato has spread to nine other European countries covering over forty regions and a dynamic and growing network of over 8500 SMEs and 500 parent companies have been part of the process. This rapidly expanding international network offers exciting opportunities to SMEs

across the continent of Europe. When transferring to other countries, the PLATO programme has been adjusted and modified to suit national and local conditions in the different countries. The most recent addition to the PLATO family is the Wessex region in the southern United Kingdom.

When transferring to other countries, the PLATO programme has been adjusted and modified to suit national and local conditions in the different countries. Each region and country manages its own individual networks, under the guidance of the general Plato process and principles.

## Operation of a Plato Network

Learning by doing and experience is fundamental to the PLATO process. SME owner-managers interact with each other and share their knowledge and competencies. The network is designed to provide practical advice to help solve their immediate problems. The process is centred on the PLATO groups comprising 10-15 SME owner/managers and two volunteer facilitators per group from the large companies. Each group meets once a month to address a wide range of management issues and to consult with each other. Guest speakers provide specialist support and technical information. Group meetings are complemented by counselling on an individual basis by the facilitators or their colleagues.

Apart from the "formal" PLATO activities, complementary activities and initiatives often take place, e.g. company visits, social events, group training etc.

Within the PLATO network, SME managers have an excellent opportunity to share experiences and learn from one another, have access to advice and assistance from specialists in large companies, and broaden their views through invited speakers and by participating in the seminars. As the relationships grow in the PLATO network, so does the range of commercial opportunities that arise from business linkages. There are many opportunities for the participants to share e.g. information, resources, premises or equipment and to acquire new customers and suppliers or pursue joint ventures. As a

result, many PLATO companies have developed new business relationships through the network.

Also the large companies and their facilitators have experienced benefits from their participation. They have outstanding opportunities over a fairly long time to gain insight into the SMEs more entrepreneurial patterns and their organisational structures, and thereby acquire an entrepreneurial experience with which they may contribute more effectively to the development of their own large organisation.

### **Detailed Support Delivered to 2000 Irish SMEs in 10 Years.**

The pilot programme in Ireland was launched in the early 1990's in Dublin and quickly spread through the rest of the country. Currently there are seven Plato regions operating and thriving throughout the island. This chapter details the activities undertaken and describes the evolution of the network activities in that time.

The earliest programme concentrated on developing the core programme of monthly group meetings. These meetings consisted primarily of local experts giving a short talk on an item of interest, followed by group interactive sessions to discuss the topic. Topics in early core programmes typically included

Taxation Business Planning Sales Forecasting Insurance Analysing Accounts Advertising Promotion Lobbying	Selling Techniques Health & Safety Statements Recruitment Employment Contracts Computer Systems Quality Control ISO 9000 Stress Control	Strategic Analysis Strategic Planning Dealing with banks Cash flow Debt Collection/Credit Control Sources of Finance Letters of Credit
---	--	--

**Table 1: Core Programme Topics**

The pilot programme ran for an initial 18 months and had 53 owner/managers members. Three results were quickly apparent (Ref: Goodbody):

- 1) There was a demand for further programme in the pilot area
- 2) There was demand in other industrial centres for similar programmes
- 3) There was demand for most specialised training.

Based on the very favourable results in the pilot programme the decision was made to formalise the programme and roll it out to other regions in the country. Currently there are seven independent Plato regions operating in Ireland, and over 2000 companies have joined the programme. The numbers have steadily grown over the years, and the following table shows the number of owner managers who have participated in Plato programmes since the pilot scheme was initiated.

Value for Money Soft Supports for SMEs

<b>Participants Numbers</b>	<b>1994</b>	<b>1996</b>	<b>1998</b>	<b>2000</b>	<b>2002</b>	<b>2003</b>	<b>TOT</b>
<b>Participants in Core Programme</b>	53	431	776	577	507	540	2,884
<b>Participants in Post Core Programme</b>	0	25	42	311	341	240	959
<b>Total Participants in PLATO Activities</b>	<b>53</b>	<b>456</b>	<b>818</b>	<b>888</b>	<b>848</b>	<b>780</b>	<b>3843</b>

**Table 2: Number of SMEs and Participants in Core Programme, Follow on and Special Activity Groups**

Responding to needs of members the range of services being offered has also expanded. Specialised training courses have been developed and implemented that address specific areas of concern to owner/managers. Bespoke course have been delivered in areas such as:

- Creative Marketing
- Financial Management
- Human Resource management
- Family Business Succession
- General Management Development
- Strategic Management
- Managing for Growth
- Etc.

These 'extra curricular' activities are held weekly, usually over a period of 6 to 10 weeks, and are designed to provide the owner/manager with in-depth training in the specialised area.

Combined with these activities many of the Group Leaders and Regional Managers provide direct One-to-One counselling and support for to the regional managers on an as-needed basis. The following table (Table 3) details the support delivered to owner managers since the programme was extended nationwide:

<b>No. of SME companies in:</b>	<b>1996</b>	<b>1997</b>	<b>1998</b>	<b>1999</b>	<b>2000</b>	<b>2001</b>	<b>2002</b>	<b>2003</b>	<b>TOTAL</b>

### **Table 3: Statistics of Participation in PLATO Activities 1993 – 2003**

While the individual totals are somewhat irrelevant, the table shows the extent of support being offered to an ever-growing client base.

### **Roadmap To Implement a PLATO Programme**

The steps to develop a PLATO network in a region are well developed and have been refined through various implementations in different countries throughout Europe. While every country and region has their own particular refinements to suit local conditions and business practices, the core steps to be followed are standard throughout all implementations.

Three major supports are available to any group attempting to start a PLATO group in their country, and these are:

- Licensing procedures for the PLATO trademark and concept are simple and straightforward. There is a desire to spread the PLATO concept and ensure the network grows as wide as possible, and consequently any serious request to operate a PLATO region under license is greeted with enthusiasm.
- A PLATO operating manual has been developed. This manual is designed for the PLATO project Manager, and includes details on all aspects of setting up and running a PLATO region. (Ref: PLATO Manual).
- The Network of PLATO Regional Managers is available to support the establishment and development of the new region. There exists a 'missionary zeal' among PLATO managers to spread the word and ensure that the network is as wide and strong as possible. In every case the network of Regional Managers provide direct support to the new region.

After the granting of a license to operate a new PLATO region typically there is a start-up phase of six months before the launch of a new programme, and the following key steps must be undertaken in that time:

1. Business and State agencies in the area briefed on the project
2. A Regional Manager and Administrator appointed and trained
3. Steering committee established
4. Recruitment of Large Company supporters
5. Selection of Group Leaders from Large Company
6. Training of Group Leaders
7. Recruitment of 100 SMEs to the programme

Details on all aspects of the above are available in the PLATO manual, which is made available when the license has been awarded.

### **Annual Budget**

The following is a minimum operating budget to run a Plato programme for 12 months. The following assumptions are made, and are in line with the situation applying in Ireland and other European countries:

- The programme requires one full time manager and a part-time administrative assistant.

## Value for Money Soft Supports for SMEs

- 100 companies join the programme
- Monthly group meetings are hosted by parent companies, at no cost to Plato
- Group leaders are provided by the parent companies at no cost.
- Programme is co-located with Chamber of Commerce, Development agency etc)
- One specialised training seminar is held every quarter.

ITEM	DESCRIPTION	COST	ANNUAL TOTAL (€ - Euros)
1	Manager Salary	50,000	50,000
2	Administrative Support	15,000	15,000
3	Group Facilitator Training	10,000	10,000
4	Overhead cost contribution (rent, communications etc.)	5,000	5,000
5	Seminar Costs (speaker, equipment rental, promotion, venue rental etc.)	1,000	4,000
<b>TOTAL</b>			<b>84,000</b>

**Table 4: Annual cost to run a PLATO Programme**

Table 4 shows that if 100 companies are recruited to the network, then the annual fee for participation should be €840 (€84,000/100). This is close to the average being charged to SME members in Western Europe at the current time, and members consider this to be excellent value for money.

The above budget is a minimum operating budget for a programme in Western Europe. Many PLATO programmes receive significant outside funding from regional or national bodies, and this additional funding is used to provide more specialised training and development to the client companies. However all PLATO regions operate on a Not-For-Profit basis and consequently all funding is used to increase services or to reduce the membership subscription.

### Typical Development Hours Delivered

On an annual basis the following is the average direct 'contact-hours' for a participant on the programme.

DESCRIPTION	#HOURS	ANNUAL HOURS
Monthly Group Meeting	4	48
Specialised Seminars	4	16
Networking Events	6	24
One-One with Group Leader	2	8
One-One with Manager	3	12
<b>TOTAL</b>		<b>108</b>

**Table 5: Direct Development Hours per Member**

Many members develop their own contacts within the various groups and of course the above numbers do not reflect this 'extra-curricular' activity.

For many owner/managers this 108 hours is the only management development training that they undertake during the year, and is a vital part of the development of their business.

## **PLATO Quantitative Benefits**

Several studies have been undertaken that show the significant quantitative benefits that accrue from membership of the PLATO Network. These benefits accrue not only to the individual company but also to the wider economy in the region. In June 1997 the European Commissioner for Regional Policy and Cohesion, Monika Wulf Mathiese launched the "European Job Challenge", a competition designed to identify projects that have been most successful in creating jobs in declining industrial areas (known as Objective 2 areas). The competition was open to all projects supported since 1989 by either the European Regional Development fund or the European Social fund, which helped inject new life into industrial areas thus creating employment. A jury of six independent experts short-listed ten projects for awards. The PLATO Network was one of the projects selected.

The most recent major study of the PLATO Programme commissioned by the Belgian Government and conducted by the Vlerick Management School for the MBA programme of the Universities of Leuven and Genk (published May 2001) studied the results of over 2400 companies over the period 1995 to 1999. Half of the companies were PLATO members and the other half comprised a control group. The primary source of information was the statutory financial reports of the individual companies. The major finding showed that turnover and employee growth were significantly higher amongst PLATO companies when compared with non-members. PLATO also has an SME failure rate of below 3%, which compares very favourably with the historic national average.

## **Summary of Plato Supports and Offerings to the Business Community**

### **Seminars**

A total of 566 PLATO business seminars have been held to date. These have been either minimum half-day, full day to specialist 10-day events which frequently used a workshop format. Attendances at the seminars totalled 19,810 SMEs.

### **Continued/ Advance/ Forum Groups**

Owner/Managers who previously completed a PLATO Core Programme can become involved in the PLATO advance programmes. Altogether 1,343 SMEs participants have been involved in advanced programmes.

### **Networking Events**

Networking on a Regional, National and International Level has been a feature of PLATO Ireland Programmes.

### **Specialist Courses**

Specialist courses (Marketing, HRD, Finance, IT etc.) have been delivered to a total of 393 Owner/Managers.

## **ISO 9000 Certification**

A total of 196 SMEs to date have achieved certification through PLATO Group Schemes.

## **Benchmarking**

PLATO has been instrumental in introducing Benchmarking techniques to 495 companies.

## **PLATO Business Planning**

The Business Planning Module was developed specifically for PLATO SMEs. It has been extensively used by PLATO companies and now forms a key element of all PLATO Group Programmes.

## **Mentoring and Individual Consultations**

A total of 19,295 hours of one to one meetings with Owner Managers have taken place. Of these 7,320 hours have been voluntarily given by Group Leaders or Senior Managers from Parent Companies.

## **Guest Speaker Database**

PLATO is most fortunate in having been able to develop a comprehensive database of highly qualified and experienced business experts and consultants who act as guest speakers. To date 1,804 presenters mostly from Parent Companies have given their services on a voluntary basis.

## **The PLATO Business Park**

The first PLATO Business Park was opened in October 2002. The development totalling 13,0,00 square metres is shared by 11 PLATO SME investors. Similar PLATO Business Parks are planned for other regions.

## **The PLATO Ireland Membership Directory**

The directory was launched in June 2004 and can be accessed on the website. It is also available on CD ROM and hardcopy. The directory contains comprehensive details on over 1,400 PLATO Companies. Its primary purpose is to promote networking between both PLATO participants and Parent companies alike.

## **The PLATO Ireland website ([www.PLATO.ie](http://www.PLATO.ie))**

The site first launched in December 1998 has been updated on a regularly basis since then. It provides comprehensive information on PLATO Ireland, all regional events and activities, the membership directory, a discussion forum, expert advice on selected business topics, linkages to PLATO partners and support organisations etc.

## **PLATO'S PLACE WITHIN ENTERPRISE SUPPORT**

Plato has evolved within the overall enterprise support and development arena to provide focused support to owner/managers in the following niche areas:

- PLATO provides business support organisations with a capacity to support business development in the indigenous SME sector.
- PLATO has a clear understanding of the entrepreneurial personality and the skills of the owner-manager
- PLATO itself is configured in an entrepreneurial manner giving it great credibility with owner-managers
- PLATO seeks to meet the challenges faced by SMEs in the context of the resources, experience and skills set of the owner-manager
- PLATO undertakes insightful needs analysis of the SME
- PLATO is a permanent source of management expertise for the owner managers
- PLATO provides good examples, case studies and critical incidents (for use of teaching)
- Overall there are relatively few centres of expertise in Irish small business management development. PLATO works closely with a number of colleges to develop appropriate pedagogies to match the learning styles of entrepreneurs
- PLATO concentrates upon developing innovative methods of building the management capability of owner-managers
- PLATO builds management development programmes much more on experience exchange than traditional teaching models
- PLATO endeavours to ensure that a focused range of problem solving techniques are central to group activities
- PLATO focuses on developing group management development schemes
- PLATO as an established network is there to support SMEs in difficult times
- PLATO has a clear focus on supporting emerging, established and mature businesses.
- PLATO is a unique interface between large businesses and the indigenous sector. The importance of a strong SME supply base to large business is an essential element in vibrant economies.
- PLATO has an overwhelming success rate of growing businesses. The number of network businesses that have ceased to trade is miniscule.

## **SUMMARY**

As more governments move from direct financial support to SMEs to providing soft-supports, agencies charged with delivering these interventions must re-evaluate their delivery methods. The PLATO model has been successfully implemented across Western Europe over the last fifteen years. This business support forum for owner managers continues to expand and deliver cost effective management development and training to SMEs in all areas of business activities. The principle of harnessing the talent available in large multinational corporations to deliver much needed management skills to small companies is proving to be very popular both with the SMEs and the economic development organisations who support the network.

## Value for Money Soft Supports for SMEs

PLATO has proven to be a very cost effective model for providing the support that owner/managers need, and can easily be adapted to suit the prevailing economic conditions in any region

The author welcomes any expressions of interest from development organisations that wish to explore the setting up of a PLATO programme in their area.

# HOW DOES OPPORTUNITY RECOGNITION CONNECT WITH ENTREPRENEURIAL LEARNING?

Dr David Rae,  
Centre for Entrepreneurial Management,

## ABSTRACT

This paper aims to connect understanding of the processes of opportunity recognition with those of entrepreneurial learning at a theoretical and practical level. The thesis is that the activities of opportunity discovery, decision-making and enaction, which are seen as central to entrepreneurial behaviour, can be conceptualised as social learning activities.

It is proposed that opportunity recognition is a learning process which arises from participation in social and cultural networks. A series of structured interviews was used to explore how entrepreneurs became aware of business opportunities; how these related to their existing context and activity; what decision making processes and criteria they used to select potential high value opportunities; what actions they took and outcomes resulted; and their reflection on their learning . The interview material was interpreted through discourse analysis and personal construct theory to identify the decision making criteria used in relation to opportunity assessment. A model of opportunity recognition is proposed, based on six clusters including a total of thirty constructs.

The paper proposes that opportunity recognition can be seen as a central learning process in entrepreneurial activity and that a model of the constructs used in opportunity selection can be of value to researchers, educators and practitioners. A case study is used to illustrate the proposed framework for opportunity recognition. The scope for further research to enhance the model is proposed.

The broader implications of this model in entrepreneurship education, support for nascent entrepreneurs within and beyond universities, and in entrepreneurial practice, are outlined. The model can be adopted as a learning framework to assist new entrepreneurs and students to identify the decision making constructs they can use in investigating business opportunities. This may lead to improved quality and effectiveness in opportunity selection and in risk reduction, as well as enhancing awareness of opportunity recognition criteria and skills.

Keywords: entrepreneurship, opportunity recognition, learning

# INTRODUCTION

Opportunity has become a central concept in the study of entrepreneurial work, and the discovery, exploration and exploitation of opportunities are recognised as fundamentally important processes in entrepreneurial activity (Stevenson & Jarillo: 1990). Until recently economic theories have dominated this field, however a purely economic approach limits understanding of human behaviour, and alternative perspectives from social sciences have started to provide important new insights (Gartner, Carter and Hills: 2003).

Entrepreneurial learning has also become a focus of recent research, and this paper aims to explore the connection between the processes of opportunity recognition and learning in entrepreneurial activity. A number of writers have proposed theoretical connections between opportunity recognition and learning, but there has been surprisingly little exploration of how this takes place in practice (Kirzner: 1973; 1997; Corbett: 2002; Shane: 2003). Based on a study of how entrepreneurs recognise and select opportunities, this paper proposes that opportunity recognition is a learning process and that a model of the constructs used in opportunity selection can be of value to researchers, educators and practitioners.

Opportunity recognition as an area of study has been illuminated by Hills (1995) and Hills & Shrader (1998). These studies of successful US entrepreneurs suggested that they identified many opportunities, showing a self-perception of high alertness and sensitivity to opportunity. The opportunities they selected were mainly problem and solution rather than market-driven; their identification of opportunity was a multi-step process rather than a single event, and that opportunities are often inter-related and sequential. They concluded that opportunity recognition often stemmed from prior experience and immersion in an industry, with long term exposure to markets and customers.

Other writers have proposed a range of theories and models of opportunity recognition. Vesper (1980) suggested a systematic search effort, Long & McMullen (1984) proposed a four stage process of opportunity identification, and more recently Kaplan (2003) suggested a five step model; however these appear to be rational conceptions of how the entrepreneur should operate, rather than being based on study of how people actually work on opportunities. Bhidé (1999) proposed that the decision to create a new venture depends on assessment of its viability and attractiveness, with viability being based on low capital requirements, high margin for error, significant pay-offs, low exit costs, and multiple exit options, with creativity and capacity to execute being critical to success, and attractiveness being based on the fit between the entrepreneurs motivation and capability.

Gartner, Carter and Hills (2003) summarised the debate concerning the dominant view from an economic perspective, in which opportunities are held to exist objectively and be discovered (Kirzner: 1997). They compared this with enaction theory (Weick: 1979; 1995) in which individuals make sense of their world through scanning, interpretation and action, and termed this the enactment perspective: 'opportunities would be the result of what individuals do, rather than...of what they see'. Corbett (2002) suggested that individual learning modes were significant in determining whether or not individuals were able to recognise opportunities in a high technology industry. Both this work, Hills (op. cit) and Shane & Venkataraman (2000) indicate the importance of individual prior knowledge and experience in an industry, and the contribution this makes to the ability to recognise opportunities.

## **Conceptual framework**

Let us accept that an opportunity can be defined as a gap or discontinuity between current, perceived reality and future possibility. This may include, for example, an unmet market need; a mismatch between supply and demand; the potential for applying a solution to a problem, the introduction of a new technology, or transferring a product or process from one situation to another. These require the imagination or perception of 'what could be' and the enaction to realise the possibility. If opportunities do not 'exist' as objective facts, but rather are recognised and created by people in their subjective perceptions, then they form part of that person's learning process. Opportunities start off as individual perceptions even if, coincidentally, different people who are quite unconnected recognise the same opportunity. The same opportunities are not apparent to everyone because of the myriad of differences in context, experience, and perception; some people will perceive the same opportunity more quickly than others through imagination and foresight. Kirzner (1973) asserted from an economic perspective that this was the result of superior learning ability. The importance of creativity and foresight in entrepreneurship has been recognised by many writers including Kaplan (2003) and Hills et al (1997).

Entrepreneurial learning has been explored by a number of researchers including Young & Sexton (1997), Deakins & Freel (1998), Cope & Watts (2000), and Rae & Carswell (2001). The activity has been defined by the writer as 'the process of learning to create, recognise and act on opportunities' (Rae: 2003). This study of entrepreneurs in the creative media industry in the United Kingdom led to the development of a triadic model of entrepreneurial learning, consisting of three major themes of personal and social emergence; contextual learning; and negotiated enterprise together with 11 sub-themes. Contextual learning includes the sub-theme of opportunity recognition through social participation, in which entrepreneurs, by being active within social and industry networks, recognise and enact opportunities for venture creation. The current study builds on this work by seeking to explore how entrepreneurs recognise and make choices between opportunities, and to investigate what constructs are actually used by entrepreneurs in their decision making.

In previous work the writer proposed a five dimensional model for opportunity assessment, which included the constructs of: the level of investment; the degree of risk; the anticipated rate of return; the degree of change caused through innovation; and the timescale of the opportunity (Rae: 1999). An assessment tool based on this model has been used extensively in entrepreneurship teaching and with entrepreneurs in new venture planning for several years. Users have found this useful but criticised the absence of a dimension which evaluates the people aspects of the opportunity, such as team and management capability and prior learning. The current study seeks to explore the basis for a more effective instrument.

## **Field research**

The target group of the study was individuals with ongoing roles in opportunity decision making. A total of 17 people were interviewed, the composition of this group being international (10 North American, 5 United Kingdom, 1 Malaysian and 1 German), including practising and experienced entrepreneurs running independent businesses (11), and a smaller group of senior managers and professionals actively engaged in corporate venturing (6). The independent entrepreneurs were running technology based businesses (5), knowledge-based business service companies (3), media companies (2) and a new business model for equipment sales (1). The corporates included aerospace, bioscience, chemicals and energy. The composition was intentionally broad in order to gain a

heterogeneity of perspectives across national groups and to enable responses from autonomous entrepreneurs to be compared with those from corporate venturers. The actual number was small as the intention is to pilot the method and to evaluate whether this can usefully be enlarged.

The research was undertaken by means of interviews in the UK East Midlands and Boston, Massachusetts in the US. Interviews took place using the following series of questions:

1. Can you think of 3 business opportunities which you have identified, at least one of which you acted on and one you did not act on?
2. How did you become aware of each of these opportunities?
3. Were they connected with existing activities or contacts, if so in what ways?
4. How did you decide on which to act and on which not to act?  
This question was used to elicit decision making constructs using personal construct theory methods.
5. Which constructs were most important in your deciding whether to act on opportunities?
6. What action did you take on the selected opportunities?
7. What was the outcome?
8. What have you learned in relation to recognising and acting on opportunities?

Personal construct theory (PCT) was used as a method to elicit the decision making constructs which individuals recollected using in relation to opportunities, and the administration of the method was informed by key texts on the subject. PCT and the associated repertory grid method provide considerable flexibility in use and interpretation and in this case the approach was used at a comparatively simple level (Kelly: 1963; Stewart: 1997; Jankowitz: 2003; Fransella, Bell & Banister: 2003). The elements in each interview were the opportunities people recalled and the constructs were the decision making criteria elicited. The opportunities included the recognition of market gaps for specific products or services, the application of technology to solve a problem or meet a need in an innovative way, and the identification of potential major customers.

From the interviews, a total of 161 individual decision making constructs were elicited. The number of constructs elicited from each person ranged between 5 and 12 with the mode being 11. The constructs were analysed by grouping into categories of related constructs which were formed from coding and comparing through discourse analysis the subject matter of the construct. In total 27 categories were created with a range between 2 and 16 constructs in each. It became apparent during this analysis, and from the related interviews, that there were connections and similarities between certain categories which enabled them to be grouped together and which differentiated them from other categories. They were grouped into 6 major clusters, consisting of the market; innovation; strategy; people; investment; and learning. These are shown in table 1 below which includes the number of constructs in each category (and total number in each cluster).

<b>Market</b> 11 (total 36)	<b>Innovation</b> 10 (total 39)
Customers 16	Technology 9
Suppliers & partners 5	Intellectual property 6
Competition 4	Application 6
	Timescale 4
<b>Investment</b> 12 (total 27)	Implementation & feasibility 4
Risk 7	
Viability 3	<b>Strategy</b> 9 (total 24)
Investor attractiveness 5	Value proposition 8
	Business model & pricing 7
<b>Learning</b> 3 (total 16)	
Control & independence 6	<b>People</b> 2 (total 19)
Personal achievement 3	CEO leadership 3
Intuition 2	Management team capability 5
Ethics 2	Prior industry knowledge 5
	Experienced staff available 4

**Table 1: Clusters of opportunity recognition constructs**

The categories of constructs were edited twice, firstly to combine those constructs which were very similar and had been repeated by several respondents, and then to emphasise those which respondents had indicated were most significant (higher order) in their decision making, and to eliminate those which related only to one specific type of opportunity and did not appear to have a more general application. In this way the constructs were reduced to 30 in number.

The constructs elicited from each person are a product of their learning; that is to say, they suggest, through language, how the person has learnt to 'construe' or make sense of the world around them. Whether this learning has resulted from direct experience, from social learning through engagement with other people, or from some other source such as teaching, cannot be determined. So if a person has learned to discriminate between opportunities in which there is a rapid return, for example, and those where they are not repaid quickly, then the construct 'speed of return' is a product of their learning. Where the same or similar constructs are elicited from different people, the repetition suggests that several people use similar constructs in their decision making and they may be of more general application. The analysis process has grouped together and combined the individual decision making constructs which were elicited in the fieldwork into a collective product of entrepreneurial learning. These are included in the model of opportunity recognition which is described below.

It became apparent during the analysis that there were differences in the constructs elicited from autonomous entrepreneurs when compared with those elicited from corporate venturers, and that these were more significant than those between respondents from different nationalities – for example, between US and UK entrepreneurs. The entrepreneurs as a group made more use of market-related dimensions in their decision making. Market position, customer reliance and interaction, and the role of partnering and networks were especially emphasised. However they showed less consideration of strategic issues, with explicit consideration of learning and people also scoring low, but higher than the corporate venturers rated the same categories.

The corporate venturers as a group emphasised more the investment and strategy factors, especially the value creation potential of the business to the corporate organisation, and

the strategic fit between the venture and corporate business. They reported the use of formal, structured decision-making frameworks and processes in opportunity evaluation, but also many difficulties in applying these in relation to corporate culture. Both groups featured innovation and investment strongly in their decision making. Owing to the small sample sizes, undue importance should not be placed on small percentage differences between the categories and groups, however the interviews suggested that these disparities arose from the corporate venturers evaluating the business opportunities as extrinsic investment decisions in relation to corporate strategy and in comparison with other opportunities, whereas the autonomous entrepreneurs recognised the market and customer-related aspects of the business venture more intensely, and also considered the personal factors of their experience and commitment more relevant to the potential success of the venture.

The table below shows the relative importance which the autonomous entrepreneurs and corporate venturers reported in their decision making in each of the six categories.

<b>Entrepreneurs</b>	<b>Corporate venturers</b>
Market 31%	Innovation 25%
Innovation 22%	Investment 21%
Investment 17%	Strategy 20%
Learning 14%	Market 18%
People 8%	People 14%
Strategy 8%	Learning 2%

**Table 2 Relative importance of factors in opportunity recognition**

## **A model of opportunity recognition**

In this section an overview is given of the model, which is included in full as an annex to the paper. The model is based on the constructs elicited from the participants, analysed and combined as described above. It aims to distinguish between high value opportunities which are worthy of exploration and possible exploitation, compared with low value opportunities less likely to be worth pursuing. Each construct is named, and describes at its poles the characteristics of the construct. It is important to note that each cluster is relevant to every opportunity; however it is likely that not every construct is applicable or of equal weight in relation to every opportunity. The issue is therefore the selection and application of the relevant constructs to the situation. Since learning is contextual and situational, one application of learning to opportunity recognition lies in selecting and adapting the most useful constructs to the situation.

### **Market**

This cluster includes six constructs related to assessment of market opportunities. These are:

1. Market growth – ability to access markets of growing size and value
2. Customer base – extent of known, identifiable customers in defined markets
3. Customer reliance – degree of customer reliance on the product
4. Customer interaction - quality and compatibility of customer relationships
5. Partnering– strength of supplier and technology networks
6. Competition - advantages and strengths in relation to competitors

## **Innovation**

This cluster includes six constructs related to the role of innovation in opportunities. These are:

1. Innovation leadership – use of prior experience to lead the market
2. Innovation providing a solution to a customer-defined problem
3. Use of differentiated technology providing performance and cost benefits
4. Strength of intellectual property protection; vulnerability to copying
5. Speed and likelihood of being first to market
6. Feasibility of implementation; extent of challenges to be overcome

## **Strategy**

This cluster includes four constructs used to assess the strategic potential of opportunities. These are:

1. Business growth – purpose, scope and strategy to create and grow a business
2. Strategic options – single or multiple options for strategy and exit
3. Value creation - profit margin and cash generation
4. Innovative business model - superiority to existing models

## **People**

This cluster includes four constructs used to assess the effectiveness of people resources in relation to opportunities, noting that they may include the decision maker as one of the people related to the business. These are:

1. Chief executive officer (CEO) - ability to show leadership and innovation
2. Management team effectiveness – skills, compatibility and motivation
3. Contextual experience - ability to use prior experience and knowledge of industry (including the entrepreneur/decision maker's own experience)
4. Staff capability - ability to recruit experienced people from the industry

## **Investment**

This cluster includes five constructs used in judging the investment, risk and return presented by opportunities. These are:

1. Investment-reward: financial return and profitability in relation to investment
2. Investor attraction: based on projected increase in equity value
3. Risk: acceptability of loss in worst case scenario
4. Commercial viability, breakeven and predictability of cash flow
5. Timescale: short-long term income stream and exit strategy

## **Learning**

This cluster includes five constructs which feature the entrepreneur's own personal learning in relation to opportunities, and which have not been included in the five preceding clusters (noting that prior contextual experience is included in cluster 4). These

constructs will inevitably vary between individuals, and those included here should be seen as illustrative.

1. Independent control of business direction
2. Personal vision & confidence in business potential
3. Incremental learning – being able to reduce margin between success and failure
4. Intuition - knowing it is the right thing to do
5. Ethics - ability to practice ethical framework and values

In reading the constructs outlined in each cluster and detailed in the model, one interpretation is that they may seem 'obvious' and the type of factor one would expect a business decision maker to consider, and therefore they do not advance the boundaries of existing knowledge. We should not be surprised that the constructs tell us, to some extent, what we already know, because they report the decision making factors which entrepreneurs and corporate venturers say they actually use, and we would expect this to be informed by existing practices. However the model does provide a means of mapping the constructs which people actually use in relation to the six clusters, and of comparing individuals' decision making constructs. The following example illustrates the use of constructs from each of the six clusters gained from an interview with one of the participants.

### **Case study - Nanotite**

The entrepreneur is Guy, the CEO of a small high technology company called Nanotite which is pioneering the application of nano-electrical switch technology. Nanotite has innovation leadership in a highly competitive field and is aiming to be first to market by managing implementation speedily and overcoming technical challenges 'so that competitors become customers'. The business is creating and exploiting a strong base of intellectual property which is legally and technically hard to copy and which will be applied in a series of follow-on products. This innovation is clearly focused onto solving an industry problem through differentiated technology, making it easy to sell to customers by offering an optimal combination of performance and cost benefits.

Nanotite has selected a large market showing potential for exponential revenue growth. If successful it will create long term customer reliance and convergence, and is entering partnerships to licence the technology to major manufacturers. Strategically, it has set out to create a high value, high margin product from the various options available. This is expected to provide a high financial return on investment over a long timescale, which is attractive to investors and in which the risks are well defined and acceptable.

Guy's background in starting two previous technology based companies have provided important prior learning and enabled him to develop skills in leading an innovative business with an effective management team. Nanotite has set out to recruit the best people in a young industry with a limited talent pool of expertise, creating a further entry barrier to competitors.

## **CONCLUSION: IMPLICATIONS FOR ACADEMIC THEORY, EDUCATION AND PRACTICE**

There are three observations to be made in connection with the research process and its contribution to existing knowledge. Firstly, the constructs elicited were those which respondents recalled using in describing specific instances which they conceptualised as opportunities. We cannot know for certain whether they actually used some or all of those constructs, or whether on different occasions other constructs were used, because the research is dependent on their retrospective descriptions. Since construing is contextual, the constructs used are likely to have been formed in a reflexive and interactive relationship with the economic, social, and cultural surroundings of the participant and their experience of the opportunity. Removing the construct from its context and including it in a generic model may result in a loss of some of its meaning.

Secondly, since the study was derived from the experiences of a comparatively small number of entrepreneurs within a limited range of environments, it is not complete or definitive, as there may well be other important and useful opportunity recognition constructs which did not arise, but which are used by other entrepreneurs in different economic and social contexts. The respondents used a range of different constructs in their decision making, and whilst there is not a consensus and not all individuals used constructs in all of the six clusters, by drawing the results together a potentially useful model of the constructs which people do use is created. It suggests that autonomous entrepreneurs pay especial concern to market, innovation, and investment factors in considering opportunities. The model builds on previous research in opportunity recognition by indicating the range of decision making constructs which practitioners use in evaluating opportunities, and in creating insight into their decision making as an entrepreneurial learning process.

Finally, the research process should be seen as an interpretive study in which the researcher is using PCT as a method to gather and analyse speech material across a small, heterogeneous group of respondents in different contexts who were recalling differing types of opportunities. This research process is reflexive and subjective, the outcomes being influenced by the researcher's own perspective and focus. The model should therefore be seen as a propositional way of gaining insight into entrepreneurial decision making, and of connecting this with entrepreneurial learning. It has experimented with the use of PCT in this field and this is capable of being refined through further research to include larger groups of participants from different backgrounds, and by more advanced analysis which will enable the model to be enhanced. This could identify the most significant constructs used in relation to specific types of opportunities and investigate further the differences between opportunity recognition in corporate and autonomous venturing.

The model can make a useful contribution to education and to entrepreneurial practice. Within entrepreneurship education and new venture training programmes it can be adopted as a learning framework to assist learners to identify the decision making constructs they can best use in investigating business opportunities, and to ensure that constructs in all the relevant clusters are applied. This may lead to an improved quality and effectiveness in decision making on specific opportunities, as well as enhancing learners' conscious awareness of their opportunity recognition criteria and skills, as part of an action-centred learning process. More experienced entrepreneurs and corporate venturers may also gain both from the model and from the research process. Participants commented that the thinking process prompted by the seven research questions was

useful in heightening their awareness of their own decision making, and that they would find it useful to see how their criteria compared with those used by others. If the model contributes to improving the opportunity recognition awareness and capability of entrepreneurial practitioners, it will be worthwhile. Possibly it has other applications? Now there's an opportunity to investigate!

## OPPORTUNITY RECOGNITION MODEL

High value opportunity	<b>MARKET</b>	Low value opportunity		High value opportunity	<b>INNOVATION</b>	Low value opportunity
Able to access market of growing size & value	Market growth	Limited growth potential in smaller markets		Able to lead the market using prior experience	Innovation leadership	Learn as you go along to catch up
Known, identifiable customers in defined market sector	Customer base	Limited or non-specific customer base		Application solves a problem informed by customers needs	Innovation related to customer needs	Application does not solve customers real problem
Customer reliance on product increasing over time	Customer reliance & convergence	Customers not reliant on product, divergent from their needs		Differentiated technology - optimal performance & cost benefits	Technology differentiation	Undifferentiated technology - marginal performance & cost improvement
Trust & open relationships with clients; compatible practices	Customer Interaction	Adversarial customer relationships; lack of fit		Strong IP protection with clear ownership & control, hard to copy	Intellectual property	Weak or no IP protection - can be copied
Long term partnerships within strong supplier & technology networks	Partnering & networks	One-off relationships within weak networks		Opportunity to be first to market	Speed to market	Unlikely to be first to market
Unique advantages & strengths apparent in relation to competitors	Competition	Undifferentiated from competitors, forced to compete on price		Implementation feasible; challenges can be overcome	Feasibility of implementation	Difficult to implement with many obstacles

High value opportunity	<b>STRATEGY</b>	Low value opportunity		High value opportunity	<b>PEOPLE</b>	Low value opportunity
Have a strategy to create & grow business	Business growth	Limited purpose and scope to build a business		CEO able to show leadership & innovation	CEO leadership	CEO not an innovative leader
Create multiple options for strategy & exit	Strategic options	Single or limited exploitation options		Management team skilled, compatible & motivated to achieve	Management team effectiveness	Team lack management skills, fit & motivation
High value creation from high profit margin & cash generation	Value creation	Low perceived value & profit margin		Able to use prior experience & knowledge of industry	Contextual experience	No pre-knowledge of industries or technology
Superior business model	Innovative business model	Similar to existing business models		Able to recruit experienced people from within industry	Staff capability	Suitably experienced & capable staff not available
High value opportunity	<b>INVESTMENT</b>	Low value opportunity		High value opportunity	<b>LEARNING</b>	Low value opportunity
High return & profitability in relation to investment	Investment-reward	Low financial return for investment		Independent control of business direction	Independent control	Not in full control of the business
Attractive to potential investors with growing equity value	Investor attraction	Unattractive to investors offering limited increase in equity value		Personal vision & confidence in business potential	Personal vision	Self doubt & lack of scope to succeed
Acceptable risk of loss in worst case scenario	Risk	Unacceptably high downside risk		Able to reduce margin between success & failure	Incremental learning	Unable to reduce margin of effectiveness

Commercially viable with predictable breakeven & cash flow	Viability & cash flow	Unpredictable cash flow, unable to achieve viability		Intuition, knowing it is the right thing to do	Intuition	Does not feel right - bad past experience
Long term opportunity & income stream	Timescale	Short term timeframe & rapid exit strategy		Able to practice ethical framework & values	Ethics	Non-ethical exploitation

# **GLOBALIZATION: ENHANCING COMPETITIVENESS OF THE SMALL AND MEDIUM INDUSTRIES THROUGH PRODUCTIVITY GROWTH – THE CASE OF SARAWAK, MALAYSIA**

**Annie Wong Muk Ngiik  
Nicholas Amin  
Lecturers**

**MARA University of Technology, Sarawak Branch Campus**

## **ABSTRACT**

Survival and growth of the small and medium industries (SMIs) today are largely influenced by their capabilities to stay competitive in the global market. With increasing globalisation and the integration of the world economy, SMIs are facing daunting tasks to stay competitive against larger enterprises. Even in the domestic front, SMIs are increasingly being sidelined by the larger enterprises in favour of the more efficient foreign-based suppliers. In view of this, it is imperative that SMIs should measure productivity and implement productivity initiative programmes in order to improve their performances and competitiveness.

This paper analyses the total factor productivity growth (TFPG) of SMIs from 1991 to 2000 in twenty, three-digit manufacturing sub-sectors using the Standard Growth Accounting model in Sarawak. The objective is to look at factor contributions to the output growth in SMIs, which consists of the physical inputs - capital (K) and labour (L) and the quality of inputs i.e. TFP. The results of the study indicate that the primary source of growth for the SMIs sector is derived from capital. TFP growth rate was found to be low during the study period. This low TFP growth rate shows that growth in SMIs is input driven rather than productivity driven. It also reflects low production efficiencies and productivity of the Sarawak's SMIs.

Consequently, there is an urgent need to step up the productivity growth performance and hence the level of competitiveness of SMIs. This paper suggests several strategic thrusts that include among others, human resource development (HRD), R&D and technological development, cluster based development and enhanced marketing efficiency towards this end.

## **INTRODUCTION**

Small and Medium Industries (SMIs) have been recognised in both the developed and developing economies for their capabilities in creating employment opportunities, maintaining social economic equality and price stability as well as for their contributions to growth,

productivity, innovations, competitions and foreign exchange generation. The contributions of SMIs to a nation's economy as well as to the global economy will continue to be important under globalisation and trade liberalization. According to Asundi (1996), SMIs account for an increasing amount of the world trade. In 2002, it was estimated that SMIs around the world accounted for between 20 to 25 per cent of the total world trade (World Bank, 2003). As SMIs are operating in a highly dynamic and competitive global socio-economic environment today, there is a need to increase their level of productivity and competitiveness to enable them to play a more effective role in the economic growth of nations.

According to the U.S. Presidential Commission on Industrial Competitiveness, international competitiveness is the ability of a country to produce goods and services that meet the test of international markets, while simultaneously maintaining and expanding the real income of its citizens (Irfan ul Haque, 1991). Therefore, based on this premise, 'competitiveness' is a multidimensional concept that engenders several parameters such as a country's ability to exports, the efficient use of factors of production, and increasing productivity that ensures rising living standards of a nation (Porter, 1990). The World Competitiveness Yearbook (2002) identified eight factors that contributed to a nation competitiveness level namely domestic economy, internationalisation, government, finance infrastructure, management, science and technology and people. Due to data limitations, this paper only confine the discussion to productivity growth as a basis to stimulate competitiveness among the SMIs.

The influence of productivity on competitiveness has been stressed in many literature (Porter, 1990 and DRI, McGraw-Hill, 1993). Porter (1990:9), stressed that productivity is the prime determinants of a nation's long-run standard of living and hence its' per capita income. DRI, McGraw-Hill, (1993) also reported that productivity is the core determinant of competitiveness of nation. The main conclusions that can be drawn from these studies is that a highly productive manufacturing establishments (and also a nation) would greatly benefit and possesses more competitive edge through cost cuttings, economies of scale and bulk purchases something that most nations and firms are unable to do. Thus, the more productive firms or business establishments will be lean, cost-effective and more quality-driven than merely input or factor-driven. Quality outputs will ensure that the manufacturing establishments especially the SMIs are able to forge ahead of other competitors in the fields. In retrospect, therefore, the survival and growth of the small and medium industries (SMIs) today are largely influenced by their capabilities to stay competitive in the globalised world. Hence, in meeting these challenges, most countries have embarked on programmes to enhance productivity among their business establishments particularly among the manufacturing establishments as productivity is the core thrusts of maintaining their competitive edge in international markets.

In Malaysia, productivity has become a major policy issue and national agenda in its quest towards achieving a developed nation status by the year 2020. Both the Seventh and Eighth Malaysia Plans have stressed the need to shift from input-driven growth to a productivity-driven growth through total factor productivity growth (TFP). As the former Prime Minister of Malaysia, Datuk Seri Dr. Mahathir Mohamad (1996) puts it:

“Our primary challenge will be that of transforming the economy from one that is investment-driven to one that is productivity and quality-driven through enhancing the efficiency of labour and capital, skills upgrading, capital deepening and improving management and entrepreneurship.”

In Malaysia, SMIs are assuming an increasingly important role in the development of the country's economy. In year 2000, they constituted about 90 per cent of the total manufacturing establishments, contributed 26.2 per cent to total manufacturing value added (MVA), and provided employment opportunities to 38.9 per cent of the total workforce in the manufacturing sector. In year 2003, SMIs in the country exported about 20.0 per cent of their output. It is expected that total export from SMIs would increase quite significantly in the near future.

The objective of this paper is to assess the TFP growth and to determine the sources of growth of SMIs in Sarawak. Several strategies for the development of SMIs are proposed with the intention to modernise and enhance the competitiveness of the manufacturing sector through productivity growth. In this paper, the definition of SMIs is adopted from the State's Ministry of Industrial Development (MID) where SMI is defined as those manufacturing establishments that have a paid up capital of RM2.5 million and less, or have full time employees not exceeding 75. This definition is adopted by the State government to suit local business conditions

## **PRODUCTIVITY MEASURES**

### **Concept and measurement of Total Factor Productivity growth**

Productivity is generally defined in terms of the efficiency with which inputs are transformed into outputs in the production process. It can be expressed as the ratio of real output over total input. The most widely used method to analyse productivity growth is based on a single input pioneered by Solow (1957). In this method, partial factor productivity or labour productivity is expressed as the ratio of output over some measure of input, mainly labour. This method, while relatively easy to compute, fails to segregate the effects of other factors apart from labour such as capital, intermediate inputs and technological change on productivity growth. Many writers have considered TFPG as a better measure of productivity growth than partial factor productivity (Maison Abdullah, 1992; Helmut F., et. al. 2002). For instance, Helmut F., et al (2002) indicates, "TFP allows for a decomposition of productivity increase into its major components and thus provides empirical evidence of its main sources of growth."

Jorgenson, et al (1987) modified the Solow's approach and decomposed the rate of growth of output into the contributions of the rates of growth of the various inputs and a residual term, which is total factor productivity (TFP). In this approach, TFP is computed as the difference between the rate of growth of output and the weighted average of the growth inputs. The weights used are the respective shares of each input in the gross value of output of each industry. This would be discussed further in the section below.

A review of cross country TFP studies indicate that many recent works adopted the Gollop-Jorgenson Model in TFP analysis in determining the growth of productivity (World Bank 1993, Abimanyu and Xie 1994). All these studies seem to reach a general consensus that capital accumulation is an important factor that has contributed to growth in

the manufacturing sector though there are varying opinions concerning the relative contributions of productivity growth. For instance, Tsao, (1980) based on a comprehensive study on TFP in Singapore revealed that capital contribution to growth was significantly higher than that of labour between 1970 and 1979. Abimanyu and Xie (1994) also indicated that in Indonesia, capital stock was a more important source of growth than labour between 1985 and 1990.

In Malaysia, TFP studies seem to centre on time series analysis of productivity growth in the manufacturing sector (Maison and Arshad 1992, Kawai 1994, Tham 1995). Tham (1995) used the Gollop-Jorgenson Model to determine the contributions of the growth of factors that include capital, energy, non-energy, and labour, and TFP to the growth of output for the manufacturing sector in Malaysia between 1971 and 1987. Her study revealed that capital was the crucial contributor to the growth in the manufacturing sector, contributing 104 per cent to growth in output while labour contributed only 18 per cent. She found out that TFPG was an unimportant source of growth contributing 0.3 per cent during the period of study.

Maison Abdullah and Arshad Marsidi (1992) estimated the TFP growth levels in forty-three five-digit Malaysian resource based industries between 1973 and 1993. Their estimates show generally low TFPG levels for Malaysian resource based industries during the period of study as compared to TFPG levels in South Korea, Japan and Turkey. This study also revealed that consumer good industries, export oriented industries and downstream activities tend to experience relatively higher TFP growth levels than capital intensive industries and heavily protected industries.

Many studies analysed the contribution of TFP to economic growth but few studies have related it to SMIs specifically. The purpose of this paper is to estimate the TFPG growth of the SMIs in Sarawak using the Jorgenson Gollop Model.

## **THEORETICAL FRAMEWORK**

TFP growth is determined by a host of factors that interact with one another in several ways. According to the Productivity Report prepared by the National Productivity Corporation (NPC), the key causal factors that have significant influence on TFP growth include the availability of capital funds (K), Labour (L) input, the level of technical progress as in the advancement in knowledge and deployment of new production techniques, the availability and quality of materials inputs, the quality of the working environment, the Management Styles adopted by the establishments, the organization set up, and a functional set of Systems and Procedures.

To identify the sources of growth of the State's manufacturing sector, the standard growth accounting framework developed by Jorgenson and Gollop (1987) is used to determine the relative contributions of growth of inputs and TFP towards growth of output. In essence, this framework decomposes the average growth rate of output into the growth of inputs and a residual category associated with TFP. Due to data limitations, tests are only carried out on the capital and labour inputs.

Following the Gollop- Jorgenson model, a production function is expressed as: -

$$X_t = f(K_t, L_t) \quad (1)$$

where  $X_t$  = output during period  $t$

$K_t, L_t$  = capital and labour inputs during period  $t$

Differentiating the production function with respect to time yields the following equation.

$$\frac{d \ln X}{dt} = \frac{\delta \ln X}{\delta \ln K} \cdot \frac{\delta \ln K}{\delta t} + \frac{\delta \ln X}{\delta \ln L} \cdot \frac{\delta \ln L}{\delta t} + \frac{\delta \ln X}{\delta t} \quad (2)$$

where

$$\frac{\delta \ln X}{\delta t} \text{ is the residual growth or TFP}$$

Following the Gollop- Jorgenson model and employing a discrete version of the Divisia Index, Equation 2 is expressed as: -

$$[\ln X_t - \ln X_{t-1}] = SK[\ln K_t - \ln K_{t-1}] + SL[\ln L_t - \ln L_{t-1}] + ST \quad (3)$$

where

$X$  stands for output

$SK$  stands for elasticity of output to  
Physical capital

$K$  stands for capital input

$L$  stands for labour input

$SL$  stands for elasticity of output to labour input

$ST$  stands for growth rate in TFP

And

$SK$  and  $SL$  are obtained as follows:-

$$SK = \frac{1}{2} (SK_t + SK_{t-1})$$

$$SL = \frac{1}{2} (SL_t + SL_{t-1})$$

Assuming constant returns to scale, a Hicks-neutral technological progress production function and perfect competition,  $SK$  and  $SL$  are the respective shares of each input in total output. For the purpose of this study, equation 3 is used to measure TFP performance of the State's manufacturing sector.

## SOURCES OF DATA AND MEASUREMENT OF VARIABLES

The data required for this study are obtained from the Manufacturing Industries Surveys conducted by the Department of Statistics of Sarawak, covering 10 years from 1990 to 2000. As no survey was conducted for the year 1998, an approximation was made using the average of the previous year (1997) and the following year (1999) as proxy. Capital inputs,  $K$

are measured using the value of fixed assets at year-end and labour inputs, L are analysed based on the number of paid employees at year-end. Both values of fixed asset and value added are analysed based on current market prices. It should be noted here that results for the growth in TFP obtained in this study might be underestimated since capital stock was used rather than the flow of capital services. This is due to data limitations for the State economy. SMIs are categorised into 20 sub sectors and the TFP analysis is conducted based on the ISIC 3-digit level. The choice was due to the technical reasons as some sub sectors were too few and insignificant when broken down to five-digit level. The selection of these sub-sectors is based on their relatively higher contributions to the growth of the manufacturing sector in Sarawak either in terms of employment, value added and number of establishments.

## **Productivity Growth Of The SMIs In Sarawak**

### **An Overview Of The Development Of SMI In Sarawak**

According to the census conducted by the Department of Statistics, in the year 2000, there were 1,853 manufacturing establishments in Sarawak, out of which SMIs constituted the majority of 89.6 per cent, with those firms employing less than 50 employees (SSI) formed the bulk of such establishments (86.0 %) (Table1). The large industries (LIs) only represented 10.4 per cent in all the manufacturing establishments surveyed in 2000.

Despite their numerical preponderance, SMIs accounted for a much smaller proportion of total output, value added and total employment when compared to the LIs. In 2000, SMIs contributed 8.7 per cent to total output (RM 2360.25 million), and 5.5 per cent to the total manufacturing value added (MVA) (RM12,514.60 million) while the LIs contributed the bulk of 91.3 per cent and 94.5 per cent respectively. In terms of capital investment on fixed assets, the SMIs are lagging far behind when compared to the LIs. The SMIs invested RM1,123.87 million on fixed assets, which is only 8.5 per cent of the industry's total whereas the LIs invested 91.5 per cent. The SMIs employed only 19,114 workers or about 25 per cent of the total surveyed enterprises' workforce, the bulk of the workforce (75 %) are being absorbed in the LIs.

It is also noted that during the period 1990-2000, the performance of SMIs has deteriorated while that of the LIs has improved. Table 1 indicated that while the total numbers of SMIs have risen by 5.3 per cent during this period, their contributions to total output and MVA have dropped by 4.7 per cent and 4 per cent respectively. In addition, their contributions to total employment and investment in fixed asset have also dwindled by 13 per cent and 0.4 per cent respectively. On the other hand, during this period, though there was a drop in the total number of establishments for the LIs by 5.3 per cent, their contributions to total output, MVA and total employment have appreciated by 4.5 per cent, 4.0 per cent, 13 per cent respectively. All this tends to suggest that there exists a large disparity between the SMIs and the LIs in Sarawak.

Differences in performance can also be seen among the various sub-sectors in SMIs. Table 2 indicates the distribution of SMIs establishments in the State in 2000. The largest concentration of SMIs in the State were found in four sub sectors; textile, wearing apparel and leather industries (19.7 %), food manufacturing (18.7 %), manufacture of fabricated

metal (16.4 %), and wood and wood products including furniture (18.5 %). These four sub-sectors dominated more than 70 per cent of SMIs. They were also the largest employers as well, accounting for more than 60 per cent of the total employment of SMIs. The five top contributors to MVA were food manufacturing at 24.4 per cent, other chemical product at 14 per cent, fabricated metal product at 9.1 per cent, transport equipment at 6.5 per cent, and wood and wood products at 8.7 per cent. These are the niche sectors of Sarawak that have potentials for further development. The establishments with the highest investment in fixed assets were Food manufacturing (23.2 %), Non metallic mineral (18.9 %) and the fabricated metal and other chemical product (both invested the same proportion of 7.7%).

It is useful to benchmark performance of SMIs in the State with those at both the national and the international levels in order to gauge the relative position of the former. Table 3 indicates that SMIs in the State are more labour intensive in nature as compared to the national level. In 1996, the SMIs in Sarawak employed on the average 40.1 workers per establishment. This is about 1.4 times higher than the number of workers per establishment at the national level (29.74). Despite their relatively larger employment size, SMIs in Sarawak are less productive as they generated only about 90 per cent of the value added at the national level. Sarawak's SMIs invested a much lower value in fixed asset as compared to that of the national level. In 1996, their total investments in fixed asset were three quarters that of the national level. They also paid less wage as compared to the national level. This is because wage rate in the State is generally lower than that of Peninsular Malaysia.

Table 4 depicts the scenario of SMIs in the State with that of the international level. SMIs in most countries export their products, with the amount ranging from a low 4.66 per cent in Singapore to a high 55.92 per cent in Taiwan. However, SMIs in Sarawak are domestic oriented. The amount exported is negligible. These indicators reveal that performance of SMIs in Sarawak are far less than satisfactory as compared to their counterparts in Peninsular Malaysia as well as those in the more developed countries.

## **Performance Of SMIs Based On Selected Partial Productivity Indicators**

Performance of SMIs based on selected partial productivity indicators is shown in Table 5. In 2000, the labour productivity, or Value added per employee (the ratio of value added over total employment) of small-scale firms (SSI) is about two-third compared to medium scale firms (MSI) and one-twelfth that of LIs. This indicates that labour productivity of the manufacturing sector, tends to increase with firm size. As indicated by the high K/L ratio (total fixed assets over total employment) of RM 211,237, the LIs are capital intensive in nature. SMIs on the other hand, are labour intensive in nature. Its K/L ratio is about one-fifth that of LIs. In 2000, the capital productivity (value added generated per Ringgit of fixed assets invested) of SMIs was 63 per cent compared to that of LIs. This indicates that capital utilization is much more efficient in LIs than the SMIs. The labour cost competitiveness of SMIs is analysed based on two indicators, namely labour cost per employee (W/L) and value added per labour cost index (VA/W). The wage rate paid by SMIs, as indicated by the labour cost per employee ratio, is 92 per cent that of LIs. This indicates that the LIs pay higher wage rate as compared to SMIs. Value added per labour cost index is also computed to reflect labour cost in relation to value added creation. This ratio gives an indication of the real worth of labour to the organisation. This indicates that on the average RM1 spent on labour gives a value added of RM 3.84 in SMIs. The corresponding value for LIs is RM 18.55, which is about 5 times higher.

**Table 1****Sarawak: Relative changes in percentage contribution of SMIs and LIs, 1991, 1995 and 2000**

Number of firms	Contribution by Sector (Percentage)			Percentage change 1991-2000	
	1991	1995	2000		
SMIs	SSI	76.7	73.7	86.0	9.3
	MSI	7.6	8.2	3.6	4.0
		84.3	81.9	89.6	5.3
	LIs	15.7	9.1	10.4	-5.3
Total output	SSI	10.0	8.6	5.0	-5.0
	MSI	3.4	5.2	3.7	0.3
		13.4	13.8	8.7	-4.7
	LIs	86.6	86.2	91.3	4.5
Total value added	SSI	7.3	8.0	2.9	-4.4
	MSI	2.2	4.3	2.6	0.4
		9.5	12.3	5.5	-4.0
	LIs	90.5	87.7	94.5	4.0
Total employment	SSI	27.7	22.4	19.4	-8.3
	MSI	10.2	5.0	5.5	-4.7
		37.9	27.4	24.9	-13.0
	LIs	62.1	72.6	75.1	13.0
Total fixed assets	SSI	6.2	3.0	4.1	-2.1
	MSI	2.7	1.7	4.4	1.7
		8.9	4.7	8.5	-0.4
	LIs	91.9	95.3	91.5	-0.4

Note: SSI refers to Small-scale industry (Less than 50 workers)

MSI refers to Medium scale industry (between 50 to 75 workers)

SMIs refers to Small and medium scale industry (Less than or equal to 75 workers)

LIs refers to large scale industry (More than 75 workers)

## Findings of Total Factor Productivity performance of SMIs in Sarawak

### Results of Regression Analyses of SMIs

Table 6 Shows the result of the multiple regression analysis using the ordinary least square (OLS) method based on the Gollop-Jorgenson model. The problems of serial autocorrelations in the respective sub-sectors are corrected using the First Difference method. In this method, a lag of one year is taken to correct any serial autocorrelations in the respective subsectors. Generally, the autocorrelation problems appear to be less serious after taking a one-year lag. This can be seen by inspecting the Durbin-Watson statistics from Table 6 below.

The value of the adjusted R<sup>2</sup> ranges from 0.521 or 52.1 per cent to a high of 0.975 or 97.5 per cent. High adjusted R<sup>2</sup> values of greater than 0.90 were observed in eight out of the twenty SMIs subgroups indicating that the independent variables explain more than 90.0 per cent in the variation of the dependent variables respectively. These industries are food industries, beverage industries, textile and apparel, printing and publishing industries, rubber products, fabricated metals and those classified under the other manufacturing category.

The regression results show that both capital and labour inputs are significant determinants to output or productivity in more than half of the SMIs subsectors in Sarawak. Negatives t-values were observed in some sectors due to incomplete or negative growth in some sectors and the data limitations. Some subsectors were not big enough to be disaggregated to be meaningfully analysed in this manner.

Table 7 depicts the average annual growth rates of value added (VA), capital (K), labour (L) and total factor productivity growth (TFPG) of the various sub-sectors from 1991-2000. During the period 1991-2000, MVA of SMIs grew rapidly (though slower than that of LIs at 29.52 per cent) with an average of 26.15 per cent per annum. All the 20 sub-sectors registered positive growth rates in MVA with the highest rate recorded in the transport equipment (0.5231 or 52.31 %), followed by industrial chemical (39.33 %), textile and apparel (38.59 %) subsectors. Others that grew at a high rate of above 30.0 per cent in value added between 1991-2000 include beverage industries, paper and paper products, other chemical products, plastic products, pottery and glass products, basic metal products, machinery and other manufacturing industries sub-sectors.

Notes: Figures in parentheses are t-values.

\*\* significant at 1 per cent level

\* significant at 5 per cent level

The rapid growth in MVA of SMIs was fuelled by the rapid growth in capital at 27.32 per cent (LIs achieved a higher rate of 29.18 %). The growth in capital denotes the injection of fresh capital to replace the existing plants or machineries in order to upgrade and modernise their operations. The highest growth in capital investment is recorded for ten out of twenty (above

31.0%) subsectors namely, beverage industries, textile and apparel, paper and paper products, pottery and glass products (the highest at 41.83%), non-metallic products, basic metal industries, electric and electronic, other chemicals, transport equipment and other manufacturing sub sectors. Capital growth in the other ten sub sectors was generally lower at below than 30.0 per cent for the period 1991-2000.

Labour, as measured by the number of full time paid employee grew at a slightly slower rate of 25.63 per cent during the period under study. The lower annual growth rate of labour as compared to that of value added and capital in both SMIs and LIs indicate low labour productivity in the State-manufacturing sector. Only five subsectors have labour growth exceeding 30.0 per cent. These subsectors were textile and apparel (35.87%), paper and paper products (37.69%), industrial chemical (92.44 %), machinery (34.81%), and the other manufacturing industries subsectors (30.82%).

During the reference period, SMIs registered the lowest TFP growth of a mere 1.33 per cent while the large industries (LIs) and the overall manufacturing sector recorded TFP growth rates of 6.1 per cent and 7.44 per cent respectively. Analysis of TFP growth in SMIs by sub-sectors indicated that most of the sub-sectors recorded negative TFP growth rates between 1991 and 2000. However, positive TFP growth rates were recorded in nine sub-sectors namely transport equipment, rubber products, textile & apparel, basic metal products, petroleum refineries, beverage industries, pottery & glass, wood & cork industries, and plastic products. With the exception of beverage industries, all of these sub-sectors achieved higher average annual growth in capital than labour. This could probably be due to higher efficiency in the utilization of capital than labour in the State.

**Table 7****Sarawak: Average Annual Growth of Output, Capital and Labour in SMI by sub-sectors, 1991- 2000.**

## **Sources Of Growth Of SMIs In Sarawak**

The primary source of growth for the SMIs sector as a whole is derived from the growth of capital (Table 8). During 1991-2000, capital played a crucial role in the growth process, contributing 87.03 per cent to the growth. Labour and TFP were unimportant sources of growth as they contributed only 8.0 per cent and 4.9 per cent to growth respectively. The low TFP value shows that growth in SMIs is input-driven rather than productivity-driven. For the manufacturing industry as a whole, capital was a more important source of growth contributing 70.65 per cent to growth while labour and TFP contributions were rather unimportant at 3.47 per cent and 25.89 per cent respectively. The higher TFP values in the overall manufacturing sector in contrast to SMIs indicate higher production efficiency in the former in contrast to the latter.

Between 1991 and 2000, the contributions of TFPG were found to be positive in nine out of the twenty sub sectors for SMIs namely, beverage industries, textile and apparel, wood and cork products, petroleum refineries, rubber products, plastic products, pottery and glass products, basic metals industries and transport equipments. In most of these industries, capital was found to be a more important source of growth than labour. The exceptions were the textile & apparel and wood & cork industries, which had low levels of capital intensity. The positive contributions of TFP to growth in these two sub-sectors may be attributed to better management techniques and capitalization on the low labour costs. Negative contributions of TFPGs were recorded in eleven SMIs sub-sectors namely, food industries, furniture & fixtures, paper & paper products, printing & publishing industries, industrial chemical, other chemical products, non metallic products, fabricated metal products, machinery except electrical, electrical and electronics and other manufacturing industries. The contributions of TFPG were negative in these sub-sectors despite their high capital intensities. This indicated that TFPG in Sarawak is dependent not only on capital intensity alone but also on the choice of technology and quality of workforce. Thus, high capital intensity is not a sufficient condition for a high TFP growth.

Capital was an important source of growth in 12 sub sectors namely, food industries, beverage, paper and paper products, printing and publishing petroleum refineries among others. These are generally the more capital-intensive industries. Therefore, capital inputs contributions seem to dominate the more capital-intensive industries. Labour was a more important source of growth in six industries - textile and apparel, wood & cork products, rubber products, fabricated metal products, transport equipment, and machinery except electrical. These are more labour intensive industries.

A few reasons could have given rise to the low TFP growth in the State's SMIs. Firstly, the State's SMIs have low production efficiencies and productivity. The low productivity of the State's SMIs has also been reported by studies conducted by Iris Syawe et al, (1990); Ibrahim Abu Shah, et. al, (1995) and Yap Yin & Nicholas Amin, (1995). For example, Ibrahim Abu Shah, et. al, 1995 indicated that SMIs in Sarawak suffered from low productivities because they utilize traditional production techniques, which are manual and ineffective.

Secondly, *the* growth and development of SMLs in Sarawak are constrained by the lack of skilled workers. In 2001, Sarawak had a labour force of 943,400 out of a population of about 2.2 million. The educational profile of the labour force is shown in Table 9. During the 1990-2001 period, the percentage of workers in the labour force having no formal education has declined from 23.8 per cent in 1990 to 12 per cent in 2000, while the percentage of workers having either college or university education increased from 3.7 per cent to 11 per cent during this period. However, the overall scenario is still not satisfactory. Recent interviews with some SMLs establishments and association representatives revealed that many workers among SMLs are found to be largely unskilled or at best semi-skilled. Some are not able to follow basic instructions in the operation process and are often hampered by their illiteracy. The low training culture, which is predominant among SMLs entrepreneurs, negates any effort by the government to enhance productivity. Most gave reasons that they have to meet tight production schedules, fear of losing workers, and regarded training as unimportant for the workers to perform their job functions.

Source: Statistical Bulletins, 1993, 2001

Thirdly, the majority of SMIs in Sarawak are plagued by inefficiencies arising from the utilization of inadequate management technique and outmoded technology. The level of technology involved in their daily operations are outdated and outmoded which have direct effect on their productivity and quality of their outputs. The use of modern technology or new methods of managements such as materials resource planning (MRP), enterprise resource planning (ERP), customer relationship management (CRM) and information and communication technology (ICT) is low or non-existent. Thus, these SMIs cannot access the benefits of modernisation. Most SMIs are also financially constrained to undertake any major production upgrading. According to a survey carried out by Ibrahim A. Shah et al. in 1995, about 86 per cent of the SMIs in the State utilized intermediate level of technology or partially mechanized method of production. Further more, more than half of the establishments surveyed had used their machinery for more than 7 years. All these could affect the quality of products of SMIs and their level of competitiveness capabilities in the market.

### **Strategic thrusts towards enhancing productivity growth in Sarawak**

Despite past efforts to develop SMI through tax exemptions and other incentives, their contributions to the State economy are unsatisfactory. Though the large enterprises are more efficient, they are few in numbers and mostly owned by the multinationals. Future

development of the industrial sector would depend on our abilities to upgrade the performance of the SMIs. This calls for the need to improve the competitiveness of SMI through productivity improvement.

This study proposes six major strategies namely, human resource development (HRD), research and development (R&D) and technological development including information and communication technology (ICT), cluster-based development, and programmes towards enhancing marketing efficiency of SMIs to enhance productivity growth in Sarawak.

The quality and quantity of work force is an important factor in enhancing the productivity of an enterprise or a business firm. A highly skilled workforce is more trainable, and is able to innovate, follow instructions, and provide the necessary impetus for change and leadership in the work place. Toward this end, HRD is crucial in ensuring productivity growth through training and development. The key to the success of SMIs in Sarawak, therefore, is to increase the pool of skilled and capable workers through diverse training programmes based on the needs of specific industries. The government, through the Industrial and technical Assistance Funds (ITAF) Scheme for example, provides several incentives for training and HRD and the number of takers should also be increased. Public delivery system through the universities, technical colleges need to be streamlined to the type of skills needed by the industries. For the SMIs to forge ahead there must be a 'critical mass' of skilled workers that can form the backbone of the elite and capable workforce in the State and the country as well.

The use of technology especially in the production process must also be updated and enhanced to meet the quality standards and conformance of the market needs or requirements if the SMIs were to remain competitive. Technological usage and application including Research and Development (R&D), Science and Technology (S&T) and ICT must be actively utilized and deployed in the operations of SMIs. Most SMIs in Sarawak employed equipments that may not have the right technological capabilities and capacities. ICT should be used more effectively in production management, e-commerce or B2B. At the same time the government should also invest in ICT infrastructure development and reduce the rates for Internet access for companies. Some of the proposed plan of actions in the technology and ICT framework cover the university-industry linkage to develop indigenous technologies that meet the local needs, construction of technology part and industrial estates specifically for the SMIs and develop and maintain technological information database and service centre in order to expedite current information to the SMIs.

Cluster-based approach can be promoted as a suitable strategy to enhance the productivity and consequently the competitiveness of the SMIs in Sarawak. Clusters are essentially concentrations of interconnected companies and institutions in a particular area or field. This concentration will benefit from the external economies for all inter-related manufacturing establishments in the industry. Further studies should be made to identify and relocate certain industries to be within a particular cluster to enable them to operate most efficiently. Through this clusters, linkages (both vertical and horizontal) between firms may be further enhanced through a maze of networking between the industries and the supporting institutions such as financial institutions, related government agencies, training institutions and a host of others. Through the clusters, it is hoped that the development of new business, increased productivity of manufacturing establishments or business firms based in the area will be promoted. Similarly, proper management and supervision and control of industrial activities can be made

and be coordinated by the various supporting government agencies that are responsible for SMIs or the manufacturing sector in general.

Marketing problems have been indicated by most SMIs in Sarawak as a major hindrance to exporting their products (Ibrahim Abu Shah, et. al 1995). Towards this end it is proposed that the government with the assistance of the local Chamber of commerce or trade associations to assist SMIs to penetrate the international market. Besides holding trade fairs and exhibitions of which may be expensive affairs for the SMIs, home markets need to be develop and further expand. This involved new products development, pricing policies, broadening the product range and also the quality enhancements of the products. Assistance must be provided for product research and also product branding scheme. Sarawak SMIs can be producers for international halal food hub in the region through collaborative efforts of the federal government.

## CONCLUDING REMARKS

Despite their inherent weaknesses, the developments of SMIs are crucial for the overall growth of the manufacturing sector in Sarawak. Results from the analyses of TFP growth during 1991-2000 indicates that capital is the main source of growth for the State's SMIs while labour and TFP were unimportant sources of growth. The main reasons for low TFP growth include lack of skilled workers, production inefficiencies, and the utilization of inefficient production techniques. In the face of changing business environments and stiff challenges resulting from the globalised market, the need to improve productivity and competitiveness is even more pressing now than ever before.

In conclusion, Sarawak needs to develop the capacity for TFP growth for instance by being more innovative, developing higher technological capability, improving quality of human capital, promoting more Research and Development (R&D) initiatives, strengthening the marketing network and adoption of the Cluster-based approach within the State's economy. In addition, SMIs need to establish stronger linkages with the large industries or MNCs or multinationals to ensure that they remain competitive and progressive in the long run.

# **BUSINESS OPPORTUNITIES FOR SMALL AND MEDIUM SIZED ENTERPRISES (SMES) IN THE COMMONWEALTH OF INDEPENDENT STATES (CIS) REGION: LESSONS FROM THE INDIAN SME PERSPECTIVE**

*Dr. Anshu Saxena<sup>1</sup> and Dr. Sudhir K. Jain<sup>2</sup>*

## **ABSTRACT**

*The objective of this paper is twofold. Economic reforms, and industrial and technological development varied widely across CIS countries giving rise to two opposite trends – Integration Vs Disintegration. How is the economic integration possible in the CIS region? The paper addresses the issue of economic transformation and integration in CIS economies in the period of independence. The paper then highlights the role of SME sector, business opportunities for SMEs in CIS countries, SME development vis-à-vis regional economic integration in these economies.*

*The paper draws a multidimensional picture of the small and medium-sized enterprise (SME) sector in CIS countries. Different subjects of economic and political life have different expectations connected with development of the SME sector. Potentially, the sector may become the major catalyst of economic development of in the whole region. The CIS countries are in a search for the optimal model of SME development, however no universal recipe could be formulated for all transition economies, especially in the area of entrepreneurship development—sensitive to historical and other cultural factors. The Indian example of the SME existence and growth in the era of industrial liberalization serves the right role model for CIS countries.*

*Finally, the paper looks at SME development issues from a regional perspective. In this context, the focus shifts from a national framework to the regional one, where development of SMEs has to be implemented parallel to acceleration of the regional integration processes.*

## **INTRODUCTION**

The Commonwealth of Independent States (CIS) was founded in 1991 after the dissolution of the Soviet Union. The collapse of the Soviet Union gave rise to a community of independent nations formerly established by a treaty signed at Minsk, Belarus on December 8, 1991 by the heads of state of Russia, Belarus and Ukraine. Within the next three weeks the original three

<sup>2</sup> Associate Professor (Economics and Marketing), Indian Institute of Technology (IIT), Delhi, India

were joined by Armenia, Azerbaijan, Kazakhstan, Kyrgyzstan, Moldova, Tajikistan, Turkmenistan, and Uzbekistan. When Georgia joined in 1993 all of the former republics of the USSR except the Baltic States had become members of the Commonwealth of Independent States (CIS), with its current headquarters in Minsk.

The CIS was conceived as the successor to the USSR in its role of coordinating the foreign and economic policies of its member nations. The treaty recognized current borders and each republic's independence, sovereignty, and equality, and established a free-market ruble zone embracing the republics interdependent economies and a joint defense force for participating republics. The republics' level of receptivity to integration with Russia has varied. All CIS nations now have their own currency, and most members have had occasion to criticize Russia for slow implementation of CIS agreements.

Ukraine had a prolonged disagreement with Russia over the disposition of the Black Sea and remains wary of Russian power. Azerbaijan's oil reserves has freed it from dependence on Russia while Moldova's insurgency in the Russian-dominated Trans-Dniester region have kept them relatively inactive in the alliance. Georgia, with its separatist movement in the region of Abkhazia, and Tajikistan, torn by a persistent civil war, Uzbekistan with its limited natural resources, and Armenia, surrounded by the Muslim nations of Azerbaijan, Iran, and Turkey, have all accepted Russia's protection under a joint defense system, although Georgia is seeking the ultimate removal of Russian forces from its soil. In 1995 the CIS established a joint air-defense system but not all CIS nations are members. An eventual customs union, which will eliminate trade restriction and eventually unite currencies, is planned. Belarus and Russia have created supranational bodies to effect such changes but actual progress toward integration has been slow. Kazakhstan and Kyrgyzstan have joined in the agreement to pursue economic integration without customs restrictions.

The process of transformation in the CIS countries has a number of major unique features distinguishing it from the international stream. To a large extent, the nature and direction of the modern reform policy and actual activities in the former Union of Soviet Socialist Republics (USSR) were formed in the 1980s on the basis of socialist *perestroika* ideas, and after the USSR collapse, the trend towards application of extensive world experience in developing countries reformation has become more obvious. The need for a new national State system creation and for a drastic change in the peoples' social and cultural mentality formed during the USSR period became indispensable for the economic transformation in the CIS countries. None of the countries undergoing reforms had encountered such a great number of problems before.

The formation in 1991 of CIS was designed to ensure a painless transition from a single united State to a system of independent national entities, and to help them establish new relations based on the principles of political, economic and social community. The lowered efficiency of trade and economic relations among the CIS countries in 1992-1993 gave an impetus to the signing of another integration agreement—the Treaty on Economic Union. In 1994-1995, a number of agreements on setting up the Payment and Customs Unions were signed. The key role in the formation of a common free market zone of the CIS countries was given to the Inter-State Economic Committee of the Economic Union (IEC) set up in 1994.

In the first few years following the acquisition of independence by the former Soviet republics and the formation of CIS, two trends were observed in the relations among the CIS countries,

i.e. the integration trend, which represented the desire to restore the broken ties, and the disintegration trend, which acted towards strengthening the national sovereignty of the CIS countries through isolationist economic measures. As a result, despite the formation of new integration structures (the Economic and Customs Unions, IEC etc.), the absence of coordination in the economic policy of the CIS countries, the introduction of national currencies and different payment mechanisms, as well as customs barriers and other factors, separated the economies of the CIS countries and considerably limited their traditional sales markets.

## **ECONOMIC INTEGRATION AND INDUSTRIAL DEVELOPMENT IN CIS**

Globalization of the world economy suggests deepening and expansion of integration spheres. Especially active in this field are social and economic reforms, which, starting from the late 1980s, early 1990s, have been accepted and called for in the CIS countries, which formerly had centralized planned economies. Although the CIS countries have their own peculiarities as regards the national reformative mentality and political practice, a connection with the global trends in the field of social and economic reforms is obvious.

A common feature of the economic reform in the CIS countries is that these reforms are related to the solution of strategic problems of a greater scope than just restructuring of the economic relations on the basis of market principles. These reforms in the CIS countries serve as an active means of the sovereignty confirmation, national state formation and establishment of independent internal and external economic policy. While having similar reform objectives, each of the CIS countries chooses its own model scenarios, priorities and sequence of reforms and limits of the social price of political and economic transformations. Scenario and models differences have caused eventually lack of consistency in reform rates and economy liberalization scope and different state mechanisms for economic regulation.

Economic reforms are distinguished by consistency, depending on the current situation, considered as a means of political consolidation and stability in the countries where exacerbation of internal political struggle did not allow to start or forced to suspend the reformation processes (Azerbaijan, Georgia, Tajikistan). Similarities and differences in conducting economic reforms in the CIS countries have given them a multi-pole configuration. The CIS countries have reached and will stay on different stages of economic reforms and new market mechanisms formation.

Despite the similarity of the reform objectives and of the stages of economic reforms in each CIS country, the process of reforming is characterized by various national, political, geographical and economic peculiarities and differences. Each of the CIS countries made its choice on the basis of its understanding and evaluation of possibilities of the national economy and interests of major social groups of the population and national elites, reasonableness of hopes for external financial and technical assistance and potentially risky political, social and economic destabilization, unavoidable in any reform process. An analysis of the industrial development results of the CIS countries in 1992-2003 shows that certain positive aspects of the CIS countries' economic development are still not based on a solid

foundation that will result in their irreversibility. Macroeconomic stabilization, to a certain extent, is reached in many countries due to external loans and foreign investments. Issues of cooperation in integration processes are a very important component of economic and industrial development of the CIS countries in the current situation. The establishment of new economic relations in compliance with equal partnership principles, reaching a new level, is one of the most important conditions of mutually beneficial collaboration in the potential development of production technology in the CIS countries.

Science, new equipment and high technologies should become key priorities of the CIS social and economic development. Within the framework of national support programmes for scientific and innovation activities in CIS countries, support of non-governmental investments (like crediting, leasing, investments in securities of science and innovation organizations etc.) is playing a more and more important role.

Formation of an economic union is a strategic objective of the CIS external economic policy, the first step in this direction being the creation of free trade zones. The massive influx of transnational corporations and international investors into the CIS countries is restrained by the underdevelopment of these States, high risks, an inadequate investment climate and absence of information transparency of the stock market. In the framework of financial and investment globalization trends, CIS still remains a “closed” zone, a periphery of the global financial market.

The inefficiency of the CIS and the decreased Russian role on the southern CIS borders has brought about stronger cooperation between central Asian countries and their southern neighbours. This trend was reflected in the creation and functioning of the Economic Cooperation Organization (ECO), which includes, beside all the five CIS central Asian States, Afghanistan, Azerbaijan, Iran, Iraq, Pakistan and Turkey. The members of this organization regard the development of a transport and communication infrastructure, power engineering branch and a transnational pipeline network in the region as their primary objective.

The key role for the restoration of a common free-market zone in the CIS framework belongs to micro-level market integration, creation of joint ventures, inter-state financial-industrial groups and other transnational production, commercial and financial structures. It is in this way, using the interests and actual activities of manufacturers, businessmen and financiers that a promising high-technology industry and high-technology enterprises can be saved both in the Russian Federation and other CIS countries. It is only in this way that traditional markets can be restored and such market pillars as small- and medium-scale enterprises can be strengthened.

## **SMALL AND MEDIUM ENTERPRISES (SMEs) IN CIS: THE REALITIES**

Economic theory has brought a revival of the Schumpeterian approach (importance of the “gifted few” who can innovate and dismantle traditional, routine structures, “the entrepreneur as the persona causa of economic development”) and schools of business around the world have been thriving on the cult of entrepreneurship. Theory of firm has become divided into

static and a dynamic one. Static theory of firm proves that large firms are efficient because they focus on the status quo; the dynamic theory suggests that small firms are efficient since they focus on change. New, small start-ups introduce change into the economy. The implications for the public policy has become therefore to implement policies that encourage the entry of new firms, support their survival, and promote their growth.

The SME sector in CIS countries is very much blurred and comparisons among countries are difficult, as generally the statistics of the sector are rather poor and unreliable. Long-term trends and comparisons among countries are difficult to define since definitions of SMEs are adopted and changed at different points of time. Primary information on SME entities is gathered in various government institutions, particular departments of statistical offices have adequate insights only into selected segments of information and a synthetic picture is not always available. These facts alone technically complicate collection of data, but more important is probably the fact that official information available is often fundamentally misleading. It includes companies that are only registered, but do not operate; at the same time it excludes those which actually operate, create demand and jobs, however only within the unofficial sector—the parallel economy.

An example from Kazakhstan gives some insights into the scope of the problem: as of 1 October 1997, there were 16,066 SMEs registered, including 7,385 legal entities. A required reporting was supposed to be submitted by 3,797 organizations, out of which only 692 (18 per cent) implemented the task, 2,299 (60 per cent) did not indicate current activity, and the remaining 806 units (22 per cent) did not complete the tasks for various reasons. Some specialists claim that this is one of the reasons why good diagnoses of SME development are rather rare; usually they are carried out in a formal and superficial manner.

Some small enterprises are registered for reasons, which reflect general weaknesses of economic systems (e.g. as a second, or third job of underpaid civil servants, or for tax reasons) and, contrary to expectations, are not in fact creating additional jobs in the country. Many existing SME development problems are presented and publicly discussed in a superficial manner, since some of the problems, such as e.g. corruption, are of delicate and political nature.

Often, SME development suffers from pressures stemming from current budget needs and influential Ministries of Finance. In the absence of strong counterbalancing government institutions that would promote long-term growth (and create a long-term vision-strategy as in case of Indian SSI Industry) of SME sector, the current income from taxes seems to be more important than all multiplier effects involved and an eventual increase in the country's wealth.

As the SME-related problems are similar in CIS countries, particular government's initiatives are mutually closely watched and most of the solutions applied or emulated, it seems appropriate that technical assistance in this area expanded more and more into a regional dimension. A good regional SME project could be more justified than several national projects, which would deal with same issues in each country separately. The regional project could generate some economies of scale, strengthen integration processes and help better use of available resources.

In Uzbekistan, SME development has now become one of the highest priorities in the development strategy of Uzbekistan. It is progressing upon a background of macro policies,

which strongly underline social aspects of development and avoid rapid and radical change. These policies—adhering to the basic principles of economic transition and development by President I. Karimov—have often been criticized and generally considered controversial by most of western experts. The country however has been developing recently at the rate of 4-5 per cent (according to the Centre For Economic Research, Tashkent) faster than many of its neighbours. The next stage of important regulatory reforms (including introduction of pro-export policies, progress in the mechanisms of convertibility and changes in the banking system) has been launched. Most of the steps undertaken aim at unfettering of the flexibility of the system and at promotion of entrepreneurial behaviour.

In Kyrgyzstan, the main task of determining SME policy was given to the Ministry of Industry and Foreign Trade; however, until present significant policy inputs are still being provided by the State Fund for SME support, the key Government organization in this area until 1998, which operates a domestic, soft credit line for SMEs. Recently, new organizational structures that deal with SME development support have been established at the central and local levels. This includes units set up at the Prime Minister's Office and in practically all of the ministries (both sector ministries, as well as the functional ones, such as the Ministry of Finance), in the Anti-monopoly Committee at the office of the President, as well as at the level of local administration. Therefore, this component of the model has become largely complex and the Government authority dispersed. The financial and banking network consist of the domestic and foreign components (domestic, soft-term credit line supervised by the State Fund for SME Support at the Government of Kyrgyzstan; domestic commercial sources: SME credits available in several leading commercial banks; foreign credit sources include German credit lines from the Kreditanstalt fuer Wiederaufbau executed and supervised in cooperation with Kyrgyz Goskom-invest, the EBRD credit line, World Bank credit lines; credit lines of the USAID, and other donor organizations). Already in the second half of the 1990s, several bilateral donors dealt with technical assistance to SMEs in Kyrgyzstan. The leading role was played by the governments of Germany, Israel, Switzerland, Turkey and the United States. Multilateral donors were represented by the UNDP and the World Bank. The latter has become the leading institution in the area of financing of small business development in the agricultural sector.

The donor community can play an important role in the process of improvement of government SME development policies and formulation of new, long-term SME development strategies. A more exposed role of donors and their more efficient activity in the field of technical assistance and financing require however a better coordination of activities among particular donors, improved dialogue with the Government and more flexible supply of various forms of technical assistance to cover existing gaps.

In some countries of the region, the ties between particular donor organizations have already been strengthened. In Kyrgyzstan, representatives of SME donor organizations meet once a month in order to exchange information, coordinate plans and discuss current activities. A spirit of better understanding of country's needs has been created, as well as more realistic assessment of own possibilities.

The specific, economic development dichotomy of the transition, known from other economies of other regions, is noticeable also in CIS. On the one hand, we may identify in each country a considerable amount of strategically important (in traditional economic terms), large enterprises that continue, rarely successfully, to struggle with the restructuring problem and

with adjustment to the new market situation. On the other hand, a large number of micro to small enterprises has emerged, e.g. in the area of trade and other services, whose presence is crucial for needs of the social and human aspects of development. Their presence increases dramatically the capacity to create new jobs and in general it addresses a broad spectrum combating poverty issues. It responds to many important social needs and expectations, including the ones that have already been created under transition. Their presence is however only beginning to change the internal production and distribution structure. Their weight is not sufficient yet to improve particular country's position in its economic environment and is rarely leading to an emergence of new generations of internationally competitive products.

## **INDIAN SMALL SCALE INDUSTRY (SSI) EXPERIENCE: AN INSIGHT**

The Small Scale Industry (SSI) sector has been contributing significantly to the overall industrial and social development in India, as in most of the other developing and developed countries, and it is expected to continue to be of significance in the Indian economy in future, although, requirements and operational details may vary with time. This sector accounts for about 95% of the industrial units and is contributing about 40% of value addition in the manufacturing sector, 80% of manufacturing employment and about 35% of exports (both direct and indirect). More than 3.2 million (32 lakh) units are spread all over the country producing over 7,500 items and providing employment to more than 178.8 million (1788 lakh) persons.

The SSI sector in India not only plays a crucial role in providing large scale employment opportunities generally at lower capital cost than large scale industries, but also help in industrialization of rural and backward areas, thereby reducing regional imbalance, sharing more equitable distribution of national income and wealth. SSI units are supplementing and complementing to large and medium scale units as ancillary units.

The SSI sector, has grown under a protected environment till 1990. With the liberalizing policies and globalizing of economies, exports, international competitiveness, quality and cost etc. started assuming greater significance for industrial manufacturing systems and services including SSIs. The relative advantages of SSIs in terms of local raw materials, capital investment, lower scales of production, use of low-end technologies and production methods, started disappearing because of development of new and sophisticated technologies, applications of computers and information technology, and internationalisation of production and many other factors resulting from globalization.

The emerging trends in international trade policies including the birth of WTO in 1995, have posed new challenges and constraints in terms of finances, infrastructural and intellectual resources etc. The local and domestic markets themselves became international markets, and hence the SSI sector has to compete with international products even in domestic markets, and also with products being produced by large manufacturers. At the same time, the Indian SSI sector seems to be gearing up with the new market realities.

A new class of entrepreneurs which are more dynamic, forward looking and technology friendly, specially in technology intensive sectors such as information technology, computer software, drugs and pharmaceuticals, auto components, design and engineering and so on, have been appearing on the scene, although they generally lack the adequate financial resources and risk taking capacities. The traditional small scale businesses specially the new generation enterprises, have also been realizing the need to equip themselves with modern tools, though they need government support in various forms including the loans for capital investments and working capital, and other support from the government including access to information and up gradation of skills as well as market promotion.

Recognizing the need and importance of SSI sector, the government has been taking various policy initiatives and setting up institutional mechanisms of different kinds to encourage and support the SSI sector, from time to time. The Government of India has set up several committees and study groups in the past including a group of ministers in July 2000 under the chairmanship of Union Home Minister. The final report of this study prepared by the Planning Commission in March, 2001 made several policy recommendations and suggested various measures to support and encourage the development of SSI sector. Some of the recommendations include the following:

- There is a need for bringing awareness in small scale sector about the WTO implications and its impact on SSI sector,
- For infrastructural development, a corpus of Rs. 2000 crore has been recommended,
- FDI should be encouraged in SSI sector for better technology transfer (within a permitted ceiling of equity participation by large scale units in the equity of SSI units), FDI ceiling is presently 24%,
- A larger FDI can be considered on case-to-case basis. An enhanced database for the SSI sector and measures to develop human resources which included training, skill upgradation, new management practices, technology transfer, acquisition and development, and simplification of procedures and rules etc. need to be implemented,
- Finally, there is a strong need to redefine Indian SSI sector and introduce medium sector.

Indian SSI sector growth and development can be used as a case study by CIS countries and appropriate actions and measures can be taken by these economies to strengthen SMEs in their respective regions for economic integration and development of CIS region as a whole.

## **CONCLUSION**

The countries of CIS have been facing the challenge of not only building individual, sound market economies, but also the challenge of using market mechanism for the purpose of the development of the whole region. Their integration has to be perceived in the context of a

common transition of the region to a fully-fledged market economy, of building together a regional investment potential and international competitiveness.

For strengthening SMEs in the CIS region, it is possible to think about common solutions e.g. simplifying the tax and licensing systems, unifying basic regulations for SMEs (e.g. common definitions and basic principles) and abolishing barriers (including custom duties for goods and services, as well as factors of production—capital and labour) without waiting for the creation of a monetary or economic union in future. In this regard, India can serve as a best example for strengthening SMEs for economic development of the country.

True economic and political integration has never been easy in CIS and always required a lot of time and efforts. However, the stakes are high; the SME sector, under market conditions, could become one of the decisive factors as far as the economic future of the whole region is concerned: from the amount of new jobs created, to development of cross-border trade and technology transfer, to developing important economic multiplier effects. Development of this sector, through creation of the middle class and its prosperity, could become one of the most efficient tools to provide social and political stability within and beyond national boundaries.

The integration processes could be further strengthened by new regional technical assistance programmes and projects that reach beyond national borders, just as the integration processes do. An example of good practices in this area was the UNDP/ UNIDO Regional SME programme with the centre in Bratislava, unfortunately interrupted at present. Such an idea could be further developed and fine-tuned to the needs of the CIS countries, whose SME Coordination Committee (at the semi-annual meeting in Kiev, June 2000) expressed officially an interest in such a programme.

There is ample room for a better exchange of knowledge and experience in SME development in the narrow Central Asian region (Uzbekistan, Kazakhstan and Kyrgyzstan) and broader (CIS) region and for intensifying the collection and sharing of business information from around the world.

# **SYNERGIES BETWEEN CORPORATE AND PRIVATE BANKING: MARKET OPPORTUNITIES IN THE RELATIONSHIP BETWEEN THE OWNER FAMILY AND THE OWNED FIRM.**

*by Stefano Caselli*

## **INTRODUCTION**

The research developed in the previous chapters has examined the complex nature of the distinctive and structural features of the family owning one or more businesses as well as the map of the financial requirements emerging from the combined evaluation of the enterprise and the owner family. In particular, the last study has allowed us to outline a logical reference framework in order to proceed with the verification and the correspondence between the system of requirements and that of the financial services. From this point of view, the explanatory scope of the above approach develops irrespective of the strategic and organizational choices made by financial intermediaries as it appears only subsequently as a general criterion for product positioning. This results in the further necessity to understand the mechanisms and the logics which enable financial intermediaries to define their own positioning by considering the specificity of the family/firm relationship as well as to organically exploit the business opportunity resulting from the family/firm connection.

This overall necessity leads to tackle two different issues that are connected and sequential.

The first issue regards the financial and the assets connections between the family and the firm. This allows us not only to clearly analyze the target functions of the two actors and to re-connect the different areas of requirements to quantitative parameters but also to establish whether the distinctive features of the same financial and assets connections represent an element of interaction potentially useful for the financial intermediary.

The second issue regards the financial operations which, due to their own nature or their being consistent with financial and assets connections, are bound to trigger important synergies between the systems of products typically designed for the corporate and the private area. In other words, the critical aspect of the intermediary's positioning choice is solved as long as the scope and the nature of the operations are synergetic and comprehensive of the corporate and the private area.

# THE RELATIONSHIP BETWEEN THE OWNER FAMILY AND THE OWNED FIRM: GENERAL PRESCRIPTIONS.

The financial structure of family business, which has been analyzed in the first chapter of the research, presents a distinctive character that reflects both size-specific and country-specific factors. If the former are intrinsic in the concept of small and medium size, the latter depend on the financial and industrial organization of the respective country. This means that the structure of corporate liabilities is characterized by an aspect common to any economic system, though showing some differences from country to country which can be gathered into a homogeneous reference path.

From the analytical point of view, the high volume of bank debts characterizing average corporate liabilities - above all for SMEs - finds a reference in the prescriptive logic of corporate finance so that the ratio between debt and equity is established on the basis of the compared evaluation between failure costs and the fiscal advantages deriving from opening different financing channels. If this applies to any typology of firms, in the specific instance of small and medium-sized enterprises both the notion of failure costs and that of fiscal advantages may be broadened so that on the one hand their strictly economic meaning is even strengthened and on the other the value of mutual interdependency connections between the owner family and the owned firm can be included.

Failure costs resulting from the direct relation between the financial leverage increase and the funding average rate increase applied by lenders - once the "market" acceptability threshold of the business risk has been exceeded<sup>1</sup> - must include also the costs deriving from the owner's loss of business control. Despite the difficult measurement of such costs, the notion of family failure assumes a strong operating value as the change in the family-firm direct relation may generate drawbacks not only in terms of future missing profits but above all in terms of explicit and social costs resulting from the failure or from breaking the existing relationships within the family. The above costs are referred, for example, to forms of dramatic and unexpected subdivisions of the family wealth due to the exit of one or more family members as a result of the changed ownership and the entry of external partners.

As for fiscal advantages, the distribution of the tax shield established by the policy maker affects directly the net rate of financing sources and the cash-flow distribution upon tax payment. This means that the firm's allocation of liabilities and its mid-term financial planning are strongly conditioned by the rules on deductible expenses and the fixing of

<sup>1</sup> *The growth of the firm debt relation may lead to exceed a psychological and functional threshold, beyond which the firm stakeholder system judges risk intolerable. This step does not necessarily lead the firm to failure, but it may generate additional costs due to the exit of some financiers, to the growth of the cost of money applied by other lenders, to possible reactions on the part of suppliers and customers. On this issue see Bradley M., Jarrel A.G., Kim E.H., "On the Existence of an Optimal Capital Structure: Theory and Evidence", in "The Journal of Finance", n. 3, July 1984 e Kane A., Marcus J.A., Mc Donald L.R., "How Big is the Tax Advantage to Debt", in "The Journal of Finance", n. 3, July 1984.*

incentives or selective criteria. The differentiation of rules is not limited to the distinction between debt and equity, but also to debt distinctions as to the origins of the debt or to contractual forms<sup>2</sup>. Moreover the incidence of the fiscal advantage can be rated in relation to the bank debt, the market debt and the different forms of fund raising among partners as well as to the length of financing and the distinction between leasing and debt. In any case the distribution of the tax shield does not exhaust the comprehension of fiscal advantages as the analysis should be extended to the performance of the family assets and thus to the relative impact of fiscal variables. This is necessary as family members allocate their financial resources according to whether they aim at the capital, at financing the firm or at investing their assets. Therefore the comprehensive review of tax variables requires a process of joint maximization of the fiscal advantage for both the firm and the family.

The general relation which opposes failure costs and fiscal advantages can be formally expressed, considering the above mentioned interactions between the family and the firm. Hence we can write

$$Kf_{firm} - Kf_{family} \geq \Delta taxshield(Debt - Equity)$$

where  $Kf_{firm}$  indicates the firm's failure costs and  $Kf_{family}$  those of the family. The above relation can be expressed more correctly by describing a series of elements. In the first place, the concept of tax shield should be suitably analyzed on the basis of quantitative and time parameters in order to have it effectively quantified. This can be obtained by means of the concept of debt weighted average cost and equity cost after taxes. So doing, not only can the tax shield be financially evaluated but the same variable relating to the pricing of financial resources as expressed by the capital market is thus included in the evaluation of the allocation of corporate liabilities. In addition the identification of the above parameters is not sufficient when we turn from financing to the investment of resources which becomes binding when the firm and the family dimensions are joint. Here, the debt after tax weighted average cost must be bound to the after tax average return lenders would obtain if they decided to invest in debt but in a different form<sup>3</sup>. Equally, the equity after tax cost must be bound to the after tax return lenders would obtain if they made another investment in equity. The bound must be interpreted as the enter and exit condition of the owner family on both equity and debt. In the first case, if the owners expect higher returns from investing in debt not related to the owned firm but to the market as a whole, debt fund raising will develop outside the family. In the second case, if the

<sup>2</sup> For a description and exhaustive evaluation of the different forms of impact of fiscal variables on the structure of firm liabilities see Dessy A., "Capitale di debito e sviluppo delle imprese", Egea, Milano, 2001.

<sup>3</sup> A significant example in this respect can be the comparison between the cost of capital obtained through the form of shareholders' financing and the return on the investment in bonds. In both instances, the legal form consists in investing and raising debt funds, but due to the presence of different fiscal rules, the investor's profitability may turn out to be different at a parity of conditions. See Tagliavini G., "Costo del capitale, analisi finanziaria e corporate banking", Egea, Milano, 1999.

owners expect higher returns from investing in equity not related to the owned firm but to the market as a whole, equity fund raising will tend to develop theoretically outside the family on condition that the cost of fund raising is lower than the cost of debt.

In the second place, family failure costs must be analyzed by considering the different components characterizing their nature. Then the three identified components have a development dynamic that is a dependent variable of the variations in the firm's equity.

The first component is the expected loss of returns due to the owner family's non-participation in the business capital. This loss is considered both in strictly monetary terms, (i.e. loss of future dividends) and in broader terms (i.e. loss of possible influence on the distribution of the same)<sup>4</sup>. This means that the above variable is directly correlated to the growth of equity in the presence of the family more profitable investments in other bonds. In this case, the absence of profitable investments in the firm deters any further re-investment of resources and the growth of equity can be guaranteed only by subjects outside the ownership. Therefore, the renunciation to the equity growth is the only means to reduce the expected losses due to the non-participation in the business capital.

The second component regards the costs of portfolio re-allocation as a result of the changes in the firm ownership. The different weights and balances within the family resulting from the changes in the assets invested in the firm or from the entry of new partners may produce transaction costs because of the necessity to re-establish the lost balances. Anyway, the definition of new balances produces both explicit costs and losses due to the unexpected disinvestment of assets.

The third component regards the "social" costs that may have a direct or indirect monetary impact. This component is an extension and somehow a completion of the second one as it emphasizes the expenses borne by the family as a result of the changed social relations among the various members of the family. The growth of equity generates imbalances which have not only immediate monetary but also relational consequences, which may reveal different economic effects in the course of time. Quite often such effects are lower profits for the firm due to the non-exploitation of business opportunities because of the presence of latent or actual conflicts within the family. Yet, the amount of social costs is a direct function of the complexity of the family, that is of the number of generations and the number of people directly involved in the business management system. The presence of multiple family nuclei does in fact extend the size of potential conflicts and the amount of transaction costs to be faced to solve the same.

As a result of the three variables, the previously mentioned formula changes as follows:

<sup>4</sup> It is worth noticing that if family failure costs include expected losses due to non-participation to business capital, by symmetry firm failure costs must also include the firm missing profits due to the investment of debt rather than equity. This happens when the presence of ambitious development plans requires a massive employment of "patient" capital so as to guarantee the risk of the same plans and the uncertainty of cash-flows dedicated to the repayment of lenders. Although this approach is theoretically correct, in the practice it is difficult to identify in advance the category of "ambitious plans" and its formalization in terms of non-profits.

$$Kf_{firm} - (EL + K_p + K_s) \geq r_d - r_e$$

where  $Kf_{firm}$  indicates the amount of the firm's failure costs,  $EL$  the expected loss due to non-participation in business capital,  $K_p$  the amount of portfolio re-allocation costs,  $K_s$  the amount of "social" costs,  $r_d$  the after tax cost of debt and  $r_e$  the after tax cost of equity.

The relation reveals the arbitrary nature of the choices regarding the structure of the business capital in the presence of family ownership. This leads to the fact that the growth of capitalization can be justified either by system fiscal policy factors so that the second part of the relation generates a differential that is favorable to equity and higher than that of the first part of the relation or by family corporate governance factors, which significantly reduce the cost component  $Kf_{family}$  relative to the first part of the relation. In addition, SMEs' size profile makes the presence of any governance capacity unlikely both in terms of business and social relations between the family and the firm as well as within the family itself, so that family failure costs are considerably reduced. Moreover, the absolutely low capitalization, which is produced by the presence of family failure costs and at parity of differential between  $r_d$  and  $r_e$ , makes  $EL$ ,  $K_p$  and  $K_s$  components more sensitive to the changes in equity. As a result, a sort of vicious circle is likely to be activated so that the limited amount of equity tends to direct the choices regarding the structure of business capital toward the area of debt.

The relevance of debt, which is characterized by size-specific and family-specific factors, is nevertheless further strengthened in Italy by a fiscal policy structurally favorable to debt with reference to the second part of the relation. From the functional point of view of the system, this is consistent with the remarkable development of bank financing circuits as reference structures for the support of corporate investment choices.

The consistency between firms' selection criteria of financing sources and the development path of the financial system produces a series of important drawbacks in the approach modes adopted by financial intermediaries in the attempt to meet the requirements of small and medium-sized enterprises. In this context there are a number of prescriptions which enable us to understand and compare positioning choices as lending represents the corporate reference product – which is strengthened by the action of a non-neutral fiscal policy – as long as it feeds the process of fund raising and guarantees the achievement of a dynamic balance between capital structure and ownership relations. Prescriptions can be summarized as follows:

- the importance of the credit function makes credit underwriting the financial intermediary's access key to firm financial requirements and family-firm relations;
- the importance for the firm to have financing sources available makes credit underwriting the tool leading to the firm's "contractual capture", thus leaving some areas for cross selling and origination in relation to non-credit products;
- credit becomes the "balance beam" of family corporate governance and gives the financial intermediary the possibility to develop a deep knowledge of the corporate system and therefore of its risks.

The specificity of the three components described above points out that within the financial system banks have a competitive advantage with corporate customers which makes them different from the other subjects as their own organizational and structural characteristics guarantee *ex ante* a stronger control of the credit function. This can be observed under three different aspects. First of all, irrespective of the counter-position and of the choice between the specialized and the generalized model of supply, the institutional specialization of the credit function gives the bank stronger incisiveness in corporate financing as a result of the monetary value of the services provided. The financing monetary profile not only allows the bank to play *a priori* the insider role of corporate financial flows, but it also becomes SMEs' instrument for reducing the complexity – in terms of knowledge and costs – and the information asymmetries of the financial system. Secondly, the monetary function potentially allows conveying cross-selling policies which multiply the areas for the identification of more and more complex requirements. The ability to understand these areas is of major importance for financial intermediaries to extend their range of services. The control of the monetary function gives banks a potential asset that gives them the chance to increase their volumes and margins on a constant basis in the course of time. Thirdly, the actual geographical distribution of banks allows them to better penetrate local economies and better monitor local enterprises. If this aspect is less relevant for big firms, for small and medium-sized enterprises the bank's "local distribution" represents a key factor for the creation and the development of market relations. The local nature of the divided bank contains the latent power of originating the entire range of financial operations. This can be exploited by the bank as the element triggering an all finance supply process which is typical of the "pure" universal bank or it can be exchanged with external economies in terms of creation and development of a network of specialists who, according to their product competencies, re-compose the internal complexity of the all finance supply in the market.

## **The relationship between the owner family and the owned firm: the nature of assets and financial connections.**

### **Distinctive aspects.**

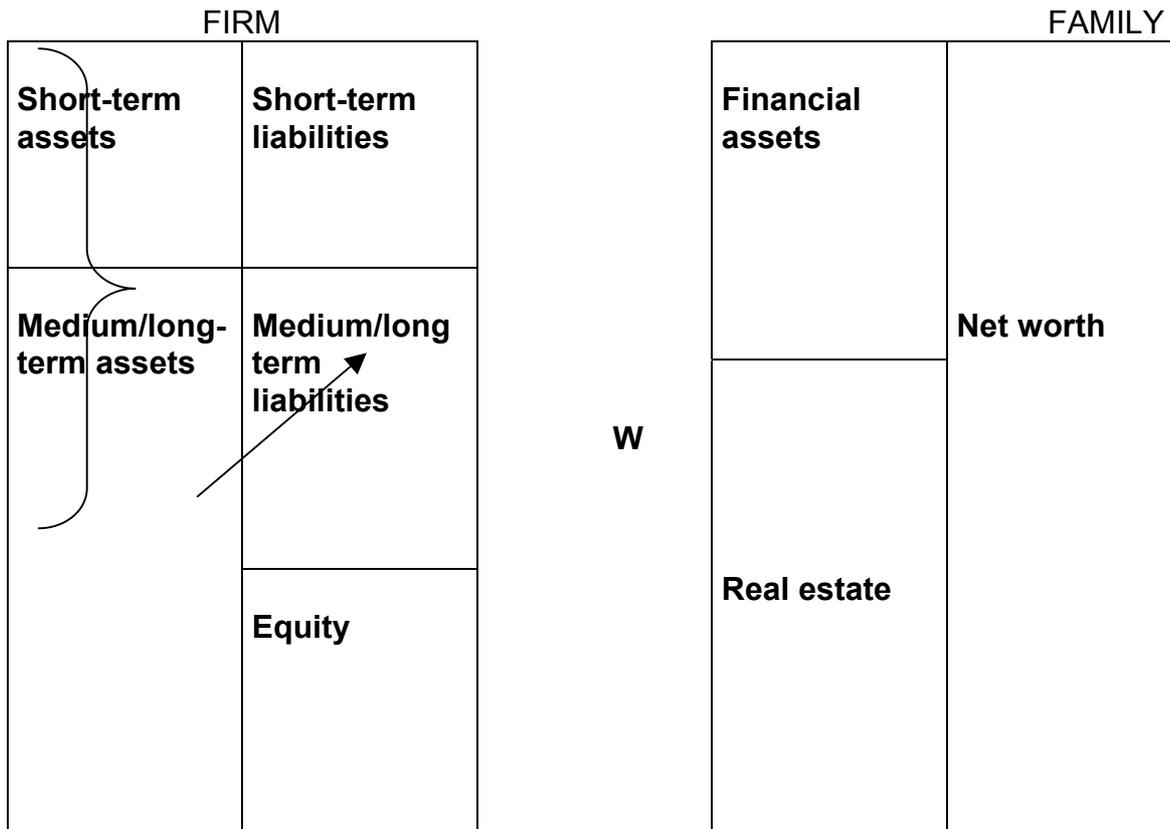

The system of assets and financial connections which develops between the owner family and the owned firm moves from a substantially simple reference frame (see table 1): the matching of the firm/s assets statement/s and that of the family shows that if, on the one hand, the firm represents one of the financial assets in the family portfolio, on the other hand the firm liabilities need to be backed in the fund raising process and the family can meet this requirement by using its own financial resources in the form of debt or equity.<sup>5</sup> This means that if in the first case the family-firm connection is on the level of assets and

<sup>5</sup> *As a matter of fact, for the purpose of a more accurate and exhaustive review of cases, the allocation of real assets in the form of capital increase should be included among the various financial operations characterized by the allocation of resources to the firm.*

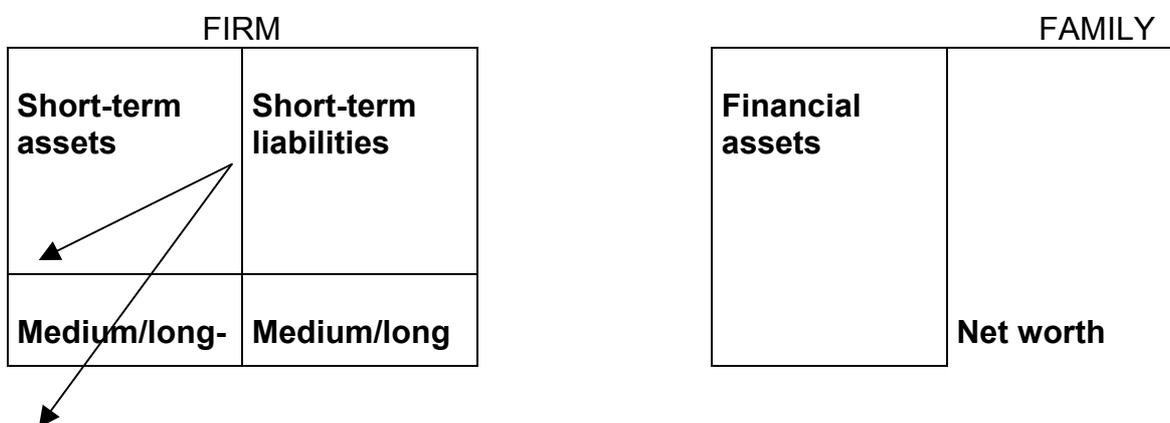

thus assumes the value of maximum aggregation, in the second case the family-firm connection is financial and thus assumes the value of family individual investment operations.

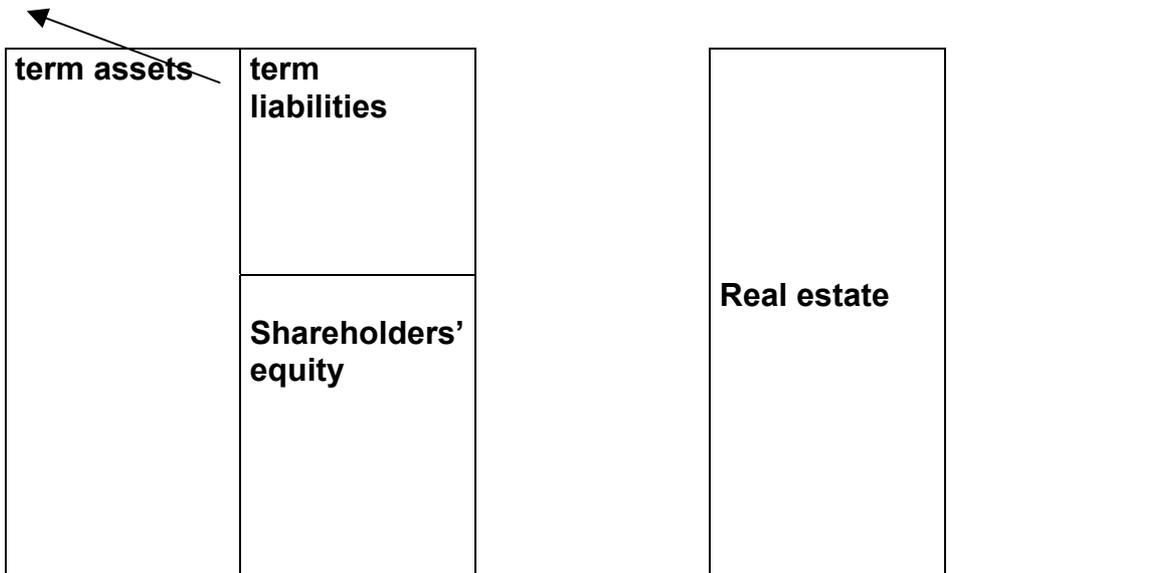

**Table 1**  
**The family-firm connection system: the assets and the financial perspectives**

The assets perspective

The financial perspective

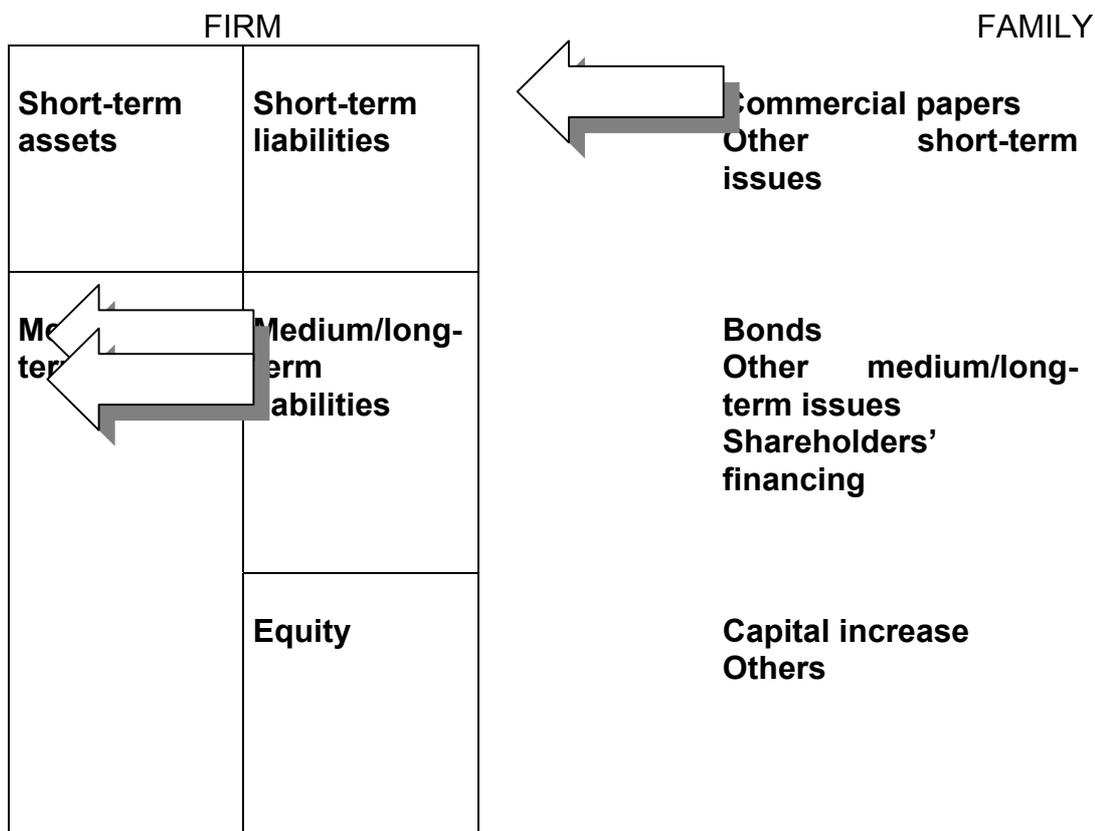

The reference to the financial and assets perspectives obviously serves to clearly identify the different criteria which connect the corporate and the family system. Yet, two important elements should be focused in order to better explain this mode of interpretation.

In the first place, the financial and assets perspectives tend to interweave, as the firm's financing choices affect its value at a parity of risk. This means that a specific financing strategy developed by the family for the firm necessarily generates an induced effect consisting in the growth of the firm value and therefore of the family net worth. This is true irrespective of the returns profile of the specific financing choice and of its contribution to the development of the family financial assets.

In the second place, within the financial perspective, the possible forms of lending financial resources to the firm are highly differentiated. This depends on the different destination of financial resources (short-term liabilities versus consolidated liabilities) and on the different contractual forms which, in that specific time and legislative context, can be actually used<sup>6</sup>. This means there is a direct correspondence between the firm requirement areas and the family allocation criteria of financial resources, whose joint profitability will need evaluating in the course of time (table 2).

**Table 2**  
**The family allocation criteria of financial resources**

<sup>6</sup> It should be noted that, irrespective of the specificity of the family different direct financing tools, it is possible to employ indirect or triangular forms of financing, where the family provides its own guarantees to a third party financing the firm. This scheme can be used with any contractual form of financing

Taking for granted the natural overlapping of financing processes and wealth creation processes in general terms, the specificity of the assets and financial profiles requires a deeper analysis of the internal rules which characterize, on the one hand, the family selection of financing operations within the firm financing process and, on the other, the investment of the value produced within the family assets portfolio.

### **The relationship between the owner family and the owned firm: the financial perspective.**

The financial connection between the owner family and the owned firm can be fully understood by analyzing two distinguished and sequential elements:

- the modes of development of the firm external financial requirements;
- the impact of fiscal variables on the economic area in relation to the firm-family exchange of financial resources.

The actual development of the family financing operation implies the verification of two different conditions.

The first is that the firm financial profile should be, at that specific time, consistent with the specifications of the family portfolio strategy in terms of size, length and risk. If not so, the necessary requisites for the exchange would be missing, except for the hypotheses of

necessity and extra-ordinariness that are sometimes connected with the impossibility for the firm to raise additional funds from financial markets and banks. In this case, the phenomena of credit rationing or the firm structural difficulty would increase both the risks and the costs of “firm failure” ( $K_{firm}$ ) – as identified in the previous paragraph –, thus urging the family to make a financial exchange with the firm. On the contrary, should there be neither the requisites for the exchange nor a particular tension for  $K_{firm}$ , the company would try to raise funds outside the family system.

The second condition – if the first one takes place – is the profitability of the exchange for the firm and the family. This means that the more asymmetrical the impact of fiscal variables on the borrower and lender’s profiles the larger the optimization areas for the family-firm exchange in terms of after tax return on the investment as well as of after tax cost of financing. Therefore an ideal continuum could be traced: at one end the maximum economic area for the exchange and on the opposite end the absolute absence of economic area. The maximization of the economic area is characterized by the presence of a fiscal system according to which any financing operation is able to produce a fiscal advantage equal to the expenses incurred and, correspondingly, no taxes on the lender returns. Vice-versa the economic area is absent when no financing operation is able to produce any firm fiscal advantages and, at the same time, produces taxes on the lender returns. It is evident that the reality of facts falls somewhere in between the two ends in a different way, in the course of time, from country to country, depending on the financial means and the fiscal strategies followed by policy makers.

The specific analysis of the modes of development of external financial requirement (FFE) moves from the traditional interpretation model, according to which the dynamics of the firm internal sources and investments can be connected effectively with its development path in the course of time. This is according to the analytical relation referred to the  $t - t-1$  time interval:

$$FFE_t = V_t \left[ \left( \frac{CI}{V_{t-1}} * \frac{\Delta V}{V_{t-1}} \right) - \frac{CF_t}{V_{t-1}} \right]$$

where  $FFE$  indicates the firm external financial requirements referred to the time interval  $t$  and  $t-1$ ,  $CI$  is the capital utilized to produce the turnover and  $CF$  is the cash flow produced by the firm in the same time interval. The study of this relation allows us to identify the firm different stages of development (start up, introduction, development, maturity, saturation, decline or recovery) and to outline the corresponding trend of the formula variables so as to find the size and the trend of the firm  $FFE$ <sup>7</sup>. Such stages of development fall within the

<sup>7</sup> For a deep analysis of the relations between FFE dynamics, the variables included in the formula for determining FFE and the trend of the firm development cycle, see relative literature (Mottura P., “Condizioni di equilibrio finanziario della strategia d’impresa”, in *Finanza, Marketing e Produzione*, n. 1, marzo 1987 e Caselli S., Gatti S., “Il corporate lending”, *Bancaria Editrice*, Roma, 2003).

mapping of requirements by firm “contextual situations”, which have already been examined in the previous chapter.

Although the approach is correct, and often utilized in corporate valuation practices above all at start up and introduction stages, in order to understand the financial profile of the family-firm relationship, two additional complexity elements must be introduced. In the first place, the owner family – except for small scope situations – confronts itself with not just one but a portfolio of firms and corporate projects, sometimes branched by groups according to different criteria. In the second place, the logical criteria of “start up” and “introduction” must be suitably analyzed on the basis of the concepts of sector or undertaking, considering the owner’s degree of knowledge of the same.

With reference to the first critical aspect, the presence of more FFEs generated by different firms and by individual projects within the firms is likely to produce a logical unbalance between the aggregate FFE and the family ability to meet a relevant portion of such requirements. If this is true in statistical and absolute terms, at a dynamic level the phenomena characterizing the management of the different FFEs lead to a partial internal compensation. This develops through market transfer policies or organizational and partnership solutions which, by exploiting the centralized treasury, the pool or of the group structure, lead to the re-distribution of credits and debits among the owned firms. As a result, the aggregate FFE becomes a net rather than gross total and allows the family to measure more effectively the scope of its commitment as well as to better design the relationship between the set of firms and that of external lenders. In addition, the determination of a net FFE must not lead to neglect the causes of the financial phenomena, that is the asynchrony, the size and the risk of the different stages of development achieved by the different firms being considered since these phenomena establish the profile of actual repayment of financing sources.

With reference to the second critical aspect, the different stages of development experienced by the family-owned firm or firms represent the indispensable support for the analysis and interpretation of the risk generated by any choice of FFE financing and, as a result, of financing choice in general. A specific evaluation in this direction requires the introduction of additional parameters, which make the valuation of the different stages more accurate as they are related to the typology of the firm sector and to the relationship between the firm and the sector itself (table 3).

More specifically, at start up and initial stage of development, the risk profile of the undertaking and the resulting verification of compatibility with the family portfolio of financial assets is closely connected with the different hypotheses of entry into the competitive arena. In this sense, the three different hypotheses illustrated in table 3 correspond to decreasing risk profiles at parity of conditions. In the first hypothesis, the family may decide to undertake a sector start up with one of its enterprises, thus tackling high risk levels. This requires the massive investment of family resources, which can be sided by the presence of other investors if the interest in the start up is considerable and if the entrepreneur’s reputation is capital-capturing. The strong unbalance of the family portfolio on the risk-side requires a careful re-allocation of not only financial but also real asset classes, if the size of the investment is liable to affect the family asset-side to a remarkable extent. In the second hypothesis, the family may decide to enter an already

existing but not known sector, with a new enterprises. In this case, the risk profile of the undertaking is more closely connected with the lack of experience in the sector and only partially with the sector dynamics. As a result, financial resources do not come necessarily from the family, but also from the financial system, in the form of traditional debt. In the third hypothesis the family may decide to enter an already existing and known sector with a new enterprise. This usually results in a substantial risk reduction – at a parity of sector profile – and may encourage the family to make radically different financing choices, which range from the full exploitation of the financial leverage to the massive investment – in debt or equity – in an undertaking where the characteristics and the rules of the competitive dynamics are well known.

**Table 3**

***The relationship between the firm different stages of development, external financial requirements and the impact of family investment choices***

Firm development stages	Possible relations between firm and sector			FFE profile	Risk profile	Compatibility with family financial portfolio
	Hypothesis A: new firm and new sector	Hypothesis B new firm in unknown sector	Hypothesis C: new firm in known sector			
<b>Start up</b>	Entrepreneur enters sector start up with one of his firms.	Entrepreneur enters an already existing sector for the first time.	Entrepreneur enters a known sector.	Always positive depending on intensity of capital required by sector commodity.	Potentially high, depending on size and length of positive FFE area. Risk degree decreases when moving from hypothesis A to hypothesis C.	The risk-return combination is usually set at high risks and high expected returns. Such relation tends to moderate when moving from hypothesis A to hypothesis C.

<b>Development</b>	Firm and sector start up produces first positive results, depending on revenue growth.	Firm through phase of revenue increase in an unknown sector.	Firm through phase of revenue increase in a known sector.	Positive but decreasing. The size of operating FFE depending on revenue increase speed.	Potentially decreasing depending on positive FFE reduction and on firm capacity of cash-flow creation. Risk profiles of three hypotheses are closer.	Gradual risk level decrease may push the family to introduce additional capital.
<b>Consolidation and maturity</b>	Differences among three hypotheses are less marked. Consolidation choices may push the firm to make acquisitions, develop holding structure, internationalize or to establish final and physiological dimension.			FFE becomes negative in relations to current activity. New financial requirements may result from consolidation choices.	Risk is no longer connected with financial structure and expected fund repayment but with industrial management and consolidation choices.	If necessary, family receives flows of repayment and/or return on invested resources. Participation is highly compatible with management of financial portfolio. Possible additional investments depending on consolidation choices.

<b>Re-structuring</b>	Firm activity is no longer aligned with sector dynamics or sector shows signs of saturation or potential decline.	FFE may become positive again.	Risk increase depending on reasons for re-structuring.	Re-structuring stage urges family to invest new resources also as virtuous signal to financial system..
<b>Decline and crisis</b>	Firm is no longer able to compete in the sector or the sector is facing crisis or structural decline.	FFE is positive.	Risk is high and drives to radical choices, such as market exit or firm liquidation.	Crisis may need the family to employ new resources and a to make definite choice on participation role.

The analysis of the economic area is instead focused, at a parity of evaluation, on the size and the risk of FFE financing choice, on the family-firm profitability profile in making a financial transaction. In this sense, the criterion of the economic area must be considered a general guide for making choices, with the physiological and recurrent possibility of making sub-optimal choices in front of necessities and obligations resulting from the firm financing requirements and from the family investment choices. The determination of the economic area must be based on the analysis of the body of fiscal rules locally enforced regarding the criteria of cost deductibility for the borrower and the taxation of returns for the lender. In Italy, the above regulations show a quite steady and well outlined configuration (table 4).

**Table 4**  
***The borrower's and lender's tax profiles in the Italian tax system as of 30.06.2003.***

The borrower's fiscal profile

Financing sources	Reference taxes		
	IRPEG or IRPEF <sup>8</sup>	IRAP	VAT
<b>Debt</b>	Interest rates and charges fully deductible.	Interest rates fully non-deductible. Charges fully deductible.	Not applicable.
<b>Leasing</b>	“Average rental” and charges fully deductible if lease maturity is at least equal to half the period of ordinary depreciation allowance of the asset. Real estate is an exception as leasing maturity is at least 8 years.	Only value of the asset and charges fully deductible if leasing maturity is at least equal to half the period of ordinary depreciation allowance of the asset. Real estate is an exception as leasing maturity is at least 8 years.	All the contract components are VAT taxable.
<b>Equity</b>	The fiscal effect is established according to equity variations occurred between 30.9.1996 and 30.06.2001, through the DIT mechanism.	No effect.	Not applicable.

#### The lender's fiscal profile

Investment modes	Recipient's legal status for purposes of IRPEG or IRPEF taxation on financial profits	
	Individual person	Corporate body
<b>Debt</b>	12.50% final tax rate or 27% if annual return is 2/3 higher than BOT annual average return.	Taxation upon income tax return.

<sup>8</sup> The indistinctive reference to IRPEG and IRPEF intends to show that tax deductibility rules relating to the three areas of financing sources, for which a different fiscal treatment is provided, are identical. As a result, however, the impact on the fiscal income statement will be different depending on IRPEF average rate for partnerships.

<b>Equity</b>	12.50% final tax rate or taxation upon income tax return and use of tax credit .	Taxation upon income tax return and use of tax credit.
---------------	--	--

With reference to the borrower, the fiscal policy maker distinguishes three forms of financing sources, i.e. debt, leasing and equity<sup>9</sup>. The debt component benefits from a net fiscal effect equal to 29.75% (that is 34% of IRPEG after 4.25% of IRAP) whereas leasing shows a fiscal structure that cannot be defined *a priori* but is dependent on different factors such as the typology of asset, the borrower's VAT profile and the maturity month of the operation. As a result, according to the different cases, the fiscal profile of leasing is definitely better or definitely worse than the debt. Finally, equity scarcely and partially benefits from the effects resulting from the DIT in the 1996-2001 period. This means that, up to now, the investment of equity does not produce any fiscal advantages for the firm and thus, at parity of conditions, it represents the most costly strategy.

In this connection, it should be underlined that although the reference context of the fiscal variables is characterized in the Italian system by high volatility, regulations governing the deductibility of interest rates for financing sources and the three categories of "debt, leasing and shareholders' equity" have remained quite stable in the course of time. In addition, it is necessary to verify the possible introduction, starting from 2004, of a mechanism of thin capitalization aimed at, on the one hand, reducing debt relative profitability starting from a given level of the financial leverage employed by the firm and, on the other, at re-directing the investment of financial resources from the debt logic to that of equity.

With reference to the lender, the fiscal system distinguishes rules on the basis of the recipient's legal status (individual person or corporate body). In the case of the corporate body, the taxation criterion seems more unfavorable as returns on the investment of resources fall into the corporate income formation and therefore are subject to IRPEG or IRPEF taxation of the corporate body. This means that the family investment of dedicated vehicles for financing its firm/s is discouraged. On the contrary, the allocation of resources as individual person leads to final tax rates of 12.50% and 27% in the case of debt. In this sense, if the percipient shows a high IRPEF rate, there is a partial area of benefit as the taxation of financial returns is lower than the personal one and therefore the withdrawal of assets becomes facilitated. On the contrary, in the case of equity, the taxation of dividends upon income tax return facilitates the withdrawal of assets owned by individuals with a low personal IRPEF rate.

<sup>9</sup> For an accurate and exhaustive review of fiscal effects on corporate lending choices, see Caselli S., Gatti S., "Il corporate lending", Bancaria Editrice, Roma, 2003.

The combined analysis of the lender's and borrower's profiles enables us to draw a map of possible exchange behaviors between the firm and the family, by taking into account the fiscal asymmetries developing in each profile.

The first consideration regards exclusively the asset borrower. The presence of three reference categories – four in perspective with thin capitalization – produces interesting areas for investment changes and financial planning, above all as to the confrontation between medium-term debt and leasing. Vice versa, such areas do not appear in the short term and once again the lack of profitability is confirmed for equity investment as it is connected with no kind of fiscal advantages.

The second consideration regards instead the asset lender. The possibility to finally tax debt returns on the basis of two rates, which are largely lower than the maximum IRPEF rate, actually creates a kind of “profitability aisle” in the investment of resources. However, it is necessary to check whether these profits can be effectively spent for the purpose of making an exchange with the owned firm, by moving the reference context from the short to the medium term.

In terms of short-term financing choices, the family source is in competition with any other financing source in the market. This means that the objective functions of the firm and of the family are radically different, as the firm aims at the lowest rate and the family at the highest within the monetary system. It is therefore difficult to match the different requirements, apart from the case where carry out strategies, that is when the family utilizes the debt lever to obtain dividends at a lower rate. In this instance, the allocation of resources in the form of debt becomes a tool of family financial strategy rather than a corporate financing tool as capital allocations and withdrawals are a kind of “vehicle” to produce profits which represent deductible costs for the firm – differently from dividends – as well as income taxed at a fixed rate for the percipients. Therefore, the intensity and the usage of the criterion described must take into account the more general restriction of a risk of elusion which can potentially occur if the amount of profits is not on line with the “reasonability” of the market rates<sup>10</sup>.

In terms of medium-term financing choices, although the family source is always in competition with the other financing sources in the market, the nature and the different degree of the commitment as against a short-term operation can reduce the interest conflict of the rate. This means that the family may well diminish the pressure on the return target if a short-term debt represents a tool for creating corporate value. Finally, the profitability of the family-firm exchange may vanish if leasing can actually produce remarkably higher fiscal advantages in comparison to those of debt.

The third consideration is finally more general. The comparison between the structure of financing sources and the investments modes from the fiscal point of view acquires the

<sup>10</sup> *The use of thin capitalization aims at preventing partners' non-physiological and non-reasonable use of debt.*

described profile only if exchange criteria are referred to the domestic context. This means that the quest of fiscal asymmetries can extend the exchange reference context by creating dedicated vehicles which, from the part of either the borrower or the lender or of both, allow carrying our asset transfers characterized by lower profit taxation and higher expense deductibility. The design of a structured operation must obviously produce advantages that are steadily higher than transaction costs, by taking into account risks connected with the volatility of the relative fiscal provisions.

## **The relationship between the owner family and the owned firm: the assets perspective**

The understanding of the family-firm relationship is based on the simple observation that shareholding is one of the family's portfolio components, where all its financial and real assets are allocated<sup>11</sup>. This means that, irrespective of the different degree of "affection" and "commitment", shareholding has the same value as any asset class from the point of view of risk and return as well as of its capacity to contribute to the growth of the wealth in the course of time. If this is absolutely true from the point of view of the form, from that of the substance the position of shareholding within the wider context of family assets is based on a prior analysis of its distinctive and differentiating elements in comparison with other forms of alternative investment.

The understanding and the precise collocation of shareholding within the family portfolio is based on four fundamental rules which characterize its dynamics in the course of time:

- the controlled enterprise/s is/are characterized by a specific risk profile and above all by a specific trend which is related to the trend of its/their own sector cycle. As a result, correct asset allocation must act on the other components of the family portfolio by carefully checking (or removing) any possible cycle synchronies with shareholding. This is carried out to reduce dangerous synergies in terms of risk and, in a broader financial and assets planning, to establish which parts of the financial portfolio might be specifically dedicated to meeting the firm FFE;
- shareholding creates a powerful induced effect which is connected, on the one hand, with the possibility to invest other portfolio components in order to proceed to financial transactions for the enterprise in the form of debt or equity (portfolio expansion effect) and, on the other, with the possible investment/commitment of financial or real assets in the form of a guarantee backing the growth of corporate lending (portfolio compression effect);
- shareholding tends to produce a strong "hostage effect" because of which a large part of family energies and attentions are prevalingly directed to corporate management rather than to the management of financial or assets portfolio;

<sup>11</sup> Reference is obviously made to shareholdings that require the family direct commitment from the operating, affective and ethical point of view. Vice versa, shareholding without such characteristics are just investments in financial assets. This distinction is clear in the presence of a quite limited number of firms. If the family assets are of quite relevant dimensions and the shareholding system has international and branching features, this distinction becomes more confused and more arbitrary.

- shareholding is nevertheless aimed at producing value in the course of time and at increasing family wealth.

The combined analysis of the above aspects is decisive to assess the scope of the assets connection between the family and the firm and to evaluate the structural diversity of shareholding in comparison to the other classes of investment. From this point of view, two main points should be underlined.

In the first place, the family-firm connection with the development cycle highlighted in the context of the financial perspective must be extended to the assets variables relating to the firm corporate value and guarantees. This is because FFE trend and the relative financing choices directly condition the corporate value in the same way as the relative support to the debt strategy stimulates the investment of a share of assets to support the settlement of the relative obligations. Therefore, rather than establish strict relations between the above measures, it is necessary to verify constantly and case by case how relations develop between the family and the firm dynamics in relation to the different development stages of the firm itself (table 5).

**Table 5**

***The relation between the firm different development stages and the assets perspective of the family-firm relationship***

DEVELOPMENT STAGES	FIRM		FAMILY	
	FFEs	DEBT/EQUITY	VALUE	GUARANTEES
Start up (hypotheses A, B, C)				
Development (hypotheses A, B, C)				
Consolidation and maturity				
Restructuring				
Decline and crisis				

In the second place, the shareholding value increase must be properly analyzed on the basis of the family objectives. This means that, differently from the other classes of investment, the meaning of the shareholding value changes in relation to the utilization function required by the family. In other words, the meaning of value and wealth is provided with usability according to the targets of the family assets management. Therefore, two macro-situations are to be distinguished: the former regards the meaning of value in a narrow sense, the latter regards the meaning of value in a broad sense.

In the first case, the concept of value refers to the measurement of the present value of future income flows, in the typical logic of a market oriented evaluation. Although the above approach is correct and can always be used to control portfolio assets evolution, it does not bear a specific meaning of usability in the “continuity” life stages of the family and the firm. Vice versa in the “discontinuity” life stages of the family and the firm, the meaning of value mentioned above has a clear and specific aspect of usability and necessity. In particular, in the context of family “discontinuity”, the meaning of value in a narrow sense becomes necessary as the firm must be evaluated. This occurs in situations relating to succession, turn-around and transfer of property. In these instances, wealth must necessarily have a marketable meaning as it may be exchanged and utilized. Obviously, the criteria for value measurement will be conditioned by and take into account all the different contextual situations urging for such evaluation. In the case of firm discontinuity, the meaning of value in a narrow sense is that of a signaling instrument for the financial system. In the stages of start up, strong development, consolidation through acquisitions or of re-structuring and crisis, the need to involve external lenders – in the perspective of lending and equity – requires the profile of the firm to be completely and organically evaluated. This means that the value measurement in a narrow sense represents the typical and necessary means.

In the second case, the concept of value refers to the spendability and utilization of the assets produced by the firm. Here the condition of continuity in the development stage of the firm and the family moves the meaning of usability onto the firm capacity of producing assets that can be used by the family in the course of time for the most different purposes: consumption, expenses, investment in financial assets, investment in real assets. Obviously, this is true if the firm is able to produce additional income and the family is interested in withdrawing the same income. The utilization process of firm assets can occur in quite different ways, partially influenced once again by the relative fiscal variables.

The first mode is based on the *carry out* logic in the form of interest receivables or dividends, according to the size and the characteristics of the economic area emerging from the firm and the family. The second mode is based, instead, on the transfer of typically family expenses into the firm, so as to benefit from cost deductibility. This obviously depends on the type of expenses and on the type of business purpose characterizing the family firm/s. The third mode is finally based on the transfer of family investments into the firm, so as to benefit from the tax advantage resulting from the depreciation of investments that have been carried out. The second and the third modes share the aspect of the *carry in* logic, that is the utilization of the corporate vehicle to benefit from the fiscal leverage as a supporting instrument in the family expense and investment processes.

## **SYNERGY      PRODUCING      OPERATIONS      BETWEEN CORPORATE AND PRIVATE BANKING**

The identification of the typology of relationships developing between the family and the firm in the financial and assets perspectives represents an important scheme of analysis to

establish the necessary conditions for the implementation of the supply on the part of financial intermediaries. In other words, the understanding of the mechanisms governing the financial transfers between the firm and the family as well as the firm's contribution to the growth of the family wealth are the necessary conditions for the supply of dedicated services to the family business.

The logic link separating the available financial and assets perspectives from positioning financial requirements in the map consists in the identification of the financial operations and situations which are characterized by remarkable synergies and overlapping between corporate banking and private banking designed services, irrespective of the positioning choice and the nature of the financial intermediary willing to approach the family business.

The research of synergies and overlapping areas requires a direct link between the specific aspects of financial and assets connections and the specific aspects of both the family and firm financial requirements. This is necessary to clearly identify the "playing ground", that is the map of business areas the financial intermediary can successfully enter. The map can be classified on the basis of two different parameters (table 6):

- the typology of investment in the overall family portfolio (asset class);
- the typology of the subject interested in the investment (owner class).

As for the asset class parameter, the observations made in the previous paragraph about the "diversity" characterizing firm investment lead us to distinguish family assets into two macro-areas: one regards the firm as such and the other the portfolio after investments in the controlled firm/s. The portfolio must be then divided into sub-areas according to the following:

- investment in financial assets;
- investments in real estate;
- investments in other profit business (arts, precious metals, commodities, jewels);
- investments in instrumental goods (cars, airplanes, ships, other transports);
- investments in non-profit business (charity, social services, etc...).

With reference to the owner class, the identification of the family as the generic, but correct, holder of property interests and rights must be divided into two different categories: on the one hand the family, that is as a coalition of individuals headed by one leader or by a restricted number of members with acknowledged charisma, and on the other the individual members of the family, that is the holders of specific rights and interests, irrespective of the assets structure of the family as a whole. It is apparent that such distinction becomes more important as the number of family members and generations increase.

**Table 6**

**Reference scheme for the identification of synergies between corporate banking and private banking**

		OWNER CLASS	
		FAMILY COALITION	FAMILY MEMBERS
ASSET CLASS	FIRM	Family wealth invested in firm, in the various possible forms	Wealth of family individual members invested in one member's owned firm, in the various possible forms
	PORTFOLIO	Family wealth invested and collectively utilized in financial assets, real estate, instrumental goods and in profit and non-profit business	Wealth of family individual members invested and individually utilized in financial assets, real estate, instrumental goods and in profit and non-profit business.

The analysis of the asset class/owner class matrix offers not only a comprehensive perspective of the internal aspects of the family-firm relationship but above all allows specifying that the nature of synergic operations relies on the capacity of wealth transfer inside the four sections of the matrix, with the final goal to increase the overall wealth or to achieve its more effective internal allocation. This is apart from *technicalities*, which are specific of the single partial aspects of the overall portfolio (financial asset management, real estate management, advisory on art investments, etc.). From this point of view, strongly synergic operations can be grouped into three main categories:

- leasing on real estate and instrumental goods;
- advisory on family discontinuity management;
- corporate finance operations connected with assets transfer requirements.

The specificity of leasing operations, as the synergy-creating tool in wealth transfer, is its fiscal asymmetry in the depreciation process<sup>12</sup>. This means that, at a parity of conditions,

<sup>12</sup> For an exhaustive review of leasing operations see Caselli S., "La valutazione del costo", in Carretta A., De Laurentis G., "Il Manuale del leasing", Egea, Milano, 1998.

the passage from the status of owner to that of lessee reduces costs significantly. The lower the asset depreciation rate, the stronger the effect. As for real estate, apart from the lowest depreciation rate in the Italian fiscal system (13%), there is the lease eight-year minimum life. If the potential lessee's income allows him to pay leasing rentals, for example by renting the same real estate, or he has a sufficient critical mass under the profile of taxable income, the transfer of the family real property into the firm represents a powerful wealth creating tool<sup>13</sup>. In this respect, the situation proposed in table 7 is a useful exemplification as it shows how real estate leasing allows the owner-family to increase the returns of the real assets owned by individual persons.

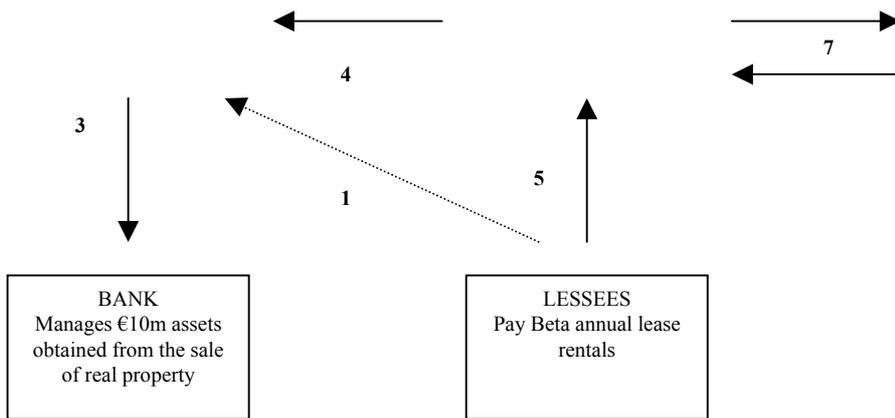

The reference to advisory for the management of family “discontinuity” cannot be directly associated to just one contract and one operation. It rather indicates the capacity of the financial intermediary to grasp and gather all the different and deep effects that may result from the occurrence of a relevant event in the life of the owner family. Succession, turn-around and transfer of property are the emblematic situations in this respect. Apart from the individual financial operations that may be employed on the part of both the family and the firm – as outlined in the mapping of requirements in the previous chapter – the distinctive element for synergy-creation is the counterpart's commitment, that is his ability to propose himself as the partner who, at the same time, is the “transaction third party”, the “confidential reference” and “privacy guarantor”. This allows the advisor to have a central role among the actors and the financial, legal and fiscal operations that are performed in relation to the customer' needs.

The functions characterizing the advisor's role are multiple and cannot be listed in an exhaustive manner. Yet, some specific tasks certainly stand out and are more recurrent : write the “family agreement”, which defines social and property relationships within the family in order to preserve its prosperity and identity; establish corporate governance connected with the event of discontinuity; establish fiscal governance connected with the event of discontinuity; identify counterparts in the event of business transfer and entrance of new partners; identify the management in case the structure is opened to members outside the family; develop mentoring and tutoring for younger family members who are about to enter the firm.

**Table 7**  
**Rea- estate leasing for value creation within the family-firm relationship: an example**

<sup>13</sup> For a more detailed analysis of the various organization hypotheses of real-estate leasing operations, see Caselli S., Gatti S., “La finanza strutturata in Italia”, Newfin, Università Bocconi, in corso di pubblicazione.

Family Alpha owns a large real estate (about €10m). The estate includes housing and office premises, which are leased to third parties. The rentals flow is equal to €600,000 per year (1). The family pays IRPEF on this flow at the highest marginal rate and has no chances to deduct various expenses resulting from the management of the real estate. Therefore, the investment net return is about 2.40%/year, without considering risks and charges resulting from possible extraordinary maintenance. A leasing operation becomes possible as one of the family businesses has real estate management included in its business purpose. Family Alpha transfers its real estate to firm Beta (2) for a value of €10m. Family Alpha has reached its first goal, that is have a financial mass to be allocated in more profitable investments compared to the initial 2.40% (3). To face capital outflow, firm BETA sells the acquired real estate to a bank (4) and at the same time stipulates an eight-year leasing contract for a total amount of 10m. The resulting effect on Beta is particularly interesting: in the first place lease rentals collected by Beta (5) are channeled to the bank and thus employed to pay a relevant share of leasing rentals (6); in the second place, the high acceleration of the leasing contract produces a relevant mass of deductible expenses, thus reducing significantly Beta's fiscal drag; thirdly, Beta's real estate management costs become deductible. At the end of the leasing contract, Beta becomes the owner of the property (7) and continues to collect leasing rentals (5). Family Alpha achieves a second goal: real estate management costs are now deductible and Beta value increases as a result of the fiscal drag reduction and of the purchase of the real estate. The overall financial evaluation of the operation leads us to observe that in the course of the leasing contract, family Alpha has at least doubled its assets as it has financial assets available (€10m) and the ownership of real estate for an overall value of €10m.

Corporate finance operations show a hybrid nature in multiple operations: they involve exclusively corporate financial aspects as well as family assets management and governance profiles. This has already been focused in the previous chapter, where several requirements areas of the family and the firm have highlighted the need to resort to corporate finance operations. Owing to the great variety of cases and technicalities of single operations, the next chapter will be dedicated to a more specific and exhaustive review. Here it is worth remembering that also in this case the synergy element is given by the presence of wealth transfer flows within the "asset class-owner class" matrix.

Key Words: Opportunity recognition, entrepreneurs, venture capitalists

## **ABSTRACT**

Opportunity recognition (OR) is at the centre of the entrepreneurial process and a defining feature of the entrepreneurship domain. However, despite contributions made in generating knowledge about the sensitivity of entrepreneurs to opportunities and the cognitive processes they use, there is still much to learn, particularly about how venture capitalists (VCs) perceive OR as distinct from entrepreneurs. It is clear that understanding OR is essential to VC survival. Whereas entrepreneurs need to be able to recognize and commit to at least one opportunity (their current business venture(s)) to ensure success; VCs need to be able to recognize multiple investment opportunities to ensure the success of their current portfolio as well as to ensure financial support for their being able to

establish future VC funds. However, although VCs need to act like consummate entrepreneurs in recognizing opportunities, a comprehensive conceptualization of similarities and differences between the two groups is absent. In this research, we examine the OR behavior of VCs and entrepreneurs and use a conceptual framework developed by Hills (1995) that highlights core structures and proactive management decision processes.

The research makes a contribution in a number of ways. First, it bridges a gap in the literature by providing an entrepreneurial framework against which VC behavior can be contrasted. Second, the framework is endorsed as being useful for identifying conceptual and operational strengths and limitations evident in the two groups. Third, the research provides practical insights into the design of training programs aimed at imparting knowledge about the OR process and idealized behaviors.

The results indicate both similarities and differences in OR behavior between VCs and entrepreneurs. Both groups demonstrated similar distinctive general OR behavior types in terms of: self perceived alertness to opportunities; underlying causes of opportunities; importance of venture ideas, individualism, creativity, and sources; OR processes, deliberate search, spin-offs, and immersion; and evaluation of business opportunities. However, there were significant differences between the two groups on each of these dimensions.

## **Are Venture Capitalists Consummate Entrepreneurs? Similarities and Differences in their Opportunity Recognition Perceptions and Behaviors**

### **INTRODUCTION**

Opportunity recognition (OR) is a key component of the entrepreneurship process (Schumpeter, 1971; Kirzner, 1979; Shane & Venkataraman, 2000) and has critical theoretical importance (Lumpkin, Hills, and Shrader, 2001). Substantial research has been undertaken in the area of opportunity evaluation. OR, however, has received less attention (Hills, 1995) until only more recently (Venkataraman, 1997). As a result, less is known about how entrepreneurs recognize opportunities (Hills, Shrader, Baltrusaityte, and Izberk-Bilgin, 2002) and the literature that exists is fragmented and often appears contradictory (Lumpkin, Hills, and Shrader, 2001).

Even less, however, is known about venture capitalist (VC) OR behavior. VCs are professional investors that raise funds from others (typically financial institutions such as pension funds, insurance companies, etc.) and invest these funds in growth oriented business. "Very little is known about the sensitivity of venture capitalists to opportunities and the cognitive processes they use to identify opportunities" (Lindsay, 2004, p.1). Some insight may be gained from examining the behavior of entrepreneurs since there is evidence to suggest that VCs demonstrate an entrepreneurial orientation (Lindsay, 2004a). In addition, there may be similar OR behavior types between entrepreneurs and private equity financiers such as VCs (Lindsay & Craig, 2002).

Motivation for this research, therefore, is driven by a need to address a gap in the literature by building upon our understanding of OR for entrepreneurs and to extend this

to VCs. In so doing, we can better understand more about how VCs recognize opportunities and whether there are similarities and differences with entrepreneurs on this construct. Thus, the aim of this research is to compare and contrast OR behaviors of VCs and entrepreneurs with a view to better understanding VC OR behavior. In doing so, the research makes a contribution to the literature by contributing to entrepreneurship theory. In addition, it benefits practitioners (such as consultants and trainers) by providing insights into VC behaviors that may be useful in developing training programs for them.

## THEORY AND HYPOTHESES

Considerable effort has been devoted to developing an understanding of the fundamental OR behaviors of entrepreneurs (Hills, 1995; Hills, Lumpkin, and Singh, 1997; and Hills and Shrader, 1988) and to providing insights into the OR process as being inherently creative (Hills, Shrader, and Lumpkin, 1999; Lumpkin, Shrader, and Hills, 2001). There are a number of behaviors that underlie OR (Hills, 1995; Hills, Lumpkin, and Singh, 1997; and Hills and Shrader, 1988). These include: self perceived alertness to opportunities; underlying causes of opportunities; importance of venture ideas, individualism, creativity, and sources; OR processes, deliberate search, spin-offs, and immersion; and evaluation of business opportunities.

The following discussion builds upon the findings of Hills (1995), Hills, Lumpkin, and Singh (1997), and Hills and Shrader (1988) who focused on OR for entrepreneurs. From this, hypotheses are developed that focus on OR behavior similarities and differences between entrepreneurs and VCs.

As there is support to suggest that VCs may act in an entrepreneurial manner (Lindsay, 2004, 2004a), it is expected that VCs will also demonstrate OR behavior types similar to those identified in entrepreneurs (Hills, 1995; Hills, Lumpkin, and Singh, 1997; Hills and Shrader, 1988). As such,

H<sub>1</sub>: VCs will demonstrate similar OR behavior types as entrepreneurs.

*Self perceived alertness*: Entrepreneurs see themselves as being alert to opportunities. They believe that it is natural for them to identify opportunities and that they enjoy thinking of opportunities (Hills, 1995; Hills, Lumpkin, and Singh, 1997; and Hills and Shrader, 1988). Venture capitalists also need to be alert to opportunities. They are professional investors. They are in the business of recognizing opportunities. As such, because this is what venture capitalists do, they will have a perception that they are opportunity aware and that they have an innate ability to recognize opportunities. Because VCs spend their work life looking for and evaluating opportunities, they will have a greater perception that they are better at recognizing opportunities than to entrepreneurs. As such,

H<sub>2</sub>: There will be differences between VCs and entrepreneurs in terms of self perceived alertness to opportunities behavior.

*Opportunity causes*: Experienced entrepreneurs appreciate that opportunities are grounded in adversity and problems that people face and that they also arise through market changes and customers and, to a lesser extent, through technology (Hills, 1995; Hills, Lumpkin, and Singh, 1997; and Hills and Shrader, 1988).

VCS see many deals. Most of them they do not invest in for a range of reasons including not being investment ready and not being suitable for VC investment. VCs do not always “pick winners”. Sometimes they invest when they should not have. Lindsay (2004, 2004a) refers to this as Type I error. Through experiential learning in picking winners and losers, VCs develop an appreciation of what causes opportunities and what does not. Because they have more experience of this than entrepreneurs, they will be better skilled at understanding opportunity causes. As such,

H<sub>3</sub>: There will be differences between VCs and entrepreneurs in terms of opportunity causes behavior.

*Ideas, individualism, and creativity:* Many entrepreneurs appreciate that ideas are not the same as opportunities and that value needs to be created in ideas to turn them into opportunities. This is where creativity plays a role and many entrepreneurs see themselves as being creative. Some entrepreneurs, however, believe that getting capital and other necessary resources is more important than the idea itself.

In terms of the latter point, VCs appreciate that there is an abundance of finance for entrepreneurial firms. This is not the problem. What they believe is lacking is a suitable stream of investment ready entrepreneurial firms (Mason and Harrison, 2001). As such,

H<sub>4</sub>: There will be differences between VCs and entrepreneurs in terms of ideas, individualism, and creativity behavior.

*Processes, deliberate search, spin-offs, and immersion:* OR is a process comprised of a number of steps. Many entrepreneurs engage in a deliberate search strategy for opportunities but appreciate that one opportunity can lead to another. In addition, they appreciate that although undertaking market research is important, there is no substitute for immersion in the market.

Although there will be similarities between VCs and entrepreneurs on this behavior, there will also be a major difference. Although VCs engage in a deliberate search process for opportunities; their opportunity search approach is different than for entrepreneurs. VCs tend to be sought by entrepreneurs looking for finance – some entrepreneurial opportunities are presented to VCs. This will not preclude VCs from scanning the environment for opportunities and/or utilizing their networks; however, they will demonstrate a different opportunity search behavior than entrepreneurs. As such,

H<sub>5</sub>: There will be differences between VCs and entrepreneurs in terms of processes, deliberate search, spin-offs, and immersion behavior.

*Opportunity evaluation:* Entrepreneurs consider gut feel to be an important part of evaluating opportunities. Although VCs will also believe in gut feel, they will more likely be inclined to back their gut feel up with formal research into the viability of the product/technology, market, and commercial operations of the business. As such,

H<sub>6</sub>: There will be differences between VCs and entrepreneurs in terms of opportunity evaluation behavior.

# RESEARCH DESIGN

## Participants

Both groups of participants (venture capitalists and entrepreneurs) were from Australia. Venture capitalist participants in the survey were identified using a venture capitalist directory as well as by accessing industry contacts to identify firms not appearing in the directory. Firms were contacted and their permission sought for decision makers in these firms to participate in the study. Responses were received from 39 Australian participants which represented a 31% response rate.

A list of potential entrepreneur respondents was developed through a database that identified firms with high growth. The entrepreneurs behind these firms were contacted. The research team contacted participants to gauge their willingness to participate in the survey. For those participants that were slow in responding, a subsequent follow up was made. In total, there were 129 entrepreneur participants which represented a 26% response rate. Demographics on the participants appear in Table 1.

**Table 1 - Respondent Demographics**

Details		Entrepreneur Frequency	Entrepreneur %	Venture Capitalist Frequency	Venture Capitalist %	
Gender	Male	89	69%	39	93%	
	Female	40	31%	3	7%	
Age	30 years or less	42	33%	5	12%	
	31 years to 40 years	37	28%	23	55%	
	41 years to 50 years	32	25%	4	9%	
	51 years to 60 years	18	14%	10	24%	
Highest Education Achieved	Primary School	1	1%	0	0%	
	Secondary School	45	35%	2	5%

Other Qualification	Other Qualification	2	1%	0	0%	
	Have you ever started your own business previously?	Yes	46	36%	19	45%
	No	81	63%	23	55%	
Missing Data	2	2%	0	0%		

Were you a founder of the firm?	Yes	38	30%	22	52%
	No	89	69%	20	48%
	Missing Data	2	2%	0	0%

## MEASURES

A questionnaire was used to gather information from participants. The questionnaire asked participants for demographic information including personal information and business-related activities. It contained several sections including measures for opportunity recognition.

The instrument adopted in the research used a modified version of a questionnaire originally developed by Hills (1995). Versions of the questionnaire have been used by others (for example, Hills, Lumpkin, and Singh (1997) and Hills and Shrader (1998)). It has been extensively pre-tested and modified where appropriate (Hills & Shrader, 1998). The instrument identifies a number of underlying dimensions associated with OR. These were adopted in this research: self perceived alertness to opportunities ( $\alpha_{\text{entrepreneurs}} = 0.766$  and  $\alpha_{\text{Venture Capitalists}} = 0.744$ ); underlying causes of opportunities ( $\alpha_{\text{entrepreneurs}} = 0.734$  and  $\alpha_{\text{Venture Capitalists}} = 0.732$ ); importance of venture ideas, individualism, creativity, and sources ( $\alpha_{\text{entrepreneurs}} = 0.820$  and  $\alpha_{\text{Venture Capitalists}} = 0.702$ ); OR processes, deliberate search, spin-offs, and immersion ( $\alpha_{\text{entrepreneurs}} = 0.845$  and  $\alpha_{\text{Venture Capitalists}} = 0.705$ ); and evaluation of business opportunities ( $\alpha_{\text{entrepreneurs}} = 0.867$  and  $\alpha_{\text{Venture Capitalists}} = 0.701$ ). Each of these items is scored on a 5 point Likert scale ranging from "1 = Strongly Agree" to "5 = Strongly Disagree".

## RESULTS

Tables 2 and 3 provide the results of the entrepreneur and venture capitalist participant self perceived OR behaviors. These are defined in terms of the frequencies associated with participant responses on the 5-point Likert scale for each OR behavior. VCs adopted similar OR behavior types as entrepreneurs (that is, they demonstrated the following OR behaviors: self perceived alertness to opportunities; underlying causes of opportunities; importance of venture ideas, individualism, creativity, and sources; OR processes, deliberate search, spin-offs, and immersion; and evaluation of business opportunities). As such,  $H_1$  was confirmed.

In addition, an independent samples t-test was conducted to compare the OR behaviors of each group. Significant OR differences between each group were found on all OR behaviors: alertness ( $t(169) = 1.971$ ,  $p = 0.050$ ); causes ( $t(169) = 4.055$ ,  $p = 0.000$ ); ideas ( $t(169) = 2.068$ ,  $p = 0.040$ ); search ( $t(169) = 1.958$ ,  $p = 0.052$ ); evaluation ( $t(169) = 2.134$ ,  $p = 0.034$ ). As such,  $H_2$  to  $H_6$  were confirmed.

**Table 2 - Frequencies: Entrepreneurs**

Measure	Mean (s.d.)	1 SA	2	3	4	5 SD
Alertness	2.31 (1.03)	27 21%	40 31%	41 32%	15 12%	6 5%
Causes	2.61 (0.704)	5 4%	50 38%	56 44%	17 13%	1 1%
Ideas	2.92 (0.814)	2 2%	30 23%	79 61%%	7 6%	11 8%
Search	2.95 (0.826)	3 2%	32 25%	70 54%	13 10%	11 9%
Evaluation	2.98 (0.980)	1 1%	38 29%	64 50%	6 5%	20 15%

**Table 3 - Frequencies: Venture Capitalists**

Measure	Mean (s.d.)	1 SA	2	3	4	5 SD
Alertness	1.95 (0.942)	11 26%	19 45%	8 19%	2 5%	2 5%
Causes	2.11 (0.683)	7 17%	22 52%	11 26%	1 2%	1 2%

Evaluation	2.63 (0.730)	4 10%	8 19%	26 62%	4 9%	0 0%

## DISCUSSION

The results suggest that in terms of recognizing opportunities, VCs demonstrate behaviors similar to entrepreneurs. However, although demonstrating OR behaviors, they demonstrate significant differences within behavior types in terms of the means or weightings placed on these behaviors as compared to entrepreneurs.

One possible explanation for this is that whereas entrepreneurs need to be able to recognize and commit to at least one opportunity (their current business venture(s)) to ensure success; VCs need to be able to recognize multiple investment opportunities to ensure the success of their current portfolio as well as to ensure financial support for their being able to establish future VC funds. Thus, VCs become more experienced in OR than entrepreneurs because they undertake OR more frequently than entrepreneurs. Entrepreneurs may see a range of potential opportunities but they may not necessarily have the time, inclination, or resources to invest in these. VCs on the other hand are in the business of OR. They must recognize opportunities and invest in them if they are to satisfy their investors that they are doing their job. As such, not only do VCs get to practice at recognizing opportunities, they also are required to back their decisions with hard cash. Because VCs tend to use investor's money in their investments, they do not have an emotional attachment to the funds they invest in. As such, they may be more objective in learning from their investment decisions than entrepreneurs who will have personal assets at stake.

## **IMPLICATIONS**

OR is not only fundamental to the entrepreneurship process, it also is fundamental to the VC investment process. Critical to VC success is whether VCs can successfully recognize opportunities. From the OR behavior perspective, VCs need to be consummate entrepreneurs. However, VCs do not always get it “right”. Sometimes they invest in deals they should not have (Type I error). Other times they may reject deals they should have invested in (Type II error). No matter how good VCs are in picking winners, with the dynamic environments they operate within, there is room for ongoing development in the OR area at the individual VC level. This can be achieved through continuing professional development courses. In terms of developing these courses, the framework developed by Hills (1995) appears to provide a good foundation.

## **RESEARCH LIMITATIONS**

There are a few limitations associated with this research. These include the following. First, only “successful” VCs were examined in the research (that is, those that were operating). There is a need in future research to examine OR behavior of non-successful firms and to determine whether OR behavior is different in these firms. Second, the sample size for VCs was relatively small; however, this is a reflection of the venture capitalist population in Australia. Third, most VC funds are closed funds (that is, they have a limited life – usually 10 years). However, some funds are open (they theoretically have an indefinite life). Future research may benefit from comparing the VC OR behaviors in closed funds versus open funds to determine to what extent organizational factors influence the OR process. Fourth, Australian VCs and entrepreneurs were used in the research. Care needs to be exercised in generalizing the results to other western countries such as the USA and the UK and to Asia.

## **SUMMARY**

This research examined the similarities and differences in OR behaviors between entrepreneurs and VCs. VCs demonstrate similar types of OR behaviors as entrepreneurs – they act like entrepreneurs in that they emulate entrepreneur OR behavior types. However, there are significant differences in the means of these OR behaviors between VCs and entrepreneurs. These differences may be explained through the skill set, knowledge, and experience that VCs acquire or develop through their entrepreneurial business dealings.

Key Words: Entrepreneurial orientation, franchisee, performance, family business

## **ABSTRACT**

Family business is considered to be a unique form of business because of a layer of complexity that overlays the bounded rationality that is associated with non-family business: the family dynamic. The family dynamic is the influence of family values, family traditions, family culture, etc. over business decisions that can modify the outcome of those decisions; for example, decisions about the entrepreneurial pursuit of opportunities and/or the entrepreneurial orientation of the business itself. Family businesses are said to be the most complex form of business requiring special consideration by governments when framing and implementing policy initiatives. To argue their case, family business associations exist around the world to provide a united family business voice in particular regions/countries.

There is, however, no universal definition of what constitutes a family business. Some definitions of family business are all encompassing (e.g., any business that is owned or controlled by one or more families including first generation family members where there may not necessarily be an intent to pass on the business to a second generation). Other definitions are more restrictive (for example, a family business is a business where at least the second generation of a family owns the equity in, or controls, the business and there is intent to pass on equity in the business to subsequent family generations).

The definition issue is not inconsequential. If a broader family business definition is adopted, family business is considered to be the most prevalent form of business globally. This has significant implications for government policy designed to support family business with related economy wide resource consequences. Thus, it becomes an important issue to ask whether the broader family business definitions are relevant. Specifically, should businesses that are owned by first generation family members be considered to be “family businesses”? Are these businesses any different from non-family businesses? These questions motivate this research. The aim of the research is to investigate differences and similarities between first generation family owned businesses and non-family owned businesses that are franchisees. This is done in terms of examining the entrepreneurial orientation (EO) of these firms.

The research identified no major differences between family and non-family franchisees. This suggests that first generation franchisee businesses are from the same population as non-family franchisee businesses. Thus, the family dynamic that has been found to exist in multi-generational family businesses may not exist in first generational franchisee businesses. As such, it may be improper to define first generational franchisee businesses as “family businesses”.

## **INTRODUCTION**

The fields of family business and entrepreneurship consist of separate and distinct yet overlapping domains (Hoy & Verser, 1994). The interaction of these domains provides a unique perspective from which to examine the dynamics of how the family interacts with and/or influences the entrepreneurship process. Yet, there is a lack of integrated theory that helps us to better understand the complex and changing relationships between entrepreneurs and their families over time (Dyer & Handler, 1994).

A family business differs from a non-family business in that it is owned, managed, and/or controlled by family. Ownership and management are inextricably intertwined (Hoy & Verser, 1994; Neubauer & Lank, 1998). As a result, family businesses often function in confusing and clandestine ways that are not evident in non-family businesses (Litz, 1997).

Family businesses are complicated (Lansberg, Perrow, & Rogolsky, 1988; Neubauer & Lank, 1998) and are considered to be the most complex forms of business (Neubauer & Lank, 1998). This complexity is due in part to family business being a culmination of two interacting systems: the family and the business (Davis, 1983; Lansberg, 1983).

In a family business, the “family dynamic” (family values, family traditions, family culture, family philosophy, the emotional attachment to family assets, etc.) permeates the business and influences decision making behavior and business activities with a view to ensuring the business’ survival beyond the current generation (Craig & Lindsay, 2002; Neubauer & Lank, 1998; Davis & Harveston, 1998). What may be a good decision for the business may not necessarily fit with the family dynamic. The notion that efficiency considerations and bureaucratic rationality “... should predominate in the workplace often leads researchers to ignore how the family dynamics of the owners influence managerial behavior” (Lansberg, Perrow, & Rogolsky, 1988, p.4).

However, although researchers, practitioners, government policy makers, etc. talk about family business, there is no universal definition of what constitutes a “family business”. Some definitions of family business are all encompassing (e.g., a family business is a business that is owned or controlled by one or more families including first generation family members where there may not necessarily be an intent to pass on the business to a second generation). Other definitions are more restrictive (for example, a family business is a business where at least the second generation of a family owns the equity in, or controls, the business and there is intent to pass on equity in the business to subsequent family generations). Table 1 provides some examples of family business definitions.

## **Exhibit 1 - Examples of Family Business Definitions**

Researchers generally agree that family involvement in the business is what makes the family business “different” (Miller & Rice, 1967). Researchers, however, cannot agree as to what family involvement in a business means (see, for example, Churchill & Hatten, 1987; Handler, 1989; Brockhaus, 1994). This has implications for defining “family business”. Family business definitions are wide ranging. In these definitions, family involvement can mean any or all of the following (Neubauer & Lank, 1998, p5):

- the percentage of share capital owned by a family
- the employment of the owning family in executive or other positions
- the extent to which the intention is to maintain family involvement in the business in the future
- the number of families involved in the business
- whether (only) the founder’s direct descendants have control of the business
- whether the family ultimately controls the business, and/or
- the number of generations of the family involved in the business (ranging from an inclusion of the first family generation - the founders - to including subsequent generations).

This list is by no means exhaustive or mutually exclusive. There are a multitude of definitions.

The definition issue is not inconsequential. Family business has been said to be the most prevalent form of business. It is thought to contribute considerable wealth to economies, employ the majority of the workforce, create most new jobs, and generate a significant proportion of GDP (Shanker & Astrachan, 1996).

The validity of these statements, however, depends upon how family business is defined. If a broader family business definition is adopted, family business is the most prevalent form of business. However, are the broader family business definitions relevant? Specifically, should businesses that are owned or controlled by first generation family members be considered to be “family businesses”? In other words, are first generation businesses any different from non-family businesses?

Government policy makers, researchers, educators, consultants, etc. need to clearly understand what is "family business" when framing appropriate policies, conducting research, and/or providing advice that affect family business. For example, there are significant implications for government policy designed to support family business with related economy wide resource consequences.

This research, therefore, is motivated by a perceived need to contribute toward a definition of family business. The aim of the research is to investigate differences and similarities between first generation family owned businesses and non-family owned businesses. This is achieved by examining the entrepreneurial orientation (EO) of these firms. Franchisees were used as participants in this research since many franchisee businesses are owned by first generation family members. In addition, franchise systems help to provide homogeneity across individuals and groups.

The research makes a contribution by refining the definition of family business. Currently, it is suggested that the range of family business definitions is too encompassing and far reaching. This definition set needs to be reduced to provide greater clarity for family business researchers, government policy makers, educators, and consultants.

## **THEORY AND HYPOTHESES**

This section examines relevant theory and generates hypotheses. Discussion pertaining to the variables and relevant hypotheses appears below. The focus of this research is at the firm level whereby the franchisee firm is regarded as an extension of the individual (see, for example, Covin and Slevin, 1991; Lumpkin and Dess, 1996).

### **Franchisees**

Franchisees join franchise systems for a variety of reasons including affiliation with a trademark or trade name (Knight, 1986; Stanworth, 1977), franchisor support ((Hough, 1986), proven business format (Withane, 1991), and/or established name, lower development costs, and/or training (Peterson & Dant, 1990. Franchising can assume at least two forms (Kaufmann & Stanworth, 1995). One form involves a manufacturer creating a contractual channel of distribution for one or more of its products/services. This is called product franchising. The other form involves a retailer licensing the right to replicate its business concept in another location. This is referred to as business format franchising. This research focuses on business format franchising. Business format franchising fits many of the diverse criteria for defining entrepreneurship (Low & MacMillan, 1988).

### **Entrepreneurial Orientation**

EO refers to the organizational processes, methods, styles, practices, and decision-making activities employed by entrepreneurs that lead to new entry (Stevenson & Jarillo, 1990; Lumpkin & Dess, 1996, 2001). New entry involves launching a new venture either via a startup firm, via an existing firm, or internally within a larger

corporation (Burgelman, 1993). New entry can be accomplished by entering new or established markets with new or existing goods or services (Lumpkin & Dess, 1996).

An EO-performance relationship exists in entrepreneurial firms (Miller, 1983; Covin & Slevin, 1989) contingent on environmental and organizational factors (Lumpkin & Dess, 1996). "Entrepreneurial firms engage in product-market innovation, undertake somewhat risky ventures, and are first to come up with proactive innovations, beating competitors to the punch". (Miller, 1983, p.771) In contrast, "non-entrepreneurial firms innovate very little, are highly risk averse, and imitate the moves of competitors instead of leading the way" (Miller, 1983, 771).

EO measures include proactiveness, risk taking, and innovativeness (Miller, 1983; Covin and Slevin, 1989; Lumpkin and Dess, 1996; Wiklund, 1999). *Proactiveness* is an opportunity-seeking, forward-looking perspective that involves introducing new products/services and acting in anticipation of future demand" (Lumpkin and Dess, 1996). *Innovativeness* represents a "...basic willingness to depart from existing technologies or practices and venture beyond the current state of the art" (Lumpkin and Dess, 1996, p.142). *Risk taking* involves a tendency to take bold actions, such as venturing into unknown new markets, committing a large portion of resources to firms with uncertain outcomes, and/or borrowing heavily (Lumpkin and Dess, 1996). These three dimensions make unique contributions to a firm's overall level of entrepreneurial orientation (Miller, 1983; Miller and Friesen, 1984; Covin and Slevin, 1989). These dimensions vary independently of each other depending on specific organizational and environmental contexts (Miller, 1988; Lumpkin and Dess, 1996, 2001). Environmental and organizational factors "influence how an entrepreneurial orientation will be configured to achieve high performance" (Lumpkin and Dess, 1996, p.151) and the extent to which the underlying EO dimensions vary independently in influencing the EO-performance relationship (Lumpkin and Dess, 1996). All, or only some, of these dimensions may influence performance when a firm engages in new entry – contingent upon specific environmental and organizational contextual factors present (Lumpkin & Dess, 1996).

Lindsay and McStay (2004) established that franchisees exhibit an EO, that the EO dimensions varied independently, and that an EO-performance relationship exists with franchisees contingent upon environmental and organizational factors. They argued that franchisees operate in dynamic environments and adopt organic structures. In dynamic environments, organic structures are appropriate (Burns & Stalker, 1961; Miller, 1983) to deal with the uncertainty and change. As such, it is expected that within the franchisee environmental and organizational context:

H<sub>1</sub>: Both first generation family business franchisees and non-family business franchisees will demonstrate an EO.

H<sub>2</sub>: Both first generation family business franchisees and non-family business franchisees will demonstrate an EO-performance relationship.

It is established that family businesses are complex and that the family dynamic that pervades these businesses influences decisions and activities of the firm. As such, the family dynamic may affect firm performance. In addition, because of the emotional attachment to family assets and the influence of family values, family culture, etc., it is expected that the family dynamic will influence proactiveness, innovativeness, and risk taking in the business and, thus, its overall EO. Thus, these EO dimensions will be

significantly different in family businesses than non-family businesses because of the family dynamic. In businesses operated by first generation families, however, it is expected that the family dynamic will not have manifested. The family dynamic needs to be incubated so that it permeates the business and it is expected that the incubation period will be insufficient in businesses operated by first generation families. As such:

H<sub>3</sub>: There will be no significant differences in the EO dimension, proactiveness, between first generation family business franchisees and non-family business franchisees.

H<sub>4</sub>: There will be no significant differences in the EO dimension, innovativeness, between first generation family business franchisees and non-family business franchisees.

H<sub>5</sub>: There will be no significant differences in the EO dimension, risk taking, between first generation family business franchisees and non-family business franchisees.

## RESEARCH DESIGN

### Participants

A number of business format franchisors were contacted and their permissions asked to use franchisees in their franchise group. The research team then either contacted individual business format franchisees in person or by telephone to gauge their willingness to participate in the survey and their preferred survey method (i.e., email, mail, telephone, fax, or a personal visit).

In all, there were 114 participants (37 first generation franchisees and 77 non-family franchisees). Demographics on these individuals appear in Table 1. To determine if a franchisee was a family business, participants were asked the question “Is your franchise a family business (that is, does your family work in or own/control the franchise you are involved in)?”

**Table 1 - Respondent Demographics**

Details		1 <sup>st</sup> Gen FB Frequency	1 <sup>st</sup> Gen FB %	Non-FB Frequency	Non FB %
Gender	Male	11	30%	24	31%
	Female	26	70%	53	69%

	11 years or more	8	22%	14	18%

## MEASURES

The questionnaire asked participants for demographic information including personal information and business-related activities. It contained several sections including measures for EO and performance metrics.

*Entrepreneurial Orientation:* A review of the entrepreneurship literature was conducted and Miller's (1983) original dimensions (proactiveness, risk taking, and innovativeness) were used to measure EO (e.g., Covin & Slevin, 1989; Khandwalla, 1977; Miller & Friesen, 1984). These three dimensions were measured using a seven point scale. Other additional EO dimensions have been identified including competitive aggressiveness and autonomy (Lumpkin and Dess, 1996; Dess, Lumpkin, and Covin, 1997). These have not necessarily been adopted by other researchers (e.g., Kreiser, Marino, and Weaver, 2002).

*Performance:* There is no consensus on the appropriate measures of performance for small firms. Performance is multidimensional and there is support for measuring different dimensions of firm performance (e.g., Lumpkin & Dess, 1996; Wiklund, 1999). Growth is advocated as the most important firm measure and measures of financial performance and performance relative to competitors should also be included (see, for example, Chandler & Hanks, 1993; Wiklund, 1999). "Performance measures testing EO dimension propositions should include multiple measures ..." (Lumpkin & Dess, 1996, p.153).

This research used two perceptual scales to measure performance. It was considered that objective measures of performance may be difficult to obtain. A

variety of studies suggest that perceptual measures can be reasonable proxies for objective measures (Chandler & Hanks, 1993).

The first performance scale was based on Zou, Taylor, & Osland's (1998) items. This scale includes six 5-point items to measure statements such as "the franchise has been successful", "the performance of our franchise has been satisfactory", and "the franchise has achieved rapid growth". These items were averaged into an internal *success performance scale*.

The second performance scale was based on the approach adopted by Li & Calantone (1998). Respondents were asked to assess the net profit and return on investment of their franchises relative to similar franchisees operating in the same market. These items were averaged to create a *competitor relative performance scale*.

## RESULTS

Tables 2 and 3 provide the descriptive statistics, reliabilities, and correlations for first generation family businesses and non-family businesses respectively. The results are discussed below.

**Table 2**  
**Descriptive Statistics, Reliabilities, and Correlations: First generation family business franchisees**

Measure	Mean (s.d.)	1	2	3	4	5
Proactiveness	4.80 (1.4)	<i><b>0.76</b></i>				
Innovativeness	3.97 (1.38)	0.359*	<i><b>0.71</b></i>			
Risk Taking	3.78 (1.36)	0.470**	0.415*	<i><b>0.81</b></i>		
Success Performance	3.75 (.79)	0.450**	0.531**	0.564**	<i><b>0.81</b></i>	
Competitor Relative Performance	3.77 (0.86)	0.486**	0.339*	0.419**	0.610**	<i><b>0.76</b></i>

*\*  $p < 0.05$ ; \*\*  $p < 0.01$*

There were five hypotheses. The idea that franchisees demonstrate an EO and that there is an EO-performance relationship contingent upon environmental and organisational factors is supported in this research. There were no significant differences between the two groups.

H<sub>1</sub> hypothesizes that both first generation family business franchisees and non-family business franchisees will demonstrate an EO. This hypothesis was confirmed.

H<sub>2</sub> hypothesizes that both first generation family business franchisees and non-family business franchisees will demonstrate an EO-performance relationship.

This was partially confirmed. All three EO dimensions were significantly related to both success and competitor relative performance measures for first generation family business franchisees. However, only two dimensions (proactiveness and innovativeness) were significantly related to success and competitor relative performance measures for non-family business franchisees (risk taking was not significantly related to either).

For Hypotheses 3 – 5, an independent samples t-test was conducted to compare the EO dimensions of each group. There were no significant EO differences between the two groups on any of the three dimensions: proactiveness ( $t(112) = 0.130$ ,  $p = 0.897$ ); innovativeness ( $t(112) = -0.433$ ,  $p = 0.666$ ); and risk taking ( $t(112) = -1.285$ ,  $p = 0.201$ ). As such, Hypotheses 3 – 5 were confirmed.

## DISCUSSION

At a macro level, the results demonstrate that franchisee firms are capable of demonstrating an EO and that a beneficial EO-performance relationship is possible regardless of whether the franchisee is a first generation family business or a non-family business. This is consistent with Lindsay and McStay (2004). They found that franchisees demonstrated an EO, that EO dimensions varied independently, and that there was an EO-performance relationship contingent upon environmental and organizational factors. This was despite the “standardization” imposed by franchise systems on franchisees. Of note, Lindsay and McStay (2004) found a relationship between proactiveness and performance and risk taking and performance. There was no relationship between innovativeness and performance. Their results differ from the results of this research. One explanation for this is that different franchisors permit differing levels of freedom to innovate within their franchise systems. In those franchise systems that permit greater freedom to innovate, there may be a relationship between innovativeness and performance. Thus, for franchisees, environmental factors need to incorporate “franchisee freedom” as an underlying dimension.

No significant differences between first generation family business franchisees and non-family business franchisees were found across any of the EO dimensions. Thus, both groups displayed a similar level of EO. One explanation for this is that the "family businesses" used in this research were really not "family businesses". There is no consensus of what is a family business. There are numerous definitions of family business. The profile of the family businesses included in this research was that they were businesses owned, controlled, and/or operated by first generational family founders (they were the principals). This profile is not inconsistent with *some* definitions of family business (see, for example, Neubauer & Lank, 1998). However, the complexity due to the family dynamic may not be as strong in first generation family businesses as it is in subsequent generational family businesses. Family values, family politics, family culture, family philosophy, family traditions, and the "family way of doing things" may not have had time to develop in first generation family businesses to the extent that they exist in subsequent generational family businesses. As such, first generational family businesses appear not to be dissimilar to non-family businesses. Any development of the family dynamic may occur only in subsequent generational family businesses. As a result, businesses where the first generation family founders are the principals of the business should be excluded from being termed a "family business".

## **IMPLICATIONS**

The implications of these findings include the following. At a practical level, government policies aimed at assisting family businesses should be directed at multi-generational family businesses where there is at least the second generation of the family involved. Family business complexity and the family dynamic that is mooted by researchers and practitioners may not exist in first generation family founded businesses. These businesses appear to be no different than "non-family" businesses.

Family businesses are said to be the most prevalent businesses in the world and contribute significant economic wealth and employment (Shanker & Astrachan, 1996). If first generation family businesses are excluded from the definition of family business, then this may not be the case. The significant economic wealth of economies attributed to being generated by family businesses may, in fact, be generated by "non-family" businesses (some of which will have founding families working in them).

At the theoretical level, researchers undertaking family business research should be wary of including in their studies businesses where only the first generation of the family is involved in the business. These businesses may create noise in the interpretation of results and may adversely affect family business theory building.

## **RESEARCH LIMITATIONS**

There are a number of limitations associated with this research. First, the sample was not selected randomly. As such, extrapolation of the results to the franchisee population should be done with caution. Although franchise systems help to promote

homogeneity across franchisees within particular franchise systems, franchisees are a heterogeneous group and future studies should control for different franchisee segment types. Second, the research did not include multi-generational franchisees in the study. Future research needs to compare the EO and EO-performance relationship between businesses owned, controlled, and/or operated by first generation family founders with second and subsequent generation family businesses. Third, only successful franchisees were examined (those that were still operating). There is a need in future research to examine the EO-performance relationship in less successful firms.

## SUMMARY

The purpose of this research was to contribute toward developing a universally accepted definition of family business. The research started with the premise that family businesses are more complex than non-family businesses and that business decision processes, decision outcomes, and business success and performance will be different for family businesses as compared to non-family businesses. The research used first generation franchisee family businesses as one of the groups to represent "family business" in the research design. No major differences were found between the two groups (first generation family and non-family businesses). As such, it was recommended that those businesses where the first generation family founders are involved in the business (and there are no subsequent family generations involved in those businesses) should be excluded from being defined as "family businesses". This has important considerations at the applied and theory levels. Further research, however, needs to be undertaken to explore this line of thinking further.

Key Words: Entrepreneurial orientation, venture capitalist, performance, cultural differences

## **ABSTRACT**

This research examines the entrepreneurial orientation (EO) and the EO-performance relationship of eastern and western venture capitalists. EO is measured in terms of proactiveness, innovativeness, and risk taking. EO is a determinant of performance contingent upon contextual variables such as environmental types (e.g. the volatility and dynamism of environments) and organizational types (e.g., organically versus simply structured firms). Many people would agree that eastern and western cultures have significant differences. These cultural differences are reflected in differing thought processes between eastern and western decision makers. Westerners typically think in terms of categories, pay attention to focal objects, and prefer abstract universal principles. Asians typically think in terms of the overall surroundings, the relationships between objects and their surroundings, and rules appropriate to particular situations.

A substantial portion of entrepreneurship research published in the major international journals uses data collected from western countries. As such, the results of many of these studies may be more generalizable to western than Asian countries. This research makes a contribution to the literature by examining similarities and differences between venture capitalists from eastern and western cultures. Cognitive differences exist between these two cultures and these are expected to be reflected in the EO construct and the EO-performance relationship. In addition, this research makes a

contribution by extending EO research that has primarily focused on firms established and driven by entrepreneurs to firms of venture capitalists.

The research results identified both similarities and differences between the two groups in terms of the EO construct and the EO-performance relationship. One possible explanation for this may be found in the cognitive differences reflected in the two cultures. Westerners tend to focus on “actors”; easterners focus more on surroundings. As such, with eastern venture capitalists, contextual variables and their relationships may play a more significant role in the investment decision process and the strategies they employ than for western venture capitalists. In other words, contextual variables may influence the EO dimensions that drive venture capitalist investment performance more with eastern than with western venture capitalists. In addition, the venture capitalist EO-performance relationship may not only be contingent upon contextual variables such as how environments and organizations are structured, the relationship may also be contingent upon cultural differences that influence fundamental venture capitalist cognitive processes. As such, the “traditional” understanding of contextual variables in EO research may need to be expanded to accommodate cultural differences.

## **Eastern and Western Venture Capitalist Entrepreneurial Orientations and their Performance Relationships**

### **INTRODUCTION**

Entrepreneurial orientation (EO) has been the subject of a number of studies that have examined the underlying dimensions of the EO construct and its relationship to the performance of entrepreneurial firms (e.g., Covin & Slevin, 1991; Smart & Conant, 1994; Lumpkin & Dess, 2001). EO refers to the processes, practices, and decision-making activities employed by entrepreneurs that lead to new entry (Stevenson & Jarillo, 1990; Lumpkin & Dess, 1996).

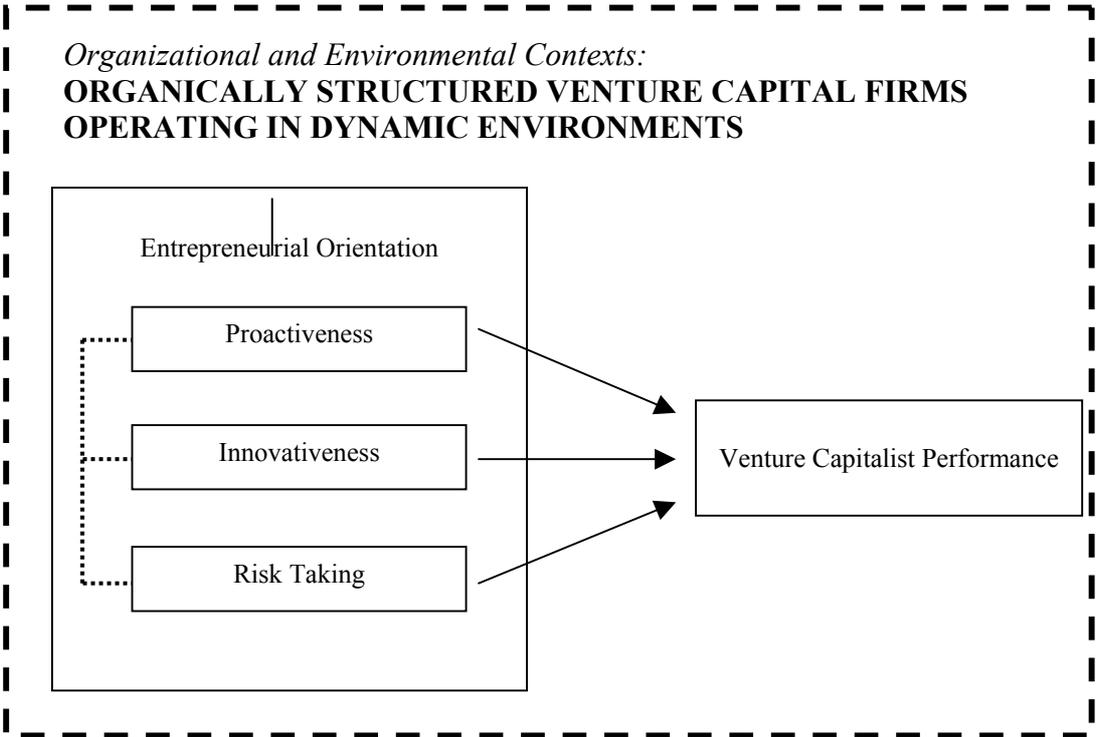

While previous EO research primarily focused on entrepreneurial firms, Lindsay (2004) extended the application of the EO construct to business angels. Business angels are private equity investors that tend to use their own money to invest in early stage entrepreneurial firms with an expectation of returns commensurate with the risks involved. Lindsay (2004) found that business angels act like “consummate entrepreneurs” in that they demonstrate an EO and have an EO-performance relationship contingent upon the dynamic environmental and organically structured organizational contexts they operate within.

This research takes the EO construct research a stage further and examines its relevance to another type of private equity investor - venture capitalists (VCs). In addition, the research examines similarities and differences between VCs in Australia and Japan. There is support for differences in cognitive processing and management styles of decision makers in the East and the West due to cultural differences (Nisbett, 2003). By investigating the EO construct simultaneously in two different cultural environments, additional insights are provided about the construct and the EO-performance relationship as well as the nature of the VCs operating in those environments.

# THEORY AND HYPOTHESES

The following section examines relevant theory. The focus of the research is at the firm level; that is, EO and the EO-performance relationship is at the VC firm level. Figure 1 presents an hypothesized model for reviewing those EO dimensions (independent variables) that relate to VC firm performance (dependent variable). Details pertaining to this model appear below.

**Figure 1 - Hypothesized Model of EO Dimensions that relate to Venture Capitalist Firm Performance**

## Venture Capitalists: Organizational and Environmental Contextual Issues

VCs are professional investors that raise money from the market (typically larger financial institutions such as pension funds, life assurance companies, banks, and government financial institutions) and manage these funds for investment in growth oriented entrepreneurial businesses with an expectation of obtaining high returns commensurate with the risks involved. They tend to be structured in terms of an investment management entity that manages the one or more funds under their control (Golis, 2002). Potential investments tend to be reviewed by an investment committee before being recommended to the board of the investment manager where the final decision to invest or not is made.

VC firms tend to be built around a relatively small number of team members with a variety of skills, experiences, and expertise. Their structures tend to be organic in that they lean toward being decentralized, relatively informal (knowledge is distributed to the

key decision makers throughout the organizations more or less equally - open communication), and “flat” in that they emphasize lateral interaction among decision makers (e.g., Burns & Stalker, 1961, p. 119).

VCs tend to operate in environments where there is a degree of dynamism and uncertainty due to the nature of their businesses in trying to identify successful investments that will be growth oriented and that will provide them with above normal returns. Dynamic and uncertain environments tend to necessitate organic firm structures (Burns & Stalker, 1961; Lawrence & Lorsch, 1967) and require innovation and marketing differentiation (Miller, 1988, p. 282). Dynamic and uncertain environments reflect ongoing changes in customer tastes, product-service technologies, and competitive weapons (Miller, 1983, P. 775).

## **Entrepreneurial Orientation**

EO is an essential feature of high performing firms (Lumpkin & Dess, 1996) and is concerned with the discovery and exploitation of profitable opportunities (Shane & Venkataraman, 2000). Measures of a firm’s EO have evolved over the last two decades and include proactiveness, risk taking, and innovativeness (Miller, 1983; Covin & Slevin, 1989). Researchers also have identified other possible elements of EO including competitive aggressiveness and autonomy (Lumpkin and Dess, 1996; Dess, Lumpkin, and Covin, 1997). These dimensions, however, have not necessarily been adopted by other researchers (e.g., Kreiser, Marino, and Weaver, 2002).

This research uses proactiveness, innovativeness, and risk taking as measures of EO (Miller, 1983; Covin and Slevin, 1989). These three dimensions make unique contributions to a firm’s overall level of EO (Miller, 1983; Miller and Friesen, 1984; Covin and Slevin, 1989). The dimensions may vary independently of each other depending on specific organizational and environmental contexts (Miller, 1988; Lumpkin and Dess, 1996, 2001). In other words, environmental and organizational factors “influence how an entrepreneurial orientation will be configured to achieve high performance” (Lumpkin and Dess, 1996, p.151); they influence the extent to which the underlying EO dimensions vary independently in influencing the EO-performance relationship (Lumpkin and Dess, 1996).

Underpinning this research is the premise that VCs need to act in an entrepreneurial manner since there are parallels between what entrepreneurs do and what VCs do (they both identify opportunities and put together the necessary resources to develop those opportunities). As such, since entrepreneurial firms demonstrate an EO (e.g., Miller, 1983), it is expected that VCs also will demonstrate an EO. As such,

H<sub>1</sub>: Australian and Japanese VCs will demonstrate an EO.

## **Proactiveness**

*Proactiveness* is an opportunity-seeking, forward-looking perspective that involves introducing new products/services and acting in anticipation of future demand (though it does not necessarily mean “first to market”) (Lumpkin & Dess, 1996, pp.146-147; Lumpkin, 2002, p.8). Proactiveness is an essential component of the new entry decision. It involves developing a vision for a new business idea and determining ways to combine previously unidentified components to capitalize on a perceived business opportunity (Bird, 1989; Schumpeter, 1954).

VCs demonstrate proactiveness in a number of ways. This includes the way they source investments via their deal flow, how they manage investments, and by their exit strategies.

VCs tend to be protective of their deal flows. They look for exceptional opportunities that they can review before their counterparts become aware of them. By getting in early, they get to identify, and have the opportunity to invest in the more exceptional deals (before their VC counterparts see them). This results in improved firm performance for the more proactive VCs.

Once VCs invest in a business, they tend to prefer to have strategic rather than operational input in the business. VCs tend to invest in entrepreneurial teams but they carefully monitor their investments through maintaining open communications with entrepreneurial team members and by regularly reviewing the performance of their investments. If any of their investments experiences difficulties, VCs will not hesitate to adopt a more proactive operational role in the business to protect their investment. Thus, VC proactiveness is pervasiveness when investments are performing as well as when they are not performing.

Finally, most VC funds are structured as “closed funds” (Golis, 2002). Closed funds have a predefined time (usually 10 years) as to when those funds will be wound up and the monies in those funds returned to investors. As such, VCs have planned strategies as to when they expect to exit their investments (as well as a particular fund). This is not to say that everything does not go according to plan; however, VCs consider exit strategies in their investments when they invest in those investments and work toward implementing those strategies. By proactively developing and implementing exit strategies, capital gain returns on individual investments and the portfolio will be enhanced. As such,

H<sub>2</sub>: There will be a positive relationship between proactiveness and firm performance for Australian and Japanese VCs.

## **Innovativeness**

*Innovativeness* is defined in terms of a firm’s efforts to introduce newness and novelty through experimentation and creative processes aimed at developing new products and services as well as new processes (Lumpkin, 2002, p.5). It represents a willingness to depart from existing technologies or practices (Lumpkin & Dess, 1996, p.142). Innovativeness is associated with creativity; that is, seeing the same objects as others but thinking about them differently. Harnessing creativity leads to innovation. This can involve combining different objects in different ways to produce new products and discovering new purposes for products (cf., Shumpeter, 1954).

VCs themselves do not tend to produce anything new. However, VCs help others to develop and market innovative technologies by providing the necessary finance to allow them to achieve this. However, providing entrepreneurial finance is not all that VCs do. When VCs invest in entrepreneurial firms, they provide another important resource – intellectual capital. Because VCs are professional investors, they have a wide range of backgrounds, skills, knowledge, and experiences, they see many types of business models – good and bad, and have extensive networks that they can call upon to help their investees. Thus, VC innovativeness is reflected in the “know-how”, “know-who”, and mentoring that they can impart to investees. This is in the interests of VCs. By

helping investees develop innovative business and financing strategies that enhance their performance, VCs enhance their performance as well. Thus,

H<sub>3</sub>: There will be a positive relationship between innovativeness and firm performance for Australian and Japanese VCs.

## **Risk Taking**

*Risk taking* involves a tendency to take bold actions, such as venturing into unknown new markets, committing a large portion of resources to firms with uncertain outcomes, and/or borrowing heavily (Lumpkin & Dess, 1996, pp.144-145). It involves deciding and acting without certain knowledge of probable outcomes (Lumpkin, 2002, p.7) or substantial variance in important outcomes (MacCrimmon & Wehrung, 1986; Yates & Stone, 1992). It is the likelihood that an individual will forego a safe alternative with a known outcome in favor of a more attractive choice with a more uncertain reward (Brockhaus, 1980).

Both entrepreneurs and VCs are concerned about risk. Ultimately, this will be manifested in backing a venture that fails. VCs, however, accept that some of their investments will fail. As such, VCs adopt a portfolio approach to help reduce their exposure.

As professional private equity investors, it is expected that VCs will be concerned about risk and that associated particularly with Type I error. Type I error is the risk of investing in an opportunity and the investor should not have since the investment fails to perform (see, for example, Lindsay, 2004). Type I error is what has the greater negative impact on VC firm performance since Type I error investments significantly reduce portfolio performance. Type II error also will negatively affect VC firm performance but only in terms of opportunity costs and benefits. These types of errors are fundamental to all types of private equity investment decision making globally.

VCs learn to manage these risks. Type I error is managed through having good quality deal flow and by carefully reviewing each deal. Most deals are rejected because the VCs perceive them as not meeting their investment criteria (they see them as potential investments but are not currently investment ready or are not VC type opportunities). Of course, by reducing Type I error, Type II error is increased. Sometimes, deals are rejected that should have been accepted. The aim of course is to strive toward managing both error types by “picking winners every time” as this will have the best result on firm performance. As such,

H<sub>4</sub>: There will be a positive relationship between risk taking and firm performance for Australian and Japanese VCs.

## **VC Differences**

Because of globalisation, travel, dissemination of knowledge, conference attendance, ongoing professional development, and ease of communication through technology, EO similarities at a broad level will be demonstrated by all VCs. This is because the nature of the VC business model is very much the same globally. This involves raising money from investors, forming a VC fund, managing that fund, looking for business opportunities, investing in the more exceptional business opportunities, and exiting those opportunities all with a view to making above normal returns for investors (and, of

course, the VCs as well). As such, VCs globally will demonstrate an EO and an EO-performance relationship contingent upon environmental and organizational factors.

At a lower level, however, it is expected that cultural differences between countries will modify the levels of EO displayed by VCs as well as the strength of the relationships between EO and performance. This is because the EO-performance relationship is contingent upon environmental and organizational contextual variables. Although VCs tend to operate in dynamic environments and respond by adopting organic structures, country specific cultural differences will affect environments and consequently the organicness of structures adopted by VCs to varying degrees.

Many people would agree that eastern and western cultures have significant differences (see, for example, Nisbett, 2003). These cultural differences are reflected in differing thought processes between eastern and western decision makers. Westerners typically think in terms of categories, pay attention to focal objects, and prefer abstract universal principles. Asians typically think in terms of the overall surroundings, the relationships between objects and their surroundings, and rules appropriate to particular situations. As such, these cognitive differences are expected to be reflected in the EO construct and the EO-performance relationship. Thus, while the dimensions underlying EO and the EO-performance relationship will be present across all VCs, the weightings attributed to those dimensions and relationships may differ due to cultural differences. As such,

H<sub>5</sub>: There will be significant differences between EO dimensions (proactiveness, innovativeness, and risk taking) between Australian and Japanese VCs.

H<sub>6</sub>: There will be significant differences in the EO dimensional weightings that firm performance of Australian and Japanese VCs.

## RESEARCH DESIGN

### Participants

In both Australia and Japan, participants were identified using directories of VCs as well as by accessing industry contacts to identify firms not appearing in the directory. Participants were contacted by telephone or by mail to determine their willingness to participate in the survey and their preferred data collection method (e.g., email, mail, fax, or personal visit). Participant demographics appear in Table 1.

**Table 1**  
**Respondent Demographics**

Details		Australian Frequency	Australia n %	Japanese Frequency	Japanese %
Gender	Male	36	90%	76	92%
	Female	4	10%	7	8%

	Other	7	17%	5	6%

In Australia, there were 49 responses. Of these, 40 responses were useable representing a 37% response rate. In Japan, there were 89 responses. Of these, 83 responses were useable representing a 31% response rate. For the Japanese part of the study, the questionnaire was converted to Japanese. The instrument then was converted back to English and checked against the original to ensure its integrity.

## MEASURES

The questionnaire asked participants for demographic information including personal information and business-related activities. It contained several sections including measures for EO and performance metrics.

*Entrepreneurial orientation.* A review of the entrepreneurship literature was conducted and Miller's (1983) original dimensions (proactiveness, risk taking, and innovativeness) were used to measure EO (e.g., Covin & Slevin, 1989; Khandwalla, 1977; Miller & Friesen, 1984). For the Australian study, details are as follows: proactiveness (mean = 5.24, s.d. = 0.90,  $\alpha = 0.80$ ); innovativeness (mean = 5.23, s.d. = 1.20,  $\alpha = 0.79$ ); and risk-taking (mean = 5.61, s.d. = 0.87,  $\alpha = 0.77$ ). For the Japanese study, details are: proactiveness (mean = 4.55, s.d. = 0.94,  $\alpha = 0.84$ ); innovativeness (mean = 4.71, s.d. = 0.97,  $\alpha = 0.75$ ); risk-taking (mean = 5.06, s.d. = 0.84,  $\alpha = 0.85$ ).

*Venture capitalist performance.* The study used three approaches to measure performance. All approaches used perceptual measures as proxies for objective measures because it was considered that objective measures of performance may be difficult to obtain. A variety of studies suggest that perceptual measures can be reasonable proxies for objective measures (Chandler & Hanks, 1993).

The first measure was based on Zou, Taylor, & Osland's (1998) items. This scale includes six 5-point items ("1 = strongly disagree" to "5 = strongly agree") to measure statements such as "we have been very profitable" and "we have achieved rapid growth". These items were averaged into an internally focused performance scale. For the Australian study, mean = 1.85, s.d. = 0.54,  $\alpha = 0.82$ ); for the Japanese study, mean = 2.57, s.d. = 0.56,  $\alpha = 0.82$ ).

The second measure was based on items proposed by Li & Calantone (1998). Two 5-point items were used. Respondents were asked to assess their before tax profits and internal rates of return on their investments relative to other firms ("1 = much lower than other firms" to "5 = much higher than others"). These items were averaged into an externally focused, competitor relative performance scale. For the Australian study, mean = 4.0, s.d. = 0.641,  $\alpha = 0.70$ ); for the Japanese study, mean = 3.39, s.d. = 0.785,  $\alpha = 0.80$ ).

The third measure used was the internal rate of return (IRR). IRR is the standard measure of performance in the venture capital industry (Mason & Harrison, 2002). Respondents were asked to rate the IRR of the entire portfolio of their investments in absolute terms ("1 = less than 5%" to "5 = over 20%"). This was referred to as the IRR performance scale. For the Australian study, mean = 4.3, s.d. = 0.516); for the Japanese study, mean = 3.66, s.d. = 0.914).

## RESULTS

The analyses used to evaluate the hypotheses included correlation analysis, independent samples t-tests, and multiple regression analysis. The performance scales

served as dependent variables; the independent variables were the EO dimensions (proactiveness, innovativeness, and risk taking).

Tables 2 and 3 provide correlation coefficients for the constructs for Australian and Japanese VCs respectively.

**Table 2**

There were six hypotheses relating to VC entrepreneurial orientation. In summary, the idea that VCs demonstrate an EO, that proactiveness, innovativeness, and risk taking are important dimensions of entrepreneurial orientation (Das & Teng, 1997; Lee & Peterson, 2000), and that there is an EO-performance link for both Australian and Japanese VCs is supported in this research. However, differences exist across the EO dimensions for the two groups as well as the weightings attributed to those dimensions in terms of being performance drivers.

H<sub>1</sub> hypothesizes that VCs demonstrate an entrepreneurial orientation. This was confirmed for both Australian and Japanese VCs.

H<sub>2</sub> hypothesizes that VC proactiveness will be related to firm performance. A relationship between proactiveness all three performance scales was confirmed for both

Australian and Japanese VCs. Proactiveness is positively related to internal, competitor relative, and IRR performance.

H<sub>3</sub> hypothesizes that VC innovativeness will be related to firm performance. A relationship between innovativeness and the three performance scales was confirmed for both Australian and Japanese VCs.

H<sub>4</sub> hypothesizes a relationship between VC risk taking and firm performance. A relationship between risk taking and all three performance scales was confirmed for both Australian and Japanese VCs.

H<sub>5</sub> hypothesizes EO differences between Australian VCs and Japanese VCs. An independent samples t-test was conducted to compare the EO dimensions of each group. Significant EO differences on all three dimensions were confirmed: proactiveness ( $t(121) = 3.85, p = 0.000$ ); innovativeness ( $t(121) = 2.59, p = 0.011$ ); and risk taking ( $t(121) = 3.62, p = 0.000$ ).

H<sub>6</sub> hypothesizes differences in EO dimensional weightings as drivers of performance between Australian VCs and Japanese VCs. Standard multiple regression analysis was used to indicate how well the EO dimensions (proactiveness, innovativeness, and risk taking) are able to predict VC performance. In this analysis, IRR was used as the dependent variable since it is regarded as a standard measure of VC performance. Significant weighting differences were recorded in the regression equation for Australian and Japanese VCs. As such, H<sub>6</sub> was confirmed. Details appear in Table 4.

**Table 4**

Dependent Variable: IRR Performance

## DISCUSSION

Numerous studies have established an EO-performance relationship of entrepreneurial firms—contingent upon organizational and environmental contexts. Far fewer EO studies have occurred in the private equity area although business angels have been found to “act like consummate entrepreneurs” and to demonstrate an EO and an EO-performance relationship – contingent upon the angel investors adopting organic structures while operating in dynamic environments (Lindsay, 2004). Empirical research that examines EO and the EO-performance relationship for VCs is not well developed. This study models and tests this relationship in order to gain a better understanding of the EO of VCs and their performance.

*VC EO Similarities:* The results show that the proactiveness, innovativeness, and risk taking dimensions of EO are present and that there is an EO-performance relationship with both Australian and Japanese VCs. Contingent upon the presence of the organic organizational structures adopted by VCs and the dynamic environmental contexts they operate within, those who are more proactive and innovative and who can evaluate and/or manage risk perform better than those who are less proactive and innovative and who are less successful in evaluating and/or managing risk. As such, there is tentative support to suggest that there are similarities between entrepreneurs and VCs, whether they are from Australia or Japan, in terms of EO and the EO-performance relationship.

This result is of interest considering only 45% of Australian VCs and only 12% of Japanese VCs indicated that they had started a business previously. In addition, only 12% of the Australian VCs and only 8% of the Japanese VCs regarded themselves as having an entrepreneur background prior to becoming a VC (refer to Table 1). Having said this, most participants in the study had considerable experience in investing (87% of Australian VCs and 92% of Japanese VCs had made more than five investments) and had considerable experience in the venture capital industry.

Interestingly although there was an EO-performance relationship, the IRRs reported by most of the Australian and Japanese VCs appeared to fall short of the 50% or more IRRs reported by Mason and Harrison (2002). This may have been a reflection of the economic climate at the time.

*VC EO Differences:* Although there was an EO and an EO-performance relationship in existence for both Australian and Japanese VCs, significant differences existed between the two groups in terms of the specific EO dimensional levels of each group and the magnitude of their respective influence on performance. It was previously mentioned that at one level, globalization, travel, the ease of communication, etc. among VCs may act as a “leveler” in terms of the distribution of tacit VC knowledge among nations (you would expect experienced venture capitalists in Australia to have a similar understanding of the basic attributes of successful business opportunities and the investment readiness of investees as their counterparts in Japan) since the basic business model remains the same. Cultural influences, however, may be responsible for influencing the cognitive weightings of such attributes in terms of their levels of importance when VCs evaluate deals. In addition, cultural influences may affect organizational and environmental contexts which, in turn, influence “how business is done”. These possible explanations – although speculative – provide a basis for understanding and debate about EO and EO-performance differences between Australian and Japanese VCs.

However, there was one difference (which was not significant) that was perplexing. This related to the negative effect proactiveness had on performance for Australian VCs (this was positive for Japanese VCs). No plausible possible explanation for this has been forthcoming.

## **Managerial Implications**

Although VCs are professional private equity investors, they do not necessarily “get it right” every time. If it was so easy to pick “winners”, everybody would be doing it. The fact is that venture capitalists do not always get it right every time. It is a “numbers game” ... you win some, you lose some. As professionals, VCs are only too aware of this. To stay in the VC game, however, investors in VC funds want winners that will provide them with the above normal returns they expect commensurate with the risk present. The ability to raise subsequent VC funds will be contingent upon a range of factors including VC performance to date in previous funds. Since EO appears to be related to VC performance, it would appear that training VCs to better understand the entrepreneurial process and the determinants of proactiveness, innovativeness, and risk taking would be beneficial to them. In addition, by enhancing their EO, they may be better positioned to mentor their entrepreneurial investments which, in turn, may result in improved performance of those investments.

## **Research Limitations**

There are a number of limitations associated with this research which may influence the generalizability of results. First, the research did not include entrepreneurs from Australia and Japan against which meaningful comparisons could be undertaken. Second, the sample response was biased. Although the population of VCs is relatively small and defined, VCs tend to be concentrated in geographic regions and the bulk of responses came from these regions. Third, only successful venture capitalists were

examined (those that were still operating). There is a need in future research to examine the EO-performance relationship in less successful VC firms.

## SUMMARY

This research developed a model of the EO-performance relationship for Australian and Japanese VCs. In so doing, the research addressed a number of questions. At a general level, these included: Are VCs consummate entrepreneurs? ... Do they demonstrate an EO? If so, does an EO-performance relationship exist? At a more specific level, research questions included are there EO differences between Australian and Japanese VCs in terms of the underlying EO dimensions and do these influence VC performance differently? In each case, the answer to these questions was "yes". The results demonstrated general support for the model. In terms of the EO construct, results suggest that VCs may be similar to entrepreneurs – contingent upon specified organizational and environmental contexts. In addition, EO differences between the two groups suggest that country specific cultural differences may need to be taken into consideration in defining environmental context – not only for VCs but also for entrepreneurs. Further research needs to be undertaken in this area. Overall, however, the research makes a contribution to the literature by extending our understanding of the nature of EO generally and in extending the construct to venture capitalists.

## **ABSTRACT**

Diversity in the small business sector and the large number of factors impacting business success has led entrepreneurship researchers to question the value of investigating universal success relations. In this study we propose a configurational individual level approach to the understanding of success in small businesses, modeling success as the fit between multiple components relevant to entrepreneurship. In cluster analyses of  $n = 102$  Zimbabwean business owners we found four distinct coherent groups of business owners who demonstrated different levels of success depending on patterns of owner strategy use, characteristics of the firm and the environment. Findings demonstrate the usefulness of a configurational approach to the understanding of business success.

## **EXECUTIVE SUMMARY**

Researchers and practitioners take an obvious interest in better understanding success of small and micro business owners in Africa. Previous efforts have typically been devoted to the identification of success relations that hold across all businesses. The small business sector, however, is represented by a large variety of owners and their firms. Success in these businesses is the result of a large number of interacting variables producing contingencies and configurations. We therefore propose a configurational taxonomic approach to the understanding of success of African small business owners. Success will be modeled as the fit between multiple components relevant to entrepreneurship.

Assuming a psychological individual perspective we examined small and micro businesses for underlying patterns of owner strategy use, characteristics of the internal firm environment created by the owner, and characteristics of the external

environment as perceived by the owner. We assume the existence of distinct coherent groups of business owners and their internal and external business environment. Depending on variable configurations, groups should vary with regard to success. Finally, as an important notion inherent in configuration research and predicted by open system theory, equifinality, the assumption of different but equivalent success routes, will be investigated. Owners with a proactive strategic stance should be equally successful.

The sample comprises  $n = 102$  indigenous Zimbabwean business owners who had been operating for at least two years. Measurement instruments included structured interviews and questionnaires. Variables that required an evaluation by the interviewer were additionally rated by an independent judge yielding good inter-rater reliabilities.

Testing our assumption of *distinct coherent groups of business owners* we applied cluster analysis techniques to sort business owners into homogeneous groups according to their characteristics of strategy use, characteristics of their firm and their external business environment. Cluster analysis aims at grouping the examined objects according to their similarity allowing maximisation of internal homogeneity within and external heterogeneity between clusters. Several steps were taken to assess distinctiveness and validity of resulting clusters. To test the notion of *equifinality* in configurations with a predominant proactive strategic mode, we examined resulting clusters for their ability to achieve success as measured by growth, size, an overall interviewer evaluation as well as an independent external evaluation.

The study confirms that there is no average in African entrepreneurship. Four different coherent clusters of business owners emerged from the analysis: *The reactive business owner in hostile environment, the opportunistic business owner in friendly environment, the highly reactive business owner in friendly environment, and the entrepreneurially oriented planning business owner*. Depending on configurations of owners' strategy use, their internal and their external business environment, clusters differed significantly with regard to success. Only clusters with a proactive strategic posture, represented by the opportunistic and planning business owners demonstrated substantial levels of success. Whereas the entrepreneurially oriented planning business owner emerged as the most successful cluster, the opportunistic business owner in friendly environment revealed an alternative route to achieve success. This route appears especially suitable for owners in the less viable informal business sector. Results partly support the assumption of equifinality.

The taxonomy can be used to highlight distinct variable relations between groups of business owners – a major advantage of the configurational perspective. Results can be used to formulate and test hypothesis derived from the classification scheme. The taxonomy is relevant for practitioners dealing with the entrepreneurs, such as training institutions, regional policy makers or credit givers. For the owner himself, the taxonomy represents a powerful tool for self-assessment. Business owners may reconsider their actions, how they evaluate and respond to their business surroundings, and how their business is set up internally.

# INTRODUCTION

Entrepreneurship research has widely acknowledged that the small business sector is represented by a large variety of business owners and firms differing with regard to strategy, firm characteristics and the environment (cf. Gartner, Mitchell, & Vesper, 1989; Sanchez, 1993; Miner, 1997, Smith, 1967; Frank, Korunka, & Lueger, 1999). In its attempt to understand and predict entrepreneurial success, research has preferred to investigate relations that hold across all organizations. The value of such findings, however, is restricted to the extent to which other variables internal and external to the firms affect these relationships to produce contingencies or configurations (Sanchez, 1993; Lumpkin & Dess, 1996).

The configurational approach extends the contingency perspective in that relevant variables forming a constellation, or a configuration, are analysed (Chell, Haworth, & Brearly; Frank et al., 1999). Dess, Lumpkin & Covin (1997) and more recently Wiklund and Shepard (in press) have demonstrated the usefulness of the configurational approach to the explanation of firm performance by uncovering three-way interactions between variables of strategy use and environmental characteristics.

However, approaches on a correlational level of analysis also pose certain limitations to a configurational understanding of success. First, opposed to the holistic stance of configuration research, only a limited number of variables can be analysed simultaneously with regard to success. Second, nonlinearity may not be discovered. Finally, equifinality - the open systems concept accommodated by the configurational approach - predicting that different configurations may be equally successful, can not be tested (Meyer, Tsui & Hinings, 1993).

A different configurational approach to the understanding of business success is to uncover distinct, internally consistent sets of firms and their environment and to subsequently relate emerging patterns to business success. Such approaches have generated a number of typologies and taxonomies and have typically been conducted at the organizational level of analysis (e.g. Miles & Snow, 1978; Mintzberg, 1979). Meyer et al. (1993) argue that the configurational perspective should also be used at other levels of analysis. Following the argument, that small enterprises will not achieve success without the actions of the founders and managers (Frese, 2000a) this research takes the configurational approach to the individual psychological level of analysis. We will examine small and micro enterprises in Zimbabwe for underlying patterns of owner strategy use, characteristics of the firm as created by the owner, and characteristics of the environment as perceived by the owner. To encompass complexity of small businesses we will use a comprehensive set of variables taking an empiricist stance to identify configurations (McKelvey, 1982; Ketchen et al, 1997).

Entrepreneurship in Zimbabwe represents a unique opportunity for configurational analysis. With the coexistence of highly developed formal businesses and a strong informal sector it can reasonably be argued that entrepreneurship in Zimbabwe as a

developing country is spread over an even larger spectrum than its counterpart in the West.

The study extends previous research in at least two important ways. First, the study applies the configurational approach to the individual level of analysis. Emphasising the psychological nature of entrepreneurship, groups of business owners will be analysed for their different use of psychological strategy characteristics in the context of their internal and external business environment. Second, research has neither explicitly examined diversity in African entrepreneurship nor has the question of different successful types of small business owners in Africa been addressed. To our knowledge, the study represents the first taxonomy of small business owners in Africa.

## **CONFIGURATION RESEARCH AT THE INDIVIDUAL LEVEL OF ANALYSIS**

Meyer, Tsui and Hinings (1993, p. 1175) define organizational configurations as “multidimensional constellations of conceptually distinct characteristics that commonly occur together”. A recent meta-analysis of organizational configurations showed that almost 30% of the variance of success can be explained by specific variable configurations (Ketchen et al., 1997). Configuration theories assume a holistic perspective analysing the entrepreneurial act in its context. Constructs are expected to correlate in a complex way forming a net of reciprocal and dynamic dependencies. Success in configuration research is modelled as the fit between multiple components relevant to entrepreneurship. Fit can be achieved through a number of variable constellations. This important assumption in configuration theories has been termed equifinality and is one of the main issues of this study. The concept in its origin goes back to von Bertalanffy (1950) and his biological experiments and is embraced in open system theory to organizations (Katz & Kahn, 1978). Equifinality denotes that a system can reach the same final state from various initial conditions and by differing paths. Configuration research, too, treats organizations as open systems. Both, configuration research and open system theory emphasise the contingent character of organizations and the interdependence of its elements.

In our study, the notions of fit and equifinality inherent in configuration research and predicted by open system theory (Katz & Kahn, 1978) will be transferred to the individual level of analysis assuming congruence between a set of individual attributes and characteristics of the internal and external firm environment.

Recent psychological individual approaches to the study of entrepreneurial success have emphasised the importance of the actions of the business owner and more proximal (Kanfer, 1992) constructs to the entrepreneurial task and behaviour in general (Frese, 2000a, Krauss, & Frese, 2004). According to psychological field theory (Lewin, 1951) behaviour is a function of the person and the environment:  $\text{behaviour} = f(P, E)$ . To understand behaviour one has to consider the specific constellations of variables related to the person and the environment. In this sense, Lewin is a predecessor of configurational theorizing at the individual level of analysis.

Behaviour in small businesses takes place in the context of the internal environment (the firm) and the external business environment. Both, the firm and the external business environment represent behaviour settings and are at the same time subject to change through the actions of the owner.

Applying the configurational approach to the individual level of analysis, our main focus is on characteristics of entrepreneurial action strategies which are assumed to interact with characteristics of the firm and the environment of the business. The first hypothesis derived from configuration theory (Meyer et al., 1993) which guided this research proposes that the complex constellation of variables within small and micro businesses in Zimbabwe can be reduced to a few distinct types of owner strategy characteristics, their firms, and the environment.

Hypothesis 1: Small businesses in Zimbabwe vary in action strategies of the owner, characteristics of the firm and the external business environment.

In line with configurational theorizing, a second assumption states that groups of businesses vary significantly with regard to desired business outcomes

Hypothesis 2: Depending on constellations businesses vary with regard to success.

Finally, we test the notion of equifinality. We assume minimal prerequisites to exist to make configurations successful. Since successful entrepreneurship essentially has to do with the discovery and exploitation of opportunities (Shane & Venkataraman, 2000) and requires business owners to act on their environments we assume business owners with a proactive strategic posture to be successful (cf. Krauss et al., Frese, van Gelderen, & Ombach, 2000).

Hypothesis 3: Different configurations that include a proactive mode - entrepreneurially oriented and pursuing a proactive psychological process strategy - may all be successful.

In the following, we will describe the characteristics of behaviour settings for African small business owners and entrepreneurial action strategies taking place in these settings. Variable dimensions and single variables falling into the respective categories are derived deductively and with regard to their contingent character. Some variables have received attention especially in the African context and are selected on the grounds of their presumed importance for small enterprises in Africa (Frese, Krauss, & Friedrich, 2000). Specific patterns of small business owners along the selected variables will be derived inductively from empirical data.

## **Entrepreneurial Action Strategies**

Strategy from a psychological point of view is defined as a sequence of actions to achieve a goal (Miller, Galanter, & Pribram, 1960). Such a definition is in line with economists emphasizing the dynamic action oriented aspects of strategy, referring to the concept as “a pattern in a stream of decisions” (Mintzberg, 1978, p. 935). We

distinguish between entrepreneurial orientation and strategy characteristics. Entrepreneurial orientation is composed of personal orientations that relate to the daily tasks of a business owner and fit with the contextual requirements (Krauss, Frese, & Friedrich., 2004a). Strategy characteristics are action templates (van Gelderen, Frese & Thurik, 2000) determining how entrepreneurial activities are carried out (Krauss & Frese, 2004).

### *Psychological Process Strategies*

The process of strategy includes the way in which entrepreneurs try to achieve their goals. In the pursuit of strategic contents business owners differ with regard to the amount of planning and proactiveness involved (Frese & de Kruif, 2000). Along the two dimensions Frese and de Kruif (2000) distinguished four psychological process strategies: Comprehensive planning, critical point, opportunistic, and reactive strategy. A *comprehensive planning strategy* involves proactiveness and planning on the part of the business owner. A person using this strategy proactively structures the business situation, specifies single steps to be taken, and develops back-up plans in case something goes wrong. In contrast, a *critical point strategy* represents a form of localized planning. Only one critical point is planned. Once this point is solved, the next critical issue is addressed. An *opportunistic strategy* is proactive, but hardly involves any form of planning. Business owners using this strategy actively scan their environment watching out for business opportunities. A reactive strategy neither involves planning nor proactiveness. Actions by the owner using this strategy are mainly driven by situational demands.

Results of studies in Europe and Africa suggest that the proactive strategies of comprehensive planning, critical point, and opportunistic strategy are positively related to success (Frese, Krauss, Escher, Grabarkiewicz, & Friedrich, 2003 in prep.; Frese, Brantjes, Hoorn, 2002; Frese, van Gelderen, & Ombach, 2000; Frese, 2000a) A reactive strategy was negatively related to success in these studies.

### *Entrepreneurial Orientation*

Entrepreneurial orientation (EO) is related to values, beliefs, and general orientations of the business owner (Frese & de Kruif, 2000) and explains why certain actions are taken.

According to Lumpkin & Dess (1996) entrepreneurial orientation consists of autonomy orientation, competitive aggressiveness, innovative orientation, risk-taking orientation, and proactiveness. Krauss, Frese, and Friedrich (2004a) extended entrepreneurial orientation to incorporate learning orientation and achievement orientation and demonstrated the usefulness of a unitary individual level entrepreneurial orientation construct.

A number of studies have reported positive relationships between entrepreneurial orientation and success (e.g. Zarah & Covin, 1995, Krauss et al., 2004a). However, increasing evidence suggest that the relationship between entrepreneurial orientation and success is moderated by a number of variables, such as hostility of the environment (e.g. Covin & Slevin, 1989), access to capital or the orchestrating effects of both, characteristics internal and external to the firm (Wiklund & Shephard, 2004).

## The Business Environment

The configurational approach argues that success in organizations results from the alignment of strategic, organizational, and environmental factors (Meyer, et al., 1993). Certain strategies work best in certain environments (Frese, 2000b). To be successful, action strategies have to be aligned with a given business environment (Lumpkin & Dess, 1996; Frese & Rauch, 1998). The environment of a business has been described along the following dimensions: Munificence vs. hostility, dynamism vs. stability, and complexity vs. simplicity (Rauch & Frese, 2000; Mintzberg, 1983). Covin and Slevin (1989) defined hostility as being characterized by intense competition, a complex business climate, and a lack of exploitable business opportunities.

This research emphasizes hostility as the main dimension of the business environment. First, we argue that hostility already includes aspects of the other two dimensions. Second, hostility in Zimbabwean business environments is particularly high due to a high degree of competition (McPherson, 1991). Hence, the study of hostility appears to be especially relevant in a Zimbabwean setting.

On an operational level the business environment can be divided into a subjective environment as perceived by the owner and an objective environment based on objectively measurable statistics. A psychological perspective emphasizes the environment as being perceived (cf. Lewin, 1951) by the individual business owner. It is argued, that ultimately the way owners perceive their environment is what impacts their actions and strategies (Mathews & Scott, 1995). Indirect effects of the environment on success are assumed to exist because certain strategies work best in certain environments (Frese, 2000b).

## Characteristics of the Firm

Firm characteristics form an internal environment for the business owners and like the external environment, represent a behaviour setting. Business owners may arrange their firms internally in many different ways. Such aspects of the firm represent important factors in the entrepreneurial process, interacting with strategy and the environment. We propose that groups of small enterprises differ in a meaningful way along the following characteristics: Formal vs. informal sector, existence of active partners, employment of family members, obligation to kinship, age of business, use of loans, and the membership in clubs or societies.

With regard to the dominance of informal businesses in Africa some attention has been given to the *legal background* of small businesses (Lubell, 1991; Harrison, 2000). Informal businesses are firms which are not officially registered and do not pay taxes. Typically such businesses are described as substance oriented and have been demonstrated to be significantly less successful than formal businesses (Frese, 2000b). However, a majority of those who eventually become formal originally started their businesses with an informal status (Neshamba, 1997). Excessive regulations and bureaucracy in Zimbabwe discourage entrepreneurs to cross the formalization barrier. The process is tiresome and costly. Harrison (2000) and Krauss, Frese, and Friedrich (2004b) argue that, nevertheless, registration is a key to business success.

The main question in this study is whether a business belongs to the formal or the informal sector.

Another important firm characteristic concerns the owner- and leadership of the business: The existence or non-existence of other *active partners* (Smith, 1967; Woo, Cooper & Dunkelberg, 1991). The existence of another partner in the business means additional human resources and brings with it the possibility to share business tasks according to the specific strengths of the individuals. It may also reduce emotional stress via shared responsibilities. Working alongside another partner creates a qualitatively different social working environment for the business owner with important implications for business strategies.

Business owners also have to decide whether or not to employ *family members*. Pressure on the entrepreneur to do so is high in Africa (Wild, 1994). Generally, the employment of family members should lead to less success, because they are usually not sufficiently qualified for the job. Findings in Africa, however, suggest that this is not the case (Frese, 2000b). The relationship between success and the employment of family members may thus have to be seen together with the owner's general tendency and motivation to deal with them – his *obligation towards kinship*<sup>1</sup> (Inkeles & Smith, 1974). A high kinship obligation may be a mechanism working against the business interests and leading to less success. In a study in Nigeria, Gebert and Steinkamp (1992) showed that the more owners attended to their family members' needs the less economic success they achieved. Frese (2000b) also argued that a firm's life cycle moderates the success relationship. Smaller firms in earlier stages may benefit from the employment of family members and their loyalty to the firm whereas it may be detrimental during later stages, when demands of those employed become higher.

An important indicator of a firm's life cycle is the *age of business* (Chell, Haworth, & Brearley, 1991). Business owners are encountered with specific problems demanding consequential behaviour in different stages of their firms. Moreover, population ecology theorists proposed that younger businesses carry a liability of newness (Preisendoerfer & Voss, 1990, Mead & Leadholm, 1998). Younger firms should thus be less successful than older ones. Data from research in Africa, however, have not supported this view (Frese, 2000b).

Lack of capital is reported to be a common problem of African small businesses (Frese, 2000a; Gray et al., 1996). As a consequence many business owners seek to borrow money from the banks or other credit givers. Surprisingly, Frese (2000b) found no relationships between *receiving a loan* and being successful in the southern regions of Africa. Using loans might thus only be beneficial to certain groups of business owners (e.g. those who engage in planning) or in certain situations (e.g. strong social networks, later business stages). Wiklund and Shephard (2004) report interactions of access to capital, entrepreneurial orientation and dynamism of the environment.

---

<sup>1</sup> Although a motivational resource in nature, kinship obligation is reported together with characteristics of the firm to emphasize the relevance of the variable in context with the employment of family members.

Finally, social networks have been viewed as an important constituent of the entrepreneurial context (e.g. Ostgaard & Birley, 1996; Dubini & Aldrich, 1991). They provide entrepreneurs with support, contact, and credibility (Ostgaard et al., 1996). A network helps business owners acquiring new customers and obtaining resources in terms of supply, capital, and work-force. Network affiliation, defined as contacts and membership in organizations, has been found to be positively related to success (Lerner, Brush, & Hisrich, 1997). Affiliation to networks will be considered broadly in this research as the *membership in clubs or societies* that help the owner to do business.

Other firm characteristics reported in the literature were not considered in the process of identifying common patterns of small business owners and their internal and external environment. Size, often mentioned as a basic characteristic of the firm (Baker & Cullen, 1993) will be treated as an outcome variable and related to emerging patterns later in the analysis. Similarly, line of business as a contextual factor was omitted from the primary analysis, but will be considered, once distinct configurations of business owners in Africa have been identified. In the following, we will describe the study sample, the process of data collection, and the procedures applied to identify patterns of African small and micro business owners along entrepreneurial actions strategies, firm characteristics, and the environment.

## METHOD

### Sample

The sample comprises N = 102 indigenous Zimbabwean business owners. All participants had established their business themselves, had been operating for at least two years and had at least one and no more than 50 employees. Owners received US \$5 for their participation. Characteristics of the study sample are displayed in table 1. Data were collected in different regions of Zimbabwe: Harare (70.0%), Mashonaland East (6.0%), and Matabeleland (24.0 %). The rejection rate to participate was low (n = 5).

The great majority of the sample were members of the majority ethnic group in the country, the Shona culture (80.4%); 17.5% belonged to the Ndebele culture, 2.1% to other African cultures. On average the owner was 38.8 years old when interviewed. Multiple answers being possible, most of the businesses operated in the manufacturing sector (56.9%) followed by retail/trade and services (each 43.1%). Other industries were gastronomy (9.8%), and construction (3.9%). Almost two thirds (64.6%) were officially registered or paid tax and were thus assigned to the formal business sector. On average businesses had been operating for 8.13 years (MD = 7). Most of them had between 1 and 4 employees (54%). The average starting capital converted to US\$ was 18 782 (MD = 1 809). During the year before the second interview was conducted almost half of the businesses had a turnover below US\$ 10 000 (M = 152 958; MD = 11 372).

## Procedure

Various forms and techniques were applied for collection of the data: a structured interview with the business owner, including behavioural event interview techniques based on Spencer and Spencer (1993), a questionnaire, an interviewer evaluation and an external success evaluation. The structured interview represented the main measurement instrument. As shown in different meta-analyses the criterion validity of structured interviews is high (e.g., .60, Wiesner & Cronshaw, 1988).

Interviews took place at the owners' workshops and lasted between 1.5 and 3 hours. Whenever communication difficulties arose, a translation in Shona or Ndebele was provided by a trained local interviewer. After completion of the interview, participants filled in the questionnaires. Meanwhile interviewers wrote down their impression of the business and the owner in the interviewer evaluation form using 5-point Likert scales.

During the interview, subjects' answers were written down in a protocol as verbatim as possible. The protocol served as the basis for two ratings. Inter-rater reliabilities for the main variables were computed as intraclass-coefficients (Shrout & Fleiss, 1978; McGraw & Wong, 1996). The scores varied between .64 and 1.00.

## Operationalization

Characteristics of scales, indices, and variables used for further analyses are presented in table 2. The table presents the number of items, number of subjects, Cronbach's  $\alpha$  (for scales), Pearson correlations for indices (measures composed of two variables), inter-rater reliabilities,  $\text{range}$ ,  $\text{M}$  and  $\text{SD}$ .

### *Entrepreneurial Orientation*

*Entrepreneurial orientation* consists of the following single dimensions: Innovative orientation, learning orientation, competitive aggressiveness, autonomy orientation, achievement orientation, risk-taking orientation, and personal initiative (Krauss et al. 2004a). The measure was based on interviewer evaluations, questionnaire data, and owner's answers rated after the interview. As shown by Krauss et al. (2004a) in confirmatory factor analysis, all seven dimensions combine into a single factor entrepreneurial orientation construct. The reliability of the scale in this study was  $\alpha = .77$ .

<sup>z</sup> z-standardized data

\* for  $p < .05$

\*\* for  $p < .01$

### *Psychological Strategy Characteristics*

We used a procedure described by Frese et al. (2003), by asking participants for their personal business goals and how they wanted to achieve the two most important goals, what they had already done in the past and what they intended to do in the future. On the basis of the type-written protocol the strength of the following strategies was rated using 5-point Likert scales: *Comprehensive planning*, *critical point planning*, *opportunistic strategy*, *reactive strategy*. Anchors in the coding scheme helped interviewer and second rater to decide how strong a strategy had been applied.

### *Characteristics of the Firm*

Seven internal firm characteristics were measured in this research. *the use of loans* (Frese, Krauss, & Friedrich, 2000), *belonging to the formal or informal sector* (Harrison, 2000), *number of employed members from the immediate or extended family* (Wild, 1994), three items taken from Inkeles and Smith (1974) measuring the owner's *obligation towards kinship* ( $\alpha = .63$ ), *membership of clubs or societies* which the owners thought was helpful in running their businesses, *age of business*, and *existence of active partners*.

### *The Business Environment*

*Hostility of the environment* was measured in the questionnaire as a subjective perception by the owner. Six 7-point-Likert items by Khandwalla (1977) were used to build a scale ( $\alpha = .69$ ). This measure had been used previously in studies on entrepreneurship in Africa (Escher, 2000; Frese, 2000a). We also asked the owner for the number of his *immediate competitors*. Whereas hostility is explicitly conceptualised as a subjective perception by the owner, the number of competitors is a more objective indicator for the harshness of the environment.

### *Success*

To receive a differentiated picture of business outcomes we measured different facets of success (Table 2). *Growth* ( $\alpha = .80$ ) included interview-based data on the development of profit, customers, and sales growth during the year before the interview was conducted (measured in percent), increased or decreased number of employees over the last 2 years, the development of profits over the last 3 years, and the average annual growth of the business overall equipment value (computed from the owner's estimate of equipments' current value, prime costs and the age of the business). *Size* ( $\alpha = .78$ ) included: Sales during the last year (McPherson, 1998), current value of overall business equipment as estimated by the owner, and the current number of employees. *External success evaluation* asked a third person who knew the business in question to give us an estimate of the performance of the business relative to direct competitors (usually an employee). In the interviewer evaluation form the *interviewer* gave an *overall impression* of the business. Besides extensive information from the interview, first-hand observations and impressions e.g. of the business itself, the premises, the workload for employees, professionalism and the correspondence of business appearance and figures were considered to assess the business overall performance.

## **METHOD OF ANALYSIS**

We applied cluster analysis techniques to identify naturally occurring configurations (cf. Frank et al., 1999; Woo, et al., 1991; Gartner et al., 1989; Ketchen et al., 1993; Lafuente & Salas; 1989). Cluster analysis aims at grouping the examined objects according to their similarity allowing maximisation of internal homogeneity within and external heterogeneity between resulting groups. Quality standards for the application of cluster analyses in the area of configuration-research have been proposed by Ketchen & Shook (1996). Along with recommendations by Hair, Anderson, Tatham, and Black (1998) these standards have guided the clustering procedures in this research. Ward's method, a conservative hierarchical procedure (Backhaus et al., 2000), was chosen, because it yields accurate solutions (Blashfield and Aldenderfer, 1988; Milligan, 1981, Bergs, 1981). Similarity between objects was computed as squared Euclidean distances. The initial cluster solution produced by Ward's method was further optimised by applying K-means partitioning method (Mac Queen, 1967). A combination of hierarchical and partitioning procedures has been recommended by a number of researchers (e.g. Moosbrugger & Frank, 1992; Bortz, 1993; Hair et al., 1998; Backhaus, Erichson, Plinke, & Weiber, 2000).

A number of tests were performed to assess the validity of our solution: stability of the cluster solutions (Cohen's  $\kappa$ ) for cluster compositions produced by Ward's and K-means method (Eckes and Rossbach, 1980), significance of mean differences along variables used for clustering, the H-statistic by Tyron and Bailey (1970), a measure evaluating cluster homogeneity (by computing cluster within variance relative to the total variance with values below 1 indicating homogeneity of the cluster solution along the specified dimension), a discriminant analysis on the basis of

active variables to determine discriminant functions and test for correct classification of objects based on these functions (Steinhausen, 1977).

Equifinality was tested by comparing the means of resulting clusters along the different measures of success.

## RESULTS

Our first hypothesis postulated that Zimbabwean enterprises can be classified into distinct and meaningful groups according to strategy characteristics of the owner, aspects of the firm and the external environment. Cluster analysis was performed to identify homogenous groups of business owners in context. In a second step we examined the cluster-success relationship.

### Configurations of Strategy, the Firm, and the Environment

Examining psychological characteristics of the owner, firm characteristics, and aspects of the firm environment Ward's clustering method suggested an initial cluster solution of four distinct groups of business owners. For each of the four clusters, we computed cluster seed-points which served as the basis for the non-hierarchical procedure. Both solutions, the initial cluster composition based on Ward's method and the optimized solution according to the K-means technique showed very high correspondence of the cluster compositions. Cohen's Kappa was .92. Of the whole sample 94.3% were assigned to the same clusters. Table 3 presents cluster profiles along the analysed variables. F-values were smaller than one for the great majority of variables indicating that clusters were sufficiently homogenous. Significant mean differences between the 4 clusters were found for 12 out of 14 variable dimensions; thus there is true distinctiveness of the clusters. In addition we applied discriminant analysis to further test the distinctiveness of the cluster solution. Based on the differences in the variables used for clustering, all subjects were correctly assigned to the original clusters. All three discriminant functions were statistically significant.

#### TABLE 3 Clustering variable profiles <sup>a</sup>

<sup>a</sup> -- very low, - low, ○ medium, + high, ++ very high

<sup>b</sup> parentheses indicate insignificant differences across the clusters

Based on particularly large mean differences across the groups, clusters were labelled *reactive business owner in hostile environment*, *opportunistic business owner in friendly environment*, *highly reactive business owner in friendly environment* and *entrepreneurially oriented planning business owner*. Demographic variables were examined to complement the picture of the different groups of business owners and their environment.

#### *The Reactive Business Owner in Hostile Environment*

The owner in this group used a reactive strategy as the dominant strategy to achieve business goals. The level of entrepreneurial orientation was low. The most distinctive characteristic regarding the business context was the owner's perception of the business environment as hostile and the number of direct competitors as high (46 on average). Business owners and their firms in this cluster were labelled *reactive business owner in hostile environment*.

The cluster included the oldest firms and also contained the oldest group of owners ( $M = 45$  years). Firms tended to be in the formal sector. The cluster could be seen as representing a relatively mature and established group of business owners. Business operations did not typically involve other active partners. Instead, membership in clubs or societies that helped the owner to do business was more common. All lines of businesses were present in this group, although the wood manufacturing sector was more strongly represented compared to other firms in the study.

#### *The Opportunistic Business Owner in Friendly Environment*

The owners in this cluster of enterprises used the opportunistic strategy as the dominant mode to achieve their goals. The level of the opportunistic strategy was shown to be the highest among the four groups. Owners also displayed some levels of complete and critical point planning, however, to a lesser extent than the opportunistic strategy. The environment of the business was perceived as friendly and the number of competitors was comparatively small (17 on average). Based on these findings, members in this group were termed *opportunistic business owner in friendly environment*.

Owners in the group showed an average level of entrepreneurial orientation. In the operation of the opportunistic enterprise, an active partner frequently existed. Owners did not belong to clubs or societies, loans were not used and businesses were relatively common in the informal sector. Retail/trade was the predominant line of business.

#### *The Highly Reactive Business Owner in Friendly Environment*

Most characteristic of this group of owners was a low level of entrepreneurial orientation, the strong use of a reactive strategy and the simultaneous absence of planning and opportunism in the pursuit of business goals. The use of the reactive strategy was much stronger than in any of the other groups. Owners perceived their business environment, as very little hostile. The level of perceived hostility was the lowest for the four groups. Correspondingly, the number of competitors was low (14 on average). Based on these findings this type of business was termed the *highly reactive business owner in friendly environment*.

Low entrepreneurial orientation indicates that the owners were hardly achievement oriented, applied low levels of innovativeness and competitive aggressiveness, and avoided risk-taking activities. In accordance with the predominant reactive strategy, owners showed low levels of personal initiative, a sub-dimension of entrepreneurial orientation.

Owners usually operated in the informal sector. Most frequently, the business operation involved the manufacturing of wood or other products. Membership in clubs or societies was rare. The level of education was low (10 years on average).

#### *The Entrepreneurially Oriented Planning Business Owner*

Business owners in this cluster showed the highest level of entrepreneurial orientation and planning. Comprehensive planning was the dominant strategy, the highest across all cluster. Owners also used the opportunistic strategy to achieve business goals, but to a lesser extent than the strategies of complete and critical point planning. None of the owners used the reactive strategy as the dominant way to reach business goals. The business environment in this cluster was perceived as moderately friendly with a relatively small number of competitors (15 on average). With regard to the owners high entrepreneurial orientation and planning this type of business was labelled the *entrepreneurially oriented planning business owner*.

Most businesses of this type were still young. The great majority of the firms were registered and paid taxes. Typically, the business owner made use of loans. Active partners were relatively common and the great majority were members of clubs or societies. The least common business sector in this cluster as well as between the

clusters was wood manufacturing. No further difference between the clusters occurred with regard to the line of business. Typically, the business owner of the entrepreneurially oriented planning business owner was well educated (14 years on average).

## The Configuration-Success Link

To test the assumption of equifinality among proactive business owners, the four emerging clusters of owners and their firms were examined for business success (cf. Table 4). Comparisons across the clusters yielded significant mean differences for all the success indicators: Interviewer evaluation, growth, size, and the external evaluation. The results confirm hypothesis 2, which postulated success differences across the groups depending on distinct patterns of variable constellations.

Of the four business types *the reactive business owner in hostile environment* showed the lowest rate of growth. Below average scores on the other success criteria also point to the fact that this type of enterprise was not successful. *The opportunistic business owner operating in friendly environment* was seen by the interviewer as being medium successful. The group was particularly able to achieve success in terms of growth. The business was still small in size, but was also estimated as successful by the external judge. *The highly reactive business owner in friendly environment* was not able to produce subsequent success. The business was small in size and it hardly grew. Interviewers as well as external raters estimated the business as not successful. *The entrepreneurially oriented planning business owner* represents a very successful group of Zimbabwean small businesses. Enterprises in this group were estimated as successful by the interviewer and in the external success evaluation. They were large in size and showed substantial growth. The findings yield some support for hypothesis 3, which assumed equifinality among enterprises with a proactive strategic stance. The opportunistic business owner in friendly environment and the entrepreneurially oriented planning business owner were both successful. However, differences existed with regard to success defined as business size and the interviewer estimate. On the other hand, similar positive outcomes were found for growth and the external evaluation of success.

Through means of cluster analysis two groups of business owners applying a reactive strategy were identified: the reactive business owner in hostile environment and the highly reactive business owner in friendly environment. Both groups demonstrated little or no evidence of success. In contrast the entrepreneurially oriented planning business owner and the opportunistic business owner in friendly environment were both successful.

**TABLE 4 Success in the four configurations of strategy, the firm, and the environment <sup>a</sup>**

## DISCUSSION

This research is based on the premise that there is no single type of business owners and their firms. We expected complex interactions between single variables to give rise to meaningful configurations of business owners and their firms. A more holistic view of entrepreneurship was suggested, describing the phenomenon across three major dimensions: Entrepreneurial action strategies, the firm-set-up, and the environment as perceived by the owner.

Four different coherent groups of business owners emerged from the analysis. As was hypothesized, groups differed across strategy characteristics, firm characteristics, the environment, and important indicators of business performance.

**Equifinality** as an important notion within the configurational approach was tested. We hypothesized owners with a proactive strategic posture to be successful. The entrepreneurially oriented planning business owner and the opportunistic business owner in friendly environment emerged as viable constellations of owners' strategy characteristics, their firms, and their environment. Overall, owners in both groups displayed a proactive strategic posture with regard to their business operation. The assumption of different success routes reflected in the alignment of process characteristics, the firm, and the environment can be seen as confirmed to the extent that both enterprises achieved substantial growth and were evaluated as successful by the external rater.

The analysis also identified two configurations with little success. Owners in these businesses applied a reactive strategy as the dominant mode to achieve business goals and demonstrated low levels of entrepreneurial orientation. For the reactive business owner in hostile environment the reactive strategy appeared to be a direct response to the perception of the business surroundings as very hostile. For the second group, the highly reactive business owner in friendly environment, reactivity of the owners was not linked to a hostile environment suggesting it more strongly resided within the person of the business owner himself.

The comparison of the four configurations and their ability to achieve success can be used to categorize single variables into **desirable and necessary characteristics for business success**. Overall, psychological process characteristics appear to be crucial for subsequent success. They also contributed most to the formation of the four groups. *Entrepreneurial orientation* was low in the groups of non-successful business owners and medium and high in the successful groups. Some degree of entrepreneurial orientation will thus be indispensable in order to achieve success. Similarly, only *proactive psychological strategies* were positively associated with success. The two successful groups of entrepreneurs both made use of proactive process strategies while the groups of non-successful businesses applied a reactive strategy. Proactiveness can therefore be seen as positive and reactivity as negative for success regardless of firm characteristics and the environment. However, in the group of opportunistic business owners in friendly environment, it

can be assumed that opportunism – to be successful – had to be coupled with a certain amount of planning as was indeed displayed in the use of the planning strategies. Owners who have seized an opportunity will need goal orientation and some planning for implementation. Escher (2000) reports evidence for this assertion in South African businesses. Similarly, success of an opportunistic strategy may further depend on the owner's level of entrepreneurial orientation; the higher entrepreneurial orientation, the less effective an opportunistic strategy (Krauss & Frese, 2003). High entrepreneurial orientation without a strong focus may easily result in misdirected investments. The opportunistic business owner in friendly environments therefore represents a well aligned configuration of entrepreneurial orientation, opportunistic action, and planning.

Whereas an overall proactive stance appears to be necessary for success, specific firm characteristics seem to be better classified under desirable rather than necessary success factors. Of the four groups, only the entrepreneurially oriented planning business owner made extensive *use of loans*. The opportunistic business owner in friendly environment, however, achieved substantial levels of success despite the fact that loans were not used. Opportunities were still sought and realized despite possible lack of capital. Similar to the use of loans, the two successful groups of enterprises differed with respect to their *membership in clubs or societies*. Membership in clubs was characteristic of the entrepreneurially oriented planning business owner and found to be rare in the group of opportunistic businesses. Club membership and the use of loans were both strongly positively associated with size and a belonging to the formal sector. With a larger proportion found in the formal sector the non-successful reactive business owner in hostile environment frequently joined clubs or societies. We therefore suggest that not club membership alone is positive for success, but rather the active use of networks in these clubs. A project carried out in Zambia currently tests this assumption (Kiel, in preparation). Finally, a *formal business status* seemed to be positively related to success. As the most successful group the entrepreneurially oriented planning business owner typically operated in the formal sector. Once again, however, the opportunistic business owner in friendly environment demonstrated that owners can also achieve success in the informal sector corresponding with a different overall pattern of strategy use and environmental characteristics.

The taxonomy can further be used to highlight distinct variable relations between groups of entrepreneurs – a major advantage of the configurational perspective (Meyer et al., 1993). Within the overall constellation of variables strong differences across the groups existed in their **relation between strategies and the perception of environmental hostility**. For the reactive business owner in hostile environment, high reactivity corresponded with a perception of the environment as very hostile. In the second group of reactive owners, the highly reactive business owner in friendly environment, the opposite was the case. In this group, high use of a reactive strategy (still higher than in the other group) corresponded with a perception of the environment as particularly friendly (in fact the least hostile across all groups).

Compared to the entrepreneurially oriented planning business owner, the opportunistic business owner in friendly environment perceived the business environment as more favorable. Such a perception may also have an impact on the use of strategies in that it encourages opportunism. Detecting business opportunities

on the other hand may once again strengthen the perception of the environment as favourable.

The taxonomy of small business owners and their firms proposed in this research raises a number of other important questions. How often do business owners change their belonging to one of the four identified groups? What factors encourage or hinder such developments? Can the taxonomy be extended into a theory of business stages? Such issues as well as the clarification of causality could only be addressed within a longitudinal research design.

As one of the first taxonomies describing small businesses on a psychological individual level, the taxonomy shows **similarities with other organization-based classifications**. Miles and Snow (1978) in their typology of organizational strategy, structure, and process distinguish between reactors, prospectors, analysers, and defenders. Operating in a “response mode” (Miles & Snow, 1978, p. 93), the reactor shares key characteristics with the two reactive types of business owners found in this research. Prospectors in contrast are described as emphasizing flexibility and seizing opportunities thereby resembling the opportunistic business owner in friendly environment. The analyser, engaging in high degrees of planning, controlling, and coordination can be seen as corresponding with the entrepreneurially oriented planning business owner. No equivalence exists for the defender. As in our taxonomy, the reactor-type in the Miles and Snow typology represents the least successful group (Miles & Snow, 1978; Doty, Glick, & Huber, 1993). Similarities also exist between the present taxonomy and a classification by Covin (1991), who describes a continuum of entrepreneurial and conservative firms. According to Covin (1991), conservative firms are risk-averse, non-innovative, and reactive. Entrepreneurial firms in contrast are risk-taking, innovative, and proactive. With regard to their strategic posture the two reactive business owners identified in this research resemble the conservative firm as described by Covin (1991). The strategic pattern of the opportunistic business owner in friendly environment on the other hand is much closer to the characteristics attributed to entrepreneurial firms whereas the entrepreneurial oriented planning business owner clearly represents an entrepreneurial firm. Covin (1991) also found significant performance differences between the groups of firms. Entrepreneurial firms were more likely to be successful than conservative firms. Similar relationships between different strategic postures and success are also reported by Bantel (1998) in a classification of technology-based firms. Whereas firms with proactive characteristics were shown to be successful the opposite was true for firms with a lack of a clear strategic profile. The latter, with a strong resemblance to the reactive business owners in this study, are described by Bantel as being “much clearer on what they are *not* pursuing strategically than what they *are*” (Bantel, 1998, p. 221 – emphasis added). Overall, there seems to be some consensus between researchers concerning the distinction between reactive and proactive, entrepreneurial firms. Strong agreement appears to exist that proactive types of enterprises will outperform enterprises with a reactive strategic stance. The present study adds to such findings within the configurational approach by introducing an individual level of analysis and explicitly emphasising strategy process rather than content.

## LIMITATIONS

Limitations of this study concern size and composition of the sample. First, the insufficient sample size made impossible the application of other statistical validity checks of the cluster solution. It would have been desirable to further test stability by applying procedures such as double cross validation (Bortz, 1993) or other split sample methods. All quality checks we applied in this study, however, point to a stable classification scheme. Second, findings are limited to a restricted group of Zimbabwean small enterprises. Only businesses which were self established, had been operating for one year and more, and had at least one full time employee at study one, were included in the sample. This restriction of the sample, however, was deliberate. Businesses of the analysed type are believed to represent a qualitatively different group of entrepreneurs from those without employees or who had taken over the business without knowing the risks involved in the foundation process. Participants of the study had to deal with different levels of responsibility and challenges in the day-to-day operation of their firms. More important with regard to the generalisation of the results is therefore the weak representation of the informal sector. Informal enterprises, the predominant form of businesses in Zimbabwe (Harrison, 2000) were underrepresented relative to the whole population of business owners. Another shortcoming concerns the possibility of common method variance as interviewers who assessed the majority of variables also evaluated business success. We addressed this problem by thoroughly training interviewers on the effects of rating mistakes and how to prevent them, the use of an elaborate coding scheme, and regular quality checks. The fact that success measures not dependent upon interviewers' judgment yielded very similar results indicates that common method variance was not a major issue. It shall also be noted that this research mainly dealt with groups of entrepreneurs. Hypotheses concerning resulting groups of business owners were not known to the interviewers.

## CONCLUSION

The taxonomy has important theoretical and practical implications. Results can be used to formulate and test hypothesis derived from the classification scheme. The taxonomy is relevant for practitioners dealing with the entrepreneurs, such as training institutions, regional policy makers or credit givers. For the practitioner, the taxonomy represents a tool for self-assessment. Entrepreneurs can reconsider their actions, how they evaluate and respond to their business environment, and how the business is set up internally.

To the authors knowledge this work represents the first attempt to study *groups* of small businesses along psychological strategy characteristics and to propose a taxonomy of small business owners and their firms in the developing world. The study showed there is no average in entrepreneurship. Success, after all, results from the constellation of a number of variables. The study underlines the relevance of the configurational approach in understanding complex, multilevel phenomena like entrepreneurship.

# CORPORATE ENTITIES IN SOUTH AFRICA

In order to elucidate the OTC environment it was necessary to define what types of companies could trade in their own shares. Discussions with many people, including accountants and attorneys, showed a distinct lack of knowledge with respect to the difference in structure of the corporate entities available in South Africa. The process of changing from a closed corporation to a proprietary limited, and then to a limited company was simply administrative although some technicalities were involved. In the USA, in 2001, a private company was not listed, but a public company was listed on a registered exchange. In South Africa, however, a private company was not listed but a public company could be unlisted and trade OTC, or be listed on the JSE.

The main difference between a sole proprietor and partnership, and those mentioned below was the issue of limited liability. "It is this separation of legal rights which admits the principle of limited liability whereby a member (one legal person) contracts with the company (another legal person) to advance a certain limited amount of money as that member's share of the capital required by that company" (Hartley, Firer & Ford, 1991:41).

A closed corporation resembled a company in having a legal personality separate from its members, but differed in having unlimited contractual capacity. In 1984 the Close Corporation Act No. 69 of 1984 was promulgated. The Companies Act (1973) had become too complicated for relevance to small companies and the implementation was costly and time consuming. A close corporation enjoyed the status of a juristic person distinct from its members. Any one or more up to a maximum of 10 could form a close corporation by registering a founding statement. The closed corporation needed to include the abbreviation 'CC' after the name to denote that the company was registered as a closed corporation (Beuthin, 1984).

Some advantages of a closed corporation compared with a company included its relative ease of formation and administration. Regular returns to the Registrar were not required, annual duty was not payable, audit procedures were less onerous, and the corporation could acquire the interest of a member and provide financial assistance to enable a person to acquire an interest. A member, without authority could bind the corporation in transactions with third parties; this was one of the disadvantages. In certain circumstances a member could lose the protection of limited liability. A closed corporation could not be a shareholder of a company or a member of a corporation. It was limited to 10 members which limited the tradability of its shareholding or members' interest (Beuthin, 1984).

The words 'member' and 'shareholder' are used synonymously in this report although technically a closed corporation has members and a company has shareholders.

The Companies Act (1973) provides for two basic types of companies: public companies and private companies

The Public Company having a share capital

Any public company was a separate legal entity with a legal persona that was distinct from that of its members. Assets belonged to the company and not to its individual members, and the creditor of a company generally had no claim on the individual members of that company. A company potentially had a perpetual existence even though its membership might change over time provided that it complied with the Companies Act (1973).

Some of the issues presented by the Companies Act (1973) are mentioned below due to their relevance to the OTC environment.

- The name of the company had to end with the word 'Limited'. This immediately informed the public that it was a public company and might or might not market its own shares or be listed on the JSE.
- It must have at least seven associated members for any lawful purpose. Generally no restriction was made regarding the maximum number of its members.
- Members needed not be natural persons, and companies themselves could become members of other companies
- Members of the public could be invited to subscribe for shares and debentures.
- It did not have to be listed on a formal exchange to allow trading in shares of the company

### The Private Company

A private company could be formed by two or more persons. It was defined as a private company. According to its articles:

- the right to transfer its shares was restricted,
- the number of its members was limited to 50, excluding those who were employees and ex-employees who continued to be members;
- prohibited any offer to the public for the subscription of its shares and debentures
- the name of a private company had to end with the words: 'Proprietary Limited'.

Further differences between private and public companies included the following.

A private company was exempt from a public company's obligations to send to the registrar, a certified copy of the annual financial statements and group annual financial statements, if any; and of the annual financial statements of every private company which was its subsidiary. It was exempted from the requirement to send to its members and debentures holders half yearly interim reports fairly presenting its business and operations, and that of its subsidiaries, and copies of its own and its subsidiaries' provisional annual financial statements in the event of it having failed to issue copies of its annual financial statements within three months of the end of its financial year (Hahlo, 1991; Beuthin, 1984).

Further differences in the requirements of the Act related to the minimum liability of directors for the debts and liabilities of a private company. The voting rights of a public company were largely determined by the provisions of the Companies Act (1973) whilst the voting rights of a private company must be determined by the company's articles of association (Companies Act, 1973).

Other differences included the requirement that a public company had to have two directors whereas a private company needed only one. A public company could appoint proxies and could issue share warrants to bearer (Beuthin, 1984).

## **Rationale behind Listing**

There is an abundance of literature on the subject of Initial Public Offerings (IPO's). Its relevance to this report is that a company that is in the process of deciding on its capital structure and is considering equity capital that can be traded, the Companies Act (1973) required certain provisions that had to be met prior to the company being allowed to do so. Under Section 145 of the Companies Act (1973), no person could make an offer for the subscription of shares to the public unless it was accompanied by a prospectus complying with the requirements of the Act and registered in the Companies Registration Office. The rationale for this discussion was to consider why companies would consider going public rather than the technicalities involved. The critical question concerned whether they would trade OTC or on a regulated exchange.

Pagano, Panetta & Zingales (1995) analysed the determinants of an IPO and the consequences of this decision on a company's investment and financial policy. They mentioned two companies, United Parcel Services and Bechtel, that in 1992, would both have easily met the criteria for a listing but chose not to do so, the question of why they did not do so was considered to be of interest.

Chemmanur & Fulghieri (1999) argued that there were three essential differences between private and public firms<sup>1</sup>. One concerned the dispersion of share ownership. In a public firm, a large shareholder base owns the shares, whereas in a private firm the original entrepreneurs and one or two others may hold the shares. The advantage of a public company in this regard, was that the shareholders could be well diversified, whereas this would be less likely in a private firm. Shareholders in a private firm would have far more bargaining power than those in a public firm with many shareholders. This was particularly relevant in the OTC environment. Secondly there was a need to convince a much larger group of investors that its projects were worth investing in. An example of this would be a private firm whose management wished to expand its plant facilities. The shareholders need only discuss together the merits or demerits of the project, and take a decision. Where the same decision was required but would have a significant effect on a public firm, a much larger group of investors would need to be convinced of the viability of the project. The cost of this evaluation would be to the firm, in the form of a higher/ or lower share price. Finally a publicly observable share price in a public company would always be available and the company could be valued according to the share price. It is much more difficult to evaluate a private company (Chemmanur & Fulghieri, 1999).

Pagano *et al* (1995) discussed the benefits to a company that goes public. The first is to overcome borrowing constraints. Pagano *et al* (1995) found that the cost of bank credit decreased after the IPO, and that these firms borrowed from a larger number of banks to reduce the concentration of their borrowing. An IPO is also an alternative to bank credit as a

---

<sup>1</sup> The authors do not define the difference between a private and a public company. I am going to assume for the purposes of this paper that private means unlisted and public means listed on an exchange.

source of capital. The portfolio diversification theory was considered to be a benefit although there was no evidence to support this (Pagano *et al*, 1995). Pagano *et al* (1995:4) indicated “when an independent company undertakes an IPO the initial owners divest only 6 percent of their holdings at that date and three percent more in the subsequent three years”. Liquidity was also discussed as a benefit to an IPO (Pagano *et al*, 1995). The authors note that in a private company it is very difficult to sell a tranche of shares, as these need to be valued in some way. Methods may be used such as discounted cash flow, price:earnings multiple, or net asset value. These methods were subjective, however, and might not offer a true value of the company at the time; the valuation might depend on the person who prepared it. A public company though, that was traded, and therefore the sale or purchase of shares is easier.

Once the decision for an IPO was made, the next decision would be where to list. In South Africa the JSE is the only place to list shares. Ellingsen & Rydqvist (1997) questioned the necessity for a stock exchange, and postulated that the abolition of the stock exchange would increase overall welfare. According to their model the existence of stock exchanges had a potentially harmful effect in diverting trade through direct sales towards the costlier stock exchange. This was an interesting argument in terms of a proposed OTC environment in South Africa. Costs would still pertain regarding participation with the exchange as a company and to the trader when buying or selling, albeit indirect costs. Outside South Africa the decision regarding whether to list impacted on where to list.

## **Corporate Governance**

The term ‘corporate governance’ was coined in the English language in 1980 (Zingales, 1997). Since then, corporate governance became an issue identified with take-overs, financial restructuring and institutional investors’ activism. Zingales (1997) considered the conditions in which a governance system was required: “The word ‘governance’ is synonymous with the exercise of authority, direction and control” (Zingales, 1997:2). Whether a free market economy requires a system with a reference to the words mentioned above was questionable.

The Fraser Institute (2000) highlighted the essence of corporate governance and the role of the stock market in the system. They noted “the tensions inherent in corporate governance arise among people, owners on the one hand and managers on the other, and controlling owners versus minority owners. The stock market acts as a dispassionate referee in this conflict, providing a vehicle (the market place for shares) through which parties can express their opinions about the way in which a corporation should be run (The Fraser Institute, 2000:6).

Black (2000) reasoned that there were two essential prerequisites for a strong stock market. A country’s laws and related institutions needed to ensure the following to minority shareholders: good information about the value of a company’s business; and confidence that the company’s insiders (that is, its managers and controlling shareholders) would not cheat investors out of most or all of the value of their investment (Black, 2000:1).

The King Commission on Corporate Governance in South Africa was formed by the Institute of Directors and supported by the South African Chamber of Business and the JSE, amongst others. The task of the commission was to draft corporate governance guidelines that would aid South Africa to re-enter the international community, and to address the emergence of

previously disadvantaged communities into the business community. The commission issued a report.

The report recommended that the JSE should adopt a listing rule that required companies to disclose in their annual financial statements the extent of their compliance with the Code of Corporate Practices and Conduct. These recommendations were included in the listing requirements of the JSE. A number of recommendations in the King Report that advocated changes to the Companies Act (1973) were being processed as law.

Corporate governance may dictate the success or failure of both the stock market and the companies listed on it. If companies and the exchange did not adhere to the system of corporate governance, then investors would not invest on that exchange or in the shares of a company that was listed on the exchange; and thus a vicious circle was created.

### Essence of International Markets

A small cap market, sometimes known as a Parallel Market, provides an exchange facility where the listed securities of small and midsize companies can be traded efficiently and competitively. Historically, investors recognise a high correlation between company size and market risk. The smaller a company, the higher the risk (higher standard deviation for rate of return) and the larger a company, the lower the risk (lower standard deviation for rate of return).

Traditionally, many exchanges have not encouraged the listing of small caps on their main market because they did not want to seem to denigrate the value of the main market by:

- Introducing extra volatility in to the main market
- Eroding the value of exclusivity maintained by main market listings
- Altering the main market to suit the special needs of Small cap companies

Nonetheless, the value that small caps contribute to the domestic and international economy is significant, and many of today's small caps will be tomorrow's market leaders. Therefore, the establishment of either a separate or integrated market that promotes small cap company development is fundamental to the healthy development of capital markets. A small cap market, like any securities market, performs three basic economic functions:

- Individual wealth allocation
- Firm resource allocation
- Source of information

### **How small cap markets are defined:**

A small cap market is a public, regulated stock exchange for small and medium size companies that may:

- Grow quickly, provide a high return on investment, and eventually move to the main market
- Grow steadily and do relatively well during economic downturns and times of uncertainty

Therefore, a small cap market may have multiple objectives:

- Provide a nursing ground for small companies to expand until they are large enough for the main market – this will increase new listings for the main market
- Maintain its own commercial viability in order to survive long term economic and market cycles – this will allow businesses to raise capital continuously, see their shares traded, and increase their commerce and notoriety
- Stimulate the regional economy by creating new paths for capital intermediation – this will motivate individuals and institutions to invest in the local economy and increase their interest in those markets

Transform the local economy by giving local businesses the stimulus for growth and the larger perspective that comes from managing a public company – this will not only open the economy and enhance the efficiency of capital transfers within the private business sector, but also cause local businesses and investors to think and behave more actively and globally

## **EXPLORING THE SEQUENCE AND DURATION OF CANADIAN NASCENT ENTREPRENEURS' START-UP ACTIVITIES: AN EMPIRICAL STUDY<sup>1</sup>**

The research reported in this paper addresses the void in our knowledge of the new venture creation process by focusing on the nature, sequencing and timing of activities individuals engage in to bring their venture to fruition. It is part of the Entrepreneurial Research Consortium (ERC), an international group of over 111 scholars associated with 32 different organizations from around the world who are engaged in finding answers to questions about nascent entrepreneurs<sup>2</sup>. Using the standardized methods developed by the ERC, this study tracks Canadian nascent entrepreneurs over a three year period following the initial interview. Results document considerable volatility in the outcomes reported from year to year. Moreover, the findings indicate that nascent entrepreneurs who bring their venture to fruition and sustain it as an operating venture engage in different activities than those whose efforts eventually result in a non-operating undertaking. In addition to analyzing and discussing the sequence and timing of activities by outcome status, the paper also discusses the implications for policy and practice.

---

<sup>1</sup> The authors are most grateful for the generous financial support of the Social Sciences and Humanities Research Council of Canada and Industry Canada.

<sup>2</sup> The term nascent entrepreneur is used to refer to those individuals who are involved in activities aimed at starting a business.

# INTRODUCTION

Finding more effective ways to stimulate entrepreneurship<sup>3</sup> is an issue of growing interest, globally, among policymakers (Stevenson and Lundström 2002; Glasson 1992). For example, a key policy objective in Canada is to build a more “entrepreneurial economy” (Government of Canada 2002). Yet, with very little known about how new ventures emerge (Van de Ven and Engleman 2004; Reynolds 2000), a rationale for policy initiatives is difficult to discern. Indeed, Savoie (1992) noted the failure to explicitly link development initiatives with theoretical frameworks over a decade ago. As governments are being called upon to be more accountable for their actions, clearly there is a pressing need for research.

The lack of “real time” study of the start-up process has been a major stumbling block to acquiring more knowledge of business formation. Currently, the Entrepreneurial Research Consortium (ERC) – comprised of researchers in nine countries - is addressing this issue (For further details on the consortium see Reynolds 2000). With members of the ERC beginning to report the results of their investigations, already we have gained some insight into the prevalence of nascent entrepreneurship in various countries. For example, nascent entrepreneurs between the ages of 18 and 65 were identified in 1.8% of Canadian households (Diochon et al. 2001), whereas in the United States 3.8% of the working-age population were similarly attuned (Reynolds 2000). In other countries, the rate of activity is somewhere between these two figures: Sweden 2.0% (Delmar and Davidson 2000), Germany 2.1% (Welter 2000) and the Netherlands 3.8% (EIM 2000).

Within Canada, this means that on average, efforts are being made to launch approximately 284,000 businesses at any one point in time. This begs the obvious question - how many of these start-up efforts become operational? In addition to providing insight into the outcomes of Canadian nascent entrepreneurs’ efforts, the paper aims to shed light on the start-up process by focusing on the activities undertaken. Specifically the paper examines whether the nature, number, duration and sequence of activities pursued by Canadian nascent entrepreneurs who bring their business to fruition differ from the activities of those whose efforts are “unsuccessful”. Indeed, as Reynolds (2000) points out, very little is known about these aspects of the entrepreneurial process. In addition, by replicating the methods used in an earlier study by Carter et al. (1996) in the United States, we aim to compare the activities of nascent entrepreneurs in Canada and the United States to identify national similarities and differences. Therefore, this research should be of benefit to researchers as well as policymakers, training and support providers, and of course, aspiring entrepreneurs.

The paper begins by reviewing what is known about the start-up process and developing a series of propositions from this discussion. Next it presents the methodology used, followed by the results. Finally, it concludes with a discussion of the implications, limitations and suggestions for future research.

---

<sup>3</sup> Within this research, entrepreneurship is defined as new business creation, a meaning that has been adopted by others (see, for example, Aldrich 1992, Low and MacMillan 1988, Venkataraman 1997).

## ***The Process of New Venture Formation***

There has been no shortage of attempts to model the entrepreneurial process in the literature (see, for example, Kuratko, Hornsby, and Naffziger 1997; Bygrave 1993; Herron and Sapienza 1992; Manning, Birley, and Norburn, 1989; Gartner 1985). However, many of the theoretical frameworks have been admonished for assuming the process of new venture creation is linear (Manning et al., 1989) and ignoring both the dynamics and time dimension (for further discussion of these criticisms see Pettigrew 1992). Why have these dimensions been overlooked?

Generally, scholars have adopted differing views of process that, in turn, influence the theories developed, the questions asked, the methods used and the contributions made (Van de Ven 1992). Van de Ven and Engleman (2004) identify two definitions of process commonly used in the literature: a category of concepts or variables that pertain to actions and activities; and a description of how things develop and change.

Accordingly, a “variance theory” (Mohr 1982) of process ensues from adoption of the first definition. Poole et al. (2000) attribute the slow progress in developing theories to explain and predict organizational and entrepreneurial dynamics to the fact that scholars continue to conceptualize process issues in variance terms. While research emanating from variance theory can deal with the “what” issues associated with process, its reliance on cross-sectional, retrospective data is inadequate in addressing “how” new ventures emerge, since the timing and pacing of activities are not dealt.

Arguably, for the start-up process to be better understood, action, dynamism, time, development and outcomes are important concerns in the development of a conceptual framework (Pettigrew 1992). A new venture is not created instantaneously; it comes about through the completion of a number of activities over time. Addressing these issues requires a focus on the second meaning of process.

Indeed, the need to view process as a sequence of events or activities that describes how things change over time has been noted by several scholars (Van de Ven and Engleman 2004; Aldrich 2001; Davidsson and Wiklund 2001; Sztompka 1991; Low and MacMillan 1988). As so aptly put by Pettigrew (1992: 5-6) “questions posed in the language of becoming rather than of being demand detailed, comparative and longitudinal data covering long periods of time.” However, progress has been slow. With few development-driven explanations of process within the entrepreneurial literature it is not surprising that empirical research is scant and inadequate. For example, Chandler and Lyon’s (2001) literature review of top-tier academic journals (1989-1999) found only 2.7 percent (8 out of 291) of the empirical studies involved longitudinal real-time data on the entrepreneurial process.

Generally, an evolutionary perspective - whereby variation, selection and retention logic is drawn upon - predominates explanations of how new ventures form and develop (Murmann et al. 2003). The central focus of “developmental” process models is on progressions (ie the nature, sequence and timing) of activities or events that an organizational entity undergoes (Van de Ven 1992 171). Activities, then, are the units of social process. Explanations are built forward, from observed or recorded activities to outcomes. Explanations are “loose” in that only the pattern or form that arranges activities in space or time is specified (Van de Ven and Engleman 2004). Therefore, amidst a general process pattern or scheme, specific sequences may differ. In order to conceptualize the pattern, activities must first be identified. Accordingly, since activities are

chosen a priori (Aldrich 2001), we turn to the extant literature as a first step in conceptual development.

The set of activities used by Carter, Gartner and Reynolds (1996) in exploring activities undertaken by nascent entrepreneurs has subsequently been incorporated by others in the study of entrepreneurial emergence (Delmar and Shane 2004; Reynolds 2000). It includes: organizing a team, preparing a business plan, buying or renting facilities/equipment, looking for facilities, investing own money, seeking financial support, getting financial support, developing a model or prototype, devoting full time to business, applying for a license/patent, forming a legal entity, hiring employees, and saving money to invest.

Arguably, these activities can be classified according to three conceptual categories: *commitment* (preparing a business plan, devoting full time to the business, saving money to invest in business, investing own money, developing a product/service, purchasing raw materials, inventory, supplies, or components), *connection* (organizing a team, marketing, seeking financing, talking to customers), and *control* (applying for or obtaining a patent/trademark, getting financing, hiring employees, purchasing, leasing or renting raw materials/major items). Such a conceptualization is consistent with three offshoots of evolutionary theory used by others (Delmar and Shane 2004; Murmann et al. 2003) to explain how activities enhance new venture survival: institutional theory (activities that increase legitimacy by making new ventures appear more reliable and accountable), social relationship theory (activities that establish relationships with external stakeholders to overcome the liability of underdeveloped social ties between new ventures and their external stakeholders), and resource-based theory (activities that focus on gaining control over and recombining resources in a way superior to that of established organizations).

We argue that the activities associated with starting a business are embedded in social relations (Granovetter 1985). Since the process of starting a business is inherently uncertain, this would suggest that personal social relations become a key factor in coping with that uncertainty (Salancik and Pfeffer 1978). Fundamentally, gaining control over the resources required involves interaction with others. Ultimately, engagement in start-up activities involves decisions concerning how long will be devoted to these efforts. Indeed, timing is a critical dimension of venture formation (Delmar and Shane 2004). It involves both pacing (the number of events in a given amount of time) and duration (the amount of time elapsed for a given event). Variations in pacing reflect the operation of cultural norms in evolutionary processes (Aldrich 2001 p 7). Arguably, the idea of socially expected duration (Merton 1949) - whereby an individual's decision is based upon how long (s)he thinks a particular relationship or event will last – is an important issue to explore.

At any one point in time, there are four outcomes of start-up efforts that previous studies have identified (Reynolds, 2000):

- an operating business – the start-up has become an “infant” business
- an active start-up – continued efforts to start a new firm
- a dormant/inactive start-up – no current efforts to implement a new firm
- an abandoned start-up/ no longer worked on by anyone – not successful and no further efforts are expected

In terms of sequencing, empirical evidence (Carter et al. 1996) indicates that the most common first event of new venture formation consists of a personal commitment. However, very little is known about the extent to which belonging to a particular outcome status grouping implies that certain activities are initiated or completed in a particular

sequence at particular points in time (Delmar and Shane 2004). Research by Carter et al. (1996) found operating businesses were most likely to have bought facilities or equipment and to have obtained financial support; active start-ups were found to be least likely to get financial support or to buy facilities or equipment; and abandoned/inactive start-ups (these two categories were grouped together) were most likely to develop models and obtain financial support. More recently, Delmar and Shane (2004) provided evidence to suggest that operating businesses are associated with initiating or completing commitment activities before others.

In terms of timing, the findings of Carter et al. (1996) indicate that operating firms engage in more activities than other outcome groups. Moreover, while those who eventually gave up were similar in their rate of activity to those who brought their venture to fruition through the first year, their rate of initiation tapered off subsequently.

Fundamentally, the key issue is not simply bringing the venture to fruition but sustaining it over time. This is an issue we know very little about. As a starting point in building our knowledge of the start-up process, our aim is to explore whether those ventures that are brought to fruition and sustained over time (hitherto referred to as “operating”) involve a different set and sequence of start-up activities than those ventures that either never become operational or cease operations (hitherto referred to as “nonoperating”).

Based on the previous discussion, we propose the following propositions:

P<sup>1</sup> Operating businesses will be associated with engaging in a different set of start-up activities than non-operating ones.

P<sup>2</sup> Operating businesses will be associated with engaging in more connecting activities than non-operating ones

P<sup>3</sup> Operating businesses will be associated with engaging in a greater number of activities than non-operating ones.

P<sup>4</sup> Operating businesses will be associated with a higher rate of activity over time than non-operating ones.

P<sup>5</sup> Operating businesses will be associated with a longer expected duration for bringing a venture to fruition than non-operating ones.

## **METHODOLOGY**

### **Research Design**

The research upon which this paper is based was designed by members of the ERC (for further details on this design, see Reynolds 2000). The main elements of the design that provide a capacity to deal with the issues being addressed here are twofold: standardized procedures (for selecting a representative sample and for developing systematic descriptions of the entrepreneurial process) and longitudinal design (to track the process). Indeed, longitudinal real-time research overcomes the research biases associated with variance driven studies (Aldrich 2001). Additionally, tracking the start-ups over time provides more accurate information on, for instance, whether a business “birth” is sustained.

## Sample and Data Collection

In accordance with the procedures established by the ERC, we engaged SOM, a national polling firm, to select a representative sample of people engaged in the start-up process (nascent entrepreneurs) in Canada during the winter of 2000. During the initial screening interview, the respondent was asked: "Among the adults living your household, is there anyone who, alone or with others, is now trying to start a new venture?" If (s)he answered yes, (s)he was asked if "Will you be an owner, in part or in whole of this company or venture that you are trying to launch, alone or with others for your own business or that of your employer?". "During the last 12 months, have you done anything to help start this new business, such as looking for equipment or a location, organizing a start-up team, working on a business plan, saving money, or any other activity that would help launch a business?"

The completed screening interviews produced a sample of 593 as some households had multiple nascent entrepreneurs. Out of these, 463 qualified for the longer telephone interview by answering affirmatively to all three questions outlined above. Of these, 416 agreed to participate in a follow-up interview.

In June 2000 detailed data collection began, using phone and mail survey instruments, covering a wide range of topics (which are detailed in Reynolds 2000). If a start-up was found to have a positive monthly cash flow that covered expenses and the owner-manager salaries for more than three months, the effort was considered an operating business. Approximately one fifth (19 percent) of the respondents were dropped at this stage as they were too far advanced to be considered in the gestation phase of the entrepreneurial process. Among the remaining respondents, it was not possible to locate and contact about 24 (percent). Another 17 percent of the remaining group would not or could not complete the phone interview.

151 verified and accessible nascent entrepreneurs completed the initial telephone interview. This represents a 59 percent response rate of those that could be contacted and were eligible. Follow-up interviews were completed at 12 month intervals - 2001 (n=132), 2002 (n=119) and 2003 (n=104) - to provide more information on the process as well as the outcome of efforts to launch a new business.

## Measures and Analysis

The following sections describe the measurement of activities pertaining to organizational emergence, including how they unfold over time. Essentially, the methods replicate those used by Carter et al. (1996).

***Start-up Activities.*** Nascent entrepreneurs were asked a series of questions about activities associated with the start-up process during the initial phone interview and subsequent follow-up interviews. The activities and their inter-correlations are displayed in Table 1.

**Table 1: Pearson Product Correlation Coefficients for Activities Initiated or Completed within Five Years of Initiating First Start-up Behaviour**

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18

For each activity, respondents indicated whether the activity was initiated, completed, not initiated or not relevant. Each activity was then coded on a set of dichotomous variables, which reflect its presences/absence or occurrence/non-occurrence. An activity was considered to be present/have occurred if the entrepreneur reported that (s)he had initiated or completed the activity. If the activity had been initiated or completed (s)he was asked to indicate the month and year of initiation and/or completion. Information gathered on when activities were initiated and completed was used to measure pacing and duration.

From the dates associated with the initiation of activities, a time frame of firm development was created. Each activity was categorized according to the length of time separating its initiation or completion from that of the earliest reported activity. The time scale was separated into categories beginning with the first month of activity and progressing by quarter through the fourth year. For example, a value of 1 corresponded to activities that were initiated during the first month of the venture's development, a value of 2 to activities within the first quarter, and 3 to activities undertaken during the 2<sup>nd</sup> quarter, and so on. A value of 17 represented activities initiated in the fourth quarter of the fourth year and 18 represented activities undertaken in the 5<sup>th</sup> year (or longer). All activities commencing in the fifth or subsequent years were grouped together. This measure was used to examine the sequencing of the start-up activities.

From the time scale, two other measures were developed. First, each activity was dummy coded to indicate whether it was undertaken or not (1=yes; 0=no). This data was used in determining what activities were engaged in during start-up. Second, the total number of activities undertaken were counted (the range is from 0 to 15). This measure was used to determine pace.

***Start-up Status.*** During each of the three follow-up phone interviews, the respondents were asked to indicate the status of the start-up. A categorical variable was used to classify respondents according to whether their start-up was: operating, active, inactive, no longer worked on by anyone, or something else.

Given our focus on better understanding firm births that are sustainable over time, we collapsed the outcome status categories as follows: ventures that were reported to be operating in each of the three years of follow-up (n=23) were considered operating while those ventures reported to be not operating (n=69) at the time of the third follow-up (2003) were categorized as non-operating.

***Analysis.*** Discriminant analysis and an independent sample t-test were used to test whether there were significant differences among the two outcome categories. Since preliminary analysis, based on the relationship between the discriminant variables (activities) and status outcomes identified by Carter et al. (1996), did not identify any statistically significant relationships, subsequent discriminant analysis was conducted by entering activities stepwise according to the Wilks' lambda criterion. Additionally, descriptive statistics were used to illustrate sequencing of the start-up activities.

## RESULTS

Table 2 provides insight into the outcomes of Canadian nascent entrepreneurs' start-up efforts for the three years following the initial interview. The percentage reporting an operating business is fairly consistent at approximately 33 percent of the sample interviewed at each follow-up. While almost 40 percent of nascent entrepreneurs were still actively trying to launch their venture at the time of the first year follow-up, only 8 percent were still trying to do so two years later. Relatively speaking, the percentage of inactive start-ups was fairly consistent, ranging between 12 and 16 percent over the three years. However, while only 15 percent of start-ups had been abandoned at the time of the first year follow-up, two years later 46 percent had given up on their ventures.

**Table 2: Outcome Status at Time of Annual Follow-up (2001-2003)**

Start-up Status	2001		2002		2003	
	n	%	n	%	n	%
Operating	44	33	39	33	35	34
Active Start-up	52	39	21	18	8	8
Inactive Start-up	17	13	19	16	13	12
Abandoned	19	15	40	33	48	46
Total	132	100	119	100	104	100

Yet, aggregate numbers can be deceiving, as they fail to capture the dynamics associated with new venture formation. For example, the high rate of failure among new businesses is well documented. The data reported in Table 2 suggest two factors have contributed to the consistency in the percentage of nascent entrepreneurs reporting an operating venture: active efforts became operational and operating efforts became non-operational. Exhibit 1 confirms this. It tracks each venture's status from the time of the first follow-up interview, thereby providing a far more complete picture of the churning involved. Indeed, Exhibit 1 shows that 52 percent (n=23) of the ventures reported to be operating in 2001 were still operating in 2003, a fact that would not be uncovered through summary data alone. These results underscore the need, value and importance of tracking start-up efforts over time if we are to better understand the start-up process.

Based on this evidence, the value of follow-up over a shorter time frame is called into question. Nevertheless, since the study by Carter et al. (1996) is the only one that reports any follow-up (only one year), it provides some basis for comparison, albeit limited. Indeed, when we compare the one-year follow-up findings, quite distinct new venture formation patterns are evident between US and Canadian nascent entrepreneurs. Among the 71 respondents in the US sample, 48 percent (n=34) reported having an operating business during the follow-up interview, 30 percent (n=21) were still actively trying to start a firm and 22 percent (n=16) had abandoned their efforts. Among the 132 Canadian nascent entrepreneurs interviewed at a comparable point in time, a much smaller percentage had established an operating business (33 percent) while a far larger percentage were still trying to do so (39 percent). With the evidence indicating that Canadian start-up efforts are brought to fruition more slowly than those in the US, it suggests that Canadian nascent entrepreneurs are more conservative/far less aggressive in their efforts to start a business than their American counterparts, especially since fewer efforts were abandoned by Canadian nascent entrepreneurs at this point in time.

Knowledge of "what" happens is useful in building our understanding of new firm emergence. Yet, it is also important to learn more about "how" this is accomplished. Toward that end, Table 3 summarizes the results of the stepwise discriminant analysis that was used in examining whether the types of activities engaged in varied by outcome status. The results show the discriminant function had an eigenvalue of 0.393, with a canonical correlation of 0.531 and is significant ( $p < 0.007$ ). The overall classification accuracy for the analysis sample was 80.5 percent.

Essentially, this analysis indicates that operating ventures are associated with different activities than non-operating ones, thereby supporting our first proposition. Although each of the eight variables listed in Table 3 are significant, the pooled within-groups correlations between discriminating variables and the standardized canonical discriminant function indicate that the four variables providing the greatest contribution to the function are: devoting full time hours (>35 per week), making child care arrangements, getting financing from others and putting together a start-up team. This means that nascent entrepreneurs with operating businesses were more likely to devote themselves full time to the venture, to have made arrangements for child care, to have received financing from others and to have initiated or formed the start-up team. In light of this evidence, our second proposition is partially supported.

It is interesting to note that many activities typically associated with providing a solid foundation for starting a business such as preparing a business plan or financial statements were not significant in this study. Such findings may mean that nascent entrepreneurs, generally, are more aware of the importance of planning and therefore, this activity does not discriminate between operating and non-operating ventures.

**Table 3: Results of Discriminant Analysis: Activities Initiated within Five Years of First Activity**

Variable	Function 1
Canonical discriminant functions evaluated at group means (centroids)	
Operating business	1.050
Nonoperating business	-.363
Standardized discriminant function coefficients	
Devoted full time hours (35 or more per week)	.750
Arranged for child care	.640
Saving money to invest in the business	.424
Put together a start-up team	.370
Asked others for money	.301
Got financing from others	.280
Determined legal status	-.405
Hired employees	-.489
Canonical correlation	.531
Wilks' $\lambda$	.718
$\chi^2$	21.203
Significance	.007
Correctly classified: 80.5 percent	

Table 4 profiles the kinds of activities initiated by nascent entrepreneurs who brought their venture to fruition as compared to the activities initiated by those whose ventures were classified as non-operating. Interestingly, among those activities that did not statistically discriminate between the groups, over 70 percent of all entrepreneurs in the study reported having talked to customers, developed a product or service model, purchased materials and determined the venture's legal form. A very similar pattern is evident among the start-up indicators used by others (Carter et al. 1996), with very little difference between the two groups. Indeed, over 70 percent of the non-operating ventures reported having income from sales.

**Table 4: Percentage of Activities Initiated within Five Years of First Behaviour**

	Operating (n=23)	Non- Operating (n=69)
Discriminating activities		
Devoted full-time	57	35
Arranged for child care	35	16
Got financial support	78	51
Organized start-up team	62	43
Asked for funding	48	27
Saved money to invest	57	42
Determined legal status of business	96	97
Hired employees	22	13
Other start-up activities		
Prepared business plan	65	63
Prepared financial statements	55	44
Purchased major items	61	47
Purchased materials, supplies, inventory	87	71
Have copyright	22	22
Applied for patent	9	3
Invested own money	96	78
Began marketing/promotion	76	65
Developed product/service model	100	87
Talked to potential customers	74	75

A t-test was used to examine whether the total number of activities initiated varied across the two groups. As proposed earlier, the results reported in Table 5 indicate that the average total number of activities initiated by nascent entrepreneurs with an operating venture (mean=8.00) are significantly greater than the number initiated by those whose ventures were non operational (mean =6.49).

**Table 5: Operating vs Non-operating Ventures: Differences in the Total Number of Activities Undertaken**

	t-statistic	p	Means	Standard Deviations
Number of activities initiated	2.502	0.014	8.00	2.045
			6.49	2.633

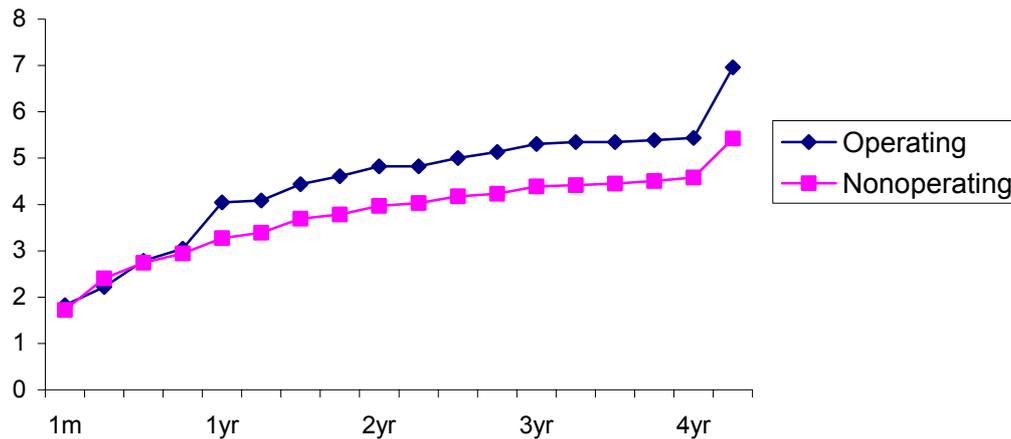

Because Levene's F was not significant, the equal variances assumed t was used.

Exhibit 2 plots the initiation of activities across the time scale. It indicates that all nascent entrepreneurs had a similar rate of activity during the first year of start-up efforts. Subsequently, entrepreneurs who brought their venture to fruition initiated significantly more activities and then maintained that rate as compared with those who eventually became classified as non-operating. (The surge of activity at the end of the time scale among both groups reflects the agglomeration of all activities initiated or completed five years or more into one category). Therefore, our fourth proposition is not supported as

aside from that small spike in the rate of activity by operating ventures, both groups had a fairly similar pace of activity.

## Exhibit 2

### Number of Activities Initiated Since First Start-up

## Behaviour

To facilitate further analysis, the scores plotted in Exhibit 2 were recalculated as a percentage of total activities initiated by each group. The results indicate that by the end of the first year, over two thirds of all activities initiated by each group already had been undertaken. Using median values, we then explored whether the sequencing of activities initiated during the first year varied by outcome status. The results are provided in Table 6.

**Table 6 : Sequencing of Startup Activities**

Year 1	Operating (n=23)	Non-operating (n=69)
1 <sup>st</sup> month		Developed product/service model
1 <sup>st</sup> quarter	Developed product/service model	
2 <sup>nd</sup> quarter	Devoted full time	Devoted full time Hired employees
3 <sup>rd</sup> quarter	Talked to potential customers/gathered information about the competition	Made purchases of raw materials, supplies, inventory Organized start-up team Prepared business plan
4 <sup>th</sup> quarter	Organized start-up team Prepared financial statements Asked for funding	Prepared financial statements Purchased/leased or rented major items like equipment, facilities or property

The results of this analysis indicate that those with non-operating ventures were far more active in attempting to bring their business to fruition within the first year. This suggests that they have a shorter expected duration for bringing a venture to fruition and supports our final proposition. Indeed, it is possible that they may have decided the venture would not meet their expectations. For example, according to self reports, the three main reasons given when asked why start-up efforts were given up included: 1) working too hard or too many hours, 2) wanting to achieve a better balance between work and other parts of his or her life, and 3) looking for or taking a job with another company.

## DISCUSSION AND CONCLUSION

Although exploratory, the results reported here highlight the dynamic nature of the start-up process. As the first real time longitudinal study of this nature undertaken in Canada, it provides considerable insight into the start-up process that Canadian nascent entrepreneurs' engage in. As the results of more longitudinal study of the start-up process become available, we will be able to build on this research through comparative analysis of national differences and similarities.

This examination of the start-up process indicates that the formation (and continuation) of an operating business implies a different sequencing of business start-up activities. The findings suggest that a personal *commitment* to bringing the venture to fruition (ie devoting full-time) underpins efforts to pursue activities associated with *connecting* to others. Since those reporting a non-operating venture appear to engage in activities more quickly than those reporting an operating venture, this may mean that members of that group perceives a larger gap between their expectations and reality and respond accordingly. The evidence suggests that it may not be appropriate to equate a non-operational venture with failure. Moreover, it suggests a need for more research in this regard. As well, it would be useful to further investigate the issue of expected duration.

This research has a number of implications. For aspiring entrepreneurs, these results indicate that starting a sustainable venture takes time and effort. However, it can be fairly quickly determined whether the venture will live up to expectations. For those providing business support and advice these findings indicate that planning activities are not a key driver among nascent entrepreneurs. Indeed, in the early stages of business start-up, the nature and speed at which activities are undertaken should not be misconstrued. For policymakers, this research suggests that it may take time for initiatives to bear fruit. While evidence indicates some degree of planning by nascent entrepreneurs, planning and action need to be integrated if a venture is to become a reality. This suggests a greater need for programs that will encourage individuals to achieve a better balance between planning and "doing".

One limitation of this research is the fact that it does not consider the impact of the context or individual factors on process and outcomes. Moreover, the impact of moderating variables is not addressed. These issues await further analysis. Finally, the research might have gained more insight by subdividing the non-operating ventures into those that were never brought to fruition and those that had been operational but subsequently were abandoned. Unfortunately, this was not possible due to the size of our sample.

With results indicating that outcome status implies a different nature, sequencing and timing of start-up activities, the findings can be used as a foundation for improving our capacity to more accurately identify the activities that foster sustainable new venture creation. In future, it would be useful to develop and test a conceptual model of start-up activities. Indeed, the differences in the nature of activities initiated between the two groups suggest that while *commitment* activities are important, engaging in activities that *connect* the nascent entrepreneur with others (ie asking for funding, organizing a start-up team) are the fulcrum for *controlling* the resources needed to establish a sustainable venture.

# CORPORATE FINANCE AND CORPORATE FINANCIAL ADVISORY FOR FAMILY BUSINESS (\*)

Stefano Gatti

## INTRODUCTION

Wealth management services for clients who are entrepreneurs or hold quotas or shares in family-owned firms (private companies) have some very particular features as regards *investment* or *asset management*. As a matter of fact, wealth management providers have to take into consideration two aspects of this type of clientele. On the one hand, an entrepreneur and his/her family or an entrepreneurial family are considered to be individuals with their own assets and annual income flows which must be optimized according to the established principles of asset management. On the other hand, however, the source of the income flows is closely linked to the management of the company and a large part of the entrepreneur's wealth is invested in the company itself. These characteristics raise particular problems in terms of optimizing the client's wealth.

This particular aspect has always had and continues to have considerable influence on those providing advisory services to entrepreneurs and entrepreneurial families. When financial intermediaries realized that this type of clientele presented some rather unusual features they began to gradually change their private banking activities. Although these activities initially focused mainly on managing the financial assets of high or very high net worth individuals, irrespective of the source of their wealth, they gradually turned into highly personalized services. This involved switching from an approach based on "financial" private banking to a broader one based on the management of the client's overall assets i.e. "wealth management". The search for a new role also meant segmenting the high or very high net worth clients even more and identifying groups of clients – including entrepreneurs and their respective families – with diversified needs due to the different source of their income or assets portfolio.

Moreover, the entrepreneur clientele often requires services involving deal planning, deal structuring and funding special transactions for companies in which the entrepreneur or his/her family hold equity stakes. Therefore, in the competitive arena, it is common to find not only operators traditionally associated with finance (mainly banks and private bankers) but also those associated with management or financial consulting.

(\*)Associate Professor of Banking and Finance, Bocconi University, Milan (Italy). Corresponding address: IEMIF Bocconi, Viale Isonzo, 25 – 20136 Milan (Italy) [stefano.gatti@uni-bocconi.it](mailto:stefano.gatti@uni-bocconi.it). This paper is part of a broader research work titled "Wealth Management for Family Business" which is still underway at Bocconi University and funded by Newfin – Research Centre for Financial Innovation. I would like to thank the Directors of the Centre, Professor Paolo Mottura and Professor Francesco Saita, for having provided the financial support for the research.

This chapter focuses on the relationship between personal and company asset management. Since a considerable part of the family assets are tied up in running the company, it is necessary to examine how corporate finance and corporate financial advisory services are integrated within the overall personalized management services. It is also necessary to precisely define what kinds of services can be offered, when they can be offered and who can provide these types of services and the kinds of business models they have developed.

The chapter is divided in the following way. Paragraph 2 describes the position of corporate finance in the more general framework of the management of the entrepreneur's wealth. Paragraph 3 evaluates the consequences in terms of the services requested to optimize the personal wealth of the entrepreneur and his family. This paragraph aims to describe, in a prescriptive way, the services that an operator should provide in order to be considered a credible partner in the wealth management business. Based on the different kinds of services required, paragraph 4 describes the effects on the offering and the prevailing business models. As regards the first point, we explain the links between *private banking*, *corporate finance* and the advisory services offered to entrepreneurs or entrepreneurial families; as regards the second point, we illustrate the business models adopted by large integrated banking groups and consulting firms traditionally associated with management consulting and corporate finance. We also describe developing trends in wealth management services for family businesses that are empirically observable at the international level.

## **CORPORATE FINANCE OPERATIONS AND WEALTH MANAGEMENT SERVICES FOR THE ENTREPRENEUR AND HIS/HER FAMILY**

*Corporate finance* and corporate finance advisory services in the area of family business – often referred to as M&A services – have one thing in common: what changes hands in a transaction is represented by a firm or part of a firm. Corporate finance advisory usually deals with shares or quotas representing companies or company divisions. If physical assets are to be bought or sold, they are usually incorporated separately from the original firm (parent company) by means of an equity carve-out or a spin-off before the sale takes place.

As regards integrated wealth management services for entrepreneurs, there are two kinds of operations, depending on the owner's objective:

entry and exit business operations;  
operations aiming at the organizational and managerial rationalization of the existing businesses or the reorganization of the existing ownership structure.

The first group of operations involves the acquisition of assets or company equity stakes (even by resorting to highly leveraged financial structures) and those involving the sale of

an entire business or business divisions to industrial partners, financial operators (*private equity*) or through listings on the Stock Exchange.<sup>1</sup>

The second group involves a different approach. In the first place, it can involve modifying the company assets so that the organization and management structure best suits the company profile and the separation between company wealth and personal wealth is sharper.<sup>2</sup> A company is likely to request these services when it has reached a more mature stage in its life cycle. By that time, its turnover is so high and management structure so complex that major changes in management have to be introduced. In this connection, particularly useful operations include equity carve-outs of firm divisions, creating group structures or even going offshore to set up holding companies in tax havens. This group of operations also includes reorganizing the company ownership structure in order to resolve succession issues through donations, acquisitions/intrafamily sale of shares, spin-offs or mergers.

This is shown in Figure 1. The matrix is made up of two dimensions.

The first, shown on the horizontal axis, indicates the presence of equity stakes in the entrepreneur's assets. When the company is small, the legal form of the firm is likely to be an individual firm (a firm entirely owned by a single person) or a partnership. However, it has been empirically demonstrated that when companies become larger, there is a tendency to make a sharper separation between personal/family wealth and company wealth by creating independent legal structures and concentrating equity stakes in the hands of the entrepreneur. However, transforming physical assets (the firm) into financial activities (equity stakes) affects both asset management – the acquisition or sale of companies takes place through the acquisition or sale of equity stakes – and the tax system. As a matter of fact, in many tax systems, the gains derived from the acquisition or sale of a company are liable to taxation just like corporate income. However, the capital gains derived from the sale of equity stakes by a physical person (the entrepreneur) are subject to a tax regime which is different from ordinary income taxes.<sup>3</sup>

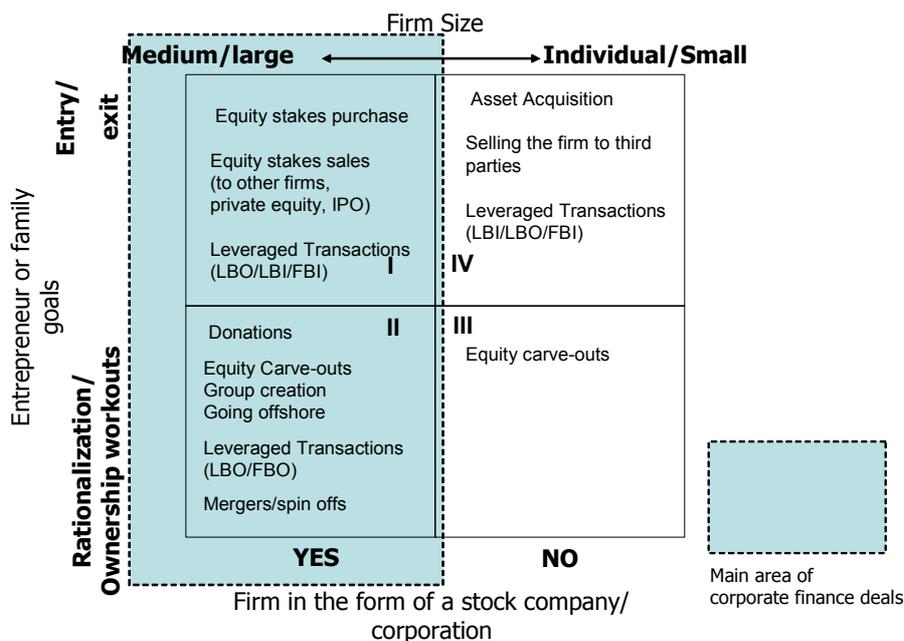

## **Figure 1**

### **Corporate finance operations in the management of family assets**

<sup>1</sup> Berger and Udell (1998) point out that during their life cycle, small family-owned firms are characterized by very different financial structures. The role of private equity is statistically more important when the business is at a more advanced stage of development and when the company is rather large. See also Fenn e Liang (1998). As regards exit from the business through IPOs, Bitler, Moskowitz e Vissing-Jorgensen (2001) empirically demonstrate that the percentage sold by the entrepreneurs has a negative impact on the subsequent valuation of the firm. This confirms the literature on market signaling (the sale of a small quota should indicate that the entrepreneur has a good opinion of the company and values it highly).

<sup>2</sup> Ang, Wuh Lin and Tyler (1995).

<sup>3</sup> The organizational variables are important in separating private wealth from corporate wealth. Avery, Bostic and Samolyk (1998) demonstrate that the organizational structure (corporate vs non-corporate) directly affects the wealth of the entrepreneur since, in the case of unincorporated structures, he/she has to commit a larger share of his/her personal wealth in order to obtain credit (and therefore to expand the business). As Lel and Udell (2002) also empirically demonstrate, personal wealth is involved when starting up a small business. Bento, White (2001) also consider the importance of the organizational structure of small businesses.

As we can see, corporate finance operations are more commonly found on the left of the matrix. In fact, operations regarding the management and rationalization of family assets invested in entrepreneurial activities become more rapid, efficient and less costly when the assets themselves are represented by equity stakes. When this is not the case, it is preferable to first carry out carve-outs or spinoffs and subsequently corporate finance operations on equity stakes representing companies or company divisions.

The second dimension of the matrix – the vertical one – focuses on the objectives pursued by the entrepreneur through corporate finance operations in the area of family business. These objectives include the entry into a new business, the total or partial exit from a business or the rationalization of the corporate structure and reorganization of the positions of the family members. It should be pointed out that it is sometimes impossible to distinguish between these two objectives. For example, there might be a single company with one or more business divisions from which the entrepreneur wants to withdraw by selling to third parties. In this case, simply selling the individual company (Box IV) is unfeasible since the business area or areas for sale must first be separated through spin-off/carve-out (Box III) and the equity stakes corresponding to these areas subsequently sold (Box I). A similar procedure is followed when the entrepreneur assigns business areas to family members in order to prevent them from participating in the same company (Box II).

If the two dimensions cross, we obtain four boxes illustrating the different kinds of corporate finance operations.

Box I includes corporate finance operations regarding equity stakes on the entry or exit from a business. These operations involve the acquisition of equity stakes by third parties or the sale of equity stakes to non-family members. The acquisitions can also involve a considerable use of debt (leveraged transactions in the form of LBO/LBI or FBI). As

regards the type of sale, the difference lies in the party making the acquisition: if the negotiations are private, the sale might be made to another entrepreneur/family or to a financial partner through private equity operations (with or without an agreement to buy back at a certain date). The second possibility is going public through an offer for sale of the company shares.<sup>4</sup>

Box II includes corporate operations regarding equity stakes aiming at rationalizing the assets used by the company or reorganizing the positions of the family members. This box differs from Box I in that the entrepreneur invests/disinvests by acquiring/selling more or less considerable parts of assets from/to third parties who are not family members. Instead, in Box II, investments or disinvestments are absent or limited to family members only. Box II includes:

- donations to ensure family succession;
- mergers and spin-offs: the first might be necessary to simplify the group structure and the subsequent chain of command, the second might be useful to separate company areas/physical assets and the respective equity stakes to assign to the different family members or to the successors of the business (especially if the company spin off is not proportional);
- equity carve-outs and creation of groups: this involves first reorganizing the company assets so as to separate the operational activities (usually in the hands of professional managers) from those involving the management of the equity portfolio concentrated in a holding controlled by the entrepreneur. Moreover, creating group structures can be accompanied by the entry of new members in minority positions (with the aim of enlarging the group dimensions with no need for the controller to invest more money) or locating holdings in countries with a low rate of taxation on dividends;
- leveraged transactions: this also involves LBO/FBO operations which, from the standpoint of the individual seller (acquirer), fall in Box I but from the standpoint of the extended family, can represent a way of reallocating the wealth and liquidity among the different family members. Take the case of two siblings who agree to carry out an LBO operation in which one acquires the shares of the other by creating a highly leveraged company.

Boxes III e IV have many of the same operations carried out in Box I and II. The difference lies in the fact that in these cases the companies are not corporations with issued shares and they are not usually large. This leads us to make the following important observations:

- the number of corporate finance operations that can be carried out are considerably reduced and limited to raising cash through the sale or acquisition of firms and (much more rarely) the realization of leveraged acquisitions/buyouts;

<sup>4</sup>In Box I, we only include the possibility of sale through IPO even if the Italian OPVS (offer for sale of already issued shares accompanied by the issuance of new shares to be underwritten by new shareholders) represents a feasible model. In this case, exit is certainly not definitive: in these cases, the entrepreneur might convert part of the equity stake into cash, thus reducing his/her financial commitment to the company by diluting the control quota determined by the underwritten tranche. Moreover, in these cases, the entrepreneur continues to maintain his/her ties with the company subject to IPO since he/she remains a member of the Board of Directors.

- when corporate finance operations have to be carried out to reorganize corporate assets, it is necessary to resort to the activities in Box III (as a preventive measure, companies or business areas are separately incorporated in ad hoc legal entities) and then proceed to carry out the operations in Box II or I.

## **CORPORATE FINANCE OPERATIONS: LINKS WITH ENTREPRENEURIAL ASSETS AND CONSEQUENCES IN TERMS OF REQUIRED SERVICES**

The above-mentioned corporate finance operations obviously affect the personal wealth of the entrepreneur and his/her family and provide important information in terms of the services required by entrepreneurs to satisfy their personal needs.

Keeping in mind that the company is only one of the assets included in the entrepreneur's portfolio, an integrated approach to wealth management has to provide assistance in the following areas:

succession planning services;

legal and taxation services;

asset management services or retirement planning services;

company valuation and corporate finance services.

These services will now be described in detail.

### **Succession planning services**

When an entrepreneur decides to definitely leave the business or wants to reorganize his/her equity holdings and still continue to participate in the company, it is necessary to obtain advisory assistance in devising a suitable succession plan.

Wealth managers usually develop relationships with entrepreneurs in this area of activity when unusual events occur in the life of an entrepreneur: events in the entrepreneur's personal life (children ready to enter the firm, the death of key collaborators, accidents leading to disability or injuries) or external circumstances seriously affecting the firm (reorganizing the business due to a sharp increase in turnover or business decline, a change in the tax system etc.).<sup>5</sup>

When these events occur, entrepreneurs need assistance to help them identify the objectives they want to reach when planning their succession. In fact, these objectives can be very different and include maintaining their economic independence after leaving the

<sup>5</sup> Rutherford and Oswald (1999) indicate that successful companies resort to strategic planning to deal with problems instead of ignoring them or facing them when they occur. In these cases of excellence, the presence of a highly-trained entrepreneur with considerable professional experience is a constant factor highlighted by empirical evidence.

business completely or in part, ensuring the firm and his successors long-term success even at the cost of personal sacrifice in terms of proceeds from the sale, minimizing tax on disinvestment capital gains, fair treatment of all the family members. These different objectives can significantly affect the kind of corporate financial advisory services offered.

## **Legal and tax advisory services**

Corporate financial advisory always require specialized legal and taxation services. Assisting the entrepreneur during negotiations, evaluating the extent to which taxes affect the value of the company and the entrepreneur's wealth are very important elements that always recur in exit and disinvestments operations as well as in intra-family shares deals or reorganization of business, particularly in the case of organizing family holdings abroad.<sup>6</sup>

In this sense, deal structuring has the dual objective of minimizing the tax on the company and on family wealth or income. Wealth management must therefore possess specialized technical expertise in order to provide the client with the most effective solutions.

## **Asset management and retirement planning services**

Corporate divestitures or equity transactions have an immediate impact on the personal wealth of the entrepreneur. The sale of an entire company or business division, the transfer of shares, a listing on the Stock Exchange obviously require strategic support and advice on the best way to invest the proceeds of disinvestment which are often quite high. Moreover, in the case of a definitive sale, these sums should ensure the seller and his/her family a suitable living standard in the medium-long term.

However, these services are also requested by entrepreneurs who, although not undertaking major divestitures, operate in mature businesses characterized by a strong cash flow generation potential. The flow of periodic returns and the various compensations received from the company might require an asset management or retirement plan that can guarantee an adequate return for the entrepreneur himself/herself.<sup>7</sup>

In this type of activity, wealth managers can suggest different strategies depending on their background.

<sup>6</sup> Cavalluzzo and Geczy (2002) draw particular attention to the influence of the tax variable when choosing a particular organizational structure. With reference to the United States, empirical data show that taxation together with the problems of separating personal and corporate assets, the increased complexity of the ownership structure and specific sector factors clearly explain the decision to opt for a proprietorship (the firm is owned by a single physical person), partnership (limited partnership), S-Corporation or C-Corporation (joint-stock company). Moreover, organizing business activities in the form of a Corporation is advantageous in terms of capital cost with respect to the alternatives represented by the individual business and limited partnership.

<sup>7</sup> As regards the compensation methods of the owner-managers of a family-owned firm see Cavalluzzo and Sankaraguruswamy (2002). Although the context analysed is the U.S., the results also apply to Europe and Italy. In fact, the authors argue that the remuneration methods of the owner-manager of a small business derive not only from the profits but also from the compensation received as member of the Board of Directors or CEO and from the interest payments if the business is financed by the owner himself. The different compensation methods aim to optimize the entrepreneur's personal tax burden.

In the case of wealth management developed in private banking, the services can cover the entire spectrum of the entrepreneur's needs:

defining the desired risk-return profile;  
devising an investment plan;  
allocating savings in the asset class proposed.

However, in the case of wealth managers with a management consulting or financial advisory background, the allocation of the sums based on the suggested investment plan is not directly feasible since these managers are not financial intermediaries. In these cases, the service includes the search for a suitable asset manager for the entrepreneur and also the continuous monitoring of the performances obtained.

## **Valuation and corporate finance services**

The principal market actors providing these services include established operators in corporate and investment banking and financial advisory services.

Each M&A deal involving the whole or part of a firm is finalized after a detailed analysis and assessment is made. In fact, it is necessary to examine sector trends, evaluate a company's past and future strategy, determine the value of the firm/business division and the relative equity stakes, define the most suitable deal structuring and finally, in the case of an acquisition, find the necessary funding.

Even for these types of services the different background of the competitors has important consequences in terms of the services supplied. Financial advisors (but not always in the case of managers with a management consulting background) can provide these services directly. However, in the case of financial wealth managers (mainly banks and financial intermediaries), they might request some form of support from their own corporate finance or corporate and investment banking staffs or from external partners linked through network relations (accountants, business lawyers, financial consultants). The first option is actually very uncommon and limited mainly to large-size transactions.

## **A summary of the services offered according to the different types of M&A deals**

By crossing the services analyzed in the preceding paragraph with the indications obtained from the matrix shown in Figure 1, we can see the different types of services related to M&A operations designed to manage the entrepreneur's family assets (see Figure 2).

### ***Figure 2*** ***Corporate finance operations in the management of family assets***

Type of service	Type of operation							
	Entry/Exit			Rationalization/Family Issues/Firm's or Group's Organisation Structure				
	Acquisition	Divestiture	Leveraged Transactions	Donations	Split Offs	Merger Spin Offs	Leveraged Intrafamily Transactions	Going Offshore
Succession Planning Services								
Legal and Tax Services								
Investment Mgmt								
Retirement Planning Services								
Company Valuation								
Corporate Finance								

The matrix is made up of columns – representing the different types of corporate finance operations provided for entrepreneurial families and corresponding to the different objectives of the entrepreneur/family – and rows representing the services required by the single operation or overall wealth management.

The boxes which are shaded indicate they are not active. However, the absence of services in these boxes does not mean that the entrepreneur does not require advisory services.

As a matter of fact, in the case of acquisitions and investment management/retirement planning services, if an entrepreneur acquires equity stakes, the problem of investing the proceeds does not arise; however disinvestment of part of his/her personal assets might be necessary as a preliminary measure before making an acquisition. In this case, the investment management service is provided before the M&A deal and is not directly linked to the realization of the operation. The same reasoning obviously holds true in the particular case of leveraged acquisitions.

If we cross donations with *investment management/retirement planning services*, donating shares or equity stakes can have serious repercussions on the donor's remaining assets. Therefore, it is necessary to evaluate whether the remaining assets ensure the entrepreneur a good standard of living. Therefore, investment management service is provided as a preventive measure before deciding to make a donation (often in connection with succession planning services which – as shown in the matrix in Figure 3 – are not shaded).

The remaining shaded boxes concern M&A deals carried out through mergers, spin-offs or offshore family holding incorporation. For these boxes, the same observations hold true as in the case of donations. In fact, the wealth of the entrepreneur is not affected by these operations except in the case of donations following spin-off operations which benefit other family members.

The other boxes of the matrix represent other services which can be offered by those administering the entrepreneur's personal wealth. More precisely, succession planning services represent a common element underlying all the operations indicated in the column. Legal and tax services are necessary in order to minimize the tax burden (at the corporate and personal level) of corporate financial operations. Finally, company valuation and corporate finance services are requested for each deal which, as pointed out earlier, is based on the valuation of the company which is the object of the transaction.

*Investment management* services are instead required for disinvestments and leveraged intrafamily operations when the entrepreneur is selling his/her assets. In these cases, the cash flows derived from the disinvestment have to be suitably allocated in securities, real estate or pension fund investments

## **CORPORATE FINANCE SERVICES IN THE WEALTH MANAGEMENT OF ENTREPRENEURS: EFFECTS ON THE OFFER AND PREVAILING BUSINESS MODELS**

The preceding paragraphs show that entrepreneurs and their families are very special clients in the panorama of services offered to *high or very high net worth individuals*.

Since they are individuals possessing an income and assets they require advisory services which help them identify the most efficient asset allocations in order to reach their desired objectives. Generally, from the standpoint of the entrepreneur as an individual, the objectives are often centered on security, protection of the family members and discretion.

As entrepreneurs, the clients participate in the management of the company and the success of the company is a prerequisite for the achievement of family objectives. These objectives depend all the more on company success the greater the family's financial commitment, the less the firm is mature and the greater the investments required to reinforce the firm's market position.<sup>8</sup>

Optimizing the investment in the firm and consequently even the cash flows benefitting the entrepreneur and his/her family require services and expertise that – as shown in Figure 2 – are not usually found in traditional investment management which usually deals with the administration of assets made up of activities different from the entrepreneurial ones. The expertise required to perform the services described in the preceding paragraph are more

<sup>8</sup> *The close connection between the business risk and personal risk of the entrepreneur and his/her family was the subject of an empirical study carried out in the United States. In this connection, see the sample of 692 businesses analysed by Ang, Wuh Lin and Tyler (1995) and the findings of Haynes and Avery (1996) based on the NSSFBF (National Survey on Small Business Finance). The holding of a considerable equity stake by the entrepreneur or family members (and therefore the dependence of personal wealth on the success of the business) is also documented by Bitler, Moskowitz and Vissing-Jorgensen (2001). According to these authors, a considerable financial commitment by the entrepreneur and his/her participation in the firm increase corporate performance even considering the heterogeneity of the sample analysed.*

similar to those of strategic consulting, management consulting as well as corporate finance and financial advisory services. From the standpoint of a bank, the services are provided by the corporate and investment banking division rather than the private banking or asset management one.

Therefore, wealth management of a family business requires a multi-disciplinary approach comprising at least three types of services:

*consultancy*: as shown in the following paragraphs, consultancy concerns the personal or family profile of the entrepreneur (for example, succession planning, optimizing the tax structure, allocating the wealth derived from corporate assets) as well as his/her role as head of the firm (for example, strategic planning, management consultancy regarding the organization of the company or group).

*investment management*: the principles of allocating the available wealth and income of the entrepreneur and his/her family require expertise in finding the best risk-return combinations compatible with the client's investment profile. This concerns investments in both securities and real estate. These services are likely to be of crucial importance to those entrepreneurs whose firms have a steady free cash flow profile and low growth rates of the invested capital (cash cow firms).

*corporate finance and investment banking*: the management of an entrepreneur's wealth might entail adopting an integrated approach to the efficient management of part of the wealth represented by the company and the part invested in other assets. In this connection, structuring, funding as well as taxation and legal services are requested when carrying out corporate finance operations.

In short, satisfying the needs of the client in the area of family business depends on a "*client-centric vision*"<sup>9</sup> in which the three above-mentioned services aim to provide an integrated wealth management solution.

## **Competitors offering wealth management services to entrepreneurs and entrepreneurial families**

The possibility of providing integrated *investment management*, consultancy and *corporate finance* services to a highly segmented clientele has made this market niche extremely competitive and selective.

This paragraph presents some models of service providers chosen among those examined at the international level. Based on empirical evidence, two types of potential competitors emerge:

large, integrated banking groups

<sup>9</sup> As will be shown, UBS uses this term to describe their approach to wealth management services.

consulting firms, especially those oriented towards corporate financial services

### ***Large, integrated banking groups***

In the case of large, international banking groups, the situation is not completely homogeneous in the approach to *wealth management services*. This applies to large European and American financial intermediaries.<sup>10</sup>

A common feature of these groups is that wealth management services are well established in the private banking divisions or in group-controlled companies providing private banking services. In fact, historically, all the large banks began by assaulting the private high income segment of their clientele and adopted a relatively undifferentiated approach, regardless of the specific needs of this clientele, and focused on asset management services (often management of securities portfolios).

In the end, however, this approach turned out to be quite inefficient both in commercial and strictly economic terms.<sup>11</sup> This led to a second stage in the development of private banking services in which asset management was accompanied each time by services focusing on the specific needs of the high or very high net worth segments of the clientele. In short, the strategies of the most trustworthy competitors began to shift towards the philosophy of the “global management” of the client’s assets or wealth management and not just “financial” private banking.<sup>12</sup>

These services are offered by many foreign banks.

Deutsche Bank is the leading European banking group in terms of revenues and total assets. In October 2002, it began restructuring its PCAM (Private Clients and Asset Management) division in order to set up a special division devoted to *Private Wealth Management* closely integrated with SBB (*Small Business Banking*) activities. This integration is designed to enable the bank to provide an integrated offer in which the core services of private banking are heightened by those closer to *corporate and investment banking*: in addition to active advisory, portfolio management, alternative investment services (centered on hedge and real estate funds), “*Special Services*” include family office, financial planning and fiduciary services.

Since this integrated service is still in its early stages, the focus still tends to be on private banking services (see Figure 3).

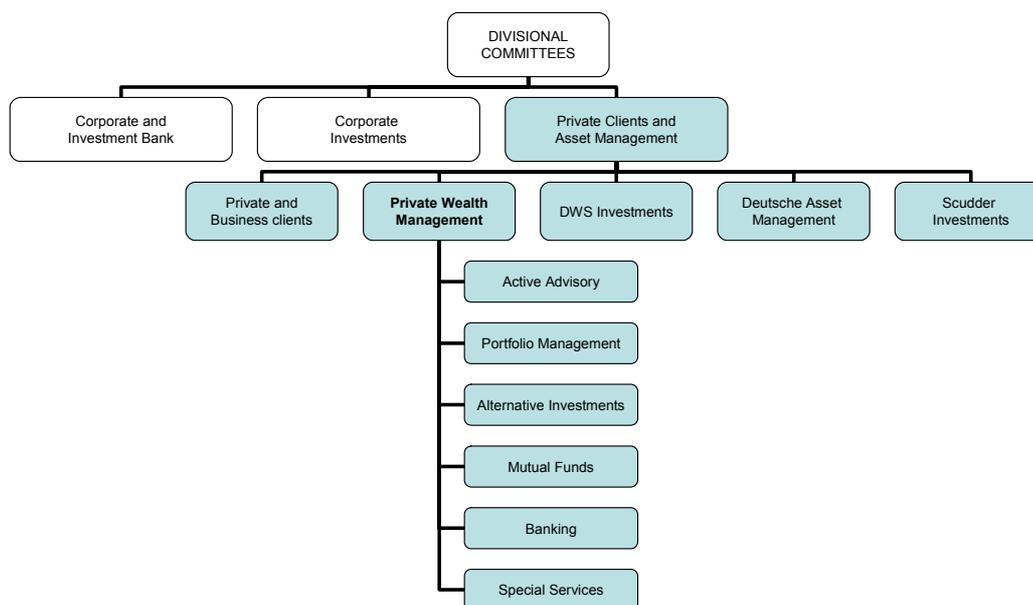

<sup>10</sup> Since the business of wealth management is almost exclusively represented by large banking groups, the intermediaries we chose to analyse were taken from the available League Tables. The European intermediaries (Sourcee R&S – Mediobanca) and the American ones (Source: The Banker) rank among the top 10 by volume of revenues and total assets.

<sup>11</sup> “Unlike competitor banks, some of which reported losses ranging from 30 to 50% last year, the Citigroup Private Bank had earnings growth of 45% over the last two years”. See Citigroup (2002).

<sup>12</sup> A more personalized approach was naturally accompanied by an increase in the access threshold to integrated wealth management services. The family office offered by Deutsche Bank, besides being available to only German or US-residents, has a minimum threshold of 30 million US dollars; those offered by Credit Suisse Trus, 50 million euros.

Figure 3

The approach of Deutsche Bank to wealth management

Source: Deutsche Bank, Company Information, 2003.

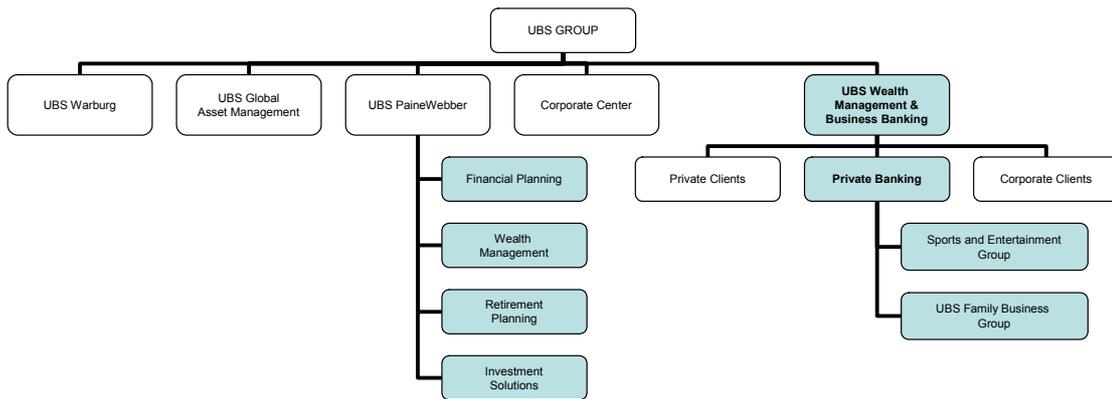

Services similar to those provided by Deutsche Bank are also provided by BNP Paribas to a high or very high net worth clientele through its Private Banking (Banque Privée) division. Even in this case, there is a tendency to integrate management and *personal financial planning* with corporate financial consulting services<sup>13</sup>. However, the latter are still handled at the local level by the Corporate and Investment Banking division through external partnerships with professionals and consultants specialized in corporate taxation and corporate finance.

The approach of UBS, focuses more on the small business and entrepreneur clientele segment. In fact, for some time, the Wealth Management and Business Banking division has adopted a very segmented approach to its private clients: in addition to the “Sports and Entertainment Group”, there is also a “Family Business Group” division devoted to entrepreneurs and entrepreneurial families. UBS PaineWebber (see Figure 3) also tends to offer personalized wealth services.

Figure 3

<sup>13</sup> In addition to the traditional asset management consulting services and the investment funds and securities services, BNP Paribas Private Bank also offers the so-called “Personalized services” in the areas of art advisory, real estate management, prestige land and country estates, luxury properties transactions (the last 2 managed directly by the Paris headquarters), trust and family holdings. It is obvious that, except for the last consulting service for the group structure, the BNP approach still tends to be mainly oriented towards private banking and personal financial planning services .

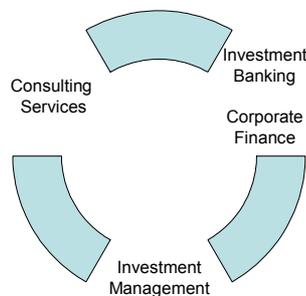

## The approach to wealth management of UBS

Source: UBS, Company Information, 2003.

The approach to clients adopted by the Family Business Group included in the broader activities of *private banking* tends to be a “client centric solution” shown in Figure 4:

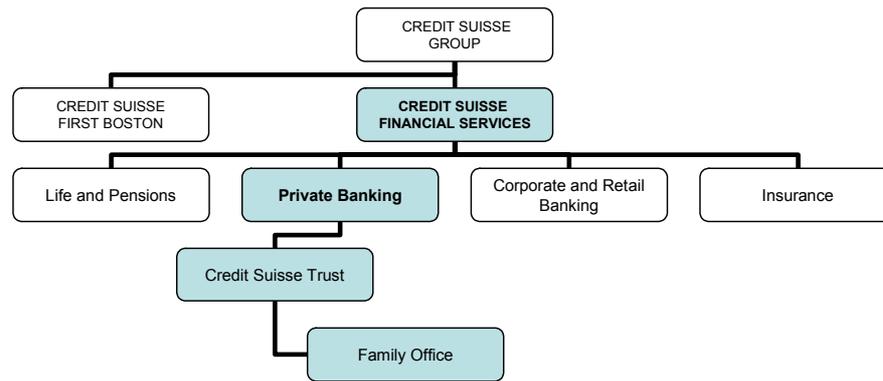

**Figure 4**  
**UBS: the “client centric solution” approach to family business**

Source: UBS, UBS Family Business Group, 2003.

Credit Suisse is also trying to focus more on the entrepreneur clientele by introducing its Credit Suisse Trust in its Private Banking Division in order to offer integrated wealth management services for *very high net worth individuals*. The fact that the bank is also planning to create a family office is a clear indication of the Group’s strategy (Figure 5).

**Figure 5**  
**The approach to wealth management of the Credit Suisse Group**

Source: Credit Suisse Group, Company information, 2003.

As regards the American banks, following the wave of mergers between commercial and investment banks which characterized the late '90s, banks have recently begun to change their approach to private wealth management services. Due to their strong position at the international level and the expertise they acquired by integrating investment banking structures, the large American banks are adopting a very aggressive strategy of highly personalized services.

Citigroup, for example, the leading American bank in terms of total assets, opened a specialized Citigroup Private Bank division in May 2002. This division has become the commercial vehicle offering private clients all the bank services including the traditional private banking services and – in the case of entrepreneurs and entrepreneurial families – corporate and investment banking. The underlying idea is to demonstrate that Citigroup is not a private banker but a “private partner”.<sup>14</sup>

The model represented by JP Morgan-Chase and Bank of America are quite similar since they have concentrated their wealth management services in their respective Private Bank divisions. In addition to asset management these divisions offer the following services:

- tax planning
- charitable planning
- estate planning
- private company advisory services.

## **Consultants**

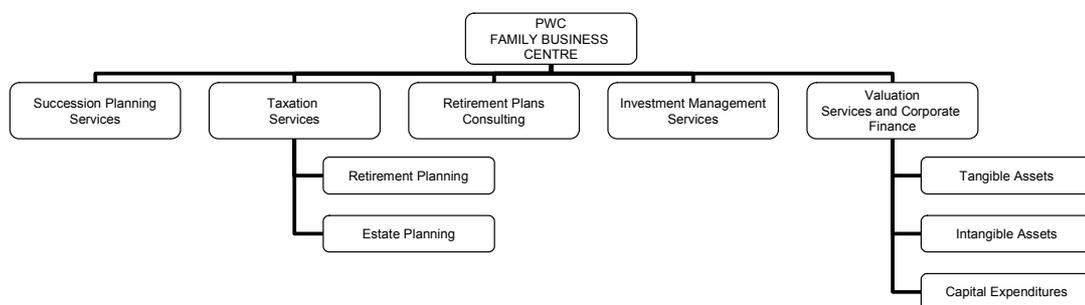

The second group of actors providing *wealth management* services to entrepreneurs is made up of consultants in the areas of strategic and financial planning.

<sup>14</sup> “The Citigroup Private Bank quickly began to transform itself from the classic private banking model into a new paradigm: It evolved to become an entry point to the breadth of financial and investment resources of Citigroup for its ultra-affluent clients around the world...The Private Bank works with the wealthiest families in the world. As a result, we are always leveraging the best investment opportunities of Citigroup in order to increase our share of their portfolios”. See Citigroup (2002).

The phenomenon should not be surprising since a considerable part of the personal financial planning of entrepreneurial wealth requires the professional services already provided to companies by management consultants or by experts in corporate finance.

Among the financial consultants, the Price Waterhouse Coopers Small Business Centre provides highly segmented solutions to entrepreneurial families. This business unit was set up to replace traditional “corporate” services with “corporate and individual” or “corporate and family” based services (see Figure 6).

**Figura 6**  
**The approach to wealth management in Price Waterhouse Coopers Small Business Centre**

Source: Price Waterhouse Small Business Centre, Company Information, 2003.

The approach of Grant Thornton and its People and Relationship Issues in Management (PRIMA) Service is similar to the approach of Price Waterhouse Coopers. The strategic consulting services focus on the relationship between the individuals who manage the business and the consulting services offered to the company :

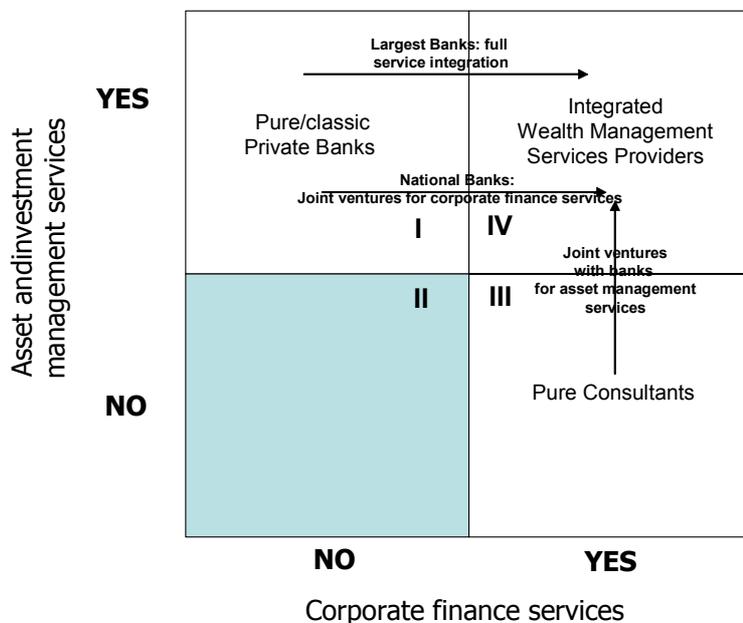

“As well as dealing with the business needs in terms of audit, tax compliance and other services traditionally associated with business and financial advisers, we have been

working with business owners for many years and recognise the unique challenge they face [...] (We) are able to provide a valuable insight into the crucial relationship issues surrounding business management, and the financial and commercial options that are available to help resolve internal conflict".<sup>15</sup>

### **A summary of the market trends of wealth management services**

The current situation of the offer of wealth management services is summarized in the following matrix (see Figure 7).

**Figure 7**  
**Strategic groupings and forecast trends in the wealth management of entrepreneurial families and entrepreneurs.**

The market trend shows a gradual shift towards Box IV in which the strategic grouping of integrated wealth management service providers is prevalent with respect to specialized operators. With the rare exceptions of some European and American banks, the cases

<sup>15</sup> See Grant Thornton (2001).

empirically found to be more numerous are concentrated in Box I and III. The first is made up of banks still oriented towards an undifferentiated private banking service and the third is made up of management and corporate financial consultants who are organizing special groups or centres to provide services to entrepreneurs or their families.

It is likely that in the future a completely integrated wealth management service will be provided only by the large multinational intermediaries since only they can provide independent commercial banking, investment banking and consulting services regarding asset management and corporate finance issues.

Smaller, national banks and consultants will tend to make outside alliances and partnerships to deliver the services they cannot provide because of operative and regulatory constraints (for example, in Europe, asset management services are by law the domain of investment companies) or constraints regarding the available human and financial resources. The banks will look for legal, tax and, in part, corporate financial consulting services abroad, as is now the case. The consultants will tend to directly carry out the activities of wealth management, legal and tax optimization and corporate finance by stipulating "portage" agreements with the banks in order to offer their clients asset management services or finance services for entrepreneurial families.

# **BUSINESS SKILLS OF SMALL BUSINESSES IN THE PERI-URBAN AREAS OF NORTHERN TSHWANE**

**Prof Johan W Strydom (School of Business Management, Unisa)**

**Dr Deon Tustin (Bureau of Market Research, Unisa)**

## **INTRODUCTION**

Peter Drucker stated in 1993 that in the knowledge society, knowledge is eclipsing the traditional factors of production such as land and capital. Thriving and growing in this changing business environment implies that the small business of today must leverage the skills and intellect of their employee base<sup>1</sup>. It has furthermore been stated that small businesses are seen as one of the most important factors to generate ways for growth and employment in South Africa<sup>2</sup>.

Of concern is the fact that up to 80% of all South African small businesses fail in the first five years of their existence<sup>3</sup>. It is estimated that the South African economy lost more than R68 million over the period 1997 to 2000 because of the failure of 117 246 small businesses<sup>4</sup>. A study in Canada indicates that 68% of small and medium enterprises (SMEs), with fewer than five employees, failed within the first five years<sup>5</sup>. Reasons for this occurrence include

- a lack of adequate working capital
- a rapidly changing business environment
- a poor market selection
- a lack of essential business and management skills<sup>6</sup>

The lack of business skills in small businesses forms the backdrop to this paper. First, existing research on the business skills of small businesses will be reviewed. Thereafter the empirical research undertaken will be discussed, and finally, deductions made and conclusions drawn.

## **REVIEW OF RESEARCH ON BUSINESS SKILLS IN SMALL BUSINESSES**

The problem of a lack of business and management skills is a worldwide malaise in both developed and developing countries. A developed country such as the UK is struggling with a workforce without basic reading and writing skills. Studies in the UK have found that at least 23% of all adults have inadequate numeracy skills which impacts negatively on the growth of small businesses. The same problem applies to a lesser extent to Europe where at least 10% of its workforce is having problems related to poor numeracy skills. As in South Africa, job creation in Europe is at the higher end of the market – that is, growth on the highly skilled side of the workforce with a growing number of workers being

unemployable, owing to the lack of essential skills. Of particular interest is the fact that the smaller businesses in the UK (defined as employing fewer than 20 workers) are suffering most severely with the problem of a lack of literacy and numerical skills<sup>7</sup>.

In Canada the lack of management skills is seen as the prime reason why small businesses fail, and it is speculated that there is a general lack of awareness of management processes and tools in the small business sector. Nine problems were identified that need to be addressed to make Canadian small businesses more successful. These are<sup>8</sup>

- the lack of a clear approach to the definition of business skills
- the lack of awareness of particular needs for business skills
- the lack of knowledge of skills required to prosper
- the lack of awareness of particular needs for business skills
- the misdiagnosis of needs or problem areas in small businesses
- a lack of critical information about the performance impacts of investment in business skills development
- a lack of awareness of sources of information on skills
- limited time for training
- limited financial resources to hire professional advisors/mentors
- a lack of a continuous learning philosophy for small businesses

Similar problems have been identified in the USA with the US National Association of Business Economists stating that 58 percent of reporting companies have a shortage of skilled workers. According to the Council of Competitiveness, this acute skills shortage threatens the foundation of competitiveness in the USA.<sup>9</sup> The workplace deficiencies listed include:

- a lack of sound work habits
- poor people skills
- poor cognitive skills specific to the workplace
- poor technical knowledge

Training is regarded as imperative to rectify the problem in the USA. Traditionally, training and development were not seen as an activity that creates value and helps an organisation to be competitive. It is in small businesses in particular that training is not really encouraged for reasons such as financial constraints and a lack of support from management. Research in the USA has found that less than 19% of small businesses include formal training programmes for new employees compared with 44% for larger organisations<sup>10</sup>. This view is slowly changing and special interest is shown in trying to determine the needs of small businesses. In research undertaken on the customer base of the Small Business Development Centres in the USA the following training needs were identified by the owners/managers of small businesses for their workers (in order of priority)<sup>11</sup>:

- how to increase sales
- how to promote the business
- how to research the market
- how to conduct financial analysis and control
- how to obtain capital
- how to obtain government contracts

Additional training needs that were mentioned include

- computer systems training
- accounting and record keeping
- international trade knowledge
- managing the inventory
- managing personnel

On the specific area of management training the owners/managers mentioned the following training needs for themselves (in order of priority)<sup>12</sup>:

- time management
- basic business and financial skills
- updates on tax laws
- conflict management and problem solving
- quality management
- improved interpersonal communications
- training employees
- providing career development for employees

Lastly, looking at the situation in South Africa, a study published by the Global Entrepreneurship Monitor (GEM) in 2001 reported an overall lack of entrepreneurial elements in the culture of South Africa<sup>13</sup>. The GEM report of 2003 indicated that if black entrepreneurs' new ventures were as successful as those of their white counterparts in South Africa, this would create 500 000 new jobs<sup>14</sup>. The entrepreneurs referred to obviously include numerous small businesses. A programme is proposed to empower black entrepreneurs and increase the survival rate of newly established black businesses. This programme should be focused on the development of business skills. In the study it was found that South African entrepreneurs feel that they have half the business skills to start a new business compared with their foreign counterparts, which indicates, inter alia, that more needs to be done at secondary school level because most of these entrepreneurs are young unemployed people. Another area in which help is needed is in existing black SMEs. Here research has shown that basic financial management skills are a major problem and that businesses that adhere to basic financial and accounting practices have three times less chance of encountering cash flow problems.

Other South African research confirms that entrepreneurial training forms the cornerstone of an enabling environment to initiate and grow small businesses<sup>15</sup>. One study indicated that problems encountered by South African small businesses in the three metropolises of Nelson Mandela, Cape Town and Egoli can be categorised into the following areas (in order of priority):

- macro-environmental problems which refer to economic and social problems such as unemployment, crime and HIV/AIDS
- marketing problems, such as a lack of knowledge of the market, and more specifically, the target market, a lack of knowledge about competitors and ineffective marketing practices
- management problems, inter alia, a lack of management experience, knowledge and skills

- social problems which relate to long working days, family and social pressures and ill health due to business pressures
- human resource problems, referring to procurement problems in not finding suitable staff, poorly trained workers and poor labour relations practices
- financial problems, inter alia, the acquisition, allocation and management of capital as well as insufficient knowledge of bookkeeping

Having briefly summarised the state of business skills of small businesses in a few countries it is time to focus on the empirical research undertaken on this issue.

## **PURPOSE OF THE RESEARCH**

The current study forms part of a larger study completed in 2003 by the Bureau of Market Research at Unisa in collaboration with the Joint Education Trust (JET) and the National Productivity Institute (NPI)<sup>16</sup>. The peri-urban areas of Northern Tswane formed part of the old Bantustan of Bophutatswana and the subsidies provided by the government to businesses in this area was discontinued after the establishment of the new democratic government in 1994. This impacted negatively on the economic well-being of small businesses in these areas and led to increased unemployment and poverty (it is estimated that about 20 000 jobs were lost during this period). In order to obtain a turnaround in this area, a skills audit was done to determine the skills base available among small businesses in this area. This formed part of a broader initiative to develop a regional development plan for this area which, inter alia, forms part of the national skills strategy of South Africa with a view to broadening the skills base of previously disadvantaged individuals and increasing overall labour productivity.

This research therefore focused on identifying the current business skills as well as the future business skills required by small businesses in this area.

## **METHODOLOGY**

Selected peri-urban areas of Northern Tswane formed the survey area of this research. For the purposes of this study, peri-urban areas are defined as the lower-density developments on the city periphery of Tshwane and include the following areas: Temba, Dilopye, Majaneng, Marakolong, Nuwe Eersterus, Ramotse, Sekampaneng, Suurman, Stinkwater and Hammanskraal.

### **Sample units**

The sample units for the survey were all small business establishments functioning in the above-mentioned selected areas. These small businesses operated under the same ownership or management with a complement of 20 or fewer employees. Based on the nature of the local economy in Northern Tswane it was decided to survey the manufacturing, retail, service and agricultural sectors, because these sectors were responsible for more than 66 percent of the employment in this area.

According to Ntsika, the small business sector can be subdivided into three basic groups, namely survivalist establishments with no employees, only the owner/entrepreneur, micro establishments with one to 20 employees and very small establishments with between five and twenty employees. The survivalist and micro establishments usually operate in the informal sector and are not registered for the payment of VAT. The very small business establishments normally form part of the formal market<sup>17</sup>.

## Sample elements

The sample elements were defined as the owners or managers of small businesses as described above in the survey area. Four main survey areas were demarcated using SA Explorer<sup>18</sup>, and the corresponding population figures by municipal ward are depicted in table 1 below.

**Table 1: Survey areas and population figures by municipal ward**

Main survey area	Municipal ward	Ward number	Population	% of total population
Western	Eersterus Stinkwater	13	18 946	24,5
		14	25 151	
Central Western	Dilopye/Sekampaneng Suurman/Majaneng	8	27 822	26,5
		76	19 922	
Central Eastern	Temba/Leboneng	74 & 75	41 986	23,3
Eastern	Ramotse/Marakolong Hammanskraal	73	22 425	25,7
		49	23 713	
<b>Total</b>			<b>179 965</b>	<b>100,0</b>

The information depicted in table 1 was used as a guideline to determine the sample size distribution by survey area. Table 1 indicates that each survey area represents roughly 25% of the total population of 179 965 for this area.

## Sample size

Owing to the fact that an ideal sample frame was not available (ie, there was no full list of small businesses), probability sampling could not be used. Non-probability sampling methodology was followed, using a judgmental selection procedure in which the Joint Education Trust, the National Productivity Institute and local residents, used as interviewers, provided inputs on the determination of the sample.

These interviewers were trained to conduct a route sample of small businesses across all four sectors areas as indicated in table 1. The sample size was based on the population estimates as depicted in table 1. The sample size per area is depicted in table 2 below.

**Table 2: Sample size by main survey area**

<b>Main survey area</b>	<b>Number of questionnaires</b>
Western	40
Central Western	42
Central Eastern	37
Eastern	41
<b>Total</b>	<b>160</b>

## **Data collection**

The data were collected by means of a structured research instrument (questionnaire) in which personal face-to-face interviews were used. All the interviews were conducted on the business premises of the owner/manager. The research themes covered in the questionnaire consisted of

- the location, registration status and activities of the small businesses
- their employment profile
- their skills profile
- their skills training and development needs

In total, 14 residents of this area were recruited and trained, using sound recruitment and training principles. A field training approach was followed in which each interviewer had to complete one questionnaire in the survey area. On completion of this questionnaire, all the fieldwork was critically evaluated and additional training and advice provided to ensure even better responses. Questionnaires that failed to meet the sample requirements were returned for correction and about 20% of the questionnaires were followed up telephonically. This follow-up also helped to measure the quality of the fieldwork.

The number and percentage of questionnaires returned by business type are shown in table 3 below.

**Table 3: Questionnaires returned**

<b>Business type</b>	<b>N</b>	<b>%</b>
Survivalist	53	32,9
Micro	72	44,7
Very small	36	22,4
<b>Total</b>	<b>161</b>	<b>100,0</b>

## **Validity**

Regarding the validity of the questionnaire, it can be surmised that the face and content validity of the questionnaire is relatively high since various experts in the field in collaboration with JET and the NPI developed the questionnaire collectively.

# RESULTS AND ANALYSIS

## Number of years in business

The number of years that the small businesses were in operation is indicated in table 4 below.

**Table 4: Number of years in business**

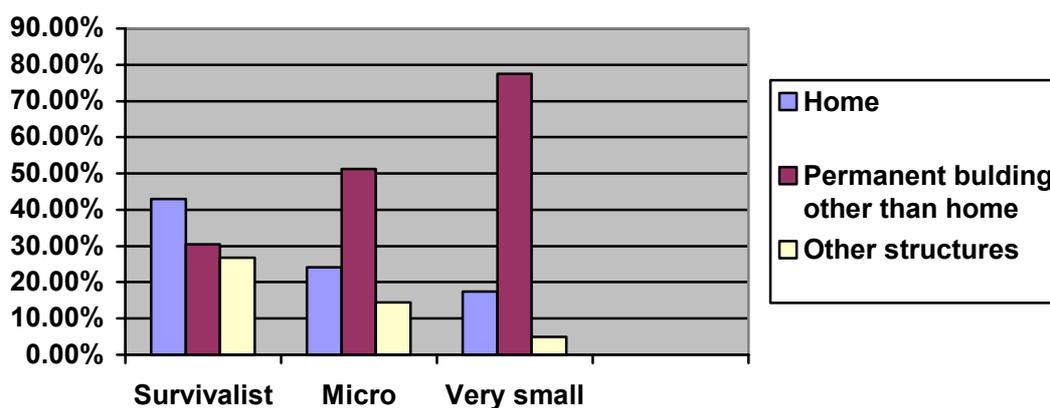

Type of business	Less than a year	One and less than two years	Two years and less than five years	Five years and less than 10 years	More than 10 years
Survivalist	15,1	22,6	15,1	22,6	24,5
Micro	15,3	27,8	19,4	23,6	13,9
Very small	13,9	13,9	36,1	16,7	19,4
<b>Average</b>	<b>14,9</b>	<b>23,0</b>	<b>21,7</b>	<b>21,7</b>	<b>18,6</b>

On average, the majority of the respondents were in the category one to less than two years in business. What is interesting is that the survivalist category had nearly 25% respondents who had been in business for more than 10 years – showing no progression or growth in terms of employment (moving into next small business category).

## Business location

The physical location from which these businesses operate per type of establishment is depicted in figure 1.

**Figure 1: Business location**

The survivalist establishments operate mostly from home, although there is a surprisingly large number (just over 34%) that operates from a permanent structure other than home, whilst nearly 18% used other structures. The micro and very small businesses operate as expected, mostly from a permanent building other than home, showing more of the characteristics of the formal business sector.

## Employment profile

Regarding the employment profile of these institutions, the following information was obtained on gender and qualifications. Figure 2 below indicates the qualification levels of full-time workers (including owners/managers) per business type.

**Figure 2: Full-time workers by qualification and business type**

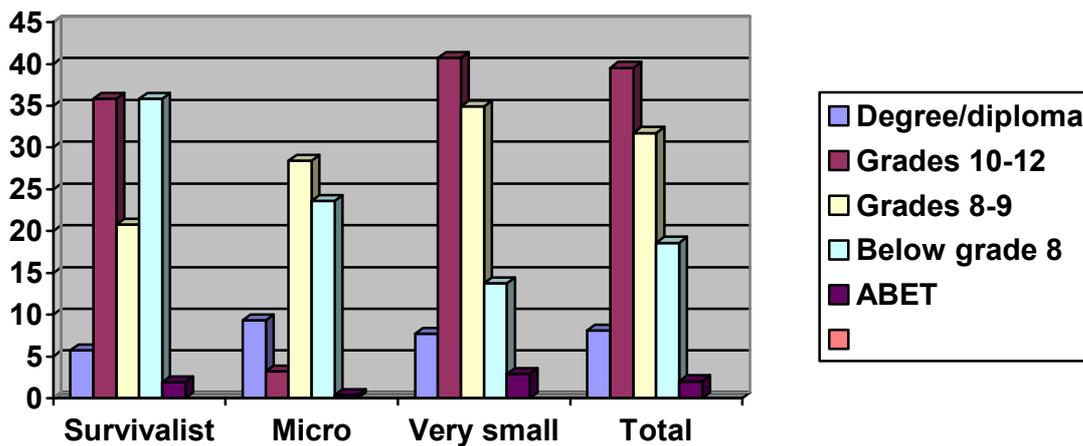

Figure 2 indicates the direct correlation between business type and qualification level. At the higher levels of qualifications, the larger business types have an increased representation, whilst at the lower qualification levels the survivalist type has the largest representation (35,85%). Of the total survey population, only 8,1% have a degree, with 39,54% having a qualification between Grades 10 and 12. It is also important to note that just more than a third of the owners/managers of survivalist establishments lack a basic education (defined as passing grade 9) and functional literacy (defined as passed grade 7)<sup>19</sup>. This obviously has implications for the long-term survival and prosperity of these establishments.

The average number of full-time and part-time workers by gender and business type is shown in table 5 below.

**Table 5: Average number of full-time and part-time workers by gender and business type**

Workers	Business type			
	Survivalist	Micro	Very small	Total
	Average	Average	Average	Average
Full-time owners/managers:				
Male	0,55	0,92	0,94	0,80
Female	0,45	0,31	0,42	0,38
Full-time employees:				
Male	No employees	1,26	6,31	1,98
Female	No employees	0,64	3,86	1,15

Total full-time workers	1,00	3,13	11,53	4,30
Part-time employees:				
Male	0,28	0,14	0,91	0,36
Female	0,18	0,04	0,42	0,17
Contract/seasonal workers:				
Male	None	None	0,16	0,04
Female	None	None	0,06	0,01

Table 5 indicates the dominance of male workers employed by the three business types. It also indicates the skewed distribution towards smaller business types in the survey (most respondents were in the micro business type category).

## Generic and vocational skills

Generic skills are defined as those skills that are universal and apply across a variety of jobs/occupational groups. There is no consensus on what these skills are, but they generally include communication, problem solving, information technology and teamwork skills<sup>20</sup>. For research purposes, financial and accounting skills and general business skills besides communication were perceived to be generic skills for these small business establishments.

Vocational skills are defined as those specific skills needed to work within the specified occupation. Thus, for example, an establishment in the textile business would need specific skills such as sewing, embroidering, etc, to be successful. Similarly, the current needs of an establishment in the agricultural business would be, say, vegetable-growing skills.

First, the owner/managers of these establishments were asked to rate their generic skills on a three-point scale where 1 = no skills, 2 = limited skills and 3 = adequate skills. The list of generic skills included the following:

- interpersonal/teamwork skills
- computer skills
- problem-solving skills
- technical skills, other than computer
- basic mathematical
- basic reading skills

Indices were developed where all adequate skills were allocated a weight of 2, and all limited skills a weight of 1. Those small businesses claiming to have none of the listed skills were allocated a weight of zero (0). The weighted total of each skill was calculated by multiplying the incidence of the skill by the respective weights. The skill with the highest weighted total was equated to 100, and the remaining skills calculated in accordance with the above, using the formula  $b/a$ , where  $b$  = the weighted total of the skill under consideration and  $a$  = the weighted total of the most predominant skill. The trends are depicted in table 6 below.

**Table 6: Generic business skills of workers employed (indices and percentages)**

Generic skills	Sur- vivor	Micro	Very small	Total	Adequate skills				Limited skills				No skills			
					%				%				%			
	Index	Index	Index	Index	S	M	VS	Tot	S	M	VS	Tot	S	M	VS	Tot

The highest level of adequate skills is basic reading skills (64,6%) and basic mathematical skills (53,4%). The three most problematic areas are lack of computer skills (10,6%) and technical skills other than computer skills (23,0%), problem-solving skills (34,8%) and interpersonal skills (40,4%). This trend is discernable across all business types but is more notable among the survivalist and micro establishments.

### **Current and future skills of owner/managers**

The last point to be surveyed was to ask the owner/managers and employees what financial/accounting, information technology and business skills they have, and what skills they will need in the near future. The results are shown in tables 7 and 8 below.

**Table 7: Current and future skills of owners/managers**

Skills category	Current skills				Future skills			
	Survivor	Micro	Very small	Total	Survivor	Micro	Very small	Total
Financial/ accounting skills	Recording of and accounting for cash transactions	Recording of and accounting for cash transactions	Recording of and accounting for cash transactions	Recording of and accounting for cash transactions	Recording of and accounting for cash transactions	Data processing/ storing, retrieving and supplying information	Computerised bookkeeping system	Computerised bookkeeping system
	Data processing/ storing, retrieving and supplying information	Recording of and accounting for credit transactions	Recording of and accounting for credit transactions	Recording of and accounting for credit transactions	Recording of and accounting for credit transactions	Implementing audit procedures/ cost accounting	Data processing/ storing, retrieving and supplying information	Recording of and accounting for credit transactions
	Recording of and accounting for credit transactions	Recording payroll transactions	Recording payroll transactions	Data processing/ storing, retrieving and supplying information	Maintaining financial records and accounts	Operating cash/credit management system and analysis/ interpretation of financial statements	Preparing financial reports	Data processing/ storing, retrieving and supplying information
Information technology skills	Typing and keyboard skills	Typing and keyboard skills	Typing and keyboard skills	Typing and keyboard skills	Basic Internet and e-mail skills	Basic Internet and e-mail skills	Basic Internet and e-mail skills	Basic Internet and e-mail skills
		Basic Internet and e-mail skills	Basic Internet and e-mail skills	Basic Internet and e-mail skills	Computer programming skills	Computer programming skills	Computer programming skills	Computer programming skills
					Information communication technology skills	Information communication technology skills	Information communication technology skills	Information communication technology skills

						Website development skills		
Business skills	Customer care	Basic business management skills	Public relations skills	Public relations skills	Public relations skills			
	Basic business management skills	Customer care	Customer care	Customer care	Marketing/communication skills	Marketing/communication skills	Labour relations skills	Marketing/communication skills
	Merchandise/selling skills	Stock control	Stock control	Stock control	Merchandise/selling skills	Merchandise/selling skills	Marketing/communication skills	Labour relations skills
					Labour relations skills			Merchandise/selling skills

**Table 8: Current and future skills of full-time employees**

Skills category	Current skills				Future skills			
	Survivor	Micro	Very small	Total	Survivor	Micro	Very small	Total
Financial/accounting skills	No employees	Recording of and accounting for cash transactions	Recording of and accounting for cash transactions	Recording of and accounting for cash transactions	No employees	Recording of and accounting for cash transactions	Data processing/storing, retrieving and supplying information	Recording of and accounting for cash transactions
		Recording of and accounting for credit transactions	Recording of and accounting for credit transactions	Recording of and accounting for credit transactions		Using information technology	Using information technology	Using information technology
		Maintaining financial records and accounts	Recording payroll transactions	Recording payroll transactions		Drafting of financial statements	Basic analysis and interpretation of financial results	Data processing/storing, retrieving and supplying information

Information technology skills	No employees	Typing and keyboard skills	Typing and keyboard skills	Typing and keyboard skills	No employees	Computer programming	Basic Internet and e-mail skills	Basic Internet and e-mail skills
		Basic Internet and e-mail skills	Basic Internet and e-mail skills	Basic Internet and e-mail skills		Typing and keyboard skills	Typing and keyboard skills	Computer programming skills
						Computer equipment operation skills	Computer programming	Computer assistance
							Information communication technology skills	
Business skills	No employees	Customer care	Customer care	Customer care	No employees	Stock control	Labour relations skills	Stock control
		Merchandise/selling skills	Stock control	Merchandise/selling skills		Marketing/communication skills	Stock control	Labour relations skills
		Marketing/communication skills		Stock control		Labour relations skills	Public relations skills	Marketing/communication skills
						Business management skills		

The need for information technology skills appears to be the highest. However, the fact that some of the required future financial/accounting and business skills correlate closely with the current skills of the owners/managers, shows that some of these skills are not being adequately addressed. This is further substantiated by the fact that for the highest incidence of current skills per skills category, only 41,6%, 20,5% and 47,4% respectively of full-time managers indicated that they have the specific financial/accounting, information technology and business skills. For the full-time workers, the highest incidence of current financial/ accounting, information technology and business skills are only 5,4%, 3,2% and 7,9% respectively. Based on tables 7 and 8, the future skills of owners/ managers and employees can be summarised as follows:

- senior management skills (eg oral and written communication, decision-making, conflict management and group/team management skills)
- general management skills (eg recruiting, training and financial skills)
- operations management skills (eg customer services and safety and security skills)

Besides specific managerial skills shortages, the owners/managers interviewed also listed shortages of certain clerical skills prevalent in their businesses, such as

- clerical office skills (eg typing, basic computer and keyboard skills)
- clerical stock skills (eg numeracy skills such as addition and subtraction, clerical and administrative, inventory control, basic mathematical and customer service skills)
- clerical accounting/bookkeeping skills (eg basic computer, organisational, communication, basic mathematical, basic filing and automated and manual bookkeeping skills)
- clerical operations skills (eg administrative, customer service and machine/equipment skills such as those in calculator and personal computer skills)

## **SUMMARY**

The analysis of the generic skills types clearly indicates the importance of financial/accounting, information technology and business skills for the effective functioning of small business. It is clear that owners/managers regard these skills as critical to the effective management and operation of a small business establishment. Consequently, the medium- to long-term survival rate of small business establishments that lack these skills is in jeopardy, and it is therefore imperative to rectify these skills problems as soon as possible. It would be beneficial to design skills programmes to promote training opportunities for owners/managers and employees of small business establishments in the peri-urban areas of Northern Tshwane. Ensuring the possibility of economic regeneration via the small business sector will require continual enhancement of worker skills. Such an approach requires sound planning and strategising by government, private business and the community. In support of this endeavour, this paper provides valuable information on the available and future skills that need to be broadened and further developed in order to improve the efficiency and competitiveness of small businesses. Greater efficiency and competitiveness of small business establishments will increase the potential of this sector to generate higher output and employment, which, in turn, could contribute to economic growth. Better prospects for community development

and social upliftment will therefore flow from increased and sustained economic growth via the small business sector.

## **ABSTRACT**

While economic aspects of small enterprises (SE) have been extensively researched, there appears to be limited research on community roles, particularly SE corporate social responsibility (CSR). This research provides insight into behaviour of stakeholders (SE owners, employees, customers, suppliers, community groups, governments) and suggests strategies to improve stakeholder performance. It is hypothesized SE's are able to identify salient stakeholders; stakeholder salience influences form and extent of CSR participation; and SE CSR participation is influenced by stakeholders' location and SE performance.

A review of the limited literature available on SE CSR provided a framework to investigate SE CSR. This framework guided a qualitative case study methodology involving SE's chosen by theoretical replication. Each SE was interviewed using a semi-structured face-to-face instrument. Interview questions comprised qualitative, open-ended questions, and quantitative closed questions using a Likert scale, for the collection of data. The following paragraphs present principal findings and conclusions of the research.

SE's were able to identify and classify stakeholders by attributes and thereby determine stakeholder salience. Despite relatively high levels of salience for employees, customers, and suppliers, it was found SE's focused CSR participation on stakeholders with lower levels of salience. SE CSR participation with community stakeholders was economically significant (\$4900 per enterprise per annum), and principally stock and cash.

Motivations for CSR participation ranged along a continuum from strategic, profit oriented activities at one end, usually expressed through marketing activities, to reactive at the other end, based on altruistic motives. Motivations measured along this continuum varied between stakeholders, with motivations for CSR towards community stakeholders determined by a common core of motivations; altruism, marketing, enterprise reputation, and needs of recipients.

Ability for SE's to participate in CSR was influenced by common factors; low enterprise profitability, lower than anticipated sales, and higher than anticipated enterprise expenses. CSR participation with community stakeholders, for example, was influenced by these factors as well as a history of engaging in CSR participation with community stakeholders.

Stakeholders, corporate social responsibility, small enterprise, Australia

## **INTRODUCTION**

Meredith (1977) argued small enterprises are multi-faceted, comprising economic and social aspects. While there exists extensive research into the economic significance and effects of small enterprises (Small Business in Australia 1999, 2000; Report of the Committee on Small Business, 1971), community and sociological contributions of small enterprises are scarcely acknowledged and remain unexplored (Reynolds, Williams, and Savage, 2000; Alizadeh, 1996; McMahon, Holmes, Hutchinson, and Forsaith, 1993; Meredith, 1977; Stanworth and Curran, 1976).

An aspect of SE interaction with the community is CSR whose modern foundations derive from Berle and Means (1932) who documented separation of ownership and control in large enterprises. Formal writing on CSR focused on roles of managers and responsibility of enterprises to communities (stakeholders) that became an important area of scholarship and research focused in the United States of America (USA). CSR literature has been related almost exclusively to large enterprises and demonstrates a presence of CSR with diversity as regards its form, motivation and impact on communities (Kedia and Kuntz, 1991). A similar recognition of small enterprise CSR has not been documented, evidenced by few empirical studies, the latest being Thompson, Smith, and Hood (1993) that addressed charitable contributions by small enterprises in the USA.

Small enterprises in Australia operate pluralistically in society, interacting with groups (stakeholders) economically and socially in a largely unknown manner, possibly with CSR participation in similar magnitudes to large enterprises, yet small enterprises have received little research attention. This exploratory study provides insights into small enterprise CSR within an Australian context.

## **LITERATURE REVIEW**

A framework for this research is provided by three literature sets; stakeholder, corporate social responsibility (CSR), and small enterprises (SE). Specifically, stakeholder theory provides a mechanism to analyse CSR participation within the Australian small enterprises.

A context for this small enterprise research is provided by the adoption of the current Australian Bureau of Statistics definition which embodied qualitative characteristics described in Wiltshire Committee (1971: p.11): 'one or two persons are required to make all the critical management decisions... with specific knowledge in only one or two functional areas,' and defines a small retail enterprise in terms of number of employees (Small Business in Australia 1999, 2000: p.2): '... a businesses employing less than 20 people...'

Stakeholder theory was pioneered by Freeman (1984) in *Strategic Management: A Stakeholder Approach*, who (1984: p.48) stated; 'The stakeholder approach is about groups and individuals who can effect the organization, and is about managerial behaviour taken in response to those groups and individuals.' Stakeholder theory implies heterogeneous stakeholders whose attributes can be analysed in terms of stakeholder attributes. A broad definition of stakeholders was adopted for this research; specifically that proposed by Freeman (1984: p.46): 'A stakeholder in an organization is (by definition) any group or individual who can affect or is affected by the achievement of the organizations objectives.'

Consistent with an objective to employ a broad concept of stakeholders, a stakeholder model developed by Mitchell et al. (1997) was chosen, as it provided multiple stakeholder categories with a mechanism to accommodate changed stakeholder relationships as a consequence of changes to enterprise environments. Mitchell et al. (1997) developed a broad-based stakeholder model linked to concepts of power, legitimacy, and urgency.

Stakeholders may be identified by attributes that depend on prior knowledge, expectations, immediate context, and capacity of owners to discern stakeholders and give an appropriate response. Stakeholder attributes - power, legitimacy, and urgency that exist independently of each other. For example, stakeholders' power to influence behaviour of an enterprise is perceived to be without regard to legitimacy. Stakeholders possess legitimacy when enterprises perceive stakeholder actions or claims based on legal rights or moral interest based on harms and/or benefits of actions of an enterprise. Power and legitimacy are core attributes expected to affect stakeholder salience and when combined, equate to legitimate power, termed authority. Stakeholders possess urgency when their claims on organizational attention are time sensitive and critical to operations of an enterprise.

A second major plank underpinning this research is corporate social responsibility (CSR): 'The social responsibility of business encompasses the economic, legal, ethical, and discretionary expectations that society has of organizations at a given point in time' (Carroll, 1979: p.500). Alternatively, 'obligations to constituent groups in society other than stockholders and beyond that prescribed by law and union contract' (Jones, 1980: p.59-60). Davis (1973) generalizes stakeholders and states mere compliance, fulfilling minimum requirements in one or more of either economically, socially, or legally, does not constitute CSR: 'social responsibility begins where the law ends.' Whether to respond to CSR is part of an enterprise's strategic plans that proactively integrates CSR into planning activities in recognizing that failure to do so may adversely impact on enterprise performance in that customers may, in due course, patronize other enterprises.

Carroll (1991: p.40) stated: 'For CSR to be accepted by the conscientious business owner, it should be framed in such a way that the entire range of business responsibilities is embraced. It was argued four kinds of social responsibilities constitute total CSR: economic, legal, ethical and philanthropic. Furthermore, these four categories or components of CSR might be depicted as a pyramid.' Economic and legal responsibilities have been acknowledged by enterprises: to make a profit, obey the law, be ethical, and be a good corporate citizen. Carroll (1991) argued that only in recent years had ethical and philanthropic functions taken a significant place that coincided with a change in nomenclature, with 'discretionary component' becoming 'philanthropic' and embracing 'corporate citizenship.'

Carroll's (1991) placement of the economic category as the base, a fundamental upon which legal, ethical, and philanthropic depends, supports the neoclassical paradigm: 'the business of business is business.' Fulfillment of responsibilities are not undertaken in a sequential manner, that is economic followed by legal, ethical, and philanthropic but coincidentally, at the same time, fulfilling multiple objectives of an enterprise despite responsibilities being differently ranked.

Although stakeholder theory and CSR literature developed independently, they have complemented and enhanced each other. Stakeholder theory provides a structure which puts 'names and faces' via an orderly classification of economic, legal, ethical, and philanthropic responsibilities as well as strategies and actions to address these responsibilities. While stakeholder theory has not been previously employed in small enterprise CSR research, there is significant support for its application. Carroll (1991), a prolific writer on CSR, endorsed stakeholder theory as providing a language and a conceptual framework for diagnosing, analyzing, and prioritizing an organization's relationships and strategies. Carroll (1991: p.43) argued: 'There is a natural fit between the idea of corporate social responsibility and an organization's stakeholders.' Carroll (1993) argued that the term 'social' in CSR is vague, lacking specificity as to which enterprises are responsible but argued stakeholder concepts specified groups or persons: puts 'names and faces' on society members or groups who are most important to enterprises and to whom enterprises are to respond. An affirmation of stakeholder theory was given by Wood and Jones (1995: p.230) who viewed stakeholder theory to be 'the most relevant theoretical framework for assessing corporate social performance.' Consequently, an integration of small enterprise stakeholders and stakeholder classifications provided a framework to investigate small enterprise stakeholder CSR.

## **RESEARCH METHODOLOGY**

This research employs an interpretivist ontology with a realist epistemology to access a 'hidden slice of reality,' and to facilitate an understanding of managerial perceptions where meanings are socially constructed rather than being value-free. Case research methodology was viewed as appropriate at a pre-paradigmatic stage (Perry, Alizedah and Riege, 1997) when 'investigating contemporary phenomena within real-life contexts when the boundaries between phenomenon and context are not clearly evident' (Yin 1994: p.13). Theoretical replication was used to purposefully select 10 cases that were chosen with the assistance of the Hunter Business Chamber, Australia. Cases were descriptively named, Butcherco is a retail butcher and Floristco is a retail florist. A semi-structured face-to-face interview was undertaken, after obtaining informed consent of interviewees, using

a research instrument comprising eight questions: qualitative, open-ended questions, and quantitative closed questions using a Likert scale. Qualitative data, words or groups of words, was analyzed within a context of a research problem and research questions with computer software used for axial coding while a need to remain 'close' to the data precluded the use of computer software for selective coding.

## RESULTS

Small enterprises listed and ranked stakeholders and on doing so, facilitated development of an aggregate ranking of stakeholders. Stakeholders were analysed in terms of attributes and based on Mitchell et al. (1997) classified according to stakeholder salience (Table 1). Employees and customers, for example exhibit stakeholder claims of power and legitimacy and classified as dominant stakeholders. On the other hand, community charities possess only legitimacy and are deemed discretionary stakeholders. Stakeholders were also analysed in terms of enterprise responsibilities according to Carroll (1991) that presented a pyramid of enterprise responsibilities. Employees and customers, for example, elicited economic/legal enterprise responsibilities while at the other end of the spectrum, community charities, for example, illustrated ethical / philanthropic responsibilities.

Rank order of stakeholders was determined using a method outlined by Zikmund (1997) that multiplied the frequency times the stakeholder ranked to develop a scale. For each interviewee, the first stakeholder was given a score of 1 while stakeholder five given a score of 5, those outside the top five rankings given a loading of 6, and aggregated across interviewees to determine an overall ranking of stakeholders.

Small enterprise owners consistently identified employees, customers, and suppliers to be of prime importance to their enterprises. Community stakeholders, although eliciting some variations due to enterprise location and preferences of small enterprise owners, were commonly identified as stakeholders, frequently ranking fourth or fifth by individual small enterprises. Aggregate ranking of stakeholders in large measure reflected individual rankings with primacy given to operational stakeholders, namely employees, customers and suppliers. Stakeholder rankings were viewed by small enterprises as remaining constant through time.

**Table 1 Stakeholder salience and enterprise responsibilities**

Ranked Stakeholders	Mitchell et al. (1997) Stakeholder attributes	Stakeholder salience	Carroll (1991) Enterprise responsibilities
Employees	Power/legitimacy	Dominant	Economic/legal
Customers	Power/legitimacy	Dominant	Economic/legal
Suppliers	Power/legitimacy	Dominant	Economic/legal
Community - charities	Legitimacy Discretionary		Ethical/philanthropic
Community – schools	Nil Discretionary/	potential	Ethical/philanthropic
Community –	Nil		Ethical/philanthropic

general	Discretionary/ potential	
---------	-----------------------------	--

Employees, customers, and suppliers were chosen and consistently ranked first, second, and third respectively by small enterprise owners as being of prime importance with community stakeholders (community-charities, community-schools and community-general) ranked fourth, fifth and sixth respectively. A rank order that placed employees, customers and suppliers (dominant stakeholders) fulfilling economic/legal responsibilities ahead of community stakeholders (discretionary and/or potential) fulfilling ethical/philanthropic is consistent with a strategic enterprise orientation. In doing so, interviewees illustrated a strategic enterprise focus by assignment of priorities to operational stakeholders that addressed economic and legal responsibilities of enterprise operations ranked before communities that may be classified and fulfilling ethical/philanthropic responsibilities.

Small enterprise owners had an intimate knowledge of their enterprises and, as a result, demonstrated little propensity to formally express enterprise objectives and policies. However, a lack of documentation need not imply small enterprises were devoid of either direction or strategic orientation. Interviewee comments suggested an expressed intention to be 'close' to operational stakeholders, such as employees, suppliers, and customers, and designed strategies and policies that addressed present and future needs of these enterprise stakeholders. Consequently, small enterprises were strategically oriented as seen in ranking of stakeholders and multiple enterprise objectives such as profit maximization, marketing activities and networking with local markets including community stakeholders.

Table 2 presents stakeholder CSR participation in monetary terms by type of participation with percentage calculations, horizontally and vertically, based on monetary CSR participation.

**Table 2 Stakeholder form and extent of CSR participation**

	Stock \$	Gift voucher s \$	Cash \$	Discounts \$	Time \$	Total \$
Employees \$					2400 (100%) (39%)	2400 (100%) (5%)
Customers \$						
Suppliers \$						
Community - Charities \$	13900 (65%) (50%)	190 (1%) (19%)	4700 (22%) (45%)	250 (1%) (7%)	2200 (11%) (36%)	21240 (100%) (43%)
Community - Schools \$	6960 (77%) (25%)	760 (8%) (74%)	150 (2%) (1%)	950 (11%) (26%)	200 (2%) (3%)	9020 (100%) (19%)
Community	6900 (42%)	80 (1%)	5620 (34%)	2450	1300 (8%)	16350

- General \$	(25%)	(7%)	(54%)	(15%) (67%)	(22%)	(100%) (33%)
Total \$	27760 (57%) (100%)	1030 (2%) (100%)	10470 (21%) (100%)	3650 (7%) (100%)	6100 (13%) (100%)	49010(100 %) (100%)

CSR participation was directed towards community-charities (\$21240, 43%), community-general that was predominantly sporting groups (\$16350, 33%), community-schools (\$9020, 19%) and employees (\$2400, 5%). Components of stakeholder participation included stock (\$27760, 57%), cash (\$10470, 21%), time costed at \$40 per hour (\$6100, 13%), discounts (\$3650, 7%), and gift vouchers (\$1030, 2%). Stock provided the highest percentage participation for each community stakeholder, namely community-charities (\$13900, 65%), community-schools (\$6960, 77%) and community-general (\$6900, 42%). Cash participation was approximately equally distributed between community-charities (\$4700, 45%) and community-general (\$5620, 54%). Schools received cash (\$150, 1%) and majority participation in gift vouchers (\$760, 74%).

Community-charities participated with stock (\$13900, 65%), cash (\$4700, 22%), time (\$2200, 11%) and minute amounts of gift vouchers (\$250, 1%) and discounts (\$190, 1%). Community-general reflected a similar spread of participation particularly in terms of stock (\$6900, 42%) and cash (\$5620, 34%), discounts (\$2450, 15%), time (\$1300, 8%), and gift vouchers (\$80, 1%). Community-schools likewise included a predominance of stock (\$6960, 77%), similar amounts of discounts (\$950, 11%) and gift vouchers (\$760, 8%), a modest participations of cash (\$150, 2%), and time (\$200, 2%). Stock and cash were major aspects of participation for community-charities and community-general while gift vouchers were the major component for community-schools with time relatively evenly spread between employees, community-charities, and community-general.

Composition of stakeholder CSR participation reflected small enterprise ease of participation and attributes of recipient stakeholders. Stock and cash, for example, are based on stakeholder attributes, a preferred means of participation by community-charities and community-general while at the same time, a relatively easy means for small enterprises to participate with stakeholders. On the other hand, community-schools would also have a preference for CSR participation via stock and cash, but primarily received gift vouchers, suggesting a marketing orientation by CSR participating small enterprises.

Stakeholder salience provided a framework to analyze stakeholder CSR participation. Community stakeholders, discretionary and/or potential stakeholders, possessing relatively little stakeholder salience, were the primary participants in enterprise CSR participation. (F3.2). Despite a significant amount of enterprise expenditure on employees, customers, and suppliers (dominant stakeholders) interviewees were not able to assign monetary values to CSR participation. There is a strong suggestion that contributions to employees, customers, and suppliers was not CSR participation but a market-driven response from competitive pressures to match provisions by other enterprises and, as such, does not constitute CSR participation. In summary, a decision to question an existence of CSR participation with employees, customers, and suppliers was not based on a qualitative-quantitative dichotomy of data but whether contributions were in excess of what was required economically and/or legally: a crux of CSR participation.

Stakeholder CSR participation took place with discretionary and/or potential stakeholders: community-charities, community-schools, and community-general. CSR participation

reflected stakeholder attributes as well as small enterprise preferences emphasizing stock and cash CSR participation. Participation ranged from a modest \$450 to in excess of \$14000 per annum with a mean enterprise participation of \$4900. Significant variations between levels of enterprise CSR participation suggest differences in motivations to undertake CSR.

Small enterprises operate with a strategic orientation, and it was further found small enterprises were able to differentiate between community stakeholders (community-charity, community-schools, community-general) and assign different CSR motivations to respective community stakeholders (Table 4.18, p.165). The relative importance of a motivation was therefore responsive to enterprise considerations and/or attributes of stakeholders. At an enterprise level, marketing, for example, was relatively important for Musico and less important for Statco while, at a stakeholder level, marketing was relatively unimportant for community-charities compared to community- schools and community-general.

Motivations to participate with stakeholders in CSR emphasized the prefix 'local.' Local occurred in conjunction with schools, charities, clubs, sporting groups and general communities being described as *the locals*. 'Locals' in turn participated, *a service for the locals* (Bakerco) and goods, donations, and enterprise vouchers. CSR participation with local affiliations was, with the exception of Musico and Butcherco, neither strategic, nor random, but appropriately described as structured CSR participation. Requests for participation were evaluated in a considered and structured manner: Clothesco, *we support local schools, they're your customers*; Jewelerco, *we'd prefer to make it somewhere where it goes to the clients who generate our income ... We prioritise or give priority to things that are local*; and Statco, who participates based on altruism have similar criterion in that requests from outside the local area receive negative replies because *they have nothing to do with us*.

Musico CSR participation with community stakeholders was an extension of marketing activities. Floristco and Butcherco were structured and deliberate with stakeholder CSR participation giving credence to a suggestion that community stakeholder CSR participation, at least for Musico, Floristco, and Butcherco, is not a random mix of stakeholders but part of an overall strategic enterprise plan. Interviewees did not view communities as an amorphous, undifferentiated stakeholders but discerned stakeholder differences as illustrated by selective participation between and within stakeholders and assignment of different stakeholder motivations for CSR participation.

A common core of five influences (policy on CSR, higher than anticipated enterprise expenses, lower than sales, low enterprise profitability, and opportunity costs-life style and time), as would be expected, accounted for 84% of influences for community-charities, 83% of influences for community-schools, and 84% of influences for community-general (F5.4: F5.6).

Stakeholder influences on CSR participation were related to small enterprise motivations to participate in CSR (Section 4.3.4.1, p.156). Certain aspects including, a non-existence of formal policies on stakeholder CSR participation and a local orientation of CSR participation, applied equally to stakeholder motivations and stakeholder influences on CSR participation (F5.5).

No enterprise had a formal written policy on stakeholder CSR participation and also, without exception, enterprise illustrated an implicit theme underlying stakeholder

influences on CSR participation centered on enterprise location, a 'localness' and, being 'in touch' with local environments. For example, Jewelerco, *We have a definite criterion. We prioritize or give priority to things that are local: Pharmco, ...if it's not within three or four kilometers radius, I do say no:* and Clothesco, *we support local schools, they're your customers.* Customers suggested elements of marketing, a view included by Musico who commented:

- *I recognise my customers, I know most of my customers so if someone approaches me for something or for some help in any way, I judge for myself the rewards that I think I can offer them.*

Butcherco who treated CSR participation as a cost of doing business, an expense, supported a marketing orientation: *it's the same as advertising.* Alternatively, an influence at the other end of a marketing-altruism continuum (Section 4.3.4.1, p.156, particularly Figure 4.4 p.166), Giftco had *no expectation of return, ... a labour of love,* towards stakeholder CSR participation.

CSR participation, derived from an analysis of quantitative data, was influenced by enterprise-level factors that included: by low enterprise profitability, lower than anticipated sales, and higher than anticipated enterprise expenses. In addition, CSR participation influences, derived from an analysis of qualitative data, applied only to community stakeholders (community-charities, community-schools, community-general) included: enterprise policy on CSR, opportunity costs-lifestyle and time, low enterprise profitability, lower than anticipated sales, and higher than anticipated enterprise expenses. Community stakeholder influences illustrated a considerable degree of consistency but with minor percentage variations applicable to community-charities, community-schools, and community-general (F5.5). Consequently, community CSR participation is affected by enterprise influences as well as influences that directly affect community CSR participation.

## CONCLUSIONS AND IMPLICATIONS

It was found SE CSR participation was conducted consistently across all ten case studies, with SE's differentiating between stakeholders and targeting CSR participation at those stakeholders with lower perceived salience. The findings and conclusions presented implications for stakeholders and further research. SE's identified who was important to their enterprise: operational stakeholders and community stakeholders. CSR participation highlighted SE's needed to be cognizant of the roles and impacts of stakeholders, particularly community stakeholders, into strategic SE planning processes. Enterprises tended to overlook operational stakeholders (employees, customers, and suppliers) and like community stakeholders, there may be a need to explicitly include operational stakeholders into CSR participation strategies.

This research raises the possibilities of further research either in different locations, industries, within or across areas of literature, or research methodologies. A case research methodology and coding procedures, for example, may be used as a basis to replicate other SE CSR in other locations including non-regional areas where research has indicated SE's operate differently compared to urban SE's.

# **FAMILY BACKGROUND AND ENTREPRENEURIAL CAPACITY**

**Vesa Routamaa & Anna-Leena Rissanen**  
**University of Vaasa**

## **ABSTRACT**

The survey clarifies the components of entrepreneurship capacity to understand the entrepreneurial readiness of different kinds of people in terms of family background. Often it can be heard that the entrepreneurial family background is most unfavorable for starting up own business because the members of an entrepreneurial family have that negative experiences of endless and economically precarious entrepreneurial work. It is proposed here that there are large background variations in entrepreneurial capacity in terms of family background. In this paper, entrepreneurship capacity and entrepreneurial intentions in regard to family background will be analyzed. The basic question is, do the family background matter in terms of entrepreneurial capacity. The common negative assumption will be proved untrue.

## **INTRODUCTION**

The rapid changes in industry structure, globalization, technological development, and increasing unemployment require more self-employment and entrepreneurship. In order to develop entrepreneurial activity in any country and region, the entrepreneurial readiness of different kinds of people in terms of the components of entrepreneurship capacity should be identified. For example, a disputable assumption is that the family background, i.e. occupational family context favors or unfavors starting up a business. Often it can be heard that the entrepreneurial family background is most unfavorable for starting up a business because the members of an entrepreneurial family have that negative experiences of endless and economically unsecure entrepreneurial work. Correspondingly, different, untestified assumptions concern the entrepreneurial attitudes and capabilities of those coming from wage earner families in public or private sector, or from decreasing agriculture sector. It is proposed here that there are large background variations in entrepreneurial capacity in terms of family background. In this paper, entrepreneurship capacity and entrepreneurial intentions in regard to family background will be analyzed. The basic question is, does the family background matter in terms of entrepreneurial capacity.

It is assumed that positive attitudes to entrepreneurship, entrepreneurship qualities, and certain entrepreneurship ideals correlate positively with entrepreneurial intentions. Entrepreneurial intentions correlate with starting up a business, although this relationship is not strong. According to pilot surveys (e.g. Routamaa 2001), however, entrepreneurial attitudes correlate slightly with entrepreneurial intentions whereas motivation correlates more significantly with entrepreneurial intentions. Positive attitudes form the basis and favourable climate for entrepreneurship but are rarely the basic reason or motive for it. That is, only

improving attitudes toward entrepreneurship is not enough but the whole scale of entrepreneurial capacity must be taken into account. In order to really increase entrepreneurial activity and start ups, strong efforts to improve entrepreneurial qualities and especially motivation should be done.

## **EARLIER STUDIES**

Discussion has addressed numerous background factors linked to entrepreneurship, for example, previous employment (Ronstadt, 1988) and gender (Buttner and Rosen, 1989; Kolvereid, Shane and Westhead, 1993). Unfortunately, only few studies have been concentrated in family background (Crant, 1996; Gray, 2001), which in this paper is hypothesized to have an impact on entrepreneurship.

Students with entrepreneurial parents reported higher entrepreneurial intentions than those without such role models (Crant, 1996). Miettinen (2001) has studied children's images of entrepreneurial requirements and according to him, children coming from entrepreneurial families appeared to be more positive and realistic in their view about entrepreneurial prerequisites. Gray (2001) suggests that people from strongly supportive families are already starting with resources and capabilities that will stand them in good stead if they wish to pursue a career as an entrepreneur.

Havusela (1999) found that the wage earner culture of a municipality unfavor and agrarian culture favour entrepreneurship in the region. It is true that farmers' entrepreneurial attitudes are quite positive but their entrepreneurial qualities are lower compared to other professional groups (Jokinen, Routamaa and Vesalainen 2000a, 2000b). In general, Jokinen et al. (2000a, 2000b) have found a more positive relationship between entrepreneurial family background and entrepreneurial capabilities compared to farming, private or public sector backgrounds. The transition from wage earner culture to entrepreneurial culture requires boosting the entrepreneurial capabilities in general. For example, Jordaan (2001: 292) concluded that 'the changing nature of agriculture in South Africa provides both 'push' and 'pull' dynamics for agriculturist to engage in entrepreneurial activities...A shift in focus from agricultural producer to agricultural entrepreneur is imperative.' In these circumstances, more knowledge of entrepreneurial capacity and prerequisites is needed in order to arrange appropriate, measures, education and training.

Of course, there are many other background variables as mentioned above associated with entrepreneurial capabilities (see e.g. Routamaa 2001; Routamaa, Rissanen & Hautala 2004) that must be taken into account in efforts to develop entrepreneurial activities. Entrepreneurs are not a homogeneous group (see e.g. Routamaa & Varamäki 1998) but their capability training must be taken care of (see Routamaa 1999, 2000a). In all, the personality of a potential entrepreneur is a key issue in developing entrepreneurship (see e.g. Routamaa 2000b; Routamaa & Rissanen 2004). In a global context, local cultures should be also taken into account (cf. e.g. Ginn 2000; Hautala & Routamaa 2001; Routamaa & Pollari 1998). The basic poverty of entrepreneurial development efforts is a constricted view of the phenomenon (see e.g. Routamaa 2003), due to lack of a wholistic, systemic approach (e.g. Routamaa 1999, 2000b).

## RESEARCH METHODOLOGY

**Sample.** The sample consisted of 9 158 people of which 51 % were females and were 47 % males. The sex of 2 % of respondents was unknown. The sample represented a working age between 18 and 55 years from different parts of Finland. Most of the respondents (15 %) were 41-45 years old and least (10 %) were between 26 and 30 years. The most common educational background of the male respondents was vocational school (42 %) and for female respondents it was institute (29 %), while and the most uncommon educational background for both genders was postgraduate studies, licentiate or doctor (0,7 %). During the time the research was accomplished, the most of the respondents had a full-day job (50 %), while only 5 % of females and 10 % of males were working as entrepreneurs. Considering the family background, the parents of the most respondents had agriculture or forestry as their main livelihood source (32 %). The parents of 28 % had been working on the private sector and 25 % on the public sector, while 15 % of the respondents came from entrepreneur-families.

**Instrument.** A survey of entrepreneurship capacity in terms of (1) attitudes towards entrepreneurship, (2) different entrepreneurship qualities, (3) entrepreneurial ideals, (4) entrepreneurship motivation, and (5) entrepreneurial intentions was performed as a part of entrepreneurial development program (see Routamaa 1999, 2000). A scale of five alternatives ranging from 'strongly disagree' to 'strongly agree' was applied when suitable. In addition to the dimensions above the barriers to entrepreneurship were inquired. The potential barriers concern economic risk, entrepreneurial role, the lack of business ideas or knowledge, social risk, resources, social support, and personal traits. Further, push-and-pull factors, i.e., dissatisfaction and opportunity factors were also inquired. Several background variables were asked about, too, for example, age, gender, education, work experience, current professional status, and family background in terms of the parents' occupation.

**Procedure.** The *Attitudes Towards Entrepreneurship* were measured by six questions. All the six questions were loaded in one factor in factor analysis, and the loadings were varying between 0.533 and 0.685. This factor had high reliability ( $\text{Alpha}=0.7140$ ).

The *Entrepreneurial Qualities* were measured by 14 questions, of which, five factors (Varimax) were obtained. One question measuring the fear of taking risks was removed because of double loading. The reliabilities ( $\text{Alpha}$ ) of these factors were: Fear of Change 0.5727, Pleasing Others 0.6146, Opportunism 0.5387, Fatalism 0.6199 and Maverick 0.4149. The first quality, Fear of Change, is described in terms of "being slacken under lot of insecurity", "having doubts about new things and believing that changes create only new problems". The second quality, Pleasing Others, included items: "avoiding situations where have to give presentations", "keeping the craziest ideas in one's own mind" and "not wanting attention to one's different thoughts or ideas". The third quality, Opportunism, contains principles such as "succeeding requires not irritating other people", "pleasing those who have power" and "making sure that one's own plans fit to those of others before accomplishing them". Fatalism-quality is described in terms of "succeeding in life is a matter of destiny" and "things will be as they're meant to be". In the last quality, Maverick, topics were: "one's destiny depends on one's own actions" and "accomplishing ideas in spite of resistance of other people".

The *Entrepreneurial Ideals* were different entrepreneurial identities. Respondents could rate the ideal from the perspective that which will suit to him/her best, a personal interpretation about how one sees oneself as an entrepreneur. These ideals were for example; "net-marketer", "shopkeeper", "part-time-entrepreneur" etc., in all 19 ideals offered, see Table 1.

*Efforts to Start up New Business* were measured by items such as: "Looking for new business ideas", "seeking patent for invention" etc.

*Entrepreneurial Intentions* were measured by items such as: The question of entrepreneurial intentions consists of three dimensions which are: the intention of starting up a firm, the intention of preparing to start one up, and the intention of being educated for an entrepreneurial career. *Entrepreneurial Intentions* were measured by items such as: "Going to start up business myself within a year", "starting up with a partner", "buying a firm alone", "buying a firm with a partner", and "going to be a shareholder in a new enterprise but not work there within next year".

*Push and Pull Factors* were measured by five questions. Reliabilities of both factors were high (Push 0.8671, Pull 0.8653).

*Needs that Could be Satisfied* more likely in the career of entrepreneur than in the current career were measured by eleven questions, of which two factors were obtained: Motivation Factor (alpha= .8158) and Hygiene Factor (alpha=.8746). Hygiene Factor includes statements: Compared to wage labour, working as an entrepreneur... "I would get more respect in society", "I would be a team member and have better relations to co-workers", "I would have better earnings", "I would have higher status and more power", "I would more surely earn my livelihood" and "I would more certainly have enough free-time". Motivation factor is described in terms of: compared to wage labour, working as an entrepreneur... "I could develop and regenerate continuously", "I would be more autonomous and independent", "I could better decide my working-hours" and "I could better accomplish my innovativeness and creativity".

Finally, the *Obstacles for Becoming an Entrepreneur*, were measured by 26 items, from which six factors were obtained: Fear of Failure (alpha=0.8398), Wrong State of Life (alpha=0.7564), Lack of Knowledge (alpha=0.6945), Practical Obstacles (alpha=0.6845), Personal Characteristics (alpha=0.5880) and Lack of Support (alpha=0.8779). Four questions were removed because of low loadings, or loadings in several factors.

Factor *Fear of Failure* included items: Fear of.. "uncertainty of livelihood", "losing my property", "running into debt", "adequate demand", "becoming imprinted as unsuccessful" and "getting laughed at", Wrong State of Life included items: "Entrepreneurship ties too much", "entrepreneurship does not offer enough free-time", "entrepreneurship means loneliness", "current state of life is not suitable for being an entrepreneur" and "it's not profitable to change my current work to entrepreneurship", Lack of Knowledge included items: "Own knowledge is too narrow", "my expertise is difficult to commercialize" and "lack of business idea", Practical Obstacles included questions: "Not getting needed finance", "not finding suitable place" and "fear of lack of skilled labour", Personal Characteristics was formed of items: "Low tolerance of uncertainty", "lack of diligence" and "persistency and lack of service orientation", Lack of Support included questions: "I do not get support from people close to me" and "family does not support me".

## RESULTS

Several significant differences were found between the family background and Entrepreneurial Attitudes, Qualities, Ideals, Efforts to Start Up New Business and Entrepreneurial Intentions as well as Entrepreneurial Prerequisites (see Table 1, 2 and 3).

**Table1: The Relationships between Family Background and Entrepreneurial Attitudes, Qualities, and Ideals (One-Way Anova).**

Post-hoc test in Table 4 and in Table 5 shows the significant differences between groups. Every item had significant difference thus they are not separately reported. Only the basic lines are reported in the text below.

In *Attitudes* overall, the respondents from entrepreneur or agriculture families had higher ratings than respondents from private or public sector families.

**Table 4: Comparison of different Family Backgrounds in case of Attitudes, Qualities, Ideals and Efforts. (Post-hoc test: Tukey HSD)**

Attitudes towards entrepreneurship	Entrepreneur, Agriculture > Private sector, Public sector
Quality 1: Fear of change	Entrepreneur > Agriculture, Public Sector Private sector, Public sector > Agriculture

	Private sector > Public sector
Quality 2: Invisible	Entrepreneur > Agriculture, Private sector, Public sector Private sector, Public sector > Agriculture
Quality 3: Opportunist	Entrepreneur, Private sector, Public sector > Agriculture
Quality 4: Fatalist	Entrepreneur, Private sector > Agriculture, Public sector
Quality 5: Maverick	Entrepreneur > Agriculture, Private sector, Public sector Private sector, Public sector > Agriculture
Identity 1: Businessman	Entrepreneur > Agriculture, Private sector, Public sector
Identity 2: Innovator-entrepreneur	Entrepreneur, Agriculture > Private sector, Public sector
Identity 3: Manager-entrepreneur	Entrepreneur > Agriculture, Private sector, Public sector Public sector > Agriculture
Identity 4: Scientist-entrepreneur	Entrepreneur, Public sector > Agriculture, Private sector
Identity 5: Sole proprietor	Entrepreneur > Agriculture, Private sector, Public sector
Identity 6: Businessman in team	Entrepreneur, Public sector > Agriculture, Private sector Private sector > Agriculture
Identity 7: Part-time-entrepreneur	Entrepreneur, Agriculture > Public sector
Identity 8: Subcontractor	Entrepreneur, Agriculture, Private sector > Public sector
Identity 9: Farmer/Forestry-entrepreneur	Agriculture > Entrepreneur, Private sector, Public sector
Identity 10: Franchising-entrepreneur	Entrepreneur, Public sector > Agriculture, Private sector
Identity 11: Co-operative entrepreneur	Agriculture > Entrepreneur, Private sector
Identity 12: Net-marketer	Agriculture, Public sector > Private sector
Identity 13: Handcraft-entrepreneur	Agriculture > Private sector, Public sector
Identity 14: Trainer/Consultant	Entrepreneur > Agriculture, Private sector, Public sector Private sector, Public sector > Agriculture
Identity 15: Transportation/Machine contractor	Entrepreneur, Agriculture > Private sector, Public sector
Identity 16: Shopkeeper	Entrepreneur > Agriculture, Private sector, Public sector Public sector > Agriculture
Identity 17: Agent/Representative	Entrepreneur > Agriculture, Private sector, Public sector
Identity 18: Social services	Entrepreneur, Agriculture > Private sector

provider	Public sector > Agriculture, Private sector
Identity 19: Restaurant-entrepreneur	Entrepreneur, Public sector > Agriculture, Private sector Private sector > Agriculture
Effort 1: Looking for new business ideas	Entrepreneur > Agriculture, Private sector, Public sector Agriculture > Public sector
Effort 2: Trying to produce own product	Entrepreneur, Agriculture > Private sector, Public sector
Effort 3: Developing new product or service	Entrepreneur > Agriculture, Private sector, Public sector Agriculture > Private sector, Public sector
Effort 4: Looking for co-operation partner	Entrepreneur > Agriculture, Private sector, Public sector Agriculture > Private sector, Public sector
Effort 5: Seeking patent for invention	Entrepreneur, Agriculture > Private sector
Effort 6: Learning business know-how	Entrepreneur > Agriculture, Private sector, Public sector
Effort 7: Starting studies of entrepreneurship	Entrepreneur > Agriculture, Private sector, Public sector
Effort 8: Participating for a starting-up business education	Entrepreneur > Agriculture, Private sector, Public sector
Effort 9: Learning entrepreneurship by working for someone else	Entrepreneur > Agriculture, Private sector, Public sector

In *Pull factors* overall, respondents with entrepreneurial background had higher ratings than respondents from agricultural, private sector or public sector backgrounds. Furthermore, respondents from agricultural background had higher ratings than respondents with public sector background.

Respondents from public sectors' background appraised *Hygiene factors* overall higher than respondents with agricultural background.

In *Motivation factor* respondents from entrepreneurial background appraised these qualities higher than respondents with agricultural or public sectors background. Furthermore, respondents with background of private and public sectors had higher ratings than respondents with agricultural background.

Overall, when looking at the post-hoc table the respondents with entrepreneurial background had the most positive ratings towards entrepreneurship when compared to others. Respondents from public sectors seem to have most often less positive ratings towards entrepreneurship.

**Table 5: Comparison of different Family Backgrounds in case of Intentions, Pull-factor, Motivation and Hygiene Factors, and Obstacles. (Post-hoc test: Tukey HSD)**

Intention 1: Going to start up business by myself within a year	Entrepreneur, Agriculture > Private sector, Public sector
Intention 2: Going to start up business together with a partner within a year	Entrepreneur > Agriculture, Private sector, Public sector
Intention 3: Going to buy already existing enterprise/business by myself within a year	Entrepreneur > Agriculture, Private sector, Public sector Agriculture > Public sector
Pull-factor	Entrepreneur > Agriculture, Private sector, Public sector Agriculture > Public sector
Hygiene factor	Public sector > Agriculture
Motivation factor	Entrepreneur > Agriculture, Public sector Private sector, Public sector > Agriculture
Obstacle 1: fear of failure	Agriculture, Private sector, Public sector > Entrepreneur
Obstacle 2: wrong state of life	Agriculture, Private sector, Public sector > Entrepreneur Public sector > Agriculture
Obstacle 3: lack of knowhow	Agriculture, Private sector, Public sector > Entrepreneur Agriculture > Private sector
Obstacle 4: practical obstacles	Agriculture, Private sector, Public sector > Entrepreneur Agriculture > Private sector
Obstacle 5: personal characteristics	Agriculture, Private sector, Public sector > Entrepreneur
Obstacle 6: lack of support	Agriculture, Private sector > Entrepreneur Agriculture > Private sector, Public sector

## CONCLUSIONS

Entrepreneurship qualities seem to be quite a decisive factor when an individual is faced with the choice of an entrepreneurial career. A clear-cut entrepreneurial identity makes it easier to choose an entrepreneurial career if one is in two minds about starting up a business. However, there is a gap between the 'ideal' and actualising it if the other entrepreneurial capacity factors are not favourable. Entrepreneurial motivation is quite decisive in the case of a free choice between an entrepreneur and a wage earner. All these factors form a chain, which can lead to an entrepreneurial career in the context of push-and-pull factors as well as

barriers to entrepreneurship. The more positive the dimensions of capacity in the chain, the more probable the entrepreneurial career. In Finland, the weakest link in the chain is entrepreneurial motivation; the security factor is the most important motive in general. This generally explains the weak position of entrepreneurship in Finland. This is largely due to the excessive social security and high taxes and labour costs. Enterprising is not experienced rewarding. Maybe also the strong uncertainty avoidance culture, typical of Finland is partly behind the dominating security factor (see e.g. Routamaa & Pollari 1998). It seems that family background also quite much predicts the entrepreneurial capacity. People originating from entrepreneurial family, farmer family, wage earner family in public sector, or wage earners in private sector quite much differentiate from each others.

## POSSIBLE IMPLICATIONS

Based on the research results obtained here, it is possible to forecast entrepreneurial capacity and intentions of different people in terms of family background. Entrepreneurship profiles revealed, for example, what kind of facilities, ideals, barriers, and motives people have. This knowledge helps to direct the development efforts to promote entrepreneurship and to make it possible to carry out better planned 'specified development activities and training'.

In the light of these results, it seems that having a public sector background is a drag on when thinking about the career as entrepreneur, and also the background of private sector can be regarded as some kind of obstacle. Thus entrepreneurial education should be recommended especially to those people who are likely to have more negative attitudes and capacity towards entrepreneurship. Of course, aiming at fast results, those coming from entrepreneurial family are most thankful target group. After identifying the attitudes, push, pull and motivational factors of each person or group, the education or training for entrepreneurship can be modified so as to gain better results.

The politicians and educators should encourage people of different backgrounds to become entrepreneurs and remove disincentives to start-up decision (cf. Routamaa 2003). Transitions all over the world require more self-employment and intrapreneurship.

# THE APPLICATION OF SUPPLY CHAIN MANAGEMENT BEST PRACTICES BY SMALL BUSINESS SUPPLIERS

**Prof JA Badenhorst-Weiss<sup>a</sup>**

***University of South Africa***

**Ms I Fourie<sup>b</sup>**

***University of South Africa***

**Mr JD Nel<sup>c</sup>**

***University of South Africa***

## ABSTRACT

In this paper a synopsis of the application of supply chain management practices by small and medium-sized businesses (SMEs) will be presented and the position of the SMEs in major supply chains highlighted. This paper endeavours in particular to provide a perspective on the following questions: (1) What are supply chains and supply chain management? (2) Can SMEs successfully apply the approach of supply chain management? (3) To what extent are SME suppliers involved in the supply chain management practices of large organisations (clients) in supply chains? (4) What is the relationship between SME suppliers and large clients in supply chains? The study, which is exploratory, found that the relationship between SME suppliers and large clients is to some extent characterised only by a long-term agreement, open communication and joint problem solving. Risk and benefit-sharing are not always part of the relationship. Other supply chain practices such as multi-organisational teams, integration of information systems and joint planning were neglected in the relationship between small suppliers and large clients. Small suppliers are therefore not afforded the opportunity to fully cooperate and contribute in the supply chain. The results of this study can promote insight into the role of SMEs in supply chains, which might be of interest to educators and consultants, when developing training programmes and advising organisations (large and small) in supply chains. SMEs must fully understand the supply chain management approach and their role. Large organisations, however must realise that, despite their size, SME suppliers are important partners who can contribute substantially to savings in the supply chain.

# INTRODUCTION

Globally, companies such as Wal-Mart, Proctor & Gamble, and Hewlett-Packard have saved millions of dollars in costs and decreased inventories while improving efficiency and customer satisfaction (Chapman, Lawrence & Helms, 2000, p. 31). Increasingly more large businesses in South Africa, implement or work towards implementing the strategic supply chain management approach and in South Africa, strategic supply chain management practices have resulted in cost savings of billions of ZAR (South African rand) (Raath & Van Kraayenberg, 2002, p. 1). This is a result of emerging trends such as intense global competition which demands businesses to be quick, agile and flexible; new technology available to any business willing to adopt it; and more advanced customer expectations. Management concepts that businesses adapt in their endeavour to implement the supply chain management approach include business process re-engineering, total cost of ownership, total quality management, just-in-time, electronic data interchange, e-business, global sourcing, multi-functional and multi-organisational purchasing teams and strategic partnerships.

The successes achieved by organisations that implement the strategic supply chain management approach will certainly have a positive impact on the popularity of the approach and a trend towards implementing the supply chain management approach by increasingly more organisations is to be expected. This trend will undoubtedly influence small and medium-sized businesses (SMEs). Many SMEs are already supplying materials, products and services to large organisations. Hence, the adoption of the strategic supply chain management approach by large organisations in supply chains will have a definite impact on them (SMEs).

## OBJECTIVES OF THE PAPER

In this paper an endeavour was made to provide a perspective on the following questions:

- What are supply chains and supply chain management?
- Can SMEs successfully apply the approach of supply chain management?
- Do large clients fully utilise their SME suppliers as partners in their supply chains?
- What are the characteristics of the relationship between SME suppliers and large clients?

Approaches pertaining to supply chain management vary substantially from organisation to organisation and even from one manager to another (Fawcett & Magnan, 2001:7). It is therefore important to define the concepts of supply chain and supply chain management to highlight the angle taken on these concepts in this paper.

### Defining a supply chain

According to Monczka, Trent and Handfield (2002:4), a supply chain encompasses all activities associated with the flow and transformation of goods from the raw material stage (extraction), through to end users, as well as the associated information flows both up and down the supply chain. It therefore comprises a physical element (the strategic partnering of various market-focused, responsive organisations involved in the transformation of

specific goods) and the information element (controlled sharing of business data and processes). A supply chain can therefore be viewed as the formation of a value chain network consisting of individual functional entities committed to the controlled sharing of business data and processes. Organisations in the supply chain focus on their core activities and outsource the remaining operations to other business partners (Lau & Lee, 2000:598). This results in strategic partnering of various segments of business.

Democker (2000:141) adds that supply chains consist of companies that build portals linking buyers and suppliers – providing a platform to exchange information about products, inventory, capacity, shipment and payment. This is achieved via the implementation of an efficient and effective information flow system – for the organisation and its business partners (Lau & Lee, 2000: 599).

Christiaanse and Kumar (2000:270) are of the opinion that in order to compete successfully, a supply chain needs to be responsive to the customer's demands, provide mass-individualised products or services at the lowest cost and response time at an acceptable level of quality.

Essentially, supply chains are series of linked suppliers and customers - every customer is in turn a supplier to the next downstream organisation until a finished product reaches the ultimate end user.

## **Defining supply chain management**

Management of the supply chain, according to Gattorna (1998:18), has evolved over the last two decades from an emphasis on integrating logistics and lowering costs to providing better products and services to customers, quickly and cheaply. Handfield and Nichols (1999:1) agree to a certain extent, defining supply chain management as a dynamic enabler for organisations to realise the challenge of getting products to consumers when, where, how and in the quantity required in a cost-effective manner.

Monczka *et al* (2002:5) regard supply chain management as the integration of all activities associated with the flow of goods from the raw materials stage through to end users, as well as the associated information flows both up and down the supply chain. These activities include systems management, operation and assembly, purchasing, production scheduling, order processing, inventory management, transportation, warehousing and customer service.

Pooler and Pooler (1997:37) indicate that supply chain management focuses on control of the entire supply chain – placing strategic emphasis on value-added activities and total cost savings. Gattorna (1998:18) takes it a step further by suggesting that corporate and supply chain goals should be united, to improve profitability and growth – thereby increasing shareholder value.

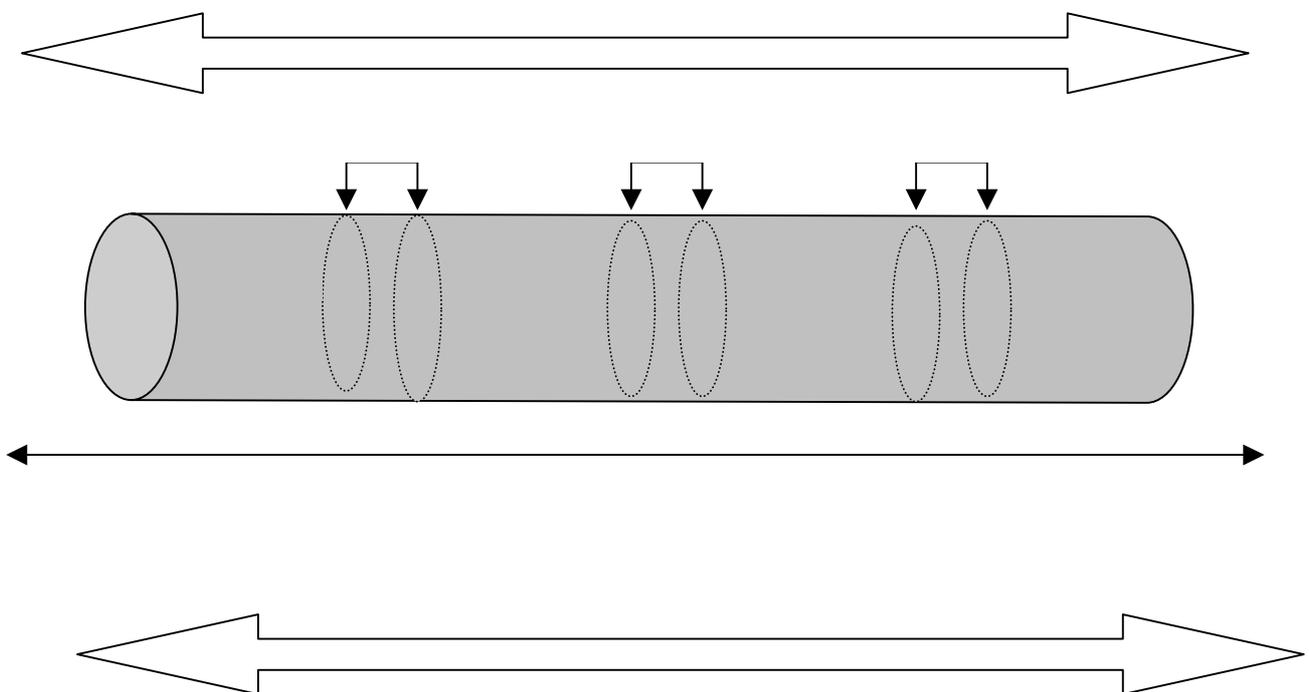

The increasing importance of supply chain management is forcing businesses to adopt the new management approach. Fawcett and Magnan (2001:7) studied the various definitions of the concept of supply chain management in depth. They concluded that to successfully implement supply chain management, businesses must possess the following characteristics:

- They must be relentlessly customer centric.
- They must be driven to improve asset efficiency.

- They must recognise inter-business collaboration as critical.
- They must focus on processes rather than functions.
- They must view open communication as a must.
- They must factor people into every decision.
- They must invest in information technology as an enabler.
- They must be obsessed with performance measurement.

Supply chain management, therefore enables organisations to identify formal processes to integrate all activities associated with the flow of goods from extraction to the final consumer by strategically establishing interbusiness collaboration and information sharing, with the emphasis on value-added activities and total cost savings – as illustrated in exhibit 1.

**Exhibit 1 A supply chain model (Hugo, Van Rooyen & Badenhorst, 2002:29)**

**How SMEs can benefit from best supply chain management practices**

Chapman et al (2000: 31) are of the opinion that SMEs can take advantage of the supply chain management strategy for various reasons:

- SMEs are critical links in many supply chains.
- SMEs are very flexible. Many SMEs are still young and developing and it is therefore easier for them to re-engineer existing business processes and adopt a supply chain management approach than for large organisations with a long-standing organisational structure and culture. The integrated approach is inherently part and parcel of SMEs.
- SMEs follow an integrated approach by nature. Various business functions are usually performed by one or a few persons working together.

- Computer software programmes are more SME friendly. IBM, for example, started the service Smart Start, which allows SMEs to use IBM's expertise with information systems along with their own business expertise to find and implement ERP system solutions that work for their business.
- SMEs can also benefit from global competition. Supply chain management provides a method of addressing the competitive challenges facing business today.

Small businesses are therefore already vital links in the supply chains in which they participate. By virtue of their size, flexibility and expertise they possess advantages that they can use to benefit their supply chain and strengthen their own businesses. Technology is increasingly affordable and available to help SMEs take advantage of supply chain strategies. Because of the competitive pressures facing small businesses it is critical for them to use supply chain perspectives and associated strategies to create synergies with supply chain partners in order to succeed in the global competitive environment (Chapman et al, 2002: 34). Despite the optimism of Chapman et al (2002: 31-34) there is reason to doubt the general implementation of the supply chain management approach and willingness and ability to implement the approach by small businesses.

## **Supply Chain Management: best practices and relationship issues identified**

Various focus group workshops with two large multinational corporations and a literature research were conducted to identify supply chain "best practices" and supply chain relationship characteristics. The following synopsis of practices and relationship issues can be regarded as necessary for a supply chain to function properly (This cannot, however, be regarded as all the practices and relationship issues involved in the supply chain management approach):

- *Cross-organisational integration* focuses on the integration of supplier and customer network processes. The purpose is to create an optimised material flow pipeline, free of all obstruction and wasteful activities (Hugo, Badenhorst-Weiss & Van Biljon 2004: 70).
- Collaboration between supply chain partners will reduce risk and greatly improve the efficiency of the overall pipeline. Supply chain efficiency therefore relies heavily on successful *long-term relationships* (partnerships) where *information sharing*, *joint problem solving*, and *trust* are key success factors (Hugo, et al, 2004: 11).
- *EDI* makes it possible for different firms to *integrate their systems and databases* despite differences in compatibility. It is increasingly replaced by more flexible, cost effective e-commerce (and other web-based systems) (Hugo, et al, 2004: 81).
- *Total quality management* (TQM) and continuous improvement (CI) encompasses quality management of the entire supply chain and include all the suppliers and customers in the supply chain down to the final customer.
- The aim of *just-in-time* (JIT) is zero inventory and waste reduction. JIT aims to reduce inventory and waste to zero and will ultimately ensure that the objectives of supply chain management are met. A great deal of trust and cooperation in the various links between firms are required.
- *Supplier development* and the *evaluation of the supplier's performance* is the first issue of managing the supplier relationship. If the supplier's performance is perceived as inadequate, it should be assisted to enhance its performance by means of training and continuous improvement teams (Gadde & Håkansson, 2001: 145-152).

- Planning for the supply chain implies *planning collaboratively* with the external environment consisting of customers, suppliers and other role players in the supply chain (Hugo, et al, 2004: 16).
- Cost transparency, open-book negotiations and *risk and benefit sharing* are an integral part of the supply chain management approach and entail a two-way sharing of cost data. The more holistic approach of *total cost of ownership* (TCO) examines the cost associated with purchased goods and services throughout the supply chain. It considers cost all the way from the generation of a new idea to product development – typically a joint effort between supplier and customer (Hugo, et al, 2004: 80).

## RESEARCH FINDINGS

In this section the research conducted amongst SME suppliers and large organisations in South Africa is explained after which the general business information and the nature of the relationships between these SMEs and large organisations in South Africa is revealed. Secondly, the supply chain management best practices that were identified in supply chains in the United Kingdom and the results of the study conducted in South Africa are compared.

### **The general background information of the research conducted in South Africa**

A questionnaire was compiled after focus group workshops with two large multinational corporations were held and literature research was conducted to identify supply chain “best practices” and supply chain relationship characteristics. The questionnaire consisted of two sections. The purpose of section A was to solicit information from large corporations. In section B information was collected from these large organisations’ SME suppliers that formed part of their supply chains. Section A of the questionnaire solicited information on (1) the nature of the business, (2) supply chain management practices that were used in the supply chain of the organisations and (3) various other elements that do not fall within the ambit of this paper. Section B solicited information on (1) the nature and scope of SME suppliers, (2) a number of relationship issues between SMEs and larger organisations and (3) the involvement of SME suppliers within the supply chain management practices of their large clients. This paper will report in particular on the findings of this part (section B) of the investigation.

A total of 451 (continuous education) students (employed in the supply field by large corporations which have either fully implemented the supply chain management approach or are progressing well with the implementation thereof) were given an assignment to *firstly* complete the first section (A) of the questionnaire dealing with the situation in their own company (large client), and *secondly*, to identify and interview, with the aid of section B of the questionnaire, a SME supplier who had been supplying materials and services to the core business processes of the company for a while. The sampling method can therefore be regarded as purposive. A total number of 257 questionnaires were received and 219 questionnaires could be used for analysis.

## **The nature and size of the business operations in South Africa**

The majority of operations included in the research were in the manufacturing sector. More than thirty percent of the large organisations were in the manufacturing sector. The rest of the findings are indicated in table one. More than two thirds of the large organisations involved in the research had an annual spend of more than R100 million on purchases from suppliers. A further 11 percent of these organisations spent between R50 million and R100 million on purchases. It is therefore quite clear that the large organisations involved in this study were huge in South African terms.

**Table 1: Large organisations- the core nature of the business**

<b>Industry/ sector</b>	<b>% of large organisations</b>
Manufacturing	32
Services	23
Mining	16
Communication	10
Logistics	10
Other	9

Forty one percent of the SMEs interviewed were in the manufacturing business while thirty percent were in the services sector. These results are depicted in table two. In contrast with the large organisations twenty percent of the SMEs interviewed had an annual turnover of less than R1 million. Thirty percent of the SMEs had an annual turnover of between one and five million rand. Sixteen percent had an annual turnover of between five and ten million rand and the rest of the SMEs interviewed had a turnover of more than R10 million.

**Table 2: SMEs- the core nature of the business**

<b>Industry/ sector</b>	<b>% of SMEs</b>
Manufacturing	41
Services	30
Agents/ wholesalers	28
Other	1

The research also indicated that the majority of SMEs were not dependent on a sole large organisation. Seventy two percent of the SMEs interviewed indicated that they received less than 50 percent of their annual turnover from one large organisation. Only 10 percent of the SMEs received more than 80 percent of their annual turnover from one large organisation. Seventy percent of the SMEs interviewed stated that they were a supplier to the large organisation's core business. It would therefore be expected that these organizations would be included in the supply chain management best practices.

## **A comparison between the supply chain management best practices identified in the United Kingdom amongst SMEs and large organisations and the research conducted in South Africa**

In this section of the paper a comparison is made between the supply chain management best practices identified in a research conducted by Jenner and Johnson (2002: 342-354)

in the United Kingdom and empirical research conducted in South Africa. A study by Jenner and Johnsen (2002: 342-354) in the UK indicated that SMEs find it difficult to implement supply chain management best practices, mainly because of lack of influence, resource commitment and knowledge. Regarding the implementation of best practices in supply chain management by SMEs, Jenner and Johnsen (2002: 345-350) report the following findings (which are highlighted in bold):

- **The business and supply chain strategies of SMEs and large organisations are not aligned.**

In South Africa, this was not the finding. More than 60 percent of the SME suppliers stated that their business strategy was aligned with that of the supply chain. This was in contrast to the findings of the UK research. Further research will indicate the reasons for this finding. A possible reason could be that nearly 70 percent of the SME suppliers delivered a core product to the large organisation and that it was therefore important that the supply chain strategies be aligned.

- **It seems as though dominant supply chain partners may put pressure on small partners to share more benefits and take more risks. SMEs, however, did not regard this as a problem.**

In the empirical research conducted in South Africa, 42,4 percent of the SMEs interviewed in the South Africa indicated that they were included in risk and benefit sharing. The extent to which the risks and benefits are shared will have to be determined with further research.

- **There was a restriction to openness and transparency with regards to communication between the SMEs and larger organisations.**

The research in South Africa initially seems to have a different finding until it is investigated more closely. Nearly 85 percent of the SMEs interviewed indicated that there was open communication between them and the larger organisations. From this finding it would seem as though open communication is being applied within supply chains. However, only 34,6 percent of the SMEs indicated that there was an integration of operational, information and communication tools between themselves and the large organisations. Only 29,1 percent of the SMEs felt there was cost transparency and that the concept of total cost of ownership was being applied of which they were part.

- **According to this research joint problem solving was functioning well.**

This was also the case as experienced by SMEs in South Africa, where 72,8 percent indicated that they were included in joint problem solving.

- **There was little evidence of a structured programme of assessing supplier performance.**

In the South African research however, 57,6 percent of SMEs felt that supplier performance assessment was being implemented and 55,8 percent of the SMEs felt that there was an assessment of supplier relationships. Nearly 57 percent (56,9%) stated that they were involved with total quality management and continuous improvement that was applied by the large organisation. Nearly 46 percent of the SMEs indicated that the large organisations were involved with developing them.

- **JIT was not regarded as a realistic proposition by the respondents in the UK study.**

Approximately 47 percent of the South African SMEs indicated that they were involved with JIT inventory management processes with the large organisations.

- **Multidisciplinary teams were used mainly for new product development.** These findings are similar to the findings of the research conducted in South Africa. Only 18,5 percent of SMEs felt that they were involved with cross-organisational process teams of large organisations. Nineteen percent stated that they were included in cross-organisational sourcing teams.
- **Although many SMEs are starting to use elements of e-commerce, it is clear that information technology can be regarded as a hurdle that SMEs will have to overcome to successfully participate in supply chains.** Important reasons for a lack of IT application in small businesses are limited funds, inadequate time to invest and lack of knowledge and skills (Caldwell et al, 2002: 123-134 & Wagner, Fillis and Johansson 2002: 721-733). The research indicated that only 20,8 percent of the SMEs in South Africa were involved with EDI and e-commerce with the large organisations.

The study of Jenner and Johnsen (2002) indicated that SMEs experience problems in the supply chain because of a lack of resources and influence over larger, more powerful suppliers and customers. The result is a “coping” approach rather than strategic control by SMEs. A final problem that was identified was the resistance to change culture throughout the supply chain. A lack of knowledge and experience may explain why some “best practices” are seen as less appropriate. The SMEs did not regard open communication between supply chain partners, risk and benefit sharing and joint problem solving as problems.

## CONCLUSIONS

In this exploratory study, conducted in Southern Africa, it was found that large suppliers prefer long-term relationships with SME suppliers in supply chains. The large suppliers who have adapted the JIT approach expect and involve their small suppliers in this approach, in contrast to the findings of the other studies previously mentioned. According to the findings of this study, joint problem solving, open communication and timely information are an integral part of the relationship. Risk and benefit sharing and the integration of systems were seldom part of the relationship. Supplier performance assessment and relationship assessment were applied to some extent. SME suppliers experienced problems integrating their systems with those of large clients. These findings are therefore in line with the findings of the studies conducted in the United Kingdom.

On basis of the findings of this study it is suggested that an additional study be conducted with a more detailed questionnaire to make advanced statistical analysis possible. It is also suggested that focus group discussions be held in addition to the interviews to enhance the understanding of the underlying reasons for these findings.

# **CREATION: THE EXPERIENCE OF KUWAIT SMALL PROJECTS DEVELOPMENT COMPANY**

**Dr. Waleed Al-Saif<sup>1</sup> , Vice Chairman and Managing Director  
alsaif@kspdc.com.kw**

## **HISTORICAL BACKGROUND:**

Before the discovery of oil in the early 20<sup>th</sup> century, the economy of Kuwait was based on trading and traditional small-, micro businesses, and handicrafts to meet the basic needs of the locals and foreign traders. Shipbuilding, fishing, diving for pearls, construction are examples of the economic activities at that time. Kuwaiti entrepreneurs managed to supply the population with their basic needs and succeeded in setting up joint ventures in India and East African countries, the main regional trading partners during that period.

In 1934, many structural changes took place as a result of oil discovery which reshaped the existing economic activities. For examples, many small business owners expand their businesses and became large business owners, and many craftsmen left their jobs to work for the government. As a result, the contribution of the small businesses to the economy declined as the public sector and large industrial and financial businesses expanded remarkably.

Today, the economic structure continues to be dominated by large public and private businesses.

## **The Private Sector of Kuwait:**

The private sector of Kuwait is very small. The total number of the private enterprises is around 25000 , of which 2700 or about 1% has around 10 employees, 60% have less than 30 employees, 15% have less than 50 employees, and 2.1% have more than 600 employees.

Enterprises with around 10 employees (SMEs) are highly concentrated in two sectors: wholesale/retail trade and hotels and restaurants (40% of SMEs), and construction industry (33% of SMEs). The remaining 27% of SMEs are distributed in finance, industry, and services.

---

<sup>1</sup> Dr Waleed Al-Saif is currently the Vice Chairman and Managing Director of Kuwait Small Projects Development Company. Previously, he was economic advisor to Kuwait Fund for Arab Economic Development, and the National Assembly of Kuwait. Al-Saif is a visiting economic professor at Kuwait University. He earned his Doctoral and Master degree in economics from the Claremont Graduate University/ California USA in 1996 and 1991, respectively. He also earned a Master degree in Business Economics from the Peter F. Drucker Graduate Management. Center in 1987.

Employment figures on the private sector show that only around 5% of Kuwaitis are employed in the private sector, this percentage reaches 95% in the public sector, where the high wage and job security.

## **Kuwait Small Projects Development Company (KSPDC)**

Due to the government need to correct the imbalance of the labor distribution stated earlier between the private and public sectors, a new policy was adopted in 1996 to encourage Kuwaitis to work in the private sector. A new National Investment Fund was established by Kuwait Investment Authority (a government institution responsible for managing oil revenues and the Kuwait reserves) with a capital of 100 million Kuwaiti Dinars ( around US.\$ 300 millions) to establish SMEs in Kuwait. A new company was founded in 1997 to carry out this mission on behalf of the Kuwait Investment Authority named Kuwait Small Projects Development Company (KSPDC).

### **KSPDC Objectives:**

The establishment statute of KSPDC specified five objectives. They are as follows:

- Establishing or participating in SMEs to meet the needs of the industrial, commercial, professional, and handicrafts sectors;
- Assisting Kuwaitis to develop their skills and encourage them to enroll in the SMEs needed by the country;
- Assisting in creating job opportunities to fresh graduates from technology and industrial institutions;
- Assisting in developing handicraft and professional projects with the citizens; and
- Preparing studies to determine the feasible SMEs in the industry, commerce, crafts, professions sectors which are needed by the country and employ Kuwaitis, direct them toward these projects, and provide experts for guidance and advice.

### **KSPDC Conditions:**

KSPDC is a venture capital firm. To participate in establishment of an SME, there are few conditions:

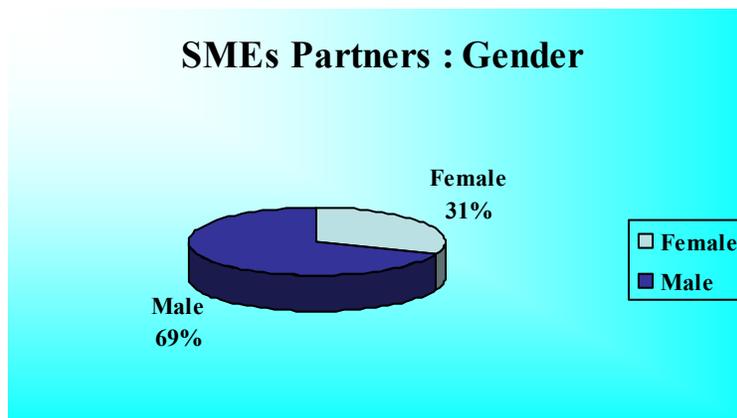

- The project owner should be a Kuwaiti national;
- Age between 21-42 year old;
- Full-time dedication to the project;
- Professional knowledge;
- Project capital should not exceed 500,000 Dinar (US \$ 1.5 million);
- KSPDC's maximum equity participation is 50% of the total cost of the project;
- Exit plan during five years; and
- Accepting the legal, fiscal, and the administrative conditions stated in the partnership agreement.

## KSPDC Sectors:

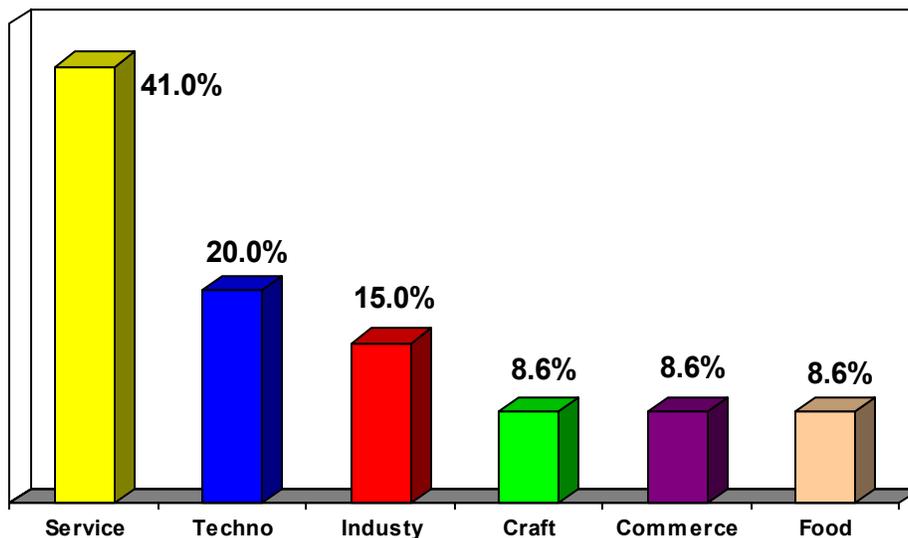

KSPDC can invest in all economic sectors except the real estate, financial brokerage, agriculture and agro-industry, public transportation,

## KSPDC Record during 1997-2003

KSPDC established a total of 42 SMEs during 1997-2003. Their total capital was around US \$24 millions. The KSPDC's contribution was about 48%. About 31 % of project owners are females, and 69% males, as shown on Chart (1):

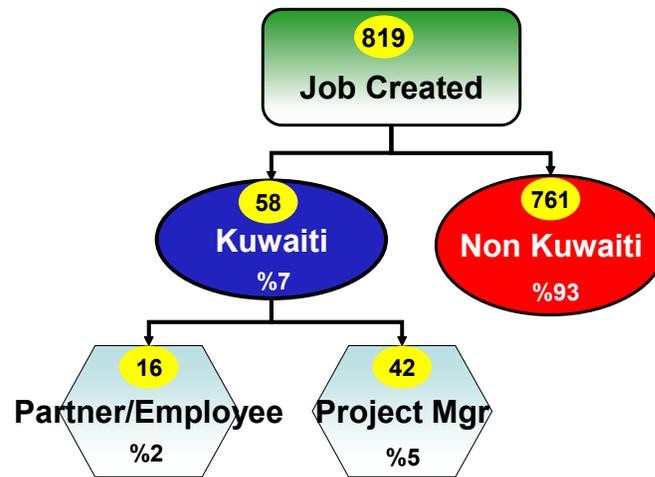

The distribution percentage of the SMEs in various economic sectors is shown in chart (2):

As of end of year 2003, the employment statistics indicate that the total number of new jobs created is 819, of which 761 Non-Kuwaitis; and the remaining 58 are Kuwaitis, and of which only 16 employees and the remaining are business owners. Therefore, of the total job creation, the percentage of Kuwaitis is about 7%, as show on the following diagram:

## Job Created 1997-2003

This employment record shows that there is a serious targeting problem: the company which was founded to create jobs for Kuwaitis, it created jobs for non-Kuwaitis. This was due to the cultural factors. From social and economic perspective, many young Kuwaitis do not like to be employed in low wage jobs, which were generated by the selected projects. Only low wage-foreign labor would accept such jobs. Therefore, there is a need to target the projects which generate socially and economically attractive jobs such as in the field of information technology and petroleum. Moreover, both education and incentives need to be provided to young Kuwaitis to encourage them to work in manual jobs, which are not acceptable to them from cultural and economic point of view.

## The Obstacles Facing the Owners of SMEs

KSPDC conducted a survey to identify the obstacles facing the entrepreneurs on October 2003. The survey results show the following obstacles:

- Lack of capital
- Lack of data and information on the market
- Lack of expertise in the area of finance, marketing, accounting, and many technical aspects of the project.
- No hands-on training before and during the operation of the project
- Complicated and lengthy government procedures
- Not sufficient banking support
- Foreign import competition
- No government support for SMEs to win government contracts or subcontracts.
- No government support for SMEs exports
- 10) No legislation to support SMEs in Kuwait

## The Future of KSPDC

KSPDC's past performance and its outreach has fallen short of expectations. Therefore a change was required in all aspects of KSPDC operation and investment activities. KSPDC has now new Board of Directors, and a new Managing Director. KSPDC is in process of reengineering its management and staff to ensure the future demand for its operations is meeting thru quality and timely services.

KSPDC's Board of Directors has approved the new strategy for the company to focus on the following:

- Partnership in businesses which yield higher value added to the economy and higher level of employment for Kuwaitis;
- Actively seeking partnership in business opportunities identified out of sector studies;
- Seeking to partner with successful foreign businesses to bring about investment and economic opportunities that would be rewarding for all partners;
- Support success of SMEs, by setting up or work with appropriate partners (private sector, Chamber of Commerce, and the Government agencies) to create an enabling environment, such as entrepreneur and SME information;
- Provide training to entrepreneurs and SMEs operators;
- Promote entrepreneurial culture in Kuwait; and
- Recruit and enhance quality of KSPDC staff

In order for KSPDC to deliver the above, KSPDC is taking proactive steps in reviewing its policies, procedures and processes and working with outside entities (private sector organizations, academic institutions, and the Government agencies) to introduce policies and programs in support of SMEs.

KSPDC would seek out investment opportunities thru equity investments by partnering with Kuwaitis and non-Kuwaitis companies in bringing about higher value added to the local economy and employment opportunities in identified economic sectors in Kuwait such as the energy sector (Petroleum services related business), and defense sector.

Challenges faced by KSPDC is enormous, but the cause is worthy of taking on these challenges.

## EXECUTIVE SUMMARY

The British Council and the UK's Department for International Development initiated the International Business Linkage Joint Programme (IBLJP) Study in 2003. This study brings together eight different donor funded programmes in South Africa in an effort to identify common strategic issues, good practices and lessons learned.

Linkage programmes participating in this study have been designed to assist companies form business relationships between South African and foreign companies. The linkages supported include those related to trade, investment and the exchange of expertise and technology.

This report forms Phase 2 of the IBLJP Study and is based on secondary data and interviews with relevant key informants from public and private sector. The objective is to critique existing programme design and sustainability in the context of the market.

Key findings of the study are:

- Programmes typically are designed to promote economic growth and / or economic transformation, by encouraging trade and investment and black economic empowerment (respectively);
- The rationale for international business linkage programmes is not based on an assessment of the market and thus an understanding of the market problem; as a result, most programmes are supply rather than demand driven and seem to respond to symptoms rather than the underlying problem in the market;
- Unless programme objectives respond specifically to market failure, effectiveness in achieving IBLs is dubious at best and results in performance measurement which is unrelated to solving the problem in the market.
- Programmes are involved in providing and facilitating international business linkage (IBL) services which enable companies to form partnerships; these services are a subset of what are referred to as business development services (BDS);
- Provision of services by donor programmes have proven to be unsustainable, distort the market and lead to greater problems; therefore, programmes should facilitate rather than directly provide services;
- Analysis of programme achievements and costs has shown that programmes are not as effective as they could be because their interventions are focused at the level of the firm and not of the market;
- Analysis of programme achievements and bilateral economic relationships shows that programmes have had limited impact on the market;

- While linkage sustainability can be undermined by inappropriately subsidized services, none of the programmes even consider sustainability of the services market, indicating a lack of understanding of what the underlying problem is;

This report proposes a model which will significantly shift the role of IBL programmes from linkage facilitator to market developer increasing the likelihood of economic growth and transformation.

## INTRODUCTION

### Background

Since 1994, several donor funded programmes have emerged which focus on developing international business linkages (IBLs) as a way of reintegrating South Africa and / or black owned enterprises in particular, in to the global economy. The British Investment in South Africa Promotion Scheme (BIS), funded by the UK's Department for International Development (DfID), is one such scheme which aims to encourage new, long term business to business linkages – typically joint ventures - between South Africa and the UK. Started in 1994, BIS was scheduled to come to an end in December 2003. Part of its legacy has been to facilitate a process of learning on linkage and joint venture schemes for South African and foreign small and medium enterprises (SMEs). The forum for this has been mediated by the British Council, managing agency for BIS and has included both members of the donor community and of DTI (see Appendix 1).

Two studies have been commissioned by DfIDSA as an outcome of this process. The first was a study designed to review and document the full range of schemes currently available in South Africa, focusing on their mandates, types of transactions, operating models, process, support mechanisms and performance measurement. This has provided the foundation for a subsequent study to investigate the effectiveness, impacts, markets and sustainability of these IBL programmes.

### Terms of reference

The purpose of this second study is to identify the design and sustainability of IBL programmes (IBLPs) and to reflect on good practice and / or lessons learned. To achieve this, objectives of BIS and similar programmes were examined as well as developmental outcomes assessed based on the principle that sustainability of markets should be the main objective.

### Approach

The study was conducted over a ten day period in January 2004 by Luqman Ahmad (BDC) and Kirsten Kennedy (**ECIAfrica**). The process included the implementation /submission of

- 20 key informant interviews with members of the donor community, DTI and private sector (see Appendix 2);
- A workshop with representatives of DfIDSA, British Council, SBP and APDF to review findings;
- Final report submitted to British Council and DfIDSA; and

- Presentation of findings at dissemination workshop.

The Phase 2 Report considers the rationale behind IBLs and how these inform the programme objectives and approaches under review. It then assesses programme effectiveness in terms of cost, market impact and sustainability and proposes a model of developing the market of IBL services which can be used as the basis for improving programme design and market sustainability. Several interventions are suggested which reflect good practice in IBL market facilitation.

## **RATIONALE FOR INTERNATIONAL BUSINESS LINKAGES**

All of the IBL programmes reviewed were launched post South Africa's transition to democracy in 1994 and in response to its isolation from the global economy and corresponding impact on growth (post sanctions) as well as the unequal participation in the economy by black business. Those agencies seeking to reduce poverty through economic development focused primarily on one of two approaches:

- Economic growth through promotion of trade and investment, and/or
- Economic transformation through black economic empowerment (BEE).

The former focus on growing efficiencies (e.g. through technology transfers), investment and market share - increasing the size of the market for goods and services for both South African and foreign owned companies - through promoting partnerships. CABSA, Norad, TIDP, BIS and the UK Partnership fall in to this category.

The latter focus on increasing access to markets by BEE companies and either increasing ownership of assets by BEE companies or increasing the BEE profile of companies. Typically, IBL programmes with this rationale focus on promoting exports, technology transfers and investment for BEE companies. SAIBL, Danida and SSBF in particular have this rationale built in to their programmes.

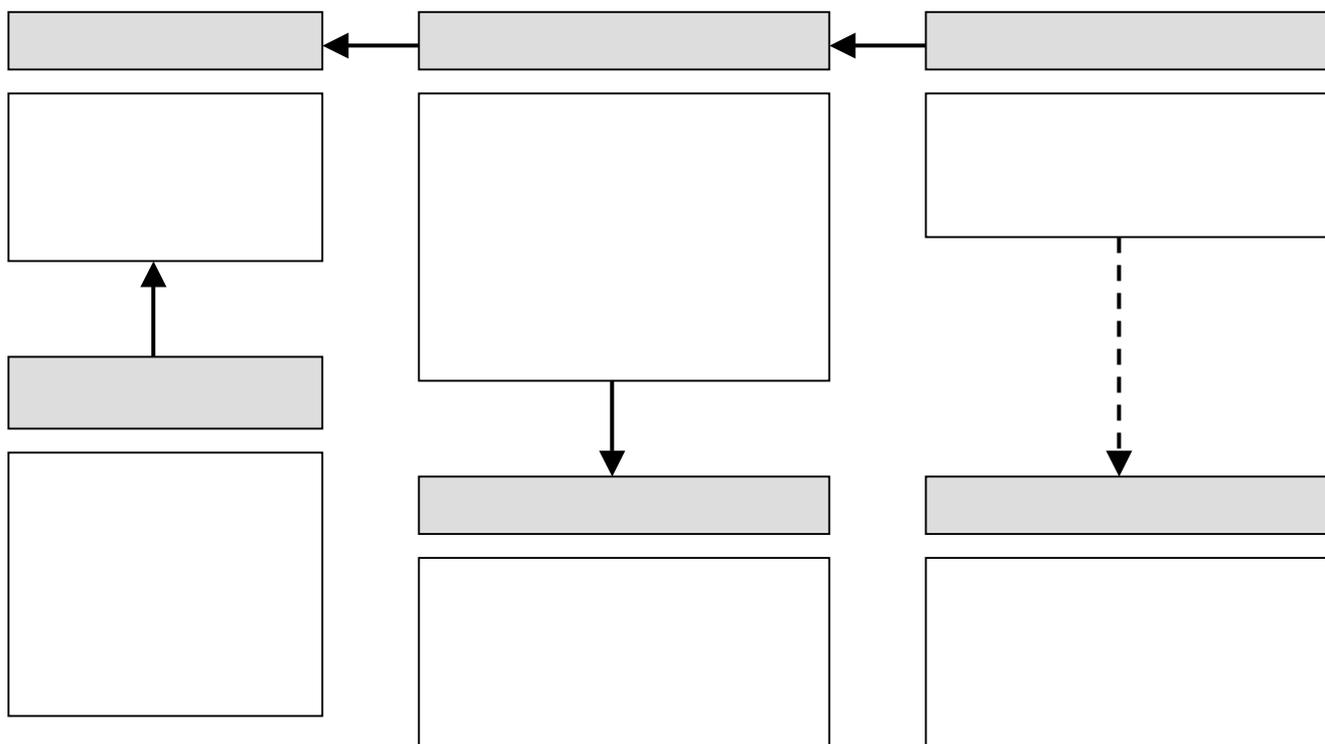

What is of note is that bilateral economic transactions (through international linkages) are but one means to facilitating economic development. Other approaches with the same rationale might prefer to focus on, *inter alia*, creating an enabling environment (through policy or regulatory reform), increasing industry or company competitiveness (through capacity building or training) or providing finance (through the creation of relevant financial mechanisms). The key questions in assessing programme design are:

- What problem are programmes designed to address, if at all? And if so, how have they understood the problem?
- How does their interpretation of the problem translate in to programme design or objectives? I.e. have programmes the "right" objectives? Do their objectives sufficiently address the problem?

The assumption is that good programme design responds to a particular need and in this respect, can be said to be "demand led". The second assumption is that programmes will be effective only to the extent that the problems which they respond to have been correctly understood.

The following framework provides a way of linking programme objectives to the perceived problem and is applied specifically to the context of post-apartheid South Africa and which the IBLs under review responded to.

**Figure 1. FRAMEWORK FOR INTERPRETING THE PROBLEM IN THE MARKET.**

Prior to '94, South Africa's isolation from the global market was due to sanctions, imposed because of its policy of apartheid, which, in turn, reinforced the development of a dual economy, biased against black owned businesses. The symptoms of poor economic growth, escalating unemployment and lack of participation in the formal economy by BEE companies were caused, in part, by constraints such as lack of access to markets, appropriate and affordable services and lack of capacity. IBL programmes then were designed to respond to the symptoms of economic exclusion and differential market access – at the initiative of donors and in response to the South African government's request to redress some of the problems inherited from apartheid.

With the transition to democracy, however, and the reintegration of South Africa in to the global community, lack of participation in the market by SMEs and BEE companies remains a symptom, caused predominantly by the inability of individual companies to effectively identify opportunities for international business linkages and to effectively attract skills and investment. Basically, many companies still do not know how to identify partners or to structure deals.

At a more systemic level, however, such problems are caused by several factors, such as lack of market information, a lack of IBL support services / service providers, or a lack of demand for IBL support services (as a result of distorted incentives). The distortion of supply and demand reflects the dysfunctional nature of the market and leads to a very different programme response *if* (the symptom is) understood in these terms.

From a range of possible interventions to address the constraints<sup>1</sup>, IBLs were selected by these programme implementers as the best way to facilitate greater economic growth and

<sup>1</sup> E.g. training, capacity building, provision of finance

/ or transformation<sup>2</sup> and as such, were designed to respond to *donor/agent* imperatives rather than based on an assessment or understanding of the problem in the market. (See Appendix 3 and 4 for a map of type of transactions and support mechanisms offered by programmes). In this respect, it is true to say that the programmes reviewed are all supply rather than demand led although they may focus on stimulating demand by promoting bilateral trade and investment. Programmes justify their existence by focusing on the fact that they assist historically disadvantaged enterprises (SMEs or black owned enterprises). While not invalid in and of itself, the challenge is to address the failure in the market (in the *current* context) while balancing the objectives of transformation, growth and enhanced access to the South African market by foreign companies.<sup>3</sup>

## **IBL PROGRAMME OBJECTIVES**

Of the eight programmes reviewed for this study, three gave their stated objective as economic transformation i.e. exclusively BEE focused; five are focused on broader economic development. All defined their objectives in terms of results they want to achieve rather than a problem they are attempting to address.

This raises the question of how programmes measure their performance i.e. what measures indicate whether they have achieved their programme objectives or not? In addition, it begs the question of how programmes assess their effectiveness and whether they are effective or not.

Arguably, programmes are effective if they meet objectives, however, if the objectives fall short of addressing the underlying problem and merely address the symptom, then programme effectiveness can be contested.

Effectiveness in this context is measured both in terms of programme cost, impact on the market and sustainability, all functions of programme design. These will be focused on in subsequent sections (see sections 6, 7 and 8). Given the above, however, it is important to decide whether IBLPs are in fact the most effective way to reach objectives or not or whether developing the market for IBLs would not be a more effective way of reaching the goal of growth and participation. Similarly, IBLP implementers need to determine the most appropriate approach (or programme design) if addressing market problems is the main objective.

Performance at this stage is defined in terms of programme achievements or results and can be measured at different levels, viz. outputs, outcomes and impact (short, medium and long term results respectively). An illustration of this is a memorandum of understanding (or MoU) which is a (short term) output of a process facilitating a deal. CABSA and Norad, for example, focus on the number of MoUs as a key indicator of their performance. Figure 2 shows a map of indicators used by the various programmes and illustrates where their primary focus lies.

By contrast, an MoU between two companies may lead in the medium term to an investment which would be regarded as an outcome of the transaction. Impact could then be measured by the number of jobs created and is most likely to be a longer term result of the initial transaction.

---

<sup>2</sup> Although it should be noted that most of the programmes are focused on the former, rather than the latter

<sup>3</sup> Recognised and acknowledged as a legitimate and important objective of donors.

**Figure 2. MAPPING PROGRAMMES WITH PERFORMANCE MEASUREMENT INDICATORS<sup>4</sup>**

Ntsika (TIDP)										
DTI (TEO)										

	1. Main area of activity
	2. Secondary focus
	3. Limited involvement
	4. Area of least involvement

Most of the programmes assessed focus on tracking outputs, with few effectively measuring impacts. The following figure (Figure 3) takes the above indicators and categorises them in to outputs, outcomes and impacts. In addition, it illustrates how programme results link back to their overall objectives. What is evident from the table below is that unless one is measuring impacts<sup>6</sup>, it is not clear whether the programme is meeting the necessary objective ... a case of “what you measure is what you get”. It follows then that if one progresses to addressing a problem in the market, it is imperative to:

- define the objectives in terms of the market (see “potential objective” in Figure 1) and
- to measure performance in terms of impacts and not just outputs.

**Figure 3. LOGICAL FRAMEWORK LINKING RESULTS TO OBJECTIVES.**

Market problem	Programme objective	Transactions	Approach	Outputs (short term)	Outcomes (medium term)	Impact (long term)

## PROGRAMME APPROACH

In order to reach their objectives, IBL programmes are involved in supporting the development of business linkages. The outcome of these linkages range from straight trade to joint ventures and investment. The approach taken by most of the programmes has been to focus interventions on services associated with making the transaction between the South African and international companies occur. Typically, the services that IBL programmes are involved in include<sup>7</sup>:

- Market information
- Partner identification
- Deal brokering
- Business planning
- Feasibility studies
- Technical assistance
- Access to finance

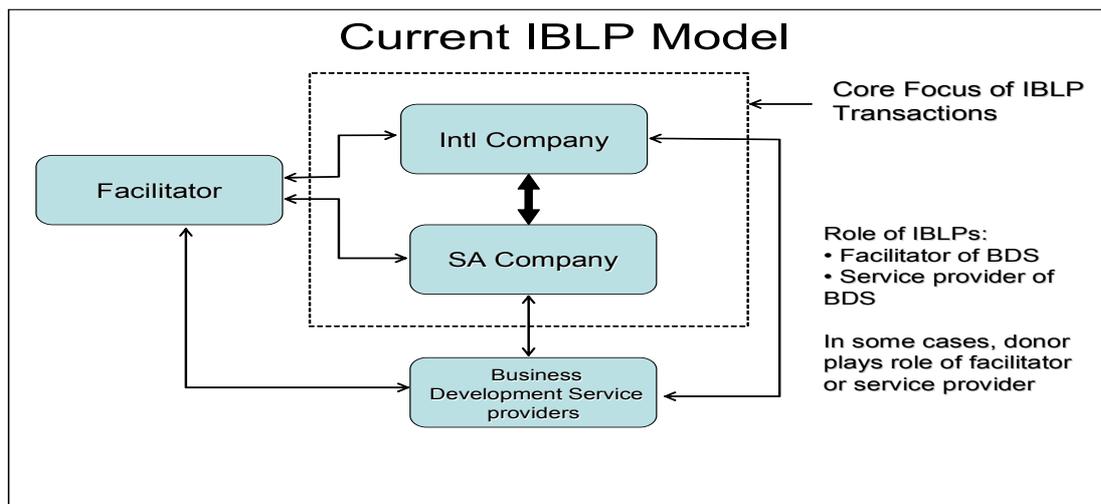

These international business linkage (IBL) associated services enable companies to form partnerships that result in outcomes sought by the programmes. IBL services form part of a broader family of business development services (BDS). In addition to IBL specific BDS, some programmes are also involved in financial services for linkage companies e.g. provision of loans and investment.

In developing partnerships or transactions, the players involved include facilitators and IBL services/BDS providers. A model depicting players, interactions and the focus of the IBL programmes can be found in figure 4.

BDS IS A WIDELY RECOGNISED TERM USED TO DESCRIBE NON-FINANCIAL SERVICES CRITICAL TO THE ENTRY, SURVIVAL, PRODUCTIVITY, COMPETITIVENESS AND GROWTH OF

<sup>7</sup> See Figure 3

**Figure 4. CURRENT IBLP MODEL**

With the focus of the interventions being on IBL services, the programme implementers typically act in one of the following ways:

- **Providing Services:** where transaction takes place between IBL programme implementers and the potential linkage companies i.e. where the services are provided directly by the IBLP (e.g. SSBF providing equity finance);
- **Outsourcing Services:** where the transaction takes place between IBLP and the linking companies, however the services are delivered by providers external to the IBLP. From the perspective of the linking companies, the IBLP provided the services. (e.g. CABSAs provided companies with market research, however, the research was conducted by external consultants and paid for by CABSAs);
- **Facilitating Services:** where services (BDS & Finance) are provided directly to linking companies by private providers. The IBLP bring the service provider and linking company together and/or provide funding to stimulate transaction (e.g. SAIBL cost shares with BEE companies for ISO certification services, where these are provided by consultants).

Only in a few cases do donors actually implement programmes directly and as such play any role within the transaction itself. Figure 5 maps the various IBL programmes and the roles that each play within the associated service areas.

	Provided			Outsourced			Facilitated	

In many cases, the IBLP's act as both service providers and facilitators. Generally, the programmes tend to provide services upstream from the linkage and facilitate services downstream.

Many programmes have traditionally considered gathering market information and partner identification as part of broader linkage facilitation. However, since both of these services are also provided on commercial terms by private providers, it is important that they be recognised as BDS.

Enterprise development experience has taught us that donor funded programmes should facilitate services rather than directly provide services. Not only have direct provision of services by donor programmes proven to be unsustainable, they often distort the market and lead to greater problems; in particular, they can crowd out other commercially driven (private) providers. There are many reasons why the programmes currently provide rather than facilitate services, many of which are based on the following assumptions:

- Lack of service providers
- Lack of appropriate services
- Companies can't afford available services<sup>8</sup>.

Programmes facilitating IBL specific BDS often subsidise transactions between linkage firms and service providers, predominantly through cost sharing mechanisms. Subsidies have proven to be valuable in encouraging firms to transact where their perceived risks are higher than actual risk; in addition, they enable smaller firms to transact where they may not have been able to in the past, creating awareness of benefits and opportunities. While recognising the benefits of subsidies, it is also important to understand the potential negative effects they can have on the business linkage as well as the market in which they operate. Inappropriately applied subsidies can distort the market, creating unfair competition or reducing a company's incentive to be more efficient. In extreme situations they actually have led to partnerships being developed that were not viable and wouldn't have occurred if the parties were not given large incentives. Inevitably, these partnerships fail once subsidies are removed.

A good practise adopted by some programmes has been to diminish IBLP subsidies over time. At the company level, reducing subsidies encourages firms to be commercial and not dependent on the programme. At the programme level, reducing subsidies to the market over time prevents a large gap from developing once the programmes exit.

## **PROGRAMME EFFECTIVENESS**

Donor funded IBLP's are a relatively new concept globally; within South Africa, the programmes have only been operating for an average of 6 years. Many of the programmes were developed without knowing exactly what they could achieve. Determining whether these programmes are effective is a fairly subjective exercise and dependent on what is expected of them. From the perspective of the donors only two of the eight programmes did not meet expectations; one can not conclude, however, that meeting expectations is a sufficient measure of whether objectives are relevant and have been effectively met or not.

---

<sup>8</sup> See "constraints" Figure 1

The programmes have different experiences, approaches, budget and measures of performance; as a result, one is not able to effectively compare programme cost effectiveness and determine benchmarks. It is estimated that over R 330 million has been spent on the eight IBLP's since 1994. When one collectively reviews the outcomes and impacts of these programmes it can be suggested that IBLP's are not the most cost effective way to simply grow or transform the South African economy. Generally IBLP transaction costs are high; one explanation may be the nature of international projects where travel and communication costs are high. If one does not place priority on the international or bilateral objectives of the programme, it is difficult to see how the programmes can be justified when one considers the cost and results one may be able to achieve through *domestic* based linkage and SME development programmes. Figure 6 captures some of the IBLP figures as they relate to primary objectives, duration and budgets.

**Figure 6. IBL PROGRAMME DATA**

Programme	Primary Objective	Years Operating	Est. avg. cost per year (million)	Future
<b>BIS</b>	Economic Growth	9	R 5.5 m	Closed
<b>CABSA</b>	Economic Growth	7	R 4.5 m	Closed
<b>DANIDA</b>	Transformation	7	R 18 m	Indefinite
<b>NORAD</b>	Economic Growth	5	R 1.3 m	2005
<b>SAIBL</b>	Transformation	5	R 4.6 m	2006
<b>SSBF</b>	Transformation	4	R 7.5 m	2009
<b>TIDP</b>	Economic Growth	7	R 8.35 m	Feb-04
<b>UK-SA</b>	Economic Growth	4	R 1.63 m	Mar-04

Of the eight IBLP's reviewed half will no longer be operational within the next six months. Based on this, future support for IBLP's seems to have diminished. Explanations for why the programmes are not continuing include:

- Limited impact and the difficulty in attributing impact to programme outputs.
- Poor cost effectiveness and high transaction costs.
- A change in donor strategy in which the current IBLP do not fit:
  - A shift towards programming that aims for broader systemic impact.
  - Increased focus on "pro-poor" programming, shifting from economic to social development.

Individual reviews have been carried out for many of the programmes and while the available reports have investigated how programmes are doing against their targets, very little has been written on whether the targets and approach are appropriate and on

effective ways in which to reach the broader objectives of economic growth and transformation.

## IMPACT ON MARKETS

While cost-benefit and impact at the level of the firms are important considerations when reviewing the effects of IBLP, it is also necessary to understand the markets in which they operate and the impact they have on them. IBLP markets fall within two broad categories.

- i. Markets defined by business linkages between South African and international companies. These then can be broken into specific markets between countries and then into segments that the programmes focus on developing. The two segments that IBLP's typically focus on are associated with SME's and/or black owned businesses.
- ii. Markets associated with IBL services. These markets are composed of service providers in both South Africa and abroad, providers include:
  - Commercial Trade Offices
  - Investment Promotion Agencies
  - Private Service Providers
  - Internal to companies (typically large companies with international business development divisions)
  - IBLP's (in the case where programmes directly provide services)

### International Business Markets

The IBLP's each place different emphasis on developing bilateral economic relationships and therefore their importance needs to be considered relative to the core objectives of growth and transformation within South Africa. Taking a broader view of bilateral economic relations requires an investigation of two-way trade and investment. Figures 7 and 8 capture recent data gathered from the South African Reserve Bank.

**Figure 7. BILATERAL TRADE BETWEEN SOUTH AFRICA AND SELECTED COUNTRIES**

<i><b>Bilateral Relationships</b></i>	<i><b>Imports into SA 2002 (R millions)</b></i>	<i><b>Percent of Total Imports</b></i>	<i><b>Exports from SA 2002 (R millions)</b></i>	<i><b>Percent of Total Exports</b></i>
Canada -SA	R 2,423	0.88%	R 1,809	0.58%
Denmark - SA	R 1,258	0.46%	R 698	0.22%
Norway - SA	R 342	0.12%	R 361	0.11%
Sweden - SA	R 3,337	1.22%	R 751	0.24%
UK - SA	R 25,117	9.17%	R 27,568	8.78%
USA - SA	R 31,981	11.67%	R 35,940	11.44%
<b>TOTAL</b>	<b>R 64,458</b>	<b>23.53%</b>	<b>R 67,127</b>	<b>21.37%</b>

**Figure 8. BILATERAL DIRECT INVESTMENT BETWEEN SOUTH AFRICA AND SELECTED COUNTRIES**

<b>Bilateral Relationships</b>	<b>Foreign Liabilities FDI into SA Dec 31, 2001 (R millions)</b>	<b>FDI into SA as % of total</b>	<b>Foreign Assets FDI from SA Dec 31, 2001 (R millions)</b>	<b>FDI from SA as % total</b>
Canada -SA	R 2,069	0.56%	R 141	0.06%
Denmark - SA				
Norway - SA				
Sweden - SA	R 640	0.17%		
UK - SA	R 281,263	75.87%	R 74,609	32.24%
USA - SA	R 18,922	5.10%	R 14,101	6.09%
<b>TOTAL</b>	<b>R 302,894</b>	<b>81.71%</b>	<b>R 88,851</b>	<b>38.39%</b>

In order to better understand the impact IBLP's have had on these markets, one needs to analyse these figures over a period of time, from when specific IBLP's were initiated to a future date when impacts of recently facilitated linkages can be assessed. Additionally, since the programmes are focusing on market segments such as SME's and BEE companies the data would need to be disaggregated into SME and BEE terms in order to more fairly assess impact. Unfortunately, this data is not readily available and a more accurate conclusion can not be made.

Based on the information provided by IBLP's and an assessment of bilateral trade and investment figures, it is fair to conclude that the programmes have little impact on the bilateral markets. If viewed on relative terms, programmes developing relationships between already weak bilateral markets have a greater likelihood of affecting their specific market. In the case of the Nordic programmes, the degree of trade and investment is small enough for the programmes to have an effect. Approximately 80 Swedish companies operate in South Africa, 15 of which came into South Africa through the SSBF, demonstrating significant relative impact. At the other end of the spectrum, the UK has consistently been South Africa's largest investor (74% of all FDI) and is one of the top three traders. In this case, developing bilateral economic relationships should not have been an objective as they were already strong in 1994, and a weakness in the market did not exist i.e. there was no apparent problem. This however does not diminish the impact in real terms: R 200 million invested in South Africa is good regardless of where it originates from. Since the approach adopted by the programmes has been to operate at the level of individual businesses it is not likely that impact on markets was initially considered. If impact on international markets is important then IBLP's need to change their approach and start operating at the level of markets.

For the programmes that only work with BEE companies, their impact on broader transformations is also a relevant issue. Empowerment is a dynamic issue in South Africa and requires a flexible approach. The way in which transformation is measured has changed and many programmes have also adjusted how they view the issue. Typically the approach has been to work with black owned businesses and measure the impact at firm level. Measuring transformation at market level will require relevant market statistics; beyond stock exchange data it is difficult to assess the progress of transformation in South Africa. Theoretically, one could measure the impact on transformation in the following ways:

- Black owned companies' or BEE share of international trade and investment

- Change in BEE companies' contribution to GDP over time
- Growth in total BEE company revenue and profits over time
- Transformation of company profile over time (non-equity based criteria)
- BEE market share at sector and sub-sector level

Currently measuring impact on transformation is not possible as IBLP's do not have the resources to effectively measure their impact on transformation at the market level.

Reflecting upon 8-10 years of IBL experience with BEE does provide us with some interesting findings. Programmes working with BEE companies have found it difficult to identify BEE companies ready for international partnerships. Based on simply reviewing the outcomes of domestic BEE linkage programmes (ECI Africa and SBP) it can be suggested that IBL's are a more difficult way through which to achieve transformation objectives. International firms are relatively uninformed (compared to domestic companies) of the advantages of partnering with BEE companies, additionally there are fewer incentives for them to transact with BEE firms at the international level compared to the domestic market.

## **IBL Services Markets**

Based on the scale of international business transactions occurring in South Africa, the market for services is assumed to be large relative to the IBLP's outreach. While the IBLP's have not been focused on developing IBL services markets they are part of them and therefore it is important to understand what effects they are having. A positive impact on the IBL services market (subset of BDS) would be the sustainable growth of supply and demand. In addition, BDS markets have proven to be more sustainable when they are commercially driven by the private sector.

As described earlier, the programmes providing services have made assumptions about the market that still need to be tested. An IBL services market assessment needs to be done to establish a baseline against which programmes measure. Without a clear understanding of these markets, programmes run the risk of either preventing the market from growing, or shrinking the existing market. It is important that IBLP's providing services recognise that they may be displacing other private providers and that their subsidies have potentially negative affects on the market.

Considering the potential market distortions resulting from current interventions and the estimated size of the IBL services market, it is unlikely that the IBLP's have undermined the market. If programmes are to develop sustainable IBL services markets, interventions need to be based on a clear understanding of what is preventing the IBL services market from growing and then designing interventions that address that problem.

# SUSTAINABILITY

Sustainability in this context should be considered at three different levels, viz. sustainability of:

- International business linkages;
- Programmes; and
- The market (for BDS).

## Linkage sustainability

As the inception phase report points out, “programmes have been designed with different performance measurement indicators and the exit strategies have generally been to achieve these within a certain amount of funding” (Ahmad: 2003; 18). Programmes have thus been limited to some degree by funding and time frame constraints rather than by exit strategies tied to performance of market related objectives. Since most programmes are interested in linkage sustainability, their interventions have also included *post* linkage support e.g. through ongoing assistance with planning, market studies, technical advice, implementation and investment<sup>9</sup>. Programme results suggest however, that this design is not sufficient to ensure formation of *effective* linkages; that the problem is, again, not with individual companies alone but with the weakness in the BDS market. This explains in part why such high investments have been made in trying to facilitate or develop individual business partnerships.

There are several barriers to linkage sustainability some of which are highlighted here. In some instances, ventures are supported which are not viable (and which would not be invested in by commercial BDS providers) however, the objective of promoting transformation and growth and of achieving outputs is such that it compromises IBLPs in who they target for assistance and in many instances, companies respond who are not export ready but who recognise and wish to take advantage of an opportunity for assistance.

A second barrier is that the most-often supply driven nature of services is such that they create artificial demand: companies may take advantage of their services because they are, in some way, heavily subsidised and not because this is what the company actually needs. One of the outcomes of this is that companies do not receive the type and quality of services which are most appropriate to their needs, nor do service providers learn to supply what companies really demand. (This is an illustration of incentive distortion – such transactions are not commercially based and therefore do not reflect “real” supply and demand. The outcome of such interventions is less likely to secure sustainable linkages than might otherwise be the case).

In addition to distorted incentives, it is found that overly subsidised transactions are difficult to exit from, creating dependency between client and provider. This accounts again for the high cost of developing such a linkage and of the unlikelihood of it being truly sustainable: unless based on real supply and demand, the linkage will not survive beyond the intervention or support of the provider.

Finally, many linkages are not sustainable because one of the two partners loses commitment to the process or is not truly committed in the first place. This happens often

---

<sup>9</sup> See Appendix 4

where the process is either deemed to be too slow or problematic or where the partner is deemed to be incapable of meeting their share of the bargain.

The learning from this is that (notwithstanding all that has been said about programme design) programmes would do well to respond to real market demand and to target companies which are export ready.

## **Programme sustainability**

At the level of *programme* sustainability, both TIDP and SSBF, for example, are concerned with adapting their programmes to become more relevant and sustainable. These are the only two programmes concerned, however, with this level of sustainability. In the case of TIDP, programme sustainability is more of an imperative given the public nature of its status and function. Other programmes have focused less on this level of sustainability as they have been confined by funding constraints and have reached the end of their life span.

Programme sustainability is of relevance only where market services are being facilitated (and even then, a clear exit point needs to be defined), however, in general, programmes are not expected to be sustainable nor should they necessarily try to be. Rather, the focus should be on linkage sustainability. One question this raises is whether the provision of financial services by IBLPs is then an appropriate intervention or not; In the case of SSBF, investments of R1 – 2 million are made in South African ventures where partnerships with Swedish companies materialise. The problem with this is that the nature of the intervention depends on the existence of the fund so that programme sustainability is of concern, however, if the market were responsible for the investment, SSBF would merely play a facilitating role and thus could have a defined exit strategy.

A final challenge to IBLPs is to ensure transfer of knowledge to local institutions and organisations who are developing linkages; not only is their knowledge of the foreign market invaluable to other providers, but their experience can contribute to the lessons learned in the market place.

## **Market sustainability**

None of the programmes reviewed were addressing market sustainability i.e. how to ensure the more effective and authentic supply and demand of IBL, or business development, services. Building these markets is more likely to address the problem in the market than simply tackling the symptom, however, it is our view that this will be addressed by the next generation of programme architects. For now, private sector IBL service providers are more likely to be sustainable than public ones because they operate within a market which requires their services and on a purely commercial basis. More will be said about this in the next section.

# **THE WAY FORWARD**

## **Rationale**

The rationale for a new model of international business linkages is based on an understanding of the problem in the market viz. that lack of growth and participation in the

current market context are caused by market problems, either through subsidies, unequal supply and demand or lack of information.

### Programme objectives

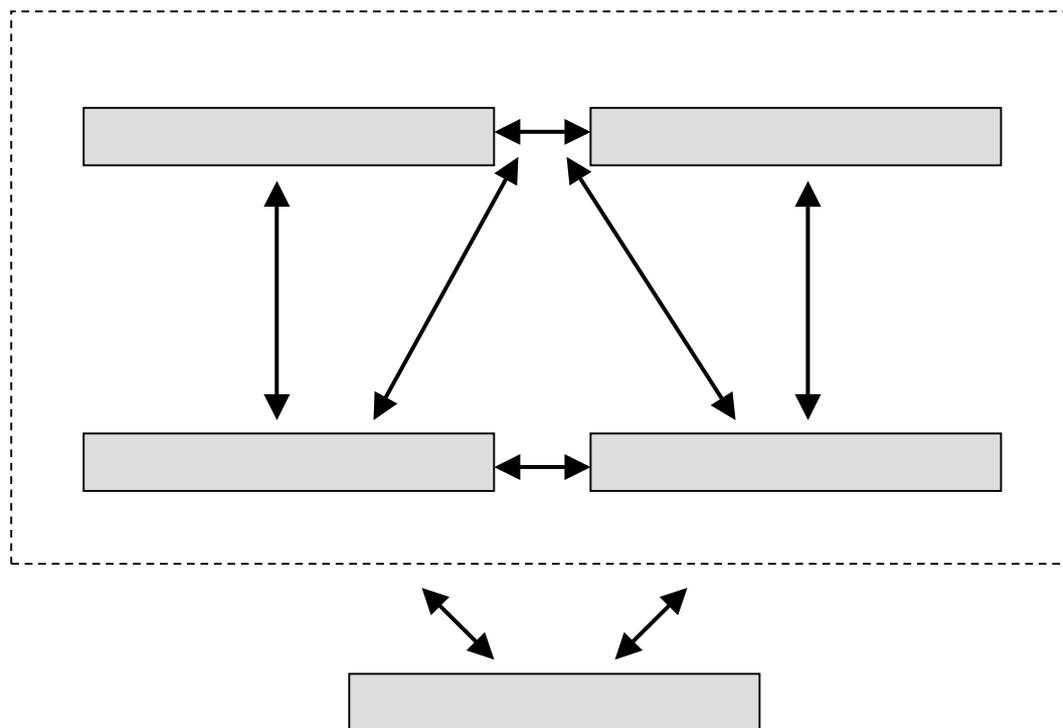

The programme objective thus becomes focused on addressing the problem at the level of the market rather than at the level of the firm. The objective may still be economic growth and / or transformation, but is achieved by developing the market rather than by developing international business linkages.

### Programme approach

Figure 9 illustrates what the new model of the market looks like, compared to Figure 4.

In the old model, the focus was on the transaction between partner firms (foreign company and local SME). In the new model, the focus is on the entire market of providers and “consumers” of BDS and partner firms. The objective is still to achieve linkages in the market, but now the focus is on developing the market: rather than IBLPs targeting their intervention at the level of individual firms, interventions are targeted at the level of the market (e.g. how to stimulate supply and demand for IBL services).

**Figure 9: POTENTIAL NEW MODEL OF THE IBL MARKET**

The role of the IBLP facilitator is also different and shifts from direct facilitation of linkages to indirect facilitation of linkages by focusing rather on market development facilitation. Of necessity, this includes supporting private service providers. In addition, subsidies will be at best removed, at least reduced, to ensure minimal effects of distortion on the market.

The focus is thus wider and no longer dependent on what IBLPs do *for* individual consumers; instead the focus is on enabling firms (the market of providers and

consumers) to transact with each other i.e. the market makes IBLs happen rather than IBLPs making it happen.

## **Programme effectiveness**

Given the rationale for this approach and the shift in objective, we would argue that this design is likely to be more effective: instead of investing in a few partner firms (as consumers of BDS), the investment might be in a few BDS providers, each of whom in turn can transact with multiple firms.

## **Impact on markets**

This design has the potential to be effective – and have impact - at two levels (IBL services and international business linkages):

- The multiplier effect on the market i.e. developing a strong market of IBL services which enables more companies to access the kinds of services required for IBL transactions i.e. an output of this might be the number of SME or BEE firms participating in the market, whereas the long term impact would be market integration and greater market share for BEE or SME firms.; and
- The effect on the IBL market i.e. making the market of linkages work. An output of this may be many deals with potential impact of jobs created, growth in GDP, increased trade and investment.

## **Sustainability**

If the market problem is addressed and distortions removed, the market will work more efficiently than it does at present; symptoms of exclusion and slow growth should then reduce over time. The assumption is that as the market moves closer to effective matching of supply and demand, it will become more sustainable. So, for example, BDS will meet consumer requirements and firms will themselves become more export ready and able to participate successfully in the market. Linkages will thus be based on effective demand and so will likewise be more sustainable.

Sustainability of programmes will thus be determined by their objective in the market. If the objective is to develop the market, the point at which programmes exit the market becomes more easily defined and measurable.

## **Practical Steps**

Ideally new programmes would be designed around the principles of the new approach. This would be founded upon an assessment of the IBL services market, identifying constraints within the market and building interventions that address these problems. Typically service market constraints can be classified into four categories:

- Demand side problems (companies engaged or interested in an international linkage);
- Supply side problems (IBL service provider);
- Transaction problems;
- Market environment problems.

While new programmes have the benefit of flexibility, existing programmes already have an understanding of the market and can better prioritise which problems are more important to address.

In trying to develop markets of IBL services, interventions should be careful not to distort the market too heavily. An effective IBL services market would be where supply equals demand. The proposed approach builds upon what we currently know about BDS market development and since IBL services are a sub-set of BDS, it is important that implementers utilise identified BDS programming good practises.

IBLP's in South Africa can build upon existing programmes by starting to introduce the market development approach in incremental steps. Below are a series of practical steps that for consideration:

- Develop a directory of IBL service providers:
  - IBLP's in South Africa contribute to developing a database of credible providers.
  - Encourage CTO's in South Africa to put forward contact details of individual brokers and consultants servicing their clients.
  - Work with partner organisations in the foreign countries to start a similar process of creating an IBL service provider directory.
- Understand Demand:
  - Survey existing or past clients to determine what services they found valuable, as well as what their willingness and ability to pay is.
- Understand Supply:
  - Engage with IBL service providers to understand the problems they have in servicing the market; this could be done through a simple survey or focus group discussion.
  - Engage with BDS providers to inform them of the opportunities within IBL service market.
- Facilitate IBL service provider linkages:
  - Encourage local providers to engage and make contact with foreign providers, either through sponsored business missions or simply by providing directories.
- Encourage direct transactions:
  - Consider reshaping funding mechanisms such that they are consumer driven and enable a degree of flexibility e.g. make use of vouchers to stimulate demand.
  - Help facilitate transactions which use innovative payment methods e.g. incentive or results based. This will open new markets for providers while making it affordable to clients.
- Harmonise IBLP efforts:
  - Discuss and agree upon an acceptable level of subsidies so that one programme does not undermine the market development activities of another (i.e. free services vs. cost sharing).
- Feedback to policy level:

- Help to create better understanding of the problems within the markets by providing information to the DTI and other relevant government organisations.

## CONCLUSION

Forty years of enterprise development experience has led to the formulation of the market development approach. What this paper has offered is a critique of the current model of international business linkage programmes by applying recognised good practice in market and enterprise development. As a response, we propose a model which addresses both the systemic problems in the market and possible steps to transition from one model to the next.

<sup>11</sup> Support that is used for negotiating or finalising a Memorandum of Understanding agreement

<sup>12</sup> Once a partnership is formed, support that is designed to assist in the implementation of the business (operational)

# **“GLOBALIZATION AND THE IMPACT ON ENTREPRENEURSHIP AND SMALL BUSINESS DEVELOPMENT IN THE DEVELOPING WORLD”**

**BY ERIC MCLAREN PHILLIPS**

## **“ROLE OF GOVERNMENT AND PUBLIC POLICY”**

Globalization is an irreversible process. Driven by the global process of Privatization and Democratisation ; underpinned by Capital Markets and Global Financial Institutions such as the IMF ; the increasing centrality of World Trade Organization in providing a common framework, Regionalization such as the European Union and the Free Trade of the Americas; the increasing interdependence of countries in the global economy ; and finally by political strategies and necessities.....Developing countries have few choices but to participate in this interdependency of “choice and coercion”.

The role of Government and Public Policy is therefore central to the sustainable growth of Small Businesses in Developing countries and especially so in multi ethnic, multi cultural, multi racial societies where historically one particular group, for one of a large variety of reasons, have dominated the political or economic landscape of that country.

More so what is needed is visionary leadership, aggressive interventionist Public Policies, a supportive legal framework to underpin policies, institutionalized financial architectures and the strategic selection of key individuals to implement these structures.

This case study looks at two Developing countries: South Africa and Guyana to illustrate why the above factors can and will determine whether Small Business Development and Entrepreneurship will be sustainable or not.

South Africa and Guyana are both recent democracies with multi ethnic, multi cultural, multi religious societies (six ethnic groups in Guyana, eleven in South Africa); both countries have histories of severe marginalisation (South Africa from centuries of colonisation and over 40 years of Apartheid; Guyana from 400 years of slavery, 132 years of colonisation and 38 years of neo colonization by the PNC and PPP ; large expatriate populations who have done extremely well overseas; rich in resources; and a Commonwealth heritage.

Yet, while South Africa is the darling of the Developing World with its leadership establishing the vision of an African Renaissance, the formation of the African Union and the New Partnership for African Development, Guyana even though it was instrumental in the formation of CARICOM and the Non Aligned Movement, is on the verge of becoming a “failed state”. South Africa is encouraging and nurturing Small Business Development while Guyana is a shrinking economy that encourages neither entrepreneurship nor Small Business Development.

Why are these two societies with so much in common so different in their future prospects and vision?

## Leadership

In Developed Nations, political stability is critical element in creating an environment conducive to sustainable Small Business Development and Entrepreneurship. In Developing countries, it becomes significantly more important. In multi cultural, multi racial societies where there has been marginalization of sections of the population, political stability is a “sine qua non” and perhaps the most significant factor in sustainable Small Business Development.

South Africa and Guyana have taken very different paths in this critical area.

After over forty years of Apartheid, South Africa went to their first “one person, one vote” election between April 26-29 1994 under the auspices of a “government of National Unity,” a constitutionally-defined multi-Party government representing all Parties that won seats. After the elections, a new constitution and Bill of Rights took effect, and a new flag and national anthem were adopted. Nine new all-race provinces came into being. After years of terrible marginalization of the majority of the population, this negotiated process brought calm to South Africa.

The ANC won 62% of the votes. The incumbent National Party won 20 % of the vote. The Inkatha Freedom Party won 10.5% of the votes. Four other Parties also won votes.

From 1995 to 2002, the country established a Truth and Reconciliation Commission which examined the violence and abuses incurred by all sides during Apartheid.

After twenty eight years of autocratic rule by the People’s National Congress, a predominantly Black Party, Guyana, in October 1992 had its first internationally held free and fair elections since 1964. A predominantly Indian Party, the People’s Progressive Party with an historic Communist/Socialist philosophy came to power. Since that time, the next two elections have basically been an “ethnic census” in which the majority Indian population, at the behest of Hindu organisations and deliberate racial campaigning and intimidation, have elected the same government. In 2001, the predominantly Indian Party received 53% of the votes and the predominantly African Party receiving 46% of the votes.

Guyana has become a deeply divided racial society. The Indian led government has acted much like the African led government it succeeded in 1992. There have been many calls both locally and internationally for changing the Westminster style winner take all model to a Constitution of “shared governance”. The World Bank has even called Guyana a “failed state”. It has become a transshipment hub for drugs given its largely unprotected borders with Brazil, Venezuela and French Guyana. Guyana is the size of the United Kingdom but has a population of 750,000.

The fundamental reality in Guyana is that Indians do not want to be ruled by an African President and Africans do not want to be ruled by an Indian President. Africans, who arrived in Guyana as slaves 203 years before Indians (who came as Indentured Servants who received freeland or a passage back to India after serving their terms) feel that their marginalisation will continue even though the Party most of them support received 46% of the votes at the last elections in 2001.

Unlike South Africa, Guyana is unwilling to move to Reconciliation. Leadership with vision, leadership with a posture of reconciliation is absent. Racial lines harden and worsen everyday while the small resource based economy keeps shrinking.

Whereas South Africa's leadership and reconciliatory spirit has led to incredible opportunities for Small Business Development and Entrepreneurship through global events such as the Rugby World Cup, the Cricket World Cup, The Global Conference on Sustainable Development, The Global Conference on Racism and ongoing Africa Union/NEPAD activities, the 2010 Soccer World Cup and other major activities that have also dramatically increased Tourism.....Guyana is currently struggling to be one of eight countries chosen as a venue for the 2007 Cricket World Cup ( in which their bid was to "be the host of the Indian Team" and foreign investment has dried up because of political instability almost all foreign investors.

Just recently, Grant Thornton compiled a report on what the 2010 Soccer bid will do for South Africa. The report indicated that the event will lead to direct expenditure of R12.7 billion; will contribute R21.3 billion to GDP; will create 159,000 new employment opportunities; and will contribute an additional R7.2 billion to government in taxes. The significant infrastructure that will remain after the World Cup and the impact it will have on an already booming tourism industry immeasurable

Entrepreneurship and Small Business Development will flourish in this environment and over the next decade, Tourism, which has the singular potential to create the most jobs in South Africa will have a very sustainable platform.

Like South Africa, Tourism can become one of Guyana's largest job creating industries. Guyana (English speaking)is geographically South American, wedged between Venezuela (Spanish), Brazil (Portuguese) and Suriname (Dutch), but culturally and historically part of the Caribbean (West Indies), hundreds of miles to the north. It is the Caribbean's largest country--- at 215,000 square kilometres, nearly the size of Britain---but also the least densely populated, with under 750,000 inhabitants. And these people, with a dizzying mixture of East Indian, African, English, Dutch, Portuguese and Amerindian ancestries, for most part occupy just a narrow strip of low-lying coastal plain.

The vast interior---lush forest, cloud hidden mountains, and dry savannah---is the Caribbean's most pristine. This is a land of extraordinary natural wealth, with great deposits of gold and bauxite, situated in the middle of oil producing Venezuela and Trinidad and Tobago. Guyana also has many unique tourism features. For example, Kaieteur Falls, the world's highest continuous single-drop waterfall, five times the height of Niagara and twice the height of Victoria Falls, with water plunging 741 feet to the rocks below, then another 81 feet to the bottom of its gorge, its cloud of mist creating an eternal rainbow.

**The lack of visionary political leadership has prevented these "economic" treasures from being harvested. Imagine the tourism "mecca" this could become and the associated thousands and thousands of jobs. Small businesses and Entrepreneurship would flourish under the right Leadership and Government policies.**

In multi-cultural multi-ethnic societies, enlightened Government and Public policies are vital to economic growth. South Africa took the path of "healing". President Mbeki has gracefully and strategically pursued the path of reconciliation started by President Mandela and with determined brilliance and a competent team has carved out broad macro economic objectives for sustainable growth "with fairness". Guyana has not yet matured and does not want to heal.

# AGGRESSIVE INTERVENTIONIST PUBLIC POLICIES

The South African government has spent tremendous political energy putting aggressive interventionist policies in place to promote Small Business Development and Entrepreneurship. One such activity has been the Black Economic Empowerment .

Industry-specific empowerment charters have so far been developed for three sectors in South Africa: mining, information and communications technology, and financial services. These are in line with the government's black economic empowerment strategy to address the economic imbalances of the past, and lay out guidelines for building a racially inclusive economy.

The first charter is the Mining The vision behind the country's **Mining Charter** is to achieve a globally competitive mining industry that can benefit all South Africans. It is an important development in a sector historically dominated by white capital and profiting off the cheap labour provided by a disempowered black majority

The stated goal of the charter is to "create an industry that will proudly reflect the promise of a non-racial South Africa". One of its key objectives is to achieve 26% ownership of mining companies by previously disadvantaged people within the next 10 years.

The charter provides a framework to help mining companies comply with the Mineral & Petroleum Resources Development Act, which obliges mining companies to promote BEE when applying for mineral rights or converting current rights.

A key component of the charter is the Mining Scorecard, which provides a framework for measuring the BEE process in the sector. The scorecard has three core elements: direct empowerment through ownership and control of enterprises and assets; human resource development and employment equity; and indirect empowerment through preferential procurement and enterprise development.

The second charter is the **Financial Sector Charter** .It has been developed by the sector as a whole, representing banks, insurers, black business, fund managers and brokerage firms. The charter is a voluntary commitment agreed on unanimously by 10 industry associations. Signatories to the charter believe it will be a key driver of sustainable growth, redressing social and economic inequities in the country and broadening the skills and asset base of the whole economy.

The charter provides for significant increases in black ownership, management and skills development over the next 10 years. It emphasises the need for procuring services from black businesses in the sector and fostering new and developing BEE firms through joint ventures, skills transferral and infrastructural support.

The charter constitutes a policy framework for the future development of the industry, and is expected to underpin sound business practices and maintain the strength and stability of the financial sector as a whole.

The third Charter is the **ICT Charter**. A working group formed by companies in South Africa's information and communications technology (ICT) sector has released its third draft of an empowerment charter for the industry. The third draft takes into account

extensive input from the country's ICT community, includes the much-anticipated targets for black economic empowerment (BEE) in the sector, and is one of last steps towards the finalisation of the charter, which is scheduled to be released in June 2004.

The World at Large may believe that these types of interventions will chase foreign investors away as the cost of doing business will become prohibitive. But the South African Government is more visionary in that it recognises that “free” markets are only partially free, and that national security, be it racially balanced future growth, job creation from within so that poverty is alleviated and people deprived of basic human rights..... the right to be free, to right to free speech, the right to go anywhere in South Africa.....security and national integration....are at this time more critical than anything else.

What does the implementation of these charters mean?

First of all, creation of incredible opportunities for previously disadvantaged people in South Africa. Positive procurement from government bodies and the enlightened Private sector will lead to a tremendous amount of new Small Businesses and the nurturing of countless Entrepreneurs. With the Financial Charter underpinning these Small Businesses and Entrepreneurs, the future looks bright especially given the 2010 Soccer World Cup.

Guyana is still preoccupied with its race war. It is fighting with itself instead of fighting for itself. In this type of environment, Small Business Development and Entrepreneurship have no space to grow.

The process of Globalisation is a cold blooded one. Nations protect their own “security” interests in many ways. Developing countries heavily subsidize their farmers for a wide variety of local reasons as all politics is ultimately local. Developing countries have been dictated to as cash, market and political power dominate. It is a dog eat dog world.

South Africa is acting to protect its own “security” with these aggressive charters. Were these not to be put in law, the few rich would get richer and the majority poor will get poorer.

## **SUMMARY**

**Globalisation is here to stay.** Its impact on Entrepreneurship and Small Business Development in the Developing World is dramatic. Developing countries can thrive or be destroyed by this process depending on the role their Governments play in setting and creating conditions necessary for sustainable **Small Business Development and in encouraging Entrepreneurship.**

Critical to their success or failure, and especially in multi-ethnic, multi-cultural societies which have endured long periods of marginalization, is a determine attempt to create fairness among all the citizens as this then allows the country to be at peace with itself. Having created political stability, then aggressive interventionist strategies to nurture Small Businesses and to encourage Entrepreneurship within the context of its national “security” envelope, will bode well for economic transformation and sustainable development. Guyana has failed miserably in this endeavour while South Africa flourishes

# Joint Consultative Committee

for Small Business Development

“Empowering the Future”

## ICSB 49<sup>th</sup> World Conference 2004

Small Business Assistance Programmes – quality  
enhancement through Monitoring and Evaluating  
the SME Service Providers sector

Peik R Bruhns, JCC - Namibia

# Issues for presentation

- ✓ Background thoughts on the topic
- ✓ The value of sector wide Monitoring and Evaluation
- ✓ The Namibian Case
  - Survey information
  - Services offered
  - Staff engaged in SME support
  - Events recorded
- ✓ Lessons

# Background thoughts

- + Monitoring – ‘to check the quality of’ (definition Random house Webster's dictionary)
- + Evaluation – ‘to determine the value, quality or significance’ (definition Random house Webster's dictionary)
- + SME sector - for the Namibian case study it is noteworthy that the SME sector is basically synonymous to local economy
- + M&E – ‘monitoring and evaluation’ is not merely a thermometer for achieved programme implementation; as a management tool it serves as barometer - reflecting on quality of programme impact, sustainability and efficiency
- + it is trendy to be demand driven; “How can demand guard quality?”

# The value of sector wide

## M & E

- + Surveys reveal that SMEs constitute the largest sector by employment, providing employment to about 30% of the country's active workforce
- + Macro economic indicators are hugely important, for the SME Service Providers sector it is crucial to know how much has this sector contributed to the flourishing (or failure) of the SME sector
- + It is often observed that SME service providers design their products either according to donors requirements and suggestions or what is already being tested by others, however often the gap would be what SMEs need.

# The Namibian Case

## Survey information

- + the sent out questionnaires must be filled by a senior manager in the recipient organisation, but must not require more than 15 minutes to be filled in
- + Survey respondents: International Development agencies, National Government departments and Regional/Provincial offices, Local Authorities, NGO's, Parastatals and Private Sector
- + The survey was conducted country wide
- + This survey is carried out on a bi-annual basis to be able to analyse trends and developments
- + The most challenging exercise was to ensure SME service providers that this is not a policing tool imposed on them by donors or others, but potential a very valuable management and planning tool

# Services offered

Service Categories	Number of organisations offering in the category			Percentage of total respondents		
	10/03	07/02	01/02	10/03	07/02	01/02
Training	31	28	22	62%	67%	66%

# Lessons

- + Sector wide surveying is a brilliant tool to strengthen the case of SME service providers vis-à-vis National Government and international donors and corporate partners;
- + Sector wide surveying assists the individual role players in their gap analysis, prepares the actors for greater understanding of the competitiveness in the sector and creates a good understanding of the value of M&E;
- + the more simplified a survey the more likely the application;
- + response to survey can be rewarded;
- + since the introduction of this tool, the performance of commercially based (and often small) SME service providers appears to get better whilst NGO type organisations struggle more than ever.

# LEARNING ABOUT THE UNKNOWN: HOW FAST DO ENTREPRENEURS ADJUST THEIR BELIEFS?

SIMON C. PARKER  
UK

## INTRODUCTION

To what extent do entrepreneurs rely on past experience when making decisions about their business ventures? And to what extent do they utilise new information about their venture's performance to learn about their true (but unknown) abilities and trading environment? These are empirical questions that we seek to address in the present paper. We do so by building a model in which entrepreneurs continually receive valuable noisy market signals, which they use to update their expectations as new information comes in. We embed a dynamic iterative formulation of this process into a model of optimal effort. This is analysed econometrically to estimate the extent to which entrepreneurs adjust their beliefs in the light of new information.

Knowing the extent to which entrepreneurs adjust their beliefs and so engage actively in learning is desirable for several reasons. First, such knowledge might help us to gauge how “alert” entrepreneurs are, in the sense of Kirzner's (1973, 1979) conception of an entrepreneur who observes the market and reacts alertly to opportunities she perceives. Second, if entrepreneurs ignore or respond sluggishly to new information then that might hinder venture performance and ultimately the vitality of the economy as a whole (Berry, 1996; Lybaert, 1998). Third, a belief that entrepreneurs are unresponsive to market signals might encourage governments to devise policy interventions such as entrepreneur education and awareness programs (Sexton *et al*, 1997). But, the suitability of such programmes presumably depends on the extent to which entrepreneurs actually do adjust their beliefs in practice - a parameter that therefore needs to be measured. Fourth, academics, practitioners and policy-makers might be interested in finding out whether particular entrepreneurial groups are more responsive than others are. That might be valuable for targeting support programs more effectively, for example. And fifth, empirical findings on this matter might improve our understanding of how rational entrepreneurs are, and thereby suggest whether it might be helpful for future theory development in entrepreneurship to incorporate models of bounded rationality, for example.

If entrepreneurs learn, *what* do they learn about? According to Minitti and Bygrave (2001), entrepreneurial decisions are a function of two types of knowledge. The first relates to market conditions, opportunities, technologies and/or new business ideas. The second relates to “how to be entrepreneurial”, or ability in entrepreneurship. In practice, entrepreneurs are rarely perfectly informed about either. For brevity, we refer to their joint impact on the entrepreneur's venture as “unobserved productivity”. We argue that, in practice, entrepreneurs obtain noisy signals about unobserved productivity, the noise deriving from stochastic variations such as macroeconomic or sector-specific shocks, or idiosyncratic luck. Entrepreneurs can update their beliefs about unobserved productivity using both the most recent noisy signal and the past history of previous signals.

It is important to be clear about *why* entrepreneurs adjust their beliefs and so engage in learning. In our view, a satisfactory model of this phenomenon should not only shed light on how entrepreneurs adjust their beliefs, but should also endogenise the incentives for doing so. It is, for example, empirically well established that entrepreneurial learning can add considerable value to business ventures: see, for example, Abetti (1997), Arrighetti and Vivarelli (1999) and Wesson and de Figueiredo (2001). There is therefore a need for a model that specifies how adjustments to entrepreneurs' beliefs affect their decisions and improve their subsequent performance. For example, an entrepreneur might only be willing to increase their input of costly effort to their venture if they have just perceived that more favourable market conditions are emerging. Thus a better understanding of entrepreneurial learning and expectations formation also implies a better understanding of what determines entrepreneurial effort (see also Cressy, 1992).<sup>1</sup>

Several previous researchers have suggested that the formation and development of ventures involves ongoing adjustment of original plans and beliefs, possibly through an iterative process of trial and error (e.g., Nicholls-Nixon *et al*, 2000). We conceptualise how entrepreneurs adjust their beliefs by imagining them comparing the latest noisy signals about their unobserved productivity with their prior expectation. Any divergence between the two conveys potentially valuable information that the entrepreneur can exploit. Like Minniti and Bygrave (2001), we contend that a learning approach based on ongoing adjustment is likely to describe entrepreneurs' actual behaviour better than an assumption of "rational expectations". Rational expectations imply that agents learn all there is to know immediately, making only unsystematic and unpredictable forecasting errors. We contend that this presumes a level of knowledge and awareness that few entrepreneurs are likely to possess in practice.

For these reasons, adaptive expectation adjustment forms the basis of our approach. We propose a framework that is theoretically and empirically tractable, and that avoids having to make strong assumptions about unobserved productivity, such as it being fixed at some constant level for all time, to which expectations converge.<sup>2</sup> An assumption of this sort will be unrealistic if underlying market conditions and entrepreneurial abilities change over time. For example, an entrepreneur's ability might improve as she gains experience from managing her venture; and new innovations might impact on an entrepreneur's venture in a profound and ongoing manner that she nevertheless does not fully comprehend at the time.

This paper makes three contributions, which to the best of our knowledge are new additions to the literature. First, we propose a joint model of entrepreneurial adjustment of beliefs, effort, and performance, which links all of these phenomena together in a unified way. Second, we provide an econometric formulation of the model that enables the researcher to estimate the extent to which entrepreneurs exploit new information when adjusting their expectations. A key aspect of the formulation is its simplicity and ease of application, placing relatively few demands on the researcher in terms of data requirements, and being amenable to estimation by simple regression analysis.<sup>3</sup> Third, we

---

<sup>1</sup> Like Cressy (1992), Minniti and Bygrave (2001) and others, we treat the entrepreneurial venture as a single homogeneous unit. This is not to deny the influence of organisations on individual knowledge and learning, the implications of learning for organisational design, or social learning, which can of course all be very important in a range of different contexts.

<sup>2</sup> See, e.g., Jovanovic (1982), and Frank (1988), for models with this assumption.

<sup>3</sup> If unobserved productivity was in fact observable to the researcher, then one might measure entrepreneurs' expectations adjustment by interrogating a sample of them directly. But by its very

estimate the model using a sample of over 700 UK owner-managers interviewed in 1999 and 2000. Estimates are obtained of the extent to which entrepreneurs adjust their expectations in response to new information, and we go on to discuss the resulting policy implications.

## THE MODEL

Consider a simple model in which an entrepreneur supplies a level of costly effort to her venture. The total costs and benefits of effort take time to emerge, and are only fully realised by the end of the period. Effort impacts on the venture's revenue via the entrepreneur's productivity. This productivity depends on the combined effect of market conditions and entrepreneurial ability, and evolves with an unpredictable stochastic (and possibly also an unknown deterministic) component. Its true underlying value is unknown, so we call it "unobserved productivity". Only noisy signals about unobserved productivity are observed in any period. Therefore the entrepreneur does not know what the unobserved productivity of her effort will be in the next period. However, she can form an expectation about it. Her incentive to do so is that this helps her choose the correct new input of effort, where effort generates both benefits (via venture revenue and operating profits) and costs (e.g., of personal exertion).

How does the entrepreneur form and change her expectations about unobserved productivity? We assume that the entrepreneur updates her previous estimate of unobserved productivity by comparing the deviation between the latest noisy signal and her previous estimate. If the former is greater than the latter, the entrepreneur has grounds for increasing her estimate; if the former is less than the latter, she has grounds for decreasing it. The key parameter of interest is the extent to which entrepreneurs adjust their expectations in the light of new information.

This model is fully dynamic, because the entrepreneur's new expectation of unobserved productivity helps determine her new optimal choice of effort, which in turn affects revenue and operating profit next period when a new noisy signal of unobserved productivity is received. Then the entrepreneur once again updates her estimate in the manner described above. This process continues over time as entrepreneurs obtain more and more information as they continue in their venture. Our main focus of interest centres on the responsiveness of entrepreneurs to new information, rather than the path of the expectations themselves<sup>4</sup>Figure 1 illustrates the learning model. Effort is denoted by  $I$ ; the subscript  $i$  refers to an individual entrepreneur  $i$ , and a second subscript refers to a time period, e.g.,  $t$ . First, the entrepreneur infers a noisy signal of unobserved productivity from their performance, measured by profit and denoted by  $\Pi$ . Performance by  $i$  at  $t$  depends in part on previous-period effort,  $I_{i,t-1}$ . Second, the signal is compared with the previous expectation of unobserved productivity according to an adaptive expectations scheme,

---

nature the phenomenon is unobserved, ruling out that approach. It might seem that an alternative would be to set up an experimental design, in which the researcher supplies market information sequentially to entrepreneurs who make decisions that also receive feedback from the researcher. But such experiments are unlikely to replicate the real world business environment, learning about which is the topic of central interest in this paper.

<sup>4</sup> For a commanding analysis of the latter, see Minitti and Bygrave (2001), who analyse the quality of entrepreneurial choices in an iterative learning model, and derive the interesting result that entrepreneurs can make decisions that are self-reinforcing rather than optimal.

whose learning parameter is denoted by  $\lambda$ , with  $0 \leq \lambda \leq 1$ . The entrepreneur updates her belief at this stage. Third, the entrepreneur uses the new belief to re-optimize effort. This affects performance in the subsequent period, when a new signal of productivity is observed. The process continues in this manner, iterating forwards over time as indicated by the “loop-like” structure of Figure 1. Under some simplifying assumptions, it is possible to derive a simple econometric specification that enables the learning parameter,  $\lambda$ , to be estimated. The simplifying assumptions are:

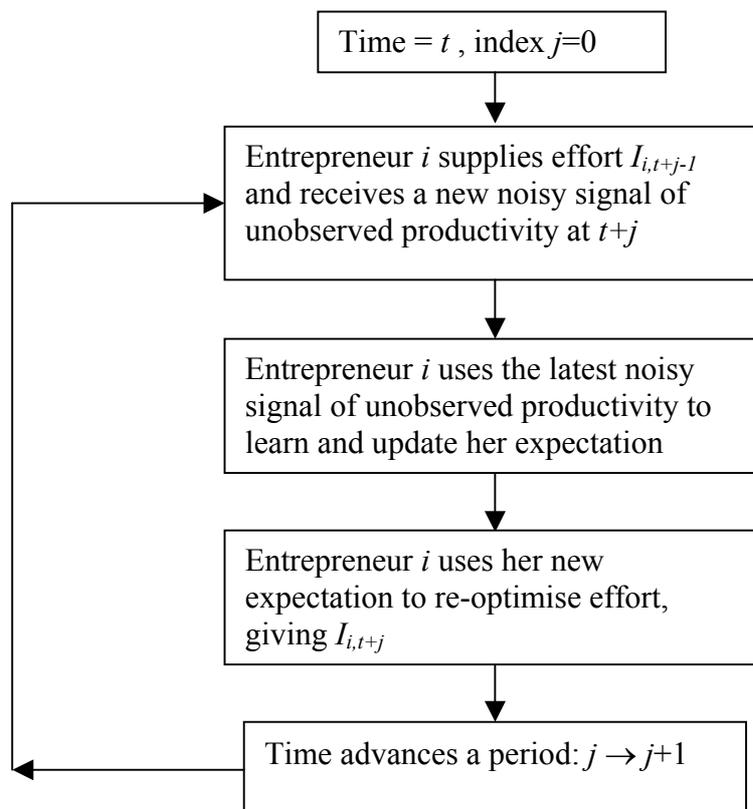

- Entrepreneurs’ utility functions are separable in income and leisure
- Utility is linear in profits and quadratic in effort/leisure.
- There are constant returns to scale in the technology mapping effort into entrepreneurial performance

The simple specification is:

$$I_{i,t} = \alpha + (1-\lambda) I_{i,t-1} + \beta [II_{i,t} / I_{i,t-1}] + u_{i,t},$$

where  $u_{i,t}$  is a white noise disturbance term. Details of the derivation of this dynamic effort equation are available from the author on request.

**FIGURE 1  
THE MODEL OF  
ENTREPRENEURIAL LEARNING**

The importance of the above equation is that it enables  $\lambda$ , i.e., the extent to which entrepreneurs exploit new information when updating their expectations, to be estimated. To do so, all the researcher needs is a sample of data on entrepreneurs' effort in two

contiguous years, and operating profit in the most recent of them. The equation can be estimated simply by ordinary least squares (OLS).

## DATA

By way of an empirical application, we utilise data from the British Household Panel Survey (BHPS). The BHPS is a nationally representative random sample collected by the UK's Office of National Statistics, using face-to-face questionnaires. It is the most well established and widely used longitudinal data set in the UK. Each year, comprehensive data on a wide variety of individual and household characteristics are obtained from some 5500 British households, comprising almost 10000 individuals aged 16 and over, drawn from 250 different areas of Great Britain, who are interviewed every autumn. The BHPS includes data on business owner-managers (the self-employed), who are treated as empirical counterparts to entrepreneurs in our application. The same individuals are re-interviewed in successive years, making it a true longitudinal data set.

We utilise data from the BHPS from its two most recent publicly available waves, namely 1999 and 2000, for both male and female owner-managers. We define entrepreneurial effort,  $l_{i,t}$ , as hours normally worked per week in the venture. The BHPS contains information on this variable, on weekly net operating profit,  $\Pi_{i,t}$ , and on a host of other person- and venture-specific variables that were used as controls in a robustness check described below.

The sample characteristics were briefly as follows. Mean weekly work hours in 1999 and 2000 were 46.11 and 45.66, with standard deviations of 18.31 and 18.78, respectively. Mean weekly net profit in 2000 was £239.53, with a standard deviation of £340.74. Our final sample comprised 716 individuals, 28.49 per cent of which were female; 33.80 per cent of which employed outside labour; and 66.76 per cent of which were aged 40 or over. It is important to stress that, being a constant rate of adjustment, the parameter  $\lambda$  is invariant to the frequency of data that are used to estimate it. Nor is it the case that the use of annual data, say - as used here - should be taken to imply that entrepreneurs update their expectations and effort only once a year.

## RESULTS

Using the data described above, we obtained the OLS estimates given in the first row of Table 1, under the heading “Pooled”. It is striking that even this simple regression can explain nearly two thirds of the variation in  $I_{i,t}$ , a goodness-of-fit statistic that compares very favourably with those commonly generated from large samples of micro-data. Of greater importance, however, is that this regression output implies that on average entrepreneurs adjust their expectations of unobserved productivity in the light of new information by around 16 per cent ( $=1-0.84$ ). Furthermore, we infer this parameter to be significantly different from both 0 and 100 per cent: its 95 per cent confidence interval is [11.5, 20.5] per cent. The statistical significance of  $\lambda$  suggests that entrepreneurs *do* exploit new information, but that they give much more weight to past experience than to new information when updating their expectations.

Are there any benchmarks with which to compare these point and interval estimates of  $\lambda$ ? According to classic work by Friedman, consumers adjust their expectations of unobserved ‘permanent income’ in the light of new information by about one third—roughly double the above estimate (see Thomas, 1993). This might be taken to imply that entrepreneurial expectation adjustment is relatively slow. There might also be policy implications arising from this finding, an issue that we discuss in the next section.<sup>5</sup>

<sup>5</sup> Aggregate estimates of how individuals adjust their occupational choice between entrepreneurship and non-entrepreneurship under uncertainty might also be pertinent. If individuals hold erroneous

Results derived from the regressions of Table 1.

expectations about the relative attractiveness of occupations, they can learn from these mistakes and change their behaviour (and occupation) next period. According to Parker (1996), the rate of this kind of error correction is about 20 per cent per annum in Great Britain.

The other rows of Table 1 explore whether entrepreneurs' rates of expectation adjustment differ by personal characteristics and the markets in which the entrepreneurs participate. We do this by allowing all of the structural coefficients in the model to vary by group. Thus in the header of Table 1, the variable  $D_{ikt}$  is a dummy variable taking the value one if entrepreneur  $i$  is a member of group  $k$  at time  $t$ , and zero otherwise. We defined groups as follows: "female", "older" (entrepreneurs aged 40 and over), "longer spell" (individuals with above-average spells in self-employment), and "employer" (if the individuals employed any other persons in the venture). We also checked for differences by industrial sector (Agriculture, Manufacturing, Construction, Distribution, Banking/Finance, and "Other" Industries).

The remaining rows of Table 1 summarise the results by disaggregating the sample in this way. Evidently, the extra terms in these regressions generate only modest improvements in goodness-of-fit over the pooled case considered earlier. For maximum clarity, the implied differences in  $\lambda$  are summarised separately in Table 2. Table 2 shows that there are few significant differences between entrepreneurial groups in terms of the extent to which they exploit new information to adjust their expectations. Whether the entrepreneur is male or female, an employer or non-employer, or working in a particular industrial sector, any differences are relatively small and not statistically significant. The only exception is age. Younger entrepreneurs adjust their expectations significantly faster in response to new information than older entrepreneurs do ( $\lambda=0.212$  for younger, compared with  $\lambda=0.140$  for older, entrepreneurs). What underpins this result? On one hand, it might reflect older entrepreneurs feeling they have "seen it all before" and so giving less weight to new information. To the extent that they do indeed know more about their innate entrepreneurial abilities than younger entrepreneurs do, they might be justified in holding such a view. On the other hand, older entrepreneurs might have grown lazy, tired or complacent, and unwilling to respond to new information that might nevertheless convey valuable news about the likely future performance of the venture. Then the finding of a low  $\lambda$  for members of this group might be a cause for concern. In fact, the "lazy, tired or complacent" explanation receives some limited support from the additional finding of Table 2 that entrepreneurs who have been in business for shorter spells do not appear to give *significantly* greater weight to new information than entrepreneurs who have been in business for longer. This points to an important distinction between age and experience. It would appear that something about ageing, other than greater experience specifically, leads older entrepreneurs to be less responsive to new information than their younger counterparts.

Finally, we tested for the possibility that the above results fail to control for other factors that might be conflated with the estimates of the learning parameter,  $\lambda$ . These factors included the length of the entrepreneur's spell in the venture, an indicator variable for whether the entrepreneur was located in the buoyant markets of London or the South East of England, and whether the ventures were essentially temporary in nature. These variables might capture the effects of previous learning by doing, demand conditions, and commitment (quality of effort), respectively. We also entered six industry for each of the sectors listed in Tables 1 and 2; and controlled for partner work hours, marital status, the number of children, and caring responsibilities. However, we were unable to reject the hypothesis that these variables were jointly insignificant.

## DISCUSSION

Our empirical estimates have revealed that the rate of exploitation of new information by entrepreneurs is relatively modest, a finding that appears to hold across several entrepreneurial groups, apart from the youngest. Do these estimates suggest that there is a role for constructive policy intervention? The  $\lambda$  estimates are certainly not on the high side, though this is a subtle issue, and judgement is difficult, because it partly depends on the nature of the new information that arrives in each period. Consider, for example, an entrepreneur who has traded for many years in a relatively static market, in which unobserved productivity is quite stable. In this special case, an older entrepreneur might have built up a very reliable expectation about unobserved productivity, and therefore might be justified in discounting further signals (implying that their  $\lambda$  is close to zero). While in principle this might help explain why older entrepreneurs have significantly lower adjustment rates than their younger counterparts, we saw in the previous section that the evidence casts some doubt on this (experience-based) explanation. If older entrepreneurs are not justified in discounting new information so heavily, there might be a role to intervene to raise awareness among entrepreneurs who are most at risk from being swept away by changing market conditions.

On the other hand, should we care if entrepreneurs discount new information and are consequently displaced? A neo-classical economist would have a simple answer to this question. If an entrepreneur is well informed and generates no externalities or market failures, and if entry and exit are free, then their displacement due to a lack of entrepreneurial awareness has no adverse implications for economic efficiency. For example, an older entrepreneur might be contemplating retirement anyway, so the prospect of losing her market might not trouble her sufficiently to compensate for exerting greater effort. However, a limitation of the neo-classical analysis is that entrepreneurs are typically far from perfectly informed, an assumption on which that analysis (but not ours) is predicated. If entrepreneurs do not know what they do not know, then programs designed to raise their awareness can enable them to take superior decisions.

We suggest that the desirable features of any program designed to enhance entrepreneurs' sensitivity to new information are likely to include the following. First, they should be open to all entrepreneurs, given the evidence above about the ubiquity of relatively limited adjustment of entrepreneurial expectations. Second, programs should emphasise the need for continuous awareness and learning, and the importance of flexibility. Arguably, this kind of pedagogy can be expected to more successful when delivered in programs that *embody* as well as *teach* strategic awareness and iterative feedback, and that are grounded in an owner-manager environment (Hartshorn, 2002). What is likely to be less successful are prescriptive "top-down" programs - which might explain why smaller businesses often report finding programs derived from applications to larger companies non-beneficial (Gibb and Scott, 1985). Third, a suitable program might also usefully emphasise the need to understand and follow changing market conditions, sector-specific innovations, and best practices.<sup>6</sup> That might usefully complement the more conventional content of many existing entrepreneurship programs. Finally, the implications for government are that provision of information, training and education along the lines described above are more likely to be effective at improving entrepreneurs' responsiveness than grants or subsidies would be. The latter do not

address the problem of limited awareness directly, and if anything might permit business managers to persist with their current beliefs rather than exposing them to the salutary practice of having them challenged by the market.

## CONCLUSION

This paper attempted to make three contributions to our understanding of entrepreneurs' use of information in shaping their business decisions. First, we proposed a joint model of entrepreneurial adjustment of beliefs, effort, and performance, which links all of these phenomena together in a unified way. Second, we provided an econometric formulation of the model that enables the researcher to estimate the extent to which entrepreneurs exploit new information when adjusting their expectations. Third, we estimated the model using data on UK business owners over 1999-2000. Estimates were obtained of the extent to which entrepreneurs adjust their expectations in response to new information, and the resulting policy implications were briefly discussed.

We found that on average entrepreneurs adjust their expectations of unobserved productivity in the light of new information by around 16 per cent. This suggests that entrepreneurs *do* exploit new information, but that they give much more weight to past experience when forming their expectations. Also, we found few differences in terms of expectation formation between males and females, employers and non-employers, and experienced and less experienced entrepreneurs. However, younger entrepreneurs appeared to respond significantly more sensitively to new information than older entrepreneurs, with adjustment rates of 21 per cent compared with 14 per cent, respectively. We went on to discuss some implications of these findings, and proposed several features of entrepreneur education programs that might help entrepreneurs improve this aspect of their business performance.

There are several ways that future research might take forward some of the issues addressed in this paper. For example, one might seek to enrich the model by allowing entrepreneurs to perform only partial (and possibly costly) observation of noisy signals. This line of enquiry holds out the promise of being able to analyse both learning processes and expectations formation simultaneously within a single framework. Another possibility is to try to model the true underlying process of unobserved productivity, to see whether one can measure how closely entrepreneurs' expectations track the true values. However, this approach would be prone to the criticism that the results will only be as good as the model of unobserved productivity, which by its nature is not amenable to direct empirical verification. A similar problem would be expected to bedevil attempts to disaggregate unobserved productivity into separate market conditions and entrepreneurial ability components.

Alternatively, it might be fruitful to extend the empirical side of the model. First, one could consider forms of costly investment other than personal effort, about which entrepreneurs also make decisions and form expectations. One example might be capital investment. In principle, this could reveal whether entrepreneurs adjust their expectations differently when the decision variable changes. A more general empirical framework might also allow entrepreneurs to choose effort and capital investment simultaneously. Second, future empirical work might seek to determine the *frequency* that entrepreneurs update their expectations, an issue that was not addressed in this paper. Third, one might sample entrepreneurs graduating from various entrepreneurship education programs and estimate

whether they differ systematically with respect to how they subsequently exploit new information in their ventures. It would then be interesting to ask whether there is any relationship between those differences and the nature of the programs themselves. Finally, it would be interesting to replicate the work performed here using data from other countries. Identifying national differences in expectation formation behaviour might highlight cultural differences that can shed further light on the phenomenon.

## **ABSTRACT**

Many researchers and business practitioners have noted the high failure rate among small firms. Most small firms fail within the first 3 years of operation and of those that survive, very few grow to medium size. This is a clear challenge to the providers of business support services including staff from universities and consultants as their programmes are failing to deliver the desired results. This situation is exacerbated by the fact that little attention is often given to the role that the providers of business support play in enhancing business development services in small firms. Whilst the results of many studies indicate that business support services are worthwhile and represent a good investment of public funds, the success of mainstream institutions in successfully meeting the needs of small businesses, remains questionable. A high proportion of owners and managers of small businesses have reported that they do not see these support services as offering 'real' solutions to their problems.

The decision to take up business support services is conditioned by both *direct* and *indirect* factors in the small firm. Direct factors comprise of market positioning and prevailing economic conditions whereas indirect factors constitute the cost of the support service, trainee motivation, serendipity – that is whether the support service is being offered at the right time and at the right place. In the light of these arguments, this study evaluated support initiatives available to small firms in the UK and identified the factors which contribute towards low take-up of business support services by small business owner-managers and their employees.

This paper asserts that the major challenge is that of educating the stakeholders who deal with the small business sector. This situation has compelled this researcher to investigate whether the providers of business support services have got it right and who needs to learn – the owners and managers of small firms or the stakeholders who provide the various support services? The main argument advanced in this paper is that most

stakeholders do not understand that founders and managers of small businesses have their own behaviour and ways of learning. In other words, stakeholders should not dictate to the founder of the small firm on how they must operate since this may not be in the best interest of the firm.

Some interesting and important insights into the support services for small firms have been drawn from the review of various studies on what is currently known. The key issue that emerged from these studies is the need to put in place support services which improve the skills of the owner managers of small firms to learn better from their transactional relationships with customers, suppliers, bankers, internal staff and from experience of their peers through networking . In other words, there should be **greater intimacy** between small firms and providers of these services.

This study established the providers are not getting it right and indicated by the literature findings which point to the need for policy makers and business support providers to be sensitive to the needs of small firms. Policy makers can play a key role in disseminating information on the 'actual' needs of small businesses and in improving the functioning of the business support market for these firms in order to enhance the learning process. An independent review on the specific support needs of small firms should be undertaken as this can significantly improve their growth and competitiveness.

## INTRODUCTION

The studies conducted in the last three decades show that while small businesses are seen as major creators of social wealth and jobs for most people in both the developing and industrialised countries. The firms also provide personal reward to the owners and tax revenues to the government. However there is increasing evidence that most of these firms are short lived and have a high rate of attrition. Very few firms that survive achieve growth. This is a direct challenge to the providers of business support services as the firms are currently facing the challenges of increased competition and lack of growth. The key to their long term survival and growth lies in the use of business support services to enhance the managerial skills of the owner-managers and employees of these firms and yet very few of them participate in support services. Business support services are increasingly becoming a critical factor in the long term survival of small businesses.

Yet, in practice, the small business sector has a long standing reputation for low up-take of business support services. Thus business support services are not part of the culture of most small firms. Owner managers only participate in the services when the needs are immediate. The need to participate in the services is also influenced by other factors such as: the owner-managers' educational levels ; the age and size of the company ; the sector in which the company operates ; serendipity – whether the service is being offered at the right time and right place.

The probability of the services being purchased increases with the 'stages' in the life of the business. It was established in the literature that owner-managers of small firms exhibit very low rates of awareness, understanding and interest in the support services on offer. Specific needs of these firms should be assessed and fulfilled. Most owner-managers of small firms are 'innovators or have technical skills required to develop the products but do not necessarily have the managerial and marketing skills needed to run and develop the business. These skills are unlikely to be inherent in the same person. People who are

good at developing products or are innovators, are very unlikely to be poor at developing and managing businesses.

The introduction of new technologies and the internet, increases competition among small firms. Greater emphasis on product or service quality has made some small businesses to operate more efficiently in a constantly changing environment. In order to respond to such challenges, owners and managers of these firms require specific and transferable managerial and marketing skills which are critical in achieving growth and competitiveness among the small firms.

The main objective of this paper is to conduct a critical literature review in order to establish the extent of the knowledge on business support services for small firms. The paper is guided by the following broad questions :

- What motivates owner-managers of small businesses to participate in business support services ?
- Which of the available business support services or initiatives appear to be more successful and why ?
- What are the direct and indirect factors that influence the provision of business support services in small firms ?
- How can the providers of business support services improve the low take-up of these services in order to enhance the learning process and effectiveness ?
- What insights can be drawn from existing support services for small businesses ?

## **A REVIEW OF THE LITERATURE**

The literature review is undertaken to establish what is known (and not known) about the factors affecting the provision of business support services in small firms. Using few but carefully selected papers, this research seeks to draw some insights into the providers of these services are getting it right and who needs to learn. In theory, small firms draw support services from a wide range of sources including such stakeholders as : bankers, chambers of commerce, trade associations, private-business support services institutions and consultancies, clients and suppliers of goods and services ; government-sponsored organizations. For example, government sponsored services in the UK included Industrial Business support services Organisations ; Investors in People ; Business Links ; Business support services and Local Enterprise Councils (TECs and LECs) ; National Council for Vocational Qualifications (NVQs); Teaching Company Schemes (Carter et al, 2000).

The above business support mechanisms have been the most common source of support for small firms in the UK and are often well resourced and benefit many businesses. In many countries, government-sponsored services are widely used by small firms especially those who would like to achieve growth and competitiveness. Table 1 shows the number of businesses and sizes in the UK

**Table 1 : UK Businesses by Number and Sizes of Firms**

<b>Number</b>	<b>Classification</b>	<b>No. of Employees</b>	<b>% UK</b>
7 000	Large	>250	0.2 %

25 000	Medium	50-250	0.7%
1.1 million	Micro/small	1- 49	29.5%
2.6 million	Sole trader	0	69.6%

Source : Barclays Bank SME Research Unit (2004)

In addition to the above, 99.1% of all UK businesses have less than 50 employees and comprise of one-person businesses and MSEs. It is also indicated in Table 1 that 69.6% of all UK businesses employ no one. A large proportion of British firms (large) are not British owned and comprise of large international firms such as BMW, Sony, Esso, IBM and many others.

According to Tacis (1999), in the UK in particular and the European Union in general, small firms represent over 99% of all businesses and account for over 68% of total employment and about 65% of overall business turnover. Furthermore, the average employment growth rate in small firms is greater than that of large firms. The increasing trend towards downsizing of large firm operations and contracting-out of marginal activities provides small businesses with challenges to upgrade their skills through business support services and new opportunities for growth and competitiveness as a result of the rapidly changing global business environment and internationalization of markets.

The recent study by Barclays Bank (2004) indicates that 67% of UK small businesses fail within the first 5 years of operation and that in a period of 10 years, 84% of the all business start-ups will have failed. Storey (1994) asserts that small businesses in the UK are failing to grow and that only very few become large firms. Most small business are growing to fail as only 17% survive beyond 10 years.

From the above statistics, it is not difficult to see why small firms deserve more attention and that current business support providers are failing to deliver the desired results, hence the 83% failure rate. It is widely believed that the up-take of business support services will confer a range of benefits to owner-managers and individual employees in these firms. After participating in support services, employers expect to recover their investment in such programmes to benefit significantly from increased productivity of their employees. At the same time, it should be noted that employees who participate in support services expect more pay and other benefits.

## **Factors affecting the provision of support services**

Carter et al, (2000) have identified a number of *direct* and *indirect factors* which are generally associated with the provision of business support services for small firms. 'Direct' factors are considered to be of primary importance to small firms and include: market positioning, prevailing economic conditions and the availability of relevant business support services. The specific marketing orientation of a small firm, with its relatively narrow portfolio of products and its perceived positioning in relation to known competitors appears to determine the choice, quantity and quality of business support services. This means that small firms that focus on low-quality products and services rely mostly on *reactive strategies* and appear to have little need to train their workforce on a regular basis. Conversely, focusing on better quality products and services appears to involve a *proactive* business resource support approach and strategy.

Prevailing economic conditions also determine the provision of business support services. According to Carter et al (2000) and Marris et al (1971), on one hand, favourable

economic circumstances results in higher staff turnover rates and also increased growth-related business support services needs. On the other hand, unfavourable economic circumstances tend to stabilize staff turnover and increase the external pool of trained personnel.

'Indirect' factors include six interrelated constraints that can have a curtailing effect upon the actual provision of business support services in their firms. These six factors are : cost of business support services ; time constraints; lack of trainee cover; lack of in-house trainers ; lack of trainee motivation ; lack of trainee interest (Carter et al, 2000). Due to shortages of specific business support services, owner managers are forced to purchase either exorbitantly priced customized business support services or expensive, large firm solutions that may have limited use.

It is noted that one of the major handicaps to the growth and support of small businesses is the lack of good managerial skills and lack of business support services among the managers (McMullan et al, 1983, Neshamba, 1997; Brockhaus, 1982; Vyakarnam et al, 1999). The competence of owner-managers and their employees has a significant effect on the performance and growth of small businesses.

In the context of this paper, business support programme or business support services is defined as the packaging of information in order to stimulate the learning of a new skill. It is small bits of information which are organised in a way to stimulate learning a new skill (Tomecko, 1998). The purpose of these services is to facilitate a behavior change which should have a positive effect on the growth and support of small businesses.

The study by Neshamba, (1997) shows that the roots of any business support services should be firmly embedded in the combination of practical experience and research. The study indicates that in general, small businesses would like business support services that will help them to achieve the following objectives

- improve in working capital and financial stability of the firm ;
- increase the capacity of owners and managers to grow their businesses ;
- share business experience with other owner-managers which in turn leads to creating networks and contacts ;
- improve marketing skills to achieve growth ;
- focus on action-oriented aspects of business development ;

Spring (1998), pointed out that business support services should not be aimed at providing general prescriptions for all small businesses but should offer specific services which are targeted at particular businesses (perhaps in a cluster) at specific level of support. According to Spring, throughout each programme, participants should be encouraged to be innovative, to learn by doing and to try new ideas out in their businesses. At the end of the Programme, all delegates are not only asked about the outcome of the programme but should be asked to develop a business plan for their businesses (on an individual basis) which incorporates their own ideas and specific needs for business support services. Thus the motivation to participate in the services should be needs-driven although serendipity plays a key factor in joining.

Other authors (Cannon, 1987; Bird, 1989) have suggested that prior to the delivery of a programme, an awareness seminar should be conducted not only for marketing a particular programme but to determine the specific needs of the businesses owner-

managers. The awareness seminars should be followed by interviews with owner-managers which may help in determining what their needs are.

While small and medium-size enterprises (SMEs) form the overwhelming majority of firms and account for large shares of employment and GDP of all countries, they are still underserved in terms of management skills. This literature review is conducted to find out the extent of any previous research on the value and benefits of business support among SMEs. This area appears to be severely under-researched and the literature exploring the value and benefits of business support services is not very extensive and yet the need to develop owners and managers of SMEs in future business needs and growth, remain critical.

Whereas Vyakarnam and Adams (1999), assert that there is a positive relationship between business support services and entrepreneurial business performance, Storey (1994) has argued that it is not possible to make direct links between business support services and business performance. This leaves us with a need to establish (through research) what motivates SMEs to participate in business support services and the value and real benefits of such services..

Some authors indicate that support and business support services needs differ according to the firms' stage of support (Vyakarnam and Adams, 1999). The two authors suggest that the propensity to purchase business support services is a function of a number of indicators. These are :

- the age of the company – likelihood of purchase increased with age ;
- the relative size of the company – likelihood of purchase increases with size ;
- the sector in which a company operates – manufacturing are more likely to purchase than service companies ;
- ownership type – professional managers are more likely to purchase than owner-managers ;
- the educational attainment of the decision-maker – likelihood of purchase increases with educational attainment.

## **Identifying Business Support Service Needs**

Some important insights on business support services can be gained from Storey (1994) who suggest that business support services in the small business sector differs significantly from that provided by large firms. He argues that business support services in small firms are more likely to convey informal work skills and knowledge. In contrast, the skills and knowledge in large firms is based on formal qualifications leading to an award. The author found no evidence of well conducted research which clearly and consistently linked business support services provision to enhanced business performance (Storey, 1994).

Other authors point out that all good business support services should satisfy an important and immediate need in the business (Tomecko, 1998; ; Cromie, 1987; Marris et al, 1971). Motivation is always linked to the achievement of a need. This need is also a key motivator among small firms. As stated in Maslow's Hierarchy of Needs, (Maslow, 1943), these needs can range from the very basic ones of survival to the more sophisticated needs of self-fulfillment – with self-actualisation being at the highest level of the hierarchy. For

business support services to be beneficial, they must satisfy or meet the needs of the owner-managers.

Tomecko (1998) asserts that some business support services may not be effective because both the *timing* and *context* are not right. For these services to be effective, he identified three basic conditions which should exist prior to take-up of business support services. These are:

- The small business should be facing an 'intense' business situation which could be either a problem or an opportunity ;
- The owner/manager should be aware of or recognise the changes that are happening or will happen in the business within a short space of time ;
- The owner/manager or his staff should be willing to seek help and be open to the possibility of learning a new skill in order to minimise the problem or capitalise on the opportunity.

Two prospects of business support services have been identified by Hurmerinta-Perltomaki et al (1998). These are: the 'reactive' and the 'transitional' models. The '*reactive*' model suggests that business support services are not part of the culture of most small firms but tend to be a response to immediate external pressures. In other words, business support services tend to be oriented towards short-term operational issues rather than long-term strategic planning for the growth of the firm. The '*transitional*' model also advocated by Hurmerinta-Perltomaki et al, shows that the probability of participating in business support services increases between various stages in the life of a business.

The other argument advanced in the literature is that when attendance to business support services is a precondition to getting a loan, the results are not good. Business support has often been seen as an adjunct to credit (Cromie, 1987; Cooper and Gascon, 1992). The results of such services are often not helpful since it is the need for credit that is the main motivator and not the need to learn.

Business support services have been seen by some owner-managers as an 'imposition rather than an opportunity'. This means the providers of these services often impose them on the participants. Thus low motivation towards business support services often leads to poor transfer of knowledge and skills. If, on the other hand, the service is structured so that learning a new skill or competence improves the chance of obtaining a loan, then the motivation is strong to learn the new skill and therefore the transfer can be effective.

From the above discussion, it is assumed that older medium-size firms that operate in international markets and managed by highly educated and professional managers has the propensity of participating in business support services. In other words, start-ups and early growth businesses are less inclined to make use of business support services than mature firms led by professional managers. Thus business support services can be effectively used to contribute to the knowledge and competence of managers operating in medium to large firms.

## **Impact of business support services and enterprise growth**

It is not yet established in the literature whether business support has a positive impact on enterprise growth. However, after evaluating the impact of business support services for small businesses in India, Gupta (1991) and Marlow (1998) linked the changes that take

place in the businesses (after business support services), to specific improvements in the business such as increases in sales, customer base and number of employees. These findings support the point made earlier in this paper that business support services do pay, even if they are introduced at early stages of support of the enterprise.

The willingness of owner-managers of small businesses to contribute towards the payment of their own business support services was suggested as the best acid test of whether or not a business support services are worthwhile. Henning (1992) and Timmons (1990), who looked at business support services for small businesses in the UK, 'cautiously' concluded that the overall impact was good and that it was valuable and beneficial to the participants, but that the *quality* varied considerably from one business service to the other. The general trend in the literature seems to confirm that these services is worthwhile and should be supported (Henning, 1992 ; McMullan et al, 1983) but most owner-managers of small firms do not see it that way!.

## **The motivation to participate in business support services**

The key point which emerged from the literature is that business support services are both valuable and beneficial to the participants when the needs are more immediate. However, to train someone for situations that they may be experienced at some unknown time in the future is less effective than business support services someone who will apply the newly acquired competence at a clearly known time and place in the future. These findings are similar to those by Tomecko (1998) who points out that the greater the proximity of the learning situation to the need and the clearer the means-end relationship can be established between the newly learned competence and the need, then the more the motivation there is to acquire the knowledge.

It is also noted by Tomecko (1998) in his studies in Asia, that by far the largest portion of services that were offered to small businesses are 'supply-led' or 'product driven' rather than 'needs-based'. Thus business support services institutions offer what they have rather than conducting their own market research to determine what the *actual* needs of small firms, are.

## **Insights Drawn**

The insights that can be drawn from this study are that the providers of business support services should be sensitive to needs of the owner-managers of small businesses. The public sector or government agents should develop policies which are aimed at making sure that suppliers of business support services are adequately informed about the needs of small businesses. The key issues that were identified that can contribute to effective delivery of business support services include : serendipity; reputations of the providers of the services; availability of sufficient information ; the need for evaluation research; methods of delivery and presentation style and finally who needs to learn.

Serendipity: The issue of serendipity was presented by Vyakarnam et al (1998) and Nafziger, (1988) as one of the critical factors in discussing business support services in small firms. Most small firms would like the services to come at a time when most needed – being at the right place and at the right time. While this aspect is considered vital among small firms, it is difficult for business support services providers to determine when is the best time for small firms to participate in the support services and to establish what type of support the firms require.

**Reputation of the providers:** It is indicated by Tomecko (1998) and Marlow (1998) that reputation of the individual service providers plays a key role in motivating owner-managers to participate in the business development programmes. This aspect is crucial if participants are drawn to the programme largely as a result of the profile of the presenters or the organisation providing the service. This calls for the need therefore for stakeholders to improve the skills and profile of their presenters.

**Availability of information:** Supplying small firms with sufficient information on the value and real benefits of the business service would improve the demand for these services. There is increasing evidence that most small firms are not provided with adequate information on business services available and how their services can be adapted to meet the specific requirements of their firms. This can be achieved by conveying information to owner-managers of small businesses. According to Henning, (1992), due to the fact that many owner-managers of small firms have very little information about business support services available and the background of the providers, they consider investing their time and money on such services as risky. Similarly, suppliers of business support services, may also not be adequately informed about business needs and wants of the small firms.

It is in the best interest of the small businesses for policy makers to disseminate information on support services available as a means of removing market distortions and creating a demand for a product that is often not well understood. Without adequate information on providers of business support services and the contents of the programmes, owners and managers of small businesses would be running considerable financial risk to pay for the support service

## **The Need for Evaluation Research**

In view of the points indicated above, it appears there is a general lack of well documented research on business support services in the small business sector. There is a need for longitudinal and qualitative studies in evaluating the long-term benefits of business support services and business support in small firms, is long overdue. Storey (1994) suggests that control groups should be used in order to compare and contrast outcomes on firms that provide business support services and in those that choose to ignore such services. The author point out that multivariate statistical techniques should be utilized in order to establish the direction and strength of causal links between business support services provision and subsequent business performance.

Much of the research on small businesses appears to be quantitative with 'snapshot' studies which are usually generalized over a wide population. Well-conducted qualitative or longitudinal research is notably absent from the body of knowledge on business support services in the small business sector.

## **Methods of Delivery and Presentation Style**

It is important for owner-managers to specify the type of business support services they require both in terms of the teaching formula and the course presenters. The study by Cromie, (1987) indicates that some services are too formal, theoretical and lecture-oriented. The number of participants involved in government-sponsored business support services services, in the view of Tomecko, 1998. Usually such services are designed to

meet the needs of everyone participating in the programme and not particular needs of the individual firms.

The study by Cromie (1987) asserts that owner-managers of small firms prefer a more interactive formula which allows them to ask questions and discuss various issues openly. The participants need practical case studies in combination with discussion workshops on specific business issues *with experienced entrepreneurs* who can be their role models. It is also suggested that the services should be oriented towards specific sectors, that is adopting a sectoral approach.

Coaching and mentoring are also mentioned as *effective* teaching method. Mentors and business advisers should be appointed to support small firms in addressing specific business problems. The mentors and business advisors should include experienced entrepreneurs with experience in particular sectors or specialists in particular skills. Suggestions are also made for the use of videos containing testimonies of successful entrepreneurs. These were considered as sources of stimulation and information for the owner-managers (Henning, 1992).

The owner-managers should also be given the opportunity to what they learn, where they want to learn and how they want to learn, hence, any business support programme must fit the entrepreneurs' needs and time. It was also established that owner-managers of small firms tend to be *reactive* and *not pro-active* in their learning process. This means that they cannot plan in advance and always want specific information to solve a specific problem when it has already occurred and not general information (Tomecko, 1998).

Owner-managers of small firms want the business support services to be presented in the context of the environment in which they operate. They do not appreciate examples of foreign-owned companies who are usually subjected to completely different business environment. They want to learn from their own peers or from those who have experienced situation similar to theirs. Thus, they prefer to be trained by other entrepreneurs or their peers whom they can refer to as 'role models'.

### **Comment:**

For business support services to be effective and beneficial to the clients, it is suggested in this paper that there is need to put in place support services which improve the skills of owner-managers of these firms to learn better from their transactional relationships with customers, suppliers, bankers, internal staff and from experience of their peers through networking. In other words, there should be greater intimacy between the owner-managers of small firms and the providers of these services.

## **CONCLUSION**

This paper has provided some understanding on the business support service needs of small firms and established that the providers of these services are not getting it right ! A number of insights into business support services for owner-managers of small businesses, were drawn.

While the literature revealed that owner-managers of small firms view support services as a necessity, these services are only appreciated if they meet the needs of their businesses at a particular point in time. The participation of owner-managers in business support services is strongly influenced by a need to solve immediate needs. Many owners of small firms do not regard business support services as offering attractive and effective opportunities to improve the competitiveness and growth of their firms.

Due to the fact that most support services for small businesses are **not** 'needs-driven', business support services often receive a low value and priority in the estimation of the owner-managers of small firms.

In order to improve the effectiveness of business support services, this paper identified a number of issues that should be considered by both the owners and managers of small firms and the support service providers such as: serendipity; reputation of providers offering the services ; availability of information and methods of delivery and presentation style.

## **ABSTRACT**

This study based on Porter's Diamond Theory aims to develop advantageous strategies for the collaboration between small and medium-sized enterprises (SMEs) and higher technological institutions in the globalization and information technology age. The subjects consisted of 44 SMEs received the National Innovation and Research Award from 1993 to 2002, and 60 higher technological and vocational institutions in Taiwan. The data was collected through expert interview, survey method and triangulation method to explore the collaboration between SMEs and institutions and the potential strategies for the collaboration. This study developed a systemic model and series of strategies for the collaboration between institutions and SMEs to contribute to Taiwanese competitiveness.

**Keywords:** small and medium enterprises, higher technological and vocational institutions, advantageous strategies for collaboration

## **INTRODUCTION**

In knowledge-based economy, the fundamental element of an enterprise's competitiveness has shifted from labor power to brain power. Businesses should transform, apply and make

use of their knowledge to improve their competitiveness (Kao, 2000). In order to respond to the market demands, small and medium enterprises (SMEs) should adopt the innovative view in the business management to acquire more resources from the academic institutions. Taiwan's participation in World Trade Organization (WTO) has resulted in an open market for foreign products and therefore caused more pressure on Small and Medium Enterprises (SMEs).

Facing the external environment changes, the managers of SMEs in Taiwan start to find out ways for improving research and development (R&D) performance in their companies. One of the possible ways might be cooperation with academic institutions. The role of business in the process of corporation with the academic institutions will transform from a passive receiver into an active role. Business should cooperate with academic institutions to construct an effective framework to improve the performance of R&D, and to get access to more resources from both sides.

Porter's Diamond Theory is often used for analyzing the industry competitiveness and constructing advantageous strategies. In this study, we adopt Porter's Diamond Theory to explore the essences of collaboration between SMEs and schools. At the end of this paper, we will develop advantageous strategies for collaboration.

## **The Development of SMEs in Taiwan, R. O. C.**

SMEs in Taiwan originated in the age of oligopoly by national industries and private syndicates in the 1960s. It has not only led to the further reconstructing of Taiwan's industries, but also been accounting for 97.7 % of enterprises in Taiwan (Minister of Economics Affairs in Taiwan, 2003). The common obstacles for business management in SMEs in Taiwan are (Lai, 2001; Li, 1998; Minister of Economic Affairs in Taiwan, 2003): (1) excluded from the autonomy of the fundamental product-parts; (2) the products are highly homogeneous, and the price is decreasing; (3) lack of man power in R&D; (4) the limited demands of the internal market which are disadvantaged SMEs' to produce, and more convenient for SMEs is to produce low-technology products; (5) forwarding to establish the system of brand assurance; (6) the marketing approach is deformed. The weakness of SMEs prompted us to construct the advantageous strategies for them to strengthen the competitiveness of SMEs' in Taiwan.

## **Collaboration**

Collaboration between business and schools means that businesses and schools build a mutual-beneficial framework without breaking laws or causing harms to a nation. The common forms and details for collaboration are (Hsiao, 1997; Zeng, 1999; Dai, 2000; Dornfeld, 2001; Business-Higher Education Forum, 2001): (1) general sponsorship; (2) collaborative sponsorship; (3) transfer of knowledge; (4) transfer of techniques; (5) unofficial collaborative research; and (6) alliance mode.

The Minister of Education in Taiwan established the Interdepartmental Planning Guiding Committee for Collaboration in Higher Technological and Vocational Institutions in 2002. The committee is involved 50% business representatives, National Science Council, and Minister of Economics Affairs, which involved. The committee selected 6 institutions which are considered the field of study, and geography position of the regional industries demand in R&D. The mission of the six institutions is to integrate the resources among government, industries and schools, and to help regional sectors operate the collaborative project (Minister of Education in Taiwan, 2003).

## Diamond Theory

Porter (1990) extended the framework of competition to address the challenges of international competition, and develop the Diamond Theory which interprets a nation's competitive advantage. The diamond model is comprised of six components, with four major determinants residing at each face of the diamond, which function individually and as a system. The two factors located outside the diamond are those of chance and government. Bosh & Proijen (1992) criticized Porter's Diamond Model, arguing that Porter's framework should also covered the factor of culture. They emphasized the importance of culture when analyzing the international competitive advantages. With the theoretical framework modified from Porter's six determinants and Bosh & Proijen's culture element, Chen&Tarn (2000) analyzed the competitiveness of Taiwan's industries. Table 1 shows the definition of these seven components.

**Table 1 Components of Porter's Diamond Theory**

Components	Definition
1. Production	The nation's position in factors of production, such as skilled labor or infrastructure, necessary to compete in a given industry.
2. Demand	The nature of home demand for the industry's product or service.
3. Related and supporting industries	The presence or absence in the nation of supplies and related industries that are internationally competitive.
4. Strategy, structure and rivalry	The conditions in the nation governing how companies is created, organized, and managed, and the nature of domestic rivalry.
5.Chance	Opportunities play their role partly by altering condition in the diamond, and the events are occurrences as the act of pure invention, major technological discontinuities significant shifts in world financial markets or exchange rates, surges of world or regional demands etc.
6.Government	Government can influence (and be influenced by ) each of the four diamond determinants either positively and negatively.
7. Culture	Behavior and artifacts; Beliefs and values; Basic assumptions as time-orientation, relations between the group and the environment, and relations among members of the group.

*Note.* Modified from Porter, 1990 and Bosh & Proijen (1992)

# RESEARCH METHODOLOGY

This study uses statistical analysis, expert interview, and literature reviews to cross-examine the phenomenon of essences of collaboration between businesses and schools. After the data analyzing, this study develops the advantageous strategies for collaboration between both sides.

## Sample

This study surveyed 44 SMEs that received the National Innovation and Research Awards from 1993 to 2002, and 60 higher technological and vocational institutions in Taiwan. We also interviewed one expert of governmental research institution, 2 business executives, and 5 chief of higher technological and vocational universities. The chief who served in the Office of Research and Development, The Center of Collaboration or The Center of Businesses Incubation which business are related to the collaboration.

## Analysis Methodology

This study utilizes several approaches: it uses descriptive statistics to describe the distribution of collection data; it uses t-test and one-way ANOVA to exam the differences between the background variables of samples and the Diamond Model; and it uses the Pearson Product-moment Correlation to test the relations between businesses and schools on the seven dimensions of Porter's Diamond Model. Content analysis is used to explore the successfully experiences of the collaborative project from results of expert interview. Finally, this study compares the phenomena from statistical analysis and content analysis to construct the advantageous strategies for collaboration.

## Research Instrument

Instruments are based on the theoretical framework of Porter' s Diamond Theory and related literature, for examples Chen & Tarn (2000) and Bosh & Proijen (1992), which are included the semi-structure interviews and the questionnaires. The questionnaires included seven dimension: (1) Factor conditions: the resources providing level; (2) Condition factors: the purposes of sectors motivate the collaborative project; (3) Related and supporting industries: the supporting rules, policies, and the carrot approach of the sector in the collaborative project; (4) Organizational strategy, structure and rivalry: the organizational strategies which are reflected on the collaborative contract, and the cooperative structure; (5) Organizational culture: the extent of mutual trust, involvement, and careens about the collaborative project; (6)Government: Examination of the existing policies of government; (7) Chance: the multi-sector collaboration based on the high-tech oriented and regional government supporting local of the cooperative project.

Semi-structure interviews and questionnaires are of two kinds: for schools and for businesses. Questionnaires are pre-tested on samples of 28 SMEs and 36 higher technological and vocational institutions, and expert examination to maintain the reliability and validity. The pre-test analysis consists of the item analysis and Cronbach  $\alpha$  test which are deleted while both have a probability  $< .05$  of the correlation coefficient and Critical Ratio (CR) for keeping the reliability and validity (Table 2 shows the values of Cronbach  $\alpha$ ). After reviews of literature and analyses of pre-test data, the questionnaires are constructed in this study to survey 28 SMEs and 60 higher technological and vocational schools. All of

the dimensions was measured by five-point Likert scale item rating perceived form from 1 (totally disagree) to 5 (totally agree).

## RESULTS AND DISCUSSION

### The Differences Resulted from Background Variables of Business in the Dimensions of Diamond Model

The test results of executive's recognition in collaboration in the dimension of Diamond Model are shown as follows (see Table 5):

- There are significant differences between the executives' sexes and the dimension of chance.
- There are significant differences between the executives' work experience and the dimension of organizational culture.
- There are significant differences of business capital and the dimension of related supporting institutions.
- There are significant differences between the different business claims and the dimension of factor conditions.
- There are significant differences between the different business claims and the dimension of organizational strategy and structure.

The results show that the more work experiences of executives could execute the collaborative projects smoothly. The expectations of different management style are different about the successfully collaborative fruits. The motivation of businesses to participate in the collaborative project would consider the provision level of resources and competencies in the R&D of schools.

**Table 5 The Test Results of Executive's Recognition in Collaboration in The Dimension of Diamond Model**

Variables	Dimension of Diamond Model							Total
	Factor Conditions	Demand factor	Related & Supporting Intuitions	Strategies & Structure	Organizational Culture	Government	Chances	
1. Executive Sex	1.35	1.46	.668	.724	1.23	1.80	2.410*	1.517
2. Executive Age	.281	1.05	.729	.193	.067	1.00	1.64	.317
3. Educational Degree	.152	1.37	.596	2.46	1.49	1.87	.250	1.628
4. Job Title	.563	.598	1.59	.572	1.16	1.02	2.02	.573
5. Work Experiences	1.54	.702	1.70	1.51	2.639*	1.37	2.04	1.735
6. Teaching Experiences	-.84	.242	-.54	-.34	-.340	-.31	-1.7	-.767

n=44, \*p< .05

## Schools

The test results of recognitions of school administrators in the dimension of Diamond Model are shown as follows (see Table 6): presents the

- There are significant differences between the total scores of questionnaire and the dimension of related and supporting institution.
- There are significant differences between administrators' education degree and the dimension of chances.
- There are significant differences between the private and public institutions and the dimension of demand factor.

The results appear that the senior administrators have more experience that helps organizations create better organized and supporting conditions. The senior education degree administrators could be aware of the more innovative foresight in R&D, and the discrepancy between public and private schools in terms of available resources would affect school members' attitude in participating in the collaborative project.

**Table 6 The significant difference of variables of schools**

Variables	Dimensions							Total
	Factor Condit ions	Dem and factor	Relate & Suppo rting Intuitio ns	Strateg ies & Structu re	Organiz & ational Culture	Govern ment	Chanc es

## The Relations of Recognitions between Businesses and Schools in the Dimension of Diamond Model

The test results of the correlation between businesses and schools in the Diamond Model are shown as follows (see Table 7):

- There is positive correlation of business in dimension of the factor conditions with the dimension of the government of schools.
- There is positive correlation of business in the dimension of the demand factors with the dimension of strategies and structures of schools.
- There is positive correlation of business in the dimension of the related and supporting institutions with the dimension of demand factors of schools, as well as the dimension of government of schools.

The results appear that the main purpose for businesses to collaborate with schools is school practice-oriented characteristics in teaching and learning. So far, businesses have been satisfied with the cooperative relation with higher technological and vocational institutions.

**Table 7 The Relations of Recognitions between Businesses and Schools in the Dimension of Diamond Model**

Schools	Business							Total
	Factor Conditions	Demand factor	Related & Supporting Intuitions	Strategies & Structure	Organizational Culture	Government	Chances

### Results from the Expert Interviews

This study interviews 3 businesses executives and 4 administrators of higher technological and vocational institutions whose businesses are related to collaboration. The motivation of schools to participate the collaborative project is to promote schools' reputation; but the motivation of business is derived from external marker pressure. Namely, businesses would not actively search schools to cooperate without external forces. An interesting finding that the opinion between schools and businesses are not consistent/is that schools and businesses have evaluated the chances factor differently. It appears that the one chance and the different interpretations between schools and businesses.

## The Advantageous Strategies for Collaboration

This study constructs a systemic model and series of strategies for the collaboration between and SMEs and schools to. The strategies are categorized seven dimensions in the Diamond Model (see Figure 1).

**Government:** Taiwan's government actively constructs the infrastructure for businesses and schools. Continuously modifies the law to motivate sectors to participate in the collaborative projects, intensify the function of matching the collaborative project and integrate the related public sectors which businesses relate to the collaborative project.

**Demand Factor:** The purpose of business to cooperate with schools is their practiced-oriented in teaching and learning. Schools should continuously intensify the characteristics to gain more cooperative chances.

**The Chances:** Businesses integrate the sensitive competencies to the market demand with the practice-oriented trainings of schools to develop the products and mutual benefits.

**Related Supporting Institutions:** The internationalization and technological transformation of competitive rules and content, both businesses and schools should based on the viewpoint of mutual prosperity cooperate with each other. Businesses should adapt to the culture of cooperative school, and schools should attempt to satisfy business demand.

**Organizational Culture:** The knowledge-based economy shifts the rules of competition. In order to cooperate with each other, schools and business should be based on the mutual prosperity. On one hand, business should try to incorporate school's culture; on the other hand, schools should attempt to meet business demand.

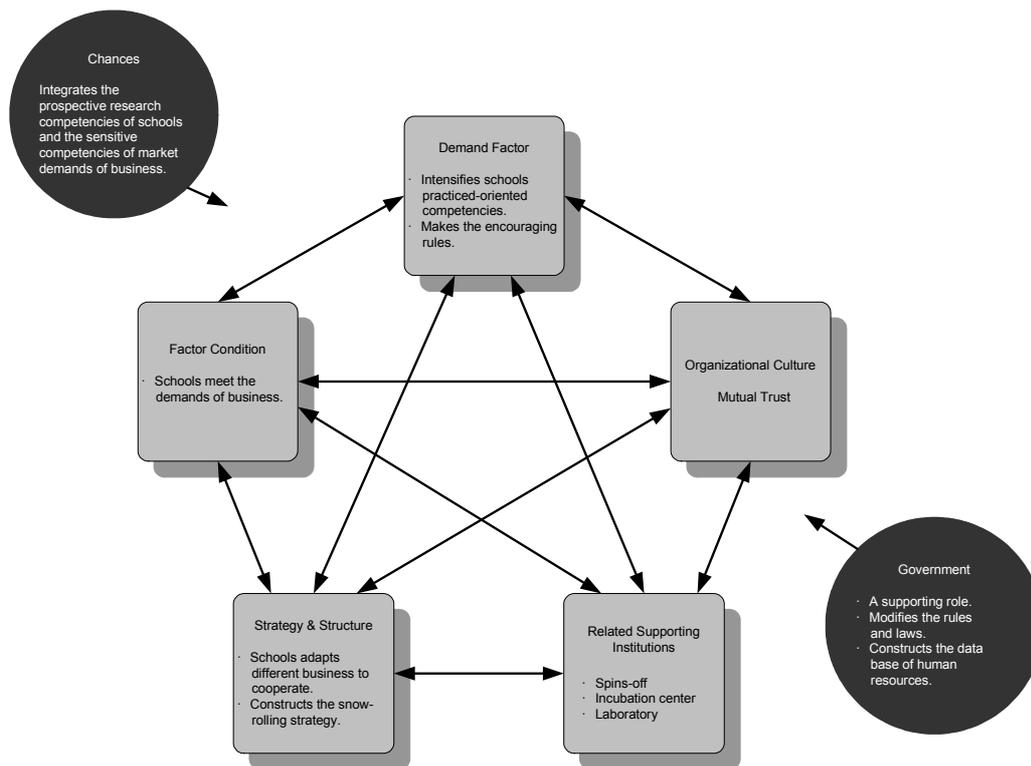

**Strategy and Structure:** Through data analysis, this study drafts the snow-rolling model approach could provide for businesses and schools. The characteristic of the sketch is showed the third business or schools to be included. Schools actively outline the strategic alliance network for businesses. The networks are categorized into three stages:

**The first stage:** Internal collaboration. Schools inform businesses of the resources and provide consulting services of departments. Schools play an active matching role in this stage and extend their network to third businesses or schools.

**The second stage:** External collaboration. Schools inform the cooperative business and the third business or the third schools of the expected role within the collaborative project.

**The third stage:** Cross domestic collaboration. The cooperative partners should search for the international sectors to participate in the projects to raise experiences in the global network.

**Factor Conditions:** For their limited resources, the motivation of private schools to participate in the collaborative project is much more than public schools. Governments should bridge the gap between public and private schools to intensify both sides' motivation.

**Figure 1 The Advantageous Strategies for Collaboration**

## Implication and Recommendation

This study found that a successful framework for collaboration for business and schools is to expand the scale of cooperation gradually when they are mutual trust. The role of government in the collaborative project, the role of government could play a director in the initial stage, and gradually decreases its dominant role to supporting role and the consultant in the long run. Four recommendations for Taiwan's government are as follows: (1) Continuously modify the rules and laws to encourage business and schools to cooperate; (2) Provides the matching service for business and schools; (3) Construct the database of human resources; (4) Integrate the departments business charged in the collaborative business into the unified portal for complete information.

The implication for business is actively to search for academic institutions to cooperate. Four recommendations for business are as follows: (1) Fund schools to research within the collaborative project; (2) Provide equipments for schools under the project; (3) Provide the human resources to serve in the schools temporarily; (4) Share the intellectual property according to the contributive level

The implication for higher technological and vocational institutions is to base the advantage of practiced-oriented in teaching and learning to promote the successful case in collaboration for business. Six recommendations for schools are as follows: (1) Integrate with the regionally academic institutions; (2) Take into consideration about business demands in the products of R&D in order to arrange curriculum; (3) Train students to be a qualified employee in the business; (4) Provide the prospective information in the academic research for business; (6) Make the encouraging rules to motivate school member to take

part in the project.

## ACKNOWLEDGEMENT

*Literature study & Action research*

## **INTRODUCTION**

In many Small Business development policies an important role is foreseen for the knowledge transfer between knowledge institutes, like universities or consultants, and Small and Medium Enterprises (SMEs). Despite the importance of this knowledge transfer, little research has been done into the process of knowledge transfer. Which methods of transferring knowledge are most effective? What is the effect of the type of knowledge to be transferred? Etc. Many questions are still open. Questions that are of particular importance to Small Business Development policies in the Netherlands. The fact that the

Netherlands combines a highly educated population with relatively low knowledge transfer has become known as 'the Dutch paradox'. The Chair of Management Consulting at the University of Professional Education Utrecht performs an action research program aimed at better understanding the relationship between different ways and settings of knowledge transfer and the effectiveness of the knowledge transfer. In this program, students together with teachers, perform business-consulting assignments in SMEs.

## Cooperation between SMEs and knowledge institutes

Many SMEs are not regular customers of consultants or knowledge institutes. In the Netherlands only 10% of the SMEs co-operate with a university. A non-commercial SME consultancy service is consulted by only 14% of the SMEs, whereas commercial consultants are consulted by no more than 20% (Blom, 2001). For large companies this number is over 70%. In these studies, the regular contact with a lawyer or accountant is not considered as management consulting. The reasons for the relatively low utilization of external expertise by SMEs are indicated as (Blom, 2001):

- High costs of a consultant (41,7%);
- No need for external knowledge (37,4%);
- Doubts about the practical usability of an external advice (10,8%);
- Does not know / No answer (10,1%).

## High costs

An often heard opinion about consultants is that they are expensive. This opinion is not exclusive to SMEs, also large companies complain about the cost of their consultants. Partly the consultants themselves have created this complaint. In the hay-days of consultancy, in the second half of the nineties, 'consultants' emerged in every trade. A consultant could be anything between a locksmith or a boardroom advisor. In the information technology industry a nearly finished education was enough to start in the business. The length of the company car indicated the level of inexperience of these 'consultants'. Attempts to introduce a quality standard to the industry failed because the market was not interested. The quality of a consultant is probably too unclear and indefinable.

Another problem in consulting is that of the benefits of a consult. Quite often these benefits are difficult to quantify beforehand. The nature of 'consulting' may make this inevitable. After all, in the end the consultant does not make the decisions. However, in an era where 'Return on Investment' seems to rule this is a serious disadvantage.

Since the argument of high costs is not exclusive to SMEs, does it provide an explanation for the limited use of external expertise by SMEs? Could the profitability of SMEs be lower than that of large companies, causing fewer resources available? Research on profitability of SMEs compared to larger companies indeed show some differences. In most countries large companies are more profitable than SMEs. In the Netherlands however, the opposite is true (Campeer et al., 2003).

Another explanation could be that economies of scale in the process of consulting provide a disadvantage for SMEs. Despite of the lack of research into this topic, the argument is

supported by many consultancy companies that experience difficulties in 'downsizing' their methodologies to a realistic approach for SMEs.

All the possible explanations of the high cost argument however cannot explain the low penetration of subsidized ways of knowledge transfer as provided by universities and government programs.

## **No need**

How should the fact that almost 40% of all SMEs indicate to see no need for external knowledge be interpreted? Following the familiar is the 'conscious - competence' learning model<sup>1</sup> typically the conscious – incompetent entrepreneur or manager will be looking for external expertise. These persons are aware of the existence and relevance of the knowledge they are lacking themselves. The unconscious – competent group does not really need advice, but might be looking for it for more certainty. The conscious – competent group is not looking for external expertise because this group is aware of their competence. The remaining group, the unconscious – incompetent one, is also not searching external advice because they are not aware of their own lack of knowledge. The question arises whether the 'no need' argument results from conscious – competent SME managers or from unconscious – incompetent ones.

Given the diversity of entrepreneurs and managers of SMEs it can be assumed that they cover all four fields of the matrix. However the fact that most bankruptcies are resulting from 'incompetent entrepreneurship' (Blom, 2000) is should be alarming. In an increasingly complex business environment, because of developments in legislation, labour, information-technology, etc., it can be expected that the need for especially functional expertise is growing.

## **Practical usability**

This argument raises the question whether business skills like marketing, finance and human resources management apply to SMEs differently than to large companies. If the answer to this question is based on the many book-titles indicating a special focus on small-business, e.g. small business marketing, small business logistics, etc., the impression arises that business skills indeed apply to SMEs differently. A closer look to the content of these books however learns that it is not so much the core-logic of these business skills that is different for SMEs, but the context of the application.

## **SME characteristics**

The reasons as outlined above do not seem to provide a satisfactory explanation for the relatively low utilization of external expertise by SMEs. For a better understanding of the difficult relationship with SME entrepreneurs and managers and external knowledge providers, a closer look at the context of a SME should be taken.

---

<sup>1</sup> It is not clear who originated the conscious - competence learning model. As well as various modern authors, sources as old as Confucius and Socrates are cited as possible originators.

## **Characteristic 1: Number of employees**

Their number of employees commonly defines SMEs. The boundaries of the definitions used can however differ by country. In most European countries define SMEs as companies with less than 100 employees. In these countries SMEs usually account for more than 95% of all companies. By far the most SMEs have 0 or 1 employee.

In understanding a company's role in society and economics its number of employees is not a very reliable indicator. In the Netherlands, airline KLM is one of the largest private employers. In the global airline business however, KLM's management was convinced the airline should merge in order to maintain competitive.

## **Characteristic 2: Industry sector**

The formal definitions of SMEs normally exclude the public sector. Also the primary sectors, agriculture, fishing and hunting, are excluded. Regarding the managerial and business issues however many public and semi-public companies are comparable to SMEs.

## **Characteristic 3: Organization structure**

Despite the fact that over 95% of all companies can be classified as an SME, most organizational theory is based on large enterprises. One of the 'godfathers' in this field, Henry Mintzberg, set the tone by introducing the 'Simple Structure' as the dominant model for the organization of SMEs (Mintzberg, 1979). In this 'Simple Structure' all employees report directly to the director, with little hierarchy. This structure probably applies to part of the SMEs, but as a general SME organization model it is a simplification. Meijaard (Meijaard et al., 2002) modifies this image and defines nine organizational models for SMEs. These models differ regarding the division of labor, division of power and coordination mechanisms.

## **Characteristic 4: Decision making structures**

In studies into the decision-making structures in SMEs the role of the entrepreneur springs to the attention. Gibcus (Gibcus et al., 2003) points out that the logical steps of a decision making process itself does not differ much between SMEs and large companies. As could be expected, is this process in SMEs not the result of a regular strategic planning process. In the execution of the process, the dominant role of the SME entrepreneur or manager limits the objectivity of decision-making. Once an idea or a dream settles into the mind of the 'boss', he or she will subjectively filter most information in order to 'prove' the quality of their plans. External information or expertise that does not comply with the dream is discarded. This makes the rationality of decision making limited.

## **Characteristic 5: Lack of supporting staff**

One of the most eminent qualitative characteristics of SMEs is their lack of supporting staff (Van der Wilde, 1987). The scale of the organization of most SMEs simply does not allow for specialist staff. Logically this creates a knowledge gap. For example, 67% of SMEs indicate to lack in-depth expertise of HRM and personnel issues, but a mere 4% can afford to hire a trained HR professional (Blom, 2001).

The lack of specialist expertise does not reflect in a high demand for external expertise. The combination of little expertise and little demand for it is alarming. Probably this illustrates the independent mind of many entrepreneurs, who like to be 'in-control' (Van Gelderen, 2003).

## **Characteristic 6: The person and role of the entrepreneur**

As already mentioned before, the person of the entrepreneur or manager is an important factor in SMEs. Given this dominant role, also the personal characteristics of the entrepreneur/manager become an important influence. In the Netherlands, the personal profiles of these entrepreneurs and managers have been studied (Blom, 2001). Based upon this study it can be concluded that:

- almost 70% does not have higher or university education;.
- entrepreneurs/managers assess as their strong skills: marketing, customer-interaction, sales and professional skills;
- their weak skills are assessed as: strategic planning, policy making, information technology, organization, administration, fiscal and legal matters;
- over 70% does not attend any courses or seminars and an even larger percentage does not allow their staff members to attend courses or seminars.

It is not unthinkable that these personal characteristics, combined with the lack of supporting staff to compensate the weak skills, is an important factor in the difficult relationship between consultants / knowledge institutes and SMEs.

## **The impact of these characteristics on Small Business management consulting**

How should the process of management consulting to SMEs be organized in order to establish an optimal knowledge exchange? Earlier we discussed the three main reasons, cost, need and usability, of SME owners/directors for not hiring consultants or knowledge institutes. Stimulation policies for SMEs are most often aimed at overcoming the first reason: high cost. Although, the multitude of stimulation arrangements and subsidies on European, national and regional level can be confusing and bureaucratic, the possibilities are huge. For the serious owner/director, the cost of external expertise can therefore hardly be the main issue.

Regarding the 'no-need' argument, the owner/director's self-assessment (Blom, 2001) and their lack of professional staff, strengthens the impression that a significant part of the SME entrepreneurs/managers must be considered 'unconscious – incompetent'. This implies that a 'pull' strategy of knowledge transfer is unlikely to be successful for these SMEs. Once the lack of awareness is overcome, also the 'no need' reason cannot be a main issue anymore.

The argument that the advice of an external consultant is generally not useful, raises the question whether the insights gained in business sciences only apply to large companies. This seemed unlikely. Given the characteristics of SMEs the difference is probably more the context in which the insights are applied than the content of the insights itself. From the analysis of the characteristics of SMEs the dominant influence of the person of the

owner/director appeared as an important factor in the difficult relationship between consultants / knowledge institutes and SMEs. Given the personal profiles of these owners/directors, the external knowledge providers should realize the 'three ways' in consulting. The first 'way' is the *way of thinking*, the business sciences. For many consultants and university researchers, the 'content' of the advice is at the 'top of the mind'. The advice has to be 'right', high quality. But a 'good' advice is not necessarily an effective knowledge transfer. Effectiveness requires acceptance and the acceptance of the advice is mostly influenced by the other 'ways'. The second 'way', the *way of working*, represents for the way information is gathered and the entrepreneur and his staff is involved in the process of developing the advice. In this 'way' the consultant should allow for interaction and should make it fun for the participants. In this aspect, the process approach of consulting shows promising. The third 'way', the *way of communicating*, represents the way the knowledge is transferred from the advisor to the entrepreneur. In this 'way' it is crucial to acknowledge the different personal profiles of SME entrepreneurs and consultants and to adjust the communication accordingly.

Taking the 'three ways' into account, the conclusion could be that the transfer of knowledge should be more the 'sharing of experiences'.

The Chair of Management Consulting will adjust her activities to explore this insight further.

# THOTH'S BENEDICTION: AN EMPIRICAL STUDY OF KNOWLEDGE INTENSIVE SMALL FIRMS

**Kshitij Chandra Jha\* & Dr. Sudhir K. Jain\*\***

Rohan and I had been exchanging e-mails daily for about a fortnight. The case study that Rohan had done for me had obviously got him excited. He had interviewed a firm in Pune at my request; and I myself had done two at Delhi. The similarities and differences were making us both analyze the situation from varied angles; however, we reached more or less the same conclusions. With his background in economics he was able to lend a tangible form to the abstract inferences that I had initially made. After checking with the wide literature available on the topic; mainly research after Sveiby and Risling's path breaking book on the topic, I more or less found a resonance in the discussions we had.

Analyzing the data with my guide also led me to trends that found justification in subsequent literature. I had expected the cultural and social background of my country to be a marked influence on my research; and produce deviations from the western work done. However, the deviations were never profound and agreement has been to an unexpected level. The reasons for this harmony amidst cultures may be attributed to two main causes. Firstly, the similarity in backgrounds between personnel in these firms across countries. They share formal education and a middle or higher middle class status in society. These lead to common traits, both organizational and personal. The personal traits of proclivity to autonomy, creativity, and flexibility lead to an organization that is informal, and collegial in structure. Second, the high levels of standards and quality required at these levels lead to uniformity in functioning.

Having been invited to do a case study at ComplexCode(pseudonym at request) ; I found myself exposed to a Bohemian order. ComplexCode gives code for embedded systems and other VLSI hardware. The book would deem the organization a failure, some of its practices sacrilegious. A small group of five was the core of the firm. They employed not more than five personnel. The core group took care of everything from coding to policy decisions. Rest was non-technical staff related with daily running of the firm. At any time I could see more people chatting in the coffee room adjacent to the lab. There were no fixed breaks and working hours were at the discretion of the core five. During most of my interview while I was talking to one of the core five, three chattered in the coffee room while one furiously hit the keyboard in the lab. I was being told that there was no fixed routine or practice that they followed. Sometimes, when a project required urgency they worked all night, at others they could take a break for days. But they had never been late for a deadline. Also, non-standard practices included scratching code on the tablecloth during discussion or delaying disliked jobs, mainly non-imaginative routine coding, till the last moment. Even though that meant a hurry to save the skin and burn the midnight oil.

At Neubauplan in Pune where they design complex high-speed machines and offer prototype making services, work culture is much more conventional. With a large library, state of the art software and computers, printers and scanners, it had personnel that were working in regular shifts. They divided their projects into parts and proceeded systematically to accomplish

them. According to the President and founder they were moving more and more towards routines and standard tasks to maximize efficiency.

Yet both of them had turnovers in multi crores, and gross margins in excess of 90%. They are examples of what are known as Knowledge Intensive Firms. Despite the obvious differences on the surface they have strategic and technical expertise at their core. Both enjoy monopoly in their respective fields and are the dominant, in some cases only provider of the services/products they offer. It is this monopolistic advantage that accounts for longevity and high gross margins.

N=40.

## **THE KNOWLEDGE PARADIGM: DEFINING A KIF**

As the Orwellian forecasts of a Big Brother watching, or the IBM 8:18 – 5:12 becomes increasingly redundant we are forced to take a look at the paradigm shift. Originating from capital and labor intensive labeling of firms, input is used as the parameter for these definitions. The advantage of using input is that it gives a good platform to assess the internal structure and operations, whereas the disadvantage lies in the obscuring of customers and distribution channels. However, there is a distinct over simplification in defining knowledge intensive firms in terms of human capital as opposed to financial or physical capital. Capital and labor can be gauged in terms of monetary units. These units give leverage to common values between firms; at best they show aspects that can be bartered in inter firm terms. They ignore or at least obfuscate idiosyncrasies of a firm and the routines followed in intra firm activities.

This ambiguity arises in part from the fact that knowledge itself is not so well defined. Most confuse it for information. But, “Knowledge is a stock of expertise not a flow of information” (Starbuck '92). The best flow line that I came across is depicted as follows:

Defining knowledge is like defining value or importance. It assumes different values in different situations. Based on my study of literature and participation in a conference on the topic; I could find the following salient features of a KIF. They were justified in my empirical take on the topic:

1. *A KIF is different from an information intensive firm:* This would be clear from the flow chart process model above. Also, I realized this when during the middle of my study I made the mistake of classifying BPOs as knowledge intensive firms. As I went for an interview in one of those firms; and I processed data, it became increasingly clear that they were information intensive and differed from the firms I was studying. Processing is much faster in an information intensive firm. Also the ratio of experts to personnel is lower.
2. *Weighed emphasis on arcane knowledge:* Expertise of the Olympian niche dominates commonplace or widely shared knowledge. This might lead to stereotypes and make such firms look special. However, if we broaden the definition then reduction of stereotypes is at the cost of a generalization that might classify many firms as knowledge intensive.

3. *Knowledge of the KIF may not be in key personnel deemed as experts:* Machinery, assets, routines, and organizational structure/culture may be other knowledge properties acquired by the firm. Nelson and Winter ('82) treated Behavioral routines as the essence of an organization. They lead to logical results in abstruse situations. The personnel contribute to the routines and structure of the firm. Thus dependence on key experts might not always be sharp.

Keeping these in mind we defined an expert as someone who has formal education or experience equivalent to a doctoral degree. A KIF is defined a firm that has 20% or more of these experts.

## THE INITIAL PHASES: TEETHING TROUBLES

Requests to fill in an html based interactive form were sent to over 500 firms taken from Indiyellowpages and Yahoo directory of small businesses. 55 replied of which 10 were classified as information intensive or not knowledge based. The remaining 45 forms the basis for all the data presented henceforth.

Respondents were asked to rate various factors on a 1-5 scale where 1 represented the least satisfaction or the least important and 5 the most. In the case of procuring seed capital people were asked to rate according to ease- 1 the hardest and 5 the easiest; the rest were satisfaction and importance ratings. This has been clarified since quite a few firms said that procuring investment was most difficult as also most important. Importance of capital is taken for granted; we are more interested in the ease of obtaining it.

These were the responses and ratings:

## THE START UP PHASE

Factor	1	2	3	4	5	N R
Access to investment	4	7	19	5	7	3
Access to loans	6	3	22	4	7	3
Support of government	13	9	12	6	2	3
Satisfaction with the interest rate	16	9	15	1	1	3
Satisfaction with the infrastructure	7	5	20	8	2	3

## MEAN SCORES AND RANKING OF FACTORS

Factor	Mean Score	Ranking
Access to investment	3.095	1
Access to loans	3.071	2
Support of government	2.404	4
Satisfaction with the interest rate	2.095	5
Satisfaction with the infrastructure	2.833	3

Also, the nature of seed capital was investigated. Most had generated the starting fund in more than one ways:

Note that the numbers do not add up to 45 since more than one option could be exercised. For the same reasons a pie chart was not possible.

It is notable that access to loans and investment is perceived not to be a hindrance; but the dissatisfaction with the interest rate is high. This leads to a high number of the respondents setting up the firm with the help of personal assets; although these occurred to the maximum extent in combination with one of the other two. The underlying fact is that money should be made cheaper.

The technopreneurs are also visibly unhappy with the role played by the government; the support and the infrastructure provided. There needs to be greater import in the policies of the government to make these people set up firms in the country. Most of the manufacturing based KIFs need imported machinery/equipment. These are examples where the expertise might be in non-human forms. This class is miniscule, high interest rate being a bane in such matters.

The following is a break up of firms into service and manufacturing units:

We can clearly discern a bias towards the service industry. The manufacturing KIFs tend to be technology intensive; which are more capital intensive than the average firm belonging to the knowledge class. Their low numbers hence are explainable as a correlation to the payback ease.

## KNOWLEDGE CREATION: A LOOK INTO THE BEHAVIORAL, STRUCTURAL, AND ORGANIZATIONAL LINKS

### THE EXPERT'S WORLD

The key to all knowledge creation lies in the hands of experts that form the heart of a KIF. It is imperative therefore to look into the work and behavioral aspects of an expert.

The work done by experts has been captured in the following model based on Starbuck's ('92) hypothesis. It is known as the CAP model (Creating, Applying, Preserving).

The performance of a KIF is closely linked with efficiency of expertise. This in turn is a measure of the environmental opportunities, and behavioral patterns of the experts- that has the organizational structure as a prime parameter. To understand the psyche of experts it is generally observed that they resist ideas; which is a paradox on the surface. This attitude is borne off constraints on time, limits of a specialist outlook, and image consciousness. Explicit learning has no immediate returns while cutting on the valuable, and paid for, time of the experts. The versatility and flexibility of analysis and perception are lost to an extent with specialization. These specialists might ignore even revolutionary concepts just outside the domain. Also, the willingness to learn might be seen as a deficiency. On the other hand, since knowledge creation accelerates social and technical changes, experts tend to find themselves in such spheres.

Since knowledge creation itself lacks a proper definition, there exists a weak, if any, correlation between knowledge intensity and creation. Adding more experts to a job that one expert can do will only delay the process by additional requirements of interaction, consultation, and protocol. Hence, it would entail a less effective use of experts.

There exist a symbiosis between organizational and expert learning. Organizational learning can be said to be a process wherein the personnel's expertise gets converted to the property of the organization. Three main classes of organizational property are recognized. They are physical capital, routines, and organizational learning. In addition a fourth intangible component of social capital might be considered.

Physical capital is the conversion of expertise and experience in concrete terms like software, databases, and defined processes.

Formation of routines represents a sort of dilemma for the KIF. A routine by nature is bureaucratic. Experts desist bureaucracy; they are people seeking autonomy, recognition of individuality, and classless environment. Quality is dependent on the other hand on consistency. Consistency across clients can be maintained only if there is personnel development and the roles occupied by these people are impersonal in nature. In other words it requires conceptual integrity, which is control by a few key people within the organization. The bigger firms are able to bureaucratize because they can balance out the opposing forces.

Organizational culture builds gradually and is a very delicate aspect. Bigger firms have to promote free communication to tolerate the bureaucratic dissatisfaction existing within. Smaller firms don't have such communication problems as the organization charts here are sketchy and environment is open, friendly, and informal. They respect the expert's desire for autonomy, and also gain in fluidity and ambiguity, which are a necessity to absorb the fluctuations in requirements.

Social capital is an amorphous concept. It measures the effectiveness of the organization in client relationships. There exists a differentiation even between experts in an organization. Some experts are more valuable as social capital for the firm, compared to others. These work in conjunction with experts who are technically more adept. Over dependence on either would

spell trouble for a firm. One might lead to loss of clients while the other loss of expertise. Also, social capital makes service look exclusive, and adds personal touch, thus enhancing client satisfaction manifold.

The strategy adopted by firms for employee motivation, or in other words expert management policy of the firm is reflected in the following bar graph. All the firms replied N=45, and there was a large majority of the firms that chose others as an option:

PaWp: Personal Appreciation of Worker's Performance  
 AoT: Appreciation of Teams  
 MoAbv: Mix of Above.  
 NthgFml: Nothing Formal

Among the explanations for other strategies were statements like "an open environment", "remuneration as the prime source of motivation", et al. Within the options available we see that a hazy kind of format is most preferred. All these target the expert's yearning for autonomy and individuality. He is made to feel special through remuneration, and also absence of hierarchy or well-defined structure implies absence of control.

Formal reviews and routines were stated in 3 firms. It was notable that they were the biggest of the lot.

The dependence of market performance on product/service variables is depicted in the following response. It depicts the strength of a KIF

## MARKET PERFORMANCE

Factor	1	2	3	4	5	N R
Originality of product	1	4	16	10	14	-----
Quality of product	0	3	15	18	9	-----
Cost of product	5	2	25	7	6	-----
Service provided	1	4	15	20	5	-----
Others	---	---	---	13	11	21

## MEAN SCORES AND RANKING OF FACTORS

Factor	Mean Score	Ranking
Originality of product	3.711	2
Quality of product	3.733	1
Cost of product	3.155	4
Service Provided	3.533	3

There is a marginal difference between the originality and quality of the product as a marking factor in market competence. Consistent quality is essential to keep long-term clients or customers. Also innovation is the forte of experts. Hence originality, which imparts monopoly, is also a defining factor on par with quality.

Even in India, for KIFs cost is the least important factor. This is because these firms at present provide mainly value added or high-end services/products. Technology has not permeated to the level where cost would be a dominating concern. Service provided is a mid level factor in the performance, because it serves mainly to ease out customer dissatisfaction and maintain the bond.

The focus of the company relates to the kind of work experts do. The following table shows the responses of the firms:

### FOCUS OF THE COMPANY

Factor	1	2	3	4	5
Marketing already developed product	10	3	10	5	17
Marketing new product	5	15	7	10	8
Developing new product	7	9	11	4	14

### MEAN SCORES AND RANKING OF FACTORS

Factor	Mean Score	Ranking
Marketing already developed product	3.355	1
Marketing new product	3.022	3
Developing new product	3.200	2

Marketing and innovating are the focus of the company. Clearly, acquiring a product and marketing it as something recent is not high on the agenda of these firms. Though alliances make for such strategic possibilities. This is also discussed as In Licensing in areas of new focus; something the pharma companies are hitting at.

### INNOVATION INCUBATION

The informal atmosphere is congenial for idea generation. To convert ideas to knowledge, it has to pass through an incubation stage. The lower the time required the more is the

emphasis on speed. Very low incubation times may be at the cost of knowledge accuracy. The following pie chart demonstrates the trade-off for speed in the industry esp. so in KIFs that have a high number of innovations and a large number of competitors to tackle.

## **ALLIANCE FORMATION**

Inter firm collaboration among knowledge intensive firms is on the upward swing due to three reasons put forward by Reid, Bussiere, and Greenaway('00) : accelerating competitions, falling regulatory barriers, and rising customer expectations.

*Definition:* An alliance is an understanding between two firms that allows for mutual sharing of resources in order to achieve a set of pre defined goals or agreed upon objectives. The stability of an alliance primarily depends upon mutual benefit. In the case of knowledge intensive firms, the sharing of knowledge as a resource may take three forms: explicit-explicit, explicit-tacit, tacit-tacit.

The following model may depict the lifecycle of an alliance:

Social environment is shown with broken lines, as it is a very abstract and not well-understood part of the organization. There is no direct correlation between it and the final output- it's not a causal variable. However, it is a secondary one wherein it influences the structure of the organization. In addition to the other effectual/causal/primary variables it affects the performance. The motivations for alliance formation in the first place may include gathering knowledge and effective usage of it, creating knowledge, to further dyad linkages to larger networks, which might prove synergistic, and to block rivals.

Out of 45 respondents 42 said they were in some sort of alliance/collaboration with other firms. The nature of the alliance is shown in the following bar graph.

Marketing tie-ups enjoy such popularity because they are required across all KIFs ; and are more universal in their character. Joint ventures or sharing of information depends on the intensity of knowledge/technology within firms. They are firm sensitive. However, it is felt that sharing of information is an under utilized activity, even in firms that could complement each other's databases towards more effective usage.

## **BUILDING UP THE KIF: STRATEGIC DEVELOPMENT**

The following model represents the flow of knowledge inside a firm.

The model runs the risk of being simplistic, since prediction is difficult and coherence lacking.

## **DIVERSIFICATION**

Diversification poses varying challenges to product and service based KIFs. For product based firms it is a matter of managing the product line as well as the number of customers it serves. For service based clients and areas of expertise are the equivalent fields. Too many or too less both have their dangers. Minimizing the number of products or the topical foci would result in a liability to perform superbly in those fields or maintaining relations with

customers at all costs. Broadening the reach and scope would be at the expense of either losing credibility or increasing customer dissatisfaction, even with the long-standing ones.

The mood of Indian KIFs as to diversification was not the most enthusiastic one. Out of 45, 27 were thinking of diversifying. The timeline pie chart for N=27 is as follows:

Considering the kind of expertise we possess, this reluctance to diversify is indeed surprising. All the same considering that with competition all around, the one product may crash or the service might lose its value or punch. This has happened time and again with China joining the arena. Diversification should be an option to be followed proactively, not as a fall back. We can also see that all plans are in the future, perhaps with the opening up and the array of options to choose from, multiple product/services companies will become more of a characteristic of KIFs. As of now, it certainly doesn't seem so:

## ***EXPANSION***

Diversification usually entails expansion. Multinationality presents difficulties that a KIF cannot deal with in the standard industrial approach of hierarchy or controls. It has to inculcate ethics in autonomous teams and individuals and rely on them to meet performance standards. This would necessitate cultural homogeneity. Also, more and more clients desire tailored solutions as opposed to standard ones. Tailoring would require experts to act differently with a complete understanding of the background in which the solution is to be tried. Interaction requires the same degree of comprehension on the part of the expert. Hiring of native is a trend gaining ground because of these factors. In addition, it also lends a much-required global image to the firm.

Multinationality here also extends to expanding to a different city in a heterogeneous society like India. When expanding outside Indian firms are often reluctant to hire foreign experts because of the high fees involved. However, thinking in terms of the long term vision of the firm, such hiring should be encouraged. They would make the firm's expansion effective.

The final step of expansion is the graduation of a company from one level to the other. We asked the firms how many were interested in growing out of the SME sector. The response was average:

## **SCENARIO AT LARGE**

### ***WORRIES AND OBSTRUCTIONS***

The worries of competing and the obstructions of growth were both polled from the firms. These are the results we obtained:

### **MARKET COMPETITION (WORRYING FACTORS)**

Factor	1	2	3	4	5
Low margins	17	8	15	3	2
Competition from	6	4	19	14	2

contemporaries					
Delay in distribution/delivery	13	10	13	6	3
Changing technology	2	6	16	12	9
Lot size problem	22	7	11	4	1

## MEAN SCORES AND RANKING OF FACTORS

Factor	Mean Score	Ranking
Low margins	2.222	4
Competition from contemporaries	3.044	2
Delay in distribution/delivery	2.466	3
Changing technology	3.444	1
Lot size problem	2.000	5

Changing technology and competition from contemporaries are factors that hit at the strength of the KIF. Monopoly is the USP of this class, and any attempt to undermine it obviously causes worry. Producing goods in efficient quantities is not a major concern as production would be a fraction of the total overheads in such firms.

The obstructions faced as per growth were also tabulated. They are in the form of the bar graph below:

**LoTKH=** Lack of Technical Know How.

The capabilities or the technology is not what is stopping these firms from growing. Corruption, lack of government support are to blame. Also in the others; risks involved and opportunity cost as also lack of mature markets in India were primary reasons given.

We see the same trend when we investigated the reason for the small number of KIFs in India.

## FACTORS RESPONSIBLE FOR THE SMALL NUMBER OF KIFs IN INDIA

Factor	1	2	3	4	5
Brain drain	2	8	10	16	9
Government's passive approach	5	7	14	17	2
Poor infrastructure	3	10	8	16	8
Bureaucracy	1	13	14	13	4
Technical know how	9	14	15	2	5
Difference in compensation	7	4	7	13	14

## MEAN SCORES AND RANKING OF FACTORS

Factor	Mean Score	Ranking
Brain drain	3.488	2
Government's passive approach	3.088	5
Poor infrastructure	3.355	3
Bureaucracy	3.133	4
Technical know how	2.555	6
Difference in compensation	3.511	1

### **HELPFUL INITIATIVES:**

Initiatives that found favor with firms can be seen in the table below:

Initiative	1	2	3	4	5
Science Park	3	10	17	9	5
Increase in Incubators	14	6	16	7	2
Industrial Areas	5	11	15	12	2
Technology Corridors	2	3	15	22	2

## MEAN SCORES AND RANKING OF INITIATIVES

Initiative	Mean Score	Rank
Science Park	3.000	2
Increase in Incubators	2.488	4
Industrial Areas	2.888	3
Technology Corridors	3.355	1

Infrastructure as a problem is reflected here. Technology corridors are a viable solution. Collaboration with universities is not that much in favor.

### **AREAS OF FUTURE FOCUS**

Midnight 31<sup>st</sup> December 2004 is a date that has aroused much speculation in the Indian industry circles. That is the day when India is committed to switch to the product patent regime from the earlier process patent one. Government had deliberately kept pharmaceuticals out of the orbit of product patent; but the long-standing empathy finally had to give way. The implications too are well known. Reverse engineered patented products permitted under the process patent regime and sold in India and the unregulated markets would find a closed market as per the new regulations.

The situation also throws in opportunities and encourages strategies. With increasing sophistication, knowledge intensity for one would be a gainer. Friendly manufacturers, supplying drugs with the approval of the holder of the patent would increase and rebel ones manufacturing made copies of patented molecules dwindle. This would be because of higher margins, non-availability of developing markets post 2004 to rebel manufacturers going under the product patent regime, and India as a cheap destination of bulk drugs for US patented products that preferred Europe previously. New Chemical Entities (NCEs) are being manufactured by the SME sector in India on a contract basis from multinational firms. Also, Bottom Fishing, which involves small firms specializing in very few, at times just one, drugs to bring down the price of that product. They are the dominant manufacturers of these products, and monopoly as previously stated provides longevity and high profits. A marketing strategy is In Licensing where the imported drug has the label of the home country. Intricate marketing and manufacturing alliances need to be worked out. There are firms going into super specialization for the advantages of monopoly. Steroids is one such segment. Contract manufacturing has small firms working for the R&D of big ones on a contract basis. It combines the complex synthesis capabilities of Indian chemists and the high degree of compliance with manufacturing practices (cGMP).

Midnight 31<sup>st</sup> December 2004 would also see the expiration of the three decade old quota regime. This has produced effects that find their parallel in the pharma industry. Textile machinery has registered unprecedented sale, consultants are being hired to raise the quality standards, and worker productivity levels are being improved by training programs. A labor-intensive firm is fast veering towards a technology intensive one. At least parts of it already are in the technology-dominated zone. All this with the interest of the world in India as a cheap sourcing destination, and the high level of exports expected post 2004.

The auto parts sector in India is rated high in terms of Quality of Supply, Design Capability, and Maturity of the Industry compared to its Asian counterparts. It falls in terms of Government Regulations and Price Competitiveness. It is learning the tricks of the trade in Design and Development. R&D is the next step in evolution. The components industry is going global and export turnover ratio is in the high 30%<sup>s</sup> on average. With more government support the perception of making it big in this sector is not unfounded.

Nanotechnology is a specialization where India has the wherewithal in terms of know how. There just aren't companies that are exploiting this super specialization. Most of the firms using it in drug release or smart garments are the big ones, or their subsidiaries. Yet, some of the small industries have evinced interest in the field. With expertise as a primary requirement, and monopoly a guarantee this is a sector that has been left largely unexploited.

## **LAST THOUGHTS**

Rather than always looking for simplicities and generalizations, this study has teaches one to celebrate peculiarities. The insight into an expert's psyche as also the intricacies of strategies that leads anywhere from synergy to disaster is a study in contrasts in itself.

The knowledge era is to dawn in the developing nations in the next two decades. In light of that the unstinted growth of these firms requires government encouragement and support.

The future excitement of the three techs- info, bio and nano merging together will produce interesting permutations. We might just be seeing the tip of the iceberg.

## SUMMARY

In many less developed and low-income countries, a substantial proportion of the population lives in rural areas where poverty presents a real challenge. Rural inhabitants often migrate to towns and cities in search of improved livelihoods, but end up being unemployed due to low education and skills levels. This adds to a growing portion of peri-urban dwellers trying to sustain a livelihood with limited means and in turn this creates communities in distress who live in poverty and experience a low quality of life. It is widely acknowledged that entrepreneurship and small business development can play an important role in the economic growth and social development of such communities. This paper reports on some issues relating to entrepreneurship training and small business development in a disadvantaged rural community in South Africa. Action research methodologies are employed to investigate if the conventional business incubation concept can be adapted and applied within the context of a disadvantaged rural community in order to enhance the start-up of entrepreneurial SME's. The use of a "demonstration and training business incubator" (DTBI) is explained, describing how entrepreneurship- and business training is integrated with hands-on demonstrations and actual participation in a small business operation in incubation. Preliminary results indicate that the DTBI can be applied with success in a rural setting and contribute to SME start-up through increased learning, entrepreneurial capacity development and exposure to the profitable operation and management of a business in incubation.

**Keywords:** entrepreneurship, small business, incubator, action research, rural community

## INTRODUCTION

In South Africa, a large proportion of the rural and peri-urban inhabitants has a limited education, lives in poverty, and generally experiences a low quality of life (UNDP, 2003; May, 1998). Smallbone, North, Baldock & Ekanem (2002) state that poverty and low levels

of education present real barriers to development and should be addressed before the economy is to thrive. It is widely accepted and acknowledged that entrepreneurship and small business development plays an important role in economic growth and social development of countries across the world (Drucker, 1995; Gorman & Hanlon, 1997; Lalkaka, 1997; OECD, 1998; GEM, 2002). However, a study by Hübner (2000) on SME development in transition economies refers to aspects such as limited own resources, lack of market economy experience, limited possibilities to identify business opportunities and a general lack of understanding about modern business as barriers to entrepreneurship and SME development. In developing countries 37 % of existing entrepreneurs fall in the category of necessity entrepreneurs (GEM, 2002) and opportunities to progress beyond subsistence levels are remote, mainly due to limited education and entrepreneurial skills (Gibb, 1987; Rosa, Jayatilika & Kodithuwakku, 1997). Research shows however that entrepreneurship education and training can play an important role in enhancing the entrepreneurial propensity of individuals (Rabbior, 1990; Jack & Anderson, 1999; GEM, 2002).

This paper draws from experiences and results of a community outreach project in South Africa, jointly managed by an academic institution and a provincial government department. The purpose of the outreach project is to benefit communities in the greater Southern Cape area of South Africa by establishing and sustaining outreach programmes in the field of entrepreneurship education, rural SME development and technology transfer. Simultaneously, an attempt is made to develop the necessary institutional, staff and student capacities and capabilities of the academic institution in the field of community outreach.

The paper focuses specifically on the application of business incubation concepts in the context of a rural community. The background to the project is discussed first to provide some context, followed by a brief overview of the role of incubators in enterprise development. An explanation of the integrated demonstration and training business incubator (DTBI) and it's application in the rural context is provided, followed by preliminary findings and experiences based on action research methodology. The paper concludes with a critical reflection on the application of the DTBI.

## **Contextual background**

In South Africa, 45 % of the population lives in rural areas where education levels are generally low and poverty presents a real challenge; over 20 % of the total population have no formal education and almost half (48.5%) the population of South Africa is living below the current poverty line of R 354 (US\$ 50) per month (UNDP, 2003; May, 1998). Often, the only means of income is from government pensions and welfare payments. Many rural inhabitants migrate to towns and cities in search of improved livelihoods, but end up being unemployed due to low education and skills levels (GEM 2001; GEM 2002). This adds to the growing portion of peri-urban dwellers trying to sustain a livelihood with limited means. This in turn creates communities in distress, living in poverty, experiencing food insecurity and a low quality of life.

Agriculture forms a significant sector in the South African rural economy, and has the potential to contribute to reducing social and economic inequalities by increasing the income and employment opportunities of the poor, improve food security and aid the conservation of agricultural resources through sustainable resource use (Oosthuizen, 1998; Kydd, Dorward, Morrison & Cadisch, 2002; DFID, 2003).

The initial focus of the outreach programme is to provide educational courses for rural and peri-urban agricultural communities to encourage enterprise formation and enhance the entrepreneurial, business and marketing skills of existing agro-based entrepreneurs. In conjunction with the provincial Department of Agriculture of the Western Cape, the first community targeted for outreach was the land reform beneficiaries of the local Thembaletu agricultural community in the immediate vicinity of George. The main question was to determine an appropriate means to facilitate enterprise development and entrepreneurship education within the particular community context. As such, business incubation proved to be an option to investigate further.

## Business incubation systems

Business incubation systems are reported in various studies as being innovative instruments to support entrepreneurship development and enterprise creation (Smilor & Gill, 1986; Bearnse, 1993; Lalkaka, 1997; Erikson & Gjellan, 2003). Business incubation is generally regarded as a process of enterprise development where entrepreneurs with young enterprises are assisted and nurtured under controlled conditions to survive and grow during the vulnerable start-up phase (Smilor & Gill, 1986; Adkins, Sherman & Yost, 2001; NBIA, 2003). The main distinguishing characteristics of incubators include: providing managed work space for carefully selected start-up businesses, shared facilities, hands-on management assistance, an entrepreneurial learning environment, access to financing, exposure to business and technical support needs and access to mentors and investors (Bearnse, 1993; Lalkaka, 1997; Schuyler, 1997; Cassim, 2001; UKBI, 2003). The real benefits are flourishing businesses that stimulate economic activity, equity growth and employment growth across the entire supply chain network (Greenwood, 1996; Matlock, 1996). A secondary effect of the incubator is the catalytic role it plays in developing entrepreneurial competencies and experiences. Entrepreneurship experience is regarded by Hart, Stevenson and Dial (1995) as a unique knowledge asset, which can be employed in the start-up of a business venture just like other business assets.

Various types of incubators, each with specific characteristics, objectives, services and approaches exist in practice (Sherman & Chappel, 1998; Lalkaka, 1997; ANZABI, 2003). In a seven-country study, Lalkaka and Bishop (1996) identify eight types of incubators, each with various objectives. Cassim (2001) provides a typology of South African incubators, confirming varying objectives for different types of incubators. A summary of the generic objectives of incubators is given in Table 1.

**Table 1. Generic objectives of business incubators**

<i>primary objectives</i>	<i>secondary objectives</i>
venture creation and growth	empowerment
enhancing entrepreneurial culture	diversify economic base of a region
employment creation	utilize existing/vacant facilities
economic development	generate income for the incubator
innovation	create goodwill in the community
commercialization of technology	technology transfer
	institutional collaboration

*Source:* Adapted from Allen & McLuskey, 1990; Bearnse, 1993; Martin, 1997; Cassim, 2001

Although many of the above objectives are not easily quantifiable or measurable, the performance and impact of incubators can be assessed against their missions and objectives (Bearnse, 1993; Lalkaka, 1997; Cassim 2001).

Lalkaka (1997) observes an increasing need for tailoring incubation programmes for specific needs and opportunities, blending advanced technologies with traditional processes to cater for early-stage entrepreneurs in rural settings. Although business incubation is widely accepted as a means to facilitate enterprise formation and entrepreneurship development, it is however not clear to what extent it can be applied in the particular context of a disadvantaged rural community and whether it will have the desired effect. In addition to incubation being a largely unknown concept in general, rural communities have unique characteristics, including poverty, a lack of infrastructure, low education, subsistence entrepreneurs, etc. This leads to the following research question:

**RQ 1:** *Can conventional business incubation systems be adapted and successfully applied within the context of a disadvantaged rural community?*

## RESEARCH METHODOLOGY AND DESIGN

The study was designed to investigate two issues: firstly, whether a conventional business incubation system can be *adapted* to fit the rural context, and secondly, to determine if such an adapted incubator can be successfully *applied* in a rural setting.

The study was conducted at a site currently occupied by a Trust of thirty indigenous smallholder farmers. A vacant outbuilding has been used as a demonstration and training business incubator (DTBI) facility. The DTBI was designed as follows: a small broiler rearing operation of 200 chickens was established as a business in incubation. Five people from the community were able to “buy” into the business as “trainee entrepreneurs” by each paying R 120 (US\$ 17). This entitled them to own 40 broiler chickens each in this operation and allowed them to participate in a training programme. The academic institution provided seed money in the form of an interest-free loan to the business, to be paid back at the end of each rearing cycle of eight weeks. The trainee entrepreneurs managed the operation as a team. At the end of the rearing cycle, each entrepreneur was to sell their birds and pay back their portion of the loan (the actual costs incurred, minus the initial fee of R 120). Entrepreneurs had the option of retaining their profits or to utilize it for re-investing in a new cycle. A maximum of five cycles (8 weeks each) is allowed before the entrepreneur should graduate from the incubator. During each cycle, hands-on demonstration and training took place. The main focus was on business and entrepreneurship training, practically simulating the whole business process in each cycle (from start-up when the day-old chickens are ordered, the day-to-day management of the operation, the marketing of the mature birds, assessing the profitability of the venture and finally, at the end of each 8-week cycle the “liquidation” of the operation when the seed money is to be repaid).

To address the question as to whether a business incubation system can be *adapted* to the rural context, an assessment was made of the extent to which the DTBI matched the characteristics and requirements of conventional incubators. To determine the successful *application* of the incubator concept in a rural setting, an assessment was made on three levels: firstly at the level of the incubator, determining the extent to which the DTBI satisfies the generic objectives of conventional incubator systems; secondly, at the level of the business in incubation, to assess the financial viability of the broiler operation; thirdly, at the level of the participants, to evaluate the entrepreneurial learning of the entrepreneurs.

The DTBI started with the broiler rearing operation in February 2003. To allow for community participation and flexibility in learning from the experiences as the project developed, action research methodologies were applied. Data collection was based on recording information extracted from informal discussions with community members, physical observation and the experiences and perceptions of the researchers during the project.

Dick (2000) describes action research as employing a family of research methodologies, having the dual aim of action and research: action is to bring about change in some situation; research is to increase the understanding of the researcher or the client. The two concepts work in unity in that action informs understanding and understanding assists in action. Action research involves a cyclic approach to investigation, starting with planning, followed by action, observation and then reflection or critically reviewing the results for input in the next cycle (Kemmis & McTaggart, 1988). Due to the cyclic nature and responsiveness of action research, it is often difficult to determine beforehand where an intervention will end and therefore precise research questions at the beginning of the project may be restrictive to the research. Action research therefore tends to be more qualitative in nature (Dick, 2000). The responsiveness of action research allows it to be used to develop new hypotheses as the research progresses, capitalizing on the understanding developed in earlier stages. Early cycles of investigation are used to decide how to conduct later cycles. In later cycles, the results or interpretations of early cycles can be challenged, tested or refined. Action research methodology is regarded as particularly suitable for investigative research and lends itself to be used in community settings (Smallbone *et al.*).

## RESULTS AND DISCUSSION

Four 8-week cycles of broiler rearing have been completed in the DTBI. To assess if the business incubation system can be *adapted* to the rural context, the DTBI characteristics have been compared with those of conventional incubators. The extent to which the DTBI conformed to the characteristics of conventional incubators is presented in Table 2.

**Table 2. Extent to which the DTBI fit the distinguishing characteristics of conventional incubators**

Characteristics of conventional incubators	DTBI characteristics	Fit
<b>1. Provides managed work space and shared facilities</b>	1. A shared and managed work space is facilitated within easy reach of the community	+
<b>2. Start-up businesses are carefully selected</b>	2. Entrepreneurs not selected ; incubator prescribes type of business (broiler)	-
<b>3. Hands-on management assistance</b>	3. Management assistance is provided by academic institution and extension officer	+
<b>4. Entrepreneurial learning environment</b>	4. An environment conducive to experimentation is maintained; mistakes are allowed; training in entrepreneurship is provided	+
<b>5. Access to financing</b>	5. Seed money is provided for each cycle; no other access to financing is provided	+
<b>6. Exposure to business and technical support needs</b>	6. Business and technical support is given throughout each cycle by academic institution and extension officer of government Department of Agriculture	+
<b>7. Access to mentors</b>	7. Academic institution and extension officer initially	+

8. Access to investors	provide mentorship 8. No access to investors provided	-
------------------------	--	---

- + DTBI characteristics fit requirements/characteristics of conventional incubator to a higher degree
- DTBI characteristics fit requirements/characteristics of conventional incubator to a lesser degree

With the exception of two characteristics, the DTBI fits the majority of the requirements and characteristics of conventional incubators. One of the most important characteristics of the incubator system, the careful selection of start-up businesses (and entrepreneurs), has not been practiced by the DTBI. The DTBI provides access to any individual or group, even without a business idea. The reason is that, in the early stage of the project, more emphasis is placed on the *training and development* of a *potential* entrepreneur, rather than on the *existing* entrepreneur's *business development*. At a later stage, when entrepreneurs have graduated from the incubator and have started a business, the focus could be broadened.

The other characteristic not present in the DTBI is the provision of access to investors. This is again due to the focus of the DTBI on training and development rather than on the start-up business itself. However, indirectly, the DTBI may enhance the potential of the entrepreneur to attract investment. With increased entrepreneurial and business management skills, the potential entrepreneur graduating from the incubator may have a better chance for obtaining financing, either through the traditional means of obtaining loan capital, or attracting venture capital.

The DTBI therefore seems to be appropriately adapted and suitable as a means to facilitate enterprise formation and entrepreneurship development in a rural setting.

To determine the extent to which the *application* of the incubator concept in a rural setting was successful, an assessment was first made at the level of the incubator, comparing the outcomes achieved by the DTBI against generic objectives of conventional incubator systems (Table 3). It is interesting to note that almost all the secondary objectives of conventional incubators are already met by the DTBI in this early stage, while very few of the primary objectives are met. It might be that the primary objectives are more long term in nature (venture creation, economic development, technology commercialization, etc.) and it is too early to expect the primary objectives to be achieved. The achievement of secondary objectives over a relatively short time span is significant, especially when considering the nature of these secondary objectives with regard to community development. Most of these secondary objectives seem to be necessary prerequisites for providing a solid base from which to operate when engaging in the socio-economic development of a region (*viz.* community goodwill, institutional collaboration, utilization of existing/vacant infrastructure, empowerment, diversification of the economic base, etc.). The application of the DTBI in the current context seems to be a possible way to contribute to the development of entrepreneurial capacity in individuals. Only when assessed over a longer time period, the DTBI will reveal its potential value to contribute to the primary objectives of enhancing enterprise formation, employment creation and economic development in disadvantaged rural communities.

The second level on which the application of the DTBI in the rural context can be evaluated is to assess the financial viability of the business in incubation. Table 4 depicts some basic economic and financial results of the broiler rearing operation over the four cycles.

**Table 3. Extent to which observed DTBI outcomes fit the generic objectives of conventional incubators**

Generic objectives of conventional incubators	Observed DTBI outcomes	Fit
<i>primary objectives</i>		
<b>1. venture creation and growth</b>	1. no outcome observed yet	0
<b>2. enhancing entrepreneurial culture</b>	2. trainees display increased self-confidence, increased awareness of opportunities, creative adaptation of production, marketing and financial processes, etc.	+
<b>3. employment creation</b>	3. limited use of community members or family members in the marketing process	+
<b>4. economic development</b>	4. no outcome observed yet	0
<b>5. innovation</b>	5. no outcome observed yet	0
<b>6. technology commercialization</b>	6. no outcome observed yet	0
<i>secondary objectives</i>		
<b>1. empowerment</b>	1. increased self-confidence, financial gain, training in business knowledge and skills etc.	+
<b>2. diversify economic base</b>	2. introduction of broiler production in area diversify traditional farming as well as retailing	+
<b>3. utilize existing facilities</b>	3. utilize vacant infrastructure	0
<b>4. generate incubator income</b>	4. no outcome yet	+
<b>5. create goodwill in the community</b>	5. goodwill was definitely created between community and academic institution	+

0 no outcome yet

Table 4 indicates that there is a positive trend in the majority of the variables measured, indicating efficiency in the performance of the business in incubation. Although sales figures moved sideways in the second cycle (due to mortalities), net income as well as the margin per bird sold increased sharply towards the third cycle. The slight decline in margin in the fourth cycle is normal as feed consumption and costs increase during winter months (June – August). Costs decreased gradually, mainly due to decreased feed costs, which was in large the result of birds being marketed at a younger age. The sharp decline in transport costs from cycle 1 was a direct effect of increased management capabilities and business understanding. The percentage cash inflow exhibits a sharp increase from the first to the second cycle. This was due to adjustments to the debtor policy and the marketing strategy induced by learning derived from the initial production cycles.

**Table 4. Selected economic and financial results of the broiler rearing operation**

Item	Cycle 1		Cycle 2		Cycle 3		Cycle 4	
	Value ZAR	Value *US \$						
Sales	R 5 218	\$ 745	R 4 059	\$ 580	R 5 885	\$ 841	R 6 265	\$ 895
Total cost	R 4 766	\$ 681	R 3 792	\$ 542	R 3 324	\$ 475	R 4 092	\$ 585
Net income	R 452	<b>\$ 65</b>	R 267	<b>\$ 38</b>	R 2 561	<b>\$ 366</b>	R 2 173	<b>\$ 310</b>
Cost per bird sold	R 25.22	\$ 3.60	R 27.48	\$ 3.93	R 18.67	\$ 2.67	R 22.24	\$ 3.18
Margin per bird	R 2.39	<b>\$ 0.34</b>	R 1.93	<b>\$ 0.28</b>	R 14.39	<b>\$ 2.06</b>	R 11.81	<b>\$ 1.69</b>

<b>Selected costs:</b>								
- Feed cost	R 3 492	\$ 499	R 2 969	\$ 424	R 2 531	\$ 362	R 3 055	\$ 436
- Transport	R 465	\$ 66	R 80	\$ 11	R 40	\$ 6	R 80	\$ 11
Age at sale (weeks)	9		7		6		6.5	
Birds sold:	189		138		178		184	
- live birds	136		44		0		10	
- slaughter	53		94		178		174	
Feed consumption (kg)	1300		1100		1000		1200	
Cash inflow	R 2 929	\$ 418	R 3 630	\$ 519	R 3 220	\$ 219	R 1 605	\$ 229
Cash flow %	61.46%		95.73%		46.03 %		39.22 %	

\* Exchange rate (R/\$) = R 7. 00

However, from the second cycle onwards, a steady decrease in cash flow was experienced. This trend resembles a pattern characteristic of the dynamics often encountered in rural disadvantaged communities and revolves *inter alia* around issues such as community purchasing power, buyer behavior and migration of poor people. Food is often purchased with the promise to pay at a later stage when (if) money becomes available. If money is not available, the payment period is merely extended. In some cases people might migrate from the area in search of a better livelihood, before it becomes possible to settle outstanding debts. The combined effect usually results in cash deficiencies for such an enterprise, affecting further growth and expansion of the venture.

When assessing the financial viability of the broiler rearing operation, the early indication is that it is possible to incubate a business successfully within the DTBI milieu. The business showed economic viability and the capacity to generate profits. However, if cash flow and debtors are not managed properly, the business may eventually have to consider closing down.

A third level on which the successful application of the DTBI in the rural context can be measured is to assess the learning of the trainee entrepreneurs. From Table 4 it is evident that performance of the operation increased progressively, indicating positive learning curve effects. Five key incidents observed from the actions of the trainee entrepreneurs are indicative of entrepreneurial learning that has taken place:

- *incident 1:* from an interpretation of cost and profit figures, the production cycle was shortened to 7 weeks in the second cycle and 6 weeks in the next; the recording of production and sales data was initiated for improved management decision making.
- *incident 2:* changing the transport contractor and utilizing freight capacity optimally by ordering more feed units less frequently led to decreased transport cost
- *incident 3:* proportionately less live birds and more slaughtered birds (some cooked) were sold, thereby adding value to the primary product
- *incident 4:* the production cycle was synchronized with pension and welfare payouts in the community in order to have marketable birds ready when customers

had money available, thereby securing a larger target market, and simultaneously reducing potential debtors

- *incident 5:* one entrepreneur initiated the replication of the DTBI at another site in another community, realizing the potential contribution towards reduction of poverty in the community

When assessing the few critical incidents reported above, quite a number of entrepreneurial-like attitudes and behaviors are recognized, such as opportunity recognition, initiative, creativity, ability to adapt and change, intimate knowledge of customer needs, value creation, coping with ambiguity / uncertainty (Timmons, 1999; Hornaday, in Kuratko & Hodgetts, 1995; Carland, Hoy, Boulton & Carland, 1984) and much more. Through demonstration, training and hands-on participation in a supported learning environment, participants were able to develop entrepreneurial capacity and a range of entrepreneurial skills, all necessary pre-requisites for enhancing the start-up of entrepreneurial SME's.

## Critical reflection

An assessment of the DTBI as a means to facilitate enterprise formation and entrepreneurial development shows positive outcomes. The DTBI is different from conventional incubators in some important ways. It focuses more on entrepreneurship capacity development of teams of potential entrepreneurs rather than on existing entrepreneurs and their own start-up ventures.

The broiler rearing venture was found to be particularly suited for the purpose of learning about entrepreneurial business ventures whilst in incubation. A few of the characteristics are highlighted below:

- The complete venture cycle and business process, from start-up to harvest, are simulated over each of the broiler rearing cycles of 8 weeks.
- In repeating the cycle several times (5 cycles allowed before graduation), it allows for adequate practical exposure and experiential learning about the intricacies of business processes.
- Because broiler rearing is a risky business, it allows for first-hand experience about business- and financial risk and the effects of these on business survival.
- By inviting five trainee entrepreneurs to participate in each cycle, team work and mutual accountability for the successful operation of each cycle was assumed.
- The number of broilers raised per cycle, (200 +), are too many to consume individually and consequently, encouraged (forced) the entrepreneurs to sell commercially. It provided cash flow for the entrepreneur and an excellent source of protein for the community.
- The broiler rearing operation also served as an example of successful technology transfer, where the possibilities of combining traditional rural systems with high-tech genetics and feed technology were demonstrated practically.

Some of the problems and difficulties experienced in the process that would serve as valuable inputs for future phases of the project include:

- The objectives of the project were not clearly communicated to the community by the academic institution, resulting in beneficiaries of the project not being clearly identified and informed
- Ownership of the project was not clearly defined, resulting in some confusion about responsibilities after the DTBI had been introduced at the particular venue
- Some deep-rooted differences and historic conflicts within the community on issues relating to the access and use of the particular venue; this resulted in much less trainee entrepreneurs participating in the DTBI than initially indicated.

However, the DTBI concept provides a good basis for demonstration and training of the main topics and issues associated with normal business. It differs from other modes of training in that entrepreneurs are motivated to learn, because they actually learn about what they experience and experience what they learn about. They can easily relate to the training content because it becomes a part of their frame of reference.

For the academic institution, the following learning experiences can be documented:

- establish trust and get buy-in from the local leadership as well as from those influencing the local leaders; informal leaders operating in the background often have more influence and power than formal leaders in the community; appreciate and respect the community dynamics
- start small and develop slowly and step-wise; involve other potential partners and collaborators only gradually to avoid the perception of a “hostile take-over”
- the responsibility for the management of projects should not remain with the academic institution, but rather be developed, mentored and transferred to the community
- lay the foundations first; basic life-skills and social empowerment are as important as economic empowerment
- it is vital for the academic institution to be in a position (financially and otherwise) to commit resources and provide tangible support over a meaningful time period otherwise community outreach becomes “window dressing”, resulting in more harm than good.

The limitations in the study are apparent. The DTBI was introduced in the community as a single project, applied at a single location, with an assessment largely based on observations of the researchers over a relatively short time span of four completed cycles. Although the findings are encouraging, evaluations made over longer time periods need to be undertaken, possibly employing statistical analyses where appropriate. In line with action research practices and principles, the observations and results of this study can be used to structure follow-up phases of the project or aid in replicating this project at other venues in other communities. Without any attempt to assess the significance of the DTBI outcomes statistically, the learning experiences are perhaps the most important outcomes of the project.

## **CONCLUSION**

It is clear from the above results that conventional business incubation concepts can be appropriately tailored and successfully applied within a disadvantaged community context. The secondary objectives of incubators are met at an early stage, while few of the primary

objectives are met. In the particular community context this may suggest that until the secondary objectives are met, the primary objectives may never be properly realized.

The financial viability of the broiler rearing operation indicates that it is possible to incubate a business successfully within the DTBI milieu. The business showed economic viability and the capacity to generate profits. The focus of the DTBI on income generation through the production of a food commodity had dual positive effects on household food security: the product could be used to increase household food security directly through increased household consumption or indirectly through the income generated through sales.

The action research methodology proved to be useful and contributed to enhanced learning and change at both the community and institutional levels. Trainee entrepreneurs were able to develop a range of entrepreneurial skills in a supported learning environment. It is anticipated that the participants that ultimately graduate from the DTBI will possess the entrepreneurial skills and experience required for the start-up and operation of a commercially oriented SME.

The experience gained from the DTBI was invaluable from an institutional point of view. The capacity and experience to provide education, training and mentorship to non-traditional target groups was increased, together with a realization of the importance of adopting a more central position in the provision of education and training for the economic and social development of the region it serves.

## **ABSTRACT**

For some time now, women have been starting businesses at a rate more than twice that of men. Globally, women-owned businesses constitute between a quarter and a third of all businesses. While little empirical research has addressed women-owned businesses, even fewer studies have addressed women-owned businesses in Africa. Using the resource-based theory, this study reports the correlates of the performance of ventures owned by Ghanaian women. More specifically, the study focuses on the strategic, firm-level factors related to business performance. We hypothesise that performance of women-owned businesses is affected by strategic planning, the resources of the business, the skill and previous experience of the owner.

The data for this study were collected in Ghana from June to August 2003. Subjects for the study were randomly selected from databases held by a quasi government organization and two women's business organizations. The data were collected by eleven University of Ghana and nine Cape Coast University students after a one day orientation facilitated by the first author. During the first half of the day, interviewing skills and the duties of the students as interviewers were discussed, and during the second half of the day, students were familiarized with the questionnaire. Before starting the actual data collection, the students under the supervision of the first author, interviewed a sample of thirty female respondents. Face to face interviews were used to collect the data because the other means of data collection by mail and telephone were found to be less effective in Ghana. The postal system in Ghana is slow and unreliable, while the telephone system is erratic and therefore not dependable. Strategic planning was measured by asking respondents to indicate how far ahead they planned certain business activities ranging from 1 = less than three months to 5 = more than two years. Ventures resources were measured by asking respondents to rate eleven items related to different resources of the firm on a 5-point Likert scale, ranging from 1=weak to 5= strong. The items were then factor analysed.

Experience was measured dichotomously where 1=yes and 2=no. Business owner's skills were measured on a 5-point Likert scale, ranging from 1=weak to 5=excellent. Factor analysis was carried out on the responses. Business performance was measured by means of sales, number of employees, and profitability. Examination of the relationship between the selected strategic capabilities and performance utilized factor analysis, one-way analysis of variance, cross tabulations and Pearson correlations. Finally, in order to examine the relationships among all the variables, we executed multiple regressions for each of the performance variables. Findings from the study and implications deriving from the findings are discussed.

## **INTRODUCTION**

For some time now, women have been starting businesses at a rate more than twice that of men (GEM, 2003; Dollinger, 1999). According to Moore (1999), globally, women-owned businesses make up between a quarter and a third of all businesses. Notwithstanding the growth in women-owned businesses, researchers (Baker et al., 1997; Holmquist and Sundin, 1996) have decried the paucity of empirical research addressing female business owners. Studies that have focused on the correlates of the performance of firms owned by women have been few (Lerner et al 1997). In particular, there is a dearth of research on the relationship between strategy and performance of women-owned businesses (Lerner and Almor, 2002). In a recent study, Moore (1999) identified areas of female entrepreneurship research, however, strategic aspects of women-owned businesses were missing. While little empirical research has addressed women-owned businesses, even fewer studies have addressed women-owned businesses in Africa. This study addresses this neglected area of female entrepreneurship research. Using resource-based theory, the study focuses on the strategic, firm-level factors related to the performance of female Ghanaian businesses.

## **RESOURCE BASED THEORY**

The resource-based perspective argues that sustained competitive advantage is generated by the unique bundle of resources at the core of the firm (Conner and Prahalad, 1996; Barney 1991). In other words, the resource-based view describes how business owners build their businesses from the resources and capabilities that they currently possess or can acquire (Dollinger, 1999). The term "resources" was conceived broadly as "anything that can be thought of as a strength or a weakness" of the firm (Wernerfelt, 1984:172). The theory addresses the central issue of how superior performance can be attained relative to other firms in the same market and posits that superior performance results from acquiring and exploiting unique resources of the firm.

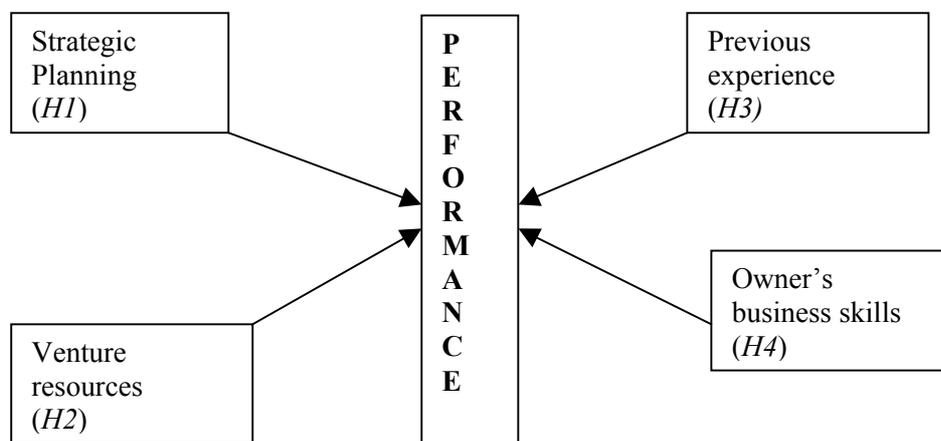

Implicit in the resource-based perspective is the centrality of the venture's capabilities in explaining the firm's performance. Resources have been found to be important antecedents to products and ultimately to performance (Wernerfelt, 1984). According to resource-based theorists, firms can achieve sustainable competitive advantage from such resources as strategic planning (Michalisin et al 1997; Powell 1992) management skills (Castanis and Helft 1991), tacit knowledge (Polanyi, 1962, 1966), capital, employment of skilled personnel (Wernerfelt, 1984) among others. Resource based theorists ( eg. Barney 1991; Grant 1991; and Peteraf 1993) contend that the assets and resources

owned by companies may explain the differences in performance. Resources may be tangible or intangible and are harnessed into strengths and weaknesses by companies and in so doing lead to competitive advantage. The resource-based theory continues to be refined and empirically tested (Bharadwaj, 2000; Hadjimanolis, 2000; Medcof, 2000). Given that the resource-based view addresses the resources and capabilities of the firm as an underlying factor of performance, it was found to be a suitable theory to use in this study.

### **Theoretical framework**

Figure 1 presents the theoretical framework for this study. Following the resource-based perspective, we hypothesise that strategic planning, the resources of the business, the skill as well as the previous experience of the owner influence the performance of Ghanaian women-owned businesses.

**Figure 1 Resource-based perspective of women owned venture performance**

### **Strategic planning and performance**

Research has shown an association between planning in small businesses and performance. The literature suggests that planning is a good management practice, and may be beneficial to business (Gibson et al 2002; Schwenk and Shrader, 1993). According to Berman, Gordon and Sussman (1997:14) “firms that plan produce better financial results than firms that do not plan”. Bracker et al (1986; 1988) found that firms that undertook strategic planning performed better financially. Lerner and Almor (2002) contend that planning lays the groundwork for developing the strategic capabilities needed for high performance.

Strategic planning has been studied by various scholars including (Mintzberg, 1973, 1994; Brush and Bird, 1996; Bracker and Pearson, 1986; Braker, Keats and Pearson, 1988 ). The findings can be summarised as follows: there is a positive relationship between strategic planning and firm performance. According to Miles and Snow (1978), successful, proactive firms have the propensity to invest time in strategic planning. On the contrary, unsuccessful, reactive firms do not invest time in strategic planning, rather they fight fires. Rue and Ibrahim’s study involving 253 US small firms found that there was a link between planning sophistication and growth in sales. A recent study of 168 manufacturing SMES s in Sri Lanka found that planning and control sophistication led to increased sales (Wijewardena et al 2004). Their study concluded that the greater the sophistication in

planning the greater the sales. A study of 297 Ghanaian entrepreneurs found a significant gender difference in the planning sophistication of small firms in Ghana (Yussuf and Saffu, *forthcoming*). Firms owned or managed by males had more sophisticated planning compared to female owned or managed businesses. Research shows that women put less stress on long-range, formalised strategic planning (Brush and Bird, 1996). Implicitly, women-owned ventures that put less emphasis on strategic planning will have low performance. From the foregoing, we hypothesise thus:

*H1: Strategic planning by Ghanaian women business owners is positively related to the performance of their ventures.*

### ***Venture capabilities and performance***

According to the resource-based perspective, venture resources in the form of capabilities, assets, and skills provide competitive advantage and underpin the organisation's performance (Barney 1991; Grant 1991; and Peteraf 1993). In other words, resource-based theory hinges on the resources and capabilities of the firm as an underlying factor of performance. Findings from Chandler and Hank's (1994) study of small manufacturing businesses demonstrate the link between the availability of resource-based capabilities and venture performance. An abundance of capabilities in the firm ensures survival, rapid growth and profitability (Chandler and Hanks, 1994). The centrality of the business owner in the operation of the firm cannot be overemphasised (Lerner and Haber, 2000). To the extent that the business owner makes all the important decisions, his/her skills become a critical asset on which the success of the firm depends. Implicitly, when the skill set is stronger, the performance of the business will be higher (Lerner and Almor, 2002). From the foregoing, we hypothesise:

*H2: Strong venture resources are positively related to venture performance.*

### ***Previous experience and performance***

There is recognition in the entrepreneurship literature of the significance of the contribution of entrepreneurial experience to venture performance (Ronstadt, 1988). Vesper (1980) contends that prior entrepreneurial experience can lead to success. Similarly, specific experience in similar businesses ensures survival and growth (Cooper, Gimeno-Gascon and Woo, 1994; Chandler and Hanks, 1994). A large proportion of women entrepreneurs lack prior entrepreneurial experience (Bowen and Hisrich, 1986). Fischer, Reuber and Dyke (1993) found that female business owners who had opened their business had less experience in similar industries, in management, and in opening and managing the businesses they were in. Based on the resource-based theory, it is plausible to argue that previous entrepreneurial experience is a resource that women bring to the firm. The findings lead to the following hypothesis:

*H3: Previous entrepreneurial experience of Ghanaian female business owners is positively related to venture performance.*

### ***Business owner's skills and performance***

Research shows that an entrepreneur's management skills contribute to venture performance and growth (Lerner and Almor, 2002; Bird, 1995; Cooper and Gimeno-Gascon, 1994). The propensity of the entrepreneur to employ and apply a variety of skills has been recognised (Hunger and Wheelen, 1996). According to Hood and Young (1993),

some of the important skills of successful entrepreneurs include accounting, marketing, sales and financial management. However, women business owners often rate themselves lower than men in financial skills (Brush 1992). Hisrich and Brush (1984) found that US women entrepreneurs scored themselves high on generating ideas, product innovation and dealing with people, average on marketing and operations, and weak on financial skills. From the foregoing, we hypothesise that:

*H4: Managerial skills of Ghanaian female business owners are positively related to venture performance.*

## **METHODOLOGY**

### ***Data collection***

The data for this study were collected in Ghana from June to August 2003. Participants for this were randomly selected from databases held by a quasi government organization and two women's business associations/organizations. One hundred and eighty female entrepreneurs were selected but 171 were used in the analysis. The sample however varies as some respondents with missing data were omitted in some analysis.

The data were collected by using a questionnaire originally developed by Hisrich and Brush (1985) and adapted for use in Israel by Lerner and Almor (2002). Eleven students from the University of Ghana and nine students from Cape Coast University were hired as interviewers. They were initially trained at a one-day orientation facilitated by the first author. During the first half of the day, interviewing skills and the duties of the students as interviewers were discussed, while in the course of the second half of the day, students were familiarized with the questionnaire. The questionnaire was pilot-tested on a sample of twenty female respondents who were not included in the final sample. Following the advice of the second author, face to face interview was employed in the data collection because the other means of data collection such as mail and telephone survey were found to be less effective in Ghana. The postal system in Ghana is slow and unreliable, while the telephone system is erratic and therefore not dependable

### ***The research variables***

Independent variables in the study included strategic planning, venture resources, previous experience and business skills.

To measure strategic planning, we used a nine-item scale and for each item, we asked respondents about how far ahead they planned certain business activities ranging from 1 = less than three months to 5 = more than two years. We computed an index by summing up all the items on the scale. Reliability analysis showed an alpha of .78. Multiple regression analysis was conducted using the nine item-scale as the predictors.

Venture resources were measured using a eleven item scale by asking respondents to rate eleven items related to different resources of the firm on a 5-point Likert scale, ranging from 1=weak to 5= strong. Pearson correlation analysis/multiple regression was conducted to test the hypothesis between venture capabilities and performance. The items were then factor analysed leading to three factors.

We measured the business owner's skills on a 5-point Likert scale, ranging from 1=weak to 5=excellent. Multiple regression, correlation analysis and factor analysis were carried out on the responses. Reliability analysis was alpha of .75.

Previous experience - entrepreneurial and family- was measured by asking a dichotomous question where 1=yes and 2=no. A univariate ANOVA and chi-square test were carried out on two independent variables.

### ***Dependent variables***

Dependent variables in this study were number of employees, sales and profitability. These performance measures have been used in prior studies (Lerner and Almor, 2000, 2002; Brush, 1984). Size was measured by the number of employees in the firm, consistent with prior practices in the small business literature (Lerner and Almor, 2000, 2002). Number of employees was an open question. Sales were divided into 5 categories and respondents were asked to indicate their gross turnover for the previous year by checking the range closest to their total revenue. Profitability was measured using an ordinal scale where 1=a profit, 2=neither profit or loss and 3=a loss.

### **Descriptive statistics**

#### Type of business

An overwhelming majority of the firms 75 percent were in the service industry, 19 percent were in retailing and the rest 6 percent were in manufacturing.

#### Firm age and size

The firms in the sample were small in size, with a mean of 11.65 full time employees. 11 percent employed less than five employees; 40 percent employed between five and fifty employees; 10 percent employed between 51 and a hundred people while 39 percent employed more than a hundred employees. The average age of the businesses was 12.08 years with minimum of 2 years and a maximum of 38 years.

#### Ownership

Almost 74% of the businesses were sole proprietorships while 12.9 % were limited liability businesses. These contrast with 2.3% and 1.8% for joint venture and other means of ownership respectively.

#### Location

Of the sample, 32 percent of the businesses were located in the business owner's home, 23 percent were in the businesses' own premises while 42 percent were located in rented premises.

#### Education of business owner

13 percent of the female business owners had nine years of schooling, 20 percent had secondary education and 67 percent had post-secondary education.

## Owner's experience

19 percent had previous entrepreneurial experience; 66 percent had previous experience in the same industrial sector; and 57 percent had a family member who owned a business.

## RESULTS

### *Strategic planning and performance*

We tested the hypothesis that strategic planning was a predictor of performance (*H1*) by conducting a multiple regression using a nine-item scale as predictors. Size was denoted by number of employees, as the dependent measure for performance. The items in the scale were measured on a five-point scale ranging from 1= planning less than 3 month to 5=planning for more than two years. The respondents were required to indicate how far ahead they planned along this dimension. Table 1 presents the findings of the hypothesised relationship between strategic planing and performance. Although the overall model was not significant thereby not fully supporting the hypothesis, one item in the scale was a significant predictor. Planning ahead for new products was more likely to lead to a higher number of full time employees.

**Table 1 Multiple regression of strategic planning on performance**

	Standardized	t	Sig.
	Coefficients		
	Beta		
Reputation	.092	.873	.384
Cash flows	-.112	-1.033	.303
New products	.295	2.779	.006
Expenditures	.012	.121	.904
Entry into new markets	.071	.717	.475
Planning sales	.108	1.143	.255
Add or drop products	-.020	-.173	.863
Hiring and other staff decisions	-.061	-.651	.516
Expansion of firm's operations	-.185	-1.900	.059

$R^2 = .112$   $F(9, 137) = 1.93$   $p = .053$

### *Venture resources and performance*

Although the main outcome variable used for the multiple regression was the number of full time employees, sales outcome and number of part time employees were also used examined in a correlation analysis. The results for both analyses are presented in Tables 2. Pearson correlations between the predictor (venture resources) and volume of sales

and number of employees (both full time and part time) indicated that efficiency and quality of product were positively related to the volume of sales. Cost control was negatively related to number of employees (part time).

**Table 2. Predicting performance from venture resources.**

Multiple regression predicting performance	Correlation between venture resource and outcome variables.				
	Beta	t	Sales Volume	Number of current employees (Full time)	Number of current employees (Part-time)
Financial resources	.070	.755	.109	.063	-.109
Marketing/sales	-.278	-2.910*	.094	-.149	.102
Geographical location	.161	1.824	.142	.099	-.324*
Equipment	.043	.384	.011	.065	.065
Human resource	.021	.183	.117	.076	-.027
Overall management	.082	.790	.052	.029	.124
Efficiency	-.086	-.666	.174*	.029	-.069
Cost control	.002	.017	.072	-.059	.033
Quality of product	.150	1.321	.165*	.041	-.044
Innovation	.158	1.462	.027	.105	-.063
Customer service	-.297	-2.919*	.072	-.113	-.143

$R^2 = .121$   $F(11, 144) = 1.809$ ,  $p = .057$

\*  $p < .05$ .

Multiple regression was conducted to test the hypothesis that entrepreneurs who considered venture resources as strong were likely to have a higher performance as measured by the number of full time employees. Again, the overall model did not support the hypothesis. Two predictor items, marketing/sales and customer service from the composite were significant. The coefficients however were negative implying that respondents who rated these venture resources as important resource to their firms were likely to have fewer number of full time employees.

As shown in Table 3, principal component factor analysis with varimax rotation yielded three factors. Human resource, overall management, equipment, efficiency and control, called GENMGT, loaded on the first factor. Customer service, quality of product and innovation, labelled NICHE loaded on the second factor. Geographical location, financial resources, and marketing/sales, LOFMA, loaded on the third factor. This contrasts sharply with findings of Lerner and Almor (2002), which showed two factors. The loadings in the factor matrix were high ranging from .55 to .82.

**Table 3. Factor Analysis for Venture Resources (Rotated)**

	Factor		
	1	2	3
Human resource	.819		
Equipment	.786		
Overall management	.667		
Efficiency	.647		
Cost control	.519		
Customer service		.819	
Quality of product		.793	
Innovation		.557	
Geographical location			.788
Financial resources			.722
Marketing/sales			.647

*Previous experience*

To examine the relationship between previous experience and performance, a univariate analysis of variance and chi-square test were conducted on two dependent variables namely, number of full time employees, and volume of sales measured on a three-point categorical scale (low growth, medium growth, and high growth). This was assessed based on volume of sales from the previous financial year. Table 4 presents the results of the relationship between number of employees and entrepreneurial and family experience. Neither the ANOVA nor the chi square analysis showed significant results. H3 was not supported.

**Table 4 Relationship between entrepreneurial experience and family experience and performance**

Variables	Sum of Squares	df	Mean Square	F	Sig.
Entrepreneurial experience	943.821	1	943.821	2.257	.135
Family experience	813.175	1	813.175	1.945	.165
Error	714.629	1	714.629	1.709	.193
	70665.485	169	418.139		

*Business owner skills and performance*

In order to test the relationship between business owner skills and performance (number of full time employees) (H4), another multiple regression was conducted. As shown in Table 5, the overall model was significant. The predictors accounted for 12.4% of the

variance. Examination of the predictors showed that human resource management and forecasting were the most important predictors. However, the relationships were not in the expected direction. For example, entrepreneurs who rated themselves as having strong skills in forecasting and human resource management were likely to have fewer full time employees.

These were confirmed in the correlation analysis presented in the Table 6. These predictors were also significant but had a negative relationship with volume of sales. Apart from these two predictors, Pearson correlation also showed product innovation had a negative relationship with the performance indicator variable.

**Table 5 Business owner skills and current number of employees**

	Beta	t
Securing finance/capital	-.055	-.625
Operations	.088	1.022

10.	Organising and planning	-.103	-.103	-.109

\* Correlation is significant at the 0.05 level.

\*\* Correlation is significant at the 0.01 level.

Factor analysis with varimax rotation resulted in three factors (see Table 7). Factor1 loaded on forecasting, organizing and planning, budgeting, and strategic management and was labeled STRMGT. Factor 2 loaded on product innovation, innovation, operations and human resource management, or OPERS. Factor 3 loaded on marketing and securing capital, MKTFIN.

**Table 7 Factor analysis for business owner skills**

	Factors		
	1	2	3

## DISCUSSION AND CONCLUSION

This study empirically examined the relationship between the resources of 171 female-owned ventures and the performance of the businesses. The study was anchored on the resource-based theory which posits that the resources of the venture are vital in explaining the firm's performance (Dollinger, 1999; Barney, 1991; Wernerfelt, 1984). Business performance was measured by number of employees, sales volume and profitability as in previous studies (Lerner et al., 2002; 2000, 1997; Brush 1984). The findings of the study were mixed.

While a recent study indicated a strong correlation between planning and performance (Wijerwarneda et al 2004) the centrality of strategic planning was not evident in this study. Strategic planning did not correlate strongly with the performance measures in this study. Although the overall model was not significant, thereby not fully supporting *H1*, planning ahead for new products, an item in the scale, was a significant predictor of performance and was more likely to lead to an increase in the size of full time employees. Research indicates indicate that no performance benefit is ascribed to the level of planning sophistication of firms (Whitehead and Gup 1985) operating in adverse economic conditions. In such an environment, firms are challenged by credit constraints and a steep rise in the cost of materials (Tambunan 2000).

In an uncertain economic environment like Ghana's, where business owners are more concerned with manipulating scarce and limited resources, perhaps it is not wise to plan strategically, but rather plan with a short-term focus. Instead of a sophisticated strategic planning regime, emphasis is placed on short-term measures to tackle the continuing changes in the business environment (Beaver and Ross, 2000). With the recent introduction of trade liberalisation regime in Ghana, competition has become unfettered, especially in the services industry where nearly 90% of the respondents in the study are located. It is expedient to plan ahead for new products just for the sake of survival in the cluttered market place. Our finding confirms a recent study of 297 Ghanaian entrepreneurs that found that sales were highest in firms with low planning sophistication (Yusuf and Saffu, *forthcoming*). Simply employing a high level of planning sophistication i.e. *planning strategically* does not necessarily yield higher performance. Planning *may* not be the only one way to best performance (Mintzberg, 1994).

Although the hypothesised relationship between strong resources and performance (*H2*) was not supported, it is worth noting that two venture resources: efficiency and product quality were positively related to sales volume. Perhaps, this is not surprising considering 89.5% of the women business owners in the sample were in the service and retail industries. An unexpected finding was the negative correlation between cost control and the number of part-time employees. In other words, as cost control increases more part time employees are hired. It is plausible that because it is cheaper to hire part time employees than it is to hire full-time employees, this may be a strategy used by the female business owners to control costs.

Contrary to the findings of prior studies about entrepreneurial experience being conducive to business performance (Bird, 1995; Ronstadt 1988) *H3* was not supported. Given the

fact that an overwhelming proportion (81.5%) had no prior entrepreneurial experience and the current business was their first venture, the finding was not surprising. Ghanaian female business owners face a *double jeopardy*. In addition to generic barriers that women business owners face (see Brush, 1984) Ghanaian female business owners also have to deal with their culturally ascribed role. While Ghanaian female entrepreneurs are hardest hit by the lack of access to credit (The Ghanaian Times June 23 2003; The Daily Graphic, June 23 2003), the Ghanaian banks' insistence on landed property as collateral makes it even more harder to access credit. Due to the cultural norms of most ethnic groups in Ghana, the control of land is often in male hands. It is therefore difficult for Ghanaian women to access land for any meaningful enterprise. Land for subsistence agriculture is all they get (Bortei-Doku Areetey, 2000).

The relationship between business skills and performance (*H4*) was supported, albeit the relationship was not in the expected direction. Forecasting, human resource management and product innovation were significant predictors. This finding is consistent with earlier studies that found women business owners considered themselves skilful in generating ideas, product innovation and dealing with people (Brush, 1984) as well as the tendency to think that their interpersonal skills are their strongest assets (Brush, 1992; Chaganti, 1986). However, it is interesting to note that the relationship was not in the expected direction. For instance, the female business owners who rated themselves as possessing strong skills in forecasting and human resource management were likely to have fewer full time employees. It is plausible that the people skills of the female business owners are such that they are able to achieve the goals of the business with fewer full time employees. These predictors also had significant but negative relationship with sales volume. Product innovation was negatively correlated with performance.

Based on our findings, to achieve a high sales volume and a large number of employees requires the need to invest more in developing the business skills of female business owners. In particular, developing training programs to enhance the human resource management, forecasting and product innovation skills cannot be overemphasised. Given the importance of small business in job and wealth creation (Reynolds et al., 2004; Birch, 1984) the government must take an active role in equipping female business owners with the requisite business skills that the study has identified. Female entrepreneurship could play a crucial role as part of the solution to Ghana's economic development problems (Chamlee-Wright, 1997).

Limitations of the study include the size and the locale of the sample. Although female owned-businesses in the Accra-Tema metropolitan area constitutes over 70 percent of all female businesses in Ghana, a larger study covering a larger sample from other regions in Ghana is warranted. In particular, the strategic capabilities of male-owned business owners should be studied and compared on the above attributes. Similarly, larger studies in other African countries and countries in the developing part of the world will be a fruitful area of research.

## **ABSTRACT:**

Case studies are some of the useful methods for analysing practical issues of concern and for disseminating information in business. They can also be used in evaluating effectiveness of methods used in measurement criteria by citing practical cases of organisational practices, problems and concerns. An analysis of cases can be applied in any business establishment, including SMEs. Swaziland is a developing country and its economy is in part dependent on the SMEs' sector. SMEs are an important base for economic development in developing countries. It has been argued that they are a seedbed for future development; they provide employment and to a great extent promote the standards of living of the rural communities. In Swaziland, most SMEs are indigenously owned. This is in part explained by shrinking inward investment, the amount of start-up capital required by this sector and other limitations in support structures for SMEs. The significance of SMEs in promoting development has led the researcher to develop a case study on some of the developments in this sector. There are significant gaps in literature and on scientific research conducted on developing countries' contexts. Often these countries rely on literature and cases from developed countries that may be inappropriate for addressing developing countries' problems. The problems discussed may hamper the SMEs development and adaptability in the globalised context and hence, hinder national development. These problems can be attributed to the developmental status of Swaziland. Concerns and need for research that is Afro-centric have been raised by different scholars and leaders in Africa. Validity of Afro-centric studies is dependent on usage of appropriate and more relevant techniques to the problems and challenges. In view of these gaps, the case study objectives are to:

1. Indicate the importance of case analysis in evaluating SMEs problems,
2. evaluate the nature of SMEs' activities in Swaziland using case analysis, and
3. analyse their constraints and challenges in the globalised context.

Globalised context

### **The importance of case analysis in evaluating SMEs problems:**

A case study is useful in the analysis of SMEs because it can utilize information from multiple sources such as documentation, archival records, interviews, and observation (Yin, 1994). It has been argued and observed in Swaziland that studies on SMEs are limited and where available, may be inconclusive because of limitations in availability of data. SMEs do not keep up-to-date records, a factor that may hinder validity of studies in this area. To counteract the limitations, the case investigator has relied on interviews, observations, and on available documentations on SMEs. The investigator interviewed two hundred and sixty five SME' owners in Swaziland, using a semi- structured questionnaire to gather insights on a variety of issues. These were randomly selected from the various regions in the country, using the scale of operation as a basis of selection. SMEs are mainly concentrated in the major city centers: Manzini and Mbabane. As a result, a substantial number came from these centers. The research results were substantiated by in-depth focus group interviews.

### **The Nature of SME's in Swaziland:**

Intensified competition and the other associated global processes have been accompanied with shrinking-inward investment and divestment and/ or closure of foreign owned business corporations. Some of the businesses have moved to countries where perceived benefits are relatively greater (e.g. South Africa and Mocambique). These processes have also been accompanied with threatened job security as retrenchments and redundancies are rising. As a result of escalating unemployment level, the informal sector that mainly consists of SMEs has been utilised as an alternative means to survival. Thus, the country is witnessing growth in informal sector due to shrinking foreign inward investment and other economic problems. SMEs in Swaziland features mainly in transport, farming, marketing, manufacturing and distribution of hand – craft, micro financing, training and food processing.

SMEs may vary according to the scale of development, number of employees and nature of ownership. For instance, in Swaziland a small-scale sector employs about 50 employees maximum (Gamedze, 1993), while in the US, they may employ more than that. SMEs are regarded as a worldwide cornerstone for economic development and may enhance the industrialisation process if the entrepreneurial mode is nurtured. However, there are numerous factors identified that hampers the entrepreneurial spirit. These include marketing, accounting, finance, limitations in training and development and other managerial constraints (Joubert and Akinnusi, 1993).

An attempt is made to counteract some of these problems by the government, non-governmental institutions and financial institutions and other international organisations. They have assisted with training and development, finance and other support services that include marketing. The type of activities rendered includes retailing, watching and protective (security), transportation, construction, farming, domestic servants, manufacture and sale of handcrafts, and rendering of other services such as cleaning and catering.

The Small Enterprise Development Corporation Ltd (SEDCO) which was established in 1970 through the assistance of the UNDP and the ILO has contributed to the promotion of small business development in Swaziland. This unit provides technical and financial assistance, premises, at a subsidised rate; facilitate purchase of equipment and other inputs, and sale of outputs (Maasdorp, 1973). In the recent years, SEDCO's services to SMEs has included training and business counselling. Despite these initiatives, SMEs in Swaziland still encounter problems of developing business plans, managing their businesses and keeping records. Because of poor record-keeping and other limitations, the economic impact of SMEs in GDP may not be easily ascertained

None-the-less, SMEs contributions economically and in terms of employment is invaluablely significant. Research evidence has proved that SMEs have a significant role in a country's economic development process (Carland et al., 1984; Joubert and Akinnusi, 1993; Trevisan, 1997). They can serve as a seedbed for big businesses, generate wealth, offer employment opportunities, and generate new business ideas and concepts and many other valuable uses.

In view of their immense contributions, SME's have to be consistently monitored to enhance further their contribution to the society. This may require consistent review of the business ideas generated for relevance and assessment of their potential to thrive and/ or survive in the contemporary world. In this regard, entrepreneurship is an imperative.

The Small Enterprise and Development (SME) unit under the Ministry of Enterprise and Employment is increasingly becoming involved in instilling entrepreneurship by rendering advice and training as well as soliciting funds internationally. It also facilitates building of effective networks to help promote their development and is responsible for formulating policies and legislation that governs the establishment and promotion of SMEs. The impact of the unit in instilling the entrepreneurship mode cannot be easily ascertained at the present moment because it is still in the process of implementing these different aspects. As a result, the SMEs' policy has not been enacted.

## **SMEs Constrains and challenges**

Despite their major role in economic empowerment and development, SMEs encounter numerous constraints and challenges. For instance, the country does not have a policy governing their operation. Furthermore, they lack the necessary skills and competencies to enable them to effectively carry out the various SME activities, while there are various essential functional activities required for operating any type of business: accounting, legal, management, marketing, financing and international business management skills as illustrated in table 2. Big businesses rely on specialists' knowledge which small businesses, usually, cannot afford. As a result, small business owners perform most of these functions. Doing all these activities may be an impediment to the growth and development of the business and may deter entrepreneurship in that SMEs may not have all the necessary competencies to carry out the wide range of activities. The

situation is expected to be worse in a globalised context, where most businesses have to internationalise their business corporations and have to deal with intensified competition.

Other required managerial competencies include, decision-making skills, continuously generating new combinations of production systems, introduction of new goods and services, industrial reorganisation, finding new markets and sources of supply. Other researchers (e.g. Mill, 1848; Schupeter, 1934; Dunkelberg and Cooper, 1982) identified the following characteristics: risk bearing, innovation, initiative, need for achievement, internal locus of control, drive, self-confidence, goal-oriented, moderaterisk-taker, need for control, responsibility-seeker, need for growth, independence-oriented, craftsman-oriented (sic) and many others.

Despite the numerous characteristics identified above, ‘it is practically impossible to provide a precise exposition of the qualities that are of crucial importance for being an entrepreneur and successful for entrepreneurship’ (Trevisan, 1997:181). For example, it is not clear as to which trait take precedence over the other and at what stage does each of these become paramount. The uncertainty could be linked to the complexity of understanding behaviour and the extent to which it changes as well as the relationships that may exist among them. Nonetheless, the most visible aspects of contemporary entrepreneurs is adaptability, profitability and growth of their businesses in a highly volatile and competitive business environment. Hence, the argument that they have to be innovative and strategic in their business practices (Carland et. al 1984). This has implications that different stakeholders have a role in the development of the entrepreneurial spirit. Suggested ways for entrepreneurial development include: innovation, creation of an enabling environment, research and development, possession of special leadership and other managerial qualities (Mushyoki 1997).

In Swaziland, it can be argued that SMEs lack a clear vision of their business. This problem is compounded by the problems of limited finance and other support structures to cater for their basic needs. Small Business entrepreneurs are mainly driven by the desire to maintain their livelihood in response to escalating unemployment in the country. Often, they emulate each others’ business ideas. As a result, most of them are engaged in similar activities. They lack one of the major components of small business entrepreneurship, creativity. Moreover, proceeds obtained in the business cater for their basic needs such as food, health and education for their families as illustrated in table 1.

**Table 1: Usage of SMEs proceeds:**  
PROFIT

	Frequency	%	Valid %	Cumulative %
Maintain family	84	31.7	31.7	31.7
save it	6	2.3	2.3	34.0
invest in business	38	14.3	14.3	48.3
pay loan	1	.4	.4	48.7
miscellaneous	131	49.4	49.4	98.1
none	5	1.9	1.9	100.0
Total	265	100.0	100.0	

Miscellaneous uses, mainly included maintenance of family, education, health and putting it back into the business for its sustenance and repayment of loans which were from family relatives and friends. Most of them barely used the bank because of the collateral problem. They were not considered credit worthy mainly because of the nature of their businesses. However, the situation is now improving; different banks do consider financing SMEs because

of the increasing significance of this sector. However, the case investigator did not ascertain from the banks measures used to finance them. In the past they tended to emphasise group loan schemes and relied on peer pressure for loan repayment. Recently, they have been extending their loan services to individuals, a factor that may promote SMEs development and their business expansion. Furthermore, Fincorp (a financing corporation in Swaziland) offers a wide range of financial services that can also be extended to individuals provided they furnish the corporation with a viable business plan and a business constitution. Despite the latter developments, difficulty in obtaining funding for the business is still regarded as a major operational problem.

**Table 2: Operational problems of SMEs**

Nature of problem	Percentage (%)
Difficulty in obtaining funding for the business	74
High machinery and other input costs	63
Unavailability of inputs locally	55
Limited infrastructural support	49
Transportation problems	43
Limited knowledge on the source of advice/assistance when needed	42
Too many dependents	42
General management problems	40
Marketing problems	34
No suitable business premises	34
Domestic responsibilities	22
Licensing problems	21

The numerous operational problems encountered are likely to hinder their development, maintenance and business growth. As a result, a substantial amount of SMEs in Swaziland appears to be static, while others do not survive very long. This creates further challenges on how they can be upgraded to viable commercial entities that can fit in a highly competitive business environment. None-the-less, most of them were optimistic on the extent of success of their business as illustrated in table 3.

**Table 3: An evaluation of the SMEs success in Swaziland**

	Frequency	%	Valid %	Cumulative %
very successful	15	5.7	5.7	5.7
successful	87	32.8	32.8	38.5
break-even	100	37.7	37.7	76.2
not at all successful	63	23.8	23.8	100.0
Total	265	100.0	100.0	

Generally, the SME owners perceived that their businesses were successful mainly because they manage to sustain them. However, this result should be treated with caution as their evaluation of success differ from most of the widely used measures of success such as

productivity level, profitability ratio, rate of return. They used sustenance of their businesses as a measure of their success and the ability to maintain their families. Most of them had been in business for over five years and were satisfied with the little source of income generated because it was perceived to help enormously in maintaining and educating their families. Family members in Swaziland, include extended families, who are also major employees in the small and medium enterprises. This is a result of 'ubuntu' or compassionate attitude of Africans towards each other as a way of maintaining close family ties and social interactions. Otherwise one may be ostracised from society or labelled for non-conformity with the prevailing African norms. Furthermore, there is a perception that an 'anti-ubuntu' attitude may perpetrate misfortune.

Thus despite the performance status of their businesses, most (60%) of them were satisfied, because of the value of the contribution to the African family ties and to the quality of life. Their businesses also offered employment to family members, a sense of purpose in life, and limit potential societal problems of crime and political upheavals.

**Table 4: Level of satisfaction derived by business owners in their business performance**

	Frequency	%	Valid %	Cumulative %
highly satisfied	17	6.4	6.4	6.4
satisfied	84	31.7	31.7	38.1
fairly satisfied	58	21.9	21.9	60.0
dissatisfied	106	40.0	40.0	100.0
Total	265	100.0	100.0	

Despite the majority of SMEs' satisfaction with their business performance, 40% of the respondents were dissatisfied with the status of their businesses. This problem was compounded by the operational problems that included managerial, marketing, finance, lack of clear policies, frustration with the procedures for acquiring licences and funding problems. There was the perception that the procedures used are cumbersome, delaying and at times not transparent. Major delays were encountered with opening of businesses in rural areas whereby they have to seek approval from the chiefs and the king as there is no title-deed land, but Swazi-nation land. Others expressed concern about the discriminatory practices between male and female entrepreneurs. Females often have to get consent from their spouses on most of the business aspects (e.g. obtaining loans from the banks) because of their minor status. If unmarried, they cannot have access to any land. However, with the ongoing reviews of Swaziland's constitution, it is envisaged that the situation may improve. The processes of reviewing the Swaziland constitution and that of enacting SMEs' policy are taking a relatively long time, and this may deter SMEs development and effective participation in the globalised business context.

## CONCLUSIONS AND RECOMMENDATIONS.

Critical issues such as commercial viability of SMEs in Swaziland transpired from the case results. Moreover, they appeared to rely on different measures for ascertaining their success. None-the-less the results revealed that SMEs have a significant role in Swaziland. Over an above the normal expectations, they enhance family ties, values and fulfil certain perceived expectations; and they enhance further the overall quality of life as they have a role in the education, health and livelihood of the society. However, they encounter insurmountable challenges and constraints that include emulating each other's ideas, accessing funding, managerial problems, securing sources of supply, transportation problems, location, marketing, keeping records and lack of a supportive small business environment.

SMEs record-keeping problems may hinder application of appropriate measures in the evaluation of their business success and in extending assistance to them. Thus despite, the perception of success expressed, this should be treated with caution because of the indicators used in ascertaining success. They relied on the ability to sustain their businesses, their livelihood and being able to meet other basic family-related needs. Validity of these measures has not been proven as these are unusual business performance indicators. As a result, future case studies may focus on the relevance and applicability of these measures in view of the scenario presented. This justifies the significance case investigations on the SMEs' sector and the need to devise appropriate and relevant strategies to help them develop further. This process may also include a clear SME policy that will address the various problems raised by the respondents, and encouragement of business networks to strengthen relationships with other stakeholders to enhance the marketability and competitiveness of their businesses.

## **ABSTRACT**

SMEs in Singapore have continued to play an important role in the local economy since 1959. Over 90 per cent of all Singaporean enterprises were SMEs of which ninety-two percent were owned by Singaporean Chinese in 1999. SMEs have contributed significantly to Singapore's economic development by providing critical support to multi-national corporations, which bring in investments, experience and technology.

In Singapore, about seventy-one percent of small and newly registered companies fail within the first five years of incorporation. Lack of entrepreneurial and managerial skills have been identified as the major causes of SMEs' failures. External professional advisers to SMEs could supplement their lack of managerial skills by providing management advisory services to enhance SMEs' effectiveness. Many professionals provide advice to SMEs but until now there was no understanding as to which advisory group had the greater impact on business performance and what services SME owners want and need.

A conceptual framework was postulated that Chinese CPA intervention, centred on microlevel organisational change, could have a positive impact on business performance of Singaporean Chinese SMEs. The study explored the impact of CPA intervention on business performance of SMEs. It was further postulated that CP As have a greater impact on SME performance than other external advisers. To test these propositions, a survey was undertaken of SMEs and CPAs.

The research findings indicate that SMEs that used CP As extensively out-performed those SMEs that did not use any external advisers. Amongst SMEs that used external advisers moderately to extensively, those Chinese SME that used CP As scored the best business performance growth, measured by net profit plus owner's remuneration over the ten-year period 1987 to 1997. Thus CPA interventions are associated with higher performing Chinese SMEs and in addition outperform other advisers. The outcome has important implications for professional advisers and SME owners as to the sources and types of services they provide to their clients.

## **BACKGROUND**

Like in many countries, Singaporean small to medium enterprises (SMEs) continue to be an important group in the local economy, particularly since self-government in 1959. This is evidenced by the fact that over ninety per cent of all Singaporean enterprises were SMEs in 1999 of which ninety-two percent were owned by Singaporean Chinese (Department of Statistics, 1997). By 1999, local SMEs accounted for 92% of establishments, 52% of Singapore workforce, or about 583,000 workers, and contributed 35% of the Gross Domestic Product (PSB, 1999).

The importance of SMEs was originally realized and rediscovered by the Singapore Government in the 1985 economic recession. In 1986, the SME Master Plan was drawn up by the Economic Development Board (EDB) and constitutes the blueprint for the local entrepreneurship development path and action strategies. With the implementation of the SME Master Plan, the Government realized that, in Singapore's future economy, SMEs must increasingly play an important role as a source of entrepreneurship and innovation, and act as the kernel of future successful indigenous companies.

As a consequence, government intervention has been directed towards the development of a strong indigenous population of firms to provide a necessary counterbalance to volatile multinational companies' (MNCs) activities. This has resulted in partnerships between entrepreneurs of local enterprises, MNCs and government-linked companies (GLCs). SMEs have contributed significantly to Singapore's economic development by providing critical support to multi-national corporations, which bring in investments, experience and technology. Unfortunately, not all small enterprises survive and grow.

High business failure rates in the small business sector have drawn the particular attention of researchers. In Singapore, the business failure rate was extremely high within five years of firm incorporation. Between 1983 and 1990, an average of 21,000 companies and businesses were registered annually in Singapore. The annual attrition rate averaged around 15,000, giving a net addition of 6,000 new businesses per year (Boey and Lee, 1994). The 1997 Asian economic crisis caused serious cash-flow problems for 92,000 SMEs in Singapore. It was reported that if no measures were taken to help these SMEs, some five per cent would not survive (Fernandez, 1998).

There are a multitude of external and internal factors that contributed to the high business failure rate. SMEs have no control over external factors, such as competitive environment (Gaskill et al, 1993), government regulation and economic conditions. Internal factors, such as access to capital in the start-up stage and for the future development of the business, managerial inadequacy (Haswell and Holmes, 1989) and failure to seek professional advice (Lussier, 1995), are offered to explain the failure of new or growing firms. Thus, lack of managerial skills has been identified as the major causes of SMEs' failures as well as not

seeking external advice. Provision of professional advisory services on an on going basis to

SMEs was identified as an effective solution to managerial incompetence (Latif and Shanmugam, 1990). When small firms are confronted by threats to their survival or growth, they may seek external assistance to supplement their own resources, particularly management skills and experiences, in order to reach an adequate solution. External professional advisers to SMEs could be used to supplement small businesses' lack of managerial skills by providing management advisory services to enhance SMEs' effectiveness (Ferris and Livingstone, 1987; Latif and Shanmugam, 1990).

Studies have indicated that external accountants are in key demand as external professional business adviser to SMEs. These studies indicate that accountants, amongst others, with a vested interest in small firm performance, essentially in a consulting capacity, offer the advantages of experience, technical knowledge, analytical skills and objectivity to help the small business in problem-solving. In the study by Peat, Marwick, Mitchell & Company (1983), it was shown that external accountants are primary business advisers to private companies more than any other professional groups, such as attorneys or bankers. In the case of Singaporean Chinese SMEs, studies have shown that their external accountants become the preferred choice on the grounds of trust, independence as well as the industry experience they have gained from their multitudes of clients. Many professionals provide advice to SMEs but until now there was little empirical evidence as to which advisory group had the greater impact on business performance and what services SME owners want and need.

Leading Singaporean CPA firms provide mainly traditional audit/accounting and tax services to their local SME clients. The need for local CPAs to provide management advisory or consulting services to their SME clients has not been widely recognized. The International Accountant Bulletin survey in 1995 indicated that selected leading Singapore CPA firms derived the majority of their income from audit/accounting and tax work (80%) and only a small percentage from management advisory fees (11 %). In contrast, in the U.K. there was a noticeable shift from audit to non-audit works amongst the international accounting firms. The contribution of audit fees to total income of the then big six declined from 70% in 1980 to 52% in 1992.

Contingency theory asserts that organizational effectiveness is a product of an appropriate matching between internal organizational characteristics and the demands created by elements of context such as technology and external environments (Burrell and Morgan, 1979). For this study, a contingency-based conceptual framework (Figure 1) was developed on the basis that CPA interventions, centred on micro-level organizational change, could have a positive impact on the business performance of SMEs. It postulates that business performance is contingent on appropriate management and control systems but CPA interventions could have a mitigating positive influence on business performance. This mitigating influence is based on the assumption that CPA interventions could compensate for the lack of SMEs' skills in business management and control. Thus, this study explored the impact of CPA interventions on business performance of SMEs. Building on long-standing and trusting relationships between CPAs and SMEs in combination with in-depth knowledge and experience of their SME clients, CPAs could intervene in SMEs' management by introducing and implementing appropriate management techniques and systems of control to enhance SMEs' business performance. Intervention is not measured directly but by association based on SMEs reporting the extent to which they used their CPAs' services to

support their business performance.

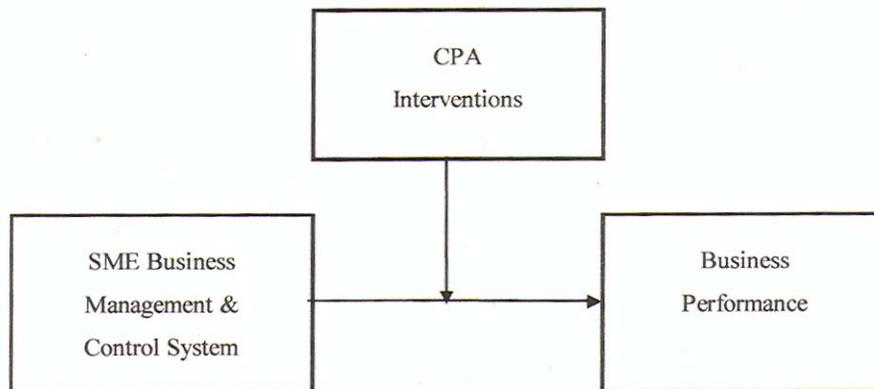

Figure 1 – Conceptual Framework for Study

In Singapore, small business research has been scant and no studies have been conducted on local CPAs providing management advisory services to their SME clients. The focus of most research has been mainly on succession planning (Khoo, et al., 1993), characteristics of family firms, integrating daughters into family business (Chan, 1996), and culture (Lee, 1996).

Theoretically, qualitative considerations and quantitative measures are used to define SMEs. In practice, however, precise quantitative criteria are generally adopted in most part of the world. There are however differences between developed and developing countries in choice of criteria. In developing countries, the definition of a SME tends to be still based on employment size. Unlike the surrounding Asian countries, Singapore has developed quite rapidly and as a consequence its SME definition has changed over time. In Singapore, there is no official legislation to define small and medium sized enterprises (SMEs) and they are defined according to the eligibility criteria used by the Economic Development Board (EDB) to qualify firms for assistance programs. In 1996, the establishment of the Singapore Productivity and Standard Board (PSB) resulted in the PSB acquiring the responsibilities of EDB for promoting SMEs. SMEs were then defined as firms with less than 200 employees and S\$5 (approximately US\$3) million net value of fixed assets, which included land, buildings and structures, machinery equipment, vehicles, and office equipment.

A definition based on the number of employees ignores the fact that certain types of industries, by the very nature of their operations (such as that in manufacturing), require relatively more workers than others. The book values of productive fixed assets serve to segregate SMEs from the large local enterprises, and the percentage of local equity serves to identify the indigenous businesses from those that are affiliated to foreign firms as subsidiaries. Given the focus of the study, it was important to also incorporate a longevity factor into the criteria for identifying the target population as the study was interested in how the client-adviser relationship affected business performance over time. Consequently, only SMEs that had been established for at least 7 years were included in the target population.

For this study a Singapore Chinese SME was defined as a business entity where:

- it employed less than 200 employees; and
- not less than 51 % of the issued shares were held by Singaporean Chinese shareholders and were actively involved in the management of the business; and
- it was an exempt private limited company (an exempt private limited company is defined under section 4 of the Singapore Companies Act as one where none of the shareholders is a corporate entity and where there are not more than 20 shareholders in the company).

A small firms performance is a measure of its success in terms of its profitability or growth in sales (Hall, 1995). However, in small businesses, the owner's personal characteristics and attitude towards risks may impact the performance it achieves, particularly the owner's objective of his/her expected long-term income, including owner's remuneration, as owner's remuneration in small business represents a greater percentage of revenues than in a large firm (Welsh & White, 1981).

Performance is the outcome of the interaction between strategic (controllable) factors and environmental (uncontrollable) factors. While this general idea has wide acceptance in the literature, there is considerable disagreement as to what exactly constitutes performance (Cameron and Whetten, 1983; Ford and Schellenberg, 1982). Not surprisingly, there is considerable evidence and consensus on the multi-dimensionality of the performance concept as it is this very multi-dimensionality that is at the root cause of the performance debate (Buzzell and Gale, 1987; Cameron and Whetten, 1983; Chakravarthy, 1986; Dess and Robinson, 1984; Venkatraman and Ramanujam, 1986; Walker and Ruekert, 1987; Woo and Williard, 1983).

In this study, the following criteria were used to assess the business performance of the Singaporean SMEs.

- Sales growth which includes growth in product ranges and customers bases.
- Profit growth which includes net profit on sales before and after owner's remuneration.
- Director's remuneration which includes rewards in terms of salary, bonus and fee payable to members of the board of directors.
- Employee size
- Shareholders' fund which includes unappropriated earnings.

Choice of Chinese accountants was based on the requirements for registration on the Public Accountant Board (PAB) register. Only CPA that were local practitioners as either sole-proprietors or in partnership firms and who had Chinese SME clients, were eligible. As the PAB's register did not identify the latter criteria, respondents were required to identify if they met all criteria.

# RESEARCH QUESTIONS AND METHODOLOGY

In developing the conceptual framework, the study explored the relationship of CPA interventions in Singaporean SMEs' management and control processes leading to changes in strategy, structure and system formulation of SMEs. Specifically, these issues were addressed by posing the following research questions.

1. Do Singaporean SMEs perceive that CP As can contribute to improving their business performance?
2. Do Singaporean SMEs perceive that CP As are the best advisers, amongst other external advisers, to improve their business performance?
3. Do Singaporean CPAs perceive that they can enhance business performance of their SME clients?
4. Do Singaporean CPAs have the skills and experience to improve business performance of their SME clients?

This research used mailed questionnaires and case studies. Empirical data was used to test the propositions and validate the conceptual framework. Case studies provided the opportunity to test the framework and gain both qualitative and quantitative feedback on its applicability in practice. Findings from case studies are not reported in this paper.

Survey findings are based on 45 useable responses from Singaporean SMEs and 66 usable responses from CPA practitioners. The sample of SMEs was drawn from those that were corporate members of the Chinese Chamber of Commerce and Industry (CCCI), Singapore, 1997/1998 and that met the SME definition criteria (target population 187). In addition, a question in the survey solicited their business age in order to select only those that met the longevity criteria. The sample of CPA practitioners was drawn from the register of CPA practicing members, Public Accountant Board (PAB), Singapore, as at March 1999 (225 were chosen at random for mailing of the questionnaire). Given the sizes of the samples, the study must be treated as exploratory and the findings as preliminary.

## FINDINGS

In reporting findings in this paper, the results discussed are focussed on CPA interventions although other external advisers' interventions were investigated but are not discussed in detail. The findings commence with a discussion of an analysis of SMEs' responses followed by a comparison of CPAs-SMEs perceptions of each other. It concludes with a correlation analysis between four advisory groups' interventions and SMEs' business performance.

Accountants were the most used external advisers to Singaporean SMEs with industry/trade associations the second most used external advisory group. Bankers' ranked after the industry/trade associations as the third most used external advisers (Figure 2). Financial,

management and business improvement consultants were least used and provided a limited range of services. Thus they were dropped from further analysis. CP As provided SMEs with a full range of advisory services (Figure 3). Financial and legal/taxation advisory services were areas identified as most contributing advisory services provided by accountants to SMEs' business performance. Industry and trade associations provided SMEs places for relationship building and exchanging trade as well as business improvement learning experience. This finding was in conformity with past research that Chinese association networks have been viewed as one of the key factors contributing to the success of Chinese business in Hong Kong, Singapore and other Asian countries (Hamilton, 1991; Wong, 1992).

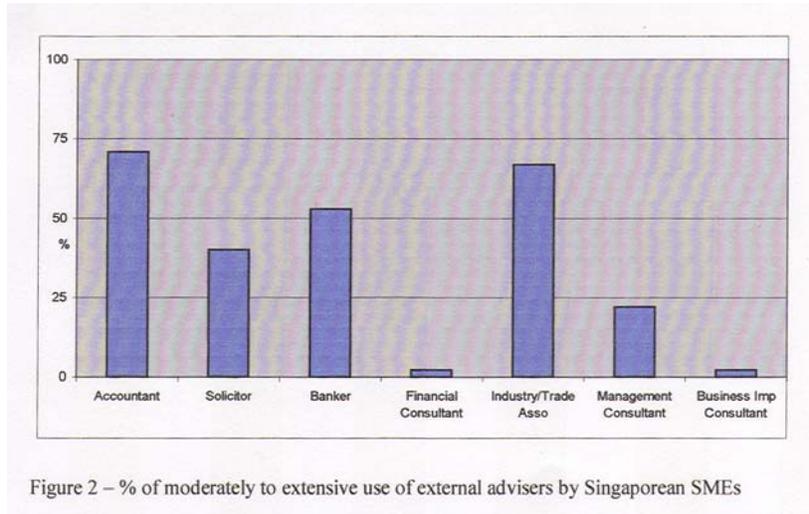

Figure 2 – % of moderately to extensive use of external advisers by Singaporean SMEs

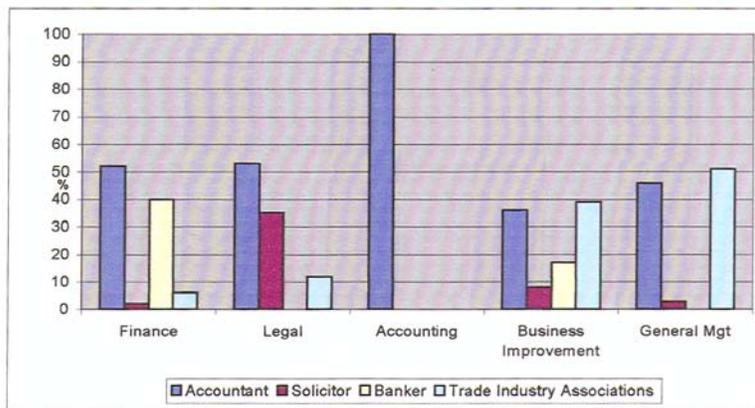

Figure 3 – % of external services used moderately to extensively by SMEs by type and adviser group

The major reasons given as to why SMEs called in external adviser were lack of skills in-house (78 %) and a need for change (69%). Owners/founders of Singaporean SMEs felt that there was a need for change in their management processes in order to improve business performance. When this need arises, accountants become SMEs first choice amongst other professionals being the closest and trusted external advisers. Lack of skills in-house, mainly in areas of business system and control, was identified by respondents as the area of immediate need for advice.

The above findings were based on SME owners' perceptions of the usefulness and contribution of external advisers including CP As. To gain further empirical evidence, the study collected data on business performance in addition to the level of use of external advisers. This evidence was used to answer the research question.

## Research questions' findings

The first research question asked was can CP As providing management advisory services positively impact the business performance of SMEs? The findings indicate that over the ten years from 1987 to 1997, under the same business and economic environment, SMEs that used CP As moderately to extensively as their external advisers achieved great improvements in business performance using the measures of business turnover (338%), net profit (549%), directors' remuneration (664%) and shareholders' funds (1,450%). Conversely, SMEs that did not use CPAs as their external advisers improved marginally in business turnover (236%), but suffered drastic business net losses (-436%) with relatively marginal growth in directors' remuneration (122%) and shareholders' funds (28%).

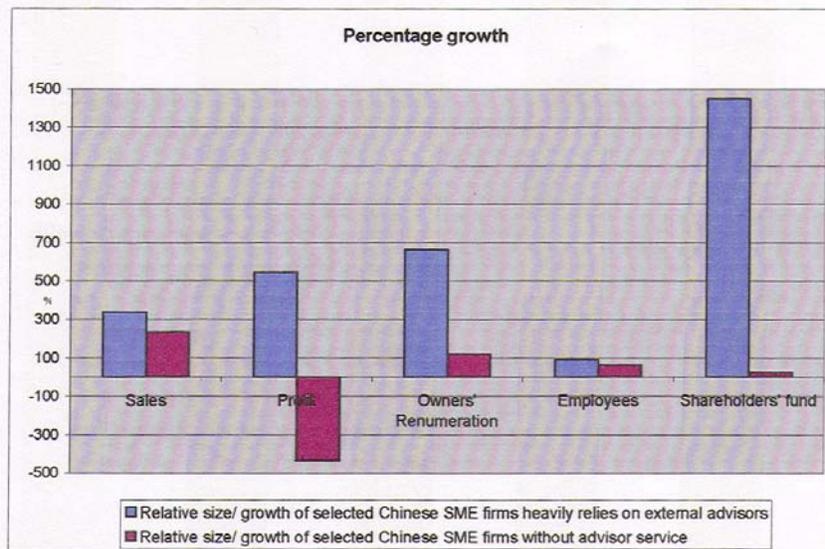

Figure 4 – % growth in performance measure of Chinese SMEs that heavily used CPAs as external advisers and those that did not

In attempting to answer the second research question (do Singaporean SMEs perceive that CP As are the best advisers, amongst other external advisers, to help improve their business performance?), SMEs were asked to rank external advisers' perceived contributions to their past business performance as well as future performance. Amongst other advisers, accountants were ranked the most used external advisers in providing value for money service (69 percent of SMEs perceive that CPAs provide value for money services) and were perceived to be the most contributing external advisers to SMEs past performance (93 percent). For the future, SMEs were asked to rank those advisers, which had not been used in the past that could possibly contribute to their performance. Industry/trade associations (42%) and banks (33%) were ranked ahead of accountants (31 %). However, the question was conditional on 'not used in the past' so a valid outcome would be that accountants were not ranked first as they have been used most extensively in the past and presumably this

would continue into the future.

The remaining two research question attempted to ascertain the perceptions of CPAs' in relation to their contribution and level of knowledge/skills. To gain confirmatory evidence, SMEs were asked the same questions and a comparison of results revealed agreement on these and other relationship issues. There were strong relations between SMEs and CPAs which made CP As their most used external advisers.

- *Value for Money*
  - 69 percent of SMEs say CPAs provided value for money service.
  - 64 percent of CPAs perceive they provided value for money service.
- *Strength of Relationship*
  - CP As scored highest in the strength of their relationship with SMEs.
- *Knowledge/skills of CPAs*
  - Both CP As and SMEs agreed 100 percent that CP As have experience to provide management advisory services.
- *Commitment of CPAs*
  - Both CPAs and SMEs agreed 100 percent that CPAs are committed in providing management/consultancy services.
- *Principal involvement*
  - Both CP As and SMEs agreed that principals of CPA firms were 100 percent involved in providing management advisory services.

Ninety-seven percent of respondent CP As felt that they were competent in their professional skills and eighty-nine percent of the respondents felt that they had appropriate levels of business experience in order to provide management advisory services to their SME clients. This was backed by the empirical evidence in that eighty-seven percent of accountants had 10 or more years in CPA practice. Fifty-two percent of CP As had three or more years of other business/management experience outside their practice. Even given this level of knowledge and experience, CP As generally concurred that they needed to acquire additional skills in human resource management, computers and communications to improve their quality of business advisory services.

However, when it came to the areas where CPAs could perceivable add to SMEs' business performance, there were some notable divergence of opinion. Although CP As perceived that in most areas they could add to their SMEs' performance, SMEs believed that their accountants could do more for them in terms of business improvement which ranked equally with of finance and banking advice (Figure 5). Given that CPAs indicated that only 7.5% of their fees came from business improvement consultancies, SME are sending a signal that they are seeking more services in this area rather than traditional compliance services in order to help improve their firms' business performance.

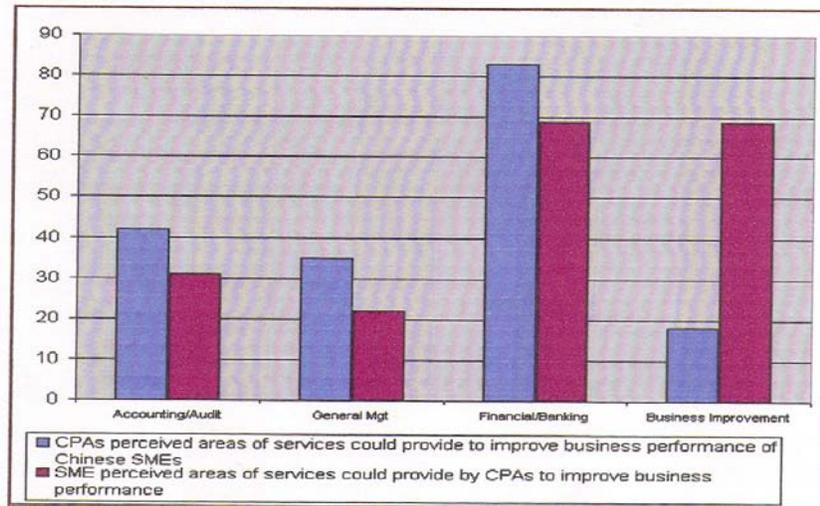

Figure 5 – Perceived areas of services that could be provided – CPAs-SMEs comparison

## Correlation analysis

In an attempt to explore the association between adviser's interventions and business performance, a correlation analysis was undertaken. To gain further evidence to support the proposition that CPA interventions have a significant impact on a SME's business performance, each group of advisers were analysed against the four business performance measures over the study period.

Use of the four professional adviser groups has a positive impact on business performance but the extent of impact varies across advisers. All advisory groups showed significant correlations with two or more business performance measures. However, as indicated earlier, the two more important business performance measures to SMEs are Net Profit and Owner's Remuneration. On these two measures, CPAs were the only group of advisers that had significant correlations for both measures. Interestingly, Bankers showed a significant negative correlation coefficient for Net Profit while Solicitors, showed significant correlations with Sale Growth, Owner's Remuneration and Shareholders' Funds.

## CONCLUSION

Singaporean SMEs used CP As most as their external advisers in comparison to other external advisory groups. Accountants have the business experience and management skills to provide financial and business improvement advisory services in addition to the normal compliance services of taxation and audit. CP As interventions contributed significantly to the business performance of Singaporean SMEs, when performance was measured by the combination of net profit plus owner's remuneration (1997 to 1987 a growth rate of 602.5%) in comparison to other key external advisers.

Table 1 – Correlation Analysis – Relationship between of four external advisory groups and SMEs’ measures of business performance

Measure	Accountants	Solicitors	Bankers	Industry/Trade Associations
Sales growth Correlation co-efficient (r)		0.457	0.411	
Significance		0.004	0.011	
Net profit Correlation co-efficient (r)	0.370		-0.510	
Significance	0.022		0.044	
Owner’s remuneration Correlation co-efficient (r)	0.354	0.409		
Significance	0.029	0.011		
Employee Correlation co-efficient (r)				0.390
Significance				0.049
Shareholders’ funds Correlation co-efficient (r)		0.373	0.417	0.430
Significance		0.021	0.009	0.018

The conclusions drawn from this research must be considered within the context of certain limitations. These limitations include both practical and methodological issues. From the practical viewpoint, the limitations include size of sample, generalisation of results, proposition testing, the matching of two interrelated samples, and the application of the model to a single case. The methodological issue revolve around the use of questionnaires, interpretation of questions, use of performance measures, and framework validation. Each of the populations surveyed (SMEs and CPAs) were independent of each other. In other words, SME respondents were not clients of CPAs who responded to the survey. Given that the responses were anonymous, there may been some SME clients of CPA respondents. Thus the actual link between SMEs and their CPA advisers is tenuous particularly as there was no direct intervention measure. Approaches were made to CP As for them to survey their clients but due to their concerns about client confidentiality, they were not prepared to send questionnaires to their clients. The study attempted to gather data on a number of performance measures. However, some SMEs were not prepared to divulge all their financial results. All did however provide data on net profit and owners' remuneration. The combination of these two measures was chosen as the better indicator of a firm's performance. Given the diversity of industries, this may not be the perfect measure of business performance.

As this study is exploratory, it is hoped that other researchers interested in improving SMEs' business performance and survival may consider undertaking similar studies to explore further the proposition posed in this paper. By undertaking additional research as to how external advisers might contribute to SME performance, many economies in both developed and developing countries will benefit.

## **Summary**

Kenya Youth Business Trust (KYBT) assists disadvantaged youth to start small businesses by providing capital to those with viable business propositions and then attaching those successful applicants to volunteer business mentors.

KYBT has been established to facilitate the development of programmes to stimulate youth entrepreneurship in Kenya. The programmes are for the young people who are unable to find help elsewhere and who are unemployed or underemployed. The business community plays a major role by providing mentoring and local business support along with flexible access to finance for young people with viable idea and an entrepreneurial aptitude.

## **Background**

There are currently over 300 million unemployed and under-employed young people aged 18 to 30 years around the world. At least 20 per cent of these young people have the potential to become entrepreneurs. Unfortunately only less than 5 per cent have the opportunity to do so.

In Kenya, the economic growth rate has not been sufficient enough to create productive employment opportunities to absorb the increasing labour force of about 500,000 annually. Most of these are the youth and only about 25% are absorbed, leaving 75% to bear the burden of unemployment. Further, some of those absorbed are doing jobs that do not match their qualifications and specification.

Kenya Youth Business Trust (KYBT) is an initiative of Youth Business International (YBI) and was launched in Kenya in March 2003 to stimulate youth entrepreneurship. The principles upon which YBI programmes are based were developed in the UK by the Prince's Trust and have now been adopted in over 20 countries around the world. These are:

- targeting disadvantaged youth.

- providing access to financial support to young people who have a viable business proposition but who are unable to find support elsewhere.
- providing successful applicants with a volunteer business mentor and full access to the organization's local and national business support network.

The countries running the YBI programme include: Argentina, Barbados, Canada, Hungary, Nigeria, India, UK, China and Australia among others.

Since its inception over 50,000 disadvantaged 18 to 30 year-olds have been assisted to start their own business through the YBI initiatives. Over 60 per cent of these businesses are still trading in their third year or beyond.

## Outreach

The programme involves outreach initiatives whereby the programme: locates, encourages and prepares young people to begin planning to start their own business. KYBT does this in three ways namely; physical visits, media and word of mouth.

- *Physical Visits:* The secretariat works with NGOs that share a common vision of building sustainable livelihoods for the youth. These NGOs are able to spread the word to prospective beneficiaries. It involves physical visits to targeted areas where partnerships are built.
- *Media:* The media is a great communication tool. KYBT have featured in the local dailies and on radio through which many young people have come to know about the programme.
- *Word of Mouth:* This is one of the fastest ways to get the word round. Those who have heard about the initiative including the beneficiaries have spread the word to others who have made enquiries about the programme and are posed to benefit from it.

## Business plans

The programme realises the complexity of starting and running business, particularly by the youth who have no experience in the same.

Based on the viability of idea, KYBT provides support to youth in developing business plans. Planning increases the chances of success and a business plan helps organise all the pieces that have to come together to make the business a success.

To make the business planning process easier for the youth, we use a business plan template borrowed from the Prince's Trust. It's simple and has some illustrations to help the youth understand what is required.

We have also seen the need of taking the youth through some short training to assist them complete the cash flow. The training is conducted by the secretariat twice a month. The training is in groups of six to eight. These trainings are not sustainable in the long run when the numbers increase.

KYBT is in the process of forging partnerships with learning institutions that offer business and finance. They are looking at the possibility of finishing students assisting KYBT potential beneficiaries in putting together the business plans. The institutions approached have shown interest and these partnerships are expected to be formalised by August 2004.

## **Mentoring**

At the heart of the KYBT programme is the business mentor, an experienced local business person who works with the young person as a guide, teacher and friend for the critical first two or three years. Business mentors are volunteer business people who are attached to every business that KYBT funds.

- They provide business advice and act as a sounding board for new ideas.
- Their main aim is to ensure that the business has the best possible chance of surviving.
- KYBT sources mentors from the corporate world as well as local and national organizations e.g. rotary.
- KYBT matches mentors to entrepreneurs after the selection panel has passed their businesses. The mentors are made aware of areas that may have been identified as weak or needing extra attention.

On average a mentor spends 4-5 hours a month with the young entrepreneur and provides assistance in the following areas:

- Monitoring monthly loan payments.
- Monitoring performance of the business and ensuring the completion of business progress forms.
- Determining the need for specialist help, training, business recovery programmes and/or loan rescheduling.
- Assisting the entrepreneur in seeking out opportunities for business development.
- Assisting the entrepreneur to take full advantage of marketing opportunities, e.g. exhibitions/fairs, media/PR/advertising, etc.

**Mentoring mobile clinic:** is a new mentoring concept that KYBT is trying out. This is when a group of four to six mentors visit several youth business together. The concept was necessitated by the fear of visiting the slum areas alone. We realised that the mentors and especially those of Asian origin and women were willing to give time to mentoring but could not visit our entrepreneurs alone.

The mobile clinic has also the added advantage of having people with different areas of experience. The entrepreneur therefore benefits from more than one mentor. Ideally, the mentoring clinic should ensure that the mentors on board at any one time have expertise in the areas that the entrepreneurs need help.

## **Business support network**

Another area of support is through business support network, which together with mentoring is used to support the young people. This involves local support network of business people, companies and other entrepreneurs who provide the young people with specialist advice and resources. KYBT is well linked with the business community /private organizations including

founding private sector partners such as GlaxoSmithkline, Barclays Bank, and KPMG. These business community and private organisations provide support in various ways. They

- Engage employees as business mentors.
  - Provide pro-bono business support and specific advice E.g. KYBT gets legal and auditing services pro-bono.
  - Bring the young entrepreneurs to their supply chain.
  - Provide training through their early years.
  - Bring them into their local business network. Mentoring mobile clinic is a good example.
  - Join the local or national board to help manage the organisation. We currently have three boards namely, Board of Trustees, Area board and Entrepreneur selection panel.
  - Join KYBT as corporate sponsors and provide funding for local business start up and programmes. E.g. Adopt a business initiative which has been discussed under fundraising
- Founding private sector partners include GlaxoSmithkline, Barclays Bank and KPMG.

KYBT is also linked to non-governmental organisations such as Rotary club (that are a good source of mentors), and also to local NGOs and CBOs who spread the word to potential entrepreneurs and provide volunteers.

## **Board of Trustees**

The Board of trustees and the Area boards are part of the support network of business people volunteering their valuable time. Currently the Board of Trustees include:

Managing Director, First Africa Capital Ltd  
Managing Director, Barclays Bank, Kenya Ltd  
Managing Director, GlaxoSmithKline Ltd  
Managing Director, Wilken Telecommunication Kenya Ltd  
Managing Director, MediaXchange  
Director, TBWA/CREATIVE Ltd  
Chief Executive Officer, Tread setters  
Chief Executive, Equity Building Society

The Trustees roles include the following:

- Create, review and monitor the national strategy
- Ensure the programme is a legal, accountable and not for profit entity
- Support the national Executive Director
- Promote the interest of the programme to the existing and potential partners
- Raise funds and resources for the programme

## **Area Board**

Further, Kenya Youth Business Trust has an Area board in Nairobi and every other area that youth will be assisted to start small businesses. The Area Board's responsibilities include among others:

- Supports the delivery of the regional strategy
- Facilitates the involvement of key organisations in the initiative.

- Promotes KYBT through external networks.
- Facilitates the involvement of key external organisations in the work of the Trust
- Actively seeks the best ways of consulting with disadvantaged youth between the ages of 18 and 30 in the area and ensure their participation in the development of services locally.
- Influences key policy makers relating to youth issues.

## Access to finance

Since initiation of any business involves finance, its access is of paramount importance. In view of that, KYBT strives to make available such finances. Thus Young people with viable business ideas get start-up capital.

KYBT has a revolving fund developed through fund raising, sponsorships and adopt a business initiative

**Fundraising:** KYBT organises a mountain climb every year. Last year, 2003, a team of 28 executives, 8 from UK, 1 from South Africa and 19 from different corporates in Nairobi went up Mt Kilimanjaro. This year another team is preparing to go up Mt Kenya in the month of August.

**Adopt a business:** This is when a corporate organisation takes up the responsibility of both funding and providing the youth entrepreneur with the business mentor. The youth are taken through a vetting process and after ESP has passed them, their businesses are then availed to the corporates in groups of five. Within the five we ensure gender balance, variety of business both in nature and funding requirements

Funds are allocated based on the project idea and budget. Average funds allocated to clients vary between Ksh.35, 000/= - Ksh. 200,000/= with an average of Ksh.150, 000/=. KYBT requirements are youth friendly and are organised as follows:

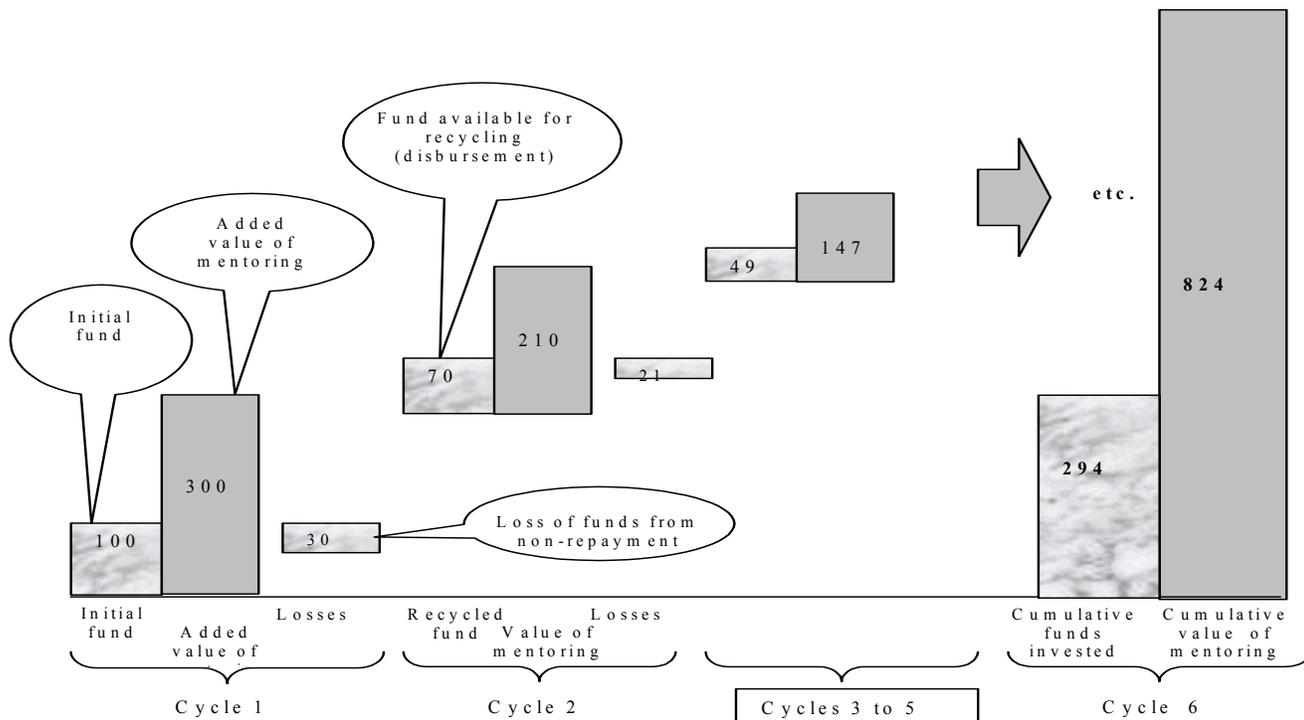

- No collateral asked for
- Management fee – 10%
- Grace period – 2 to 6 months
- Payback period – 3 yrs

The money is then recycled to support other young entrepreneurs.

Experience Worldwide on YBI youth businesses indicates a success rate of 70%. Reasons for default include:

- Formal employment: Some youth opt for formal employment when that opportunity avails itself
- Absconding: Even with the help of mentors, some youth give up business after a short while.
- Business failure

These young people redeem their financial obligations and therefore the initial support to one business is passed on to many, more prospective youth entrepreneurs. The mentor enriches the fund by 300 units to every 100 units. If you allow for a 70% repayment rate for businesses, the fund would generate within a relatively short time a net investment into the community of more than 1100 units (As explained on chart A below) By the 6th cycle the value added amounts to 1100 units which is more than ten fold what was invested.

Source: Youth Business International

**Chart A:** Financial implications of a youth business programme

## Loan panels

The process of loaning is transparent and goes through a panel. This is important for good judgement and to provide opportunity to all those deserving cases. The panel comprises of business people from the local community who volunteer their services on a regular basis. The panel is known as the Entrepreneur selection panel (ESP).

The ESP plays an important role in the selection of the entrepreneur to be funded by Kenya Youth Business Trust (in accordance with the directions and criteria laid down by the BOT). The ESP consists of senior and experienced business people, who are representatives from Industries, Banks, Management and Technical Professions.

The ESP meets at least once a month for 1-2 hrs to:

- Study applications and conduct interviews. Potential entrepreneurs are presented to the panel by the Secretariat after the initial screening procedures are successfully completed.
- Access the viability of the projects based on the entrepreneur summary, site visit report, and technical evaluation report.

During the interviews, ESP finds out (from the entrepreneur) the following:

- Vision for development / future plans
- Growth potential to the business
- Market demand for the project / service
- Investment required
- Payment schedule and monthly expenses etc

Other crucial aspects questioned and analyzed by the ESP include:

- Average monthly sales, monthly expenses etc
- Break-up of working capital
- Profit margin
- Cash-flow statement

Based on the above findings, the ESP then provides guidelines on the loan amount to be approved and suggest the appropriate mentor for the business.

The ESP has the responsibility to

- Select entrepreneurs and approve loans to them in accordance with the criteria and directions recommended by Board of Trustees.
- Suggest /recommend appropriate mentors for the businesses
- Review the progress of the selected cases from time to time
- Pay special attention to the problematic cases. ESP members may be called upon from time to time to visit the entrepreneur's unit for counselling or to put pressure in case of failure to repay.
- Decide on rescheduling of the loan amount in case there is a genuine need.

## **Programme Achievements**

- *Applications to date:* 265
- *Complete business plans:* 83
- *Interviewed applicants:* 24
- *Approved loans:* 16 (10 funded for pilot)

## **Challenges**

### **1) Business plans**

It takes a long time for the applicants to prepare the business plan, especially the cashflow forecast. Although KYBT has a simple template that should make the process of business planning simple and manageable, many of these young people come to the office up to 3 times, before they can successfully complete the plan. It therefore became necessary for the secretariat to conduct business plan preparation sessions with about 5-8 applicants at a time. The sessions are geared towards the youth explaining in detail what the plan is about. These enables each applicant assess there plan and make amendments where necessary before submitting them.

During these sessions, there is a lot of useful information that is revealed that the secretariat would otherwise not know.

## **2) Selection of viable businesses**

The secretariat has to evaluate each business plan and select the most viable businesses. We base our selection on the ideas rather than on the execution of the business plan. We have realised that some young people have good ideas but are limited due to lack of proper education. Youth with good ideas are assisted in the execution of the business plan in preparation for the interviews by the Area board panel.

## **3) Recruiting mentors**

Mentors are volunteers. They sometimes contact us having heard about us from friends but usually, we have to put a fair amount of energy in the recruitment process. We have done this by raising the profile of KYBT and by sending information through mail (emails) to potential recruits who need to fully understand the commitment they are going to make. On 11<sup>th</sup> March 2004, we had mentors' recruitment cocktail and 42 potential mentors attended.

It has been a challenge to find mentors who are committed to their roles. The need for volunteer business mentors in any YBI initiative cannot be underestimated. A study of YBI young entrepreneurs found that 75% felt their business mentor had made a difference to their success. This is also one of the key reasons why 60% of all the businesses YBI have helped launch are still operating successfully in their third year.

## **4) Matching businesses to mentors**

Matching mentors with the entrepreneurs requires careful consideration. An unsuitable match could damage the confidence of the young person, make the business mentor leave the programme and create a lot more work for the secretariat.

We try to match the skills and characteristics of the business mentor to the personal and professional needs of the entrepreneur. This means considering details such as gender, religion, race or age with knowledge of the particular business, interests and background.

## **5) Training in good business practices**

Most young entrepreneurs have not been trained in business ethics. The secretariat therefore has to conduct short training sessions with those who have completed their business plans. The mentors also aid their mentees learn good business practices during their meetings

In addition, KYBT organises three formal training sessions for both Mentors and the entrepreneurs every year.

## **Conclusion**

### **YBI Model**

The YBI model has been successful in 26 countries, Kenya included. However, it requires customisation to suit the different environments. In Kenya several adjustments have been made and there is a likelihood of more adjustments in the future. Challenges faced are overcome by adjusting the model accordingly.

## **Examples of customisation:**

- The youth that qualify for the loan don't receive cash or a cheque in their name. We pay the provider of the equipment or materials needed directly.
- KYBT has a Field officer who works closely with the mentors. Initially the mentors were expected to send monthly reports to the secretariat. This was not viable as the mentors were either travelling on business or bogged down with their office responsibilities.
- Introduction of mentor mobile clinics in the urban areas.

## **Mentoring**

Mentoring is indeed at the heart of every YBI programme. KYBT has developed a mentors' programme with the help of the mentors themselves. The aim of the programme is to help keep the mentors motivated. These include:

- Three training sessions in a year,
- Regular get-togethers with other KYBT volunteers
- Networking cocktails to give them an opportunity to interact with the BOT, Area board, ESP and KYBT sponsors.

## **Programme impact**

As noted in the background, unemployment is a worrying phenomenon all over the world. However, it poses even more threat to the developing countries such as Kenya where young educated youth find themselves on the street without anything to do and frustrated. Many of these have turned to criminal activities, destroying their lives, the country's image and posing danger to the very existence of nations. All means must be put in place to create opportunities for the youth. KYBT has started playing a role however small it may be in alleviating this particular problem. Among the results noted already include empowering the young to realise their dreams and to become good contributing citizenry. A number of projects started have started showing signs of success and some of the youth who otherwise would be in the streets on drugs and criminal activities are now engaged in fruitful businesses. The programme impacts the entrepreneur, local and business community as indicated below:

### **1) To Entrepreneur /Beneficiaries**

- Empowerment of youth through self-employment
- Economic independence
- Self respect and a sense of worth increasing self esteem
- Knowledge in good business practices
- New contacts through networking with mentors and other Entrepreneurs

### **2) To Community (Multiplier effect)**

- Entrepreneur's family and next of kin benefit from increased income
- Each youth business employs an average of two persons therefore reducing unemployment

- Knowledge learnt by Entrepreneur is shared with friends and relatives
- Entrepreneur becomes a role model encouraging more youth into self-employment

### **3) To the business community**

- An opportunity to get involved in the local community
- Development of an entrepreneurial culture
- Development of dynamic small business sector
- Sharing skills through mentoring and networking that impacts on the whole community

The programme has provided opportunity for successful entrepreneurs to “give back to society” by volunteering to support the youth to stamp out unemployment and reduce poverty.

## **Recommendations**

### **1) Business plans**

KYBT does not discriminate against youth that can't put together a business plan. In the past the secretariat has put great effort in ensuring that all youth with good ideas are assisted in understanding and completing the business plan template.

This current arrangement is not sustainable as the number of youth applying for funding increases. KYBT is in the process of forging partnerships with learning institutions that offer business and finance. They are looking at the possibility of finishing students assisting KYBT potential beneficiaries in putting together the business plans. The institutions approached have shown interest and these partnerships are expected to be formalised by August 2004.

### **2) Vetting process**

The vetting process needs to be very stringent to minimise risk since our funding requirement exclude collateral. Before we ask a potential entrepreneur to put together a business plan we undertake a site verification exercise. The Field officer makes a physical check on the youth to confirm his/her background, residence and area of proposed business. We also require two referees who are not relatives to sign that they know the youth well.

If the exercise is satisfactory, the youth is given the business plan template to fill. The business plan is taken through technical evaluation to confirm viability. Technical evaluators are volunteers who are attached to KYBT to assist in assessing businesses in their specific areas of expertise. If the youth wants to start a shoe-manufacturing unit, we ask a person (evaluator) in a shoe industry to perform the technical evaluation.

It is only after the youth has successfully passed these two exercises that they qualify for the final stage, the panel (ESP) interview.

### **3) Mentoring**

The one on one mentoring model (where one entrepreneur is attached to one mentor) is not always easy to implement. As stated earlier, there is fear of visiting the slum areas alone. We have solved this problem by introducing the mentoring mobile clinics. These clinics have safety in numbers and have the added advantage of exposing the youth to mentor with varied expertise.

## **ABSTRACT**

While many studies have been conducted and documented on the impact of enterprise education, this study concentrates on the evaluation methods used to assess the outcomes of enterprise education. The results of the study will enable educators to better understand the process of evaluation and how it can be applied to best effect in practice. The research for this paper was undertaken in six European countries: Finland, Ireland, Austria, Germany, Norway, and Spain. Each country had a key partner who was responsible for the work undertaken in that country. The research was funded under the European Union Leonardo initiative<sup>1</sup>. The literature review began with an examination of the various types of enterprise education interventions that were categorized as follows: (1) Learning about entrepreneurship; (2) Learning to become entrepreneurial (non-business focus); and (3) Learning to become an entrepreneur (business focus). The literature review also assessed the different types of evaluation methods that are available to education providers and how they might be utilized at different stages of intervention. Following the development of a taxonomy of reports for each country under these headings, qualitative research was then undertaken by each participant through five in-depth interviews with local experts in each of the six countries, giving a total of thirty interviews. This paper offers educators a greater understanding of the evaluation processes in enterprise education, the different levels of evaluation required to suit the different stages of the programme, as well as insights into developing pre and post-programme evaluation.

# INTRODUCTION

It has become increasingly recognised by governments across Europe that the creation and encouragement of an enterprise spirit is a critical constituent to generating jobs, and to improving the competitiveness and economic growth of an economy (European Commission, 2002). In order to engender entrepreneurial activity, numerous interventions are delivered by a variety of bodies across Europe. These interventions are extremely diverse, ranging from pan-European policies to highly localised initiatives. However, according to the European Observatory for SME Research (1994), these interventions tend to converge upon nine areas of activity:

- Start-ups and growth,
- Job creation,
- Research and development,
- Capital and finance,
- Investment,
- Exports,
- Co-operation,
- Sub-contracting,
- Education.

Each of these areas of activity offers its own form of specialist, but broadly varied, support. For example, in terms of structured intervention for education (including training and development), there are a very large number of initiatives now taking place across EU countries (Henry et al, 2003b). Therefore, from an analysis perspective, it is quite difficult to generalise these initiatives as the focus of the programmes vary greatly dependent upon the needs of the local economy. An additional difficulty in generalising about enterprise education is that the term 'enterprise education' covers a broad spectrum of training and support provided to owner-managers, budding entrepreneurs, and students of entrepreneurship. However, investment in this type of support represents considerable expenditure and therefore there is a need to ensure that it represents good value for money. This can be difficult to achieve, as it can be very challenging to effectively evaluate the long-term impact of soft supports. It can be argued, for example, that the impact of financial support is more easily evaluated than educational support, as there is a more direct correlation between the support and the outcome (Moran et al, 2003). Nevertheless, the primary objective of this study is to focus on the evaluation processes used to assess the outcomes of enterprise education and to deliver to the enterprise education community a greater understanding on how to maximise the evaluation process.

## DEFINING ENTERPRISE EDUCATION

Within the study of entrepreneurship, the debate continues as to whether or not entrepreneurship can be taught. Some people are undoubtedly 'born' or 'natural' entrepreneurs and will display entrepreneurial skills and behaviour without any enterprise education or training. But there is also a school of thought that argues that entrepreneurship is a skill and can be learned. Drucker (1994) is quoted as saying that 'most of what you hear about entrepreneurship is all wrong. It's not magic; it's not mysterious; and it has nothing to do with genes. It's a discipline and, like any other discipline, it can be learned' (Hill et al, 2003). If one considers Drucker's version of entrepreneurship, it implies that if entrepreneurship can be learned, it is something that

can be taught. While many authors have debated the arguments for and against intervention in entrepreneurship development, the benefits of interventions such as entrepreneurship education and training are widely acknowledged and accepted (Henry et al, 2003b).

Over the past decade, there has been significant growth in the provision of structured education and training programmes across Europe (Henry et al, 2003a). But entrepreneurship education is a broad subject area and it covers a wide variety of education and training interventions, delivered by an extensive number of providers, ranging from universities to state agencies and private training companies. It can be applied at a number of different levels, ranging from primary school level all the way up to and including adult education and training, and lifelong learning. However, some authors make a clear distinction between entrepreneurship *education* and entrepreneurship *training*. Henry et al (2003a) identified three categories of intervention based primarily on the stage at which the intervention is provided. These interventions were categorised as follows:

1. Education **about** enterprise,
2. Education **for** enterprise,
3. Training **in** enterprise.

The first of these is focused on awareness creation and is academic in nature, the second is aimed at the preparation of aspiring entrepreneurs who want to set up and run their own business. The third category, training in enterprise, is an extension of the second category and provides further entrepreneurial development to growing or established entrepreneurs. These distinctions in categorisation are critical when determining the purpose of an enterprise education programme.

There are also other important distinctions that need be made when considering the field of entrepreneurship education. Entrepreneurship is often considered to be a skill applied in the development of a new business, but this is only one aspect of the role and importance of entrepreneurial skills and attitude. Increasingly, it is being recognised that entrepreneurship is not only a means for creating a new business, but it is also an attitude that can be developed and applied by everyone in day-to-day life and working activities (Iredale, 2002). Indeed, many large corporations now seek to instil entrepreneurial attitudes and skills in their workforce, more usually associated with smaller companies. This is known as intrapreneurship and can bring about many benefits for large companies who need to be creative and innovative to stay ahead of their competitors.

Educational systems have not traditionally been geared towards the development of entrepreneurship but have tended to have as their final goal, the creation of employees who would work in large companies or public administration. However, this situation is changing and there is a growing awareness in Europe that initiatives should be developed to promote an enterprise culture and encourage risk-taking, creativity, and innovation. The field of enterprise education has an important role to play in enhancing and developing entrepreneurial skills and capabilities. Enterprise education from an early age should underpin the process of developing a culture of enterprise within society as opposed to one of dependency (Iredale, 2002), and in doing so, recognise that not everyone can be an entrepreneur, but everyone has the potential to be enterprising.

Entrepreneurship and entrepreneurship education can therefore be considered from a variety of perspectives, including the traditional education system from primary up to

tertiary level and the vocational education system. What is to be taught will depend largely on the target population. Throughout Europe, entrepreneurship education is being provided through a range of avenues and through a wide variety of initiatives and programmes designed to encourage entrepreneurial behaviour and creativity. However, the question remains 'how successful are these programmes'?

## **METHODS OF EVALUATING TRAINING PROGRAMMES**

An issue that has been raised by many writers is the vagueness of objectives of enterprise policy, thus making the resulting interventions difficult to evaluate. Menzies (2003) pointed to the fact that education, as opposed to training, is not an 'instant payback phenomenon' and noted that, while a number of studies do exist, research related to the outcomes of entrepreneurship education is under-researched in the entrepreneurship literature. Hill and O Cinneide (1998) argued that while some studies have investigated the effectiveness of entrepreneurship education, they often tend to focus on one particular programme and its immediate outcomes. There also appears to be a lack of longitudinal studies, such as that by Owusu-Ansah et al (2001), which monitor the impact of entrepreneurship education over a significant period of time.

One of the most popular models for training evaluation is the Kirkpatrick model, developed in 1959 and presented as a series of four articles in the American Society of Training and Development Journal. Kirkpatrick's four level model measures the impact of training in an incremental manner. Level one measures **reaction**, which ascertains the participants' reaction to the programme or intervention and is normally assessed immediately or very soon after the completion of training. This is done by asking participants to give their immediate views on the intervention. This level of evaluation is often applied to enterprise education and training. Level two measures **learning** and level three measures **transfer of learning** (changes in behaviour as a result of what has been learned in the intervention). Level two evaluation is more laborious and time consuming than level one and aims to assess the amount of skill or knowledge acquired as a result of the intervention. Level two evaluation can also be more difficult to apply to entrepreneurship interventions. Level three evaluation measures changes in behaviour. It is known that the higher the level of evaluation attempted in the Kirkpatrick model, the more complex the evaluation process becomes and the more difficult it is to attribute changes in behaviour, for example, to any one particular intervention (Abernathy, 2001). Changes in behaviour may not occur for a considerable amount of time after the intervention and after any evaluation has taken place. Level four evaluation is about **results**. This is sometimes known as the 'bottom line' evaluation and measures the Return On Investment (ROI) or cost benefit of the intervention. Non-financial indicators such as improved quality of work, improved safety record or better morale, all of which have the potential to translate into financial gain at a future date, can be used as well as financial data. Again, level four evaluation is quite challenging because it is difficult to establish clear evidence that a particular intervention resulted in level four outcomes.

The Phillips model could be considered to be an extension of the Kirkpatrick model, where ROI is calculated by placing a monetary value on training worth and using that to calculate ROI of a training intervention (Donovan et al, 1999). The Phillips approach is to collect the post-programme data and isolate the effect of training from other influences, thereby estimating the contribution of the training intervention in financial terms. This is a strength of the model, but weaknesses include a lack of attention to the pre-programme phase where the pre-testing must take place if the model is to be tested and secondly, the

reliance on an estimator's ability to identify a unit of output, which can be reliably converted into monetary worth.

Models such as those of Kirkpatrick and Phillips are not without their limitations and alternative views of training evaluation are beginning to emerge as organisations seek to find an appropriate method of evaluating the return on their training investment (Donovan et al, 1999; Abernathy, 2001). However, research (Moran et al, 2003) found that, in terms of the evaluation methods currently used, none were considered to be ideal in the evaluation of enterprise education in the long term. With reference to the Kirkpatrick model, most interviewees felt that it was not possible to truly go beyond stage one or two in the evaluation process, due to the increasing complexity of evaluation beyond stage two and the associated costs and difficulties in obtaining meaningful data from the participants. It was felt that an element of stage three evaluation might be possible, but that most evaluations remained at level one or two and that this could provide an indication of the likely outcomes of stage three and four evaluation. This research also found that there are relatively few published evaluations available on the benefits of enterprise education, but it is clear that the importance of evaluation is recognised and that evaluations are in fact carried out. There is not a universal model of evaluation that is applicable to enterprise education evaluation, and it would appear that there is a considerable amount of scope to improve on the methods currently employed. This study set out to establish the current methods that are being utilised in six European countries and thereafter, to offer insight into the development of appropriate methods for evaluating enterprise programmes.

## **RESEARCH METHODOLOGY**

The research began with a survey being carried out in six different European countries (Austria, Finland, Germany, Ireland, Norway and Spain) of the literature on evaluation studies in the field of enterprise education and entrepreneurship training that was available in each country. In total, ninety unpublished or published evaluation studies were reviewed, analysed, and classified by the national researchers. The data gathering was conducted by using agreed guidelines in order to retrieve comparable data from all of the participating countries. Some of the studies analysed were not linked to a particular programme or initiative, but instead represented a more general discussion with regard to evaluations in the field or incorporated an evaluation of a range of programmes. One of the key difficulties in this phase of the research was in accessing reports that were available for public information. Many organisations evaluate their programmes but do not make them available publicly. Later research with interviewees suggested that some reports are not made public because of the negative impact they may have on the funding of the programme due to unproven value or results emanating from the programme.

The second phase of the research study involved interviewing experts in the field of enterprise education and entrepreneurship training so as to gain more in-depth insight into the evaluation of these programmes. The experts were selected from three different groups: programme promoters, evaluators and policy makers. The interviews were conducted using templates (one for each group) that were developed based on the results of the literature survey. Each country partner was required to carry out at least one interview with a representative from each category, and to carry out a total of five successful interviews in their country. A total of thirty experts were interviewed from the partner countries. The interviews were analysed thematically as areas of convergence and divergence were sought across countries.

## **ANALYSIS OF DATA**

As the ambition of the research project<sup>2</sup> was broad, since it sought to examine the problems of evaluation of enterprise education programmes from a wide perspective, this research paper concentrates on specific elements of the qualitative interviews and literature survey. The original aim of the research was to develop a standardized evaluation system which could be utilized in any country across Europe and which would have different levels to suit the different stages of the programme, as well as pre- and post-programme evaluation. However, the research carried out clearly demonstrated that no 'one-size-fits-all' model could be developed. The results of the expert interviews highlighted that there exists a wide range of different aims for evaluations due to multiple parties being involved in evaluations. Also the programmes differ greatly from each other in their aims and contents and therefore a generalised system of evaluation was considered inappropriate. The paper therefore focuses on the different aims of evaluations and the measures used in evaluations.

The result of the research study was positive in many respects since it engendered important recommendations on how to conduct an evaluation in the field of enterprise education and entrepreneurship. Some of these recommendations and results may also be applicable to evaluations in other fields/areas. As a result of the research project a web tool for planning the evaluation of enterprise education and entrepreneurship training will also be developed. This web tool will develop the multiple possibilities when conducting an evaluation and will help the user to plan an evaluation for their own education programme. This web tool will be available for the public at [www.entreva.net](http://www.entreva.net) from October 2004. In the following sections, some of the important findings concerning the aims and measures in evaluation studies of enterprise education are discussed in detail. A comprehensive review of the study is contained in the report by Hytti and Kuopusjarvi (2004).

### ***Basic Prequisite***

When planning an evaluation of a programme, the specific characteristics of the education programme in question should be considered, particularly its objectives. As already discussed in the previous paragraphs, the field of enterprise education and entrepreneurship training is quite diversified and the aims of education can be divided into three categories: (1) Learning about entrepreneurship; (2) Learning to become entrepreneurial (non-business focus); and (3) Learning to become an entrepreneur (business focus). Therefore, the objectives of the education programme needs to be clarified since it has implications on what actually can or should be measured/evaluated. Other characteristics of the programme, such as the level of education of the target group, will also have a significant bearing on the suitability of the evaluation methods.

### ***Aims of Evaluation***

One of the first considerations in the evaluation process is to decide the purpose of the evaluation. Based upon the literature review undertaken, there are many different needs for evaluations, some based on the phase in the policy-making process in which the

Small Business Institute, Business Research and Development Centre, Turku School of Economics and Business Administration.

programme takes place, and others on the objectives set for the programme. There is a unique set of possible uses for evaluations but a multitude of potential uses. However, evaluation studies can be divided into several categories. Depending upon the conductor and/or financier of the study, the evaluation can be either internal or external. In internal evaluation studies and procedures, the programme promoters generally aim at learning from their own activities in order to improve the training offer. In external evaluation studies, an outside evaluator is contracted for conducting the evaluation study. Internal and external evaluations can also be overlapping or substitute one another. Whether the evaluation is internal, external, or a mixture will most likely influence the aims set for evaluation study.

In order to classify the multiple aims in some way, the taxonomy developed by Diamond and Spence (1983) was employed as a basis for the analyses of the literature and interviews. They acknowledge four basic types of questions for evaluation research:

- 1) Programme planning questions,
- 2) Programme monitoring questions,
- 3) Impact assessment questions,
- 4) Economic efficiency questions.

Based upon analyses of the data, a focus was placed on the first three objectives: programme planning, monitoring, and impact analyses, since economic efficiency was not a topical question in the data. *Impact assessment* was the most common aim in the evaluation studies analysed. *Programme planning* questions and *programme monitoring* questions were both equally common. The expert interviews revealed the same emphasis on the different aims, although the different expert groups emphasised the aims very differently. Programme promoters are more interested in developing the programme, whereas programme evaluators were more interested in monitoring the programme, and programme policy-makers were more interested in impact assessment. It was quite clear that the different parties involved in evaluations also have very differing aims for the evaluation of certain programme(s). This in turn may cause major difficulties in the use of evaluation studies and in the results as it causes a lack of clarity in the purpose of the evaluation process.

The research also revealed that evaluation studies have aims that may not always be very openly communicated. The evaluation studies may be conducted, for example, for the justification of policies, or for marketing and public relations purposes. In fact, frequently it appeared that some stakeholders (e.g. financiers or programme promoters) had some hidden agendas, which may even lead to developing such a methodology that will 'falsify' positive results for projects.

## **Measures**

One of the most difficult issues in the evaluation of enterprise education is what to measure and how. The research sought to gain a solution to this particular challenge by asking the experts what they considered to be the 'most suitable' or 'potential' measures to be applied when evaluating different kinds of programmes. When analysing the answers it became clear that most respondents understood the issue by way of measuring the *impact* of the different programmes. The lack of measuring instruments was thus highlighted with many of the experts asking/wishing for commonly accepted criteria that would also improve the usability of evaluation studies in the field of enterprise education and training. The following sections present measures that should be used in the evaluation of enterprise

education and are based on the three most important aims presented earlier (programme planning, programme monitoring, impact assessment).

## **1. Programme Planning**

In many of the evaluation studies, the primary aim is to assist in *programme planning* (i.e. identifying the appropriate education/training techniques, target groups, and budget). The concept is that it is possible – and necessary – to evaluate the process, not only the outcome. From the perspective of the different aims for the enterprise education and training, programme planning is an important aim for all evaluations. It is no surprise therefore that in the qualitative expert interviews, the programme promoters put much emphasis on carrying out evaluations that assist in continuously improving materials, adapting to change, and planning of the programmes.

For the programme planning purposes, it is quite customary that the participants (students, teachers, stakeholders) are asked questions directly about the programme. These questions typically centre about the different elements of a programme: *Contents* (knowledge and skills the programme aims at providing), *Methods and Materials* (the way the knowledge and skills are learned/taught), *Teachers and Tutors* (the people responsible for teaching/facilitating learning and of their relationship with the students), and *Organisation of the Programme* (the process, timing, rooms and facilities). The questions about these areas can include questions about the expectations of the students for the course and an assessment if these expectations have been met, questions about the motives for attending a particular course, questions about the usefulness of the programme or satisfaction of the respondents towards a course, identification of what the participants had learned, and suggestions to improve the course. These questions are clearly structured in 1 below.

**Table 1 - Questions Addressed in Evaluation Studies for Programme Planning Purposes (Hytti & Kuopusjärvi, 2004)**

	<b>Motives or expectations vs. meeting of expectations</b>	<b>Usefulness of the programme, satisfaction</b>	<b>Learning outcomes</b>	<b>Suggestions to improve the course</b>
<b>Contents</b>	What the participants had expected from the contents? Had these expectations been met?	Were the participants satisfied with the contents? Were they useful?	What the participants had learned from the programme? (Improve contents?)	How to improve the contents of the programme?
<b>Methods and materials</b>	What the participants had expected from the methods applied? Had these expectations been met?	Were the participants satisfied with the methods and materials? Were they useful?	NA.	How to improve the methods and materials of the programme?

<b>Teachers and tutors</b>	What the participants expected from the teachers? Had these been met?	Were the participants satisfied with the teachers and tutors and their role? Were they useful?	NA.	How to improve the teaching of the programme? (A need for replacement of teachers?)
<b>Organisation of the programme</b>	What the participants had expected organisation of the programme? Had these expectations been met?	NA	NA.	How to improve the organisation of the programme?

In terms of the Kirkpatrick model, many of these questions lie within Level 1 (Reaction), and Level 2 (Knowledge) to a lesser extent. The questions are orientated towards an immediate feedback of how the programme could be improved and what the individual believes they have learned from it. The evaluation would have to take place some time after the programme was completed before a better understanding of Level 2 (Knowledge) and Level 3 (Transfer of Knowledge) could be acquired.

## **2. Programme Monitoring**

The evaluation of programme monitoring provides a systematic assessment of whether or not a programme is operating to the conformity of its design and whether or not it is reaching the target population. If a programme deviates from its original intentions then much care must be exercised when interpreting the results from the evaluation study (Diamond & Spence, 1983). Based on the literature review, monitoring studies are frequently aimed at measuring and reporting the following issues:

- Number of participants,
- Recognition of participants (who they are),
- Numbers who return to further training ('satisfied customer'),
- Costs / participants (linked to economic efficiency),
- Number of failed students,
- Strengths and weaknesses of the programme.

Similar to programme planning, programme monitoring can be carried out irrespective of the programme aims. However, in the expert interviews, monitoring was not emphasised, except by the financiers. This reflects the fact that monitoring alone is not very important but it is needed for carrying out programme planning and programme impact evaluations. From the financing perspective, however, it helps to keep track of the activities and expenditure.

## **3. Impact Assessment**

The most common perception of evaluation is impact assessment. Impact assessment evaluation gauges the extent to which a programme causes change in the desired

direction. This implies that programme stakeholders are not only interested in the effects, but also in the direction taken by the participant after the programme has been completed (Diamond & Spence, 1983). Based on the analysis of the research, it was found that two main categories of measures should be used in assessing the impact of the programme: start-ups, new ventures, entrepreneurs and jobs; and attitudes, perceptions, intentions (and behaviour). These categories are introduced below but greater information is offered in the report by Hytti and Kuopusjarvi (2004) which discusses the research study in full detail.

### 1) *Start-ups, new ventures, entrepreneurs and jobs*

The most popular measure suggested in the data was *measuring of new start-ups*. Not surprisingly this was especially underlined in the programmes that aimed at increasing the number of new ventures and entrepreneurs but it was quite common in the other programme types as well. This result is interesting because it highlights the (hidden) meanings and agendas that people involved in enterprise education have about the role of enterprise education. Alternatively, the start-up measure is suggested because it is concrete and relatively easy to measure.

According to some of the interviewed experts, not only should start-ups should be measured, but also the decisions of participants on a course that they will not start a business (testing of ideas, self-critical aspect). The experts also argued that it is necessary to take into account the time factor. It was understood that while the long-term effects are more important, they are more difficult to assess. It was also emphasised that it is not enough to produce a large number of start-ups but to create *successful* start-ups, and hence it was suggested that measures should be put in place to measure the quality of the companies (e.g. by measuring the number of sustainable start-ups such as companies that are on the market 3-5 years after the start-up, or by measuring if these start-ups are entering prospering or dead-end markets). Furthermore, the number of jobs created (and the quality of these jobs) was also suggested as a measure reflecting also the question of 'quality' of these companies.

The comparative element of start-ups is interesting as it helps to assess what is an expected or accepted level of start-ups. In some of the interviews, comparisons of results between different programmes, different regions and/or entrepreneurs of different groups were suggested, such as comparisons across different categories of entrepreneurs: 1) Entrepreneurs that have participated on a programme and have been successful; 2) Entrepreneurs that have not participated on a programme and have been successful; 3) Entrepreneurs that have participated on a programme and not been successful; and 4) Entrepreneurs that have not participated on a programme and have not been successful. These comparative studies will enable evaluators to analyse how participants on programmes have progressed in comparison to matched groups who did not participate on the programme. A significant difficulty with this type of study is that it cannot legislate for all other variables that may influence the success of a business.

### 2) *Attitudes, perceptions, intentions (and behaviour)*

The start-up measure was also considered to be too limited and a process approach was suggested to measure the different steps in the process, starting from changes in skills, motivation and intentions. In many programmes where the time lag is important, it is difficult to observe or to account for start-ups in the short term, necessitating another measure. In these types of programmes, the measurement of *attitudes, perceptions and*

*intentions* is frequently applied. The changes in attitudes, perceptions of own capabilities, and possibly also intentions are applied as the measurement tools for the impacts.

Based on the analysis of this research study, it was significant that the attitudes measured primarily dealt with entrepreneurship as a general phenomenon, as a personal career choice, and as a teaching subject. However, in measuring the attitudes, the challenge remains: 'what is the acceptable standard against which to measure the attitudes?' An alternative or complementary measure is the change in the attitudes as a result of doing (or during) the programme. It must also be noted that there are other intervening factors than just the course that may also account for the changes in attitudes, intentions, and perceptions. The third option is to apply the same survey at the same level over time. Another potential measure that has been applied is to question the beliefs and perceptions of one's own capabilities to act as an entrepreneur or entrepreneurially. The results of these studies must, however, be interpreted with caution. First, self-confident people might be more inclined towards an entrepreneurial career. Second, it would be relatively easy to suspect that as a general trend people perceive their capabilities to be better than they are in reality. Attitudes and beliefs are not objective measures for the (long-term) impacts of a programme. However, attitudes and beliefs are important in the sense that they can be understood as the products of social and cultural environment and that they can be applied as a starting point for interventions in the school or university environment.

### *3) Increase in knowledge and development of skills*

In some cases – especially concerning those programmes that aimed at increasing knowledge and/or skills about entrepreneurship - the interviewed experts suggested that it could be measured whether the participants possessed the necessary knowledge and skills, e.g. for start-ups, after the programme. It was suggested that this type of impact could, for example, be measured by analysing business ideas and the quality of them. It was also suggested that (acting/real) entrepreneurs could analyse the skills and knowledge of the participants concerning entrepreneurship and starting-up since they could be regarded as experts in this field since they would/should know what is required. Long-term evaluations were also suggested for identifying what happens to the participants over the course of the years, what they remember and how they rate the usefulness of the experience. In addition, traditional measurement techniques were also suggested, for example measurement of improvement in understanding business through exams.

### *4) Entrepreneurial behaviour and learning about entrepreneurship*

A critical finding of the study was the need to develop new tools for evaluating the impact of programmes that aim at boosting entrepreneurial behaviour or learning about entrepreneurship (non-business focus). The experts interviewed found this to be very challenging task and based on the literature review, the lack of experience in this type of evaluation was evident. For example, it appears that a fairly low number of existing evaluations made use of qualitative material, such as learning diaries or stories written by the students or observational material gathered in the process. This is of course also a matter of effort and costs - they require the use of highly qualitative, time-consuming research methods. In the expert interviews, however, where the approach was more future-oriented (i.e. not linked to actual evaluating practices), there were some highly innovative suggestions for measurement and evaluation techniques. For example, observation as a method was suggested especially in relation to children who may have it more difficult to verbalise their learning experiences than adults. In addition, there were suggestions to introduce visits at the workplace to assess to what extent any elements of

the programme are implemented. Furthermore, simulation games, meetings and practical experiences were included.

#### *5) Possible causes for impact*

In the impact evaluations, measuring the impact (how much, to what direction) is the key but an equally important analysis should be also the analysis of the causes for impacts. For example, it is necessary to analyse the achieved results against the aims and assess if the aims set in the first place have been realistic or over optimistic. In addition, understanding why a particular programme has been a success is important for being able to repeat the programme. Furthermore, a necessary analysis when assessing the results is the choice and selection of participants for the programme, since it could be a critical factor in the success of the programme.

When evaluating 'Impact Assessment', it is important to consider the five different elements that have been identified in this section and to carefully determine how they can be utilized to best effect within the evaluation process. As has been identified earlier in the paper, evaluating the benefit of a programme is fraught with challenges as one needs to consider the many other external variables that can influence the impact of the programme and the fact that it needs to be carried out over time, rather than at a point soon after the programme has been completed. These extra requirements add cost and difficulties to the evaluation process. A final barrier to undertaking this type of evaluation is that the final result may not provide the outcome that was anticipated, thereby offering proof of the inadequacy of the programme to meet its aims. Neither the programme promoters, providers, or policy-makers wish to read of such an outcome thus making evaluation of programme planning and monitoring much more preferable.

### ***Research Methods, Data, and Timing***

Based on the expert interviews and literature analysis, any general recommendations for the selection of methods and data sources cannot be given. The selection of methods is greatly dependent upon the aims of evaluations and the measures selected. As in all evaluation research, it is best to use multiple sources for data and multiple methods, both quantitative and qualitative. However, concerning the timing of the evaluation, two main recommendations were given. The experts interviewed emphasised both the need to carry out ex-post evaluations with an extended time lag as well as the need to carry out interim evaluations that allow changes in programmes also while the programme is running. These recommendations clearly reflect the different approaches of programme promoters and policy makers concerning the aims of evaluation.

## **CONCLUSIONS**

Based upon the analysis of this study, Diamond and Spence's (1983) classification was still relevant as a tool in planning evaluation studies and thus a focus was placed on the first three objectives: programme planning, monitoring, and impact analyses. When planning a programme, the following are the key issues for participants:

1. Contents
2. Methods and Materials
3. Teachers and Tutors
4. Organisation of the programme

It is necessary to acknowledge that the different kinds of programmes for enterprise education and entrepreneurship training and the different potential reasons for carrying out the studies create a situation where it is not possible to give 'one size fits all' type of recommendations for conducting evaluation studies. Hence, different results – at least on the short-term – are to be expected from the different programmes and different issues should be measured in relation to the programmes.

From a detailed analysis of the study, it would appear that as an individual measure, the number of start-ups is by far the most frequently used and acknowledged measure in the evaluations in the field of enterprise education, even in the programmes that aimed at learning about entrepreneurship, learning entrepreneurial skills, and learning to become an entrepreneur. It seems generally that the 'hidden agenda' behind enterprise education and entrepreneurship training is creating start-ups. This might also reflect the complexity of enterprise education and the lack of suitable measures. Based upon the analysis of the data, some other measures that may be more realistic and usable in the short term, given the different aims for the evaluations (see table below) could also be found.

**Table 2 - Aims and Measures of Evaluation (elaborated from Hytti & Kuopusjärvi, 2004)**

<i>Programme planning</i>	<i>Programme monitoring</i>	<i>Programme impact</i> →	<i>Possible consequences of impact</i>
<ul style="list-style-type: none"> <li>• Motives for participating, expectations</li> <li>• Meeting of expectations</li> <li>• Usefulness of the programme, satisfaction</li> <li>• Learning outcomes</li> <li>• Suggestions to improve the course</li> </ul>	<ul style="list-style-type: none"> <li>• Number of participants</li> <li>• Recognition of participants (who)</li> <li>• Costs / participant</li> <li>• Number of failed students</li> </ul>	Start-ups, new ventures <ul style="list-style-type: none"> <li>• Start-ups (time factor)</li> <li>• Non start-ups</li> <li>• Successful start-ups at viable markets</li> <li>• Comparisons</li> </ul>	<ul style="list-style-type: none"> <li>• Analyzing aims of (un)expected</li> <li>• Selecting participants</li> </ul>
		Attitudes, perceptions, intentions <ul style="list-style-type: none"> <li>• Changes in attitudes, perceptions, intentions</li> </ul>	
		Knowledge and skills (related to acting as an entrepreneur) <ul style="list-style-type: none"> <li>• Business ideas and plans</li> <li>• Assessment by "experts"</li> <li>• Traditional exams</li> </ul>	
		Entrepreneurial behaviour & learning about entrepreneurship (non-business focus) <ul style="list-style-type: none"> <li>• Learning diaries, stories</li> <li>• Observation of actual behaviour, simulations</li> </ul>	

To place all of this in context, it is important to offer an overall checklist of key considerations when undertaking an evaluation of an enterprise education programme. The principal considerations are:

1. Programme details
  - aims,
  - target group/market,
  - course contents,
  - methods and materials,
  - teachers and tutors

- organisation of the programme
- 2. Aims of the evaluation
  - planning,
  - monitoring,
  - impact,
  - economic efficiency.
- 3. Measures to be used
  - based upon the aims of evaluation
- 4. Sources of information
- 5. Budget
- 6. Conductor of the evaluation (internal or external evaluation)
- 7. Timing
- 8. Report structure
- 9. Availability of the report
- 10. The use of the results

It is only in considering each of these elements that the evaluation of an enterprise education programme can be properly undertaken. The complexity of the evaluation will be dependent upon the evaluation level being sought, and each measure is fraught with its own difficulties. What is critically important to the development of enterprise education is that such programmes are evaluated and the results of evaluation are used (for improvement) as well as made available for others (to learn). Otherwise, the educators are not learning themselves.

## **ABSTRACT**

There are strong indications that the institutional environment has a direct effect on the performance of small enterprises. Furthermore, perceptions of how the institutional environment will hinder or foster their respective firms shape the actions entrepreneurs take. This research looks at the Filipino entrepreneurs' perceptions of institutional obstacles in doing business - specifically the government-business interface. A sample size of 290 small and medium sized firm owners from different industries were provided with a list of 15 areas where the firm is confronted with government action and were asked to evaluate the degree to which these different areas create obstacles for conducting business. Data analysis included computation of means as well as a factor analysis to determine significant categories of obstacles. A discussion of the overall findings, as well as applicable lessons and future research follows.

## **INTRODUCTION**

There are strong reasons to believe that productive entrepreneurship is an essential explanatory factor for the economic performance of a country, and hence that cross-country differences in the degree of productive entrepreneurial activity are partial explanatory factors of observed cross-country differences in economic performance (Davidsson and Henrekson 2000). The promotion of small and medium enterprises (SMEs) has become an important strategy for economic development for most countries. It is interesting to note that despite differences in the institutional environments, entrepreneurs still flourish. In developing countries such as the Philippines, rates of business start-ups have increased, which is despite the difficulties in finding financing, high tax regulations, inflation, crime and theft and corruption.

Attitudes towards smaller businesses and entrepreneurial start-ups appear to be shifting favorably among political and economic decision-makers as the evidence of their importance mounts (Lundstrom and Stevenson, 2001). The role of the government in the development and growth of SMEs cannot be underemphasized. The government's role in encouraging entrepreneurship is not just limited to providing an institutional environment conducive for business, and a stable political scene. To stimulate economic growth through entrepreneurship, the government must provide the right combination of policies and incentives to attract individuals to become entrepreneurs.

In identifying key institutional determinants of firm emergence and growth, Davidsson and Henrekson (2000) analyzed a number of institutions and policy measures that are likely to have contributed to an environment that discourages firm activity and growth. The aspects dealt with included: the lack of entrepreneurship in the care sectors and household related services, taxation of entrepreneurial income, incentives for wealth accumulation, wage-setting institutions and labor market regulations. The investigation provided evidence of a low prevalence of nascent entrepreneurs and a small employment contribution by high growth firms. Among the high growth firms that existed in 1987 either as independent companies or as SME company groups, and which still existed as independent entities in 1996, the most spectacular growth case added 596 new jobs. Only fourteen cases added more than 250 jobs each; collectively these fourteen cases added 5217 new jobs over the ten-year period. This represents close to a complete void of spectacular high growth firms.

Entrepreneurs may be discouraged from starting a business if they have to adhere to an excessive number of rules and procedures. The level of procedural requirements for registration and licensing, taxes, and financial reporting may either facilitate or hinder entrepreneurial activities. Research shows that most small businesses consider paperwork very time consuming and cumbersome (Dana, 1987, 1990; Young and Welsch, 1993; Fogel, 1994). Countries that keep procedural requirements to a minimum generally have a viable and dynamic entrepreneurial sector. Research also shows that tax and other start-up incentives have a positive impact on small business establishments and growth (Davidsson and Henrekson, 2000).

In a worldwide study of institutional environments, a World Bank policy team (Brunetti, Kisunko and Weder 1997) surveyed more than 3,600 entrepreneurs from 69 countries and developed five quantitative indicators of institutional uncertainty: predictability of laws and policies, reliability of the judiciary, political stability, corruption in bureaucracies, and security of property rights. They found that uncertainty about policies, laws and regulations has hampered development of the private sector in many developing countries.

The above-mentioned investigation has motivated this research. The main purpose of this study is to determine the perceived policy obstacles affecting entrepreneurs in the Philippines. This paper will use the index developed in the World Bank Report on the overall government-business interface as perceived by entrepreneurs themselves.

## **PROBLEM STATEMENT**

This paper primarily focuses on the perceptions of the entrepreneurs on various obstacles in doing business. They consist of the following items: start-up regulations, price controls, foreign trade regulations, financing, labor regulations, foreign currency regulations, tax regulations, inadequate infrastructure supply, policy instability, safety/environmental

regulations, inflation, general uncertainty on cost of regulations, crime and theft, corruption and terrorism. This research will also compare the perceptions of entrepreneurs from the Philippines and less developed countries (LDCs).

To date, very few studies have evaluated the institutional environment surrounding SMEs. Even rarer are cross-country comparisons of institutional environments affecting small businesses. Cross-country comparisons would give more insight into how differences in context would affect the conduciveness of a country towards entrepreneurship. This type of investigation will also present similarities and differences in the perceptions of entrepreneurs from different countries, regardless of the context. It is also important to note that in this study, the entrepreneurs themselves evaluated the institutional environment. In order to be effective in promoting and developing SMEs, it is important to evaluate the institutional environment from the point of view of the main actor - the entrepreneur.

## **THEORETICAL BACKGROUND**

Institutional theory is the theoretical framework used in this study. This theory developed by developed by Douglass C. North, primarily analyses economic structures by explaining how institutions and institutional changes affect the performance of economies. Veciana (1999) stated, "Without doubt the theory that currently supplies the most consistent and appropriate conceptual framework to probe the influence of environmental factors on entrepreneurship is institutional theory."

Institutions, according to North (1989:238), which arise because of the uncertainty associated with human interaction, provide structure and order, the rules of the game to human exchange, whether political, social or economic. It provides the framework, the structure, to facilitate certain kinds of exchange as well as a framework within which people have some confidence as to how outcomes will be determined. They consist of both formal and informal constraints as well as their enforcement characteristics.

Informal constraints include norms, codes of behavior, subjective perceptions and traits. They arise to coordinate repeated human interaction and these constraints are extensions, elaborations, and modifications of formal rules, social sanctions and internally enforced standards of conduct. Formal constraints on the other hand include political (and judicial) rules, economic rules, and contracts (North, 1991:47). The function of these rules is to facilitate political or economic exchange. Enforcement on the other hand refers to whether the rules and informal constraints are enforced (and how rigidly it is enforced) or not enforced.

Using North's institutional theory, the perceived overall government-business interface has an effect on the entrepreneurs' perceptions of conduciveness of the environment for business. If entrepreneurs perceive the obstacles as being problematic, this hampers development of the private sector. Therefore, individuals tend to feel discouraged in pursuing entrepreneurial endeavors,

This study will only focus on the formal institutional factors specifically the government-business interface. Other aspects such as informal and enforcement factors will be dealt with in a forthcoming paper.

# **METHODOLOGY**

## **Sample**

The total sample consisted of 290 randomly selected entrepreneurs from the Manila. Firms that had an employment size of 10-199 employees served as respondents. Only the following four industry sectors were included in the survey of entrepreneurs: manufacturing; wholesale and retail; finance, real estate, insurance and business services; as well as community, social and personal services. Almost 90% of all SMEs in Manila are from these industry sectors.

## **Instrumentation**

The complete questionnaire contained 25 questions. They were from a World Bank survey questionnaire conducted by Brunetti, Kisunko and Weder (1997). The researcher obtained permission to use the questionnaire from the authors. This paper will deal with only one aspect of institutional obstacles specifically the government-business interface. This section provided the respondent with a list of 15 areas where the firm encounters government action and asks the owner to evaluate the degree to which these different areas create obstacles for doing business. The questionnaire used a Likert scale of six choices. The answers for the questions ranged from one (not a problem) to six (very strong problem) with the option of answering zero if the question was not applicable to the respondent or where there was no response.

## **Data Gathering Procedure**

Use was made of research assistants, who after instruction learned how to distribute and collect the questionnaire. Each research assistant distributed the questionnaire to several assigned firms. They emphasized that only the entrepreneurs themselves should answer the questionnaires. They then collected the completed questionnaire the following day. Before leaving the premises of the firm, the research assistant ensured the completion of all questions. This method of data collection ensured a higher response rate.

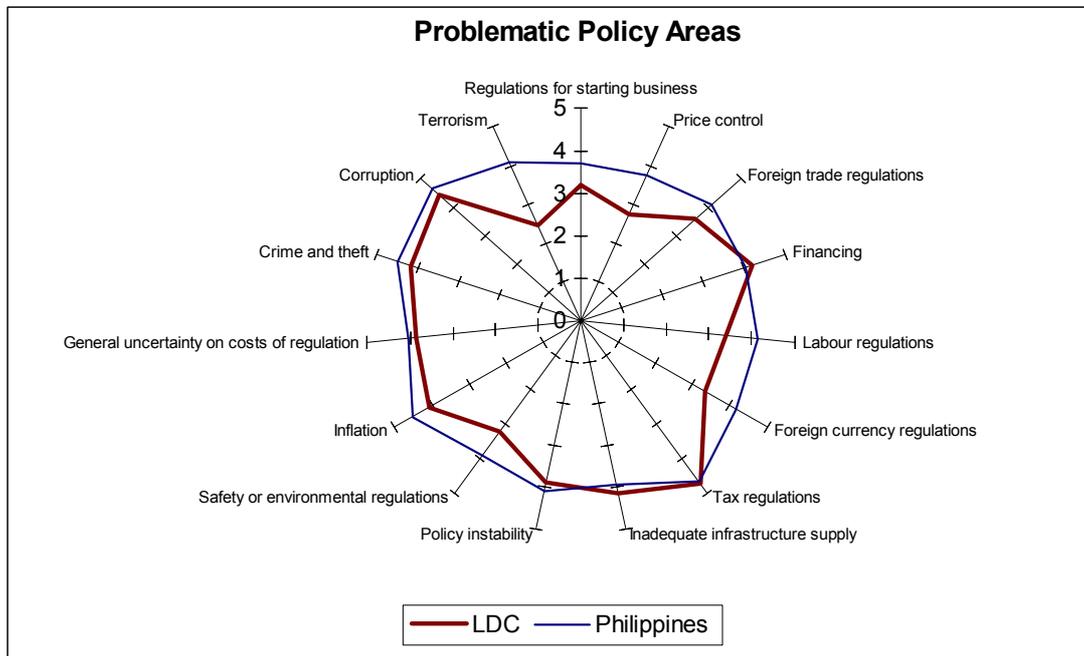

# **DATA ANALYSIS**

The data analysis in this study includes descriptive statistics such as means, frequencies and cross-tabulations. The index of obstacles for doing business on the other hand, takes the mean scores of the sample's responses on each of the 15 items. The computation of chi-squares ( $\chi^2$ ) indicated differences between the entrepreneurs from the Philippines and LDCs on the perceived problematic obstacles. A factor analysis on the 15-item scale identified underlying categories of perceived policy obstacles.

# **RESULTS**

Figure 1 graphically presents the means for each of the fifteen problematic policy areas for both Philippine and LDC entrepreneurs. The mean was computed by adding all the

responses of the entrepreneurs, and dividing it by the number of respondents. Generally, entrepreneurs from the Philippines have higher mean scores than their LDC counterparts in the different policy areas except for financing, tax regulations and inadequate infrastructure supply. This indicates that Philippine entrepreneurs in general feel that they encounter more problematic policy areas than their LDC counterparts. Notable differences in means can be seen in price control and terrorism (refer to table 1).

**Figure 1. Problematic Policy Areas - Philippines and LDCs**

Table 1 shows that at 6 degrees of freedom and  $\rho \leq 0.05$ , the critical value from the Chi-square table is 12.59. The computed values for all but one (corruption, with a computed chi-square value of 10.191) of the fifteen policy areas from the analysis exceed the critical value (12.59). This indicates that there are significant differences in the perceptions of problematic policy areas between Philippine and LDC entrepreneurs except in the policy area corruption.

**Table 1  
Comparison of Means: Problematic Policy Areas**

Policy Area	Phils. Mean	LDCs Mean	$\chi^2$ Value
Regulations for starting business	3.69	3.19	47.964*
Price control	3.75	2.72	135.536*
Foreign trade regulations	4.07	3.57	31.331*
Financing	4.04	4.18	50.345*
Labour regulations	4.12	3.39	79.418*
Foreign currency regulations	4.16	3.32	78.718*
Tax regulations	4.67	4.72	14.246*
Inadequate infrastructure supply	3.92	4.16	23.882*
Policy instability	4.07	3.88	25.808*
Safety or environmental regulations	3.90	3.21	110.165*
Inflation	4.51	4.06	36.704*
General uncertainty on costs of regulation	4.02	3.86	41.031*
Crime and theft	4.49	4.17	27.408*
Corruption	4.65	4.45	10.191*

Terrorism	4.07	2.45	290.646*
-----------	------	------	----------

\*  $\rho \leq 0.05$ , one tailed.

Findings from the factor analysis illustrated in table 2 show the emergence of a four-factor solution that accounts for 57.56 percent of the variance.

**Table 2**  
**Rotated Factor Matrix for Policy Areas**

Item	Security & Bureaucracy	Regulatory Environment	Economic Policy	Start-up Regulations
Crime and theft	0.811			
Terrorism	0.765			
Corruption	0.739	0.374		
General uncertainty on cost of regulations	0.433	0.400	0.376

Price control			0.539	0.398
Tax regulations			0.509	
Regulations for starting business/new operations				0.874
Labour regulations	0.346			0.475
<b>Eigenvalue</b>	<b>4.818</b>	<b>1.543</b>	<b>1.196</b>	<b>1.077</b>
<b>Cronbach's Alpha Coefficient (<math>\alpha</math>) (Overall 0,8373)</b>	<b>0.7628</b>	<b>0.7354</b>	<b>0.6857</b>	<b>0.4260</b>
<b>Percent of Variance Explained (Total 57,555%)</b>	<b>32.123</b>	<b>10.285</b>	<b>7.970</b>	<b>7.178</b>

Extraction Method: Principal Component Analysis

Rotation Method: Varimax with Kaiser Normalisation

The four factors identified through the factor analysis are:

### Factor 1. Security and bureaucracy

This factor had five item loadings ranging from 0.422 to 0.811 and included items such as crime and theft, terrorism, corruption, general uncertainty on costs of regulations and financing. This factor related to the entrepreneurs' perception on how secure his property and personal safety is, the ease of dealing with government, and availability of financing.

### Factor 2. Regulatory environment

This factor had three item loadings and included the following items: inadequate infrastructure supply, policy instability, and safety or environment regulations. This factor deals with the entrepreneurs' perception of how stable the policy environment is and the ease of obtaining much needed resources such as financing and infrastructure. The component loadings ranged from 0.695 to 0.806.

### **Factor 3. Economic policy**

This factor had five item loadings ranging from 0.539 to 0.789 and included items such as foreign currency regulations, foreign trade regulations, inflation, price control and tax regulations. This factor corresponds to entrepreneurs' perceptions of the basic economic policies. This factor emphasizes that entrepreneurs consider economic policies as important and critical in their decision to start their business. Entrepreneurs perceive economies based on free competition and minimalist government intervention as favorable.

### **Factor 4. Start-up regulations**

This factor had two item loadings ranging from 0.475 and 0.874 and included the following items: regulations for starting business/new operations and labor regulations. This factor deals with the entrepreneurs' perceptions of how easy it is to start-up the business in terms of what is required by the government. The less stringent and numerous the regulations are the more the entrepreneur perceives the environment as positive.

The initial-components factor analysis method determined the number of possible factors present. From the eigenvalues greater than one, the decision to have four factors was because from the fifth factor onwards, the eigenvalues were less than one. In order to determine a finer selection of factors, an orthogonal varimax rotation was completed. The factor loadings for each of the four factors is greater than 0.35. All the eigenvalues for the respective factors are greater than 1.0, which fulfills the Kaiser criterion (SPSS, 1990; 1999).

The performance of a scree test confirmed the number of factors to select. Based on the scree plot and the Kaiser criterion, the correct number of factors to extract was indeed four.

The completed rotated factor matrix presented in table 2, also shows specific factor eigenvalues, alpha coefficients, and the percentage of total variance that each factor accounts for. As can be seen from the table, a number of items loaded onto more than one factor. For purposes of interpretation, only factor loadings greater than 0.30 are shown in table 2, and the highest loading of each variable were identified and used in the labeling of the factors.

Results illustrate that all the four factors have an eigenvalue of above one, ranging from 1.077 to 4.818. Factor 1, security and bureaucracy, contributes a variance of 32.123 percent, followed by factor 2, regulatory environment, which contributes 10.285 percent. Economic policy, factor 3, contributes 7.97 percent of the variance, while factor 4, start-up regulations, explains 7.178 percent of the variance. The total cumulative variance explained by the four factors is 57.555 percent.

Item analysis was also performed on the data. The Cronbach's alpha coefficient ( $\alpha$ ) determined the internal consistency of the items on the scale. The alpha value for the entire problematic policy areas scale was 0.8373, which indicated that the internal consistency was quite high. Cronbach's alpha coefficients for each factor of the scale were as follows: factor 1 = 0.7628; factor 2 = 0.7354; factor 3 = 0.6857; and factor 4 = 0.4260.

## CONCLUSION

The results of the analysis indicate that improvements must be made on the following policy areas: security and bureaucracy, regulatory environment, economic policy and start-up regulations. To improve on security and bureaucracy, the government must improve the overall security measures in protecting the property and persons of its citizens against crime, theft and terrorism. There should also be tougher sanctions taken against individuals that participate in corrupt practices in the government, avoid changing the cost of regulations often as this confuses the entrepreneurs. Regulatory environment improvements will entail the provision of adequate infrastructure supply (such as electricity, water, communications facilities), ensuring changes in policies involve entrepreneurs themselves and are communicated well in advance, and making sure that safety and environment regulations are reasonable and realistic. Economic policies specifically involving foreign trade, currency regulations, inflation, price control and tax regulations must be formulated to create an incentive structure positive towards entrepreneurship. Lastly, start-up regulations such as registration and licensing as well as labor regulations need to be clarified with new entrepreneurs to avoid confusion.

**KEYWORDS:** ethnic entrepreneurship, social capital, South Africa.

## ABSTRACT

The objective of this study is to better understand how entrepreneurs from different ethnic groups mobilise social capital. A survey of 325 entrepreneurs from the KwaZulu-Natal province of South Africa was conducted. Analysis of variance, t-tests and multiple regression analysis was performed on a 20-item scale on social capital variables. Results indicate that among the three ethnic groups of entrepreneurs studied, Europeans mobilised social capital better than their Indian and African counterparts. Europeans tend to favour more formal avenues of accessing social capital while Indian respondents tend to prefer informal means. Respondents that accessed social capital better were divorced, had a degree or diploma, was more likely to be male, and had a close relative that was an entrepreneur. Regression results show that various network variables are positively influenced by trust, acceptance of diversity and participation in community activities.

## INTRODUCTION

Presently, the concept of social capital has been given more attention by sociologists and economists as an alternative to traditional forms of capital, such as financial, physical, and human (Marger, 2001). Social capital may be defined as those resources inherent in social relations that facilitate collective action. Social capital resources include trust, norms, and networks of association representing any group which gathers consistently for a common purpose. The critical issue is that norms of trust, obligation and reciprocity are established through membership in these social networks (Coleman, 1988; Light and Gold, 2000; Portes and Sensenbrenner, 1993). In addition, social capital is an entity, consisting of all expected future benefits derived not from one's own labour, but from linking with other persons (Portes, 1995). It is from this membership of a network that individuals are able to obtain scarce resources. Social capital does not constitute the resources themselves, but rather the individuals' ability to mobilise these resources on demand.

The intensity of a community's networks is a major factor that enables a particular region to develop competitiveness on wider national and international markets. This view is supported by Johannisson (2000), who stated that the personal network provides not only information and access to important physical and financial resources, but also human and social capital. Menning (1997) argued that one of the secrets of the success of the silk industry in Surat, India is a system of "ethnic entrepreneurship" in which business people rely on informal networks based on ties of kinship, caste, sect and place of origin. Participation in these flexible networks gives merchants and manufacturers access to community resources, and allows them to minimize costs, adapt to market fluctuations and avoid government restrictions.

Empirical research illustrates that the context has a major impact on entrepreneurial activity. However, even within the same context, studies show that there are differences in rates of entrepreneurship between ethnic groups. Researchers argue that the reason for this lies in the entrepreneur's access to various forms of capital, and the ethnic groups with higher rates of entrepreneurship utilize networking extensively in order to access resources.

## **KEY LITERATURE**

Social capital has its roots in several theoretical traditions. Putnam (1993) defined the concept as "those features of social organisation, such as trust, norms and networks that can improve the efficiency of society by facilitating co-ordinated actions, or as features of social life – networks, norms and trust – that enable participants to act together more effectively to pursue shared objectives" (Putnam, 1995). Portes (1998) argues that the concept refers to dense interlocking networks of relationships between individuals and groups. People engage with others through a variety of lateral associations, which must be both voluntary and equal (Onyx and Bullen, 2000). Social capital cannot be generated by individuals acting on their own in isolation. It depends on a proclivity for sociability, but a spontaneous sociability, a capacity to form new associations and to co-operate within the terms of reference they establish (Fukuyama, 1995).

Another common theme of social capital is reciprocity. This is not the immediate and formally accounted exchange of a loyal or business contract, but a combination of short-term altruism and long-term self-interest. The individual provides a service to others, or acts for the benefits of others at a personal cost, but in their general expectations that this kindness will be returned at some undefined time in the future (Onyx and Bullen, 2000). A further theme refers to trust. Trust entails a willingness to take risks in a social context based on a sense of confidence that others will respond as expected and will act in mutually supportive ways, or at least that others do not intend harm (Fukuyama, 1995).

Putnam (1993) and Coleman (1988) both refer explicitly to social norms. Social norms provide a form of informal social control that obviates the necessity for more formal, institutionalised legal sanctions. Social norms are generally unwritten but commonly understood formulas both for determining what patterns of behaviour are expected in a given social context and for defining what forms of behaviour are valued or socially approved. Both Coleman (1988) and Putnam (1995) argue that in communities where social capital is high, there is little crime and little need for formal policy. On the other

hand, where there is low level of trust, few social norms, people will co-operate in joint action only under a system of formal rules and regulations, which have to be negotiated, agreed to, litigated, enforced, sometimes by coercive means, leading to expensive legal costs (Fukuyama, 1995).

## **Social capital and ethnicity**

Within ethnic settings, actors rely upon social capital created by their common membership to reach economic ends. Groups' collective resources, including trust and co-operation, help them overcome the disadvantages of outsider status and maximise the value of their human and financial capital in order to achieve economic stability or betterment. In many cases, ethnic-based trust offers definite advantages over the impersonal and legalistic forms of co-operation that underlie modern economic exchange. The benefit of ethnic-based trust can be attributed to the flexible human relationships in which this trust is embedded (Light and Gold, 2000). Further, because the use of social capital tends to reinforce the relationships from which it originates, its consumption may actually increase rather than deplete its availability in a given context. Finally, unlike resources available through impersonal market transactions, social capital is often delivered within an environment of human caring and concern. At the same time, however, social capital can only be created at a cost, in terms of money, effort, or the exchange of favours. Forms of mutual obligation involved in the maintenance of social capital can diminish the value of resources by limiting individual freedom, requiring assets to be shared, mandating contributions to community welfare, permitting "free riding", and the like.

Flap, Kumcu, and Bulder 2000: 142) deliberate over why members of some ethnic groups enter business ownership in numbers disproportionate to the size of the group, whereas other ethnic groups shun entrepreneurship almost altogether (Aldrich and Waldinger, 1990). Existing explanations for differences in the success of ethnic entrepreneurs look to very diverse causes, such as prior experience in the business as an employer or employee, the characteristics of the settlement or servicing a particular, often co-ethnic clientele. Light and Karageogis (1994) make a useful distinction between market conditions on the demand side and supply sides. On the demand side of the market they identify five conditions that are favourable to success: the special consumer demands of co-ethnics, the local industrial mix, the resurgence of small and medium-sized business, vacancy chains emerging from the retirement or exit of existing business owners, and political encouragement (Flap, Kumcu, and Bulder 2000: 144). Special consumer demands of co-ethnics refer to ethnic products or services that co-ethnics know best how to produce and distribute. A local industrial mix that favours small and medium-sized firms, for example, with a large share of service industries, also favours ethnic enterprises. Major opportunities for ownership result from the process of ethnic succession: vacancy chains emerging from the retirement or exit of existing business owners offer opportunities for minorities to take over an existing line of business. The final condition identified by Light and Karageogis can be formulated as the absence of encouraging policies. Government measures often affect ethnic minorities in such a way that – as they are not fluent in the official language, have little or no formal education or are illegal immigrants – they are forced to work in informal or illegal circumstances (Portes, 1995). Another well-known explanation for the relative success of ethnic entrepreneurs, is that they operate in product markets where entry barriers are low, for example in markets where one can start production without much technology, where little capital is needed to finance this and other necessities and where competition is minimal (Flap, Kumcu, and Bulder 2000).

As it relates to ethnic groups and their adaptation to the host society, social capital refers to participants within social networks of kin and especially co-ethnics (Marger, 2001). Ethnic networks have been described as fulfilling a crucial role in the adaptation process of ethnic entrepreneurs, for whom valuable sources of social capital include ethnic business associations, informal and formal credit groups, a co-ethnic clientele, and co-ethnic workers. They provide the embeddedness, that is, networks of social relations that engender mutual trust and enforcement of norms. Such networks function as vital resources in the establishment and operation of their businesses (Light, 1972; Light and Gold, 2000; Waldiner et al, 1990). Social capital theory states that the extent and effectiveness of social and community relations transforms the returns to human capital. According to this perspective, social networks provided by the extended family or community-based relationships are likely to augment the effects of education, experience, and financial capital, facilitating the accumulation and utilisation of resources. Social capital can help obtain limited resources because it provides external actors with full or partial control over interests or activities that are shared by members.

### **Downside of social capital**

Social capital is seen as a “double edged sword”. On the one hand, it can provide community members with a familiar variety of benefits, ranging from job referrals to cash. But there is also a downside, in that the ties can place enormous non-economic claims on members’ obligations and commitments, cutting them off from information about employment opportunities (Woolcock, 2001).

Portes and Landolt (1996) report the case of many successful businessmen in the Andean highlands in Ecuador. They choose to be Protestant, rather than Catholic, because by shifting religions, these entrepreneurs removed themselves from the host of obligations for male family head associated with the Catholic Church. The convert becomes, in a sense, a “stranger” in his own community, which insulates him from demands for support from others on the strength of Catholic norms. For these men, social capital comes at too high a price (Portes and Landolt, 1996: 5). They go onto state that it is not the lack of social capital, but the lack of objective economic resources – beginning with descent jobs – that underlies the plight of impoverished urban groups.

Furthermore, Portes and Sensenbrenner (1993) give examples in which social capital has detrimental effects. Firstly, people become trapped in their network by their investments in their local community, and if they try to escape from their investments in their local community, and if they try to escape from their fate they are ridiculed as “wannabes”. Secondly, those who are successful will be approached by job and loan-seeking kinsmen who lay claim to their profits. Tight ethnic communities produce a great deal of social capital in the sense of enforceable trust, as Portes (1995) calls it. People fear getting a bad reputation or even being ostracised. Not living up to the implicit repayment agreement certainly means losing face. Thus business owners may lie about their financial situation, and in some cases they may in desperation even sell family properties in the home country (Flap, Kumcu, and Bulder 2000: 155). Not only is the successful use of social capital by a particular ethnic entrepreneur or group of entrepreneurs or groups detrimental to the business chances of other ethnic entrepreneurs or groups of entrepreneurs with less or less effective social capital, there is another consideration. One can also have social capital of a kind that does not work. Finally, one can have too much social capital, leading to adverse effects.

Brown and Butler (1993: 104) claimed that these strong ethnic and cultural ties also act as

borders to those entrepreneurs who are not members of the ethnic group. For example, in Zambia, a large proportion of the business sector is run by Asian immigrants, who are not bound by the cultural factors in the country, and the production and trade of indigenous goods, as well as trade in imported goods were discouraged among “natives” by colonial economic policies.

In addition, Kobonyo (1999: 131) argued that networks can act as strong barriers for entry by those who are outside the network. Based on research in Kenya, for example, non-Asian, particularly Africans found it very difficult to penetrate business sectors dominated by Asians. This is largely due to social networks among the Asian business operations, which excludes anybody who is not of Asian origin.

Given that ethnic businesses may face discrimination, not only in accessing formal institutional sources of start-up finance and advice but also in reaching customers and receiving credit from suppliers, it is expected that they would draw heavily upon their social resource base. Thus, the family and kinship networks may be viewed as building blocks for business development that ethnic minority owners rely heavily upon. Furthermore, the pooling of resources provides the “trust”, security and reliability, which come from dealing with persons from the same ethnic background (Ram, 1994: 43). In addition, Ram (1997: 149) and Basu and Goswami (1999: 251) argue that ethnic minority businesses often arise out of a context of disadvantage, and that the adverse “opportunity structure” carries greater explanatory power than speculations on “culture” and so-called “ethnic” resources. Sanders and Nee (1996: 233) accept the importance of social capital in explaining interethnic variations in self-employment, but locate the relevant social unit as the immediate family rather than the immigrant community. As a social organization of production, the family’s chief advantages are not simply tangible products, such as unpaid labor, but also involve the mutual obligation and trust characteristic of solidaristic small groups. Morris (2000) argues that differences in relative success of ethnic groups can be explained by considering not just financial capital available to that group, but also the cultural, human and social capital. Forms of family-based co-operation and strategizing are instrumental among these groups in providing a degree of stability, support and resource acquisition.

Often groups subjected to equal discrimination are unequally successful in entrepreneurship. Irrespective of economic conditions and income levels, some groups save more and lend more than others. The causes of inter-group disparity in savings rate include values and attitudes that bear upon saving and lending, the size and integrity of the group’s kinship system, and the availability of rotating credit associations (Light & Gold, 2000). Furthermore, Dana (1993: 30) in a study of three different immigrant groups illustrated that entrepreneurship rates were substantially lower in the Black/Caribbean group. He explains that one possible reason is that for some ethnic groups, entrepreneurship is culturally desirable, and for others, it is a means of coping with marginalisation.

## **The African environment**

Kinunda-Rutashobya (1999: 24) contends that entrepreneurial activities vary from one socio-economic context to another. These differences are due to differences in economic, political, historical and social circumstances, laws and the regulatory framework, policies and levels of state involvement, formal and informal socio-economic institutions, type and distribution of resources and socio-cultural sectors (Buame, 1996). Ahwireng-Obeng and

Piaray (1999: 78) argue that formal institutional factors exert a powerful negative influence on entrepreneurship in South Africa, and the historical and political system has served to promote an anti-entrepreneurial culture due to the dependency on, or control of, the population by the state which decreased the propensity for entrepreneurship (Olomi, 1999: 164).

In addition, Mbaku (2000) believes that the South African government failed to maintain an enabling environment for the development of indigenous entrepreneurship and the participation of Africans in national development. Kinunda-Rutashobya (1999) advocates for more empirical work especially in the African context and argues that reasons for success of one ethnic group over another can be further understood by network theory. This perspective is reinforced by the research of Godsell (1991), in her study of four ethnic groups in South Africa. She discovered that although both Indian and African entrepreneurs were victims of discriminatory legislation, the Indian entrepreneurs were able to utilize resources provided by family and the community, which included the local, national and international community. Among the African entrepreneurs, very few networks were found, which was ascribed to the low status of small business in the African community. A further explanation for this lack of networks was the perception that traditionally African entrepreneurs have had very few entrepreneurial role models. In trying to explain the lack of entrepreneurship among African entrepreneurs in the UK (Basu & Goswami, 1999; Ram, 1994, 1997), and in the US, (Light & Gold, 2000; Yoo, 2000), it is argued that one feasible explanation was that there was a shortage of entrepreneurial role models in their community.

## **RESEARCH METHODOLOGY**

Data for the analysis was collected from 325 entrepreneurs in Durban, the largest city in the province of KwaZulu-Natal, South Africa. Entrepreneurs were requested to fill in a structured survey instrument to ensure reliability and validity in responses obtained. The sample was selected from entrepreneurs from the three dominant ethnic groups in the region: African, Indian and European. The three ethnic groups chosen for this study will contribute more to our understanding of how social capital is mobilised by entrepreneurs within a developing country. The African entrepreneur group is an example of a marginalised group, but in South Africa, they are a majority, and not a minority group. Therefore by studying this group will add to our understanding of entrepreneurship in this context. Also this group is not an immigrant group, but an indigenous group, and it is important when comparing ethnic groups to have a “native” group. The Indian ethnic group is an example of a group filling the “middleman minority” group. However, in South Africa, they were also marginalised by institutional factors, and will therefore make for an fascinating study. The European ethnic group also have a long history in South Africa, but their position in South Africa has always been one of privilege, and was originally one of being the colonial power. However, with change, firstly with the Afrikaner-led government and then the Black-led government in 1994, their position has changed dramatically.

The sample was selected largely by personal contacts and referrals and introductions by those interviewed. Given that a large amount of ethnic businesses are still operated in areas dominated by specific ethnic groups, research assistants from the same ethnic group as the respondents' were used. This methodology was utilised by Ram (1991; 1994) and Basu and Goswami (1999) in studies conducted in England, and Yoo (2000)

and Light and Bonacich (1988) in studies in the US, whereby having interviewers with the same ethnic background led to more access and acceptance by the entrepreneurs.

The data analyses consisted of frequency analyses of the demographic information. A chi-square ( $\chi^2$ ) test was then performed on the data to measure if there were any significant differences between the African, Indian and European entrepreneurs. With regard to the statements concerning social capital, an ANOVA was conducted to determine whether there were any significant differences between the mean scores of the three ethnic entrepreneur groups in the social capital variables. Furthermore, a stepwise multiple regression analysis was conducted to determine the best demographic predictors of respondent's scores on the social capital variables.

## **RESULTS AND DISCUSSION**

This section presents a profile of some of the characteristics of the entrepreneur in addition to the results of the analysis of variance, and a multiple regression analysis on the social capital variables.

Of the 325 respondents, 34.2 percent (N=111) were African entrepreneurs, 37.2 percent (N=121) were Indian entrepreneurs, and 27.7 percent were European (N=90), while 1 percent (N=3) were classified as other. Several demographic characteristics are presented in table 1. The majority of the entrepreneurs in the ethnic groups were male, except for the European group. Chi-square test results indicate that at the  $p = .001$  level, there were significant differences between the three groups on gender, with less than 22 percent of Indian, 41.4 percent of the African, and 51.1 percent of the European respondents were female.

**Table 1: Frequency Distribution of Characteristics of the Entrepreneur**

Characteristic	African	Indian	European	$\chi^2$
<b>Gender</b>				20.910*
Male	58.6%	78.3%	48.9%	
Female	41.4%	21.7%	51.1%	
<b>Age</b>				60.179*
21 – 30	24.1%	8.7%	11.6%	
31 – 40	38.9%	19.6%	4.7%	
41 – 50	22.2%	32.6%	53.5%	
51 – 60	11.1%	26.1%	23.3%	
61 – 73	3.7%	13.0%	7.0%	
<b>Marital status</b>				55.241*
Never married	36.8%	8.3%	8.9%	
Married	55.7%	80.8%	66.7%	
Divorced	4.7%	10.0%	15.6%	
Widowed	2.8%	0.8%	8.9%	
<b>Education</b>	2.8%	2.5%	0%	21.644**
Primary school or less	10.1%	16.7%	8.9%	
High school or less	36.7%	53.3%	42.2%	
Matric/12 <sup>th</sup> grade	45.9%	23.3%	42.2%	
Degree/diploma	4.6%	4.2%	6.7%	
Postgraduate degree				
<b>Entrepreneurs in family</b>				
Father	14.8%	12.4%	9.5%	1.501
Mother	4.8%	2.5%	2.6%	1.169
Close relatives	24.3%	68.6%	66.7%	53.892*

\*  $\rho \leq .001$

\*\*  $\rho \leq .05$

Looking at the age distribution, it is evident that that the African ethnic entrepreneurs were younger, with the majority (63%) below the age of 40. In contrast, more than 70 percent (71.7%) of the Indian and 85.8 percent of the European ethnic group were over the age of 40. The  $\chi^2$  results show that at  $\rho = .001$ , there are significant differences in the ages between the entrepreneurs from the three ethnic groups.

When one looks at the marital status of the entrepreneurs, the  $\chi^2$  results also show significant differences between the three ethnic groups. The majority of entrepreneurs in all three ethnic groups are married (55.7 percent of the Africans, 80.8 percent of the Indians, and 66.7 percent of the Europeans).

In terms of education, the results indicate that at the  $p = .05$  level, there were significant differences between the three ethnic groups on education, with the majority having completed twelve years of schooling (African 87.2%; Indian 80.8%; European 91.1%). Interestingly, in the African group, 45.9 percent had either a degree or a diploma.

Looking at whether the entrepreneurs had immediate family members who were entrepreneurs, all groups showed that very few of them had parents who were entrepreneurs. However, looking at whether they had close relatives who were entrepreneurs, only 24.3 percent of African respondents, while 68.6 percent of the Indians, and 66.7% of the Europeans had said that they had a close relative who was an entrepreneur.

To determine whether there were significant differences in the various social capital variables among the three ethnic groups, an analysis of variance (ANOVA) was performed. The results are shown on table 2.

Of the 20 items included in the questionnaire, at  $p \leq .05$ , 17 were found to be statistically significant when ethnic groups was used as a differentiating factor. The findings indicate that among the respondents from the three ethnic groups, the Africans scored the lowest and the Europeans scored the highest in the social capital variables. This shows that the African entrepreneurs do not mobilise social capital as well as their Indian and European counterparts.

When marital status is used as a differentiating factor, the ANOVA yields results which indicate that out of the 20 social capital variables, 8 are significant. These include being satisfied with the meaning of ones life, feeling safe walking down ones street after dark, going outside the community to visit family, running into acquaintances when shopping, knowing where to find information when needing to make a life decision, helping organise a new service in ones area, thinking that multiculturalism makes life better and enjoying living among people of different lifestyles. The overall findings show that the divorced followed by married, widowed and unmarried respondents were most effective at mobilising social capital.

Using level of education as a grouping variable, the ANOVA results show that only 5 of the 20 social capital items are significantly different between groups. The five items were: believing that by helping others one helps oneself, running into friends and acquaintances when shopping, being in a management committee for any local group, taking part in a community project, and helping organise a new service in ones area. Overall, the findings indicate that the respondents that have a degree or diploma are able to mobilise capital more effectively followed by respondents with postgraduate degrees, matric (grade 12), less than high school and primary levels.

In determining whether there were significant differences in the various social capital variables among male and female entrepreneurs, an analysis of variance (ANOVA) was performed. Table 2 presents the findings.

Using gender as a grouping variable, of the 20 items included in the questionnaire, at  $p \leq .05$ , 7 social capital items were found significantly different for the two genders. Male respondents scored higher on 4 of the 7 items namely: feeling valued by society, being satisfied with what one's life has meant, helping out a local group as a volunteer, and helping organise a new service in one's area. Females scored higher in three items: feeling that the community is like home, thinking that multiculturalism makes life better,

and enjoying living among people of different lifestyles.

Only one social capital variable (being an active member of a local organisation or club) was found to be significantly different when the sample was categorised according to whether the respondent had a father that was an entrepreneur. When mother's occupation was used to categorise the sample, none of the social capital variables were found to be significantly different between groups.

When the entrepreneurs were classified according to whether they had close relatives who were entrepreneurs, 6 social capital variables emerged as significantly different between groups. These variables were – attending a local community event, going outside one's community to visit family, running into friends and acquaintances when shopping, feeling free to speak out even when one disagrees with what everyone else agreed on, thinking that multiculturalism makes life better and enjoying living among people of different lifestyles. Entrepreneurs with relatives who were also entrepreneurs scored higher in the first 4 variables mentioned.

**Table 2: Analysis of Variance of Social Capital Variables with Ethnic Group, Marital Status and Level of Education**

Item	Ethnic Group	Marital Status	Education Level
Do you feel valued by society?	14.934*	0.760	2.344
If you were to die tomorrow, would you be satisfied with what your life has meant?	19.846*	3.467*	1.465
Do you believe that by helping others you help yourself?	14.383*	1.182	4.665*
Do you help out a local group as a volunteer?	1.138	1.334	1.247
Do you feel safe walking down your street after dark?	4.555*	4.371*	0.964
Do you agree that most people can be trusted?	3.505*	2.205	1.307
Does your area have a reputation for being a safe place?	5.198*	2.044	2.475
Have you attended a local community event in the past 6 months (e.g. church fete, school concert)?	18.719*	2.743	0.295
Are you an active member of a local organization or club (e.g. craft, sport, social club)?	3.460*	1.499	1.034
Does your local community feel like home?	9.625*	1.508	.989
Do you go outside your community to visit your family?	48.957*	3.037*	1.644
When you go shopping in your local area are you likely to run into friends and acquaintances?	44.883*	2.825*	3.202*
If you need information to make a life decision, do you know where to find that information?	17.188*	3.028*	0.799
Are you on a management committee or organizing committee for any local group or organization?	6.905*	1.579	2.463*
In the past 3 years, have you ever joined a local community action to deal with an emergency?	7.936*	2.246	0.873
Have you taken part in a community project?	1.209	1.882	2.507*
Have you helped organize new service in your area?	2.557	3.380*	2.836*
If you disagree with what everyone else agreed on, would you feel free to speak out?	11.916*	0.616	0.847
Do you think that multiculturalism makes life better?	8.923*	7.561*	0.716
Do you enjoy living among people of different lifestyles?	3.361*	6.065*	0.170

**Table 3: T-tests of Social Capital Variables with Gender, Father's Occupation, Mother's Occupation and Entrepreneur Close Relative**

Item	Gender	Father's Occupation	Mother's Occupation	Entrepreneur Close Relative
Do you feel valued by society?	3.900*	0.005	-0.048	1.844
If you were to die tomorrow, would you be satisfied with what your life has meant?	2.503*	-0.323	-0.858	3.364

<b>Analysis of variance</b>	<b>DF</b>	<b>Sum of Squares</b>	<b>Mean Square</b>	<b>F</b>	<b>Sig.</b>
Regression	3	4339.221	1446.407	10.185	.000
Residual	227	32238.155	142.018		
<b>Variables in the equation</b>	<b>B</b>	<b>Standard error of B</b>	<b>Beta</b>	<b>t</b>	<b>Sig.</b>
Constant	4.253	3.449		1.233	.219
Thinking that multiculturalism makes life better	3.127	0.719	-.277	-4.351	.000
Running into friends and acquaintances when shopping	2.951	0.846	.220	3.489	.001
Being an active member of a local organization or club	1.518	0.681	.141	2.228	.027

The best solutions for the NUMPEO dependent variable, in terms of R<sup>2</sup>, significance of t and significance of F were obtained with model shown in table 4. Only 12% of the variation of NUMPEO was explained by the following variables – thinking that multiculturalism makes life better (t=-4.351, p=.000), running into friends and acquaintances when shopping (t=3.489, p=0.001), and being an active member of a local organization or club (t=2.228, p=0.027), with R<sup>2</sup> =11.9%. Analysis of variance indicated that F=10.185, p=.000 for the model.

Constant	0.998	1.667		0.595	.553
Enjoying living among people of different lifestyles	1.758	0.547	.216	3.215	.002

The solution for the HRSDEV dependent variable, in terms of R<sup>2</sup>, significance of t and significance of F were obtained with model shown in table 5. Only about 5% of the variance of HRSDEV can be explained by only one variable – enjoying living among people of different lifestyles (t=3.215, p=.002), with R<sup>2</sup> =4.7%. Analysis of variance indicated that F=10.334, p=.002 for the model.

Table 6 presents the results of the multiple regression analysis on the dependent variable “number of hours spent maintaining contacts” (HRSMAN). The solution for the HRSMAN dependent variable, in terms of R<sup>2</sup>, significance of t and significance of F were obtained with model shown below.

Going outside ones community to visit family	-6.198	2.363	-.201	-2.623	.009	

Multiple regression analysis was also performed with the responses on the question “what percentage of time spent establishing contacts” (PERTIM). Table 7 indicates the best solutions for the PERTIM dependent variable, in terms of R<sup>2</sup>, significance of t and

significance of F. the results show that 32% of the variation of PERTIM was explained by six social capital variables. An analysis of variance indicated that  $F=16.967$ ,  $p=.000$  for the model. The t-value of the coefficient for the significant social capital variables are as follows: running into friends and acquaintances when shopping ( $t=-3.234$ ,  $p=0.001$ ), being in a management committee ( $t=3.080$ ,  $p=0.002$ ), feeling safe walking down ones street ( $t=2.653$ ,  $p=0.009$ ), attending a local community event ( $t=-2.984$ ,  $p=0.003$ ), helping out a local group as a volunteer ( $t=2.829$ ,  $p=0.005$ ), and going outside ones community to visit family ( $t=-2.623$ ,  $p=0.009$ ).

## CONCLUSION

As the literature indicates (Portes, 1995) social capital refers to the individual's ability to mobilise resources. For entrepreneurs to be successful they need to be able to obtain scarce resources through various sources. It is important for them to establish relationships with others in order to access these resources. The findings indicate that among the respondents from the three ethnic groups, the Africans scored the lowest and the Europeans scored the highest in the social capital variables. This shows that the African entrepreneurs do not mobilise social capital as well as their Indian and European counterparts. These results support Godsell (1991)'s findings that Indian entrepreneurs access social capital better than Africans.

Quite surprisingly, the African entrepreneurs were more educated than the Indian and European group. However, even though the Indian and European groups are not as highly educated, the majority of them had completed their high school education. Assuming that higher education levels improve one's chance of accessing formal sources (e.g. financing) then the African respondents would have found it less difficult than Indians or Europeans to find resources needed for the business. This could explain the higher levels of social capital mobilisation for Indians and Europeans. The findings also show that respondents that have higher education levels (i.e. degree or diploma) are able to mobilise capital more effectively followed by respondents have postgraduate degrees, matrics, less than high school and primary levels. The respondents that have degrees have a higher level of acceptance of people with different cultures and enjoy living among people of different lifestyles. As different types of social capital can be accessed from individuals of different characteristics, acceptance of diversity can improve social capital mobilisation.

The overall findings also show that divorced followed by married, widowed, and unmarried entrepreneurs were most effective in mobilising social capital. This can be attributed to the fact that respondents that have been or are married, have access to the networks of their respective spouses widening their own networks. Also they tend to accept diversity and participate more actively in community activities when compared to their unmarried counterparts.

An analysis of the demographic data revealed that the sample was predominantly male. Male entrepreneurs scored slightly higher than females in terms of accessing social capital. Males tend to do better in participating at community activities. Participation in community activities increases the chances of the entrepreneur in meeting an individual that will be able to provide resources he needs. Females on the other hand excel in accepting people of different cultures and lifestyles.

Regarding having other entrepreneurs in the family, less than 20 percent of all the groups had an entrepreneurial parent. However, when asked if they had a close relative that was an entrepreneur, 68.6% of the Indian and 66.7% of the European group responded in the affirmative. Less than one quarter of the African group had a close relative who was an entrepreneur. This result partly explains why the level of entrepreneurship is lower among Africans. Being related to an entrepreneur by blood or marriage most facilitates one's own entrepreneurship when one can take over a parent or relative's business relationships and reputation (Light and Gold, 2000). Hence, more Indians and Europeans becoming entrepreneurs. Entrepreneurs who had close relatives who were entrepreneurs were also better at mobilising capital particularly through participation in community activities.

The regression results indicate that an individual is able to discuss his/her business to more people if he is open to networking with diverse people and participating in community activities. The number of hours spent developing and maintaining contacts also increases when the entrepreneur enjoys living among people of different lifestyles. Lastly, the percentage of time spent networking also increases when the entrepreneur participates actively in community activities and has trust in other people.

To conclude, this paper has attempted to add to our understanding of ethnic entrepreneurs in South Africa. It is widely accepted that entrepreneurship is a social activity, embedded in a social context. Therefore, in line with the mixed embeddedness perspective, there is a need to examine the influence of the wider socio-economic and politico-institutional environments on entrepreneurship.

# TOWARDS HARMONIOUS TRANSITION OF FAMILY BUSINESS BY FIRST GENERATION ENTREPRENEURS IN INDIA

by  
Dr. Sudhir K. Jain\*, Muchsin\*\* & Samarth S. Rajnyak\*\*\*

## INTRODUCTION

In most countries of the world, the role of small and medium enterprises (SMEs) has remained noteworthy throughout the 20<sup>th</sup> century. The importance of the SMEs also seems to have been increasing over time. The reasons for growing importance have been largely economic (Dunlop, 1993; Thomassen, 1992; de Jordy, 1991). The SMEs constitute the backbone of the nations and are significant in terms of their contribution to the GDP, employment generation, exports (foreign exchange earnings) etc. The SMEs constitute an important source of outsourcing various inputs or components required by the large scale enterprises (LSEs). The dedicated ancillary units to the LSE are also SMEs. The SMEs are started by the individuals who possess basic traits like initiative, drive to succeed, risk taking ability etc. Such individuals who start the enterprise are known as The First Generation Entrepreneurs (FGEs). There are several types of FGEs such as:

- Manufacturer Entrepreneur (ME), i.e. an entrepreneur who establishes plant and machinery for the purpose of production of manufactured merchandise products, including the assembled products.
- Service Entrepreneur (SE), i.e. an entrepreneur who starts an enterprise to produce commercial services of all types, including retailing, consultancy, data processing, professional expertise, like medical, legal architecture etc.
- Other Entrepreneur (OE), i.e. an entrepreneur who establishes an enterprise that cannot be clearly classified as a manufacturing enterprise or commercial service enterprise. Such enterprises range from not-for-profit non-governmental organizations (NGOs), religious organizations and even the criminal and intimidating organizations producing services such as smuggling, pick-pocketing, thieving, robbing, terrorizing etc.

All entrepreneurs, including the “other services” producing entrepreneurs look forward to a “smooth” succession of their business before they decide to retire. Danco (2004) points out that many family firms go out of existence after 10 years and only 3 out 10 survive into a

second generation. Davis and Harveston (1998) point out that a mere 30 % of family business survive past the first generation (Dyer, 1986; Beckhard and Dyer, 1983) and only 10 % to 15 % survive to a third generation (Applegate, 1994). Obviously, there are alternative situations of family business transition from one generation to another and there are reasons and occasions of conflicts. This paper attempts to analyze the conflict situations between the first generation entrepreneurs and offsprings as well as the factors affecting the succession. Based on the said analysis, the Harmonious Business Transition (HBT) Model is proposed.

## **ANALYSIS OF CONFLICT SITUATIONS**

Conflicts exist in most relationships throughout the world. The root cause of conflicts can be attributed to clash of social, psychological, economic, political or any other type of interests between the two parties. Here, our objective is to discuss the conflicts that may come in the way of harmonious business transition from FGEs to their offsprings. The process of family business transition from parents to offsprings is quite similar in all countries like in India. However, this process deviates in case of democratically developing countries which are facing the problems of high population growth and lack of investment to generate jobs for the growing labor force. The economic prosperity, prevailing social system and reasonably remunerative job opportunities in the western developed countries make the family business succession for SME entrepreneurs a challenge as the offsprings may not be interested in entrepreneurship at all. On the other hand, in eastern underdeveloped country like India, the situation is quite different in the sense that the nature of challenge assumes different dimension. Because of increased focus on socialistic policies in India in the 1970s, the investment was officially restricted to prevent the growth of capitalists and this resulted in rapid growth in unemployment, particularly the educated unemployment. Forced by the created circumstances, the government developed policies towards facilitating and encouraging youth, particularly the engineering graduates to become First Generation Entrepreneurs. This trend has continued since then. However, with the economic reforms of 1991, followed by the WTO regime that came into being in 1995, the competition started growing in India and the protected environment to the industry started fading away. The 'feel good' factor among the entrepreneurs got converted into 'feel challenged' factor which has probably added to the conflicts in family business transition.

In similar environment in several developing countries, the people who were not able to find jobs for themselves became entrepreneurs or job creators. They also took the advantage of various government incentives for promotion of entrepreneurship and thus accumulated wealth. But their journey to survival and success was hard. This phenomenon is also sometimes termed as 'zero to hero' syndrome and results in high ego of successful First Generation Entrepreneurs. High ego of any person causes problems in general and particularly the conflicts between two generations. Most business owners hope and often expect that their children will eventually succeed them in the business (Family Business, 1993; Ward and Aronoff, 1990). The father wants his son to work as hard as he did, without leisure, in his youthful days, without realizing the fact that he started the struggle for survival whereas his son is at the doorstep of inheriting an established family business, which the latter has to eventually own and run. The major conflicts that may arise when the family

business is in transition from a First Generation Entrepreneurs to his son(s) are analyzed as follows.

1. The competent but egoistic entrepreneur finds faults with the way of doing any activity by his son who gets fed up with his father and this emerges as the major cause of future conflicts.
2. The entrepreneur does not assign a defined role to his son and does not delegate tasks. Instead, son is *used* by the entrepreneur as his personal assistant. Parents always put pressure their offspring to work in the family firm (Nelton, 1991). This does not give any satisfaction to the son and the conflict begins.
3. The entrepreneur does not empower his son who starts feeling unimportant and disgusted with the situation. Sometimes offspring may think that they are not wanted in the family or are discouraged from wanting to enter the firm (Ward, 1987). Here the conflict starts.
4. The son is not adequately compensated, in financial terms, for his full time services rendered to the family enterprise and this necessitates him to look for another independent entrepreneurial venture. This increases the potential for conflict. Rosenblatt *et al.*, (1985) mentioned that conflicts are usually invoked from unique problems relating to the way in which family relations affect the process of supervision and issues of compensation at work.
5. When there is significant difference between an entrepreneur and the spouse in terms of their socialization process from the bringing up stage, then there is high probability of personality clash and this adversely affects children's bringing up who start learning to defy and, in the process, loose confidence of the entrepreneur. This results in increasing conflicts at later stage. This type of conflict can be termed as "Husband - Wife - Children Personality Triangle".
6. When children grow in an open environment, they develop their own liking and disliking about all aspects in life and particularly the choice of profession. Offspring may decide that they do not want employment in their parents' business because they want to take advantage of the education opportunities available to them (Stavrou and Swiercz, 1999) and because they will not be able to make best use of their skills there (Stavrou, 1996). Thus, one cause of conflict arises due to offsprings not being interested in joining the family business irrespective of its size.
7. When the son is involved in family business under father's leadership, the management thinking and style of the two may be conflicting due to generation gap. This may be regarding continuance of the old technology vs. technology upgradation, compensation package to the workers, product pricing, distribution channels, advertising budget, choice of suppliers, product quality strategy, diversification strategy etc.
8. Sometimes the problems are also induced by certain people who have some vested interests or are jealous of the FGE. Rivalries can arise among family members (Morris, *et al.*, 1997). Such people create misunderstanding and cause conflicts.

There are other reasons also that cause conflicts and hinder harmonization transition of family business from one generation to the next generation. The key to smoothen the succession process lies in successful management of the conflicts that may arise between the two generations in the process of family business transition.

## **FACTORS AFFECTING SMOOTH SUCCESSION**

Succession includes the transfer of ethics, values and traditions along with the actual business itself (Danco, 2004). All entrepreneurs look forward to a smooth succession of their business enterprise by the time they retire. Most entrepreneurs have expectations, hopes and desires from the successor for their organizations. It is hoped that the successor(s) will share this vision and be able to run their business enterprise at least as efficiently as was done earlier. The entrepreneur usually focuses on a son as a successor with the intent of gradually giving him the operational responsibilities followed by strategic power and ownership. Different problems may occur and affect the smooth succession of the family business enterprise.

One major concern is the level of willingness to relinquish management authority and control (Morris *et al.*, 1997). To a large extent, the owner's personality and talents shape up the SMEs. Some entrepreneurs are easy to replace whereas for others, suitable replacement is difficult. An entrepreneur who is the idea person in a high-tech operation, if he is removed from the picture, the company might be unable to continue. The same is true for an entrepreneur whose personal business-facilitating contacts are the key factors for the enterprise's success. However, an entrepreneur running an operation that requires a minimum of knowledge or expertise usually can be replaced without much trouble. Additionally, the entrepreneur may not want to be removed.

The potentially dysfunctional outcomes of sibling rivalries and /or failure to accommodate one another has/have been another factor(s) affecting smooth succession (Barnes and Herson, 1976; Handler 1991; Kaslow, 1993; Ket de Vries, 1993). When an entrepreneur has more than one son interested in taking over the family business, it becomes very difficult for the owner to choose a successor among his sons. Succession becomes a highly charged emotional issue for him as well as for the family and sometimes even the close blood-relations get involved with the issue. Each of the owner's sons may feel that he should be put in charge of the operation. Many times the SME is too small to accommodate all the sons. It may be tempting for the owner to put different children in charge of different areas of the business enterprise. But this could cause disputes later on which could even lead to the business breaking up. Given that only one of them could succeed the family business, the rivalry could lead to the sale or bankruptcy of the business.

The factors such as aptitude of the son and his level of preparedness, i.e. the extent to which he has the requisite business skills, managerial capabilities, knowledge of company operations, and attitudinal predisposition to run the business etc. matter a great deal (Doescher, 1993; Fenn 1994; Hyatt, 1992; Osborne, 1991). If he possesses the aptitude to run the family business, the succession would be smooth. On the other hand, if the son lacks the aptitude to run the business, the father would be very apprehensive in relinquishing the

control of the business enterprise to his son. Son's incapability could lead to losses or even bankruptcy of the firm. So in the absence of any other heir, the owner would prefer to sell off his business enterprise.

Age difference between the father and the son plays a significant role in the smooth succession of the business enterprise. A higher age gap among them would lead to quicker succession since by the time the son becomes competent enough to succeed, the father would be nearing his retirement. So there is a smoother and a quicker succession. On the other hand, in case of a lower age gap, succession takes place very late, which leads to more conflicts. By the time the son becomes mature enough to succeed, the father is at his peak, rapidly expanding and growing his business enterprise. At this stage, the entrepreneur desires to control almost all aspects of his enterprise and generally, may not be interested in handing over the family business to his son. He finds it very difficult to relinquish or delegate any authority to his son at that point of time. Another dimension of age gap is the father not wanting to hand over the reigns of the family business to the son(s) fearing that loss of economic control would adversely affect his importance and care by the youngsters in the family.

Conflicts that arise due to higher age gap can be resolved by making the son an independent entrepreneur in a different business enterprise. The father can allocate a new factory for his son and ask him to run it independently. Gradually, the entrepreneur would empower his son. Another way to resolve this problem is that the son works as the entrepreneur's Apprenticeship. This way he would be able to understand the functioning of the business enterprise and be groomed adequately for future inheritance of the family business.

Another important factor in the venture's success is whether the founder and the heirs can get along. The basic thing to be developed is trust and affability (Morris, *et al.*, 1997). Trust is characterized by openness and honesty among family members, as well as confidence in family's member's reliability and integrity. It can be associated with such qualities as consistency, competence, fairness, responsibility, helpfulness and benevolence. Affability is concerned with respect between the family business head and heirs, on the one hand, and with the minimization of rivalry, bickering, hostility and tension, on the other hand.

Another important factor affecting the succession is the nature and the level of the education that the son acquires. His over-qualification vis a vis the business size would be a disincentive for him to inherit the family business. For example, after completing his MBA, the son may like to opt for a job. He would prefer a high paying job rather than take over the family business. Suppose he decides to succeed his father in the business. Being very competent, he would be a fast learner and would be able to take the family business to new heights. In this case, smooth succession of the family business would take place. On the other hand, in case of under qualification of the son, the father would hesitate to relinquish the family business to his son. In such a case, the succession may take place very late or perhaps the owner might prefer to sell off his business enterprise. When the son is 'appropriately qualified', he would be able to run the family business well as envisioned by his father and be able to meet his father's expectations, hopes and desires.

Size of the family business also plays an important role in smooth succession. In case of a small family business, the son, even though moderately qualified, would not be interested in taking up his family business. So the succession becomes difficult in such cases. However, in

case of a big SME, the son would be interested in joining the family business and succession in this case would be easier.

Sometimes, it so happens that the entrepreneur is required to step aside and let someone else take over the control of the company. This happens mostly due to death or some kind of physical incapacitation or some mental or psychological breakdown, which results in the entrepreneur having to withdraw from the operations of the business enterprise. Such events are called forcing events. These types of events are often unseen and the family seldom has a contingency plan for dealing with such situations. It places an unnecessary burden on those whom they leave behind and create major problems for the business if the entrepreneur has not identified any successor for his business enterprise. It reflects the lack of preparedness of entrepreneurs of family business in passing managerial control to the next generation. The earlier the entrepreneur begins to plan for a successor, the better are the chances of finding the right person since in the prospect of events that force immediate action, it results in inadequate time to find the best replacement.

Of all factors, the greatest amount of attention has been devoted to the need for family members to develop formal succession and to engage in early estate planning (Ward, 1987; Ward and Aronoff, 1992; Kets de Vries, 1993; Danco, 1982). The entrepreneur needs to develop a succession plan in order to make a decision regarding his heir. He then needs to groom his successor so that he becomes an able entrepreneur. In order to do so, he must become be able to turn from being a leader to being a coach, from being a doer to being an advisor (Danco, 2004). The successor must respect the owner's attachment towards the enterprise and be sensitive to his possessive feelings. He needs to blend family traditions with future business goals. At the same time he must be able to use his entrepreneurial flair to initiate necessary changes in the enterprise if needed.

## **HARMONIOUS FAMILY BUSINESS TRANSITION MODEL**

The conflicts in the family business transition that are faced and the factors that effect smooth succession can be synthesized to develop the proposed Harmonious Family-Business Transition Model.

When the offsprings (sons) are in school, the parents should start educating and motivating them towards the advantages of joining the family business. When the offsprings reach the college level, the parents start providing entrepreneurship education and suitable exposure to them so that they feel themselves close to the family business by heart and mind both. When offsprings join the family business, they should be assigned the well defined role in the SME rather than just assisting their father. Initially, they must work in all functional areas and take independent responsibility so as to understand the complete functioning of the SME and then they should work as 'entrepreneur-apprentice'. If the SME is very small then not more than one son/daughter should be involved in the business. For other children, similar SMEs may be initiated so as to avoid the conflicts and sibling rivalries. However, if the SME is big then all those children who have to join the SME must have well defined roles and continue working in it until the FGE reaches the stage of retirement. At this stage, the share holding division should be amicably executed.

When the age gap between the FGE and his heirs is less, then the offsprings should be encouraged to gain working experience outside the family business by taking up job as an employee or new SME may be started for/by them. The extent of delegation and empowerment should be increased with the passage of time for a harmonious family business transition by the FGE. When the offsprings/sons gain adequate experience and develop the maturity for operating the business independently, then the family business may be transferred by the FGE to the offsprings/sons. The Harmonious Family-Business Transition Model is presented in Exhibit 1.

## CONCLUSION

Entrepreneurs have been traditionally facing the problem of smooth transition of the family business. However, the difficulties faced by the FGEs are more crucial and they also lack the experience of witnessing the family business transition in the past. In the environment of democratically developing countries such as India, another problem that is faced by the FGEs is a higher degree of conflict due to generation gap. This is precisely so because the FGEs struggled much more in the process of growing their business enterprise. Normally, they faced the situation of scarcity in their initial period of struggle. The major generation conflict arises due to the fact that their offsprings are brought up in an environment of plenty and comfort. The conflicts that arise relate to attitudes, interests, way of thinking, personality, leadership style, trust, delegation, empowerment etc.

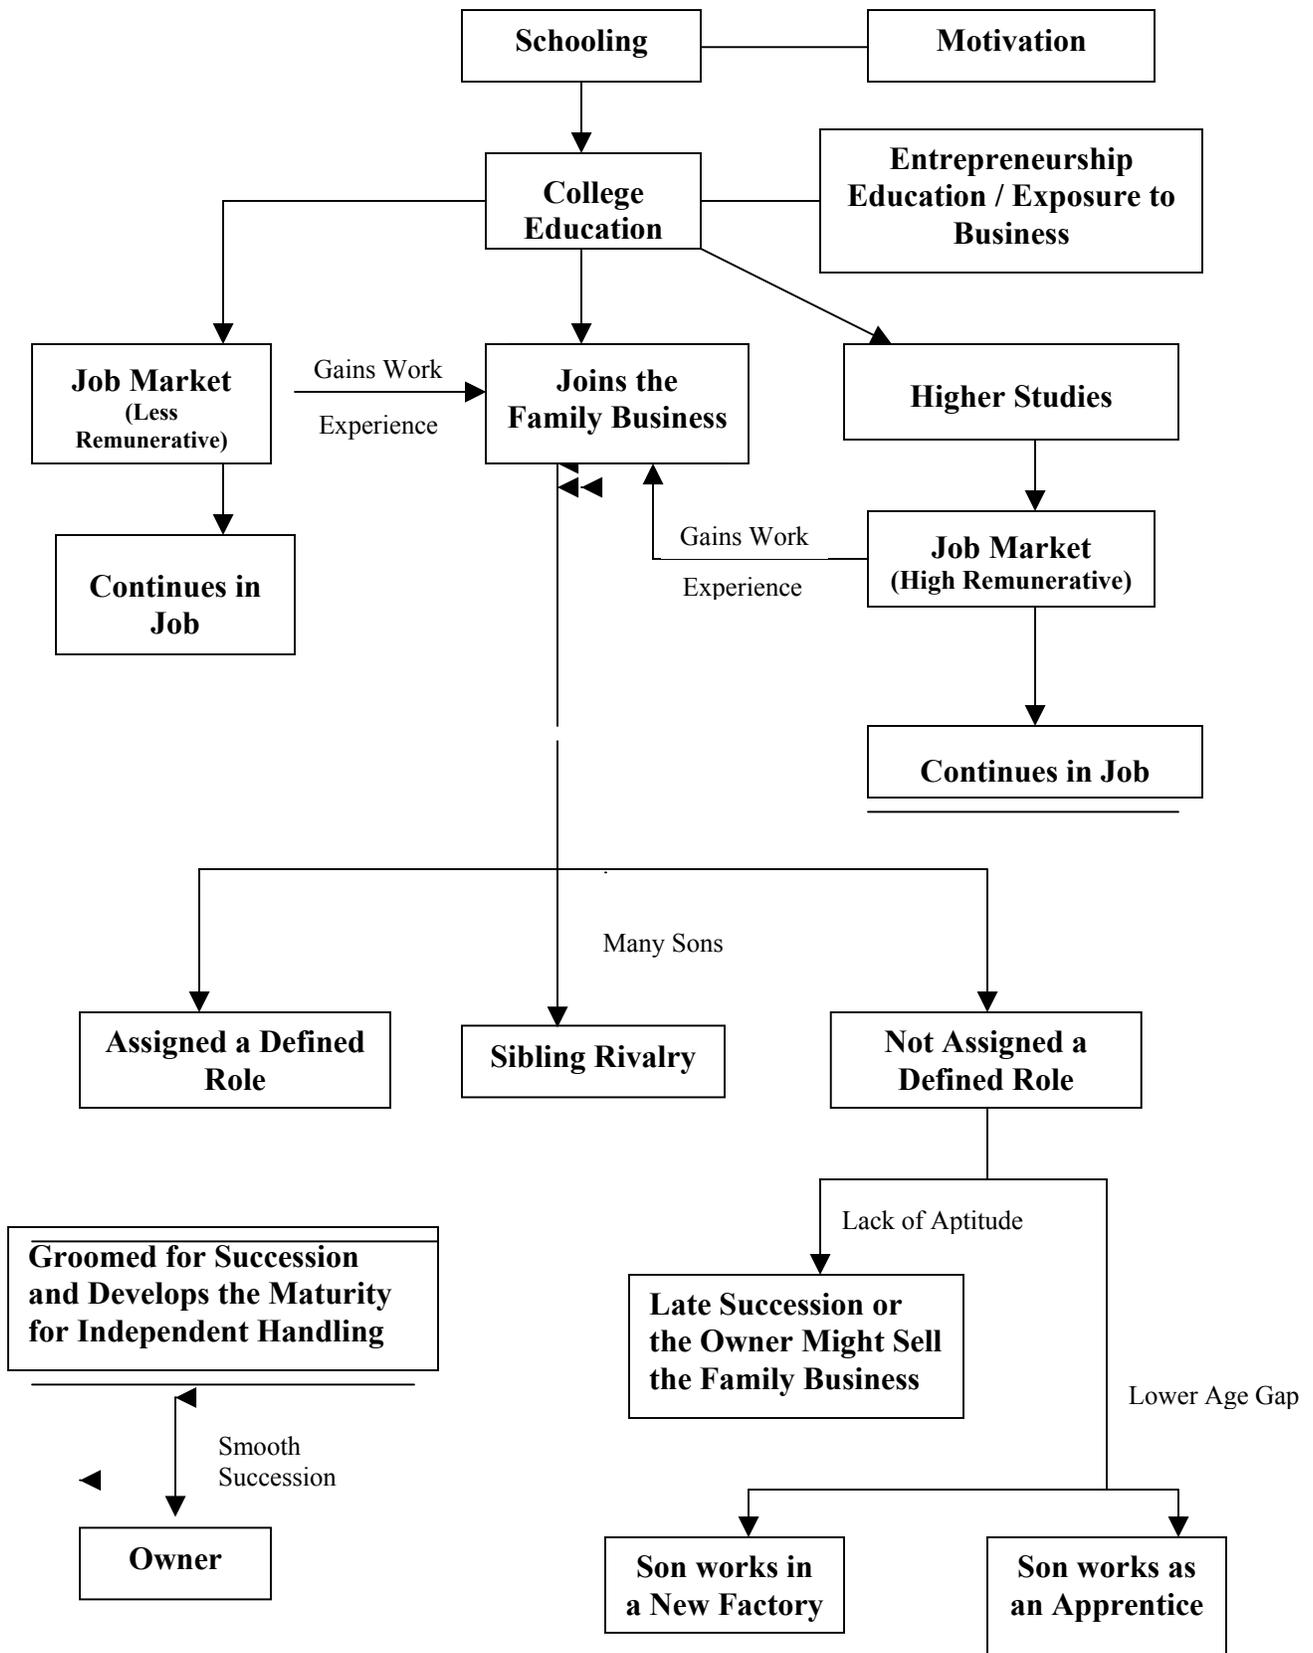

There are several factors that affect smooth succession and the transition of the family business such as the age gap between the father and offsprings, level and nature of their education, sibling rivalry, grooming process and so on. These factors remain more pronounced in case of FGEs. The analysis and discussion of the conflict situations and the factors affecting smooth succession lead to the development of the Harmonious Family-Business Transition Model which proposes the smooth and harmonious way for family business transition from the FGE to the heir/offsprings.

## **INTRODUCTION**

The last half-century has seen rapid developments in technology mainly due to rapidly growing competition and massive investments in R&D by the USA, Japan and several European countries. In particular, the recent developments in information and communication technologies such as satellite, computers, fax, cellular/mobile phones, Internet, etc. have virtually turned the world into a global village. The international community is now getting closer as never before. There is a growing and irreversible trend towards globalization. Large companies all over the world have been forced to outsourcing a large number of parts, components, sub-assemblies and accessories to cut costs of production in order to stay competitive. Thus, there is an increasing world-wide integration of the productive processes based on the economic principle of "efficient international division of labor".

International trade is now becoming as common as the domestic trade was until recently. This has thrown open vast opportunities to Small and Medium Enterprises (SMEs) throughout the world for growth in business, expansion and profitability. The vast opportunities have brought the threat of loosing out in the world of increasing competitiveness. Thus, SMEs everywhere have to find ways to grow and become more competitive by reducing costs, penetrating new markets, upgrading product quality, introducing new innovative products, increasing production levels, deriving economies of scale, reducing employee turnover, upgrading the techno-managerial skills of self, managers/supervisors and workers, and so on. The techno-managerial skills are upgraded through training. However, it is a general perception that entrepreneurs are averse to training and do not respond to the training programs offered by the trainers or training institutions. If the entrepreneurs do not care for training then how can they enhance their own as well as their employees' managerial competence. This paper first presents the structure and performance of Indian SMEs and then the findings of a major study undertaken in the National Capital Region (NCR) of India, i.e. Delhi and neighboring States' districts around Delhi to assess the training needs of SMEs as perceived by the entrepreneurs. This is followed by the analysis of the supply side scenario and the recommendations for the action plan.

## **STRUCTURE AND PERFORMANCE OF INDIAN SMES**

Traditionally, the Indian economy was known to be agriculture in character as majority of population was engaged in agriculture and related occupations. However, the agro-industrial base of India was also quite developed simultaneously, in addition to the industries such as gold / silver / copper / tin / iron / sugar / salt / paper / jute / wood / rubber / chemical manufacturing, brick- laying, leather works, pottery, weaving, dying etc. Prior to the beginning of planning era in 1951, there were plenty of tiny industries whereas the modern type of small and medium enterprises (SMEs) were generally missing as there was no planned industrial development of the country before independence. Accordingly, in the era of planned development, the tiny and small scale industries were clubbed together to form the Village and Small Industries (VSI) sector that was designed to cover a wide variety of activities which were sub-divided into eight sub-sectors viz., (a) Khadi, (b) Village industries, (c) Handlooms, (d) Sericulture, (e) Handicrafts, (f) Coir (g) Powerlooms and (h) Small Scale Industries (SSIs). Thus, the modern SMEs in India are known as SSIs.

India's second five year plan (1956-61) laid emphasis on development of heavy industries mostly in the public sector and this absorbed the growing labor force. However, because of the huge capital requirement, such trend of investment could not continue. With the spread of college education, the problem of educated unemployment started surfacing in late 1960s and early 1970s, and the only alternative was development of SMEs which could provide employment to the masses at low capital investment. Table 1 reveals that the number of SMEs grew very rapidly from about 500 thousands in 1975 to about 3.37 millions in 2001 with more than four fold increase in employment to about 18 millions during this period. The Manufacturing SMEs Survey in 1994-95 revealed the sectoral structure of the SMEs as shown in Table 2. It was found that wood products, food products, repair services accounted for more than 50% of the SMEs. Tobacco related, textiles and garments accounted for about 25% of the SMEs.

In 1974-75, the SMEs accounted for production worth Rs. 92 billion (approximately US \$ 18 billion) which rose to Rs. 6.45 trillion (approximately US \$ 141 billion) in 2000-01 as shown in Table 3. The SMEs had negligible exports in 1951-52. The most remarkable achievement of the Indian SMEs is their contribution to exports and foreign exchange earnings of about Rs. 490 billion (US \$ 11.64 billion) in 1998-99 and US \$13.13 billion in 2000-01 as shown in Table 4.

In spite of the significant contributions to the national economy, the Indian SMEs suffer from the problem of industrial sickness. As on 31<sup>st</sup> March 2001, there were 249,630 sick SMEs (out of total of 3.37 millions) amounting to 7.41% of the total SMEs. Of these, only 13,076 units (5.24%) were considered potentially viable by the financial institutions (banks) with an outstanding credit of Rs. 3.99 billion (US \$ 85 million) out of the total blocked amount of Rs. 45 billion (US \$ 962) million 91.2 % of the total blocked amount will have to be written off on account of bad debts. In India, the sickness of an industrial unit has been defined in alternative ways. According to Reserve Bank of India (RBI), "a sick unit is one which incurs cash losses for one year and which, in the judgment of the bank, is likely to incur losses for the current year as well as the following year, and which has an imbalance in its financial structure, such as a Current Ratio of less than 1 and worsening debt-equity ratio. The Sick Industrial Companies Act (1985) defines a sick industrial company as "a company registered for not less than 5 years which has at the end of any financial year accumulated losses equal to or exceeding its entire net-worth and has also suffered cash losses in such financial year and the financial year immediately preceding such financial year". The sickness may be caused due to exogenous and/or endogenous factors. Some of the exogenous factors relate to changes in international economic environment (e.g. WTO), government policies pertaining to production, distribution, prices, taxation etc.,

and/or infrastructure and related problems such as shortage of power, transportation, raw materials, deteriorating industrial relations etc. Some important endogenous factors causing industrial sickness are: mismanagement, bad planning, overestimation of demand, diversion of funds, excessive overheads, insufficient provision for depreciation, wrong dividend policy etc. As mentioned above, out of the total of 3.37 million SMEs, about 7 per cent have been found to be sick which cannot be considered as a very high proportion of the total units, particularly in the emerging WTO regime where the business environment is changing rapidly.

Commercial Banks and specialized financial institutions play an important role in extension of financial assistance, particularly for meeting the working capital requirement of this sector. The major institutions extending credit to the SSI enterprises in India include Small Industries Development Bank of India (SIDBI), State Finance Corporations (SFCs) in each State/Province of the country, public sector commercial banks, regional rural banks and cooperative banks. If the loans of these institutions were not repaid in time then the banking system would tend to collapse. India underwent the first phase of nationalization of major private commercial banks in July 1969 followed by the second phase of nationalization in early 1980. The nationalized banks rapidly expanded their branch network to mobilize resources and disperse loans to the priority sector, which included the agricultural sector, household/tiny industries and small-scale enterprises. The economic policies of the government that were followed during the 1970s and 1980s created an increasing number of willful defaulters resulting in the rapid growth of bad debts and non-performing assets. The economic reforms initiated in the country in 1991-92, which have been continuously strengthened by the successive governments since then, have tended to make the borrowers more responsible and the problem of bad debts has moved in a direction to find the solution.

## **TRAINING NEEDS OF SMES**

The managerial competency can be enhanced through training of entrepreneurs and managers/supervisors of the SMEs. Some useful training themes have been identified as follows: Performance Appraisal, Reward System, Motivation, Japanese Management System, Effective Communication Skills, Self Management, Management of Change, Managerial Excellence, Managing Competition, Effective Negotiation Skills, Time Management, Stress Management, Creative Problem Solving Skills, Decision Making, Team Building, Conflict Management etc. Some of these themes are quite standardized whereas others are not. A thorough investigation may reveal many more useful training themes for the SMEs.

Unlike the large corporate sector, the SSI Units do not have separate HRD Managers. Accordingly, these do not have the system of scientifically identifying the training needs of their personnel. Also, in view of their smallness, the training needs of managers, supervisors and workers of the SSI Units are identified directly by the entrepreneurs. Here the situation is such that a person (entrepreneur) tries to find out the training needs of his employees without knowing and adopting the right procedure for doing so. The exposure of any entrepreneur is not so much that he or she can identify all possible training needs of the employees. In the absence of adoption of a systematic methodology, all training needs cannot be identified correctly. An entrepreneur needs to be made aware of alternative training themes so as to give him a broad spectrum of training alternatives so

that he/she can indicate the extent of usefulness of these training themes. The present study attempts to assess the extent of usefulness of training on various such themes.

## **RESEARCH METHODOLOGY**

This study uses structured and non-disguised questionnaire to seek the response of the SME entrepreneurs in the NCR of India that consists of the State of Delhi, and includes Gautambudh Nagar (Noida) and Ghaziabad districts of the State of Uttar Pradesh, and Faridabad and Gurgaon districts of the State of Haryana. The number of industrial areas in the State of Delhi is very large and it is an extremely difficult task to cover all these areas which are several hundred in number. Therefore, two largest industrial areas of Delhi, viz. Okhla and Wazirpur were selected for the study. The results of the empirical study are based on 374 valid responses from the entrepreneurs of 3400 selected SMEs to which questionnaires were sent. More than 10 per cent response rate could be achieved by way of repeated reminders and sending another copy of the questionnaire through mail as well as personal contacts.

## **FINDINGS & ANALYSIS**

The survey findings and analysis are presented as follows.

### **1. Training Needs for Developing Managerial Competence**

Table 5 presents the extent of usefulness of training on policy and knowledge-based themes. About 50 per cent of the respondents have indicated the extent of usefulness of training on 'Government Policies on SMEs' as medium or high. About 43 per cent sample entrepreneurs have indicated 'WTO and Its Impact' as medium or highly useful theme of training. In contrast to this, the training on 'Intellectual Property Rights' has been considered 'not applicable' by about 46 per cent entrepreneurs and only one-fourth of the entrepreneurs have considered it as medium or highly useful theme of training.

Table 6 presents the usefulness of training program related to production management and productivity. From about one-fifth to one-third of the sample entrepreneurs do not find any applicability of production management related training for their SSI units. The most important theme for training in this category has been found to be 'Improving Work Culture and Productivity' by about 47 per cent of the sample entrepreneurs. About 27 per cent of the respondents have indicated its usefulness as medium. The next most important themes for training are indicated as 'Rejection and Wastage Control' and 'Process-time Reduction' by about two-third of the sample entrepreneurs. Other themes like 'Project Management', 'Materials Management', 'Vendor Development', 'Safety Management', 'TQM & ISO Certification' and 'Quality Circles & Suggestion Scheme' have also been considered as medium or highly useful by about 50 % to 60 % of the sample entrepreneurs.

Table 7 indicates usefulness of Human Resource Management (HRM) related training programs. The entrepreneurs response has been sought on the following themes: (a) performance, reward system & motivation, (b) Japanese management system, (c) effective

communication skills, (d) self management, (e) management of/for change, (f) managerial excellence, (g) managing competition, (h) effective negotiation skills, (i) labor laws, (j) time management, (k) stress management, (l) creative problem solving & decision making, (m) team building & conflict management, (n) A to Z management of SSI unit. About two-third to three-fourth of the sample entrepreneurs consider medium or high usefulness of training in the areas of 'Self Management' (71 %), 'Effective Negotiation Skills' (71 %), 'Reward and Motivation' (70 %), 'Managing Competition' (69 %), and 'Creative Problem Solving' (66 %). For other themes, the medium or high importance was indicated by about 60 per cent of the respondents except that 'Japanese Management System' was considered useful by about 39 per cent respondents.

Thus, it has been found that training on Managing Competition, Effective Negotiation Skills, Performance Appraisal, Reward System, Motivation and Self Management is perceived to be **highly useful** by more than one-third of the respondents. This is followed by the training on Managerial Excellence, Effective Communication Skills, Creative Problem Solving Skills, Time Management, Team Building and Conflict Management which have been considered as highly useful by a little less than one-third of the respondents. If the entrepreneurs' responses as 'medium' and 'high' usefulness of training are combined then it is found that about two-third of the respondents have indicated training on these themes as medium or highly useful. The training on themes such as Stress Management, Management of Change, Japanese Management System and Labor Laws has been perceived as less useful.

Table 8 presents the distribution of respondents according to the extent of usefulness of training in the area of Marketing Management. Two-third of the sample entrepreneurs have indicated medium or high usefulness of training on 'Effective Sales Management' whereas 55 per cent respondents have indicated medium or high usefulness of training on 'Advertising and Sales Promotion'. The e-Marketing or e-Commerce does not seem to be the favorite of sample entrepreneurs. For about one-third respondents this theme is indicated as 'not applicable' and only about 47 per cent respondents consider this as useful.

Table 9 presents training needs of sample entrepreneurs in the area of Financial Management. More than two-third of the entrepreneurs have indicated as medium or high usefulness of training on 'Cost Analysis for Profit Planning' and 'Cost Control and Decision Making'. About 60 per cent entrepreneurs have also favored training program on 'Alternative Sources of Working Capital'.

Table 10 presents the extent of usefulness of training programs related to the workers. For most of the training themes for the workers, more than half of the sample entrepreneurs have found training to be medium or highly useful. In terms of high usefulness of training themes for the workers, 'Improving Workers Productivity' has been found to be highly useful by about 58 per cent of the sample entrepreneurs. This is followed by 'Training on Technical Skills' (48.8 %), 'Good Work Habits' (46.1%), 'Work Ethics' (43.2 %). The 'Preventive Maintenance' and 'Industrial Safety' followed by 'Evils of Drinking & Smoking Habits' and 'Constructive Union Leadership' have also been considered as useful training themes by the sample entrepreneurs.

Thus, it is discernible from the foregoing discussion that the responding entrepreneurs do consider managerial as well as workers training on various aspects as useful. The extent of usefulness of various training themes as indicated by these entrepreneurs is a significant finding of the present study as these results can be used by the trainers and

training organizations committed to organized relevant and suitable training programs for the SSI sector.

## **Training Needs & SME Size**

Table 11 reveals the survey findings on training needs by the size of SMEs as measured by number of employees. It has been found that as the number of employees in the unit increases, the usefulness of training generally becomes higher. The training on themes such as Managing Competition, Effective Negotiation Skills, Performance Appraisal, Reward System, Motivation, Managerial Excellence, Effective Communication Skills and Self Management has been indicated as **highly useful** by more than 45 per cent of the SMEs having more than 25 employees. About three-fourth of the responding entrepreneurs of these SMEs have indicated training on these themes as 'medium' or 'highly' useful. In case of training on Time Management there is significant difference between the perceptions of its usefulness by the units with more than 50 employees and those with employees' strength between 26 and 50. Only about 30 per cent of the SMEs in the latter category consider training on Time Management as highly useful in contrast to more than 52 per cent in the former category. Somewhat similar pattern is exhibited in case of training on Creative Problem Solving and Decision Making. Training themes such as Japanese Management System and Management of Change have not been perceived as highly useful by more than one-third of the responding entrepreneurs of this category SMEs.

## **Training Needs & SME Turnover**

The size of an industrial unit usually increases with its turnover. The analysis of training needs of the sample SMEs reveals that more than half of the respondents (50% to 60%) from SMEs with turnover more than Rs. 5 crores consider training on Performance Appraisal, Reward System, Motivation, Effective Communication Skills, Managing Excellence, Managing Competition, Effective Negotiation Skills to be **highly useful** (Table 12). The usefulness of such training has been found to be increasing with the turnover of the organization. This finding is consistent with the increasing usefulness of training in these areas when analyzed from the point of view of size of the SME by the number of employees. Similar pattern is observed in the responses towards the training on Japanese Management System, Self Management, Management of Change, Time Management, Stress Management, Creative Problem Solving, Decision Making, Team Building and Conflict Management. These are also consistent with the findings regarding usefulness of training needs with increasing number of employees in the responding SMEs.

## **Training Needs & Organization's Age**

Although the training needs as perceived by the organizations of varying ages do not show upward or downward trend, it can be broadly concluded that the usefulness of training has been found to be lower for the older SMEs set up before 1970 as well as those young SMEs set up in the 1990s. These results are presented in Table 13. It has been found that the organizations set up in the 1970s realize the training as highly useful. About 40% of these SME entrepreneurs have considered as **highly useful** the training on Performance Appraisal, Reward System, Motivation, Effective Communication Skills, Self Management, Managerial Excellence, Managing Competition, Effective Negotiation Skills, Time Management, Creative Problem Solving Skills, Decision Making. Other themes have not been found as highly important by more than one-third of these entrepreneurs. This could

be due to the age factor of the entrepreneur, motivation for growth, succession-planning interest of the potential inheritor of the business.

## **SUPPLY-SIDE SCENARIO**

The analysis presented above reveals the extent of training needs of different sets of SMEs. Although the entrepreneurs have revealed high importance for training, in practice they show a lukewarm attitude towards sponsoring their managers/supervisors for training.

Unlike the SME sector, the large corporate sector systematically earmarks budget for training, most of the Indian professional trainers are engaged in the corporate sector training. New training programs are designed for the corporate sector executives and conducted at attractive Indian/foreign locations. Such programs are also well marketed as there is potential demand as well as attractive returns for trainers and training organizations.

On the other hand, the training for SMEs is neither associated with much demand by the entrepreneurs nor does it provide satisfactory returns to the trainers and training organizations. Thus only the philanthropist trainers or otherwise less competent trainers are engaged in the business of SME training. Thus, the vicious circle of low importance of training by the SMEs starts. As there is dearth of good and appropriate training programs, the SMEs do not wish to spend money for training and when there is no reasonable demand for training, the good trainers do not get into the SME training. Another hampering factor in SME training is the psychology of the entrepreneurs which works in two ways. One, an average entrepreneur does not want to spare his people for training as he considers it to be a double loss, i.e. the loss of work due to absence of the employee sent on training as well as the cost of training (Registration Fee, transportation expense etc). The other psychological factor that hinders SME training is the entrepreneur's attitude that 'he knows everything' and 'nobody can impart "training" to him', and that the training is important but it does not add to (future) profits.

India has several professional bodies of trainers but specialized tailor-made SME Training Programs hardly exist and no efforts seem to be underway in this regard. Thus, it can be said that the supply-side of SME training is weak in India. The situation does not seem to be much different in most other developing countries as has been revealed by the SME experts from those countries. Thus, it may be concluded that the supply-side side of SME training needs significant upgradation.

## **CONCLUSION AND RECOMMENDATIONS**

The SMEs contribution to the national economy has been found to be quite significant in India, as is true elsewhere in the world. The findings of field study reveal that the SMEs, particularly in the NCR of India, consider training as important. Some of the training themes such as Performance Appraisal, Reward System, Motivation, Effective Communication Skills, Self Management, Managerial Excellence, Managing Competition, Effective Negotiation Skills, Time Management, Stress Management, Creative Problem Solving Skills etc. are considered important by the entrepreneurs. The training needs are

higher for SMEs with large number of employees and higher turnover. The SMEs do not feel need for training to be strong if they have been set up during the past 10 years. However, there are psychological road-blocks on the part of entrepreneurs that are responsible for their lukewarm attitude towards training. The findings of the study are extremely important for the trainers and training organizations actively engaged in this activity. If extremely well-designed training packages are developed and offered to the SMEs, then the SME Training Programs would sell like hot cakes. The enlightened entrepreneurs must come forward in this regard. Governmental SME Training Institutions would also need to work hard in this direction. If all stake holders join hands, then the SMEs would tend to be more successful in this era of globalization and industrial sickness will be far away from them.

# **CELENTIS DEVELOPING AN ENTREPRENEURIAL CULTURE INSIDE A CROWN RESEARCH INSTITUTE**

**Prepared by**

**Dean Prebble, Senior Lecturer, Unitec Institute of Technology<sup>©</sup>  
and  
Alex Maritz, Senior Lecturer, Unitec Institute of Technology**

## **INTRODUCTION**

In 1992, the infrastructure of New Zealand government departments and ministries that supported research and development and technology transfer, were dismantled. In its place was established a series of Crown Research Institutes (CRIs). AgResearch is the largest of these institutes.

In 2001, Celentis was established as the commercial arm of AgResearch to deliver products and technologies to the market.

This case study involved the writer gaining a deep understanding of the Celentis business from his involvement as a consultant from March 2001 through to May 2001. This included facilitation of the strategic planning process, documentation of the plan and involvement of the team in aligning organisational structure with strategy. In May 2003 after no contact for two years, the writer spent four weeks analysing the current state and comparing it with 2001. The result of this analysis has provided insight into the key drivers of cultural change and a detailed account of the development of entrepreneurial capability in a highly innovative environment.

It was found that significant changes had been made over the period with respect to processes and people. The study describes the challenges faced when incorporating a commercial focus into a predominately “science” culture and provides insight into the type of results that can be achieved.

### **The Celentis Business**

Celentis’ purpose is to create value for its shareholder by commercialising technology. It does this primarily through:

- Creating, incubating and strategically growing standalone companies, either to be sold, or to provide an ongoing source of dividends
- Licensing technologies

In addition to their primary purpose of creating companies and licensing technologies, the capabilities of Celentis can be leveraged to generate secondary sources of revenue by providing third party services. These include:

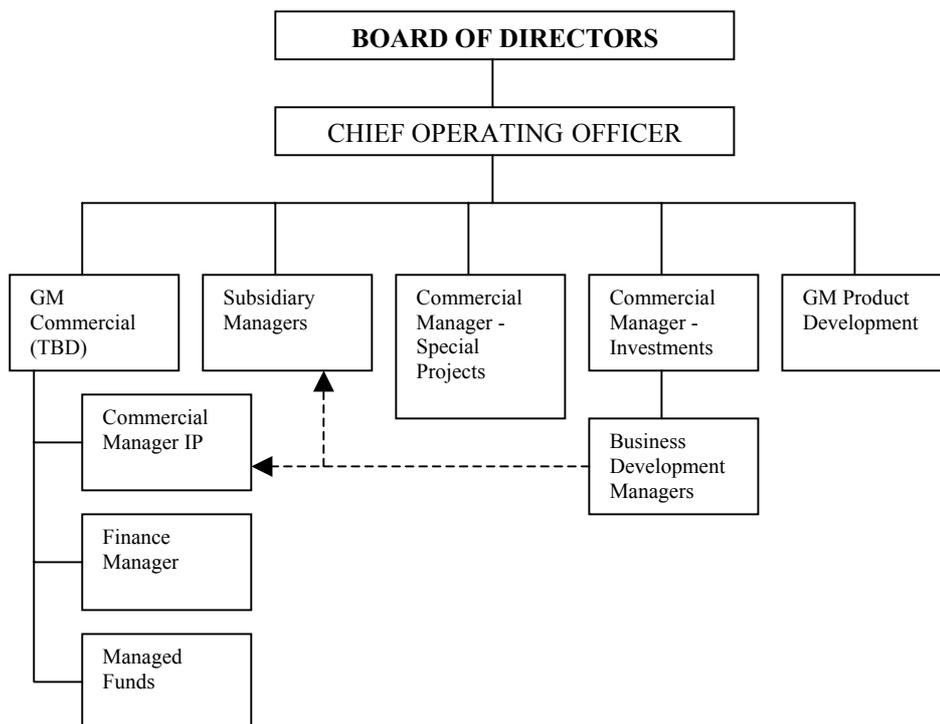

- Consulting revenue from intellectual property management services
- Brokering fees for arranging finance
- Brokering fees for arranging contract R&D

## March 2001 – Situation Analysis

In March 2001 Celentis, a division of AgResearch, was undergoing significant change under the guidance of their newly appointed General Manager. The majority of staff had worked previously for AgResearch. Their new roles and responsibilities in Celentis were not well defined and accountability was poor. Celentis had yet to be incorporated and operations were significantly influenced by AgResearch senior management.

The organisation chart is shown below:

**Figure 1: Celentis Organisation Chart, March 2001**

It is important to note that the above structure was evolving as at March 2001 and there was considerable overlap between the positions of Commercial Manager (Investments) and the General Manager (Product Development). The GM Commercial had not been appointed and the Chief Operating Officer spent considerable time in subsidiary affairs and dealing with operational issues.

Celentis was located in Ruakura, Hamilton alongside the scientific research facilities of AgResearch. The emerging commercial culture was dominated by the surrounding

scientific culture and there was deep suspicion amongst the AgResearch scientific community with respect to the Celentis value-add.

## **Capability - 2001**

A survey carried out by senior management at Celentis identified the following capability deficiencies:

1. Capability in Science Commercialisation scored 4 out of 10. This process focussed on capabilities such as:
  - The process of taking a science concept through the product development process.
  - The process of launching new products through subsidiaries and investments.
  - The process of collecting and using market intelligence in a timely manner.
  - The process of aligning science with the market
  - The process of protecting and managing intellectual property.
2. Capability in establishing new business arrangements scored 5 out of 10. This process focussed on capabilities such as:
  - Establishing new start-up companies.
  - Negotiating partnerships with larger industry players.
  - Establishing license agreements.
  - Valuing intellectual property and businesses and scenario analysis.
3. Capability in investment management scored 4 out of 10. This process focussed on capabilities such as:
  - Managing businesses
  - Investment management
  - Arranging Finance
  - Analysing risk – portfolio management
  - Negotiation
  - Forming and managing strategic relationship

In addition to the capability gaps above, the following weaknesses and risks were identified:

### **Weaknesses:**

- High uncertainty with respect to intellectual property competitiveness
- High business development compliance costs within New Zealand
- Lack of seed capital funders within New Zealand
- Under developed linkages between research institutes, investors and businesses
- Lack of a commercial focus
- Constraints imposed by AgResearch shareholders

## Risks:

- Risk of product failure – where products Celentis are connected with fail in the marketplace
- Commercial risk – where Celentis fails to deliver commercial outcomes
- Intellectual property risk – where Celentis misses out on opportunities
- Lack of succession planning – where loss of key staff impact on performance
- Financial risk – where Celentis fails to fund its business expansion

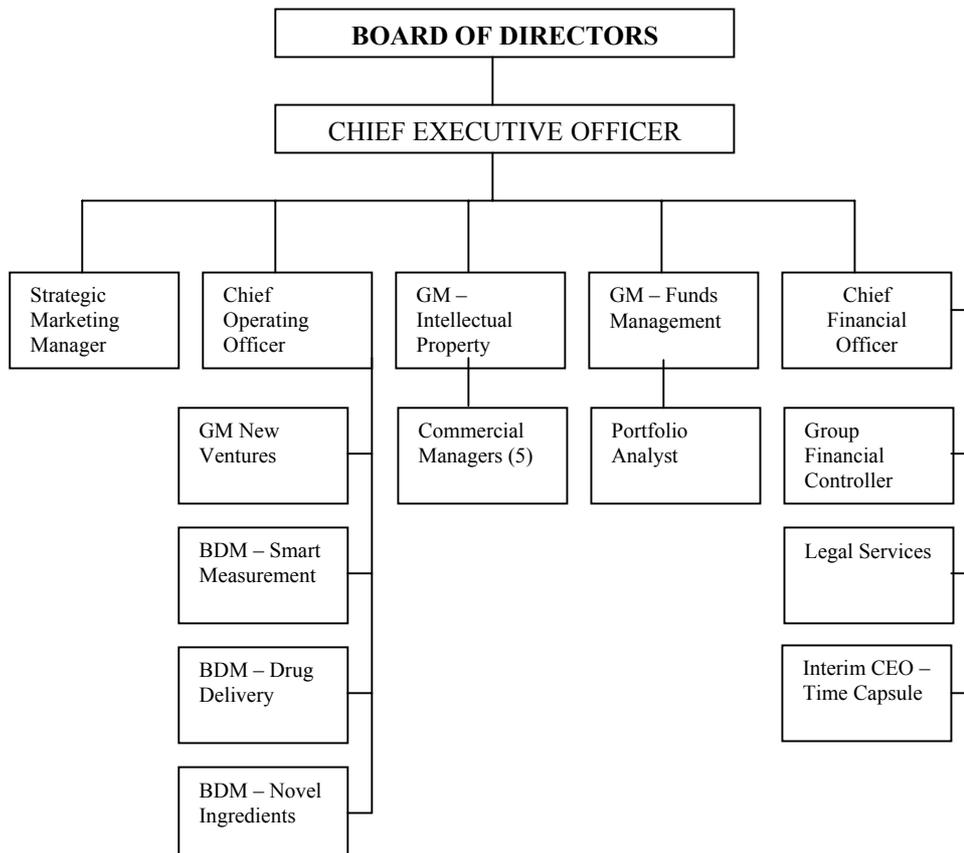

## May 2003 – What has changed?

In May 2003 Celentis is a stand alone entity with a strong commercial identity and focus. The company is now located in Auckland. A new Chief Executive Officer was appointed mid way through 2002 with significant Biotech start-up and wealth creation experience. This was followed by the appointment of an experienced Chief Financial Officer and a Strategic Marketing Manager.

Subsidiaries now all have their own independent Boards of Directors with Celentis representation. Funds are sourced both internally and externally and invested in portfolios of science projects (product development) and new start-up projects. Dealflow is now being sourced from outside of AgResearch and consultancy and brokering services can be offered to external parties.

The new organisation chart is shown below:

**Figure 2: Celentis Organisation Chart, June 2003**

## Capability – 2003

The self-assessed ranking of the capability gaps identified in 2001 are now rated as follows:

- Capability in Science Commercialisation scored 7 out of 10.

“We are now good at forming new companies around technologies and then encouraging their ongoing work with AgResearch science. We still have plenty of room for improvement in the area of setting obtainable milestones. Linking funding to milestones has been a major breakthrough” Stewart Washer, CEO, Celentis

- Capability in establishing new business arrangements scored 7 out of 10.

“We have launched five new subsidiaries over the past year and now have a much better link between our product pipeline and market opportunities” Stewart Washer, CEO, Celentis

- Capability in investment management scored 6 out of 10.

“We still haven’t got a track record yet. In two years we should be able to say, 8 successful deals, \$24m invested successfully plus proof of successful exit. We have had three successful exits over the past year” Stewart Washer, CEO, Celentis

In response to the weaknesses identified in 2001:

- With respect to competitiveness, the company has increased its customer responsiveness and speed to market. This is demonstrated by the focussed nature of meetings and the improving performance measures.
- With respect to intellectual property, the company continues to build its portfolio and is now inviting other research institutes to utilise the services offered by Celentis.
- With respect to the costs of doing business in New Zealand, the company is thinking internationally with respect to all operating, financing costs and taxation. It will relocate where it makes economic sense to do so.
- With respect to commercial focus, the company has built a strong commercial team and culture with the introduction of new staff and the relocation to Auckland. The previous GM, Product Development has been appointed to specifically develop relationships with investors in New Zealand under the GM, Funds Management Role.

In response to the risks identified in 2001:

- Risk of product failure – Celentis is moving toward an ISO or similar type quality rating
- Commercial risk – all incentives for employees, science and managers are aligned around commercial success. All transactions between related parties are full arms-length commercial with written agreements.

- Intellectual property risk – a focussed team of four intellectual property specialists is in place
- Succession planning – depth is now held in all senior positions. There are now no serious key man risks.
- Financial risk – Celentis is well on the way to securing a pre-seed funding mechanism and has built considerable relationships in the capital markets with respect to post start-up funding. In addition their CEO has significant previous experience in attracting funding from angel investors.

## **Cultural Shift**

There has been a significant cultural shift brought on by the new appointments and commercial clients becoming increasingly more demanding. Benefits of this cultural shift include:

- There is clarity with respect to future direction
- A new, positive mindset created by the shift to Auckland – the office and external environment spell out that they are here to do business
- Meetings held are strongly centred around the dollar – far more efficient and focussed than in 2001
- There are minimal politics in the structure “it is all about people focussed on the dollar”
- There is a deeper understanding of the investors perspective i.e. what they want deals to look like
- A science “involvement and incentive” scheme ensures that 14% of royalties collected go straight back into science (10% to the science platform and 4% to the individuals). A philosophy of milestone-based payments with bonuses attached has been established.
- Business development managers concentrate on a specific focus areas and are building international relationships and sourcing deal opportunities
- A focus on leveraging existing offshore partners and targeting specific individuals ensures a growing web of international networks
- The marketing team provide a strong research function which feeds directly into market assessment studies

## **Capability going forward**

Celentis is now well positioned to offer its services to other science agencies and to replicate its commercial model offshore.

Key capability can be summarised as follows:

## **Market analysis and business development**

Celentis’ resources in this area include:

- A team of three business development managers
- A dedicated strategic marketing manager
- Two marketing analysts

In addition, a Chief Operating Officer is currently being recruited to optimise the returns from customers in the focus areas with the business development managers.

The business development team is capable of identifying new customers within and beyond New Zealand, building relationships with them and building revenue by packaging contract R&D, new product development, and co-investment.

The marketing team is capable of evaluating markets and gathering customer intelligence to ensure that science projects are only undertaken if there is a strong likelihood that there will be a strong demand for the outcomes.

#### Intellectual property management

Celentis' resources include:

- A general manager of intellectual property
- A four person in-house intellectual property team
- A strategic relationship with James and Wells, Intellectual Property Attorneys
- Access to external databases

In addition to their primary role of supporting the wider AgResearch Group, the intellectual property team is capable of generating revenue by out-licensing AgResearch technologies and brokering technology transfers between third parties. In addition they can consult to third parties on intellectual property commercialisation.

#### Fund raising and management

Celentis' resources include:

- A general manager of investment
- A senior portfolio analyst

The investments team maintains a network of contacts covering most of the venture capital firms in New Zealand and is rapidly building networks of venture capital firms based overseas. They are capable of evaluating and packaging science projects for investment by external fund providers. Furthermore, they can oversee the management of these projects through to proof of concept stage where they can be developed as standalone companies or licensed to third parties.

### **Business incubation**

Celentis' resources include:

- A dedicated general manager for new ventures
- All new businesses have, or are in the process of recruiting, their own CEO/General Managers and Boards of Directors<sup>1</sup>

The general manager of new ventures draws upon the resources of the rest of Celentis and AgResearch, as well as external consultants to provide the infrastructure necessary to support incubating businesses.

---

<sup>1</sup> CEOs are usually appointed by the Boards via a professional executive search

## **Maximising return from maturing subsidiaries**

The corporate team at Celentis (consisting CEO, CFO, manager of human resources and accountant) oversee the operation of four mature subsidiaries (profit making in 2002/3) and five incubating businesses.

The corporate team draw on extensive experience from the financial, banking and agricultural sectors in order to put in place an investment strategy to maximise the return from dividends or increase in equity value.

## **RESULTS TO DATE**

In addition to the significant capability building programme described in this case study the following commercial results have been achieved over the two year period:

- Founding of nine subsidiary companies covering areas such as anti-ageing nutraceutical development, animal health, food processing technology, asthma prevention drug development, human health products and biocontrol solutions.
- Development of commercial alliances with global heavyweights in the biotech industry.
- Over fifteen licensing deals.
- Revenues of \$33,275,700 for the current financial year.

The study provides insights into the transition from a government-owned science agency into a dynamic commercial entity.

## **WHAT WOULD THEY DO DIFFERENTLY?**

In its first year, Celentis was deeply involved in the product development process. It had many unfocussed meetings with Scientists. It is now very focussed on establishing new companies that have natural incentives to drive product development to meet the needs of specific target markets. Celentis has become a commercial facilitator, matching “proof of concept” research with the market demands of spin-out companies. Product development is now the domain of subsidiaries.

## **THE YEAR AHEAD**

Celentis will concentrate on five activities in 2003/4

1. Building revenue through licenses, collaborative investment and contract R&D

Celentis will work to expand its customer base in 2003/4. Business development will be focussed in three areas:

- Novel ingredients from nutraceuticals and functional foods
- Smart measurement systems for the food industry
- Drug delivery for animal health

The target customer base will be mainly outside of AgResearch's established clients and will include a substantial number of non-New Zealand companies. The Business Development Managers all have a deal pipeline. They must complete or replace failed deals with equivalent deals.

## 2. Forming and incubating new companies

A key priority for business incubation in 2003/4 will be the establishment and growth of the company formed to commercialise the production of high value proteins from transgenic cows.

In addition, five established but relatively young subsidiaries will be assisted in their business building process. A priority will be to recruit an executive team and expert Board of Directors for each business.

## 3. Creating ScieNZe

The ScieNZe fund will be established during 2003/04. Celentis, in combination with its partner New Zealand Asset Management plan to raise a fund of \$20m. Celentis Funds Management will put together a portfolio of projects for ScieNZe investment and manage the investment into these projects.

## 4. Developing new products

The medium to long term viability of Celentis depends on a steady and growing product pipeline for four applications:

- i) subsidiaries
- ii) licensing out
- iii) ScieNZe fund investment
- iv) new venture developments

## 5. Accelerating growth of mature subsidiaries

Subsidiary companies will be the largest growing contributor to the Celentis Group EBIT. Consequently, ensuring that these subsidiaries are able to maximise their profit potential will be a key priority in 2003/4. This will be achieved through Celentis forming subsidiary Boards with independent high value Directors and setting clear growth targets and strategies for these companies.

The long term future will see Celentis establishing their track record and then applying their capability and business model across other science disciplines and in other countries.

# INTRAPRENEURING STRATEGY FOR SMALL FIRMS SURVIVAL IN A GLOBALIZED ECONOMY

## ABSTRACT

It is replete in the literature that problems and constraints of small firms are enormous. To thrive in this very competitive environment has been the major concern of many scholars. Could intrapreneuring maintain their competitive position? The study examined the intrapreneurship approaches of small firms in a developing nation in a globalized economy.

The survey was conducted in southwestern part of Nigeria among 60 small-scale manufacturing firms. A multi-stage sampling technique was used to select three states out of the six states comprising the region. Twenty enterprises were randomly selected in each of the states making a total of sixty respondents for the study. A focus group discussion in three sets of twenty respondents was held. Questionnaire was developed to collect the relevant and more specific information needed. Intrapreneurial strategies as well as the problems faced by the firms were measured using a five-point scale, while success was characterized into performance and growth and these were categorized into technological development, market expansion and increase in manpower size. The data were analyzed using descriptive and inferential statistics. While all the variables of interest were highlighted, their relationships were correlated for linear dependence.

The unprecedented shrinking and wiping out of small firms in the economic arena due to lack of competitiveness could be prevented by the adoption of intrapreneurship innovation strategies. These include benchmarking, total quality management, product and service innovation, market niche opportunity, intra-capital strategy, and community development among others. Through these intrapreneurial efforts, their survival in a globalized economy could be sustained.

**Key words:** market niche, organizational innovation, adaptive innovation, rightsizing.

## INTRODUCTION

In recent decades, several nations sought to protect their domestic economy against external forces and to limit the net outflow of surplus by adopting economic nationalism,

that is nationalization of key industries, indigenization decrees, requirements for local corporation of a portion of foreign capital, and so on. Other nations have embarked a more radical strategy of self-reliance as a means of insulation from the world system.

Today, however, the world system has deepened its concept to globalization in which the world is becomingly homogenized economically, socially, and culturally, developing a global village by market penetration through dispersing production capacity to an unprecedented number of developing as well as industrialized countries. It is noteworthy however, that in the process of globalization, as it affects all regions of the world, it generates social and cultural resistance. While the opportunities offered by the integration of the world economy can be large for accelerating growth and development, there is growing concern on its significant effects on market structure, labor condition and mobility, capital mobility, among others. Obviously and significantly, the process affects the industrial sector.

The quest of moving up in the global economy, Third World regions confront a significant productivity gap. In their efforts to narrow the gap and gain international competitiveness, they pursued a variety of policy and institutional reforms. For instance, the relatively large resource-rich economies pursued Import Substituting Industrialization (ISI) approach in which industrial production was geared to the needs for sizable domestic markets. The smaller resource-poor countries like the Newly Industrializing Countries (NICs) adopted the Export-Oriented Industrialization (EOI) approach that depends on global markets to stimulate the rapid growth of manufactured exports. This approach has led to a notable enhanced competitiveness among the NICs in the 1980s and 1990s (Gereffi, 1997).

Moreover, Third World development involves ascending a ladder of industrial complexity that requires a dynamic enterprise base, appropriate state policies, and on improving set of skills and wages in the workforce. Whereas the less developed countries (LDCs) of the Third World have limited industrial experience, they are on a trajectory that many other countries with rich as well as poor resource bases already have traversed.

Several strategies were suggested to maintain the competitive advantage of the developing and the less developed countries by many scholars. According to Gereffi (1997), there is a scant attention given to the role of local innovations in stimulating productivity increases. He further stressed that there are several kinds of innovation elements to include: breakthrough innovations, adaptive innovations, and organizational innovations.

Apparently, there exist an intrapreneurial functions imperative in the quest of the developing economies in reaching the status of core countries in the world economy. To close the productivity gap, innovation is critical. Pinchot (1987) submitted that the economy of the United States is on innovation treadmill and said:

“Our competitors enjoy cheaper labor, cheaper capital, and more government support than we. To maintain our competitive position, we need superior technology, more proprietary products, services, and better processes. As our competitors become more scientific, and managerially sophisticated, it takes them less and less time to understand and copy our innovations, we have to increase our speed and cost-effectiveness or innovations in our country to match our competitor’s increasing sophistication in copying and capitalizing on our technology”.

In other words, in-house entrepreneurs, those “dreamers” who can increase the speed and cost-effectiveness of technology transfer from research and development to the marketplace brings the productivity gap closer.

## **PROBLEM STATEMENT**

The tumultuous changes wrought by economic globalization apparently had affected industrial sector specifically the small-scale industries in developing and less developed countries of the world. As globalization affects all spheres, even multinational organizations cannot but to leave no avenue for the small firms to grow outside their shells. Undoubtedly, very soon as their socio-economic roles are shrinking, they cannot be found in the economic scene any longer.

By and large, small firms have assumed a critical role in industrialization and economic development of most developing countries. The literature has recorded a magnitude of social and economic benefits they have contributed. They have been observed and seen as vehicles for employment generation, utilization of indigenous resources, distribution of income, self-fulfillment, economic rejuvenation, among other socio-economic benefits. They are also seen as the seed of corn of the economy, providing medium and large firms of tomorrow. As Ogbimi (1992) stressed, multinational companies should not be forgotten that they are not a product of a two-day activity they have been nurtured for decades.

In Nigeria, small firms were observed to have been promoting indigenous skills and abilities to tap latent savings and skills that could not otherwise be mobilized (Adejugbe, 1987). Small firms are also recognized for the utilization of domestic inputs and the development of local technology. They are always ready to adapt and improve their production within their respective localities. For example, in the food industry, there has been a number of breakthrough in the production of composite flour from local raw materials such as yam, cassava, rice and maize. In another direction, there has been some success in making biscuit from plantain. In employment, small firms had contributed seventy percent of the industrial labor force in the country in the past.

The promotion of small firms is regarded as a way of enabling the local population to participate in the country's economic and social development. When people are involved from various localities, it creates and improves the national value system and eventually brings equitable distribution of income, thus promoting social harmony. This means that if income is not only in the hands of a few, there will be less poor people. Therefore, the proliferation of small firms brings end to poverty while satisfying the basic needs of the people. It also helps in solving social problems.

While small firms are receiving recognition as the bedrock of economic development in many countries, their survival and growth are constrained and hindered by many obstacles militating against their effectiveness. They are constrained by the basic physical infrastructure, high illiteracy level, cumbersome government procedures, environmental impact, political economy, and lack of financial support among others. In light of this, the study accentuated on examining the intrapreneurial strategies used by small firms to thrive from the threat of all these problems and the negative impact of globalization. The study specifically aimed at determining the adoption of intrapreneurship as a function and a strategy for survival and growth.

## FRAMEWORK FOR ANALYSIS

Entrepreneurship is often viewed as a function, which involves the exploitation of opportunities that exist within a market. Such exploitation is most commonly associated with the direction or combination of productive inputs. Gill (1963) described entrepreneurs as an individual who possesses drive, ambition, foresight and imagination to breakthrough traditional barriers, overcome social inertia and transform theory into practice. Schumpeter (1934) saw entrepreneur as an innovator who implements change within markets through carrying out of new combinations. The carrying out of new combinations can take several forms: 1) the introduction of a new good or quality thereof, 2) the introduction of a new method of production, 3) the opening of a new market, 4) the conquest of a new source of supply of new materials or parts, 5) the carrying out of the new organization of any industry.

Pinchot (1987) described an entrepreneur as any of the dreamer who do and those who take hands on responsibility for creating innovation within any kind of an organization. In other words an intrapreneur is an entrepreneur within an existing organization. Being a part of the corporate structure, an intrapreneur is also referred to as a corporate entrepreneur. Pinchot further elaborated that an intrapreneur may be a creator or the inventor but is always the dreamer who figures out how to turn an idea into a profitable reality. The major thrust of intrapreneuring, then, is to create or develop the entrepreneurial spirit within the corporate boundaries, thereby allowing an atmosphere of innovation to prosper, thus bridging the productivity gap to maintain competitiveness.

According to Gereffi (1997) the several kinds of innovations can be distinguished in three ways. One is the breakthrough innovation where new products and process that allow firms to fundamentally redefine the cost structure of modern industries so that old products and technologies become obsolete. Second is adaptive innovations which involve the use of modern technologies, and third is organizational innovations using a vertical and horizontal organizational forms like trading, sub-contracting, networks and triangle manufacturing that changes the status of the manufacturer from primary production contractor to middleman. This third party production or subcontracting has become popular and had served several important implications to large and small firms in general.

There are other innovative elements that are dynamic sources of competitiveness. Total Quality Management (TQM) is one of the latest management innovations that set out a guiding principle of continuously improving organization. It is the application of new materials to improve all the processes to meet customer needs and satisfaction. In collaboration, Grint (1997) added that in a dynamic market economy, the only way to stay marginally ahead of your competitors is to generate some kind of competitive advantage through innovation. In fact TQM is a new approach to improving the effectiveness and flexibility of business as a whole. It is a quality process that involves every person in every department of the organization, all to be working together to eliminate errors and prevent waste. Okollie (1986) viewed TQM as a management philosophy that builds customer driven, learning organization dedicated to total customer satisfaction with continuous improvement in the effectiveness and efficiency of the organization. This philosophy is anchored on the concept that customer satisfaction is the primal goal of any organization may be profit or non-profit. More over if this core group are satisfied they are assets to the organization but if otherwise they are cankerworm to the growth of the enterprise.

Furthermore, Michael and Chen (1993) were of the opinion that TQM is a system that comprises a set of integrated philosophies, tools and processes used to accomplish business objectives by creating delighted customers and happy employees. Rightsizing is another organizational innovativeness. It is an approach to strategically reshaping the organization by expanding part of the organization into new markets. Similar are delayering and outsourcing in improving organizational efficiency. These downsizing strategies of organizational change were recorded to have improved efficiency (Appelbaum, 1999). Another element of organizational innovation is re-engineering. It is a fundamental rethinking and radical redesign of business processes to achieve dramatic improvements (Lankford, 1999). It encompasses the envisioning of new work strategies, the actual process design strategy, and the implementation of the change in all its complex technological, human, and organizational dimensions.

Another most common innovative tool is benchmarking. Benchmarking being a survival strategy can be viewed as a management technique to improve business performance. It is used to compare performance between different organizations or units within a single organization undertaking similar process. It has been defined as the search for industry best practices, which lead to superior performance (Walleck, et. al. 1991). Paradoxically, an organization will not like to be at a status quo, the management executives will like to know how the organization is performing, particularly in the competitive environment. The areas that require changes must be identified and make improvements that will be worthwhile. In order to achieve this, structured approach such as benchmarking is essential when seeking opportunities, improve services and reduce costs through efficiency (Fuld, 1988).

Ashton (1988) theorized the concept of benchmarking and stated that it is a continual process of measuring products, services and practices against the toughest competitors or those companies recognized as industry leader. Benchmarking as a management technique came to prominence due to organizational changes in the 1980's. It is a technique, which was initially used to support companies in gaining competitive advantage (Codling 1992). However, today it is also used to measure similar operations as a way of improving business processes. It is worth mentioning that, unlike other traditional competitive management techniques, the success of benchmarking depends on cooperation between partners (Allan, 1993).

Forming alliances is strategy of forming networks of partner firms. Successful organizations benefit from social supports, which entail forming close associations with trusted, empathetic partners who are good confidence builders. Those associations are needed to get people through stressful situations. Today such alliances if deliberately sought out and developed are needed for the growth of small firms. Similarly networking strategy will help the small firms to cope better and be more effective. Further, niching strategy is another dimension of intrapreneurship. The intrapreneur has to seek for more niches in his local areas that are not paid attention to by the multinationals and serve them better than the competitors. Fuld (1993) in his study of how America's high and mid-size growth companies succeed, opined that smaller firms normally avoid competing with larger firms by targeting small markets of little or no interest to the larger firms. He further stated that firms with low shares of the total market could be highly profitable through smart niching.

Research and development is an element of innovation. It directly faces on the problems of creatively handling large amounts of information in an atmosphere of uncertainty in which future effects of different decisions must be compared and in the end require

important financial, technological and moral choices. Additionally, enterprises are situated in communities. They can also grow by taking active part in community development. Serve the community with best products and enhance the satisfaction of the community dwellers. Apparently if the entrepreneur cannot compete globally in has the chance to grow at its local environment.

These are the many intrapreneurial strategies, the innovation elements available to small firms and if these could be adopted, a chance of survival and growth is apparent.

## **METHODOLOGY**

The study was conducted in southwestern part of Nigeria. The country is situated on the West Coast of Africa occupying an area of 923,786 square kilometers with a population of 133,881,703. The climate varies; equatorial in South, tropical in Center and arid in North. These are characterized by high humidity and substantial rainfall. Petroleum, tin, iron ore, coal, limestone, lead, and zinc among other resources abound in the country. The land area that have been used comprises 31 percent for arable land, 3 percent for permanent crops, 23 percent for meadows and pastures, 15 percent forest and woodland, and 28 percent for other use. Generally, the temperature is high and constant. Rainfall varies between the coastlands and the Savannah region. Thus, there are two seasons, the wet and dry.

The study selected sixty small-scale industries through multi-stage sampling procedure. Out of the six states of the region, three were randomly selected and twenty industries were randomly selected in each selected state making a total of sixty respondents. A focus group discussion was done in three sets. Each set comprised twenty respondents. The information generated from the discussion was explicated in the questionnaire. This has assisted in tapping the right concepts of the study.

The variables of the study such as, problems and constraints, intrapreneurial strategies specifically the innovation elements were measured by nominal, five-point, and likert scales; while performance was measured by categorizing into technology development market expansion, and manpower increase. The data collected were analyzed using both the descriptive and inferential statistics. In order to determine the correlation between variables, Pearson correlation was used, while regression analysis was used to test the relationship between the intrapreneurial strategies and the organizational performance.

## **RESULTS AND DISCUSSION**

Several innovation elements have been associated with manufacturing firms for their performance and growth. These elements are intrapreneurial strategies hence these are entrepreneurial functions within an existing organization. Similar innovation elements were predicted to have been very essential for the survival of small firms specifically in the period of globalization where their existence in the economic arena has been threatened. These include the various innovation elements in the three categorized innovation namely, breakthrough innovations, adaptive innovations and organizational innovations.

### **5.1 Adoption of Intrapreneurial Innovations**

There are six intrapreneurial innovation strategies have been adopted by the small firms for survival and growth. By rank of their mean scores, these include benchmarking, (3.666), total quality management (3.633), introduction of new products and services (3.583), intra-capital (3.533), market niching (3.483), and community development (3.050). The results show that about 95% and 97% of the respondents have an opinion that sub-contracting, and re-engineering have only very little influence and that the adoption is very negligible. However, alliances and introduction of new techniques in operation have shown to have almost averagely adopted by the small firms. The total mean score (2.584) of intrapreneurial innovation strategies adoption indicates the readiness and willingness of the small firms to adopt intrapreneurship in their organizations.

## **Perceived Effect of Intrapreneurial Innovations**

The results in Table 2 show an average (3.546) opinion of the small firms respondents that the adoption of the intrapreneurial innovation strategies will enhance their performance thereby increasing their productivity and competitiveness not only in the local market but also in international market competition. The adoption of the strategies as shown in the results indicates that the respondents are of the opinion there will be an improvement in the quality of their products (4.383), which will enhance product patronage (3.600), thus expanding their market share 94.033). This will likewise be supported by the opinion that innovation strategies will encourage building original brand initiatives (3.633). Overall, the adoption of innovation strategies would highly improve manpower development (3.533).

## **Intrapreneurial Innovations and Performance**

The results in Table 3 show the average (mean=2.000) performance of small manufacturing firms. The average performance was indicated by almost high increase in manpower size. This result is supported by small firm characteristic of being labor intensive operation. The data in Table show the correlation analysis among the intrapreneurial innovation strategies available to business organizations made available for small manufacturing firms. Out of the sixteen innovation strategies, eleven strategies were revealed significant. These include total quality management ( $r=0.2528$ ), benchmarking ( $r=0.2521$ ), networking ( $r=0.1348$ ), alliances ( $r=0.1664$ ), community development ( $r=0.1653$ ), market niching ( $r=0.1937$ ), research and development ( $r=0.1333$ ), new product/service ( $r=0.2297$ ), intra-capital ( $r=0.2296$ ), original brand ( $r=0.1498$ ), and rightsizing ( $r=0.1974$ ).

The results further revealed that there is linear dependence between the innovation strategies and small firms' performance. Eleven variables have shown influence in performance contributing 47 percent ( $R^2=0.4719$ ). Thus, variables total quality management (5.26%), benchmarking (6.36%), networking (1.89%), alliances (2.81%), community development (2.72%), market niche (3.79%), research and development (1.92%), new product/service (5.45%), intra-capital; (4.99%), original brand (2.58%), and rightsizing (3.97%) have contributed to small firm performance.

## **CONCLUSION AND RECOMMENDATIONS**

A magnitude of social and economic contributions have been attributed to small businesses both in the economically advanced countries and less developed economies. However, the tumultuous effect wrought by globalization has affected every economic activity in all regions of the world, with no exception of small firms. They have been

struggling to survive in the very competitive environment. Having been threatened to shrink and be wiped out in the economic arena due to their weaknesses, problems and constraints, small firms must survive and grow. Several innovation strategies within the organization are made available by many scholars to an entrepreneur, whose firm, be it small, medium or large.

In the small-scale operation, intrapreneurship innovation strategies such benchmarking, market niche opportunity, total quality management, product and service innovations, intra-capital strategy, and community development participation among others have significant relationship with small firms' performance. Intrapreneurship therefore, being a key element for survival and growth among small firms, there exist a need to improve intrapreneurial spirit and capacity.

## **ABSTRACT**

The study examined the determinants of entrepreneurial success of small firms in a developing nation. It anchors on propositions that relate several factors to the success of small-scale industries specifically in today's era of globalization. It specifically aims at determining the personality characteristics of the entrepreneurs; identifying their motivations factors, management skills, and level of education; and government policies specifically on trade predicted to contribute in the performance and growth of small enterprises.

A survey of 39 small-scale industries in southwestern part of Nigeria was conducted employing area and purposive sampling techniques. Questionnaire was used to collect the primary data and was supported by a focus group discussion on important issues relevant to their successes. The independent variables: entrepreneurial personality, motivation, management skills and abilities, level of education and entrepreneurship training, and government trade policies predicted to influence entrepreneurial success were measured by nominal, ratio, and likert scaling methods; while the dependent variable, entrepreneurial success to mean performance and growth of the enterprise was operationalized by characterizing it, into market share expansion, technology development, and manpower size. The data were analyzed using descriptive and inferential statistical tools. Correlation and regression analyses were used to test the relationship among the variables.

Despite business environmental uncertainty in the country, small firms have demonstrated a relative stability. This is predicated by the results of the study showing the determinants of entrepreneurial success on small firms performance and growth. Specifically, entrepreneurial personality has shown a positive and significant relationship with entrepreneurial success and having the highest contribution among other predictors that contributed significantly and averagely with the exception of entrepreneurship training.

**Key Words:** entrepreneurial personality, motivation, management skills.

# INTRODUCTION

In most developing countries, small-scale industries have assumed a critical role in industrialization and economic development. The literature has recorded a magnitude of social and economic benefits contributed by the small firms, both in the developed and developing countries. An observation was made in the 1990s' global economic depression that while the large industries are retrenching their workers, small industries on the other hand, are increasing in terms of production and employment. Small firms by then were seen as vehicles for employment generation and economic recovery in most of the countries.

The economically advanced countries where problems and constraints are less if not negligible compared to the developing economies are experiencing a great positive impact of small firms contributions to their economic growth. The culture of entrepreneurship has already deeply rooted in their society. Reynolds, et.al. (2000) submitted that the United States is having the highest prevalence rate in entrepreneurial activity. This is indicated by an observation that one in every fifteen adults invests in new venture. Their economic condition has accomplished much because of the favorable conditions not primarily geographic as others had attributed but they have exceptionally favorable cultural and historical conditions. More so, US has enjoyed a political stability. They have that readiness and willingness to adopt the necessary changes towards development. As a consequence, the industrialists have been able to go about their business in an orderly community with the basic assurance that they would be able to enjoy the fruits of their labors; at the same time, the rule of order has never been dogmatic and authoritarian but practical and democratic. Adjusting itself to new situation and to the needs of the people.

In the same vein, the English Industrial Revolution, beginning in the late part of the eighteenth century, marks the first real breakthrough into modern growth we are witnessing today. Their dramatic revolution in technology, invention in particular was great acceleration of technological progress which preceded by major innovations especially the basic techniques of production that is well suited to the natural resources and other factors of production available to England. This take off into modern economic growth involving an accelerated pace of technological advancement demanded a group of men who had economic foresight, the intangible factors of production who responded positively to the call.

Today, the rate of entrepreneurial activity in the United Kingdom is high. Both men and women are engaged in the productive sector (Reynolds, et.al. 2000). Being the first to recognize the significance of entrepreneurs, United Kingdom has a supportive business environment for entrepreneurship.

# PROBLEM STATEMENT

The world's acclaimed potentialities of small-scale industries in developing the economy have also been the experience of various countries that follow the lead of the economically advanced countries specifically in promoting the small firms. To many, inclusive of developing countries, the promotion of small firms is regarded as a way of enabling the local population

to participate actively in the country's economic and social development. When many people are involved from various localities, it creates and improves the national value system, and eventually brings equitable distribution of income, thus promoting social harmony. And when income is more evenly distributed people will have money with which to buy products and services they need. This means bringing in more money to the enterprise. Therefore, if income is not only in the hands of a few there will be less poor people. Eventually, it brings end to poverty, thus solving social problems.

However, this positive impact of small of small firms on economic development varies depending on environmental conditions prevailing in the society and the extent of influence of such conditions to entrepreneurial activity. This is predicated by Reynolds, et.al (2000) submission that the level of entrepreneurial activity differs significantly between countries due to some factors like social, cultural, political and entrepreneurial framework conditions such as availability of finance, government policies and programs designed to support start-ups, and education and training for entrepreneurship. In South Africa for instance, Naude (2003) noted that in their recent research, has been casting doubt on the hopes of small firms contributions expecting them to drive economic growth in the country. Small business often face very high transaction costs, which does not favor increase returns to scale. Increasing returns to scale can be obtained through large market size, which allows specialization to take place. Large market size generates high volumes of trade, which depends on low transaction costs of which the small firms lacks.

Additionally, the research revealed that ineffectiveness of small firms to drive economic growth in Africa is due to lack of property rights, prohibitive regulations and absence of institutions that support their development like lack of credit, tax policy influencing smallness of firms. Nigeria, being a developing nation has not also felt the great impact of small firms contribution, though they are seen as the heart of free market economies, the primary creator of jobs and economic stability. Although small firms have demonstrated a relative stability, despite environmental uncertainties in the country, many entrepreneurs have lamented that their hampered growth is due to government's lack of interest in their quest for development (Ajayi, 1987). This relationship being not best to the interest of the economy, the government poured its resources by providing funds for research on small businesses with a view of identifying their problems, which hinder the growth. Many factors were revealed militating against the effectiveness of small firms. These include shortage of basic physical infrastructure, finance and capital, illiteracy, lack of entrepreneurship and management abilities, political economy among others.

In view of the aforementioned factors found to have been hindering the growth of small firms in the country and the attractiveness and importance of small firms having a great positive impact on economic growth seen in developed countries, what factors might have been responsible in determining the slow growth or no growth at all of small firms in developing countries? In light of this, the study accentuated on identifying and examining the factors affecting entrepreneurship success in small businesses and investigate the relationship between the entrepreneurship success determinants and their performance and growth in terms of increase in market size, number of products, and manpower size.

# CONCEPTUAL FRAMEWORK FOR ANALYSIS

Entrepreneurship is more than starting a new business enterprise, acquiring or expanding an existing business. Entrepreneurship requires skills and ability of an entrepreneur regardless of business size, be it small or large. The entrepreneurial process remains the same and the roles and nature of the entrepreneur are universal. It is notable however, that a society has its own peculiar environment different from other societies. These environmental factors have been identified to be influencing the development and success of entrepreneurship. That is why there are countries or societies whose entrepreneurial level is high and there are those that is low.

Looking at the many attributes of an entrepreneur and his nature and characteristics, personal qualities, and his roles and functions in the socio-economic development, entrepreneurship is best viewed as a creative process that stimulates an individual to undergo five stages of creative process as shown in Figure 1. These include steps such as ideation, conceptualization, enterprise creation, commercialization, and growth. Throughout the entrepreneurship process, the entrepreneur uses his creativity. It begins with ideation. Ideation is the process of generating ideas and becoming thoroughly familiar with them. It is a period of sleepless nights thinking for business opportunities. He looks at the economic opportunities offered by the environment. He has to develop solutions to human needs. In so doing, he is introducing an innovation. Innovation is a creative process that enables the entrepreneur to do things never done before in order to change and improve the quality of life.

Conceptualization stage is the process of generalizing the possibility of idea into a tangible offer by considering all the factors needed in making the idea a reality. These factors include the market, raw materials, technology, economy, workforce, competition, and finance among other factors. These enumerated factors require risk-taking, business planning and capital formation.

In establishing the enterprise, the entrepreneur starts in deciding what business choice opportunity and what legal form of business ownership and the allocation of resources needed to start the operation. In production, the entrepreneur decides and sets the organization's goals. His creativity in decision-making is required in recruiting as well as coordination personnel, introducing new method of production, opening new supply sources, product quality, and satisfying consumers.

When an enterprise is in full swing operation, the entrepreneur decides on the desired level of growth and plans how to achieve it. Hence business firm aims at growth, an entrepreneur does not cease being creative. He looks at the success of the venture. Venture success, though is relative, could mean growth of an enterprise. Indications of growth can be an increase in terms of productivity, market share, and diversification among others. Such growth is commonly measured in terms of profitability. Generally, every business firm has its own mission and purpose of existence, but all work towards profit. Growth and performance are determined by several factors influencing entrepreneurial success as shown in Figure 2. Porter and Lawler in Luthans (1974) described that performance is not only affected by effort, but also by skills, ability, traits and perceptions of their roles. Similarly, there are factors

external and internal to entrepreneurs influencing his performance. These factors are grouped into triggering factors, enhancing factors, and sustaining factors.

Triggering factors are those that push the entrepreneur to go into thinking. These include personality and motivation. Personality captures the whole person concept. It includes the person's moods, attitudes, motives, tradition, values and many others that describe an individual. Allport in Luthans (1974) defined personality as the dynamic organization of the psychophysical systems within an individual that determine the characteristics, behavior and thought. As Luthans (1974) puts personality is determined by biological, social, cultural and situation. Motivation is seen to have direct implications for the consequences of performance. Motivation is a causative factor that enhances a person to behave or do something in order to attain an objective. According to various studies, achievement motive is revealed as profile of the high achievers. In McClelland (1961) work, he observed that in a society with generally high level of need for achievement (n Ach) produce more energetic entrepreneurs. He has identified that n Ach does most in predisposing individuals to vigorous economic activity.

Enhancing factors are identified to have synergy effect influencing entrepreneurial opportunity. These are called entrepreneurial capacity factors known to enhance the entrepreneur into doing. Enhancing factors include management skills and ability, and level of formal and informal education attained. Management skills and ability affects the process of setting and accomplishing goals through the use of human, technical, and financial resources within the context of environment. It involves the functions of planning, organizing, directing and controlling both human and non-human resources to achieve the set goals, thus influencing entrepreneurship performance or enterprise growth. In fact, from the time the idea is conceived, management takes over. In other words, to be successful the entrepreneur needs the breadth of knowledge in managing the available resources to ensure that performance does in fact move the enterprise towards the desired goals.

Education is another essential factor that enhances performance and growth. The ability of the person to assimilate tradition and morals, and the development of his social and attitudes, and the optimum development of an individual intellectually, mentally, socially, culturally, economically, and psychologically make possible for an entrepreneur to perform better.

Furthermore, from the onset of innovation, an entrepreneur needs assistance from the government. The government promotes business by stimulating economic expansion and development, by providing assistance in terms of technology, marketing, and others, by subsidizing selected industries, by supporting research and even protecting some businesses through special tariffs. Political leaders and legislators must also be given consideration, hence the role of the government is to promote and regulate business. It protects workers, consumers and communities. Others are designed to make contracts enforceable and protect property rights.

Infrastructural facilities are of course known to be indispensable to business growth and development. The transportation problem can cause inability to expand market and unavailability of raw materials. The poor training facilities result in unskilled labor affecting the product quality and the marketability of the product as well. Entrepreneurship is also influenced by business environment, such as economic, technology, and government. During recession business operation slackens, traditional technology stunts technological

development, and unfavorable government regulations to entrepreneurial activities squeeze the capital outlay yielding negligible profit.

## **METHODOLOGY OF RESEARCH**

The study was carried out in Nigeria. The country is situated on the West Coast of Africa occupying an area of 923,768 square kilometers with a population of 133,881,703. The climate varies; equatorial in South, tropical in Center and arid in North. These are characterized by high humidity and substantial rainfall. Petroleum, tin, iron ore, coal, limestone, lead, and zinc among others abound in the country. The land area that have been used comprises 31 percent for arable land, 3 percent for permanent crops, 23 percent for meadows and pastures, 15 percent forest and woodland, and 28 percent for other use. Generally, the temperature is high and constant. Rainfall varies between the coastlands and the Savannah region. Thus, there are two seasons, the wet and dry seasons.

Thirty-nine selected small firms in the southwestern part of the country served as the respondents of the study using area and purposive sampling techniques. Questionnaire was used in collecting the primary data and was supported by a focus group discussion on important issues relevant to the variables of the study. The independent variables predicted to influence the success of small firms were entrepreneurial personality characteristics, motivation management skills and abilities, environmental conditions, and entrepreneurship education. These variables were measured by nominal and likert scale methods through developing statements that characterized the variables. The dependent variable entrepreneurial success was defined and described as the performance and growth of the enterprise. This variable was operationalized into market size expansion, technological process development, and manpower size and was measured by ratio scale method. The data collected from the primary source were analyzed using descriptive and inferential statistical tools. Frequency, percentages and means were computed to describe the variables. Correlation analysis was done and variables having significant relationship were analyzed by regression.

## **RESULTS AND DISCUSSION**

Several factors influencing the performance and growth of small firms have been revealed by various studies. It has been also established that each society has its own peculiar situation different from others. This differences prompted this study to investigate the determinants of success among small firms in a developing economy specifically in today's era of globalization where no one is exempted from its effect. The discussion on findings is sectioned according to the variables used in the study namely, the selected socio-economic characteristics, entrepreneurial personality, management skills, motivation factors, environment influence, level of formal education and entrepreneurship training, and relationship between success factors and performance.

## **Socio-economic Characteristics of Small Firms Entrepreneurs**

Majority (56%) of the respondents attained secondary level of education as shown in Table 1. Sixty-eight percent of them have not attended any informal education on entrepreneurship training or other related programs like bookkeeping, technical, commerce and management. Among those who have attended entrepreneurship training programs, 58 percent have technical training, 18 percent on bookkeeping, and 12 percent for start your own business seminar.

## **Entrepreneurial Personality**

The data in Table 2 show that the entrepreneurial personality characteristics of small firms predicted to influence the success of the firms is high (mean score=4.402). This indicates that entrepreneurs in small firms possess significant attributes to entrepreneurial activity. The attribute resourcefulness scored the highest (4.710) among all the entrepreneurial personality predicted to influence small firms successes. It is an attribute that will never allow lack of capital to stop a person from getting ahead. In other words the small firms entrepreneurs can search and provide the resources needed for the business. They can work hard for the survival and growth of the enterprise. Through persistence, they are determined to achieve their objectives while taking the risks. This is followed by attribute initiative with a mean score of 4.614. Initiative means taking every opportunity the environment offers. In this attribute, the entrepreneurs have displayed self-confidence and independence. It is a feeling of ones ability to handle whatever difficult situation is cast in their path. This also explains in part why entrepreneurs are risk- takers. They believe in their ability to influence the outcome of every decision they make more than what the people can do. They are optimistic that everything they do would be a success.

The results also show that the entrepreneurs have the personality that is high (4.106) in innovation. This explains that apart from having the ability to conceive multiple possible futures and proactively create the most desire, they have the ability to see things in novel ways. This is an important attribute to conceive and develop an idea beneficial to mankind. This explains further the attribute necessary to create and utilize profitable opportunity, an attribute that considers all things are resources that even waste products should be utilized for a profitable venture. Similarly, in achieving success of an enterprise, enthusiasm is an important attribute that displays a keen interest to respond to an economic opportunity and the eagerness to perform. This attribute scored also high (4.332).

## **Management Skills**

The data in Table 3 show the management skills of the respondents influencing entrepreneurial performance and growth. Management skills demonstrate an efficient and effective conduct of the management functions on planning, organizing, staffing, directing, and controlling. The results provide an understanding that the respondents averagely (mean score=3.982) performed the management functions. A high score of 4.383 is depicted for their ability in organizing. This shows their skills in coordinating human and material resources, the ability to establish structure of roles for workers in order to create an environment for human performance. This also gives an understanding of their ability in grouping similar and related activities in order to encourage coordination among various types of work. The data also

show that the respondents attempt to find and employ the right person for the job offered and the ability of the respondents to lead by using the motivational tools in achieving increase in productivity. The data further show the ability of the respondents to ensure events conform to the plans and actions set prior to business execution.

## **Motivation Factors**

Entrepreneurs are known for being self-motivated. Economic status, achievement, self-reliance, prestige, and desire to use the skill are inner motives that drive them into business undertaking. The same is true of the respondents of the study. The data in Table 4 show the average (3.862) influence of motivation on the success of small firms. It is important to note that in McClelland submission, individuals with high in need achievement are predisposing to vigorous economic activity. In this study, however, the results show that small firms entrepreneurs are highly motivated by self-reliance motive (4.512) and economic motive (4.177) more than achievement motive (3.870). Information gathered from focus group discussion show that these entrepreneurs are those who lost their jobs, those who want to augment their income, and those who can't find a job. Prestige (3.423) and desire to use skill (3.331) averagely influenced entrepreneurial success.

## **Environmental Factors**

A business enterprise does not, of course, exist in a vacuum. Rather, it is dependent on its environment, both internal and external. A business is a part of the larger systems like the industry where it belongs, economic system, and the society. It could be either direct or indirect. Direct elements like the government agencies, financial institutions and the indirect elements like technology, economy, infrastructure, political and legal are influencing the business operations. The perceived influence of these systems is shown in Table 5. Technical and financial factors are among those that scored high with a mean score of 4.256 and 4.255 respectively. The rest like infrastructure in communication and transportation have averagely influenced the performance and growth of the small firms. Government trade policies have also averagely influenced the success of the firms.

## **Performance and Growth**

The regression results in Table 6 show the relationship between the six variables predicted to influence entrepreneurial success, which means performance and growth of small firms. The positive correlation of entrepreneurial personality ( $r=0.67640$ ), management skills ( $r=0.22611$ ), motivation factors ( $r=0.19908$ ), environmental forces ( $r=0.10892$ ), level of education ( $r=0.19058$ ), and entrepreneurship training ( $r=0.05268$ ) indicates that the higher the magnitude of variation of these predictors, the higher the entrepreneurial performance and growth of the enterprise. The results also predict an overall linear dependence of entrepreneurial performance and growth on the six independent variables indicated by  $R=0.47129$ . It also shows that 18 percent ( $R^2=0.18461$ ) of the variation in entrepreneurial success is explained by the predicted determinants. Thus, the predictors of entrepreneurial success contribute 48%, 5%, 4%, 1%, and 4% respectively. However, the regression coefficient results explain that for every effect of one unit in each variable stands an equivalent expected change in entrepreneurial success when the rest are controlled. In other

words, the absolute values contributed by the predictors of entrepreneurial success are 36%, 17%, 12%, 10%, 11% and 3% respectively.

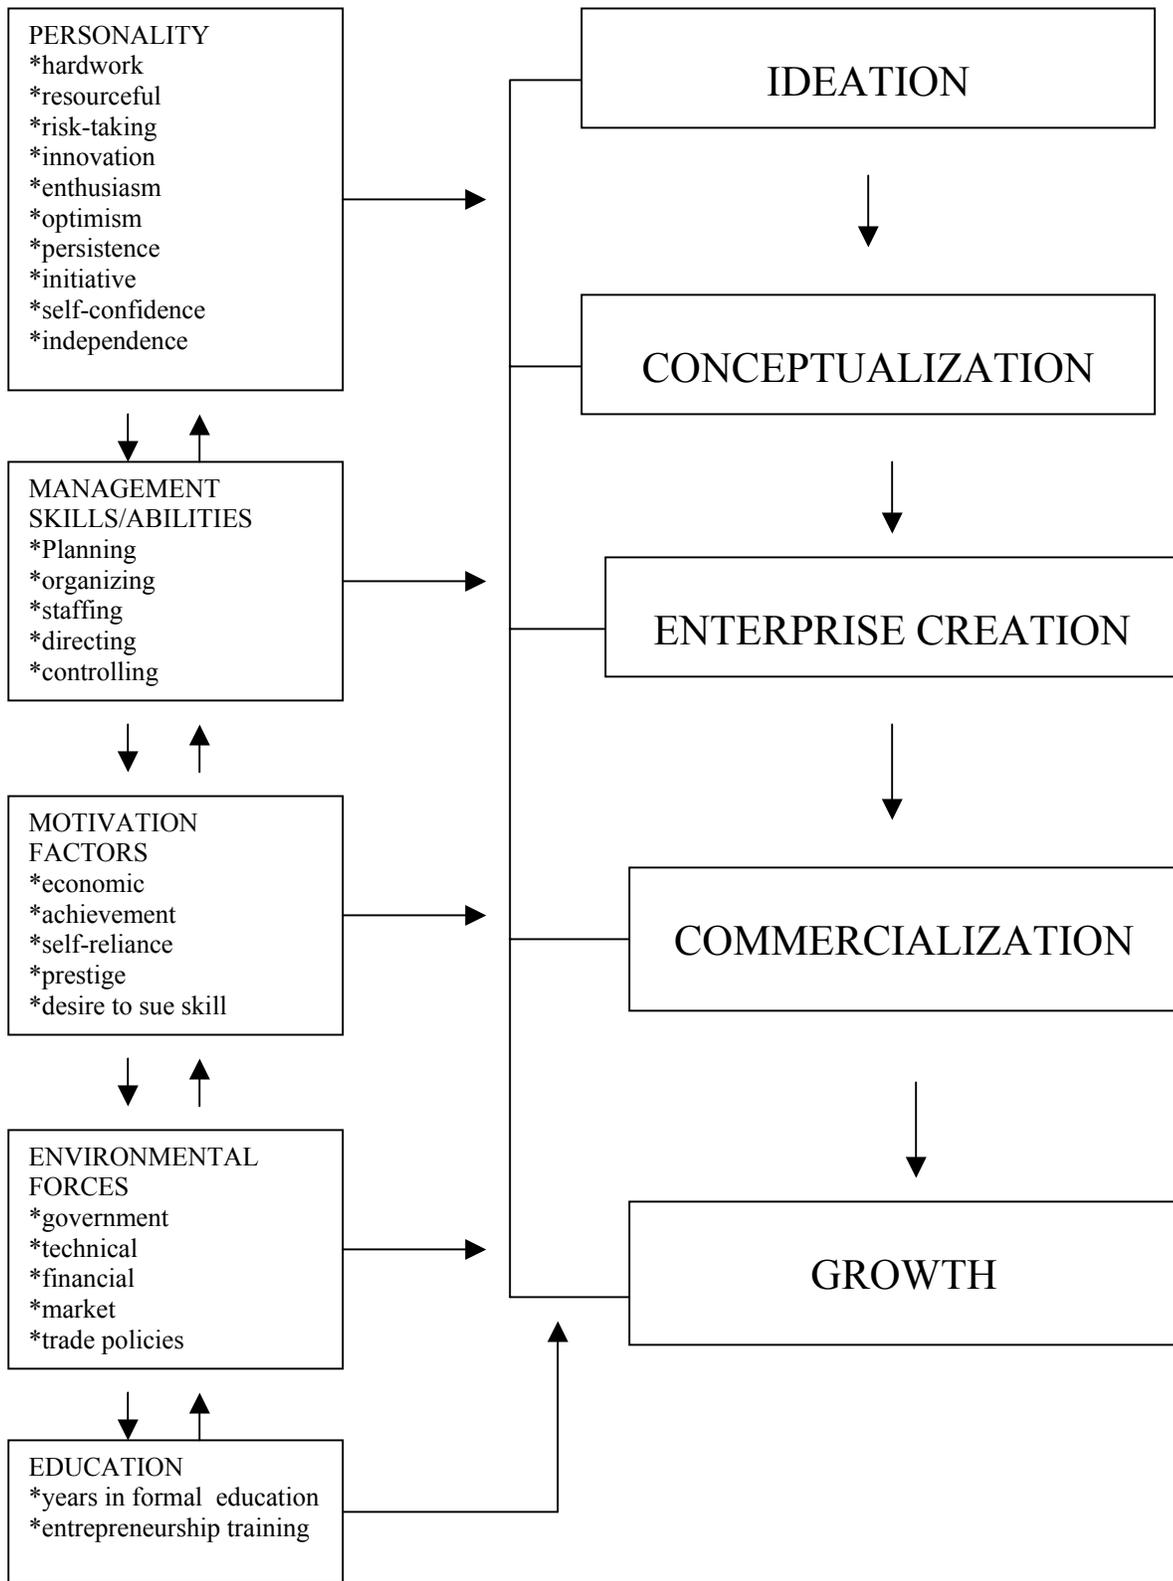

## CONCLUSION

All enterprises be it small or large work toward success. Success is relative, however, in business success is measured by the performance and growth of the enterprise. Success is dependent on several factors called determinants in this study. By ranks, these include personality characteristics, management skills and abilities, motivation factors, environmental forces and level of education. They are found significant and have positive relationship with entrepreneurial success. Personality has the highest contribution, while management skills and abilities, motivation factors, environmental forces, have average influence on the success of small firms.

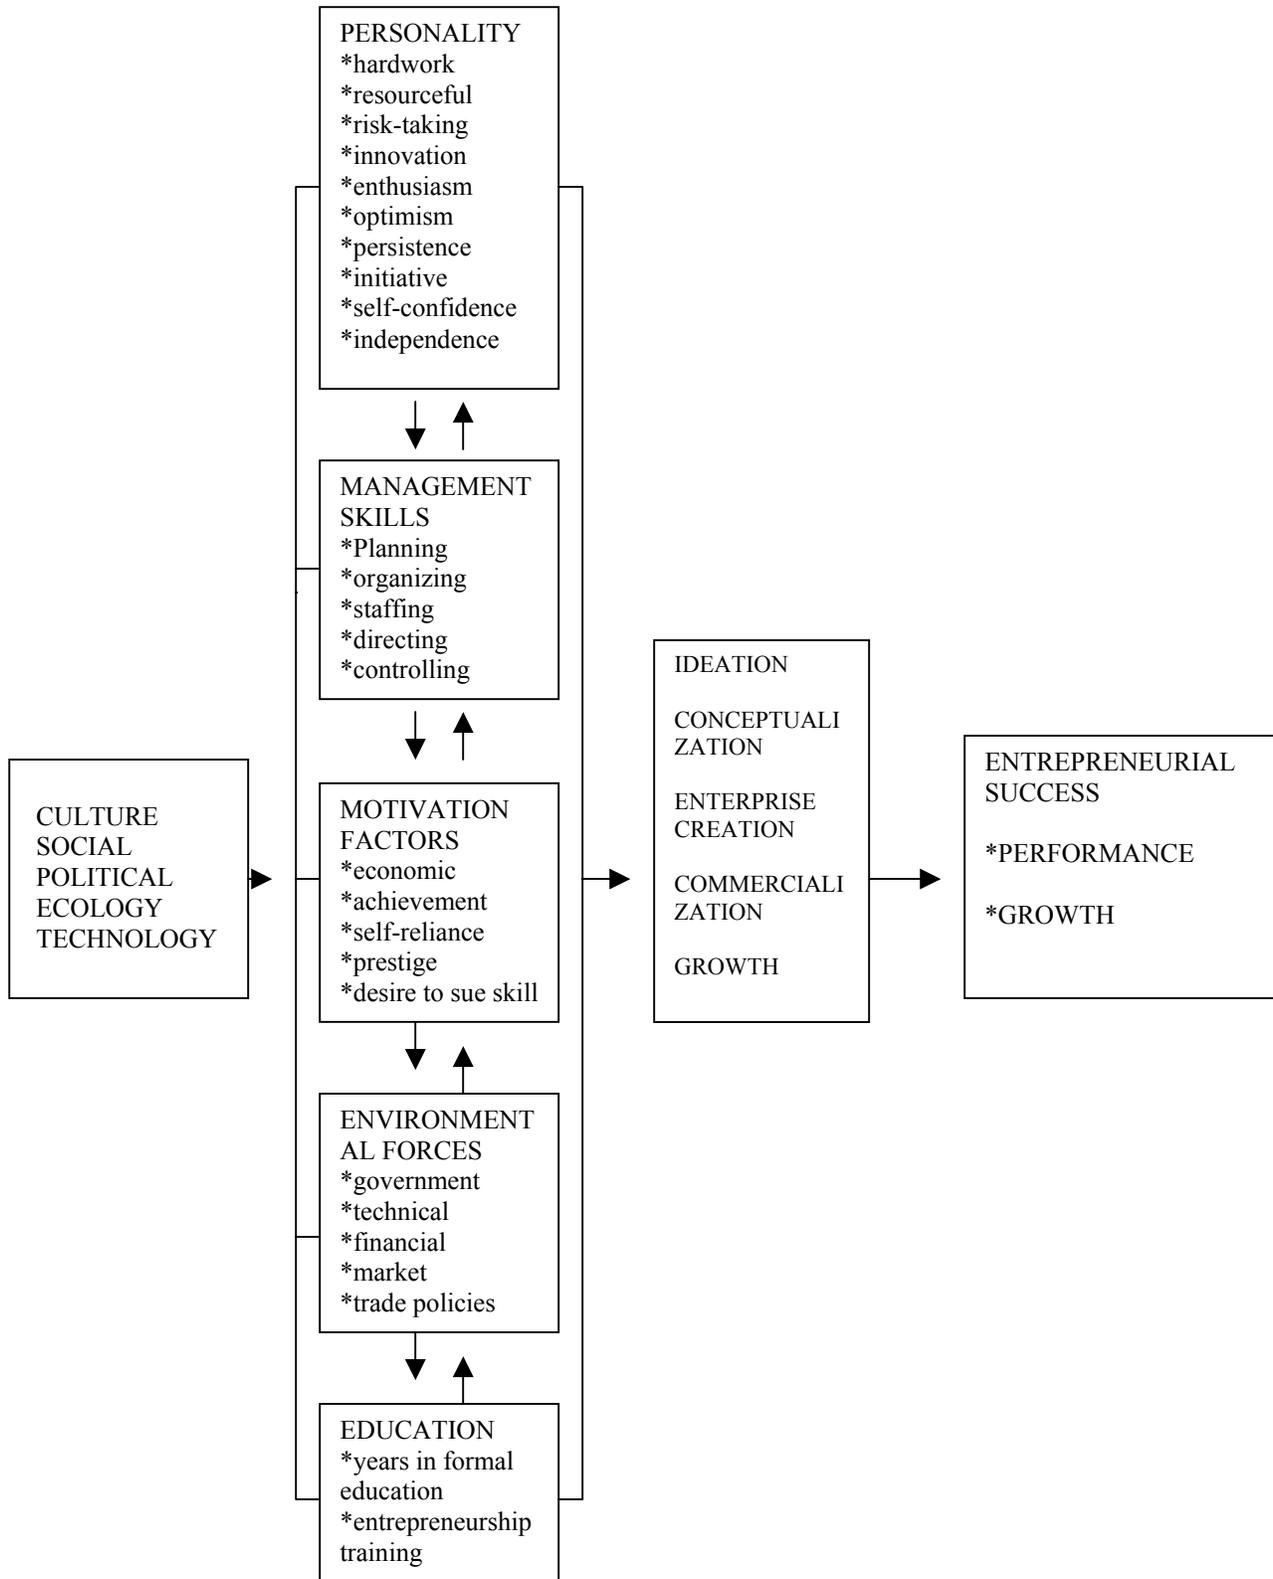

For the impact of small firms to be largely felt by the society, there is a need to increase awareness on small-scale industry development with the aim of encouraging people to go into entrepreneurship. Creating awareness could be an intensified effort in promoting small businesses. Efforts towards building an enabling environment are essential in developing entrepreneurial personality characteristics and highly self-motivated people. Promoting education as well and introducing entrepreneurship programs into the curricula will be beneficial.

## **ABSTRACT**

International research on entrepreneurship shows that substantial variation exists in entrepreneurial activity between countries (Orford, Wood, Fischer, Herrington & Segal 2003:8). Entrepreneurial activity is measured in terms of the proportion of adults who are involved in starting a business or are owner-managers of new firms. Variations exist between countries in terms of the number of persons starting up new enterprises.

Literature proposes that entrepreneurs are not only persons who start up businesses but also persons who possess certain characteristics or traits to varying degrees. It is thus of importance and interest to entrepreneurial educators to establish whether variations in countries also exist with regard to the possession of these entrepreneurial traits. Against this background, the primary aim of this research is to learn more about the entrepreneurial traits of undergraduate Commerce students at selected tertiary institutions in each of the following countries, namely South Africa, the United States of America and the Netherlands. The objectives of this research are to report on the levels of students' entrepreneurial traits in the different countries and to establish whether significant differences exist between the countries with regard to the level of entrepreneurial traits of students.

Convenience sampling was used to measure the responses of 1 528 undergraduate students. The sample consisted of 758 South Africans, 379 American and 391 Dutch students. The data analysis involved firstly calculating the descriptive statistics for the sample and secondly the internal reliability of the measuring instrument was established by calculating the Cronbach Alpha Coefficients. All the items in the research instrument were subjected to a factor analysis procedure to determine which items should be used in summated scales to calculate the entrepreneurial trait category scores. Finally inferential statistical analysis (ANOVA) was

conducted to establish whether significant differences existed between the countries with regard to the level of entrepreneurial traits of students.

It appears that undergraduate students from the United States score higher on most of the entrepreneurial traits investigated than students from the other two countries. Dutch students, on the other hand, scored the lowest on most of the traits investigated. Significant differences were found between countries with regard to all the entrepreneurial traits investigated. These findings provide important insights for entrepreneurial educators, because the reasons for the development of a trait in one country could provide the answer as to how to develop them in another.

## **INTRODUCTION AND PROBLEM STATEMENT**

While the relationship between entrepreneurship and economic growth is multi-faceted and complex, it is beyond dispute that entrepreneurial capability is a necessary ingredient in a country's capacity to sustain economic growth. There is little doubt that entrepreneurship plays a critical role in contemporary world economies and that entrepreneurship is a driving force of both economic growth and job creation (Levin, 1998:79; Lunsche and Barron, 1998:1; Sunter, 2000:23).

Given the importance of entrepreneurship, it is imperative to understand the concept of entrepreneurship and its practical implementation. However, to find a single appropriate definition of entrepreneurship is a challenge for academic researchers and students of entrepreneurship. In scrutinising numerous definitions and traits, common characteristics of successful entrepreneurs become evident. These include the ability to recognize business opportunities; to create, establish and/or expand profitable economic organisations through time, effort and money; to blend creativity, innovation and risk-taking with hard work; and to correctly appropriate resources. On this basis it becomes evident that entrepreneurship is not just about establishing a new enterprise, but it is also about the psychological make-up of the person behind this endeavour, a person who possesses specific traits or characteristics.

International research on entrepreneurship shows that substantial variation exists in entrepreneurial activity between countries (Foxcroft, Wood, Kew, Herrington & Segal 2002:13). Entrepreneurial activity is measured in terms of the proportion of adults who are involved in starting a business or are owner-managers of new firms. Variations exist between countries in terms of the number of persons starting up new enterprises.

As mentioned above, literature proposes that entrepreneurs are not only persons who start up businesses but are also persons who possess certain characteristics or traits to varying degrees. It is thus of importance and interest to entrepreneurial educators to establish whether variations in countries also exist with regard to the possession of these entrepreneurial traits. The existence of developed entrepreneurial traits in one country could provide solutions as to how to develop these traits in another.

## **RESEARCH OBJECTIVES**

Against this background, the primary aim of this research is to learn more about the entrepreneurial traits of undergraduate Commerce students at selected tertiary institutions in each of the following countries, namely South Africa (SA), the United States of America (USA) and the Netherlands (NED). The objectives of this paper are to:

- Determine the levels of entrepreneurial traits of Commerce undergraduate students at selected tertiary institutions in South Africa, the United States and the Netherlands; and to
- Establish whether significant differences exist between the levels of entrepreneurial traits of undergraduate students in the different countries.

With the problem statement and objectives as background, the focus will first be on a brief literature overview, from which a classification of entrepreneurial traits was made. This is followed by the empirical findings on the entrepreneurial traits of undergraduate students at the selected tertiary institutions in Port Elizabeth (South Africa), Iowa (USA) and Utrecht (The Netherlands). Finally conclusions and implications of the research findings are discussed.

## An Overview of Entrepreneurial Traits

The field of entrepreneurship has been approached from many perspectives and by many disciplines. Most research about entrepreneurial traits undertaken in the psychological discipline is centred on the influences of genes, family, education and career experience (Timmons 1999: 24; Dollinger 1995:9). Although numerous descriptive studies and some valuable empirical research have been undertaken in this regard, there is no guarantee that the guidelines derived from such research will automatically ensure entrepreneurial success.

The present comparative research into the entrepreneurial traits of undergraduate students made use of an existing measuring instrument, which was slightly modified according to the country in which the instrument was administered. A new category (P), named business knowledge, was also added to establish whether respondents possess a basic understanding of business operations and terminology. The original measuring instrument focused on one of Gartner's (1985) conceptual framework dimensions for new venture creation, namely *individual characteristics*. In this respect, attention is placed primarily on individual characteristics, specifically the evaluation of those attitudes and behaviours that are shared to varying degrees by successful entrepreneurs. It must be stressed that entrepreneurs who succeed, not only possess creative and innovative flair, attitudes and behaviours, but also solid general management skills, business acumen, the ability to use networks effectively and of course hard work and luck. Luck may be described as favourable outcomes linked to chance events, for example starting the appropriate type of business to meet specific market needs at a specific point in time.

The individual entrepreneurial traits included in the measuring instrument, as well as literature substantiating these traits, are presented in Table 1. Three categories G, J and O, from the previous research, were excluded in this study. This was done to improve the validity of the results.

Category C: <b>Communications Ability</b> (Ability to communicate ideas to others, verbal and written)	Marx, Van Rooyen, Bosch and Reynders (1998); Barrier (1995)
Category D: <b>Competing Against Self-imposed Standards</b> (Compete against high yet realistic self-imposed standards, accept responsibility, accountable)	Siropolis (1990); Marx, Van Rooyen, Bosch and Reynders (1998)
Category E: <b>Dealing with Failure</b> (Failure to be regarded as a learning experience)	Gerdes (1988); Burns and Dewhurst (1989); Kuratko and Hodgetts (1993); Goodman (1994)
Category F: <b>Self-confidence / Belief in Self-determination</b> (Belief in own ability to achieve goals that are self-determined, high need for autonomy)	Mushonga (1981); Goodman (1994); Zimmerer and Scarborough (1998); Longenecker, Moore and Petty (1997); Kreitner and Kinicki (1998); Driver et al (2001), Nieman & Bennet (2002); Nieman et al (2003); Timmons & Spinelli (2003)
Category G: <b>Risk-taking</b> (Predisposition for taking moderate, calculated risks providing a reasonable chance for success)	McClelland (1967); Schackle (1979); Burch (1986); Siropolis (1990); Kroon and Moolman (1991); Kuratko and Hodgetts (1993); Mariani (1994); Wickham (1998); Zimmerer and Scarborough (1998); Casson (1991); Driver et al (2001), Nieman et al (2003)
Category H: <b>Taking Initiative / Seeking Personal Responsibilities</b> (Need to use own initiative, make important decisions and determine action steps. Accept consequences)	Gerdes (1988); Marx, Van Rooyen, Bosch and Reynders (1998); Goodman (1994); Kreitner and Kinicki (1998); Maré (1996)
Category I: <b>Drive and Energy Level</b> (Ability to work long hours, vigour, good health and persistence)	McClelland (1967); Burns and Dewhurst (1989); Casson (1991); Goodman (1994); Mariani (1994); Marx, Van Rooyen, Bosch and Reynders (1998); Timmons & Spinelli (2003)
Category J: <b>Tolerance for Ambiguity and uncertainty</b> (Ability to live with modest to high levels of uncertainty concerning job and career security, perform different tasks simultaneously)	Bowler (1995); Zimmerer and Scarborough (1998), Nieman & Bennet (2002); Timmons & Spinelli (2003)
Category K: <b>Thinking Ability</b> (Need for original thinking, creativity and critical analysis of situations)	McClelland (1967); Gerdes (1988); Casson (1991); Hjelle and Ziegler (1992); Burch (1986); Kreitner and Kinicki (1998); Nieman & Bennet (2002); Timmons & Spinelli (2003).
Category L: <b>Use of Outside Resource Persons</b> (Seek expertise and assistance of others in the accomplishment of goals)	McClelland (1967); Mushonga (1981); Bowler (1995)
Category M: <b>Knowledge seeking</b> (Developing skills, experience and resources in known territory)	Kroon and Moolman (1991); Hatten (1997); Hellriegel, Jackson and Slocum (1999)
Category N: <b>Number Sense</b> (Ability to understand and/or interpret financial statements /performance)	Bygrave (1994); Maré (1996); Marx, Van Rooyen, Bosch and Reynders(1998); Zimmerer and Scarborough (1998); Wickham (1998)
Category O: <b>Money Sense</b> (Ability to recognise that money is an important	Burch (1986); Kuriloff and Hemphill (1981); Kroon and Moolman (1991); Burns and

ENTREPRENEURIAL TRAITS	SELECTED RESEARCH
factor, correct appropriation)	Dewhurst (1993)
Category P: <b>Business Knowledge</b> (Possess a basic understanding of business operations and terminology)	Van Vuuren (1997), Marx, Van Rooyen, Bosch and Reynders (1998), Zimmerer and Scarborough (1998)

## RESEARCH DESIGN AND METHODOLOGY

In an effort to assess the entrepreneurial traits of students, a positivistic research paradigm was adopted using a previously developed research instrument by Louw, Du Plessis, Bosch & Venter (1997). A convenience sampling method was used, in which 1 528 undergraduate Commerce students completed the questionnaires. The research instrument consisted of two sections. Section A, the self-assessment section, covered 104 items divided into sixteen categories, each representing an entrepreneurial trait. The items were phrased as statements with the possible response continuum linked to a Likert-style five-point scale (1 = strongly disagree to 5 = strongly agree). It is important to bear in mind that responses to the self-assessment section are based on the perceptions of students of themselves. The item scores on the five-point scale were categorised into *Low* (less than or equal to 2.6), *Average* (between 2.6 and 3.4) and *High* scores (above 3.4). Demographical information relating to gender, age and country of residence was requested in Section B.

## DATA ANALYSIS

Data analyses relating to reported results were conducted in four stages:

- All the items in the research instrument were subjected to a factor analysis procedure to determine which should be used in summated scales to calculate the entrepreneurial trait category scores. The Statistical Program BMDP 4M (Frane, Jennrich & Sampson 1990) was used, specifying principal component analysis as the method of initial factor attraction, with Direct Quartimin oblique rotation of the original factor matrix. Most of the original items loaded on one or more of the sixteen trait categories. It should be noted that the concept of discriminant validity is not applicable in this study, as the sixteen categories are not postulated as mutually exclusive dimensions of the respondents' traits construct.
- To assess the internal reliability of the measuring instrument, Cronbach alpha coefficients were calculated. Reliability coefficients of less than 0.50 are deemed to be unacceptable, those between 0.50 and 0.60, are regarded as sufficient and those above 0.70 as acceptable (Nunally 1978; Peterson 1994). Coefficients greater than 0.80 are regarded as good (Sekaran 1992: 174, 284, 287).
- Descriptive statistics such as the mean, standard deviation and frequency distributions were calculated to summarise the sample data distribution. This was done for the individual items and the summated scores relating to the problem categories and perceived success.
- The BMDP Program 2V was used to perform inferential statistical analysis such as the analysis of variance (ANOVA). Scheffé and Cohen's d tests were done to investigate whether significant differences exist between countries with regard to the level of entrepreneurial traits. The discussion of the results will however be based on the Scheffé tests.

## Sample Size and Demographical Information

The measuring instrument was completed by 1 528 undergraduate students. The respondents included 758 South Africans (SA), 379 American (USA) and 391 Dutch (NED) students. In all three countries students were primarily from a Commerce field of study. The demographical information of the respondents is given in Table 2. It is evident that for SA and the USA the sample consists of a satisfactory spread between males and females. This figure is however slightly skewed in the Netherlands, with more males than females participating in the study. In SA, the USA and NED it is evident that the majority of participants fall in the 20-25 years age group.

**Table 2: Composition of the respondents**

South Africa	N	%	USA	N	%	Netherlands	N	%
<b>Total</b>	758	100%	<b>Total</b>	379	100%	<b>Total</b>	391	100%
<b>Male</b>	319	42.1%	<b>Male</b>	182	48.0%	<b>Male</b>	247	63.2%
<b>Female</b>	439	57.9%	<b>Female</b>	197	52.0%	<b>Female</b>	144	36.8%
<b>&lt;20</b>	299	39.5%	<b>&lt;20</b>	8	2.1%	<b>&lt;20</b>	109	27.9%
<b>20-25</b>	419	55.3%	<b>20-25</b>	363	95.8%	<b>20-25</b>	273	69.8%
<b>&gt;25</b>	40	5.3%	<b>&gt;25</b>	8	2.1%	<b>&gt;25</b>	9	2.3%

## EMPIRICAL RESULTS

### Item Analysis

The statistical analysis of the data included an assessment of the internal reliability of the measuring instrument. This consisted of calculating Cronbach Alpha coefficients, which measure the internal homogeneity or consistency among a set of items, i.e. the extent to which the same set of respondents replies in a consistent manner to similar items (Diamantopoulous & Schlegelmilch, 1997:36). The calculated Cronbach Alphas for each entrepreneurial trait category are reported in Table 3.

**Table 3: Reliability of category scores (Cronbach Alpha coefficients)**

Category	South Africa	Netherlands	USA
A: Goal Setting / Perseverance	0.78	0.64	0.77
B: Human Relations Ability	0.67	0.64	0.68
C: Communications Ability	0.70	0.55	0.70
D: Competing Against Self-imposed Standards	0.64	0.70	0.70
E: Dealing with Failure	0.58	0.56	0.60
F: Self-confidence / Belief in Self-determination	0.56	0.52	0.50
H: Taking Initiative / Seeking Personal Responsibilities	0.79	0.69	0.78
I: Drive and Energy Level	0.61	0.54	0.64
K: Thinking Ability	0.72	0.58	0.70
L: Use of Outside Resource Persons	0.62	0.58	0.68
M: Knowledge Seeking	0.73	0.78	0.77
N: Number Sense	0.72	0.64	0.76
P: Business Knowledge	0.71	0.64	0.72

As mentioned earlier the categories *G (Risk-taking)*, *J (Tolerance for ambiguity)* and *O (Money sense)* were excluded from the study. From Table 3 it is evident that all the Cronbach Alpha values are above 0.50, most of which are between 0.60 and 0.78, indicating that the internal reliability of the measures used in this study can be regarded as acceptable.

## The Levels of Entrepreneurial Traits of Undergraduate Students

Tables 4, 5 and 6 contain a summary of the descriptive statistics obtained for the various entrepreneurial trait categories for each of the countries under investigation. In Section A of the questionnaire, the students had to respond by assessing themselves according to the entrepreneurial trait categories as summarised in Table 1.

**Table 4: Descriptive statistics of entrepreneurial traits: South Africa**

South Africa				Frequency Distribution					
Category	N	Mean	SD	Low		Average		High	
A	758	<b>3.82</b>	0.58	16	2.1%	152	20.1%	590	77.8%
B	758	3.78	0.58	24	3.2%	143	18.9%	591	78.0%
C	758	3.42	0.56	54	7.1%	308	40.6%	396	52.2%
D	758	<b>4.05</b>	0.80	33	4.4%	135	17.8%	590	77.8%
E	758	<b>3.93</b>	0.57	18	2.4%	148	19.5%	592	78.1%
F	758	3.76	0.55	11	1.5%	190	25.1%	557	73.5%
H	758	3.32	0.60	88	11.6%	337	44.5%	333	43.9%
I	758	<b>3.91</b>	0.57	12	1.6%	114	15.0%	632	83.4%
K	758	3.61	0.56	19	2.5%	263	34.7%	476	62.8%
L	758	3.18	0.63	160	21.1%	296	39.1%	302	39.8%
M	758	3.14	0.76	185	24.4%	312	41.2%	261	34.4%
N	758	3.49	0.85	145	19.1%	227	29.9%	386	50.9%
P	758	3.55	0.75	83	10.9%	233	30.7%	442	58.3%

From Table 4 it can be seen that the four highest mean scores or four most developed traits among South African respondents, were:

- Category D: Competing against self-imposed standards (mean = 4.05)
- Category E: Dealing with failure (mean = 3.93)
- Category I: Drive and energy levels (mean = 3.91)
- Category A: Goal setting and perseverance (mean = 3.82)

The most developed trait among South African students was *Competing against self-imposed standards* (mean = 4.05). For the four most developed traits more than 77 per cent of respondents obtained high scores (above the threshold value of 3.4 on the five-point Likert scale) or agreed that they possessed the traits concerned.

In South Africa the lowest scoring traits were as follows:

- Category M: Knowledge seeking (mean = 3.14)
- Category L: Use of outside resource persons (mean = 3.18)
- Category H: Taking initiative and seeking personal responsibility (mean = 3.32)
- Category C: Communications ability (mean = 3.42)

In the case of the three lowest scoring traits less than 45 percent of respondents obtained high scores. Although *Communications ability* had the fourth lowest mean score, like the remaining traits, it obtained a mean score of above the threshold value of 3.4 on the five-point Likert scale, thus indicating the possession of this trait.

**Table 5: Descriptive statistics of entrepreneurial traits: The Netherlands**

In the Netherlands the four most developed entrepreneurial traits, with more than 64 percent of respondents obtaining high scores, were as follows:

- Category N: Number sense (mean = 3.68)
- Category E: Dealing with failure (mean = 3.65)
- Category I: Drive and energy levels (mean = 3.64)
- Category B: Human relations (mean = 3.61)

The lowest scoring traits or the least developed, with no more than 32 per cent scoring high scores, were as follows:

- Category L: Use of outside resource persons (mean = 2.74)
- Category M: Knowledge seeking (mean = 2.96)
- Category H: Taking initiative and seeking personal responsibility (mean = 3.08)
- Category C: Communications ability (mean = 3.22)

The remaining traits all obtained mean scores above the threshold value of 3.4 on the five-point Likert scale, thus indicating that they possessed the traits concerned.

**Table 6: Descriptive statistics of entrepreneurial traits: The USA**

H	379	3.49	0.52	16	4.2%	143	37.7%	220	58.0%
I	379	<b>4.06</b>	0.50	4	1.1%	30	7.9%	345	91.0%
K	379	3.84	0.46	2	0.5%	63	16.6%	314	82.8%
L	379	3.19	0.61	66	17.4%	168	44.3%	145	38.3%
M	379	2.95	0.70	115	30.3%	177	46.7%	87	23.0%
N	379	3.85	0.68	23	6.1%	73	19.3%	283	74.7%
P	379	3.69	0.62	14	3.7%	103	27.2%	262	69.1%

In the USA the four most developed traits, with more than 86 per cent of respondents obtaining high scores, were as follows:

- Category D: Competing against self-imposed standards (mean = 4.32)
- Category I: Drive and energy levels (mean = 4.06)
- Category B: Human relations (mean = 3.98)
- Category E: Dealing with failure (mean = 3.96)

The four least developed traits were as follows:

- Category M: Knowledge seeking (mean = 2.95)
- Category L: Use of outside resource persons (mean = 3.19)
- Category H: Taking initiative and seeking personal responsibility (mean = 3.49)
- Category C: Communications ability (mean = 3.54)

Less than 40 per cent of respondents scored high scores for *Knowledge seeking* and *Use of outside resources*. The remaining traits (including H and C) however all obtained mean scores above the threshold value of 3.4 on the five-point Likert scale. This indicates that the sample group possessed the traits concerned. For the USA, students scored high scores for 85 per cent of the traits investigated.

## Significant Differences between the Levels of Entrepreneurial Traits

From Tables 4, 5 and 6 it can be seen that for eleven of the thirteen entrepreneurial traits under investigation, the USA scored the highest score, with SA scoring the second highest and the Netherlands scoring the lowest. The exceptions were for the traits *Knowledge seeking (M)* and *Number sense (N)*. *Knowledge seeking (M)* scored low mean scores in each country but for this trait the order was somewhat different. South Africa scored the highest mean, the Netherlands scoring the second highest and the US scored the lowest mean. For the trait, *Number sense (N)* the order was also different in that the USA scored the highest, followed by the Netherlands and the lowest score was obtained by the South African respondents.

The extent to which these differences in mean scores and order are significant however, was established by undertaking an analysis of variance. This was done to determine whether significant differences exist between the countries and the level of development of entrepreneurial traits of the students. Significant differences ( $p < 0.00$ ) were found and from Table 7 below the Scheffé test also shows that significant differences between countries exist (at the 95 per cent confidence level) with regard to all the entrepreneurial traits.

Significant differences (at the 95 per cent confidence level) between the means scored for the entrepreneurial trait categories, existed between all three countries with regard to the following traits, namely *Goal setting and perseverance (A)*, *Human relations (B)*, *Communication (C)*, *Competing against Self-imposed Standards (D)*, *Self-confidence (F)*, *Taking initiative (H)*, *Drive and energy levels (I)*, *Thinking ability (K)*, *Number sense (N)*. Although mean scores were significantly different for all three countries, the USA respondents scored significantly higher means for all the above mentioned traits than the other countries, with South Africa scoring the second highest (except number sense). For the traits *Number sense*, the mean scores were significantly different between all three countries with the USA (3.85) scoring significantly higher than both the Dutch (3.68) and SA (3.49). In this case however SA scored the lowest mean score.

In four instances significant differences did not occur between all three countries namely, *Dealing with failure (E)*, *Use of outside resource persons (L)*, *Knowledge seeking (M)* and *Business knowledge (P)*. For the trait, *Dealing with failure (E)*, significant differences were found between the means scored by the USA (3.96) and SA (3.93), on the one hand, and the Netherlands, on the other. The Netherlands scored a significantly lower score of 3.65. For the trait, *Use of outside resource persons (L)*, the Dutch respondents (2.74) also scored significantly lower than both the USA (3.19) and the South African respondents (3.18).

## CONCLUSIONS AND IMPLICATIONS OF THE RESEARCH FINDINGS

The main objectives of this paper were to report on the levels of students' entrepreneurial traits in three different countries and to establish whether significant differences exist between these countries with regard to the development of the entrepreneurial traits under investigation. It was found that the four most well-developed entrepreneurial traits for the three countries were as follows:

### South Africa:

- Competing against self-imposed standards,
- Dealing with failure,
- Drive and energy levels and
- Goal setting and perseverance

### The Netherlands:

- Number sense,
- Dealing with failure,
- Drive and energy levels and
- Human relations.

### The USA:

- Competing against self-imposed standards,
- Drive and energy levels,
- Human relations and
- Dealing with failure.

It is evident that the means scored as well as the order of the four most developed entrepreneurial traits differed for each of the three countries. It is however interesting to see that two categories, namely *Dealing with failure* and *Drive and energy levels*, were among the four most developed traits in all three countries. South Africa and the USA had three of the top four most developed traits in common, namely *Competing against self-imposed standards*, *Dealing with failure* and *Drive and energy levels*. The mean scored by Dutch students for their most developed trait, namely *Number sense*, was however lower than the means of any of the other four most developed traits of both South Africa and the USA. *Number sense* was also not among the four most developed traits for either South Africa or the USA.

If one considers the age of the respondents in this survey, it is not surprising that the traits, *Drive and energy levels*, and *Dealing with failure*, were among the top four most developed traits in all three countries. Younger people or students are more able to work long hours and in most cases have the drive and energy to do so. Younger persons might also not have been exposed to difficult situations, major disappointments or have made life-changing mistakes. In the USA for example, the competitive nature of American society and the high involvement in sports enables individuals to learn from an early age that failure is part of life. Americans are also taught from an early age that failure is an opportunity to learn from one's mistakes. *Competing against self-imposed standards* scored the highest score in both SA and the USA. This could be attributed to the educational and social systems that encourage individuals to set high standards and to take responsibility for themselves.

In South Africa three of the thirteen entrepreneurial traits investigated obtained means scores of below the threshold value of 3.4 on the five-point Likert scale, namely *Use of outside resources*, *Knowledge seeking*, *Use of outside resources* as well as *Taking initiative and seeking personal responsibility*. In the Netherlands four of the thirteen entrepreneurial traits investigated obtained means scores of below the threshold value of 3.4, namely *Knowledge seeking*, *Use of outside resources*, *Taking initiative and seeking personal responsibility*, and *Communication*. On the other hand, in the USA only two of the thirteen trait categories obtained mean scores of below 3.4, namely *Knowledge seeking* and *Use of outside resources*. These observations suggest that the trait categories that scored below the threshold of 3.4 were regarded by the respondents as not being well-developed.

Although the order differed slightly for the Netherlands with regard to the least developed traits, the four lowest scoring traits in all three countries were the same. In South Africa and the USA the ranking of the four least developed traits were the same. *Knowledge seeking* and *Use of outside resource persons* were the least developed traits in all three countries. *Taking initiative and seeking personal responsibility*, and *Communications ability* were the other two least developed traits. Young people today are bombarded with vast amounts of information and the idea of *Seeking knowledge* might not seem relevant to them. Knowledge and information is continually presented to them without their having to seek for it. Students also follow strict programs and the idea of obtaining more information beyond the scope of their coursework might not occur to them. A possible explanation for the low score for the trait *Use of outside resource persons* could be that many of the items relating to this trait made specific reference to obtaining assistance when starting up a new business. As most of the

respondents were students it is possible that the issue of starting and looking for assistance to start an own business would not be a priority for them. It appears that the trait *Taking initiative and seeking personal responsibility* is also not that well-developed among the respondents in all three countries. If one considers the age of the respondents, it can be seen that most are in the earlier stages of their university studies and would still be settling down at university and after having undergone numerous changes would not seek additional responsibilities. It is possible that in some cases, young people come from homes where wealth has been created in previous generations. Many have possibly been given that which their parents or grandparents would have had to work for. As such these young persons have not needed to take the initiative and create opportunities for themselves, but been given these opportunities by their parents. Students in all three countries scored low on the trait *Communication*. In the USA and SA at secondary school level much emphasis is placed on sport. This has become the main extracurricular activity whereas activities such as drama, debate, speech and writing competitions take second place. Students are thus not exposed to as many activities at school level, where communications skills can be developed. In countries like South Africa it could also be a culturally biased aspect that prevents individuals from standing out or drawing attention to themselves.

For eleven of the thirteen entrepreneurial traits under investigation the USA scored the highest score, with SA scoring the second highest and the Netherlands scoring the lowest. International research (Foxcroft, Wood, Kew, Herrington & Segal 2002: 14) on entrepreneurship shows that substantial variation exists in entrepreneurial activity between countries. This afore-mentioned research measures entrepreneurship in terms of the proportion of adults who are involved in starting a business or are owner-managers of new firms. It thus identifies variations between countries in terms of the number of persons starting up new firms. According to that study the USA is ranked 11<sup>th</sup>, South Africa is ranked 19<sup>th</sup> and the Netherlands is ranked 26<sup>th</sup>, in terms of total entrepreneurial activity or number of persons starting up new firms. When considering only the three countries included in this research and the total entrepreneurial activity, the USA ranked first, South Africa ranked second and the Netherlands ranked last. It is interesting to note that this ranking corresponds with the existence of entrepreneurial traits among students revealed in this study. On 85 per cent of the entrepreneurial traits investigated in the study the USA scored the highest score, South Africa the second highest and the Netherlands the lowest. Although no attempt has been made to prove any statistical correlations, it appears that in the countries where more entrepreneurial output (starting businesses) occurs, more entrepreneurial input (entrepreneurial traits) exists. This supports the notion that entrepreneurs are not only persons who start up businesses but are also persons who possess certain entrepreneurial traits to varying degrees. These traits thus need to be developed if more entrepreneurial activity is to occur.

Numerous explanations could be put forward to explain the ranking of the entrepreneurial traits among the three countries included in the investigation. These could be amongst others, culturally or language based. According to Hofstede's dimensions of culture (Hofstede 1994; Thomas & Bendixen 2000) the American and South African societies are more masculine than the Dutch society. In masculine societies assertiveness, toughness, individual achievement, material success, and heroism are valued, as opposed to feminine societies in which attitudes of modesty, tenderness, and concern with the quality of life are highly valued (Arrindell 2001). This distinction could account for the modest Dutch outcomes as compared to the American and South African outcomes.

It should, however, be noted that when ranking entrepreneurial activity between the three

countries, in terms of opportunity entrepreneurs (those pursuing a business opportunity as opposed to those starting a business out of necessity), the ranking is changed with South Africa being place third among the three countries in the investigation. In terms of the global comparison South Africa ranks 9<sup>th</sup> in terms of necessity entrepreneurship, but only 29<sup>th</sup> in terms of opportunity entrepreneurship. The score for necessity entrepreneurship is much lower in the USA and in the Netherlands, and it appears that in countries where a comprehensive social security system is in place the incidence of necessity entrepreneurship is lower (Foxcroft, Wood, Kew, Herrington & Segal 2002:15).

The extent to which these differences, between the means scored on the entrepreneurial trait categories between the different countries, were however significant was established by undertaking an analysis of variance. Significant differences (at the 99% confidence level) between the means scored for the entrepreneurial trait categories, existed between all three countries with regard to the following traits, namely *Goal setting and perseverance, Human relations, Communication, Competing against Self-imposed Standards, Self-confidence, Taking initiative, Drive and energy levels, Thinking ability and Number sense*. Although mean scores were significantly different for all three countries, the USA respondents scored significantly higher means for all the above traits, with South Africa scoring the second highest (except for *Number sense*). For the traits *Number sense*, SA scored the lowest mean score, with the Dutch scoring the second highest.

In four instances significant differences did not occur between all three countries namely, *Dealing with failure (E), Use of outside resource persons (L), Knowledge seeking (M) and Business knowledge (P)*. For the traits, *Dealing with failure* and *Use of outside resource persons* the Netherlands scored significantly lower than the USA and SA.

For the traits *Knowledge seeking*, however, the SA respondents scored significantly higher than both the USA and the Netherlands. A significant difference was also found for the trait *Business knowledge*, where the USA respondents scored significantly higher than both the Dutch and the South African respondents.

These research findings have important implications for all stakeholders who are involved in entrepreneurship education and fostering entrepreneurial ventures. It is believed that the Entrepreneurial traits, which seem to be underdeveloped, should be addressed in a responsible manner. *Knowledge seeking, Taking initiative, Using outside resource persons and Communications ability* are all skills that need to be encouraged and developed. Through adapting curricula and implementing practical initiatives students can be given the opportunity to develop these skills. Attention should thus be given to the creation of a learning environment where these skills are fostered and further developed.

Based on empirical results, it is evident that in some cases students from different countries possess different entrepreneurial abilities or some traits are more developed in one country in relation to another. The reasons for these differences should be identified as they could provide possible solutions as to how to develop these traits in countries where they are underdeveloped. It is imperative that institutions of higher education in all three countries pay attention to skills development, with particular emphasis on those of an entrepreneurial nature. The research findings derived from the empirical evidence do have real implications for educators in Entrepreneurship and for institutions which foster entrepreneurial development. Entrepreneurs are not necessarily born with the required characteristics. These characteristics can, however, be acquired through education, life experiences, and even through the entrepreneurial process itself. Potential entrepreneurs

have to develop a robust psychological make-up because what they are undertaking is invariably daunting.

# **INTERACT CASE STUDY CITY OF THE HAGUE: LOCAL GOVERNANCE OF BUSINESS START-UPS**

**Author: S. Santokhi, MA MBA PhD-candidate**

## **INTRODUCTION**

The small and medium-sized enterprise (SME) sector is seen as an important job market necessary for the city economy. There are more than 17.000 firms in The Hague that are part of SME. They are responsible for 90% of all the firms in The Hague and take care of 100,000 jobs, more than 50% of the employment in The Hague. The SME sector is very important for offering work to lower trained people. A great deal of the national increase in employment comes from an increase in the number of new businesses. The Hague was behind the national trend. The large numbers of new firms that are to be found nationally are not in The Hague. In the period 1991-1996 the number of new starter firms decreased by 16%. This decrease was the initiative for The Hague government to bring out a 'Starter's memorandum' to stimulate new entrepreneurship. Creating new jobs, especially in the market sector is the most important task of the government of The Hague in the coming decades. The Hague wants to achieve this target by encouraging entrepreneurship, with a special focus on immigrant entrepreneurship because of the high unemployment rate, by making a more professional business background, increasing the market for entrepreneurs and raising the preconditions by increasing the training levels, creating more business accommodation and business areas, simplifying regulations, forming 'one counter' (The Business Desk) for the business community and making easy accessibility to the city. The foundation of The Hague Starters Counselling Association (Stabij 1997) and the Business Desk (1998) have been set up to add form to these aims. The main goal of the business starter project, which is a part of a broad city economic policy, is to stimulate business starters at the bottom end of the market by means of an integrated approach embedded in partnerships with internal and external actors, with a special reference to immigrant business start-ups.

This case study addresses the following questions:

- What policy is the city of The Hague developing to promote business start-ups, with a special reference to entrepreneurship among immigrants?
- What parties are involved in implementing the policy?
- How successful is the business starters policy?
- What bottlenecks arise in the implementation of the policy?
- What improvements can be recommended?

The case study has two components: an analysis of the city's structure and an analysis of processes of policy implementation. The analysis of the city structure provides background

information about the city policy in general. The process analysis is meant to give specific insight in three dimensions of local governance:

- Integrated approach (multi-sectoral approach);
- Participation of partners;
- Area-wide perspective.

Within the three dimensions the analysis will focus on four specific items:

(1) partnership, (2) leadership, (3) organisational learning and (4) financial innovations as possible preconditions for innovativeness of the project.

First, the data will be described according to the format developed by the Scientific Committee of Interact. After that conclusions will be drawn in the context of the three dimensions.

The study was carried out in association with one of the partners, the Haagse Hogeschool. The data was collected from 15 in depth interviews with professionals in the working field and policy advisors. The results were discussed with policy assistants in The Hague city council, two of the other partners involved in implementing the policy and the University of Amsterdam. Because of privacy reasons the opinions are anonymised as much as possible.

## **CHAPTER (SECTION) I: STRUCTURAL ANALYSIS**

### **The environment of the case study project**

**Analysis of institutions and regulations: national, regional, metropolitan, municipal, infra-municipal levels.**

### **Political-administrative structures**

Central government, the provinces and local authorities are the three levels of government that set policy. Although cities have been given greater scope to formulate policy in the last twenty years, central government still has enormous influence on municipal economic policy. The policy culture in the Netherlands is characterised by the desire for a 'makeable' society. The intensity of regulation is a good illustration of this policy culture. However, significant changes have occurred in this respect in recent years. Economic policy is a good example of this, as the era of intensive regulation has given way to increasing deregulation. This process provides opportunities for economic development of the Netherlands. The small and medium-sized enterprise (SME) sector is one of the economic sectors where deregulation has proceeded rapidly. As regards (immigrant) entrepreneurship, the subject of this study, the number of incentive measures has steadily increased since the end of the 1980s. Broadly speaking, the evolution of government policy targeting (immigrant) entrepreneurship can be divided into the following phases.

## Urban development and Major Cities Policy

From 1994 the government is stimulating urban development in the major cities. In 1994 a voluntary agreement was concluded with the four largest cities, including The Hague, and later with 21 smaller cities to take urban regeneration measures. This policy, known as the Major Cities Policy, was instigated by the cities themselves, and is based on a thorough analysis of the cities' strengths and weaknesses, as well as possible future opportunities and threats. In 1999 the cities produced, on request of the national government, an integrated vision for the years 1999-2003 in preparation for the 'second generation' of agreements with cities and the national government. This vision was to outline the future of the cities as seen by themselves, with a time span of ten to twenty years.

The main features of this "second generation covenants" Major Cities Policy were:

- Vision;
- An integrated approach that interrelates physical, economic and social measures;
- The targeted and combined use of central and local government resources
- A sustainable alliance;
- An area-specific approach with full involvement of local residents, and
- Measurable objectives.

Unusual about this policy is that cooperation between the government, the cities and private partners does not follow the normal Dutch administrative pattern. The aim of the urban regeneration policy is to enable cities to work with local partners in devising policies tailored to local conditions. This development is being facilitated in several ways by the government.

- Firstly, a process of deregulation and removal of obstacles is taking place.
- Secondly, the power of the cities is being increased.
- Thirdly, extra funds are being provided.
- Fourthly, the performance is monitored.

The government has contracted to act in partnership with the cities. The government and the cities are now equal partners who have reciprocally bound themselves by contract (in the form of a covenant) to certain commitments.

In return for government input, the cities have committed themselves to achieving certain quantifiable goals, such as achieving reductions in crime, unemployment and the social and economic deprivation of immigrants, and increasing the number of jobs. Attention is also being focused on qualitative aspects, such as levels of public satisfaction. Each covenant between a city and the government is based on a four-year development programme (with measurable goals) produced by the city in question. This development programme must comply with different types of requirements specified in the agreement between the government and the city. Besides national programmes also European resources and programmes (Urban and Objective Two) are put in to regenerate disadvantaged urban areas in The Hague.

The programme should be compatible with the future development of the city over the following ten or twenty years as envisaged in the city plan. Government and city should agree on the programme, although the city alone is responsible for developing its own long-term

plan. This integrated long-term plan should be based on an analysis of the city's strengths and weaknesses, and express clear goals and objectives. This insistence on formulating a long-term plan is an essential part of the strategy to force cities to work and think integrally in terms of the intended social outcome.

### **(Immigrant) entrepreneurship and Major Cities Policy**

Until the end of the 1980s policymakers showed little interest in immigrant entrepreneurship and there were also relatively few entrepreneurs from ethnic minorities. Towards the end of the 1980s the government began to develop policy more actively. More precisely, it was in 1987 that the Ministry of Economic Affairs published a policy document entitled: "Scope for enterprise, Policy for small and medium-sized enterprises in a new perspective"(1987). This policy document announced that the government would commission further research to help it formulate its position on entrepreneurship among members of ethnic minorities. On the basis of the results of this research and its experience with a number of special facilities for entrepreneurs from ethnic groups, in 1989 the government produced a position paper ("Policy towards entrepreneurship by persons from ethnic minorities"). The WRR summed up the results of the research and earlier experience as follows (WRR, 1989): the financial situation of entrepreneurs from ethnic minorities, especially Turks and Moroccans, was poor; most companies were set up in sectors with a low entry threshold, and they lacked entrepreneurial know-how (professional skills, management skills, the Dutch language and the diplomas required to start a business). Since 1987 central government has devoted specific attention to entrepreneurship among ethnic minorities as part of its policy on small and medium-sized enterprises. The main objective of the policy specifically targeted at SMEs was to promote equal opportunities for commercial success for entrepreneurs from ethnic minorities. A secondary objective was to create equal opportunities for self-employment among members of those groups.

In 1995 the Ministries of Economic Affairs, Social Affairs and Employment and Finance produced the memorandum "Work through enterprise". This memorandum discussed a number of trends in the SME sector. The main points it identified were:

- Changes in consumer preferences;
- Outsourcing of activities to suppliers;
- Growing demand for services;
- Development of technology;
- Cooperation and increase of scale;
- Globalisation.

These trends led to a greater policy focus on small enterprises in the Netherlands and abroad. Small and medium-sized enterprises played a major role in Dutch economy in the period 1987-1993 since just over 50% of production and 58% of employment (in man-years) in the private sector was generated by SMEs. New companies (start-ups and subsidiaries) created more than 30% of new jobs in that period (Ministry of Economic Affairs/ Ministry of Social Affairs and Employment, 1995). SMEs can therefore justly be seen as the engine of job growth. More recently, the SME sector has been shrinking.

The government proposed five measures in 1995:

- Improving the tax climate;
- Rolling back regulations that curb business dynamism;
- Improving the quality of entrepreneurship;
- Reducing the costs and increasing the flexibility and quality of labour;
- Increasing the possibilities to secure external financing for start-ups and existing companies with potential for growth.

The government recommended establishing centres of expertise specifically for entrepreneurs from ethnic minorities. These proposals were designed to increase the possibilities for starting and expanding companies, for example by removing obstacles to the hiring of staff. With the second voluntary agreement on Major Cities Policy in 1999 entrepreneurship among ethnic minorities was firmly embedded in urban economic policy. Because unemployment remained high the government decided that further measures were still needed. A year before the second voluntary agreement on Major Cities Policy (1999) took effect the government asked the Social and Economic Council (SER) to produce an advisory report on the policy to be pursued with respect to entrepreneurship among ethnic minorities with special reference to Surinamese, Antilleans/Arubans, Turks, Moroccans and refugees. The government adopted most of the SER's advice in developing its policy.

The SER made the following recommendations. First, specific promotion of entrepreneurship in the market for personal services, whereby forms of public-private partnership could also be tried. Second, immigrant entrepreneurship should be embedded in the urban-economy element of Major Cities Policy by considering the creation of an "urban economy fund" designed to finance projects that would strengthen the economic structure in pre-designated economic incentive areas, projects for which the public and private sector would be jointly responsible, for instance small business centres in the city for Dutch and immigrant entrepreneurs, the establishment or restructuring of shopping centres and business parks, facilities for business starters, education for entrepreneurs and information. Third, immigrant entrepreneurs should be encouraged to join franchises and shop chains. According to the SER, the franchise formula could help to solve three of the problems associated with entrepreneurship among ethnic minorities: (1) lack of management skills, (2) the problems they have gaining entry to some sectors, and (3) a shortage of good locations. A fourth recommendation was to give more attention to external financing, for example by providing guarantees for loans to entrepreneurs from private banks in the economic incentive areas in the Major cities and good communication between borrowers and commercial banks. Fifthly, the SER identified room for improvement in the field of legislation and regulations and their implementation specifically with reference to:

- A single contact point, or one-stop shop, in local authorities (front office);
- Streamlining and coordination of procedures in the back office;
- A short, pre-announced lead-time for licensing and other procedures.

The SER also said that more could be done for unemployed people who were starting their own enterprise under the Self-Employed (National Assistance) Decree.

In 1999 the Ministry of Economic Affairs produced the policy document "The enterprising society. More opportunities and fewer obstacles for entrepreneurship". This document followed the line taken in the earlier SER advisory report with respect to entrepreneurship among ethnic minorities. The government favoured a tailored local approach built around the following action points:

- The appointment of mentors from the entrepreneur's own ethnic group;
- Consultation with commercial banks and other institutions about the possibilities of increasing lending to small entrepreneurs from ethnic minorities;
- The implementation of "Local Business", an action plan drawn up by the chambers of commerce of the four large cities. This plan was designed to improve the service provided to ethnic entrepreneurs in particular by appointing consultants for particular districts and creating networks. The government's intention was that other chambers of commerce would also adopt this approach.
- The government also felt the Self-Employed (National Assistance) Decree could be used to enable unemployed members of ethnic minorities to start a business.

The period since the Major Cities Policy was adopted (1994) has been the most intensive in terms of policy for the development of (immigrant) entrepreneurship in the Netherlands up to now. Almost all the measures are applicable for immigrants as well as the native business starters.

## **From national to urban policy**

For a city like The Hague, which has no large-scale industry, small and medium-sized enterprises are particularly important for economic growth. But in that respect the city failed to profit sufficiently from the strong national growth. Although self-employment in the Netherlands has grown explosively in recent years, in the period 1994-1997 the number of start-up businesses in The Hague declined from 1,700 to 1,200 per year (Chamber of Commerce, 1997). The fall in the number of business starters led the local authority in The Hague to publish a policy document on start-up businesses in The Hague "Stimulating new entrepreneurship" in 1996. The policy on business starters is important for expanding and upgrading the municipal economic structure. The policy programme for 1998-2002, "Renewed perspective", stated that the policy on business starters would be expanded in the coming years with special attention to business starters from ethnic minorities and business start-ups by people receiving social security benefits. Besides advising new entrepreneurs the local authority will stimulate the reservation and construction of inexpensive business premises for start-up businesses. There is a direct relationship between the business starters policy and the Major Cities Policy. "The Strength of The Hague", the city's plan for the Major Cities Policy for the period 2000 to 2004 refers to business starters as one of the most important target groups of this policy.

The main aims of central government's business starters policy correspond with The Hague's policy document on business starters, these being to optimise the service to individuals starting a business and to remove the bottlenecks they face. The target groups of the business starters policy are start-up businesses and existing entrepreneurs in financial difficulty. Each organisation in turn divides the target groups into subsidiary target groups. For

instance, organisations also target existing companies that are in difficulties or entrepreneurs who have questions about their enterprise.

### **The Hague's policy on business starters contains eight action points:**

- To set up a counselling service for business starters (Stabij);
- To draw up a list of organisations that help business starters;
- To improve the activities for business starters in The Hague;
- To set up a Business Desk for entrepreneurs;
- To create a databank of business accommodation;
- To construct business premises for business start-ups and small enterprises;
- To stimulate mini-enterprises;
- To increase the opportunities for business starters to secure financing.

### **Role of supra-local levels in relation to the local project: financial relations, power relations (legal disposition and regulation system)**

Central government stimulates municipal policy and in that context provides extra funds as part of the Major Cities Policy. It has provided 100 million euro for projects in the 'soft economy' (such as business starters policy) and 408 million euro for the physical infrastructure. These funds are primarily intended to address local problems relating to the provision of information and advice and business accommodation. In addition, central government has provided over 18 million euro for other activities such as opening a Business Desk, stimulating education about entrepreneurship and for export policy and policy measures for fast-growing companies and technology start-up businesses. European subsidies such as Objective 2 funds (funds under an EU programme targeting areas affected by urban decay) are used for some elements of the policy. Central government "monitors" the policy. The funds provided are linked to performance targets and in principle the agreement is that the funds will be reduced if the performance targets are not reached. But the local authority is free to produce its own analysis of the city's problems and to gear measures, resources and performances to them. An independent assessment committee decides whether the procedures and performances accord with the contract that The Hague concluded with central government.

The municipal authority also has to account for its use of the European subsidies it receives. In that respect, the European Union is far more bureaucratic than the national government. The city has appointed a broad-based advisory committee made up of representatives of different departments and chaired by the alderman for economic affairs to monitor the use of European Objective 2 funds in areas affected by urban decay.

### **Existing development agencies, planning structures and other mediating organisations**

The Major Cities Policy represents an important framework for The Hague's economic policy. The plan for the city's long-term future, "The strength of The Hague", is as mentioned the city's overall strategic plan for the economic development of The Hague. Entrepreneurship is an important topic in the plan in view of the opportunities afforded particularly by small and

medium-sized enterprises. One of the gains arising from the Major Cities Policy is the development of public-private partnerships. The Hague faces a number of major challenges in its effort to reverse the widening socio-economic gap in the city. In order to do so it needs allies in business and among NGOs. The city therefore operates in various networks that also include large companies such as KPN, Siemens, the banks, etc. Central government regularly relies for advice on policy from bodies such as the Social and Economic Council and the Social and Cultural Planning Office. The Association of Netherlands Municipalities represents the interests of local government.

## **Civil society participation procedures**

The Hague uses a system involving district plans. Residents, NGOs, housing associations, interested parties and municipal services are all involved in drawing up these plans. Residents can make their wishes known during the restructuring of their immediate living environment. In general, the public input is used to prepare the annual plans. In the eight city districts there are management teams in which the various policy sectors are represented. It is they who initiate resident participation, together with residents associations. Under the title "The Hague 2025" dozens of interactive policy sessions were held in the period 1997-1998 with citizens, businesses and NGOs to discuss long-term socio-economic policy and a website was produced to assemble the ideas for policy received from individuals. These sessions resulted in four master plans, including the Urban Economy Master Plan, which incorporates suggestions from participating actors about entrepreneurship. A recent law has now created the possibility of holding referenda. It did not apply for this project although a survey was held to gauge public views on the future of their city. In addition the City Survey is held each year and in the Quality of Life Monitor every two years residents of the city are asked how they see the future of the city and what recommendations they would make.

## **Land use system or any spatial related element in connection with the project (land use plan, master plan, strategic plan etc.) and status of these elements (e.g. necessity of a local land use plan to conform with a master plan)**

The economic policy of The Hague rests on the Urban Economy Master Plan, the long-term development programme "The Strength of The Hague", Choosing and Sharing, the policy document on business starters, the Social-Educational Master Plan, the Restructuring Master Plan (urban regeneration) and the Hoog Hage Master Plan (a plan for a high-quality office economy). These strategic policy documents were used extensively in discussion of the policy on business starters. Spatial planning is crucial to the city's economic policy. This is why The Hague invests a great deal in the traffic infrastructure to make it attractive for companies to locate in The Hague, for example by reducing traffic jams. Because of the lack of space the city uses the instrument of dual land use, which means that in areas designated for regeneration business premises are created on the ground floor with dwellings above. The city also invests in a pleasant living environment by creating shopping streets to attract business activity. The master plan for the coastline around The Hague will also have a positive effect on business activity in the city. A mixed function/gentrification strategy is adopted in the poorer neighbourhoods. In effect, this involves creating a mix of cheaper and more expensive dwellings so that wealthier people are also attracted to these areas. The assumption is that increasing the purchasing power in these areas will lead to more business

activity. In this way the city can retain its middle class and people will also have the chance to move to more expensive housing.

The city's economic policy is also strengthened by the policy of constructing housing in urban regeneration areas for wealthier households who are expected to produce an economic spin-off. As with the office economy, the assumption is that jobs will be created in the service economy markets. It is these markets that generate employment for low-skilled workers, so that opportunities will be created for businesses run by immigrants. In particular the personal services industry, with its low entry threshold but high potential for growth, offers opportunities for immigrant enterprises. In the first place it eases the competitive pressure in the saturated small retail sector, which attracts most immigrant business starters, so that existing companies will have greater opportunities to grow. Second, immigrant businesses will be more widely spread over different markets, hence increasing their chances of success.

### **Spatial related elements in connection with the project**

The Hague Starters Counselling Association (The Stabij) pays special attention to business starters in certain sections of the city like Transvaal, Schilderswijk, Stationsbuurt, Groente- en Fruitmarkt en Laak-Noord (the inner city). These neighbourhoods have been made an economic stimulation area by the European Commission. Female entrepreneurs are also one of the priority groups. Ethnic minorities receive special attention in the SME policy, because as well as creating chances for an increase in status through independent entrepreneurs, there is also an emancipation factor. The stimulus for entrepreneurship is an important integration factor for the city and its concern about inhabitants who are not part of the labour market. The wishes of specific groups of inhabitants with regards to housing are also being taken more into account. Examples are the collective business buildings of the Hobbit, Fruitweg Business Centre and the Schilde, which have taken into account an excellent infrastructure as an innovation motive for starter businesses. Similar initiatives will take place together with private partners in the coming years. As well as the advantage of combined use of services, this concept also offers the possibility of better support to and co-operation between starter businesses.

### **General data related to the metropolitan area and the city: population, number of municipalities, wealth**

Before the redrawing of the boundaries on 1 January 2002 The Hague had a population of approximately 440,000. The figure is now roughly 480,000. The city is now divided into 42 local districts. Immigrants make up just over 40% of the population. The percentage of the population made up of the traditional immigrant groups from Morocco, Turkey, Suriname, Aruba and the Dutch Antilles is around 25%. As in the other large cities in the Netherlands in The Hague the gap between rich and poor widened rather than narrowed during the economic boom. Income statistics for 1994 show that 52% of the households in The Hague fall into a low-income category, with a wide gulf between rich and poor households. Poor households are concentrated in certain districts of The Hague. There is also income segregation in the region as a whole. The region around The Hague is wealthier than the city. The average income in the Haaglanden region is 24% higher than in The Hague. The concentration of low-income households in the four large cities increased in the period 1994

to 1998. The numbers of people in the middle and higher income groups declined in this period.

## **THE CASE STUDY**

### **The area: demographic, social, economic and spatial structure**

The decline of small industry and the wholesale trade has negative consequences for unskilled workers, who are over-represented in The Hague, since this sector generates most jobs for the unskilled. This is a worrying development, especially for migrants, a large proportion of whom depend on unskilled work. The level of education of the average resident of The Hague is also at odds with the needs of the services sector, which makes up a large share of the city's economy. Knowledge plays a dominant role in this sector and that places great demands on educational standards. However The Hague has only a limited pool of workers with secondary and higher education (NEI, 1998). NEI observed that The Hague is losing its status as a commercial and residential centre. People are moving to the surrounding region to live and shop and this is having a negative effect on purchasing power in The Hague. The conclusion was that economic development is passing parts of The Hague by so that in certain districts prosperity is lagging behind the rest of the city. Features of these districts are vacant buildings, a lack of diversity in the population, extremely high unemployment and impoverishment. Two districts of The Hague stand out in this respect: the Schilderswijk and Transvaal. These are also areas with large ethnic concentrations. Certain districts also stand out in terms of the proportion of the working population that are dependent on long-term national assistance. In the period 1996 to 2000 the overall percentage remained stable at around 4%, but in the deprived neighbourhoods that percentage was at least twice as high.

Having work is regarded, as the most important factor for integration but the fact is that the chance of unemployment among migrants is far higher than among the native Dutch population. The unemployment rate among Dutch people in 1998 was 4% compared with 16% among ethnic minorities, although that figure has since fallen to below 10%. There are, however, significant differences between the various ethnic groups. For instance, unemployment among Moroccans is 22%, among Turks 17%, Surinamese/Antilleans/Arubans 12%, other ethnic minorities 17% and other immigrants 7% (CBS/EBB figures, 1999). Around 46% of the unemployed in The Hague are members of ethnic minority groups (Statistics of the National Manpower Agency, 1999). There is an obvious correlation between long-term unemployment, level of education and ethnicity.

The trend in The Hague is for the productive members of the population to move to somewhere else in the region. For instance, the population statistics for The Hague in 1997 show that 70% of the population who left certain districts of the city chose to move elsewhere in the Haaglanden region. On the other hand, only 13% of people living in the Haaglanden region settled in The Hague. The native Dutch are over-represented among these 'suburbanites'. On the other hand, the inner-city areas also attract new residents, generally young people and migrants who chose to live in the city centre, for example because housing is cheaper and because there is a social network they can fall back on. With the suburban

flight of the overwhelmingly native population and the arrival of immigrants the demographic profile of the inner-city areas is still changing and that process is not yet complete. The ethnic concentration seems likely to continue in the coming years as a result of the selective migration, particularly of native Dutch, to the suburbs, the net natural growth of the immigrant population and the influx of new immigrants.

## **City policy response on these tendencies**

The city policy of The Hague is reacting to the mentioned tendencies with a coherent and integrated social, physical and economic policy. The Hague has opted to build upon its strong points, the so-called Investment Triangle.

This involves:

- Aiming at high-quality office economy with a positive spin-off for low trained jobs;
- Strengthening small and middle sized firms and promoting self-employment, specifically among ethnic minorities;
- Aiming at competitive living environments, which are to draw well to do citizens and firms to The Hague;
- Tackling the lack of space through double land-use;
- Strengthening the links between education and the job market;
- Developing and improving the knowledge infrastructure;
- New commercial activity;
- Neighbourhoods with a stronger economic and social foundation;
- A competitive residential climate which is attractive to those with middle and higher incomes;
- A better average educational level of its population;
- A challenging economic, social and cultural climate and
- Businesses back to the neighbourhoods.

For every three jobs requiring qualified staff, the market creates one job for relatively unskilled staff in the so-called secondary support sector - catering, hospitality, construction, security and so on. Based on this fact, the city is concentrating its investments in the service economy:

- More office space;
- Efforts to attract more ICT businesses;
- International organisations which fit The Hague's image and reputation as a United Nations city and as the international capital of justice, peace and security;
- Efforts to improve accessibility in and around the city;
- Redevelop existing industrial and commercial sites;
- To introduce an incentive policy aimed at new businesses;
- To promote tourism which will increase the need of more lower skilled jobs.

In the social sphere, most significant challenges facing The Hague are:

- To raise the average educational level of its citizens in order to achieve a better match with the employment market. This should begin with the very youngest;
- To increase safety and security, particularly in public areas, and reducing crime.

Important spearheads of this policy are to encourage more children from the ethnic minorities to join in nursery school activities, to provide support in bringing up children, and to improve co-operation between the various organisations involved in childcare and youth work.

The number of children leaving school without any form of qualification must be reduced to zero. As mentioned earlier, an increasing proportion of the population of The Hague is of an ethnic origin. If the city is unable to offer good prospects to the ethnic minorities, the effect will be disastrous to the city. The extra efforts of the city in social integration of immigrants are geared towards eradicating their social and economic disadvantage.

The city wishes to give them full access to the employment market, but also to break through the social isolation they will experience if they are insufficiently familiar with the Dutch language and Dutch society. However, the policy in this field goes further than just alleviating disadvantage. The ethnic minorities represent a force for renewal within The Hague's society. This policy includes an important place for the encouragement of 'ethnic enterprise' and other forms of social and cultural initiative on the part of the ethnic minorities.

To achieve the mentioned goals all city departments have agreed a set of performance indicators. All the sectors in the physical, economic and social policy fields work together to achieve the goals. The City Management Team sees to it that the performances are achieved.

The inhabitants of the backward areas should profit the most from these policies, so as to take the Major Cities Policy slogan "vital and undivided" live up to expectation.

### **Major actors: municipalities, economic actors involved, civil society, etc. detailed description of the various administrative and technical bodies involved in the project**

There are a number of parties involved in the business starter policy. Some of these parties were not specifically established to implement business starter policy but do provide information or deliver services for business starters. The main actors in The Hague's policy on business starters are discussed below.

#### External parties

The most important actor in the business start policy is Stabij. Stabij was founded by local authority of The Hague to implement the city's business starter policy and to act as a one-stop shop for business starters. The aim of the local authority is to make it easier for entrepreneurs to find the information they need and to start a business. Another of Stabij's tasks is to direct the start-up process and coordinate the activities of the participating parties. Another function of Stabij is to keep pushing the various agencies concerned to handle the applications they receive. Stabij also provides coaching and counselling to students, immigrant entrepreneurs and social security beneficiaries who are starting a business. Stabij helps them to draw up a

business plan, but above all tries to fill in the gaps in their knowledge and skills. At the same time it provides general business advice, negotiates in loan applications to the Gemeentelijke Kredietbank (GKB) under the Guarantee Fund or the municipal Social Affairs and Employment Department. Stabij also gives intensive workshops on business administration, market research and starting your own business. Stabij also runs the SME service point, which is used mainly by immigrant entrepreneurs.

Stabij is also:

- A platform for policymakers and suppliers of services for business starters;
- The implementing organisation for joint projects;
- An initiator of new projects;
- The account holder for the Economic Incentive Area (European policy).

How successful Stabij is as a key actor in the governance of business start-ups, in its role as mediator in conflicts between partners and in negotiations with actors in the benefit of the individual starter, in building up a good coordination with the actors and achieving the agreed performance will be discussed in the process analysis.

## **The Chamber of Commerce**

The Chamber of Commerce provides information for all businesses, gives advice and refers people to other bodies. It also produces the starters orientation set, organises meetings for business starters and conducts trade name research. Every new business, except certain free professions, must file its name with the Trade Register at the Chamber of Commerce and is assigned a registration number.

**Syntens** is also involved in The Hague's business starters policy. It is an innovation network for businesses that was founded in 1994. It provides coaching and advice for innovative business start-ups from the implementation phase with the emphasis on six themes: new entrepreneurship, information and communication technology, personnel and organisation, product and process development, cooperation and marketing and strategy.

The **banks** are also involved, providing information to start-up businesses as well as financial support if necessary. They assess the financing of the business, provide advice on credit control, payment systems and insurance. The banks involved are ABN AMRO, GKB, ING Bank, Rabobank and VSB Bank (Fortis Bank).

**Steenworp** is another participant. It manages a database of all business accommodation in the Haaglanden region available for start-up enterprises.

**Trade associations** and **retailers' associations** are also involved. Individuals who are starting a business in a particular sector can go to these parties for information about it. They provide assistance, regulate their sectors and member of the association and provide legal protection in conflicts, etc.

**Some accountancy firms** are also involved in business starter policy. They provide information about business plans, general business advice, assess the budget, mediate in loan applications to banks, draw up annual financial statements and tax returns, produce the financial administration and advise on the purchase and sale of a business. Among the well-known firms of accountants taking part are BERK, Arentzals and partners, BDO CampsObers, Deloitte & Touche, Ernst & Young Ondernemersservice, KPMG Accountants and PricewaterhouseCoopers.

### **Important internal parties**

Four departments of the municipal authority are also intensively involved in the business starter policy: the Urban Development, Social Affairs and Employment, Maintenance Department and City Management Department.

### **Department of Urban Development:**

The Department of Urban Development is the section that develops economic policy. Its core tasks are to carry out research into economic, infrastructure and spatial developments and develop appropriate policies. The SME sector is a very important one for generating employment. The Department of Urban Development tries to stimulate business start-ups, which will in turn lead to more employment and a stronger urban economy. The department's directorate of Economic Affairs and Services coordinates business starter policy and the activities of the different departments. It also provides the link with Stabij as the body responsible for implementing the business starter policy.

**The Business Desk falls under the Department of Urban Development** and was formed in 1998 as a contact point for small entrepreneurs and business starters. The majority of entrepreneurs, around 65%, that visit this contact point are immigrants. The purpose of the Business Desk is to contribute to growth in the number of small and medium-sized enterprises by helping the small and first-time entrepreneurs, for instance in making applications for licences and in finding a suitable location. The entrepreneur must however start the business himself.

### **Department of Social Affairs and Employment Projects:**

The involvement of the Department of Social Affairs (Service) and Employment Projects is important with respect to people who are receiving national assistance and want to start their own business. The Self-Employed (National Assistance) Decree provides the department with an instrument to help people receiving national assistance benefits to start their own enterprise. The department's Self-Employment section is responsible for this aspect of the policy. The Department of Social Affairs and Employment Projects can provide income support and/or business capital in the form of a loan during the start-up phase of the enterprise. Since 1997 the department has referred recipients of national assistance who want to start their own company to Stabij for advice on drawing up a business plan. Applicants for a loan under the Self-Employed (National Assistance) Decree must submit a business plan. The department and Stabij together provide information about

entrepreneurship to recipients of national assistance who are interested in starting their own business.

Since 1 April 2000 new legislation under the National Assistance Act (Bulletin of Acts and Decrees, 23/12/1999) has provided greater possibilities to counsel recipients of national assistance in preparing their own business start-up and expanded the possibilities for securing financing. Examples include:

- Recipients of national assistance can retain their benefits for a year while they prepare to start their own business if they are advised during this period by an external agency designated by the municipality. They can receive financial support under the Self-Employed (National Assistance) Decree;
- Local authorities (social services) are allowed to reclaim the costs of the assistance provided by the designated external agency from central government;
- The period for which recipients of national assistance can avail of the facilities of the Self-Employed (National Assistance) Decree after starting their own business was extended from 18 to 36 months;
- For individuals who for medical or social reasons are only partially able to work the period of 36 months can be extended further;
- The maximum loan that can be provided as start-up capital was raised from around 19,500 euro to around 27,500 euro in order to give business starters more financial leeway.

In association with Stabij the Department of Social Affairs and Employment has developed an integrated process for the practical implementation of the 'preparatory year' referred to in the law. Stabij is responsible for carrying out the process.

The basic principles of this cooperation are:

- The Department of Social Affairs and Employment Projects makes a preliminary selection and investigates the best way of mediating for a recipient of national assistance;
- Recipients of national assistance for whom self-employment is the best way of permanently supporting themselves are referred to Stabij;
- The selection phase may involve following a short orientation course at Stabij;
- A decision is taken on whether the applicant can take part in the scheme while retaining the right to national assistance and with an exemption from the requirement to apply for jobs;
- Counselling and training are geared to the needs of the participant;
- The department monitors the progress of the participants;
- Stabij continues to provide counselling after the start of the enterprise;
- The approach is comprehensive, so the department can continue mediating for any dropouts from the scheme in a different direction.

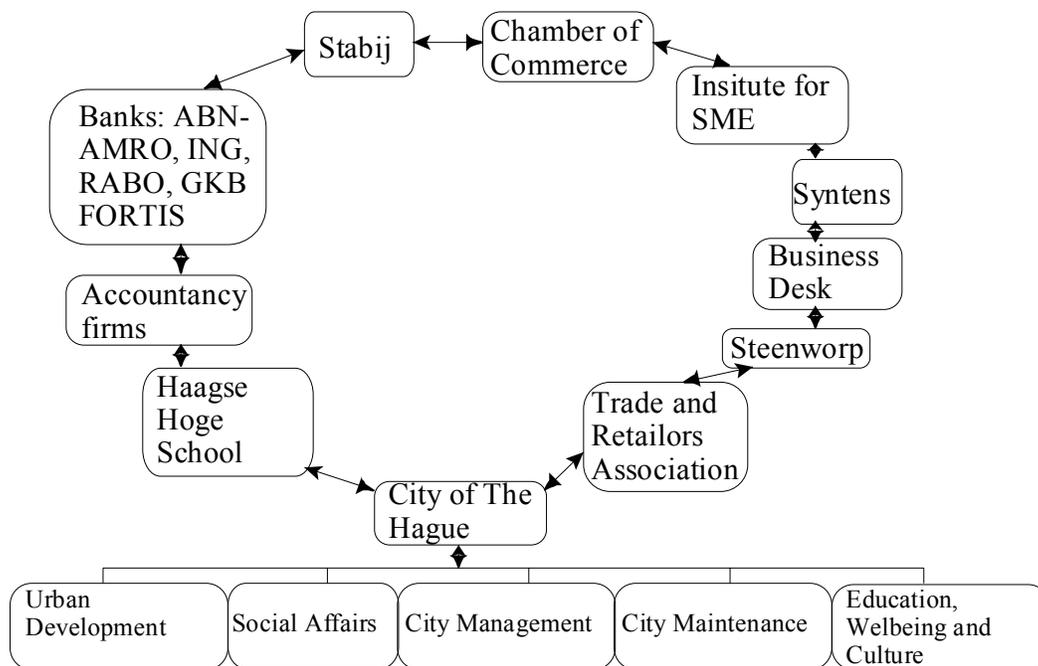

## **Coordination:**

Besides coordination within the local authority itself, there is also coordination with the external intermediaries for business starters. Stabij plays a leading role in this. An important

initiative in this respect is the *"Hague Business Starter Process"*. This process is designed to reap the benefits of cooperation between the various parties in The Hague, which provide services for start-up enterprises. The business starter process is intended to lead to a higher success rate among business start-ups. To achieve this, the services provided by the various parties are matched to the needs of the business starters, business starters are informed of the existing supply of services and offered coaching and mentoring. The cooperation between the intermediary institutions is also reflected in *"Haagse Start"*, a competition for business starters run by the city, the ABN AMRO, the *Haagsche Courant* newspaper, the accountants Moret, the employment agency Randstad, Syntens, the Chamber of Commerce and Stabij.

The next chart gives an overview of all the participating partners

**Chart 1: Overview of participating partners**

**The financing structure of the project: sources of funding (ranging from local to European funding)**

Stabij's main partner is the local authority, which is the main source of subsidies (annually 325,000 Euros, including 100,000 Euros for female starters), with subsidies also from the Institute for SME (about 1 million Euros for the SME Service Desk), central government and Europe. Consequently, Stabij is very vulnerable to spending cuts. Since recently the local authority is also obliged to put contracts for services out to tender as a result of the Work and Income (Implementation Structure) Act. This means that Stabij faces competition and its financial position is therefore under pressure.

## **Goals of the project and specific objectives pursued by the main actors by participating in the project**

The goal of the business starter policy is to increase the number of successful business starters, including business starters among ethnic minorities, with the potential to run a viable business in the long term. Because of the criterion that the venture must be promising 90% of the applicants do not complete the process successfully. Stabij essentially deals with a group of business starters with fewer qualifications for entrepreneurship, including social security beneficiaries. It has mediated for 3,000 potential starters in the period 1998-2002. Its target is to help 60 business starters to launch their own business each year. In practice this means it pursues a policy of positive discouragement (Statistics of Stabij 1998-2002).

## **Brief history of the project (conception, elaboration and implementation)**

Since 1996 The Hague's business starters policy has concentrated on eight action points, which are described below.

### **Action point 1: foundation of Stabij**

Stabij officially started operations in mid-1997. The board of the foundation is made up of representatives of the chamber of commerce, Syntens, the banking and accountancy industry, the Haagse Hogeschool and organisations of immigrant entrepreneurs. The Hague local authority acts as advisor to the executive.

### **Action point 2: drawing up a survey of organisations for business starters**

The second action point in the policy document on business starters policy involved drawing up a list of organisations that provide services for starting entrepreneurs. The intention was to create transparency in The Hague's business start-up market. The list would make it easier for a starting entrepreneur to find the right agencies when they needed assistance. In 1999 Stabij published the brochure "Starting your own company?" which clearly explained which agency provided which service for business starters. These are agencies that are involved in The Hague's business starter process. The intention was to update the list each year.

### **Action point 3: improving activities for business starters in The Hague**

The third action point involves improving the cooperation between the various municipal departments involved in the business starters policy as well as cooperation within the city council and between the participating parties. There are a number of parties involved in the business starters policy.

### **Action point 4: opening The Hague's municipal Business Desk**

This action point involved opening a municipal office to provide information directly to entrepreneurs with questions about municipal policy, regulations and licences. The office can refer applicants to other departments that will handle the enquiries further. The business desk can also play an important role in speeding up the handling of enquiries from entrepreneurs and improving coordination between the various municipal services that deal with entrepreneurs. The business desk was named "Bedrijvenbalie gemeente Den Haag" and was officially opened in June 1998.

## **Action point 5: creating a databank of business accommodation**

Action point 5 relates to a databank with an up-to-date list of business accommodation from the various suppliers (estate agents, housing associations and the city council). This databank would provide business starters and other entrepreneurs with a complete list of the business accommodation available in The Hague. Besides improving the choice for entrepreneurs it could also be useful for business starters, many of whom are unfamiliar with the market for business premises. A possible spin-off benefit would be that there would be less need for entrepreneurs to leave The Hague because they cannot find business accommodation. The various suppliers of business accommodation in The Hague were sounded out about the databank (see Steenworp).

## **Action point 6: establishing small business centres for business start-ups and small enterprises**

When the business starters policy started in 1996, like the other large cities The Hague had a shortage of affordable business accommodation for business start-ups. Action point 6 in the policy document on business starters relates to the development of business accommodation for start-up businesses. The goal was to develop an optimal supply of affordable business accommodation for start-ups and other small enterprises. The emphasis was on premises with small and flexible units at reasonable prices. In this context, the Economic Affairs and Personnel Committee recently adopted a memorandum on subsidising the construction of business accommodation at the unprofitable top end of the market. Three small business centres entirely or partially for business start-ups have been established since the business starters policy was launched. NV Stedelijk Belang bought "De Schilde" with a subsidy from the city of The Hague. In the other premises, "De Hobbit", the city provides rent subsidy for start-up businesses to make it easier for them to survive the first difficult years of the business. The business centre on Fruitweg was sold to a private institution.

## **Action point 7: stimulating mini-enterprises**

To increase the number of business start-ups in the future and create enthusiasm among young people for entrepreneurship the city supports mini-enterprises. This is an initiative by the business community and its aim is to improve the match between vocational education and business. The Mini-Enterprises Foundation enables young people to become familiar with self-employment by allowing them to set up their own business for one school year. The Mini-Enterprises Foundation uses volunteers to advise students. Sponsors such as VNO NCW, ORDINA, ABN-AMRO, the city of The Hague and the city of Dordrecht finance the foundation. The foundation plans to call on more local authorities for subsidies. Twenty-three mini-enterprises have been started in higher (mainly in the Haagse Hogeschool), secondary and preparatory vocational education in The Hague since 1997.

## **Action point 8: increasing possibilities for business starters to secure financing**

Action point 8 refers to expansion of the financing possibilities for business start-ups. Lack of finance is a frequent problem for starting entrepreneurs. They often do not have sufficient capital and banks are frequently reluctant to provide loans for start-ups. The Gemeentelijke

Kredietbank (GKB) plays an important role in increasing the financing possibilities for start-up businesses. To increase the range of financing options for start-up companies the Gemeentelijke Kredietbank started the Guarantee Fund for Starting Entrepreneurs. The Guarantee Fund exists for entrepreneurs with a viable plan but who do not have sufficient collateral for a "normal" loan so that commercial banks find the risk of lending too great.

## **Brief presentation of the skills, backgrounds of the main persons involved in the project**

A striking conclusion of the study is that the success of the business starters policy depends heavily on the motivation of key individuals. Some of these individuals have a lengthy background in business and some have worked for many years as civil servants. This personal motivation means that the continuity of the business starters policy could eventually be at risk. On the other hand, these individuals could encourage other professionals to follow their example. For immigrant entrepreneurship special business advisers were appointed who are familiar with their cultural background. The core competencies and background of the institutions concerned were described earlier.

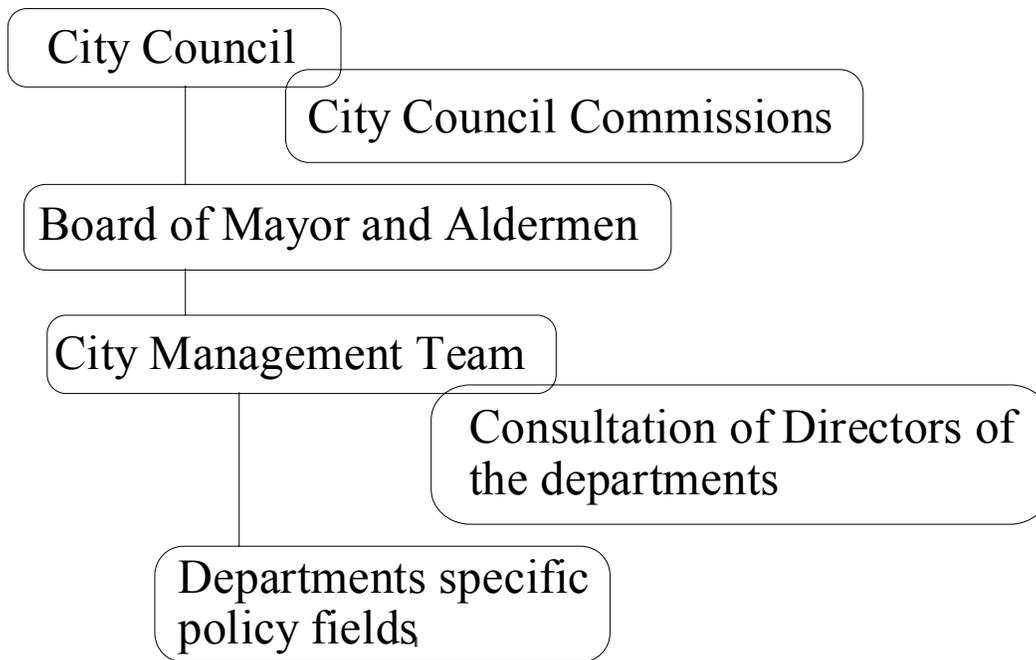

## **Management system of the project (structure and how effective it is)**

Since 1999, when the 2<sup>nd</sup> voluntary agreement under the Major Cities Policy was concluded, the structure of municipal policy with respect to reversing urban decay and creating new opportunities has changed. The strategic choice for an integrated approach – coordination of social, economic and physical planning measures – means that the key departments are jointly responsible for urban policy. Administrative responsibility rests with the Municipal Management Team in which five core departments are represented. There is a quality control system in place to monitor their performance. Political responsibility has been delegated to the alderman for economic affairs, personnel and large cities policy. The mayor and the relevant aldermen have responsibilities in specific policy areas such as education, culture, welfare, labour market policy, social affairs, public order, security and quality of life. In other words, the municipal executive of mayor and aldermen form a joint executive and are therefore jointly responsible for policy. So long as economic policy is part of Major Cities Policy the Major City Policy projects office supervises the activities. The coordinators of the social, economic and physical infrastructure elements and the project director for Major Cities Policy together form a sort of everyday executive that monitors activities and develops strategy. The project director is part of the Municipal Management Team and forms the link between operational management on the one hand and tactical and strategic management on the other. With respect to the business starters policy, the management structure is clustered around Stabij and the Economic Affairs and Services section of the Department of Urban Development. The management structure of Stabij is embedded in a municipal structure but it also has its own executive that coordinates the partnership. There are no specific management structures for immigrant entrepreneurship because The Hague essentially pursues a general policy in this respect. However, there are frequent contacts with intermediaries from this target group such as associations of shop owners. By contrast, in the City Mondial project there is a clear management structure that focuses on immigrant entrepreneurship. When the local authority absorbed City Mondial in 1996 it assumed the form of a foundation in which associations of shopkeepers, the chamber of commerce, SMEs

and other relevant parties are represented. Entrepreneurs from ethnic minorities started City Mondial.

The following chart gives insight in the organisation structure of the city.

### Chart 2: City Structure

## CHAPTER (SECTION) II: PROCESS ANALYSIS

### Obstacles and problem areas regarding the conception, elaboration and implementation of the project

#### Introduction:

The main conclusion from the study is that Stabij does not pursue any policy specifically targeting immigrant entrepreneurs with the exception of a number of measures to facilitate the group. These include establishing Stabij in an ethnically-segregated neighbourhood to make it more accessible, providing information in the languages of ethnic minorities, the appointment of experienced business advisers who are themselves immigrants and providing information via media for ethnic minorities. In the selection process only promising candidates are considered. The criteria adopted are business-economic rather than ethnicity. This highlights a discrepancy between proposed city policy and the practice of Stabij on the issue of business start-ups. Stabij pursues a policy of positive discouragement. However, within the

city policy three main projects concerning immigrant entrepreneurship are promoted and financed: City Mondial, Avenue Culinaire and China Town. Besides these projects EU Objective Two measures are taken in five most ethnic concentrated districts to promote immigrant businesses. So the fact is that there are many city initiatives that take immigrant entrepreneurship into account. This conclusion means that there is no damaging influence on this research on local governance, despite the fact that Stabij is not pursuing a positive action policy towards immigrants. The fact is also that immigrant business start-ups cannot be isolated from the general policy on entrepreneurship. All the taken measures on this subject are very much applicable on non-immigrants as well, except for the information in foreign languages and the assignment of advisors from ethnic minority groups to advise immigrants. With the collected data the three dimensions of the process analysis can be described properly.

Although there is no special emphasis on immigrant business starters Stabij does receive a lot of applications from immigrants (45%). Of all the 327 starters so far (in the year 2002), 50% are immigrants. Nationally, only 10% of prospective starters are promising. The figure is the same for all the starters in The Hague, which is due to the fact that Stabij mainly attracts applicants from the bottom end of the market. Essentially, the fact is that the central government's ambitions for immigrant entrepreneurs are higher than those of Stabij. However, the city council of The Hague promotes, as mentioned, three projects very specifically aimed at immigrant entrepreneurs: City Mondial, Avenue Culinaire and China Town.

The first is aimed at promoting tourism in ethnic neighbourhoods by stimulating ethnic enterprises. The intention is to remove the negative image of ethnic neighbourhoods by attracting more people to them. City Mondial is an initiative of The Hague to make a positive relationship between ethnic cultures and economic business in ethnic neighbourhoods. Each year 1,700 new businesses are set up in The Hague, most of them in the services sector and the wholesale and retail business. Some 300 of these starters are members of ethnic minority groups and their numbers are still growing. In the year 2000 The Hague had 4.478 immigrant businesses (source: Chamber of Commerce). The majority of these businesses are owned by Turks (34%) and Surinamese residents (21%). Most ethnic minorities open businesses in the retail sector and the catering industry and are focused on an ethnic clientele. In the tourist sector immigrant businesses are under represented, while this sector has a tremendous potential. To illustrate, each year 25 million people visit the various sections of the city of The Hague and spend 400 million dollars. The multi-cultural supply of products and services in the segregated city areas offers good perspectives for the development of an exotic tourist product. At the same time the tourist sector offers opportunities to link immigrant entrepreneurship with cultural and economic integration.

With this in mind, in December 1996 the city of The Hague started an experiment utilizing the economic potential of its ethnic communities. The Hague embarked on a journey to develop a new tourist product based on the infrastructure of immigrant entrepreneurs' cultural institutions. The new product is now known under the name City Mondial. An immigrant entrepreneur from Surinam developed the idea.

The local government is linking the multi-ethnic culture with local economy and is building a positive image of the three most ethnic concentrated urban areas, Schilderswijk, Transvaal and Stationsbuurt.

There are six innovative aspects in this project:

- Starting from the strengths of the ethnic community, not from its weaknesses;
- Developing a new tourist product based on cultural diversity with a link to economic development of deprived neighbourhoods;
- The linkage of this project with culture and economics (in the municipality of the Hague ethnic minorities were up to now mostly a concern of the department of welfare);
- Positive image building of the ethnic groups and neighbourhoods;
- Opening a new economic sector for immigrant entrepreneurship;
- Integrating the tourist concept in the physical planning of the migrant areas.

A project like City Mondial needs a formal status, good marketing and an excellent network. City Mondial is now a foundation and has ties with many external participants. A network of partners has been built up to develop an ethnic tourist concept. The participants are: mainstream tourist bureaus, religious organisations, individual ethnic entrepreneurs, cultural institutions, associations of (ethnic) entrepreneurs, organisations of local inhabitants, employers network, ethnic organisations, Starters Foundation, Chamber of Commerce, Institute of SME, local political parties and the media.

One of the major partners is the municipality. The different departments of the municipality involved are the economic, management, urban development and cultural department. With these departments a vision is developed in how to integrate the concept of City Mondial in the plans for the physical spatial development of the multi-ethnic area. That means to signpost the City Mondial activities, the upgrading of the market and upgrading of shopping streets.

City Mondial is already a success. One of the highlights is a guided tour through the multi-cultural districts, visiting mosks, temples, cultural and religious events, shops of immigrant entrepreneurs and artisans at work, providing multi-cultural lunches and dinners and introductions about the history and culture of the major immigrant communities. Each year more than 1,200 visitors take part in the guided tour.

The plans of City Mondial are very ambitious. First of all, the project "Avenue Culinaire" is set up in one of the main streets of the city centre, consisting of fifteen multi-cultural restaurants. Secondly, in a street connecting the two railway stations, the concept of "China Town" will be developed. China Town is a project designed to promote enterprise among Chinese in the city centre. Within a year a collective business building will be delivered for small and medium-sized enterprises, in a street that already has many Chinese and South Asian shops, restaurants and health centres. The idea is that by creating a larger and more varied range of business activity between The Hague's two railway stations the city will acquire a more cosmopolitan image like cities such as New York, San Francisco, London and Sydney. This is predominantly a private initiative. City Mondial will be financed mainly by the city. One of the goals of the project, financed by the European Union and the municipality, was to have a major success on the short term. This goal has been achieved, because in 2000 in Leipzig, City Mondial was rewarded with the *Eurocities Award on Innovative Urban Strategies*. In this initial phase it is difficult to indicate the economic value of City Mondial. The expectation is that this concept will work, and it will have a major impact on the development of economic activities in multi-cultural neighbourhoods and on the integration of ethnic minorities.

This introduction makes it clear that the process analysis focuses on business starters policy in general as well as on policy specifically for immigrant entrepreneurs.

## **Political obstacles: conflicts of powers, functions**

Before Stabij was founded business starters, including those from ethnic minorities, had no single contact point. Information was provided from a number of sources. But when it launched Stabij the local authority failed to properly consider a number of issues. It brought together two competing parties that served the same target group in a partnership without clearly defining their tasks and powers. As a result, in practice conflicts of powers arise. A second problem is that over time the city council has withdrawn too much from the process. A number of problems have arisen in the implementation of the city's policy. Thirdly, respondents commented that there is too little information available about the business starters policy at a number of institutions. There is also room for improvement in external communication. For example, different bodies sometimes offer the same services to the same target groups among business starters. The local authority could and in fact should be the most appropriate mediating partner for solving the problems that arise. In practice, it rarely performs this role. Stabij cannot fulfil that role because they are no neutral party in the partnership. Questions of partiality can easily arise and undermine trust in the partnership. Agreements need to be reached on this to improve the planning process for the adjustment of policy. The local government should take the lead to manage the process of business start-ups and not one of the partners when conflicts occur.

The region and the business cycle heavily dictate the economic function of the city since the economic market extends to the entire Randstad. The Hague has to set itself apart and specialise within the region and ensure that it strengthens the Randstad as an economic unit. Various local authorities in the Randstad therefore collaborate in the Delta Metropolis. The government produces policy to promote this development so that there are no political obstacles between the three tiers of government – state, province and city. Conflicts arise over building in the Green Heart, especially with environmental groups and some political parties. There are no serious political obstacles between the three tiers of government when it comes to policy on business starters.

## **Financial and fiscal obstacles**

As described above, some individuals encounter financial obstacles to entrepreneurship. Various measures have been introduced to assist them. The city itself has a serious shortage of space to create sufficient business accommodation. Financially, it therefore depends heavily on central government funding and the resources of housing associations to create room for more business activity during the physical regeneration of the city.

As far as stimulating business activity in particular areas of the city is concerned, the rules make tax breaks practically impossible. With additional tax advantages entrepreneurship could be promoted even more strongly. One of the reasons for not allowing initiatives like the Empowerment Zones in the US is the risk of distorting competition. The city council in The Hague does offer reduced rents for business starters for a certain period, but this is a general policy.

Increasing the possibilities for business starters to secure financing is seen as a problem by a number of parties involved in business starters policy. Some are not fully aware of the greater possibilities of securing financing. Reducing the Guarantee Fund for starters in the future will mean that fewer starters enter the market and reduce the viability of the companies that have already been started. It should also be noted that banks are very reluctant to lend to immigrant entrepreneurs as they regard the risk as too great.

## **Administrative obstacles: conflicts between administrations, technical bodies,**

This section describes the main organisational problems.

A number of the parties referred to the following problems in the implementation of the business starters policy.

### **Foundation of Stabij:**

Stabij targets the bottom end of the business starters market. A substantial proportion of the candidates who approach Stabij to start their own business are immigrants (45%) and individuals who are receiving social security benefits (around 60%, most of them receiving national assistance). Compared with the other large cities in the Netherlands Stabij reaches a relatively large number of immigrants but far fewer women (26%). One of the main goals of Stabij is to avoid failed business start-ups through a strategy of positive discouragement. There are many more discouraged starters than successful starters. Only a small proportion of people who want to start a business in the Netherlands (around 10%) are suited to entrepreneurship. Stabij has a difficult target group by comparison with other cities as it consists of the long-term unemployed and unskilled workers. Stabij's target group in The Hague requires intensive counselling. A problem is that the chamber of commerce and Stabij have not clearly defined their respective tasks and questions of competence arise (conflicts in powers). The victims are the starting entrepreneurs who want to be well informed about how the official agencies can help them to start a business.

The main problem with drawing up a **list of organisations that assist business starters** was that once the list was drawn up it was not consistently kept up to date. A number of parties also feel that there are too many organisations and that the cooperation between them does not always proceed smoothly. Various parties feel it is a pity that there is no transparent flowchart for starting entrepreneurs to show where they need to go and who they need to talk to during the various phases of the start-up process.

The **Business Desk** feels it should have the power to issue licences to the entrepreneur. Entrepreneurs are currently referred to the eight city district offices which issue the permits.

A **business accommodation databank** known as Steenworp has been established. However, some parties are not familiar with Steenworp's tasks. Starting entrepreneurs who are looking for business accommodation are still referred to estate agents. Nor is everyone aware of the existence of Steenworp and this is certainly a problem. Most parties agree that there is too little cheap business accommodation for business start-ups. This is seen as one of the major bottlenecks but Steenworp has no influence over it. The double use of ground for

business centres and perhaps building high-rise and creating more office space in these buildings can provide solutions. In this matter the housing corporations should be major partners.

Another action point regarded by some parties as a problem is the **building of small business centres** for start-up and small businesses. By selling business centres the local authority loses control over them. In addition housing associations are very reluctant to reserve business space for economic activities (shopping streets) during regeneration projects.

Increasing the **possibilities of securing financing** for starters is seen by a number of parties as a problem. Although the possibilities have increased they are still inadequate. Banks are extremely reluctant to provide loans to immigrant entrepreneurs. The financial risk is regarded as too high. A very important bottleneck is the phasing out of the Gemeentelijke Krediet Bank whose social function is being lost. This is a problem for business starters.

## **Economic obstacles**

There has been a shift between business sectors in the last 25 years. This trend was reinforced in The Hague by a lack of space. There was no room for new business parks and existing companies were forced to make way for different functions. The lack of space led to high production costs so that the accommodation costs for companies rose sharply. This caused many companies to leave the city.

In the same period many middle-income residents left the city to settle elsewhere in the region. The number of residents declined and the composition of the population changed. On balance less money was spent in the city.

A second consequence of this selective exodus is that the qualities of the remaining working population in The Hague do not properly meet the needs of business. The business community is mainly looking for highly qualified staff, while the job seekers are mainly unskilled. A consequence of this discrepancy is high unemployment, although unemployment has declined sharply in recent years thanks to the economic boom and urban economic policy. At the moment 60% of the unemployed in The Hague are not immediately employable and depend on social services and care.

Commuters from outside the city account for almost 50% of the working population, and this figure grew by 8% in the period 1994 to 1997. Because of this increase the congestion around The Hague has worsened over the years. As a result, The Hague's position as a business location has deteriorated and that has negative consequences for the start-up and establishment of new companies. The lack of purchasing power in certain areas of the city is also a negative factor for the establishment of companies in the city.

The lack of cheaper business accommodation is one of the major threats for new (immigrant) enterprises. One area of concern is that the abolition of the requirement to have a diploma to start a business has led to an increase in the number of bankruptcies. Finally, the recent decline in the SME sector is a problem for business starters.

## **Environmental obstacles**

The Hague is not an industrial city and has no major environmental problems. However, it has congestion problems around the periphery (traffic jams) and the city centre is jammed. The heavy traffic in the city produces a lot of CO<sub>2</sub> emissions, which is a typical problem for large cities. Business starters in certain sectors face stringent health and environmental standards that sometimes represent a major problem for starting and continuing a company, for instance in the hospitality and meat sectors.

## **Social hardships**

Another factor that applies for starting entrepreneurs, and especially immigrant entrepreneurs, is the fact that starters work long hours, usually six to seven days a week, for a small profit margin or cannot survive on their income. 30% go bankrupt in the first year. Many immigrants borrow money from family or friends. Bankruptcy therefore has not only negative financial consequences, but also social implications not only for the entrepreneur but also the social network. This is another reason for the policy of discouragement for certain business sectors.

## **POSITIVE FACTORS EXPLAINING THE SUCCESS OF THE PROJECT**

### **Role of existing mediating structures to enhance cooperation and coordination among actors (e.g. planning or development agencies)**

The first action point of the business starters policy, "setting up Stabij", was generally seen as a success factor in the implementation of the policy. The reason is that it gave starting entrepreneurs a contact point where they could get information and help in preparing for entrepreneurship.

Also seen as positive is the fact that the various agencies are represented in the executive of Stabij. As a result, there is greater contact and communication between them so the cooperation has improved. The coordination is relatively good, although questions of competency arise from time to time, especially between Stabij and the chamber of commerce.

The municipal executive deliberately chose not to join the board of Stabij so the foundation has greater freedom to develop policy and resolve problems without politicising the issues. This means policy can be implemented smoothly and speedily. It also makes Stabij more effective since political assessments do not have to be made for every decision.

## **Role of mediating mechanisms to foster cooperation and integration (e.g. planning process, round tables)**

The parties concerned were positive about the degree of cooperation. However, there are occasional quarrels and it is sometimes unclear who should be doing what. The contacts are good but not frequent enough. Bottlenecks are discussed in the Stabij executive.

## **Role of supra-local bodies (including the State) and their policies**

National policy has played an important role in establishing the emphases of municipal policy towards entrepreneurship, both with ideas and with resources. For instance, the government recommended setting up a one-stop shop for entrepreneurs, expanding lending possibilities, appointing business advisers, monitoring performance, etc. The government is essential for the regeneration of the city since it provides the funds, particularly for revitalising decaying neighbourhoods and creating opportunities for business activity, with its policy on gentrification. European subsidies - Urban and Objective 2 – provide welcome additional finance but accounting for the policy involves a lot of red tape.

## **Existing incentives (financial, administrative)**

Broadly speaking three local measures provide a financial incentive:

- Starters loans for unemployed business starters and payment of the cost of living;
- Guarantee fund;
- Reduced rents for business accommodation for a certain period.

In addition there are various national tax schemes such as the *Tante Agaath* scheme for private venture capitalists, initial exemption from tax payments, allowances for training, VAT refunds, etc.

## **Existence of leadership (by an institution, a specific character, etc.) and how effective this leadership has been)**

Stabij as key actor in governance, mediator, negotiator and the main actor to be judged on the achieved performance

## **Stabij as key actor in the governance of the primarily process**

The city council has an explicit role as director of the business starters policy when it comes to creating the basic conditions such as policy frameworks, legislation and enforcement of the licensing policy. Stabij is the director of operations. The city council has mandated Stabij to take the lead in the primarily process as a key actor. That means guiding the individual starter to set up their business, the governance of the quality of the primarily process and cooperation with the various actors that are involved to achieve the objectives.

The process in which the individual starter is guided is as follows.

- Information and pre selection of the starters by Stabij and Starter/Business Desk. That means the discouragement of starters with little chances for success and stimulating the starters with potentials;
- The preparations. By means of workshops, advice by accountants and projects the future starters are prepared for the business start-up;
- The Start. The advisors of Stabij negotiate and sometimes mediate with banks that provide loans. For business starters receiving social benefits the Social Service is contacted to guarantee the financial position in the starting phase. Accountants coach the starters and if necessary, Stabij helps to find business location.
- After-start-phase. In this phase the starter gets intensive coaching. The coaching is focused on more information, networking and helping with the bookkeeping. Gradually the starter should manage their own managerial process and should be able to contact official institutions independently.

In the years 1998-2002 there were about 3,000 contacts with business starters. In general, one third of the cases there was a face-to-face contact. In 64% of the cases there were contacts by telephone. In other cases the starters were reached through general information. By the end of 2002 about 3,000 starters were in a trajectory (starting with the intake) to start a business (statistics Stabij 1997-2002 and current case study). This illustrates the intensive way Stabij has to reach the starters. In total 327 starters have set up a business in the period 1998-2002. Only 8% failed in the first year, while the country average is 14%. 74% of the starters are still in business. These percentages underline the success of Stabij. So the intensive guidance by Stabij works. The conclusion is also justified that Stabij is successful in the governance of the primarily process, considering the fact that the annual target of 60 starters is achieved with an annual budget of approximately 325,000 Euros with only four professionals that coach the starters and two administrative officers. In fact it is an excellent performance. The city council considers the achieved target also as a success. When the agreed targets are achieved, one can speak of an effective governance of the primarily process.

## **The governance of the coordination**

Stabij has a three monthly meeting with all the actors. In that meeting the progress of the business start-up project is discussed. A central point on the agenda is the quantitative performance and the quality of the partnership. This meeting can be seen as an assessment of the project. The difficulties in the cooperation and coordination between partners are discussed, but this research shows that this does not take place on every issue. An example is the difference between the Chamber of Commerce and Stabij. The position of the Chamber of Commerce is that they are the main actor when it comes to business start-ups. Actually the Chamber of Commerce is trying to expand their core competence, because their main task is to register starters and give information. This shift towards the core competence of Stabij leads to some tension. So, the position of the Chamber of Commerce towards Stabij is not fair because they have signed an agreement to work together in a partnership in which the local government has given Stabij a key position. The Chamber of Commerce should have considered their position before starting this partnership. On the other hand Stabij, financed by the local government, has a better access to the Social Affairs Department and Urban Development and to the city council. The Chamber of Commerce has always been a partner on a distance when it comes to clients of the Social Affairs. Stabij is doing an excellent job for

this category. In 2001 30% (statistics Stabij 2002) of the starters were selected by the Social Affairs Department. That means that Stabij offers opportunities to these residents to participate in the economic market.

Stabij and The Chamber of Commerce see each other as competitors but the issue is not always discussed openly. That makes it hard to use the existing mediating structure. So, the three-monthly meetings provide in a mediating structure to solve conflicts between partners, but it does not work effectively when interests between partners are involved. Although Stabij has a leading role it is not always considered as a neutral partner and that makes that Stabij cannot fulfil the role of mediator when interests are involved. It can too easily be blamed for being partial or defending its own position. It should be considered to give the role of mediator to a neutral party when conflicts between partners occur. That can be an officer of the city administration or the alderman. When it comes to mediation and negotiations for the benefit of the individual business starter, Stabij is the mediator and the organisation structure provides in that mediating structure. This is also a core competence of Stabij. The partners accept that role of Stabij.

The contact between Stabij and the city is intensive. These contacts create transparency, although Stabij would like to keep the city council at arm's length to have more policy freedom. On the other hand, the local authority is the major financier of Stabij and must continue to audit it. The leadership can be described as effective because of the achieved targets, despite some obstacles, and is buttressed by support from business and NGOs. These obstacles arise because of putting competitors- Stabij and Chamber of Commerce- in a partnership and a city council that is on a distance. Despite the differences the targets are still achieved and that makes the differences less important.

Although Stabij directs operations the city council should be more intensively involved so that it can provide overall leadership and ensure that problems that arise in implementation can quickly be translated into policy. The city council now has too much of a policy-making role. The local government of The Hague is now planning to work on a strong leadership. Another problem is the difference in views between the Social Affairs and Stabij. The Social Affairs Department focus on social security beneficiaries and give greater weight to social factors in providing assistance. Stabij is more concerned with business-economic arguments and looks at the long-term effect of a business start-up. The city council should also intervene here so that good working arrangements are made.

## **Model for governance**

The Netherlands are famous because of their so called "polder model". This means a consensus structure in which the government and partners like employers associations and unions make agreements on certain issues. In this consensus structure there seems to be no question of strong leadership from the government, instead there is a belief in joint leadership of all the partners on the basis of clearly defined responsibilities. Recently this structure is under pressure and there is a growing demand for more leadership from the national and local government.

## **Organisational continuity and learning**

The choice of an integrated approach for the long term means that there is continuity in policy. With this long-term approach The Hague has developed an economic plan with a horizon stretching to the next 15 years. The business starters policy is constantly monitored, for instance with the 'benchmark of the business climate' and annual output measurements. Consequently, the effects of policy are constantly being reviewed; lessons are learned from this and where necessary policy is adjusted. A university also monitors the development of immigrant entrepreneurship annually and a trend in the number of entrepreneurs from ethnic minorities is recorded in the annual City Survey for The Hague. The fact that the city also has to account to central government on the extent to which it is meeting targets also guarantees continuity.

## **Innovative elements (i.e. creation of bodies, procedures or mechanisms to facilitate the project in terms of integration of policies and of cooperation among actors)**

Bringing together various parties active in the area of business start-ups in a platform can be described as an innovative development. In this platform the parties can agree on policy and work processes. The policy coordination between the various sectors is essential. The success of the business starters policy depends for example not only on good economic policy but also on coordination with the education policy to ensure a good match between what the market needs and what the educational institutions can offer. The physical infrastructure of the city also helps determine business activity. Plans for regeneration therefore also have to consider opportunities for entrepreneurs. Policy discussions of this nature take place between the actors in the existing platform. An additional benefit of this platform is that the work processes are better coordinated. This greatly benefits customer friendliness although there are still a number of bottlenecks. The amalgamation of existing institutions and coordination of the work processes also led to a search for missing links. These were found and as a result two new institutions were formed, the Business Desk and Stichting Steenworp (databank of business accommodation).

## **Financial innovations (opening up of existing sources of funding, new criteria for funding, new mechanisms)**

The action point "increasing possibilities for business starters to secure financing" is a positive development, since the local authority has genuinely increased the possibilities of financing. An example of this is the creation of the Guarantee Fund, through which the municipality can guarantee a loan from the bank so that entrepreneurs can take risks in their business. The result is that enterprises have been started that would otherwise not have been. Unemployed business starters who earn too little income from their enterprise can receive a top-up for a certain period, which provides them with a certain security and allows them to continue.

## **Institutional innovations (e.g. creation of a new structure to enhance integration, cooperation, participation, partnership)**

Until 1996 there was no integrated business starters policy in The Hague. There were various parties all with their own goals. The isolated nature of these activities had an impact on the business starters market. The Hague lagged behind the national trend of steady growth in the SME sector. For a city like The Hague without major industries this sector is very important. The foundation of Stabij gave a clear signal that the city wanted more business starters in order to create an economically lively city.

The launch in 1996 of a structured business starters policy resulted in the series of new initiatives mentioned under the eight action points. The one-stop shop approach in the form of Stabij, the Business Desk, Steenworp, the Guarantee Fund for business starters, mini-enterprises, an intensive effort by the social service to refer applicants to Stabij and the promotion of entrepreneurship in ethnically segregated neighbourhoods can all be regarded as innovative for The Hague. Some elements can be regarded as the most innovative and as having proved themselves in practice:

- The mini-enterprises. Students of the Haagse Hogeschool have already started 23 mini-enterprises on a trial basis. The projects were the students' graduation projects. A number of the mini-enterprises showed real promise for a real enterprise.
- A second innovation in the business starters policy is the stimulation of the City Mondial project that offers opportunities to immigrant entrepreneurs in segregated neighbourhoods.
- A third innovation is the opening of the "Business Desk". There is a huge need for a centre where entrepreneurs can go with their questions.
- A fourth innovation is the business accommodation databank in the form of the Steenworp foundation. The 'weaker' starting entrepreneurs among the target group can go to Steenworp for help in finding suitable business premises. The databank, which is kept up to date by a single body, creates greater transparency for the (prospective) entrepreneur. This could lead companies to locate in The Hague rather than in other cities because they now have a number of options.
- The Guarantee Fund for business starters also provides an extra stimulus for (new) business activity. Entrepreneurs will now take greater risks in starting a business.

## **Administrative innovations within the municipality (addressing the same goals)**

Before Stabij was created most of the current participants already existed but they had no platform. The foundation of Stabij created one. This marked the start of good coordination between the actors. It also represented the first in a series of administrative innovations and an integrated approach to business starters policy in The Hague. For example the intensive collaboration between the three core departments in the implementation of the business starters policy can be regarded as innovative. Previously this policy field was entirely the reserve of the Department of Urban Development. There is now greater cooperation at strategic, tactical and operational level so that integrated measures now have a far greater multiplier effect.

## **Administrative innovations (new working groups, for instance) among public actors, between public and private actors, involvement of civil society)**

For the actors that make up the executive of Stabij the business starters policy can be described as innovative because where they formerly operated entirely independently their administrative procedures are now geared to each other to make them as customer-friendly and transparent as possible. Retailers' associations are actively involved in the policy. The chamber of commerce organises frequent meetings to provide information for starting entrepreneurs to prepare them properly for running a business. The tax authority has a Business Starters Desk to answer questions from starting entrepreneurs. The representative organisation for the small and medium sized business sector conducts regular research to keep entrepreneurs informed about developments in their sector and members can subscribe to a regular newsletter which is distributed via the Internet. The Hague recently launched a Business Class in which key figures discuss aspects of entrepreneurship. Finally, the Haagse Hogeschool now teaches entrepreneurship as a subject.

## **ICT innovations: Internet instruments (consultation, group decision procedures)**

The ICT aspect of policy for business starters is still developing. The Hague wants to establish a profile as an important centre for the ICT sector and a number of well-known companies have already located within the municipal boundaries. Stimulating small businesses in this sector is one of the main areas of attention. Internet consultations and group decision procedures are not used in the development of policy, although there was a group decision session involving members of the municipal executive, directors of a number of departments and external experts to discuss the future economic profile of The Hague. The city does not use ICT to help business starters in the same way as Barcelona. The chamber of commerce and the tax authorities do have such services.

## **IDENTIFYING TRANSFERABILITY IN THE GOVERNANCE OF THE PROJECT**

### **Factors specific to the area (the territory of the project) that make transferability difficult**

The City Mondial project could be an example for other cities.

### **Factors specific to the project (the content of the policies) that make transferability difficult**

Laws and regulations differ greatly from country to country in Europe, so it seems unlikely that policies can be transferred integrally. In a political-administrative sense the 'polder model' would not seem to be feasible in every situation. The consensus culture would not work in

every country. The Stabij approach essentially rests on a consensus structure; parties make commitments to each other to deliver a certain level of performance.

The level of public services in the Netherlands is also high, especially with respect to social security benefits. The National Assistance Act provides opportunities to stimulate business start-ups. For example, business starters can retain their benefits for a certain period of time after they start a company. But this policy is not really feasible in the poorer European countries.

## **Elements that may be transferable**

A shortage of space is a problem confronting many European cities. The Hague is no exception. That has an impact on policy both towards creating more business space and more and varied housing and the development of neighbourhoods that meet the needs of today's residents. A creative solution that could be adopted and would be transferable is the dual use of ground. In other words, creating space for business activity on the ground floor and for housing on the upper floors. The Hague makes efficient use of its scarce space. It has also been revitalising dilapidated industrial estates, for example to build small business centres where starting entrepreneurs can secure accommodation at a reduced rent for a few years after they start a company. Such innovations are transferable to other cities.

Other elements of The Hague's business starter policy could also be applied in other cities, such as the one-stop shop approach represented by Stabij, creating a central executive for starting entrepreneurs, mini-enterprises to encourage students and young talent to become entrepreneurs, setting up a central business accommodation databank and a business desk, the approach of City Mondial, the Guarantee Fund for starters, a competition for starting entrepreneurs and the all-in concept of providing services from a central point.

## **(Influences in the other direction) experiences in other cities that have inspired the method/project**

The cities of Rotterdam and Birmingham have influenced policymakers in The Hague in their ideas about the one-stop shop approach. The interviews held with the actors involved showed that there is a huge need for a single physical contact point as is the case in Rotterdam and Birmingham. In the development of the China Town concept administrators and policymakers in The Hague were inspired by cities like London, New York Vancouver, Sydney and San Francisco. Finally, the use of ICT for business starters in Barcelona also provided inspiration. That policy could definitely be applied in The Hague.

## **THE DATA INTERPRETED ACCORDING TO THE THREE DIMENSIONS**

### **Integrated approach (multi-sectoral approach)**

With the slogan "vital and undivided", the profile of 'The Hague in 2025' has been further elaborated in four interrelated master plans that reinforce one another. In the Master Plan 'Hoog Hage', The Hague proceeds further with the redevelopment of the inner city that was started in 'Den Haag Nieuw Centrum' (The Hague New Centre). In the Master Plan 'Stadseconomie' (Urban Economy), attention is given to broadening and strengthening the economic structure of the city. The Master Plan 'Herstructurering' (Restructuring) is devoted to strengthening the residential function of The Hague and the realisation of a promising environment in which to live. Finally, the Social-Educative Master Plan 'Mensenwerk' (People Work) is directed mainly at strengthening the qualifications of The Hague's residents for the labour market and the participation of all residents in the urban community. These four master plans constitute the basis for 'De Kracht van Den Haag' (The Strength of The Hague), the development programme that The Hague has drawn up within the framework of the national government's "Policy on the Major Cities" and the "Investment Budget for Urban Renewal". With the implementation of these plans, The Hague has started along the road to a complete city, a city with a strong social, physical and economic infrastructure. The vision is that one cannot solve city problems by simply taking measures in one field and ignoring the other. The central government has signed an agreement with The Hague in which there is a link between financial support and performances. Internal and external partnerships and a multi-sectoral approach are the basis for financial support. The central government is monitoring this issue. The city complies with this agreement. The already mentioned four master plans illustrate the multi-sectoral approach in the city of The Hague. The City Management Team, in which all the main sectors are participating, sees to it that all the performances are achieved. In the case of business start-ups the Departments of Urban Development (economy and spatial planning), Social Affairs, Education, Wellbeing and Culture, and Maintenance are partners that work closely together. Urban Development is responsible for the starter policy, financing Stabij, setting up the Business Desk and building or buying business centres for starters. Social Affairs is motivating the unemployed living on social benefits to start up a business, has an agreement with Stabij to direct potential clients to their office and offers loans. The Maintenance Department provides in permits to start up a business. The Haagse Hogeschool (Advanced School for Higher Education) works together with the Department of Education, Wellbeing and Culture and Stabij. They offer a special course for young business starters. The external partners are already described. All the partners are involved in the primary process of Stabij. This illustrates that the starter policy is multi-sectoral.

## **Participation of partners and leadership**

This issue has been tackled thoroughly in this report. The basis of the four master plans of the city is the consequence of a long and intensive consultative process with the residents of the city. During the past few years, The Hague has focused intensively on the future. Together with residents, businesses, experts and social organisations, a visionary picture of the city has been developed, with the title 'The Hague in 2025'. Accessibility, economic vitality and social cohesion are key concepts that are appropriate for such a city.

The city plan is evaluated each year. On the basis of these evaluations the new annual plans are formulated. The Hague has a widespread network in the city. The annual plans for the eight city sections are based on consultations with residents and bodies that represent them like BOOG (Association of Residents) that operates all over the city. The annual City-survey

(Stadsenquête) is also an input for the policy making process and the legitimacy of the policy. In this survey residents are asked to provide ideas for future policy.

Stabij achieves the agreed performance and that makes that they fulfil effectively their role as the main actor in the governance of the business start-up process, despite some tension with the Chamber of Commerce. The tension has to do with a changing vision of The Chamber Commerce of their core competence. The structural meetings with all the actors provide in a mediating structure. That structure does not work effectively on every point. When tensions between actors occur, Stabij is not a neutral party to mediate. It should be a neutral party to assure that private interests are not dominating. The city should provide in that role. On the other hand Stabij can mediate in the benefit of the individual starter. In the structure of the cooperation between partners this is taken into account. The partners accept that role.

### **Area-wide perspective**

The Netherlands has three political levels: central, provincial and local. The city economy cannot be developed without the metropolitan area. The Hague works together with the city region (Haaglanden) on the issue of environment, mobility and health care and tries to develop a Deltametropole to be competitive within the other regions and in Europe. The last three decades the city has lost thousands of businesses because of traffic congestion. Now, the city is working together with the metropolitan region to solve this issue and making The Hague attractive for businesses to settle down. In the Business Benchmark the business climate is monitored.

On the issue of business start-ups the city council has taken special measures for the inner city. The development of City Mondial, Avenue Culinair, China Town and Objective Two measures in designated areas illustrate the territorial dimension of the starter policy. This aspect has been discussed before.

## **CHAPTER III: CONCLUSIONS AND RECOMMENDATIONS**

There has been an intensive business starters policy in The Hague since 1996. The SME sector has grown rapidly in recent years and this sector more than any other affords opportunities for business start-ups. The Hague did not profit from this growth as much as the rest of the country and therefore developed policy to make up lost ground. At the same time it was apparent that unemployment among immigrants remained high, four to six times higher than among the native Dutch population, and the government felt that it could increase the participation of immigrants in the labour force by promoting entrepreneurship among members of ethnic minorities. Instruments to achieve this were developed on the basis of government policy documents. In many respects local policy follows national policy, with a helping hand from financial measures and deregulation. Up to 1996 The Hague had no integrated approach to business starters policy. The different parties had their own agendas and work processes, but now they are working together in a platform. The business starters policy has also led to the creation of a number of new institutions that now provide tremendous added value for business starters policy.

The business start-up project is characterized by a multi-sectoral approach based on partnerships between internal and external partners. The Hague works closely with the central and provincial government to solve the cities problems. Main efforts have been made in the inner city. That part of the city needs more support because of the weak social and economic position. Making these areas vital and livable, means tackling the social and economic division of the city. More economic participation by means of business start-ups is one of the targets. The project City Mondial, Avenue Culinair and China Town in ethnic concentrated areas and the Objective Two measures (EU policy) in five city districts illustrate the territorial approach of business start-ups in The Hague. The residents, business partners and NGO's take part in the policy making process.

The launch of Stabij in 1997 created a platform designed to put into practice the all-in principle based on a one-stop shop approach. Various internal and external parties working in this field, which had previously seldom worked together, are now partners in the platform. Immigrants form one of Stabij's target groups. A specific aspect of the policy is to promote entrepreneurship among ethnic minorities. Immigrants are given practical assistance through the media for ethnic minorities, the establishment of Stabij in an ethnic neighbourhood, by providing them with information in their own language and the appointment of business consultants who are themselves immigrants. In the selection of prospective entrepreneurs, however, only promising candidates are admitted and ethnic background is not a consideration. Consequently, this case study had to focus on The Hague's business starters policy in general. This focus has no damaging influence on this research on local governance, because the start-up of immigrant businesses cannot be isolated from the general policy on entrepreneurship. The rules and regulations are applicable for all business starters.

The study shows that with the all-in concept various innovations have been introduced, a number of which are transferable to other cities. There is now cooperation, customer-friendliness has improved and promising entrepreneurs are entering the market through the creation of a Business Desk, the Guarantee Fund, targeted information, the creation of a databank of business accommodation and a good economic structure policy which ensure that the scarce space that is available is used well. The dual use of ground and the revitalisation of run-down industrial sites create opportunities for enterprise. The annual target of 60 successful starters is met by pursuing a policy of discouragement.

But a number of bottlenecks have emerged in the management sphere. The local authority has surrendered too much of the control over the operational process. The partners themselves are happy with this and desire greater autonomy. This in itself is not a problem because the partners, especially Stabij, have more room to manoeuvre in the implementation of the policy. On the other hand, the local government has become too engrossed in developing policy and has consequently lost a certain feel for the implementation, a feel which is important if the policy cycle of research and problem definition, policy formulation, implementation, evaluation and policy adjustment is to proceed properly. Frequent interim evaluations of implementation are essential for adjusting policy. Another problem is that the social service and Stabij hold different views. The social service focuses on social security benefits and gives greater weight to social factors in providing assistance, while Stabij adopts more business-economic arguments and looks at the long-term effect of a start-up business.

There are also conflicts in powers between Stabij and the chamber of commerce, because after the creation of Stabij there were two competing parties cooperating in a partnership in

which the tasks, responsibilities and powers were not clearly defined. Another fundamental problem is the long-term financing of Stabij, which is too dependent on the local government.

Finally, I would like to make a few more observations and recommendations for policy.

First, the local authority has to define its role as director more clearly and become more closely involved in the development and implementation of policy. By becoming more directly involved in the implementation the local authority can manage the policy cycle more effectively.

Second, the participants need to improve their marketing. Practice has shown that the participating parties are not fully aware of each other's core tasks. This means that starting entrepreneurs are not always adequately informed and don't always know what task each of the participants has in each phase of the start-up process. From the entrepreneur's perspective, the transparency of the process could be improved. In other words, it must be clearer to the client, the business starter, where he needs to go with a particular question. An up-to-date flowchart of the process could be a useful tool for the starter showing where he needs to go for information at each phase of the process. There is a flowchart, but it is not up to date. It is important to investigate the extent to which such flowcharts would be used. All cooperating partners should take action.

Third, the various parties would prefer that starting entrepreneurs could go to a single physical location for help. One possible alternative that was mentioned is that the same information should be available at all locations. The starter would then not have to shop around the various agencies. The local government should take necessary steps.

Fourth, it was suggested that the division of tasks should be defined more clearly. There is an overlap in the tasks of the various parties. This leads to issues of competencies and competition between the various parties, especially the chamber of commerce and Stabij. It also means that conflicting signals are sent to the business starter. All the partners should take action.

Fifth, improvements are needed in the availability of suitable and cheap business accommodation. The Steenworp initiative is a good one but the problem is that there is a shortage of cheaper business accommodation within the city's boundaries. That can only be resolved with a good economic structure policy initiated by the local government supported by the national government.

Sixth, it is suggested that existing contacts with the Haagse Hogeschool should be intensified to increase the interest in entrepreneurship among students and to ensure that the teaching materials match the needs of business more closely. There are already projects in which students in their final year can set up a mini-enterprise. But at the moment the companies close down after a year when the student has earned the study points. A number of parties feel that this does not provide a real incentive and are in favour of giving students the opportunity to continue their business even after completing their study. Stabij and banks should take action to make these enterprises successful on the long term.

Seventh, a number of participants referred to the abolition of the requirement to possess the necessary certificates to start a company. Until recently, these were mandatory. Statistics

have shown that a large proportion of the bankruptcies in the last year involved business starters without a diploma. Various parties said that the abolition of the requirement to have a business diploma should be reversed. There is good reason to study the effect of the abolition of the business diploma requirement on the viability of start-up companies. It is up to the central government to take measures and local partners can put this issue on the political agenda.

Finally, it is recommended that better use should be made of ICT for digital provision of information. The Barcelona approach could serve as an example. The local government should take action.

# HUNTING FOR FEMALE ENTREPRENEURS

## ENTREPRENEURIAL CAPACITY AND GENDER

Vesa Routamaa, Tiina Hautala & Anna-Leena Rissanen  
University of Vaasa

### ABSTRACT

Due to the low rate of female entrepreneurs, women's entrepreneurial activity should be increased. In spite of many initiatives to promote female entrepreneurship, the number of self-employed women is still low. It is proposed here that there are differences in entrepreneurial capacity between men and women. That is, a survey of the components of entrepreneurship capacity to understand the entrepreneurial readiness of women is needed. A number of gender-related capacity differences was found.

### INTRODUCTION

Women make up only about one-third of the self-employed in Finland and also in the Nordic countries in general. That is why the share of female entrepreneurs should be increased. One of the objectives of the Economic and Employment Development Centers, representing the essential ministries in Finland, is to increase entrepreneurial activity among women. There are some initiatives to promote female entrepreneurship, e.g., micro-loan programs specifically for enterprises started by women, female advisors specialized particularly in questions related to women's entrepreneurship, and entrepreneurial mentoring for women. However, more understanding about the orientations of potential female entrepreneurs is required. It is proposed here that there are differences in entrepreneurial capacity between men and women. In general, a survey of the components of entrepreneurship capacity to understand the entrepreneurial readiness of different kinds of people is needed. In this paper, entrepreneurship capacity and entrepreneurial intentions in regard to gender will be analyzed. The main research question is, does gender matter when it comes to entrepreneurial capacity.

Principally, it is assumed that positive attitudes towards entrepreneurship, as well as entrepreneurship qualities, and certain entrepreneurship ideals correlate positively with entrepreneurial intentions. Entrepreneurial intentions correlate with starting up a business, although this relationship is not strong. According to pilot studies (e.g. Routamaa 2001), however, entrepreneurial attitudes correlate slightly with entrepreneurial intentions whereas motivation has stronger association with entrepreneurial intentions. Positive attitudes towards entrepreneurship form the basis and favourable climate for entrepreneurship but are rarely the basic reason or motive for it. The rate of entrepreneurial intentions is very low in Finland (see Jokinen, Routamaa and Vesalainen 2000a, 2000b). However, if a much greater share of the intentions could become true, the problem of relatively low number of enterprises and high rate of unemployment might be solved. That is, only developing attitudes is not enough but the whole scale of

entrepreneurial capacity must be taken into account. Especially concerning women, the barriers to entrepreneurship should be made known.

## **EARLIER STUDIES**

Considering the entrepreneurial intentions, for example Crant (1996) found that men had higher entrepreneurial intentions than women. According to Covin (1994) when compared the family-owned firms and non family-owned firms in case of perceptions of "attributes of employees", "competitive weaknesses", "formal performance policies", "favoritism", "opportunities for non-family contributors", "attributes of managers" the gender of respondents were not found to have a significant influence.

When considering "push and pull" -factors the researchers have found that men start their businesses primarily as a result of "pull" factors such as the opportunity to work independently, to have greater control over one's work, and to earn more money. There is a lesser influence from such "push" factors as limited advancement opportunities, job frustration, and avoiding an unreasonable boss or unsafe working conditions. Male entrepreneurs were most motivated by the need to improve their positions in society for themselves and their families, while the female entrepreneurs were most motivated by the need for achievement (Shane, Kovereid and Westhead, 1991). Buttner and Moore (1997) found out that women's entrepreneurial motivations were a complex function of personal aspirations and organizational influences. "Pull" factors like seeking challenge and the opportunity for self-determination were the most important. Those who left for the highest rated "pull" reason -seeking challenge- measured success primarily in terms of self-fulfillment, and secondarily in terms of profit. "Blocks to career advancement" were considered of less importance in deciding to leave an organization and start one's own business. Women who contemplate leaving the corporate environment to achieve a better balance between work and family may want to re-examine their organizational options before leaping to entrepreneurship.

According to Goh, Koh, and Seet (1996), motivational factors differed between women and men as well. Female entrepreneurs perceived the motivational factors to be more important than their male counterparts. Females' ratings were higher in independence (e.g. "desire to be one's own boss"), financial rewards (e.g. "desire for higher earnings"), opportunity ("take advantage of an opportunity"), escape (e.g. "disagree with boss because I feel that I could have run things better"), recognition ("get recognition for my achievement"), and others ("follow in the footsteps of relatives who are in the business").

The personal profile of female entrepreneurs has been studied with regard to education, experience, motivation, and personal traits in Poland. In case of motivation, financial motives were the most important, and after that came self-fulfillment, independence, family tradition and fear of unemployment, risk and imitation and others. Women pointed out positive motives more frequently than negative ones. A similar situation can be found among male entrepreneurs. However, men looked for risk and kept tradition more often than women. Financial motives, fear of unemployment, and other motives (taking care of a child) were more often chosen by women. Women were more persistent than men, but when other traits were considered, they were less inclined to take risks and less ready to devote them to the firm (Wasilczuk, 2000).

# RESEARCH METHODOLOGY

## Sample.

The sample consisted of 9 158 respondents representing the working age between 18 and 55 years, of which 51 % were females and were 47 % males, from different parts of Finland. The sex of 2 % of respondents was unknown. Most of the respondents (15 %) were 41-45 years old and least (10 %) were between 26 and 30 years. The most common educational background of the male respondents was vocational school (42 %) and for female respondents it was institute (29 %), while and the most uncommon educational background for both genders were postgraduate studies, licentiate or doctor (0,7 %). During the time the research was accomplished, the most of the respondents had a full-day job (50 %), while only 5 % of females and 10 % of males were working as entrepreneurs. Considering the family background, the parents of the most respondents had had agriculture or forestry as their main livelihood source (32 %). The parents of 28 % had been working on the private sector and 25 % on the public sector, while 15 % of the respondents came from entrepreneur families.

## Instrument.

A survey of entrepreneurship capacity in terms of (1) attitudes towards entrepreneurship, (2) different entrepreneurship qualities, (3) entrepreneurial ideals, (4) entrepreneurship motivation, and (5) entrepreneurial intentions was performed as a part of an entrepreneurial development program (see Routamaa 1999, 2000). A scale of five alternatives ranging from 'strongly disagree' to 'strongly agree' was applied when suitable. In addition to the dimensions above, the barriers to entrepreneurship (26 items) were inquired. The potential barriers concern economic risk, entrepreneurial role, the lack of business ideas or knowledge, social risk, resources, social support, and personal traits. Further, push-and-pull factors, i.e., dissatisfaction and opportunity factors were also inquired. The question of entrepreneurial intentions consists of three dimensions that are the intention of starting up a firm, the intention of preparing to start one up, and the intention of being educated for an entrepreneurial career. These dimensions include several alternatives, for example starting up alone, starting up with a partner, buying a firm alone, buying a firm with a partner, et cetera. In this connection, starting up a firm with a company will be concerned. Several background variables were asked about, too, for example, age, gender, education, work experience, current professional status, and family background in terms of the parents' occupation.

## RESULTS

The *Attitudes Towards Entrepreneurship* were measured by six questions. All the six questions were loaded in one factor in factor analysis, and the loadings were varying between 0.533 and 0.685. This factor had high reliability (Alpha=0.7140). The attitudes of males and females were compared by T-Test, but there were no statistically significant differences between sexes, although women had slightly more positive attitudes towards entrepreneurship (see Table 1).

The *Entrepreneurial Qualities* were measured by 14 questions, of which, five factors (Varimax) were obtained. One question measuring the fear of taking risks was removed because of double loading. The reliabilities (Alpha) of these factors were: Fear of Change 0.5727, Pleasing Others 0.6146, Opportunism 0.5387, Fatalism 0.6199 and Maverick 0.4149. The first quality, Fear of Change, is described in terms of being slacken in insecure situations, having doubts about new things, and believing that changes create only new problems. The second quality, Pleasing Others, included items: avoiding performing in public, keeping the craziest ideas to oneself, and not wanting attention to one's different thoughts or ideas. The third quality, Opportunism, contains principles such as succeeding requires not irritating other people, pleasing those who have power, and making sure that one's own plans fit to those of others before accomplishing them. Fatalism-quality is described in terms of succeeding in life is a matter of destiny and things will be as they're meant to be. In the last quality, Maverick, topics were: one's destiny depends on one's own actions and accomplishing ideas in spite of resistance of other people. These entrepreneurial qualities of males and females were compared by T-test. Significant differences were found in Opportunism, Fatalism and Maverick quality. Females were more Opportunistic than males, whereas men had more Fatalistic and Maverick characteristics than women. Both, men and women had highest score in Maverick-character, which is proposed to be the most entrepreneurial character (see Table 1). It may be noted, however, that the Fear of Change was nearly as high as Maverick, i.e. there is a lot of people avoiding risks.

**Table 1. Attitudes towards entrepreneurship and entrepreneurial qualities.**

	Female (mean)	Male (mean)	t-value (sig.)
Attitudes towards entrepreneurship	3.7168	3.6911	1.877 (0.061)
Quality 1: Fear of Change	3.4836	3.4571	1.494 (0.135)
Quality 2: Pleasing Others	3.2659	3.2424	1.173 (0.241)
Quality 3: Opportunism	3.0455	2.9558	5.027 (0.000)
Quality 4: Fatalism	3.3225	3.4498	-6.002 (0.000)
Quality 5: Maverick	3.5354	3.6566	-7.254 (0.000)

The preferred *Entrepreneurial Ideal* is a personal interpretation about how one sees oneself as an entrepreneur. Respondents could rate the ideal from the perspective that which will suit to him/her best, a personal interpretation about how one sees oneself as an entrepreneur. These ideals were for example; "net-marketer", "shopkeeper", "part-time-entrepreneur" etc., in all 19 ideals offered; see Table 2. The preferred Entrepreneurial Ideals seems to be different for men and women (see Table 2). Both would most probably consider being a team entrepreneur, a safe alternative in terms of shared responsibility. Instead, men preferred more businessman, innovator, manager, scientist, part-time, subcontractor, farmer/forestry, transportation/machine contractor, and agent/representative entrepreneurial identities than women. Women, on the other hand, could consider themselves having a career of sole proprietor, franchising, net-marketer, handcraft, shopkeeper, social services provider, and restaurant entrepreneur more that

men did. Women seemed to favour more secure, small-scale enterprising compared to men.

**Table 2. Entrepreneurial ideals.**

Ideal	Females (mean/order)	Males (mean/order)	t-value (sig.)
Businessman	2.16 (13.)	2.68 (8.)	-18.801 (0.000)
Innovator-entrepreneur	1.93 (17.)	2.59 (10.)	-26.432 (0.000)
Manager-entrepreneur	2.41 (9.)	2.74 (6.)	-11.784 (0.000)
Scientist-entrepreneur	1.81 (18.)	2.09 (16.)	-11.891 (0.000)
Sole proprietor	3.14 (2.)	3.05 (3.)	3.156 (0.002)
Businessman in team	3.31 (1.)	3.29 (1.)	0.643 (0.520)
Part-time-entrepreneur	2.89 (5.)	3.04 (4.)	-5.258 (0.000)
Subcontractor	2.61 (8.)	3.12 (2.)	-18.761 (0.000)
Farmer/Forestry- entrepreneur	2.15 (14.)	2.59 (10.)	-8.162 (0.000)
Franchising-entrepreneur	2.23 (12.)	2.00 (18.)	8.883 (0.000)
Co-operative entrepreneur	2.40 (10.)	2.39 (13.)	0.603 (0.547)
Net-marketer	1.94 (16.)	1.61 (19.)	14.211 (0.000)
Handcraft-entrepreneur	2.99 (4.)	2.88 (5.)	3.698 (0.000)
Trainer/Consultant	2.67 (7.)	2.66 (9.)	0.532 (0.595)
Transportation/Machine contractor	1.62 (19.)	2.70 (7.)	-38.408 (0.000)
Shopkeeper	2.84 (6.)	2.59 (10.)	8.219 (0.000)
Agent/Representative	2.03 (15.)	2.17 (14.)	-5.228 (0.000)
Social services provider	3.10 (3.)	2.04 (17.)	36.834 (0.000)
Restaurant-entrepreneur	2.28 (11.)	2.14 (15.)	4.878 (0.000)

Next, the *Efforts to Start up New Business* and *Entrepreneurial Intentions* of both men and women were compared. In all the questions, men had higher means and therefore they were more eager to start up a business, although the intentions of neither men nor women were high (see Table 3). The most common activities for preparing for entrepreneurship for

men was looking for new business ideas while for women it was learning for business know-how.

**Table 3. Entrepreneurial efforts and intentions.**

Effort/intention	Female (mean)	Male (mean)	t-value (sig.)
Looking for new business ideas	1.68	2.19	-18.890 (0.000)
Trying to produce own product	1.64	1.94	-11.791 (0.000)
Developing new product or service	1.67	2.02	-13.462 (0.000)
Looking for co-operation partner	1.55	1.93	-15.604 (0.000)
Seeking patent for invention	1.22	1.47	-13.897 (0.000)
Learning business know-how	1.69	1.95	-10.183 (0.000)
Starting studies of entrepreneurship	1.56	1.67	-4.820 (0.000)
Participating for a starting-up business education	1.57	1.70	-5.564 (0.000)
Learning to be an entrepreneur by working for someone else	1.55	1.76	-7.378 (0.000)
Going to start up business by myself within a year	1.52	1.84	-8.475 (0.000)
Going to start up business together with a partner within a year	1.50	1.77	-7.907 (0.000)
Going to buy already existing enterprise/ business by myself within a year	1.33	1.51	-5.873 (0.000)
Going to buy already existing enterprise/ business together with a partner within a year	1.35	1.53	-6.347 (0.000)
Going to be a shareholder in a new enterprise but not work there within next year	1.35	1.59	-7.848 (0.000)

*Push and Pull Factors* were measured by five questions. Reliabilities (Alpha) of both factors were high (push: 0.8671 and pull: 0.8653). Push factors did not differ significantly between men and women. Male respondents evaluated the Pull factors higher than female respondents. Altogether, both men and women considered the Push factors more influential than Pull factors.

**Table 4. Push and pull factors.**

	Female (mean)	Male (mean)	t-value (sig.)
Push	2.8908	2.9392	-1536 (0.125)
Pull	2.0457	2.4542	-13.94 (0.000)

*Needs that Could Be Satisfied* more likely in the career of entrepreneur than in the current career were measured by eleven questions, of which two factors were obtained: Motivation factor (alpha=0.8158) and Hygiene factor (alpha=0.8746). Hygiene factor includes statements: compared to wage labour, working as an entrepreneur... "I would get more respect in society", "I would be a team member and have better relations to co-workers", "I would have better earnings", "I would have higher status and more power", "I would more surely earn my livelihood" and "I would more certainly have enough free-time". Motivation factor is described in terms of: compared to wage labour, working as an entrepreneur... "I could develop and regenerate continuously", "I would be more autonomous and independent", "I could better decide my working-hours" and "I could better accomplish my innovativeness and creativity". Men experienced, more than women, that the Hygiene factors would be more satisfied in the career of an entrepreneur. For both, men and women, however, the Motivation factor seemed to be more important than the Hygiene factor. See Table 5.

**Table 5. Hygiene and Motivation factors.**

	Female (mean)	Male (mean)	t-value (sig.)
Hygiene factor	2.4456	2.4962	-2.115 (0.034)
Motivation factor	3.2071	3.1989	0.320 (0.749)

Finally, the *Obstacles for Becoming an Entrepreneur*, were measured by 26 items, from which six factors were obtained: Fear of Failure (alpha=0.8398), Wrong Life Situation (alpha=0.7564), Lack of Knowledge (alpha=0.6945), Practical Obstacles (alpha=0.6845), Personal Characteristics (alpha=0.5880), and Lack of Support (alpha=0.8779). Four questions were removed because of low loadings, or loadings in several factors.

Factor "Fear of Failure" included items: fear of uncertainty of livelihood, fear of losing my property, fear of running into debt, fear of adequate demand, fear of becoming imprinted as unsuccessful and fear of getting laughed at, "Wrong Life Situation" included items: entrepreneurship ties too much, entrepreneurship does not offer enough free-time, entrepreneurship means loneliness, current state of life is not suitable for being an entrepreneur and it's not profitable to change my current work to entrepreneurship, "Lack of Knowledge" included items: own knowledge is too narrow, my expertise is difficult to commercialize, and lack of business idea, "Practical Obstacles" included questions: not getting needed financing, not finding suitable place and fear of lack of skilled labour, "Personal Characteristics" was formed of items: low tolerance of uncertainty, lack of diligence and persistency, and lack of service orientation, "Lack of Support" included questions: people close to me don't support and family doesn't support entrepreneurial intentions.

Altogether women experienced more obstacles than men, especially there was more fear of failure, wrong life situation, lack of knowledge, and they faced practical obstacles. Like men, women considered the fear of failure having the most influence on not becoming an entrepreneur. See Table 6.

**Table 6. Obstacles for becoming an entrepreneur.**

	Female (mean)	Male (mean)	t-value (sig.)
Fear of Failure	2.7077	2.4849	11.618 (0.000)
Wrong Life Situation	2.6181	2.3702	11.875 (0.000)
Lack of Knowledge	2.6237	2.3527	12.221 (0.000)
Practical Obstacles	2.1026	1.9822	6.122 (0.000)
Personal Characteristics	1.9158	1.9086	0.381 (0.703)
Lack of Support	1.8651	1.8441	0.870 (0.384)

## **CONCLUSIONS**

This study focused on the differences of entrepreneurial capacity between men and women. The main research question was, whether gender matters in terms of entrepreneurial capacity.

Results indicate that men tend to have more fatalistic and maverick entrepreneurial capacities whereas women are more opportunistic by nature. The gender also has influence on the preferred entrepreneurial ideals. Women favour more small-scale, secure entrepreneurial careers. Altogether men were having more entrepreneurial intentions, they were making more efforts to start up new business, they experienced more push and pull factors, and they believed that entrepreneurship could satisfy more needs than women did. Women, instead, experienced more obstacles than men. Strong fear of economic troubles was typical for both men and women but still worse for women.

Entrepreneurial capacity is quite decisive in the case of a free choice between entrepreneur and wage earner. The factors of entrepreneurial capacity form a chain where the weakest links can stop the path to an entrepreneurial career. The less weak links of capacity in the chain, the more probable will be the entrepreneurial career. One of the weakest links in the chain of entrepreneurial capacity of women is the specific obstacles found by women, e.g., insecurity associated with many entrepreneurial activities. When fear of change, fear of failure and lack of knowhow are high associated with wrong life situation, women's motivation does not carry over the threshold of starting up. In addition, the pull factors do not support women's entrepreneurial activity. This partly explains the low share of female entrepreneurs in Finland, in a country of excessive social security, and huge high taxes and labour costs. In all, it seems that entrepreneurial capacity is different between genders.

## **IMPLICATIONS FOR FUTURE RESEARCH AND PRACTICE**

As the research results indicate, the capacity of potential female entrepreneurs greatly differs from the entrepreneurial capacity of men. That is also why the entrepreneurial courses arranged for casual participants may be rather wasting of money than profitable promotion of entrepreneurship. Based on the research results, it is possible to forecast entrepreneurial capacity and intentions of women. Understanding better facilities, ideals, barriers, and motives of potential female entrepreneurs, the specified development

activities and training can be better focused, and the target group can be better selected. Women need special efforts in supporting economic fears as well as improving entrepreneurial qualities to strengthen the weakest links on the way to start up. Attitudes and motivation are the strongest chains, but the high need of security is the worst barrier. Actually, the Finnish welfare system is the worst barrier to increase the level of self-employment. On the one hand, the welfare system with its subsidies is so high that working in low or middle-level jobs will not pay; on the other hand, when one becomes self-employed social security benefits are lost (see Routamaa 2003). That is something policy makers should finally realize.

# THE MISSING LINK THE KNOWLEDGE FILTER AND ENTREPRENEURSHIP IN ENDOGENOUS GROWTH<sup>1</sup>

Zoltan J. Acs, David B. Audretsch, Pontus Braunerhjelm and Bo Carlsson<sup>2</sup>

## ABSTRACT

The intellectual breakthrough contributed by the new growth theory was the recognition that investments in knowledge and human capital endogenously generate economic growth through the spillover of knowledge. Endogenous growth theory does not explain how or why spillovers occur. The missing link is the mechanism converting knowledge into economically relevant knowledge. This paper develops a model that introduces a filter between knowledge and economic knowledge and identifies entrepreneurship as a mechanism that reduces the knowledge filter. A cross-country regression analysis over the period 1981-2000 provides empirical support for the model. We conclude that public policies facilitating knowledge spillovers through entrepreneurship may be an important new approach to promoting economic growth.

Keywords; Endogenous growth, knowledge, innovation and entrepreneurship.

## INTRODUCTION

Endogenous growth theory has provided two fundamental contributions that constitute intellectual breakthroughs. The first is that the formation of knowledge and human capital takes place as a response to market opportunities. The second is that, investment in knowledge is likely to be associated with large and persistent spill-over to other agents in the economy. Thus, knowledge impacts growth endogenously. However, empirical evidence supporting the hypotheses derived from these models is ambiguous at best.<sup>3</sup> The simple correlation between R&D expenditure and GDP growth reveals no systematic

<sup>3</sup> See Jones (1995a, 1995b), Young (1995) and Greenwood and Jovanovic (1998). Educational variables have been more successful in explaining growth (Barro and Sala-i-Martin, 1995). Jones proposed a semi-endogenous growth model where it becomes more difficult over time to discover new products. See Dinopoulos and Thompson (1998) and Aghion and Howitt (1998) for a discussion of empirical problems.

relationship (Figure 1).<sup>4</sup> Thus, the model seems to offer no explanation as to why countries such as Japan and Sweden with high rates of R&D spending grew so slowly during the last decades, while other countries less endowed with knowledge – such as Denmark and Ireland – experienced persistent and high growth rates. We believe that the ambiguous empirical support for endogenous growth models is associated with far too mechanistic a view on the spillover of knowledge.<sup>5</sup>

We go back to Arrow's (1962) recognition that knowledge is not the same thing as economically relevant knowledge, suggesting that spillovers may not occur automatically. The endogenous growth proponents (Romer 1986, 1990, Lucas 1988, Rebelo 1991, and others) picked up the thread suggested in the spillover literature a couple of decades earlier. Their aim was to explicitly introduce knowledge into models of growth. Aggregate knowledge capital was defined as a composite of R&D and human capital, not embodied in processes or products. Accumulation of capitalized knowledge assets was then shown to lead to increased growth and a well-defined general equilibrium. The major contribution – because of the properties of non-excludability and non-rivalry attached to knowledge – of these models was to analytically demonstrate that since the marginal productivity of knowledge capital does not diminish as it becomes available to more users, growth may go on indefinitely.

The first wave of endogenous growth models (Romer 1986, Lucas 1988, Rebelo 1991, and others) gave little attention to how spillovers actually took place and treated the process as exogenous. Their emphasis was on the influence of knowledge spillovers on growth without specifying *why* and *how* knowledge spills over. Yet, the critical issue in modeling knowledge-based growth rests on the spillover of knowledge. This was to some extent remedied in the second generation of endogenous growth models (Schmitz 1989, Segerstrom, Anant and Dinopoulos 1990, Segerstrom 1991, Aghion and Howitt 1992, Cheng and Dinopoulos 1993, Segerstrom 1995). These neo-Schumpeterian models design entry as an R&D race where a fraction of R&D will turn into successful innovations.

While this implies a step forward, the essence of the Schumpeterian entrepreneur is missed. The innovation process stretches far beyond R&D races that predominantly involve large incumbents and concern quality improvements of existing goods. As pointed out by Schumpeter (1947) “the inventor produces ideas, the entrepreneur ‘gets things done’ ..... an idea or scientific principle is not, by itself, of any importance for economic practice.” Indeed, the Schumpeterian entrepreneur, by and large, remains absent in those models. We intend to highlight how the introduction of the “pure” Schumpeterian entrepreneur influences knowledge spillover and how knowledge thereby can be more or less smoothly filtered and substantiated into business activity.

The purpose of this paper is to extend the endogenous growth model to explain how knowledge is converted into economic knowledge and how economic knowledge influences economic growth. First, in contrast to previous endogenous growth models, we explicitly introduce a transmission mechanism that determines the rate at which the stock of knowledge is converted into economically useful firm-specific knowledge. Second, we develop a model that demonstrates how entrepreneurship is necessary for the exploitation of knowledge. Thus, whether regions or countries experience higher growth depends rather on the entrepreneurial skills in the economy than on how much resources that are

---

<sup>4</sup> In Figure 1, changing or removing the time lag does not materially change the results.

<sup>5</sup> Solow (1956) and Cass (1965) are two standard references on neoclassical growth theory. Kendrick (1981) and Maddison (1987) are examples of studies that have studied the importance of technological change as a source of growth.

spent on knowledge creation, e.g. in terms of R&D-outlays. Third, we show how the suggested modifications of the endogenous growth model imply a new policy approach.

The paper is organized as follows. In the next section, we outline the basic structure of the knowledge-based growth model and specify how the model can be extended to identify the missing link in the spillover process. In Section 3 we present a model that incorporates a filter in the spillover mechanism determining the link between entrepreneurship and growth. In Section 4 we provide empirical support of the contribution of entrepreneurship to economic growth. The following section 5 discusses the implications of growth policy. Finally, we provide a summary and conclusion in Section 6.

## THE MISSING LINK IN THE ENDOGENOUS GROWTH MODELS

### *The Knowledge-Based Growth Model*

Endogenous growth theory took off in the later part of the 1980s, with Romer (1986) and Lucas (1988) as the standard references. The knowledge-based growth models have three cornerstones: spatially constrained externalities, increasing returns in the production of goods, and decreasing returns in the production of knowledge. These provide a micro-economic foundation for explaining the mechanisms that promote growth at the macro level. More precisely, profit-maximizing firms produce knowledge in one period which is used as inputs in subsequent periods.<sup>6</sup> Production of knowledge is assumed to be characterized by (strongly) diminishing returns to scale. The result is an upper bound of knowledge that can be used in the production of goods. Each firm  $i$  can appropriate only a portion of the knowledge ( $l_{i,R}$ ) it produces; this implies that firms also benefit from

spillovers originating in all other firms' knowledge investments ( $A = \sum_{i=1}^n l_{i,R}$ ).

The focus of the endogenous growth literature changed markedly with Romer's (1990) article, where the role of technology (designs) in the growth process was emphasized.<sup>7</sup> Invention of new technologies emerges as profit-maximizing firms invest in R&D. As a result new products were supplied, but also the overall level of knowledge in society at large increased because of increased R&R-investments, which in turn improved productivity in future R&D. Thus the accumulation of knowledge was distributed on firm-specific part and broader general knowledge, implying that knowledge was partially excludable.

Romer furthermore argued that the economic impact of new technologies was likely to be large, as technology was non-rival and hence could be used by many agents simultaneously. The combination of partial excludability and non-rivalry suggested an important role for technology in explaining growth. Since R&D-production was explicitly

<sup>6</sup> In a continuous time period world the maximization problem is:

$$\max U(c) = \int_0^{\infty} u(c_t) e^{-\rho t} dt, \quad \text{s.t.} \quad \dot{K} = AK^\alpha - c \quad \text{and} \quad \dot{K} \geq 0, \quad \text{where knowledge is denoted } A \text{ and}$$

capital accumulation implies sacrificed consumption.

<sup>7</sup> Grossman & Helpman (1991) and Aghion & Howitt (1992) are two further standard references in the area. Initially, the endogenous growth models focused on the role of physical and human capital. As Rebelo (1991) showed, endogenous growth can be sustained if the output of capital goods in at least one sector is linear in the stock of (broad) capital.

modeled and also privately financed in these models, there was scope for growth-enhancing economic policies to correct externalities due to underinvestment in R&D.<sup>8</sup>

### *The Missing Link*

New knowledge – in the form of products, processes, and organizations – leads to opportunities that can be exploited commercially. But converting new ideas into economic growth requires turning new knowledge into economic knowledge that constitutes a commercial opportunity. For example, only about half of the invention disclosures in U.S. universities result in patent applications; half of the applications result in patents; only 1/3 of patents are licensed, and only 10-20 % of licenses yield significant income (Carlsson and Fridh 2002, p. 231). In other words, only 1 or 2 percent of the inventions are successful in reaching the market and yielding income. Such opportunities are a function of the distribution of knowledge.

Just as important is that opportunities rarely present themselves in neat packages; rather they have to be discovered and applied commercially. Such discoveries are made in all types of economic activities, not only in R&D-intensive activities. Precisely for that reason the nexus of opportunity and enterprising individuals is crucial in order to understand economic growth (Shane and Eckhardt, 2003).

This implies that knowledge by itself is only a necessary condition for the exercise of successful enterprise in a growth model. An interesting approach recently presented (Michelacci 2003) focuses on the allocation of societal resources spent on R&D and entrepreneurship. Michelacci concludes that low rates of return to R&D may be due to lack of entrepreneurial skills. Hence, the ability to transform new knowledge into economic opportunities involves a set of skills, aptitudes, insights and circumstances that is neither uniformly nor widely distributed in the population.

In particular, the uncertainty, asymmetries and high transaction costs inherent in knowledge generate a divergence in the assessment and evaluation of the expected value of new ideas (Arrow, 1962). This divergence in valuation of knowledge across economic agents and within the decision-making process of incumbent firms can induce agents to start new firms as a mechanism to appropriate the (expected) value of their knowledge. This would suggest that entrepreneurship facilitates the spillover of knowledge in the form of starting a new firm.

Moreover, empirical findings suggest that entrepreneurial startups are important links between knowledge creation and the commercialization of such knowledge, particularly at the early stage when knowledge is still fluid (see section 4). There are undoubtedly many mechanisms that impede the commercialization of knowledge. By serving as a conduit for the spillover of knowledge that might not otherwise be commercialized, entrepreneurship is *one* mechanism that links knowledge to commercialization and economic growth.

## **ENTREPRENEURS AND THE KNOWLEDGE FILTER –A SIMPLE MODEL**

---

<sup>8</sup> See Shell (1966) for an early model of R&D-driven growth. As e.g. Fagerberg (1994) argues, the endogenous growth literature has brought the treatment of technological progress much closer to what empirical research tells us.

In order to model the filter as well as the mechanism that generates spillovers, we impose the following assumptions:

1. A given set of individuals  $L_0$  can either be employed in the goods producing sector ( $L_M$ ), the knowledge (invention) producing sector ( $L_R$ ), or in the entrepreneurial (innovation) sector ( $L_E$ ).
2. Entrepreneurial ability is distributed unevenly across individuals. They deploy their endowments of entrepreneurial capabilities to evaluate the knowledge accessible to them in reaching a decision how best to appropriate the returns from that knowledge, i.e. they make profit-maximizing inter-temporal choices whether to remain employees or become entrepreneurs (Knight, 1921).
3. There is a filter  $\sigma_R$  in the economy influencing how efficient knowledge is transformed into economic knowledge, implying that only part of the stock of knowledge (A) is converted into economically useful firm-specific knowledge. The filter depends on policy, traditions and path-dependence that influences networks and technology transfer mechanisms
4. There are two channels to transform knowledge (A) into economically useful knowledge. The first involves incumbent firms and the second involves the entrepreneurial startup of new (Schumpeterian) firms.
5. Incumbent firms transform knowledge into economically useful knowledge by employing knowledge workers ( $L_R$ ) which results in new inventions, new varieties of products ( $x_i$ ) and new knowledge (A). The “thickness” of the filter determines how efficient firms can transform knowledge into goods and services (commercialization),

$$0 \leq \sigma_R \leq 1$$

The thicker the filter ( $\sigma$  is close to zero), the less efficient exploitation of knowledge.

6. A start-up (innovation) represents any kind of new combination of existing or new knowledge, where individuals ( $L_E$ ) draw on their (given) entrepreneurial ability ( $\bar{e}_i$ ) and the aggregate stock of knowledge (A).<sup>9</sup> Also entrepreneurial activities are governed by how efficient knowledge is exploited and transformed into goods,

$$0 \leq \sigma_E \leq 1$$

7. Knowledge produced by firms is non-rivalrous and partly non-excludable.

These assumptions imply that two conditions are decisive for an increasing stock of knowledge (through R&D and education) to materialize in higher economic growth. First, knowledge has to be transformed into economically useful knowledge, and, second, an economy must be endowed with factors of production that can select, evaluate and transform knowledge into commercial use. If these conditions are not fulfilled, an increase in the knowledge stock may have little impact on growth. Moreover, economies endowed with small knowledge stocks may experience higher growth than regions more abundantly endowed with knowledge due to a less impeding knowledge filter.

### *The entrepreneurial choice*

Consider an economy endowed with a population of  $L_0$  individuals that live for two (or more) periods. In the first period all individuals are employed by incumbents, but between periods they make intertemporal choices between remaining an employee or becoming an entrepreneur.

---

<sup>9</sup> Schumpeter (1911).

Individuals at the higher end of the distribution of entrepreneurial ability identify more opportunities to commercially exploit A as compared to individuals with lower ability. By combining given entrepreneurial ability ( $\bar{e}$ ) with the economy's knowledge stock A (given how efficient the system works), individuals (i) with the ability to identify opportunities switch from employees to entrepreneurs. Thus,

$$a_i = f(\bar{e}_i, A, \sigma), \quad \sum_{i=1}^{\bar{s}} a_i \equiv L_E \quad (1)$$

where aggregate entrepreneurial ability in the economy is increasing in ( $\bar{e}$ ) and in A.

The intertemporal choice between becoming an entrepreneur or remain an employee depends on the expected pay-off accruing to the respective alternative. Suppose that the individuals' preferences are characterized by von Neumann-Morgenstern utility functions allowing a strictly increasing utility representation of the expected utility form. Moreover, assume that individuals are strictly risk-averse and that  $u(0) = 0$ . The decision whether to become an entrepreneur or not is illustrated in Figure 2.<sup>10</sup>

Figure 2

The individual who choose to remain an employee will receive a wage ( $w$ ) with certainty, yielding utility,

$$U^{Worker} = u(w) = u^w(x) \quad (2)$$

which we will refer to as the individuals expected utility from remaining an employee, allowing consumption of  $x$  goods. If, on the other hand, the individual chooses to become an entrepreneur, expected utility is dependent on the probability of success ( $\phi \in [0,1]$ ) and the expected pay-off ( $\pi$ ),

$$U^{Entrepreneur} = \phi u(\pi) = \phi u^\pi(x). \quad (3)$$

To engage in entrepreneurial activities the individual's expected net pay-off from entrepreneurial activities ( $u^\pi$ ) must be larger then expected net pay-off from remaining an employee ( $u^w$ ). As shown in Figure 2, if  $\pi \geq w$  then there exists a probability  $\phi^*$  such that the choice of being an entrepreneur is optimal for the individual for all  $\phi > \phi^*$ . Assume that there exist a  $\pi > w$  and a  $\phi > \phi^*$  for a subset of individuals (since  $\bar{e}$  is assumed to be unequally distributed). Then a share  $L_0$  will shift from employees to entrepreneurs, thereby commercializing part of the given aggregate knowledge stock.<sup>11</sup>

<sup>10</sup> The concave curve in Figure 2 - the Bernoulli utility function - is associated with certain outcomes and the straight line - the von Neumann-Morgenstern utility function - with uncertain outcomes. The certain utility of  $\pi$  is  $u^\pi(x)$  and the certain utility of a zero payoff is  $u(0) = 0$ . If, as is the case for the entrepreneur, the outcomes are uncertain and can only be described in probability terms, we have to look at the von Neumann-Morgenstern utility function. This utility function gives the expected utility of becoming an entrepreneur as the linear weighted average of the certain outcomes (wage earner), where the weights are the probabilities of the respective outcomes. The expected utility of the choice to become an entrepreneur is therefore  $\phi u^\pi(x) + (1 - \phi)u(0) = \phi u^\pi(x)$ .

<sup>11</sup> Compare Murphy, Schleifer and Vishny (1991).

At the aggregate level entrepreneurial activity in the economy ( $L_E$ ) depends on entrepreneurial ability and factors influencing the filter, assumed to be contained in a vector  $\sigma_E$ . A policy that increases the probability of success ( $\phi$ ) – given e.g. by facilitating the regulatory burden or making knowledge more accessible, increases the expected utility from becoming an entrepreneur. This can be illustrated as a move along the straight line in figure 2 toward the “northeast” corner.

The share of entrepreneurs can also increase due to a policy that increases the expected pay-off (e.g. for an entrepreneur (e.g. through lowered taxes). In the figure, this implies a shift downwards of the straight line and the intersection with the u-curve would take place further to the “east” in Figure 2. Thus, even though the probability of success is held constant, the expected utility of becoming an entrepreneur may increase through other measures.

### *A simple endogenous growth model with entrepreneurship*

To illustrate the role of entrepreneurs in growth we take the model of Romer (1990) as our departure point. Assume that there are two methods of developing new products; research labs in incumbents and entrepreneurs. There exist three factors of production: labour, different varieties of capital goods and entrepreneurship and markets are characterized by monopolistic competition. Entrepreneurship is embodied in labour, but in contrast to raw labor entrepreneurship is distributed unevenly across the population. This means that some individuals are inherently better at performing entrepreneurial activities, whereas all individuals have the same ability to do R&D and to produce final goods.

Researchers and entrepreneurs develop new varieties of (patented) capital, which can be thought of as either new types of physical capital, blueprints or “business models” that are being rented or sold to final good producers thus increasing the efficiency of production of final goods.<sup>12</sup> Specifically, new varieties of capital goods and new knowledge is produced as:

$$\dot{A} = \sigma_R L_R A + \sigma_E Z(L_E) A \quad (4)$$

where the  $\sigma:s$  are efficiency parameters in invention activities (R&D) and innovation (entrepreneurship). Labour is distributed between personal involved in R&D and those engaged in entrepreneurial activities, whereas  $A$  is the stock of available knowledge at a given point in time. Entrepreneurial activities are assumed to be characterized by decreasing returns to scale ( $\gamma < 1$ ),

$$Z(L_E) = L_E^\gamma, \gamma < 1 \quad (5)$$

since entrepreneurial skill is unevenly distributed among the population. Hence, doubling the amount of people engaged in entrepreneurial activities will not double the output of new knowledge and varieties. Rewriting (4) as

$$\frac{\dot{A}}{A} = \sigma_R L_R + \sigma_E Z(L_E) \quad (6)$$

---

<sup>12</sup> As e.g. Grossman and Helpman (1991) have shown, the new varieties of capital goods can just as well be thought of as new varieties of consumer goods entering consumers utility function directly.

shows that the rate of technological progress is an increasing function in R&D, entrepreneurship and the efficiency in these two activities. Combining equations 4 and 5 with a standard consumer optimization problem and a production function for final goods yields a well-defined balanced growth path (see Appendix 1). It can be shown that in steady state some entrepreneurial activities will always be profitable ( $L_E > 0$ ), while R & D may or may not be profitable, depending on parameter combinations. Moreover, growth is increasing in both efficiency parameters ( $\sigma : s$ ) and in both R&D and entrepreneurial activities. However, the latter effect depends in a non-trivial way on the range of parameters. The degree of entrepreneurial activity is, for instance, decreasing in the productivity of R&D as long as R&D is profitable. Thus, R&D and entrepreneurship are to some extent substitutes. But overall

Apart from these model-specific properties, the model shares a number of characteristics with previous models (e.g., growth is decreasing in the discount factor but increasing in a larger labour force). But most important is that an economy endowed with a labour force having high entrepreneurial skill enjoys higher growth rates.

The model implies some (testable) predictions. Firstly, a country with relatively low spending on R&D may grow faster than one with high spending on R&D if entrepreneurship is much more prevalent in the first country. Secondly, the amount of labor engaged in entrepreneurship may not necessarily be the best indicator of the level of entrepreneurial efforts in a country, as the distribution of entrepreneurial skill may differ across countries. Finally, R&D and entrepreneurship may be substitutes in growth.

#### *Extending the neo-Schumpeterian growth model to include entrepreneurial start-ups*

The first versions of the so called neo-Schumpeterian growth models appeared a few years after Romer presented his work on endogenous growth. The objective was to insert entry and exit into the Romer model through innovation races. Basically the neo-Schumpeterian models built on the later Schumpeter's (1942) view on entry through the introduction of new ways of producing goods (processes) and production of higher-quality versions of already existing goods.

Notwithstanding that the neo-Schumpeterians extended our knowledge on growth by introducing an entry mechanism, the problem is that the mechanism they suggest (R&D-races) is not compatible with stylized facts: R&D-races occur predominantly among large, technology-based incumbents. In the model below we will return to the early Schumpeter (1911), emphasizing the combinatorial innovative capacity of entrepreneurs.

Let us first outline the basic structure of the neo-Schumpeterian model (see Aghion and Howitt, 1998) and then introduce our proposed modifications. Individuals' allocation between savings and consumption is based on maximizing their discounted utility over life, and savings are invested in R&D-shares. The return to R&D-investments is related to an instantaneous market interest rate ( $r$ ), which in equilibrium equals consumers' rate of time preferences,  $\rho > 0$  (the discount rate). The standard utility function can be depicted as,

$$U = \int_0^{\infty} e^{-\rho t} \ln[h(\cdot)] dt \quad (7)$$

where the sub-utility function  $h$  describes how utility is increasing in improved quality ( $\nu$ ) – i.e. new knowledge - of existing goods,

$$h(x_0, x_1, x_2, \dots) = \sum_{n=0}^{\infty} \nu^n x_n, \quad \nu > 1. \quad (8)$$

Assuming prices on the preceding quality equals one, consumers are willing to pay  $\nu$  ( $>1$ ) for the quality enhanced product. As consumers switch to the new products, resources are shifted from production of old to new products; i.e., creative destruction takes place.

New qualities are the outcome of R&D races between firms, where the outcome is stochastic and sequential. Each new race builds on previous investments in knowledge. As firms hire labor to undertake research and augment their firm-specific knowledge ( $l_{i,R}$ ), they enhance their probability of winning the R&D race; that is, commercializing knowledge. A winner of the R&D race will enjoy a temporary monopoly market power, which induces more investment in R&D and new races. Such quality-enhancing innovations enter the market through a Poisson process by probability ( $\mu$ ),

$$\mu = \left( \sum_i^n l_{i,t} \right) dt = L^\gamma dt \quad (9)$$

where the assumed technology in knowledge production implies decreasing returns to scale ( $0 < \gamma < 1$ ). Or, assuming that a filter is present that impedes the transformation of knowledge into commercialized products,

$$\mu = \left( \sum_i^n l_{i,t} \right) dt = \sigma_R L^\gamma dt \quad (10)$$

The economy's growth is driven by consumer preferences for enhanced qualities of the good  $x$ , i.e.  $h(x_0, x_1, x_2, \dots)$ . In steady state income, consumption and knowledge-investment remain invariant over time, but new qualities augment consumer utility. This means that growth ( $g$ ) is driven solely by the innovative capability to commercialize knowledge investments;  $tL^\gamma \ln \nu$ . Hence,

$$g = dG(t, Y) / dt = L_R^\gamma \ln \nu \quad (11)$$

that is, growth increases in knowledge-investments (hiring more R&D-workers), i.e. the intensity by which new innovations enter the market, the level of improvement (the quality  $\nu$ ), but decreases in the degree of diminishing returns to scale ( $\gamma$ ).

Despite many appealing features of the model it does not capture the characteristic of the "pure" Schumpeterian entrepreneur; combining entrepreneurial skill and the knowledge stock to innovate, thereby reducing the filter between knowledge and economically useful knowledge.

To emphasize our point about the entrepreneur, consider the case when knowledge (R&D) workers contribute to an invention ( $\delta A$ ) that leads to a productivity increase. Hence, marginal productivity of knowledge workers increase by  $mp_R = w_R \delta A$ . If knowledge workers appropriate the whole rent associated with the productivity increase, wages remain constant in the section producing final goods,

$$mp_R = w_R \delta A, \quad mp_m = w_m \quad \text{and} \quad w_m \leq w_R \delta A.$$

The final goods worker can then either take up work in the knowledge producing part or become an entrepreneur.<sup>13</sup> As an illustration we relax the assumption of substitutability between research and manufacturing workers, i.e. only the option of entrepreneurship is feasible. Individuals abundantly endowed with an entrepreneurial ability ( $e$ ) will then combine that with available knowledge ( $A$ ) to innovate and introduce new products,

---

<sup>13</sup> A higher price lowers demand for the knowledge input in final goods sector, implying that per worker in the final goods production less of the knowledge input is employed.

thereby raising their income from wage  $w$  to entrepreneurial profit  $\pi$ . The reshuffling of labor between sectors implies that a new (temporary) equilibrium is established where wages are equalized at a higher level for both employees in final goods production and entrepreneurs.

To include the innovative part into the neo-Schumpeterian framework, we propose the following alterations, based in profit-maximizing behavior of individuals.<sup>14</sup> First, start-ups of entrepreneurial new firms occur in the same manner as new qualities enter the market, i.e., a subset of the given population of  $L_0$  individuals will randomly appear governed by a Poisson procedure,

$$\eta dt = \left( \sum_{i=1}^{L_0} l_{i,E}(\bar{e}, A, \sigma) \right) dt = \sigma_E L_E^\gamma dt, \quad (12)$$

where  $0 < \gamma < 1$  implies decreasing returns to scale in aggregate production and  $\sigma_E$  represents the efficiency – or filter – parameter. For simplicity, we have equalized the degree of diminishing returns to scale in entrepreneurial entry and entry through R&D-races. The intuition for decreasing returns to scale in entrepreneurial activities is that it would be sub-optimal for all economic activities to be undertaken by entrepreneurs; some tasks are better performed by incumbents and large firms.

Accounting for “pure” entrepreneurship, simultaneously as we allow for R&D-based entry, implies

$$\kappa dt = \mu dt + \eta dt = \sigma_R L_R^\gamma + \sigma_E L_E^\gamma dt \quad (13)$$

where we have used the additive property of Poisson distributions. In terms of long-run steady state growth (see Appendix 2), the expression would then become,

$$g^* = dG / dt = (\sigma_R L_R^\gamma + \sigma_E L_E^\gamma) \ln v \quad (14)$$

which obviously exceeds – given that  $L_E \succ 0$  – the expression in equation 10. Hence,

$$g = \sigma_R L_R^\gamma \ln v < (\sigma_R L_R^\gamma + \sigma_E L_E^\gamma) \ln v = g^*. \quad (15)$$

Thus, a higher intensity rate in the commercialization of knowledge generates higher growth. Depending on the degree of the quality improvement and the market structure, growth may be either to low or to high from a social welfare point of view. As long as the demand elasticity and modest innovation levels are not too low, the social growth rate will normally be below the social optimum.

## EMPIRICAL EVIDENCE

There is ample evidence that entrepreneurship can be found in almost any industry (Acs and Audretsch, 2002). Examples of fast growing entrepreneurial start-ups that do not originate in R&D-intensive activities are Walmart, Starbucks and McDonalds from the U.S., and H&M, Ikea and Tetra Pak from Sweden. It therefore seems reasonable to include all firms when we look at the relation between growth and start-ups, not only knowledge intensive.

A series of recent studies have found an empirical regularity in the form of a positive relationship between various measures of entrepreneurial activity, most typically startup rates, and economic growth (Figures 3 and 4).<sup>15</sup> Other measures include the share of

<sup>14</sup> See Appendix for details.

<sup>15</sup> See for instance Acs and Armington (2003), Audretsch and Keilbach (2003) and

SMEs, and self-employment and business ownership rates. For instance, Thurik (1999) provides empirical evidence from a 1984–1994 cross-sectional study of 23 Organization for Economic Co-operation and Development (OECD) countries. He shows that increased entrepreneurship, as measured by business ownership rates, is associated with higher rates of employment growth at the country level. In another study for the OECD, Audretsch and Thurik (2002) undertake two separate empirical analyses to identify the impact of changes of entrepreneurship on growth. Regardless of the measure of entrepreneurship or the geographic unit of observation (city, region, state, or country), recent studies suggest the existence of a positive relationship between entrepreneurship and subsequent economic growth.

As an illustration of the model, we present a brief empirical analysis of the model. Expression 24 could be interpreted as a composite of the contribution to growth from new firms and incumbents, where research based entry ( $\sigma_R L_R$ ) refers to incumbents, whereas  $\sigma_E L_E$  is associated with “pure” entrepreneurs. We are interested in the contribution of the respective category to annual GDP growth. We regress the following variables on annual GDP-growth for 19 countries: Following Evans and Jovanovic (1989), Evans and Leighton (1989) and Blanchflower and Oswald (1998), we approximate the share of entrepreneurship (ENT/L) by self-employed; that is, non-agricultural self-employed as a share of civilian employment (lagged in the last regression). Knowledge is measured as the share of R&D in relation to GDP (R&D). We know that the overwhelming part of knowledge produced relates to large, incumbent firms (Braunerhjelm and Ekholm, 1998).

We the control for the capital/labor ratio (CAP/L), and the regulatory burden in these countries approximated by government expenditure in relation to GDP (GEXP).<sup>16</sup> We expect all explanatory variables, except government expenditure (as in Barro and Sala-i-Martin, 1995) to have a positive effect on annual growth. The data cover the period 1981 to 2000 and are taken from OECD sources We implemented fixed effect panel regressions, and the result is shown in Table 1.

**Table 1. Regression results, panel estimations. Dependent variable, annual growth, 1981-2000.**

R&D	1.27*** (3.02)	-	1.67*** (3.46)	1.82*** (3.38)	1.03** (2.09)
ENT	-	.13** (2.08)	.23** (2.13)	.17* (1.69)	-
ENT (-1)	-	-	-	-	.25*** (2.58)
Cap/L	-	-	-	.06 (1.25)	.02 (.39)

---

Callejon and Segarra (1999).

<sup>16</sup> Capital per labor is approximated by GDP per capita (the correlation coefficient is .88). The second regression stretches from 1970 to 2000. In the sixth regression the entrepreneur variable is lagged one period, similar results were obtained when a lag-structure of two or three years was imposed.

No. of obs.	337	549	319	316	331
-------------	-----	-----	-----	-----	-----

Note: t-values within parentheses. \*, \*\*, and \*\*\* refer to statistical significance at the 10-, five- and one-percent level, respectively. All data from OECD Statistical Compendium.

Note that even at this aggregate level, self-employed are shown to have a positive and significant effect on growth, although the significance varies between 1 and 10 percent level. The share of R&D (incumbents in the model) attains strong positive significance impact on growth, as do the share of governmental expenditure, albeit negative,. Only the capital-labour ratio is insignificant in the regressions.

## POLICY IMPLICATIONS

The policy focus of the neoclassical growth models was on deepening capital and augmenting it with labor (Solow, 1956). Thus, the policy debate revolved around the efficacy of instruments designed to induce capital investment, such as interest rates and tax credits, along with instruments to reduce the cost of labor, e.g., reduced income and payroll taxes and increased labor market mobility.

A significant and compelling contribution of the endogenous growth theory was to refocus the policy debate away from the emphasis on enhancing capital and labor with a new priority on knowledge and human capital – in particular through a combination of taxes and subsidies. As Lucas (1993) concluded, “The main engine of growth is the accumulation of human capital – of knowledge – and the main source of differences in living standards among nations is differences in human capital. Physical capital accumulation plays an essential but decidedly subsidiary role.”

Lucas also elaborates on specific policy instruments designed to enhance investments in human capital and knowledge. Thus, the policy debate to generate growth revolves around the efficacy of such instruments as universities, education, public and private investments in research and knowledge, training programs, and apprentice systems.

By contrast, the extension of the endogenous growth model suggested in this paper implies the central, although not exclusive, role played by a very different set of policy instruments. This policy focus is on instruments that will reduce the filter that generates a wedge between A and commercialized knowledge, or between knowledge and economic knowledge. Such policies are targeted to enhance the spillover of knowledge and focus on enabling the commercialization of knowledge. Examples of such policies include encouraging new-firm startups. The different specific types of policies being implemented to enhance knowledge spillovers are too numerous to be identified and listed here, but Storey (2003) provides a set of examples.

The point emphasized in this paper is that entrepreneurship policies are important instruments in the arsenal of policies to promote growth. As this paper suggests, while generating knowledge and human capital may be a necessary condition for economic growth, it is not sufficient. Rather, a supplementary set of policies focusing on enhancing the conduits of knowledge spillovers also play a central role in promoting economic growth.

## CONCLUSION

A careful examination of the basic structure of the knowledge-based endogenous growth theory reveals that the model is limited by the assumption that knowledge not only exogenously spills over but also that it is automatically transformed from knowledge to economic knowledge. Such an assumption violates the basic premise of Arrow's (1962) insights into the economics of knowledge. These misspecifications may account for the somewhat ambiguous empirical results the model has generated in explaining growth differences across countries.

Recent literature on entrepreneurship suggests that the process of starting a new firm commercializes knowledge that might otherwise not be commercialized. By serving as a conduit for the spillover of new knowledge, entrepreneurship is one mechanism that may reduce the knowledge filter. This is certainly consistent with the recent wave of statistical regularities that provide compelling, systematic empirical evidence linking measures of entrepreneurship to economic growth.

We suggest that the endogenous growth model needs to be modified in order to incorporate the knowledge filter constituting a wedge between knowledge and economic knowledge. To achieve this end, we have suggested an extension to the endogenous growth model that we believe will narrow the gap between the model and real world behavior. The role that entrepreneurship plays in reducing the knowledge filter and increasing the arrival intensity of innovations, thereby generating economic growth implies a whole new policy approach. Hence, growth is enhanced through individual entrepreneurs exploiting knowledge even though they are not producing knowledge. Policies that generate entrepreneurship facilitate economic growth by reducing the filter between knowledge and commercialized knowledge.

As we have emphasized throughout this paper, entrepreneurship is just one type of mechanism reducing the knowledge filter. We look to future research to empirically identify and analyze other mechanisms that can also serve to reduce the knowledge filter and thus enhance the impact of investments in knowledge on their impact on economic growth. In this paper we have made a first preliminary attempt to separate the contribution to growth that emanates from entrepreneurial spillovers relative to the commercialization by incumbent firms. Future research needs to more rigorously identify the different contributions to growth by entrepreneurial and incumbent firms.

## Appendix 1

### Appendix

Entrepreneurs and researchers engage in knowledge production in order to develop a new variety of a differentiated capital good that is used in final production. Different varieties of capital goods compete in a monopolistic competition fashion, meaning that they never become obsolete and earn an infinite stream of profits. As a side effect of their efforts, researchers and entrepreneurs produce new knowledge that will be publicly available for use in future capital good development. Equations (1) and (2) describes the production of new knowledge, i.e. the evolution of the stock of knowledge, in relation to resources channelled into R&D ( $L_R$ ) and entrepreneurial activity ( $L_E$ ). Production of final goods takes place using labor and the different varieties of capital-goods:

$$Y = L_m^\alpha \int_0^A x(i)^{1-\alpha} di \quad (\text{A.1})$$

Given the symmetry of different varieties in (A1), demand for all varieties in equilibrium is symmetric, i.e.  $x_i = \bar{x}$  for all  $i \leq A$ . We therefore rewrite (A1) as

$$Y = L_m^\alpha A \bar{x}^{-1-\alpha} \quad (\text{A.2})$$

Assume that capital goods are produced with the same technology as final goods and that it takes  $\kappa$  units of capital goods to produce one unit of capital (See e.g. Chiang, 1992). Then it can be shown that

$$K = \kappa A \bar{x} \quad (\text{A.3})$$

(A2) and (A3) then gives

$$Y = L_m^\alpha A^\alpha K^{1-\alpha} \kappa^{\alpha-1} \quad (\text{A.4})$$

Labour market equilibrium implies that employment in R&D, entrepreneurship and final production equals total labor supply.

$$L = L_m + L_R + L_E \quad (\text{A.5})$$

Finally, we assume that consumer preferences can be described by constant elasticity utility

$$U(C) = \frac{C^{1-\theta}}{1-\theta} \quad (\text{A.6})$$

We form the Hamiltonian for the representative consumer

$$H_C = \frac{C^{1-\theta}}{1-\theta} + \lambda_A (\sigma_R L_R A + \sigma_E L_E A) + \lambda_K (\kappa^{\alpha-1} A^\alpha K^{1-\alpha} (L - L_R - L_E) - C) \quad (\text{A.7})$$

Maximizing (A7) gives the first-order conditions

$$\lambda_K = C^{-\theta} \rightarrow \frac{\dot{\lambda}_K}{\lambda_K} = -\theta \frac{\dot{C}}{C} \quad (\text{A.8})$$

$$\Delta = \frac{\lambda_A \sigma_R A}{\lambda_K \alpha} (L - L_R - L_E) \quad (\text{A.9})$$

$$\Delta = \frac{\lambda_A \gamma \sigma_E L_E^{\gamma-1} A}{\lambda_K \alpha} (L - L_R - L_E) \quad (\text{A.10})$$

where  $\Delta = (\kappa^{\alpha-1} A^\alpha K^{1-\alpha} (L - L_R - L_E))$ . Combining (A9) and (A10) gives

$$L_E = \left( \frac{\sigma_R}{\gamma \sigma_E} \right)^{\frac{1}{\gamma-1}} \quad (\text{A.11})$$

Thus, on a balanced growth path, where both R&D and entrepreneurship is profitable, the amount of resources engaged in entrepreneurial activities is independent of consumer preferences. As  $\gamma$  is less than 1, entry into entrepreneurship is increasing in  $\sigma_E$  and decreasing in  $\sigma_R$ . The maximization of (A7) also gives the equations of motion for the shadow prices of knowledge and capital as

$$\frac{\dot{\lambda}_K}{\lambda_K} = -(1-\alpha)K^{-1}\Delta + \rho \quad (\text{A.12})$$

$$\frac{\dot{\lambda}_A}{\lambda_A} = -\sigma_R L_0 - \sigma_E L_E^\gamma + \sigma_R L_E + \rho \quad (\text{A.13})$$

On the balanced growth, knowledge, final production and consumption all grow at the same rate, while  $\frac{\dot{\lambda}_K}{\lambda_K} = \frac{\dot{\lambda}_A}{\lambda_A}$ . Combining (A8) and (A13) gives

$$L_R = \frac{1}{\theta \sigma_R} (\sigma_R (L_0 - L_E) + (1-\theta) \sigma_E L_E^\gamma - \rho) \quad (\text{A.14})$$

Combining (A14) with (A11) and (1') gives

$$g = \frac{1}{\theta} \left( (\sigma_R L - \rho) - \sigma_R^\gamma \gamma^{\gamma-1} \sigma_E^{\gamma-1} + \sigma_E^{\frac{2\gamma-1}{\gamma}} \gamma^{\frac{\gamma-1}{\gamma}} \sigma_R^{\frac{\gamma}{\gamma-1}} \right) \quad (\text{A.15})$$

where it can be shown that the growth rate is increasing in  $L, \sigma_R$  and  $\sigma_E$  but decreasing in  $\rho$ . It should be noted that (A15) only applies when both R&D and entrepreneurship is profitable. The given specification implies that some entrepreneurial activity will always be profitable as long as  $A > 0$ . This does not apply to R&D activities however. If R&D is not sufficiently profitable (following from (A14)), then we can combine (A8), (A10), (A12) and (A13) to derive the reduced-form growth rate. The resulting expression however provides little new insights and is not shown here.

## Schumpeterian endogenous growth: A basic structure

Standard basic assumptions apply; labor is the only production factor, one unit of labor is required to produce one unit of output (goods or knowledge), wage rates ( $w$ ) are normalized to unity. We will discuss the assumption regarding labor mobility between sectors (research and production sectors). Moreover, sequential innovation takes advantage of positive spillovers from knowledge introduced through market entry, but there are also negative spillovers from the fact that each new innovation makes the current innovation/product obsolete.<sup>17</sup>

*Demand side:* Subject to a budget constraint, consumers maximize linear intertemporal utility,

$$U = \int_0^{\infty} e^{-\rho t} \ln \left[ h(\cdot) \right] dt, \quad (A.1)$$

where  $\rho > 0$  equals consumers rate of time preferences (discount rate).  $h$  is the sub-utility function,

$$h(x_0, x_1, x_2, \dots) = \sum_{I=0}^{\infty} \nu^I x_I, \quad \nu > 1. \quad (A.2)$$

where products ( $x$ 's) are assumed perfect substitutes and  $I$  refers to the innovated, new quality. If  $\nu p_{I-1} > p_I$ , then all consumers will prefer the new product (product obsolescence).

*Production:* New products (qualities) are innovated by incumbent firms hiring labor to undertake research ( $L_R$ ). Commercialization of knowledge is defined as market entry and occurs through a Poisson process by probability ( $\mu$ ),

$$\mu \left( \sum_i l_{i,R} \right) dt = L_R^\gamma dt. \quad (A.3)$$

The probability of launching successful innovations is increasing in  $L_R$  and production technology is characterized by decreasing returns to scale ( $0 < \gamma < 1$ ).<sup>18</sup>

Instantaneous profit maximization for the innovating firm implies,

$$\pi = (p_I - 1)Y / p_I = (\nu - 1)Y / \nu \quad (A.4)$$

where  $p_I$  represents price of the new good, corresponding to the quality improvement ( $\nu$ ) of new products based in new knowledge, and  $Y$  is the derived demand which equals consumption expenditure. First order condition implies that  $\nu \geq p_I \geq 1$ . The discounted profits ( $V$ ) – which could be interpreted as the value of a firm at time  $t$  - of a temporary winner (firm  $i$ ) of the race is equal to,

$$V(l_{i,R} / L_R) \mu dt - l_{i,r} dt \quad (A.5)$$

where the first expression refer to revenues from knowledge production (where the firm's probability of commercialization increases in a larger share of total knowledge production and  $\mu$  is the aggregate probability of entry of a new variety) and the second expression

<sup>17</sup> We refer to work by Dinopoulos (1996) and Aghion and Howitt (1998) for details of the standard model and restrict the appendix to modifications required to allow for the inclusion of the “pure” Schumpeterian entrepreneur.

<sup>18</sup> We focus on the knowledge producing sector. The general production function is  $x = Ak^\gamma$ .

alludes to wage costs related to that production ( $L_{i,R}$ ) times wage costs (which by assumption equals one). Free entry implies that over time,

$$\mu V(t) = L_R \quad (\text{A.6})$$

implying that revenue is increasing in higher knowledge expenditure.

Firms' instantaneous profit ( $\pi = (\nu - 1)(Y/\nu)$ ) and the discounted return ( $V$ ) is linked through the financial market. Assume that investors (savings by consumer) buy shares in all firms, implying a riskless return of  $r(t) = \pi - m$ , where  $m$  is the costs related to the firms' debt service (mortgage and interest rate). Incumbents run the risk of being replaced by the introduction of new qualities ( $\mu$ ),

$$[\pi(t)/V(t)]dt + \dot{V}(t)/V(t)[1 - \mu dt]dt - [(V(t) - 0)/V(t)]\mu dt = r(t)dt \quad (\text{A.7})$$

where  $(1 - \mu dt)$  is the probability that the firm survive and  $\mu dt$  represents the probability that the firm will be forced out of business. As  $dt$  goes to zero,

$$\dot{V}(t)/V(t) + \pi/V(t) = r(t) + \mu, \quad \dot{V}(t) = 0$$

$$V(t) = \pi / (r(t) + \mu). \quad (\text{A.8})$$

The higher risks associated with an investment in incumbents (because they may become replaced), requires a higher return in steady state. Or, put differently, the discounted value of the firm decreases with interest rate and the risk of being replaced, and increases in profits. The temporary incumbent monopolist at time  $t$  will not undertake knowledge investments.<sup>19</sup>

The factor (labor) market, equilibrium is obtained when,

$$L_E + (Y/\nu) = \bar{S} \quad (\text{A.9})$$

where  $(Y/\nu)$  is the production of manufactured goods which equals employment in that sector.

Equilibrium in knowledge production is derived by substituting equations A.4 and A.6, using the (Euler) conditions that  $r(t) = \rho$  and  $\dot{V}(t) = 0$  in steady state, into equation A.8,<sup>20</sup>

$$(\nu - 1)Y = \nu (L_R^{1-\gamma} \rho + L_R) \quad (\text{A.10a})$$

or

$$L_R = \mu\pi / (\rho + \mu) \quad (\text{A.10b})$$

Consumer expenditure ( $Y$ ) is thus increasing in new knowledge ( $\nu$ ), a higher rate of arrival ( $\mu$ ) and consumers' rate of time preferences ( $\rho$ ). Alternatively, knowledge production is shown to be increasing profits, and in the arrival rate, but decreasing in higher interest rate (or higher preferences for current consumption). Together with factor market equilibrium (equation A.9), where production in the residual manufacturing sector is diminishing in increased costs for knowledge inputs (due to productivity increase in the research sector

<sup>19</sup> See Dinopoulos (1996) for a model of the financial market.

<sup>20</sup> Maximizing the Hamiltonian,  $H = \ln C(t) + \lambda(t)[r(t)A(t) + 1 - C(t)]$ , yields the dynamic optimization where

steady state implies,  $\dot{C}/C = \dot{Y}/Y = r(t) - \rho$ , i.e. over time the rate of (constant) change in consumption must equal the rate of change in income. Balanced growth takes place when consumers intertemporal rate of preferences is equal to the interest rate (Euler conditions).

related to augmentation in knowledge,  $L_R$ ), this determines the balanced growth equilibrium allocation between knowledge production and  $Y$ .

*Aggregate growth:* In steady state income, consumption and R&D-investments remain invariant over time, but new qualities augment consumer utility. Let  $G(t, Y) = Exp[\ln(x)]$  represent the expected aggregate utility in the economy at  $t$ , where the indirect sub-utility at time  $t$  is given by  $x(\cdot) = v^I C / v$ . The number of innovations ( $I$ ) as the economy moves along its steady state rate of growth then follows a Poisson process  $Exp(I) \equiv \mu dt = t L_R^\gamma dt$ . In logarithms the expected aggregate utility at time  $t$  is

$$G(t, Y) = \ln C - \ln v + t(L_R)^\gamma \ln v, \quad (\text{A.11})$$

where the first two terms on the right-hand side denote the quality-adjusted expenditure level, and the last one represents the rationally expected introduction of new qualities over time.

Long-run Schumpeterian growth is defined as,

$$g = dG(t, Y) / dt = L_R^\gamma \ln v \quad (\text{A.12})$$

that is, per capita growth rate is expressed in terms of consumption of new goods, weighted by quality ( $v$ ). Growth increases in knowledge-investments (hiring more R&D-workers), i.e. the intensity by which new innovations enter the market, the level of improvement (the quality  $v$ ), but decreases in the degree of diminishing returns to scale ( $\gamma$ ).

#### *Allowing for “pure” entrepreneurs in the Schumpeterian growth model*

As shown above, growth is increasing in the entry rate of new varieties based in inventions that originates in R&D-races (A.10a). Assume a second mechanism for entry through innovations by “pure” Schumpeterian firms (individuals) combining entrepreneurial ability ( $\bar{e}$ ) with overall knowledge ( $A$ ). Also here entry occurs through a Poisson process with probability  $\eta$  (cf eq. A.3),

$$\eta dt = \sum_{i=1}^S e_i S dt = \sigma_E L_E^\gamma dt, \quad e_i = f(\bar{e}, A, \sigma_E) \quad (\text{A.13})$$

where entry depends on the number of individuals engaging in entrepreneurial activities. We also introduce an efficiency – or filter – variable in the economy representing obstacles for entrepreneurial activities. If we assume “perfect” efficiency ( $\sigma_E = 1$ ), the A.13 corresponds exactly to A.3. Since it would be sub-optimal for all economic activities to be undertaken by entrepreneurs,  $0 \leq \gamma < 1$ . Allowing for Schumpeterian entrepreneurs alter the expression in A.5 - discounted profits - to

$$\begin{aligned} V(l_{i,R} + a l_{i,m} / \sigma L) (\mu + \eta) dt &= (l_{i,r} dt + a_i l_{i,m}) dt, \\ V(\mu + \eta) &= \sigma L = \sigma_R L_R + \sigma_E L_E, \\ V &= \sigma_R L_R^{1-\gamma} + \sigma_E L_E^{1-\gamma} + (\sigma_E L_E) / L_R^\gamma + (\sigma_R L_R) / L_E^\gamma \end{aligned} \quad (\text{A.14})$$

where  $0 < \mu + \eta < 1$ . Profits (or the value of the firm) stem from two sources: either because a firm engages in successful research activities (inventions) or because of entrepreneurial ability (innovations). The latter type of entry means that an alternative cost is incurred, defined as foregone income from being a wage earner in the residual manufacturing ( $m$ ) sector. To simplify we set the cross-sectional effects in the last two terms to zero

(( $\sigma_E L_E$ )/ $L_R^\gamma = (\sigma_R L_R)$ / $L_E^\gamma = 0$ ). Including Schumpeterian start-ups into the economy implies that also expression A.7 changes,<sup>21</sup>

$$\begin{aligned} & [\pi(t)/V(t)]dt + \dot{V}(t)/V(t)[1 - \mu dt]dt - [(V(t) - 0)/V(t)]\mu dt \\ & + \dot{V}(t)/V(t)[1 - \eta dt]dt - [(V(t) - 0)/V(t)]\eta dt = r(t)dt \end{aligned} \quad (\text{A.15})$$

Hence, incumbents may now be replaced by either other firms engaged in a R&D-race (inventions) or by “pure” entrepreneurs (innovations), implying that a higher risk-premium is required in order to invest in incumbents.

$$\dot{V}(t)/V(t) + \pi/V(t) = r(t) + \mu + \eta \quad (\text{A.16})$$

As regards the labour market, individuals can choose between research work, manufacturing work and becoming an entrepreneur,

$$L_K + L_E + (Y/\nu) = \bar{S}. \quad (\text{A.17})$$

Retaining the assumptions used to derive A.10a and substituting A.4 and A.14 into A.15,

$$\begin{aligned} & \dot{V}(t)/V(t) + \pi/V(t) = \rho + \mu + \eta, \\ & ((\nu - 1)Y/\nu)/(V) = \rho + \mu + \eta, \\ & (\nu - 1)Y = \nu(\rho + \mu + \eta)(V) = \nu(\rho + \mu + \eta)(L_R^{1-\gamma} + L_E^{1-\gamma}) = \\ & \rho(L_R^{1-\gamma} + L_E^{1-\gamma}) + L_R + L_E + (\mu/\eta)L_E + (\eta/\mu)L_R \end{aligned} \quad (\text{A.18})$$

Taking into account that the efficiency ( $\sigma$ ) - the filter – may differ across sectors, expression A.16 becomes,

$$\begin{aligned} & (\nu - 1)Y = \rho(\sigma_R L_R^{1-\gamma} + \sigma_E L_E^{1-\gamma}) + \sigma_R L_R^\gamma + \sigma_E L_E^\gamma \\ & + (\mu/\eta)\sigma_E L_E + (\eta/\mu)\sigma_R L_R \end{aligned} \quad (\text{A.19})$$

Consumer expenditure is thus influenced by the rate of consumer preferences, research and entrepreneurial efforts, impediments to research and entrepreneurial activities, and the relative size of probabilities of entry. Difference between countries as regard the filter and the level of the labor force allocated to invention or innovation thus influence growth.

Building on the additive property of Poisson distributions, from A.3 and A.11

$$\kappa dt = \mu dt + \eta dt = (\sigma_R L_R^\gamma + \sigma_E L_E^\gamma)dt. \quad (\text{A.20})$$

In terms of long-term growth, the expression would then become,

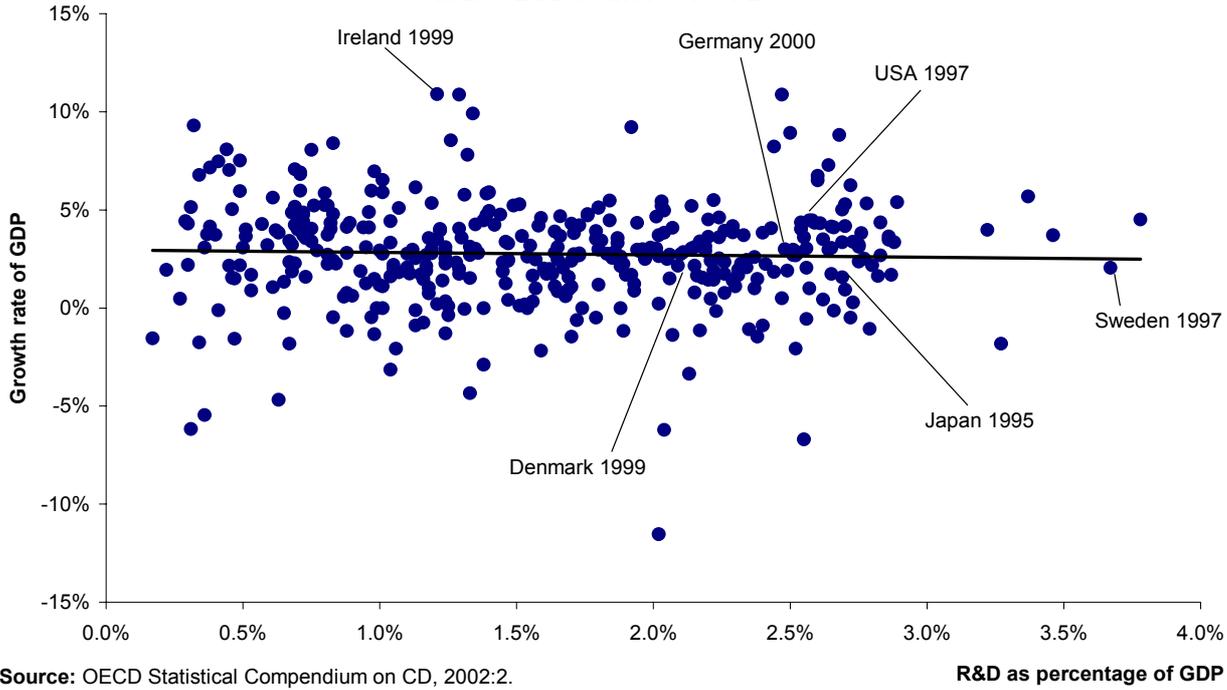

$$g^* = dG/dt = \sigma_R L_R^\gamma + \sigma_E L_E^\gamma \ln \nu \quad (\text{A.21})$$

which obviously exceeds growth ( $g$ ) building on entry solely from R&D-races,

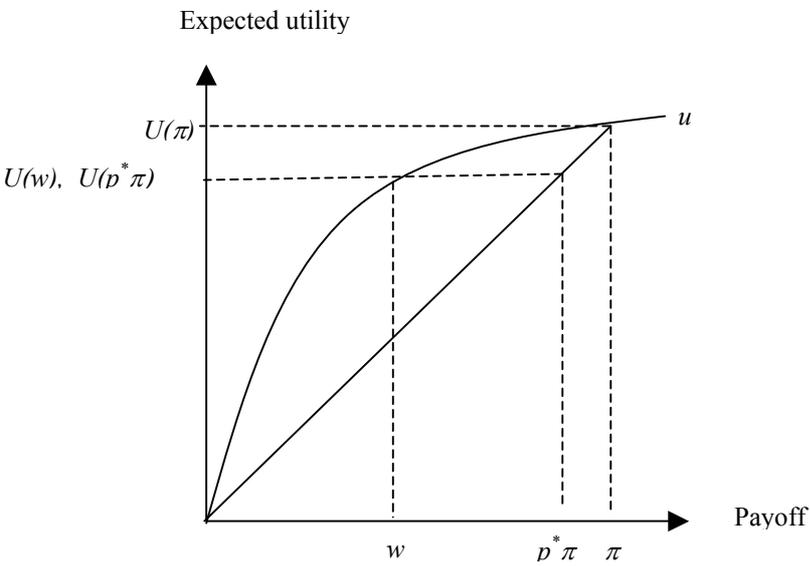

$$g = \sigma_R L_R^\gamma \ln \nu < (\sigma_R L_R^\gamma + \sigma_E L_E^\gamma) \ln \nu = g^*.$$

<sup>21</sup> We assume that cost – though not related to R&D - is associated with market entry by “pure” Schumpeterian entrepreneurs (e.g. marketing costs) and that the portfolios of investors instantaneously include these firms as they enter the market.

# **BEST PRACTICE IN UK HOSPITALITY AND TOURISM SMES: THE IMPLICATIONS OF SIZE, LOCATION AND OWNER STYLE**

## **ABSTRACT**

This paper explores factors central to the success of high performing SMEs based on the results of a nation-wide study into best practice in the hospitality, leisure and tourism industry. The research was conducted for the 'Profit through Productivity' initiative and sponsored by the Department of Trade and Industry (DTI). It focussed on eight areas deemed crucial to the success and continuity of businesses within these industries. Operational 'core capabilities' were identified and there is evidence to suggest that best practice in SMEs does not vary by industry sector, that is, hospitality, tourism or leisure sectors or geographic region. However, three ways in which best practice does vary between operators were identified, namely the size of the business, its location and the owner's philosophy. The analysis emphasised that success is based on each of the various types of SMEs adapting their core capabilities to match their internal and external environmental context. That is, adopting a '*contingent*' approach to best practice.

Keywords: Best practice, Small and Medium Sized Enterprise, Hospitality, Tourism.

## **INTRODUCTION**

Following the foot and mouth outbreak in 2001, the government recognised the importance of tourism to the UK economy, hence the Department for Trade and Industry (DTI) funded a best practice initiative in the tourism and hospitality industry and the "industry forum adaptation programme" (IFAP) for the industry was established. This research study, forming part of the 'Profit through Productivity' initiative, was planned to identify high performance and best practice within UK SMEs.

The significance of SMEs arises from the employment opportunities generated and their contribution to regional development. In the UK representing 99.1% of all businesses in the private sector and accounting for 55.4% of employment and 45.4% of turnover in (2001), based on Small Business Service (SBS) statistics. The hospitality, tourism and

leisure industry includes a broad range of small businesses varying considerably in size and scale, representing a key force in the economy. Looking at the figures quoted for the Hotels and Restaurants sector alone, there were over 123,000 businesses of which 98.3% had less than 50 employees. These businesses accounted for 43.4% of employment out of a total of 1,560 million and 47% of turnover out of a total of approaching £50 million. Although there are no directly comparable statistics available for the other sectors included in this study, it is expected that they will show a similar pattern. The dynamism of the hospitality, leisure and tourism sectors, increasing customer demands, as well as the low barriers to entry within the hospitality and tourism industry ensures a continuous supply of new businesses.

This paper explores the results from a major study of best practice in Small and Medium Enterprises (SMEs) in the UK hospitality and tourism industries. Examining the key factors that influence the success of outstanding SMEs

## **BEST PRACTICE**

The concept of 'best practice' itself is very wide ranging and there is little agreement on a specific definition. There remains significant dispute over the interpretation of what is considered the 'best', as it implies 'a single best way' rather than 'the most appropriate way for the circumstances'. According to Ogden (1998) no single organisation is likely to attain the best performance in all aspects of their operation.

Research pertaining specifically to the hospitality industry into best practice is very limited. One of the more comprehensive studies was that of CERT (McIver Consulting, 2000) in benchmarking hospitality best practice across Ireland, the United Kingdom, continental Europe and the United States. However, this was a practitioner-based study and failed to develop theoretical concepts of best practices or a rigorous method for summarising the areas identified or the companies selected. One of the most comprehensive studies to-date is the Cornell study, by Dubé *et al.* (1999), which suggests that best practices are exemplary or successfully demonstrated ideas or activities that are viewed to be highly valuable or effective. However, their identification of 'best practice' was based purely on the opinions of the managers of the businesses targeted. Wöber (2002) stated that the research is limited by judgmental assumptions in the sampling, with some doubt that the managers from hotels deemed to be champions were the best source of insight into the operation of their competitors.

The Cornell study also highlighted the argument that 'best in class' is a more suitable definition of what is meant by 'best'. Cook (1995) identified 'best-in-class' as companies that may not be exemplary in all areas, however, due to the nature of competition and their drive for excellence, these businesses have implemented practices that help to position their operation as some of the most admired, most profitable or keenest competitors in the industry.

The seeking of best practices across industries or sectors adopts the method of generic benchmarking. This approach allows companies to make intra and extra organisational comparisons at organisational, process, functional or tool and technique level by establishing key success factors and their associated measures, and hence benefiting from the potentials of learning best practice (McAdam and Kelly, 2002).

Codling (1998) stressed that benchmarking provides an organisation with a focus on the external environment and an emphasis on increasing process efficiency. Together with the growing interdependence between organisations and their customers, the increasingly rapid rate of innovation is identified as a major driver for the need for companies to focus to a greater extent on the external environment. Walgenbach and Hegele (2001) believed that the major attraction of benchmarking is that it provides a method which compares a possible (enhanced) state with an existing state in a similar manner, thus making certain actions appear inevitable if communicated in the right way. Along with sharing information, the firm may reduce development times and increase capabilities.

Francis et al. (1999) also identified a number of potential problems in what could be a costly and time-consuming activity in practising benchmarking - difficulties in finding partners who are considered suitable comparators, resource constraints (especially time), access to other organisations, staff resistance and confidentiality (in descending order of frequency).

Some warn that the introduction of best practice may improve performance in one subsystem of an organisation, but may result in a significant cost for the whole of the organisation if the balance between desired strategic outputs and the basic principles of organisation dynamics and culture are disturbed. Monkhouse (1995) argues that SMEs are often at a disadvantage as relevant benchmark tools and techniques may either be unknown or inaccessible. The benefits of the practice of competitive benchmarking in SMEs may not be as great as claimed as the learning examples come from well-resourced and successful companies. Further, the best practices adopted in a certain successful organisation may not necessarily be the best when adopted by other organisations (Dattakumar and Jagadeesh 2003).

Therefore unless the barriers are understood, SMEs are unlikely to benefit from the fundamental features of benchmarking studies to raise their performance standards to world class (McAdam and Kelly, 2002). One way to solve this sceptical view of benchmarking is to utilise third-party grading schemes as a form of benchmarking. In the UK, several grading and award schemes against various standards of business practice or service quality are provided by the Tourist Boards, Investor in People (IiP) and the Excellence through People awards from British Hospitality Association, being particular to the hospitality and tourism industries (Kozak and Rimmington, 1998). Recently, the attention has moved away from a simple measurement based approach to benchmarking towards companies identifying, managing and transferring best practice in operational processes and management practices (Ashton, 1997).

Gunaskeran (2003) suggest that more attention needs to be paid to benchmarking in SMEs. He contends that it would afford not only various opportunities for evaluating their own performance against the best in class, but would also enable them to identify gaps in their performance and then suitable best practices. McAdam and Kelly (2002) concluded that benchmarking studies for SMEs should move beyond traditional deductive measurement and develop a deep, grounded, inductive approach that includes cultural based measures, for instance in leadership and people management. With this previous knowledge about SMEs in mind, this research examines businesses that have implemented practices that help to position their operation as one of the most admired, profitable or keenest competitors in the UK industry.

## METHODOLOGY

The overall aim of the project was to identify leading business processes within outstanding SMEs<sup>1</sup> across the hospitality, leisure and tourism industry. It was deemed that the case study approach would be most appropriate in order to elicit more in-depth information regarding the issues under consideration, as research cases offer a unique tool to build theory by examining phenomena not suited to traditional statistical approaches (Stake 1995).

In order to identify the areas for detailed research, a preliminary investigation into the critical success factors in hospitality, leisure and tourism SMEs was conducted by interviewing 38 SME consultants, owners, and managers in the hospitality industries, (see Jones and Hwang 2002). From this study, together with an extensive literature review into best practice, the key areas for investigation were identified. A decision was made to confine the study to areas that were currently relatively under-researched. This led to the selection of eight targeted areas, namely, partnerships and networks, achieving standards, internal and external communications, measurement and performance evaluation, leadership, employee retention, operational planning and control, and adding value.

In order to compile a comprehensive list of target businesses, experts from the associations affiliated with the project were consulted. This included committees from the various Tourist Boards, National Associations and the Department of Trade and Industry, forming the IFAP Board. Snowball sampling was used as it afforded the research team the opportunity to solicit assistance from experts and businessmen in the industry in order to identify the population under investigation more accurately. This list was further refined by identifying companies that were the recipients of such awards as the Excellence through England Award, Leisure Property Forum Award, AA Hospitality Awards, Investors in People and Vision 100.

This facilitated greater focus within the research and afforded the opportunity to avoid some of the limitations associated with random sampling through cross-referencing the various lists and targeting those businesses that appeared most frequently. Initial telephone interviews were also conducted in order to filter out unsuitable organisations and thereby identify prima facie cases representing the most appropriate businesses. The resultant list sought to identify outstanding businesses geographically spread throughout the UK, involving a wide variety of hotels, guest houses, restaurants, bars, pubs, leisure centres and visitor attractions.

For each of the eight study areas (partnerships and networks, achieving standards, internal and external communications, measurement and performance evaluation, leadership, employee retention, operational planning and control, and adding value) semi-structured interview protocols were developed based on the existing literature in these areas and specific gaps in understanding. For each study area, ten outstanding businesses were selected to cover each of the industry sectors and give wide geographic

---

<sup>1</sup> For the purpose of this research the Department of Trade and Industry (DTI)'s definition of SMEs is used, this identifies SMEs as businesses employing under 250 employees. Other stipulations involve a limitation on ownership by any other enterprise that does not constitute an SME. This definition varies from that of the European Commission which enforces a maximum limit on the amount of turnover and the balance sheet total.

coverage. Face to face interviews were conducted with a cross section of owners, managers, employees and customers in each of these 89 businesses as appropriate for the area under consideration. In addition to these, a further, 94 telephone interviews were subsequently conducted with businesses involved in the main and pilot study in order to substantiate the previous data.

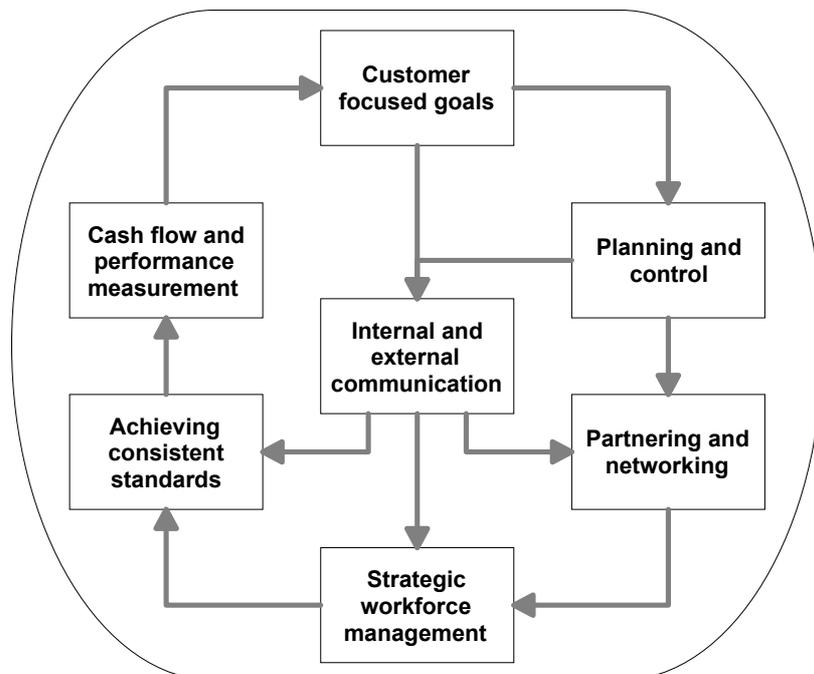

A detailed case study was prepared for each of the ten businesses and a report written for each study area to draw out the emergent themes and issues from the cases.

A grounded theory approach was applied to uncover recurring themes within the case studies and interview transcripts. Goulding (1998) maintains that this method is useful to generate theory where little is already known or to provide a fresh slant on existing knowledge and requires early data collection, analysis, and further theoretical sampling and category saturation. The analysis procedure worked retrospectively through the basic data transcripts, generating critical success factors to describe the features of each case, and these were summarised into the subject reports.

## FINDINGS

An analysis was performed across cases and subjects combining the eight study area reports and this has resulted in the development of the model shown in Figure 1. It identifies the core capabilities pertinent to the execution of best practice and the achievement of high performance. The elements outlined are all inter-related in a cyclical manner as they often directly impact on each other, thereby becoming a self-reinforcing cycle.

**Figure 1: SME Core Capabilities**

## **Setting Goals Around a Customer Focus**

This is based on the owners of the business having a well developed idea of what they want out of the business and setting the appropriate personal, social and commercial goals that will provide a clear direction for the conduct of the business. However, in order for goal setting to facilitate productivity, sound customer knowledge is vital, as well as a sound appreciation of the external operating environment. Based on factors such as knowing your customers; developing detailed service standards for each market segment and package of benefits; communicating a clear vision of the direction or mission of the business to all the people who work within it; ensuring good feedback on the success of the operation through a high level of direct and indirect contact with the customer; knowing your competitors; continued communication with customers after their visit to build profitable long term relationships and customer loyalty.

*'Everything we do is because of our customer. We don't do anything because we think it looks nice. It's done because that is what the customer is going to want'.  
(Hotel, Edinburgh)*

*'I spend my life with customers. Myself and my colleagues eat regularly in the restaurant, and we are able to give each other loads of feedback. I am always doing customer research. We always try to listen to what the customers are saying. Being a restaurant manager is very much like being a football manager - everyone thinks they can do it better than everyone else. Listening is a very important part of the role, but you can't rely on being reactive to what the customers say. It's a matter of being pro-active and taking a broader brush stroke.'* (Restaurant, Dedham).

*'Continual contact with the customer is very important. We care how they feel about us. We care how they feel about the surroundings they're in and what they thought about the service. So we're constantly aware of our customers' feelings and constantly watching them as well. If there is anything wrong we can spot it'.  
(Restaurant, Winteringham)*

## **Planning and Controlling the Operation**

From the research it has been established that operational planning and control can be most effective and successful if the owner/manager has sound knowledge of the customer base. Forecasting demand and managing resources through marketing, reservations and labour scheduling was also found to be highly significant. Another crucial element was developing clear policies and procedures for handling resources – understanding who does what when, in addition to building loyal relationships with suppliers, customers and employees. Activities such as yield management and menu engineering were also used to enhance operational efficiency.

*'...We have inculcated a culture of watching stock levels, portion control and measuring etc through all our staff.'* (Restaurant, Scotland)

*'Within our limited resources we try, as far as possible, to target new audiences ...so that if school visits drop because of external factors like transport costs or changes in the curriculum, we have other ways in which we can generate income and earn money for the museum...'* (Tourist Attraction, Bromsgrove)

*'...Everyone is responsible for the general stock control or items whether it's portion size, presentation of drinks, standards, using the correct glassware so we're not*

*giving too much, too little etc. ... we do a lot of training in weights and measures in our bar as well.'* (Pub, Edinburgh)

### **Partnering and Networking**

All of the businesses had identified ways of using such relationships to further the success of their business. They highlighted some of the crucial elements for successful partnerships and networks, such as the level of involvement, encouraging proactive participation in external organisations. Other factors include, mutuality, that is, both parties contributing to the relationship; value for money both in terms of actual cost (such as membership) fees, but also hidden costs (time and effort to participate) and whether their specific needs are addressed both personal and/or commercial

*'It is very much above the line that the attractions need to have the visitors brought in partly through their own efforts but through other people's efforts as well.'* *'If an authority wanted to push something forward through marketing work, or whatever, they can bring other people on board to work their project forward. This means they minimise the risk, share in expertise and bring other expertise in. Being able to access more clients.'* (Visitor Attraction, Northumberland).

*'To attract people to the region in the first place, to link up with other organisations you make it worth people's while to come to this part of the world...if they come to 'X' for a day they wouldn't come for a week but if you link with other people then perhaps they would ... I don't think you can operate a business in isolation with the region that you're operating in. I think you've got to be part of that region and understand how it works so by becoming partners within these various organisations you link in with the whole region. If you try and stand alone you're not going to go far.'* (Visitor Attraction, Leeds)

### **Having Clear Internal and External Communication**

All of the businesses used both informal and formal channels striving to develop an organisational climate based on participation, trust, co-operation, learning and teamwork.

*'There is a high level of management interaction and involvement within all job roles. The supervisory role is also taken on by the owners, thus they are also viewed as co-workers and perhaps this is why they can achieve such a relaxed and informal atmosphere.'* (Pub, Barnsley).

*'The owner/manager tries to make sure that the company objectives are understood by trying to link the company's goals into their job tasks so that they actually understand their contribution to the company's main goals and objectives.'* (Hotel, Dartmouth).

*'If there is any problem we work very close together, we are a team, and we just pull together and see what we can do. We resolve it as a team.'* (Leisure Centre, North Somerset).

In terms of external communication, emphasis was placed on co-ordination in order to create a distinctive identity. This was achieved by using one or more marketing communication techniques such as word-of-mouth, advertising in the local press, exhibitions and events, telemarketing, public relations, networking, websites and personal selling as well as obtaining quality awards. They also held a wide and elaborate view of their competitive arena. The main underlying principle found in all of the operations was

the alignment of business strategy with internal and external communications strategy and organisational culture.

*'We work closely with other five star hotels. We work with them and share mutual ideas and interests. Although they are our competitors it is beneficial to work together because we can refer business to each other. We do know exactly what is going on in other hotels locally and nationally and that helps.'* (Hotel, Berkshire).

*'Networking I find very important. That's me going round to specific businesses in the area. Me going to Freshers' Fair. One thing I also try to do is to encourage my managers to be proactive in terms of marketing.'* (Brasserie, Bristol).

### **Strategic Workforce Management**

The businesses emphasised the significance of selecting and retaining a competent and qualified workforce. Suggesting that this may be achieved through understanding the changing nature of employee needs and expectations from their employment relationship as well as committing to providing personal and professional development

*'The challenge is not to hire and develop people that you are training for your competitor. How do you build a culture that people do not want to leave? The challenge is retention. Our culture has developed to 'hey he really is looking out for my well-being'. I lose very few people to my competitors'* (Restaurant, Edinburgh).

*'And that is you have to figure out what is driving them. What are their needs and wants? And then assuming that there is a fit between what you want, you have to lay out the vision of how in their particular instance, they are ideally suited to do the best they are going to do in life with you'* (Leisure Centre, Mainland Orkney)

*'We need people to care for our company at the very lowest levels and we can't treat them as a commodity and can't even think of them as a commodity. We need some consistency, we don't to have huge turnover there. We want people to build up from the ground up. We want to continue to train and teach them'* (Hotel, Torridon).

*'The key to retaining staff is striving to make the business a happy place to work. We are all in it together. If one of our staff is having problems with a customer or even with another member of staff, it becomes a communal matter'* (Leisure Centre, Sussex).

### **Setting and Achieving Consistent Standards**

This is highly dependent on the role and involvement of the owner. The respondents stressed that the owner/manager must have a very clear vision of what the business is intending to provide for the customer, a clear customer focus with a high level of direct and indirect contact, involving the staff, systems and controls, and effectively manage complexity.

*'I think that it is just a feeling amongst ourselves that if we can get the standards and quality we want then the guests will be happy and will then come back again...'* (Hotel, Stockcross)

*'On standards, we know what we actually want of ourselves ... it's being straight, honest, you're only here for the best and you go for everything 100%'* (Visitor Attraction, Devon)

*'It's an in-built feeling with management, with owners, and that runs right down to the person who is washing the dishes, doing the garden. It's dedication and a passion that they want us to be the best it can be'. (Restaurant, Winteringham)*

*'We have very specific standards on every aspect, every key performance indicator in the business and within that we have questionnaires which we give to members of the public and staff ... everything is targeted against those achievement levels which we set standards on'. (Leisure Centre, Vale of Glamorgan)*

*'We tend to make sure that each person we take on has to justify their position in terms of increasing the visitor experience in some way or other. (Leisure Operation, Cotswolds)*

*'the advice, local knowledge, experience and confidence of my people. It makes the customer feel more relaxed ... regardless of the duration of the tour or the experience they're having...we want all of our customers to feel that they are in safe hands, good hands. They don't really have to think. They just have to enjoy.'* (Leisure Operation, New Forest)

### **Managing Cash Flow and Performance Measurement**

Respondents in the pilot study identified cash flow as being of major importance. The subsequent studies identified the need for a balance between investment and profitability. Cash flow played a significant role in the ongoing success of the businesses. They stressed the need for exercising budgetary control with a view to increasing total revenue and cash flow. Undertaking of customer relationship management as a means of improving quality of service and customer retention was also highlighted. In addition to the necessity for strategic management in managing internal business processes, and the necessity for collaboration (both inter and intra) to drive innovation and learning.

*'We have a weekly business meeting. Following that one, we have a yield meeting which discusses where we can go to and get extra business to meet financial targets. Following that, we have a financial forecast meeting where we pull the results of the two meetings down into spreadsheets to work out how much our budget is going to be exceeded by or under by. Then we forecast where we can make cost savings as appropriate.'* (Hotel and Leisure Complex, London)

*'Telephone research is ongoing so that everyone who contacts us is asked how they found out about us and that information is subsequently logged in the database. Also we conduct on-site market research via questionnaires. On occasion if there is a specific need we would actually go out and do questionnaires outside if necessary'. Leisure Centre, (Vale of Glamorgan)*

*'we reward them for their return custom, it also allows us to create a fantastic database. Let them know of any special events that we are running...' 'every time they use the card we see exactly what the customer is using it for.'* (Pub, Edinburgh)

*'One reason we're successful is because we don't have lots and lots of systems...I think we're more successful than a lot of big companies because we cherry pick the good things in big companies but we also put in a lot of impetus and motivation from hands on management. That's what makes us successful. It's very difficult for us to*

*analyse the system by which we work because there aren't any set systems'.  
(Restaurant, Skipton)*

*'Staff are absolutely our key performance indicator. We used to do a guest questionnaire and we used to use the responses but next year's performance measurement will be to introduce a more formal customer review process. We will invite customers to make comments and we will actually send to them, once they've stayed, a little note asking them just to complete it...to actually measure how well our staff and how our product are performing.'* (Hotel and leisure complex, London)

*'Innovation and learning is inextricably linked to managing the customer relationship, and having effective internal business processes, through the work of the staff.'* (Hotel, Newcastle upon Tyne)

## **VARIATION IN BEST PRACTICE**

The initial model in Figure 1 suggests that there is a single model of 'best practice' and that all of the core capabilities are consistent across all of the sectors. However, variation in practice was evident between cases and this was resolved to three factors, namely the business's size, its location and the owner philosophy. These factors are explained below again drawing on quotes from the interviews to illustrate the effects.

### ***Business Size - Micro or Small-Medium Sized Business***

The distinction here is based on operational activities, in the sense that, the micro-sized businesses (those with fewer than 9 employees) used primarily informal planning and control methods more than the small-medium-sized businesses and had significantly less need for strategic workforce management as they had very few or indeed no employees to manage.

*'because we're a small establishment – husband and wife running it – you don't document these things (i.e. operating procedures/standards) ...we don't have them documented because we're not asking someone else to go through it. We do it ourselves.'* (Pub, Berwick upon Tweed)

*'The heads of departments are the key people involved in ensuring that standards are maintained on a day-to-day basis. They are aware of the operating quality standards that you are trying to achieve and they assess on a daily basis whether they are being achieved.'* (Hotel, Stockcross)

*'Staff are there to make sure that as you go down the ladder everybody below you is doing their job right to make sure that the person under them is doing their job right.'* (Leisure Facility, Greenock)

### ***Location - Rural or Urban***

This factor distinguishes between businesses situated in rural or remote areas and those situated in urban areas. The distinction is based on issues such as accessibility to resources and work force recruitment capabilities and how these issues impact on planning, logistics, staff management and retention.

*'...because we've got this small market place ...we can't let people down. We've got to get it right all the time. We're much more focussed on customer care, ...than you would need to be in, say, central London because there will be another 100 along in a minute. We don't get another 100 along.'* (Pub restaurant, Belfast)

### **Owner Philosophy – Transactional or Transformational**

This consists of a number of dimensions, such as the owner/manager's attitude and values, leadership style adopted and 'lifestyle choice'. The 'lifestyle choice' includes the level of commercial motivation of the owner. A second component was the attitude and values of the owner-manager, relating to the company's culture and how it is influenced by the attributes of the owner. Evidence from this study suggests that two types of culture are predominant – transactional and transformational. Although further study would be required to determine more accurately the key attributes of these approaches, it appears that they are closely linked to leadership style, the subject of one of the individual reports. This report identified a range from more task oriented (i.e. transactional) to more adaptive (i.e. transformational.) styles of leadership and for the purpose of this study the terms have therefore been extended to describe the overall difference in philosophy between owners. There is also some evidence that links these styles to the stage of development of the business – with transactional being linked to stable businesses and transformational to those going through a process of change.

*'the manager takes charge – it is not over the top – she just makes people understand her, everyone has a very clear idea of what they should be doing so everybody is pulling their end'* (Bar, Bristol)

*'I think my objective is to provide a working environment for staff so they get some sort of satisfaction from working her ... we are all under pressure, but it is mutual support and respect for each other'* (Bar, London)

## **DISCUSSION**

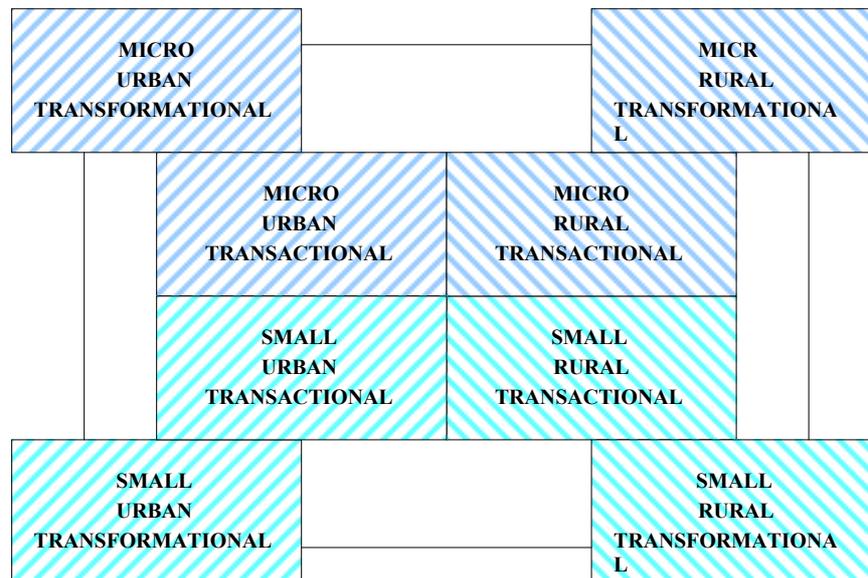

Our objective was to identify best practice in hospitality, tourism and leisure SMEs. What was uncovered was that at the core of successful operations, there are certain core capabilities that all small business owners must address in order for the businesses to be successful. Contingent on the business's operating environment as external factors are particularly significant for small businesses, given their limited resources etc. Of particular interest is the fact that the findings suggest that best practice in SMEs does not vary by industry sector or by geographic region. It was uncovered that the size, location and ownership philosophy are more influential in terms of the company's response to its operating environment. Further, long-term survival hinges on a company's ability to adapt to changing technologies, competition and customer needs.

### **The Contingent Approach**

Small businesses can be more flexible and capable of adapting to their environment, as illustrated by the SMEs in the study. They readily adapt to their environments and, as acknowledged by the owner/managers, are becoming increasingly dynamic. Based on the three variables outlined above, it is proposed that there are potentially eight alternative models of 'best practice' contingent upon the specific size, location and ownership philosophy of the business as illustrated in Figure 2. The business will have to change

the way it approaches each of the seven core capabilities described in Figure 1 based on which segment of the diagram it occupies.

**Figure 2: Variables Affecting SME Core Capabilities**

The ownership philosophy factor which includes dimensions such as leadership style, lifestyle choice, attitudes and culture may be considered rather contentious because it is a very broad-ranging category that attempts to capture the behavioural characteristics and style of the owner/manager. It suggests that the transactional leader is more concerned with a static working environment, utilising systematic techniques and being very task-oriented. Whereas the transformational leader promotes and embraces change and adopts a more progressive perspective and inspires the workforce. Transactional leadership behaviour is still considered to be the most prevalent in businesses, however this study found that transformational style leadership was more prevalent and best capable of change management.

It can be argued that one of the key issues in promoting best practice in SMEs is the personal hands-on and active involvement of the owner. Many of the best practice operations analysed here are owner operated and thrive on their personal commitment.

There comes a point as the business grows in complexity through increasing scale or scope, however, at which the complexity of the business becomes such that the owner cannot cope alone without moving toward more formal and more documented procedures. The key factors influencing the complexity are the scale of the operation and its operational scope. There will come a point as the business expands that the owner's active control becomes too difficult and similarly there will be a point where the operation becomes too diverse, operates too many services or facilities, for the informal approach to continue.

Due to the size of most SMEs, management and employees agree on the importance of informal, face-to-face communication at all levels. However, as the business grows in size and complexity more formalised channels need to be developed and utilised with the danger of introducing increased amounts of bureaucracy into the business. These are in agreement with Orser et al. (2000) findings.

The UK, particularly England is considered a rather urbanised economy by the standards of other places such as North America or even continental Europe. However, the research did uncover variances based on the location of the business and proximity to resources. A study of the British SME sector between 1999 and 2002 was conducted by Cosh and Hughes (2002) examining the locational variations in the degree to which SMEs engaged in formal or informal collaborative or partnership arrangements with other firms or organisations. It was found that the urban-rural differences in collaboration were not great enough to be statistically significant but it could be noted that rural SMEs recorded the lowest frequency of collaboration and networking, relative to firms in the urban groups, possibly reflecting the greater isolation of some rural firms from potential collaborators. Our study also found evidence to support this claim.

The results of the research also yielded similarities and differences in comparison with the results of other studies, such as the Cornell study (Dube et al 1999). It should be noted that the study did not focus specifically on SMEs. Nonetheless, it must be considered because it represents the largest study in the hospitality sector to-date. Their study mostly targeted the views of senior management and customers whereas; this study embraced the views and perspectives of the owner/managers, supervisors, staff and customers. One of similarities is the acknowledgement that employee involvement was frequently cited as key to the achievement of customer satisfaction and overall success. They also acknowledged that the best practice properties stressed the importance of understanding customer needs and creating value for stakeholders, such as owners, employees and customers.

Another, perhaps unfortunate similarity is the subjectivity of the definitions of 'best practice' used. Wober (2002) commented that the Cornell study used a purely judgmental definition. Conversely, this study tried to minimise this by utilising various sources and cross-referencing them in order to obtain the most suitable business. Though, admittedly, it cannot be guaranteed that all of the businesses used are the 'best'.

Another similarity is that the findings of both the Cornell and the CERT study emphasised that best performance exists in organisations that possess a clear perspective of their position and values and continually strive to align their work practices with their strategic view/standpoint.

## **CONCLUSION**

An analysis of the key themes from across the eight study areas revealed seven core capabilities pertinent to the execution of best practice and the achievement of high performance. It was also found that best practice varied based on the size of the business; the business's location; and the intentions of the owner, whether they are more transactionally or transformationally oriented, as well as their attitudes, values, and 'lifestyle choice'

However, one of the main underlying principles found in all best practice operations is the alignment of business strategy with internal and external communications strategy and organisational culture - without forgetting the alignment with human resource practices regarding appropriate training to support the business strategy and future planning. In other words, it is the integration of all the above domains under the same strategic and

human resources umbrella rather than the how of organisational and communication management that underpins organisational success.

Further, throughout the world customers' requirements and preferences are changing more rapidly in present times than in any previous era. Managers and owners of small businesses not only face the challenge of doing the right things but also of doing things in the right way.

Heavy reliance on SMEs is not only present in England, it is also evident in most countries and in the developing world they could represent a good opportunity to be more competitive and effective. In South Africa, tourism is growing rapidly and it represents an opportunity to improve economic growth and reduce unemployment. As such sound businesses need to be developed that can be highly competitive, flexible and operationally sound, delivering consistent quality and service.

While this study has taken place in the UK, the evidence suggests that the model could be extended internationally as a blueprint for SME best practice relevant in all countries and may prove particularly useful when putting together developmental interventions.

According to Gibb (2000) cross-country comparison may not be easy in the hospitality, tourism and leisure industries for a number of reasons, such as, risks in ideology, culture, language, concept, context, local enterprise agencies, agenda of local governmental policies, field of production, and customer aspects. However, due to the conceptual nature of the model it should be highly adaptive as it takes full consideration of the internal and external operating environments.

## **INTRODUCTION**

The term "globalization" has acquired considerable emotive force. Some view it as a process that is beneficial—a key to future world economic development—and also inevitable and irreversible. Others regard it with hostility, even fear, believing that it increases inequality within and between nations, threatens employment and living standards and thwarts social progress. This brief offers an overview of some aspects of globalization and aims to identify ways in which countries can tap the gains of this process, while remaining realistic about its potential and its risks.

Globalization offers extensive opportunities for truly worldwide development but it is not progressing evenly. Some countries are becoming integrated into the global economy more quickly than others. Countries that have been able to integrate are seeing faster

growth and reduced poverty. Outward-oriented policies brought dynamism and greater prosperity to much of East Asia, transforming it from one of the poorest areas of the world 40 years ago. And as living standards rose, it became possible to make progress on democracy and economic issues such as the environment and work standards.

By contrast, in the 1970s and 1980s when many countries in Latin America and Africa pursued inward-oriented policies, their economies stagnated or declined, poverty increased and high inflation became the norm. In many cases, especially Africa, adverse external developments made the problems worse. As these regions changed their policies, their incomes have begun to rise. An important transformation is underway. Encouraging this trend, not reversing it, is the best course for promoting growth, development and poverty reduction.

The crises in the emerging markets in the 1990s have made it quite evident that the opportunities of globalization do not come without risks—risks arising from volatile capital movements and the risks of social, economic, and environmental degradation created by poverty. This is not a reason to reverse direction, but for all concerned—in developing countries, in the advanced countries, and of course investors—to embrace policy changes to build strong economies and a stronger world financial system that will produce more rapid growth and ensure that poverty is reduced.

How can the developing countries, especially the poorest, be helped to catch up? Does globalization exacerbate inequality or can it help to reduce poverty? And are countries that integrate with the global economy inevitably vulnerable to instability? These are some of the questions covered in the following sections.

## **WHAT IS GLOBALIZATION?**

Economic "globalization" is a historical process, the result of human innovation and technological progress. It refers to the increasing integration of economies around the world, particularly through trade and financial flows. The term sometimes also refers to the movement of people (labor) and knowledge (technology) across international borders. There are also broader cultural, political and environmental dimensions of globalization that are not covered here.

The major multilateral institutions acknowledge the need to improve the transparency of their decision-making and each has programs to make themselves more open to outside contributions and develop better information flows. However they are all organisations composed of governments. In the case of the World Trade Organisation, the practice has been that no decisions are made unless a consensus of governments is achieved. This guarantees that the WTO reflects the will of its member nation states.

As the work of the United Nations has demonstrated, globalisation is more effective when there are strong governments, with sound domestic institutions.

Globalisation benefits both big and small business, together with the citizens of those countries that embrace international trade. There are no grounds for asserting, however, that large companies are bent on subverting governments. Large corporations generate employment, tax revenue and wealth for the nations in which they operate. They invest in proportionately more research and development than smaller businesses.

Multinational corporations on the other hand are key agents transforming the international political and economic landscape. Because they are highly visible organizations with great economic power and mobility, they inspire both awe and fear. The changes in today's global business environments will gain even greater momentum as the world economy continues to shift from nationalism to regionalism and, increasingly, to globalization.

This means that any country, any enterprise, and any brand of product or service will face unlimited competition when the trade barriers and other protective market measures are removed, through the dynamic processes of globalization. The anticipation of these developments, the management of MNC's and other firms involved in international business has to be pro-active. This will generally require knowledge of internal as well as external environments, and the management and leadership skills to utilize environmental information and capitalize on opportunities in the competitive and dynamic global arena.

## **WHO ARE THE MAIN PLAYERS ? - INTERNATIONAL ORGANISATIONS:**

**The World Trade Organisation (WTO)** is established in 1995 to administer the rules of international trade agreed to by its 123 member countries. These rules have been ratified by the parliaments of all members.

The key difference between the WTO and the General Agreement on Tariffs and Trade (GATT), which it replaced, is that the WTO is a permanent organisation with the judicial powers to rule on international trade disputes. The WTO also covers trade in services, whereas GATT only covered trade in goods.

The WTO's rules make it hard for a country to favour their own industry over imports from other countries. Also, the WTO rules do not allow a country to favour the imports of one country over those from another.

The WTO argues that the growth of trade between countries increases the wealth of everyone. Trade allows the production of goods and services by those who are most efficient, thus maximising their availability at the best price.

The growth of trade is helped by the lowering of barriers, such as tariffs and import quotas, which is the object of WTO agreements.

**The International Monetary Fund (IMF)** was established in the wake of the World War II in 1946 to:

- promote international cooperation on finance,
- encourage stability in exchange rates and orderly systems for exchanging money between countries
- providing temporary assistance for countries suffering balance of payments problems

The IMF frequently seeks institutional reform in the countries to which it provides temporary financial assistance. Like the WTO, the IMF believes that world prosperity is enhanced by greater exchange between nations and that this is made possible by

everyone agreeing to abide by rules. The IMF has 182 member countries.

**The World Bank** provides loans to poor countries for development projects. The bank provides loans for investment projects, such as water and sanitation, natural resource management education and health. It also lends for what it calls adjustment projects, which are to support governments undertaking policy reforms, such as improved public sector management.

The growth in trade between nations has contributed to lifting 3 billion people out of poverty over the past 50 years. Reducing tariff barriers, which makes it easier for nations to trade with each other, lifts the wealth of all nations by allowing them to concentrate on those where they have greatest expertise.

Poor countries that have lowered their tariff barriers have gained increases in employment and national income because labour and capital shifts from import-competing industries to expanding, newly competitive export industries. In addition to providing jobs, companies moving to developing countries often export higher wages and working conditions compared with those in domestic companies operating in the country. While wages are often lower in developing countries than those in developed countries they reflect lower levels of education and productivity. The experience in countries like Korea is that as countries develop their wage levels rise and the focus shifts from labour intensive to more capital and knowledge intensive industries.

## **DEVELOPMENT OF SMALL AND MEDIUM ENTERPRISES**

There has never been a more exciting time to start your own business! New businesses are springing up every day all across the country. Whether these new ventures are inspired by women re-entering the job market, young people starting their careers at home-based businesses, previously employed middle managers, or just regular folks looking to earn some extra cash on the side, everyone is finding themselves caught up in the entrepreneurial spirit.

What has led to this entrepreneurial boom? First, there has been a sharp increase in downsizing at both large corporations and medium-sized businesses. As you may be aware, many of the larger corporations in the United States, like IBM and General Motors, have been laying off workers in record numbers, and the end is not yet in sight. Nearly one-third of companies surveyed by major outplacement firms say they are considering cutting their work force in 1996 by as much as 30 percent.

As companies are learning to be leaner and meaner, career-minded professionals cannot expect job security the way they could in the past. In today's economy, chances are good that you will probably not stay at one company throughout your professional career. And a growing number of people feel that the best way to prevent an almost inevitable layoff is to take the skills they have and open up shop for themselves.

Changes in government programs and tax benefits for minority-owned businesses provide still more clues why entrepreneurship is on the rise. And despite affirmative action programs, it is still a statistically proven fact that there is a lack of opportunity for women and minorities within medium- to large-sized companies.

Thus, thousands of women and minorities are recognizing that their earning potential is much higher "on their own" than it would be in the corporate world, and that there is no "glass ceiling" to deal with when you are your own boss. In addition, it is now easier for minorities and women to get financing to start new ventures, either through local banks or government programs.

## **ENTREPRENEURIAL - THE SUCCESS FORMULA**

Every year, hundreds of thousands of businesses are started. Most will fail, some will muddle along, and a few will thrive. Which ones thrive, and why? The reason some businesses experience spectacular sales and profit growth from the start isn't because they had a lot of money at the beginning. Their fast growth can be attributed to the fact that they were put together the right way.

In every instance, the founders either had or acquired the experience and knowledge they needed to start-up and run the business. They recognized what their weak points were, subsequently nurtured alliances, and acquired the skills they needed to start their company off right.

They also understood how the various parts of the business fit together to form a total structure and knew that if one part was missing, the total structure would break. For example, they knew that a successful sales plan is directly dependent upon support from the marketing and promotional plans, and that the strategic business plan acts as the glue that holds all the subplans together so that they work in concert.

### **Developing Ideas**

Clever product and service ideas are a dime a dozen. Everybody has one, and most of them never get implemented. The successful entrepreneur starts with a basic idea. This idea is first tested to staying power. Can it be used to grow a customer base, and will it be profitable? The pseudo-entrepreneurial itch often ends before the basic idea gets tested. Studies show that a high percentage of people who open new businesses do so because they are frustrated with their current job. They'll jump into any business venture that comes along without first checking it out. Ninety percent of this group will go out of business in their first year.

Those that make it are smart enough to recognize the symptoms of their emotional state. They are acutely aware that they may be in a vulnerable position. As a result, they may hang on to the security of their current job and start a business on the side. They'll make the move to become a full-time entrepreneur when the time is right for them and after they have thoroughly checked out their business venture ideas. There are three basic concepts to keep in mind as you develop and refine your business start-up ideas.

### **Be Creative**

The opposite of creativity is rigidity. Entrepreneurs are not rigid in their thinking. If you cling to the old ways of doing things because "that's the way we have always done it," you'll never come up with the new solutions that are demanded by today's small businesses. To test your creative ability, practice finding ways to tie together seemingly unrelated ideas.

## **Understand Every Problem**

You must have a clear understanding of what it is you are trying to achieve and be able to identify the obstacles that stand in your way. Break each problem down so that you understand it and know what you need to do to eliminate it. For example, the problem may be that you need more space. Why do you need more space, and what are the alternatives? An alternative may pose a new set of problems, but if they reduce the magnitude of the original problem, the alternative may be a more viable option.

## **Brainstorming**

When you come up with a solution to a problem, brainstorm the solution with as many qualified people as you can find to avoid judging your own answer. Accept modifications that make sense, and be prepared to replace the solution with a totally new and better alternative. The key to the brainstorming process is to be objective. Brainstorming is an excellent way to come up with a new set of ideas for new products, services, or improvements that could accelerate the growth of your business.

## **THE IMPACT OF GLOBALISATION ON THE DEVELOPMENT OF SMALL AND MEDIUM ENTERPRISES ENTREPRENEURIAL - SELF-ANALYSIS**

If you work for a company, you probably have a steady job and income. You probably enjoy the usual fringe benefits, such as paid vacations and life and medical insurance. If work runs out, it is up to somebody else to find something for you to do. When work piles up, somebody else can be brought in to help. If you get sick, it's up to your boss to cover you. You may have some flexibility in deciding where you want to live if you work for a company with many locations.

You may even have a career path established with your company. If you follow this career path, you can probably enjoy a comfortable retirement through the company pension plan. Are you sure you want to abandon the corporate life to start your own business? Before you answer this question, let's explore the reasons people become self-employed.

## **Controlling Their Destiny**

Many people find regular employment unsatisfying because it forces them to accept and respond to decisions others make on their behalf. They may not like the people they work for, their work location, their working hours, or their possibilities for advancement. The company may be poorly managed or in poor financial condition, or there may be frequent layoffs. Whatever the trigger, the ability to control one's destiny can be a major motivation for opening a personal business.

## **The Creative Urge**

If you have truly developed a better mousetrap or discovered a better way of doing something, starting your own business may be the simplest and most direct way to get

your idea into the market. If you succeed, there is a great deal of personal gratification in being able to say, "I did it with my idea, my way."

The creative urge can be a powerful driver that gives people the incentive to start their own business. It can also prove to be one of your worst enemies if you lose your objectivity along the way. If your unique idea proves to be not so unique after all, will you recognize the facts when you see them, and adjust your strategies accordingly?

## **Financial Rewards**

Most people who start their own business expect financial rewards for their endeavour. They have every right to this expectation. In the business world, financial rewards increase in direct proportion to the level of risk a company is willing to take.

The banking industry provides a classic illustration of this simple concept. If you ask for an unsecured loan, what happens? The bank charges you a higher interest rate to compensate it for the higher risk of loans that are not secured by collateral.

The same principles apply if you open a business. The failure rates for personal businesses are very high. As a business owner, you have a right to expect a high rate of return to compensate you for the risk you are taking on, just as the bank does. Entrepreneurs are driven to achieve high financial rewards. They know that if they do not achieve acceptable profit levels, their business venture will not survive. Since they are in it for the long term, they reject one of the most common start-up scenarios: "I'll try it for a while to see if it works. If it doesn't work, I can always go back to my old job."

If this is your scenario, you'll probably end up back at your old job. Entrepreneurs know exactly how much money they need to make to stay in business. They are committed to the achievement of specific financial goals and do not consider their old job as a viable option.

Chrysler's Lee Iacocca was once asked, "After you joined Chrysler and discovered how much trouble the company was in, did you ever consider throwing in the towel and going back to Ford?" Iacocca responded by saying, "Never! Once I made the commitment, I never lost my determination to do everything I could to make sure the company achieved reasonable financial rewards."

## **PROFILE OF AN ENTREPRENEUR IN THE GLOBAL DYNAMICS - DO YOU HAVE WHAT IT TAKES ?**

If you think you want to be your own boss and run your own business, but are not sure you have the right qualifications to be an entrepreneur, read on. What are the characteristics of an entrepreneur? How does an entrepreneur think? Is your personal profile similar to that of a successful entrepreneur?

Until recently, entrepreneurs were not widely studied. There was a general lack of knowledge and information about what made them tick. The recent interest in revitalizing America's dormant productivity has changed all that. Most business universities now offer courses in entrepreneurship. As a result, business professionals have learned a lot about what it takes to become a successful entrepreneur.

Although no one has found the perfect entrepreneurial profile, there are many characteristics that show up repeatedly. In the sections that follow, we'll cover several important characteristics of entrepreneurs for you to consider and dispel the entrepreneurial myths.

## **Entrepreneurial Characteristics**

A series of interviews were conducted with distinguished entrepreneurs. They were asked what characteristics they felt were essential to success as an entrepreneur. Good health was a characteristic mentioned by every entrepreneur interviewed. Entrepreneurs are physically resilient and in good health. They can work for extended periods of time, and while they are in the process of building their business, they refuse to get sick.

In small businesses, where there is no depth of management, the leader must be there. You may not be able to afford a support staff to cover all business functions, and therefore you will need to work long hours. We all know people who use part of their sick leave each year when they are not sick. Entrepreneurs are not found in this group. At the end of the eight-hour day, when everyone else leaves for home, the entrepreneur will often continue to work into the evening, developing new business ideas.

## **Self-Control**

Entrepreneurs do not function well in structured organizations and do not like someone having authority over them. Most believe they can do the job better than anyone else and will strive for maximum responsibility and accountability. They enjoy creating business strategies and thrive on the process of achieving their goals. Once they achieve a goal, they quickly replace it with a greater goal. They strive to exert whatever influence they can over future events.

In large, structured organizations, entrepreneurs are easy to recognize by the statements they make: "If they wanted that job done right, they should have given it to me." A dominant characteristic of entrepreneurs is their belief that they are smarter than their peers and superiors. They have a compelling need to do their own thing in their own way. They need the freedom to choose and to act according to their own perception of what actions will result in success.

## **Self-Confidence**

Entrepreneurs are self-confident when they are in control of what they're doing and working alone. They tackle problems immediately with confidence and are persistent in their pursuit of their objectives. Most are at their best in the face of adversity, since they thrive on their own self-confidence.

## **Sense of Urgency**

Entrepreneurs have a never-ending sense of urgency to develop their ideas. Inactivity makes them impatient, tense, and uneasy. They thrive on activity and are not likely to be found sitting on a bank fishing unless the fish are biting. When they are in the entrepreneurial mode, they are more likely to be found getting things done instead of fishing.

Entrepreneurs prefer individual sports, such as golf, skiing, or tennis, over team sports. They prefer games in which their own brawn and brain directly influence the outcome and pace of the game. They have drive and high energy levels, they are achievement-oriented, and they are tireless in the pursuit of their goals.

## **Comprehensive Awareness**

Successful entrepreneurs can comprehend complex situations that may include planning, making strategic decisions, and working on multiple business ideas simultaneously. They are farsighted and aware of important details, and they will continuously review all possibilities to achieve their business objectives. At the same time, they devote their energy to completing the tasks immediately before them.

Accounting reports illustrate this characteristic. Accountants spend hours balancing the accounts and closing them out. For them, the achievement is to have balanced books. The entrepreneur only wants to know the magnitude of the numbers and their significance for the operation of the business.

## **Realism**

Entrepreneurs accept things as they are and deal with them accordingly. They may or may not be idealistic, but they are seldom unrealistic. They will change their direction when they see that change will improve their prospects for achieving their goals. They want to know the status of a given situation at all times. News interests them if it is timely, and factual, and provides them with information they need. They will verify any information they receive before they use it in making a decision. Entrepreneurs say what they mean and assume that everyone else does too. They tend to be too trusting and may not be sufficiently suspicious in their business dealings with other people.

## **Conceptual Ability**

Entrepreneurs possess the ability to identify relationships quickly in the midst of complex situations. They identify problems and begin working on their solution faster than other people. They are not troubled by ambiguity and uncertainty because they are used to solving problems. Entrepreneurs are natural leaders and are usually the first to identify a problem to be overcome. If it is pointed out to them that their solution to a problem will not work for some valid reason, they will quickly identify an alternative problem-solving approach.

## **Status Requirements**

Entrepreneurs find satisfaction in symbols of success that are external to themselves. They like the business they have built to be praised, but they are often embarrassed by praise directed at them personally. Their egos do not prevent them from seeking facts, data, and guidance. When they need help, they will not hesitate to admit it especially in areas that are outside of their expertise. During tough business periods, entrepreneurs will concentrate their resources and energies on essential business operations. They want to be where the action is and will not stay in the office for extended periods of time.

Symbols of achievement such as position have little relevance to them. Successful entrepreneurs find their satisfaction of status needs in the performance of their business,

not in the appearance they present to their peers and to the public. They will postpone acquiring status items like a luxury car until they are certain that their business is stable.

## **Interpersonal Relationships**

Entrepreneurs are more concerned with people's accomplishments than with their feelings. They generally avoid becoming personally involved and will not hesitate to sever relationships that could hinder the progress of their business. During the business-building period, when resources are scarce, they seldom devote time to dealing with satisfying people's feelings beyond what is essential to achieving their goals.

Their lack of sensitivity to people's feelings can cause turmoil and turnover in their organization. Entrepreneurs are impatient and drive themselves and everyone around them. They don't have the tolerance or empathy necessary for team building unless it's their team, and they will delegate very few key decisions.

As the business grows and assumes an organizational structure, entrepreneurs go through a classic management crisis. For many of them, their need for control makes it difficult for them to delegate authority in the way that a structured organization demands. Their strong direct approach induces them to seek information directly from its source, bypassing the structured chains of authority and responsibility. Their moderate interpersonal skills, which were adequate during the start-up phases, will cause them problems as they try to adjust to the structured or corporate organization. Entrepreneurs with good interpersonal skills will be able to adjust and survive as their organization grows and becomes more structured. The rest won't make it.

## **Emotional Stability**

Entrepreneurs have a considerable amount of self-control and can handle business pressures. They are comfortable in stress situations and are challenged rather than discouraged by setbacks or failures. Entrepreneurs are uncomfortable when things are going well. They'll frequently find some new activity on which to vent their pent-up energy. They are not content to leave well enough alone. Entrepreneurs tend to handle people problems with action plans without empathy. Their moderate interpersonal skills are often inadequate to provide for stable relationships. However, the divorce rate among entrepreneurs is about average.

## **MAPPING OUT YOUR STRATEGY FOR SMALL BUSINESS DEVELOPMENT**

The majority of the books written about corporate turnarounds, are written by executives who have fixed Fortune 500 companies. These individuals have the ability to cut large numbers of employees, tap pension funds and banks for infusions of capital, and sell off enormous assets to raise cash and decrease debt.

Although not demeaning the accomplishments of these people, few small and midsize companies can make such dramatic changes. These businesses can have a difficult time getting a line of credit from a bank, typically don't have meaningful assets to sell to increase the company's cash position, and can't afford to lay off large numbers of people.

There is another category of books written by business consultants that focus on financial and accounting issues. Unfortunately, many of these books deal with only the half the problem an executive faces in a turnaround, and none of them provide examples of how to write business plans to raise new capital or marketing/sales plans to increase sales. They also don't address the people management issues and the mistakes the leaders make.

Turning around and starting small companies are found that both offer unique and sometimes very painful challenges. To accomplish corporate turnarounds successfully you need a great deal of energy, self-confidence, resiliency, and the ability to maintain a positive mental attitude every day. Your employees, shareholders, and family look to you for leadership and stability.

Business leaders who find themselves in a turnaround situation are initially afraid and likely to question whether they have the skill to fix their company. They might even feel worthless and sorry for themselves. Unfortunately, those feelings can't last long or they'll affect the energy and ability that is needed to turn the ship around.

Before discussing how to recognize that your company needs to be fixed, and how to fix it while maintaining control, let's review some information on business bankruptcies and failures published in a 1997 Small Business Administration report.

According to the Small Business Administration, business failures are up 16.6 percent from 1995 to 2001. Business bankruptcies increased by 5.3 percent during 1996, rising from 50,516 in 1995 to 53,214 in 2001.

Why did I share this information? First, to let you know that if your business is in trouble, you aren't alone. Second, I hope those numbers will scare you into taking a positive action.

## **How Do You Know You're in Trouble?**

Companies usually don't find themselves in trouble overnight. It happens over a period of a few months to a couple of years.

How do you know your company is in or is coming close to being in dire straits? Here is a simple list of symptoms:

- Sales are decreasing in a growing market
- Current customers are leaving for reasons that are in your control
- Clients complain their calls aren't being returned
- More client projects are over budget
- Profits are declining and expenses are going up
- Employees are telling each other, and, unfortunately, customers, they aren't sure of the company's direction
- Employees are telling management they don't feel they are being led
- Employees are coming in late and leaving early
- Employee monthly meetings stop taking place and good employees start leaving
- Employees stop trusting management
- Employees are beginning to bicker over small things
- Management meetings that used to be weekly are happening whenever people feel like getting together
- Management isn't working as a team

- The company can't afford to pay its taxes
- The company is falling behind paying its vendors

If, after an honest assessment, you recognize these symptoms and realize you are in trouble, then you need to take the following steps to get your shareholders, employees, and yourself out of trouble.

## **IS THERE ANY ALTERNATIVE TO GLOBALISATION?**

Supporters of globalisation argue that it can be rolled back and point to the period between the first and second world wars as evidence. The increase in world trade as a proportion of world GDP was proportionately greater between 1870 and 1914 than it has been since 1975. That expansion was stopped, not just by the first world war, but also by the loss of support for free trade which followed. Tariffs and controls on capital were imposed around the developed world. This led directly to the 1930 depression and indirectly to the second world war.

There is clear danger in the gathering strength of opposition to globalisation that it could be halted again. The consequences of a decline in world trade would immediately be felt with rising unemployment throughout the trading world. The poorest countries of the world would also be affected by a fall in aid and opportunities for trade.

A weakening of the institutions of the global order, such as the WTO, would leave them unequal to the task of adjudicating between nations. The fate of the League of Nations at the end of the 1930s provides a parallel example of the cost of weak international institutions.

It is not clear what alternate form of economic production to the corporation the opponents of globalisation have in mind. However the sharing of risk in the limited liability corporation has proven a robust framework for the development of innovation, wealth and the advance in global living standards.

Although trade and economic integration could be undone by concerted political opposition, it is not possible to turn back the globalising influence of communications technology.

## **CONCLUSIONS**

This country and Africa as a whole still has one of the most unequal distributions of income in the world. This is a direct result of the extremely low levels of black participation in the mainstream economy. As a consequence, our economy continues to perform below its potential. This can impact on Africa to be regarded as a junior partner in the global economy.

Despite the adoption of transformative policies implemented within the framework of sound fiscal and monetary management aimed at overcoming economic disparities, entrenched inequalities continue to characterize the economy and act as a deterrent to growth, economic development, employment creation and poverty eradication.

Vast racial and gender inequalities in the distribution of and access to wealth, income, skills and employment persist. Continued levels of unemployment and increasing poverty threaten to undermine the stability of our new democracy.

The country still has one of the most unequal distributions of income in the world. This is a direct result of the extremely low levels of black participation in the mainstream economy. As a consequence, our economy continues to perform below its potential.

Evidence emerging from the recent published 2003 Global Entrepreneurship Monitor (GEM) conducted by the University of Cape Town's Graduate School of Business revealed that South Africa's levels of entrepreneurship are roughly half what they are in other developing countries such as Brazil, India, Argentina and Mexico comparatively.

The factors contributing to this are complex and include the state of economy, cultural and social norms and the existence of business opportunities.

This declining levels of entrepreneurship confirms that South Africa compares very poor, and this has a direct effect in economic growth, poverty eradication and job-creation, which is one of this NEPAD's main objectives. It has then been suggested that in order to halt South Africa's dismal slide down the entrepreneurial scale is raising the priority of enhancing entrepreneurship in SA at the highest level, developing ways to increase the pool of potential entrepreneurs and ensuring that existing entrepreneurs are receiving the right kind of support.

In another survey carried out by the London Business School and Babson College, which compares countries' competitiveness, rated South Africa as one of the lowest-ranking countries in terms of entrepreneurial activity. It was found to be the weakest performer out of 38 countries surveyed, which included developing countries such as Argentina, India, Uganda, Chile, Thailand and Mexico.

Entrepreneurship is an indispensable prerequisite for success in an increasingly globalised and competitive economy. Entrepreneurs are wealth creators. In order to create jobs and alleviate poverty, entrepreneurs are a must. South Africa needs more of a culture dominated by entrepreneurship spirit in providing the engine for innovation and growth, which creates jobs and alleviate poverty. The challenge is to create an enabling environment that encourages risk-taking.

What then must South Africa and Africa do to inculcate and nurture a culture of entrepreneurship ? First, entrepreneurship needs to be embedded into the basic fabric of society. Every aspect of public policy must seek to encourage the entrepreneurial spirit and potential of the nation. Second, entrepreneurship should be celebrated. Entrepreneurs should become national heroes. The US glorifies its entrepreneurs, as it does its sportsmen and women.

Third, the education system needs to be aligned accordingly. Education system should not be geared to produce workers, as it happened during colonial era, but it must be capable of producing entrepreneurs. In showcasing how academic innovation can lead to productive business that generate value and job-creation, institutions of higher learning in Africa as a whole need to integrate their activities into the mainstream economy while maintaining their commitment in knowledge production.

Leading Universities like Stanford, Oxford, Cambridge and Harvard have shown and proved this point beyond reasonable doubt.

The New Partnership for Africa's Development (NEPAD) on the other hand has the potential to turn Africa into a dynamic and economically vibrant continent offering many to the SMME sector. It is also a strategic framework and long-term programme for the socio-economic renewal of Africa. It is a programme that will help us to overcome the challenges and problems that we face as a continent.

NEPAD is a strategic framework and a long-term programme for the socio-economic renewal of Africa. The challenges in Africa affect and constrain small businesses in a number of ways. In addition, African small firms still have to deal with some of the prejudices that they find in their own market development strategies.

It is anchored on the determination of Africans to extricate themselves and the continent from the malaise of underdevelopment and exclusion in a rapidly globalizing world.

Africa need to reinvent itself to address its growth and development deficit, and Nepad provides a good foundation for a Marshall Plan for Africa.

The main difference between the Marshall Plan and Nepad is that the former was initiated by the US for Europe, and the latter is an initiative by Africans for Africa. If the Marshall Plan was as true for Europe then Nepad is as true for Africa today. The international community in its endeavour to assist Africa should not be seen as an issue of charity, it makes sound business and ethical sense.

The big challenge is to build strong and viable economies to boost the purchasing power of Africans. This would enable Africa to be an effective player in the global economy. It would also transform Africa's relations with the rich world from being aid-based to being driven by trade and investment.

The need to counter the rise of communism in Europe was one of the main strategic drivers behind the Marshall aid. The Marshall Plan served as the economic and political foundation of the western alliances. It also allowed the US gradually to engage in the bipolar confrontation by first committing money, not blood.

For Nepad to have a positive effect on Africa, as indeed it must, Africa leaders and the private sector need to do more to provide a conducive environment for growth and prosperity. The initiative and commitment must come from Africa.

Developing countries such as India, Singapore and South Korea have shown that it is possible to liberate a nation's entrepreneurial spirit in a way that enhances its global competitiveness. This requires focused strategies that lay the right foundation for current and future entrepreneurs. It is a prerequisite for Africa to assert and position itself in the mainstream spheres of the global economy.

I thank you all.

Keywords: Competitive intelligence, small business, market research

## **ABSTRACT**

Without appropriate intelligence, companies are unlikely to succeed. Recognizing this, most companies in North America with sales over \$1 Billion and some of the largest companies in South Africa have installed intelligence units. CI may be more important for small business than it is for larger ones. Everyone needs to conduct CI to thrive and identify opportunities, but smaller companies cannot absorb market mistakes in the same way that large firms can. Organized properly, good competitive intelligence can level the playing field between small and large businesses. Smaller businesses must take advantage of CI to grow. But these companies feel that they lack the resources necessary to develop full scale intelligence capabilities. The objective of this paper is to explore how SME's can conduct world class intelligence and the role of size in the intelligence effort. The paper reports on research conducted in Canada that looks at intelligence practices in technology firms and reports on initiatives underway in Canada and South Africa to bring Intelligence capability to these firms. The study debunks two of the more popular CI myths

Myth 1: Competitive Intelligence is not for small business

Myth 2 : Small Business Cannot Conduct CI

## **What is competitive intelligence?**

At a simplistic level, competitive intelligence (CI) can be defined as information that makes the firm more competitive. One of the better definitions comes from the Business Intelligence Institute in the United States:

"Competitive/Business intelligence is the total knowledge a company possesses about the environment in which it competes. It is synthesized from the vast amount of bits

and pieces of external information bombarding the firm every day. It paints a whole picture of the present and future competitive arena of management decisions." (Gilad, 2000)

The fuller definition is:

Competitive intelligence is the art and science of preparing companies for the future by way of a systematic knowledge management process. It is creating knowledge from openly available information by use of a systematic process involving planning, collection, analysis, communication, and management which results in decision-maker action. " (Calof and Skinner 1999)

Whatever definitions is chosen, all point towards creating knowledge from openly available information by use of a systematic process involving planning, collection, analysis, communication, and management which results in decision-maker action. The intent of CI is to better understand customers, regulators, competitor's, and so forth to create new opportunities. In fact, the intent is to forecast changes in any of these forces and better position the firm to take advantage of these changes.

### **Myth 1: Competitive Intelligence is not for small business**

The overall objective of an intelligence program is to assist decision makers by providing forward looking views of the environment. In a sense to avoid market surprises and provide appropriate recommendations. If you are a large company and you read the market wrong, what are the risks? Coca Cola came out with the new coke – a dismal failure; Microsoft was late to market with a web browser but now holds most of the market share (Netscape's market share was at 7% after Internet Explorer 6 was released). How is it that these companies were able to survive despite such poor intelligence – deep pockets comes to mind.

But what of small business? As noted in a Business Week article " If you're Coca-Cola, and you read the market wrong, you can buy your way out of the problem. If you're a small business, and you read the market wrong, you're dead." (Business Week June 16, 2000). CI may be more important for small business than it is for larger ones. Organized properly, good competitive intelligence can level the playing field between small and large businesses.

More importantly, small businesses are the cornerstone of most economies around the world. Ensuring their viability and success is of paramount importance for a thriving domestic economy. For example, in Canada less than 1% of all businesses are large (.3% to be exact) and most employment arises from small business. As for the United States, Donald A Manzullo, U.S. House of Representatives estimated 25 million small businesses in the United States which employ over half the US workforce. From a CI growth perspective, over the past decade in the United States, 75% of all new jobs and 50% of all new technologies have come from small businesses.

It's not that CI is not important for larger businesses -- everyone needs to conduct CI to thrive and identify opportunities. But smaller companies can not absorb market mistakes in the same way that large firms can. Besides, today's large business did start out as a small business (Microsoft was once a two person operation). Smaller businesses must take advantage of CI to grow and

become a large business. Reality 1: CI is very important for small business

## **Myth #2 : Small Business Cannot Conduct CI**

“Sure, CI is important for small business,” states the Reporter from Business Week, “but are they not too small to conduct competitive intelligence?” How great it must be to have tens of thousands of employees to draw upon for information collection, or to have access to expensive databases. Also consider that some technical intelligence analytical techniques cost into the hundreds of thousands of dollars. Clearly, small business cannot afford to conduct these activities, at least not on their own.

Lets look at the results of a survey conducted of Canadian technology firms.

To understand the practice of BI in Canada, a two-phase approach was undertaken;

- 1) Surveys were administered to 3080 Canadian companies. The mailed questionnaire consisted of 44 true/false questions designed to measure a company’s BI practices. Some 1,025 useable responses were received. About 400 of the respondents indicated willingness to participate in follow-up.
- 2) Interviews were held with executives from 20 companies (selected from the 400 respondents willing to engage in follow-up), to validate the questionnaire responses and obtain more context for the study findings.

The rest of this report will address the outcomes of the research and end with suggestions for further study.

## **THE SURVEY**

We developed a questionnaire to measure BI awareness and use in Canada on the basis of a similar questionnaire designed jointly by the US-based Industrial Research Institute (IRI) and Society of Competitive Intelligence Professionals (SCIP) and administered to IRI companies in the United States in 1996-97. The IRI/SCIP questionnaire was oriented particularly to CTI practices in large manufacturing companies; we gratefully acknowledge the support and advice of IRI in allowing us to modify the questionnaire for use with a broader range of companies in a different national context. The CICI questionnaire contains 44 true-false questions designed to examine how BI is practiced in Canada. The questions constitute a basic BI audit examining the following areas:

- 1) Planning and focus - BI is not about collecting everything but focusing on those issues of highest importance to senior management.
- 2) Collection - BI requires collection from a broad base of information sources. The best sources, according to BI experts, are a company’s own employees followed by contacts outside the company.
- 3) Analysis - 35% of BI project time should be spent analyzing the information. This is where the true intelligence is created.
- 4) Communication - BI results need to be communicated to those with the authority and

responsibility to act on the findings.

- 5) Counter-intelligence - A well run BI effort should also involve attention to protecting the most important information in the organization.
- 6) Process/structure - BI requires appropriate policies and procedures so that employees contribute effectively to the BI system.
- 7) Awareness/Culture - For BI to thrive, all in the company need to be aware of what BI is and contribute to its efforts.

3,080 questionnaires were mailed in late November 1998 to Canadian technology-intensive companies identified through STRATEGIS and relevant industry association membership lists. Of the 3,080 surveys sent out, 1280 were returned. 255 were eliminated for a variety of reasons - some were eliminated, for example, as too few answers were filled in; others as they lacked identification. In all 1,025 surveys were used in this study – just over 33%.

A 33% response rate is very high for a survey of this type. Also impressive is the fact that some 64% of responses were apparently completed by the President or CEO, and another 26% by a Vice-President. Responses were received from all regions of the country, in proportions basically similar to their representation in the initial mailing. Distribution of responses by size of company (based on number of employees, since revenue estimates are lacking for many of the firms) also mirrors the mailing list.

## RESULTS

### Average scores

The 44 questions in the survey instrument support 13 functional areas or components of CI capability. The average scores in each question and functional area are shown. For the purposes of initial analysis, we grouped the scores obtained by the respondents by quartile, and subdivided the top quartile into the top 10% and the next 15%. Group 5, containing 109 responses, achieved an average score of 59.2 out of a maximum of 83, or 72%; this group can clearly be characterized as “world-class” in CI capability.

A summary of the average scores, by quartile group, for the whole questionnaire and for each component, is provided in Table 1, below:

**TABLE 1: Average scores**

	Total	CI Awareness	CI Focus	CI Target	Collection	Analysis 1	Analysis 2
Max. Pts	83 (100%)	6	6	10	9	8	6
Group 5 (109)	59.2 (71.3%)	5.6	5.8	8.8	5.9	3.4	5.4
Group 4 (145)	47.5 (57.2)	5.3	4.6	7.3	5.3	1.8	4.6
Group 3 (258)	36.9 (44.5%)	4.6	3.4	5.8	5.2	1.1	2.9
Group 2 (265)	27 (32.5%)	3.4	2.3	4.2	4.6	0.5	1.8
Group 1 (252)	12.7 (15.3%)	1.3	1	1.6	2.9	0.2	0.6
Average		3.7 (62%)	2.9 (48%)	4.9 (49%)	4.6 (51%)	1.1 (14%)	2.6 (43%)

	Technology Assessment	Communic'n	Counter-CI	CI Culture	Employee Role	Technology Tools	KM Readiness
Max. Pts	6	3	6	6	8	6	3
Group 5 (109)	3.4	2.1	4.2	4.5	5.5	2.6	2.1
Group 4 (145)	2.2	2.1	3.3	3.8	4.6	1.2	1.3
Group 3 (258)	1.5	1.5	2.9	3.4	3.2	0.7	0.8
Group 2 (265)	0.7	1.1	2.4	2.9	2.1	0.5	0.5
Group 1 (252)	0.1	0.1	1.4	2.1	1	0.2	0.2
Average	1.3 (22%)	1.2 (40%)	2.6 (43%)	3.1 (52%)	2.8 (35%)	0.8 (13%)	0.8 (27%)

## CI Organization

It is interesting to note that of the 109 companies scoring in the top decile included 32% of those claiming to have a CI unit; 23% with dedicated, full-time CI staff; 27% of those claiming that CI is integrated throughout the company; and 6% of those with staff whose duties include part-time CI work. Therefore, a preliminary conclusion is that the chance of having world class CI practices is higher with a full time CI component. In fact, of the 13 CI functions examined in this study, 11 showed significant statistical variation with type of CI organization. This aspect of the survey results is further illustrated in Table 2, below.

**TABLE 2: CI Organization**

	Total	CI Awareness	CI Focus	CI Target	Collection	Analysis 1	Analysis 2
Max. Pts	83 (100%)	6	6	10	9	8	6
Dedicated CI Unit (25)	48	5.1	4.2	7.4	5.3	3.1	4.2
Full-time CI Staff (48)	41	4.3	3.9	6.0	5.4	2.0	3.5
Integrated CI (174)	42	4.6	3.7	6.5	5.1	1.8	3.7
Part-time CI Staff (644)	31	3.8	2.9	4.7	4.7	0.9	2.4

	Technology Assessment	Communic'n	Counter-CI	CI Culture	Employee Role	Technology Tools	KM Readiness
Max. Pts	6	3	6	6	8	6	3
Dedicated CI Unit (25)	2.2	1.9	3.1	4.1	4	1.8	1.4
Full-time CI Staff (48)	1.7	1.9	2.8	3.6	3.5	1.5	0.9
Integrated CI (174)	1.9	1.2	3.3	3.8	4	1.3	1.1
Part-time CI Staff (644)	1.2	1.2	2.5	3	2.7	0.7	0.8

## Regional Distribution and Company Size

The companies in the top decile include 11% of the Ontario respondents; 11% of Quebec respondents; 9% of those from the Western provinces; and 6% of those from the Atlantic Region. Within the top group, 48% are from Ontario, 25% from Quebec, 23% from the West and 4% from the East -- essentially the same distribution as for the total respondents.

By size, the top group included 28% of the very large firms (over 500 employees); 14% of large (100-500); 7% of medium (25-99); 11% of small (10-24); and 9% of the smallest firms (1-9 employees). Within the top group, 4% were very large and 37% were very small. Correlation company size with CI capability is summarized in Table 3, below.

**TABLE 3: Results by Company Size (number of employees)**

	Total	CI Awareness	CI Focus	CI Target	Collection	Analysis 1	Analysis 2
Max. Pts	83 (100%)	6	6	10	9	8	6
Very Small (1-9) (265)	29.8	3.3	2.6	4.3	4.3	0.8	2.5
Small (10-24) (197)	32.3	3.9	2.9	4.9	4.6	1	2.4
Medium (25-99) (157)	32.6	3.9	3.1	5.0	4.5	1	2.4
Large (100-499) (74)	35.2	4.1	3.1	5.4	5.1	1.7	2.8
Very Large (>500) (32)	41	4.1	3.8	6.6	5.3	2.7	3.6

	Technology Assessment	Communic'n	Counter-CI	CI Culture	Employee Role	Technology Tools	KM Readiness
Max. Pts	6	3	6	6	8	6	3
Very Small (1-9) (265)	1.2	1.2	2.5	2.9	2.8	0.6	0.7
Small (10-24) (197)	1.3	1.1	2.5	3.0	3.0	0.9	0.9
Medium (25-99) (157)	1.3	1.3	2.7	3.2	2.9	0.7	0.7
Large (100-499) (74)	1.2	1.2	2.6	3.5	2.5	1.2	0.8
Very Large (>500) (32)	1.4	1.5	2.9	4.2	2.7	1.4	0.8

The implication of this table is that while there are several smaller firms with top level CI, the chance of having world class CI practices is higher in larger firms. It is interesting to note that of the 13 CI functional areas examined in this study, five showed no statistical variation with firm size. In terms of provincial breakdowns, the probability of having higher level CI practices does not depend on geographic location.

How dramatic are the differences by province, size and type of function? To examine this, all 44 questions were subject to an ANOVA analysis using SPSSx. ANOVA (analysis of variance) is a statistical technique used for comparing the averages of different groups. For example, suppose that we are interested in finding out if type of BI structure is related to whether or not the company recognizes BI as a legitimate and necessary activity for business (question 16). The researcher would specify Question 16 as the Dependent variable and type of intelligence structure as the Independent variable. The program would then calculate the average responses for question 16 for each of the different intelligence structures (part time resources, full time resources, intelligence department, integrated) and then compare them to see if the differences are statistically significant.

Provincial location: - The location of the company made very little difference in responses. Of the 44 questions, only 8 showed statistically significant differences by location of the company.

Number of employees - Of the 44 BI audit questions, 19 had significant ANOVAs - with most being in the predicted direction (the larger the firm the higher the probability of a yes response).

This means that for 19 of the questions, the larger the firm (as measured by number of employees), the more likely they were to be engaged in the intelligence practice being queried.

Type of BI organization - No variable was more important in predicting type of BI activity than the sort of organization used for BI. Of the 44 questions, 36 had significant ANOVAs. In general, companies with a BI unit had higher numbers of "yes's" than any other type of structure, followed by companies with full-time BI personnel. Companies that used part-time resources had the lowest incidence of "yes" answers.

*After analyzing the results of over 1000 respondents, it was concluded that there were few differences between the intelligence practices of smaller versus larger firms with the exception of larger firms conducting more formal analysis and making greater use of their employees.*

The study looked at 40 different aspects of CI including:

- culture of information sharing
- type of analytical techniques used
- formal structure for intelligence
- counterintelligence procedures
- collection systems

Follow up interviews were carried out with several companies. Based on the responses and the subsequent scoring of the study, company practices were divided into four categories – ranging from low or non existent CI practices to world class CI practices. The results:

*While the chance of having world class CI practices was higher in larger firms, there were more small firms with top level competitive intelligence practices*

**Given these findings, the remainder of this paper looks at results by area of competitive intelligence.**

## Planning and Focus

Question #	% yes
4 Our company is only concerned about the companies with which we directly compete.	46
5 Our company produces intelligence reports and assessments on the competitors and/or emerging technologies that we believe are most important.	34
6 Our company continuously and systematically monitors our technologies globally to determine whether new competitors or technology substitutes are emerging.	59
7 We monitor and assess the activities and plans of organizations and groups whose view of our company could affect us.	41
8 Our company focuses its intelligence efforts on competitors and technologies that management has identified as important.	77
23 We interview our executives regularly to understand their intelligence	23

requirements.	
26 Senior executives' stated intelligence requirements are used to focus intelligence resources.	36
29 Our company has a variety of methods for collecting current intelligence, e.g organized methods to exploit conferences and tech. Scouting program.	35
41 We are concerned to understand the plans and intentions of not only our key competitors but also of key allies and partners, such as suppliers, distributors, investors and collaborators.	76

Nine planning questions were posed in this study. The positive elements of the responses in this section include the large number of respondents who recognized that BI is more than just asking questions about competitors but involves other aspects of the environment (76%: question 41). As well, most felt that they were focused on the needs of senior management (77%: question 8). Unfortunately, only 23% (question 26) regularly interview executives to truly understand their needs. Effective intelligence procedures require regular interviewing of executives to truly understand their needs. A second negative aspect in this section was the large number of respondents who indicated that their activities are focused only on their direct competitors (46%: Question 4). Today's competitors are unlikely to be the competitors of yesterday. As a result new entrants will be missed by these procedures.

## Collection

Question #	% yes
2 We use secondary sources of information (public literature, reports) to learn about key competitors and/or new technology.	88
10 Our employees regularly report information about our competitors or relevant emerging technologies to appropriate managers.	73
11 Our company maintains a network of human contacts outside the company that we call on to answer senior management's questions in a timely and credible fashion.	61
17 Our company collects and uses patent and scientific literature to assess our competitors' R&D programs and/or emerging technologies.	33
32 Company scientists and engineers are our primary source of intelligence on competitors' R&D programs and/or new emerging technologies.	38
33 Our contacts outside the organization are our primary source of intelligence on competitors' R&D programs and/or new emerging technologies.	44
35 Secondary information sources (e.g. publications, trade show materials) are our primary source of information.	76

Seven questions on collection were asked. One of the more positive results of the study was the high percentage of respondents who regularly get information about competitors or emerging technology from their employees (73%: question 10). Unfortunately the dominant source of information from responding companies was secondary, external sources (76%: question 35) rather than internal sources (38%: question 32). Intelligence theory posits that employees should be the dominant source of information, followed by other primary sources, this was not the case with the sampled firms.

## Analysis

Analysis is the most important part of the intelligence project process. Unfortunately this section along with the process/structure section recorded the lowest scores of any of the intelligence questionnaire sections. None of the nine analysis questions had more than 31% answering "yes". Further, the two questions that addressed higher level analytical techniques (questions 14 and 27) had fewer than 10% of the respondents answering yes. Clearly, the Canadian respondents were highly deficient in their analysis.

Question #	% yes
1 Our company regularly prepares profiles of our competitors including their R&D plans.	21
9 Our company produces assessments that address several possible outcomes of our competitors' actions and that identify the threats and opportunities those outcomes present for our company, R&D plans, new products, etc.	31
12 Our company analyzes our competitors' R&D plans and strategies to predict and anticipate their actions.	21
13 We use formal competitor analytical models such as SWOT and resource gap analysis.	12
14 We use formal psychological models such as competitor management profiling.	3
27 Our company uses advanced analytical techniques (e.g., on-line data screening, photography/imaging of competitor technology) to analyze our competitors' R&D programs and assess their future business implications.	8
28 Our company develops profiles of emerging technologies to better understand their characteristics, potential applications and market advantages.	46
40 Our company assesses our core technologies worldwide to identify advances that could impact our company.	56
43 Our company produces forecasts of key technologies that are potential competition, substitutes, or upgrades for our current and projected core technologies.	35

## Communication

Question #	% yes
30 Our staff distributes intelligence findings only to those who are authorized to see them.	39
36 Our staff distributes intelligence findings throughout the company to anyone who is interested in them.	54

While information should be given to everyone, intelligence should only be given to those who are authorized to use it. In this study 54% indicated that the results were given to everyone in the organization who is interested (question 36).

## Counter-Intelligence

Question #	% yes
------------	-------

15 Our employees understand clearly that our proprietary information and intellectual property should not be disclosed, and what to do if they become aware of potential inappropriate disclosure or access.	88
19 Our CI activities specifically include counter-intelligence, aimed at assessing the success of CI efforts directed against us.	10
25 In our communications activities (media relations; marketing, advertising; etc.) we consider the potential CI benefits that competitors could gain from our disclosures.	71

The results of this section indicate that Canadian firms generally have good protective practices. In fact, questions 15 and 25 generated the highest percentage of yes responses. Unfortunately, question 19, on assessing the results of BI activities directed against the company, which can be said to represent the highest level of intelligence practice, generated one of the lowest response rates. Security awareness is fairly high; translating that awareness into counter-intelligence is deficient.

## Process/structure

Question #	% yes
3 Our company has developed legal and ethical guidelines for the conduct of CI activities	20
20 Our company has incentives to encourage employees to report their competitive observations and information.	13
21 We proactively communicate the company's intelligence needs to employees.	36
22 We have convenient ways for employees to report observations & information.	49
31 We use information management techniques, such as data-mining, data-warehousing, OLAP or "business intelligence" software, to understand our customers.	13
34 We use the corporate Intranet as a means of storing and accessing competitive information that our employees need in their day-to-day work.	31
37 Our corporate Intranet is specifically designed to facilitate and support our CI activities.	8
39 We maintain a comprehensive map or inventory of internal information and knowledge.	26

The results of this section indicate that Canadian companies are not yet investing appropriately in building the internal infrastructure required for fully effective BI. Only 26% claimed a capability to locate internal sources of information and knowledge (question 39), for example, and apparently very little use is made of computer systems to support BI activities (questions 31 & 37). While 49% indicate that they have convenient ways for employees to report BI input (question 22), only 13% have incentives to ensure that this happens (question 31).

These indicators of structural deficiency are supported by the responses to two other questions which examined the process/structure of BI. Near the end of the questionnaire respondents were asked if they had a formal/organized system and how they formally or informally conducted BI.

The following indicates how respondents responded when asked what best described how they

are organized for conducting intelligence:

- Scattered/disorganized (2%)
- One part time person (23%)
- Several part time personnel (47%)
- One full time person (3%)
- Several full time personnel (2%)
- BI unit (3%)
- Integrated throughout the organization (20%)

When asked if they have a formal system, only 11% said yes.

These results suggest that the Canadian model of BI is currently a part time one. This runs counter to accepted BI practice, which suggests that some full time complement is needed.

## Awareness/Culture

Question #	% yes
16 Our company recognizes CI as a legitimate and necessary activity for business.	74
18 Senior company management supports intelligence activities.	76
24 Senior managers use CI regularly in their planning and decision making.	49
38 We recognize the potential CI value of information held within our company.	74
42 Our employees understand that sharing information and knowledge is important to the success of the company.	89

Of all the sections in the questionnaire, this section yielded the highest number of "yes" responses. With the exception of use by senior management (question 24), all awareness/culture questions recorded greater than 70% yes responses. This indicates a culture highly supportive of effective intelligence.

## CONCLUSIONS OF THE SURVEY

The survey portion ends with the observation that Canadian companies have a good culture to support BI but are not really practicing it. Low scores were evident in Planning/Focus, Analysis, Communication and Systems/Procedures. Medium level scores appeared on Counter-intelligence and generally a very high score in Awareness/Culture. What was most disturbing was that only 36% communicate intelligence needs to employees (question 21), yet in the collection section twice this number indicated employees regularly reported information. Taken together with the results from the planing section, this suggests that a lot of Canadian companies have employees regularly contributing information without being informed about management's information needs. Further, for those few that informed the employees what to collect (36%), less than half (44%)

actually interview senior management regularly to understand their needs.

Based on the responses and the subsequent scoring of the study, company practices were divided into four categories – ranging from low or non-existent CI practices to world class CI practices. The results: *While the chance of having world class CI practices was higher in larger firms, there were more small firms with top level competitive intelligence practices.*

In fact, of the 85 top scores, only nine came from large businesses – the rest from small and medium sized businesses, including 26 that came from businesses with ten or fewer employees. Reality 2: Small business can and does conduct world class competitive intelligence operations.

## **POSSIBLE RECOMMENDATIONS**

The key is that small businesses had to focus on fewer intelligence objectives (Key Intelligence Topics), can not conduct as varied intelligence analysis techniques and obviously can not have a formal intelligence unit with full time employees. In other words, the resource limitation required a more scaled down intelligence operation. But, small business can still coordinate collection, focus on top management concerns, train employees in intelligence, consider counter-intelligence implications of their information, share information, conduct some analytical techniques and in general be aware of the role of and need for CI.

*The key for small business is to recognize that CI for them is more about developing an appropriate culture for intelligence and a focus for intelligence activities.*

So how does a small business create a process for intelligence?

- Assign CI to someone in the organization.
- Ensure that they get appropriate training.
- Gather everyone and discuss what the key intelligence plan should be.
- Get all employees focused on reporting in the information needed for the plan – whether they find it on the net, hear it on the phone, or see it at an event – make sure they know what is important.

As well, there are several analytical techniques that are easy to learn and use just read Strategic and Competitive Analysis: Methods and Techniques by Craig Fleisher and Babette Bensoussan, 2002.

### **A final piece of advice**

Even though a firm may be small, they can collect with the strength of a large firm by using information networks. An article by Calof and Fox (2003) describes how small businesses can work together to collect information at trade shows by sharing portions of their intelligence plans.

As well, part of the network for collection should include customers, suppliers, friends, association executives, government officers and so forth – people who would like to see you succeed. By letting these associates know what information you are looking for (or even tasking them with collecting specific pieces of information), firms can expand their collection potential and may even

approach the collection capabilities of large firms.

# **EVALUATING ENTERPRISE EDUCATION IN A VIRTUAL LEARNING ENVIRONMENT: THE CASE OF E-COLLEGE WALES**

**by Mr. Paul Jones, Dr. Gary Packham, Dr. Chris Miller, Dr. David Pickernell, Dr. Brychan Thomas**  
**Welsh Enterprise Institute, University of Glamorgan Business School,**  
**Trefforest, CF37 1DL**  
**Contact: Mr Paul Jones +44 1443 654128 wpjones1@glam.ac.uk**

## **ABSTRACT**

E-College Wales (ECW) in conjunction with the Welsh Enterprise Institute (WEI), both based at the University of Glamorgan, have designed an online, interactive, Web based Enterprise degree that aims to create and develop business and enterprise skills in Objective One areas of Wales. The programme is supported by the European Social Funds and a network of Welsh Further Education colleges whose primary objective is to assist individuals and communities to generate their own economic development solutions by raising entrepreneurial awareness and improving entrepreneurial capacity.

This paper examines the need for increasing entrepreneurial activity and capacity, and considers the reasons for undertaking this through the platform of Web-based learning, and the characteristics of the first cohort of students undertaking the course. Finally, conclusions are drawn and the requirements for a future research agenda are given aimed at determining the ultimate success or otherwise of ECW.

## **INTRODUCTION**

The strategic approach taken by the University of Glamorgan and partners through the ECW project is geared towards addressing weaknesses in the SME sector, particularly business and enterprise skills, slow adoption of new technologies and the low take up of information and communications technology (ICT). Cooper et al (1988) found that people are more likely to pursue opportunities if they have developed entrepreneurship skills from previous employment. In the absence of work based learning for many individuals in the Objective One areas of Wales, ECW provides an important alternative to obtaining such information through its delivery of the BA Enterprise degree award.

The BA Enterprise Award is also aiming to ensure that support infrastructures are in place (Pickernell, et al, 2003; Jones et al, 2003; Jones et al, 2004) to provide opportunities for all members of the region to engage in new technologies, and gain access to training and support to encourage entrepreneurial activity and Community Economic Development (CED) (by providing free lap-top computers and ISDN lines to all students undertaking the course). The on-line delivery mechanism has been designed in recognition of the need to introduce more flexible methods of delivering education and training to Objective One

communities, and to exploit more effectively the potential of educational institutions to develop the skills of local populations (using local FE institutions as partners and focal points for the face-to-face contact). This requires innovative approaches to delivery, use of ICT and new technologies to support open and distance learning. The Award also addresses a number of key aims of the National Learning Strategy of Wales, including: providing better access to information and provision; developing new measures to increase and widen participation; strengthening co-operation, collaboration and partnership at the local, regional and all-Wales level.

The concept of the project is based upon forming an alliance of complementary organisations in the commercial, educational, media, communications, public and voluntary sector to deliver training and skills development. The clear focus of the BA Enterprise Award is based upon a broad partnership across these sectors, looking to:

- provide a focus in Wales for the development and promotion of excellent management, entrepreneurship and ICT skills in Welsh industry, commerce, public sector and voluntary organisations
- form the hub for future research and learning within Wales for entrepreneurship, small business management and successful practice in e-commerce
- help to create an environment for the regeneration of the Welsh economy.

As a result, the BA Enterprise Award has the aim of helping to achieve the following in Wales:

- Raising productivity and competitiveness in SMEs by updating and upgrading the knowledge, skills, competence and vocational qualifications of employees and employers, including higher level skills, ICT, basic and generic skills.
- Ensuring the development of entrepreneurship and management skills, alongside information technology capabilities.
- Encouraging a partnership approach to the modernisation of work organisation.
- Increase business start-ups through enterprise training.
- Raising the skills base and promoting entrepreneurship within existing social economy businesses.
- Promoting an understanding and appreciation of the opportunities offered by entrepreneurial activities among learners and educators alike.

The primary aim of the BA Enterprise Award is to help individuals establish, stabilise and grow their own small company. In order to achieve these objectives, technologies of e-communication, virtual classrooms, Web technology, video conferencing, broadcasting, distance learning techniques and traditional educational excellence are being used. It is envisaged that the use of these technologies in education will also stimulate their introduction into businesses large and small throughout Wales.

## **THE BENEFITS OF THE E-APPROACH**

Given the interlinked importance of education, entrepreneurship and CED within the Objective One Programme, it would seem sensible to utilise approaches that can simultaneously help meet all of these objectives. Use of ICT potentially offers such an approach, in a number of different ways. Edwards (2001) and Anderson and Simpson (1999) provide examples from Australia where provision of access to ICT has linked communities together both internally and externally with other communities and government agencies. In the UK, Edwards (1996) also outlined a clear example with

respect to education specifically in his explanation of “community learning empowerment and resources” (CLEAR), community learning utilities which exploit ICT to create widespread affordable access to education and training resources, including for those whose previous access was disadvantaged. As he argues:

*“It does not seem beyond the realms of probability that provision of community access to electronic highways at least for education and business purposes could bring a tremendous boost to a local economy. It is true that start-up costs will be very high, and the pay-off uncertain when seen from the point of view of an SME...or even a college...However, there are numerous ways in which competitive advantage and social equity can be delivered through public enablement of community access to electronic highways”*  
(Edwards, 1996, p.5)

It is also commonly agreed that knowledge will become increasingly important in sustaining a nation’s competitive advantage (Packham and Miller, 2000). In December 1999, the European Commission (EC) also launched the eEuropean initiative, with the aim of accelerating the uptake of digital technologies across Europe and ensuring that all Europeans have the necessary skills to use them. The application of digital technologies has become a key factor for growth and employment in this newly emerging knowledge based or e-economy, which is built around the Internet. The EU eLearning initiative addressed the need for Europe’s education and training systems to adapt to the knowledge society. A proposal has also been presented to create an action programme for encouraging ‘European content’ on the Internet. However, Taylor (2002) outlines a large number of problems and opportunities to on-line learning that institutions need to consider. Thus, the key to its ultimate success is the suitability of the methods it uses relative to the students’ needs and the materials to be delivered. Morgan (2000) argues that the challenge is to use e-learning appropriately, where it is optimum, and use other modes of instruction where they are most effective. Of course, in order to understand this and ascertain the usefulness of ECW, one needs to understand the nature of the main and potential delivery methods.

## POTENTIAL DELIVERY METHODS

Potential delivery methods can be used together with e-learning to provide an appropriate and effective means of instruction (Morgan, 2000). These need to be considered to determine what can be used to train individuals. Table 1 shows the training methods used in organisations which are relevant to ECW which have been researched in this paper and are described in the sub sections below.

**Table 1: Training methods used in organizations**

TRAINING METHOD	Regularly (%)	Sometimes (%)	Never (%)
<b>On-the-job training</b>	<b>87.3</b>	<b>11.4</b>	<b>1.4</b>
<b>Face-to-face</b>	<b>84.3</b>	<b>14.7</b>	<b>1.0</b>
<b>Coaching/mentoring</b>	<b>59.4</b>	<b>32.1</b>	<b>8.6</b>
<b>Formal education</b>	<b>49.6</b>	<b>46.2</b>	<b>4.2</b>

Source: ‘Training and Development 2001’ Survey Report, CIPD

## **On-the-job training**

On the job training is essentially a form of work experience, involving coaching and mentoring, and may take the form of internal secondment. The question of transferring the learning to the actual job and working environment does not therefore arise and if properly planned and carried out it can be very effective for some jobs (Reid and Barrington, 1999). Although the trainee is restricted within this environment as the trainer usually has other responsibilities, if a particular role is being focussed upon then the trainer may act as a role model. Throughout on the job training the trainee must be encouraged to learn how to learn from the experiences at work, thereby providing a relative model from which to glean knowledge and skills. Anderson et al (1998) found in their Scottish study that entrepreneurs acting as mentors were seen as very important to the success of the entrepreneurship education process. Williams and Turnbull (1996) reported that entrepreneurs felt an obligation to undertake such mentoring and teaching as they viewed it as an important method to build future markets. In the case of ECW this was influenced by the fact that students wanted to set up enterprises but many did not have equipment or businesses.

## **Face-to-face**

Voci and Young (2001) posit that traditional classroom based learning provides the social interaction that human beings need and enjoy by affording a direct exchange of ideas. Further advantages includes that learners are comfortable with the familiar and comfortable method. In addition face-to-face allows the learner to receive immediate feedback about the appropriateness and acceptance of their responses. In the case of enterprise-orientated training and education, the learner's objectives are to transfer the acquired skills into the workplace, which is very much distinct from the classroom environment. This brings in the danger of the learner not being able to cope outside the classroom, or not being able to apply the knowledge effectively (Reid and Barrington, 1999).

## **Coaching/Mentoring**

*"Mentoring has the advantage of inducting newcomers to the organisation and assisting them with organisational problems and personal development, thereby increasing motivation and job satisfaction. The mentor can also pass on the organisational culture."* (Reid and Barrington, 1999 p.241)

By comparison this method of training is inexpensive, providing an efficient method of knowledge development. Mentoring can be an extremely useful method for imparting knowledge in entrepreneurial development, and has already been used in Wales (e.g. Menter a Busnes). Cooper points out in McCarthy (2001) that entrepreneurship tends to flourish in areas already strong in entrepreneurship. However, given the need in Wales, and Objective One areas in particular, to significantly increase the relatively small base of entrepreneurs, then mentoring is not viable as a kick-start to the large scale transfer of basic knowledge. Mullen's (1997) UK wide study recommended that entrepreneurship communities able to provide guidance and advice through the entire process should be encouraged. This may become increasingly viable as the entrepreneurship base widens, and ECW may facilitate this as it builds up a database of entrepreneurs who have gone through the process and started up their own businesses.

## Formal education issues with distance-learning

ECW's distance-learning Web-based model is clearly driven by practical as well as educational considerations, given the need to reach large numbers of non-traditional students. It clearly builds upon the distance model, which in the UK largely began with the Open University model, through stand-alone Computer Assisted Learning (CAL) systems (that often tried and failed) (see Brooksbank and Pickernell, 1998; Brooksbank et al, 2001) to mimic traditional teaching and learning, to the on-line style that ECW has adopted. However, there are clearly educational issues related to online learning (see Honey, 2001) that require careful consideration prior to implementation.

## E-APPROACH OF ECW

The Chartered Institute of Personnel and Development (CIPD) define online learning as "learning that is delivered, enabled or mediated by electronic technology for the explicit purpose of training in organisations." (CIPD Website, 2002). We live in a digital age and the speed of technological advancement is transforming our society and therefore it should not be surprising that this technology has the, "potential to revolutionise training and learning." (Ravet and Layte, 2001:2). Online learning gives people access, through computers and the Internet, to everything they need to learn (Hammond, 2001) and the potential benefits can be summarised as follows:

- Cost savings. (Fry, 2001; Clarke and Hermans, 2001)
- Increased access to training. (Fry, 2001; Clarke and Hermans, 2001)
- Flexible and continual learning. (Clarke and Hermans, 2001)
- Knowledge on demand.(Thorne and Mackay, 2001)

The Internet can be used to simply transmit Web-based training materials to the users' computers to be used "off-line" by downloading the course materials. Alternatively the Web can be used as an online instructional medium itself. However, the introduction of online methods entails a sharp learning curve for the teacher also. When distanced from their students the teacher can often feel isolated (Benfield, 2000). In a classroom the teacher faces an initial struggle to establish an environment of free communication with every new class. Online it is necessary to establish a comfortable Computer Mediated Communication (CMC) facility.

Raelin (2001) also found that on-line learning technology could inhibit action (i.e. research-based) learning because of the absence of non-verbal and socio-emotional transmitted information. However, Hiltz et al (2000) presented evidence that while learning in isolation on-line may be less motivating than learning in a traditional classroom, working collaboratively on-line may actually lead to higher motivation than from within a traditional classroom setting. Canning (2002) also found that even where on-line facilities were established at work for on-line delivery of Web-based materials, the learners preferred to actually undertake their learning at home.

*"Research suggests that collaboration in an online course can enhance learning, reduce feelings of isolation, increase satisfaction with the course, and increase motivation. Unfortunately, creating an environment within which collaboration can occur doesn't happen automatically. A review of the literature suggests that for on-line collaboration to be most effective, participants must: (1) see the value of expending the (considerable) effort required, (2) be comfortable with and trust the medium, (3) be comfortable with and trust their instructor (or facilitator) and their*

*fellow collaborators, and (4) feel as though they are immersed in a rich, engaging, and rewarding social experience." (Hughes, et al., 2002)*

The need to generate such an environment becomes more important when one considers the types of student typically involved. Jones and Martinez (2001) found that compared to the general student population, students choosing Web-based distance learning courses tend to have learning orientations characterised by more self-directedness and discovery learning. Some individuals may be attracted to distance learning because it offers them an opportunity to learn autonomously and effectively without having to interact much with others. This may be especially true in the case of busy professionals who are drawn to distance learning because they do not have time to take traditional courses. This, of course, is one of the benefits of ECW. Indeed, Ragoonaden and Bordeleau (2000) found that some students actually resented having to communicate with others whose work habits were different from theirs.

There are also a number of practical difficulties that ECW has had to overcome. One obvious potential drawback of online learning is access, or the lack of it to the very excluded groups often the ones most in need of the education it offers (Fry, 2001). However, the opportunities provided by ECW make it possible to cross this divide using European Objective One funding to ensure access to those undertaking the course, through free laptop computers and ISDN lines.

Technical difficulties can also create frustration by obstructing communication, interaction and collaborative learning (Canning, 2002; Ragoonaden & Bordeleau, 2000). Diverse technological skill levels amongst learners, if not addressed, may also be demotivating (Ge et al, 2000). Learners need both to be comfortable with the technology and be aware of the correct responses to technical problems when they do arise (Hughes et al. 2002). This requires the use of skills audits and training prior to the learning process itself, to allow students to develop trust and breakdown their natural resistance (Wegerif, 1998). In the case of ECW both of these have been put into place for students undertaking the course.

This process also needs to be on-going once the students go on-line. This can take several forms. For example, Harisim (1999) created a social Web conference forum called the "coffee house." Clark (2000) suggested that students could post a public introduction and biography so that their peers could gain an immediate insight into their classmates' backgrounds, interests, and skills. This was meant to make it easier and more comfortable for them to subsequently collaborate. Group learning contracts have been successful in establishing trust and a sense of community among group members (Murphy et al, 2000). Instructors can also help in facilitating the process of both group interaction and individual student work (Canning 2002). This often requires a shift to learner-centred environments where instructors act as facilitators, mediators, and problem solvers, offering guidance and suggestions for group projects and addressing any difficulties that arise (Murphy et al, 2000; Rogers, 2000). They thus have a fundamentally different role from in a traditional classroom where Abell (2000) notes that the instructor traditionally disseminates information and students merely absorb it. In the on-line environment, knowledge is generated through relationships and interactions (student-to-student and student-to-instructor). When groups collaborate on projects, a great deal of co-ordination is required, because the development processes are more complex on-line than they are in person (Hughes et al, 2002). On-line collaboration can provide many opportunities for the on-line learner, but requires facilitation via: encouragement to students of its worth; creating familiarity with using the technology; establishing trust between instructors and students; and creating a social environment on-line to promote collaboration (Hughes et al, 2002).

Many of these measures have been put into place with e-college. It is also important to note that, as Hodson et al (2001) have pointed out, computer based learning has the ability to offer distinct advantages to adult learners (of which the e-college student set is predominantly made up). This is because on-line based learning is particularly well suited to delivering materials that support and promote experiential learning (Kolb, 1984). Furthermore, it is able to deliver this material flexibly to overcome the problems that adult distance learners experience in terms of social responsibilities, limited time etc. Gasse and Garnier (1994) found that entrepreneurship was best taught using multiple methods when the participants were not well defined or the objectives were multiple and broad. However, when specific groups and objectives had been identified then specifically suitable methods could be used. E-college's methods have been chosen to be suitable to its target audience and objectives. Tyler's (1994) analysis of suitable curricula for enterprise education found that finance, business planning and identifying market conditions were seen by business owners, professionals and community groups as the most important elements of formal curricula. ECW's curriculum has been designed to meet these needs, with the first year of the programme aiming to give the student the skills to start a business, the second year's curriculum being concerned with survival, and the final year being the growth phase part of the course.

## **A PROFILE OF ECW STUDENTS: THE STORY SO FAR**

A statistical profile of the first 183 ECW students indicates the broad nature of the audience that ECW is engaging with, and indicates some optimistic trends that can be discerned for the role ECW is playing in meeting the range of objectives outlined earlier. The geographical spread of the first cohort shows that 94 (51.4%) students are located in South East Wales and The Valleys, 57 (31.1%) are located in West Wales and 32 (17.5%) are located in North Wales. There is a relatively even spread around the Objective One areas. The course is promoting female entrepreneurship, the proportions of females on the course being much greater than those in the business community at large. This is shown by the fact that there are 74 (40.4%) females and 109 (59.6%) males.

ECW is promoting formal degree level education within non-traditional age groups. Most degrees are begun whilst students are still in the 18-20 age range. Conversely, ECW is being undertaken by students with a much broader spread of ages. For the first cohort 2 (1.5%) are under 20, 47 (25.6%) are 21-30, 53 (28.9%) are 31-40, 46 (25.1%) are 41-50, 31 (16.8%) are 51-60 and 4 (2.1%) are over 60. ECW's potential role is in increasing high level educational attainment, given that it indicates that the course represents an improvement in qualification level for nearly half the students. For the rest, ECW is also promoting entrepreneurial capacity more generally through its material.

The current employment status of students shows that 37 (20.2%) are unemployed, 50 (27.3%) are self employed, 43 (23.5%) are professional, 21 (11.5%) are academic related, 29 (15.8%) are industrial/engineering and 3 (1.6%) are other/not known. For the 20% of students currently unemployed the successful use of the course (to start their own business) will represent a reduction in unemployment/inactivity. For those currently self-employed the course, if successful, should improve their entrepreneurial capacity, whilst for the rest ECW is promoting more entrepreneurial activity.

Given the current relative paucity of finance and business related activities in Wales generally and the Objective One regions specifically, the concentration of students' business ideas in sectors such as sports/leisure, computing, engineering, hotel/catering, consultancy, business development, retail and design work also offers some grounds for

optimism about the worth of ECW. A more in-depth examination of the business ideas also revealed that nearly a third were for businesses that would serve the immediate local area (e.g. crèches), local firms (accountancy and business services) or community groups. Community enterprise type examples included creation of Web sites of local entertainment, for communities, and for linking communities and schools, a consultancy for small voluntary groups, and a local skills centre for teaching agriculture, horticulture and woodwork. Firms supplying local IT training and advice, access (cybercafés) and home computer repair were also strongly represented, which is of obvious importance given that many of the communities in the Objective One areas do not have proximate access to these services.

When examining the business ideas it is also clear that over a third of the students are already in small businesses or community activities and are using the course to advance skills linked to their existing employment. The spread of these people also fits in with the patterns mentioned earlier, in that two thirds of the people already working in these activities were to be found in the West Wales parts of the Objective One area, and only a third in the relatively entrepreneurially deficient Valleys area. Included amongst these existing players were managers of local charities, youth organisations, and organisations to help community groups, all of whom hoped to improve their capacity to run their organisations. Thus, whilst the course is specifically designed to encourage entrepreneurship in the Objective One areas, it is also having the potential knock-on effect of improving the capacity of community-based organisations and increasing the goods and services available to local communities provided by members of local communities themselves.

## **CONCLUSIONS: DEVELOPING THE RESEARCH AGENDA FOR ECW**

The initial signs for ECW are encouraging. In a number of broad interlinked areas related to increasing educational, technological, entrepreneurial and community capacity and participation, ECW can be seen as a potentially very successful delivery mechanism. This involves a blended learning approach to supplement and enhance the online learning experience due to the specific needs of the students. The challenge will be to spread this approach further afield to other areas and countries especially as the nature of the individual can be very much different from the traditional Higher Education student. ECW, however, is at an early stage and this brief examination of the issues indicates a number of areas where further research is needed. A full evaluation of ECW will be a long-term project. However, there are a number of shorter-term projects that could fit into this research agenda.

Further research into the effectiveness of the digital delivery mechanism of enterprise education and analysis of whether the systems adopted should be changed/added to in future (e.g. mentoring) would seem to be necessary. This may be analysed both specifically and also in comparison with other enterprise education initiatives. This could include a psychological profile of e-learners against the literature to determine whether the course is attracting “traditional” entrepreneur types. There is already much literature on this issue (see for example, Gaedeke 1995; Cooper et al, 1988; Miner 1996), but the degree to which successful entrepreneurialism can be predicted by psychological characteristics is still a topic of debate.

The significance of the virtual enterprise degree course to the economic and social structure of Wales also needs to be examined. This should include an examination of the ways in which overall entrepreneurial capacity has been affected by the programme. This could involve a longitudinal study of student activity to assess the effectiveness of on-line delivery of enterprise education in terms of its comparative impact on business start-up and growth. A sectoral study of the companies created (and their success or otherwise) compared with the existing structure of the Welsh economy and the sectoral make-up of business start-ups in Wales may also form part of this. An examination of the CED effects of e-college in terms of capacity building, community businesses and networking within, and between, communities would be of significant use to policy makers and funding providers. The specific effects of the course will also require analysis, particularly whether entrepreneurial skills gaps have been closed as a result of e-college.

The analysis of the ECW project will cut across the neo-classical distinctions between production, utilisation, consumption and governance, because the potential effects of ECW are wide-ranging. The effects of globalisation are making the old reliance upon inward investment a risky strategy as multinationals fragment operations in search of cost advantages. Instead, internally driven economic development will become increasingly important. Based on the proverb, "If you give someone a fish they will eat for a day, but if you teach them how to fish, they will eat for a lifetime", ECW is an important tool helping to deliver improved economic and social performance in Wales.

University of Pittsburgh

# Production Regions

Allentown-Bethlehem-Easton, Harrisburg,  
Lancaster, Reading, York

- High Degree of Industrial and Economic Vitality
- Top in Generating Jobs
- Substantial Human Resources
- Affordable
- Role of Higher Ed:
  - Build Linkages with Innovation Regions
  - Maintain Competitive Edge: Workforce Development
  - Community Anchors

# Stressed Regions

Altoona, Erie, Scranton–Wilkes-Barre–Hazleton, Sharon

- Substantial Challenges To Maintain Population And Employment
- Not Likely To Benefit From General Improvements In State
- Comprehensive Approach Required
- Role Of Higher Ed:
  - Community Anchors
  - Workforce Development
  - Conveners

# Slipping Regions

## Johnstown, Williamsport

- Lagging The State In All Ways—beyond Stressed Regions
- Lack Resources To Solve Own Problems
- Will Require Specific And Direct Support From State
- Role Of Higher Ed:
  - Community Anchors
  - Workforce Development
  - Conveners

# Setting the Stage

- What Are The New Realities?
  - The Realities Facing Everyone
  - Additional Realities Facing Universities/Colleges
- What Are The New Requirements?
  - New Thinking About Economic Development
  - New Thinking About University/College Mission
- What Are The New Opportunities?
  - Benefits Can Be More Widely Shared
  - A New Common Ground Is Possible

# New Reality: Change

**1999:** *During the the late 1990s the US research university began to be anointed as the poster child of the knowledge economy.*

**2001:** *“Only two entities in our society are basically still operating as they were 100 years ago. One is education; the other is government. Everything else in the world has changed with the advance of technology. These two things kind of grind along in 19<sup>th</sup> century form.”*

--Craig Barrett,  
Intel Corporation

# Powerful Engines of Discovery

## Are They Being Fully Tapped?

- Recognizes universities are the locus for multiple innovation “ingredients” (talent, interdisciplinary teams) for regions
- Recognizes that barriers to innovation have been traditional “walls” that separate universities, industries and entrepreneurs
- Recognizes the power of “tacit knowledge”

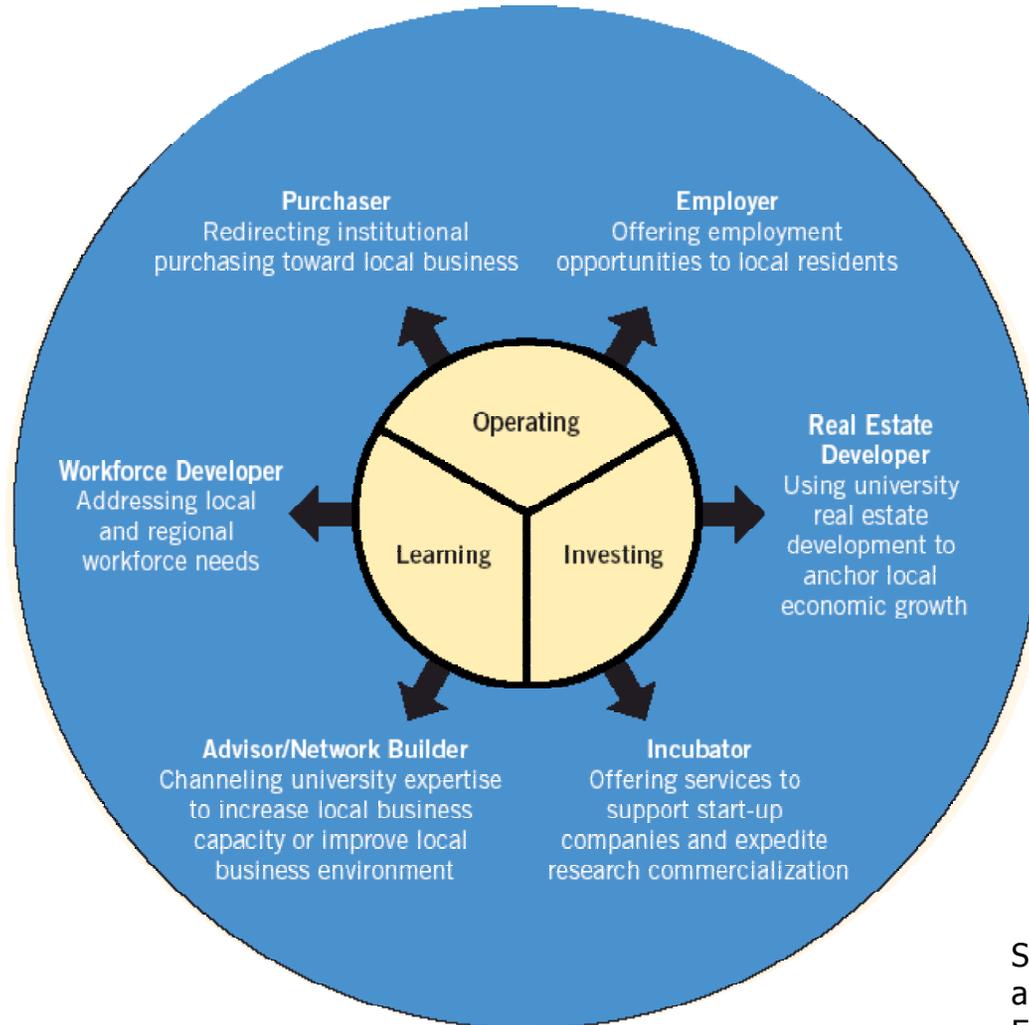

# New Way of Thinking About Roles

- Create an explicit urban ED strategy focused on the surrounding community
- Include meaningful community participation and dialogue
- Charge specific areas with explicit ED goals
- Create a high-level champion to oversee/advance the effect
- Integrate university leadership to serve on community initiatives and boards
- Think long-term

## **INTRODUCTION**

South Africa is by far the richest and most economically developed country in Southern Africa. Its industrial sector is well developed and active, and a healthy competition makes its companies more efficient. In a world characterised by a growing interdependence among national economic systems, however, being competitive means being able to face international competition and to operate in foreign markets. The presence of South African companies in foreign markets is increasing but, still, it is concentrated in a few industries and mostly among larger companies.

South African Small and Medium sized Enterprises (SMEs) still do not contribute in a significant way to South African exports and appear reluctant to push into foreign markets. South Africa needs SMEs to sustain widespread growth that big business alone has not been able to deliver. But also for SMEs being competitive means the ability to succeed in foreign markets.

Indeed, in a context of increasing globalisation, the internationalisation process is no longer a choice<sup>1</sup>, even for South African SMEs, but a path to follow in order to be

---

<sup>1</sup> This is certainly not a novelty: more than twenty years ago Levitt wrote: "Companies that do not adapt to the new global realities will become victims of those that do". LEVITT T., "The globalisation of Markets", in *Harvard Business Review*, vol. 61, May-June, 1983, p. 102.

competitive<sup>2</sup>. Alternatively, the risk is to endure passively the expansion of competitors on the local markets, putting into danger the survival of the business. Indeed an interesting - and unforeseen by most theories - feature of the globalisation process is the growing involvement of small businesses<sup>3</sup>. This involvement, however, is not equally strong across the globe. While in most industrial and industrialising countries for many small businesses it represents an opportunity to be taken, in less industrialised countries for many small businesses globalisation appears as a serious threat. This seems to be the case for most African countries, including South Africa. In this country, the small and medium enterprises seem to endure international competition on their home market without succeeding in creating a space for themselves in foreign markets. The proportion of exports generated by South African SMEs is worryingly low. It is clear that it is of vital importance that the competitiveness of the South African enterprises, specifically SMEs, in international markets be improved. In order to achieve this, it is necessary to understand how South African companies, larger ones and SMEs, move in foreign markets.

This paper presents one side of a study, aimed at comparing attitudes of exporting SMEs in African and European countries in order to understand the reasons of the latter's SMEs success in international markets and to evaluate the teachings that can be extracted for helping the former to be more competitive internationally.

It is well established in literature that companies can approach foreign markets in significantly different ways. These can be distributed between two extreme positions, the proactive approach and the reactive approach to internationalisation.

The former implies that the company makes a clear strategic choice, deeming important to be able to operate on a regular basis in foreign markets, wherein it tries to penetrate carefully and deliberately planning its way<sup>4</sup>. Opposite to this is the passive approach, typical of companies that albeit present in foreign markets, deem such a presence of limited importance for the company itself and incidental to their adapting to transitory circumstances.

For a long time it was assumed that SMEs would adopt, as a matter of course, the latter approach to internationalisation and that only following a process of steady growth they would – almost while shedding their nature of SME – be able to embrace the former. Recently, however, empirical research in many countries<sup>5</sup> has shown that a small but growing proportion of SMEs displays a clearly proactive approach to foreign markets.

Another tenet in the understanding of how SMEs move in international markets is the theory of the stages approach to internationalisation, which traces, with slight differences among authors, a sort of path in the internationalisation process of SMEs. The firm moves (or can move) from a stage where it is completely uninterested in foreign markets, through sequential steps, to the condition of experienced exporter, strongly present in all the world markets.

---

<sup>5</sup> As an example see: JULIEN P.A., JOYAL A. DESHAIES L., RAMANGALAHY C., "A typology of strategic behaviour among small and medium-sized exporting businesses. A case study.", in *International Small Business Journal*, vol. 15, 1997; and TREVISAN I., "I modelli di approccio incrementale ai mercati esteri e i percorsi di internazionalizzazione delle imprese minori del Triveneto", in *Piccola Impresa Small Business*, n 1, 2001.

This model, developed by the “Swedish school”<sup>6</sup> and subsequently readapted by various authors<sup>7</sup>, maintains that the expansion of SMEs in foreign markets happens incrementally, with the timing and the happening of the various steps influenced by their growing knowledge of foreign markets, and growing confidence in their capability of acting in such markets, due to their increased expertise therein.

The stages approach theory has been variously criticised as being too deterministic<sup>8</sup> and cannot be considered as the only possible model of SMEs internationalisation. Indeed, it increasingly appears that SMEs tend to leap-frog one or more stages in the sequence, both in terms of where they firstly enter in foreign markets<sup>9</sup> and in the intensity of their initial presence therein. In particular, it must be pointed out the growing phenomenon of the so-called “Born Globals”: companies, sometimes SMEs, which aim at foreign markets since their establishment<sup>10</sup>. Usually they are technology-oriented companies that develop innovative products or production processes.

The present study takes into consideration South African SMEs in the textile and clothing industry. Specifically, in this paper, their attitude towards foreign markets will be analysed: whether it is reactive or proactive, as well as whether their moves in those markets can be well explained by the sequential path laid out by the stages approach theory.

In order to set these findings in their proper context, the internationalisation process of larger South African companies will also be analysed.

## METHODOLOGY

The study of the internationalisation routes taken by the firms under examination is based on the analysis of interviews with their owners or export managers carried out using a questionnaire<sup>11</sup>:

South African firms operating in the textile and clothing industry were identified, about eight hundred of them were contacted and a questionnaire was either given directly to them, in the Pretoria-Johannesburg area, or sent them by mail or e-mail, in the rest of South Africa. The return rate was low and we collected or received back 82 questionnaires. The sample is then made up of those who were willing to return the questionnaire; therefore no statistical representative-ness can be claimed for it. Some of the questionnaires received were incomplete or otherwise not usable, mainly because the answering firm was not a manufacturer but only a trader. We kept in our sample 11 questionnaires of firms that besides being manufacturers are also distributors of imported

<sup>11</sup> The questionnaire was drawn up in such a way as to be applicable to any enterprise, irrespective of size or sector. The type of question is based mainly on hypotheses made in the literature on internationalisation.

clothing or textile products. In the end our sample is composed of 69 SMEs, 43 of them exporters; 26 are in the textile industry, 37 are clothing producers and 6 are in specialised productions.

The tool for the research is a questionnaire specifically developed, consisting of four parts: two, related to the characteristics of the firm and the factors that in their perception are an obstacle to their exports (actual or planned), were aimed at all the businesses, while the other two, related to the reasons for their decision to operate in foreign markets and the timing and the extension of their internationalisation process, were aimed at the firms that are actually exporting. Almost all the questions were closed or semi-closed questions, most of them with pre-coded multiple answers. Some questions consisted of a number of items whose importance had to be evaluated on a scale from 1 (irrelevant) to 7 (most important).

In this paper the analysis of the results is mostly descriptive, in order to establish the path towards internationalisation followed by these businesses and comparing it with what appears to be the normal internationalisation process of SMEs as is reported in literature.

## **THE SAMPLE: STRUCTURAL CHARACTERISTICS OF THE FIRMS**

The clothing and textile industry is among the most important manufacturing industries in South Africa, producing about 6.5% of the total manufacturing output of the country. Its role in the country's export is, however, rather marginal: in 2001 textile and clothing exports amounted to US \$ 544 million, only 1.9% of the total.

About 530 textile and 2,300 clothing productive units were counted in the year 2002<sup>12</sup>, including the micro enterprises. According to the South African Clothing Federation (Clofed) 654 firms were operational in the clothing industry in 2001. The 800 firms contacted during the research are about one third of the total and more than one half, if micro enterprises are excluded. The sample used, thus, despite the low rate of return of the questionnaires, represents 5.6% of the clothing companies numbered by Clofed and about 5% of the textile productive units counted in South Africa.

Most of the firms in the sample (62%) are limited companies, a few of them (9%) public ones. All the larger firms belong to this category, while among the SMEs, the largest group is made up of partnerships (42%). Among these firms, sole proprietorships and public limited companies are in the same proportion (9%). There is a correlation between size of the firm and type of ownership: most of the limited companies tend to be larger businesses, all the other firms are SMEs. However, this correlation is weak. There is one single proprietorships and one partnerships among the firms with 150 to 249 employees, while there are limited companies in all the classes of employees, including that from 1 to 4.

Of the 69 firms of the sample, 48 (69,6%) are SMEs (the E.U. definition of SME as a company with less than 250 employees, is adopted). The proportion of SMEs among the 43 exporters of the sample is only slightly lower: 26 firms corresponding to 60,5% (see

---

<sup>12</sup> NAUMANN E., "An analysis of the spatial distribution of the clothing and textile industry in SADC", in DPRU WORKING PAPER N. 02/66, 2002.

table 1). More than half (56,5%) of the sample is made up of firms with up to 100 employees, the largest group being the class between 21 and 50 employees (27,5%). The next two classes in order of size are those of the larger companies (between 250 and 500 and more than 500 employees, almost equally represented).

**Table 1 The dimension of the firms (employees)**

Employees	All firms		Exporters	
	N.	%	N.	%
Between 1 and 4	1	1.4	-	0.0
Between 5 and 10	5	7.2	2	4.6
Between 11 and 20	6	8.7	3	7.0
Between 21 and 50	19	27.5	9	20.9
Between 51 and 100	8	11.6	6	13.9
Between 101 and 150	4	5.8	1	2.3
Between 151 and 249	5	7.2	5	11.6
Between 250 and 500	10	14.5	6	13.9
More than 500	11	15.9	11	25.6
Total	69	100.0	43	100.0

It can be noticed that while all the companies in the larger class are exporters, only 60% of those in the second largest are.

Examining the sample according to the other parameter for the dimension of the firms, the turnover, it appears that almost a quarter of the firms have a low turnover of less than € 500,000 and for another 30% the turnover stays below € 2,5 million. (see table 2).

**Table 2 The dimension of the firms (turnover)**

Turnover	All firms		SMEs		Larger companies	
	N.	%	N.	%	N.	%
Up to € 125,000	6	8.7	6	12.5	-	-
From € 125,000 to € 250,000	5	7.2	5	10.4	-	-
From € 250,000 to € 500,000	6	8.7	6	12.5	-	-
From € 500,000 to € 1 million	6	8.7	6	12.5	-	-
From € 1 million to € 2.5 million	14	20.3	14	29.2	-	-
From € 2.5 million to € 5 million	6	8.7	5	10.4	1	4.8
From € 5 million to € 12.5 million	10	14.5	3	6.3	7	33.3
From € 12.5 million to € 25 million	9	13.0	1	2.1	8	38.1
From € 25 million to € 50 million	1	1.4	1	2.1	-	-
More than € 50 million	4	5.8	-	-	4	19.0
N.R.	2	2.9	1	2.1	1	4.8
Total	69	100.0	48	100,0	21	100,0

All these companies are SMEs, the larger companies start appearing, albeit one firm only, in the next class of turnover, up to € 5 million. If it is true that the larger companies show a high turnover, the converse – firms with a high turnover are larger companies – does not apply. Indeed more than 20% of the SMEs have a turnover of € 2.5 million and higher (and two of them higher than € 12.5 million). Among the SMEs, higher turnover generally but not necessarily means larger size; indeed, the SME with the higher turnover is the smallest firm of the sample. This is explained by the fact that a large proportion of its turnover is due to the sale of imported products, while only a smaller proportion is due to its own

manufactured products. This applies also to a couple of other SMEs with high turnover, but most of them are pure manufacturers.

Most firms have been in business for a long time: only one quarter of them was established after 1990 and almost half (48%) before 1981(see table 3). This can be considered as a sign of solidity and good management of these firms; at least insofar as the long term survival of the business was attained.

There is a clear difference between SMEs and larger companies in terms of year of establishment, and the SMEs are more recent: one third of them was established after 1990 (and the only firms in the sample born after 2000 are SMEs) and exactly two thirds after 1980.

**Table 3 Year of establishment of the business**

Period		Before 1945	1945-1960	1961-1980	1981-1990	1991-2000	After 2000	Total
All firms	N.	7	10	15	19	16	2	69
	%	10.1	14.2	21.7	27.5	23.2	2.9	100.0
SMEs	N.	4	4	9	16	13	2	48
	%	8.3	8.3	18.8	33.2	27.2	4.2	100.0
Larger companies	N.	3	6	6	3	3	-	21
	%	14.3	28.6	28.6	14.3	14.3	0.0	100.0

The main concentration of firms birth is in the period 1981-1990, but births among large companies are concentrated in the period 1945-1960, followed by 1961- 1980 (the former has a higher rate per year). SMEs are clearly younger and make up more than 80% of the firms in the sample founded after 1990. We will discuss presently whether this affects the presence of those firms in the foreign markets.

## ATTITUDE TOWARDS EXPORTS

Close to two thirds of the firms in the sample are exporters (see table 4). The situation, however, is rather different if the size of the firms is taken into consideration.

While only slightly more than half of the SMEs sell in foreign markets, more than four fifths of the larger companies do so.

**Table 4 Exporters in the sample**

	SMEs		Larger		All firms	
	N.	%	N.	%	N.	%
Exporters	26	54.2	17	81.0	43	62.3
Non-exporters	22	45.8	4	19.0	26	37.7
TOTAL	48	100.0	21	100.0	69	100.0

Looking at the data from another angle, it appears that the larger companies (which are about 30% of the sample) represent 40% of the exporters and only 15% of the non-exporters. This might be taken as a tentative indication that the firms in the sample comply with the traditional view that a larger size makes it easier deciding to operate in foreign markets. A closer look, however, shows that the reality is more nuanced.

Almost 18% of them earn from foreign markets more than half of their turnover. But also almost 12% of the SMEs are in the same condition and they are exactly one half of such strong exporters in the sample as a whole (see table 5). Looking at the other end of the range, the firms that are marginal or moderate exporters (up to 10% and 30% of turnover from exports, respectively) form almost 70% of the SMEs and 82% of the larger companies.

Using as a gauge of the importance of foreign markets for the business, the proportion of turnover earned abroad, it can be noticed that the prevalence of larger companies somewhat disappears.

**Table 5 Turnover from exports**

Exports as % of turnover	SMEs			Larger companies			All firms	
	N.	%	%Exp	N.	%	%Exp	N.	%
No exports	22	45,8	N/A	4	19,0	N/A	26	37,7
1-10%	15	31,3	57,7	7	33,3	41,2	22	31,9
10,1-30%	3	6,3	11,5	7	33,3	41,2	10	14,5
30,1-50%	5	10,4	19,2	-	-	-	5	7,2
50,1-75%	2	4,2	7,7	2	9,5	11,8	4	5,8
Oltre 75%	1	2,1	3,8	1	4,8	5,9	2	2,9
<b>Total</b>	<b>48</b>	<b>100,0</b>		<b>21</b>	<b>100,0</b>		<b>69</b>	<b>100,0</b>

In terms of intensity of the presence in foreign markets, then, it appears that the SMEs that are actually exporters tend to be, in a greater proportion than larger companies, strongly involved in these markets. The most important consideration that can be made from these data, however, is that within the limits of the sample, South African textile and clothing companies appear rather slothful in their involvement with international markets.

The two groups of exporters and non-exporters can be further subdivided to take into consideration the stages approach model. Classifying the attitude towards exporting of the firms of the sample according to the different stages as established by Bilkey and Tesar<sup>13</sup>, the situation reported in table 6 can be observed.

Non-exporters are divided between those who are not interested in foreign markets, which are all SMEs, (6% of the sample and a little more than one sixth of the non exporters) and those who claim to be interested in exporting but have not yet started doing so (32% of the sample). In the following stages are distributed the exporters, the largest group of whom (25% of the sample) exports regularly, but only to one or few countries (most of them to the U.S.A. or the E.U.).

**Table 6 Attitude towards exports**

	SMEs			Larger			All firms		
	N.	%	% Exp	N.	%	% Exp	N.	%	% Exp
<b>Not interested in foreign markets</b>	4	8,3	-	-	-	-	4	5,8	-
<b>Interested, but not yet exporting</b>	18	37,5	-	4	19,0	-	22	31,9	-
<b>Satisfies unsolicited orders</b>	1	2,1	3,8	-	-	-	1	1,4	2,3
<b>Exports, but not regularly</b>	9	18,8	34,6	5	23,8	29,4	14	20,3	32,6
<b>Exports regularly in one or few countries</b>	9	18,8	34,6	8	38,1	47,1	17	24,6	39,5

<sup>13</sup> Bilkey W. Tesar G., "The export behaviour of smaller Wisconsin manufacturing firms", in *Journal of International Business Studies*, spring-summer, 1977.

<b>Exports regularly in many countries</b>	7	14,6	26,9	4	19,0	23,5	11	15,9	25,6
<b>TOTAL</b>	48	100,0	100,0	21	100,0	100,0	69	100,0	100,0

The really international firms are those that export regularly in many countries and they comprise 16% of the sample. None of the firms interviewed said that they have invested in foreign countries, therefore, at least among the businesses of the sample, South African textile and clothing firms have not yet reached the last stage in the model, that of the Foreign Direct Investment.

The difference between SMEs and larger companies is again clear to see among non-exporters, while it becomes blurred among exporters. Since in the sample there is a prevalence of SMEs (70%), it is not strange that they are a majority also of the exporters. However in two of the three principal classes of exporters, including those that export regularly in many countries, they are almost two thirds of the total. Furthermore, to the latter class belong 27% of the exporting SMEs, versus 23.5% of the larger exporting companies.

There is, then, no particular prevalence of larger companies among the exporters, not even when looking at those that have the strongest involvement in foreign markets. The same conclusion can be reached when type of ownership is taken into consideration. It is true that among the most internationalised exporters, only limited companies are present. But among regular exporters to one or few countries, one third are sole proprietorships and partnerships, a type of ownership not normally associated with strong involvement in foreign markets. Also in terms of size, similar remarks can be made. One sixth of the companies that are present regularly in many countries have a turnover of between € 1 million and € 5 million and less than 100 employees.

When looking at the motivations that led the firms to start their adventure in international markets, 13 motivations were mentioned in the questionnaire and the respondents had to evaluate them on a scale ranging from 1 (irrelevant) to 7 (most important).

Table 7 gives the average mark and the standard deviation for each item. The motivations are grouped: in the upper half of the table there are the reactive motivations and in the lower half the proactive ones.

**Table 7 Reasons for starting exports**

	Motivation	SMEs		Larger companies		TOTAL	
		Average	$\sigma$	Average	$\sigma$	Average	$\sigma$
1	Unsolicited foreign orders	3,24	2,14	1,92	1,04	2,74	1,90
2	Saturated domestic market	3,67	2,31	5,00	1,88	4,20	2,22
3	Excess capacity	3,41	2,22	3,71	2,02	3,53	2,12
4	Decrease in domestic market share	3,41	2,52	4,21	2,04	3,72	2,35
5	Competitive pressure	3,45	2,28	3,57	2,10	3,50	2,18
6	Imitation of competitors	2,59	1,94	2,71	1,77	2,64	1,85
7	Proximity to foreign markets	2,40	1,70	2,79	1,67	2,56	1,67
8	Prestige of the business	3,90	2,17	3,86	1,99	3,89	2,07
9	Profit goals	5,81	1,69	5,27	2,12	5,58	1,87
10	Development goals	5,00	1,97	4,86	2,14	4,94	2,01
11	Diversification of markets	4,81	1,94	5,14	1,92	4,94	1,91

<b>12</b>	Unique product	3,90	2,38	3,00	2,32	3,54	2,37
<b>13</b>	Technological advantage	3,00	2,14	3,21	1,97	3,09	2,05

The most important reason for entering foreign markets, with an average mark of 5.58, is profit goals, followed by development goals (4.94) and diversification of markets (4.94). These are all proactive motivations. The first two reactive ones, saturated domestic market (4.20) and decrease in domestic market share (3.72), rank fourth and sixth. Of six proactive motivations five are in the first seven places for importance. The missing one is technological advantage (3.09) that ranks tenth. The least important motivations are, from the bottom, proximity to foreign markets (2.56), imitation of competitors (2.64) and unsolicited foreign orders (2.74). The standard deviation, however, is rather high for all the items (the lowest is for proximity to foreign markets, 1.67). Indeed, excluding the two least important motivations that no firm considered of the utmost importance (maximum score was 6), all the others have been considered either irrelevant or most important by some firm.

There are, however, differences between SMEs and larger firms, in terms of order of importance, average mark and standard deviation. The average marks of the SMEs are in part higher for proactive motivations and mostly lower for the reactive ones (the main exception being unsolicited foreign orders). The standard deviation is slightly higher among SMEs for proactive motivations. Table 8 gives the motivations in the order of importance attributed to them by the two groups of firms (in **bold** type are the proactive motivations). The pattern of these differences confirms the evolving nature of SMEs internationalisation.

The first five motivations for the SMEs are all proactive ones. In the case of the larger companies the fifth one is in ninth place. This points to a more proactive approach to internationalisation among the SMEs than among larger companies. This is not completely unexpected since, as mentioned earlier, a growing body of empirical research shows that a small but increasing proportion of SMEs displays a clearly proactive approach to foreign markets.

**Table 8 Reasons for starting exports, in order of importance**

<b>SMEs</b>		<b>Larger companies</b>	
<b>Profit goals</b>	5,81	<b>Profit goals</b>	5,27
<b>Development goals</b>	5,00	<b>Diversification of markets</b>	5,14
<b>Diversification of markets</b>	4,81	Saturated domestic market	5,00
<b>Prestige of the business</b>	3,90	<b>Development goals</b>	4,86
<b>Unique product</b>	3,90	Decrease in domestic market share	4,21
Saturated domestic market	3,67	<b>Prestige of the business</b>	3,86
Competitive pressure	3,45	Excess capacity	3,71
Decrease in domestic market share	3,41	Competitive pressure	3,57
Excess capacity	3,41	<b>Technological advantage</b>	3,21
Unsolicited foreign orders	3,24	<b>Unique product</b>	3,00
<b>Technological advantage</b>	3,00	Proximity to foreign markets	2,79
Imitation of competitors	2,59	Imitation of competitors	2,71
Proximity to foreign markets	2,40	Unsolicited foreign orders	1,92

Nevertheless, having this confirmed also for South African SMEs, notoriously lukewarm in their approach to foreign markets, is a sign that one of the effects of globalisation, which applies also in some developing countries, is to launch towards active internationalisation

a growing proportion of SMEs. What is unexpected, however, is that SMEs look more proactive than larger companies. This, from the data previously discussed, unfortunately appears caused more by limited interest in foreign markets on the side of the larger companies rather than by the SMEs being actually strongly export oriented.

Another aspect that shows weakness in the approach to foreign markets of the South African firms of the sample is that technological advantage (3.09 in the whole sample) is valued among the least important motivations. The relatively high value of the standard deviation for this item shows that this does not apply uniformly to all the firms: indeed 31% of the sample considers this motivation as important (evaluation 5 or higher). Again it is the SMEs that reveal stronger competitive potential: 38% of them valued technological advantage as an important reason to start exporting, against 21 % of the larger companies. A similar situation is revealed when uniqueness of the product is considered. Here, 14% of the larger companies say that this was a most important reason to start exporting; this is the same proportion as among SMEs, but the other larger companies rank this item as of little or no importance (4 or less) while among the SMEs a full 47% ranks it as important.

Examining the motivation for starting to export, then, the South African SMEs in the textile and clothing industry appear to have reasons to feel confident in their ability to compete in international markets.

## THE PACE OF INTERNATIONALISATION

The majority (53%) of the firms of the sample have started to move abroad only recently, and the pace at which they did so increased toward the end of the century, to slow down in the last couple of years (see Table 9). A strong group of firms (35%), both larger companies and SMEs, have a longer experience in foreign markets (12% of the sample did not answer this question).

**Table 9 Period of the beginning of exports**

	SMEs		% N.=23	Larger companies		% N.=15	TOTAL	
	N.	%		N.	%		N.	%
<b>2001-2002</b>	2	7,7	8,7	2	11,8	13,3	4	9,3
<b>1999-2000</b>	5	19,2	21,7	3	17,6	20,0	8	18,6
<b>1996-1998</b>	5	19,2	21,7	1	5,9	6,7	6	14,0
<b>1993-1995</b>	2	7,7	8,7	3	17,6	20,0	5	11,6
<b>Before 1993</b>	9	34,6	39,1	6	35,3	40,0	15	34,9
<b>Total answers</b>	23	88,5	100,0	15	88,2	100,0	38	88,4
<b>N.R.</b>	3	11,5		2	11,8		5	11,6
<b>Total</b>	26	100,0		17	100,0		43	100,0

The main difference between SMEs and larger companies is that it appears that the former have been slower in taking advantage of the new environment, more conducive to South African firms' presence in foreign markets: 9% of the SMEs that answered this question started exporting in the period 1993-1995, while a full 20% of larger companies did so. This is the only period when SMEs are outnumbered. In this regard, it is remarkable that practically the same proportion of SMEs and larger companies (40% of those that answered) were already active in foreign markets in a period when South African exports, particularly from light manufacturers, were hindered by politically motivated obstacles.

Indeed, within the sample more SMEs than larger companies started exporting in that period. If SMEs have been slower in taking advantage of the new conditions, they have not been very far behind. In the following years, quite a few of them took the plunge and started exporting. However, in the last couple of years a smaller proportion of SMEs moved abroad.

Among the countries where the first contact was made UK and USA stand out, with just short of 25% and 20%, respectively. Then there is Germany with just more than 10% and Zimbabwe, which has the same proportion of first movers, if a company that started exporting quite a few years ago to then Rhodesia is included. Neighbouring countries sum up almost 25% of the first movers but, a bit unexpectedly, there is an almost even split between the companies that moved there in the last ten years and those that did so earlier. Interestingly, first movers to the USA make up one third of the firms that started exporting in the last four years (UK and Germany make another third). This spurt of first exports to the USA, after a ten years' interval, can be, at least in part, attributed to the AGOA (African Growth and Opportunity Act) of 2000. On the other hand, the TDCA (Trade, Development and Cooperation Agreement) with the E.U., might have had less influence, since first exports to European countries, in particular the UK, are present in all the periods. The fact that two thirds of the first destinations of exports are distant countries (Europe, USA, Australia) is clearly linked to the origin or background of the owners. To support this, it can be noticed that the firms that have as first country for their exports an "exotic" country (China and Iran) are run by people who originate there. In this light, what appears unusual is the fact that more than 20% of the first moves were towards a neighbouring country, because they are the only ones that do not fully comply with the stages approach model that has as first destination of the exports of a firm countries that are geographically and culturally close (this is the only explanation: Europe, USA, China and Iran are in the respective cases closer to the firm than Botswana or Zimbabwe. The alternative explanation that the exporting companies of the sample are particularly globalised and adventurous does not stand up).

Another important tenet of the stages approach model is that firms take a step by step and prudent approach to their internationalisation, and take their time before they decide to move to foreign markets, consolidating their presence in the home market before taking the risks linked to operating in other countries. It is possible to check if it applies to the sample under study by measuring the time lag between the establishment of the firm and the beginning of exports.

Of the 35 firms that answered the questions, more than half (55%) took ten years or more before deciding to tackle foreign markets, and almost one third (31%) took more than twenty years (see table 10). This proportion is higher for larger companies (66% and 53% respectively) than for SMEs (45% and 15%, respectively). This cannot be attributed to the fact the latter are younger than the former. It is true, but among the exporters 43% of the SMEs have been established more than twenty years ago and another 35% have been established between ten and twenty years ago.

**Table 10 Time lag between the establishment of the firm and the beginning of exports**

	SMEs		Larger companies		TOTAL	
	N.	%	N.	%	N.	%
<b>0-1 year</b>	3	15,0	2	13,3	5	14,3
<b>2-4 years</b>	2	10,0	2	13,3	4	11,4
<b>5-7 years</b>	3	15,0	-	-	3	8,6

<b>8-10 years</b>	3	15,0	1	6,7	4	11,4
<b>11-20 years</b>	6	30,0	2	13,3	8	22,9
<b>&gt; 20 years</b>	3	15,0	8	53,3	11	31,4
<b>Total answers</b>	20	100,0	15	100,0	35	100,0
<b>N.R.</b>	6		2		8	
<b>Total</b>	26		17		43	

In contrast with that 55% of reluctant exporters, stands a group of firms that have moved to foreign markets in a very short time, if not since their establishment. They make up 25 % of the sample, almost evenly divided between those that first exported after three or four years of life and those that did so in the year of their establishment or the year after that (11% and 14% of the sample, respectively). They are also almost evenly divided between SMEs and larger companies, the former being 56% to 44% of the latter. This is particularly worth noticing because it shows that, within this sample, some South African textile and clothing SMEs are showing, albeit in a not too large proportion, a strong stance towards internationalisation.

Most (78%) of the firms that have started exporting immediately after their establishment were founded after 1991, the remaining, evenly divided between SMEs and larger companies, between 1981 and 1990. The fast exporters make up 39% of the firms established from 1991 onwards. It is, then, possible to claim that the nature of exporting firms in the South African textile and clothing industry, as far as the present sample goes, seems to be changing and a number of clearly export-oriented firms, many of them SMEs, is appearing. The SMEs among the fast exporters (later it will be discussed whether they can be considered in the category of the “Born Global”) are of various sizes, ranging from the largest class (between 151 and 250 employees) to the second smallest one (between 5 and 10 employees).

Some of the fast exporters (22%) still have only a marginal involvement in foreign markets, earning 90% or more of their turnover at home. On the other hand, 55% make more than half of their turnover from abroad, and they make up almost the totality of the firms that derive most of their turnover from foreign markets. The countries first destination of the exports of these firms are, with respectively 44% and 33% of the firms, the E.U. and the USA, the remaining being Iran and China (one did not reply to this question). This points to the conclusion that the firms that had “exotic” destinations as first move abroad were specifically set up with export to these countries in mind (remember that their owners originate in those countries). A positive aspect is that those firms did not stop at the countries where they first exported: in both cases these countries make up less than half of the turnover from exports of the firm.

In order to evaluate whether the fast exporters can be considered as belonging to the category of the “Born Globals” it is possible to look at the correlation between time lag to exports and the stage reached by the firm in its internationalisation process (see table 11).

Almost all of the firms in this group (89%) are habitual exporters. Those that export regularly to one or few countries are 33% and those that export regularly to many countries are 55%. They have, thus, reached the last stages, for exporters, of the internationalisation process. Looking from a different point of view, while these firms make up 25% of the sample, they are 9% of the sporadic exporters, 20% of the regular exporters to one or few countries, and 55% of the really international firms that export to many countries.

**Table 11 Time lag to exports and stage in the internationalisation process (N = 35)**

Time lag to export	Exports, but not regularly		Exports in one or few countries		Exports in many countries		Total	
0-1 year	1	9,1	1	6,7	3	33,3	5	14,3
2-4 years	-	-	2	13,3	2	22,2	4	11,4
5-7 years	1	9,1	2	13,3	-	-	3	8,6
8-10 years	2	18,2	1	6,7	1	11,1	4	11,4
> 10 years	7	63,6	9	60,0	3	33,3	19	54,3
<b>Total</b>	<b>11</b>	<b>100,0</b>	<b>15</b>	<b>100,0</b>	<b>9</b>	<b>100,0</b>	<b>35</b>	<b>100,0</b>

It seems then possible to say that most of the firms in this group seem to fit the most important characteristics of the Born Globals: rapid passage from establishment to internationalisation; rapid movement through the stages of the internationalisation process, leapfrogging some of them; large proportion – at least more than half – of turnover obtained in foreign markets. There is not much in terms of technology, making them a specific sub-species of the “Born Globals”, but there is little doubt that they should be considered as such.

Comparing the evaluation of the motivations for entering foreign markets given by these firms with that of the sample as a whole, it is possible to measure their attitude toward internationalisation and to ascertain whether their approach shows a strong proactive tendency, and confirms the assessment of these firms as strongly “Born Globals”.

Table 12 offers such a comparison. The first consideration to be made is that almost all the items receive a higher mark from these firms than from the sample as a whole. This does not change much, since there is no clear pattern in the difference of the evaluation.

**Table 12 Ranking of motivation to start exporting for the “Born Global”**

BORN GLOBALS (N = 7)	mark	Δ	TOTAL SAMPLE	mark
<b>Profit goals</b>	6.29	+ 0.71	<b>Profit goals</b>	5,58
<b>Diversification of markets</b>	5.50	+ 0.56	<b>Development goals</b>	4,94
<b>Unique product</b>	5.00	+ 1.46	<b>Diversification of markets</b>	4,94
<b>Prestige of the business</b>	4.71	+ 0.82	Saturated domestic market	4,20
<b>Development goals</b>	4.71	- 0.23	<b>Prestige of the business</b>	3,89
Decrease in domestic market share	4,50	+ 0.78	Decrease in domestic market share	3,72
Competitive pressure	4.33	+ 0.83	<b>Unique product</b>	3,54
Excess capacity	4.29	+ 0.76	Excess capacity	3,53
Proximity to foreign markets	3.83	+ 1.27	Competitive pressure	3,50
Saturated domestic market	3,50	- 0.70	<b>Technological advantage</b>	3,09
<b>Technological advantage</b>	3.29	+ 0.20	Unsolicited foreign orders	2,74
Imitation of competitors	3,29	+ 0.65	Imitation of competitors	2,64
Unsolicited foreign orders	2.43	- 0.31	Proximity to foreign markets	2,56

The ranking of the items is also slightly different: the first five motivations to go abroad in order of importance are proactive ones, with profit goals even more clearly the most important among them. The other proactive motivation, technological advantage is considered even less important by the Born Globals than by the sample as a whole. (One firm says that technological advantage was a most important reason to start exporting, but five other consider it either totally irrelevant or of very scarce importance). Certainly in the

case of these firms, one of the main characteristics of the Born Globals, the technological superiority, is almost absent. However, the item where the difference between these firms and the sample is larger is having a unique product. This indicates that the Born Globals have specific competitive advantages linked to the nature of their products, which points to a certain degree of innovation capacity, even if not linked to technology.

In general, then, the difference between these firms and the sample as a whole, albeit existing, is more quantitative than qualitative: they are a bit more proactive in their attitude to exports than the other firms in the sample, but the difference is not as clear cut as one would expect.

## **CONCLUSIONS**

This paper aimed at analysing the attitude of a sample of South African SMEs in the textile and clothing industry towards foreign markets, comparing it with the attitude of larger companies. We wanted to ascertain whether also in South Africa could be registered the presence of export-oriented SMEs that are actively pursuing opportunities in the global market and their proportion among SMEs, as an indicator of the potential for global competitiveness of South African SMEs.

The results are mixed.

The proportion of SMEs among exporters is only slightly lower than among the sample as a whole. This may indicate that in the textile and clothing industry South African SMEs are starting to consider internationalisation at least as a feasible strategic alternative. However, little more than half the SMEs are exporters, while among the larger companies they are slightly more than four fifths. Internationalisation may be considered a practicable route by South African SMEs, but not too many of them are taking it. This becomes clearer when looking at how the firms are present in foreign markets: 12 % of the SMEs are truly international firms, with exports accounting for at least half of the turnover. There is not a great difference with larger firms, but this is because the latter, too, are only weakly present in foreign markets (18% with at least half of the turnover from exports). The same applies when judging the intensity of internationalisation from the stage reached in this process: 15% of the SMEs and 19% of the larger companies export regularly to many countries.

This means that while, in general, South African textile and clothing firms are not overly inclined to operate in foreign markets and their presence therein is basically weak, a small proportion of SMEs seems to have made the big step towards full involvement with foreign markets.

In terms of attitudes towards the internationalisation process, as they can be inferred from the importance attributed to different reasons for starting to export, the differences between SMEs and larger companies, albeit not great, are more surprising. SMEs appear to have a more strongly proactive approach than larger firms. Although this might reflect more a reluctance on the side of larger companies than a particularly strong interest in internationalisation among the SMEs, the most important consideration to be made is that the old assumption that SMEs can basically adopt only a reactive approach is falsified also in South Africa, which is not known for harbouring many internationally dynamic SMEs. It seems that internationally proactive SMEs can be considered as a normal occurrence.

Another important point is related to the conformity of the SMEs to the stages approach model of internationalisation: whether their moves in foreign markets can be well explained by the sequential path laid out by that theory. Again, while most of the firms of the sample, both SMEs and larger companies, appear to conform to the model and to pass from one stage to the other at a steady pace, a noteworthy proportion of SMEs (and a similar proportion of larger companies) seems to have skipped one or more steps of the internationalisation process and to have moved very fast on that road. A small nucleus of truly international SMEs is appearing in the South African textile and clothing industry and this is an encouraging sign of development for the country.

## **ABSTRACT**

The emergence of new business models as a result of the growth of the knowledge-based economy have brought to the rise of the entrepreneurship atmosphere among the younger generation, particularly the university graduates. For many years ago, it was strongly believed that entrepreneurs need no formal education. A successful entrepreneur is someone who works hard and has accumulated substantial experiences in relevant activity. The traditional entrepreneur usually starts from small business and small capital, involves in traditional business with low value-added and it takes him to struggle for many years to build up his career. Today, as evidenced by successful entrepreneurs at United States, especially from those in the Silicon Valley involving in high tech, high growth and high value-added activities, a new breed of entrepreneurs with strong academic background, particularly those who know how to take advantage of Internet and other information communication technologies (ICTs) is required. Therefore, the growing concern is how should the education institutions, particularly the tertiary education institutions, impart essential entrepreneurial knowledge in the syllabus to equip future entrepreneurs with the necessary skills – the so called “entrepreneurship education”.

This paper looks at the entrepreneurship education in Malaysia as the Malaysian government has taken great effort to transform the economy into the knowledge-based economy. In this regard, “entrepreneur” has been identified as one of the key elements to the development of the knowledge economy. Thus, this paper attempts to study the development of entrepreneurship education in Malaysia and to investigate the effectiveness of the entrepreneur education in Malaysia.

To achieve the objectives of the study, primary data are collected. In order to examine the development of entrepreneurship education in Malaysia, interviews with students are conducted to collect students’ feedback on the effectiveness of the entrepreneurship teaching, to reveal their knowledge about entrepreneurship, their willingness to start up their own business, and factors influencing their decision to be entrepreneurs.

# INTRODUCTION

Since the time of Plato, education is important for two basic purposes, i.e. to produce new knowledge and to transfer knowledge. However, in the new economy, which is also a knowledge-based economy, education institutions, particularly higher education institutions, are entrusted with a new additional task, which is to contribute to the development of entrepreneurial talent among young graduates. Nowadays, entrepreneurship education has been actively implemented in many countries, including Malaysia. Many universities and higher education institutions in Malaysia have recently introduced courses related to entrepreneurship or majors in entrepreneurship. For instance, in Multimedia University (MMU), a programme in Bachelor of Multimedia (Media Innovation & Entrepreneurship) has been introduced and entrepreneurship is a core course for the programme. In addition, the subject "Introduction to Cyberpreneurship", has been made a compulsory subject for all students in Multimedia University, regardless of their majors. The purpose of introducing the cyberpreneurship subject are twofold, which are: 1) to develop students interest to become entrepreneurs, even if they are not students from business or management faculties; 2) to enhance students knowledge and understanding on the role of entrepreneurship in the new business world, especially the cyber world. In fact, besides MMU, entrepreneurship is offered in almost all universities in Malaysia. In Univerisiti Putra Malaysia (UPM), it is one of the subjects offered for Bachelor of Business Administration programme, in University of Malaya (UM), entrepreneurship is offered by the Department of Business Strategy and Policy, and in Universiti Kebangsaan Malaysia (UKM), Information Technology and Entrepreneurship is a compulsory subject in Bachelor of Science in Information Technology programme. At the MBA level, entrepreneurship is a core subject in most of the higher education institutions in Malaysia.

The burgeoning of the entrepreneurship education since mid-1990s could be a result of the growing of the newly emerging knowledge-based economy. The new economy is experiencing a fundamental transformation. Rapid changes, globally inter-linked, death of distance, life long learning, constantly innovating, creativity, flexibility and responsiveness, small enterprises and co-opetition, are some of the prevailing characteristics of the current economy. The dynamism of the new economy creates enormous business opportunities that necessitate people to engage in innovative enterprising activity to grasp the opportunities at the right time and using the right way.

Following the global transformation, Malaysia has made its effort to transform the economy from a production-based economy to the knowledge-based economy. In September 2002, the Institute of Strategic and International Studies (ISIS), Malaysia, released the Knowledge-based Economy Master Plan, which has identified seven critical areas and 136 recommendations to lead the economy in propelling toward the knowledge-based economy. Entrepreneurship is one of the key elements discussed in the Master Plan. It has been said that without entrepreneurs, there is no knowledge economy (V. Sivapalan, 2001). Realising the importance of entrepreneurs in the development of the knowledge-based economy in Malaysia, efforts have been taken to nurture entrepreneurship in all ways. Conferences, seminars, short courses and training on entrepreneurship are common activities organised by various organisations, along with the formal entrepreneurship education offered by higher education institutions. The related issues are: despite all the efforts taken, how many

graduates are exposed to the entrepreneurship education? What does entrepreneurship education aim to achieve? How to teach entrepreneurship? What types of skill are needed to become a successful entrepreneur? How effective is the entrepreneurship education implemented in the nation?

To attempt an answer to the above mentioned questions, this study has collected feedback from 90 randomly selected undergraduate and MBA students from public and private universities and colleges. Questionnaire consisted of three sections is designed to elicit students' comment on the effectiveness of the entrepreneurship teaching, to reveal their knowledge about entrepreneurship, their willingness to start up their own business, and factors influencing their decision to be entrepreneurs. The information collected would serve as essential inputs for universities in Malaysia and in other countries to design a more effective teaching of entrepreneurship.

## **WHAT IS ENTREPRENEURSHIP EDUCATION?**

What is entrepreneurship education? Before we are able to answer this question, we have to first of all look at the question on "who is an entrepreneur?" Different authors use different words to define entrepreneur. For instance, Hamilton and Harper (1994) define an entrepreneur as a person who bears certain risks in order to take advantage of an invention while for Thompson (1999); entrepreneur is someone who is able to "smell" a new opportunity and is willing and able to act on it. Joseph Schumpeter, in his famous book, *Theory of Economic Development* (1911), defined an entrepreneur as the person who destroys the existing economic order to create and benefiting from the new structure through a few channels, such as by introducing new product and service, or by creating new forms of organisation, or by exploiting new raw materials. In fact, there are many expressions used to describe an entrepreneur. However, all definitions are centring on the fact that an entrepreneur is someone who has unique instinct, plan, mind, inspiration, vision, strengths, and sensitivity and willing as well as able to conceptualise ideas and to see change as an opportunity.

Based on the discussion presented above, it seems that basic personality dimensions, or in other words, personal traits, are essential factors in determining whether a person could become an entrepreneur. Therefore, a belief which is prevalent even in today's society is that there is no way to teach or train someone to become an entrepreneur as entrepreneurs are born to be entrepreneurs. Is it true?

Many people would agree that an entrepreneur is someone who is awarded with gifted quality, which depends on factors such as personal background and characteristics, life-path experiences and environmental influences, which are essentially not transferable from one to another. Hence, it is not possible to teach someone to become an entrepreneur. However, many studies that have been conducted recently have conversely showed that entrepreneurship education does play a significant role to cultivating entrepreneurship spirit among graduates.

Based on a study done by Kolvereid and Moen (1997), it is shown that as compared to other students, those who have taken a major in entrepreneurship have revealed greater interest to become entrepreneurs and these students act more entrepreneurially than other students in taking up the challenge to start up a new business. Thus, it is suggested that although it may not be possible to develop entrepreneurship from education exclusively, to certain extent, education does have an effect to alter and contribute to the formation of entrepreneurship. In another study done earlier by Webb, *et. al.* (1982), it is shown that students who participated in entrepreneurship programme were more likely to start their own business than other students. Upton, *et. al.* (1995) found that 40 percent of those who attended courses in entrepreneurship have started their own businesses. According to Ibrahim and Soufani (2002), school and education system play a critical role in identifying and shaping entrepreneurial traits. Other studies have pointed out that entrepreneurship education, especially education that provides technological training, is crucial to enhance entrepreneurs' innovation skills in an increasingly challenging environment (Clarke, 1990; Menzies and Paradi, 1999).

Previous studies have indicated that despite the fact that many believed that entrepreneurship is born, there are ways to train entrepreneurship. Thus, entrepreneurship education is essential in today's society. However, there is no one definition available to explain what entrepreneurship education is. Entrepreneurship education has always been defined narrowly as education that provides the needed skills to setting up new businesses. However, Hytti and O'Gorman (2004) begged to be different as they argued that there are many ways to offer entrepreneurship education, depending on the objectives of such education. If the objective of the education is to increase the understanding of what entrepreneurship is about, the most effective way to operationalise the objective is to provide information through public channels such as media, seminars, or lectures. These methods are effective in terms of sending the relevant information to a broader population in a relative short time period. If the objective is to equip individuals with entrepreneurial skills which are applicable directly to work, the best way is to provide education and training that enable individuals to involve directly in the entrepreneurial process, such as industrial training. Lastly, if the objective of the education is to prepare individuals to act as entrepreneurs, the most effective technique is to facilitate experiments by trying entrepreneurship out in a controlled environment, for instance through business simulation or role playing.

According to Kirby (2002), entrepreneurship education is different than "traditional" management studies as the traditional management education may impede the development of the necessary entrepreneurial quality and skills. Entrepreneurship education needs a different teaching pedagogy, hence, there are studies trying to relate entrepreneurship education to work related learning (Dwerryhouse, 2001); experiential learning (Kolb, 1984); action-learning (Smith, 2001), and entrepreneurial training (Gibb, 1999).

Entrepreneurship education is more than business management, it is about "learning", i.e. learning to integrate experience, skills and knowledge, to get prepare to start with a new venture. Hence, for the purpose of this study, entrepreneurship education refers to the formalised programme to equip students with the needed skills and knowledge to:

- recognising business opportunities
- searching customers insights
- understanding the needs of the market

- creating an idea
- developing the business plan
- running the business
- evaluating environmental, institutional and political issues

## **FINDINGS AND DISCUSSIONS**

Based on the data collected, this study attempts to provide information on the the level of entrepreneurial knowledge among students in Malaysia, effectiveness of the entrepreneurship teaching in Malaysia, and factors affecting their decision to become an entrepreneur. A total of 90 respondents are randomly selected from one private university, two public universities and two private colleges in Malaysia. 37.8% of the respondents are MBA students while others are undergraduate students. 46.7% of the respondents have experience of working full time as an employee while 11.2% have experience of running own business. Though the sample size is small, it is expected that this study would provide important pilot information on the issues mentioned above.

### **Entrepreneurial Knowledge among Students**

Even though many universities and colleges in Malaysia have started to offer entrepreneurship as a major or a subject in most programmes since mid-1990s, both at the first degree as well as at the MBA level, only 37.8% of the respondents (12.2% are MBA students and 25.6% are undergraduate) said they have taken courses on entrepreneurship or related subjects and know what entrepreneurship is. The rest of the respondents (25.5% are MBA students and 36.7% are undergraduate) indicated they have not been exposed to knowledge on how to start their own business or how to manage the new venture. In addition, 44.4% of the total respondents believed that entrepreneurial talents are born, thus it is impossible to teach a person to become an entrepreneur through formal education.

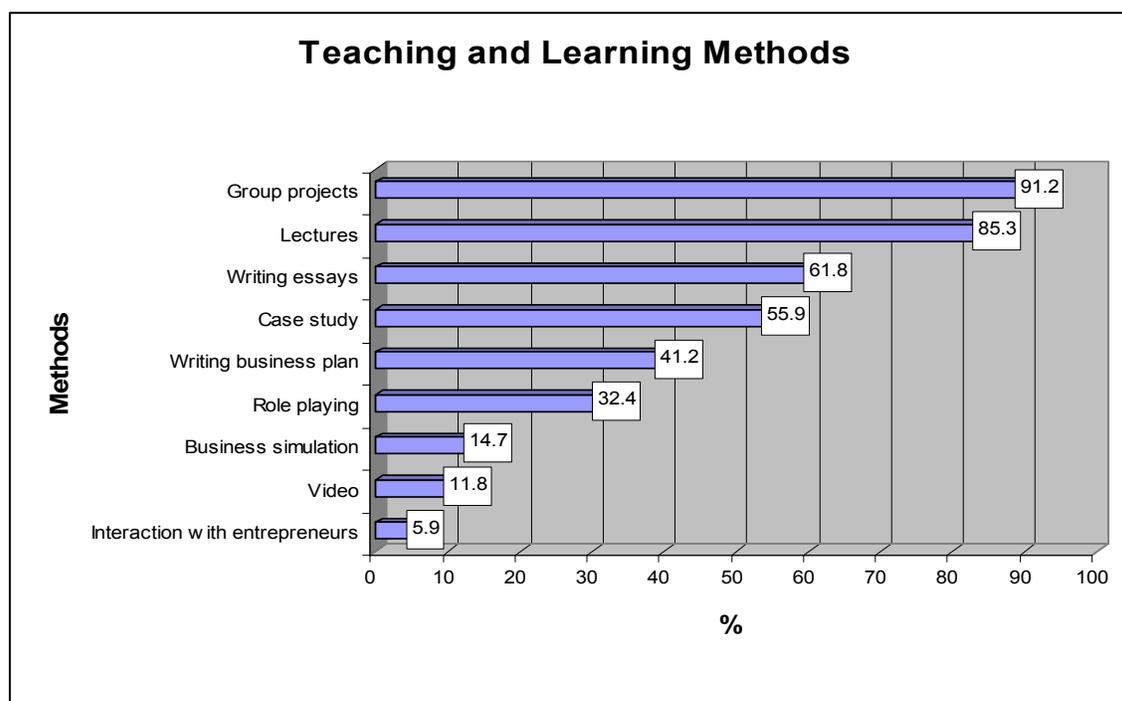

According to the respondents' perception, 11.1% of them felt that education system in Malaysia places a great deal of emphasis on entrepreneurship while 72.3% of the respondents think that the emphasis on the teaching of how to start and running a business is still not enough and 16.7% said there is no emphasis at all on this particular issue. Among those who have gained substantial knowledge on entrepreneurship, 55.9% have obtained the knowledge from a module in a programme while 44.1% gained the knowledge from other sources, such as from work place or from real life examples (for instance, family members or friends who are entrepreneurs).

The result indicated that despite the popularity of entrepreneurship education in Malaysia, there are still great deals of students who have not been exposed to the entrepreneurship education. The finding revealed that the level of entrepreneurial knowledge among students at higher education institutions is still low despite the relative high level of interest in entrepreneurship. Thus, there is a need to revise the curriculum at the higher education institutions and to examine method of teaching in order to disseminate the entrepreneurial knowledge and skills to more students at higher education institutions.

## **Effectiveness of Entrepreneurship Education in Malaysia**

Among the respondents who have experienced entrepreneurship education at respective institutions, 11.8% of the respondents said the courses on entrepreneurship are excellent, 44.1% said very well and 44.1% said fair. The major comments include: lecturers are not equipped with the skills to teach the subject, teaching method not appropriate and the concept of entrepreneurship has been explained in a too abstract manner which is difficult to understand, only entrepreneurship theory is taught, but no practical implications discussed in lectures.

As shown in Figure 1, the respondents have revealed that the most popular way of teaching entrepreneurship is by giving group projects to discuss topics related to entrepreneurship (91.2%). It is followed by lectures (85.3%), short essays (61.8%) and case study (55.9%). The least popular method is arranging face to face interview with successful entrepreneurs (5.9%).

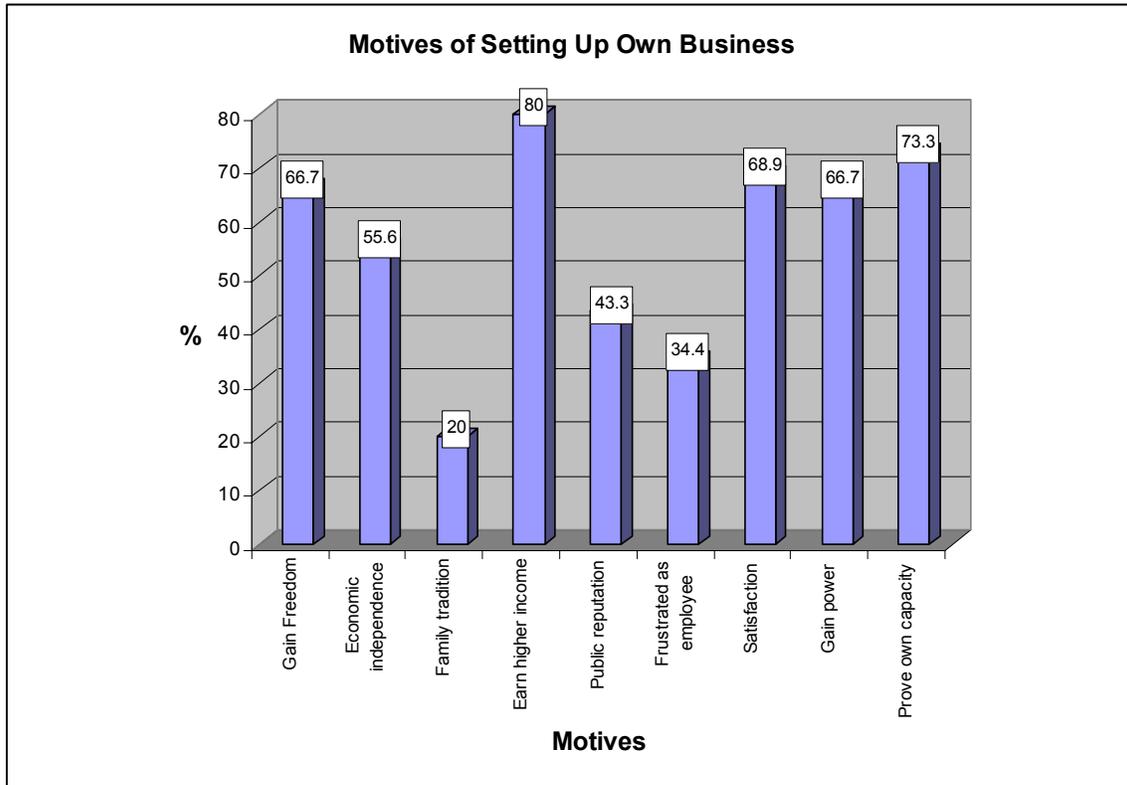

**Figure 1: Teaching and Learning Method**

Which teaching and learning method is the most effective way to teach entrepreneurship? As discussed by Hytti and O’Gorman (2004), different approaches are required to operationalise different educational objectives. Thus, there is a need for higher education institutions in Malaysia to examine the objectives of offering the entrepreneurship education. Without knowing what the entrepreneurship education aims to achieve, it is difficult to judge whether the methods of teaching and learning is effective.

### **Factors Determining the Entrepreneurship Decision**

In the survey, respondents were also asked to reveal the most important reason for them to consider starting a new business. More than 50% of the respondents said higher earning

potential is the main factor that will drive them to start their own business while 11.1% wanted to have more freedom and 18.9% said only when they saw a market opportunity, then they will consider starting their own business. Figure 2 illustrates the main reasons for respondents to involve in setting up own business.

**Figure 2: Motive of Setting Up Own Business**

In terms of major barrier or obstacle, lack of funding is ranked at the top of the list as the most significant perceived obstacle to start a business (38.9%), followed by lack of training (21.1%) and lack of knowledge on how to start a new business (13.3%).

Based on the feedback provided by respondents regarding the ideal entrepreneurs' characteristics, 75.6% of them felt that an entrepreneurs should be someone who is visionary and creative, 57.8% said entrepreneurs should know how to work in a team, 74.4% revealed that they should possess organisation skills, other qualities include committed (63.3%); strong networking (51.1%); risk-taker (75.6%), inspirational (42.2%) and optimistic (58.9%).

When asked about their readiness to become an entrepreneur, 15.6% of the respondents said they have absolutely no intention to start up own business; 10% said they are already running a business; 11.1% are considering starting up own business now; 4.4% already in the process of preparing the start-up; 8.9% hope that they would be able to create new venture upon completion of study and 33.3% said within 5 years after graduation, they would consider to involve in their own business while 16.7% said within 10 years period, they might start up their new business.

## CONCLUSION

The study provides critical preliminary information on entrepreneurship education in Malaysia, in terms of the level of understanding and effectiveness of entrepreneurship education in Malaysia to nurture the necessary entrepreneurship spirit among younger generation in order to achieve the nation's interest in developing a successful knowledge-based economy. The findings indicated that the level of understanding on "what is entrepreneurship" is still low among the respondents selected in this study. There is a need to identify the objectives of entrepreneurship education to determine the most effective teaching method. The study also showed that there is a low level interest among students to become entrepreneurs immediately after graduation. Rather, respondents chose to work for few years before venturing into own business.

# **THE FEMALE ENTREPRENEURSHIP IN GREEK RURAL AREAS: THE CASE OF MAVROTHALASSA, PREFECTURE SERRES**

**Harissia Vlahou, Phd Candidate of Agronomics, Department of Agricultural Economics, Aristotle University of Thessaloniki**

**Dr Olga Lakovidou, Prof. Of Agronomics, Department of Agricultural Economics, Aristotle University of Thessaloniki**

The development of enterprising initiatives taken by women living in rural areas is a recently emerged phenomenon. By establishing small enterprises, women make a new appearance in the family farming. Then gradually turn from assisting and volunteering members into manageresses of their own enterprise.

This survey refers to the undertaking of enterprising initiatives taken by women who live in the community of Mavrothalassa, prefecture Serres. It presents the factors – both internal and external – that determine the women's decision to set up their own enterprises. In addition, the survey displays the enterprising entrepreneurial areas of rural women take an active an active part.

The use of a questionnaire provides further information as to the features of these women entrepreneurs, the data relating to the enterprise (that is how it was formed and how it is currently operating), the problems these women face and come up with during their enterprising activities.

The results of this survey, after a statistical analysis, have shown that rural women form small individual enterprises without employing work force. Moreover, these enterprises do not yield a large profit for the women. The areas women mainly work in are stores and small industries. These women are usually not aware of the national and European Community programmes. Additional to the above, a major factor that prevents rural women from setting up their own enterprises is the lack of infrastructure support for both the elderly and the children.

# **CORPORATE VENTURING PERFORMANCE: ENTREPREUNERIAL MINDSETS**

**Maria Aggestam  
Lund University, Sweden  
Maria.Aggestam@fek.lu.se**

## **ABSTRACT**

This paper examines, from the perspective of corporate venturing, the internal and external determinants of entrepreneuring in the context of environmental jolts in Poland. It focuses on understanding the entrepreneurial mindsets of entrepreneurs through the meanings constructed and acted upon by the actors facing both the opportunities and the liabilities of newness in their business environment. This paper analyzes qualitative field study data to understand individual-level responses to discontinuities in routines, activities and entrepreneurial mindsets occasioned by environmental jolts. Of special relevance to the corporate venturing perspective, I suggest that environmental jolts trigger corporate venturing to cope with radical change, stimulating organizational actors to identifying and exploit entrepreneurial opportunities. Employing individual-level adaptive mechanisms, these copings are critical in facing the novelty ushered in by implementation of the new socio-economic order.

# **TITLE: OPENING THE BLACK BOX – THE ROLE OF ENTREPRENEURS IN CREATION OF SUSTAINABLE COMPETITIVE ADVANTAGE DURING THE SMALL FIRM’S INTERNATIONALIZATION**

**Navid Ghannad**

For all the rich literature on separate areas of entrepreneurship, strategic management and international business, not many studies have explored the dynamism of the managerial /entrepreneurial role in creating value necessary for continued achievement during company’s internationalization process. The way in which the role of the entrepreneur through time shapes these processes has yet to be fully explored. Consequently, the result from early empirical work, together with the fact that there is a lack in previous literature concerning the dynamics involved in the role which the entrepreneur plays in the firm’s internationalization process, motivated this researcher to open the black box by conducting an explorative approach for understanding and describing the entrepreneurial process and the dynamics and conditions under which value is created for the competitiveness of the small and medium-sized firm during the internationalization process. More specifically, this study aims at answering questions such as what a small company’s core competence (and critical resources behind it) is, and more significantly how it has been developed and how it contributes to the sustained competitive advantage of the firm? By focusing on the individual entrepreneur throughout the lifecycle of the smaller firm, this researcher will also be able to answer questions such as what role of the entrepreneur during the internationalization/strategy/entrepreneurial processes has been, and how it has affected the company’s international competitiveness.

## **METHODOLOGY**

This study is using a qualitative case-study approach. With a conceptual model (which is based on early empirical work and literature review of the fields of entrepreneurship, international business and strategic management) and our research purpose in mind, the data used in this study are based on three longitudinal (three years) case studies which are collected by semi-structured personal interviews with most of the individuals involved during the establishment and internationalization of the firm. By using the technique of crystallization this researcher has been able to look for a richer description and deeper understating of the phenomenon under investigation.

## **POSSIBLE CONCLUSIONS AND RECOMMENDATIONS**

At present (November 2003) the final data has just been collected and will be analyzed during the next few months. The result of this study will have both a practical and theoretical

contribution. The final mode and in-depth descriptions will give a better understating of how entrepreneurs in smaller heterogeneous resources into idiosyncratic capabilities to achieve competitiveness during the domestic and international expansion.

# DEVELOPING AND NURTURING SMMES AS A TOOL TO ACHIEVE THE 2020 VISION OF THE ROYAL BAFOKENG NATION.

A CASE STUDY BY:  
QUEEN MOTHER DR. SEMANE BONOLO MOLOTLEGI  
ROYAL BAFOKENG NATION  
PHOKENG, NORTH WEST PROVINCE  
SOUTH AFRICA  
TEL: 01456 63813

E-mail: [mmemogolo@bafokeng.com](mailto:mmemogolo@bafokeng.com) and/or [gracem@bafokeng.com](mailto:gracem@bafokeng.com)

## EXECUTIVE SUMMARY

This paper shares how our nation, the Royal Bafokeng, is looking at the development and nurturing of Small, Medium and Micro Enterprises as a tool to achieve our 2020 vision. The vision is: ***“We the Bafokeng Nation, the Council and Kgosi are determined to develop ourselves to be a self sufficient nation by the second decade of the twenty first century.”***

It will introduce the Royal Bafokeng Nation and this will provide a context and understanding of how as a nation we have been enterprising for over a century and how far we have come since the days of our ancestors travelling to Kimberly to seek a better life for future generations in the late 1800s.

A S.W.O.T. analysis will provide context to where we are at the moment in relation to achieving the 2020 vision and how the decision to establish the RBEB as the economic implementing arm was arrived at. A brief synopsis of the RBEB including its mandate and governance structure will be provided.

A critical analysis of the unique challenges and frustrations facing the entrepreneurs in our nation in particular, given our particular circumstances will be shared in this paper. The strong and unwavering believe that education and practical skills are key to achieving a vibrant and self-sustaining economy has been a corner stone of this nation from the beginning. What has been done in the past and being practised now and what is planned for the future will be elaborated on here.

Though fairly new, the RBEB is now finding its feet and is changing our SMME landscape. The solutions and care that they have started implementing as well as the plans they have for the future will be shared. There are other key Stakeholders and structures that are very critical in achieving the 2020 vision in the RBN who have been involved in SMME development all along without whom the work of the RBEB would not be possible. The King, Kgosi Leruo Tshekedi Molotlegi, and his political governing structures as well as the administrative arm the Royal Bafokeng Administration lead these key stakeholders. The community at large including its formal structures the Bafokeng Women’s Club, Bafokeng Youth Organisations, Disosaete (Burial Societies), Ditokofela (Informal Financial Clubs)

and others who together engage in one way or another with the formal economy and banks will be discussed in the paper.

We as a nation have long realised the need and critical role that partners play in developing the economy and SMMEs in particular. The partnerships that we currently have will be elaborated on. The quest for skills and human capital development drives us to seek even more partners all the time. Some of the partnerships that we seek urgently are discussed and details of how we can hook up post conference are provided. Ideas on how to assist in our efforts are invited from all corners of the world.

This journey started with a trip to Kimberly in the 1800s and we will share how when things seem to be too tough for our generation and for all the future generations we look back at our ancestors' vision and sacrifice for us. We are then filled with gratitude, pride and strength and we know that we cannot afford to and refuse to be discouraged. The story will be shared in this paper.

# THE RELATIONSHIP BETWEEN CORPORATE CULTURE AND TQM IMPLEMENTATION IN SOUTH AFRICA

**Andres Sousa-Poza**  
**Alfonso Sousa-Poza**  
[asousapo@odu.edu](mailto:asousapo@odu.edu)

Corporate culture has been assigned a pivotal role in the implementation of Total Quality Management (TQM). In developing countries, the effect of culture may be accentuated due to the common practice of implementing management theories and techniques generated in extremely different cultural contexts – primarily the United States of America, Europe and Japan. This exploratory analysis adds further empirical results to the growing body of literature on the effect of culture on organizational behaviour. It presents the relationships between corporate culture and quality management implementation in the manufacturing industry in South Africa.

Corporate culture is measured using an adaptation of the Competing Values Model (Quinn and Rohrbaugh, 1981). Implementation levels of TQM are measured using a questionnaire developed at the University of Missouri-Rolla by Wu (Wu, 1996).

The information collected is analyzed using cluster analysis techniques and canonical correlation analysis on the two variable sets (corporate culture and TQM). Cluster analysis, which is traditionally more extensively used in culture studies, gives no clear indication that culture has an effect on the implementation of TQM. In contrast, the canonical correlation results indicate that relationships between corporate and the TQM variable sets exist.

Several important relationships are identified that would suggest that TQM implementation is facilitated when a "People" with and/or "Outward" corporate culture is emphasized. Unclear, however, from the available results is what a "People" culture entails in the South African context. A primary conclusion that can be drawn from comparing the results to available literature (for example, Mbigi and Maree, 1995) is that corporate culture and its effects in Southern African companies may not be understood. Recommendations for industry and future research are made.

# QUALITY MANAGEMENT SYSTEMS AND ISO 9000:2000 IN SMALL ENTERPRISES

Andres Sousa-Poza<sup>1</sup>  
Charles Keating<sup>2</sup>  
Rafael Landaeta<sup>3</sup>  
Alfonso Sousa-Poza

[asousapo@odu.edu](mailto:asousapo@odu.edu)

**Abstract:** On December 15, of 2000 the International Organization of Standardization published its latest version of its ISO9000 series. The new version differs from its predecessor (the 1994 version) not only in mere semantics, but includes sweeping changes in the way that a Quality Management System (QMS) is to be perceived. The standard can longer be viewed as a set of mildly interrelated requirements. A system perspective must be taken of dependant elements. In fact, taking a systems-based approach provides the applicant with a more comprehensive understanding of the requirements than that which is provided by the traditionally applied process approach. The new version no longer applies to basic information procedures but rather to the organization as a whole.

A further intent of the changes that were made to the standard was to make it more amenable to a greater variety of organizations. This includes small and medium sized enterprises. Given that research shows that ISO 9000 increases an organization's international competitiveness- ISO 9000 implementation is a strategy that many small organizations should be considering. Implementing a QMS, and particularly an ISO 9000-based QMS has implications for small organizations that are quite different to large organizations.

This paper presents a systems-based ISO 9000 implementation methodology for small organizations. The methodology ensures that ISO 9000 is integrated into the organization, requiring that changes be limited to those areas that are deficient according to the standard. This contrasts with most methodologies that apply ISO 9000 as a collateral function to the organization- a practice that becomes prohibitively expensive for small organizations. The ISO 9000 implementation methodology and the models have been tentatively validated through their implantation in five companies. A qualitative research methodology was used to ensure the rigor of the application. The results of the application of the methodology and methods are presented.

# **AGOA: AN ASSESSMENT OF THE OPPORTUNITIES FOR WOMEN'S ENTERPRISE DEVELOPMENT IN GHANA, CAMEROON, GAMBIA, SENEGAL AND MALAWI**

[c.b.Phillips@reading.ac.uk](mailto:c.b.Phillips@reading.ac.uk)

Background: the UNDP Gender Programme commissioned the research for this paper. The fieldwork, undertaken in each of the five countries, consisted of interviews with representatives from Ministries, NGOs, Chambers of Commerce, Women's Groups, medium and small enterprises and individual women working in the informal sector. Secondary data were also used, though the vast majority of information was obtained from open-ended interviews.

## **ABSTRACT**

The African Growth and Opportunities Act (AGOA) was promulgated in 2000 to stimulate development of the sub-Saharan countries via trade with the US and the adoption of economic reforms that will form the basis of long-term effective trade and investment regimes. It provides tariff and quota free access to the US markets for over 6000 African product categories, with a focus on textiles and apparel. The potential gains under textile and apparel are reduced post 2005 after which inputs must originate from participating countries or from the US. The time scale for AGOA is currently limited to 2008 but negotiations are in progress to ascertain if this can be extended.

Five countries – Cameroon, Gambia, Ghana, Malawi and Senegal were selected for the study. The purpose of the study was to assess the impact actual and potential of AGOA (African Growth and Opportunities Act) on enterprise development and export sustainability of women working within the SMEs (Micro Small and Medium Enterprise) sector. The study starting from a macro and institutional perspective and working down to women enterprise owners in the informal sector examined the extent to which countries AGOA orientated, and the challenges facing women enterprise owners.

The findings demonstrated that all five countries face significant challenges in harnessing women into export production under AGOA. Women entrepreneurs lack support at all levels, and gender constraints prevent them from accessing information and available opportunities – women officials spoke of lack of gender awareness at ministry levels, and of programmers that had failed to make any real progress. Vast numbers of women are excluded from mainstream economic activities and the situation will not improve without political will and effective co-coordinated efforts. Interviews revealed that coordination between NGO and donor activities was, in many instances, weak. This led to duplication and a fragmented ad hoc approach.

Individual enterprises were found to be constrained by a large number of factors, many of which are well documented in the literature, including lack of finance, high interest rates, access to technology, inputs, storage and business know-how.

Underdeveloped and fragmented supply chains, bounded rationality and information failure were found to exist in all five countries. Lack of effective systems and structures to mobilize effective production and trust between women, together with customs and practices that dictate that women operate in low value added markets, exacerbate the challenges facing attempting to engage in export activities.

The paper analyzes the constraints discussed above and the opportunities, potential and actual that exists in the five countries before going on to discuss a range of possible interventions and mechanisms aimed at addressing the constraints. The final section of the paper makes several policy recommendations.

---

<sup>1</sup>The author would like to thank Mr Abdoulie Janneh, Assistant Administrator UNDP and Director for Africa, for funding this research

# **GHANA MICRO-CREDIT PROGRAM CASE STUDY**

**CHRISTINE R. SCHRAGE  
UNIVERSITY OF NORTHERN IOWA  
CBB 218  
CEDAR FALLS, IOWA 50614  
Email: [schragec@uni.edu](mailto:schragec@uni.edu)  
Tel: 319 273 2126  
Fax: 319 273 2922**

In 1999, Self-Help International, a non-profit organization in the United States, began providing micro-credit loans to groups of women in Ghana. These loans help purchase equipment to allow the women to mechanize palm oil processing. In the past few years, the women have been refinanced after repaying loans to improve their operations incrementally. Along with the financial assistance the women received training with each loan. Beginning with just one group, the organization is now funding 11 groups and 1 individual.

This case study intends to look at the overall program with specific focus on a group in Serebuoso. This group began with 17 members and now has 20. Self-Help has recently granted a fourth micro-credit loan that will allow for the full mechanization of the extraction process. The Serebuoso group was the first beneficiary of the new program and has been very successful in the repayment of their loans and improving their standard of living for women in the community. It is for this reason that they have been chosen as the subject group for the case study.

## **METHODOLOGY**

Three methodologies will be used to construct the case study. First, careful compiling of the historical data is currently being complete. Secondly, each group member will answer a questionnaire for identifying additional data for the case study to be written. Finally, Self-Help International Board members and staff involved in the program will be interviewed for their insights. These three resources will provide different perspectives into the strengths and shortcomings of the micro-credit program.

## **CONCLUSIONS AND RECOMMENDATION**

This information should provide “best practices” information for other micro-credit programs. It can also identify challenges and problems that can occur. Both aspects can be important for organizations wishing to finance micro-credit program in other countries. Having some background available can impact the success rate of future economic development operations. Entrepreneurial activities in developing countries require both financing and

training support to make them successful. Analyzing what appears to be a successful program will only enhance future efforts of Self-Help International and similar organizations.

## **ABSTRACT:**

The role of entrepreneurship in economic development and national competitiveness has become increasingly prominent in recent years. As a consequence, definitions of entrepreneurship tend to focus on two aspects of business performance – growth and innovation. Influenced by Joseph Schumpeter’s concept of the role of entrepreneurship most current entrepreneurship policy and research tends to link the two aspects and focus on the role innovation in the growth of small and medium enterprises (SMEs), sometime with an emphasis on the management issues involved. This paper’s focus is on the management issues of entrepreneurship but more on the organizational effects of growth and how SMEs develop the new management cadre they need as a result of their growth. In particular, the paper examines the differences between management development practices and links to the firms strategy in growth-oriented entrepreneurial firms and other SMEs. Starting with a consideration of research on management development in SMEs, the paper is based mainly upon an analysis of the 401 SME respondents to a pan-European study of management development, funded by the EC’s Leonardo programme. During mid 2003, surveys were conducted among HR managers and line-managers in structured samples of 100 firms (on average 25 per cent SMEs) in Britain, Denmark, France, Germany, Norway, Romania and Spain. The findings indicate that entrepreneurial SMEs (defined here as growth-oriented firms that reported actual growth in sales and staff) are more strategic and structured in their approach to developing their managers and engage in more management evaluation and development activities, to the greater satisfaction of their managers. Non-entrepreneurial SMEs are less active in managing their managers and are more likely to adopt a recruitment not an internal development approach.

# **WOMEN INTO THE NETWORK A DYNAMIC MODEL FOR DEVELOPING WOMEN'S ENTREPRENEURSHIP THROUGH THE DEVELOPMENT OF SOCIAL CAPITAL**

**[Dinah.Bennett@durham.ac.uk](mailto:Dinah.Bennett@durham.ac.uk)   [patrichardson1@btopeworld.com](mailto:patrichardson1@btopeworld.com)**

Female entrepreneurs are an important and growing proportion of the economy, with higher than average success rates compared to their male counterparts. (Rosa et al., 1994; Lloyds TSB, 1998; Carter, 2000). The number of women starting up their own business in the UK is on the increase, reaching a level this year that has not been seen since the beginning of the 1990s. Women's business start up and development is recognized as one way of enhancing the competitiveness of an economy (Bennett, 1999).

It is clear of women's ever-growing importance in the global market and the growth of women's economic activities can determine the success or failure of each country's long-term economic health. (OECD, 2001). The recent GEM report states 'Expanding the involvement of women in entrepreneurship is critical for long term economic growth' (GEM, 2003).

Networking has been demonstrated as a powerful tool for new venture creation and business development (Hall and Bennett, 2002). However, women are often excluded from traditional business networks and lack access to information (Shaw, 1998). Research conducted in the North East of England found that there were over 700 networks in the region providing support to existing and potential business women, but the majority of women were unaware of their existence and of what they offered therefore missing out on opportunities. Women Into the Network (WIN) is an initiative which uses networking and associated interventions to breakdown the barriers which stand in the way of women's success in business.

WIN supports the creation and management of effective businesses by women through addressing their lack of integration into mainstream Business Networks and has assisted in the creation of over 600 new jobs in women owned businesses.

The paper sets out to identify a number of themes and raises a range of issues relating to promoting relationships building for women's enterprise.

- The paper has a background in exploring the whole issue of confidence and how that relates and impacts on women's business development in the UK.
- It has a focus on relationship building through networking and essentially this is seen as building social capital for women's enterprise as a key component in helping to build confidence.
- The paper is based both upon practice and action research that has been undertaken over the past two years as part of activities of the broader WIN project and highlights implications for future interventions.

# THE GLOBAL ENTREPRENEUR

DR ERVIN WILLIAMS

[cheers@ervinwilliams.com](mailto:cheers@ervinwilliams.com)

According to the North American, Dr Ervin Williams, a new breed entrepreneur is emerging today – they are called Global Entrepreneurs (G/E). The new G/E represent the highest of entrepreneurship and operates differently from traditional entrepreneurs of the past. These G/Es use new management skills and innovative organizations to compete in an ever-changing international arena. They may even start their global venture at birth of their enterprise. They are true cosmopolitans in contrast to the local-oriented entrepreneurs of the past. The G/E is completely wired for business in the information, knows how to effectively harness knowledge/technology, and will often establish a network of relationship enterprises in order to operate their venture on an international basis.

Entrepreneurship has long been recognized as the major engine of economic growth worldwide. Now nations everywhere are turning to entrepreneurship as a means of encouraging greater economic growth. Dr Williams says the G/E clearly helps facilitate such international economic growth. The world is at a cross road, at a new turning point in history, as a result of a dynamic new system of creating wealth. In the new world economic, the soft assets of knowledge and technology, are greater wealth creators than are hard assets such as land, equipment and factories. As a result, management models and organizational paradigms of the Industrial Era are giving way to fresh appreciation of virtualization, outsourcing, minimizing of scale, working with competitors, strategic alliances, networking, empowerment of individuals and a new understanding that plenitude creates wealth – many factors utilized the G/Es.

The motivational force behind the Global Entrepreneur is a desire to create a challenging global enterprise which will serve as a vehicle for *creating substantial wealth*. The G/E recognizes that combining their intellectual talents with technology is the most viable way of creating wealth in the 21<sup>st</sup> Century. The author shows how knowledge and technology are the primary factors in creating wealth in today's new economic order. Dr Williams defines technology as the practical application of knowledge for the purpose of achieving some beneficial economic value. The more one uses knowledge, the more it is shared, the more it proliferates and creates additional knowledge. The author posits that knowledge/technology can create unlimited resources which allow developed countries to achieve almost anything they desire to accomplish anywhere in the world. The internet allows knowledge/technology to be available to global entrepreneurs and to others who have the capability of tapping into the new wealth creating opportunities.

Global Entrepreneurs are interested in ideas at the cutting edge of their disciplines and they seek ventures and opportunities with worldwide impact. While the internet is a vital tool, not all G/Es, business ventures are Internet- related. Most G/E's enterprises span countries and involved a network of business partners. The G/E

often utilizes a virtual organization and virtual products – all of which are created upon demand to serve both known and unknown international markets. A virtual product is one that does not physically exist at the time it is sold. The product concept, its design and production are in the mind of the G/E and can be instantaneously customized and delivered in response to the unique needs of customers wherever they are located. Knowledge/related products are recognized as valuable inputs (raw materials) to production and/or as outputs (products/services) to customers from the G/Es virtual organization.

Just who is likely to become a G/E? It is likely to be a savvy employee of large corporate organization whose new product ideas have been rejected by upper management. You will also find potential G/Es as owners of local-orientated businesses, in particular, individual who are seeking further growth through international expansion. This new concept will appeal to those individuals who are seeking to gain a better understanding of how knowledge and technology and how this these disciplines can be used to create dynamic self-employment opportunities while networking with an array of like-minded associates throughout the world. The author of the article can be reached at [cheers@ervinwilliams.com](mailto:cheers@ervinwilliams.com)

# **BUSINESS START-UP PROCESS: A STUDY OF MALE AND FEMALE ENTREPRENEURS**

**Dr Hesham Magd  
Assistant Professor  
Department of Computer & Support Studies  
Prince Sultan College for Tourism and Hotel Sciences, Abha, Saudi Arabia**

## **ABSTRACT**

SMEs are seen to be an important part of the UK economy with 96% of all firms employing less than 20 employees, over 99% less than 100. Only one third of 1% employ 200 or more. Self-employment in the UK has been raised by 70% since 1979, and the highest rise has been among those without employees and the female self-employed in the UK, and in different countries. The increase in self-employment and venture creation in the UK has been much faster for women at 123% compared to 46% for men since 1979. Women now account for one quarter of all the self-employment in the UK. It is clear that female entrepreneurs are of importance to the UK economy and the UK SME sector. However most of the research has focused on male entrepreneurs and researchers have ignored any research, which focuses on women entrepreneurs. Consequently, female entrepreneurship has been in the public eye recently, and the government is making different efforts to encourage women to create their own ventures. It is important to study female entrepreneurs. The researcher intends to identify any differences among female and male entrepreneurs in venture creation through the start-up process, to help and encourage female entrepreneurs in setting up more businesses in the UK. The literature review offers many different opinions concerning gender in SMEs, but there is little empirical research that has been carried out in the UK and more specifically Scotland. The purpose of this study is to assess any gender differences in business start-up process in the UK through a structured mail survey. This method was chosen because it is a cheaper and quicker procedure than interviews and more appropriate when dealing with sensitive issues because it offers respondents complete autonomy and confidentiality. The sample of companies used in this study was obtained from the FAME CD-ROM UK corporate database. The criterion for selection was whether or not the company had last updated its statement in the previous quarter. This ensured that only successful firms with up-date information on the database were included. To achieve the objectives of the study, an exploratory study was carried out on a sample of 500 Owners/Managing Directors of SMEs in Scotland. Once all the information has been received, statistical techniques were used to analyze the data collected in the study. The results of this study are expected to be useful for further improvement and acquisition of knowledge concerning SMEs start-up process and interesting for practitioners and academia that are interested with the current situation of business start up in Scotland. Results indicate that the business characteristics of male and female entrepreneurs are very different, which imply that different policies would be required to target their different needs. With regard to start-up activities that there are more similarities than differences.

# **CHARACTERISTICS OF SUCCESSFUL ENTREPRENEURS DYSLEXIA, LEARNING AND ENTREPRENEURIAL SUCCESS**

**DR. JULIE LOGAN, CASS BUSINESS SCHOOL**  
**j.Logan@city.ac.uk**

## **ABSTRACT**

This paper briefly discusses two previously unrelated things and seeks to examine the relationship between them. The subject areas are dyslexia and entrepreneurship.

Two investigations were undertaken as the foundation for the study. These were the exploration of the incidence of dyslexia in corporate and owner manager populations, and the examination of the relationship between dyslexia and success in entrepreneurs. In the process of exploring these issues, other questions have emerged such as dyslexics are absent from some industry sectors but predominant in others.

This research study produced some interesting findings. There was a significantly higher incidence of dyslexia in the owner manager population than in the corporate management population (more than four times the UK national incidence). Both dyslexic and non-dyslexic entrepreneurial respondents possessed characteristics that are accepted as being present in successful entrepreneurs. The dyslexic entrepreneurs showed significantly higher degrees of creativity, lower levels of confidence and more developed oral skills than their non-dyslexic counterparts. Another interesting finding from this study was that whilst the non-dyslexic entrepreneurs came predominantly from working class families, dyslexic entrepreneurs came from middle-class families.

# **ATTITUDES TOWARD THE WOMEN ROLES IN A PUERTO RICAN ENTREPRENEURSHIP ENVIRONMENT**

**Submitted by : Dr Noemi Alvarado and Dr Kenya M Carrasquillo,  
Professors**

This research project is related with the culture entrepreneurship topic of your conference sub-themes. It consists of a field descriptive correlational research project with the purpose of analyzing the existence of certain attitudes and obstacles in a Puerto Rican entrepreneurial environment and its possible relation with the personal and professional development of women.

## **RESEARCH METHODOLOGY**

The research variables are the attitudes toward the women role, attitudes toward women roles in administrative positions, obstacles related to the women roles, personal and professional development for women. These variables were used to establish nine investigative questions and six research hypothesis in order to provide guide and direction to the data search and analysis.

The research will be conducted in small business firms of the Puerto Rican entrepreneurial environment. Random samples of women and men will be used as focal groups. The data collection will be done by a questionnaire designed by the researchers to obtain the perception of the participants. The primary data collected will be statistically analyzed to provide the necessary data bank to test the hypothesis and answer the investigative questions. Measures of central tendency as well as variation will be calculated. The following non-parametric hypothesis testing will be used: chi square, consensus analysis of variance and ranking test for items. Also the following parametric test will be used: z test for large groups, t test for small groups, and correlational Pearson test.

## **POSSIBLE CONCLUSIONS**

The perception between men and women toward women roles are different, the attitudes of men toward women roles in the entrepreneurial environment constitute important handicaps toward women personal and professional development. It really

exists certain attitudes toward women roles in the Puerto Rican entrepreneurial environment that are related with her personal and professional development.

## **RECOMMENDATIONS.**

Promote the development of policies and programs that enhance the professional women roles.

Make aware the top management of the professional potentialities of women as an added value to small business firms.

Motivate women to establish support networks in order to manage the professionals barriers in her personal and professional environment.

Reviews the administrative policies and practices such that women will have better opportunities in leadership positions in the small business firms.

Establish a corporate environment favourable for intrapreneurship in the organization that not only support the creative activity but also have the planning flexibility to establish new objectives and directions as needed.

Motivate women to establish their own small business.

# MANAGERIAL ROLES IN SMALL FIRMS

HENRIK FLOREN\*#

SCHOOL OF BUSINESS AND ENGINEERING, HALMSTAD UNIVERSITY  
COLLEGE #DEPARTMENT FOR PROJECT MANAGEMENT, CHALMERS  
UNIVERSITY OF TECHNOLOGY  
BOX 823, 301 18 HALMSTAD, SWEDEN  
PHONE + 46 35 167 444; [henrik.floren@set.hh.se](mailto:henrik.floren@set.hh.se)

The behaviour of managers in organizations is a frequently studied phenomenon. An examination of the literature does, however, reveal that our knowledge about this issue is based on studies of managers in large organizations. In most of the literature on managerial work, organizational size is not considered as a factor affecting managerial practice and when size is considered, it is seldom on the basis of systematic empirical studies of managerial behaviour in small firms. An example of this is Henry Mintzberg's contingency theory of managerial work, which includes an environmental dependence in which the size of the organization is one of the two variables (the other is industry). In his propositions on how size affects managerial work, Mintzberg draws solely on a small-scale study of three presidents in small firms observed for a period of two days each. Due to the limited scope of this study (made by Chorán), it can be argued that the empirical basis of Mintzberg's propositions on managerial work in small organizations is weak.

Using the same observation method as Mintzberg, Chorán, in his unpublished MBA thesis, studied if roles and activities differ between large and small companies. In his replication of Mintzberg, he identified two additional roles (the specialist role and the substitute operator) – which added to the ten roles identified by Mintzberg – that top managers in small organizations play that their peers in larger organizations do not. The purpose of this paper is to replicate Chorán in order to verify his list of roles that top-managers in small organizations play. Drawing on the empirical description of managerial practice in small firms presented in the paper, a secondary purpose of this paper is to provide a first explanatory account of *why* small firm managers behave the way they do. In doing this, I draw on recent work by Mintzberg and Hales. Empirically this study draws on direct observation (using the same method as Mintzberg and Chorán) of owner-managers in six small manufacturing firms (17-43 employees). Each manager was observed for one week and in all the study includes 1650 activities and about 270 hours of observation.

Although the conclusions from this study are still to be drawn, it could be said that the study carries both empirical and theoretical implications. In rejecting or supporting Chorán's rather tentative description of what managers in small organizations do, this study offers a deepened understanding of managerial practice in small organizations. The study provides managers in small organizations with an empirically grounded framework based on direct observation that could be used by supporting bodies in improving their activities and initiatives aiming at developing managerial practices in small organizations. The theoretical contribution includes a first step towards an explanatory account of the generic characteristics of managerial work in small organizations raising itself above descriptions of activity patterns depicting managerial behaviour.

# Entrepreneurship Training for Regional Growth and Innovation: A Swedish Case Study and Ten Year Retrospective

Magnus Klofsten and Mary Spaeth

## ABSTRACT

*This paper examines the underlying assumptions that have led to the development and institutionalisation of entrepreneurship training in universities and will seek to assess the benefits of this development over the last ten years in the context of those assumptions. In this paper we will take a brief look at entrepreneurship training in its recent historical context. We will also consider what current researchers are defining as the characteristics of entrepreneurs and what correlations may or may not exist between the theoretical and psychological aspects of entrepreneurship and the actual training of individuals. It is our hope that this ten-year retrospective on the ENP programme will contribute new suggestions and recommendations for entrepreneurship training and demonstrate its ability to impact regional growth through both skills development and innovation catalysis.*

## INTRODUCTION

As interest in the study and practice of entrepreneurship continues to grow, definitions of the entrepreneur are probably less defensible than ever. Ray Smilor in his book, *Daring Visionaries*, notes the remarkable diversity of entrepreneurs and says that the attempt “to predict who will be a successful entrepreneur has proved to be a generally frustrating and unsuccessful endeavor” (Smilor, 2001, 20). Smilor has identified one characteristic that all entrepreneurs share however. “Every entrepreneur believes his or her company will succeed” (Smilor, 2001, 21). It is perhaps this very optimism that forms the foundation of an entrepreneur’s character. And, it may also be this optimism and unfailing positivism that attracts many of us to study and to teach in the arena of entrepreneurs.

In Sweden today, entrepreneurship training initiatives that were initiated in the last decade have been replicated throughout the country as the demand for this training continues to increase. One of these initiatives, developed within the Centre for Innovation and Entrepreneurship at Linköping University<sup>1</sup> is the Entrepreneurship and New Business

---

<sup>1</sup>The Centre for Innovation and Entrepreneurship (CIE) was founded in 1994 and is a centre within commissioned R&D at Linköping University. The basis of the enterprise is different activities and programmes whose aim is to stimulate growth and development in young and expanding technology-based firms. The intention, moreover, is to integrate this enterprise with research and teaching in entrepreneurship and new business development. SMIL stands for Business Development in Linköping and is a member organization for technique- and knowledge-intensive firms. SMIL’s purpose is to stimulate business development in these firms. It was founded in 1984 and currently has 200 member firms, from one-man firms to large firms. Common for these firms is that most of them come from Linköping University. SMIL and CIE have a very close collaboration with each other. Linköping University is located in Linköping, Sweden 200km southwest of Stockholm. Its 25000+ undergraduate and graduate students follow a breadth

Development Programme (ENP). This programme, begun in 1994 in cooperation with a private network of enterprises, has catalysed the formation of more than 400 new firms, 75% of them still in existence today. What's more, 20% of these companies now employ more than five people.

While it is impossible for business development schemes to demonstrate that companies under their tutelage would not have evolved without their support, it is possible to demonstrate and suggest that more companies are catalyzed today and indeed thrive as the result of start-up support. Statistics supported through studies done by the National Business Incubation Association (NBIA) in the United States, as well as by the UK Business Incubation (UKBI), show that between 75 and 80% of start-ups supported by incubators or business support are still in existence after five years compared to only 20 to 25% of businesses that receive little or no support.

It is with similar assumptions for success that entrepreneurship training exists. Entrepreneurship programs are in some ways a form of early-stage incubation support within the walls of universities. This paper will examine some of these underlying assumptions that have led to the institutionalization of entrepreneurship training and it will seek to assess the benefits of this development by reviewing the practices and performance of Linköping University's Entrepreneurship Programme (ENP). We will present an overview of entrepreneurship training in its historical context while considering what researchers define as the characteristics of entrepreneurs and what correlations may or may not exist between the theoretical and psychological aspects of entrepreneurship and the actual training of individuals. We will not attempt to argue these points, but instead, through presenting the ENP programme, we will seek to contribute suggestions and recommendations for entrepreneurship training and to demonstrate its value for stimulating economic growth.

## **Entrepreneurship and Entrepreneurs**

Entrepreneurship as a component of theory and economic study is not at all new to the university curriculum, but entrepreneurship education as an application-based training for new business development is a relatively recent phenomenon. Before the 1970s, it was most likely that undergraduate and graduate students enrolled in collegiate schools of business had little opportunity to study entrepreneurship. While some colleges offered a single course in small business management, it was rarely required and even more rarely respected. (Kent, 1990, p. 111) In the *Annual Review of Progress in Entrepreneurship Research: a Rationale*, David Watkins echoes this sentiment and confirms that "the field of Entrepreneurship has indeed 'emerged,'" and he notes numerous conferences, institutes, associations, and journals dedicated to entrepreneurship and entrepreneurial discourse to support his assertion (Watkins, 2003, 10). From an academic perspective, where the validation of a discipline's value is determined by whether or not it is a research discipline or scientific discipline, entrepreneurship has not yet gained the full recognition as a domain within academia (Watkins, 2003). However, by virtue of the sheer numbers of papers, articles, theses, dissertations, and university courses dotting the landscape of entrepreneurship, one could argue that it has indeed become a relevant, if not respected, research discipline.

of liberal arts offerings including business, engineering, life sciences, mathematics/informatics, history and social sciences, medicine, teaching, languages and literature. See <http://www.liu.se>

### *How did it happen?*

The 1970s and 1980s witnessed the end of the Vietnam conflict, the slowing and ultimate end of the cold war, and the realization by the United States government that traditionally-funded scientific research could be transferred into the marketplace to support and encourage new trends in economic development. As institutes contemplated ways to exploit the research commercially for both profit and economic good, they became more aware of their place, if not obligation, within the economic framework of their communities. In 1975 [in Sweden as well as in other countries] a third objective was added to the agenda of universities to “be open to influences from the outside world, [and] disseminate information about their teaching and research activities” (Henrekson and Rosenberg, 2000, 6). Today this third objective is an integrated component of most Swedish higher education (Johannisson, 2003).

By the 1980s influences both inside and outside many universities led to changes in what had been very traditional management education programs. Over the ensuing twenty years, increased interest in the commercialisation of university technology; establishment of science, research, and technology parks; and the development of business incubation programs led to an ever-heightened awareness of the need for more and better business managers of new enterprises. University business schools, some more readily than others, took up the gauntlet and introduced programs designed to train young graduates to take on the challenges of business creation. “College presidents and deans began to recognize that their most prolific and potentially biggest donors were often entrepreneurs who were willing to support entrepreneurship programs on college campuses through scholarships, contributions, endowed chairs, and centers” (Kent, 1990, p. 112). In the United States, traditional business schools such as the Kellogg School of Management at Northwestern University, could finally justify and formalize their entrepreneurship programs without fearing the threat of reduced contributions from large accounting firms which expected MBAs to be specially trained for executive management. In fact, new entrepreneurial graduates throughout the country, particularly between 1990 and 2000, were themselves becoming significant donors to their universities.

Increased global mobility and competitiveness has also catalysed entrepreneurship programs.

As early as 1988, Senator John Button, then Federal Minister of Industry, Technology and Commerce of Australia, said, “Many of our best inventions are lost to overseas concerns because Australians fail to exploit their industrial potential. If we are to capitalize on our ingenuity we must train entrepreneurs capable of developing and managing technology-based industries” (Wan, 1988, 66).

So, while it is true that many universities within the United States, Europe and Australia have offered graduate level programs in entrepreneurship, mostly theory, for many years, the recent surge in popularity has been catalysed by significant changes in technology commercialisation practices within university settings just since the early 1980s. This phenomenon in addition to increased global market competitiveness has led many academic and non-academic researchers and/or professionals to attempt to describe, define, and teach the skills and behaviours that could presumably lead to greater numbers of entrepreneurs and entrepreneurial activity. As this process has become validated within universities, government-funded business development agencies, and in private consulting firms, it has also become formalised and in fact, institutionalised.

By the mid 90's, more than 120,000 college students in the United States enrolled in entrepreneurship classes and Rice University in Houston, has required all of its students to take a full course in entrepreneurship since 1996. (Randall, D. 1997)

In 2001, the University of Kentucky looked closely at Lee T. Todd, an entrepreneur who had started, run and sold two high-tech businesses—Projectron Inc. and DataBeam Corp. Today, Todd is the President of the University and has established an entrepreneurship center, increased funding to a venture-capital fund, and working to improve the university's research capabilities—"not just to boost the school's academic stature, but to fill the pipeline for high-tech start ups" (Barker, 2003, 2).

One of the most important indicators for increased entrepreneurial activity on university campuses in North America is found in a recent survey by the Association of University Technology Managers (AUTM) which shows university revenues from technology licensing increasing from \$186 million in 1991 to \$1.3 billion in 2000. At the same time, university inventions led to the start of some 454 companies in 2000 compared to 241 in 1994. (Barker, 2003). Data on start ups between 2000 and 2004 reflect market downturns, but according to AUTMs 2002 survey of licensing activities, 450 new companies (reported by 214 institutions) were started in 2002 and new licenses and options executed in 2002 increased by 15.2% over 2001, showing the slow reversal of the downward trend of previous years (AUTM 2002).

### ***Defining the entrepreneur***

Smilor's suggestion that every entrepreneur wants to succeed may be the single characteristic of entrepreneurs on which many, if not most, can agree. It is possible that to ultimately *define* entrepreneurship as a disciplinary domain within the university is to render it definable—an action which in itself seems threatening to the very essence of what it may mean to be entrepreneurial. The actionable, yet indescribable nature of entrepreneurship makes it nearly Zen-like in character. Zen came into China in the first century A.D. through influences of Indian Buddhism. And while the Chinese of the so-called Middle Kingdom did not like all aspects of this Buddhism, they (especially the Taoists) were impressed by "its subtle dialectics, and penetrating analyses and speculations" (Suzuki, 1973, 1). According to Daisetz Suzuki, "Zen is not necessarily against words, but it is well aware of the fact that they are always liable to detach themselves from realities and turn into conceptions. And this conceptualization is what Zen is against. . . Zen insists on handling the thing itself and not an empty abstraction. It is for this reason that Zen neglects reading or reciting the sutras or engaging in discourse on abstract subjects. And this is a cause of Zen's appeal to men of action in the broadest sense of the term" (Suzuki, 1973, 5).

As with Zen, the *being* is more important than the *doing*. Taoism purports that being alive is more important than the meaning of life. Athletes strive to reach a state of 'being in the zone' where performance exceeds ones own expectations and one achieves a level of confidence, ability to focus, and to relax (Taylor, 1996). Psychologists, sociologists, historians, and economists are interested in researching entrepreneurs in part because of their phenomenological quality. There are those who discuss entrepreneurship from a behavioral or even gender perspective. Psychologist, Alan Jakobowitz, describes five stages inherent to the development of an entrepreneur. "He suggests that a child is often exposed to entrepreneurship in early childhood, experiences trouble in school, problems at work, enjoys an exposure to risk, and is blissfully independent" (Farris 99 in Spaeth 2004,

10). Most would agree that not all human beings are entrepreneurial. There are also studies that have also demonstrated that those who have so-called entrepreneurial traits are not guaranteed to start businesses (Huefner, J., Hunt, K., and Robinson, P.B. 1991 in Spaeth 2004). Not all would agree on the particulars of the origins behind an individual's inclination to practice or behave entrepreneurially, however. The view that something 'unusual' is inherent to the entrepreneur is a part of the fascination of its study and of the attempt to create or emulate it. Psychologists would probably be challenged by Schumpeter's notion that the behavior might actually be 'abnormal' and even by the notion that entrepreneurship could be a behaviour. Economists have sought a definable behaviour in the entrepreneur, for to be definable is to be measurable and to be measurable is to be predictable—allowing for greater control of organizational change that can ideally lead to a company's profitability. Today, however, what may prove to be more measurable and even understandable is the concept of entrepreneurs reacting and acting within their respective cultures and environment (Davidson, Low, and Wright 2001; Anderson, 2000; Aldrich and Martinez 2001).

These discussions will likely lead to a long future of research and debate. In the meantime, economists, investors and regional developers are content to gamble on the notion that an individual who is both entrepreneurial and managerial is worth cultivating for the development and financial well-being of a community.

The teaching of entrepreneurship as a practice is a form of practical application of existing theory or definition. As in the application of any science, practical applications can often comfortably avoid theoretical debate. The application is based on the acceptance of the general assumptions made about entrepreneurship by most theoreticians and generally resting on Schumpeter's views that, as Watkins reasserts "entrepreneurs do things other than those that are accomplished by normal behaviour" (Watkins, 2003, 32).

Certainly, enough data, qualitative and quantitative alike, has accumulated to lead most of us to believe, theoretically perhaps, that it is worthwhile to attempt to train entrepreneurs—either by giving creative and innovative individuals the skills to manage business, or giving business managers the notion and opportunity to create and innovate.

If we are to accept that some aspects of creativity, ingenuity, drive, and perhaps some financial and organizational abilities lay at the base of the entrepreneur's character, then we can assume also that entrepreneurs have existed since the beginning of humankind. How or if the entrepreneurial or enterprising person functioned or didn't within his or her community would have and still does depend entirely on the politico-socio-economic environment in which that individual lives.

Whatever genetic predisposition might lend certain entrepreneurial characteristics to any individual, he or she must also be supported by a society that does not inhibit those traits. In Russia today there exists an intellectual understanding of and curiosity for entrepreneurship. Government officials and many academics have read about and have seen the results of business development programs around the world. Still, the majority of university professors and deans in the Russian universities are baffled by the notion of their students' even 'needing' to consider 'having' to work for themselves when they can 'certainly find work' when they leave the university. On the streets, outside the halls of academia, entrepreneurs abound—most of them in the form of unofficial taxi-drivers—citizens trying to make a few rubbles, dollars, or euros from non-sanctioned forms of business.

In 1954, human psychologist, Maslow first published "Motivation and Personality." He recognized that most people seek to satisfy personal needs through their work. He suggested that there exists a predictable scale of needs that most people will attempt to satisfy in sequence. He also theorized that a person could not even recognize or pursue the next higher need in the hierarchy until her or his currently recognized need was substantially or completely satisfied, a concept called prepotency. Maslow's hierarchy of needs is often illustrated as a pyramid with the survival need at the broad-based bottom, moving up through safety/security, then social/love/acceptance, then to esteem/recognition/success and finally self-actualisation need at the narrow top.

In order for an individual to satisfy a need, he or she must be able to recognize the need. Hunger and thirst—basic survival—are relatively easy needs to recognize. Maslow's establishment of a hierarchy of these needs, with success and self-actualization at the top suggested that these were also needs that are not necessarily achieved or even recognized by the individual as necessary. The entrepreneur is a self-actualizer. For him or her, success defined by wealth and recognition (of self and invention) is a principal motivation. The social environment in which an entrepreneur thrives is an environment that encourages or at least accepts what the American writer Thoreau called self-reliance. (Spaeth, 2001).

In Sweden, the community of Gnosjö<sup>2</sup> is regularly cited as a place that holds a particularly entrepreneurial spirit. Historically, Gnosjö has, unlike other Swedish communities, shunned the support of 'outsiders' including the state whenever it suffered low economic times. The citizens of Gnosjö are historically, self-actualizers. Caroline Wigren, in her most thorough doctoral dissertation on the spirit of Gnosjö examines what prove to be not so extraordinary characteristics of a community that is actually more 'enterprising' than entrepreneurial (Wigren, 2003, 202). The people are indeed self-actualizers. They have also found ways to create wealth through producing products that are in demand regardless of economic influence or cycle—"dish drainers, whips, outdoor furniture, wire baskets" (Wigren, 2003, 73). Whether they can be said to be innovative in their conceptualising of new products or needs may be questionable. On the other hand, it could be argued that a community or region is entrepreneurial if it can create wealth by successfully understanding and exploiting market needs.

If one were to evaluate Gnosjö's entrepreneurial characteristics by the same measures as the GEM<sup>3</sup>, the distinctions made by Wigren between what she calls 'enterprising' and what she might like to have called 'entrepreneurial' become clearer. GEM distinguishes between *opportunity entrepreneurs* who take advantage of business opportunities and *necessity entrepreneurs*, those who, as the name also suggests, start a business out of a basic need to survive. In their 2003 regional profile on entrepreneurship in South Africa for example, they conclude that 63% of the entrepreneurs took advantage of business opportunities, while 37% were necessity entrepreneurs. The report suggests that "because entrepreneurs can be motivated by both opportunity and necessity or other reasons (e.g. lifestyle), the total entrepreneurial activity rate does not necessarily equal the sum of opportunity and necessity entrepreneurial activity" (GEM, 2003). If we assume that self-actualization and drive are key components for entrepreneurship, however, without the added element of creativity and innovation (i.e. *how* one actually exploits the business

---

<sup>2</sup> Gnosjö (pronounced Gnoh-whə) is a community in southern Sweden of just over 10,000 inhabitants.

<sup>3</sup> GEM-The Global Entrepreneurship Monitor is an annual assessment of national levels of entrepreneurial activity. Conducted by a partnership of the Ewing Marion Kauffman Foundation, Babson College, and London Business School the GEM began in 1999 and now studies approximately 30 countries each year. (see: <http://www.gemconsortium.org>)

opportunities and necessities), then perhaps we are not adequately distinguishing between enterprise development and entrepreneurship. It is likely that Wigren uses the term 'enterprising' rather than 'entrepreneurial' for this very reason. The entrepreneur, then, regardless of definition or environment, can be said to help stimulate economic development through the creation of new business *and* to *accelerate* economic development through creativity and innovation that leads, ideally, to higher levels of productivity and competitiveness.

## Stimulating Entrepreneurship

When entrepreneurship training was in its infancy within universities twenty years ago, there was considerable doubt as to the qualification and competence of professors to offer such training. Earlier studies demonstrated that the small business person (as well as participants in the ENP programme) can harbour a certain skepticism towards organizations which perform such training (Gibb, 1990; Klofsten and Mikaelsson, 1996). Such skepticism has often been the result of misunderstandings between the worlds of academia and industry where the concepts of management, commercialization, profit and wealth are viewed or thought to be viewed from significantly different perspectives. In other words, the business person will assume that the academic has little or no experience with the so-called 'real world.'

Today, graduates and/or participants of early entrepreneurship programs and practice are, yes, middle aged. The programs themselves are mature and ever-diversifying. According to the Kauffman Foundation, more than 1,500 colleges and universities offer some form of entrepreneurship training and interest in entrepreneurship education has spread to non-business disciplines, where students in engineering, life sciences and liberal arts are interested in becoming entrepreneurs.

A recent study conducted jointly by the University of Arizona's Eller College of Business and Public Administration and the Kauffman Center for Entrepreneurial Leadership, revealed that entrepreneurship education program alumni start more new businesses, develop more products and are more likely to be involved in high technology endeavours than their peers.

In their study, published in 2000 by the Kauffman Center and titled *The Impact of Entrepreneurship Education*, Alberta Charney and Gary Libecap surveyed 2,484 Eller College alumni, including 460 who were graduates of the Berger Entrepreneurship Program. Also surveyed were department heads and other administrators from the University of Arizona (including the Office of Technology Transfer), the UA Foundation and the Eller College dean. They learned that compared to other business school alumni, entrepreneurship graduates:

- Are three times more likely to start new businesses.
- Are three times more likely to be self-employed
- Have annual incomes that are 27 percent higher and own 62 percent more assets.
- Are more satisfied with their jobs.

Furthermore, it is important to be clear that entrepreneurial activity is not a compulsory outcome of an entrepreneurship education program. (Rabbior, 1990, p. 54) Courses that inspire entrepreneurship as behaviour will foster a society of confident self-actualizers and

innovators who are equally as valuable to the economic well-being of a community as the business creators themselves. Today, some universities in Sweden have suggested that as many as 50% or more of their students should start companies—even before they complete their studies. This notion, often promulgated by local economic developers in the hope that it will encourage graduates to remain in the community where they've attended university, is one that—if it were 'successful' would likely lead to an over-abundance of inexperienced business 'managers' many of whom have had little or no exposure to business experience prior to graduation. During the nineties this may have worked for thousands of software programmers who were supported by so much money that their own lack of skills was as transparent as many of the companies they pretended to manage. Today however, hard economic lessons have demonstrated that for most entrepreneurs, the experience of working for someone else may make them better leaders when they start their own companies.

Formal training of entrepreneurs in South Africa is still relatively new. In the 1990s, "the government's Reconstruction and Development Programme (RDP) placed major emphasis on entrepreneurial awareness and training" (Ladzani and Van Vuuren 2002, 155). Inspired by entrepreneurship practices in other parts of the world, regional service providers began entrepreneurial training, but today, in spite of considerable efforts, just three of eleven, or 27%, of service providers in South Africa's Northern Province, actually provide business, entrepreneurial, and performance motivation training (Ladzani and Van Vuuren 2002).

Ladzani and Van Vuuren, in their recent study of South African entrepreneurship training for emerging SMEs, emphasize these four clear strategies necessary for reducing the failure rates of new business development:

- Existing Training Firms Should Revise their Training Materials. *It is good that business skills are offered to entrepreneurs. It is even better to introduce and strengthen entrepreneurial skills, particularly to emerging entrepreneurs, so that they know how to generate ideas, screen these ideas, identify opportunities from the generated ideas, and assess whether they have entrepreneurial characteristics that would enable them to succeed in business.*
- SME Service Providers Should Benchmark their Services with Successful Similar Institutions. *SME service providers that are successful should share the secret of their success with those that are attempting to succeed.*
- Educational Institutions Should Introduce and/or Strengthen Entrepreneurship Education. *An entrepreneurial culture should begin at home, and then proceed to higher education and training institutions. When pupils are oriented into entrepreneurship from an early age, it becomes easier when they have their own entrepreneurial ventures.*
- Emerging and Potential Entrepreneurs Should be Encouraged to Take Courses in Entrepreneurship. (Ladzani & Van Vuuren, 2002)

Given what we've learned over the last ten years, through others' experiences and our own, is that there are a multitude of different activities necessary to train or influence entrepreneurship (Klofsten, 2000). Certainly three basic activities should continue to be found at a university:

- The creation and maintenance of an enterprising culture on the whole at the university.

- Separate courses in entrepreneurship where students can learn more about entrepreneurship as a subject itself.
- Specific training programmes for individuals who feel that they may wish to start their own enterprise; for example the ENP-programme. These are primarily 'hands on' and may or may not university credit and which may be suitable for students, faculty, staff, and members of the local community (Klofsten, 2000).

What is different today from just ten years ago is that universities not only have more qualified business practitioners teaching on campus, but professors studying the phenomenon of entrepreneurship have themselves developed substantially. Universities that were criticized for lacking competency in undertaking entrepreneurship training (Klofsten and Mikaelsson, 1996) are today held in much greater esteem. Today, entrepreneurship is a 'household' word among students in business and even among those in some scientific and technology disciplines, but it remains a foreign concept to many students and professors alike on university campuses. Gibb's notion that entrepreneurship should permeate all facets of university activities invites us to consider the importance of providing not only access to business development concepts within individual departments and courses, but to foster entrepreneurial thinking across all disciplines. Students studying education, philosophy, the arts, music, history, and languages, as well as engineers, scientists, and business majors should be provided with a basic foundation of economics and business development practice in order to fully appreciate the "street value" and potential, as it were, of their work.

## **The ENP Programme**

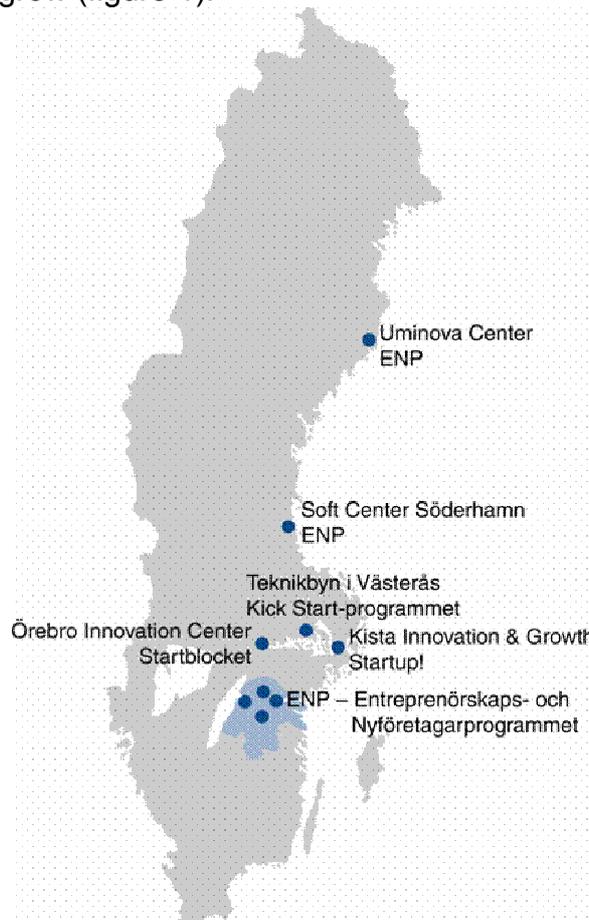

In the spring of 1994, Linköping University launched the Entrepreneurship and New Business Development Programme (ENP). It was seen as a critical component of a more comprehensive programme structure for business support of technique- and knowledge-intensive firms.<sup>4</sup> The University, together with SMIL (a private network of enterprises), already had a great deal of experience in providing support to established firms. They had a good track record of starting firms, but there was no formalized infrastructure for the 'younger' entrepreneurs to become a part of the start-up process or to ensure or improve the quality of these firms. The founders of the ENP also envisioned an opportunity to create a more enterprising university. As with many institutions new to the entrepreneurship game, the administration neither hindered nor supported the founding of the programme (Klofsten, 2000). Since ENPs inception in addition to many other related programs, the university has become an ardent defender and supporter of business development and entrepreneurship.

The first ENP workshop served as a pilot programme. Ten persons representing five companies participated, their response was very positive, and we were encouraged to continue. Over ten years the program has grown considerably. In the spring of 2004, 35 persons participated in the fourteenth programme (ENP-14). The programme has also been developed in 10 other regions throughout Sweden and among these regions a total of 35 ENP programmes have been conducted, which has resulted in approximately 400 businesses (up from 80 in 2000) that employ approximately 2000 persons (up from 800 in 2000). Since 2000 the ENP-programme has been a part of a project funded by the

---

<sup>4</sup> A firm can be considered to be technology-based or knowledge-intensive if a certain portion of the firm's budget is devoted to research and development, the employees have a high level of education (Master of Engineering or equivalent), and the firm has a technology-based or knowledge-intensive business idea.

European Commission, 'Unispin', whose aim is to support regions in Europe that lack an infrastructure for entrepreneurial development (Klofsten, 2000). The CIE ENP Programme in Sweden continues to grow (figure 1):

**Figure 1**

### ***Content and execution***

The ENP programme is based on a holistic approach in assisting the entrepreneur to grow his or her company in such a way that it attains a “business platform” (Klofsten 1998). This platform requires a business to attain some level of success in the majority of eight principal areas of their business. Aspects related to the core group of the business (for example, the founders’ driving forces and competence), external provision of resources (for example, customer relations and other corporate relations), and the business itself (for example, idea, product, market, and organisation) formed the foundation, therefore, of the portfolio for the ENP programme.

Over the years, a large number of articles have been written on business support and business training. In a comprehensive literature review (Autio and Klofsten, 1998; Jones-Evans, 1996), the authors highlighted two main categories of support—configuration orientation and process orientation. Configuration orientation (which seems to be the one most studied) deals with static arrangements, for example the description of facilities, budgets, organisational charts, localisation, and institutional links. Process orientation refers to support of a more ‘hands-on’ nature that investigates and takes into consideration, for example a firm’s actual need for management support, the heterogeneity of the population of firms, and the need to learn by doing. A third conclusion is that process orientation is preferred over configuration orientation in the training of

entrepreneurship because the former's dynamism and pedagogy is more able to meet the individual participant's need of support. With this, we do not mean to say that 'hardware', for example in the form of good premises and money, are unimportant, rather that 'software' is often a crucial resource and decisive for whether an activity will be successful (Heydebreck et al., 2000).

Instead of focussing on premises and finance ('hardware'), the ENP programme focuses on supplying a solid base of general knowledge to the participants ('software'). The ENP-training programme builds on four important precepts that support the participant's attainment of the eight cornerstones of the business platform. These four precepts include:

- A neutral approach—no investments/no interference: There is an understood 'code of conduct' among the trainers, mentors, and participants in the program so that the sharing of ideas and information can flow freely.
- A credible environment—While openness and sharing are encouraged, there is also a demand for respect of proprietary material rights.
- People, not just ideas—It is understood also that ideas change more often than people. Therefore, we focus on the development of the person more than on the idea.
- Motivated persons only—Entrepreneurship requires motivated, reliable and committed individuals with positive outlooks.

Once enrolled in the programme, each participant is to develop a business plan based on his/her own idea, but with a strategic and realistic perspective. The development of this plan is aided through:

- Workshops. In these, the most important components in the process of developing a business, for example marketing, sales, and legal issues, are discussed.
- Mentoring. Each and every one who participates is assigned a mentor who is a senior entrepreneur able to share significant experience with the participant.
- Supervision. The participants meet in person with programme management to check progress, receive advice and coaching.
- Networking. Each and every one receives free membership in SMIL the year the programme takes place.
- Use of Incubator facilities. Here, the possibility of renting premises in one of the local science parks<sup>5</sup> on very easy terms is offered.
- Seed Financing. If an idea is judged to be economically sound, help with good funding is offered in the form of grants or soft loans.

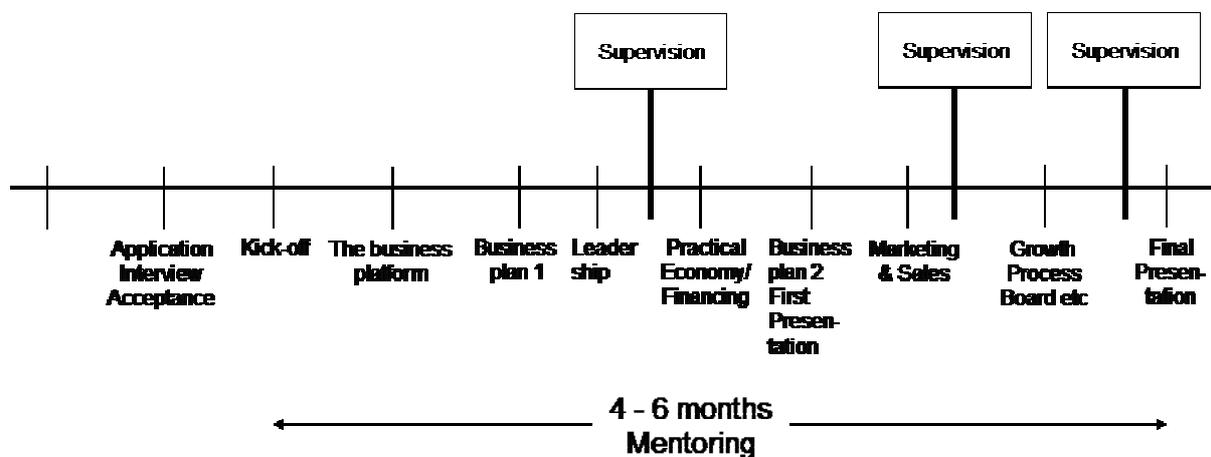

The main theme that holds the different sections of the programme together is that of the business plan and the platform cornerstones, whose purpose is to facilitate development work. These combined provide the framework of the programme and help to generate successful business presentations at the culmination of each ENP. Participants are supported at all times by an experienced business network. In this network, there are not

---

<sup>5</sup> Mjärdevi Science Park, Berzelius Science Park, and ProNova Science Parks are located within close proximity to the university. Mjärdevi was founded in 1984. Currently, approximately 170 companies who employ nearly 5,000 persons comprise the park, making it one of the most expansive in Europe. Berzelius focuses on the fields of medicine and medical technology. ProNova, located next to the university's Norrköping Campus, is a smaller inner city park with substantial company formation dedicated to IT and electronics.

only many entrepreneurs but also venture capital companies and other supportive organisations. The University and its entrepreneurship programs including ENP, rely on close collaborations with the local and regional science parks (2) where we often recruit candidates for ENP, conduct workshops and seminars, and where our participants can find flexible premises in which to work temporarily or long-term.

When ENP was initiated, the first programme lasted approximately one year, starting in the early spring and finishing in late fall. It became obvious that this time span was much too long, mainly because most of the eager participants started up their firms before the programme was due to finish. The participants needed access to the programme for a shorter time. Today, the ENP is conducted in fewer than 6 months, using the same content. The result has been positive and the participants are more committed for the entire programme than they had been previously. The following diagram illustrates the process (Figure 2):

**Figure 2**

### ***Target Group and Recruiting***

The ENP-programme has been marketed principally through the university's internal newspaper and leaflets, distributed primarily to students in the higher years of study. Firms and other organisations which are associated with the SMIL network are invited to visit by email, fax, or the regular mail. Perhaps the most important instrument for marketing is the direct communication with the students in the entrepreneurship courses or the word-of-mouth effect that arises from satisfied participants of previous programmes. Certainly, due the success of the program and its growth, we have seen that personal references have contributed positively as well.

The ENP-programme has two main target groups and these are employees at:

- Linköping University, for example students, researchers, and teachers.
- Technology-based or knowledge-intensive firms and organisations.

The criteria that are used to recruit persons from these target groups are very simple - the person must have an idea (which does not need to be particularly well articulated) and must, as a person, be strongly motivated. Each and every one of the applicants is interviewed by programme management to ensure that the applicant fulfils these two criteria and that they have understood that the issue is that of a programme whose

purpose is to start businesses and not that of a traditional university course. The relatively simple and informal recruiting procedure was chosen based on the following:

- It is almost impossible to judge at an early stage whether an idea is economically sound, and it is not at all certain that the best idea leads to success (Timmons, 1994; Klofsten, 2003).
- The entrepreneurial process itself is distinguished by active and performance-oriented behaviour in persons in the form of being able to develop business opportunities (Bygrave, 1994, McClelland, 1961).

Consequently, the programme focuses on the individual (the entrepreneur or the entrepreneurial team) rather than the greatness of the idea. To develop an idea into a business is a process that can take a long time. It is totally dependent on the persons behind the firm and their ability to take advantage of business opportunities on the market. In the programme, consequently, active participation is expected where one, for example must take the initiative in the relationship with his/her mentor, take advantage of the network that is offered, and exploit the relations created in the programme. What is offered can be likened to an arena of activities (or opportunities) where it is a matter of the participant taking advantage of these as effectively as possible.

### ***Financing the Programme***

No fees are charged for participating in an ENP-programme. The target groups, which largely consist of students, lack the ability to pay, and it has not been considered appropriate to demand a fee for the simple reason that certain individuals with entrepreneurial potential would perhaps, by having to pay, miss the opportunity for training. Ten years ago, it had become popular to discuss taking ownership or equity in new enterprises developed through training or incubation. In creating the ENP programme, we elected to remain a neutral partner and avoid creating the image of being an investment company.

The programmes are financed with public money and the total cost of conducting a programme of 'normal' size (10-12 business start-ups) is approximately 450 KSEK (52 KUSD), and this does not include the costs of other components of the business development network such as incubator or seed capital management.

### **Success Factors behind the ENP programme**

Over ten years' time we have learned a great deal about entrepreneurs and entrepreneurship training. Past and present participants in the ENP program have provided valuable feedback that has allowed us to continually improve our own performance and results from year to year. All participants have appreciated the discipline and pace of the programme, the structured outcome of their own ideas and plans, and the increased network of professionals who are ready and willing to support them, not only during the program, but afterwards as well.

During the spring and fall of 2003 data was gathered reflecting the program's ten year history. <sup>6</sup>In the first stage of research ten case studies of young knowledge-based ventures

---

<sup>6</sup> This research was conducted by the CIE under the supervision of Professor Magnus Klofsten and Semir Nouira, PhD Candidate in Industrial Organization at Linköping University.

representing different industries were completed. The purpose of these studies was to understand the process of idea generation, development and execution in terms of internal and external factors that might influence the process itself. The identification of any influences could also assist in deriving 'relevant' measures for our survey study. The case studies revealed degrees to which an idea either expanded or contracted over time in terms of the business concept and its execution. These variables of convergence or divergence provided a useful starting point for a survey which examined

1. start-up origin, localization, turnover and employment, business orientation and market aspects
2. idea development
3. financing, and
4. The founding team.

From 321 identified businesses, we selected 170 as accessible (we could identify them) and relevant (there existed some kind of activity around the idea) for the study. Using this sample as a base, we received 167 completed questionnaires through telephone interviews. The interviews reduced non-response and helped to avoid any misinterpretation of the questions.

## ***Summary of Results***

The surveys, which also looked at characteristics such as the age, size, and ownership of the firms, reflect some extremely positive trends in entrepreneurship training:

- the average firm is now 3.6 years old
- 70% of these firms employ fewer than 5 people and report turnover of less than 1.5msek or 170,000 €
- 40% want to expand
- 60% are started by teams
- 61% are spin-off firms (32% from private sector)
- 74% are exclusively owned by the founder(s)
- 60% have been located in a business incubator
- 85% offer service or combination of service and product
- 39% sell their service or product internationally

Although the assessment of idea development in and of itself proved to be an interesting outcome of the survey and forms a significant part of another work in progress, the most relevant portion of the survey for this review of the entrepreneurship training program has demonstrated that over ten years, there is a growing interest on the part of new companies to expand and an increasing number of companies started by teams. In fact, the National Business Incubator Association (NBIA)<sup>7</sup> has reported similar trends among companies supported by their members offering start-up support through incubation.

Based on results from the survey and from previous lessons learned, we can suggest the following twelve-step program for a successful entrepreneurship training program:

---

<sup>7</sup> See online reports at <http://www.nbia.org>

- 1) Develop a broad and holistic program. Consider the breadth of what it takes to conceive of and to start a company. For universities teaching entrepreneurship across the curriculum, it is reasonable to assume that while some students may never choose to become entrepreneurs, it is likely in today's economy that they may work for one.
- 2) Supply the best competence available to suit the needs of the course. Those who are entrepreneurs or have worked with entrepreneurs generally have the best competence.
- 3) Define the needs of each participant. Often new entrepreneurs are not fully aware of their own needs, or they have not found a voice to express them. Programme managers and mentors can help to assess these needs and propose actions and solutions.
- 4) Associate the programme with a network of firms. Many of the participants will not have an established network and are in great need of coming into contact with other entrepreneurs both for advice and for business.
- 5) Increase the participant's self-confidence as entrepreneurs and new business owners. Many of the participants lack business life experience. Help them to feel comfortable with their 'business' image.
- 6) Demand measurable returns. Record and document progress and deliverables including business plan stages, visits with customers, presentations, and other project specifications.
- 7) Use functioning 'toolboxes' that have been well-tried. Since the programme is 'hands-on', its success will largely depend on the structure and quality of the workshops. Be certain that lecturers and guests have proven 'toolboxes' for training.
- 8) Plan the mentorship carefully. Practice openness to what all mentors may have to offer regardless of age, color, gender or religion. Our experience has shown that the criteria for selection should consider such things as personal chemistry, competence, openness, and enthusiasm for sharing knowledge.
- 9) Practice versus theory. It is important to ensure a practical orientation to the programmes, but nearly any toolbox or structure will likely have some theoretical underpinnings. Remember that there is an important relationship, too, between starting a company and exiting or ending one. The business plan should not be an exercise in itself, but a concrete manifestation of idea, design, and implementation that can lead to the successful sales of the product and/or service.
- 10) Focus your programme on your target group. Although it can be interesting to invite participants from diverse sectors, a training program such as ENP is not the place to incite innovation between the pizza manager and the robotics engineer. We heartily encourage their meeting in order to develop a better system for pizza production, but in the context of a training program we encourage a more homogenous mix of entrepreneurs simply to facilitate conversations, commitment and contributions from the participants. The ENP program is designed for technology-based and knowledge-intensive activities.
- 11) Create credibility. Participants, while understandably protective of their business ideas, need to work in an open atmosphere. They must feel confident that they can do so without compromising their business and material rights privacy.
- 12) Balance the formal and informal. Training entrepreneurs also requires remembering to act and be somewhat entrepreneurial. While necessarily structured, the programme should allow flexibility, openness, and action. New ideas should be allowed to evolve according to their own timetable if possible.

In 1990, C.A. Kent wrote a text entitled *Entrepreneurship Education* in which he said, “Like any new venture, these new programs in entrepreneurial studies must be given room to breathe, flexibility of movement in order to develop their educational products, and protection to grow and flower into a healthy maturity” (Kent, 1990, p. 84) Maintaining the ‘entrepreneurial’ quality of a programme in an academic setting would be considered by some as an oxymoronic futility. But his words are worth calling to mind today. He likely could have predicted many of the lessons learned the ‘hard way’ by university entrepreneurship trainers. He cautions about over emphasizing marketing while ignoring product development, production, customer support or finance, for instance. He bemoans the badly written student business plan, and urges more emphasis on raising funds from informal sources. “How to approach and work with professional venture capitalists is simply irrelevant for 99.9 percent of all entrepreneurship students” he insists. (Kent, 1990, p. 85) .

Looking back over the ENP programme’s ten years’ of evolution, we are confident that we have kept a broad perspective on entrepreneurship. We would concur with those who have said that searching for appropriate definitions of entrepreneurship is not constructive and in fact increases the risk that narrow definitions may actually inhibit the participation of potential entrepreneurs in entrepreneurship training. (Rabbior, 1990, p. 53)

In his contribution to Kent’s work on Entrepreneurship Education, W.F. Kiesner echoed some of the fears of both administrators and industry professionals alike when he said, “Courses must be totally relevant to the entrepreneurial experience, and must also appear relevant. They must be taught by faculty with actual small business entrepreneurial experience. The courses should be industry- and market-specific. Perks such as college credit are of little relative importance to the consumers of entrepreneurial education. Short, quick, hard-hitting courses, during nonworking hours, are perceived by the entrepreneurial community as being of most value. (Kiesner, 1990, p. 110) While these fears were certainly justifiable, they reflected some of the early barriers that had to be overcome by those who saw even greater value in teaching entrepreneurship—well beyond ‘nonworking’ hours.

Fourteen years later, this paper is but one of hundreds of testimonies that entrepreneurial studies are well on their way to healthy maturity.

“College campuses are idea incubators where people learn skills and forge work habits and relationships that serve them all their lives,” said Rob Chernow, the Kauffman Foundation’s senior vice president of entrepreneurship. “We know there’s an entrepreneurial spirit sweeping across college campuses today, and we’re thrilled to build on this momentum so that entrepreneurship becomes a natural and vital aspect of the American educational experience.”

In fact, in June 2003, the Kauffman Foundation selected 15 universities<sup>8</sup> from among thirty schools invited to demonstrate interest by developing a preliminary concept to compete in the Kauffman Campuses initiative. Each of the 15 universities selected was awarded a \$50,000 planning grant to assist with the development of a comprehensive proposal to be presented in December. At that time, five to seven universities will be awarded grants of up to \$5 million each based on their creativity and commitment to make entrepreneurship

training and experiences available across college departments and to students of diverse disciplines. Universities must also demonstrate their ability to raise matching funds.

## **CONCLUSIONS AND IMPLICATIONS FOR RESEARCH AND PRACTICE**

In this paper we have provided an overview of university-based entrepreneurship training and have focused on the training of entrepreneurs in university environments in Sweden. While not attempting to debate the origins or definitions of entrepreneurship, we acknowledge that regardless of its origin, it reflects the actions of some individuals more than others. And, we acknowledge that the acts of an entrepreneur, especially when enhanced with business skills and/or knowledge, lead to successful company formation. Hence, we, and many others cited in this paper have concluded that not only is it possible to stimulate entrepreneurial 'behaviour' but that to do so leads to an improvement in the quality and productivity of firms.

Much of the discussion in entrepreneurship education continues to focus on how to motivate young people as though these were motivations that they have never possessed. Rabbior pointed out some years ago now that people "are indeed born with ambition, motivation, and a willingness to take risks, but encounter barriers that erode this spirit of adventure" (Rabbior, 1990, p. 53) His message is one that we might still remember as we continue to develop new programs. We should examine our existing systems of education at all levels and seek to remove as many barriers, political and pedagogical, as possible that "erode self-confidence and self-esteem and, along with them, the spirit of adventure and the willingness to take initiative and risk--the spirit of entrepreneurship" (Rabbior, 1990, p.53).

The ENP model has been developed to stimulate technology-based and knowledge-intensive businesses. There is little reason to assume that it cannot be used to catalyze start-up development in other environments. As regions explore ways to encourage economic growth and greater business independence, training, not only at the university level, but at much earlier ages will be an important consideration. The opportunities are great but the implications for practice are varied given the environment, available expertise, education and backgrounds of participants, and local and regional support. Certainly as these programmes are tried and tested they will become the important models of the future and the material for further research.

The ENP programme, although begun as a university-based model is now used in 10 regions throughout Sweden. It has demonstrated its success in helping to inspire entrepreneurial behaviour among students and business professionals alike. This model has been developed to stimulate technology-based and knowledge-intensive businesses, and it has now been shown to encourage entrepreneurship in diverse environments where communities have sought to improve their business development climate.

In previous studies, including in our own past studies, it has been pointed out—despite highly positive talk about entrepreneurship—that certain barriers exist, both on the supply side and in the execution of entrepreneurship training. These barriers have ranged from clashes in internal priorities and questions about necessary competence to the credibility of

the one supplying the training. While these barriers are not completely gone, they are certainly lower—and fewer. In just the last four years, literally thousands of universities worldwide have adapted some form of business start-up training—not just to support growth and community wealth through taxation, but to provide a valuable tool to graduates who otherwise might not have even considered the possibility of creating their own wealth and/or success through the commercialisation of their ideas.

It has become clear that the successful institutionalization of entrepreneurship in universities today has generated new implications for research. Entrepreneurship as behavior has become the domain not only of business schools, but also of the social sciences, engineering, history, and even philosophy schools. The questions that face us now may be where the many facets of entrepreneurial studies belong, and why. Within business schools it seems clear that their role is to promote the practical training of new business developers, those who are business majors as well as those who come from many disciplines at the university. We content that it remains an important task for those intending to carry out research in entrepreneurial behaviour or to stimulate individuals practically to behave entrepreneurially is to create an understanding of the mechanisms underlying the criteria for success. These criteria are not unlike the criteria of good executive business management, but the critical difference lies in scale. The one or two individuals who start up a company have no staff, no money, little support, and often little experience. Their compass is their soul—their driving spirit, as it were.

Rabbior insisted that “entrepreneurship education programs should not be assessed based on the number of entrepreneurs that they create.” (Rabbior, 1990, p. 54) It’s possible that some who participate in many university programs will not actually start a company for many years, if at all. Rabbior suggests that programs are easier to evaluate and measure if they are written with clear objectives in mind. The ENP program with its emphasis on technology and knowledge-based ideas, holistic approach, and use of professional mentors and networks helps to ensure its success. Nevertheless, with each group of participants, we learn more about their needs and our abilities to meet those needs, and we are reminded to be entrepreneurial in the development of our own programme.

As we look back over the last ten years of the ENP program, we understand that while it is the goal of the program to encourage the establishment of firms, we also have learned the important values of our broader based entrepreneurship studies within the school of economics which are offered to students from throughout the university. Entrepreneurship embodies the very spirit of academia—creativity, innovation, leadership, ambition, and success.

## **MAGNUS KLOFSTEN**

Dr. Magnus Klofsten is associate professor and director of Centre for Innovation and Entrepreneurship (CIE) at Linköping University, Sweden. His research is oriented towards the early growth and development of technology-based firms, financing young ventures and university-industry relations. He has had many articles and books published in that field. As director of CIE and secretary of SMIL (a foundation of technology-based firms), which provides support in business development for the member firms, he has long experience of planning and implementation of different growth and development programs for technology-based firms.

## **MARY SHEPARD SPAETH**

Mary Spaeth has taught entrepreneurship and new business development at Linköping University for the last three years. Prior to coming to Linköping where she has directed internationalisation efforts for Mjärdevi Science Park and developed the incubator business plan and strategy for the Mjärdevi Business Incubator, she established the United States subsidiary of the ANGLE Technology Group, a technology commercialisation venture firm based in London, and served as Executive Vice President of ANGLE Technology LLC for three years. She also worked as the Director of Marketing for the Northwestern University/Evanston Research Park in Evanston, Illinois, and has presented numerous papers for the International Association of Science Parks (IASP), the National Business Incubation Association (NBIA), and is currently a member of the EU Paxis-funded task force Start-Up Providers (SUP). She is chairman and owner of Transmera AB and Transmera International, Inc. and just recently accepted a post as general manager of the East Sweden Development Agency—responsible for inward investment activities to 13 municipalities in the eastern region of Sweden.

## **Appendix:**

### **Main Findings from GEM 2003 Executive Report on South Africa**

This is the first GEM report to analyse cross-regional patterns of entrepreneurial activity in South Africa. Many of the national findings about entrepreneurship from the GEM 2001 and 2002 reports have been confirmed. However, there is considerable and significant variation in entrepreneurial activity across regions. In particular we find:

- Gauteng's total entrepreneurial activity rate of 9.9% is three times higher than the rate in Northern Cape and North West, which has the lowest total entrepreneurial activity rate. Much of this variation is due to differences in opportunity entrepreneurial activity levels across regions. In particular, high opportunity activity rates in Gauteng and the Western Cape considerably boost the overall rate of entrepreneurial activity in South Africa.
- Total entrepreneurial activity in Gauteng and the Western Cape is significantly higher amongst people between 18-54 years old than it is in the rest of South Africa. The pattern of entrepreneurial activity by age in these two regions more closely reflects that in developing countries than entrepreneurial activity in the rest of South Africa does. To some extent, therefore, lower entrepreneurial activity rates in South Africa

compared to other developing countries reflect lower entrepreneurial activity rates by young South Africans outside of Gauteng and the Western Cape.

- As in previous GEM reports, a positive relationship between educational attainment and entrepreneurial activity was found. This pattern is true across regions. There

is,

however, a notable exception in Gauteng where non-matric and matric entrepreneurial activity rates do not differ significantly. Gauteng also has significantly higher non-matric entrepreneurial rates than all other regions.

- As in previous GEM reports, this report finds that individuals located in major urban areas are far more likely to be involved in entrepreneurial activity than those in

rural

areas. This difference is much greater for opportunity entrepreneurship than necessity

entrepreneurship. This no doubt reflects the greater availability of opportunities and higher proportion of people with matric in large urban areas.

- As in previous GEM reports, this report finds that Black Africans are far less likely to be involved in entrepreneurial activity than other racial groups. However, in contrast to this national finding, GEM 2003 finds that opportunity entrepreneurship activity rates amongst Black Africans in Gauteng are not significantly different to those amongst Whites. Furthermore, Black Africans in Gauteng have much higher opportunity activity rates than Black Africans in the rest of South Africa.
- As in previous GEM reports, this report finds that individuals who believe they have the skills to start a business are much more likely to do so. Overall, Black Africans are much less likely to believe they have the skills to start a new business, even after controlling for education.

# **THE ROLE OF GOVERNMENT AND PUBLIC POLICY SMTEs and the Role of Government and Public Policy in Libya**

**Mokhtar Jwaili, Dr Brychan Thomas and Dr Said Al-Hasan  
University Of Glamorgan Business School  
majwaili@glam.ac.uk**

## **ABSTRACT**

The tourism industry in Libya consists of many small and medium sized tourism enterprises (SMTEs), with various activities ranging from tour operators to café and restaurants. The majority of these businesses operates independently and do not belong a large chain. All of these enterprises fall under the umbrella of the General People's Committee for Tourism (Ministry of Tourism), which was established in 2003 to replace the General Board for Tourism and Antiquities. The Ministry of Tourism is a Government and public sector body holding authority for public policy and development instruments for tourism-related industries. There are also public sector organizations involved in running the Libyan tourism industry below the Ministry.

The Committee was established with the aim to provided a comprehensive strategy for the development of tourism in the country and to progress its implementation. The objectives are to implement the tourism master plan, which was approved by the General People's Congress in 1998 as well as carrying out marketing and promotion of the country. This is as a destination for international tourism festivals and fairs, and to encourage intra-regional tourism through national festivals, which are organized in more than five of the Regional Municipalities. The General People's Committee for Tourism also considering a new tourism law that will take into account comments made by parties related to the tourism industry including a new classification of tourism establishments especially accommodation outlets.

The research reported involved the use of methods to access the policy environment, which currently exists in the tourism industry in Libya. The paper draws primarily on existing research, secondary data sources and a short questionnaire to key policy makers. Secondary data sources include literature in the area, which consists of both published and "gray" material (including reports from national and international bodies, universities and consultants). In addition, data has bee obtained from key policy makers involved with the Libya SMTE sector. In order to determine the nature of public policy and development instruments in relations to SMTEs, a questionnaire survey was distributed to key tourism organizations. The findings from this are to be reported in the paper and these show the importance of public policy and the development instruments in the running of the tourism industry. From the analysis of the results of the survey, the role of government and public policy in relation to SMTEs is determined and those aspects that are important for the sustainable development of the Libyan tourism industry are reported.

# **ECONOMIC EMPOWERMENT LEADS TO SOCIAL EMPOWERMENT OF WOMEN**

## **ABSTRACT**

There is a popular proverb in Nepal, even the Hindu God “Shiva” opens his third eye when he sees money. It applies to our society as well.

Most of the women are involved in reproductive work a\such as becoming mothers, housewives and voluntary service providers. Even though this reproductive work is very important, it is undervalued in the society because it is not linked with monetary values. As a result women have a subordinate position in all aspects, most of which is reflected in their lack of access to economic resources, lack of mobility, lack of power and control and their own bodies and power of the family. So it is necessary for them to be involved in the economic activities so that their work can be valued and they can be independent. However, getting a job outside the house is difficult for them since they are less educated. Therefore, the economic empowerment through the micro enterprise is a perfect solution for them. Entrepreneurial development is a difficult task for women who are form the low income families, but the UNDP programme, Micro-Enterprise Development demonstrated that women entrepreneurs from low-income families can be developed if, necessary support services are provided. Based on the programme, extra income of women definitely reduces the poverty of the household. In addition to that, income in the hands of women has important beneficial effects not only for the whole family’s well-being, but also, it improves women’s status, - increases the power relationships in the home, in the community and in the market.

# **TITLE: THE INFORMATION SYSTEMS CONTENT OF BUSINESS EXCELLENCE MODELS**

Excellence\ICSB-abstract1-oct2003.doc  
18/11/2003

Business excellence models like Baldrige and EFQM include sections devoted to information systems. For example, the Baldrige model has a section called “measurement, analysis and knowledge management”. This section accounts for 90 points out of the Baldrige total of 1000. However, an initial analysis of the content of both of these models indicates a tendency for them to focus on the *informing* role of data and information rather than the *enabling and strategic* role for information systems that is reflected in contemporary literature. Thus this paper will examine the information systems content of the Baldrige and EFQM models with the purpose of evaluating the content and recommending ways that such models can be improved.

## **RESEARCH METHODOLOGY**

1. Summarise the information systems content of the Baldrige and EFQM business excellence models. Data will be collected by analyzing documents that discuss the content of each model, including material on their website.
2. Evaluate the content validity of the information systems sections of both the Baldrige and EFQM models. This evaluation will be conducted using either interviews with SME managers or a focus group of SME managers. The relevant extracts from the current versions of the two instruments will be discussed with managers of SMEs to see if they believe that the instruments adequately cover the topic. Where the content is seen as inadequate, the managers will be asked to indicate topics that need adding.
3. Summarize the above findings and discuss them in relation to current literature . This discussion will aim to identify ways to improve the information systems coverage of business excellence models.

## **POSSIBLE CONCLUSIONS**

A major possible conclusion is that the coverage for information systems in the Baldrige and EFQM models is too narrow. The study will also identify topics that SME managers believe should be included in excellence models.

## **POSSIBLE RECOMMENDATIONS**

It is likely that the recommendations will suggest that the excellence tools should reflect the enabling and strategic role for information systems rather than just the *informing* role. The recommendations will include specific topics that could be incorporated into instruments that better reflect best practices in small firms.

# **UNCONVENTIONAL FORMS OF HUMAN CAPITAL, DO THEY MAKE A DIFFERENCE FOR BUSINESS PERFORMANCE AND MOTIVATION ANALYZING THE EFFECTS OF ILLEGAL ENTREPRENEURSHIP EXPERIENCE**

**Ruta Aidis**  
**SSEES, University College London**  
[r.aidis@ssees.ucl.ac.uk](mailto:r.aidis@ssees.ucl.ac.uk)

**Mirjam van Praag**  
**University of Amsterdam**  
**Faculty of Economics and Econometrics**

Existing studies show a positive relationship between business development and conventional human capital as measured by formal education attainment, previous business experience and prior management experience. In this paper, we explore whether an unconventional form of human capital, namely illegal entrepreneurship experience (IEE) has an effect on either business performance or motivation of existing legal businesses in a transition context.

## **METHOD**

Empirical analysis is based on a survey of business owners in Lithuania (n=399) conducted in 2000. Descriptive statistics and regression estimation models (ordinary least squares, ordered prohibit, logit models) are used to test the impact of human capital variables with control variables on three measures of business performance and two measures of business motivation. Human capital is measured in terms of conventional human capital measures such as work experience, educational attainment and age. Business performance is measured in terms of size, business turnover and business financial success. Business motivation is measured in terms of intention to continue in business and growth aspirations.

## **RESULTS AND IMPLICATIONS**

Our regression results indicate that IEE is significantly associated with subjective measures of business motivation but not at all with performance measures such as business turnover. These results hence, do not support the notion that prior experience in black or grey market under a centrally planned economic system may provide valuable human capital for entrepreneurs in a more open market-oriented setting. It is more likely that the more motivated and enthusiastic entrepreneurs started as soon as possible or even earlier and

have maintained their motivation throughout. We conclude that IEE is not productive for entrepreneurship performance but can be seen as selection device for motivated entrepreneurs.

## **RECOMMENDATIONS**

IEE or experience in the grey or 'unofficial' economy might be used as a screening device to select highly motivated entrepreneurs in emerging market economies.

# SUCCESSFUL ENTREPRENEURIAL LEADER: A PUERTO RICO'S ENTREPRENEUR AND BUSINESS ADMINISTRATION STUDENT PERSPECTIVE

**Nilda M. Seda-Cuevas, PhD**  
**Associate Professor**  
**Pontifical Catholic University of Puerto Rico**

[jsantiago@email.pucpr.edu](mailto:jsantiago@email.pucpr.edu)  
**787-841-2000, ext. 2509**

The most successful enterprises around the world are those that are managed by successful leaders. Leaders with good business actions and behaviours can be characterized as prosperous and excellent. Characteristics focused on performance that leads to completing the job and obtaining the desired results. Diverse researchers identify successful entrepreneurial leader's characteristics. According to Gokenbach (2003), true leaders challenge process, inspire a shared vision, enable others to act, model the way, and encourage the heart. Successful leaders of the future will find ways of attracting and retaining good people, (Lewin, and Regine, 2000).

Whereas, Cangemi, Miller and Hollopeter (2002) argue that successful leadership is characterized by sound technical knowledge of our own's products and services, and on motivating employees to excel. Preston (2001) establishes that successful leaders set goals, reaches them and motivates followers in the process. Various leadership theories have been developed in order to offer an effective process. Amongst the most popular is the idea that effective leaders have something called emotional intelligence, (Maccoby, 2001). According to Maccoby (2001), effective leaders are able to control their actions and behaviours.

This research investigates the characteristics that successful entrepreneurial leaders of Puerto Rico possess according to the perspective of entrepreneurs and business administration students in southern Puerto Rico. The participants include entrepreneurs whose businesses have less than 500 employees and located in the southern region of Puerto Rico. Also included in an Entrepreneurship course during the 2004 Spring Semester, at various universities in Puerto Rico.

The participants will be asked to voluntarily complete a questionnaire. The sample will be obtained fro the list of bona fide members of the Ponce and Southern Puerto Rico Chamber of Commerce. Statistical analysis includes: percentages, ranking, T tests, Chi Square tests, and Cross tabulation. These results will be compared to a study performed in 2000 among Puerto Rican business leaders in southern Puerto Rico to determine changes in the past three years.

# THE VERY SMALL ENTERPRISE – A PERMANENT INTERNATIONAL OPTION

Owen Leeds

## ABSTRACT

There is an ever growing body of knowledge pertaining to the internalization of small to medium enterprises (SME), however there seems to be no consistency in what defines an SME (Coviello and MacAuley 1999). Existing definitions offered from a human resources perspective range from as few as 10 to as many as 500 full-time effective (FTE) employees (cf. Calof 1994). In cognisance of this, the authors suggest a benefit in the creation of a separate category called the very small enterprise (VSE), comprising of 5 or less FTE employees. Ample justification exists for this, in that over 85 percent of businesses in small economies such as New Zealand fall into this group (NZ Department of Statistics 2000), and a significant number of these are active exporters.

Of even greater interest, is the proposition of the existence of a large number of these VSE's being viable internationalizing concerns, with no desire for, or intention of, internal growth beyond this level. This should not be confused with having no plans to grow in profitability or indeed in the number of products and markets serviced. In fact, there is compelling evidence to suggest that this growth is occurring, via the use of both horizontal and vertical networks to acquire the necessary resources and capabilities (f. Axelsson & Easton 1992), and overcome liabilities of smallness and newness (cf. Adrich and Auster, 1986). With this in mind, the main aim of our study is to understand the approach that the VSE's take to enter the international marketplace, and in particular how using networks can expedite the process of internationalization, by avoiding traditional barriers (cf. Johanson and Vahlne 1977, 1990). In addition, an attempt will be made to show that this business model, has long term viability and effectiveness as an internationalization alternative, and worthy of considerably more public and private sector support than is currently available.

As the forerunner to a much larger quantitative project, a qualitative multiple case study was conducted enabling both within and cross-case analysis to be carried out, and facilitation of theoretical replication and extension (Eisenhardt 1998, 1991; Yin 1989). Data has been collected from four cases, with the specific unit of analysis being the VSE exporter. By exploiting the multiple sources of data available within each of these firms, our initial findings indicate significant reasons and factors as to "why" and "how" the VSE successfully retained their business structure in an international context. Such a methodological approach is extremely important because of the 'tap' the richer contextual dynamics that would otherwise have been missed in a quantitative study alone.

From the research conducted to date, we have found that the process a VSE follows in entering new international markets may be grounded in social exchange theory (cf. Homans 1961; Thibaut and Kelly 1959). Key reasons for remaining internally small include a desire to retain control; a perception of risk associated with human resource growth; a desire to focus on design and entrepreneurial activities, preferring to leave a production and marketing up to networks partners; and a belief that smallest equates to greater business flexibility.

# Building an Entrepreneurial Organisation – A Preliminary Study in the U.K.

**Satirenjik Kaur Johl**

Although traditional research on entrepreneurship has very much concentrated on small and medium organizations and new business start-up there has been growing attention in research on entrepreneurship in large established organizations in recent years (Cooper and Dunkelberg 1986, Wright et al.1992, Guth & Ginsberg 1990, Zahra 1995). Many large companies are soliciting for ways in reinventing or revitalizing their entrepreneurial roots. These companies are looking for innovation, speed and risk taking that they once had but has eroded due to size, bureaucracy, complex processes and hierarchy. The practice of corporate entrepreneurship has gained increasing attention among managers and academicians as it possess the ability to create innovation, a critical element for businesses to compete in today's competitive environment. In addition, entrepreneurship within an existing organization has become an important element in organizations and economic development.

Given the importance of having entrepreneurship skills within an organization, this pilot study examines the perception of government agencies, organization and academicians on corporate entrepreneurship. In particular the study compares the findings from this study against existing literature on corporate entrepreneurship and analyses whether there any gaps that need to be addressed. Four open-ended questions were developed in analyzing the characteristics, factors, benefits and constraints in forming an entrepreneurial organization. These questionnaires were distributed to 39 selected government agencies, business organizations and academicians to gauge the level of understanding on corporate entrepreneurship before embarking on the next stage research.

The findings seem to indicate that the government agencies, academicians and organization are rather familiar about what constitutes in being an entrepreneurial organization and is consistent with prior studies. More interestingly, the survey finds that some of the less cited characteristics, benefits, factors and constraints appeared to be equally important as highlighted by some of the respondents in creating a successful entrepreneurial organization.

# MONITORING THE STRATEGIC EFFECTIVENESS OF SME INFORMATION SYSTEM

## ABSTRACT

The strategic use of information and communication technology (ICT) has been involving both large companies and smaller ones. However, while large companies usually own the managerial competence and financial resources to manage innovation, a lot of research emphasizes the typical weaknesses related to small and medium enterprises (SMEs). The typical focus on production activities, together with their limited investment budgets, very often lead SME entrepreneurs to keep out Information system (IS) issues whenever planning organizational and strategic development. As a result, SMEs usually allocate insufficient resources to the IS department and, whenever they do, IS staff competence are strictly narrowed to technical issues. The consequent lack of managerial competence among the IS staff limits the exploitation of the strategic opportunities related to the effective use of ICT, and inevitably leads SMEs to develop an IS which is inadequate to their organizational needs.

Therefore, it is questionable whether within SMEs the IS development process is aligned with the business strategy: these remarks show how smaller companies could greatly benefit from an IS check-up tool supporting the monitoring of IS adequacy and the decision making process about the IS development.

Most of the previously developed IS check-up tools refer to the traditional functional view of a firm, which certainly makes simpler its analysis and representation. On the other hand, a lot of research claim that a process-based approach is more adequate to support any managerial activity, since it should help addressing a number of common organizational problems, such as fragmentation or the lack of cross-functional integration, while enabling individual workers to identify and anticipate new business opportunities. In particular, a process-based approach seems to properly fit SMEs, where employees carry out inter-functional tasks and do not precisely define their roles.

This paper will present an IS check-up model specifically designed for SMEs and based on the process based view of the company. Within SMEs, the identification of the processes

actually carried out is not always easy. Thus, starting from the literature review on process analysis procedures, the model proposes a subset of processes typically characterizing SME activities, and focuses the check-up analysis on these processes.

The main aim is the evaluation of the alignment between the company strategy and the ICT support, highlighting the possible weaknesses of the IS management process. To pursue this goal, the literature suggests considering indicators such as the **strategic importance of business processes**, the **extent to which they are supported by ICT**, as well as the **level of ICT investments**. The latter indicator will be analysed not simply in terms of ICT product prices, but considering their total cost of ownership.

At the end of the development phase the model will be tested on a set of 50 SMEs to find out possible weaknesses and fine tune it. The final paper will present the developed model as well as the first results of the test on the field, trying to underline its usefulness and its possible role as a tool supporting the effective management of the SME information system.

## INTRODUCTION

The strategic use of Information and Communication Technology (ICT) has been involving both large companies and smaller ones. However, while large companies usually possess the managerial competence and financial resources to deal with innovation, a lot of research emphasizes the common weaknesses related to small and medium enterprises (SMEs<sup>1</sup>) (Raymond, 1985; Raymond, 1992; Burns, 1996). The typical focus on production activities, together with their limited investment budgets, very often leads SME entrepreneurs to keep information system (IS) issues out whenever planning organizational and strategic development. As a result, SMEs usually allocate insufficient resources to the IS department and most of the times the IS staff competencies are narrowed to technical issues (Palvia et al., 1994; Soh et al., 1994; Zinatelli et al., 1996). The consequent lack of managerial competence among the IS staff limits the exploitation of the strategic opportunities related to the effective use of ICT, and inevitably leads SMEs to develop an IS which is inadequate to their organizational needs (Cragg et al., 1995; Lai, 1995; Lang, 1997). Therefore, it is questionable whether the *IS development process* within SMEs is aligned with the *business strategy*: smaller companies could greatly benefit from an IS check-up tool supporting the monitoring of IS adequacy and the decision making process about the IS development.

This paper presents an IS check-up model specifically designed for SMEs and centered on the process-based view of the company. The identification of the processes actually carried out is not always easy within SMEs. Thus, starting from the literature review on process analysis procedures, the model proposes a subset of processes typically characterizing SME activities, and focuses the check-up analysis on these processes. The main aim is the evaluation of the alignment between the company strategy and the ICT support, highlighting the possible weaknesses of the IS management process. A first version of the model presented in this paper, as well as the theoretical framework justifying the main choices on the model features, have been described by the authors in a previous

---

<sup>1</sup> This paper will refer to the current definition of SMEs provided by the European Community (EU Commission 2003), which identifies those companies with less than 250 employees, a turnover lower than 50 million €, and which are owned for less than 25% by non-SMEs, except banks or venture capital companies.

work (Faverio et al., 2003). This paper proposes an IS check-up model based on the qualitative evaluation of three main indicators: the *strategic importance of business processes*, the *extent to which they are supported by ICT*, and the *ICT organizational impact*.

## CONCEPTUAL FRAMEWORK

The existing literature proposes many different IS check-up approaches, but most of them require either to assess the value of a large number of variables from a quantitative point of view or to involve a lot of people in the evaluation process. As a consequence, their application is appropriate within large companies but seems to be difficult within SMEs (for more details, see (Tagliavini et al., 2001)).

### ***Process-based approach***

Most of the previously developed IS check-up tools refer to the traditional *functional* view of a firm, which certainly makes its analysis and representation simpler. On the other hand, a lot of research claim that a process-based approach is more adequate to support any managerial activity, since it should help address a number of common organizational problems, such as fragmentation or the lack of cross-functional integration (Galbraith et al. 1986; Harrington 1991; Garvin 1998), while enabling individual workers to identify and anticipate new business opportunities (Davenport 1993; Brooke 2000). In particular, a process-based approach seems to properly fit SMEs, where employees carry out inter-functional tasks and do not precisely define their roles (Dutta et al. 1999).

The model presented in this paper refers to the company as a set of *processes*. The identification of these processes started from the *American Productivity & Quality Center's International Benchmarking Clearinghouse process classification framework* (APQC, 1995), which includes 209 processes. Because of SME peculiarities, not all these processes are typically carried out within smaller companies: thus, the APQC set has been reduced, by referring to activities that actually create value for the customers, are easily identifiable, and do not require too many resources. Finally, those activities characterized by very similar purposes (thus difficult to distinguish within SMEs) have been consolidated, obtaining a final set of 44 processes, classified in 9 groups according to the traditional model of Porter's value chain ( Table 1).

PRIMARY ACTIVITIES	SUPPORT ACTIVITIES
<b>Inbound logistics</b>	<b>Procurement</b>
Accept orders	Plan for and acquire the resources needed
Select and certify suppliers	
	<b>Human Resource Management</b>
<b>Outbound logistics</b>	Create and manage human resource strategies
Deliver products	Manage deployment of personnel (recruit, select and hire)
Manage production and delivery service (monitoring)	Develop and manage training programs
	Manage employee performance, reward and recognition
<b>Operations</b>

Provide after-sales service		Manage information system
Handle warranties		Select information technologies
Manage claims		Manage information storage and retrieval
		Manage software and hardware resources
		Manage financial resources
		Manage the tax function
		Formulate environmental management strategy
		Communicate with shareholders and manage relationships with the government
		Develop public relations program
		Measure organizational performance
		Design and implement TQM systems

**Table 1. The list of the 44 selected processes classified according to Porter's Value Chain model.**

### ***Dimensions of the analysis***

The IS check-up model is based on the evaluation of three main indicators: the strategic importance of business processes, the ICT coverage, and the ICT organizational impact.

- The **strategic importance of a business process** is the relevance of that process with respect to the company strategy, in order to get or maintain a sustainable competitive advantage. This indicator is useful to evaluate the "strategic alignment", i.e. the degree of coherence between the ICT support to company processes with respect to the business strategy (Faverio et al., 2003). This theory has been empirically verified, showing that the integration between business planning and IS planning can lead to widen the extent of the IS contribution to organizational performance (Teo and Ang 1999, Gottschalk 2001). The values of this indicator range on a 5 value Likert scale, from 1 (low strategic importance) to 5 (high strategic importance).
- The **ICT coverage** represents the actual extent of the support provided by ICT to business processes. It depends on both the distribution of ICT within a company and the users' ability to exploit it to fulfill the business strategy (Faverio et al., 2003). The values of this indicator range on a 5 value Likert scale, from 1 (low ICT coverage) to 5 (high ICT coverage).
- The **ICT organizational impact** is one of the most discussed topics within IS literature. The underestimation of the organizational issues has been very often addressed as one of the main reasons for the failure of IS project (Strassmann 1990; Davenport 1993, Stratopoulos et al. 2000). Many researchers claim that a competitive advantage through the use of ICT can be achieved only if organizational issues are planned and managed properly: research on the field has

emphasized that “for ICT-based change to be effective, technology, business processes, and organization need to be adapted to each other” (Benjamin et al. 1993; Malhotra 1993). To identify the issues needed to evaluate the ICT organizational impact, the authors started from the list described in (Tagliavini et al., 2001). It refers to Palvia’s work, specifically focused on the evaluation of end-user satisfaction within small businesses (Palvia 1996) and to a measure by Kanellis (1999) assessing the IS fit to the organization (

- Table 2). Since the model requires to cross the ICT organizational impact with the previous indicators (*strategic importance* and *ICT coverage*), these three items should be independent variables. Thus, the authors decided to consider only those issues not influenced by the ICT coverage: *ease of use*, *timeliness*, *data security and integrity*, and *documentation quality* (the shaded rows in
- Table 2). The evaluation of each row should range on a 5 value Likert scale, from 1 (low organizational support) to 5 (high organizational support).

Organizational impact issues		Items
CBIS features	A1	The system precisely provides the information you need
	A2	The system provides sufficient information
Ease of use	B3	The system is user friendly
	B4	The system is easy to learn
Timeliness	C5	The system provides up-to-date information
Productivity	D6	The system has improved process productivity
	D7	The system supports acquiring and distributing information more frequently and/or with greater speed
	D8	The system supports making decisions of a higher quality
Data security and integrity	E9	The system includes features for preventing and reducing user errors
	E10	The IS user is confident that the information acquired and distributed is reliable and valid
Documentation quality	F11	The system documentation effectively supports the use of the system itself
Overall evaluation	G12	The IS user is satisfied with the system
	G13	The system adds value to the activity performed by the IS user

**Table 2. Evaluation of the ICT organizational impact: shaded rows represent those items not directly influenced by the level of ICT coverage.**

## DESCRIPTION OF THE MODEL

### *Strategic alignment verification*

One of the main aims of this model is to verify the alignment between the company strategy and the level of ICT support. In other words, we want to test the following hypothesis:]

**RQ1: is the management of the information system coherent with the firm strategy?**

The strategic alignment verification is carried out by comparing, for each of the 44 processes described in section 0, its *strategic importance* (assessed by the chief executive officer – CEO) and its level of *ICT coverage* (assessed by the chief information officer –

CIO or the person in charge of the IS). Thus, to collect more complete information, the authors suggest to separately interview both the CEO and the CIO.

The collected values allow the definition of two place-lists: one ranking the business processes according to their strategic importance, and the other ranking them according to the ICT coverage. Then, it is possible to compare the positions of a given process within the two place-lists: two very different positions would emphasize a strategic misalignment.

Table 3 outlines 12 possible results of the strategic alignment verification: each process must be positioned in one of the 12 cells according to its values of strategic importance and ICT support (table rows) and its positions within the two corresponding place-lists (table columns). For more detailed information about the meaning of the positioning on the table see (Faverio et al., 2003).

	Same positions in the Strat.Imp. and ICT.Cov. place-lists <b>Correct alignment</b>	Better position in the Strat.Imp. place-list; Worse position in the ICT.Cov. place-list; <b>Misalignment:</b> the level of ICT support could be inadequate according to the strategic importance of the process	Worse position in the Strat.Imp. place-list; Better position in the ICT.Cov. place-list; <b>Misalignment:</b> it could be convenient to allocate less resources to the ICT support of this process
High Strategic Importance High ICT support	<b>Result: OK</b>	<b>Result: OK</b> Some other less relevant processes may receive a <i>marginally</i> higher level of ICT support.	<b>Result: OK</b> Some other more relevant processes may receive a <i>marginally</i> lower level of ICT support.
High Strategic Importance Low ICT support	<b>Result: Verify</b> Most of the firm processes have a low level of ICT support: it could be useful to increase the ICT budget. <b>Verify</b> that other less relevant processes are not over-supported by ICT.	<b>Result: Critical</b> Some less relevant processes receive higher ICT support. The seriousness of the problem is directly proportional to the extent of the misalignment. Resources allocation audit required.	<b>Result: Warning</b> <b>All</b> the firm processes have a level of ICT support $\leq 3$ . There is <b>at least</b> one more relevant process that could have a lower level of ICT support (verify).
Low Strategic Importance High ICT support	<b>Result: Verify</b> If the firm has more relevant processes, verify the adequacy of their level of ICT support.	<b>Result: Verify</b> <b>Absence</b> of processes with high strategic importance. Verify the correct assessment of their strategic importance. Some other less relevant processes may receive a <i>marginally</i> higher level of ICT support.	<b>Result: Warning</b> Often the result of large process automation actions. Beware that other more relevant processes receive adequate ICT support. Verify ICT budget allocation.
Low Strategic Importance Low ICT support	<b>Result: ok</b>	<b>Result: Verify</b> <b>Verify</b> the allocation of ICT resources.	<b>Result: Verify</b> Possible low ICT budget. <b>Verify</b> the ICT coverage of processes with higher strategic importance.

**Table 3. The results of the strategic alignment verification: by positioning each process within the table it is possible to assess the coherence between its strategic importance and the level of ICT support.**

### **Comparing two points of view: CEO vs. CIO**

Although the increasing strategic importance of the CIO's role is widely recognized (Ravarini et al., 2003), many empirical studies show that within SMEs the CIO is often focused on technical issues, such as the management of the hardware and software infrastructure. A lack of involvement with the company management may prevent the CIO from taking correct decisions about the IS development.

Moreover, the recurrent lack of technical competencies characterizing most of SME managers often makes them unaware of the strategic opportunities related to the use of ICT.

By asking both the CEO and the CIO to assess the strategic importance and the level of ICT support for each of the 44 processes, it is possible to verify the “alignment” between their perceptions of the company. On one hand, the role of the CEO is definitely the most suitable to assess the strategic importance of each business process, but he/she may not be aware of the actual level of ICT support within the company. On the other hand, the CIO is clearly able to assess the level of ICT support of each process but he/she could even ignore the firm strategic objectives. Therefore, we want to test the following hypotheses:

**RQ2 (a): is the CEO aware of how ICT actually support the business processes?**

**RQ2 (b): is the CIO aware of the firm’s strategic objectives?**

To answer these research questions, it is necessary to estimate the “distance” between the CEO’s and the CIO’s point of view. A possible way of making this estimation is to compare their answers to the 88 questions (44 assessments of strategic importance and 44 assessments of ICT coverage) and:

- calculate the distances between the answers to the corresponding questions;
- consider the absolute values of these distances (to avoid compensation effects);
- summarize these 88 values.

The higher the final result, the greater their misalignment, hence the need to improve the level of communication and cooperation between them.

Of course, by applying this procedure only to the 44 answers about the level of ICT coverage or to the strategic importance of business processes, it is possible to answer to RQ2 (a) and RQ2 (b) separately.

### ***The ICT organizational impact***

The model requires to take into account the end users’ opinions about the IS effectiveness (often referred to as “end user satisfaction”) as an estimation of the ICT organizational impact. Therefore, all the end users involved in a given process should evaluate the IS support to the process itself. More precisely, the evaluation process of the ICT organizational impact is composed of the following steps:

- the users involved in each of the 44 business processes are identified;
- for each business process, each involved user is interviewed and evaluates the items described in the shaded rows of
- Table 2;
- the average of the values provided by all users involved in a given process can be considered as an estimation of the ICT organizational impact of that process.

A high value of the ICT organizational impact means that the users of the process are satisfied with the IS support. On the other hand, the reasons for a low value of the ICT organizational impact may be different:

- the users may need training activities;
- the software application may be too difficult to use;
- the IS may not adequately support the process information requirements.

The relationships between the values of the three analyzed dimensions (strategic importance, ICT coverage and ICT organizational impact) can be explored by means of Table 3. The positioning of a given process within

Table 3 provides information about its strategic importance and ICT coverage; then, the process could be represented as a circle with a radius directly proportional to the extent of the ICT organizational impact.

## CONCLUSIONS AND FUTURE WORK

This paper focuses on the strategic role of Information and Communication Technology (ICT) within SMEs. The authors propose a model to verify the alignment between the strategic importance of business processes and the related level of ICT support, through direct interviews with both the CEO and the CIO. Moreover, the significance of a possible misalignment in a given process is assessed according to the ICT organizational impact and examined through the answers of the IS end users involved in the process itself.

To test these hypotheses, the authors developed a questionnaire and are testing it on a first sample of 50 Italian SMEs: next research steps will be the fine tuning of the questionnaire according to the experience on the field and the statistical analysis of the collected data, in order to determine the actual strategic effectiveness of SME information systems.

## **ABSTRACT**

This paper analysis and evaluates the performance of a number of small enterprises established through a program sponsored by the government of Puerto Rico. This program is identified under the acronym "AAFET" which stands for ("Administración para el Adiestramiento de Futuros Empresarios y Trabajadores") Administration to train future entrepreneurs and workers. The program started in 1985 to recruit and provide training to young people ranging in age from 18-28 years. Program participants who develop an acceptable business plan are provided with startup capital of \$1,100 by AAFET.

An investigation of the survival rate and performance of these small businesses created through AAFET program is made utilizing two methods. One approach involves telephone interviews of approximately 120 small businesses from a listing of the enterprises obtained from this agency (approximately 400 firms with telephone numbers). The telephone interview covers aspects of employment, performance and future prospects of the firm. The second approach involves selecting a random sample of 40 enterprises from the total list and conducting an in depth personal interview. The personal interview helps to critically evaluate the business operation and its potential for success. The owners' assessment of the government program and problems faced by the enterprise provides added information.

An analysis of the data and information collected helps to draw conclusions about the performance of the enterprise initiated through this program and their contribution to employment and economic output. Conclusions about the effectiveness of the AAFET program, and the general types of problems facing these small businesses are also made. Recommendations to improve the training program, and a system to assist these small businesses to become successful will be developed.

# RISK MANAGEMENT AMONG VENTURE FUNDS

**Jan Smolarski ([ism@fek.su.se](mailto:ism@fek.su.se)), Stockholm University**  
**Bengt Pramborg, Stockholm University**

The decrease in the funding of entrepreneurial ventures and the recently published low cumulative returns among venture funds have increased the need to analyze how risks are being managed in funds that invest in SMEs. In the long-term, inadequate or by venture capital firms to fund entrepreneurial ventures. This affects not only new investments in high-growth areas but also add-on investments in existing SMEs. Traditional investors such as pension funds and insurance companies may also make less funding available to venture firms. Government programs may be curtailed if research shows lower than expected rates of political return. In addition to protecting invested capital, returns may increase if venture firms explicitly manage risks. This is a new topic in entrepreneurship that has not received any attention in the literature.

From the entrepreneurs' and venture firms' perspectives, the results of this study is important since additional funding may be directed toward venture firms that develop proper risk management programs as a part of their overall investment strategy. In addition, increased goal congruence among the stakeholders in entrepreneurial activities may also result from being able to better understand the effectiveness of certain risk management techniques and procedures. This study may also allow policy makers to design improved entrepreneurship initiatives.

Our research focuses on analyzing how venture firms manage risks. Specifically, we analyze management of risk in new investments, management of risk in existing portfolio companies, portfolio risk and macro oriented risks. We analyze not only financial risks but also qualitative risks such as agency and corporate governance related risks. The sample consists of venture firms in Europe. The sample was selected from the European Venture Capital Association and the British Venture Capital Association databases. Data was collected using a survey instrument, publicly available data and from databases available from commercial data providers in the venture industry. Venture firms in Sweden, Denmark, Ireland, Luxembourg, Poland, Holland, Austria, Portugal, Greece, Italy, Spain, France, Switzerland, Germany, the UK and Turkey participated in the study. In the countries where the survey has been completed, a combined response rate of more than 50 percent has been achieved. We estimate regression parameters in analyzing the data. Dummy variables include fund performance, investment stage, sector focus, size, geographic location and investment focus.

During the nineties, the interest for the small businesses increased, and today, big hopes are put on them from governments all over the world that they take over from the large companies in employing people and innovative. A justified question one might ask in this regard is what we really know about this group that we put so much faith in. Going through articles and textbooks concerned with small business research, you find that there are a lot of statistical facts collected about entrepreneurial traits and small enterprise growth pattern and so on. What strikes you when reading is that there are very few articles that actually go any deeper and really try to find out what the leaders of these organizations (the small business managers) really do.

The purpose of this paper is to improve our understanding of the work of small enterprise managers through a literature review and an observational study (six weeks, where almost 270 hours of empirical material have been categorized) of managerial behavior in small enterprises. The deployed methodology in the observational study is inspired by the observational methodology developed by Henry Mintzberg, labeled structured observation. The methodology of structured observation provides a means to collect data that is both “grounded” in empirical observations and that is structured in order to facilitate comparison between observations in different contexts.

A conclusion of this paper is that the daily activities of the small business manager is characterized by, among other things, informality and constant interruption as the process by which their work is organized. Further, the majority of the managerial work conducted could be classified as administrative work. There are also surprisingly large similarities between the six owner managers in this study.

These findings raise some interesting questions for future research, such as if the above-described situation is the daily life for all groups of small enterprise managers or is it so that some groups (for instance growth-oriented enterprises) have managed to organize their work in some other way, which could explain their better performance and from which other managers can learn?

# **COMPUTER ANXIETY AMONG ENTREPRENEURS ASCRIBED TO THE CHAMBER OF COMMERCE OF PONCE AND SOUTHERN REGION OF PUERTO RICO**

**Lillian Valázquez-Zamora, Ph.D**

Entrepreneurs commit themselves to various activities when operating their businesses. One of them being the management of technology. Information system technology changes constantly and rapidly, thus, forcing the entrepreneur to adapt day after day. Sometimes these changes may be resisted because different entrepreneurs may be affected by the system in diverse manners. While some entrepreneurs may welcome a new technological system because it brings changes they perceive as beneficial to them, others may resist the change because they believe the shifts are detrimental to their business interests.

This resistance range from computer anxiety, computer phobia, negative attitudes towards computers, frustration, among others. There are many researchers that have expressed their opinions on computer anxiety and how it may affect the individual performance and state of mind. Linda V. Orr, states “as the academic and business environments continue to move forward in computer technology, the gap is widening for those who experience computer anxiety”. Computer anxiety as defined by Howard, Murphy & Thomas (1986) is “the fear of impending interaction with a computer that is disproportionate to the actual threat presented by the computer”. O.V. Doronina’s (1995), in her article Fear of Computers, indicates that a person in a state of computer anxiety, “a person’s behavior is characterized by negative comments against computers and information science, attempts to reduce the amount of time spent using, and even the avoidance of using computers to accomplish their tasks”.

This research investigates entrepreneurs ascribed to the Chamber of Commerce of Ponce and Southern Region of Puerto Rico anxieties regarding the computers and the sources of this anxiety. The researcher examined how certain variables (age, gender, computer confidence, computer ownership, computer liking, and the number of computer courses taken by the participants) can affect the level of computer anxiety in the business community of the southern region of Puerto Rico.

The participants include entrepreneurs whose businesses have less than 500 employees and are located in southern Puerto Rico. Each participant will be asked to voluntarily complete the Computer Anxiety Scale (CAS) designed by Loyd and Gressard (1984). The Computer Anxiety Scale (CAS) contains 29 Likert-styled items which present statements of

attitude toward computer and their use. The scale is designed to measure three separate factors: computer anxiety, computer confidence, and computer liking.

Statistical analysis includes: frequency and percentage distribution. Chi-square tests, Correlation, Cross tabulation, Z-Tests, T-Tests, coefficient of determination, and hypothesis testing

## ABSTRACT

The link between higher education and development has been one of the most important issues extensively discussed in multiples conferences and action proposals in a regional and international context during the nineties. (World Declaration about Education for All, Thailand, 1990; Iberoamerican Conference in Education, Argentina, 1995; Regional Conference about Higher Education in Latin America and the Caribbean, Cuba, 1996; Higher Education, 1998; Higher Education in Developing Countries: Peril and Promise, UNESCO, 2000; Constructing Knowledge Societies: New Challenges for Tertiary Education: A World Bank Report, 2002).

This issue, of increasing importance within the knowledge economy, argues that quality and relevance of teaching and research conducted in underdeveloped countries are critical to close the gap between rich and poor countries. These areas depend at the same time on the availability of highly qualified and compromised scholars in underdeveloped countries. In this context priority has been given to the necessity of international cooperation to attain the objective of faculty development.

Moreover, development requires that efforts be made to ensure that higher education institution's curricula respond to local skill requirements. In this sense the development of scholars in Entrepreneurship is of critical importance since it is linked to the creation and growth of local new firms, which will provide an economic alternative and social improvement for the country's people in order to attain autonomous development.

This paper analyzes the European Doctoral Program (EDP) contribution to development. The Program is studied from its creation in 1989 to 2002. The founder of the Program was interviewed in order for us to become acquainted with the original objectives. As part of the research methodology the enrolment for the period studied was analyzed. Participants were distributed by country of origin, gender and area of study from which they come. In addition, a survey was realized among the students who have completed their P.h.D. degrees in order to know their actual performance and contribution to their countries of origin, including the research area.

Through the years the Program's enrolment has been changing. Participants coming from countries other than the European region have been increasing. It is argued that the Program's structure and logistics facilitate the high standard development of scholars and researchers and their return to the countries of origin, besides promoting the creating of regional and international networks through which the development agenda advances.

# THE IMPORTANCE OF INNOVATIVE MANAGEMENT STRATEGIES AS PART OF BUSINESS SUCCESS IN A DEVELOPING NATION: A CASE STUDY OF COMMUNICATIONS FIJI LTD.

## ABSTRACT

This paper examines one of the dimensions of entrepreneurship, innovative behaviour, and how it has been utilized to effectively manage a culturally diverse organization in a developing nation. Communications Fiji Limited (CFL) is a highly successful, publicly owned media organization originally set up in a Fiji by William Parkinson in 1986. This company has established itself as a market leader and has grown throughout the Pacific over the last decade to include radio stations in Papua New Guinea and the Solomons Islands. Much of the success of this small to medium enterprise (SME) has been due to the innovative management practices employed and encouraged by Parkinson. He has successfully incorporated indigenous traditions and artifacts into everyday management philosophy and used these effectively to build employee and management loyalty, accountability to shareholders and clients, and in overcoming the everyday issues of doing business in a developing economy, namely bureaucracy, lack of appropriate human and physical resources, and political unrest. Furthermore, Parkinson has encouraged advancement within the organization, established achievable career paths for employees and resisted the importation of expat management. Instead, he has fostered indigenous management and leadership within CFL through appropriate and culturally sensitive training and advancement. Based on the analysis of this case, it could be argued that larger, Westernised, global organizations may experience frustration in establishing successful branches in developing nations due to the required differences in the organizational culture.

## About the Authors

Morris W. Shanahan, BA, MA (Psychology) is Principle Academic Staff Member with the New Zealand Broadcasting School, Christchurch Polytechnic Institute of Technology. He joined the school with over 25 years of commercial radio experience in the United States, Australia and New Zealand. Morris completed his undergraduate degree at Western Washington University in the United States and his Post Graduate work in Psychology at the University of Canterbury. Morris control the research year of the Bachelor of Broadcasting Communications Degree and also consults a number of radio stations throughout the South Pacific region, including stations in Fiji, Papua New Guinea and the Solomon Islands. His areas of interest are in the psychology of the media and the introduction of commercial radio into developing markets.

Dr. Yvonne P. Shanahan is Head of Department for Accounting, Finance and Information Systems at the University of Canterbury, Christchurch, New Zealand. She completed her undergraduate work at Massey University before attending Syracuse where she completed her Masters of Science. She was awarded her PhD from the University of Canterbury in 2003. Dr. Shanahan has also had experience in the private sector as financial controller for two entertainment businesses. Her research interests include a focus on management accounting and small to medium sized family businesses. She is also a strong contributor to professional accounting education through her extensive involvement with Advanced Business Education Limited, the educational arm of the New Zealand Institute of Chartered Accountants.

## ABSTRACT

### BACKGROUND

Initial Public Offerings of equity (IPOs) are an important means of raising capital for U.S. firms and are critical to the growth of these companies. A large number of studies have focused on the characteristics of IPOs, as well as, on the phenomenon of underpricing of IPOs in the U.S. as well as in foreign countries. <sup>1</sup>This phenomenon has been well documented since the mid-1970s. For example, Ibboston (1975) found a 16.8% average excess return relative to the market. Ritter (1984) reported that for approximately 5,000 firms that went public during 1960-82 in the U.S., on average, they were trading at a price 18.8% higher than their offering price shortly after public trading started. A comprehensive study by Ibboston, Sindelar, and Ritter (1988) reported a 16.37% average return for 8,668 common stocks during the 1960-1987 period. In general, these papers are based on theoretical models that analyze the possible underpinnings of the underpricing phenomenon.<sup>2</sup> One of the most convincing explanations relies on the adverse selection consequence of asymmetric information between different types of investors or between issuers and investors.

Over the past decade there has been a dramatic increase in the U.S. The shares of non-U.S. firms that list on U.S. exchanges are traded in the form of American Depository Receipts (ADRs). Foerster and Karolyi (1999) provide a detailed discussion on the increasing number of foreign firms that chooses to list on exchanges in the U.S. They report that approximately 1,300 ADRs have listed on different exchanges in the U.S. over the past decade. Interestingly, over 30% of these new companies are relatively smaller companies with an asset size less that \$2m and less than 30 employees. Forester and Karolyi extend the work of Jayaraman, Shastri, and Tandon (1993) and Forester and Karolyi (1193), and focus on the stock performance and changes in risk associated with the initial listing of ADRs. Although their data do not include, “true IPOs” (only cross-listed seasoned offerings), their results suggest relatively better performance and changes in risk associated with the initial returns compared to their U.S. counterparts at least at the time of listing. Forester and Karolyi (1999) and Ejara, Ghosh, and Nunn (1999) discuss four different types of disclosure and are considered important designations for raising capital. While the former paper uses both level II and III cross-listed securities, the latter uses only level III, the most prestigious and costly listings. The ADRs, used by Ejara, et al., were either going public for the first time or were traded previously in their home country. None of these papers however highlighted the experience of smaller companies.

## **HYPOTHESIS**

The essential hypothesis in this paper is that foreign IPOs are characterized by a greater degree of under-pricing than domestic IPOs. In this paper, we follow a approach that includes both level II and III ADRs as our foreign IPOs sample. We specifically trace the experience of smaller companies [lowest decile (as well as quartile)]with less than 30 employees of all foreign companies seeking capital in the US initial Public Offering markets. We do not include firms whose securities were previously traded. Using a sample of domestic and foreign IPOs of smaller companies, matched by size, SIC code, offering month and year, we use the theories of IPO under pricing based on asymmetric information, to examine the key characteristics and differences of foreign and domestic firms going public in the U.S. capital markets during the 1985-2000 period. This is to date the most comprehensive attempt to understand the experience of smaller foreign companies seeking funds in the U.S.

We base our study on the analysis of Rock (1986), Carter and Manaster (1990), and others, which suggest that IPOs associated higher levels of information asymmetry are more under priced. This difference is due to the higher cost of information gathering as well as the greater level of uncertainty that is generally associated with foreign IPOs. In addition, we also examine whether or not FIPOs are deliberately under priced due to potential home equity bias.

## **POSSIBLE CONCLUSIONS**

The initial evidence of this paper reveals that smaller foreign IPOs are significantly more under priced than their domestic counterparts although such difference does not exist for the larger groups. This evidence of higher under pricing remains after controlling for underwriters' prestige, insider's ownership, and ex-ante risk of the company. From this, we should be able to make recommendations that will reduce the under pricing of non-US IPOs to the benefit of non-US small firms.

# **THE USE OF PRACTICES AS CAPABILITIES A STUDY OF THE RELATION BETWEEN USE OF BEST PRACTICES AND GROWTH IN MANUFACTURING SMES IN A REGION OF SWEDEN**

**Ragmar Ahlström Söderling**  
**Dalarna University, Business Entrepreneurship & Technology**  
**S-781 88 Bolange, Sweden, Phone +46-(0)23-778 621,**

**Fax: +46-(0)23-778 501, e-mail: [ras@du.se](mailto:ras@du.se), URL: <http://www.du.se/~ras>**

This paper reports analysis on the use of “Best practices” among manufacturing firms, in the county of Dalarna in Sweden, with ten and more employees. The study focus on the following question: Can the use of “best practices” be seen as a contributing factor in the creation of competitiveness and in that sense contribute to the growth of the firm?

Traditionally a common view on strategy has been conceptualized as a situational choice of generic strategies (e.g. Porter) assuming a type of contingency based view of the firm. During the last decade and still dominating is the focus on core competencies or distinctive capabilities assuming a resource based view of the firm (RBV). But where do the capabilities come from? It is generally acknowledged in research that these often intangible or tacit capabilities are developed through experiential learning or learning by practicing. This is the basis of a “practice based view of the firm” (PBV), often assumed in quality theories and methodologies, as a variant or specification of RBV. It is in PBV assumed, based on research findings, that there are practices that, in combination and when effectively linked together, can be expected to consistently improve operational performance and thus provide firms who adopt them with an advantage over those that do not.

Thus good business practices, and the learning and knowledge creation developed through using them, can be thought of as the base or foundation on which distinctive capabilities and hence competitive advantage is built.

## **Research Methodology**

The basis for the analysis is a dataset (127 firms) that was collected in the beginning of 2001 through a survey (BPPS) among manufacturing sites with 10 and more employees. The survey was sent to all firms (327) meeting the criteria above and the response rate was 40%. The Business Practices and Performance Model (BPPS) have been developed from a Practice empirical investigations in New Zealand during the 1990s and recently in five regions in Sweden.

## **Possible Conclusion**

The responses from the participating firm in this regional sample indicate that:

- Firms that hold a wide strategical focus seems to be more likely to grow.
- The likelihood for growth seems to be positive correlated with operational outcomes
- Operational outcomes are correlated with the use of practices

### **Possible Recommendations**

A recommendation for the firm management might be:

As long as firm's products or services are interesting on their market will it be a good idea to hold a broad strategic focus and put energy to implement and maintain practices to ensure good operational outcomes that make it possible to meet the pull from the market in a successful way.

A recommendation for policymakers and support organizations might be to support the management of growing firms to implement and maintain practices to ensure good operational outcomes.

# **WOMEN ENTREPRENEURS IN PAKISTAN: PROFILE, PROBLEMS, AND POLICY RECOMMENDATIONS**

Women's productive activities, particularly in industry, empower them economically and enable them to contribute more to overall development of their country. The actual and potential contribution of women in all areas of development has already been recognized; but they also have a valuable contribution to make in the area of enterprise development. Assisting women entrepreneurs in achieving their full potential contributes to economic growth and to social and political development. However, in many societies such as Pakistan, women do not enjoy the same opportunities as men. Progress has been achieved in opening doors to education and health protection, but political and economic opportunities for women have remained limited.

Although many of the problems are shared by small enterprises run by both male and female entrepreneurs, women entrepreneurs face additional obstacles. This is due to deeply-rooted discriminatory socio-cultural values and traditions, embedded particularly concentrated in a few traditional areas and are characterized by low technology and low production levels. These areas are typically those which require skills that are extensions of household skills, or which reflect the different educational and employment experiences of women, as compared to men.

The research conducted by the author shows that in Pakistan, women's full economic potential is not being tapped. The main obstacles for women entrepreneurs are the lack of access to, including control over, capital, land, business premises, information and technology, as well as the lack of training, production inputs, networking and assistance from governmental agencies.

Women's enterprises tend to be the smallest of all small medium enterprises, since women often have less access to the support services which would allow their enterprises to grow. It is therefore of crucial importance to find ways to assist women's enterprises to increase their productivity and thereby their income. Concerted efforts are needed to provide them with access to credit, technologies, and entrepreneurial training to enable them to make

better economic choices and to transform their businesses into competitive enterprises, generating income and employment through improved production.

If given the right support, women entrepreneurs can improve their success rate and their contribution to the economy. Therefore, better policy environment, revision of discriminatory legal rules and practices, increased access to finance and technology, improved access to business development services (BDS), and more facilitation of national, and international networking for women entrepreneurs have been recommended to enhance women's entrepreneurship and integrate women into mainstream economic development.

The study was done by conducting a survey based on a sample of 216 women entrepreneurs in five major cities (one federal and four provincial capitals) of Pakistan. The sample was stratified according to the geographical locations, size of the enterprise, and the sector of operation. The instrument for collecting primary information was in depth one to one interviews based on a questionnaire. The in-depth interview was considered to be the most appropriate method for a couple of reasons. Firstly, the indigenous researcher was able to draw on his own understanding of how the respondents see and experience the world in supplementing and interpreting the data. Secondly, the in-depth interview enable the researcher to capture the details needed for penetrating qualitative analysis without requiring contact over a prolonged period of time with the respondents. This was particularly important given the limited resources and time available to the researcher.

The biggest challenge for conducting the study was the absence of any sampling frame of women entrepreneurs in Pakistan. The Federal Bureau of Statistics (FBS) has recently started the first economic census of Pakistan, which is expected to provide a necessary frame for future surveys but this is not likely to happen before 2004. The respondents were randomly picked from directories prepared by different support organizations such as Export Promotion Bureau (EPB), donor agencies, NGOs, and government organizations working for the establishment and development of women entrepreneurship in the country.
