Pre-departure interviews were conducted with all students on campus, en-route to the campsite and upon arrival. All students thought of entrepreneurship as desirable, although they were also keen on getting a well-paid and challenging job. All felt that they have obtained some start-up skills at university. However, they were unsure whether they have obtained all the necessary skills required to start a business, and whether their theoretically orientated learning can be applied practically.

The camp was held in a purpose build campus in central Finland. During the camp, individual and small group interviews took place in an informal environment during break time. Therefore the length of each interviews ranged between 10 minutes to an hour. In order to promote discussion and obtain “rich” (i.e. detailed) information about how each student perceive the importance of the training camp, an “interview
guide” (as suggested by Buchanan et al., 1988) rather than a more structured questionnaire was used. This consisted of a series of key questions, but with some prompts to help the interviewer probe further during the interview. This approach provided the flexibility to explore issues with the students being interviewed, but it also ensured key topics were covered (Greenbank, 2009). Two formal focus group discussions, each lasted between 1-2 hours, were conducted on the last and second last days of the camp. The study also relies on information provided by students in the learning log that they submitted after the camp. Finally, follow-up interviews were conducted with students after three and six months to examine whether changes made during the camp were sustainable.

A Summary of the Learning Programme

The “entrepreneurship boot camp” was a one week long training programme aiming to provide support to business students who have seriously considered starting their own businesses as an alternative to employment. The learning programme can be divided into three parts:

a) Idea formulation and development

Sessions were held at the beginning of the camp to help students to formulate ideas through brainstorming exercises, as well as an assessment of the opportunities arose as a result of the political, economic, social, technological and environment situation of the world in the forthcoming decades. The next stage involved consolidating and refining ideas. Students moved between groups to discuss and refine their business ideas based on advices received. As a continuous development process students were given discussion time everyday to discuss with fellow students, on-site-supervisors and visiting speakers. At the end of the camp students were required to complete a business plan based on their favourite idea, and competed in a
Dragon’s Dan style competition where winners were chosen based on their plans as well as executions (i.e. presentation).

b) Technical training

Technical training comprised of a number of skills sessions, including finance and budgeting, marketing, business growth, internationalisation, and human resource management. These sessions were generally followed by a workshop where students were required to relate these issues to their own business.

c) Motivational talks with entrepreneurs

In additional to technical training for starting a business, the organiser also invited four entrepreneurs to talk about their personal experiences. These entrepreneurs operate in very different sectors, and have very different profiles in terms of age, education and previous experiences. These talks were followed by a Q&A session allowing students to ask the entrepreneurs for more details as well as for to advice on their own businesses.

Effects of Entrepreneurship Boot Camp on Students’ Perceived Feasibility of Entrepreneurship

a) Effects on Business Ideas Formulation

There appear to be a change in attitude towards discussing business ideas with peers. Students all agreed that business discussions are crucial in idea formulation and development, which many of them felt they always knew but never realize the effectiveness of. A student said that:

At the beginning, some students were joking and playing around while others simply did not come up with good ideas. Nevertheless, as we rotated between groups, ideas began to evolve and something that began as a joke eventually became more viable. Sometimes we found that even within a bad idea there
are good elements that we can take out of, and sometimes elements from
different people can form new ideas.

Some students felt that the camp had helped them to overcome fears in expressing
their business ideas, which many had had problems with in the past. A student
described a number of factors that held her back on campus:

I do not normally like discussing my ideas with other people, because I have
no ideas how they would react. I would normally get very nervous, and feel
extremely embarrassed when people disagreed with me, or think that my idea
is not good enough. I also wonder if anyone would be interested to discuss
business with me…

Students felt that there are a number of reasons why they were able to express
themselves better in the camp environment. First, students felt that the key behind the
success was the encouraging approach of the instructors. One student said that:

In the camp, sessions were conducted in a light-hearted manner. We received
constant reassurance from instructors and visiting entrepreneurs that it is okay
to come up with any idea, as you never know which type of business can
become profitable… Though them, I realised that even running what people
perceived as average businesses with ordinary ideas can also be highly
successful. This reinforced the view that ideas do not need to be large, but
more importantly, to explore a niche market where no one has been before.

Second, students felt that it was beneficial to discuss their business ideas with like-
mineded individuals:

In the camp I felt it is okay to discuss, not just because the instructors said so,
but because everyone else was thinking of starting a business. I was therefore
certain that I was not talking to the wrong crowd. There were opportunities to
discuss business ideas in some of the entrepreneurship modules on campus. However, I doubt that most people would be seriously interested.

Third, students felt that the relaxing and friendly atmosphere provided an ideal environment for business discussions:

We were shown time and time again during the camp that even an ordinary idea can be highly successful... Therefore there was no pressure for us to come up with an amazing idea, but simply an idea that is workable and something that we enjoy working on for the duration of the camp.

Students felt that such an atmosphere fostered the type of creativity that was discussed by Jack and Anderson (1998) and Shepard and Douglas (1996), which is essential for idea formulation and development:

The relaxing atmosphere allowed us to discuss all kinds of ideas, wild ideas, ambitious ideas, unrealistic ideas, crazy ideas, etc... It is important to have a sense of humour as it facilitates pleasant discussions. It would be impossible to be creative if people are too serious, and I think the environment allowed all of us to take a more relaxing approach in our discussions.

**b) Effects on Skills and Knowledge Development**

Consistent with Soloman (2007), most students felt that these trainings had been extensively covered on campus, and the trainings that they received on campus were far more technical than those they received in the camp. Students were able to recall a number of existing modules on campus dedicating to marketing, finance, HRM and international business where theories in these areas were taught extensively. Students also recalled a module dedicated to technical training for business plan writing, and some students had chosen to complete a business plan as part of their degree. Students felt that, in pure technical term, what they learnt from the camp
alone is not adequate, and if they are to conduct a business plan properly, more technical knowledge from lecturers and textbooks are required. This is especially the case for finance and budgeting, where, without prior knowledge in the field, they would not be able to follow some of the sessions given by the practitioners.

Nevertheless, students felt that the camp helped them to connect theories with practices. Students found considerable discrepancies between what is in the textbooks and what actually happened in some of the small firms. Many students also realised that starting up a business is a lot harder than they first thought, and certainly less glamorous than they imagined in the first place. A student said that:

Running a small business is about getting your hands dirty, requiring hard work and persistency to make things happen. Due to cost and other constraints running a small firm is definitely much harder than I first thought… I have learnt to be more realistic and forget about the grand business marketing techniques because they won’t work in small businesses... I need to be more practical. One of the entrepreneurs, for example, outsourced just about everything whilst focusing just on marketing the product, whilst another one focused simply on marketing.

Talking to entrepreneurs also exposed students to different operating styles and principles. One student mentioned that:

Through talking to entrepreneurs I realised that there is no single way to start a business. Whilst conventionally nascent entrepreneurs possessed some ideas, skills, resources and contacts, one of the entrepreneurs who visited the camp started his company without any clients and even any person who could deliver his service in mind. He simply had a vague idea of the type of business that he wants to operate. This is in complete contradiction with what another
entrepreneur, who said: “do not start your business if you do not have enough clients”. I therefore realised that there are infinite ways of becoming a successful nascent entrepreneur.

Students felt that the camp provided them with a burst of entrepreneurial ideas in a short space of time, which allowed them to compare and contrast between different business approaches, and inspired them to choose a business strategy that is unique for their proposed business. They felt that this is something that cannot be provided in the school setting, where entrepreneurs’ seminars are held irregularly over a long period. Students felt that on campus it is very difficult to develop the right entrepreneurial mindset and to develop a lasting impact on their entrepreneurial inspiration, as the “pressure of the immediate” took over immediately after these seminars as Johnson (2008) suggested.

c) Effects on Business Plan Development

Students also found that advices from entrepreneurs were instrumental in developing their business plan. Whilst business plan training on campus focused on the theoretical and technical aspects of business planning, the learning sessions in the camp focused instead on innovation and creativity. Many students who are writing a business plan as part of their degree felt that while on campus they took a more cautious approach to ensure that their work satisfied the academic requirement of their programme. One student said that:

The business plan on campus, which is an assessed module, required us to consider whether the idea has been explored previously, whether data and information existed regarding product demand and market size, whether the measurements they adopted are conventional, and whether there is sufficient literature to back up the adoption of such ideas and measurements, etc.
Consequently students felt that they had no choice but to opt for safe and workable ideas that are often less interesting. In the camp they felt that they can approach business planning in a more creative manner.

Another notable difference between writing a business plan on campus and writing it in the camp is the reliance on entrepreneurs’ advices. Whilst inside the camp they found that the practical advices from entrepreneurs extremely helpful, on campus they tended to rely on their lecturers. This is because lecturers were the ones who marked their plans and therefore understood the marking criteria. On the other hand, since their business plan will be marked according to their academic rigour more so than their creativity and originality, they did not realise the benefit of discussing with entrepreneurs who regularly visited the university.

**Effects of Entrepreneurship Boot Camp on Students’ Entrepreneurial Intention**

**a) Immediately After Departure**

The camp appears to have no significant effect on students’ entrepreneurial intention. None of the student was planning to actively pursuing their business plan upon graduation. Instead, for those who were about to graduate, their priority was to find employment within large private corporations. Some felt that entrepreneurship would probably be their last resort if all other employment options failed, which some perceived as likely due to the current economic crisis. Even one of those who had been running a business suggested that if he could find a good employment opportunity, he would give up his business.

In the long run, some students mentioned that they will be using the idea that they developed for their future business. However, most mentioned that they would only do so if the opportunity to pursue it arises. They also felt that they need more
planning and more discussions with other people to explore the validity of their business plans. Therefore even if they came up with their business plans it is unclear at this stage whether they will be taking them further. This confirms with Johnson (2008) that learning needs to reflect everyday life as well as getting down to the “nitty gritty” or else the transferability of learning is likely to be low.

Nevertheless, the students felt that the main advantage of the camp is for them to be more aware of business opportunities around them, as well as the tools require to develop them further. Therefore, when an opportunity arises in the future, students are confident that they can come up with a viable idea that will be appropriate under the specific context at the time, as well as to develop it further.

There is no evidence to suggest that starting a business has suddenly becoming a more or less desirable option in the immediate future. All remained positive in their perception of entrepreneurship, although none of them has developed a burning desire to start or to expand business as a result of the camp. Instead some students felt that they have been on an exploration journey, and discovered both positive and negative aspects of entrepreneurship:

The camp gave us the opportunity to determine our goals in life, to examine both positive and negative aspects of becoming an entrepreneur… I am now fully aware that some product will not be an instant success. For example, one entrepreneur went really close to bankruptcy before landing a big deal with Subway (a major fast food chain)… I now know that running a business is not easy… it requires a lot of guts, determination and risk taking, and, even when it is successful it is often not as glorious as the media portrayed… but at least we now know what it is really like (some of barriers are) now.
Another student said that:

The camp gave us the opportunity to think about why we want to become entrepreneurs and what are the goals of our businesses? Is it about profit? Is it to fulfil our dreams? Is it to change the world? ... These are very basic issues about starting a business, it’s just that we never had the opportunity to think about them.

Nevertheless the problem identification process is accompanied by notable positivity in students’ attitude towards business challenges. A student said that:

As one of the entrepreneurs said, problems are opportunities, rather barriers, for the business growth. If they are viewed in this way, then business can identify effective ways to change and to respond. The change leads to success which would not be identified without the problem.

Even through none of the student are actively anticipating starting a new business upon graduation, some students have now set themselves a timeframe where their entrepreneurial ambitions can be achieved. For example, one student said that:

I consider accumulating experiences as an important step and therefore I would prefer to become an intrapreneur before considering starting my own business. I feel that at this stage my skills, knowledge and expertises is clearly inadequate and therefore after gaining a few years of experiences I will be more prepared to start my own business. I can foresee myself starting a business in the area of providing consultations and assistances to Latin American companies to export and to internationalise. At this stage I feel that I lacked skills and contacts particularly in the area of internationalisation and therefore I will target import-exporting companies in the future where I gain skills in this area.
Therefore, although the camp did not make entrepreneurship more desirable, it provided students with a platform to assess all the available information regarding entrepreneurship. This provides participants the opportunities to realistically reflect and assess on their life, and how entrepreneurship can fit into it based on their personal strengths and weaknesses.

**b) 3 Months After Departure**

Pressure of immediate does appear to take over, particular for the master’s students, as they were completing their final piece of coursework. Most of them were also applying for jobs, as they mentioned they would do three months ago. However, there appears to be little change in terms of participants’ attitude towards starting a business after 3 months. Students remained positive regarding entrepreneurship, and the possibility of engaging in entrepreneurship in the future. There also appears to be no change in terms of student’s perception of their own ability to start a business, and channels that can explore if they are to start a business. This is in contrast with some literature such as Johnson (2008), which suggests that short term environmental change does not have any lasting impact on learning and motivation.

**Discussion: The Role of Environment in Fostering Entrepreneurship**

Given the success of the camp in increasing perceived feasibility and understanding of the process of entrepreneurship, an important question to answer is whether the programme can be incorporated into their school curriculum. All students felt that the camp is something that they have not experienced on campus, and that they would welcome the incorporation of it into their university programme. Some suggested that the there should be a new module focusing on the business development process altogether, whilst others suggested that different elements should be incorporated into different modules, for instance, the idea formulation and
development processes into the creativity module. Likewise, students felt that practical knowledge in marketing, finance, internationalisation, and HRM provided by the entrepreneurs should be incorporated into respective modules, perhaps as seminars after discussing the theories in the main lectures. For undergraduate students where writing a business plan is not part of the curriculum, they felt that they have never devoted this amount of time to work on their business plan, and would definitely welcomed the idea of having it as an option. Nevertheless, some students expressed reservation as they fear that creativity will be suffocated as a result of incorporating the camp’s elements into their study programme. Alternatively, some students suggested that the camp should be incorporated into their after school activities, perhaps as a prized competition.

However, students certainly felt that being in a camp provide additional values. Being in a tranquil surrounding without any distraction, students felt that the camp successfully created an atmosphere where they can freely discuss their business idea amongst each others:

Here for the whole week your purpose is to talk about businesses. There are constant opportunities to discuss our businesses, not just within formal sessions but also during breaks and activity time. You don’t feel embarrassed talking about your business ideas, because you are meant to do so.

Another student said that:

Everybody is friendly, and everybody has been thinking about starting a business. For example, in the earlier sessions, we can discuss all sorts of ideas… the group here consists of people from different programmes that we hadn’t interact before… and the more you share the more ideas you can get and that there are people with different expertise’s that are more than willing
to help you and contribute with solid propositions regardless who you are or where you come from.

Some students felt that such an atmosphere is difficult to replicate on campus, due to the constant pressure of homework and other matters:

I found it impossible to discuss my business with anyone on campus. On campus people are doing different things, and I just don’t feel that many of my friends at school are keen on starting a business. They are more concerned with coursework deadlines, exams, their part-time job, job applications, and social life.

Some students also felt that they are being stigmatised when they discuss their business ideas:

When I talked to them about my business ideas I tended to get ignored… or very quickly some people changed topic… It makes you feel embarrassed talking about your business idea. I mean, in the UK we lacked this kind of culture… Actually some people do have business ideas but they are so protective of them that they would not reveal to anyone what they are.

Therefore, in order for the incorporation to be successful, there is a need to create an environment within the campus where a group of likeminded individuals can get together and discuss about businesses, for example, through a Student Enterprise Programme, with guidance from lecturers and entrepreneurs to ensure that they are not drifting away from their objectives.

**Conclusion**

Our exploratory finding suggests that entrepreneurship summer camp can be an effective tool in teaching the “art” form of entrepreneurship, which Jack and
Anderson (1998) and Shepard and Douglas (1996) felt cannot be taught in a classroom context. The camp environment facilitates communications between students, instructors, and entrepreneurs, which is extremely crucial in idea formulation and development. In addition, the format of the camp allows students to develop their own initiatives utilising on their personal strengths and weaknesses, so that they can develop a business plan that is most applicable for them. Furthermore, the camp’s environment takes students away from other distractions and focuses their mind purely on development business ideas. However, the importance of classroom-based entrepreneurial learning should not be overlooked, as without the foundation the students will not be able to absorb the practical knowledge provided by the entrepreneur speakers. The camp can therefore be seen as a complementary to the existing classroom-based entrepreneurship learning, as well as the more practical work experience programmes.

In terms of the effectiveness, this exploratory study found little evidence that entrepreneurship summer camp increase participants’ perceived desirability of entrepreneurship start up. Likewise, participants’ entrepreneurial intention remains largely unchanged. However, it appears that participants are now more informed about the attractions and obstacles of starting a business, and consider more seriously about how entrepreneurship may fit in to their long term future career plan.
Workshop for the ICSB 2010 World Conference, Cincinnati:

Bridging the gap between academic theory and business practice in the area of innovation: an example of entrepreneurship education initiatives across the curriculum

José M. Romaguera and Luis A. Santini

University of Puerto Rico at Mayaguez

Contact: jose.romaguera@upr.edu

The workshop shares a process undertaken for bringing practitioner developed and implemented methods for innovation and entrepreneurship from one part of the world to entrepreneurship education across the curriculum in a different academic and cultural setting. The workshop will present input that was obtained from entrepreneurs, researchers, educational professionals and policy makers that were exposed to the systematic search method for opportunity recognition, new product development, process and service innovation. Additionally, workshop participants will be exposed and will have the opportunity to comment on the curricular and extra-curricular activities being designed and tested for use across different academic programs.
The Venture Design Studio: A Design Thinking Approach to Teaching and Learning for the Conception, Communication and Innovation of New Venture Concepts*

By Alex Bruton

It has been said in recent years that little evidence exists to show that the business planning process enables entrepreneurial learning. This paper advances a design thinking approach to teaching and learning for the conception, design, characterization, prototyping, testing, pitching and innovation of new venture concepts. The curricular approach and the associated scholarly inquiry project are described, as are the encouraging results obtained as we have begun implementing the so-called Venture Design Studio as part of our renewed and now cross-campus entrepreneurship offerings. This includes an approach to assessment that facilitates student-led learning, engages experienced entrepreneurs as “choreographers” and results in the design of new venture models that are both highly innovative and highly feasible. The number of textbook stores and student-bars being proposed has been driven down in favour of significantly more ventures deemed to be highly scalable. Implications are discussed for the design of curricula that help students reach into and catalyze innovation within their local ecosystems.

Introduction

Educational Context and Challenges

Calls are being made around the world for new approaches to education (Owen et al. 2006; Guntram 2007) on the premise that we are part of an information society characterized by: technology-savvy students who learn more by absorption and experience than by reading a

* The author acknowledges the support of the Mount Royal Teaching and Learning Scholars program and the Bissett School of Business, and thanks his colleagues Stephen Kenny, Laurie Jenson, Carolyn Sterenberg, Vance Gough, Patti Derbyshire and Douglas MacDonald for their input and roles in teaching the Venture Design Studio the first time through.

Alex Bruton (PhD) is an Assistant Professor and Teaching and Learning Scholar at the Bissett School of Business at Mount Royal University. He has academic, industrial and entrepreneurial experience, including roles in engineering, in product management, as an inventor, as co-founder of an Innovation Department, as a business consultant and most recently as VP Business Development for a technology start-up. He is a passionate teacher, has spoken to audiences up to 500 in size on over 40 occasions in six countries, and has led the development of a renewed entrepreneurship curriculum for delivery to students across Mount Royal. His research interests include innovation and the scholarship of teaching and learning for entrepreneurship.

training manual or attending a course (Brown 1999); a shift in the focus of creativity from generating original content to the timely rip-mix-burn reshaping of existing content (Ito 2007); increasing requirements for interdisciplinary work carried out by teams across functional and institutional boundaries (Guntram 2007); new ways of perceiving and organizing knowledge in society (Weinberger 2005) and in the educational sector (Cunningham and Duffy 2000); and new forms of teacher and learner interaction enabled by innovative technologies and approaches to copyright (Dillon and Bacon 2006). And it is frequently argued that Web 2.0 technologies are causing a disruption in higher education much like those that took place or are taking place in the music, newspaper, book and television industries (Christensen, Johnson and Horn 2008; Tapscott and Williams 2010). In order to survive in the networked, global economy of the future, universities are being told to embrace collaborative learning and collaborative knowledge production (Tapscott and Williams 2010) and teachers are being encouraged to shift their practices from the traditional teacher-centered transfer of subject-area-focused knowledge to the development of resources and practices that teach students the skills required to learn, collaborate and build knowledge on their own (Owen et al. 2006; Guntram 2007).

National and Regional Motivation

The Council of Canadian Academies (2009) has indicated that “Canada’s poor performance in respect of innovation is due to the prevalence of business strategies that do not emphasize innovation as a key competitive tool,” and its president has said (Nicholson 2009) that “how to teach this is perhaps the greatest challenge and opportunity facing educators in the 21st century.” Alberta’s Value Added and Commercialization Task Force recently recommended actions (Martin 2007) for overcoming a reliance on commodity resources and assuming a leading role in the global knowledge economy. Their report heavily informed today’s Alberta Action Plan.
and emphasized the roles that universities need to play in order to create the "ideal training ground and launch pad for [the] new entrepreneurs who will help shape Alberta's economic future and sustainable growth."

**The Entrepreneurial Education Context**

At a time when the field of entrepreneurship is debating and seeking its own legitimacy (Katz 2008) and charting its path forward (Kuratko 2004) and when many researchers, such as Kuratko (2004), Alberti, Sciascia and Poli (2004) and Pittaway and Cope (2007), are seeking to better understand and advance the role of entrepreneurship education, we suggest that there is no discipline in which the shifts described above are more relevant than in entrepreneurship. And as those calls for change are being made, debate about and research into how to best teach entrepreneurship continue to be wide-reaching and extensive (Alberti, Sciascia and Poli 2004; Pittaway and Cope 2007) and there are questions as to whether the business school is the best place to teach entrepreneurship (Gibb 2002; Kirby 2004). In addition, questions persist about the appropriateness of traditional approaches to learning how to conceive of and start successful new ventures. For example, despite the ubiquity of the business planning process in entrepreneurship education (Honig 2004) and typically high levels of excitement about its use as a teaching method (Roldan et al. 2005), little evidence exists that the business planning process helps student entrepreneurs learn (Honig 2004) (even if it might have other benefits in a new venture setting as suggested by Delmar and Shane (2003) and others).

**This Study**

**Aim and Central Questions**

This paper is written in direct response to the challenges outlined above. The main purposes are: 1) to introduce the Venture Design Studio (VDS), a novel approach to teaching and learning
for the conception, design, characterization, prototyping, testing, pitching and innovation of highly innovative and highly feasible new venture concepts; and 2) to report on work taking place in order to add a level of rigorous scholarly inquiry to what is happening in our classrooms and at their interface with our regional entrepreneurial ecosystem. Since an early pilot of the VDS took place in the September 2008 semester as part of our entrepreneurship curriculum renewal project, we have felt that the approach may have advantages over a traditional textbook or case-based course, business planning process and competition, and other modern approaches to entrepreneurial teaching for similar learning outcomes. However, despite having had this anecdotally-informed gut feel up to this point, we had not been able to rigorously describe what happens when students learn in this way, to understand how exactly learning takes place in this way, or to make an evidence-based claim about whether and in what ways the approach might be better suited than other methods. The aim of the work being reported here is to take a step toward answering these questions in a way that can be generalized for use by teachers, learners, practitioners and researchers. The central questions at this stage of the research are:

1. How well does the concept of design thinking lend itself to teaching and learning for new venture conception, communication and innovation?

2. What happens when people learn to conceive of, characterize, design, prototype, test, pitch and innovate models of new ventures that are highly innovative and highly feasible in an experiential, authentic and computer-supported design environment?

The Experiment, Data Sources and Methods Used

The VDS is an authentic and highly experiential 12 to 16-class activity that is iterative in nature and makes up over half of a new first-year undergraduate course called The Entrepreneurial Experience. Students from across campus work in teams of four (of their
choosing) to design, represent and pitch new venture concepts. As has been mentioned, their objective is to develop a venture concept that is both very innovative and very feasible - a combination they find out quickly is not easy to achieve. Every three classes they draw on custom topic materials, submit and share their ventures through a collaborative web environment (a customized wiki), do a videotaped elevator pitch in front of a panel of experienced entrepreneurs, and assess their own performance. The whole experience builds to a final competition at which students from each class go head to head and only four (of between 100 and 160) students have their submission crowned the venture with the highest potential value.

A wealth of data was collected for the study using the collaborative web environments created by over 120 students in four classes. These include: student surveys; videotaped elevator pitches and snapshots of their written work (available at each of four design iterations as learning took place); and reflections and self-assessments (also available at each iteration).

The second of the above central questions is a “what is question” meaning that we seek to more fully understand what is happening for students throughout the learning process (Hutchings 2000). Although the results of a quantitative survey are available, the methodology at this stage of the research has involved more of a phenomenological approach (Creswell 2009) in which qualitative methods are being used to describe and systematically analyze the student experience and learning outcomes throughout the learning process.

**Background**

**The Design Thinking Hype**

It has been suggested in recent years that the process of innovation should be modeled on the concept of *design thinking* (Dunne and Martin 2006; Brown 2008), and this has gained a lot of attention in the popular press; whether business people read *Fortune, BusinessWeek*, the New
York Times or Fast Company, for example, they are being told that design thinking is the new driver of innovation, a new competitive weapon, and a means of unlocking breakthrough ideas. But despite this attention, the idea of applying design approaches to management remains largely undeveloped (Dunne and Martin 2006), and a review of the academic literature yields a lack of generalizable data-informed studies that can speak to how well design thinking works when applied to the innovation process. In other words, other than the sometimes-recurring cases described in the above-mentioned publications and popular press articles, it is not clear whether and in what situations modeling the process of innovation on design thinking would improve an individual or a firm’s capacity to innovate. This conclusion has also been reached by Jahnke (2009) who describes his forthcoming work which promises to provide some empirical evidence.

Having said all this, it behoves the forward-thinking business educator not to ignore the hype until enough such evidence is available. After all, we have heard many times in many ways that design boosts innovation. For example: strategic management, design management and innovation management scholars have long suggested incorporating design early and throughout many stages of management to increase and accelerate innovation (Kotler and Rath 1984; Borja de Mozota 2003; Trott 2005; Chhatpar 2007); innovation scholars have urged innovators not to ignore the design process (Verganti 2006; Utterback et al. 2006); and management scholars advise us that design strengthens innovation generally, and leads to greater profits (Slywotzky et al. 2002; Boland and Collopy 2004). And whether sufficient empirical evidence exists or not, it is hard to expect our students or the entrepreneurs with whom they work to ignore the appeal of the many books and journal articles being published today about the use of design thinking techniques for achieving innovation (Beckman 2007; Johansson and Woodilla 2009; Martin 2009; Brown 2009).
Design Thinking for Business Education in North America

Design and design thinking are the topics of several recent articles predicting or calling for a shift in how business schools offer their services. For example, Cooperrider (2008) suggests that “future business schools will look more like design schools – alive with design studios, interdisciplinary teams, and rapid prototyping – where managers act as designers who recognize disruptive, unexpected innovation opportunities.” And it is reported in Dunne and Martin (2006) that Toronto’s Rotman School of Management website says that “we are on the cusp of a design revolution in business,” and as a result, “today’s business people don’t need to understand designers better, they need to become designers.”

Despite these calls for change, design thinking is only evident today in a small number of educational programs in North America, with only a few of them at the undergraduate level (Weightman 2009). The following are cited as examples by Weightman (2009): the D-School at Stanford University (cross-disciplinary course offerings including design thinking); the design department at Carnegie Mellon University (undergraduate and graduate design programs with links to the MBA in the business school); the Institute of Design at the Illinois Institute of Technology (dual degree in design and MBA, as described further in Alexis and Hassan 2007); the Segal Design Institute at North Western University (masters combined with MBA); and the University of Toronto’s Rotman School of Management (MBA stream). And although there are few institutions offering design thinking at the program level, it should be noted that some educators are looking at teaching design thinking at the course level in the fields of engineering (Dym et al. 2005), information systems (Wang and Wang 2008), and business (Ungaretti et al. 2009).
Design Thinking for Entrepreneurial Teaching and Learning

We are not aware of any prior work done to implement a design thinking approach to teaching and learning within an entrepreneurship program, but it is important to note the work of Duening (2008) in which a theoretical framework was advanced specific to the challenge of developing curricula for teaching entrepreneurship. Based on the “five minds for the future” approach of Gardner (2007), Duening proposed five “minds for the entrepreneurial future” meant to provide an intellectual foundation for entrepreneurship education and curriculum development. One of these was a so-called “designing mind,” for which the following curricular approaches were recommended (Duening 2008):

- Design thinking is inherently interdisciplinary and combinatory. Students should be challenged to work on projects that require multiple perspectives to achieve acceptable outcomes.
- Designing requires relentless prototyping. Students should be taught to review their ideas with trusted others for feedback that results in evolutionary and incremental improvements in their original concepts.
- The outcome of design is a narrative or story. Students should be encouraged to review an entrepreneurial venture and develop a compelling story about it to share with others.

We also note the work of Jacoby and Rodriguez (2007) who share the belief “anyone pursuing innovation, given the right training and mindset, can think of him or herself as a designer.” It is with these comments and the work of Duening (2008) in mind that we set out in early 2008 to implement a design thinking approach to teaching and learning for the conception, communication and innovation of highly innovative and feasible new venture concepts.
Results: A Tour of the Venture Design Studio (VDS) Curricular Landscape

As described earlier, the VDS is an authentic and highly experiential 12 to 16-class activity that is iterative in nature and makes up over half of a new first-year undergraduate course in entrepreneurship. To introduce and fully describe the VDS in the sections that follow, we will use the map of the curricular landscape that is shown in Figure 1. This map was proposed by Bruton (2010a) to contain the essential elements that shape the design and intention of an entrepreneurial curriculum, and to highlight the various domains of research and scholarly inquiry important to a SoTLE project. It can also be thought of as a map that describes the curricular landscape at the program, course and topic levels.

Why Does This Kind of Learning Need to Take Place (Figure 1a)?

As shown in Figure 1a, the first point on the map of the landscape prompts us to answer the question of why the learning needs to take place at all. This was addressed early in our curriculum development process (and in the Introduction to this article). Very broadly speaking, the VDS was designed to help meet the needs and respond to the calls for change within higher education and to the roles of entrepreneurship programs within our regional ecosystems and the lives of our students. It provides an example of how collaborative learning and collaborative knowledge production are being embraced at our university, as has been urged by Tapscott and Williams (2010), and, as such, it has required of our teachers a shift in their practices from the traditional teacher-centered transfer of subject-area-focused knowledge to the development of resources and practices that teach students the skills required to learn, collaborate and build knowledge on their own, as has been called for by Owen et al. (2006) and Guntram (2007). At the regional economic level, the VDS contributes to meeting the demand for highly qualified personnel within our regional innovation ecosystem; it is part of our ongoing and very deliberate
attempts to create the ideal training ground, launch pad and network into the ecosystem for the new entrepreneurs who will help shape Alberta's economic future and sustainable growth, as called for in Martin (2007) and Government of Alberta (2010). Generally from a scholarship standpoint, the inquiry we are carrying out as part of the delivery of the VDS has been designed to help meet the need for generalizable answers to questions about how to best teach entrepreneurship, as called for in Kuratko (2004) for example. Specifically, we hope that this work will help educators answer questions about how best to teach students to conceive of, communicate and innovate highly innovative and highly feasible new ventures. The general need for this can be found in many publications including those referred to in Kuratko (2004). Above all else, we have been guided throughout our curriculum renewal process by a vision of providing our students with the best, most relevant learning experience possible. It has been our goal to design and create a curriculum that provides an intense, immersive and challenging entrepreneurial learning experience like no other in North America during which students can pursue their passions and gain experience relevant to their lives and careers. The VDS is a key component of our plan to meet this vision.

Who Are Our Learners (Figure 1b)?

An articulation of an in-depth understanding of who your students are is the second point on the landscape, shown in Figure 1b. Mount Royal University is an undergraduate university with over 13,000 students and offers four-year degrees in disciplines such as arts, science and technology, communication, business, health and community studies, and teaching and learning. The course in which the VDS is offered is the first course in our new minor and it is available to students in any discipline of study across campus as part of their General Education requirements. As such, students going through the VDS have varied interests, backgrounds and
experiences, and may not have taken any previous course in business. Their average age is 20
years old and this is usually their first exposure to entrepreneurship.

Figure 1: Map of the SoTLE Landscape (Bruton 2010a; adapted from O’Brien 2008 and Alberti et al. 2004)
What Defines Success – Learning Objectives (Figure 1c)?

As shown in Figure 1c, the learning objectives, or desired learning outcomes, are the next stop on the landscape. Overall, the VDS aims to contribute to the course goal of providing students with an authentic experience and a taste of what it is like to be an entrepreneur. The specific student learning objectives for the VDS are:

1. To experience forming and working with an entrepreneurial team;
2. To collaboratively create new knowledge in the form of a prototype new venture model;
3. To access appropriate internal and external value networks in order to test the venture model and offering(s);
4. To present the outcomes of the earlier three objectives by communicating the value of the underlying new venture concept in an elevator pitch;
5. To innovate the venture concept such that is judged to be both highly innovative and highly feasible; and
6. To learn about themselves and their personal practices as entrepreneurs.

What Must Be Learned – Not Just Content (Figure 1d)?

As shown in Figure 1d, the fourth point on the curricular landscape has to do with defining what will be learned. As discussed in O’Brien (2008), it is important that this is not just limited to defining content and, as proposed in Bruton (2010a), it is better if content definition is left until last in favour of first considering the core constructs, types of knowledge and fundamental elements being imparted to the students. This is done here for the VDS.

Core Constructs. To meet the objectives of the VDS outlined above, students must tackle two core constructs: 1) what is the entrepreneurial business model as defined by Morris,
Schindehutte and Allen (2005) and others referenced therein; and 2) how does one carry out business model innovation as defined by Markides (2006) and Chan and Mauborgne (2005). In other words, we are requiring that our students learn to conceive of, characterize, design, prototype, test, pitch and innovate models of new ventures. We use the term venture model throughout the activity (rather than business model, for example) to emphasize that students are encouraged to do this for any type of new venture, including for and not-for profit ventures and those within new and existing organizations. We distinguish this from the term venture concept because we see the venture model as an articulation and prototype of a venture concept.

Types of Knowledge. A major element that sets the VDS curricular design apart is the kind of knowledge the students need to master in order to achieve the objectives. We target functioning knowledge, which is defined by Biggs (2003) as knowledge within the experience of the learner that is based on a performed understanding. This is shown at the top of Figure 2 along with the other types of knowledge he tells us our curricula might address. In other words, a student cannot succeed in the VDS without the going through learning that takes place as one actually designs and innovates a business model. As Biggs (2003) tells us, mastering this kind of functioning knowledge also requires that the student goes through the learning required to develop a solid foundation of knowledge about business models and their innovation (declarative knowledge), to carry out the associated procedures or enact the required skills (procedural knowledge), and to know when, why and under what conditions to use the other types of knowledge (conditional knowledge). And so it becomes our job as designers of the curriculum to provide an authentic learning environment in which the student can learn from experience and gain all four types of knowledge about business models and their innovation.
Fundamental Elements. Speaking about ways of thinking and practice, O’Brien (2008) points out that it is generally accepted “across the academy that knowledge is itself a construction of particular social and cultural communities (Berger and Luckmann 1967) and that all such communities orient to the specific and shared aims, activities and ways of achieving them that comprise and make distinctive that community (Wenger 1998).” The community of entrepreneurs that our students join before and after graduation is most certainly no exception to this. We have tried therefore to articulate and build into the VDS curriculum the relevant ways of thinking and practice common to successful entrepreneurs. As they go through the VDS, we have seen evidence of students adopting the following ways of thinking and practice for example: thinking about challenges as opportunities to create value; seeing oneself as an agent of change; accepting and even yearning for criticism; tolerating ambiguity; and being open to taking risk.

![Diagram of knowledge types](image)

**Figure 2: Relationships between Different Types of Knowledge (after Biggs (2003))**

According to O’Brien (2008), threshold concepts are concepts that:

- Represent fundamental ways of thinking and knowledge within the field;
- Are transformative, in that learning about them changes the way students think about the phenomena or area of application; and
- Once understood open up a deeper level of thinking that in turn affords access to other important concepts within the field.
Examples of threshold concepts we see evidence of students learning in the VDS include: that a group is different from a team; that having “skin in the game” is usually a condition for greater success; and that in the eyes of an investor one’s experience and passion can be more valuable than one’s venture idea. Also according to O’Brien (2008), troublesome knowledge is a kind of transformative knowledge that “brings into view aspects of troublesomeness that are less about difficult concepts and more to do with the challenges inherent within a change to one’s inner landscape, perspective and worldview (O’Brien 2008; Perkins 2006).” In entrepreneurial learning, threshold concepts and troublesome knowledge seem to have been addressed in the context of learning from ‘critical events’ that cause one to question previously taken-for-granted beliefs and assumptions (Deakins and Freel 1998; Cope and Watts 2000; Cope 2003), and to reframe one’s understanding to create a shift in mindset (Applebaum and Goransson 1997). We have made room for this type of learning in two ways in the VDS. First is through the nature of the authentic and experiential curriculum design, outlined in more detail below. Second, as Cope (2003) suggests, is through opportunities for critical self-reflection that have been built into the learning process in order to encourage this sort of higher level of learning and capture it when it occurs. We have seen evidence of students gaining troublesome knowledge in the VDS as a result of: the breakup of an entrepreneurial team; seeing a good idea receive support because it was pitched more convincingly than a great idea; recognizing and being tempted by the perceived gains that would come from misrepresenting their work; and receiving conflicting advice from two equally accomplished and well-respected entrepreneurs.

**Content.** Custom content was developed for the VDS in four areas of focus shown in Table 1. Even though we require our students to get all the way up to a functioning understanding of the core concepts (recall Figure 2), we have selected the content in Table 1 so
as to favour breadth over depth; the idea in this first undergraduate course in entrepreneurship is to provide just enough depth for them to innovate on a venture model while providing the breadth required to be authentic to the experience.

<table>
<thead>
<tr>
<th>Iteration</th>

</table>
| 1         | What value will you create and for whom? (factors related to the offering, market and team fit) | Who’s your target customer?  
• customers, buyers and users; pre-adoption use case; want, need or “should” being met; individuals vs. markets; size and trend  
What’s your economic offering?  
• commodity, good, service, experience; mixes of offerings; features of your offering; related offering(s)  
What’s your value proposition?  
• benefits vs. features; costs; value; value proposition; articulation using a value curve  
Team, experience, specific knowledge and fit  
• team members; experience; general and specific knowledge; team fit with proposed venture |
| 2         | As above +  
How will you create the value? (factors related to industry structure and internally derived competitive advantages) | Internal value chain  
• generic internal value chain; your internal chain; what/whether to outsource  
Key strategic resource(s)  
• resources and capabilities; valuable, rare, costly to imitate, used by the organization; key strategic resource(s)  
Industry value chain  
• generic industry value chain; your place in the chain; your specific value network |
| 3         | As above +  
What is your competitive strategy? (factors related to competitive landscape and strategic position) | Types of competition and competitive landscape  
• direct competitors, substitutes, alternatives; your competitive landscape;  
Generic strategic position  
• broad, focused; your cost structure; low cost, differentiated; your strategic position; same for competitors |
| 4         | As above +  
How sound is your economic logic and look-ahead? (factors related to economic logic and the ask) | Economic logic  
• direct costs; burn rate; purchase price; bottom-up sales forecast; breakeven; adjusting your venture model  
Look-ahead  
• what does first revenues look like; investment required to get to first revenues; the ask |
Naturally, this content gives rise to a number of topic-level learning objectives relating to the declarative, procedural, conditional and functioning knowledge being gained. These, the full content and all of the resources for the VDS can be accessed freely at Bruton (2010b).

**How Do We Enable the Learning (Figure 1e)?**

The section of the curricular landscape shown in Figure 1e speaks to how we enable the learning that has been defined above. This includes clearly articulating the nature of the teaching and learning activity itself, recognizing the roles that teachers and learners need to take to make it happen, and identifying the dominant metaphors and theories of learning.

**Structure and Nature of the Activity.** It was at this point in the curriculum design that we turned to the recent discussions about design thinking for innovation and began a process that eventually yielded the Venture Design Studio framework shown in Figure 3. This studio-based teaching and learning activity models the innovation process on the concept of design thinking as proposed in (Dunne and Martin 2006; Brown 2008). As shown in Figure 3a, the Venture Design Studio takes place over four iterations spread over a ten week period. Additional content and new design goals are presented to the students at the start of each iteration (recall Table 1), along with additional assessment criteria (to be discussed later). Each iteration is comprised of three scheduled lecture hours, as shown in Figure 3c, and implements a curricular “design for learning” for students graduating into today’s global society and knowledge economy (Selander 2008). As shown in Figure 3b and c, this means that: 1) in the first class of an iteration the stage is set, tasks are described and goals are clearly articulated; 2) between the first and third classes the students go through a process of forming and transforming knowledge (referred to in class as creative jamming) and representing their work in a collaborative website (custom wiki) that is visible to the whole class; 3) during the third class they present their venture models in an
elevator pitch to a panel of external judges and, together with the judges, do some meta-reflection on the product; and 4) shortly after the third class they do some personal reflection on the learning process and their personal practice. As shown in Figure 3a, they also reflect on their learning personal practice at the end of the course as part of a personal practice project.

This process for learning to conceive of, characterize, design, prototype, test, pitch and innovate new venture models is true to the concept of design thinking which, as Brown (2008) tells us, results in creative and innovative breakthroughs not just as a result of brilliant minds and lightening strikes but as “the result of hard work augmented by a creative-human centered discovery process and followed by iterative cycles of prototyping, testing and refining.” In that
spirit, we encourage and enable our students to: act as designers; follow passions; seek inspiration; immerse themselves in and see the real world; brainstorm; look for patterns; seek help, criticism and user input (especially in the prototype stages); embrace failure and start over if necessary; and build their ideas iteratively.

Teachers’ and Learners’ Roles. As recommended by Selander (2008) the teacher is required to intervene and facilitate throughout this type of learning process, clarifying concepts, encouraging where possible, and highlighting signs of learning. We have observed top performing student teams shift from positions 1 to 2 to 3 in Figure 4 for example; consistently, top teams are involved in and direct their own learning. And teachers have had to do their part by shifting their practices toward true facilitation, delegation and consultation to the process.

![Figure 4: Roles Required of Teachers and Learners (after Grow 1991) in the Venture Design Studio](image)

Theories and Metaphors of Learning. Figure 5 provides a sketch of the curricular context for the VDS. It takes place in the first course, called The Entrepreneurial Experience, which is in Phase 1 of the minor. As shown, we think of the learning taking place in that phase through the lenses of the constructivism and social constructivism learning theories. Social constructivism is
a process of learning through working with others, whereby knowledge and meaning are collaboratively constructed by team members (Marshall 1996; O’Brien 2008). Because of the nature of the design of the VDS, the teacher needs to think in these terms. Unlike many approaches to teaching and learning entrepreneurship, which are based on knowledge-acquisition and participation metaphors of learning, teachers in the VDS environment view learning more as a process of knowledge creation for innovation as described in (Paavola and Hakkarainen 2005).

Figure 5: A Sketch of the Curricular Context for the Venture Design Studio
We view the latter point as important because, unlike the acquisition and participation metaphors which focus on adopting knowledge individually or in groups, the knowledge creation metaphor of learning focuses on creating and developing new material and conceptual artifacts (such as business models), and on conscious advancement, discovery and innovation (Paavola and Hakkarainen 2005). This distinction is important given the nature of entrepreneurial learning and its importance in today’s knowledge-based economy and society.

**How Well Has the Learning Taken Place – Assessment (Figure 1f)?**

As shown in Figure 1f, the last stop on the curricular landscape speaks to how well the learning has taken place. This includes assessment of learning outcomes and the products of the learning.

**Assessment.** The assessment strategy for the VDS was very carefully designed using the notion of constructive alignment. As described in Biggs (2003), this means that the learning activities, the assessment methods, and the learning objectives are all consistent with and supportive of each other. We have also taken care to ensure they are consistent with the ways of thinking and practice of successful entrepreneurs. Constructive alignment is often a challenge to achieve in entrepreneurship where it is not at all unheard of to find complete misalignment. For example: a teacher lecturing on business planning (the learning activity) and the students delivering a business plan (to be assessed), all with the hope that the student will be able to one day start their own business (the actual learning objective). As such and in order to support the learning objectives defined earlier, we defined the assessment schedule shown in Table 2. Students are assessed at the end of each iteration in four different ways: 1) by their teacher playing an advisory role; 2) by a panel of two to three experienced entrepreneurs playing the dual role of potential investor and advisor; 3) by themselves as nascent entrepreneurs; and 4) by their
peers playing the role of shareholders. This provides them with a wealth of constructive and formative feedback every iteration that is quite authentic to what a real entrepreneur would receive over time. As shown in Figure 3 and Table 2, only the feedback from the last iteration is used as a summative evaluation. We note that the students are not assessed directly on the quality of their pitch. Rather, the elevator pitches are assessed in exactly the same way as the prototype venture models (using the rubrics in Table 3 and Table 4 which are based loosely on the work of Fiet and Patel (2006)). This has kept the focus of the pitch on the potential value of the venture and how to communicate that value clearly and convincingly. Interestingly, it has not precluded the teaching and learning of best practices in how to do an elevator pitch but, rather, has encouraged the students to seek out those practices on their own, experiment with different combinations that may be appropriate to their situation, and learn from each other.

All of this feedback is provided to the students at the end of every iteration through the same collaborative website the students use to develop and submit their work. Because every team can see the work submitted and feedback received by every other team, they learn from each other between iterations.

**Products of the Learning.** Finally, we share what has turned out to be a very powerful assessment-related tool for communicating with and motivating the students when providing them with feedback. Because the rubrics in Table 3 and Table 4 have been designed to speak to the innovativeness and feasibility of their venture concepts, respectively, it is possible to determine the relative positions of their ventures in each of these dimensions. In turn, it is possible to graph the relative positions of all the venture concepts in a class, as shown in the example in Figure 6a. We create two such plots after every iteration: one based on the assessment of the prototype venture models submitted through the collaborative web site and one
based on the judges’ assessment of their pitches. Students and teachers both report how this serves to focus the whole venture model design process around getting ventures into “the top right corner” of Figure 6a; the common goal quickly becomes the iterative design of venture concepts that are both highly innovative and highly feasible. This has had the effect of driving down the number of used textbooks stores and student-bars being proposed and significantly increasing the number of ventures that are deemed to be highly scalable with solid potential for growth; students tend to either select a new concept or find ways to make their concepts more innovative. They report feeling safe doing this because of the trusting and collaborative environment that develops and because only the last iteration counts toward their grade. This trend can be seen by comparing Figure 6a with Figure 6b.

Table 2: Assessment Done At Each Iteration of the VDS

<table>
<thead>
<tr>
<th>Type</th>
<th>Assessment</th>
<th>Contribution to mark</th>
</tr>
</thead>
</table>
| Teacher (as advisor) | • The teacher assesses the students’ new venture model based on their collaborative web site  
• The rubrics in Table 3 and Table 4 are used | These three components are worth an equal amount and together make up the VDS total of 35 percent of the final grade in the course |
| Judges (as advisor/investor) | • A panel of external judges assesses the students’ new venture concept based only on their elevator pitch  
• The rubrics in Table 3 and Table 4 are used again | Full feedback is provided every iteration but only marks received in the final iteration count toward the final grade |
| Self (as nascent entrepreneur) | • Each student assesses his or her own learning against four outcomes:  
• Entrepreneurial toolset outcomes;  
• Network, team and communication outcomes;  
• Collaborative knowledge creation outcomes;  
• Personal mindset and entrepreneurial identity outcomes.  
• Rubrics like the one in Table 5 are used for each of these categories | Provides a bonus mark in the course: 1 percent for each investment made in the winning venture |
| Peer (as shareholder) | • Every iteration the students vote individually for the venture concept they think will win |                                                                                       |
**Table 3: Assessing the Innovativeness of a New Venture Model**

<table>
<thead>
<tr>
<th>The venture's offering is very dear to me and presents a compelling value proposition to the buyer/user</th>
<th>strongly disagree</th>
<th>strongly agree</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

For this type of venture the following are true:

1. The buyer and user are very compelled by the offering - the venture has identified a very significant "need", "want" or "should"
2. The offering is very clearly articulated - I have no questions about the commodity, good, service or experience
3. The buyer is encouraged to make a decision to purchase
4. Price, switching and adoption costs are small relative to the buyer's overall costs

<table>
<thead>
<tr>
<th>I believe the venture's choice of customer (buyers and users) could lead to significant value creation</th>
<th>strongly disagree</th>
<th>strongly agree</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

For this type of venture the following are true:

1. There is a very large number of potential buyers and users
2. The number is growing significantly
3. Buyers have appropriate financial capability
4. Customers are not likely to backwards integrate (i.e. not likely to become a competitor of the venture)

<table>
<thead>
<tr>
<th>I believe the supply situation is very favorable</th>
<th>strongly disagree</th>
<th>strongly agree</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

For this type of situation the following are typically true:

1. It would be very easy to switch suppliers, e.g.
   - There are many possible suppliers ventures like theirs could choose from
   - Suppliers are providing undifferentiated materials
2. And/or, suppliers are motivated to supply to the venture, e.g.
   - There are few other buyers; the venture promises to sell in large volumes; the venture has developed a unique relationship with its supplier
3. Or, ventures in the industry do not depend highly on suppliers, e.g. in a consulting industry
4. And suppliers are not likely to forward integrate (i.e. not likely to become a competitor of the venture)

<table>
<thead>
<tr>
<th>I believe the venture's strategic position would lead to significant value creation</th>
<th>strongly disagree</th>
<th>strongly agree</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

Although there are exceptions, a new venture of this type typically:

1. Has a very highly differentiated position or represents a low-cost leadership position relative to others in the industry
2. Starts off focused, i.e. targets a niche at first, and plans to target a broader group of customers over time
3. Has few competitors, substitutes and alternatives sharing the same strategic position

*Alex Bruton, ICSB 2010*
Table 4: Assessing the Feasibility of a New Venture Model

I believe the team’s fit with the proposed venture will lead to significant value creation

<table>
<thead>
<tr>
<th>strongly disagree</th>
<th>strongly agree</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

For this type of team and venture the following are true:
1. I have been told enough about the team members to make a reasonable assessment
2. The team inspires my confidence and I would invest in all of its members
3. Team members have relevant prior experience (jobs, education, social relationships, hobbies, etc...)
4. That experience provides them with relevant specific knowledge (people, places, timing, circumstances, technologies, etc...)
5. It is clear that their specific knowledge forms the basis of their venture’s offering

I believe the venture has one or more key strategic resources that are valuable, rare, and costly to imitate

<table>
<thead>
<tr>
<th>strongly disagree</th>
<th>strongly agree</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

For this type of venture the following are true:
1. The team/venture brings at least one key strategic resource to the table with the potential to provide a significant competitive advantage, e.g. physical, financial, team members, offering (good, service, experience), reputation, technology, raw materials, geographic locations, specific know-how, etc...
   • This key resource is valuable, rare and costly for others to imitate
2. No (or very few) other ventures possess the same key resource(s)
3. Other ventures would find it too costly to acquire the same key resource(s)
4. It is hard to find a substitute for its key resource(s)

I believe the venture’s competitive situation is very favorable

<table>
<thead>
<tr>
<th>strongly disagree</th>
<th>strongly agree</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

For this type of venture the following are true:
1. The team has provided a sufficiently realistic picture of the competitive landscape and there are no omissions in their analysis
2. The venture has a significantly different value proposition from that of its direct competitors
3. The benefits do not outweigh the costs of substitutes and alternatives

I believe the breakeven numbers are sound and the plan to develop a prototype is a reasonable next step

<table>
<thead>
<tr>
<th>strongly disagree</th>
<th>strongly agree</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

For this type of venture the following are true:
1. Indicators like the following seem consistent with the venture and industry, and seem to be based on reasonable assumptions:
   • The price to the customer; The sales needed to breakeven on direct costs and burn; The sales forecast; The gross margin or gross margin percentage
2. The proposed prototype or trial would help them get to first revenues
3. The money requested is in the right ball park for getting to the prototype stage

I have demonstrated an excellent understanding of the entrepreneurial toolsets we learned in this iteration.

Pick and describe at least 2 specific examples that show you what you learned this iteration and why you deserve the grade you gave yourself above:

This might help:

1. In this iteration you had to learn and apply the tools in the following topics: 1) Team, specific knowledge and alignment; 2) Who’s my customer?; 3) What’s my economic offering?; and 4) What’s my value proposition? You used these to come up with the seed of a new idea. And you learned about pitching.
2. People with a high grade in this area are able to provide:
   a. Examples of what you know now that you didn’t know before
   b. Recognizing how you learned and how that ties back to your learning styles
   c. Learning about the concepts on your own time, ahead of the classes in which they were used
   d. Learning about the steps and procedures required to implement each topic
   e. Understanding how the topics work together to help you come up with an idea for a new venture
   f. Examples where you explained or clarified the concepts for your team mates
   g. Applying the topics to your own venture, and specific examples of how you applied what you learned
   h. Things that you would do differently next time based on what you learned
   i. Other things you did that you feel provide evidence of your learning

Figure 6: Visualizing the Evolution of the Innovativeness and Feasibility of Ventures throughout the Iterative Design Process

Alex Bruton, ICSB 2010

26
Summary and Concluding Thoughts

We have introduced The Venture Design Studio, a design thinking approach to teaching and learning for the conception, design, characterization, prototyping, testing, pitching and innovation of new venture concepts. Based on our experience and the data-based evidence available to date, we propose that this is a very attractive approach to entrepreneurial learning for curricula that aim to provide students with an authentic entrepreneurial experience and the opportunity to reach into and catalyze innovation within their local ecosystems. For example, the data tell us that: student response to its introduction has been overwhelmingly positive; they frequently express a desire for the approach, their preference for the delivery medium, and their feeling of gaining skills relevant to their careers and new ventures; students were able to meet or exceed all learning objectives to do with toolset, mindset and network building, and collaborative knowledge creation; students report applying the VDS approach (and content) in other courses, including their business planning course; students’ abilities to persuasively pitch their concepts were vastly improved as a result of the iterative nature of the process and the collaborative network from which they received feedback; students became versed in and aware of entrepreneurial ways of thinking and practice, threshold concepts and troublesome knowledge to a level not usually associated with classroom approaches, including business planning; local entrepreneurs and venture capitalists were engaged with and provided regular feedback on student learning and their prototypes; and learners, teachers and experienced entrepreneurs all reported (anecdotally) that the resulting new venture concepts were considerably more innovative and feasible than those resulting from other approaches with which they are familiar.

To rephrase Cooperrider (2008) a little: some of our classrooms now look more like design schools than they used to – alive with a design studio, interdisciplinary teams, and prototyping –
where student entrepreneurs act as designers who seek out disruptive, unexpected innovation opportunities. And to respond to Dunne and Martin (2006), we too see merit in thinking like designers, at least so far as teaching and learning for the conception, communication and innovation of highly innovative new venture concepts.

We look forward to our future work, the plans for which include: describing in more detail what happens when students learn in this way; understanding how exactly learning takes place in this way; and making claims based on more evidence about whether and in what ways the design thinking approach might be better suited than other teaching and learning methods for meeting similar objectives. We also look forward to applying the design thinking approach to other innovation processes in our classrooms and within our regional innovation ecosystem.

Finally, we close by acknowledging that this research is in its early stages and that much more remains to be learned. However, because student response has been so strong to their learning experience, because so many of the typically hard-to-teach learning outcomes seem to be teachable in this kind of environment, and because we have (finally!) seen a very convincing shift away from used textbooks stores and student-bars (even in this first undergraduate course), we are thrilled to be sharing what we have learned to date.

An Exploratory Study of Entrepreneurship Curriculum and Faculty in the U.S. and China

Donna Kelley, Babson College, USA
Xiangzhen Hu, Shanxi University, China

International Council for Small Business Conference, Cincinnati, OH
June 2010

Abstract

This paper explores entrepreneurship education in China, drawing on insights about university entrepreneurship curriculum in the U.S. We present an analysis of curriculum of 26 top entrepreneurship programs in U.S. universities, and an in-depth case study of Babson College in the U.S. We then present an overview of entrepreneurship education at the university level in China, focusing on leading university entrepreneurship programs. We conclude with some recommendations for the development of this field in China. We cite the need for experiential methods and connections to practice, and identify the shaping of attitudes and skill development as key objectives.

Introduction

Much has been written about entrepreneurship education, starting primarily in the 1980s and accelerating after the turn of the century with the increased recognition of the contribution entrepreneurship makes to the health of a national economy. Governments in several countries have declared their commitment to entrepreneurship education as a key priority, as several studies document (Kyro, 2006; Sorgman and Parkison, 2008). Entrepreneurship education levels differ markedly among countries, however, as a recent report by the Global Entrepreneurship Monitor details (Coduras et al., 2010). In China, entrepreneurship education has been well received, but is still a relatively new practice in higher institutions (Li et al., 2003).

Developed countries, on the other hand, tend to have a longer history with university entrepreneurship education. In fact, the first efforts to deliver entrepreneurship courses were attributed to Shigeru Fujuii of Kobe University in Japan in 1938 (Solomon, et al., 2002) and Myles Mace at Harvard’s Business School in 1947 (Katz, 2003). In the United States,
entrepreneurship education is relatively established, and attention has turned toward assessing existing programs, sharing best practices, identifying constraints, and providing recommendations. Katz in 2003 declared that the entrepreneurship education field has reached maturity in the U.S. and that future growth lies outside this country.

This paper explores entrepreneurship education opportunities in China, drawing on insights about university entrepreneurship curriculum in the U.S. We address the following question: “What is the state of entrepreneurship education in China and what lessons might be learned from the U.S.?” Following a review of literature on entrepreneurship education, we present findings based on an analysis of 26 top entrepreneurship programs in U.S. universities, and an in-depth case study of Babson College, the long-time leading university entrepreneurship program in higher education in the U.S. We then present an overview of entrepreneurship education at the university level in China, drawing from interviews with Chinese professors. We conclude with some recommendations for the development of this field in China.

The Nature of Entrepreneurship Education

The value of entrepreneurship education can be reflected in its impact on entrepreneurial activity. High SME failure has been attributed to a lack of training, for example (Ibrahim and Soufani, 2002). Studies on the influence of education and training on attitudes have found a positive link to interest in entrepreneurship and perception of feasibility: for example, in post-secondary education in Northern Ireland (Hegarty, 2006), and among university students in England (Souitaris et al., 2007). Cruz, et al. (2009) show that individuals who are concerned about furthering their university education in management and entrepreneurship are more innovative and less conformist. The WEF (2009) indicates that higher education addresses
opportunity-based, innovation and high growth entrepreneurship; this illustrates the potential for universities to increase employment and national competitiveness through entrepreneurship education.

The most compelling evidence of the benefits of entrepreneurship education thus far has come from the Global Entrepreneurship Monitor (GEM) survey of 38 countries in 2008 (Coduras et al., 2010). This study shows a range of impacts on entrepreneurial attitudes. With regard to entrepreneurial activity, the survey found a greater association between training and new business starts in more developed economies compared with less developed ones. In the latter, education may be less beneficial when factors such as inadequate infrastructure or government policies pose constraints. Then again, entrepreneurship education may simply not have reached the level of maturity it has in the more developed economies. As such, it would be useful to understand the particular considerations that could help advance entrepreneurship education in countries such as China.

In attempting to understand how education can influence entrepreneurial activity, researchers have called for greater depth of insights about how these programs and learning strategies lead to the formation of new ventures (Garavan and O Cinneide, 1994a). Researchers have suggested that education and training for entrepreneurship should positively impact actions by enhancing one’s skills (Honig 2004) and cognitive ability for managing the complex process of opportunity recognition and assessment (DeTienne and Chandler 2004). One way this can be done is by providing examples of the entrepreneurship process, and by using role models an individual can identify with. This can show people what is possible, and equip them with the ability to recognize, assess and shape opportunities (Fiet, 2000).
Similarly, most authors agree that experiential-based learning is more effective for developing entrepreneurial skills and attitudes, compared to more traditional methods like lectures (European Commission, 2008). A number of studies in innovation-driven countries, like Singapore (Tan and Ng, 2006), Sweden (Rasmussen and Sørheim, 2005), and the UK (Raffo et al., 2002) show that entrepreneurs learn best with a “learning by doing” approach. These experiential methods may also impact attitudes and intentions, which can boost the chance individuals will attempt entrepreneurial endeavors at some point in their lives (Souitaris et al., 2007).

Regarding content, Sexton (1997) identified the ten most desired topics for achieving and managing fast growth. These include: (1) using cash flow to make operational/financial decisions; (2) financing growth; (3) increasing the value of the business; (4) compensation for self and associates; (5) hiring, training, and motivating for growth; (6) succeeding in a rapidly changing world; (7) successful selling via helping the customer buy; (8) sales force management; (9) management succession; and (10) problems and pitfalls of growth.

Yet entrepreneurship training needs to be much broader. It needs to impact attitudes, help people recognize opportunities and think creatively, and enable them to build leadership skills and confidence. Entrepreneurship is multidisciplinary in nature, and can also cross into nonbusiness subjects. The European Commission (2008) even questions whether business schools are the most appropriate place to teach entrepreneurship, given that the most innovative and feasible ideas are likely to come from the technical and creative disciplines. This report goes on to state that the goal should be to promote creativity, innovation and self-employment.

There is not just a need for multidisciplinary approaches, but also cross-global training. The value of sharing ideas across national borders could provide benefits in the creativity and
relevance of ideas leading to innovative opportunities. In addition, many entrepreneurial endeavors will benefit from a global perspective. Additionally, technology may be necessary to increase the scale and scope of training programs; internet-based learning may therefore be effective in meeting high demand and extending a program’s geographic reach (Solomon, et al., 2002; Hegarty, 2006).

Universities may experience difficulties transitioning to an experiential, cross-disciplinary model, however. They may struggle in their attempts to shift from the lecture-centered approach common in many economies. In addition, Ph.D. programs are not providing enough faculty to meet the demand for entrepreneurship education (Katz, 2003; CE, 2008) and current faculty are locked into narrow disciplinary structures (Janssen, Eeckhout, and Gailly, 2005). Entrepreneurship as a discipline is still not widely accepted in many universities, and where it is, it tends to fall under the business umbrella. While the requirements for entrepreneurship education call into question the usefulness of traditional education practices, developing such programs will require a mindset shift from mainstream education and training routines (WEF, 2009).

**Examination of Entrepreneurship Curriculum at U.S. Universities**

We examined the curriculum of 26 U.S. colleges and universities ranked as top entrepreneurship schools in at least two of the following sources: U.S. News and World Report, Entrepreneur.com, Fortune Small Business, and Business Week. Babson College was identified as the number one entrepreneurship school in each list, and in the next section we provide a more detailed case study of the curriculum and teaching methods at this school. For the 26 schools, we obtained course listings for the spring semester 2010 from their websites. Where this information
was not available, we used a listing of courses from the website. We identified courses having entrepreneurship, venture, and small business in the title.

We recognize that many of the schools also had courses related to entrepreneurship, such as technological innovation, although we did not include these in our examination. Often, complementary courses like this were listed as requirements or electives for concentrations. In addition, other business courses were often included in concentrations as providing content in areas such as marketing, finance, and other disciplines. This highlights the interdisciplinary nature of entrepreneurship. Foundation knowledge in a range of disciplines is not only relevant, but these other courses can offer content in entrepreneurship. A product commercialization course, for example, can provide skills relevant to entrepreneurship. Moreover, courses in marketing, finance and other topic areas can include content applicable to entrepreneurial ventures. As such, complementarities should be considered in entrepreneurship curriculum design. In some schools, these complementarities may be used in place of providing a wider array of distinct entrepreneurship courses.

Separate courses were identified for practical or experiential elements. Examples of these include field projects or internships with startups, or those in which students take actual steps to develop their own business concepts. Included in the experiential offerings, of course, are offshore trips to different countries, which can involve tours of companies and discussions with local entrepreneurs and others involved in this activity, such as government officials, business associations, venture capitalists, and others. Courses are even offered with trips in-country, such as Silicon Valley, showing the value of examining entrepreneurial regions within one’s own region.
A few schools provided some basic educational components in separate courses, such as business plan writing and case studies. A number of schools provided short courses with as little as a half credit in focused topic areas, such as “managing enterprise risk” or “financing entrepreneurship in emerging markets.” This may allow faculty with specific expertise or interests to create specialized offerings, without having to build an entire 4-credit course around them. Curriculum developers should therefore address whether to offer individual specialized courses or those inclusive of a range of topics and pedagogies.

One consideration for the above may be faculty expertise and training. Especially when an entrepreneurship education program is in its earlier stages, and faculty are more accustomed to traditional methods like lectures, it may be better to have a few faculty members skilled or trained in case teaching, business plan writing or practical experiences provide this, and then disseminate these practices more broadly over time. In addition, a university should not expect faculty to adopt or embrace new pedagogies and content without providing training and allowing for the development of subject matter expertise.

The topics offered in the U.S. universities could be categorized as encompassing phases, functions, and context relating to entrepreneurship. Entrepreneurship can be represented as passing through different phases over time, each presenting their own particular challenges. Phases are often represented in life cycle diagrams. They can include: (1) opportunity evaluation or feasibility analysis, (2) starting a business, and (3) growing and managing the venture one it’s started. The second phase is represented in new venture or entrepreneurship courses, which is the core foundation course offered in nearly all of the schools examined. A few schools had multiple versions of what appear to be new venture courses. Others had seemingly different courses, but narrowed their offerings to this phase. One could question the efficiency of such an approach,
and whether this curriculum provides sufficient breadth of knowledge and training about entrepreneurship.

Entrepreneurship curriculum can also contain courses in particular functional areas, including those that may be particularly important for entrepreneurs. Finance was, by far, the most frequently listed functional course. Beyond a basic entrepreneurial finance course, more specialized courses were offered in other aspects of finance, most typically around private equity, and often more specifically on venture capital. What is interesting about this is that despite all the publicity this financing form gets in the U.S., it represents an unlikely source of financing for most new firms. This indicates the importance of understanding the financing environment for entrepreneurs, and providing a realistic and relevant education for our students.

Entrepreneurial marketing, and selling in a few cases, was offered in some schools, reflecting the merit of customer and market understanding, and the unique challenges encountered in an entrepreneurship context. Many schools also offered some core courses on creativity and innovation, which can develop basic skills in identifying and building opportunities with differentiation potential in highly uncertain, complex environments. Together, entrepreneurial market understanding and creative thinking may be key abilities that make entrepreneurship distinct: the underlying element in identifying unique and valuable business concepts.

It is also worthwhile to note the frequency of entrepreneurship law courses offered. Although entrepreneurs are likely to consult lawyers for advice on such areas as intellectual property and contracts, a basic knowledge of legal matters is likely one component contributing to the multidimensional understanding entrepreneurs possess.
While a core entrepreneurship course can be applied to various organizational forms, these different contexts may present unique considerations and challenges. Across the sample, courses were offered on entrepreneurship in family businesses, established corporations, social enterprises, technology ventures, women-led businesses, and international ventures. For several schools, there was a heavy emphasis on social offerings, which likely reflects the current attention being paid toward addressing societal well-being, economic development of poorer countries, nonprofits, social responsibility of for-profits, and environmental and sustainability concerns, among others. Several schools offered courses in alternatives ways to enter entrepreneurship, such as buying a business or franchising.

Technology-focused courses were either broad in coverage, or focused on particular technology areas, such as biotechnology or software. Likewise, international courses either encompassed the globe or examined specific regions like Asia or Latin America. These courses, as well as family, women, and corporate may be complementary to other strategic areas for the college. In other words, a school may also have strengths and concentrations in global business or they may be interested in developing more programs for women leadership. In other cases, a school may recognize the prevalence of students coming from family businesses, who are interested in entrepreneurship. Current or prospective MBA students coming from nonbusiness backgrounds or likely to seek employment in a particular region, industry, or functional specialty may indicate a particular emphasis. This illustrates the value of understanding the institutional and environmental context when planning entrepreneurship curriculum.

The range of schools studied could be classified into four approaches, with some adopting more or less of a single approach, or displaying characteristics of multiple approaches. The first approach is a basic one, covering just new ventures, or a set of core courses that are
popular across the sample, most likely: entrepreneurship, growth, business planning, and finance. The second approach is a balanced one, where courses are offered across stages, functions, and contexts. Third is a weighted focus, where an institute may concentrate more heavily in a certain area, like finance, social, or innovation. Finally, some institutions took a creative approach, with several unique offerings not widely available in other schools. The basic approach is likely a safe starting point; whereas a balanced one may represent a larger and perhaps more established program. The weighted focus could account for institutional or environmental factors. The creative approach likely requires an allowance for experimentation and access to faculty with a variety of experiences and knowledge (including adjunct practitioners).

Of the 26 U.S. colleges and universities studied, most offered courses at both the undergraduate and graduate level. One offered only undergraduate entrepreneurship courses, and three offered only graduate level courses. All but four of the colleges had entrepreneurship centers. Interestingly, the four without entrepreneurship centers tended to follow more of a basic approach with curriculum. Entrepreneurship centers played a variety of roles. They could oversee entrepreneurship research and teaching at the college, but also engage in outreach to the community. The latter involves a variety of connections between the business community and students. For example, business people could volunteer as guest speakers, advisors or mentors. They may also offer opportunities for student projects or internships. Entrepreneurship centers may also provide students with hands-on entrepreneurship experience in a supportive environment: for example, assisting students in starting their own businesses. Funding for these centers often originate through private donors, who could also be alumni of the college.
Analysis of Babson College

As the long-time number one entrepreneurship school in the U.S., Babson College has both comprehensive entrepreneurship curriculum and some unique teaching methods and programs. Babson could be considered as taking both a balanced and creative approach. Balance is offered in the stages, functions, and contexts covered. Courses feature multiple phases: starting new ventures, managing growth, and entrepreneurship in mature organizations. Finance and marketing-related courses are core offerings. Selling is another functional area covered; there is no law course, however, which was offered at many other schools. The curriculum also includes a wide variety of contexts: family business, technology businesses, social enterprise, and others.

Examples of creative offerings include one based on ethnographic methods for developing opportunity awareness, taught by an anthropologist, and another course on entrepreneurship, social media and virtual worlds. One enabler of this creative approach is the culture of the entrepreneurship division, which is a separate division at the college, and the college itself. Faculty are encouraged to propose experimental courses to their division chair and the undergraduate or graduate dean. These can run twice before going through a formal approval process to become a permanent course. Ideas for new courses come from full-time faculty as well as adjuncts with a variety of experience.

Given the array of unconventional courses offered, textbooks are not common beyond the core new ventures courses. There are simply no texts written for new and niche courses. Instructors often assign readings from academic/practitioner journals, like Harvard Business Review. Some will assign business or popular press books. The core new venture course, in addition to others offered by this division, assign as many as ten cases on average during the
semester; this demonstrates the emphasis on case teaching. Babson produces a variety of cases on entrepreneurship; many are written about Babson graduates that have started businesses.

Entrepreneurship courses are offered at both undergraduate and graduate levels at Babson, and students at both levels may concentrate in entrepreneurship. Entrepreneurship majors or concentrations are uncommon even in the U.S., and those providing this option often include some non-entrepreneurship courses in the required or elective offerings. At Babson, only entrepreneurship courses count toward an entrepreneurship concentration, although many are cross-disciplinary and may count toward other business concentrations.

Although not all students concentrate in entrepreneurship at Babson, they are all exposed to entrepreneurship during their college experience. Freshmen learn about the different business disciplines by starting and running actual businesses as part of their Foundations of Management and Entrepreneurship course during their first year. MBA students learn entrepreneurship fundamentals during their core foundation modules. Courses in other disciplines typically include some entrepreneurship components. While practical elements are available outside of class, like business plan competitions or student business incubators, there is a particular emphasis on providing experiential elements in the courses. Application of entrepreneurship concepts therefore happens both inside and outside the classroom.

Like many schools in the U.S., entrepreneurship courses employ a mix of case discussions, lectures, and guest speakers. The frequency in which a variety of exercises and student presentations are used leads the class to a high level of engagement. This style of teaching stimulates frequent student participation, which is supported by grading expectations (participation is often 30% of the total grade) and relatively small classes, with most limited to 42 students.
A level of commitment on the scale offered by Babson requires enormous faculty resources. What sets Babson apart is not only the extent they draw on adjunct practitioners to teach courses, but also the level of entrepreneurship experience revealed by their tenured faculty, in addition to their academic accomplishments in the entrepreneurship field. Faculty have started businesses, worked in entrepreneurial environments and invested in ventures, before and during their academic careers. Babson has 16 tenure-track or tenured professors in the entrepreneurship division and an additional six shared with other divisions at Babson. All of these hold Ph.D. degrees. There are as many as 39 adjunct lecturers/practitioners, who come from different business fields, most with MBAs or masters degrees. While the tenured faculty have a high practical orientation, the adjunct faculty are as unique in their ability to understand theoretical frameworks.

Like many other schools in the U.S., Babson College has an entrepreneurship center. The Arthur M. Blank Center for entrepreneurship was named after Babson graduate and donor Arthur M. Blank, the founder of Home Depot, a large home improvement and construction warehouse retailer based in the U.S. This center focuses on enhancing entrepreneurship education and practice through research and outreach into the community.

*The Current State of Entrepreneurship Education in China*

University entrepreneurship education has received significant attention by only a handful of universities in China, and only since the last decade. Awareness about entrepreneurship education is therefore emerging, yet rapidly growing. There are three main drivers for this interest. First and most importantly, the enormous growth in the university student population in China has produced a substantial number of graduates. Universities are
concerned about employment opportunities for these educated people. Entrepreneurship is a viable option, particularly as the dominance of state-owned enterprises is displaced by the encouragement of private business, and both ambitious Chinese entrepreneurs and multinational companies set examples that motivate China’s populace.

Second, this educated workforce can be employed to increase China’s comparative advantage with other nations as it moves away from being the low cost “manufacturing center of the World” toward developing new technologies and introducing innovations, particularly in knowledge-based industries. Entrepreneurship is an attractive means for stimulating individual initiative. Third, entrepreneurship is a major contributor to economic growth in China, as it has been in many nations. Entrepreneurship requires knowledge and training and as such, universities must rise to this responsibility.

The majority of Chinese universities, numbering at least a thousand, offer no entrepreneurship education at all. These schools have not currently embraced the concept of entrepreneurship education or have not yet dedicated resources to start such programs, but they could pursue this opportunity in the future. About one hundred universities offer some entrepreneurship courses. Most of these offer training through the “Know About Business Program” (KAB). Only a handful, however, can be considered advanced universities offering entrepreneurship courses taught by university faculty. Both the advanced programs and the broader-based general training that is currently offered by the KAB are needed in China. We next review the KAB program, followed by an analysis of the advanced universities.

**KAB Program**

KAB is an education program developed by the International Labor Organization (ILO). The ILO is a specialized agency of the United Nations that works with governments, employers
and workers to shape policies and programs that promote job creation and labor rights. The KAB program provides entrepreneurship education at vocational, secondary, and higher education levels. KAB was co-introduced into Chinese universities by the ILO, the Central Committee of the Communist Youth League, and the All-China Youth Federation, and the first class was offered in 2007.

The purpose of this program is to prepare college students with basic knowledge about enterprise and entrepreneurship—particularly those studying non-business subjects. It strives to open their minds to the possibility of opening their own businesses and increase the chance they will do well in this endeavor. Realistically, KAB training does not expect most students to become high-potential entrepreneurs based on KAB training. It teaches them about this option. Beyond this, it is likely that more professional entrepreneurship education will be needed.

KAB is a widespread program offered in more than 30 developing countries. The program has unified requirements and standardized content and teaching materials. In order to qualify as a KAB school, universities must send at least two instructors to a training seminar. The schools must offer the course “Student’s Basic KAB Entrepreneurship Knowledge” as a public for-credit elective course with at least 32 contact hours. The maximum enrollment in class should be 35 students.

More often than not, KAB instructors are not university faculty; they typically come from the administrative ranks. They may be advisors or counselors for students, particularly those responsible for assisting them in obtaining employment. Because KAB is aimed toward addressing the employment problem in China, these advisors usually are assigned to take the KAB instructor training to become KAB instructors. In addition, KAB does not require particular education requirements for KAB instructors; they likely have bachelor’s degrees in
various fields. In fact, many KAB schools do not have a management division, which could otherwise provide qualified business faculty.

The standardized KAB teaching content includes the following eight modules:

1. What the enterprise is
2. Why the entrepreneurship spirit is recommended
3. Who can become an entrepreneur
4. How to become an entrepreneur
5. How to find a good entrepreneurial idea
6. How to start an enterprise
7. How to operate an enterprise
8. How to prepare a business plan

These modules are exactly the same for all schools, regardless of differences in student majors, level, or other aspects. A standard KAB textbook is used. Students electing to take the course usually receive two credits. While the KAB model provides some entrepreneurship training to university students, any expectations for this program should recognize limitations such as the following:

1. With only 32 hours of class time, KAB can only provide the most basic level entrepreneurship training. Its value lies in eliminating illiteracy about business and inspiring entrepreneurs. But it should not be assumed that students will have all the knowledge they need to start a business, particularly when many students do not enter the course with prior business training.

2. As a public elective course offered to all major students, the teaching content and methods all the same. The program could benefit from adapting to different student levels and experience, and regional differences.

3. There are no specific professional requirements for instructors. They often lack academic backgrounds, and they do not have entrepreneurship experience. Some
schools invite successful business people as temporary instructors, but even these lack teaching qualifications.

The biggest issue for Chinese universities now is student employment after graduation. What the student population needs most, regardless of their field of study, is a change in the traditional Chinese ideals of discouraging risk taking. This should be the purpose of entrepreneurship educational at a general level, and could be the reason that KAB has become so popular in such a short time: with universities, students, and governments that promote the program. KAB focuses on building basic thinking about entrepreneurship for youth; however, it does not lead to deep and broad understanding about entrepreneurship.

**Advanced University Entrepreneurship Education in China**

The popularity of the KAB is a signal of the emerging interest in entrepreneurship education in China. Another indicator is the leadership of a few exceptional universities in offering more extensive curriculum in this field. These programs offer more professional and wider scope entrepreneurship courses, like Enterprise Growth Management, Entrepreneurial Leadership, The Entrepreneurship Financing Decision and so on. These universities have qualified professional faculty with academic research backgrounds and achievements in the entrepreneurship field. They can offer entrepreneurship courses containing both theory and practice, and students in these universities can be developed into entrepreneurship professionals. Most of these are also KAB schools.

While some universities in China may offer an occasional entrepreneurship course, perhaps due to the interest of an individual faculty member, there are not many more than ten universities that can be considered advanced: in other words, making a high-level commitment to entrepreneurship education. Examples of schools in this advanced category are: Qinghua
University, Zhejiang University, Nankai University, Shanghai Jiaotong University, Sun Yat-sen University, Central University of Finance and Economics and Jiangxi Normal University. We collected information on these schools through a review of their websites and interviews with faculty.

These advanced universities have two common characteristics. First, they all have sophisticated business management programs, which can be considered a foundation for entrepreneurship education. Their business expertise developed rapidly over past few decades, providing a solid base from which they could offer many professional entrepreneurship courses. Second, they all have close relationships with foreign advanced entrepreneurship research and education organizations, which provided a basis for learning from more established institutes. For example, Qinghua University has partnered with University of California at Berkeley in the U.S. and Zhejiang University has partnered with Babson College in the U.S. and EM Lyon Business School in France.

The motivation for university entrepreneurship programs comes from three sides: universities, government and student demand. Basically, students are concerned about their employment prospects, governments focus on employment and economic development, and universities are interested in employment and new academic research fields. Additionally, for a university, higher student employment rates boost the stature of the university and attract more students.

In China, 99% of universities are financially supported by the government. Besides the general funds universities receive, money is also available from different government agencies like scientific bureaus, education bureaus, and development and reform commissions. All provinces in China have funds to support research each year, with universities receiving most of
these funds. Entrepreneurship education is one area that can receive support, and universities may receive specific funds for these programs if it is a special focus of the provincial government.

Entrepreneurship courses at the eight universities are generally taken as elective courses, and are offered at undergraduate, graduate, and doctoral levels, although MBA programs are where they are mostly found. Only a few offer majors or concentrations in entrepreneurship, although students may also have an entrepreneurship component in their thesis work. Although entrepreneurship courses are typically offered as electives, they are often restricted to business and management majors. Students outside the business disciplines can take entrepreneurship through the KAB program.

In many of the universities, entrepreneurship overlaps with innovation topics. Finance-related topics are also popular. Qinghua, Zhejiang, and Sun Yat-sen have some of the more diverse offerings, with courses on entrepreneurial leadership, growth, strategy, and business plan courses, among others. The nature of the course offerings can often reflect the strengths of the faculty or university.

Many faculty in these universities have academic research achievements in entrepreneurship field. Most of the entrepreneurship faculty come from business disciplines, such as human resource management, technology innovation, organization behavior, finance, accounting, marketing, information management, project management, strategy and others. Some have had doctoral dissertations focused on an entrepreneurship topic. Full-time faculty rarely have entrepreneurship experience, however. But they will often ask guest speakers to visit class, which provides a practical element. In addition a few of the schools have adjuncts with work experience teaching or co-teaching some courses, particularly at the MBA level. The universities
often recruit business people or visiting faculty from overseas to give one-two hour guest lectures; this is often done outside of regular classes, and is sometimes arranged as part of a seminar series.

In each university, there is typically a group of four or five professors both teaching and researching in the entrepreneurship field. One or two will have a heavier emphasis on publishing. Publishing is often heavily weighted toward writing textbooks or translating foreign textbooks. But some faculty have published articles in international journals, and this is increasing. Among the eight universities, Qinghua, Zhejiang University and Nankai University have larger groups of entrepreneurship faculty than the others, with ten or more professors teaching this topic.

According to our interviews, only Qinghua, Zhejiang, and Sun Yat-sen Universities offer some entrepreneurship classes in English. At Qinghua, the English language classes are taught primarily by part-time adjuncts. At Zhejiang University, half of the entrepreneurship courses are taught by Chinese teachers in English, and the other half are taught by foreign teachers. At Sun Yat-sen, the entrepreneurship classes for the international MBAs are taught in English. Some universities have professors from other countries, either living in China or there as visiting faculty. They tend to teach in other, more established business disciplines, however. Because entrepreneurship is not yet a strong field in China, universities are not likely to allocate the resources needed to afford foreign professors.

Entrepreneurship courses consist mainly of lectures and cases. Cases are often used to illustrate principles taught in the lecture. Professors usually use cases about Chinese companies, which are more relevant for the Chinese situation; these tend to come in case books. Cases from international sources like Harvard Business School are not commonly used at this point. Students sometimes participate in group activities and may be expected to give some group presentations
during the semester: for example, pitching a business idea. Participation in entrepreneurship classes is higher than in others. The level of participation, however, is still much lower than at Babson College. Babson provided one of the earliest entrepreneurship faculty training programs in China in 2006; this teaching model has influenced Chinese entrepreneurship teaching methods in some schools.

Courses like those focused on business plans may have a more practice-based element. There are some entrepreneurship “lab” facilities, but this requires resources, which may fall on the students themselves to invest funds in starting their small business during their studies. As mentioned previously, entrepreneurship centers may be where the experiential element is provided.

Most entrepreneurship centers are based in the business management academic divisions. They rarely are independent; they are just “two labels, but the same people.” The resource requirements are a key reason for this. However, these centers are valuable in providing a base from which to organize and support all the entrepreneurship initiatives at the university. Some of the centers take part in international entrepreneurship research projects; this keeps them up to pace with other parts of the world. Some have more connection to the outside: for example, creating training programs for managers. The centers can also focus on providing experiential elements for students, such as helping them to start businesses.

Discussion and Conclusions

Through dynamic entrepreneurship, China can transition its economy toward innovative and knowledge-based enterprise. University entrepreneurship education is in its early stages of development in China, but presents great opportunity for creating high potential businesses and
employment options for graduates. While lessons from countries with mature programs may be useful, however, it is important to consider Chinese culture and the particular environmental conditions that impact entrepreneurial activity more specifically in this country. The experience of the leading Chinese universities reviewed in this paper should therefore be integrated with the lessons learned in countries like the U.S.

Entrepreneurship education should have two main objectives: to foster positive attitudes about entrepreneurship and develop skills for starting businesses. China’s younger generations have grown up in different times. They share ideas within and outside China through advanced communication technologies and broad travels. They have developed new perspectives, yet respect China’s traditions and historical achievements. Universities can expand their students’ already broad outlook and build their individual initiative for venturing into more highly uncertain but potentially more rewarding career pursuits. This will require positive attitudes about entrepreneurship and a willingness to take risk.

At the same time, entrepreneurs do not operate in isolation. Rather, they depend on the support of an ecosystem of players and favorable environmental conditions. Universities will need to work with policy makers to help them understand the elements that can promote entrepreneurial activity in China. Tsinghua’s leadership of the Global Entrepreneurship Monitor research project in China is one way of informing policy makers about entrepreneurial attitudes, activity and relevant framework conditions.

Additionally, entrepreneurs in China need family members that support their ambitions. They need employees, suppliers and distributors to work with them and customers willing to try their products and services. And while policy makers and businesses may open up access to capital, seed capital often comes from informal sources. Entrepreneurs may therefore rely on
family, friends and acquaintances willing to financially back their ideas. In short, attitudes about entrepreneurship extend beyond the entrepreneurs to their stakeholders and the ecosystem in which they participate.

Educators designing entrepreneurship programs in China need to consider how to use experiential methods, which have shown to be effective in the U.S. and elsewhere. These methods can be acquired and adapted for the Chinese situation through entrepreneurship educator training, or by learning from visiting faculty with experience teaching entrepreneurship. In addition, the experiential component often happens outside or peripheral to the classroom, through such activities as business plan competitions, student incubators, and campus-wide guest speakers. Educators also need to make a connection to practice. Co-teaching with adjunct business people or inviting guest speakers to class have been used by the advanced universities to help students understand how principles translate to practice.

The transition from traditional faculty and structures will be a challenge for many universities. Even in some U.S. universities, conventional faculty do not see entrepreneurship as a “real” discipline. Administrators will need to allow for experimentation with new courses and support the development of entrepreneurship programs. Where resources are limited, it may be best to train a few (more adventurous) faculty members and follow a basic model, first offering a new ventures course, then adding other core courses like managing growth and finance as the programs develop.

Faculty may be able to adapt disciplines like marketing or finance to the entrepreneurship context, with careful research and understanding about how this can be done. Similarly, it is apparent that some Chinese universities leverage strengths they already have in areas like finance, engineering, or human resources: for example, by offering courses relating to these disciplines.
These types of courses can help both faculty and students stretch their knowledge into a new context.

Although most of the entrepreneurship courses in the advanced universities were offered at an MBA level, it might be useful to introduce this topic into the undergraduate curriculum as well, to inspire college students early in their studies. At the same time, development of this field will require Ph.D.s with an entrepreneurship focus, indicating the need for doctoral programs in this field in China.

This study offers an exploratory look at entrepreneurship programs in China, and how lessons from the U.S. might be applied toward further development of this field. A follow on study is planned to gain a range of insights from faculty, administrators, and students of the leading Chinese universities. We hope to gain a greater depth of understanding about how entrepreneurship is taught and the particular considerations that are relevant for building programs in this specific context. In so doing, we hope this research will contribute toward the development of entrepreneurship education at the higher education level in this exciting culture.

References

Entrepreneurship is broadly viewed as a major contributor to the economic growth of nations. When economic growth stalls we can assume there are more challenges, yet perhaps more opportunities, for entrepreneurship. A major goal of this session will be to extend knowledge about entrepreneurship in diverse and dynamic world environments. This session will explore the frequency and nature of entrepreneurship during the 2008-9 global recession. It will start with background on changes in global entrepreneurial activity and aspirations, followed by a discussion of the nature and impact of several Entrepreneurial Framework Conditions during the economic recession. Audience participation will ensue.
Leadership and Culture matters: Empirical Investigation for the Mediating Mechanism of Entrepreneurial Orientation

Jae Hyeung Kang, Sang Chul Park, and Ayman Tarabishy 1

ABSTRACT

Using survey data collected from the three entrepreneur firms located in South Korea, we empirically investigate the unique East Asian cultural value and leadership mechanisms explaining how East Asian entrepreneurial organizations achieved remarkable firm performance. In order to do so, we examine the influence of both long-term orientation based on Confucianism and employees’ perceived transformational leadership on organizational performance. We further examine entrepreneur orientation as an important mediator of these relationships. Our arguments have practical and theoretical implications for understanding how leadership, national culture, and organizational culture make important contribution on organizational performance.

INTRODUCTION

Western researchers admit that the East Asian countries such as China, Taiwan, and Korea achieved remarkable economic growth over the past decades (Franke, Hofstede, and Bond 1991). Although the financial crisis in 2008 threatened economic stabilities in those countries, East Asian countries showed fast recovering capability and several Asian entrepreneur organizations entertained unbelievable financial growth after the crisis. It seems that East Asian countries have a unique national value to overcome tremendous crises. Researchers attempted to explain the factors that made these impossible missions possible (Franke et al. 1991; Hofstede 1991; Karn 1979), but they have suggested somewhat broad explanations so far. Given this theoretical limitation, we clearly explain this growth mechanism among East Asian countries from leadership and national culture perspective. More importantly, we suggest entrepreneurial culture as an important mediation construct that can explain how East Asian countries and entrepreneur organizations made significant economic success overcoming various risk and obstacles.

An organization’s entrepreneurial orientation (EO) is a specific aspect of organizational culture that has extensive quantitative empirical research behind it. EO can be defined as the organizational culture that is represented through their risk taking, proactivity and innovation (Miller 1983). Miller (1983) emphasized that all entrepreneurial organizations must innovate, take proactive action, and take risks. Specifically, Miller (1983) argued that, in general, theorists would not call a firm entrepreneurial if it changed its technology or product line (‘innovative’ according to our terminology) simply by directly imitating competitors while refusing to take any risks. While changing
companies’ business process, a firm must to take proactive approach as well. By the same token, risk-taking firms, which are highly leveraged financially, are not necessarily entrepreneurial. They must also engage in product-market or technological innovation. Thus, Miller (1983) reserved the label of “entrepreneurial” for firms which are concurrently risk taking, innovative, and proactive.

Although still in its infancy, this stream of research has highlighted some important factors, including contextual factors, and characteristics of the EO itself (Covin and Slevin 1991; Dickson and Weaver 1997; Dirk and Imanol 2007; Lumpkin and Dess 1996). We also note that researchers have endeavored to identify the theoretical and empirical relationship between national culture, entrepreneurship, and organizational performance (Ardichvili and Gasparishvili 2003; Kreiser, Marino, and Weaver 2002; Lee and Peterson 2000; Marino, Strandholm, Steensma, and Weaver 2002; Swierczek and Ha 2003). Despite this progress, the question of how East Asian’s long-term orientation culture and transformational leadership influence organizational performance has yet to be explored. In addition, the strategic mediation effect of EO on those relationships was not well articulated. Given these theoretical and empirical gaps, we believe that it should be valuable to investigate the empirical relationships between leadership, national culture, EO, and organizational performance. In this study, we will examine the key antecedents and consequence of EO. In so doing, we make three important contributions to the leadership, culture, and entrepreneurship literature.

First, we examine the mediation mechanism of EO on the positive relationship between transformational leadership and organizational performance. In this study, transformational leadership refers to “a longer term relationship established between a
leader and followers, built up over many interactions and having a more organizational or strategic orientation” (Herold, Fedor, Caldwell, and Yi 2008, p. 348). This leadership style is one of the most frequently applied constructs in business literature (Bass 1985; Bono and Ilies 2006; Burns 1978; Richer and Vallerand 1995; Rubin, Munz, and Bommer 2005). In addition, several researchers investigated various constructs such as self-efficacy belief (Kirkpatrick and Locke 1996), intrinsic motivation (Charbonneau, Barling, and Kelloway 2001), and organizational citizenship behavior (Boerner, Eisenbeiss, and Criesser 2007) mediating the relationship between transformational leadership and performance. Given these previous contributions, the importance of transformational leadership can not be neglected in entrepreneurship study as well. However, there are limited literatures investigating the relationship between leadership styles and entrepreneurship (for an exception, see García-Morales, Llorens-Montes, and Verdú-Jover 2006; Todorovic and Schlosser 2007). In this study, we examine how EO plays an important mediating role between transformation leadership and organizational performance. We expect the EO will provide strategic links between transformational leadership and organizational performance. Given this strategic importance of EO, we will contribute to entrepreneurship literatures by clearly identifying the theoretical relationship.

Second, we propose the mediation mechanism of EO on the positive relationship between national culture and organizational performance. Kreiser et al. (2002) point out that only one study (Knight 1997) has examined the psychometric characteristics of the Covin and Slevin’s (1989) EO construct in a cross-cultural setting. Applying Hofstede’s (1984; 1991) cultural dimension of long-term orientation, we explain unique East Asian
cultural value of Confucianism and its direct and indirect influence on EO and organizational performance in workplaces. Although Hofstede (1991) attempted to address the relationship between long-term orientation and entrepreneurship, there is no existing research that clearly demonstrates the relationship between long-term orientation, EO, and organizational performance. Since EO consists of sub-elements such as risk taking, pro-activity and innovation (Miller 1983) and Confucianism value contains critical entrepreneurial elements, we will be able to find the direct and indirect links between long-term orientation, EO, and organizational performance.

In summary, we build a theoretical model to examine how organizational performance is influenced by employees’ perceived transformational leadership and their long-term orientation culture. In addition, we explain the important mediation mechanism of EO between these relationships. The theoretical model is shown in Figure 1 and discussed below.

STUDY HYPOTHESES

Transformational Leadership and Organizational Performance

The debate over the nature of the leadership and performance relationship has not yet been resolved. Many researchers ascribe organizational performance to factors other than leadership, typically macro variables at the organizational or environmental level. For example, Meindl, Ehrlich, and Dukerich (1985) criticized that the attribution of performance results to the actions of leaders is most often the consequence of romantic fantasy rather than a solid description of a causal relationship. However, a review of
leadership in organizations, with a focus on the leadership-performance relationship, counters the above arguments (Kaiser, Hogan, and Craig 2008; Victor, Francisco, and Antonio 2008). For example, Kaiser et al. (2008) clarified the construct of the leadership and performance relationship, pointing out the much prior research has centered on the emergence and approval (by followers as well as supervisors) of leaders rather than on the effects that leaders may have on organizational performance outcome. In addition, there exist specific research studies that demonstrate that leaders can be the cause of organizational performance (Smith, Carson, and Alexander 1984) as well as well-designed meta-analyses (DeGroot, Kiter, and Cross 2000; Judge and Piccolo 2004) that support this conclusion. Moreover, prominent leadership scholars such as Bass (1985) and Yukl (2005) generally agree that leadership is positively associated with organizational performance.

In this study, we specifically argue that transformational leadership provides positive influence on organizational performance. Transformational leadership is based on the notion that leaders inspire and motivate individuals to perform at exceptional levels (Bass 1985). In this notion, transformational leaders themselves do not solely play a significant role on increasing organizational performance. More importantly, employees who perceived their supervisors’ transformational leadership are inspired to perform well in the organization. Given this, most leadership theories support that the leaders affect performance most strongly by their direct effects on followers (Bass 1985; Conger and Kanungo 1998; Kaiser et al. 2008; Kouzes and Posner 1987).

The next question is how perceived transformational leadership contributes to organizational performance. A central thesis of Bass's (1985) theory is that
“transformational leadership goes beyond exchanging inducements for desired performance by developing, intellectually stimulating, and inspiring followers to transcend their own self-interests for a higher collective purpose, mission, or vision” (Howell and Avolio 1993, p. 891). According to an empirical study by Howell and Avolio (1993), transformational leadership based on intellectual stimulation and individualized consideration generates advantages for organizational performance. From these studies, we note that leaders use transformational leadership as a strategic method to increase organizational performance. In recent transformational leadership study, Victor et al. (2008) noted that transformational leaders use knowledge and innovation to increase organizational performance. In addition, both Bass (1985) and Howell and Avolio (1993) clearly identified that followers under the influence of transformational leadership are inspired and motivated to work beyond their job related expectations, and these collective motivations and behaviors create more opportunities to increase organizational performance. As a result, the critical driver for organizational performance is inspired and motivated followers. In summary, transformational leaders can inspire and motivate their followers collectively maximize performance (Howell and Avolio 1993), and this process eventually improve organizational performance.

H1: Perceived transformational leadership provides positive motivational impacts on followers to improve organizational performance.

Long-term Orientation and Organizational Performance

Researchers have identified certain characteristics of national culture and attempted to find some common characteristics based on various definitions about culture (Hofstede 1984; Schein 1992; Triandis 1989). Hofstede (1984) defined culture as “the
collective programming of the mind which distinguishes the members of one category of people from those of another” (p. 389). The members of a group interacting for a certain period of time share assumptions, values, and artifacts, which in turn induce culture (Schein 1992). Culture, then, defines structures and systems, guides management processes, impacts work-unit climate, and, ultimately, affects organizational performance.

Researchers studying national culture have developed various frameworks to understand cultural differences and have added important contributions to the cross-culture literature (Hofstede 1984; Triandis 1989). For example, Hofstede (1984) introduced several cultural dimensions, such as power distance, collectivism, masculinity, long-term orientation, and uncertainty avoidance. These frameworks have been frequently applied and explored by other researchers in the behavioral and cultural literature (Earley 1993; Gelfand et al. 2006; Lee and Peterson 2000; Marino et al. 2002; Swierczek and Ha 2003; Wheeler 2002). Among various cultural dimensions suggested by Hofstede (1984; 1991), long-term orientation is defined as “the degree to which people’s actions are driven by long-term goals and results, rather than the short-term need for immediate gratification” (Ardichvili and Gasparishvili 2003, p. 32). This dimension is also called “Confucian dynamism”, which refers to the long-term versus short-term orientations in life that appear to differentiate Westerners from Easterners. For example, East Asian countries such as China, Korea, and Hong Kong ranked the highest in the long-term orientation index while Western countries such as the United States and Canada were ranked relatively low (Hofstede 1991). This cultural dimension has been dominant traditional value in East Asian societies and still provides significant influence to East Asian employees.
Karn (1979) and Hofstede (1991) noted that the economic success of the Eastern during 1960’s and 1970’s could be attributed to common traditional cultural values and this has generated a competitive advantage for successful business activity. Based on this notion, we argue that long-term orientation based on Confucianism positively influence on organizational performance. For example, Franke et al. (1991), in a study of economic growth in 20 countries over a 20 year period, found that high levels of long-term orientation were associated with fast economic growth in Asian countries. Franke et al. (1991) also suggested that Confucian dynamism is associated with national economic growth rates. This Confucian dynamism emphasizes the dynamic rather than the static values traditionally found in Confucianism (Franke et al. 1991). This historical data show a positive relationship between long-term orientation and national economic growth. In addition, Wang, Farh, and Luo (1999) argued that emphasis on HR practices of long-term orientation will positive influence firm performance. Since national economic growth is an aggregated outcome of each organizational performance within a country, we can anticipate that this cultural value is also positively associated with organizational performance.

In the long-term orientation dimension, there are important sub-elements that provide positive impacts to increase organizational performance. First, people in the long-term orientation culture are willing to subordinate themselves for an organizational purpose (Hofstede 1991). This collective oriented mindset requires a value that individuals sacrifice themselves for collective goals even in difficult situation and moment, and leads employees to attach to the organization as a form of long-term commitment. Second, people in long-term orientation culture respect for social and status
within limits (Hofstede 1991). This cultural value leads employees to admit limited resources within current organization and to work hard in order to overcome this limitation. Third, long-term orientation emphasizes thrift, being sparing with resources (Hofstede 1991). As a result, employees within long-term orientation culture traditionally regard thrift behavior as desirable to organizational success, and this collective attitude generates more opportunity to increase organizational performance.

$H2$: Long-term Orientation perception based on Confucianism provides positive impacts to create more opportunities to increase organizational performance.

The Mediating Mechanism of Entrepreneurial Orientation

We expect that employees’ perceptions of EO will be an important mechanism through which the predictors in the theoretical model (employees’ perceived transformational leadership and long-term orientation) influence organizational performance. We discuss these mediation propositions below by first considering the relationships between the two predictors and EO, and then the relationships between EO and organizational performance.

**Transformational Leadership and Entrepreneurial Orientation.** Entrepreneurial organizations generally have small number of employees compare to matured organizations. In this organizational context, leaders seem to be able to create organizational culture more prominently than large and matured organization (Schein 1992). Moreover, success of small business clearly depends upon leaders’ innovative business idea and their strong desires to implement business (Yukl 2005). Leaders not only choose the basic mission and the environmental context where the employees will work, but they also choose their employees who will implement the leaders’ business
idea (Schein 1992). Therefore, leaders of entrepreneurial organization position themselves as an influential source of shaping organizational culture.

Transformational leaders appeal to their followers by getting them to accept a higher vision and exert themselves to accomplish that vision (Burns 1978). In a entrepreneur context, transformational leadership behaviors include articulating and presenting a clear vision for the new business opportunity, showing passion and enthusiasm for implementing the business idea, inspiring employees to align with the organizational goal by helping them understand the reasons for pursuing its business and the opportunities that the new business idea can generate, challenging employees to reexamine their assumptions and question old ways of doing things, and being sensitive to the needs and concerns of employees (Bass 1985).

From the leadership perspective, there are recent papers that explain the relation of transformational leadership with entrepreneurship (García-Morales et al. 2006) and innovation (García-Morales, Matías-Reche, and Hurtado-Torres 2008). I further argue about how the sub components of transformational leadership positively influence employees shaping high level of entrepreneurial culture (EO). There are several reasons why transformational leadership behaviors are likely to influence EO. First, transformational leaders have been shown to inspire and intellectually stimulate others to act in innovative ways (Burns 1978; Richer and Vallerand 1995; Yukl 2005), which will predispose their employees to be generally more receptive to innovative culture suggested by the leaders. Gumusluoglu and Ilsev (2009) found that transformational leadership positively related to organizational innovation that was measured with a market oriented criterion developed for developing countries and newly developing
industries. Their finding suggests that there is a strategic link between transformational leadership and innovative culture within EO. In addition, Victor et al. (2008) suggested that transformational leadership, in general, positively affects innovative behavior. Thus, transformational leadership would create innovative organizational culture. Second, transformational leaders generate enthusiasm on the part of employees and confidence that they can successfully implement immature business ideas and potential business opportunities (Bass, 1985). This is also likely to lead to employees having a more positive perception of the leader’s proactive attitude, because the entrepreneurial organization transforms its previous identity toward leader’s value, and thus employees within the organization will be able to fully identify their value with their leader’s one. This “organizational identity transformation” will lead organizations to shape proactive business culture within entrepreneur firms. Third, transformational leadership has been shown to relieve anxiety and induce positive emotions in followers (Bono & Ilies, 2006; Rubin et al., 2005). This will also influence the extent to which employees become more tolerant toward the potential risks and thus shape the positive emotion to take any internal and external risk against their job. If leaders do not successfully create the organizational culture, entrepreneurial organizations are exposed to risky environment and can not survive in a long run (Schein, 1992). As a result, leaders of small business have strong responsibilities to risk taking and continue to make their business profitable. This risk taking attitude of leaders should be successfully embedded in organizational culture where their followers are also willing to take risks. In summary, transformational leadership will positively influence to shaping innovative, proactive, risk-taking organizational culture.
**Long-term Orientation and Entrepreneurial Orientation.** We argue that employees’ long-term orientation perception based on Confucianism is positively related to employees’ EO perception. Some of the successive studies with Hofstede’s (1991) framework tried to link the long-term orientation with entrepreneurial behavior. Although Hofstede (1991) did not specifically discuss about EO, his theoretical perspective on entrepreneurship suggested implicit insights for understanding national culture influence on EO. For example, countries with long-term oriented cultures (e.g., China, Taiwan, and Korea) seem to be generating more individuals with high entrepreneurial behaviors (Hofstede 1991; Ardichvili and Gasparishvili 2003). According to Hofstede (1991), the values at the long-term orientation are very Confucian oriented and supportive to entrepreneurial activities. From the East Asian perspective, Confucianism value provides subtle but significant influence on East Asian people’s work and life. Given this unique cultural value of long-term orientation, we propose a strategic linkage between long-term orientation and EO.

One of key principles of Confucian teaching is the virtue with regard to one’s tasks in life consists of trying to acquire new skills, focusing highly on education, and working hard (Hofstede 1991). For example, Korean and Chinese people heavily value on developing their educational background and acquiring new knowledge and skills. Moreover, East Asian entrepreneurs tend to generate creative and innovative idea based on their previously acquired knowledge and skills (Einhorn 2007). In addition, Lin (2009) empirically suggested that long-term orientation is positively related to innovation among major automakers in 14 countries. These proactive and innovative approaches emphasize the dynamic rather than the static values traditionally found in Confucianism (Franke et
al. 1991). As a result, dynamic and future-oriented natures of Confucian value are relevant to enhance innovative and proactive culture among East Asian entrepreneurs (Allred and Swan 2004; Lin 2009; Nakata and Sivakumar 1996). Second, being patient and pursuing of whatever goals are essential assets as an entrepreneur (Hofstede 1991). Since Asian entrepreneurs keep the core value of persistence tenacity, they are willing to take any internal and external risk and develop their creative business idea into real service and product. These Confusion values will make entrepreneurs take any potential risk. Given this, entrepreneur firms based on long-term orientation tend to take innovative, proactive, and risk taking approaches in order to survive in severe competition. Therefore, employees’ long-term orientation perception based on Confucianism positively influences to their EO perception.

**Entrepreneurial Orientation and Organizational Performance.** According to Schein (1992), organizational cultures are basically shaped from three sources; “(1) the beliefs, values, and assumptions of founders of organizations; (2) the learning experiences of group members as their organization evolves; and (3) new beliefs, values, and assumptions brought in by new members and leaders” (p. 211). Schein (1992) points out that organizational performance effects are more likely to occur as a result of cultural values and beliefs that are accepted by organization members and that therefore guide their actions.

Previous research has demonstrated a significant relationship between EO and organizational performance (Covin and Slevin 1989; Covin and Slevin 1991; Naman and Slevin 1993; Rauch, Wiklund, Lumpkin, and Frese 2009; Zahra and Covin 1995). There are several conceptual and empirical literatures in favor of a linkage between EO and
both individual and organizational performance (Block and MacMillan 1993; Covin and Covin 1990; Covin and Slevin 1991; Pearce, Kramer, and Robin 1997; Wiklund 1999). The association between EO and high performance has led many firms to consider EO an important factor for success (Chadwick 1999; Rauch et al. 2009). In this study, we mainly focus on employees’ believes on their future organizational performance (Swierczek and Ha, 2003). Since there are various factors that directly and indirectly influence organizational performance and various measurement approaches on firm performance (e.g., revenue, net profit, and return of investment), it seems to be controversial to argue that EO is the most important and direct factor for improving organizational performance in general. However, the relationship between EO and employees’ believes on future organizational performance can be investigated with fairly objective approach. Given this, Swierczek and Ha (2003) designed measurement items that investigate employees’ perceived level of importance on their organizational performance. Covin (1991) also suggested that non-financial data can be used in entrepreneurship study to investigate the employees’ and managers’ perceptions towards the organizational performance because there is a strong correlation between financial and non-financial data.

In summary, our arguments in this section suggest that in addition to the direct effects of transformational leadership and long-term orientation on organizational performance, discussed in earlier sections, these factors will also influence organizational performance through their impact on EO. In other words, EO will partially mediate the positive relationship between transformational leadership and organizational performance, and partially mediate the long-term orientation and organizational performance.
H3: Employees’ entrepreneurial orientation perception partially mediates the positive relationships between transformational leadership and organizational performance; such that transformational leadership is positively related to employees’ entrepreneurial orientation, which in turn is positively related organizational performance.

H4: Employees’ entrepreneurial orientation perception partially mediates the positive relationships between long-term orientation perception based on Confucianism and organizational performance; such that long-term orientation perception based on Confucianism is positively related to employees’ entrepreneurial orientation, which in turn is positively related organizational performance.

METHODS

This empirical study was conducted at three entrepreneur companies that currently operate in Korea. In order to maintain the external validity, we controlled employees’ demographic characteristics and chose functionally similar companies. We invited employees in entrepreneur companies to participate in the study. Employees from all entrepreneur companies that were potentially impacted by the national culture participated in the study.

Research Design

The study utilized a non-experimental (naturally occurring) research design and individual level of analysis. Employees reported on their perceived transformational leadership and long-term orientation. In addition, employees reported on their perceptions of EO and organizational performance. In order to reach participants more easily, we collected the survey data through the web-based survey in which each participant was
assigned a unique ID number that safeguarded the individual’s confidentiality of their responses. Employees’ perceptions data formed the analysis in the study.

**Participants**

We sent out invitation e-mails to 480 employees which resulted in 178 employees (37.1% return rate) included in the study. We also collected data on gender (89.4% male), age (mean = 36.5), highest education level (65.7% with a Bachelors degree or higher), organizational tenure (75.0% less than 5 years, 21.6% between 6 and 15 years, 3.4% greater than 15 years), and tenure in current position (61.9% less than 2 years, 38.1% greater than 2 years).

**Measures**

**Long-term Orientation.** Bearden, Money, and Nevins’s (2006) 8-item scale was used to assess long-term orientation. Participants rated their long-term orientation perception on a 5-point scale ranging from 1 (strongly disagree) to 5 (strongly agree). Sample items for long-term orientation include “Respect for tradition is important to me,” “I don’t mind giving up today’s fun for success in the future,” “I plan for the long term,” and “Traditional values are important to me” (alpha = 0.83).

**Transformational Leadership.** Transformational leadership was assessed using 12 items from Podsakoff, MacKenzie and Fetter (1990), whereby participants rated the leadership that their supervisors displayed within entrepreneur companies. These items represent four sub-dimensions of transformational leadership: charisma/vision, inspiration, intellectual stimulation and individual consideration. Sample items for each of these dimensions respectively are: “My boss has a clear understanding of where we are going”, “My boss inspires others with his/her plans for the future,” “My boss challenges
me to think about old problems in new ways,” and “My boss has ideas that have challenged me to reexamine some of basic assumptions about my work,” (alpha=0.92).

**Entrepreneurial Orientation.** Covin and Slevin’s (1989) 9-item scale was used to assess Entrepreneurial Orientation (EO). For each item the two end-points are briefly defined. Participants selected the number, from 1 (at one end) through 9 (at the other end) that best describes these business practices. Sample items for EO include “In dealing with its competitors, my firm typically initiates actions to which competitors then respond,” “When confronted with decision-making situations involving uncertainty, my firm typically adopts a bold, independent posture in order to maximize the probability of exploiting potential opportunities”, and “In dealing with its competitors, my firm typically initiates actions to which competitors then respond” (alpha = 0.90).

**Organizational performance.** Swierczek and Ha’s (2003) 7-item scale was used to assess organizational performance. Participants rated the level of importance that they attach to the factors as enterprise objectives, from 1 (not important at all) through 5 (very important). Sample items for organizational performance include “High revenue,” “Innovative leadership”, “Business stability,” and “Contribution to the community development” (alpha = 0.86).

**Control Variable.** Since some respondents in the study were both managers and employees reporting to their leader, we controlled for status (manager or employee). In addition, we controlled for educational background, because employees who have a higher educational background may perceive and response to the national and organizational culture differently to those who have a lower educational background. Controlling these variables, we were able to capture robust empirical relationships.
Analytic Approach

It is not easy to objectively capture and measure the aspect of culture in a context of country because there is an inherent heterogeneity within a country’s culture. It seems to be irrelevant to apply the homogeneous cultural characteristics on the entire country, because cultures can be significantly different from each other even within a single country. As a result, Hofstede's work (1980) has been criticized for many of its conceptual and methodological issues due to the inherent heterogeneity within cultures (Parboteeah et al. 2005). In order to solve these issues, we needed to assess these cultural variables at the individual perceptions for capturing relevant data from the sample. Fortunately, there is several literature measured national culture at individual level (Earley 1993; Kirkman, Chen, Farh, Chen, and Lowe 2009; Wheeler 2002). Therefore, we also investigate national culture characteristics from individual perceptions.

RESULTS

Table 1 shows the descriptive statistics and bivariate correlations for all study variables. Hypothesis 1 predicted that transformational leadership would be positively related to organizational performance. As shown in Table 2, transformational leadership was directly and positively related to organizational performance ($\beta = .17, p < .05$). Hence, Hypothesis 1 was supported. Hypothesis 2 predicted that long-term orientation would be positively related to organizational performance. As shown in Table 2, long-term orientation was directly and positively related to organizational performance ($\beta = .32, p < .001$). Hence, Hypothesis 2 was supported.

----------------------------------------------
Insert Table 1 and Table 2 about here
----------------------------------------------
In order to analyze mediation effects of EO, we applied Baron and Kenny’s (1986) causal steps methods. Hypothesis 3 predicted that entrepreneurial orientation would partially mediate the relationship between transformational leadership and organizational performance. Specifically, we expected that transformational leadership would be positively related to entrepreneurial orientation, which in turn would be positively related to organizational performance. To test this hypothesis we first tested the relationship between transformational leadership and entrepreneurial orientation. The results of this analysis are shown in Table 3. As predicted, transformational leadership was positively related to entrepreneurial orientation ($\beta = 24, p < .01$). Next, we tested the relationship between entrepreneurial orientation and the organizational performance. However, entrepreneurial orientation was not positively related to organizational performance ($\beta = -.01, p > .05$). Thus, the effect of transformational leadership on organizational performance is somewhat mediated through entrepreneurial orientation. This analysis partially supports for Hypothesis 3.

Next, we tested the mediating effect of entrepreneurial orientation on long-term orientation and organizational performance. Specifically, we expected that long-term orientation would be positively related to entrepreneurial orientation, which in turn would be positively related to organizational performance. To test this hypothesis we first tested the relationship between long-term orientation and entrepreneurial orientation. The results of this analysis are shown in Table 3. Unfortunately, long-term orientation was not positively related to entrepreneurial orientation ($\beta = .10, p > .05$). Thus, we were not able to conclude that the effect of long-term orientation on organizational performance is
mediated through entrepreneurial orientation. This analysis does not support for Hypothesis 4.

DISCUSSION

The purpose of this paper was to identify important leadership and cultural antecedents to employee perceptions of EO, to find the impact of such perceptions on employees’ believes on the future organizational performance. We proposed that perceived EO mediates the relationship between employees’ perceived transformational leadership and organizational performance, and between employees’ perceived long-term orientation and organizational performance. Therefore, our research on leadership and cultural matters provides an additional contribution to the leadership, national culture and EO literature. We discuss the implications of our theoretical arguments below, and also discuss the suggestions for future research.

Theoretical Implications

This research provides several important theoretical implications to the leadership, national culture and EO literature. First, we investigated that transformational leadership plays an important role in shaping employee perceptions of EO. In spite of strategic importance of transformational leadership in entrepreneurial business, there were limited literatures explaining the relationship between transformational leadership and EO. In this paper, we found that employees whose manager exhibited more transformational leadership had more positive perceptions of EO and help improving organizational
performance. We believe that our paper will invite further fruitful arguments on leadership study in entrepreneur business.

Second important implication is that our finding leads us to consider national culture perceptions as a direct predictor for organizational performance and EO. After Knight (1997) suggested EO possessing high cross-cultural reliability and validity, many researchers attempted to investigate and explain the cultural impacts on EO. However, there are still various counter arguments exist in this area. In this study, we clearly suggest that long-term orientation is key factors influencing organizational performance. Although we failed to find a direct relationship between long-term orientation and EO, we found that high long-term orientation stimulates organizational performance.

**Managerial Implications**

This study also has important practical implications for understanding cultural differences in entrepreneurial firms. East Asian entrepreneur companies having long-term orientation and strong transformational leadership tend to increase employee’s belief on the high organizational performance. This study also has important practical implications for understanding leadership and culture impacts in entrepreneurial firms. Practitioners should understand the importance of transformational leadership in shaping strong EO. It is also important to understand the practical relationship between long-term orientation culture and organizational performance. When transformational leaders suggest the long-term vision for their business, employees take the responsibility of actualize the suggested vision. In this paper, we argued that organizations whose founders exhibiting more transformational leadership create more strong organizational culture (EO) and this might eventually help improving organizational performance.
**Limitations and Future Research Directions**

Despite the theoretical and practical contributions of this study, it is not without limitations. First, organizational performance may not be a single factor that represents a fast economic growth. However, we believe that it is clearly one of the most important factors. Besides organizational performance, other factors such as government policies and collaborative teamwork between all economic actors should be considered as important factors that accomplish remarkable economic growth in a short period of time. For example, Lee and Peterson (2000) noted that economic, political, and social factors moderate the relationship between culture and EO. Thus, Future research might broaden potential micro and/or macro contributors for overcoming the economic crisis. Second, this study is based on a correlational research design which makes it difficult to establish the causal relationship between the variables. However, given that transformational leadership and long-term orientation are generally agreed as predicting variables in the organizational study, it is likely that it is the causal variable that impacts employee responses in the model. Future research might use longitudinal analysis to explore how employee perceptions of leadership and culture and its consequences change over time. Third, while we focused here on cultural impacts on organizational performance, future research might examine other meaningful ways to investigate cultural interaction impacts. One fruitful area for future research is to examine whether long-term orientation and uncertainty avoidance are related, either directly or indirectly to other important outcomes. For example, long-term orientation might be moderated by uncertainty avoidance and thus mitigate the positive relationship toward organizational performance. These East Asian cultural values seem to generate some psychological tensions among
employees. Therefore, it would be valuable to investigate the interaction relationship between them long-term orientation and uncertainty avoidance. As we mentioned earlier, there are still limited studies on the relationship between leadership, national culture and EO. We hope that this study will stimulate successive leadership, national culture and EO researches.

**Conclusion**

This study adds to our understanding of how East Asian entrepreneur organizations achieved significant economic growth overcoming tremendous crisis and how employee responses on EO vary for employees within cultural and leadership contexts. We shed light on leadership and cultural factors that influence EO, and the impact of EO on organizational performance. Our arguments clearly argue that both transformational leadership and long-term orientation positively influences organizational performance and that EO partially mediates these theoretical relationships. We hope that this study will promote future research related to how employee responses to EO develop and how these responses differ among different cultural contexts.

FIGURE 1
Model of Hypothesized Relationships
Leadership and Culture Matters: Empirical Investigation for the Mediating Mechanism of Entrepreneurial Orientation

Jae Hyeung Kang, Sang Chul Park, and Ayman Tarabishy

Abstract

Using survey data collected from the three entrepreneur firms located in South Korea, we empirically investigate the unique East Asian cultural value and leadership mechanisms explaining how East Asian entrepreneurial organizations achieved remarkable firm performance. In order to do so, we examine the influence of both long-term orientation based on Confucianism and employees’ perceived transformational leadership on organizational performance. We further examine entrepreneur orientation as an important mediator of these relationships. Our arguments have practical and theoretical implications for understanding how leadership, national culture, and organizational culture make important contribution on organizational performance.

Keywords: Entrepreneurial Orientation, Leadership, National Culture

Introduction

Western researchers admit that the East Asian countries such as China, Taiwan, and Korea achieved remarkable economic growth over the past decades (Franke, Hofstede, and Bond 1991). Although the financial crisis in 2008 threatened economic

---

stabilities in those countries, East Asian countries showed fast recovering capability and several Asian entrepreneur organizations entertained unbelievable financial growth after the crisis. It seems that East Asian countries have a unique national value to overcome tremendous crises. Researchers attempted to explain the factors that made these impossible missions possible (Franke et al. 1991; Hofstede 1991; Karn 1979), but they have suggested somewhat broad explanations so far. Given this theoretical limitation, we clearly explain this growth mechanism among East Asian countries from leadership and national culture perspective. More importantly, we suggest entrepreneurial culture as an important mediation construct that can explain how East Asian countries and entrepreneur organizations made significant economic success overcoming various risk and obstacles.

An organization’s entrepreneurial orientation (EO) is a specific aspect of organizational culture that has extensive quantitative empirical research behind it. EO can be defined as the organizational culture that is represented through their risk taking, pro-activity and innovation (Miller 1983). Miller (1983) emphasized that all entrepreneurial organizations must innovate, take proactive action, and take risks. Specifically, Miller (1983) argued that, in general, theorists would not call a firm entrepreneurial if it changed its technology or product line (‘innovative’ according to our terminology) simply by directly imitating competitors while refusing to take any risks. While changing companies’ business process, a firm must to take proactive approach as well. By the same token, risk-taking firms, which are highly leveraged financially, are not necessarily entrepreneurial. They must also engage in product-market or technological innovation.
Thus, Miller (1983) reserved the label of “entrepreneurial” for firms which are concurrently risk taking, innovative, and proactive.

Although still in its infancy, this stream of research has highlighted some important factors, including contextual factors, and characteristics of the EO itself (Covin and Slevin 1991; Dickson and Weaver 1997; Dirk and Imanol 2007; Lumpkin and Dess 1996). We also note that researchers have endeavored to identify the theoretical and empirical relationship between national culture, entrepreneurship, and organizational performance (Ardichvili and Gasparishvili 2003; Kreiser, Marino, and Weaver 2002; Lee and Peterson 2000; Marino, Strandholm, Steensma, and Weaver 2002; Swierczek and Ha 2003). Despite this progress, the question of how East Asian’s long-term orientation culture and transformational leadership influence organizational performance has yet to be explored. In addition, the strategic mediation effect of EO on those relationships was not well articulated. Given these theoretical and empirical gaps, we believe that it should be valuable to investigate the empirical relationships between leadership, national culture, EO, and organizational performance. In this study, we will examine the key antecedents and consequence of EO. In so doing, we make three important contributions to the leadership, culture, and entrepreneurship literature.

First, we examine the mediation mechanism of EO on the positive relationship between transformational leadership and organizational performance. In this study, transformational leadership refers to “a longer term relationship established between a leader and followers, built up over many interactions and having a more organizational or strategic orientation” (Herold, Fedor, Caldwell, and Yi 2008, p. 348). This leadership style is one of the most frequently applied constructs in business literature (Bass 1985;
Bono and Ilies 2006; Burns 1978; Richer and Vallerand 1995; Rubin, Munz, and Bommer 2005). In addition, several researchers investigated various constructs such as self-efficacy belief (Kirkpatrick and Locke 1996), intrinsic motivation (Charbonneau, Barling, and Kelloway 2001), and organizational citizenship behavior (Boerner, Eisenbeiss, and Criesser 2007) mediating the relationship between transformational leadership and performance. Given these previous contributions, the importance of transformational leadership can not be neglected in entrepreneurship study as well. However, there are limited literatures investigating the relationship between leadership styles and entrepreneurship (for an exception, see García-Morales, Llorens-Montes, and Verdú-Jover 2006; Todorovic and Schlosser 2007). In this study, we examine how EO plays an important mediating role between transformation leadership and organizational performance. We expect the EO will provide strategic links between transformational leadership and organizational performance. Given this strategic importance of EO, we will contribute to entrepreneurship literatures by clearly identifying the theoretical relationship.

Second, we propose the mediation mechanism of EO on the positive relationship between national culture and organizational performance. Kreiser et al. (2002) point out that only one study (Knight 1997) has examined the psychometric characteristics of the Covin and Slevin’s (1989) EO construct in a cross-cultural setting. Applying Hofstede’s (1984; 1991) cultural dimension of long-term orientation, we explain unique East Asian cultural value of Confucianism and its direct and indirect influence on EO and organizational performance in workplaces. Although Hofstede (1991) attempted to address the relationship between long-term orientation and entrepreneurship, there is no
existing research that clearly demonstrates the relationship between long-term orientation, EO, and organizational performance. Since EO consists of sub-elements such as risk taking, pro-activity and innovation (Miller 1983) and Confucianism value contains critical entrepreneurial elements, we will be able to find the direct and indirect links between long-term orientation, EO, and organizational performance.

In summary, we build a theoretical model to examine how organizational performance is influenced by employees’ perceived transformational leadership and their long-term orientation culture. In addition, we explain the important mediation mechanism of EO between these relationships. The theoretical model is shown in Figure 1 and discussed below.

**Study Hypothesis**

**Transformational Leadership and Organizational Performance**

The debate over the nature of the leadership and performance relationship has not yet been resolved. Many researchers ascribe organizational performance to factors other than leadership, typically macro variables at the organizational or environmental level. For example, Meindl, Ehrlich, and Dukerich (1985) criticized that the attribution of performance results to the actions of leaders is most often the consequence of romantic fantasy rather than a solid description of a causal relationship. However, a review of leadership in organizations, with a focus on the leadership-performance relationship, counters the above arguments (Kaiser, Hogan, and Craig 2008; Victor, Francisco, and Antonio 2008). For example, Kaiser et al. (2008) clarified the construct of the leadership and performance relationship, pointing out the much prior research has centered on the
emergence and approval (by followers as well as supervisors) of leaders rather than on the effects that leaders may have on organizational performance outcome. In addition, there exist specific research studies that demonstrate that leaders can be the cause of organizational performance (Smith, Carson, and Alexander 1984) as well as well-designed meta-analyses (DeGroot, Kiter, and Cross 2000; Judge and Piccolo 2004) that support this conclusion. Moreover, prominent leadership scholars such as Bass (1985) and Yukl (2005) generally agree that leadership is positively associated with organizational performance.

In this study, we specifically argue that transformational leadership provides positive influence on organizational performance. Transformational leadership is based on the notion that leaders inspire and motivate individuals to perform at exceptional levels (Bass 1985). In this notion, transformational leaders themselves do not solely play a significant role on increasing organizational performance. More importantly, employees who perceived their supervisors’ transformational leadership are inspired to perform well in the organization. Given this, most leadership theories support that the leaders affect performance most strongly by their direct effects on followers (Bass 1985; Conger and Kanungo 1998; Kaiser et al. 2008; Kouzes and Posner 1987).

The next question is how perceived transformational leadership contributes to organizational performance. A central thesis of Bass's (1985) theory is that “transformational leadership goes beyond exchanging inducements for desired performance by developing, intellectually stimulating, and inspiring followers to transcend their own self-interests for a higher collective purpose, mission, or vision” (Howell and Avolio 1993, p. 891). According to an empirical study by Howell and
Avolio (1993), transformational leadership based on intellectual stimulation and individualized consideration generates advantages for organizational performance. From these studies, we note that leaders use transformational leadership as a strategic method to increase organizational performance. In recent transformational leadership study, Victor et al. (2008) noted that transformational leaders use knowledge and innovation to increase organizational performance. In addition, both Bass (1985) and Howell and Avolio (1993) clearly identified that followers under the influence of transformational leadership are inspired and motivated to work beyond their job related expectations, and these collective motivations and behaviors create more opportunities to increase organizational performance. As a result, the critical driver for organizational performance is inspired and motivated followers. In summary, transformational leaders can inspire and motivate their followers collectively maximize performance (Howell and Avolio 1993), and this process eventually improve organizational performance.

\[ H1: \text{Perceived transformational leadership provides positive motivational impacts on followers to improve organizational performance.} \]

**Long-term Orientation and Organizational Performance**

Researchers have identified certain characteristics of national culture and attempted to find some common characteristics based on various definitions about culture (Hofstede 1984; Schein 1992; Triandis 1989). Hofstede (1984) defined culture as “the collective programming of the mind which distinguishes the members of one category of people from those of another” (p. 389). The members of a group interacting for a certain period of time share assumptions, values, and artifacts, which in turn induce culture
Culture, then, defines structures and systems, guides management processes, impacts work-unit climate, and, ultimately, affects organizational performance.

Researchers studying national culture have developed various frameworks to understand cultural differences and have added important contributions to the cross-culture literature (Hofstede 1984; Triandis 1989). For example, Hofstede (1984) introduced several cultural dimensions, such as power distance, collectivism, masculinity, long-term orientation, and uncertainty avoidance. These frameworks have been frequently applied and explored by other researchers in the behavioral and cultural literature (Earley 1993; Gelfand et al. 2006; Lee and Peterson 2000; Marino et al. 2002; Swierczek and Ha 2003; Wheeler 2002). Among various cultural dimensions suggested by Hofstede (1984; 1991), long-term orientation is defined as “the degree to which people’s actions are driven by long-term goals and results, rather than the short-term need for immediate gratification” (Ardichvili and Gasparishvili 2003, p. 32). This dimension is also called “Confucian dynamism”, which refers to the long-term versus short-term orientations in life that appear to differentiate Westerners from Easterners. For example, East Asian countries such as China, Korea, and Hong Kong ranked the highest in the long-term orientation index while Western countries such as the United States and Canada were ranked relatively low (Hofstede 1991). This cultural dimension has been dominant traditional value in East Asian societies and still provides significant influence to East Asian employees.

Karn (1979) and Hofstede (1991) noted that the economic success of the Eastern during 1960’s and 1970’s could be attributed to common traditional cultural values and this has generated a competitive advantage for successful business activity. Based on this
notion, we argue that long-term orientation based on Confucianism positively influence on organizational performance. For example, Franke et al. (1991), in a study of economic growth in 20 countries over a 20 year period, found that high levels of long-term orientation were associated with fast economic growth in Asian countries. Franke et al. (1991) also suggested that Confucian dynamism is associated with national economic growth rates. This Confucian dynamism emphasizes the dynamic rather than the static values traditionally found in Confucianism (Franke et al. 1991). This historical data show a positive relationship between long-term orientation and national economic growth. In addition, Wang, Farh, and Luo (1999) argued that emphasis on HR practices of long-term orientation will positive influence firm performance. Since national economic growth is an aggregated outcome of each organizational performance within a country, we can anticipate that this cultural value is also positively associated with organizational performance.

In the long-term orientation dimension, there are important sub-elements that provide positive impacts to increase organizational performance. First, people in the long-term orientation culture are willing to subordinate themselves for an organizational purpose (Hofstede 1991). This collective oriented mindset requires a value that individuals sacrifice themselves for collective goals even in difficult situation and moment, and leads employees to attach to the organization as a form of long-term commitment. Second, people in long-term orientation culture respect for social and status within limits (Hofstede 1991). This cultural value leads employees to admit limited resources within current organization and to work hard in order to overcome this limitation. Third, long-term orientation emphasizes thrift, being sparing with resources
(Hofstede 1991). As a result, employees within long-term orientation culture traditionally regard thrift behavior as desirable to organizational success, and this collective attitude generates more opportunity to increase organizational performance.

**H2: Long-term Orientation perception based on Confucianism provides positive impacts to create more opportunities to increase organizational performance.**

The Mediating Mechanism of Entrepreneurial Orientation

We expect that employees’ perceptions of EO will be an important mechanism through which the predictors in the theoretical model (employees’ perceived transformational leadership and long-term orientation) influence organizational performance. We discuss these mediation propositions below by first considering the relationships between the two predictors and EO, and then the relationships between EO and organizational performance.

**Transformational Leadership and Entrepreneurial Orientation.** Entrepreneurial organizations generally have small number of employees compare to matured organizations. In this organizational context, leaders seem to be able to create organizational culture more prominently than large and matured organization (Schein 1992). Moreover, success of small business clearly depends upon leaders’ innovative business idea and their strong desires to implement business (Yukl 2005). Leaders not only choose the basic mission and the environmental context where the employees will work, but they also choose their employees who will implement the leaders’ business idea (Schein 1992). Therefore, leaders of entrepreneurial organization position themselves as an influential source of shaping organizational culture.
Transformational leaders appeal to their followers by getting them to accept a higher vision and exert themselves to accomplish that vision (Burns 1978). In an entrepreneur context, transformational leadership behaviors include articulating and presenting a clear vision for the new business opportunity, showing passion and enthusiasm for implementing the business idea, inspiring employees to align with the organizational goal by helping them understand the reasons for pursuing its business and the opportunities that the new business idea can generate, challenging employees to reexamine their assumptions and question old ways of doing things, and being sensitive to the needs and concerns of employees (Bass 1985).

From the leadership perspective, there are recent papers that explain the relation of transformational leadership with entrepreneurship (García-Morales et al. 2006) and innovation (García-Morales, Matías-Reche, and Hurtado-Torres 2008). I further argue about how the sub components of transformational leadership positively influence employees shaping high level of entrepreneurial culture (EO). There are several reasons why transformational leadership behaviors are likely to influence EO. First, transformational leaders have been shown to inspire and intellectually stimulate others to act in innovative ways (Burns 1978; Richer and Vallerand 1995; Yukl 2005), which will predispose their employees to be generally more receptive to innovative culture suggested by the leaders. Gumusluoglu and Ilsev (2009) found that transformational leadership positively related to organizational innovation that was measured with a market oriented criterion developed for developing countries and newly developing industries. Their finding suggests that there is a strategic link between transformational leadership and innovative culture within EO. In addition, Victor et al. (2008) suggested
that transformational leadership, in general, positively affects innovative behavior. Thus, transformational leadership would create innovative organizational culture. Second, transformational leaders generate enthusiasm on the part of employees and confidence that they can successfully implement immature business ideas and potential business opportunities (Bass, 1985). This is also likely to lead to employees having a more positive perception of the leader’s proactive attitude, because the entrepreneurial organization transforms its previous identity toward leader’s value, and thus employees within the organization will be able to fully identify their value with their leader’s one. This “organizational identity transformation” will lead organizations to shape proactive business culture within entrepreneur firms. Third, transformational leadership has been shown to relieve anxiety and induce positive emotions in followers (Bono & Ilies, 2006; Rubin et al., 2005). This will also influence the extent to which employees become more tolerant toward the potential risks and thus shape the positive emotion to take any internal and external risk against their job. If leaders do not successfully create the organizational culture, entrepreneurial organizations are exposed to risky environment and can not survive in a long run (Schein, 1992). As a result, leaders of small business have strong responsibilities to risk taking and continue to make their business profitable. This risk taking attitude of leaders should be successfully embedded in organizational culture where their followers are also willing to take risks. In summary, transformational leadership will positively influence to shaping innovative, proactive, risk-taking organizational culture.

**Long-term Orientation and Entrepreneurial Orientation.** We argue that employees’ long-term orientation perception based on Confucianism is positively related
to employees’ EO perception. Some of the successive studies with Hofstede’s (1991) framework tried to link the long-term orientation with entrepreneurial behavior. Although Hofstede (1991) did not specifically discuss about EO, his theoretical perspective on entrepreneurship suggested implicit insights for understanding national culture influence on EO. For example, countries with long-term oriented cultures (e.g., China, Taiwan, and Korea) seem to be generating more individuals with high entrepreneurial behaviors (Hofstede 1991; Ardichvili and Gasparishvili 2003). According to Hofstede (1991), the values at the long-term orientation are very Confucian oriented and supportive to entrepreneurial activities. From the East Asian perspective, Confucianism value provides subtle but significant influence on East Asian people’s work and life. Given this unique cultural value of long-term orientation, we propose a strategic linkage between long-term orientation and EO.

One of key principles of Confucian teaching is the virtue with regard to one’s tasks in life consists of trying to acquire new skills, focusing highly on education, and working hard (Hofstede 1991). For example, Korean and Chinese people heavily value on developing their educational background and acquiring new knowledge and skills. Moreover, East Asian entrepreneurs tend to generate creative and innovative idea based on their previously acquired knowledge and skills (Einhorn 2007). In addition, Lin (2009) empirically suggested that long-term orientation is positively related to innovation among major automakers in 14 countries. These proactive and innovative approaches emphasize the dynamic rather than the static values traditionally found in Confucianism (Franke et al. 1991). As a result, dynamic and future-oriented natures of Confucian value are relevant to enhance innovative and proactive culture among East Asian entrepreneurs.
(Allred and Swan 2004; Lin 2009; Nakata and Sivakumar 1996). Second, being patient and pursuing of whatever goals are essential assets as an entrepreneur (Hofstede 1991). Since Asian entrepreneurs keep the core value of persistence tenacity, they are willing to take any internal and external risk and develop their creative business idea into real service and product. These Confusion values will make entrepreneurs take any potential risk. Given this, entrepreneur firms based on long-term orientation tend to take innovative, proactive, and risk taking approaches in order to survive in severe competition. Therefore, employees’ long-term orientation perception based on Confucianism positively influences to their EO perception.

Entrepreneurial Orientation and Organizational Performance. According to Schein (1992), organizational cultures are basically shaped from three sources; “(1) the beliefs, values, and assumptions of founders of organizations; (2) the learning experiences of group members as their organization evolves; and (3) new beliefs, values, and assumptions brought in by new members and leaders” (p. 211). Schein (1992) points out that organizational performance effects are more likely to occur as a result of cultural values and beliefs that are accepted by organization members and that therefore guide their actions.

Previous research has demonstrated a significant relationship between EO and organizational performance (Covin and Slevin 1989; Covin and Slevin 1991; Naman and Slevin 1993; Rauch, Wiklund, Lumpkin, and Frese 2009; Zahra and Covin 1995). There are several conceptual and empirical literatures in favor of a linkage between EO and both individual and organizational performance (Block and MacMillan 1993; Covin and Covin 1990; Covin and Slevin 1991; Pearce, Kramer, and Robin 1997; Wiklund 1999).
The association between EO and high performance has led many firms to consider EO an important factor for success (Chadwick 1999; Rauch et al. 2009). In this study, we mainly focus on employees’ believes on their future organizational performance (Swierczek and Ha, 2003). Since there are various factors that directly and indirectly influence organizational performance and various measurement approaches on firm performance (e.g., revenue, net profit, and return of investment), it seems to be controversial to argue that EO is the most important and direct factor for improving organizational performance in general. However, the relationship between EO and employees’ believes on future organizational performance can be investigated with fairly objective approach. Given this, Swierczek and Ha (2003) designed measurement items that investigate employees’ perceived level of importance on their organizational performance. Covin (1991) also suggested that non-financial data can be used in entrepreneurship study to investigate the employees’ and managers’ perceptions towards the organizational performance because there is a strong correlation between financial and non-financial data.

In summary, our arguments in this section suggest that in addition to the direct effects of transformational leadership and long-term orientation on organizational performance, discussed in earlier sections, these factors will also influence organizational performance through their impact on EO. In other words, EO will partially mediate the positive relationship between transformational leadership and organizational performance, and partially mediate the long-term orientation and organizational performance.

**H3:** Employees’ entrepreneurial orientation perception partially mediates the positive relationships between transformational leadership and organizational
performance; such that transformational leadership is positively related to employees’ entrepreneurial orientation, which in turn is positively related organizational performance.

H4: Employees’ entrepreneurial orientation perception partially mediates the positive relationships between long-term orientation perception based on Confucianism and organizational performance; such that long-term orientation perception based on Confucianism is positively related to employees’ entrepreneurial orientation, which in turn is positively related organizational performance.

Methods

This empirical study was conducted at three entrepreneur companies that currently operate in Korea. In order to maintain the external validity, we controlled employees’ demographic characteristics and chose functionally similar companies. We invited employees in entrepreneur companies to participate in the study. Employees from all entrepreneur companies that were potentially impacted by the national culture participated in the study.

Research Design

The study utilized a non-experimental (naturally occurring) research design and individual level of analysis. Employees reported on their perceived transformational leadership and long-term orientation. In addition, employees reported on their perceptions of EO and organizational performance. In order to reach participants more easily, we collected the survey data through the web-based survey in which each participant was
assigned a unique ID number that safeguarded the individual’s confidentiality of their responses. Employees’ perceptions data formed the analysis in the study.

Participants

We sent out invitation e-mails to 480 employees which resulted in 178 employees (37.1% return rate) included in the study. We also collected data on gender (89.4% male), age (mean = 36.5), highest education level (65.7% with a Bachelors degree or higher), organizational tenure (75.0% less than 5 years, 21.6% between 6 and 15 years, 3.4% greater than 15 years), and tenure in current position (61.9% less than 2 years, 38.1% greater than 2 years).

Measures

Long-term Orientation. Bearden, Money, and Nevins’s (2006) 8-item scale was used to assess long-term orientation. Participants rated their long-term orientation perception on a 5-point scale ranging from 1 (strongly disagree) to 5 (strongly agree). Sample items for long-term orientation include “Respect for tradition is important to me,” “I don’t mind giving up today’s fun for success in the future,” “I plan for the long term,” and “Traditional values are important to me” (alpha = 0.83).

Transformational Leadership. Transformational leadership was assessed using 12 items from Podsakoff, MacKenzie and Fetter (1990), whereby participants rated the leadership that their supervisors displayed within entrepreneur companies. These items represent four sub-dimensions of transformational leadership: charisma/vision, inspiration, intellectual stimulation and individual consideration. Sample items for each of these dimensions respectively are: “My boss has a clear understanding of where we are going”, “My boss inspires others with his/her plans for the future,” “My boss challenges
me to think about old problems in new ways,” and “My boss has ideas that have challenged me to reexamine some of basic assumptions about my work,” (alpha=0.92).

**Entrepreneurial Orientation.** Covin and Slevin’s (1989) 9-item scale was used to assess Entrepreneurial Orientation (EO). For each item the two end-points are briefly defined. Participants selected the number, from 1 (at one end) through 9 (at the other end) that best describes these business practices. Sample items for EO include “In dealing with its competitors, my firm typically initiates actions to which competitors then respond,” “When confronted with decision-making situations involving uncertainty, my firm typically adopts a bold, independent posture in order to maximize the probability of exploiting potential opportunities”, and “In dealing with its competitors, my firm typically initiates actions to which competitors then respond” (alpha = 0.90).

**Organizational performance.** Swierczek and Ha’s (2003) 7-item scale was used to assess organizational performance. Participants rated the level of importance that they attach to the factors as enterprise objectives, from 1 (not important at all) through 5 (very important). Sample items for organizational performance include “High revenue,” “Innovative leadership”, “Business stability,” and “Contribution to the community development” (alpha = 0.86).

**Control Variable.** Since some respondents in the study were both managers and employees reporting to their leader, we controlled for status (manager or employee). In addition, we controlled for educational background, because employees who have a higher educational background may perceive and response to the national and organizational culture differently to those who have a lower educational background. Controlling these variables, we were able to capture robust empirical relationships.
Analytic Approach

It is not easy to objectively capture and measure the aspect of culture in a context of country because there is an inherent heterogeneity within a country’s culture. It seems to be irrelevant to apply the homogeneous cultural characteristics on the entire country, because cultures can be significantly different from each other even within a single country. As a result, Hofstede’s work (1980) has been criticized for many of its conceptual and methodological issues due to the inherent heterogeneity within cultures (Parboteeah et al. 2005). In order to solve these issues, we needed to assess these cultural variables at the individual perceptions for capturing relevant data from the sample. Fortunately, there is several literature measured national culture at individual level (Earley 1993; Kirkman, Chen, Farh, Chen, and Lowe 2009; Wheeler 2002). Therefore, we also investigate national culture characteristics from individual perceptions.

Results

Table 1 shows the descriptive statistics and bivariate correlations for all study variables. Hypothesis 1 predicted that transformational leadership would be positively related to organizational performance. As shown in Table 2, transformational leadership was directly and positively related to organizational performance ($\beta = .17, p < .05$). Hence, Hypothesis 1 was supported. Hypothesis 2 predicted that long-term orientation would be positively related to organizational performance. As shown in Table 2, long-term orientation was directly and positively related to organizational performance ($\beta = .32, p < .001$). Hence, Hypothesis 2 was supported.
In order to analyze mediation effects of EO, we applied Baron and Kenny’s (1986) causal steps methods. Hypothesis 3 predicted that entrepreneurial orientation would partially mediate the relationship between transformational leadership and organizational performance. Specifically, we expected that transformational leadership would be positively related to entrepreneurial orientation, which in turn would be positively related to organizational performance. To test this hypothesis we first tested the relationship between transformational leadership and entrepreneurial orientation. The results of this analysis are shown in Table 3. As predicted, transformational leadership was positively related to entrepreneurial orientation ($\beta = 24, p < .01$). Next, we tested the relationship between entrepreneurial orientation and the organizational performance. However, entrepreneurial orientation was not positively related to organizational performance ($\beta = -.01, p > .05$). Thus, the effect of transformational leadership on organizational performance is somewhat mediated through entrepreneurial orientation. This analysis partially supports for Hypothesis 3.

Next, we tested the mediating effect of entrepreneurial orientation on long-term orientation and organizational performance. Specifically, we expected that long-term orientation would be positively related to entrepreneurial orientation, which in turn would be positively related to organizational performance. To test this hypothesis we first tested the relationship between long-term orientation and entrepreneurial orientation. The results of this analysis are shown in Table 3. Unfortunately, long-term orientation was not positively related to entrepreneurial orientation ($\beta = .10, p > .05$). Thus, we were not able to conclude that the effect of long-term orientation on organizational performance is
mediated through entrepreneurial orientation. This analysis does not support for Hypothesis 4.

**Discussion**

The purpose of this paper was to identify important leadership and cultural antecedents to employee perceptions of EO, to find the impact of such perceptions on employees’ beliefs on the future organizational performance. We proposed that perceived EO mediates the relationship between employees’ perceived transformational leadership and organizational performance, and between employees’ perceived long-term orientation and organizational performance. Therefore, our research on leadership and cultural matters provides an additional contribution to the leadership, national culture and EO literature. We discuss the implications of our theoretical arguments below, and also discuss the suggestions for future research.

**Theoretical Implications**

This research provides several important theoretical implications to the leadership, national culture and EO literature. First, we investigated that transformational leadership plays an important role in shaping employee perceptions of EO. In spite of strategic importance of transformational leadership in entrepreneurial business, there were limited literatures explaining the relationship between transformational leadership and EO. In this paper, we found that employees whose manager exhibited more transformational leadership had more positive perceptions of EO and help improving organizational performance. We believe that our paper will invite further fruitful arguments on leadership study in entrepreneur business.
Second important implication is that our finding leads us to consider national culture perceptions as a direct predictor for organizational performance and EO. After Knight (1997) suggested EO possessing high cross-cultural reliability and validity, many researchers attempted to investigate and explain the cultural impacts on EO. However, there are still various counter arguments exist in this area. In this study, we clearly suggest that long-term orientation is key factors influencing organizational performance. Although we failed to find a direct relationship between long-term orientation and EO, we found that high long-term orientation stimulates organizational performance.

**Managerial Implications**

This study also has important practical implications for understanding cultural differences in entrepreneurial firms. East Asian entrepreneur companies having long-term orientation and strong transformational leadership tend to increase employee’s belief on the high organizational performance. This study also has important practical implications for understanding leadership and culture impacts in entrepreneurial firms. Practitioners should understand the importance of transformational leadership in shaping strong EO. It is also important to understand the practical relationship between long-term orientation culture and organizational performance. When transformational leaders suggest the long-term vision for their business, employees take the responsibility of actualize the suggested vision. In this paper, we argued that organizations whose founders exhibiting more transformational leadership create more strong organizational culture (EO) and this might eventually help improving organizational performance.
Limitations and Future Research Directions

Despite the theoretical and practical contributions of this study, it is not without limitations. First, organizational performance may not be a single factor that represents a fast economic growth. However, we believe that it is clearly one of the most important factors. Besides organizational performance, other factors such as government policies and collaborative teamwork between all economic actors should be considered as important factors that accomplish remarkable economic growth in a short period of time. For example, Lee and Peterson (2000) noted that economic, political, and social factors moderate the relationship between culture and EO. Thus, Future research might broaden potential micro and/or macro contributors for overcoming the economic crisis. Second, this study is based on a correlational research design which makes it difficult to establish the causal relationship between the variables. However, given that transformational leadership and long-term orientation are generally agreed as predicting variables in the organizational study, it is likely that it is the causal variable that impacts employee responses in the model. Future research might use longitudinal analysis to explore how employee perceptions of leadership and culture and its consequences change over time. Third, while we focused here on cultural impacts on organizational performance, future research might examine other meaningful ways to investigate cultural interaction impacts. One fruitful area for future research is to examine whether long-term orientation and uncertainty avoidance are related, either directly or indirectly to other important outcomes. For example, long-term orientation might be moderated by uncertainty avoidance and thus mitigate the positive relationship toward organizational performance. These East Asian cultural values seem to generate some psychological tensions among
employees. Therefore, it would be valuable to investigate the interaction relationship between them long-term orientation and uncertainty avoidance. As we mentioned earlier, there are still limited studies on the relationship between leadership, national culture and EO. We hope that this study will stimulate successive leadership, national culture and EO researches.

**Conclusion**

This study adds to our understanding of how East Asian entrepreneur organizations achieved significant economic growth overcoming tremendous crisis and how employee responses on EO vary for employees within cultural and leadership contexts. We shed light on leadership and cultural factors that influence EO, and the impact of EO on organizational performance. Our arguments clearly argue that both transformational leadership and long-term orientation positively influences organizational performance and that EO partially mediates these theoretical relationships. We hope that this study will promote future research related to how employee responses to EO develop and how these responses differ among different cultural contexts.

The Study of Entrepreneurial key-factor in Taiwan Craft Creative Industry

Yen-Dan Lin  
Chao-Shiang Li

Abstract:
Taiwan has been advocating cultural creative industry since 2002 and craft creative industry has become one of the key industries promoted by the state. In the 2008, the sales and number of firms of Taiwan Craft Industry at top of all Culture Arts category industry. Craft Creative Industry is the more maturely developed among Taiwan Arts Industries. In this study, we conduct interview of 15 executive and entrepreneurs in craft creative industry. The Outline with the key factors of Craft Creative Industry is as following: Venture attitude of business founder and individual business, Entrepreneurial activity, Entrepreneurial aspirations and Entrepreneurial framework conditions (EFCs). From this research, we would present the conclusion of the success mode of craft industry and future research direction of creating craft industry, the management implication and suggestions in industrial policy.

Key Words: Taiwan Craft Creative Industry, Entrepreneurial Key Factor, Entrepreneurial Management

1. Forward

The development of the craft industry in Taiwan has a very long history. However, with the global economic structure changing, the craft industry has gradually shifted from the manufacture industry of mass OEM production and exports in early days to an art industry featuring local cultures embodied in the products with tremendous meaning of the change of times and a profound impact on the development direction of the industry. Since Taiwan initiated the cultural and creative industry promotion and cultivation policy 2002, the craft industry has always been one of the key industries to be promoted by the country. Taiwan has injected huge manpower and resources to include the craft industry as one the 13 cultural and creative industries and a key area of development for the country. However, the lack of the conceptions of comprehensive marketing and high added value on the part of the players-be them the operators making transformation or the newcomers - in the
craft industry in Taiwan makes the adequacy of their entrepreneurial ability an issue to be tested especially given that past studies on craft tend to focus on the artistic, esthetic cultural and historic aspects with little promotion of studies on the emerging craft industry.

2. From tradition to innovation: the craft creativity industry

With the unfolding of the Industrial Revolution in modern times, besides the manually produced “handicraft”, craft is called “Industrial Art”, “Mechanical Art” and “Technical Art” if processed by machines. The delicacy and deep cultural content of the crafts made by hands is being replaced by a great variety of articles produced by machines in large quantities (Zhuang & Xu, 2002.). In mid-19th century, the “Arts and Crafts Movement” in the Great Britain was instigated and inspired by John Ruskin and William Morris who did not but into the products mass-produced by machines. The movement flourished and spread across Europe. In Japan, Yanagi Soetsu initiated the “Folk Craft Movement” in 1926 for collection and preservation of crafts made by the folks. In Taiwan, Yen, Shui-lung is the person dedicated to the development of the art of handicrafts. It is apparent that crafts are closely related with the human life and cultural quality and a form swinging between art and commerce. The development of the craft industry is divided into 4 stages in Taiwan:

(1) 1945-1960

The labor force in Taiwan was exuberant during this period. The craft industry was dominated by handicrafts produced for everyday living purposes with close relevance to the general public life. The craft industry in Taiwan during this period was one of the industries actively supported by the government. The craft industry, characterized by low costs, labor-intensiveness and excellent skills, powered the post-war economic development of the island.

(2) 1970~ mid 1980s

The government continued to develop the handicraft industry and came up with two ideas: the “moderate wealth plan” and the “living room factory”. From that time to mid-1980s, part of the home-type OEM businesses had transformed into the model of small or medium-size processing factories to expand operation, marking the full
bloom period of Taiwan crafts exports. However, due to domination of the OEM model of the craft industry and replacement by the cheap and mass-produced plastic products after industrialization, the craft industry in Taiwan had an increasingly weak link with everyday living and finally became alienated from the life experience of consumers (Hsu & Yang, 2009).

(3) Late 1980s:

Impacted by exchange rate deregulation and appreciation of NT dollars, and competed by the cheap labor force of Southeast Asian countries and mainland China, the Taiwan’s craft exports was hard hit and lost its competitive edge with the scale shrinking as a result of industry outflows. The craft industry in Taiwan, unable to transform from the OME to the design business model, shrank rapidly. Meanwhile, the major diplomatic setbacks suffered by the country made many an intellectual turn to embrace the indigenous culture and arts. Against such a backdrop, many traditional crafts turned out to become the focal point of the art community. Some of the tradition-adhering craftsmen began to shift to a delicate artistic style with small quantities produced, forming a new wave of folk craftsmanship.

(4) 1990~present:

Cultural and spiritual activities had become an important part of the people’s life in Taiwan in 1990s. The craftsmen have always focused on honing their own skills and many polices were made to encourage and support traditional arts with a view to preserving and promoting the beauty of traditional crafts. The government has also provided incentives to culture and art, organized craft competitions and encouraged crafts creations to elevate the status of the art workers. The distribution channels of the crafts have shifted from the general daily supply market to the specific art market. The crafts in Taiwan has transformed from a production activity to an art creation one. The ideas of “integrated community development” and “industrialization of culture and culturization of industry” were proposed by the Council of Culture Affairs (CCA) in 1993 and 1995 respectively to arouse local awareness and discover the roots of traditional arts and culture through efforts to revive local cultural presence to confer more local cultural features to the crafts industry in Taiwan.

In the beginning of the 21st century, culture and knowledge related industries
have brought about new economic opportunities for all the countries. Taiwan at this point has launched the cultural and creative policy to include the crafts industry with an expectation that the industry, with artisticity and practicality would be rejuvenated in an environment where spiritual life and cultural quality are being emphasized.

3. The status quo and challenges of the crafts industry in Taiwan

According to the 2009 “Taiwan Cultural and Creative Annual Report” (Ministry of Economic Affairs, 2009), the craft industry has the largest number of businesses; however, there is no statistics on the people working in the industry. For the operation model, most businesses are individual workshops or simple home-type establishments rather than the larger size companies that can adopt modern management models. Simply structured, these businesses are not in an urgent need of modern financial management skills, making the increase of business relatively difficult. The people working in the craft industry tend to adopt the form of individual businesses and few operate their business as a company or corporate body. Generally speaking, the crafts industry in Taiwan is growing steadily with numerous retail businesses and better export performance for manufacturers. Despite better performance improvement for the corporatized organizations, small and medium size enterprises still dominate the crafts industry in Taiwan. The economic benefits increase with the degree of urbanization, showing uneven development of the crafts industry among different regions and the need for subsequent reform of operation strategies.

The second phase of the Cultural and Creative Industry Development Plan (2008 to 2013) is based on the ideas of “local esthetics and global vision” and actively promotes the construction and marketing of the core values of the crafts which cover both the cultural and industrial values to inspire the public to observe culture and art in their lives and uplift the esthetic upbringing and quality of the people for the sustainable development of the crafts industry in Taiwan. The two strategies of Crafts Industry Flagship Plan including “Innovative R&D Design” and “Marketing Channels Expansion”, the 3 Action Proposals as well as the 11 Key Point Plans are developed based on the Phase 2 plan (Chart 1).
Related studies show the following characteristics of the structure of the crafts industry in Taiwan (Ministry of Economic Affairs; Chang, 2009):

(1) Majority for retailers and mostly exports for manufacturers

To compare by industries, it is evident that retailers take up the majority of the craft industry in Taiwan. However, the crafts manufacturers that are at the core craft industry have the best performance in exports, an evidence of the uniqueness and international marketability of the crafts made in Taiwan.

(2) Majority of all and medium-size businesses and prevailing proprietorship

In addition, for the entire crafts industry, businesses with capitals less than 10 million NTDs take up 96% of the businesses in the industry, an evidence of majority of all and medium-size businesses in the crafts industry; the analysis of the organizational structure shows that the proprietorship-type manufacturers have the largest number with the percentage of 69%; the sales structure tells a similar story that revenues of the businesses are mostly under 5 million NT dollars.

(3) Long history and strong growth potential of the industry

Most of the businesses covered by this study have been operating for more than 10 years with a stable economic performance, an evidence of strong growth potential of
(4) Geographical distribution related to urbanization

The number of the crafts businesses is about 20% of the total number of cultural and creative businesses in all the counties and cities, an evidence of the important role of the crafts in the cultural and creative industry today. And the crafts industry in the cities of Taipei and Kaohsiung has a better performance on the average while the more distant eastern region and offshore islands are seeing the decline of the industry as a whole, an evidence of proportional relation of crafts industry with the urbanization of the cities.

Generally speaking, the crafts in Taiwan is growing steadily, however, there is still a room for growth in terms of both the total industry scale and economic performance, the weakness in each aspect has to be adjusted and improved to broaden and deepen the development of the crafts industry. Except for the few larger businesses that can apply the modern operation model, most businesses are individual studios or home-type establishments with very simple structures and no urgent need for modern financial management frameworks, making business growth relatively difficult.

4. The entrepreneurial experience and GEM theory structure

Why do entrepreneurs start businesses? What makes them do so? Since motivations are the factors that trigger entrepreneurial behaviors, how to inspire young people with entrepreneurial potentials to be engaged in the entrepreneurial activities and how to develop a social environment that fosters entrepreneurial motivations are important issues for the development of an entrepreneurial society and realization of entrepreneurial management activities. Timmons (1999), a well-known expert of entrepreneurial management in the U.S. suggested the three factors of success in the development of new businesses to be “opportunities, resources and teams”. In terms of the content of entrepreneurship, Shane & Venkataraman (2000) argued that an entrepreneurial activity must include the consideration that “factors of how, who and what would influence the discovery, assessment and use of opportunities” and therefore asserted that the studies on
entrepreneurship should focus on “the sources of opportunities”, “the process of opportunities discovery, assessment and use” and “the individuals discovering, assessing and using opportunities”. Dollinger (2003) suggested the three main characteristics of entrepreneurship to be “innovation and creativity, integration of resources and establishment of economic organizations and opportunities and ability to grow amid risks and in uncertain conditions”. To sum up, factors affecting the early success of businesses include: external conditions; management capabilities of entrepreneurial teams such as experience, expertise and teamwork; entrepreneurial management capabilities.

As entrepreneurial activities are closely related with national economic development (Acs & Szerb, 2007), understanding the conditions of entrepreneurial activities and the ways to enhancing entrepreneurship is a very important issue. Entrepreneurial activities are the spring of national economic development and can contribute to economic growth if they are vibrant. However, entrepreneurial activities are not like large or well-established businesses which can be measured with concrete ways and statistics. The surveys and studies on the new and potential entrepreneurs, therefore, are scarce. The Global Entrepreneurship Monitor (GEM) was formed against such a backdrop. The GEM surveys are a national-level entrepreneurial framework jointly developed by many international entrepreneurial scholars and practical experts, which deals with the impacts of entrepreneurial activities on job creations and economic growth. The system includes the social, cultural and political contexts, entrepreneurial framework conditions (EFCs), and related factors with a particular focus on the surveying of the conditions of early entrepreneurial activities (Chart 2).
5. Key entrepreneurial factors of crafts creative industry

This study conducted in-depth interviews with executives of businesses in the crafts creative industry, entrepreneurs facilitated by the Small and Medium Size Business Innovation Incubation Center and individuals aspiring to be engaged in the crafts creative industry. The reviews on the aspects of entrepreneurs, industry and policies based on the GEM theatrical frameworks such as attitudes, activities and aspirations entrepreneurial framework conditions (EFCs) are as follows:

(1) Attitude: opportunities and abilities

1. The crafts industry attaches importance to the ability of the customers to appreciate the artistic beauty and values of its products. The industry guidelines proposed by the operators in the crafts industry must be able to elevate the esthetic quality of the people on the crafts so as to appreciate the delicate crafts culture through the influence of competent government...
agencies.

2. Effective reduction of the defect rate of the products is the utmost issue for the crafts industry. The imperfections of crafts dramatically increase operation costs. To lower the impact of defect rate on the maturity of the product skills, the operators must be fully prepared.

3. It is necessary to strengthening the service spirit by education. Students at schools must be taught the service spirit of creating values for others and build others. The intent of businesses of helping others to do good things will generate something valuable in return and even enable them to do mass productions to become industrialized.

4. Lack of efforts on self-branding to increase consumer acceptance of the craftsmen in Taiwan.

5. The issues of ageing of wood sculptors and the possible cease of succession must be seriously addressed. It is therefore necessary to increase job opportunities for current craftsmen and foster a new generation of wood sculptors with the vocational education system.

6. It is necessary to improve the knowledge of the operators in marketing, financial management and enhance the circulation of local craft products.

7. It is necessary to improve the ability to explore the domestic and international markets.

8. The issue of lack of studies on the characteristics of indigenous cultures must be addressed.

9. The difficulties of finding distribution channels for local micro-type studios must be overcome.

10. The lack of product development and production that meets the modern life needs remains an issue to be resolved.

11. For the crafts education system issue, the basic crafts creative education should be incorporated into the compulsory education.

12. The key concepts of revive the crafts: taste (the integration of esthetics and life), industrialization (realization of techniques and productivity) and marketing (strategic expansion of markets and creation of new markets).

(2) Activities: initial period, growth period and withdrawal

1. The cultural and creative industry is faced with the image issues of branding and business commitment. Powerful government intervention is needed to reduce the problems and remove the obstacles of distribution and the marketing.

2. The challenges of brand ageing, transformation and innovation are present.
3. The development of the crafts in Taiwan today should not be limited to the art of “handicrafts”. It is necessary to add fashion elements to the crafts to expand vision to the design level and combine the “marketing”, “strategic exhibitions”, and “mass production” to form the “industrial chain”.

4. The operators may lose their competitiveness and withdraw from the market as a result of changing economic environment.

(3) Aspirations: innovation and values

1. The people are lack of aesthetic awareness in life.

2. The crafts industry has been challenged by the imports of the products from mainland China and Southeast Asian countries. The issue is even aggravated as it is very easy to pirate the design ideas. However, despite the easiness of copying of the product outward appearance, the operators all pointed out that the proprietary core techniques possessed by their businesses were not easy to be copied and distinguished their products from the copycats in terms of quality. Furthermore, different positioning of products is for consumers with different buying motives.

3. The crafts are being increasingly polarized with one direction being the mass-produced vessels for daily use purposes and the other the art crafts for visual appreciation purposes. The latter seem to present themselves as an art creation which is to be treated with respect and not to be tampered with, alienating themselves from the consumers who stress the practical use of crafts. The mass-produced vessels used by the general public return to the original purposes of the crafts, however create a fear that the artistic and aesthetic experience would be ignored or lost.

4. The expansion of the domestic market can be achieved by education. The popularization of the cultural and creative products in the life of the general public starts with the environment, government offices, designs and posting of promotion literatures, street furniture improvement, or even the improvement of the road works, etc. The designs of the government building materials and creative plastic bags can be provided to the production units to enhance the things seen in everyday life to beautify the environment.

5. The mentality issue: the importance and values of the crafts, cultural acceptance and environmental sustainability awareness and the crafts spirit promoted and
respected by the life crafts movement.

(4) EFCs

1. The limited economic scale of the domestic market necessitates government assistance in integrating resources to explore the international markets.
2. Adequate funding is required for maintaining normal operation. In most cases, an entrepreneurship will be in loss at the beginning and it takes time to break even and then become profitable. Without proper financial planning and management, failure is very likely as a result of inability to achieve the financial balance.
3. How esthetics takes deep roots in our education is key to the fostering of talent.
4. The policies must allow a condition favorable to the cultural and creative industry.
5. A cross-agency unit must be established for the promotion of the Chinese culture and introduction of the delicate Taiwan cultural products to the Chinese markets for greater acceptance.
6. The government units stationed abroad must be integrated to assist the businesses with the distribution channels to sell the brands from Taiwan.
7. The cultural messages contained in the products can be promoted abroad through the power of penetration.
8. It is necessary to build an industrial system complete with the upstream, midstream and downstream.
9. Copyrights and patent must be protected and operators should be encouraged to innovate and develop products. The inadequate protection of intellectual property rights has diminished the possibility of the development and production of quality craft products.
10. Raise of tariffs on imported craft products, provision of low-interest rate loans for business starting and investments and enactment of preferential tax act are recommended.
11. Promotion of the craftsman certification system is necessary.
12. The issue of the lack of a distribution structure to supply popular and high-quality craft products exists.

For the viewpoints to be considered by the operators of the crafts industry, in terms of the entrepreneurial and operating strategies, a two-way approach is recommended. The first strategy is solely based on the Taiwanese culture: (1) the culture of largest ethnic group on the island constitutes the backbone while cultures of other ethnic groups are incorporated. The integration of these ethnic and culture
features provides main elements of crafts designing and production; (2) Instead of being “worshipped” like artists, the so-called traditional crafts should be revived and new techniques and markets should be developed, which will require connection with the “new lifestyle”. (3) At the national policy level, studies must be conducted on why many crafts businesses not supported by the policy incentives turn out to flourish while the even more businesses receiving the “National Traditional Craftsmen” support on a long-term basis end up failing in both technique passing down and product sales. Secondly, the Taiwanese culture should be used on a strategic basis for sharing of tasks across the Strait: (1) Use the Chinese culture as the main elements of craft creation and production by combining of the cultural advantages of Taiwan and the mainland and capitalize on the industrial advantages Taiwan still enjoys; (2) build task sharing model for Taiwan and the mainland. Keep the R&D and marketing decision departments in Taiwan while production activities are carried out in the mainland; (3) broaden the range of crafts related industries for cooperation and even with different industries for promotion of the bigger task sharing model.

6. Conclusion

The Taiwan crafts are a meltpot of aboriginal, Dutch, Spanish, Japanese and Han Chinese cultural elements and have developed as an industry since the 17th century. The crafts in different periods are each has its distinct features, laying a profound cultural foundation and economic growth potential for the current crafts industry in Taiwan. The formation of global economic community and advancement of modern technology have brought about a new wave of industrial innovation to which the Taiwan crafts industry with a long history is of no exception. The government has promoted the cultural development, incorporated the cultural aspect into the crafts, used its resources such as cultural activities, legislations and competition incentives to rejuvenate the crafts and brought a new horizon to the Taiwan crafts. The future development of the Taiwan crafts are divided roughly in two directions: one for the inheritance of traditional culture as the preservation, maintenance and promotion of the traditional crafts; the other for the promotion of the local culture, image shaping of the local crafts and finding new direction of development for the local crafts.

In this study, we proposed future development of the strategy and management recommendations are as following:
(1) Specialization of organization task sharing

The crafts industry in Taiwan is still mainly formed by small and medium size businesses or even individual studios. However, this is no implication of the inability to reach the economic scale. If an industrial chain can be established effectively at the beginning of the entrepreneurship—be it the fineness of vertical task sharing, clustering power of price negotiation coming from the concentration of manufacturers and supply of the production lines—the operators can also expand the production scale and lower the costs and increase profits.

(2) Integration of the industry value chain

For the crafts industry to reach the effective economic scale, the connection of the industrial chain of the crafts industry is very important. The information exchange among the manufacturers requires a stable platform for the information to flow, achieving a relative advantage of lowered long-term average costs. Moreover, in view of the extreme difficulties experienced in the entrepreneurship, the structure of the numbers of years in operation shows a growth bottleneck for the crafts industry during the development process. Not only dose a business need favorable external conditions at the beginning stage, but also a support system to help it get through the difficulties, such as establishing the platform for exchange of the crafts talent, funding and business information and providing the aids to the manufacturers needing support. For the industry to grow steadily, sole reliance on the government support is not the way to go. From an economic perspective, only the fit survive and the weak are eliminated in a freely competing industry. The government should assume the role of the intermediary or matchmaker, not the aid provider to each business. The resources need to be properly applied and allocated.

(3) Development of overseas markets and enhancement of globalization

Both the export revenues and export percentage of the craft products are low in the industry, suggesting the dominance of the domestic market. The data of the industry divided in smaller categories shows that part of the crafts industry in Taiwan, particularly the manufacturers, has an outstanding performance in exports, an evidence that of the international market potential of the Taiwan crafts. The keys to a successful entrepreneurship should therefore include a long-term marketing plan and an emphasis on overseas market development to significantly increase the economic benefits and achieve the purpose of driving the economy with the crafts industry.
(4) Deepened development of the local crafts industry

The crafts industry is one of the few creative industries that are not limited by geographical conditions and instead develop the features. The development of the crafts industry with distinctive features therefore needs to be strengthened and innovation businesses encouraged at the local level. This, however, does not mean all the crafts have to be industrialized but that the craft items possible of industrialization will naturally be industrialized during the development of the crafts industry with local features. If the crafts with local features are to be appointed by the government, it would be to industrialize for just the sake of industrialization, the core cultural features will not be manifest. A cultural product would have no difference from an ordinary industrial product if it can not touch people. The natural and cultural features in each area of Taiwan are distinctive. Since the counties and cities already have the basic industrial structure, they should properly develop the industry to preserve the best part and discard whatever is inappropriate and concentrate all the resources on the most valuable crafts.

The assessment of the productivity of the crafts industry in Taiwan is yet to be established. There are basically three forms of businesses—studios, small and medium size businesses and big corporations in the industry with the former taking up the most manpower, the middle claiming the biggest market share and the latter having the smallest number. The crafts policy under the cultural and creative industry policy should use the production values of the industry as the measurement indicator with the focus placed on culture, art and creativity and the design conceptions as the way of realization. For entrepreneurship, the craft designs should include both the techniques and the artistic and cultural designs. In Taiwan, the concept of craft designs is quite limited to the technical level, just like architecture is classified under the school of engineering instead of the school of design or art, which emphasizes only the safety and practicality of the structures and ignores the esthetics of the art aspect. This study has summarized the key success factors of entrepreneurship for the reference of those who desire to be engaged in the creative and culture industry of crafts. The objective is for the craftsmen who are already working among the general public to improve their innovative design ability and guide the new generation of designers and entrepreneurs to incorporate the crafts and cultural features to maintain the competitiveness and innovation advantages of the crafts industry in Taiwan.

The Study on Art-Culture Industrial Entrepreneurs and their Core Competency

Introduction

Li Chao-Shiang

Abstract:
Culture creative industry development is listed as one of the rising industries in Taiwan. However, as the statistical data of art-culture industry manpower are not available and the challenge of the bottleneck in incubation of talents in present art-culture industry are becoming the underlined worry of entrepreneurship of art-culture industry. The questionnaire survey pinpointed the visionary, musical and performance art, craft and exhibition facilities industries in Taipei, and recovered 253 valid copies. The study analysis of present situation of art-culture industry and studying relating factors affecting art-culture industry entrepreneurial core competency. According to studies, the overall core competency performance is between fair and satisfactory and individual traits are mostly of curious analyst. Background of entrepreneur and the establishment have significant difference in core competency performance, and based on the background factors of entrepreneur individuals and businesses, make prediction of the performance of core competency.

Key Words: Art - Culture Industry, Entrepreneur, Core Competency

I. Introduction

1. Origin of the Research

The Knowledge Economy first proclaimed by Drucker (1966) in last century is now entering the Creativity Economy Era of Howkins (2001). As an indicator for measuring the cultural creativity competitiveness of a country, the soft power of arts and culture has become the base of competitiveness of a country. In order to understand and get hold of the core competence of managers of arts and culture industry, we would like to present the background of research as the following:

(1) Arts and Culture Industry is the main target of the development of present cultural creativity industry

In 2008, Council for Cultural Affairs presented “Cultural Creativity Industry Development 2-Stage Plan” which proclaimed that NT$5.64 billion will be
invested between 2008 and 2011 to carry on promoting of cultural creativity industry (CCA, 2008) which covered fortifying of development of industrial environment, development of crafts and creativity industry and forward of creativity culture park and a sizable fund will be injected into cultivation of arts and culture talents and competence.

(2) Lack of Statistical Data of present Arts and Culture Industry Manpower

There is simply insufficient, if not none, statistical information of art related professional manpower market, and the employment market is vague in its rule and market prices, also these data are not included in culture or human resource statistics. The Taiwan Cultural Creativity Industry Yearbook published by Cultural Creativity Industry Promoting Team of Ministry of Economic Affairs is in its 5th edition but there is still lack of manpower statistical data in visual, music, performance arts and cultural exhibition and performance facility and craft industry, the main source of knowledge and creativity. (MOEA 2009)

(3) Challenge to Present Culture Industry Talent Cultivation

Due to the second renaissance (Naisbitt & Aburdene, 1990) most countries regarded arts and culture talents as the key force in guiding knowledge, creativity and aesthetic economy (UNCTAD, 2008; Naisbitt, 2006; Florida, 2002; Howkins, 2001; Landry, 2000). The demand of business world in MFA is not less than MBA (Pink, 2005), and major colleges have set up departments and schools of arts and culture management, and there are many extended courses offered by formal and informal education institutions. The massive need in extended learning signalize the rapid development of arts and culture and it also market the difference between the needs of industries and the educational system. We shall spell it further as the following:

1. Nurture of Arts and Management Talents are active in respective fields. Since 70s, US education world started to provide arts profession and business administration dual core programs training for students interested in arts and culture industry. It was in late 80s that Taiwan introduced Arts and Culture Management and Administration System, and the employment of professional art administration talents. They were initially nurtured by arts and culture groups through trial and error to cultivate talents to meet their needs. The arts administration and management has just risen with short history with limited base in talent nurture and it leads to gap between supply and demand. In Taiwan, there is lack of comprehensive manpower equipped with both languages of culture and economics and result in barrier of integration and communication of the two fields (Li, 2008). This is also another reason why the arts and culture industry is hard to develop. Overall, between arts management and business
administration, there is not only difference in development history, but also gaps in communication and integration, it is necessary to establish complete flow and exchange as well as practical operation experience (Ping, 2008).

2. Generation Fault of Manpower of Art Workers: between 1970 and early 1990s, the prime mover of Taiwan arts and culture came mainly from art galleries, music and performance groups, and the artists actively cooperating with them. Following the industrial forerunners entering academies to instruct in mid and late 1990, Taiwan Arts and Culture performing drive changed to the younger generation came from college and graduate school since late 1990. Yet, another problem of retention and loss of talents came up. It displayed in heavy loss of middle age talent and retiring of arts worker and difficulty in finding successors; the primary level workers lost the leaders that they could work with and learn from. These have serious impact on the cultivation of manpower in arts and culture industry.

2. Purpose of the Research

In view of the above historical background, for clear view of the core competence and development of Arts and Culture Industry Managers in Taiwan, this Research aimed at 1) Setting up the definition and context of core competence of Arts and Culture Industry Manager, 2) discussing the present reality of manager of Arts and Culture Industry and their core competence, and 3) Analyzing the factors that affect the core competence of managers in Arts and Culture Industry.

3. Scope of Research and Restriction

Arts and Culture Industry as studied in this research include: Visual, Musical & Performance, Exhibition and Play Facility and Craft Industries. Since Arts and Culture industries space distribution and revenue are mostly concentrate in Taipei City and Taipei County (MOEA, 2008), so this research focused on the two jurisdictions, and in proportional sampling principle in sending out questionnaires of 640 copies. The venture core competence of arts and cultural industry managers dealt in this research include General Knowledge Ability, Professional Skill, Administration and Business Management. The core competence of managers of arts and culture industry is concentrate in integral; general and needs based development in our discussion, without covering contents detail or structure of professional skill.

II. Literature Exploration

1. Arts, Culture and New Economy

In years of knowledge economy, the new economy industries originated from culture, art and aesthetic innovation will be the type of industry with the highest
value addition. In 1980s, French sociologist Bourdieu (1984) proclaimed the coming of culture consumption era. For culture industry, Andomo & Horkheimer of Frankfurt School called industrially manufacture of mass produced cultural commodity as culture industry. Throsby (2001) presented Arts Production Model and divided it into commercial oriented, non-commercial oriented and non-art work. While commercial creation aims mainly in cultural value and non-commercial oriented is in cultural value, but both of them are generating economic and cultural value. Arts has surpassed sport competition, human leisure time and money and gained absolute advantage. In 2008, spectator of MLB reached 1.4 billion, but museum took the lead of 8.5 billion (Mondello, 2008). Naisbitt (2006) said that the competition edge focused in the world is education emphasizing technology and arts education. Art is not a product and is not individual culture interest, but has become a life style. It is out of question that culture and art are indeed becoming the display of competitive edge of a country (Chu, 2005).

2. Content of Core Competence of Entrepreneurs of Arts and Culture Industry

Core Competence was first brought up by Prahalad & Hamel (1990) and they defined it as one combination of special skill or technology that can create benefit to customers, creating innovative products, extending market share, produce competition edge, and at the same time they can shape culture and value. Prahalad & Hamel (1994) regarded core competence as a combination of knowledge, skill and ability. Drucker (1995) further pointed out that Core Competence, Organization Environment and Mission is the 3 major elements in business management theory. After surveyed several multinational companies’ executives, Robert etc. (2000) summarized the key capacity of “Global Literacies”. And in this research, the content of core competence is theorized into: 1) Core Competence is integral synergy; 2. Core Competence is result of accumulation of knowledge; 3) Core Competence is a key ability; 4) Core Competence of members of an organization is also representing core competence of the organization; 5) Core Competence is an unique competitive edge; 6) Core Competence covers individual character, knowledge and skill; 7) Core Competence can be improve through training and development. In concluding the above, the key ability required by manager of arts and culture industry in arts and culture creation, execution and service related business are 10 General Knowledge Ability, 2) Professional Skill and 3) Administration and Business Management. In addition, this research combined MBIT personality attribute scale, identifying the preference in life, information collect, decision making and life style of an individual as the reference for studying background of an individual.

III. Design and Conduct of Research
Through exploration of domestic and foreign literatures, the research compiled initial draft of questionnaire and Likert Scale 5-point evaluation was adopted for answering based on fitness of own core competence in the scale from 5 points to 1 points in the sequence of Agreement. After completing interview outline and initial draft of questionnaire, the research adopted key case sampling and select 5 experts and scholars to review. The pre-questionnaire was put through Item analysis, factor analysis and internal consistency analysis (α in general knowledge ability is .897, in professional skill is .888, in administration and business management is .950 and in the full scale is .963). After correction through expert review and pre-questionnaire, the formal questionnaire, the core competence scale has total 47 questions. Please refer to the appendix. Samples of the research are art and culture industry of Taipei City and Taipei County and they were sampled in proportion. Total 640 copies were sent off and 253 valid questionnaire. The design structure of questionnaire is shown in the following Fig. 2.

(1) Individual

In this research, questionnaire recovered mostly from female and in the age group between 25 and 45 years old, education background is mostly college or higher and only 30% of them have international arts and culture education and / or experience. In personal income per month, the largest group is 45 persons (18.3%), between NT$40,000 and 45,000. Disciplines majored are diversified, indicating managers in this industry have high cross-discipline characteristics. Seniority in arts and culture is mainly concentrate in the group of less than 10 years. In personal
attributes, base on MBTI occupational characteristics, scholar is the highest (15.7%), male chauvinist (10.5%) is the next and journalist (10.1%) further next.

(2) Of organization

The recovered questionnaire of this research shows that 202 (71.5%) firms existed for more than 5 years since founding, and most of them have turnover last year less than NT$5 million, consistent with the survey of 2007 Culture Creativity Industry Development Year Book (MOEA, 2008). Total number of member is mostly less than 49 persons, meeting the result of Arts, Entertainment and Leisure Service General Survey of 2006 Industrial, Commerce and Service Industry Survey (Budget, Accounting & Statistics Office, 2007) and of small/ medium business entity. Major products / services are arts creation, exhibition and performance and sales.

2. Analysis and discussion of the present situation of Core Competence of Managers in Arts and Culture Industry

1. In overall perspective: Tend to agree to the core competences listed in this research, with Individual General Knowledge scored highest and the lowest is Marketing Management

2. In General Knowledge Ability Perspective: Individual General Knowledge is most agreed and cultural general knowledge is the lowest.

3. In Professional Skill Perspective: indicating the level of a manager identifying to own arts and culture knowledge profession. In contrast, managers are poorer in the market application profession, particularly in familiarity of arts and culture consumers and employment of new technology.

4. Administration and Business Management Perspective: Managers performs better in innovation management and team coordination, indicating the operation and management of arts and culture industry require innovation and input of manpower. In arts administration and in arts market management, they are poorer and these have impact in the control of domestic environment and in exploration of international market.

### 3. Analysis of personal background factors affecting core competence of manager of arts and culture industry

#### (1) Discussing per perspective

1. **Overall core competence:** This shows significant difference due to difference in personal background of managers in age, highest education, personal monthly income, graduating background, seniority in the business and personal attributes.

2. **General Knowledge Ability:** This shows significant difference due to difference in personal background of managers in age, highest education, personal monthly income, graduating background, seniority in the business and personal attributes.

3. **Professional Skills:** This shows significant difference due to difference in personal background of managers in sex, international education and experience, personal monthly income, graduating background, seniority in the business and personal attributes.

4. **Administration and Business Management:** This shows significant difference due to difference in personal background of managers in age, highest education, personal monthly income, graduating background and personal attributes.

*p<.05, **p<.005, ***p<.001*
(2) Discussing in the variables of personal background

1. **Sex**: not significant in all perspective, indicating that sex has no significant effect on core competence.

2. **Age**: There are significant differences in general knowledge ability, administration and business management among different age groups. Through Scheffe Post Comparison, in administration and business management the group between 41 and 45 years old is higher than group of 26-30 years old.

3. **Highest education**: Different education levels have significant effect on general knowledge ability, administration and business management as well as in full scale. Through Scheffe Post Comparison, it is found that managers with master and doctor degree are higher than those of lower than high-school, master degree managers are higher than college graduate. In overall scale, master and doctor degree managers is higher than college graduate and doctor degree is higher than below high school.

4. **International education / experience**: Difference in International Education and Experience has resulted in significant difference in professional skills. Through Scheffe Post Comparison, it is found that the core competence of manager with international experience is better than those without.

5. **Personal monthly income**: Different personal monthly incomes have significant effect on general knowledge ability, professional skill, administration, business management and in full scale. Through Scheffe Post Comparison, in administration and business management, managers with monthly income of 40000 to 50000 and 70000 to 80000 in NT dollar are higher than those less than 30000, group of 60000 to 70000 is higher than group of less than 40000. In administration, 60000-70000 group is higher than less than 40000. In overall scale, 60000-70000 group is higher than group of 30000 to 40000.

6. Graduating Discipline: Different graduating disciplines have significance difference in professional skill, administration and business management and full scale, but they did not pass Scheffe post test.

7. **Seniority in the field**: Difference in seniority in the field has show significant difference in general knowledge ability and professional skill. Through Scheffe Post Comparison, in general knowledge ability, manager with seniority of 15 to 20 years in the field has higher level of core competence than the one of 5 to 10 years and longer than 20 years is higher than 10 years or less.

8. **Personal attributes**: Difference in personal attributes shows significant difference in general knowledge ability, professional skill, administration and
business management and full scale. After Scheffe Post Comparison, it is found that in general knowledge ability, General and Invention type managers has core competence level higher than Philosophy type; in administration and business management, male chauvinism type, public service and adventurer are higher than philosophy type, general type is higher than journalist, scholar and philosophy types. In overall scale, general type and invention type is higher than scholar and philosophy types.

4. Sorting and Discussion of Open-end Questionnaire

(1) Challenges meeting Managers of Arts and Culture Industry in venturing into the business
It is topped with “Strengthening competitiveness of the industry”, indicating that overall competitiveness of arts and culture industry needs be promoted. As shown in Table 4, the top 5 are: Strengthening competitiveness of the industry, Resource integrating ability of Managers, Policy planning and execution, Domestic market environment and Business management ability of manager. This indicate the resource integration and business management ability of managers in arts and culture industry are rather insufficient (Xue etc., 2002) and the competitiveness of the industry, government policy support and domestic market develop are not strong enough.

V. Conclusion & Suggestions

1. Conclusion

(1) Presenting conclusion based on the purpose of the research “Definition and Content of Coe Competence of Managers”

1) **Core Competence is discussed in 3 perspectives:** General knowledge ability, Professional skill and Administration and business management, total 47 questions and full scale reliance $\alpha$ is 0.963

2) **General Knowledge Ability is divided into:** Individual general knowledge, Social General Knowledge, Business General Knowledge and Cultural General Knowledge, total 12 questions and this perspective reliance $\alpha$ is .897.

3) **Professional skill is divided into:** Arts and culture knowledge specialty and Market application specialty, total 11 questions and this perspective reliance $\alpha$ is 0.888

4) **Administration and Business Management is divided into:** Administration Management, Product management, Marketing management, Finance and Human resource management and Innovation and Integration management total 24 questions and this perspective reliance $\alpha$ is 0.950

(2) **Conclusion presented per purpose of research “Reality of Manpower and Core Competence of Manager”**

1) **Reality of Manpower of Managers**

a. Individual: It is found in this research that Most of Arts and Culture Industry managers are female and in the age group of 25 to 45, of college education background and less of them have international education and experience.
Monthly income is in the range of NT$40,000 to 50,000. Majored disciplines are diversified which indicate high cross-discipline among managers of this industry. They engaged in this field only 10 or less years. In Personal Attributes, under MBTI Occupational Personality types, most of them are of scholar type and are curious analyzer.

b. Organization: The finding of this research shows that most of the organization have been founded for more than 5 years and turnover of last year is NT$5 million or less and total member of the organization is mostly less than 49, and is small / medium size; their main products / services are arts creation, exhibition and sales.

2) Reality of Core Competence of Managers

a. Overall perspective: Responders appears to agree to the core competence listed in this research and most agreed are the Individual General Knowledge under General Knowledge Ability and Marketing Management under Administration and Business Management scored the least.

b. General Knowledge Ability Perspective: Level of agreement is highest with personal general knowledge and lowest is culture general knowledge.

c. Professional Skill Perspective: Results indicate that managers are mostly identified to own arts and culture knowledge specialty. In contrast, managers are rather low in market application specialty in the industry, particularly in familiar with arts and culture consumers and the application of new technology.

d. Administration and Business Management Perspective: Research findings indicate that managers are better performed in innovation management and team coordination and the management and operation of arts and culture industry needs innovation and input of manpower. In administration and marketing management, they performed poorer, indicating that domestic environment is not clear and weak in exploration of international markets.

(3) Conclusion presented in accordance of research purpose “Factors affecting Managers’ Core Competence”

1) Difference in education level, international education / experience, monthly income and personal attribute on the overall core competence performance has significant difference.

2) Managers with different education level, international education / experience, seniority in the field and personal attribute have significant difference in their
general knowledge ability performance

3) Difference in international education / experience has significant difference in performance of professional skill

4) Difference in age, education level, international education / experience, monthly income and attributes has significant difference in performance in administration and business management.

2. Suggestions

1) Suggestions for promotion power of the industry

(1) Building power of the industry through cooperation in the trade and alliance among trades: Arts and culture industry players are mostly small or medium size and they set up marketing points through joining and / or linking with the trade or other leisure, tourism and festival industry to expand their field of performance. In the cross-field cooperation is not forcing one or more of the cooperating parties to learn from other party, but join together to create competitive product or works between the creator and high-tech people with their equipment.

(2) International exchange and cooperation to replace international competition: It is recognized that in the globalization era, competition with foreign arts and culture industry is inevitable. Domestic players shall be shut the market from foreign participant, but shall step out to develop international market to demonstrate the cultural creativity energy of Taiwan. With the exchange between and among countries, there will be benign competition through introduction of quality arts and culture performance to other countries and into Taiwan, and at the same time expands international vision and awareness of Taiwan players.

2) Suggestions on legislative support

(1) Acceleration of drafting and legislation of police and acts: Legislations for Arts and Culture Industry has been delayed for years and it has become a major reason that keeping domestic arts and culture industry from becoming healthier. Government and legislators are urged to establish related subsidy, guidance, support and tax preference ac, so that the operation of the industry has a clear route to follow, and help to stimulate growth of the market.

(2) Setting up dedicate agency to provide data and material of arts and culture industry: Bureau of Statistics of Australia has established National Culture and Entertainment Statistics Center to provide information about the
Australian Attitude toward Arts, and Benefits brought to the Country by Arts. On the other hand, since Arts and culture industry was included in national development policy in 2002, Taiwan is still lack of trade categorization and statistical data for this industry, that make people from viewing the full picture and blocking new comers.

The general suggestion of this Research is that it is necessary to establish Credential System and Industry Information Platform, placing attention on the development of talents in arts and culture media organizing, broking and critics, and help the involvement of all parts related in establishing Arts Venture Mechanism to develop knowledge economy based industrial power through industry platform and to form close network inside and outside the industry, and utilizing mass communication, commercial and educational mechanism to help and protect specialists in arts and culture and their entrepreneurial spirit.

Small Business Transfer Outside of the Family:
Evidence from the French Actors Playing in the Web and Blogosphere

Katia Richomme-Huet, and Aude d’Andria*

In Europe, despite underrepresented scholars’ researches, less and less succession are taking place within the family. Consequently, firms are transferred to employees or third parties, especially in France. We investigate two primary questions. First, what is a business transfer outside of the family? Second, how can buyers reduce the opacity of the market and the cost of the information? We suggest investigating and analysing the online market. We notice that no sellers are directly present on the Web and that intermediates (both public and private institutions) endorse the lack of information for reducing uncertainty and decreasing information costs.

Introduction

Researchers, policy actors and practitioners agree on the fact that most current economies have a very large small business sector (Nieto and Santamaria, 2010). These micro, small and medium-sized enterprises (SMEs) add an important value to local, national and international economies (Liberman-Yaconi, Hooper and Hutchings, 2010). SMEs are essential and critical with regards to entrepreneurial activity, innovation, job creation, industry dynamics (Sheperd and Wiklund, 2005) and economies of countries (Liedholm and Mead, 1999). In the European Union, currently, up to 23 million enterprises fall within the scope of the SME definition (Commission Recommendation of the 6 may 2003). SMEs employ fewer than 250 persons for an annual turnover not exceeding 50 million euro and/or an annual balance sheet total lower than 43 million euro. These criteria are the standard approach for researchers, who considered them as a useful delineation (Davidsson, 2004) to facilitate

* Aude d’Andria is Associate Professor of Human Resource Management at University of Evry, France. Katia Richomme-Huet is Associate Professor of Entrepreneurship at Euromed-Management. Address correspondence to: Dr Katia Richomme-Huet, EUROMED- MANAGEMENT, Ecole de Marseille, BP 921, 13 288 Marseille Cedex 9. Tel: +33 (0) 491 827 389. E-mail: katia.richommehuet@euromed-management.com.
comparisons between all European countries. Both, SMEs provide around 75 million jobs and represent 99% of all enterprises (European Commission, 2006).

Consequently, most governments implement a range of policy initiatives to enhance productivity and regional development in the SME sector (Locke, 2006). At a European level, a recent political engagement refers to the creation of a favoured environment in which entrepreneurship and SMEs are rewarded (Mandl, 2008). The Small Business Act of June 2008 gave special emphasis to business transfers (European Commission, 2008) and, consequently, to established business in the sense of Global Entrepreneurship Monitor (more than 3,5 years old). Indeed, business transfer is a major issue in Europe, with one in three company directors (owners-managers) in the retirement process, which affects an annual average of 690,000 businesses and almost 2.8 million jobs (European Commission, 2006). Moreover, figures suggest that the problem of business transfer is likely to become internationally more pervasive in the next decade (Meijaard and al., 2005). Undeniably, this phenomenon is not disconnected from any durable and persistent dynamic, but this is an actual and heavy tendency in all European countries. “It is estimated that one third of European companies will be transferred in the ten next years. After the phases of creation and development, the transmission constitutes the third crucial stage in a company’s life cycle” (European Commission, 2003: 3). Because of the importance of a successful transfer of ownership and management, there has been much written about the family business succession in the world literature (Harvey and Evans, 1995; Sharma, Chrisman and Chua, 1996; Koiranen, 2000), broadly defined as “the passing of the leadership baton from the founder-owner to a successor who will either be a family member or a non family member” (Beckhardt, and Dyer, 1983: 3). However, in Europe, less and less businesses transfer are taking place within the family and “more family enterprises will need to be transferred to employees or third parties” (European Commission, 2004). Though, business transfer within
the family remains notably underrepresented in Entrepreneurship and SMEs research literature, and there is a call for more research in the area (Malinen, 2004). The present study was conducted in France, to investigate two primary questions. First, what is a business transfer outside of the family? Second, how can buyers reduce the opacity of the market and the cost of the information? We begin by reviewing the past research, which has provided some insight into the small business transfer. Then we describe the nature of our data source and the methodology we applied to create the tables and graphs shown herein. This is followed by a series of propositions about the players involved in small businesses transfer. Next, we describe the results obtained from the analysis and, lastly, we briefly present the concluding remarks.

**Literature Review**

**Small Business Transfer**

Business transfer can be defined as the sale of the firm (Holmes and Schmitz, 1990) to family members, namely succession, or to third-parties, with takeovership (Richomme-Huet and De Freyman, 2010). According to European Commission and the Small Business Act (2008:6), an estimated 6 million small business owners will retire over the next ten years and only three options remain: the succession, the business transfer to a non-family member or the inactivation of the business (Malinen, 2004). The governments cannot afford to risk losing these businesses, their economic and social effects at regional and national level: “Recognition of the special role of SMEs and in particular family-based enterprises, their typically local base, socially responsible attitudes and capacity to combine tradition with innovation, underpins the importance of simplifying the transfer of businesses and the skills associated with them” (SBA, 2008:5). The emergence of an aging population and SMEs sector is still a focus point of public policy research (Bruce and Picard, 2006). The issue
conducts researchers to carry on with studies in business transfer, with a larger part of succession due to their significant portion in all countries.

**Small Business Transfer Within the Family**

Worldwide, family businesses are prominent economics players (Arrègle and Mari, 2010; La Portat, Lopez-de-Silanes and Shleifer, 1999; Shanker and Astrachan, 1996). In the US, they comprise an estimated 80% of the companies and 78% of the new jobs. Across Europe, we can consider the same proportion with about 70 to 80% of family businesses, but a minor contribution to employment with about 40-60% (FBN International Monitoring, 2007). According to Mandl (2008), the gap can be explained because of the size of the companies: a large share of European family businesses is SMEs, especially micro enterprises with less than ten employees. Nevertheless, their economic and social effects to job creation, self-employment and economic prosperity may be highlighted in order to help the increasing number of SMEs which face the challenge of business succession and/or business transfer to third party (family internal succession, tax issues, failure rates…). In their analysis of articles published in thirty management journals between 2001 and 2007, Debicki and al. (2009) showed that matter of succession constitutes significant portion of family business research (15,1%). In addition to traditional succession process models (from Hershon, 1975 or Handler, 1990 to Cater and Justis, 2009), scholars highlighted our comprehension of the actors (from Dyer, 1986 or Ward, 1987 to Sharma and Nordquist, 2007) involved in the business transfer. But, the main hypothesis is twofold: first the predecessor has offspring, and, second, he wants his son/her daughter to become the new owner-manager (and he/she gave his/her consent). But the facts are at variance with the researchers’ attention. The European nations are not facing the same reality: if in Germany (78%), Italy (78%) and the Netherlands, the majority of families intend to transfer the business to family members, only a quarter of
them are likely to be taken over within the family in Spain and, especially, in France (FBN International Monitor, 2007). So what will happen to these companies if the families want to discontinue the business?

**Small Business Transfer Outside of the Family**

A serious imbalance exists thus between the studies devoted to the principal option of proximity (intra-family succession) and the business transfer (Takeovership) to third-parties (Richomme-Huet and De Freyman, 2009). If we except Birley and Westhead (1990), Donckels (1995) and Howorth, Westhead and Wright (2004), selling out as an alternative to succession has received almost no attention in the literature (Debicki, Matherne, Kellermans and Chrisman, 2009). Birley and Westhead (1990) defined four choices open to the owner, if he does not consider succession: (1) Sale to a third party; (2) Sale to the management and/or employees; (3) Public quotation on the Stock Exchange; (4) Liquidation. If we apply these choices to SMEs’ owners, and especially to the companies with less than ten employees, we can eliminate the third option. Indeed, the mainstays of Europe's economy are micro firms, each providing work for two persons, in average (European Commission, 2008). Moreover, as we studied business transfer, the last option can also be removed. From the primary choices of Birley and Westhead (1990), we define two main choices, namely (1) succession (Intrafamily and Intrabusiness) or (2) sale (Extrafamily but Intra or Extra Business). Then, three options remain: (2-1) Sale to Management and/or employees; (2-2) Sale to a third party (personal entity); (2-3) Sale to another enterprise (third party as a legal entity). We summarize these choices in the following table.
### Table 1: Family Business Owner and Business Transfer Choices

*Source: De Freyman and Richomme-Huet, 2010.*

In the innovation-driven economies, including France (GEM, 2009), the positive reasons expressed behind discontinuing businesses represent 40%: 20% for “personal reasons”, 7.8% for “retirement”, 7.8% for “opportunity to sell”, and 4.4% for an “exit planned in advance” (GEM, 2009:20). When an owner-manager decides the passing of the leadership baton (Beckhardt, and Burke, 1983) to a new individual, it is not a trivial decision. The circumstances of the selling, the strategic choice taken and the process used to exit the family from the business will affect the owner’s eventual lifestyle (Birley and Westhead, 1990) and the survival or failure of the company. According to these authors, two main results emerge from their study in the UK. First, the most frequently used exit route is private advertised sale. Second, they notice that more firm were sold outside of the family, with a “strategic loosening” in the corporate market-place. According to De Freyman and Richomme-Huet (2010), the buyers on this market may be third-party (Extrafamily and Extrabusiness) or employees (Extrafamily but IntraBusiness). Managers and/or employees can obtain information from the owner about the sale of their company (Scholes, Wright, Westhead, Burrows and Bruining, 2007), but what about private buyers, who know neither the company nor the owner? Where can this category of buyers find information and private advertised sales?
The Lack of Information and the Endorsement

Studies (European Commission, 2004; Transregio, 2006; PricewaterhouseCoopers, 2007; KGMP 2008) show that one of the problems for the small businesses transfer is conjointly the opacity of the market and the cost to acquire information. One of the most important characteristics of family businesses is the strong interrelationship between the family and the business. In contrast to non-family businesses, they know each other since a long period, which facilitates the built of trust and confidence, the transfer of knowledge, technology and information (de Massis, Chua and Chrisman, 2008). When the transfer is outside of the family, all information remains localized in the company and private. The owner knows that the business he has exploited and the firm he has created has economic value. So, he wants to preserve its confidentiality. Moreover, theories on asymmetric information confirm that owners are significantly better informed than any outsider (Storey, 1994). The owner knows more than the transforee the weak and strong sides of his business. But the buyers need to find information about the targeted company. The questions are: what sort of information? Where can they find it? How can they trust the ones they found? Even if they can locate the appropriate information, they might question its veracity, the reputability of the source, the possible conflict of interest, the reliability and the recentness (Sorenson and Stuart, 2009). Buyers are uncertain about the true value of the company they want to acquire. They need advices and evidences. “In such situations, actors with credibility both in the information they provide and in their ability to assess the quality of potential partners can resolve this uncertainty when others observe their choices. Parties in such advantaged positions can include both public and private institutions” (Sorenson and Stuart, 2009: 532). They also introduce the idea that endorsements by the state (or by European Commission in our situation) help to reduce uncertainty, meanwhile endorsements by minor partners may provide useful signals or information regarding the true quality of potential sellers. If we
except buyers and sellers, different players influence the environment of the business transfer such as institutional (European commission, national government, regional institutions, banks, employers’ organizations, chambers of commerce, nonprofit organization, mentors,...) and brokers (providers of support services, advisors, accounters, lawyers...). In France, for instance, the Chambers of Trade have created a national virtual marketplace for buyers and sellers who are interested in enterprises in the craft industry. After evaluating the applicant companies, the advisers disseminated the successful offers on the “national enterprise exchange for craft enterprises”, namely BNOA (www.bnoa.net). They can also provide support and accompany the transfer process during the different steps. Transferees (buyers) and transferors (sellers) need trustworthy intermediaries and database host organizations.

**Research Methodology**

We carried out research for an exploratory empirical study of French actors playing in the Web and blogosphere. The validity of our data depends on same validity and evaluations than other types of qualitative data (Denzin and Lincoln, 1994). To conduct this type of method, Füller, Jawecki and Mülbacher (2007) recommend following four major steps: (1) Research objectives definition; (2) Observation and data collection; (3) Data analysis and insuring a reliable interpretation (triangulation with others methods of investigation); (4) Enforce an ethical code (in connection with the non participatory observation method). To gain greater understanding of the transfer business practices, we identified and analyzed the body of websites where the primary topic of interest was related to entrepreneurship and venture creation or venture taking over.

**Data and sample size**

Due to the nonexistence of a ready to use Websites database on Transfer Business, the sample used in this paper was constructed from the French Webpages provided by Internet. Our
sample size consists of websites and blogs that explicitly mentioned “entrepreneurship, takeover, buyer, seller, advisers, private advertised sale” without placing boundaries on time period. Given that business transfer is a relatively narrow research stream, we wanted to explore every websites on the subject. First, we start the sample identification with a search query on Google, from the keywords “business transfer” (74 000 results at all). From the given links, we create a panel data, which consists of 123 webpages, namely websites and blogs. Data collection has been staggered over a period of six months in order to check the webpages’ life expectancy. We conducted the analysis of the sites until saturation and redundancy. This constitutes the sample used for our coding scheme and content analysis that follows. A complete list of the names of 123 websites used in our review is presented in the Appendix 1.

We have introduced information from the following relevant variables: name of the web and its link; characteristics of the web domain (distinction between websites, weblogs or forums: while a website presents information from wide sources and relative to a common address URL, a blog is an online personal journal with regular entries, reflections and comments, and a forum is an online discussion site); origin of the sector (distinction between public or semi-public sector such as State Agency or Chamber of Commerce, and private sector, namely consultant or business corporation); actor on the online business transfer (potential transferee or “buyer“ who wants to take over a business; future transferor or “seller” who wants to sell his firm, and intermediates or “others” who provide a mediation service, from impartial institutions or private companies, namely brokers, professionals in the business transfer); and cost to acquire information (distinction between free of charge or not free: one can find plenty of information, advices or tools to help entrepreneurs starting, running and/or growing their business).
Because this represents a preliminary study, we have only taken into account these items. This is based on the idea of findings relevant differences between our groups. Our data collection includes 123 websites and excluded none. The sample may be temporally biased: the webpages, especially blogs, although they have historical value, can present possible obsolescence. Indeed, individuals might stop to maintain their online journal; regularly, the webmaster cleans the webpages, even more when the blogs are hosted on an institutional website. Nevertheless, it would be interesting to include in future analysis, the precise classification of each webpages and its various contents.

**Findings and Discussion**

Table 1 provides some descriptive statistics of the data collection.

</table>

First, the web domain excludes entirely the forum: there is no forum about business transfer in our sample. The webpages are balanced between websites and blogs, with a larger representativeness of the blogs (53,3%). This is probably a biased result, because of a website which develops blogs to favor exchanges ([http://blog.apce.com](http://blog.apce.com)). By coincidence, results are the same considering the origin of the sector, with an advantage for the public (44,7%) against
private (53.3%). In France, the public sector uses to be present on administrative and formal procedures; institutional leave the business activities to private sector. Moreover, we notice the same scattering in real life than in online: even if improvements have been realized, there are still various and numerous public services for each entrepreneurial action.

More significant, there is no seller in the Web. This result confirms the opacity of the market and the secrecy around the business transfer. The owners prefer to keep their information and they protect their business from unknown online visitors. We can easily image the employees’ surprise and confusion if they discover that the company they work on is on sale. A business transfer, as a key step in a company’s life, can destabilize the stakeholders. The sample majority is constituted by all the intermediaries (91%) who hover around business transfer process: institutional and practitioners. This result confirms the complexity and the extent of the process, which needs various skills and knowledge in different fields, such as economical, legal, social and psychological ones. A quarter is component of buyers (26%), but more often potential transferees in a starting process rather than firm’s purchasers.

Lastly, the three quarter of the websites (75.6%) provides free access to information. The cost to acquire information is rather free of charge. For business transfer, the Web is significantly a tool for diffusing suitable and relevant information. Indeed, SMEs’ owners-managers and/or potential buyers have limited financial means: they need strategic information to preserve their resources and to involve them in the purchase, rather than in the search of the ideal company.

In this exploratory research, we wanted to know if there is statistically significant correlation between all variables for the total sample. Thus, chi-square independence tests are first examined (appendix 2). Then, bivariate relationships are examined using Pearson product-moment bivariate correlation statistics (Table 2).
The results show that there is a bivariate correlation statistic between all variables for the total sample. Moreover, we notice that the web domain (websites and blogs) has almost no influence on the actors \( (r= -0.459; p<0.01) \) who will use it and on the cost to acquire information \( (r= -0.479; p<0.01) \); it also not constrained the origin of the sector \( (r= -0.215; p<0.05) \). Indeed, the access on Internet must go through one of these medium, namely websites or blogs. These tools, accessible via Internet, foster successful company transfers (European Commission, 2006).

Although these findings make intuitive sense, other findings seem to run counter to expectations. For instance, the marketplace provides more platforms for bringing together potential buyers and sellers. Our results show that no sellers are “present” on the web domain; they are more “virtual” than the Web. Nevertheless, many webbased business transfer “bourses” have been established, varying in terms of the legal status of the provider (European Commission, 2006). Our study confirms that the origin of sector (public or private) is significantly correlated with the actors \( (r=0.437; p<0.01) \) who intervene: 26 buyers are in

* Correlation is significant at the level 0.05 (bilateral).  
** Correlation is significant at the level 0.01 (bilateral).
public sector and 62 intermediates in the private sector (appendix 2). In parallel, a heavy link appears between origin of sector and cost to acquire information ($r=0.244$; $p<0.01$), but both favor the free information (at least, in the first approach).

Lastly, the buyers only provide free information (100%), which is the best strategy in the first step of the business transfer. Two-third of the intermediates uses the same logic in order to attract potential customers. The influence between these two variables is very significant ($r=0.337$; $p<0.01$).

**Contributions**

In spite of a growing body of theoretical and empirical research in succession, the business transfer outside of the family is quite limited and notably underrepresented in Entrepreneurship and SMEs research. Thus, we had two objectives when we began this research. First, we wanted to investigate what is a business transfer outside of the family. Secondly, how can buyers reduce the opacity of the market and the cost of the information? This research makes three specific contributions to emerging research focusing on business transfer outside of the family.

Theoretically, we add to knowledge of business transfer started by Ambrose (1983), Malinen (2004), Stund and Melin (2008) and make a contribution to entrepreneurship and small business literature because, to the best of our knowledge, the perspective of selling out as an alternative to succession has received almost no attention in the literature. We argued that SMES’s owners have two main choices, namely (1) succession (Intrafamily and Intrabusiness) or (2) sale (Extrafamily but Intra or Extra Business). Then, three options remain: (2-1) Sale to Management and/or employees; (2-2) Sale to a third party (personal entity); (2-3) Sale to another enterprise (third party as a legal entity).
Empirically, we analyzed a Websites database on transfer Business, especially a French Webpages provided by internet. In this densely inter-connected world, much of the communication and the information exchange happens online. Recently, Sorenson and Stuart (2008, p.538) propose a focus on some of the new research in Entrepreneurship on the problems of uncertainty reduction, the transmission of private information and “the role that online interaction may play in fostering and shaping entrepreneurial activity”. Our sample is based on more hundred (N= 123) institutions, brokers and individual webpages. Preliminary evidence was presented that suggests that the web and the blogosphere serve to facilitate the match making between potential buyers and third parties who offer a mediation service. Thus, the new technologies, especially web 2.0, offer professional information and advices with original means of answering the opacity of market and the cost to acquire information.

Practically, we wish to offer policy makers, practitioners and all the small businesses’ actors another point of view and others insights, to encourage a no discrimination between nascent or young ventures and long-time or old ventures, such as an Equal “Employment opportunity for the small companies.

**Limitations and Next Steps**

There are several limitations to our empirical investigation. The first limitation is the heuristic method of data collect and the small size of our sample of websites. The sample is somewhat biased because we wanted to get enough answers to begin our exploratory research. The question is to know when to stop and when to be sure that the analysis of the sites is conducted until saturation and redundancy. The next step of a future research may probably examine more websites to answer this point.

The second limitation is our choice of a small list of aggregated items: characteristic of the web domain (item#1), origin by sector (item#2), actor on the online business transfer
(item#3) and cost to acquire information (item#4). Thus, we are able to provide only emerging evidence from the French small business transfer outside of the family on the Web. The next step of a future research may probably deep our measurement approach of theses dimensions. Moreover, others items, which have not been include in this study, may complete the future research. That is why, any conclusion could be generalizable.

Finally, this paper investigated small business transfer outside of the family to provide some pointers for the direction of future research. Our study focused on actors playing in the Web and blogosphere. In fact, actors in the small business transfer are dispersed among different individuals and entities. Hence, the exponential development in the Web of websites and blogosphere offers new opportunities to get information or advice and meet business partners. Even if virtual connections may change the volume and the nature of information exchanged, we envision that the rate of actors stay the same as in the physical-world connections.

Abstract

Significant disparities in the rates of business ownership and operation persist between racial/ethnic minorities and their majority White counterparts in the U.S. In 2002, the total U.S. population consisted of 68.2% non-Hispanic Whites and 31.8% minorities. However, minorities owned only 18% of all the 23 million U.S. firms. Utah’s minority population of about 360,000 (15.5% of the state’s population) owned only 10,000 firms (or 5.3% of all firms in the state). This business case discusses the achievements and setbacks of The Pete Suazo Business Center, a minority small business center that was established to specifically address these disparities in Utah.

Presented at:
55th World Conference of the International Council for Small Business (ICSB)
Cincinnati, Ohio, USA, June 24-27, 2010
The Pete Suazo Business Center as a Model High Impact Minority Small Business Development and Resource Center

Gladys Gonzalez wanted to return a favor for the generosity that the late Senator Pete Suazo of the Utah State Senate had extended to her some ten years earlier. In the early 1990’s her start-up Spanish-language newspaper, Mundo Hispano, based in Sandy, Utah, United States was a financially struggling enterprise. Senator Suazo had helped her get a $10,000 loan to salvage her newspaper business (DMN Editorial, 2004; Mitchell, 2003). As a result, she had become a leading owner and publisher of a newspaper that targeted Utah’s Hispanic community that comprised of 11.2% of the state’s nearly 2.55 million people. To return the favor, Gonzalez established a business center in memory of Senator Suazo, to carry forward the Senator’s lifelong dream and efforts of “empowering minorities to become a part of the business community” in the United States (Bulkeley, 2004). In just about 10 years of establishment, the center had grown to become a leading resource center for Utah’s minority population. Gonzalez wanted to address the center’s challenges and expand it to the wider minority community in the United States.

Introduction

Ethnic minorities are groups that have shared unique cultural traditions and a heritage that persist across generations, and that differ from the majority population. Racial groups are determined by visible features, such as color and race. In many cases, race and ethnicity tend to overlap (Salazar, 2007). Distinct minority groups in the United States include Hispanics, Asian, African American, American Indian & Alaskan Natives, Native Hawaiian, and other groups. In addition, over recent years, various individuals have immigrated to the United States, creating a minority group of immigrants with unique characteristics such as language and culture. Because minority groups exhibit economic disparities as compared to the majority White ethnic group in the United States, factors that explain these disparities are worth investigating. This business case focuses on discussing
The Pete Suazo Business Center, a minority small business center that helps address the business ownership disparities in the state of Utah, United States.

**Minority Business Ownership in the United States**

Significant differences in the rates of business ownership and successful operation persist between racial and ethnic minorities and their majority counterparts in the United States. In 2002, the total U.S. population consisted of 68.2% non-Hispanic Whites and 31.8% minorities. However, minorities owned only nearly 18% of all the 23 million U.S. firms. Also, on average, for every dollar that White-owned firms made, Pacific Islander-owned firms made about 59 cents, Hispanic-, Native American-, and Asian-owned firms made 56 cents, and Black-owned enterprises made 43 cents (Lowrey, 2007). Also, the odds of minority groups opening businesses are 55% lower than those for the majority White population. In addition, female emerging entrepreneurs are less likely to start a business than males (Salazar, 2007). Thus, many minority groups tend to engage in the mainstream labor market rather than pursue business ownership.

Besides ethnic groups, the immigrant population is another minority group that contributes significantly to total U.S. business ownership, formation, and income, sales, and employment. In 2000, immigrants constituted 12.5% of the total population of U.S. business owners, generating a total business income of $67 billion (or 11.6% of all business income in the United States). Immigrants are nearly 30% more likely to start a business than are non-immigrants (Fairlie, 2008, November). For example, among self-employed Asians, 80.8% are immigrants, compared with 67.9% of Islanders and 56.8% of Hispanics (Lowrey, 2007). After noting this trend, many developed countries, including the United States, have created special visas and entry requirements in an attempt to attract immigrant entrepreneurs. Nonetheless, immigrants face barriers to the American society, such as low literacy levels, poor language ability, and cultural competence, which tend to impede their successful business operations. For example, although business owners from Mexico
constitute the largest share of immigrant business owners (255,300 business owners or 2.22% of all business owners), they have a rate of business ownership substantially below the national average (6.5% compared with 9.5%).

**Minority Business Ownership in Utah**

According to the 2000 Census, the United States had 1,436,410 immigrant business owners, representing 12.5% of all business owners in the nation. Utah had 4,546 immigrant business owners, representing 5.2% of all business owners in the state (Fairlie, 2008). In 2002, Utah had the 37th minority population, numbering about 360,000, or 15.5% of the state’s total population. However minorities owned nearly 10,000 firms, which accounted for only 5.3% of all the firms in the state. These firms generated $1.6 billion in gross receipts, or a mere 2.6% of the total gross receipts for the state. Although Hispanics, the largest minority group, accounted 9.7% of the state’s population, it owned 2.8% of all firms in the state, generating only 0.9% of the state’s total gross receipts. Except for Asians, other minority groups showed similar disparities. Asians accounted for 2.4% of the state’s population, owned 1.5% of all firms in the state, generated 1.1% of the state’s total gross receipts (MBDA, 2008). Despite the greater disparity between whites and minorities in the correlation between their population sizes and business ownership, minorities continue to contribute to the state’s economic growth. For example, in 2002, minority firms employed nearly 15,000 workers in the state. Also, the number of minority firms in Utah increased by 14% between 1997 and 2002, compared to 13% for all firms in the state (MBDA, 2008).

**Challenges Limiting Minority Business Ownership and Success in the United States**

Except for Asians, other minority groups in the United States generally have relatively lower business ownership and success rates as compared to Whites. Barriers and challenges that these minority groups generally encounter in their business operations include (Fairlie, 2005):
i). **Limited Assets:** Fewer assets including liquidity constraints generally limit business entry among minorities. Latinos and African Americans have substantially lower levels of assets than Whites, and hence they are less likely to become business owners.

ii). **Lack of Networks and Ethnic Enclaves:** Racial differences in access to business, social, and co-ethnic networks generally create racial disparities in business ownership among Latinos and African-Americans, as compared to Whites. These networks and ethnic enclaves may be especially important in providing financing, customers, technical assistance, role models, contracts, and information related to successfully running a business.

iii). **Discrimination:** Consumer and lending discrimination tend to discourage would minority entrepreneurs and reduce the longevity of their businesses. Consumer discrimination might occur in cases where predominantly White consumers have distaste for purchasing goods and services from minority-owned businesses, thus leading to lower profits and sales, fewer employees, and higher closure rates for minority firms. Lending discrimination occurs when minority-owned businesses experience higher loan denial probabilities and are charged higher interest rates by lending institutions, as compared to White-owned businesses with equal performance and creditworthiness. Consequently, some minority business owners are less likely to apply for business loans because they believed they would be denied.

iv). **Inadequate Human Capital:** Relatively low levels of education among some minorities are partly responsible for limited opportunities in entrepreneurship. For example, the 6.0% of the African-American/White gap in self-employment entry rates is explained by racial differences in education levels. 14.3% of African Americans are high school dropouts compared with only 6.2% of Whites. Also, a significantly high 53.1% of immigrant Latinos and 20.4% of native-born Latinos do not complete high school, which limit their entrepreneurial success.
v). **Intergenerational Progress and Family Business Capital:** The probability of self-employment is two to three times higher among the children of self-employed parents than among those for non-self-employed parents. Despite substantial gains in education, earnings, and civil rights made during the twentieth century, lack of African-American traditions in business enterprise is a major cause of low levels of African-American business ownership.

vi). **Language & Cultural Barriers:** Although also evident among ethnic minorities, these barriers tend to be more dominant barriers among immigrants to the United States. For example, immigrant business owners make up the largest share of the least educated business owners in the United States. Slightly more than 28% of all business owners with less than a high school degree are immigrants (Fairlie, 2008, November).

**The Pete Suazo Business Center**

The relatively smaller number and weaker performance of minority-owned businesses in the United States have become major concerns among policymakers. Federal, state, and local governments have set up programs to support entrepreneurship among minorities, women, and other disadvantaged groups, in order to enable families to leave the welfare and unemployment insurance rolls (Fairlie, 2005). Some of these programs include loans, grants, technical support offered through Service Corps of Retired Executives (SCORE) and Small-Business Development Centers (SBDCs), and government contracts to minority-owned businesses. Despite being well-funded, these programs remain ineffective in fully and effectively reaching minorities. In the light of evident barriers to minority-owned business and accompanying disparities in business ownership and success among minority groups as compared to among Whites, policies promoting minority entrepreneurship need to be creative to directly confront these prevalent barriers and effectively reach these underserved minorities. The Pete Suazo Business Center located in Salt Lake City, Utah is a private nonprofit Small-Business Development Center that creatively addresses the unique challenges faced by
minority business owners. Although the center primarily serves the Hispanic community in Utah, its services are open to other minorities and disadvantaged entrepreneurs. The center is named after the late Pete Suazo, the first Latino senator in Utah’s Senate.

**Senator Pete Suazo**

Pete Suazo was born in Salt Lake City, Utah on June 4, 1951. He graduated from West High School in Salt Lake City in 1969. He received a Bachelor’s degree in Criminology/Corrections in 1973 and a Master's degree in Human Resource Management & Economics in 1978, both from the University of Utah. Suazo had enough resources to move out of his poor neighborhood on the west side of Salt Lake City, but he committed himself to staying in his community to improve it, and ensure that the concerns of its residents were not overlooked in the public process. After working with a number of community-based non-profit organizations, he became the Administrative Assistant to Salt Lake City Mayor, Palmer DePaulis. In 1992, he was elected to the Utah House of Representatives, and in 1996 to the Utah Senate (Dmitrich, 2001; DMN Editorial, 2004).

Senator Suazo was a ceaseless advocate for civil rights and social justice. He worked to bring about social change in many ways. Through political advocacy, he worked to enact or change laws aimed at attacking the dynamics of race, class, and gender that kept people in the state from living the American dream. His other initiatives included painting homes for senior citizens, anti-graffiti campaigns, youth gang prevention centers, and Neighborhood and Mobile Watch (Rosario 2008). Suazo fought for the rights of minority entrepreneurs to qualify for business capital from financial lending institutions. Language, cultural barriers, lack of experience in establishing banking relationships, and relatively short-term credit histories had barred many promising minority business owners from qualifying for funding from Utah banks (Oberbeck, 1994). To recognize his efforts and achievements, Suazo received several meritorious community service awards, including Youth
Service Award (1992), for his involvement in the Salt Lake Area Gang Project; and Human & Civil Rights Award (1999), from Utah Education Association (Rosario 2008).

In August of 2001, Senator Suazo died in a tragic all-terrain vehicle accident while hunting in Sanpete County. His wife, Alicia Suazo, was asked by delegates at the Utah Democratic convention to finish his term in office. This case discusses mission, goals, objectives, and strategies of the Pete Suazo Business Center, which was established in 2002 to carry on Suazo’s dream of “empowering minorities to become part of mainstream American society.” The center focuses on assisting underserved minorities in Utah.

**Hispanics and Other Minorities in Utah**

According to the 2006 U.S. Census Bureau data, Utah had a total population of over 2.55 million, and included Hispanics (11.2%), Asians (2%), Native Indian and Alaska Native (1.3%), Blacks (1%), Pacific Islanders (0.8%), and others (1.5%) (U.S.C.B., 2008). Thus, Hispanics remain the dominant minority group in Utah. Hispanic persons are of Spanish origin or descent, who designate themselves as being Mexican American, Chicano, Puerto Rican, Cuban, or of other Spanish/Hispanic origin, regardless of race.

Utah’s Hispanics have satisfied their need to belong by maintaining their cultural heritage through the use of Spanish, special foods, festivals, and interactive art (music and dance). Social support systems have included churches, social organizations, and mutual aid societies (Gallenstein, 1998). Nonetheless, these practices have somehow alienated Hispanics from the predominantly English Utah society. Although the value system and culture that the majority of Hispanics maintain have resulted in a strong work ethic and family support system, the Hispanic population has experienced bias and discrimination in schools and the wider community. They have been offered the lowest paying secondary work positions, often because of their low educational levels. Many Hispanic and other immigrants to Utah usually face problems that include low wages, poor quality
housing, inadequate health care, racism, language and cultural barriers, profiling from law enforcement authorities, adverse media reporting, and other basic human rights concerns (Gonzalez, 2008). Despite these challenges and barriers, the future for the Hispanics of Utah is one of growth. From 1990 to 2005, Utah’s Hispanic population grew by nearly 200%, more than twice the national rate. In 2007, Hispanics made up about 11% of Utah’s population and 57% of the state’s foreign-born immigrants. The buying power of Utah’s Hispanics was $2.5 billion in 2000, and is expected to grow to about $6.5 billion in 2010 (NACORP, 2008). The Pete Suazo Business Center exists to assist Hispanics and these minorities to achieve full participation in the social fabric of the state and nation.

The Pete Suazo Business Center

The Pete Suazo Business Center was established to help strengthen and develop Hispanic and other minority businesses in Utah, with the goal of raising these communities’ living standards and enhancing their quality of life (Marriott School, 2008).

1. Background & Operations Information

a). History

At the time of its finding by Glady’s Gonzalez, the center’s original location was at 625 W. Girard St. (540 North), on the poor west side of Salt Lake City (Mitchell, 2004). To extend its services and help more clients, the center constructed and relocated to a larger facility building near 900 West and 1700 South in Salt Lake City, in 2005. The new center is in the heart of a minority neighborhood, close to clients, many of whom speak Spanish and some English (Sanchez, 2005). The 4,200 square feet building has four start-up incubator offices for rent to new small business clients (with all services of a small office – copier, fax, and secretarial services), a large conference room for seminars and classes with a capacity of 80 people, a computer training classroom with 15 to
20 computers, two small mentoring/counseling offices, administrative offices for staff, and a kitchen area (Nii, 2005). Colored in bright stucco colors, rooted in Hispanic history and culture, the building has a parking lot and a reserved plot for future construction expansion (petesuazocenter.org, 2008).

b). Vision / Mission

The Pete Suazo Business Center exists with a two-pronged mission to serve Utah's Latino/Hispanic and other underserved populations. First, it provides education, training, mentoring, and counseling to minorities on how to start and run successful businesses in the United States. Secondly, it serves as an access point for resource and service organizations, private and public institutions, and other parties that wish to offer their services to the underserved communities in Utah (SCORE, 2007). Although the center's primary area of focus is Utah, the center provides help to clients wishing to establish or expand businesses throughout the United States. Also, while the center focuses on developing and empowering Latino/Hispanic and other underserved minority entrepreneurs, deserving whites are also welcome for assistance (petesuazocenter.org, 2008). The center's lasting vision and mission are to become a “place where all minority small-business owners can come to get the help and the resources they need to be successful, to create wealth for themselves and their families.” (Nii, 2005).

c). Culture and Structure

Just as Pete Suazo himself was adept at forming coalitions, the center thrives on the culture of partnership and coalition building to carry forward its mission. For example, it has a diverse and savvy board of directors who have abundant business knowledge, experience, and connections to the mainstream Utah community. Also, it has strong support from government and business leaders, local governmental and non-governmental agencies, as well as several local institutions of higher education. The center focuses on creating successful business leaders, rather than diverting to other
community-support initiatives. For example, some parties have urged the center to initiate English as a Second Language (ESL) classes, but the center has resisted, choosing to focus only on business development initiatives. Lastly, the Suazo center has a very conservative culture, in terms of its planning and spending. Unlike other organizations which initiate programs and raise funding to support them later, the Suazo Center does not implement any of its programs until it has enough funding to support it.

*d). Financial System, and Fundraising Sources and Methods*

The center relies heavily on donations and grants from corporations, institutions, and private donors. About 90% of the grants come from private entities, and the remaining from governmental agencies (Heyn, 2008). Donations are both in monetary or in kind. The new building at 950 W. 1700 South was constructed using a $500,000 federal grant from the U.S. Department of Housing and Urban Development, secured with the help of U.S. Senator Bob Bennett (R-Utah). Design and construction management work were done for free (Sanchez, 2005). In 2004 Zions Bank (one of Suazo center's key contributors) donated $75,000 over three years to the center (Bulkeley, 2004).

Also, from February to August 2005, the United Way of Salt Lake (UWSL) loaned its executive, Mark Haymond, to the Suazo Center to act as the center’s Development Director. During this period, Haymond raised funds to cover the center’s operating expenses, developed relationships with and secured donations from 30 major donors, and acquired a donation of more than $50,000 worth of office furnishings for the center’s new building (United Way, 2005). Besides making financial contributions, various parties have supported the center though other resources, such as providing volunteer mentors and counselors.
e). Human Resources

The Suazo center is run by a full-time executive director (currently Robert H. Heyn), one full-time administrator, one part-time secretary/receptionist, and four regular volunteers. In addition, it has several volunteers, including business professionals and students from local business schools, who assist it on regular and occasional basis. The center has a very strong board of directors, with some members who are CEOs, and prominent in the business community of Utah. The board helps the center set strategy and direction for its growth and operations, raise funds, and connect with the right contacts and resources in the mainstream community. Lastly, Zions Bank staffs at the Suazo center its full-time commercial loan officer and loan assistant to provide the center’s clients easy access to the borrowed business capital (Nii, 2003).

f). Organizational Strategies

To achieve its mission of improving the quality of life for minorities in Utah, the center employs strategies such as, entrepreneurial support, strategic partnership with existing community agencies and resources, reward and recognition for entrepreneurs, and advocacy for minority workers’ safety.

(i) Entrepreneurial Support

In general, the Suazo center assists its entrepreneurial clients through direct business management counseling, financial literacy, development of business plans, and acquisition of business loans from appropriate financial institutions. More specifically, the center helps clients understand the ramifications of running their own businesses by assisting them with initial feasibility discussions, conducting market research, preparing funding requests, and obtaining legal licenses and permits. The center accomplishes some of these tasks by providing group courses, seminars, and workshops – in business law, finances, accounting, taxes, marketing, management, and procuring
business financing (petesuazocenter.org, 2008). Currently, the center offers 17 seminar classes on business management, every month. Besides group sessions, the center conducts one-on-one mentoring and counseling sessions.

(ii) Strategic Partnership with Community Resources & Agencies

The center strategically partners with government representatives, the local business community, non-profit organizations, and institutions of higher learning that wish to serve minority communities, to ensure that their services effectively reach minority entrepreneurs (petesuazocenter.org, 2008). It helps its clients understand and access the numerous community resources that are available to them (Sanchez, 2005). Some of the center’s strategic partners include Utah Hispanic Chamber of Commerce, Small Business Administration, Utah Small Business Development Center (SBDC), SCORE (Service Corps of Retired Executives), Utah Microenterprise Loan Fund, University of Utah, Brigham Young University (Marriot School of Management), Westminster College, Utah Supplier Development Council (USDC), and United Way of Salt Lake. Through these partnerships, the Suazo center has successfully linked minority entrepreneurs to financial institutions that offer business loans and to resources such as counseling and consulting services from SCORE (a leading America’s counselor to small business) (SCORE, 2007).

(iii) Reward and Recognition for Entrepreneurs

The Suazo center seeks to reward and encourage entrepreneurs to achieve excellence in their operations. For example, in 2007, Pete Suazo Business Center and leading Hispanic chambers of commerce in Utah partnered with Zions Bank to honor promising Hispanic entrepreneurs in the state with Utah Hispanic Business Awards, for their contributions to the community and economy (Deseret News, 2007). The Center played a leading role in nominating the awards recipients. Categories for award recipients included: Hispanic Small Business of the Year (for growth and
expansion in sales or operations), Most Innovative Hispanic Small Business (for creativity in marketing and technology or product ingenuity), and Community Service Business Award (for contributions to the community). Eligible businesses had to be Utah-based, with majority Hispanic ownership. In addition, they had to have 100 or fewer employees, and had to be in good standing with legal obligations. Each of the winners received an advertisement package valued at $20,000 that included radio, newspaper, marketing, and consulting services.

(iv) Workplace Safety for Predominantly Multicultural Minority Employees

The Suazo center has joined the Coalition for Multicultural Workers’ Safety and Health’s, a coalition of organizations around the state, to raise awareness and facilitate solutions for minority workers’ safety. Language proficiency, cultural differences, and fear of termination or deportation affect the workplace safety for many immigrant workers in the United States. Most of these workers tend to be multicultural or non-English-speaking. National surveys show that foreign-born workers, who are predominantly Hispanic, are getting hurt and killed at work in disproportionate numbers. The fatality rate for Hispanics for 2004 was 25% higher than for non-Hispanics. In Utah, employers are hiring more foreign-born workers in industries prone to injuries (Nii, 2006). As a result, safety-training in job tasks remains a primary concern and challenge among multicultural workers.

Formed in 2005, the coalition’s other members include the Mexican Consulate, Workers Compensation Fund, the Department of Workforce Services, Utah Safety Council, Utah Labor Commission, among others (Nii, 2006). The coalition calls for and conducts ongoing workplace safety seminars, presentations, and conferences for businesses or companies with multicultural workers. In addition, it maintains a Web site that offers resources and information for interested parties to dialog on workplace safety issues. Lastly, the coalition hopes to make sure its issues are represented at the Legislature. The coalition has considerably succeeded in helping employers and
employees to become more informed, to learn about the responsibilities of each party, and utilize available resources, in order to reduce and prevent occupational hazards.

g). Impact / Results

By mid 2005, the center had helped create more than 25 new businesses in Utah, and conduct seminars for more than 900 clients (Nii, 2005). Since then, the center has seen major improvements. In the past four years, it has risen from a less known center with a single office and a computer to a well established agency in Utah’s mainstream community that is well known to donors, volunteer groups, media houses and minority communities. It has helped many existing Latino businesses, which are mainly in the service industry, grow to become larger, more efficient, and have more appeal beyond the self-employment small businesses units (Heyn, 2008). Also, it has helped entrepreneurs create dozens of new businesses and hundreds of new jobs, establish several economically self-sustaining and hopeful families, and contribute heavily to the state’s tax revenues and purchasing power (Heyn, 2008).

In addition, the Suazo center has significantly earned the trust of the Latino community. There is a lot of mistrust among the Latino community, in many of Utah’s institutions. Some institutions are perceived as agents of federal immigration authorities that seek after illegal immigrant Latinos to deport them. The Suazo center has worked hard over time to restore confidence among Latinos by strictly focusing on developing Latino businesses and helping them achieve significant growth and profitability. It has built tremendous grass-root work, working with local communities and their leaders, and helping entrepreneurs understanding the business markets that they are targeting. The Latino community now views the center as a “real Latino center” that is dedicated to assisting them.
**h). Current Dilemmas**

Despite the center’s optimistic growth and achievements, it faces the dilemma of its overwhelmingly increasing clientele size, and the accompanying demand for its services. In 1998, there were 4000 Latino businesses in Utah. In just 10 years, this number has increased to 9000, with about 90% of these businesses located on the Wasatch front of the state. With Latino population growing at a faster rate in Utah, the trend of business growth is projected to grow at a much faster rate. Other minority communities in the state are experiencing similar growth in size and business need. To extensively assist these clients, the center is planning to build an office in Provo and Ogden areas. It is already conducting classes and seminars in Provo area (Heyn, 2008). Nonetheless, given the center’s limited resources, it faces a great challenge to cater for this fast growing minority community.

The center’s current resources already seem to be overstrained, given that seminars and counseling sessions incorporate a large number of service hours that the center cannot adequately provide. Also, the client size and need is outgrowing the center’s existing space, creating a need for more classrooms and regular seminars. With Utah’s unemployment rate among minorities and Hispanics on the rise, and minority populations continuing to grow, the center has a greater challenge to meet this growing need (Marriott School, 2008).

**2. Challenge / Major Task Facing Suazo Center**

To fully support its programs, the center faces a great challenge of raising enough financial resources from the scarce sources available. The financing of non-governmental organizations (NGOs) is becoming more challenging, mostly because the number of NGOs has grown over recent years, and all these NGOs are targeting the same limited number of existing funding sources. Also, some donors are only supporting non-business initiatives such as youth education and child health,
rather than business support centers (Heyn, 2008). Thus, the center’s challenge is to find more donors who are willing to fund business development agencies.

In addition, the center faces a great challenge of fully reaching out to other culturally-complex and multi-lingual minority communities in the state. The center has a greater task of convincing these groups that “it’s not just for Hispanics and Latinos…but also for Asians, Tongans and black business owners” (Nii, 2003). To meet this task, the center plans to increase its space, offer business classes in several languages, provide training and fund-raising assistance, and foster international trade missions. Nevertheless, navigating though these communities’ unique cultural differences, language barriers, and literacy levels to create business growth, remains a unique challenge for the center.

3. Possible Action Plan for Suazo Center to Address its Challenges

To uniquely meet its financial need and reach the wider underserved community, the center has tried to strongly pursue its culture of coalition-building and partnerships with other parties. Already, the center is planning on partnering with other Utah’s small business development centers to effectively reach underserved communities. While these centers have enough resources, they don’t know how to reach minority populations (Heyn, 2008). Under this joint partnership, the Suazo center plans to provide service and minority out-reach efforts to these centers to ensure that the state’s existing resources, facilities, and services for underserved communities are optimally utilized. In a sense, the center doesn’t want to duplicate what's already available in the community. Rather, it wants to help the underserved community realize and access the available resources (Nii, 2005). To multiply its funding, the center should consider establishing pilot businesses to fund its programs, with capital coming from donors.
4. Strengthening the Suazo Center

To strengthen the Suazo center, the center has been trying to fully utilize technology in order to efficiently and effectively serve its rapidly increasing number of clients. For example, rather than using the manual filing system to store, access and retrieve client information, the center is planning to use a computerized intake software. Several other areas of technology use that could strengthen the center and increase its capacity include offering mentoring and training online classes to reach massive numbers of clients, and monitoring clients’ business metrics and progress using computer technology. This challenge comes with training employees, volunteers, and clients to be technology-savvy.

Also, the center is exploring strengthening its talent acquisition and management practices to acquire a committed and effective work and volunteer force that will help it to fully meet its clients’ needs. At the moment, recruiting employees and volunteers to work at the Center remains a challenge. It is difficult to find employees and volunteers who understand the unique challenges and opportunities of Utah’s minority communities, have the education and skills to become mentors or educators, possess language capabilities, and have great passion and willingness to work for a non-profit organization. This challenge comes with convincing academic institutions to train more social entrepreneurs rather than just for-profit entrepreneurs.

5. Actual Plans Implemented and Results

The center is implementing several initiatives as part of its growth plan. It has created an intake process to manage the intake of new clients. It is now designing an effective educational curriculum to gear its training activities toward the clients’ various business competence levels. In addition, the center is designing its strategic growth plan for the next five years. The growth plan includes expanding to meet the needs of the growing client size; hiring more employees and volunteers; and expanding its existing facility to create more space for classes, seminars, mentoring,
and counseling sessions. So far, Marriott School students have worked with the Suazo center to help it create a business plan, Web page, brochure, and an intake process. They have also consulted for some of the center’s clients (Marriott School, 2008). More projects remain to be implemented as the center plans for its future expansion.

Conclusion

Barriers to business entry and success for minority-owned businesses that are created by imperfect capital markets, discrimination, and lack of opportunities to acquire business human capital may impose a large efficiency loss in the overall U.S. economy. Furthermore, the potential benefits of promoting minority business ownership in terms of increasing minority employment should not be overlooked. In 1997 alone, there were 2.9 million minority-owned firms hiring 4.3 million employees in the United States. Estimates from the Congressional Budget Office (CBO) indicate that more than 40% of African-American and Latino employer firms hire at least 90% minority employees (Fairlie, 2005). The Pete Suazo Business Center remains a key partner to minority business owners in enabling them to achieve lasting success. Already, the center has made greater achievements among Utah’s minorities and greatly contributed to the overall state’s economy, despite its limited resources. The center hopes to remain committed to assisting immigrants to America achieve the American dream. Many immigrants come to the United States educated, with business background, and English fluency. However, they need help to understand rules, regulations, strategies, and best practices of doing business in the United States. As the center grows and expands, it will make entrepreneurship more attainable to a wide range of minorities and other underserved individuals. The center’s management hopes to divert from focusing on primarily providing assistance on running small businesses, to providing support to a wider range of larger businesses, including retail enterprises and professional services offices.

Innovation, Entrepreneurship and Governance: The Shanzhai Handset Business

Professor Jay Mitra
Centre for Entrepreneurship Research, Essex Business School, University of Essex
and
Professor Si Chunlin
School of Management, Fudan University, Shanghai, China

Abstract

The spread of the Shanzhai phenomenon across several Chinese industries has attracted considerable interest in policy and research circles in both China and abroad. It has also generated a variety of opinions on the modalities, ethics and capacity for innovation and entrepreneurship related to this phenomenon. Taking the Chinese mobile phone industry as an example, this paper investigates the technological background and the market conditions under which the Shanzhai Handsets emerged. Based on the specific analysis of the challenges of the Shanzhai Handset to regulatory (government) and governance (industry) issues, the authors propose a model of ‘innovation governance’ which could apply to the future of the manufacturing industry involved with Shanzhai Handsets.

The relationship between entrepreneurship, innovation and governance has been considered critical to the development of efficacious framework conditions and notions of an enterprise culture (Baumol, 1990, 2007; Acs, 2009; Estrin, 1998, 2006). Arguments pertaining to the absence of suitable governance structures especially in transition economies have been put forward to suggest the need for strong institutional structures to be in place to protect property rights. Such arguments have compared the ostensible benefits of sophisticated intellectual property rights and governance in western countries with those of various transition and newly industrialising nations often providing intellectual support to industry level concerns. This literature offers little by way of explanation of local modalities, the search of legitimacy and conditions of governance, especially the informal ones embedded in local and distributed networks. This paper attempts to throw new light on the subject by examining a novel phenomenon which allows for innovation to occur both at the margin of legitimacy and through a network-centric approach involving a range of players. Such an occurrence raises issues about new forms of organizational innovation in particular together with those of product and service innovation.

The authors examine organisational innovation in terms of governance issues. The paper identifies three mechanisms of governance: industry governance, firm level governance and government regulation, and examines the way in which these mechanisms influence or impact on the innovation process. The paper is divided into six parts: the first part introduces some conceptual and theoretical issues; the second part introduces the phenomenon and analyses the technical background and market conditions related to the products on offer; the third part provides an analysis of the challenges that Shanzhai Handset manufacturers face
together with the difficulties associated with its development; the fourth part examines the governance mechanisms of Shanzhai handsets; the fifth part is to discuss implication of the model of ‘innovation governance’ (IG) in the context of the increasingly-popular Shanzhai culture; and finally, the paper concludes with a discussion on the implications of the IG model for policy and innovation and entrepreneurship theory.

**Key words:** Shanzhai handsets, innovation governance, entrepreneurship

**Introduction**

From around 2005, a number of ‘Shanzhai Handsets’ which were not well known in the country appeared in China’s mobile telephone market. Handsets such as “NOKLA” (not the hand slip of NOKIA!), and “Samsang” (not wrong spelling!) began to find their way into the market place. Shanzhai Handsets are mainly characterized by their ability to imitate famous brand handsets, and even surpass them in aspects of appearances, functions, or price. Numerous small-scale electronic factories that produce those odd, brand handsets are referred to as Shanzhai Enterprises. These enterprises are identified as having no formal brands, operating without any formal marketing channels but offering products at low prices, generally being referred as ‘creative’ players. A report, entitled *Uncovering Secrets of Shanzhai Handset Market*, from 30 Minutes Economic Update of CCTV broadcast on June, 2008 indicated that according to incomplete statistics, the output of Shanzhai Handsets in 2007 had amounted to at least RMB 150 million Yuan, which nearly equaled the total output of handsets in China’s domestic markets.

**The Meaning of Shanzhai and Shanzhai Handsets**

In Chinese, ‘Shanzhai’ means villages, territories, and protective fences built in mountains. Historically, these were strongholds of warlords built in defiance of the feudal official, and outside the power and reach of government and officialdom. A feeling of independence and autonomy is associated with the word Shanzhai. In our times the so-called ‘Shanzhai Products’ are those which are regarded at best as imitation or improvised products, and, at worst, ‘fake’ or ‘knock-off’ versions of well known brand names in mainstream markets. Increasingly, however, they have been endowed with new brand images representing perhaps an act of ‘commercial defiance’ to the hegemony of established brand names in the mobile telephone business.

Shanzhai Handsets are one of the earliest Shanzhai products. The emergence of these handsets unleashed a strong shock wave to the market, leading domestic handset enterprises that used to occupy half the China’s handset market, such as Bird, TCL, Kejian, Panda, Amoi and others, to close down their operations. Bird Co., Ltd., which had a net profit of RMB 245 million Yuan in 2003, suffered a loss of 539 million Yuan in 2007. Similarly, Eastcom and Panda Co., Ltd. relinquished their hold in the market with considerable losses, while the restructured Kejian gave up handset manufacturing in 2007. At the beginning of 2008, Lenovo declared that it would sell its handset business at the price of 100 million Yuan to 4 investment institutions.

Handset experts and critics hold different opinions on Shanzhai handsets: some consider that the emergence of these handsets is the result of technical progress, heralding the trend of future technological development. Others believe that these handsets violate market rules, referring to the Shanzhai Handsets as “Shady Handsets”.

In addition to being popular in the domestic market, Shanzhai handsets are also sold in the Middle East, other parts of Asia and Africa. Sales levels in the European market also appear to be increasing. Even, some of the locally unknown Shanzai Handsets have become popular brands in India, in Eastern Europe, and in Africa. Shanzhai handsets have now spawned Shanzhai computers, Shanzhai costumes, Shanzhai Spring Festival Galas, Shanzhai’ films,
and other Shanzhai products” of various brands all across China. It has now become part of the phenomenon of popular culture.

In common with all popular phenomena, the handsets and the culture that it has generated have received a mixed response. Critics associate the Shanzhai phenomenon with plagiarism and the infringement of intellectual property rights. Some even consider Shanzhai’ to be an insult to or humiliation for China. In some countries such as Pakistan and India the need for handset IMEI certification shows that people have started to question the legitimacy of Shanzhai versions of different products. Others with perhaps an open mind regard the Shanzhai phenomenon as symptomatic or symbolic of the spirit of anti-monopoly and innovation. Varied views offer appropriate measures to deal with the phenomenon. Some think Shanzhai should be banned, others preach tolerance and the adoption of different sanctions or measures according to their application and use.

**Structure of the paper and methods**

The paper is divided into six parts: the first part considers some conceptual and theoretical issues of entrepreneurship, innovation and governance. The second part introduces the phenomenon and analyses the technical background and market conditions related to the products on offer. The third part provides an analysis of the challenges that Shanzhai handset manufacturers face together with the difficulties associated with its development, and the fourth part examines the governance mechanisms of Shanzhai handsets. Part five discusses the implication of the model of ‘innovation governance’ (IG) in the context of the increasingly-popular Shanzhai culture; and finally, in the sixth and conclusive part the authors discuss the implications of the IG model for policy and innovation and entrepreneurship theory.

The paper provides a broad macro level analysis of the Shanzhai handset industry and its location within the wider Shanzhai phenomenon. The purpose is to obtain a broad understanding of the rise of this phenomenon in a particular cultural context. This understanding is achieved through observation of the evolution of mobile telephone handsets in China, the network-centric approach adopted by different Shanzhai players, the odds and difficulties they face in competing with global brand names, and how they have organized themselves through multiple governance structures reflecting innovative approaches to organizational development. Most of this observation is carried out by way of secondary search methods involving the examination of industry and government generated data. The ‘threatened species’ environment in which Shanzhai manufacturers have sought both survival and ingenious adoption of innovation practice, makes it difficult to obtain primary data, although the authors are exploring this ground for further research on this subject.

**Part One: An Overview of Conceptual and Theoretical Issues**

For the purpose of this paper innovation takes the form of an introduction of a product in new markets (where brand names are not necessarily affordable), whether by way of an invention or by imitation, leading eventually to diffusion in the market (Schumpeter, 1934). We also consider innovation in terms of the organization of its production and distribution, the introduction of incremental benefits, and recognition in the market, which allows for the conceptual link between innovation and entrepreneurship. While innovation is regarded as the creation (production or initiation) of something new (Bozeman and Link, 1983), entrepreneurship is referred to as the perception of opportunity associated with the innovation, and the ability (organizational arrangements, learning and governance arrangements) to act on such perception (Link and Seigel, 2007, Acs and Audrestsch, 2007, Mitra, 2009).

Networks of operation and production offer new opportunities for firms to develop products and services (Hooh-Soi and Roberts, 2003). Networks often follow open innovation architectures (Chesbrough, 2003) and are augmented by end –user involvement (Von Hippel,
2005), generating even greater opportunities for sophisticated and dynamic forms of product development. They also open up possibilities for different types of transactional arrangements and their governance.

The emergence of Shanzhai handsets in the market has raised specific questions about the relationship between on the one hand innovation as a process which embraces imitation and notions of governance on the other. Innovation as imitation has long antecedents. Schumpeter (1961) argued that the “spell is broken” as soon as innovation is made with the first innovation drawing followers leading to successful imitation making the innovation familiar through a process of diffusion in the market. The diffusion process eventually wipes out the entrepreneurial profit till another innovation surfaces and renders the first innovation obsolete. This process of ‘creative destruction’ is at the heart of capitalism as far as Schumpeter was concerned. Following Schumpeter many arguments have been made about the specific function of imitation as innovation enabling a process of technological learning (Kim, 1997, Kim and Winter, 2000), facilitating economic growth (Segerstrom, 1991), and as a form of benchmarking (Massa and Testa, 2004). The growth of Asian economies from Japan to Korea to China and India has often been attributed to imitation-oriented innovation (Kim, 1991, Kim and Nelson 2000). Imitation’s darker side is reflected in the flourishing output of fake goods in the hidden economy or in so-called ‘black markets’ across the world challenging and disrupting the institutional and moderating role of patents and often the legitimate process of buying and selling goods and services in the open market. The seemingly unstoppable growth of the hidden economy has inevitably raised questions of trust, the value of intellectual property and governance at firm, institutional and governmental levels.

An examination of the relationship allows for the proper consideration of new product development in uncharted and sometimes inchoate markets where established routines and practices can be called into question. The paper puts forward the idea of ‘innovation governance’ with reference to three mechanisms of governance: industry governance, firm level governance and government regulation. It examines the way in which these mechanisms influence or impact on the innovation process, and finally points out general implication of innovation governance to the evolution of a Shanzhai culture.

The relationship between entrepreneurship, innovation and governance has been considered critical to the development of efficacious framework conditions and notions of an enterprise culture (Baumol, 2007; Acs and Audretsch, 2009). At the level of the firm Coase (1937) had examined firms and markets in terms of alternative modes of governance rather than in terms of a production or technological function. How a firm was governed depended on differences between various forms of transaction costs which they had to incur both within and outside the firm. Any consideration of such costs gave rise to issues of conflict, mutuality and order (Commons, 1932), and their management. Managing the ‘Commons triple’ (Foss, et al, 2000) necessitated adaptation to particular environments and the use of resources. According to Hayek (1945) adaptation is only possible spontaneously through markets while Barnard (1938) identified a more ‘conscious, deliberate and purposeful’ kind of adaptation which was dependent on co-operation between firms and possibly other stakeholders.

The extent to which there is incentive intensity, administrative controls and a legal rules regime helps to define the meaning and value of governance either at the level of the firm or in markets (Williamson, 1991). For governance to function effectively at both levels there is a need for ‘soft’ (values, mores, and norms of practice) and ‘hard’ institutions (government institutions, industry bodies and agencies). The mix of these institutions lay down certain boundaries of business activity.

In making new products and in competing with incumbent players, new firms incur various transaction costs which they choose to reduce through a variety of means. In most cases firms
seek legitimacy by working within the institutional boundaries referred to above. Networks of firms can help to reduce some of the transaction costs and offer tangible outcomes for any search for legitimacy. Networks of operations also call for alternative forms of governance at the level of industry and those of firms, especially when their operations reach across borders of different countries.

However, survival in uneven playing fields can tempt firms to transgress boundaries. Such transgression can lead to unproductive forms of entrepreneurship (Baumol, 2007) judged by normative standards set in dominant environments, such as in Western countries. Such standards are of course not exclusive to specific cultures. Most firms in varied cultural environments would uphold values of integrity, honesty and fair trade as they manifest themselves in the activities of the firm. How these values are monitored and governed will sometimes be subject to different structures of governance.

Arguments pertaining to the absence of suitable governance structures especially in transition economies have been put forward to suggest the need for strong institutional structures to be in place to protect property rights. Such arguments have compared the ostensible benefits of sophisticated intellectual property rights and governance in western countries with those of various transition and newly industrialising nations often providing intellectual support to industry level concerns.

This literature offers little by way of explanation of local modalities, the search of legitimacy and conditions of governance, especially the informal ones embedded in local and distributed networks. What happens when we are faced with phenomenon and innovation that occurs at the margin of legitimacy and involving a range of players? Such an occurrence raises issues about new forms of organizational innovation together with those of product and service innovation.

The study of the Shanzhai handset phenomenon offers us the opportunity of re-examining some of the theories of organizational innovation, governance and network, from the perspective of a specific but complex, social and cultural environment.

In this paper we make the connection between innovation and governance, developing a framework which examines typologies of innovation to understand the emergence of a phenomenon, and forms of governance which we believe are necessary to legitimize, support, control and generate incentives for the producers of the Shanzhai innovation phenomenon. We note the evolution of the Shanzhai phenomenon and track the process by which Shanzhai manufacturers select, retain, and vary their actions in order to survive and grow in a highly competitive market. Alongside this tracking exercise we examine how different forms of governance at three distinctive levels – the firm, the industry and the state – can help to create and augment entrepreneurial value creation. A graphical version of this approach is shown in the diagram below.
As Figure 1 shows, each type of innovation can be associated with a form of governance at a specific level. The early stage, imitative innovation process is linked to firm level governance, where firms seek to acquire legitimacy by learning through imitation. Thus, a form of learning enables the Shanzhai manufacturers to define their place in the market. As the manufacturers develop an enhanced capacity for innovation, through functional or incremental measures and then on to new technological know-how and network-centric organizational innovation, the complexity in the forms and levels of governance change. Each stage of development has a mix of moderating variables, tools and factors, including learning, open innovation platforms and networked-based activity which influences both the nature of the innovation process and the forms of governance that are best suited to the stage of development. In referring to stages of innovation or associated forms of governance, we note that they do not represent a linear movement from one stage to another, but in keeping with evolutionary dynamics, there is a complex connection within and between each of those stages of innovation and the forms of governance.

Part Two: The Technical Background and Market Conditions

The “Turn-key” Mode Adopted by MediaTek

Handset production depends on a production network. Bird, TCL, Kejian, Panda and other brand enterprises all have their own production networks, with the significant characteristic of these networks being mutualism. Prior to the emergence of Shanzhai Handsets, handset manufacturers were the core players in the manufacturing process.
They developed and integrated peripheral techniques such as handwriting, Bluetooth, imaging and other techniques to develop new handsets within 6 to 9 months.

**Fig. 2: The Manufacturing Mode with a Handset Manufacturer the center**

All manufacturing enterprises have, in fact, shaped a network structure, in which different enterprises undertake different tasks:

- to manufacture moulds;
- to design appearances; and
- to match functions.

With a handset manufacturer at the center of the network, different manufacturers in different fields are tightly connected with each other to form a network structure which has a relatively high density and intensity. The emergence of Shanzhai handsets did not affect the network characteristics of handset manufacturing. What has changed, however, is the structure of the networks.

**Evolving Networks**

In 2005, the MTK handset chip, produced by Taiwan chip manufacturer MediaTeck, integrated into one handset a main board and software which required completion by a wide range of people for more than one year. In the manufacturing network, critical components are supplied by MediaTeck, while the handset manufacturer designs handset casings, shapes and other components, around the critical chips. A new type of handset is produced within 3 months (as shown in Fig. 2).
Conversion of the manufacturing technique network has led to important changes in handset development, production and marketing. Comprehensive solutions to the “turn-key” mode launched by MediaTek, resulted in chips and operation software, even liquid crystal displays, cameras and other components being brought together using a “one stop shop” business model. For each Shanzhai enterprise at least two links in the handset manufacturing chain are removed: an application platform and various software. These two links are now integrated into the products produced by MediaTek and other chip manufacturers. As a result, the most critical components have been packed as a semi-finished product. A manufacturer needs only to purchase the semi-finished product, match it with a handset casing and a cell, and assemble the handset with a relatively simple flow of operations and at low cost. The core technique controlled by famous brand handsets now has become a common one facilitating the production of Shanzhai handsets. Consequently, handsets also can be produced by some small businesses and individuals.

Changes in the network structure are part of the network-centric organizational innovation process opening up opportunities for small firms and self-employed individuals in the mobile telephone market.

**The Technical Platform of Shanzhai Handsets**

The outstanding features of the production network of Shanzhai handsets are the MTK handset chips of MediaTek and comprehensive “turn-key” solutions which supply a common technical platform for all manufacturers. The creation of the technical platform indicates considerable progress along technological lines. With the platform, it is pointless for manufacturers to start at the very beginning of the manufacturing process. The common platform provides effective ways to manage the diversity of products on one production line.

The idea of using technical integration within a variable range of specific applications was generated by H Meyer and Alvin Lehnerd. They pointed out that the product platform is “a set of interfaces and subsystems which can form a common frame, through which a series of various products can be effectively improved and be produced”. As Figure 3 below shows manufacturers and users are connected by way of a public or open technical platform which is effectively an innovation tool box allowing for both to work together to achieve multiple uses through technology exchange and integration. Von Hippel (2005) refers to such models as end user innovation which also embraces ideas of open innovation (Chesbrough, 2003).
Innovation and Cost Reduction
The major function of the platform is to reduce manufacturing cost. The chip supplied by MediaTek is a highly-integrated, multimedia baseband chip solution, which includes a mode, a baseband chip, operation software, LED, camera head and other components that all can be solved “in one stop”, thereby, greatly reducing handset production links and cutting down development costs. The price of an MTK chip is 75% lower than that of Nokia and about half that of handsets produced by larger-scale factories. A brand handset with relatively simple functions can be sold at a price of more than 1,000 Yuan, while a Shanzhai handset with a large screen, bluetooth, imaging, camera, handwriting, TV functions, etc. can be sold at a price of just a few hundred Yuan. If a famous-brand handset is equipped with all the functions of the Shanzhai handset, the selling price of such a product is likely to at least 3000 Yuan. It is often quipped that a Shanzhai handset can be sold at “the price of a Chinese Cabbage”.

Innovation and Effective User-Friendly Functionality
Secondly, the platform enables innovation to be more effective in terms of what it offers to its users. Chips of MediaTek and “Turn-key” solutions are only semi-finished products for handsets. The diversified value-added solutions can be chosen for processing a handset to be a final product. For instance, the solution can generate a main board with many different shapes and this main board can be made into a handset with different external configurations. Handsets can take the forms of watches, cigarette boxes, and car moulds of BMW, Mercedes Benz, Porsche, and others! The technical platform built by MediaTek solved many technical difficulties related to the original value chain, making it easier for production to realize and adapt to specific users’ requirements. Once a user puts forward the requirements, he or she will obtain the customized handset with particular functions within 3 days. Some “Shanzhai Handsets” combine aesthetic originality with functions such as super-large screen, intelligence, a TV, double cameras, a multimedia player, and a simultaneous standby of double cards, all within one handset!. The array of functions that can be built into a handsets is of staggering proportions.

User-led Constant Innovation
Finally, the new technical platform allows for easy integration of users’ innovation. Some users have started to use handsets for more than just communication, as they regard the Shanzhai handset as an item for fashion and an expression of individual style. Users often
possess critical and essential understanding of the requirements of product performance and can play an important role in putting forward proposals on product refinements and innovation (Franke, Hippe 2003, 2006). It is the most discriminating consumer with the most sophisticated set of requirements who is likely to help boost the quality of a product and a service. Take the following Game handset for example. With an external connection handle, the handset needs only to be put on the handle and connected with it, making games directly controllable by the handle. This simple facility turns the handset into a complete gaming machine. Handsets resembling “transformers” are equipped with eight speakers.

**The Innovation Toolbox**

New types of Shanzhai handsets are launched constantly, as the result of users’ enthusiasm for participating in product innovation. Von Hippel (2003, 2005) considers that a manufacturer needs to be aware of the exact consumer requirements for new products in a hundred and one ways, and that traditional production methods makes it difficult to absorb rapid changes and modifications generated by users. Von Hippel (2003, 2006) advises that a manufacturer should give up traditional methods and suggests that the best way to adapt to user led change is to provide the latter with a “Toolbox for Innovation”, so that users can make their independent innovations in designated systems of particular products and services according to their interests. In this way, a preliminary design is created, following which the “embryo mould” evaluated by consumers. A series of improvements are made until the product is considered satisfactory by the user. Von Hippel’s research (2002, 2003, 2005) shows that the “Toolbox for Innovation” is more effective than the traditional method of production.

**Innovation and Multiple Users**

The public technical platform of handsets here has become the toolbox for users’ innovation, which enables communications between an innovative user and a manufacturer to become easier. At the very beginning, Shanzhai handsets just imitated appearances or functions of mainstream brands, offering their ‘copy cat’ products at a very low promotion price. The motivation of users, the integrated functions and the novel appearance of Shanzhai handsets have changed the way these handsets are made and how they have started to attract an increasing number of consumers. Variously models in the shape of racing cars, cigarettes, and watches, for example meet the vagaries of the fashion conscious young consumer, while Shanzhai handsets with “large screens”, “large keys”, traditional fashion and best fit design ideas, appeal to the older generation. Functionality is extended when the handsets are equipped with an LED light, helping farmers in villages for example to use it as a torch. The multi-functional product characteristics of the handset enable consumers with a low consumption ability (in terms of both access and cost) in China to be share in the new technological experience.

**Innovation and the Market Characteristics of Shanzhai Handsets**

The two segments of the Chinese telephony market include one in which low-end users just buy handsets with basic functions at the lowest price, while the second segment covers high-end users who buy expensive new model handsets with a wide range of functions and good-looking or customized appearances. The market entry for a new product always begins with high-end users; for example, the latest handsets are always used by merchant princes and tycoons as well as top government officials. Their adoption helps to popularize the products for common consumers over time. While the volume of sales increases during this process demand in market takes on an evolutionary path of development.
The emergence of Shanzhai handsets has upset the dynamics of the market to a certain degree. Low-end handsets are increasingly endowed with numerous specifications. Handwriting, a large liquid crystal screen, double speakers, double bluetooth, etc. have become part of a basic configuration. Shanzhai products have all the functions of a famous-brand handsets all at a far cheaper price than their branded counterparts. All functions being equal a normal manufacturer sells a handset for a minimum of 1000 Yuan while the corresponding Shanzhai handset is sold only at a price of few hundred Yuan. Consequently, the latter were firstly welcomed by low-income consumers, satisfying a lifestyle desire for a luxury product. The variety of offerings and the price also attracted the younger generation, as some young users even purchase several handsets with different functions for use in different environments.

Changes in consumer behaviour tend to impact on the psychology of a society to a certain extent. A typical secular society divides consumers into levels according to classes of brands which they use. Users of Shanzhai handsets appear to embody what the media in Taiwan refer to as the “Shanzhai Spirit” – the value of the free social spirit which is not afraid to lose one’s face, or to make low profits in order to meet the needs and requirements of all consumers. It generates a new spirit of innovation which allow producers and users to be part of a generation of change in society which does not forsake traditional notions of the welfare of the community (Li, et al, 2009) sand the minds of 1.3 billion consumers in mainland China.

**Part Three: Challenges and Difficulties: Innovation and Legitimacy**

Shanzhai handsets and other subsequent Shanzhai products imitate their mainstream famous-brand counterparts while offering them at a very low price. Some Shanzhai handsets even surpass the imitated products in appearance, functions and prices. This has led to the creation of a movement loosely referred to as the “Shanzhai Phenomenon”, by both its admirers and its detractors.

The first disputable focus concerns intellectual property rights. Professor Ge Jianxiong in Fudan University argues (2009) that most of “Shanzhai Products” are
Unauthorized goods, most of which are characterized by plagiarism, copycat activity and spoof; only a fraction present uniqueness that can stand out in the market place. Pointing to features of the “Shanzhai Culture” like plagiarism, imitation and fake products, he puts forwards the view that “we can’t tolerate it excessively”. Others point out that innovation was once the key-word to describe the “Shanzhai” spirit when the first products emerged in the market place. Still others refer to how Shanzhai producers are now increasingly “naked” in their ambition and how their products have deteriorated with the adoption of malicious forms of plagiarism. An investment expert Wang Ran states in his own blog article ‘Spread of Shanzhai Culture is a Disgraced Thing’ that a Shanzhai product is now synonymous with a counterfeit product, which will remind people of infringement of intellectual property rights, shady handwork workshops, inferior quality, and other crimes. New laws and business sanctions should be applied to the treatment of these products in the market instead of the current norm of tolerance by both institutions and the market. Such views suggest that attempts at legitimizing both Shanzhai products and the enterprises involved in the phenomenon should not be allowed to acquire any form of cognitive or socio-psychological legitimacy (Aldrich and Baker, 2004, Aldrich, 1999) necessary for any form of embedding in both the market and in society.

The Shanzhai handset also arouses controversy overseas. For example, a German magazine commented that the ‘Shanzhai’ is “infringing on intellectual property rights unscrupulously”.

Concerns and observations referred to above raises serious questions about the legitimacy and acceptance of new products, the production and development process, the methods of organization and business models. These questions tend to reflect popular notions of poor regulation and a leaky intellectual property rights infrastructure in China. Media and institutional campaigns in the Western world have been obsessed with these issues about China. However, not much attention has been given to the value of innovation by imitation or event to the ingenious methods and techniques adopted in newly industrialized countries to develop new products, experiment with organizational design that reflect certain social values of community involvement. When both sets of arguments are taken on board various economic arguments and business management models tend to get blurred. Is market equilibrium affected adversely by innovation through imitation? When is imitation a legitimate process of innovation and when does it acquire a sense of notoriety? If brand –based hegemony is punctured by smaller rivals is that bad for the industry and the market in which it operates? Must developing and new industrialized countries be dependent on products and services from developed nations being embedded in local markets before they can embark on their own innovation pathways? Can anything be learnt from the adaptive, entrepreneurial responses to technologies, production methods and organizational structures that emerge and evolve in developing countries?

The questions above reveal a complex and challenging economic environment in the global market place. They raise issues about transparency and competitiveness, regulation and governance which allow all players a level playing field without too many constraints being imposed by those first in the market. While random and unregulated markets affect operators in all environments (as the recent economic crisis has revealed in relation especially to financial service operators in the western world), there is a need to address issues of governance, regulatory frameworks and institutional structures which do not stifle innovation and opportunity creation. The following paragraphs deal with these issues in relation to Shanzhai handsets.
Regulating Shanzhai: Imitation and Infringement

Shanzhai handsets are often referred to “handsets leaning on brands”, as there appears to be a general suspicion of infringement of intellectual property rights. It is understood that once infringement is deemed an issue, governments should supervise the production and sale of such products strictly. China’s objective is to build an innovative country, adhering to an independent innovation trajectory. The government supports and encourages innovation, and protects intellectual property rights like patents, brands, and copyright as part of its economic development objective.

The determination of infringement needs certain principles and guidelines with the need to consider the scope and boundaries of legal protection. Infringement cannot be affirmed as long as imitation is not within the scope of legal protection for intellectual property rights like protected patents, trademarks, and brands. It is generally believed that except where there is an obvious demonstration of illegal activity such as in smuggling, illegitimate production, the operation of counterfeit products, assembly and renovating handsets, the majority of the products do not cross the legal boundary. It is hard to judge any notion or practice of infringement under current laws. At present, China has set up and perfected a series of intellectual property protection systems geared to international standards; yet it is undecided whether to stipulate new laws and regulations aimed at Shanzhai products.

Brands, Values and Society

A brand is a comprehensive reflection of internal quality and external characteristics of a product, it is a bridge for consumers and enterprises to communicate, and is also a promise of a product value. However, a brand cannot exist without a market; without a clear market issue the brand is a mirage. Shanzhai handsets offer economic, social and personal value to a wide range of consumers, which enables their producers to establish a broad market foundation. While imported branded products cater to a rising upper middle and rich consumer class, Shanzhai handsets have a mass appeal. While the brand producers are concerned with the vagaries of a select market place, their Shanzhai counterparts explore mass, social acceptance of products which open up opportunities for social mobility an personal consumption. These differences account for both their places in the market with selectivity being the driver for the foreign brands and mass market availability being the spur of the Shanzhai makers. If the approach of the latter engulfs the former’s position because of the nature of the consumer market place then that is an issue of competiveness at the level of firms.

Recent research evidence indicates that half of 1.3 billion Chinese (or 650 million Chinese) use mobile phones and that more than a quarter of these users are Shanzhai handset users. These users are referred to as “common or grassroots people”. The Shanzhai handset is, therefore “the handset of the common people” and “the handset of grassroots”. The main objective of public services is to provide the society with more and better public utilities and products. Therefore, the issue of public demand cannot be left out any consideration of legal and institutional matters.

Understanding the Value Chain

If the government is to supervise and block survival opportunities of Shanzhai handset producers it will have to deal with the complete industry chain that has been established around this phenomenon. MediaTek Handset’s shipment exceeds 200 million sets; making it the second largest handset chip company in the world. It has a market share of more than 70% of the mainland handset chip market. A manufacturer of a Shanzhai handset is essentially an integrator, who integrates all the end points on the handset chain such as a design firm, a handset test business, or a factory.
Depending on the functions of the chips supplied by MTK, the design firm’s work is like embroidery on silk products. The parameters of handsets are nearly the same for all standard products - a touch screen, a surround sound, MP3/MP4, a million-pixels camera. If a handset is more expensive, it will have additional functions including, for example, double-card standby, a digital television, and JAVA. With MTK rushing into the mainland handset market ahead of others, Taiwan’s industry supply chain is well established with manufacturers of quartz and wireless communication components, IC design, IC access, medium-small-sized panel, PCB, and LED. In the mainland, specialized factories produce liquid crystal screens, earphones, cells, chargers, walk pens, and even camera lens, dust screen, and other such “embroideries”. So a mature industry chain has already been formed. Statistics show that, in Shenzhen by 2007, there were nearly 140 handset manufacturers, 36 plan integration firms, 140 main board research and development enterprises, 50 appearance and structure design businesses, and 300 bluetooth manufacturers, all are integrated with the handset manufacturers. In addition, there were 3000 sales operators at all levels and 150 auxiliary transportation logistics enterprises (Xu Chao, et al 2007).

The financial crisis is a prompt for the development of strategies that expand domestic demand in China. A prevailing view among many consumers in China indicates that the quality of Shanzhai products is the same as those of foreign brand products. Intensifying Shanzhai’s national consumption can enable enterprises with good-quality products to have a larger domestic market, enabling Chinese firms and the national economy to tide over the financial crisis.

Shanzhai handsets’ challenges posed by market rules and government regulations can cause a plurality of economic and social issues. As for “Shanzhai”, can the government regulate it? Does it really need to regulate it?

**Part Four: Governance and Shanzhai**

China is the largest handset market in the world. Foreign brands in China include Motorola and Nokia while the famous domestic brands are, among others, Amoi, Bird, Lenovo, Konka, and TCL. Survey data issued by Internet Data Center at the first half of 2008 shows that foreign capital brand handsets account for 60% of the market share, while the market share of the Shanzhai handset is 23.1%. This suggests that home-made brand handsets are in a particularly awkward position in that that they are caught in a pincer type attack both foreign-brand and Shanzhai handsets. Most domestic brand handset firms show a heavy loss, save of them are resold and some have even withdrawn from the competition stage. Foreign brands such as Nokia and other manufacturers are also attempting to avoid the competitive pressures from Shanzhai handsets by moving into the laptop market.

The Shanzhai handset has become a “heckler” disrupt the stage occupied by famous-brand handset manufacturers. As a result of the financial crisis, the predominance of the Shanzhai handset is likely to be more obvious. The cost of a Shanzhai handset will be about 150 to 200 Yuan less than that of a famous-brand handset, and even though brand handset prices were reduced by 15%~20%, (compared with a Shanzhai handset) in 2007, it still has no price advantage. Shanzhai handset manufacturers reduce costs by saving technology monitoring fees, which tend to raise problems for governmental testing laboratories. These handsets have no relevant technical data prompting brand manufacturers to push government departments to impose strict measures for managing and regulating the Shanzhai rebels.

On December 18, 2008, the Industry and Information Department released a notice for a handset IMEI number registration, inspection and management policy. The
Telecommunication Terminal Test Technology Association under the IID was expected to inspect and issue IMEI identification numbers to domestic handset manufacturers. IMEI has been the unique identification number of a handset; and only with the IMEI, can a handset be used on GSM/UMTS network. Without a legal IMEI, a Shanzhai handset can just use a fake “ID” or many Shanzhai handsets can share one “ID”. As a result, in July, 2008, handsets exported to Pakistan were locked, resulting in the interruption of communication of a few hundred Chinese Shanzhai handset users. If the administration department and operators run strict surveillance tests, Shanzhai handsets will just have two alternatives: one is to formally apply for a corresponding IMEI number; the other is to purchase a lawful IMEI number.

Professor Han Kaili, who supports Shanzhai handset marketing, questions the legitimacy of the way a handset gains access to the network via a handset number rather than an IMEI number. The Shanzhai handset belongs to a legal business operation. Before the introduction of IMEI number registration, the market had more than 600 million handset users. This calls into question the feasibility of the measure introduced. Since the handsets purchased in the past can still be used today, it would be difficult to distinguish a handset produced “before” the IMEI number policy is introduced from one produced “after” that event. Even if every handset needs an IMEI identification number, it is not too difficult a problem to provide a decoding service for users.

The challenge is, therefore, to choose between putting an administration system in place or to allowing market mechanisms to solve difficulties and challenges posed by Shanzhai handsets.

**Difficulties facing the “Shanzhai” manufacturers: Brands and Imitation**

The Shanzhai handset manufactures have no stable brands and lack formal marketing channels, so it primarily chooses to produce the handsets by copying others brands. Mere imitation in the long run is not sustainable and this reality poses difficulties for Shanzhai handset manufacturers.

Competition in the current international market has passed the stage of product competition and moved into an era of brand competition. Chairman Woodruff of Coca-Cola telling remark that all large banks would rush to provide loans to Coca Cola in the event of a fire destroying the company, is indicative of the importance of brands. In outwitting brand players of mobile telephones, Shanzhai handset manufacturers can be a victim of their own success.

Intellectual property rights are embedded in brands, trademarks, patents, and technical know-how. While building up a tangible product, an enterprise should also operate its own intangible assets or knowledge assets. The operation of its material assets goes hand in hand with its knowledge assets. By leaning on the brands of others Shanzhai manufacturers can acquire certain material benefits but they cannot develop a brand. Copying and imitating enables a Shanzhai handset manufacturer to produce a duplicate of an “original edition”; and make money in the process of selling only the duplicate. This process does not allow manufacturers to build up their own brands. Rather, and in effect, they are publicizing the brands which they have copied. If Shanzhai handset manufacturers want to overcome this brand deficit it is not sufficient for them to remain in the shadow world of imitation.

**Product Development**

The other difficulty for Shanzhai manufacturers is the absence of product maintenance and after-sale service together with quality assurance. From the design of a handset and the supply of raw material to the production and assembly of all links, the
Shanzhai product is dependent on the division of labour and functions of and the links in the industry value chain – the search for chips, software solutions, die sinking, production and marketing. Popular handsets incorporate the functions of MP3s, digital cameras, radio and digital videos, and in some handsets other functions such mobile TV and GPS navigation can be found too. Unless Shanzhai manufacturers leave out other important links such as research, design, and technical testing, which all famous-brand handset producers value, and unless they reach agreements with manufacturers of integrated chips, GPS, and molds and other functions, it would be difficult to reduce costs and to put products on the markets quickly. The paucity of technical data based on industry specifications makes it rather difficult for the handset to be tested. Coupled with the lack of maintenance and after-sale service the Shanzhai manufacture can face serious problems.

Complaints received by Consumption Association are about “terminals” in mobile communications. The majority of these complaints are about Shanzhai handsets. In many people’s minds, “Shanzhai” has begun to be associated with unoriginal and even fake products, which have “not been tested in the sun”. Even among those more tolerant of Shanzhai products, there appears to be a reluctance to purchase new Shanzhai products. This negative perception is a far cry from the views linked to the ideas of free spirit, suggesting a waning of the rebel Shanzhai!

**Part Five: The Innovation Governance Mechanisms**

The Shanzhai phenomenon appears to face twin challenges – one for institutions and competitors in terms of the legitimacy of the products, and the other for the Shanzhai manufacturers themselves as they encounter their own problems of development. It is clear that imprudent legislation which seeks to curtail or remove Shanzhai products from the market would perhaps be impossible to achieve in practice. In some places, the Shanzhai handset market has gone partly underground. Even then the products continue to generate interest. Given that markets, institutions and the Shanzhai producers all face specific problems, concerted action by all three parties, industry, government and Shanzhai firms – need to be encouraged. Such action in itself can be regarded a innovative as it calls for the development of new forms of governance that can best realize the productive value of entrepreneurship and innovation.

**Forms of governance**

Three means of governance could be considered - industry governance, government governance and enterprise governance.

**Industry governance: Disrupting and gaming**

The turbulence in the mobile telephone handset market caused by Shanzhai handsets could be regarded as a typical case of disruptive innovation studied by Clayton Christensen. Christensen (1997) discovers that “disruptive innovation” affects many leading businesses which often tend to lose their leading position when major technological or market change occurs. These changes provide opportunities for new incubents. Christensen differentiates the two types of disruption: one is new-market disruption and the other is low-end disruption.

The popularity of Shanzhai handset should be attributed to the practice of low-end disruptive innovation. The so-called low-end disruptive innovation means saving cost first, by unceasingly digging up customers’ basic requirements, analyzing the non-basic requirements in products and services, so as to reduce costs and to expand outputs, and finally realizing small profits and a large volume of sales. Shanzhai handsets take the ‘low-end’ route way and even though they never advertise, their popularity fizzes across a wide community of users.
The process of low-end disruption is in fact a game. The Shanzhai handset can be seen as an intruder while the incumbent is a “temple”. For disruptions caused by “Shanzhai”, the temple may have no way to deal with it, temporarily or in the long run. When the incumbent becomes aware of the damages to its position from the intruder and plans to fight back, it is already too late. The rigid organisational arrangements of the incumbent caused by their internal cultures, values, and processes (typical of large firms), offer no solutions to the problems of rapid and disruptive changes of technologies and the market. Disruptiveness drive the failure of often efficient but rigid organizations.

The occurrence of disruptive innovation does, however, follow a process resembling the game process between the “Shanzhai” and the “Temple”. One of the frequently-used strategies in a game pattern is to obtain help from the third party. In the game process, one of the coping strategies used by “temple” is that of “crashing”. The other strategy is to borrow “identification numbers” or “industry rules” and to take administrative means. The former strategy just means a kind of “technical error” for the Shanzhai handset, which can be dealt with by technical means. The effect of the latter strategy is to push Shanzhai to a corner through the introduction of measures by the third party. The use of the IMEI measure is a good example.

Perhaps the most important strategy for the “temple” is to adjust its own act and to “reply in kind”. For example, Nokia has started to make use of its own advantages of scale and scope to move into the low-end handset market; a handset type at the price of 500 Yuan or so has functions equaling those of the home-made handset after careful research of products such as the Tianyu Langtong which is honored as the “Shanhai King”.

Dynamic Strategic Change

Firms in nearly all newly-developing industries, particularly high-tech and monopolized industry, have depended on high profit margins for a long time. The business models of these “temples” of fortune have ignored the ordinary or common user and consumer who do not play any part in the making of these profits. Their early entry in emerging markets have been characterized by the continuation of the production marketing and selling of products in the same vein as they have done in developed economies. The emerging of Shanzhai, has disrupted the complacency of the “temples”. Their overspreading advertisements do not work, their research and development teams to be at a loss to understand the consumption requirements of common people, and extravagant profits appear to be eroding with time.

In effect there are two related battlefields, one in China, where Shanzhai handsets are disrupting mainstream market, and the other is in the international market, where mainstream international manufacturers facing low-end disruptions generated by the handset chips of MediaTek. If we estimate the handset requirements all over the world to be 1 billion for one year, the handset chip output of MTK in 2006 accounted for 5% of that global market, rising to between 13% to 15% in 2007(150 million chips), and reaching 220 million in 2008. 250 million handset chips are expected to be produced in 2009. MTK is second largest handset chip supplier after Qualcomm. No wonder experts are talking about the future of handsets belonging to either a “Qualcomm Era” or an “MTK Era”!

From the third quarter of 2007, handset chip shipment of MTK has exceeded that of Freescale which ranked second in the world. In addition, the global financial crisis has had negative impacts on the market, so handset chip giants such as Texas Instruments, Freescale, and others etc. are facing the dilemma of either to sell their handset chip business or to allow these units to continue operating independently. A batch of patriarch-level handset baseband chips manufacturers, including, Texas Instruments, Freescale, Agere, ADI, and NXP, have stepped out of the historic stage gradually, and only three of the first-team handset chip
manufacturers are now left to compete in the market place – Qualcomm, MTK and ST-NXP-EMP (ST-NXP-EMP is a joint venture, which focuses mainly on European and American handset manufacturers). The global handset sales volume is approximately 1.2 billion, of which MTK’s share accounted for 12.5%, (see the rise in the position of MTK’s competitiveness from Fig. 6 (steady growth status of the operating income of MTK).

Figure 6: Operating Income Variation Chart of MTK

Operating income (New Taiwan Currency/ 100 million)

The games between the “Shanzhai” and “Temple” both at home and abroad continue unabated. China Mobile Telecommunication’s entry into a “3G” era, has intensified the game among WCDMA, CDMA2000 and TD—SCDMA, making it complex and as it moves into a new stage. China Telecom started to conduct CDMA-EVDO service test partially at selected places on March 16, 2009, while China Unicom also decided to bring forward 3G mobile phone number distribution to April 15, 2009, in four cities – Shijiazhuang, Baoding, Tangshan and Qinhuangdao. The regular handsets cannot enter the market before a network entrance certificate is acquired. Acquisition of the network entrance certificate needs at least 2 months. Starting a war on the 3G handset in advance gives rise to a lack for 3G handsets, which seemingly offers an opportunity for the Shanzhai handset to enter the market with their characteristic speed and networked-worked flexibility of operations.

Qualcomm, the joint venture ST-Ericsson, Broadcomm and other chip tycoons are monopolizing WCDMA chip market. Even though on the 2008 Beijing International Communication exhibition, MTK showed off its WCDMA/EDGE baseband chip MT6268, claimed that the chip had passed IOT tests carried out by well known international operators, and sent chip samples to some handset manufacturers, it is still not certain whether the handset with a MTK chip can swing the WCDMA terminal bidding initiated by China Unicom in the immediate future.

Intense competition among operators of China Unicom prompts them to take the mode of customizing handsets when promoting 3G business. They will form a powerful “third party” which can help the “temple” to fight against the Shanzhai under these new circumstances. On March 17, 2009, Forbes revealed that the US subsidiary of ZIE Corporation was attempting to build up partnership with large-scale operators like Sprint, Verizon Wireless, AT&T, etc. so as to increase its market share. Evidence shows that the mode of a consumer purchases a handset, and then choosing a network is being replaced by a new mode of an operator of China Mobile
bundling a network with a handset, and offering a handset for free “at the expense of netting in”. International handset corporates are launching their own on-line software shops in the hope of strengthening the user’s stickiness to smart handset products through more software applications, and enabling a win-win arrangement by cooperating with operators.

In such a case, the Shanzhai position of Shanzhai handsets does not change. Instead, it acquires a different profile. Since related products do not go through the national certification test, and the business and financial operations are irregular at the best of times, the Shanzhai handset is unable to be part of an operator’s 3G handset large scale customization and batch procurement programmes. Even if a certain number of Shanzhai 3G handsets appear in the market they just can realize some primary functions such as high-speed web-surfing and video call. The core advantage of a 3G network system including the supply of high-speed data business, and all videos, media, web-searching can be compromised due to lack of support from official channels. In the long run, the success of hand-hold equipments depends instead of software. The new mode of making profits raises a higher requirement for a research regime for handset enterprises. The dependence on handset terminal manufacturing, on solutions provided by MTK, without technical knowledge accumulation and independent research activity, can pose serious problems for China’s Shanzhai manufacturers.

**Internal Governance: Firm-Level Self-governance and “Becoming Regular”**

Suspicious about the infringement of exclusive rights of trademarks of famous-brand handsets, have led various regional industry and commerce to investigate Shanzhai manufacturers. The Bureau of Industry and Commerce in Xinjiang Uygur Autonomous Region has organized four investigative actions since October, 2007, confiscating 20,000 faked and counterfeit handsets in the process. One hundred and sixty eight brands are involved in these products. Shenzhen, the “base camp” of the Shanzhai handset, has been exposed several times by CCTV. Local executive departments investigate the entire electronic market within a district, cracking down severely on faked and counterfeit Shanzhai handsets from one factory to another. Other trade and commerce organizations in Zhejiang Province, Shanxi Province, Shijiazhuang of Hebei Province, and Suzhou of Jiangsu Province, also organize similar executive investigative actions aimed at the Shanzhai handset manufacturers.

Despite the cleaning-up process the Shanzhai handset continues to prosper in the open market. Shanzhai, now has its own code of conduct and discipline resorting to internal governance measures in common with good network systems. Self-interest has begun to restrict high-imitation handsets from infringing on others exclusive trademarks, such actions being regarded as being harmful to consumers’ lawful rights and interests and to the image of the industry. Many manufacturers and distributors of the Shanzhai handset also regard high-imitation handsets as “individuals who bring disgrace to their groups”, so they take positive attitudes towards closing down the faked and counterfeit Shanzhai handset manufacturers. An ‘e-pal’ named “super-moderator” leaves a message on a forum: “we insiders also agree that faked Shanzhai handset should be cracked down. High-imitation handset is always sold by purchasing casings for assembly without any technical contents. From this point, the media’s exposure is a good thing. So only by developing businesses together without variation, we just can go further; having our own brands is inevitably the trend of the future.”

Many Shanzhai handsets do not borrow trademarks of famous-brand handsets. They are called “Shanzhai products” because they do not go through the net-entry test. Referred to as the “regular” Shanzhai handsets, their manufacturers hope to distinguish themselves from other “irregular” ones, and to set up their own autonomous associations. In December, 2007, a Shanzhai “alliance card” was shown on line in preparation for the China’s Shanzhai Association. In the draft regulations of the “China Shanzhai Economic Innovation Association”, “Shanzhai” is redefined as “high-imitation, creation, innovation and production”. The Association required that members should “not have records of
manufacturing and selling faked or inferior goods, or of infringement of intellectual property rights like trademarks, patents, copyrights, etc.”, demonstrating that the Shanzhai manufacturers have developed their own self-regulating environment. The establishment of the Shanzhai Association can help to specify and restrict illegality and infringement of IPR. It can also help with the absorption of technology and originality in a legally constituted environment, which in turn should allow for the faster and more stable growth of Shanzhai.

Inside of Shanzhai other changes are taking place. One of the motives is competition among Shanzhai handsets” when disrupting and occupying part of the field of foreign-and home handset brands. The other motive stems from pressure of brand “temples”. Before 2007, there were more than 2000 enterprises involved in handset manufacturing in Shenzhen. As a result of low-level and homogenized competition among a great number of manufacturers, oversupply, severely overstocked products, and the continual clearance of goods with reduced profit margins, and even the sale of goods at a price lower than cost became the norm. For some Shanzhai manufacturers maintaining their current operational status was more than struggle.

Competition comes not only from domestic market but also from global market. In overseas markets, price competition for the home-made Shanzhai handset had reached its nadir. Unless handset manufacturers run business without profits it was not possible consider any further price reductions. Since some of these handsets were manufactured without adequate quality control, handset distributors home and abroad created psychological obstacles due to their fear of being regarded as being dishonest by their customers because of the low quality of the products.

If competition means selecting the superior and eliminating the inferior, internal competition spurs Shanzhai to be stronger as a group. A survey shows that the market share of Shanzhai handsets has grown to 25% in China, and the exported Shanzhai handsets have even a higher share of the market. Diversified value innovation in low-end market rather than infringements of intellectual property rights or tax evasion, appears to be driving this growth. MTK provides Shanzhai enterprises with an open innovation platform. The solution purchased by Shanzhai enterprises from MTK is merely a circuit diagram. Although a number of main boards with different configurations can be drawn from the circuit diagram technology inputing is needed to complete the process. Most of research and development personnel are engineers who had worked in former domestic handset enterprises, and in firms such as Nokia, Motorola. Most auxiliary manufacturers in China are first-class operators.

In this scenario of intense competition, a batch of large-scale Shanzhai handset manufacturers is positively applying for registration of their brands in order to build their own “Shanzhai”. The existence of lots of Shanzhai brands suggests that Shanzhai handsets are moving from imitation to innovation, as they seek variation after retaining their specific technical and organizational skills in order to survive in the market. Here innovation takes the form of integration of functions. Shanzhai handset manufacturers are building up their own brands and stepping out of the arena steeped in “brand difficulties”.

If Shanzhai handsets want to overcome problems of quality assurance they would be expected to participate in the net-entry technology test and build up their own quality assurance, maintenance and after-sale service system. In the trade this process is described as “being married” or “being regular”, “Being married”, “being regular” and “accepting surrender” all mean that Shanzhai handset manufacturers hope to cast off their own image of imitative “Shanzhai”, and the values associated with that tradition.

The Chinese classical novel Water Margin describes the process of formation, development and evolution of “Shanzhai”. In the initial stage of formation of Shanzhai, a lot of greenwood
Baw cocks united in Shanzhai, confronting the feudal official, “enforcing justice on behalf of Heaven”. Then Shanzhai was just a “united hall”. Subsequently Shanzhai was converted into a “loyalism hall”, and the Baw cocks accepted “amnesty and surrender” to the then royal court. When the above story is applied into the situation of Shanzhai handsets, it means that Shanzhai manufacturers may insist on Shanzhai while seeking cooperation with regular manufacturers, or “accept amnesty and surrender” (accept to be purchased or merged), and even “adaptation” (accept others’ investment in them).

The morphing process is paradoxical in the sense that for the Shanzhai producer not surrendering is to die, while surrendering is to die quicker! It has proved difficult for many Shanzhai manufacturers to surrender to the IMEI registration process and survive. But why is surrendering the same as dying quicker? The Anycall story provides a clue. A handset imitating Anycall boasts of good quality and performance. The above handset is produced in a factory in Shenzhen. When the factory is discovered and visited by Anycall management, the visitor offers the Shanzhai producer an opportunity to manufacture handsets with the original brand Anycall. Much to everyone’s surprise the visitor’s offer is rejected. The reason for the refusal of the opportunity is because developing a famous-brand handset means high logistic costs and the production of large quantities. This in turn implies that the response to market will be slowed down and the cost advantages of imitative production will be lost. This story shows why regular handset manufacturers were unable to expand their business in the third or fourth market or even in rural markets. These markets were left the Shanzhai makers. “Shanzhai King” K-Touch which changed into a regular manufacturer in 2006 took the first place in the domestic handset market in 2007 relying on subcontracting for their production. In 2008, its much vaunted move into brand handset development led to an advertisement investment of more than 100 million. It gained brand premium together with increased cost, but realised retarded growth!

In becoming ‘regular’ manufacturers must accept formal certification from tests carried out by the Beijing Center of Handset Test Identification (CTI). “The Beijing CTI is merely like a freeway toll station, which is unable either to speed up or to assure safety. The only effect is letting you line up and pay more money,” says one e-pal named “Reasonable Analysis” on a “Network of the Shanzhai Handset”, “any innovation or expansion must have 17 or 18 official seals of license authority, which is the fatal reason for domestic handsets to resort to “high diving” after the glory of occupying half of the market.”

As operation risks become higher with official crack downs, and since the traditional channel is unwilling to sell the Shanzhai handset without a brand and after-sale service provision, a large number of operators are joining the ‘regular’ bandwagon. In Shenzhen, a batch of large-scale Shanzhai handset manufacturers is proactively applying for licenses and registering brands, preparing for regularization. Deputy Managing Director Liu Wenquan of AHONG Communication points that each Shanzhai handset manufacturer, in fact, hopes to get rid of the title of Shanzhai handsets. For those Shanzhai handset manufacturers which have been regular or are becoming regular, they have experienced the initial stage of accumulating capital, and are about to step into a new development stage of establishing their own brands. “Some manufacturers and distributors are still doing Shanzhai handset business, because they are still in the process of primitive accumulation of capital.”

**State Level Governance and Government Regulation: Tolerance and Regulation**

Handset industry governance and internal governance of Shanzhai handsets all need a proper social and economic environment, which requires proper administrative governance.

The Shanzhai handset belongs to a kind of “shady handset” at first, which is because China stipulated a handset license system in 1998 so as to avoid repeated investment in handset projects and to guarantee a robust development of the national mobile communication industry. Consequently, handset production licenses become scare resources. A large number
of handsets without licenses sprung up in the market. On October 12, 2007, the removal of the administrative control in handset manufacturing industry led to the disappearance of the concept of ‘shady handsets’. The change in policy indicates that the government is adopting a different approach to administrative governance in relation to the handset industry.

The handset license system embodies strict supervision on handset entry, which is unfavorable to the early stage development of the handset industry. Entry barriers restrict investment of private capital, and some manufacturers acquire privileges and protections. Elimination of restrictions means tolerating the Shanzhai handset and is good for creating a tolerant and fair-competition environment for the handset industry, thereby, effectively and fundamentally putting an end to disadvantages of industry-entry restrictions.

Tolerance is favorable for the development of China’s handset industry today. China is the manufacturing center of the world, which includes not only OEM enterprises that supply manufacturing and production for various global brands but also numerous small-sized manufacturing enterprises and Shanzhai manufacturers. In order to pursue rapid profit returns, all Shanzhai manufacturers begin with imitations at the early period of development. Innovations always start from imitations. According to statistics given by State Intellectual Property Office and National Association of Industry and Commerce, 61% of patents are completed and applied by folk innovators.

It is common practice in many countries to take a tolerant attitude towards new industries. Tolerance of the Shanzhai phenomena can be found at both home and abroad. China has “Shanzhai”, while the US has the “garage”. “Garage” entrepreneurs imitate frequently. For instance, AMD imitated others’ integrated circuit at the beginning of its establishment; 5 years later, AMD self-designed 2901; at the end of the last century, it launched the K7 series CPU. DELL, which was set up in 1984, shared lots in common with those of Shanzai
manufacturers, prosperous in streets selling electronic products.

The growth history of Japanese and Korean enterprises shows that they also make use of Shanzhai methods in large numbers during the early period of development. Sony purchased foreign products for analyzing and researching at the early period. It also conducted all kinds of combinations and innovations on the basis of digesting the core technology, and finally, it launched into the market the products with more functions and better quality than those original ones.

In Hong Kong in the 1950s and 60s, many small Shanzhai factories lacking equipment and management existed in the cabins built at the foot of Lion Mountains. After moving into buildings founded by the government along the districts of Tuguawan and Shixiawei, the industries of Hong Kong grew out of the Shanzhai factories. Shanzhai stands for Hong Kong men’s spirit of diligence, with which to both combating and pursue change.

Tolerance can be classified into three types:

- negative tolerance, which does not seek any action;
- neutral tolerance, which means observing changes without being involved; and
- positive tolerance – including intolerance of “badness” so as to prevent badness and to advocate goodness.

Adopting a similar three pronged strategy experts classify handsets into three types: the first one belongs to smuggled shady handsets which should be strictly cracked down; the second type includes fully copied models or partially imitated handsets, which raise issues of intellectual property rights and other manufacturers’ brands. Such handsets are illegal; the third one is unfamous-brand handsets which can be frequently seen in the market, and which can quickly reflect the consumer’s requirements for the market by making use of handset chip suits. These experts regard the emergence of Shanzhai handsets to be a great innovation in the handset industry of our country, and to be a meaningful revolution in the handset industry chain.

The positive attitude also includes constructive interventions. In order to lead the Shanzhai handset to establish its own brand in Shenzhen, a shopping mall was constructed to sell regular handsets. The mall was used for exhibition and promotion of the Shanzhai handset to the public. Now, a batch of large-scale Shanzhai handset manufacturers are actively applying for trademark registration as they explore prospects of regularization.

The constructive intervention process means reducing net-entry test fees. The reason of not taking the net-entry test for the Shanzhai handset is the following two: firstly, manufacturers cannot afford net-entry test fees; secondly, they have no time to waste for the long-drawn-out test. It would take several hundred thousand Yuan and at least one and a half months to test a particular handset. At present, only one laboratory, a non-profit institution under government control, in Beijing conducts the net-entry test. The expensive test fee and the prolonged net-entry test time does not help with the adaptation to the requirements of the market where changes happen in minutes. If the service in the aspect of net-entry could be improved, or a competitive mechanism could be introduced in the administration of the net-entry, they could have productive outcomes.

The “Shanzhai Culture” and Innovation Governance

_reverse innovation_

The Shanzhai phenomena have spread to all industries of manufacturing. It is interesting to note how the “Temple” is learning from the “Shanzhai”. For example, VIA along with
Microsoft sets up an “Open Super-mobile Industry Strategy Alliance”, helping customers finish designing a complete laptop, which copies the operation mode of “Shanzhai handsets”. The first fifteen downstream manufacturers include Tsinghua Tongfang, E-Lead, YiLi, Great Wall, CZC and fitting manufacturing partners like SanDisk and AMI. For VIA, copying the operation mode of “Shanzhai handsets” has the two advantages: first, it can challenge Intel and AMD with the help of lots of manufacturers in the mainland; second, it can cut down the time of research, production and product shipment to accelerate market response and to reduce cost.

**The Spread of Shanzhai**

A combination survey carried out by China Youth Daily and QQ.com shows that e-pals have different comments to make on “Shanzhai culture”. Within one week, 2,169 persons completed the survey on line; among them 38.7% of persons regard Shanzhai culture as a duplicate culture; 33.7% regard it as a fake culture; 30% regard the core of Shanzhai culture in fact to be a kind of plagiarism; and 24.9% regard Shanzhai to be a synonym for inferior quality. However, a small number of ‘net friends’ consider that Shanzhai products are economical and practical and that Shanzhai culture is very promising particularly for new product development and innovation.

As the Shanzhai phenomena spreads certain features remain constant across a range of products and services. Firstly, the Shanzhai phenomenon is based on a specific platform. In manufacturing industry, technical integration brought about by improvements and adoption of manufacturing technologies provide for a technical platform for Shanzhai manufacturers. The platform of the Shanzhai phenomenon in culture and entrainment industry is a tolerant and loose environment of respecting differences, and maintaining diversity, and a relatively convenient and cheap expressive technique which is owned by the common people.

Secondly, the appearance of Shanzhai products and Shanzhai culture is dependent on a broad market space and a mass base. The cultural field is generally the stage of a few “cultural elite”. Shanzhai culture enables ordinary people to participate in cultural discourse and provides them with an opportunity for seeking novelty, expressing their appeal and self-amusement. Some people consider that Shanzhai in the culture field comes from rebellion against the mainstream, challenge to authority, imitation of elite, and release of grassroots’ depressions.

Thirdly, by depending on others’ brands, Shanzhai manufacturers bring disruptive impacts and shocks for mainstream manufacturers. In the manufacturing industry, their imitations lead to a disturbance of the effect of regular brands and of the regular market order. It also prompts mainstream manufacturers to change their strategies. In the culture and entertainment field, elite behavior, discourse and products are challenged while they are copied. For example, the ‘Shanzhai Spring Festival Gala’ challenged the more exclusive CCTV Spring Festival Gala.

Fourthly, Shanzhai culture needs comprehensive governance. It’s easy for Shanzhai products to infringe on intellectual property rights. So Shanzhai products should be guided properly so as to avoid some negative social consequences. The future development of Shanzhai culture is not clear. It might gradually disappear as it competes for diversification. It may “accept surrender” to the “Temples”, both in China and abroad to adapt. In addition, some typical Shanzhai models may build their own brands. For instance, on October 9, 2004, Variety & Art channel of CCTV launched a talent show named Avenue to Stars, which advocates healthy and elegant art appreciation and builds a platform for the ordinary citizen to showcase their talents.

**Part Six: Conclusions and Problems for Future Investigation**

The Shanzhai phenomenon which is both fashionable and controversial in China, and which attracts attention from all over the world, has a complicated and profound social economic background. The paper analyzes the technical level and market foundation of the phenomenon,
points out the internal mechanism and environmental conditions, and considers Shanzhai phenomenon to have the broadest mass base under certain conditions of technological, economic and social change. It challenges market monopolists and mainstream fashion with its unique way while hovering at the edge of intellectual property rights issues, imitation and innovation. The survival and development of the Shanzhai phenomenon needs comprehensive governance of administration, industry and inside. The findings in this paper suggest that the as the Shanzhai manufacturers struggle to survive in a highly competitive market place, their strategies for varying their methods of operation tend to follow an evolutionary pattern depending on the type of innovation they consider necessary for their growth and development. The selection and retention of technologies, networked links, compliance with registration and co-operation with both global brand players and government legislation, is accompanied by different forms of learning. As figure 7 below shows, each of the stages through which they evolve and learn offers positive and negative outcomes. The way in which they navigate their way through these stages is dependent on the trade-offs between these outcomes. Governance plays a significant role in helping these manufacturers make appropriate choices, with different and relevant forms of governance reflecting the nature of the evolution of the Shanzhai phenomenon.

Figure 7:

Shanzhai Innovation and Governance: An Analytical Framework

It is still unclear which key factors have the biggest influence on the development of Shanzhai manufacturers. Secondly, Shanzhai has helped to bring expensive knowledge-based, hi-tech products, brands, patents, etc. to ordinary people. How can these models be developed to enable consumption expand domestic demand in China. Fourthly, changes in the market development activities of large brand names appear to have been the result of competition by Shanzhai manufacturers. What can brand manufacturers learn from this process to operate more effectively in emerging economies and to generate new business models. Finally, the network-centric structure and its evolution in the Shanzhai market place calls for a network-oriented governance structure involving government, industry and firms. How can these
network governance structures be established so as to legitimize and gain from Shanzhai business models?

Shanzhai lies in that fuzzy state between productive and unproductive or rent-seeking types of entrepreneurship (Baumol, 1997). Their effective governance could obtain more productive value in terms of both their legitimacy and also in relation to the realization of new opportunities. Shanzhai offers an network-based organizational construct which embraces both social and economic values. Its manifestation in a Chinese cultural environment does not necessarily make it difficult to understand Their counterparts in American “garages” and other cultural spaces suggests that there is something to be gained from the commonality of such phenomena.

Restricted Development of SMEs in Japan’s Software Industry: Reasons and Solutions*

by Nobuhiro Takahashi

This paper examines the reasons that most small and mid-sized enterprises (SMEs) in Japan’s software industry do not develop into large firms. Several papers have already suggested reasons for this phenomenon, but each paper in the literature has given few reasons. This paper analyzes the issue more comprehensively. I first survey the literature and determine five factors that contribute to the issue. Then I show the causal connections among these five factors, demonstrating how they complicate the issue and make it difficult to solve. Finally the paper illustrates several approaches in an effort to find solutions.

Introduction

The Japanese software industry works within a large subcontracting system. Thousands of small and mid-sized enterprises (SMEs) are informally organized under several large companies. Those SMEs have experienced difficulty developing into large firms. This industrial structure has remained for several decades.

Nobuhiro Takahashi is an associate professor at Osaka City University in Japan, and a visiting scholar at University of California, Berkeley.

Several authors have taken up this issue in the past; however each paper in the literature has given few reasons for the failure of SMEs to expand to become large companies. Additionally these papers failed to analyze the issue comprehensively. As this paper shows, factors that contribute the issue have causal connections with each other. These connections complicate the issue and make it difficult to solve, and the preceding literature has not fully recognized this point.

This paper proposes five reasons why software SMEs have experienced difficulty in developing into large firms. Then, I show the causal connections among these five factors, demonstrating how these connections complicate the issue and make a solution difficult to identify. I analyze the issue comprehensively and prove that these factors as a whole prevent software SMEs from developing into large firms.

This paper focuses on software firms which develop packaged or custom software. I do not aim to analyze embedded software or game software, as embedded software is simultaneously developed with the hardware of manufactured goods. The game software industry is largely influenced by the Japanese animation culture. Therefore, I distinguish them from packaged and custom software. However, some factors which I describe hold true to embedded and game software in Japan.

This paper is organized as follows. In Section 2, I survey the literature and determine five factors that contribute to the issue. Section 3 shows the causal connections among these five
factors, demonstrating how these connections complicate the issue and make it difficult to solve, and offers solutions. Section 4 concludes this paper by illustrating several approaches in an effort to find solutions.

**Five Factors Preventing Software SMEs from Developing**

**The Division of the Market**

The first factor, the division of the market, stems from the business environment in Japan’s computer industry. Until the early 1990s, Japanese computer manufacturers had been developing both hardware and software. Since the software worked only on the hardware developed by the same manufacturer, it had to be specially developed for the hardware of each manufacturer. This resulted in the partitioning of the software market into many small markets. For the software SMEs, segmentation makes it difficult to spread high fixed costs, so they were not able to develop their own products (Baba et al., 1996).

Since the middle of 1990s, software has worked for hardware made by any computer manufacturer. Therefore, the segmentation does not exist anymore. However, the next section shows that this factor still influences the Japanese software market.

**The Inappropriate Valuation of Software**

The second factor is that the value of software is not appropriately evaluated, and software
development is therefore inappropriately priced. This situation is described by Porter and Takeuchi:

Japanese customers strongly preferred custom software, which was often bundled with mainframe computers by Japanese computer companies. Because they expected software to come ‘free’ with the computer, Japanese customers resisted paying for pre-packaged software separately. That inhibited development of the much more cost-effective software solutions that were widely accepted in the United States and elsewhere (Porter and Takeuchi, 2000).

**Problems Related to Securing Human Resources**

The third factor involves the problems that software SMEs encounter when seeking reliable and efficient human resources. A major reason for this is Japanese students’ image of the software industry. The industry has a reputation for terribly long overtime work as the norm. The image of software industry is hard work, going home late at night or even sometimes sleeping at the workplace and low wages, among other negative conditions. A survey also shows that the largest problem for IT (Information Technology) firms in recruiting newly graduating students is “the bad image of the industry” (Information-Technology Promotion Agency, Japan, 2008). In addition, highly-skilled engineers are not always paid nor promoted appropriately. This custom hampers software engineers’ motivation to acquire more skills.

These conditions negatively affect the ability of the software industry to recruit top students, and cause engineers working for software firms to transfer to other industries.
**Problems Related to Universities**

The fourth factor is problems related to Japanese universities. As the content of research conducted at software engineering firms is far from considered practical use, research in universities rarely contributes to software SMEs, which lack ample funds for their own research and development.

Japanese university education also has several problems. In the 1990s, there existed a lack of professors of computer science to a large extent. Since then there has been an increase in these positions, however it is said that their education is not towards any practical use compared with the United States, India, and other countries (Yamashita ed., 2007). As a result, most Japanese newly-hired software engineers cannot carry out the work of software firms.

**The Lack of Able Engineers**

The fifth factor is the lack of ability and motivation among Japanese software engineers. Tomoo Matsubara, a former engineer at Hitachi, Ltd. attributed to a lack of “creative ideas and products” among the software community (Matsubara, 2001). In addition, the Software Global Competitiveness Research Committee, established by the Institute of Electronics, Information and Communication Engineers in Japan, has stated that “the motivation of Japanese software engineers to capture market is weaker than foreign engineers” (Matsumoto,
Causal Connections of Factors Preventing Software SMEs from Developing

In this section, I show the causal connections among these five factors, and demonstrate how these connections complicate the issue and make its solution evasive.

The Reason why the Inappropriate Valuation of Software is caused

I now consider why the second factor, the inappropriate evaluation of software is caused. As I described in the former section, Japanese computer software had to be specially developed for the hardware of each manufacturer. This business environment resulted in the first factor, the partitioning of the software market into many small markets.

Because of the partitioned market, there was not much competition among computer manufacturers. They earned excess profits from hardware sales, so they tended to handle software as an add-on of sorts, selling it for very low prices. Consequently, Japanese software clients did not place an accurate value on the software, leading to the second factor.

The segmentation of the market disappeared in the middle of 1990s. However, the Japanese clients still inappropriately evaluate the value of software. In other words, they don’t understand the value of software even today. This situation indicates that the first factor
causes the second factor.

**The Cause of the Problem Related to Securing Human Resources**

I now consider the cause of the third factor, problems related to securing human resources. Because software clients have failed to understand the value of software, large software firms in Japan have needed to decrease the cost of developing software by using software SMEs as subcontractors. This practice has resulted in the establishment of a huge subcontracting system in the Japanese software industry.

This subcontracting system causes a further problem. The system is suitable for the waterfall model, which is the most widely-used software development process in Japan. The model requires that each phrase of the software development be perfectly determined and never changed afterward. However, because Japanese clients cannot decide what kind of software they need, they often revise the design of software after it is almost completely developed. This kind of large-scale design change causes significant overtime work for software engineers. This then leads to problems related to securing human resources. This situation indicates that the second factor causes the third factor.

**The Cause of the Lack of Able Engineers**

Next, I consider the causes of the fifth factor, the lack of able engineers. As I discussed
under the third factor, significant overtime hours is common in Japan’s software industry. These working conditions and low wages lead to the decline of the industry's image. In addition, the fourth factor shows that the research and education of universities is far from involved in practical use. These things contribute to the lack of able engineers. This situation indicates that the third and fourth factors cause the fifth factor.

**Concluding Remarks**

This paper examined the reasons why most software SMEs in Japan’s software industry have failed to develop into large firms. I determine five factors that contribute to the issue—(1) the division of the market, (2) the inappropriate valuation of software, (3) problems related to securing human resources, (4) problems related to universities, and (5) the lack of able engineers.

This paper also shows the causal connections among these factors. The first factor causes the second factor, which causes the third factor. In addition, the third and fourth factors cause the fifth factor.

The first factor, the partitioning of the software market into many small markets, resulted in excess profits for hardware sales and lower prices for software. This custom caused the second factor, the inappropriate valuation of software by clients.

Because of the inappropriate valuation of software, large software firms in Japan have
needed to decrease the cost of developing software. They exploit the many software SMEs as subcontractors and use the traditional software development process. However, the development system does not suit the behavior of Japanese clients, resulting in prolonged overtime work for software engineers. This situation results in problems related to securing human resources.

Because of problems related to securing human resources and universities, the software industry has encountered difficulties in recruiting motivated engineers and encouraging them to obtain practical knowledge and skills. These circumstances contribute to the lack of able engineers.

These connections complicate the issue and make it difficult to solve. This is why most SMEs in Japan’s software industry do not develop into large firms. As a result, this industrial structure has remained for several decades.

This paper illustrates several approaches that could be applied to new software development processes in order to solve this issue. As an example, I now take up the problem of large-scale design change by Japanese clients, which leads to the third factor. I suggest two methods of dealing with this problem.

The first method is introducing agile modeling and other iterative software development processes. Agile modeling adjusts design change more easily compared with other software development processes. Other iterative software development processes also adjust design
change easily compared to the waterfall model. By using these processes, software engineers can avoid long overtime work, which contributes to the difficulties in securing human resources.

It is sometimes said that the agile modeling is not suited to large-scale projects. In fact, there are so many Japanese projects that hundreds of engineers participate in using the agile model. Therefore, the agile model and other iterative software development processes are applicable to various projects.

The second method is for software firms to demand appropriate compensation for each design change. Japanese clients usually pay smaller compensation for design change compared to the amount of work associated with the task. Therefore software firms must reduce their costs for changing the design by decreasing the number of software engineers for the task. This is one of the reasons for long overtime work. However, some foreign software firms in Japan already demand appropriate compensation from their clients for design changes. If many Japanese firms did this, overtime work would be shorter.

Successful cases through these methods would create new business models, which would set Japanese software firms free from the above causal connections. Firms and governments must cooperate with each other to produce these trends.

---

1 IBM Japan started positively exploiting agile modeling in 2006. The firm implemented more than 320 projects using the model for three years until 2009.
References

Abstract

Two research issues are examined using a panel data of new technology-based firms (NTBFs): whether the involvement in research collaboration with universities contributes to improving research productivity of NTBFs; and which type of NTBFs are likely to receive spillover via research collaboration. Estimated treatment regression models reveal that NTBFs collaborating with universities and public research institutes in research demonstrate higher research productivity. The positive impact of research collaboration on research productivity is salient when NTBFs experience in collaboration with any partners, or possess greater or small absorptive capacity.

Keywords: research collaboration; universities; new technology-based firms; research productivity; spillover
1. Introduction

After the Plaza Accord on exchange rates in 1985 that admitted strong Yen, Japan experienced two major upheavals in economy: the emergence and collapse of the bubble economy during 1985 and 1989; and a very long-term slowdown in 1990s and 2000s (except for during 2001 and 2006, the period when structural reforms under the Koizumi administration were working). The crucial factor that accounts for the serious stagnation encountered by the Japanese economy is not a financial crisis per se, but downturn in total factor productivity growth. New technology-based firms (NTBFs) that are young and attempt to enter markets by introducing new products are a significant source of total factor productivity growth, since they improve industrial metabolism by promoting entry of new firms and exit of inefficient incumbents, and promote industrial innovations. Supporting NTBFs has a positive implication on macroeconomic growth but policy instruments for the promotion of NTBFs are distinct from those applied to other small firms (Tether and Storey, 1998; Storey and Tether, 1998). Compared to other small firms, the source of innovation of NTBFs is more science-based, implying that the promotion of knowledge interaction with universities and public research institutes will improve their innovative capacity. The previous literature supports this view by indicating that NTBFs are a significant recipient of spillover via research collaboration with universities and public research institutes.

Based on a review of extant theoretical and empirical studies, a panel data on NTBFs, and an econometric model taking account of an endogeneity problem, this study examines whether cooperative research with universities contributes to improving the efficiency of the knowledge resources, and if so, which type of NTBFs are more likely to receive spillover via cooperative research with universities.¹ Foreshadowing the results, NTBFs collaborating with universities and public research institutes in research

---

¹ NTBFs are defined as small, R&D-performing firms that are not subsidiaries. The Basic Law on Small and Medium Enterprise defines small firms in the manufacturing sector as firms with 300 employees or fewer, or firms with capital of 300 million Yen or less. The threshold applied varies according to industry.
show higher research productivity, and the positive impact of research collaboration on research productivity is salient when NTBFs experience in collaboration with any partners, or possess greater or smaller absorptive capacity.

The remainder of this paper is organized as follows. Based on an extensive review of the previous theoretical and empirical studies, hypotheses on the relationship between cooperative research with universities and research productivity of NTBFs are proposed in Section 2. The econometric model and the dataset are introduced in Section 3. In Section 4, implications of empirical findings are discussed and Section 5 refers to agendas for future research.

2. Hypotheses

Theory suggests that R&D cooperation affects research efficiency of the participants in two distinct ways. First, R&D cooperation enables participants to share the fixed costs of R&D and avoid overlapping investment. This improves R&D efficiency by reducing individual R&D expenditure and dividing R&D tasks to exert economies of scale. Irwin and Klenow (1996) show that this argument holds true for SEMATECH, interfirm R&D cooperation in the US semiconductor industry. Second, R&D cooperation enables participants to share technological skills and improves the quality of R&D personnel via spillover, which may result in an increase in individual R&D expenditure (Sakakibara, 2003). Link and Bauer (1989) show that although cooperative research per se does not yield significant innovation outputs, high-tech firms engaging in cooperative research can exploit their knowledge resources more efficiently for successful innovations, indicating spillover via cooperative research. Cooperative research is conducive to spillover because it implies a close communication among scientists affiliated with different institutes. Face-to-face communication is required to transfer not-codified knowledge embodied in researchers (Von
The second channel in which cooperative research affects the efficiency of NTBFs’ innovation activities is important in university-industry collaborations. Odagiri et al. (1997) indicate that the research consortium on the fifth-generation computer project is designed to maximize knowledge transfer among participants by encouraging the interorganizational mobility of star scientists and engineers affiliated with universities and industry. It is reasonable that frequent communication among R&D personnel affiliated with different institutes through R&D cooperation fosters the transfer of tacit knowledge and improves the quality and usage of knowledge resources. A number of empirical studies in various regions indicate a positive impact of research alliance with universities on research productivity of NTBFs via spillover. Small high-tech firms that engage in university-based research are more likely to improve R&D efficiency, compared to their larger counterparts (Link and Rees, 1990). Small high-tech firms collaborating with local universities are likely to achieve new product development (Acs et al., 1994; Romjin and Albaladejo, 2002). Motohashi (2004) indicates that younger R&D-performing firms are likely to exploit university knowledge via cooperative research more efficiently to achieve technological and commercial success in innovation. Furthermore, recent studies examining small biotech firms indicate a positive correlation between their research alliances with universities and research productivity (Deeds and Hill, 1996; Powell et al., 1996; Zucker et al., 1998; Baum et al., 2000; Rothaermel and Deeds, 2004). Such advantage of small biotech firms may partly stem from sectoral characteristics that innovations in biotechnology depend heavily on public knowledge (McMillan et al., 2000), and, more importantly, may stem from that small firms have more to learn from external sources of knowledge with a greater potential for growth stimulated by knowledge linkages (Sakakibara, 1997).

**H1:** NTBFs with collaborating with universities in research are likely to show higher research productivity, compared to NTBFs without research collaboration with universities.

---

Theory suggests that establishing university linkage does not necessarily imply the improvement of research efficiency because spillover and absorptive capacity are complementary (Cohen and Levinthal, 1990; Kamien and Zang, 2000). Since cooperative research implies that participants match contributions in research and learn mutually, absorptive capacity represented as knowledge stock within the firm is necessary for entering into and exploiting knowledge linkages between economic organizations. Firms with absorptive capacity attract more potential R&D partners (Ahuja, 2000) and thus have more opportunities to establish research alliances with various partners, which leads the firm to be central in the knowledge network and to acquire a positive rent (Powell et al., 1996; Powell et al., 1999; Powell et al., 2005). Therefore, it is predicted that NTBFs with greater absorptive capacity are likely to exploit university research as a source of innovations more effectively than others.

H2: The impact of research collaboration with universities on research productivity of NTBFs is salient in the case of NTBFs with greater absorptive capacity.

Research alliance is not without hazard. R&D cooperation entails risk of leaking valuable knowledge as well as benefit from knowledge transfer (Sakakibara, 1997; Baum et al., 2000; Branstetter and Sakakibara, 2002), implying the dilemma between sharing and appropriating knowledge. Firms competing in the same product market may attempt to learn from others as much as possible while concealing their own knowledge that is valuable for innovation, which discourages firms to collaborate or to exert research effort in collaboration (Katz, 1986). This type of dilemma affects not only interfirm R&D cooperation but also university-industry research collaboration (Rothaermel and Deeds, 2004). The previous literature suggests working solutions to this problem. First, cooperative research tends to take place in the phase of basic research rather than in the phase of applied research (Link and Bauer, 1989;
Link et al., 2002), where the serious conflict of commercial interest is unlikely. Second, and more importantly, establishing organizational assets among participants reduces coordination costs stemming from opportunism such as free-riding (Dyer and Nobeoka, 2000; Kale et al., 2000; Kogut, 2000). Transaction cost theory suggests that frequent transaction generates organizational assets. For more effective knowledge transfer, organizational assets play a more significant role in the case of an interactive channel such as cooperative research, than in the case of less interactive channels such as technical consultation (Izushi, 2003). Therefore, it is predicted that organizational assets enable NTBFs to assimilate knowledge flow from universities more effectively.

**H3**: The impact of research collaboration with universities on research productivity of NTBFs is salient in the case of NTBFs with more organizational assets.

3. Method

The formation of research alliance is a choice variable of the firm. Put differently, the probability of engaging in joint research with universities is not distributed randomly across NTBFs. If the probability is affected by the factors that cannot be measured by available data, and those factors affect research productivity of NTBFs too, a statistically significant relationship between research collaboration and firm performance revealed by usual econometric approach might be spurious. In this regard, recent progress in econometrics enables us to deal with endogeneity problem appropriately. This study employs the treatment regression model to estimate the true impact of cooperative research on research productivity. The econometric model is described as follows.

\[
Y_{it} = a + b^*X_{it} + c^*D_{it} + u_{it} \quad (1);
\]

For theoretical development and empirical applications of the two-step or recursive model to estimate policy impact with controlling for endogeneity, see Heckman et al. (1999), and Greene (2000).
\[ D_{it} = d^*Z_{it} + v_{it} \quad (2); \]

where \( Y \) denotes research efficiency measured as inventions applied for the Japan Patent Office between \( t \) and \( t+1 \) divided by the number of scientists at the time of \( t \), \( X \) denotes determining factors in research efficiency, \( D \) denotes a binary dummy taking a value of one when the firm engages in cooperative research with universities and public research institutes at the time of \( t \), and zero otherwise, and \( Z \) denotes determining factors in research collaboration. If OLS is run on Equation 1 using the pooled data of cooperative research-active and cooperative research-inactive firms, the estimated impact of collaboration tends to be inappropriate due to endogeneity. This is because \( D \) in Equation 1 is not a random but a choice variable, and thus is associated with unobservable factors, i.e., \( u \) in Equation 1. The treatment regression model estimates Equation 2 using probit model, and then estimates Equation 1, incorporated with selection correction variables, using OLS. To satisfy the assumption of normally distributed dependent variable in OLS, \( Y \) is log transformed. For this purpose, a value of one is added to the number of patent application before divided by the number of scientists, since many firms report zero for patented inventions.

An unbalanced panel on NTBFs was established using “Nationwide Research Institutes Directory,” compiled by Lattice. This biannual survey collects information on universities and public research institutes, and also provides information on research activities of approximately 500 small, R&D-performing firms.\(^5\) The dataset of survey conducted in 1996, 1998, 2000, and 2002 is collected. The data of patent application is collected from patent database that is opened to the public, the National Center for Industrial Property Information, “Industrial Property Digital Library”. As noted above, the relationship between cooperative research and innovation output yielded following two years is examined. This is because this research is not focused on direct output of cooperative research. It is assumed that spillover effect via collaboration improves the quality and usage of knowledge resources that are allocated for other research projects as well, which may elicit the effect in a relatively short period of time. For the same\(^5\) No financial indicator is available from this survey.
reason, patent applications instead of grants are used to measure innovation output. Due to the database constraints, simple patent counts without controlling for value or quality of knowledge are used, while innovation counts or weighted patent counts are better indicators of innovation output than simple patent counts (Griliches, 1990; Trajtenberg, 1990; Acs et al., 2002). Due to sectoral characteristics such as technological opportunities and appropriability, the probability of engaging in cooperative research with universities and patenting inventions significantly varies across industries (Levin et al., 1984; Pavitt, 1984; Cohen et al., 2000). Therefore, industry dummy variables are introduced in regression models representing Equations 1 and 2. Brower and Kleinknecht (1999) indicate that smaller firms show a lower propensity to patent due to difficulty in obtaining sufficient information and application costs. Therefore, firm size represented as the number of employees is introduced in regression models representing Equation 1.

4. Results

Table 1 presents sample statistics for variables. Table 2 shows research intensity, defined as the number of scientists divided by the number of employees of the firm, and the degree of involvement in cooperative research with universities and public research institutes by industry. The results show a significant inter-industry variation in technological opportunities represented as research intensity. In high-tech sector, such as electronics, firms tend to allocate more knowledge resources to innovation activities than other sectors. Analytical service industry shows the highest research intensity and the highest probability of engaging in cooperative research with universities. High-tech sectors such as chemical and electronics show relatively low propensity to engage in cooperative research with universities while relatively low-tech sector such as textile shows higher propensity to engage in cooperative research with universities.

_____________________

Tables 1 and 2 about here
Table 3 presents the results of regression analyses. Model 1 shows the result of estimation using the entire observations. Regarding Equation 2, NTBFs with smaller absorptive capacity tend to engage in cooperative research with universities, which contradicts my prediction. Age of the firm has no correlation with the probability of establishing university linkages. Regarding Equation 1, smaller firms show higher research efficiency. Cooperative research with universities has a positive impact on research efficiency of NTBFs, which supports H1. This is consistent with a number of empirical findings in various regions that show the positive relationship between cooperative research with universities and improved research productivity of small high-tech firms.

Is the effect of collaboration with universities on research productivity contingent on other factors such as organizational assets and absorptive capacity of the firm? Models 2 and 3 show the result of estimation using observations with and without organizational assets. Organizational assets are measured as experience in cooperative research with any partners including competitors, customers, suppliers, and research institutes. Regarding Equation 2, absorptive capacity negatively correlates with the probability of engaging in cooperative research with universities in Model 2 while there is no significant relation between the two variables in Model 3. Regarding Equation 1, smaller firms show higher research efficiency in both models. Cooperative research with universities has a positive impact on research efficiency in both models, but the coefficient is greater and more statistically significant in the case of NTBFs with experience in research collaboration, which supports H3. The results indicate that NTBFs with experience in cooperative research acquire organizational skills to manage collaborative relationships and assimilate knowledge of universities and public research institutes more efficiently. This is consistent with empirical findings showing the positive correlation between experience in research collaboration and spillover via research collaboration (Branstetter and Sakakibara, 1998; Anand and Khanna, 2000).

Models 4, 5, and 6 show the result of estimation using observations classified according to the
level of absorptive capacity. Although the capacity to assimilate external knowledge is affected by knowledge that is already accumulated within the firm, i.e., knowledge stock, research intensity is used as a proxy variable for absorptive capacity due to data constraints. Observations are classified into three groups: observations with research intensity greater than 75 percentile; observations with research intensity smaller than 75 percentile but greater than 25 percentile; and observations with research intensity smaller than 25 percentile.\(^6\) Regarding Equation 2, absorptive capacity plays different roles as determinants in conducting cooperative research according to the categories. Among NTBFs with the greatest absorptive capacity, there is a negative correlation between absorptive capacity and the probability of engaging in cooperative research, while there is no significant relation between the two variables regarding NTBFs with medium and low level absorptive capacity. These results are partly consonant with arguments that firms with great absorptive capacity will find it unnecessary to establish alliance while firms with poor research quality will find it difficult to attract potential partners, implying the inverse U-shaped relation between absorptive capacity and the probability of engaging in cooperative research (Mowery et al., 1998; Ahuja, 2000; Sakakibara, 2003). Regarding Equation 1, smaller firms show higher research efficiency in all models. That firm size negatively correlates with research efficiency in all models in Table 3 suggests the possibility that, as firms grow, they may expand innovation activities to the extent of unrealistic research programs with poorer chance to succeed (Cohen and Klepper, 1996). There is a positive and significant correlation between cooperative research with universities and efficiency of research activities in the case of NTBFs with greater absorptive capacity while there is no significant relation between the two variables in the case of NTBFs with medium level absorptive capacity, which supports H2. However, there is also a positive correlation in the case of NTBFs with smaller absorptive capacity, and the coefficient is greater than in the case of NTBFs with greater absorptive capacity, which contradicts my prediction. The result in Model 4 implies that highly research-intensive NTBFs are likely to go it alone

\(^6\) The main results remain unchanged by using alternative thresholds for research intensity such as 33 percentile and 66 percentile.
because they face greater risk of leaking valuable knowledge and have more difficulty in finding an equivalent research partner, however, once they have established university linkages, they exploit the interactive channel of knowledge transfer most effectively, which suggests complementarity between spillover and absorptive capacity (Cohen and Levinthal, 1990; Kamien and Zang, 2000). The result in Model 6 implies the U-shaped relation between absorptive capacity and the impact of research collaboration with universities, since two extremes are advantageous in exploiting university knowledge via research collaboration. This may reflect that, among NTBFs with low absorptive capacity, there is a greater potential for growth stimulated by knowledge linkages with universities and public research institutes (Sakakibara, 1997).

5. Conclusion

As Jaffe et al. (1993: 596) point out, it is important to investigate the mechanism of knowledge transfer as well as the presence of spillover, and this study contributes to the previous literature on both research issues. As for the presence of spillover, the results show that knowledge created by universities and public research institutes is a significant source of improved research productivity of NTBFs. As for the mechanism of spillover, the results show that cooperative research is a significant channel of knowledge transfer from public knowledge to NTBFs, and that NTBFs with organizational assets and NTBFs with greater or smaller absorptive capacity are significant recipients of spillover. More important research question will then be how efficient university-industry knowledge transfer via various channels is promoted in the national or regional system of innovation. Recent innovation studies pay an increasing attention to spillover that is contingent on the geographical proximity to the spillover pool, and thus to
policy instruments that facilitate university-industry knowledge flow within the region. Therefore the future research will investigate whether property-based initiative such as science parks contributes to the promotion of knowledge interaction between NTBFs and universities, and whether the interregional variation in university-industry knowledge flow correlates with the interregional variation in research productivity.

A Fourth Way Between Regular, Social and Green Entrepreneurs:  
The Sustainable Entrepreneur

by Katia Richomme-Huet, and Julien De Freyman*

We want to encourage the debate and to confront points of view (about the problematic of entrepreneurship), and perspectives (managerial and political implications, global program of research). Our theoretical reflexion suggested the construction of sustainable trajectories from which each type of entrepreneur (regular, social, green and sustainable) could gain in comprehension. This research proposes to supplement this prospect by subjecting it to an empirical exploration. Multiple case studies will serve its reading and its operationalisation.

Introduction
There has been much written about Entrepreneurship over the last decades (Gartner, 2008) and there is considerable debate about the purpose of entrepreneurship research (Davidsson, Low & Wright, 2001). The literature identifies several theoretical perspectives from which the domain could be understood and explored: entrepreneurship as an economic function (Cantillon, 1775 ; Knight, 1921), entrepreneurship as innovation (Schumpeter, 1935), entrepreneurship as organizing (Gartner, 1993, 2001), entrepreneurship as value creation (Bruyat and Julien, 2000), entrepreneurship as opportunity recognition (Venkataraman, 1997 ; Shane and Venkataraman, 2000 ; Shane, 2003) or entrepreneurship viewed in behavioural terms (McClelland, 1961 ; Carland et al., 1988 ; Aldrich and Zimmer, 1986 ; Delmar, 1996).

However, although the lack of an agreed definition of entrepreneurship has been clearly hampering the development of the field (Eckhardt and Shane, 2003), the consensus about how entrepreneurship is important to economic development and growth was rapidly established. Hence, entrepreneurs were considered as the single most important player in a modern economy (Lazear, 2002). What is less considered is the emergence of new types of entrepreneurs in developed countries and the future consequences of their entrepreneurial activities on the world economy. After focusing on the links between Entrepreneurship and Economic Growth (Audrestch, 1995), the “New Deal” for entrepreneurs is to be the engine of sustainable development (Pacheco, Dean and Payne, 2009). Many scholars consider entrepreneurs as the drivers of the next industrial revolution for a more sustainable future and decline new terms such as “sustainable entrepreneurship (Dean and McMullen, 2007), green entrepreneurship (Berele, 1991), environmental entrepreneurship (Anderson and Leal, 2001; Dean and McMullen, 2007; Keogh and Polonsky, 1998), ecopreneuring (Bennett, 1991; Blue, 1990; Shaper, 2002), and social entrepreneurship (Dees, 2001)” (Pacheco, Dean and Payne, 2009). So, following pioneer scholars, we want to provide an explicit link between Entrepreneurship and Sustainability, by asking “why and how do these new entrepreneurs matter?” The remainder of this paper is organized as follows. First, we lay down the theoretical bases of our study, namely regular, social, green and sustainable entrepreneurs. We expound a theoretical and methodological model that formalizes some of the key insights indentified in the literature. Second, we describe the methodology and the sample, which is analyzed and discussed.

LITERATURE REVIEW

Scholars identified in the last decades four main classes of entrepreneurs: first, the field of entrepreneurship focuses on “regular entrepreneur”, an individual who creates a venture for his self-employment or for the development of his business project. Then, “social entrepreneurs” decided to create an organization such as association or cooperative, in order to help individuals and to contribute to well-being. They can also only exploit the opportunities related to the personal services. The third category cares more about environmental challenges, with the objectives to wash the world from pollution and climate changes: they are called “green entrepreneurs” and, sometimes, are suspected of “green-washing” to surf the green wave and to gain more profit. Then, last but not least, a new entrepreneur type is described as a combination of the three first.

Regular entrepreneur

The regular entrepreneur is someone who assumes both the risk and the management of a business venture (risk-taker). His objective is to add value through profit by introducing news goods or new methods of production and implementing change in an economy (Schumpeter, 1942). So, he will start a profit-seeking business venture in the Say-Schumpeter tradition, reaffirmed by Drucker (1998), as a catalyst and innovator for the economic progress. Recently, according to Lumpkin and Dess (1996), the entrepreneurs launch new venture towards various ways: starting up, taking over or corporate venturing. They discover (Kirzner, 1979) and exploit opportunities (Shane, 2003) in order to gain profit and without regard to resources currently controlled (Sahlman and Stevenson, 1991). We agree with the idea that an entrepreneur is also a manager (or an administrative) who knows that his firm must generate enough profitability or cost-effectiveness to survive. A regular entrepreneur is not attracted only by wealth creation but his position on for-profit market needs financial resources and return on investment. Wealth is not only end but it is fundamental means to avoid failure. Indeed, “entrepreneurs not only seek out and identify profitable economic opportunities but are also willing to take risks to see if their hunches are right” (OECD, 1998:11).

Social entrepreneurs

However, generating profit and social value is also a possibility which receives increasing attention from the new social entrepreneurs. Although scholars and practitioners have proposed a plethora of definitions for social entrepreneurship, no generally accepted definition exists in the research community (Brock, 2008; Short, Moss and Lumpkin, 2009). According to Dees (2001), “social entrepreneurs are one species in the genus entrepreneur” with a central and explicit social mission, rather than a wealth creation. Considering this tendency, Austin, Stevenson & Wei-Skillern (2006:2) had recently noted, as an underlying drive, that the social entrepreneurs create social value rather than personal and shareholder (Zadeck and Thake, 1997) and introduce innovation rather than replication. They consider that we can combine the triple ideas of “social value”, “innovation” and “profit approach”. There is no consensus on what exactly is the essence of social entrepreneurship. But Light (2008) purposes a basic agreement shared by most authors: “social entrepreneurship must change the status quo by creating social value (Dees), systemic social change (Drayton), a new social equilibrium (Martin and Osberg)or pattern-breaking change (Light)”. Global Entrepreneurship Monitor (GEM) recently decided, in an attempt to examine the prevalence and nature of entrepreneurship with a social purpose, to adopt a broad definition: social entrepreneurship is defined as individuals or organizations engaged in entrepreneurial activities with a social goal (Mair and Marti, 2006 ; Van de Ven, Sapienza and Villanueva,
2007; Zahra et al., 2008; GEM, 2010). This definition fits with Dees’s first suggestion (2001), a social mission. More scholars are getting involved as social entrepreneurship members, accompanied by several national foundation heavily invested in research: Ashoka, the Skoll Foundation and the Schwab Foundation.

**Green entrepreneur, Ecopreneur or Enviropreneurs**

External conditions (economic, regulatory, social, environmental and combinations of these) create opportunities (Howard-Grenville, 2007) that can be exploited by firms and entrepreneurs. Since the nineties, scholars argued that holistic green business solutions can contribute to increase value creation (Porter and Van der Linde, 2005) and to introduce a new comprehensive business philosophy and culture (Nair, 2004). Their main contribution is to making environment matter. Green entrepreneur (Isaak, 1998; Walley and Taylor, 2005), also called ecopreneur (Schaper, 2002), or environmental entrepreneur, nicknamed “enviropreneur” (Keogh and Polonsky, 1998; Linnanen, 2002) want to preserve natural resources and act as a 'pull' factor that entices other firms to proactively go green” (Schaper, 2002). Ndubisi and Nair (2009) introduce the concept of Green Value Added (GVA), in order to encourage entrepreneurs to build “sustainable” ventures based on environmental and social issues. But they are aware that only green entrepreneurs who founded SMEs are the ideal applicants for this green platform and big challenge for nations. As Audrestch (1995) argues, entrepreneurs are agent of change so they can introduce subsequently new ideas in the market. But what differentiate entrepreneurs who are social, regular or green from those who are sustainable? And why is important to introduce and study this new kind of entrepreneurs?

![Figure 1: Taxonomy of Entrepreneurs defined according to their values](image)

**Sustainable entrepreneur: a regular entrepreneur with important ecological and social values**

Sustainability can be considered as an entrepreneurial strategy either corporate or individual and called green washing, or as an opportunity to preserve natural resources and to change the world. In these two visions, sustainability is divided into several degrees, from weak to strong importance for the entrepreneur (Dean and McMullen, 2007; Cohen and Winn, 2007). Schaper (2002) highlights the issue of balancing three variables: economic and commercial imperatives (wealthy and efficient economic system), environmental considerations (to maintain and enhance the state of the earth) and social justice factors (individual and community needs). According to these variables, a sustainable entrepreneur is an individual
who discovers, evaluates and exploits opportunities and creates value that produces economic prosperity, social cohesion and environmental protection (Katsikis and Kyrgidou, 2009).

**Research questions**
Entrepreneurship theory and empirical practice were mobilized in order to investigate a primary research question: How can an entrepreneur decide to become sustainable? Does he/she perceived himself/herself (or is perceived) as regular, social or green entrepreneur? If so, do they stay in this category or do they decide to move to another one? Exploring these questions will provide a first comprehension of the process by which sustainable entrepreneurs can emerge in developed countries.

**METHODOLOGY**
Our basic proposition is that entrepreneurs can change their initial position from regular to sustainable, passing or not by social or environmental, with a direct trajectory, or moderate the change steps by steps, degrees by degrees, under specific conditions, constraints or personal values. We construct a methodological framework to identify the profile of an entrepreneur according to the venture he/she created, the activities, the motivations and values they defend when they decide to create.

**Figure 2: Methodological representations of theoretical profiles of entrepreneurs**

**Phenomenological methodology**

As per Sarasvathy (2004) and Busenitz and al. (2003), entrepreneurship needs enactive design and interpretation. Phenomenology assists our comprehension of how the things are experienced by entrepreneurs themselves (Bogdan and Taylor, 1975). Things, acts and facts exist in the meaning that individual attach to them. According to Berglund and Hellström (2002), these methods authorize the scholars to investigate the way that entrepreneurs interpret and enact their actions and decisions.

**Sampling**

This study sought to elucidate the trajectories of specific entrepreneurs. Sampling focuses on getting a relevant group of individuals with whom the investigated phenomenon will be salient. We decided to present interesting and well-known cases, such as success stories easy to track down; we identified sixteen entrepreneurs distributed across the world, who actually are considered as social, green or sustainable entrepreneurs. We collected secondary data about their lived experiences of the business they created. In an exploratory phase, we have decided to find a representative data, in order to illustrate our theoretical profiles of entrepreneurs (Thompson, 1999; Walley and Taylor, 2002).

<tr>
<td>Rodrigo Baggio Brazil</td>
<td>Create schools and train teachers to allow the children from the slums to connect to the internet and improve their future thanks to computer skills</td>
<td>From an early age, R. Baggio cultivated two passions: computing and voluntary work. He left school and went to join the computing teams of an American company (artificial intelligence programs). A few years later he created his own publishing firm. His success gave him the opportunity to devote himself to young Brazilians through the creation of the website JovemLink (online discussion). After that, thanks to a national campaign to salvage computer equipment, he set up the first computing school in the Dona Marta favela (in association with the local parish and a NGO). Today there are more than 900 computing schools throughout Brazil. From an early stage his parish involvement in youth movements made him aware of the difficulties in the favelas, however perhaps it also give him the impression that he was not achieving his full potential. On the other hand, R. Baggio understood that his success could help him to achieve this by giving him the means (time, money, network, etc.) to fight poverty in the favelas.</td>

| **Sulo Shrestha Shah**  <br> **Formation Carpets**  <br> Nepal | Create a productive and profitable company which takes care of children’s education and contributes to the emancipation of women in Nepal | Coming from a well-off family from Katmandu, Sulo Shah was able to study in Germany where she obtained her doctoral degree in mathematics. On returning to her country, she successfully integrated the national education system and non-governmental organizations, but each time the gap between her beliefs and values was too great for her to stay there. She no longer wanted to work for a boss and decided to create her own company, Formation Carpets, which would enable her to take more practical actions for her environment. After only 3 years, Sulo Shah’s hand-crafted carpet factory had taken on more than 60 employees, virtually all of whom were women from the poorest classes of society. She also systematically forbade child labor, contributing to the creation of an ethical label for the carpet making workshops. The profits from Formation Carpets allowed Sulo Shah to reproduce her model by buying similar companies and subsequently socially transforming them. | Sal $\rightarrow$ S.E.  
| **Olivier Peoples**  <br> **Metabolix**  <br> Cambridge  <br> United States | Use bacteria to produce plastic | O. People originally comes from the mining area of Aberdeen in Scotland, and from an early age his passion was biochemistry. He rapidly received his diploma in engineering before going on to teach and then to join the researchers from the Massachusetts Institute of Technology. MIT enabled him to devote himself to one single objective: to genetically modify an enzyme so that it would produce plastic (polymer). 20 years of research led to this discovery and consequently the creation of a start-up Metabolix (1992). He left MIT, who invested in the young business enterprise. 12 years later, thanks to a completely biodegradable plastic, biomaterials become known in the plastic industry. O. People continues to work for and support sustainable development. | Sal $\rightarrow$ S.E.  
| **Mike Hannigan**  <br> **Give something Back**  <br> Californie  <br> United States | Make profits to then donate them to humanitarian work | He studied at Berkeley where he obtained a diploma in sociology and also promoted her beliefs. Employed by Xerox as a debt collector, he quickly worked his way up the ladder, before being headhunted by a competitor to manage the administration and finances (Ricoh). Sacked for having refused a mission that went against his principles, he would defend himself in court against this redundancy and gain enough compensation to turn his situation around. Hence in 1991, he decided to go into partnership with Sean Marx to set up the project Give Something Back, a Californian mail-order company specialized in office supplies and equipment that donates 70% of its profits to local association and reinvests the other 30%. Today, despite his principal objective of satisfying the community, he makes sales of 21 million Euros. | Sal $\rightarrow$ S.E.  
| **Allen Chan**  <br> **Sino Forest**  <br> Hong Kong  <br> Chine | Stop deforestation by planting more trees which are cut down without trimming the profits | A. Chan is from Hong Kong, with a passion for Chinese art and culture. He studied sociology before going on to teach at university. However, he did not feel that he was reaching his full potential and decided to abandon everything to join a chain of restaurants and put his management skills into practice. In just a few years, he became a financial advisor, much sought after by foreign investors, notably from the hotel complexes sector. Unfortunately, the events in Tiananmen Square (1989) scared off his investors and his activity went downhill. In 1993, he got back on his feet and introduced a new concept of tree farms with Sino Forest, a real sustainable alternative to deforestation. | Sal. $\rightarrow$ R.E.

| **Tristan Lecomte**  
**Alter Eco**  
France                      | Enable underprivileged small farmers from developing countries to improve their revenues | T. Lecomte is the founder of Alter Eco, the leading brand in France for fair trade products. A graduate from HEC, he started his career working for a large multinational cosmetic firm as cost controller. In 1997, he left his job to create a NGO supporting local associations for development. In order to finance it, he decided to draw on the sale of fair trade products. However the means became the end result, and as of the following year, Alter Eco would open its first store in Paris. In order to work with small underprivileged producers, he had to sell large quantities to be able to pay them a fair price and foresee education, housing or health programs. The solution was to make “Alter Eco” the leading French brand of fair trade products to be sold in French supermarkets (Monoprix, Cora, Carrefour, etc.). He continues to travel the world to offer even more products, his concern being to support initiatives that conserve the environment such as reforestation. | Sal. → S.E.

| **Suraiya Haque**  
**Phulki**  
**Dacca**  
Bangladesh                  | Offer company day-nurseries to emancipate women in developing countries | Suraiya Haque was born in Chittagong, the second largest city in Bangladesh. She was forced to leave school at the age of 16 and was pushed into becoming the wife of a family friend, 10 years older than herself. Called upon to follow her husband to Dacca the capital, she would refuse to hire a cleaning lady who was accompanied by her child. This meeting was decisive as, filled with remorse, it would give her the idea of setting up a day-nursery in the neighborhood. She succeeded in proving to each factory owner that a day-nursery was a profitable investment, by showing the increased efficiency of the women concerned (in terms of absenteeism, quality of work and productivity). In 1996, the firm Phulki would set up its first day-nursery in a friend of S. Haque’s organization. She managed to communicate her model to national ministers, while setting the example to other entrepreneurs and other countries. | Sal. → S.E.  
**T**<sub>E12</sub> |
| **Nick Moon**  
**Approtec**  
Nairobi  
Kenya                      | Manufacture agricultural equipment adapted to the small farms in the rural zones of Africa | N. Moon was born in Singapore to an Irish father and an English mother. He started off by creating a cabinet-making workshop with an associate, an activity which led him to reveal his talents to rich Londoners who were beautiful furniture enthusiasts. At the beginning of the 80’s, on an impulse, he decided to leave for a rural zone in East Kenya and taught villagers there the art of cabinet-making. In Nairobi he trained young people from the most insanitary slums and met Martin Fisher, an American engineer with whom he | R.E. → S.E.  
**T**<sub>E13</sub> |
wanted to put the world to rights, imagining solutions for the development of their adoptive country. The two men came to the same conclusion: 7 out of 10 Kenyans were farmers, and 9 out of 10 did not have electricity (the only way to improve irrigation and to capture ground water with pumps). Together they would develop a manual pump that was handheld and adapted to the majority of the farmers’ needs, at a price 3 times less than existing products and which they would sell through the company Approtec (pumps that are today distributed in several African countries).

| **Aloys Wobben**  
**Enercon**  
Allemagne | **Distribution of wind power**  
**At the age of 23, after passing the baccalaureate and a diploma in electrical engineering at the Oldenburg University of Applied Sciences (Germany), A. Wobben managed to convince Meinard Remmers to invest in a project for the construction of wind power systems. He experienced a first setback, which did not hold him back insofar as a few years later he founded Enercon (a company with just one secretary) and would work out of a furniture warehouse measuring less than 50m². Over the years, orders multiplied, making Enercon the second largest wind turbine manufacturer in the world. Today, he is still a brilliant inventor who continues to offer mass produced inventions contributing to the development of clean energy.**  
S.E. Tₑ₁₄ |
| **Gary Hirshberg**  
**Stonyfield**  
Londonderry  
United States | **Introduce biological food to American consumption habits**  
G. Hirshberg carried out his studies in the field of the environment after being confronted by environmental problems during his childhood and adolescence (as a world class skier). He took up a career as a naturalist guide in the United States and China, before joining, rather by chance, the new team of an organic agriculture training centre founded by Samuel Kaymen. The financial situation of the centre was a disaster. Gary and Samuel thought they would be able to solve it by selling Samuel’s yoghurts and for this reason decided to found Stonyfield in 1983 (with a loan from Catholic nuns). They wanted to be the model of a socially responsible firm by only using ingredients from organic agriculture. Unfortunately reality proved to be a lot more complicated and financial difficulties were recurrent despite the consumers’ plebiscite. It was not until 1991 that Stonyfield would make its first profits, enabling the firm to finance its development. Today it is the fourth manufacturer of yoghurts in the United states, renowned for its commitment to the environment.

S.E. Tₑ₁₆ |
DISCUSSION AND IMPLICATIONS

A central feature of our discussion is the concept of trajectory, behind hero models, such as Anita Roddick (Body Shop) or David Green (Aurolab). Based on sixteen well known personal stories, the results of the present work point out the existence of three main trajectories leading to social, green or sustainable entrepreneurship (with different implications and probably lessons to learn) : direct, indirect and sustainable trajectories. That does not mean that there is only three ways to follow. As the next figure shows, others trajectories are theoretically possible, but none have been identified in the personal stories exposed.

**Figure 3: The main trajectories in the entrepreneur evolution**

Direct trajectories concerned individuals making a career choice or being still students who have never experimented with entrepreneurship. Personal stories study seems to show that there is at least two specific contexts leading to this trajectory. Individuals choose to start a social or green business. In this case, what is important to explore are the push factors and their profiles. First evidences are consistent with the ideas that technical skills and knowledge

[Diagram of trajectories]
are factors leading more easily to direct trajectories and that early exposure to social or green environment can directly influence social or green business creation. But individuals can be constrained to start their own business (lose of job, unwillingness to accept new location, difficulty to get a first job, etc.) and the entrepreneurial project is social or green oriented in order to respect personal values and/or to exploit actual opportunities. It can explain that seven out of eight entrepreneurs with direct trajectories are social entrepreneurs (more opportunities and probably less difficulties to reach financial equilibrium).

**Indirect trajectories** are more complex, involving different steps in the building process of a social or green entrepreneur. Obviously, due to some barriers many entrepreneurs are not able to follow their desire of becoming a social or green entrepreneur. Theoretically, when social utility or environmental respect is viewed as important and essential as economic success and personal achievement, the evolution can be twofold: (a) the regular entrepreneur decides to migrate toward a new social or green activity (social or environmental purpose of the business); (b) the regular entrepreneur adopts a social economic model in the existing activity or try to modify it in order to be in line with green principles (social or environmental performance). However, while most of regular entrepreneurs can evolve following the two trajectories, favorable conditions need to be reached and economic constraints have to be considered and respected. That means that the entrepreneurial context requires a coexistence of economic and social or green objectives (“profit necessity” and “profit will” are two different approaches).

**Sustainable trajectories** are not the most usual ones. In our sample, it concerned only three entrepreneurs who are in capacity to develop social and green entrepreneurial projects. What is interesting when analyzing world important sustainable entrepreneurs (such as Allen Chan, Takao Furuno, Carlo Petrini, Tristan Lecomte, Olivier Peoples, etc.) are the different steps that each of them followed before being able to generate hybrid profit (economic, social and environmental values). Their respective experience seems to confirm that it is preferable and sometimes necessary, to construct solid backgrounds and convictions (experimenting managerial and/or classic entrepreneurial activities). Societal value creation associated to sustainable entrepreneurs is supposed more important and salutary than any other form of entrepreneurship. In this sense, we have to make efforts to establish a good comprehension of how sustainable entrepreneurs are born.

In a more general way, what is interesting from this point of view is to observe how the migration toward green entrepreneurship seems more complex to achieve (R.E. \(\rightarrow\) G.E.; N.E. \(\rightarrow\) G.E.). Only two out of the eleven entrepreneurs concerned by direct and indirect trajectories developed a green project. In our opinion, part of the explanation can be linked to the constraints of profitability and the difficulty to reach a financial equilibrium in the first years of existence. With a long lead time for securing a return on investment, Thierry Kazazian and Allen Chan faced for example resistance from investors, who are insisting on more economic considerations (rather on green orientation). Paradoxically, when we only consider sustainable trajectories, the three entrepreneurs concerned were green entrepreneurs. Does it mean that green entrepreneurs are more likely to adopt a social complementary orientation than social entrepreneurs with the green orientation? In our point of view, considering the potential implications, question deserves to be addressed.
CONCLUSION

Countries are exposed to demographic, environmental and social pressures, making necessary the introduction of specific support. As a result of the growing and proliferating interest and emphasis on entrepreneurship as the driving force to economic development and job creation, most of the policy makers have initiated public programs for entrepreneur and venture support. Unfortunately, detecting a would-be social, green or sustainable entrepreneur, early enough to give him the priority in regard to the societal value, is not an easy task. Knowledge is missing to achieve this goal. Therefore, in order to bridge this gap, the present research aimed to examine the entrepreneurial evolution of sixteen entrepreneurs having contributed to social changes and/or integrating environmental constraints in their entrepreneurial practices. In line with this objective, we underlined three main trajectories (respectively direct, indirect and sustainable trajectories) and tried to discuss the differences.

The objective was also to propose a methodological construct articulating the different types of entrepreneur and second to use it with several sustainable entrepreneurs (well-known in the world) for a better understanding of the role of their respective trajectories. Obviously, this research is a first step in addressing the question of entrepreneur evolution and it needs to be extended to better understand the profile of each entrepreneur (regular, social, green and sustainable). Therefore, in focusing on these trajectories, scholars will clearly contribute to develop an emergence model of sustainable entrepreneurs. In this sense, we consider this first study as a pretest for future researches on sustainable entrepreneurs.

Considering the importance that politicians, practitioners and researchers have placed upon entrepreneurs and new ways for entrepreneurship, investigating and teaching new opportunities at Universities and/or Business Schools, before the beginning of a concrete entrepreneurial process, can favorite new trajectories and increase the number of future sustainable entrepreneurs. We started to introduce this possibility in our lectures and had good returns for our students.

Capital Structure of Information Technology Small Firms
Entering NewConnect Market in Poland\textsuperscript{1}

Agnieszka Kurczewska\textsuperscript{2}

The problem of the optimal financing is a leading topic of two main capital structure theories: static trade off theory and pecking order theory. Despite many research conducted for many years there is still no unequivocal answer which theory better explains the behaviour of firms and thus the relation between the level of indebtedness and profitability is still not clearly determined. The aim of the paper is to present and discuss capital structure of Polish information technology SMEs. The regression model of financial leverage is tested for IT firms entering NewConnect (NC), an alternative market for young, small and medium enterprises in Poland (OLS method). According to the results the financial leverage of IT firms entering NewConnect is determined positively by tangibility of assets and their size and is negatively related to their profitability. The econometric analysis proves the relevance of pecking order theory for researched group. According to the study IT firms entering NewConnect prefer equity than debt financing which is visible even before entering the market. NC creates possibilities to acquire capital for investments of start ups without involving in long-term debt financing. From the point of view of investor, the investment risk in IT firm listed on New Connect is not high.

Introduction

There is a permanent drive to improve the processes of finance management in each well organized company, despite its size, legal form, specialization or current financial situation. Among plenty of issues a company deals every day a lot of attention is paid on the effectiveness of obtaining and using of capital. To achieve rationale management of capital in a company its managers have to shape and evaluate consciously its capital structure, that is the relation between equity and debt financing. Each enterprise all the time balances between risk and profitability, seeking the capital structure that maximizes its value. In consequence, capital structure is very often understood as a compromise between higher profits for

\textsuperscript{1} The paper is a part of a project financed by Ministry of Science and Higher Education in Poland.
\textsuperscript{2} Agnieszka Kurczewska is an assistant professor in the Department of Finance and Accounting of SMEs at the University of Lodz, Poland. Address correspondence: Agnieszka Kurczewska, University of Lodz, Faculty of Economics and Sociology, Department of Finance and Accounting of SMEs, ul. Rewolucji 1905r. nr 39, 90-214 Lodz, Poland, Phone: +48426355189, Fax: +48426339085, Email: akurczewska@wp.pl
shareholders and profits for companies being result of using cheaper debt capital (Wilmowska and Wilmowski 2010). One of the biggest dilemma in theory of finance is the problem of an optimal capital structure. On the one hand most economists agree that a company should lead to its optimal capital structure, on the other one the question about existence of optimal capital structure is still open.

The problem of the optimal source of financing (its level and sequence of choice) is a leading topic of two main capital structure theories: static trade off theory (STO) and pecking order theory (POT), as well as an issue discussed when theoretical concepts of financial asymmetry or bankruptcy costs are discussed. Despite many research conducted for many years there is still no unequivocal answer which theory better explains the behavior of firms and thus the relation between the level of indebtedness and profitability is still not clearly determined. It is generally accepted however that positive relation between these variables legitimates static trade off theory, whereas negative one confirms the assumptions of pecking order theory. Particularly few research concerns capital structure of companies in Central and East Europe, as well as companies listed on alternative markets (meaning stock submarkets for small and medium sized enterprises). The paper matches these two gaps. It analysis the capital structure of SMES entering Polish new stock market – NewConnect. The empirical research embraces information and technology (IT) sector. The sector is selected because its undisputable innovativeness – it requires high capital investments, projects are usually associated with: high level of innovativeness, high risk and uncertainty, inability for quick market verification, difficulty in merits evaluation. As a result, research group embraces very special and selected group of companies: small and medium sized, young, innovative, and entering alternative market in Poland.

The aim of the paper is to present and discuss capital structure of Polish information technology SMEs entering NewConnect by testing static trade off against pecking order
models of capital structure.

The paper is divided as follows. First part describes theoretical framework connected with capital structure, the basis of static trade off and pecking order theory. In second one the determinants of capital structure (on micro and macro level) and their measurements are determined and described. Third section characterizes NewConnect market as a place where small and medium enterprises (preferably innovative) may search for equity financing. Fourth section is dedicated to methodological issues and fifth to the results of empirical work. The paper ends with conclusions.

**I: Capital Structure In Theory**

There are two leading and competing theories dealing with company’s capital structure: pecking order theory and static trade off theory.

- **Pecking Order Theory (POT)**

  The fundamentals of pecking order theory were created by Donaldson in 60ties of XX century, however it was greatly developed by Myers and Majluf in 80ties. According to POT, in a long term perspective, the companies present some preferences for particular forms of financing (equity versus debt capital) and thus for particular financial instruments (chart 1). As a first and basic source of financing they choose retained profits (retentions) so they decide on internal way of financing. If these resources are not enough companies next opt for debt financing (credits and loans). The least preferred option is external equity financing (emitting shares). This logics of hierarchy is justified by the fact that self-financing generates lower costs (compared to external financing) and in its consequence there is no external limits for company’s functioning (Myers and Majluf 1984). Using external sources of financing very often means giving in the discipline and rules of capital market (Nawrot 2007). The supremacy of debt financing over external equity financing is based on its results – the only
commitment in debt financing is the repayment of debt, the managers (owners) do not pay personal losses and do not lose control over a company (Cobham 1999). The aim of a company is not achieving optimal capital structure but gaining less costly sources of financing. Recapitulating, according to pecking order theory, a company unable to use self-financing should decide on following sequence of external financing (Nawrot 2007):

1. Trade credit,
2. Bank credit,
3. Bonds,
4. Hybrid instruments (for example convertible bonds),
5. Shares.

In line with pecking order theory a company giving higher profits is less indebted because it has more possibilities to use internal sources of financing. Less profitable company needs external financing and in a result increases its debt (Mihalca and Antal 2009).

CHART 1.

SEQUENCE OF CHOICE OF FINANCIAL SOURCES ACCORDING TO POT.

<table>
<thead>
<tr>
<th>SELF-FINANCING</th>
<th>DEBT FINANCING</th>
<th>EXTERNAL EQUITY FINANCING</th>
</tr>
</thead>
</table>

The capital structure is set in a way that enables to limit ineffectiveness of investment decisions taken by a company in a circumstances of information asymmetry (Gajdka 2002). However, the pecking order theory does not explain all determinants of company’s capital
structure, it does not take into consideration tax shield, bankruptcy costs, or costs related to securities emission (Gajdka 2002). As Paranque (1999) claims, the companies are conscious about advantages and disadvantages of particular forms of financing, but logics of their behavior is very often the result of imperfect markets.

*Pecking order theory* is very often perceived as a more binding for small and medium sized enterprises as smaller firms have more difficulties in accessing external financing sources.

- **Static Trade Off Theory (STO)**

The basis of *static trade off theory* was established by Modigliani and Miller in 1958. As a name of the theory suggests it assumes static capital structure of a company. It is based on a constancy of capital and assets in a company (Grzywacz 2008). *Static trade off* theory assumes that there is optimal, predefined capital structure that company tries to follow. It presumes that company determines a debt target ration and then moves towards achieving it. The tax profits being result of company’s indebtedness cause that company is incurring a debt. According to STO each firm aspires to achieve its own optimal level of indebtedness, and that implies necessity to set a proportion between tax profits (being a result of debt) and costs of possible financial problems (bankruptcy costs). A company is using financial leverage to attain optimal capital structure and is seeking such a capital structure that maximizes firm’s value. The risk connected with debts is compensated by tax profits. The company decides on compromise between savings from debts and their costs. *Static trade off* theory assumes that big companies, obtaining substantial fixed assets are more willing to borrow money, than small firms which are characterized by higher risk of functioning and mainly current assets. Companies having valuable assets, smaller portfolio of investments and less volatile financial results are distinguished by higher financial leverage (Mihalca and Antal 2009). The differences between POT and STO are presented in table 1.
The interdependence between capital structure and its determinants is not obvious. When a relation between profitability of a firm and its indebtedness is discussed, it is usually assumed that positive correlation between these variables testifies *static trade off theory* whereas negative one legitimates *pecking order theory*.

The second dilemma concerns the structure of assets. The direction of influence of assets on firm indebtedness is also not clearly evident. If a structure of assets is expressed by relation of tangible assets to total assets, the companies achieving higher value of this coefficient are more indebted as costs related to debts are lower due to possible collaterals. Companies with high level of tangible fixed assets should incur more debts in that case, but on the other hand high level of tangible assets in total assets may mean that a company uses internally worked out profits (retained profits) and does not have to look for external sources of financing. It is difficult to determine undeniably the influence of assets’ structure on company’s finance, but assets are undoubtedly the factor that greatly determines financial possibilities and perspectives of a firm (Frank and Goyal 2003).

</table>
Debt level | Reaches the level at which compromise between tax profits and debt costs is achieved. | Is a result of preference of financing.

Previous studies provide different results on capital structure. Despite many research conducted during last years there is no definite agreement which theory – POT or STO - is more valid to explain financing processes in a company. The two most famous and frequently quoted works are done by Shyam-Sunder and Myers (1999) and Frank and Goyal (2003). However Shyam-Sunder and Myers support *pecking order theory* whereas Frank and Goyal find *static trade off theory* more relevant.

**II: Determinants Of Capital Structure**

Typologies of capital structure determinants may be built on different criteria. The most natural seems to be a division based on source of the determinants. According to it, factors influencing capital structure may have external character (exogenic), being domain of macroeconomics, and internal one (endogenic), constituting the field for research of microeconomics. The former are mostly the result of economy development and existing financial system and law system. They are independent from financial strategy and decision of a single company. Their set, due to objective character, may be called environment of a company. Internal determinants of capital structure are related to functioning of a particular company, its character, taken decision and perspectives of growth. On these group of factor entrepreneur (manager) has a clear influence, as they are dependent on company’s financial policy and its market strategy and thus affecting capital structure.
From the point of view of microeconomics the capital structure of a company is usually determined by following factors:

- Size of a firm,
- Sector,
- Cost of capital,
- Liquidity,
- Level of risk acceptance,
- Perception of company’s position on market,
- Tangibility of assets
- Profitability of a firm,
- Dividend policy,
- Investment strategy;

This set of factors was used to test capital structure of firms functioning on highly developed markets (Rajan and Zingales 1995, Hall, Hutchinson, and Michaelas 2004) and on developing ones (Booth et al. 2001), for small and medium sized enterprises (Zoppa and McMahon 2002; Heshmati 2001; Michaelas, Chittenden and Poutziouris 1999) as well as for big companies (Rivaud-Danset, Dubocage, and Salais 1998). The capital structure of big quoted firms was a topic of research for Demirgüç-Kunt and Maksimovic (1995) or Welch (2004).

From macroeconomics point of view the capital structure is shaped by external factors, on which single company does not have any influence (Antoniou 2002). They include:

- Level of country’s development in which company operates,
- Fiscal policy,
- Monetary policy
- Law regulations,
• Size and effectiveness of banking sector,
• Level of technology accessible in a country,
• Level of development of financial markets;

In order to build a model of capital structure its determinants have to take form of measurements. The examples of various measures of selected determinants are presented in table 2. As the paper concerns companies existing on Polish market, and they all encounter the same macro conditions, only selected measurements of micro level determinants are included in the table.

TABLE 2.

</table>

Debt ratio is usually measured as a relation of total debt to total assets or quotient between total debt and equity.

**III: NewConnect Market**

In August 2007 Warsaw Stock Exchange created an alternative trade system NewConnect, a new market for small and medium enterprises. NC is a financial platform and a vehicle of investment, playing role of entrepreneurship incubator for young, dynamically developing firms, mainly from perspective sectors (ICT, biotechnology, advanced manufacturing, electronic media, alternative energy or environment protection). From the debut till mid of April 2010, 124 firms have been already quoted on NewConnect and the NC capitalisation reached the level of 3361 million zlotys. To be quoted on NewConnect an issuer is obliged to have appropriate legal status (joint stock company or a joint-stock limited partnership company) and to guarantee unlimited transferability of shares. An appropriate information document has to be prepared and cooperation with Authorised Adviser or Market Animator ensured. NewConnect is designated for small and medium enterprises seeking a source of financing from several hundred thousand zlotys to several million zlotys. The entry criteria, formalities and costs are more lenient than for regular stock exchange.
NewConnect is one of ten alternative markets associated in FESE (Federation of European Securities Exchanges), which includes: ENA (Athens), Entry Standard (Frankfurt), Alternext (Euronext), IEX (Dublin), AIM (London), MAC (Milan), First North (OMX), Axess (Oslo) and Dritter Markt (Wien). Taking into consideration number of quoted firms, NC takes fifth place.

The main characteristics of NewConnect are:

- It is a source of financing for young, small and medium sized enterprises (usually functioning on the market no longer than three or four years),
- Expected capitalization of quoted firms is minimum maximum 20 million zlotys (approximately 5 million euro),
- It is designated for enterprises with a capacity to expand and perspectives for dynamic growth,
- The companies and their projects are characterized by higher than average investment risk,
- It is based on idea of mid- and long term investments, not short-term gains,
- It enables a company to be transparent, recognizable and visible on market,
- It softens an entrance on regular stock exchange in future and accustom with public capital markets;

NewConnect was established with the view that mainly innovative firms will be listed, however at present it is visible that many SMEs operating in traditional sectors are allowed to enter the market.

**IV: The Methodology**

The aim of the paper is to present and discuss capital structure of Polish information technology SMEs planning to use equity financing to reach their growth intentions. The
regression model of financial leverage is tested for IT firms entering NewConnect, an alternative market for young, small and medium enterprises in Poland (Ordinary Least Square method). The research group consists of all 11 IT firms entering New Connect from August 2007 (the debut of the market) till the end of March 2010. In proposed regression model the leverage (measured as the ratio of total debt to total assets) is determined by:

- profitability of a firm (measured as a relation of gross profit to total assets),
- tangibility of assets (measured as relation of tangible fixed assets to total assets),
- size (measured by the natural logarithm of total assets).

This set of determinants, plus growth perspectives factor, was used by Harris and Raviv (1991), Rajan and Zingale (1995) and Booth et al. (2001). However, growth perspectives is not included as all firms entering NC are regarded as high growth ones (an interesting fact is that vast majority of them have zero long term investments while entering the market). Taking into consideration theoretical output, two alternative hypotheses are made:

**H1:** Pecking order theory explains the behavior of companies entering NewConnect if:

- a relation between debt ratio and profitability is negative,
- a relation between debt ratio and tangibility of assets is positive,
- a relation between debt ratio and size is negative,

**H2:** Static trade off theory explains the behavior of companies entering NewConnect if:

- a relation between debt ratio and profitability is positive,
- a relation between debt ratio and tangibility of assets is positive,
- a relation between debt ratio and size is positive,

The expected relations between leverage and its determinants are presented in table 3.
TABLE 3.
DETERMINANTS OF CAPITAL STRUCTURE AND THEIR INFLUENCE ON A
FIRM’S INDEBTEDNESS ACCORDING TO POT AND STO.

<table>
<thead>

<td>+</td>
</tr>
<tr>
<td>Tangibility</td>
<td>+</td>
<td>+</td>
</tr>
<tr>
<td>Size</td>
<td>+/-</td>
<td>+</td>
</tr>
</tbody>
</table>

Following regression model is proposed:

$$L_{i,t} = \beta_0 + \beta_1 \text{PROFIT}_{i,t} + \beta_2 \text{SA}_{i,t} + \beta_3 \text{SIZE}_{i,t} + \varepsilon_{i,t} \quad (1)$$

$L_{i,t}$ - leverage (measured as the ratio of total debt to total assets),

$\text{PROFIT}_{i,t}$ - profitability of a firm (measured as a relation of gross profit to total assets),

$\text{SA}_{i,t}$ - tangibility of assets (structure of assets measured as relation of tangible fixed assets to total assets),

$\text{SIZE}_{i,t}$ - size (measured by the natural logarithm of total assets),

$\beta_0$ the intercept,

$\varepsilon_{i,t}$ the random error term.

All data used in a research are extracted from published financial statements available on NewConnect website. They cover financial data of a whole financial year preceding a debut on NewConnect market. The data are book value. To avoid heteroscedasticity problems the variables are deflated by total assets value (Buferna, Bangassa, and Hodgkinson 2005).

V: Results
The results lead to the following form of function:

\[ y = -0.94976 - 0.16553 \times \text{PROFIT} + 2.70237 \times \text{SA} + 0.084677 \times \text{SIZE} \quad (2) \]

\( \beta_1 < 0 \) (profits are negatively correlated to leverage)

\( \beta_2 > 0 \) (the higher the share of tangible fixed assets in total assets, firm has more collateral possibilities, so the level of debt may be higher)

\( \beta_3 > 0 \) (bigger firms tend to be more indebted as they have better reputation among creditors)

Detailed results of OLS regression and statistical descriptions of the model are put in table 4 and 5 respectively.

</tr>
</tbody>
</table>

The function (2) shows that financial leverage of IT firms entering NewConnect is determined positively by tangibility of assets and their size and negatively by their profitability. The model indicates thus more relevance of pecking order theory for firms entering NewConnect market. The more profitable the firm, the less debts it incurs.

All used independent variables explain the debt ratio determinant. The correctness of a model was evaluated by:

- Coefficient of determination – measuring goodness of fit - the adjusted R-squared is at 71,3 percent, which may be evaluated as satisfactory.
- the Jarque Bera test for normality – checking whether data are form normal distribution – the test proves that data have normal distribution (the J-B test for the sample is 0,016 so much lower than critical value 5,99). The regression model may be used to estimate capital structure.
- T-student test – checking the significance and consistency of parameters of a model - T statistic results are satisfactory, all explanatory coefficients, except intercept, reach higher
level than critical one, which is 2,365. All the coefficients are statistically significant at the level of confidence of 95 percent.

- The F-statistic proves the validity of the estimated model. The regression model may be used to estimate capital structure.

The results show that tangibility is positively related to profitability while profitability has a negative relationship with size and leverage. This may lead to the conclusion that smaller firms tend to have higher profitability, whereas profitable companies tend to have more tangible fixed assets. The negative relationship between profitability and financial leverage seem to signal the relevance of pecking order theory.

**Conclusions**

According to the results, the financial leverage of IT firms entering NewConnect is determined positively by tangibility of assets and their size and is negatively related to their profitability. An empirical evidence supports the relevance of pecking order theory for researched group. According to the study, IT firms entering NewConnect prefer equity than debt financing. Especially long term debt financing is not popular among tested group. It leads to the conclusion that NC creates possibilities to acquire capital for investments of start-ups without involving in long debt financing. From the point of view of investors, the investment risk in firm listed on New Connect is not high.

The study contributes to the global discussion on capital structure of a firm by including data on Polish companies, precisely Polish IT SMEs entering NewConnect. It gives an information to IT firms about their capital structure and in some way may help them to chose a proper strategy of development. Results may have an influence on development of NewConnect market. Knowledge of financial specificity of firms entering this market will
contribute to better understanding of NewConnect mechanisms not only for firms but for all market participants: investors, market makers and animators, authorized advisors.

The aim of the article was to test two competing capital structure theories and to determine capital structure of Polish IT firms. It seems that *pecking order theory* provides better explanation of capital structure of Polish IT firms entering on NewConnect market. However, for more general conclusions, further research, embracing other sectors is needed.

Insights Into the Determinants of Family Business’s Succession

Abstract

Family owned businesses in Germany are regularly confronted with creating and conducting a sophisticated succession plan. According to Mahnke (2005) less than 30 percent of the active entrepreneurs have prepared a succession plan. Especially, the wish of current company owners to take the offspring into responsibility (Kaushik, 2009) is often encountered by the unwillingness by the offspring (Leach & Bogod, 1999) due to the far-reaching consequences for them (Krüger, 2006).

Within this study the focus is laid on family owned businesses that have already undergone a succession. Hence, companies that are run in the second or a later generation were addressed. The respondent had to fulfill in addition the criteria of being the manager (respectively Chief Executive Officer) of the company and being an offspring of the former manager. Hence, fostering and inhibiting factors in the succession phase are undisclosed and analyzed.

As research instrument a quantitative study was conducted and 75 successors completed the questionnaire.

* Corresponding author
Introduction

Family-operated small and medium enterprises (SMEs) are responsible for two out of three jobs in Germany and generate almost two billion Euros of annual sales (IFM Bonn 2009). With a percentage of 95 percent of the total number of companies, 40 percent of sales, and 50 percent of employees, their influence on the economic power of the country is very high (Hauser and Wolter 2007; Röhl 2008), and their national and international significance is considerable (Alcorn 1982; Pichler and Bornett 2005).

Since many of these businesses have changes forthcoming, they need to take extensive efforts to find successors (Wiese 2003). In the past, a clear wish to keep the business in the hands of the family and to have the owner's children take over operations, if possible, could be seen in most companies (Kaushik 2009). However, this trend has been declining over the past few years (Düben et al. 2006), since heirs nowadays are not automatically willing anymore to take over succession (Leach and Bogod 1999). This creates the existential problem for businesses of not being able to find a successor (Hölper 2007).

Planning the business succession, however, is often adjourned (Mahnke 2005), since the thought of retiring from one's own company is often suppressed by the passing entrepreneur for as long as possible (Rietmann 1988). For successors, however, the takeover is often a step into self-employment that has far-reaching consequences. Not only do they take over responsibility for the affected business, but also for its employees and – indirectly – for their families as well (Krüger 2006). In the past, the specific challenges from the successor's point of view were only rarely pointed out and were mostly concerned with fiscal and civil law issues. The present study therefore focuses on successors of small and medium-sized German family businesses and their personal experiences, opinions, and assessments. It is also to be shown which factors can be drawn upon as indicators for a successful transition and continuation of the business.

Theoretical Background

Family Businesses

The term "family business" emerged from everyday language and evades a standardized definition (Färber 1993; Wimmer et al. 1996). Family businesses are owner-managed, this means that the entrepreneur provides capital on one hand but also carries the business risk
(Fasselt 1992). In a family business in the narrower sense, at least 50 percent of the company shares are distributed between up to two natural persons or their family members (Flören 1998). Therefore, the majority of the business must be owned by one or more persons (Becker and Tillman 1978) that share family relations and have the will to keep the business restricted to their circle, also for the future, and follow family goals (Bertsch 1964; Hengstmann 1935; LeMar 2001; Trefelik 1998).

**Business Succession**

When handing over a business, the first question to be dealt with is whether the union of ownership and management in the hands of the family should be preserved (Krüger 2006). Should this be the case, the first distinction concerns the one between internal and external transfers. The external solution is chosen if the 'life's work' of the entrepreneur is to be preserved, despite the lack of a suitable successor (Seeghitz 2000). This may happen gratuitously, as a donation or inheritance. In practice, however, the option of a remunerated transfer to family outsiders is used far more frequently (Deimel and Zacharias 2008), for example as a management buyout by employees that already work for the company (Lüders 2008), or as a management buy-in by managers outside the company, or selling the company to investors (Seeghitz 2000). In the long run, however, the continuation of the company as an independent entity is not ensured in such cases (Lüders 2008). For this reason, the option of discontinuing the business needs to be mentioned as an additional succession plan, in contrast to the goal of securing business continuity postulated by Albach and Freund (1989). The second way of securing continuity and the union of ownership and management is an internal transfer to family members (Bechtle 1983). Here too, the different options of the aforementioned remunerated and gratuitous solutions for third-party succession are to be distinguished (Groschoff and Koming 2008).

The subject of this paper is the family-internal succession plan, since it not only represents the favored solution (Hasch et al., 2000) but is, in the form of management buyouts (Schütz and Kahl 2008), also the most frequently used method in Germany, with 43 percent of all cases (Wallau 2008). A family-internal succession plan hereafter refers to the process of transferring management and controlling functions as well as financial responsibility for a company to the next generation (Freiling and Gersch 2007; Gerke-Holzhäuer 1996; Handler 1989; Olbrich 2005; Spielmann 1994). A generational change in the form of a personal change needs to have occurred in this case at least (Fasselt 1992). Two basic possibilities are
conceivable: Either the senior retires from his management position as planned, for example, for reasons of age (Fasselt 1992), or the transition is initiated suddenly, for example, by an emergency due to a serious illness of the business owner (Spielmann 1994).

The aim of a successful transfer is to permanently secure the continuity of the business (Becker and Stephan 2001). Next to economic and family-related goals, personal goals of the company owner, like providing for the entrepreneur and his family after his retirement, avoiding claims to the estate, or fragmentation are also pursued (Deimel and Zacharias 2008). These controversies often result in a hazardous area of conflict that the owner is required to handle (Smeja 2006; Stephan 2002).

**Determinants of Success in the Handover Process – State of Research**

According to Diegruber (1991), next to the owner and his family, the company and the environment are crucial for the success of the succession process.

Based on the sources of success mentioned above, the success factors will be examined in the statistical analysis of the survey, using the factors collected from the academic literature. The perspective of the successor will be retrieved here. The attempts at explanation found in the literature deal with economic indicators, like the increase in value, growth, returns, and profit on one hand and, on the other, with subjective personal criteria that focus on the individual. Since the former component is already analyzed in scientific literature, the present paper will place a stronger emphasis on the latter to address an existing research gap. Weinläder (1998), furthermore, argues that, a satisfactory solution cannot be reached without it. Therefore, a generational change will be labeled as successful hereafter if the independent continuity of the business was secured and the personal goals of the owner were achieved (Spielmann 1994). In order to accomplish this, the following determinants are to be seen as decisive for the success of a succession plan.

**Minimum Size as a Basic Requirement**

The first basic requirement to make a change possible at all is that the business to be transferred must have a minimum size in order to seem sufficiently attractive to the successor (Hölper, 2007)
Personal Factors

Another important aspect is the human factor, which is a prerequisite for a promising continuation of the business. However, this factor is often neglected when speaking of a successful transfer (Becker and Tillman 1978). It primarily refers to the personalities of the transferor and the successor, which have a decisive influence on the transition process and a successful continuation of operations. In this case, the senior needs to be willing and ready to retire and transfer the business (Risak and Nagy 1999; Schröer and Freund 1999). In many cases there is a lack of awareness for the necessity of a succession plan, or the fear of retiring obstructs the transfer (Wimmer 2007). However, one fact that most entrepreneurs are fully aware of is often disregarded – that a bad succession plan is still better than no plan at all (Klughardt 1994). Consequently, the basic requirement for a successful transfer is that the parting entrepreneur deals with separating himself from a task that previously filled up his own life.

Next to a willingness to retire on the part of the senior, the junior is also required to have a firm will of his own. Next to qualities that can be learned, like the right qualification and experience, as well as personal prerequisites like competence, flexibility, leadership traits, and creativity, an entrepreneur also needs a strong will that enables him to face challenges (Risak and Nagy 1999; Spielmann 1994; Vorwold 2001).

An excellent level of education and professional skills, combined with good on-the-job training by the senior are further determinants for the successful continuation of a family business (Schröer and Freund 1999). Oftentimes, business skills like management knowledge are named as a central factor for success in the literature (Szyperski and Nathusius 1977; Voigt et al. 2006). Next to the factor of knowledge, a family business also draws upon the personality of the entrepreneur himself for its corporate culture (Vorwold 2001). Key factors that a prospective successor should possess are primarily emotional intelligence, knowledge of human nature, and entrepreneurial thinking (Kronz 2008). Strong leadership, a sense of responsibility, and the ability to motivate are also required (Hennerkes 2004).

Next to those directly involved, the family as an influential factor also deserves to be emphasized (Brockhaus 2004; Hennerkes 2004). It decisively contributes towards achieving
success by providing assistance and emotional support, especially in emotional situations (Risak and Nagy 1999).

If, next to the family, competent advisors are also included into the complex task of planning and realizing the transfer, the larger variety of skills will increase the probability that all areas to be observed will be sufficiently integrated into the process. Albach (1984) holds the position in this regard that family members should not take advisory functions since they lack the necessary detachment to assess the company situation and circumstances without bias and without emotionality. Advisors may act as conflict solvers and maybe avert crises in case of deadlocks by taking the position of an impartial referee and inspire an exchange of thoughts (Gerke-Holzhäuer 1996). This improves chances of making the succession plan a success (Bachmann and Liebernickel 2000).

**Organizing the Generational Change**

Next to personal criteria, the organizational factors are also to be mentioned as variables with an influence on overall success. In order to ensure long-term business continuity even after the retirement of the senior entrepreneur (Ward 2004), early, preventive, and detailed planning is a very important factor (Heß 2008; Kaushik 2009; Lea 1991).

An anticipated succession may underline the senior entrepreneur's consent to the change during his lifetime and therefore lead to increased acceptance of the arrangement with the family and employees (Gratz 1997). It also facilitates the prevention of inheritance disputes, since the legal and fiscal conditions of the transition and the transfer of assets can already be settled in advance (Horster 1999; Hutcheson 2007; Vorwold 2001). The time, circumstances, and duration of the transfer also have an influence on the success of the generational change (Alcorn 1982). Putting aside the possibility of an unforeseeable exit of the senior, the right time depends on the conditions of the business as well as the expectations and leadership skills of the current senior director (Hess 2006). An abrupt, unplanned generational change creates high risks for want of preparation on the part of the successor, a lack of acceptance of the generational change by the employees, or due to the predecessor not being able to provide counsel and support anymore (Risak and Nagy 1999). A planned generational change provides the opportunity to be proactive instead of just reacting (Spielmann 1994). Furthermore, the employees have the opportunity to better adapt to the new situation and the
new boss (Seeghitz 2000). A good organization of the generational change can therefore contribute towards lowering the potential risks and allows the junior and the senior to better realize the succession plan (Horster 1999).

**Research design**

The study was conducted between April and June 2009 as a quantitative, written survey. Therein, successors in family businesses were asked to participate. To increase the probability of participation the questions were asked in an anonymous way and the questions were limited to the utmost possible (Wübbenhorst and Wildner 2007). The addresses were acquired randomly to strengthen the representativity (Kromey 1986).

Based on an extensive literature research hypothesis were developed. The operationalisation of the variables followed especially the studies of Freund and Kayser (2007), Schlömer and Gude (2008); Schlömer and Kay (2008); Spielmann (1994); Schlömer et al. (2008) and Terwey et al. (2006).

A pretest was conducted by 48 people to ensure the quality of the questionnaire. Meaning, understanding and scales of the items illustrate the main aspects of the pretest (Schnell et al. 1999). The final questionnaire contains 30 questions which are grouped in thematic blocks.

The analysis was carried out with help of a descriptive, multivariate procedure (Backhaus et al. 2008). The analysis followed and was restricted by the chosen scales of the variables of the questionnaire (Fürtjes 1982; Green and Tull 1982). The hypotheses are examined with correlations and regression analyses. For variables with interval scale and Gaussian distribution a Pearson correlation was used, while for ordinal scaled or not equally distributed variables the Spearmen method was chosen (Bourier 2005). Causal relations were examined with a regression analysis (Backhaus et al. 2008). Following Albach and Freund (1998) the statistical significance is categorized into \( p \leq 0.01 \) as “strongly significant”, \( 0.01 \leq p \leq 0.05 \) as “significant” and \( 0.05 < p \leq 0.10 \) “slightly significant”.

Based on the prior shown literature overview following main research aim was derived.
**Research aim**

Is there a correlation between the satisfaction of the succession success and the satisfaction with the companies’ further development with the circumstances, the prerequisites and the condition of the generation change?

Following variables result from that research aim:

- satisfaction with the succession success (DV₁)
- satisfaction with the companies’ further development (DV₂)

Hence, the research hypotheses within this study are:

Hypothesis 1: Socio-demographic attributes have an impact on the perception of satisfaction with the succession success and the further development of the company.

Hypothesis 2: There is a correlation between the way in which the generation change occurs and the perception of the satisfaction with the succession success and the further development of the company.

Hypothesis 3: The predecessor influences the perception of satisfaction of the succession success and the further development of the company.

Hypothesis 4: The qualification and experience of the successor influences the perception of the satisfaction with the succession success and the further development of the company.

**Descriptive Findings**

Within this study 75 successors participated. The percentage of women is 17.3 percent which corresponds with the overall number of women in Germany in top management positions. 48 percent of the participants are between 30 and 44 years old, while 9.3 percent are younger than 40 years. 48 percent are between 30 and 44 years old and 34.7 are in the age between 45 and 59. Only eight percent are at least 60 years or older. Regarding the educational background, 24 percent of the respondents have achieved an academic degree. 24 percent finished an apprenticeship. Eight percent have an A-level 17.3 percent have chosen the option “others”. The majority of those 17.3 stated to have a master craftsmen diploma.
The successors run a business which belongs mainly to the group of small businesses. 41.3 percent of the companies have less than two million Euro turnover and less than 10 employees. 37.3 percent of the enterprises have less than 50 employees and earned as much as ten million Euro. 21.4 percent have a revenue 50 million Euro and 250 employees maximal.

**Analysis of the Correlations**
Based on the analysis, a normal distribution of the variables is assumed.

**Influence of Socioeconomic Characteristics**

**Research Hypothesis 1:** Socio-demographic attributes have an impact on the perception of satisfaction with the succession success and the further development of the company.

The factors of educational and family background, unlike age and gender, do not show a metric, but merely a nominal scale measurement. Due to a lacking natural sequence of the criteria, neither a correlation analysis nor a regression analysis delivers interpretable results for the variables of educational and family background. Therefore, the examined correlation with satisfaction regarding the success of the transition and company development can only be presented in cross tabulations and verified using the $\chi^2$ test. This findings show, that satisfaction generally increases with the educational background. An exception illustrates people with a master craft’s men diploma whose satisfaction exceeds those with an A-level or an academic degree. Married respondents varied most strongly in their evaluation, while singles tended to be rather satisfied, and divorcees were also mostly in the medium range, i.e., the neutral expression represented the mode. Middle-aged people rated success of the transition and development of the business succession more negatively than people under 30 or over 60 years of age. Women rated satisfaction with the development of the business succession slightly more positively than men and are more likely to be satisfied with the success of the transition. However, these are only tendencies, since the values do not prove to be significant after being verified using the $\chi^2$ test.

Surprisingly, when analyzing the metric criteria, there is no correlation of the analyzed criteria when verifying the criteria of age and gender according to Spearman (Heckmann 2009). The linear regression of the variables does not yield any results that can be reasonably interpreted.
either, which collectively leads to a rejection of the alternative hypothesis. This means that there is no significant correlation between the socioeconomic criteria of the participants and satisfaction with the success of the transition and the development of the business. This is very surprising, since clear significances were to be expected especially in relation to human capital and gender (Heckmann 2009). The assumption stated above can therefore not be confirmed for the present sample. For this reason, the research hypothesis is to be rejected in favor of the null hypothesis.

Implementing the Generational Change

In the further development of the task at hand it was examined if there is a causal relationship between the implementation of the generational change and the satisfaction with the success of the generational change or the development of the business. For this, the criteria of the decision about the time of accession, duration of the transition, the required help for assessment and support, steps of the transition, conditions, and satisfaction with the time of the transfer were examined more closely on the basis of the following research hypothesis.

Research Hypothesis 2: There is a correlation between the way in which the generation change occurs and the perception of the satisfaction with the succession success and the further development of the company.

First, the cross tabulations of all according variables are examined and tested for two-sided significance using Pearson's chi-square test. Significant values occur in three cases. Significant correlations with regard to satisfaction can be observed between the assessment of the satisfaction with the time of the transfer ($\chi^2=42.870; \ p=0.014$) and the satisfaction with the business succession ($\chi^2=34.379; \ p=0.024$). The same goes for the correlation between satisfaction with the success of the transition and the circumstances of accession ($\chi^2=35.864; \ p=0.016$).

In the next step it is examined if there is a correlation between the examined metric variables. The calculation according to Spearman does not indicate that independent variables have any significant influences on the observed dependent variables of satisfaction with the success and satisfaction with the development of the business, however, correlations between some of the independent variables can be observed. With a correlation coefficient of 0.380, there is a positive correlation between the duration of the transfer and the steps it requires with a high
significance of 0.001. Furthermore, the duration of the transfer \((r=0.227; p=0.050)\) is negatively correlated to the time of the transfer \((r=0.253; p=0.028)\).

The variance analysis indicates that the model is not suited for a valid forecast, since no significant results can be calculated with regard to the two dependent variables. Although correlations within the set of independent variables and within the set of dependent variables are found, still no actual connections between the independent and dependent variables can be identified. Consequentially, the regression analysis does not contribute towards confirming the research hypothesis. According to the \(H_0\) hypothesis, no significant correlations are found that could be traced to a verifiable influence of the implementation of the generational change on the satisfaction of the successors with the success of the transition or the development of the business. For this reason, the hypothesis is to be rejected in favor of the null hypothesis in the present case.

**Influence of the Predecessor**

In order to establish a connection between the influence of the predecessor and the two dependent variable of success of the transition and development of the business, it is examined next whether the senior entrepreneur had difficulties handing over managerial responsibility and whether there were problems during the transition. Thierfeld (2009) provides on reason for suspecting a relationship by mentioning that the senior has difficulties letting go in 38.4 percent of all cases. This begs the question which relationship exists between the senior and the success of the generational change. The following research hypothesis will be examined for this purpose:

**Hypothesis 3: The predecessor influences the perception of satisfaction of the succession success and the further development of the company.**

First, the correlation is analyzed in a cross tabulation and tested for significance using the Chi-square test. By examining results it stands out that the successors are apparently more satisfied with the success of the transition and rate the development of the business more positively in those cases were there were no problems with the predecessor and handing over managerial responsibility was not too difficult. However, these are only tendencies, since error probabilities of more than 5 percent apply here.
Although no significant correlations can be determined after performing \( \chi^2 \)-tests, a negative correlation of -0.337 still results from the correlation according to Spearman between DV\(_1\) and the independent variable (IV) problems with the predecessor, which indicates a highly significant correlation on a level of 0.01 with a probability of error of \( p=0.003 \). Furthermore, a positive correlation \( (r=0.315; p=0.00) \) between handing over of managerial responsibility and problems with the predecessor can be identified. This indicates an indirect correlation between DV\(_1\) and handing over managerial responsibility. Additionally, DV\(_1\) and DV\(_2\) show a positive correlation with \( p=0.000 \) and \( r=0.611 \).

No reliable statement regarding satisfaction with the success of the transition can be made using the independent variable handing over of managerial responsibility due to a significance value of 0.825 and a beta value of only 0.026. The additionally performed variance analysis confirms this.\(^1\) The additionally performed variance analysis confirms this. With a probability of error of 0.528 and a negative adjusted R\(^2\), it provides no verifiable correlation between handing over managerial responsibility and the satisfaction with the success of the generational change.\(^2\) In this case, the model is not suited for forecasting significant results. When performing a variance analysis on problems with the predecessor and satisfaction with the success of the generation change, the model, having a significance of 0.003, turns out to be suitable for a forecast and, with an error rate of 0.3 percent at a standardized coefficient beta of -0.337, explains a negative correlation.

The results of the correlation analysis are narrowed down through the linear regression of the independent variables with the satisfaction with the success of the transition. The regression show that the variance analysis of the variables of problems with the predecessor and handing over managerial responsibility have a significance of 0.013 with regard to the DV\(_1\) and are suitable for forecasting the DV. Accordingly, given a positive adjusted R\(^2\) of 0.090 and a probability of error of 0.004, an average negative influence of -0.345 of the IV problems with the predecessor on the dependent variables can be presumed. The predecessor therefore has an influence on satisfaction with success of the transition. Regarding satisfaction with the development of the business succession, no significant results were returned. Overall, the results lead to a rejection of the null hypothesis, thereby confirming the research hypothesis.

---

\(^1\) The standardized beta is a relative proportion that the IV contribute in order to forecast DV.

\(^2\) The more IV are included into a calculation and the smaller the sample is, the more important it becomes to avoid overrating the variables and the individual values. This is done using adjusted R\(^2\).
Qualification and Experience of the Successors

The next issue to be determined is the influence of qualifications and experiences on the dependent variables. Experience collected in external businesses and in the business to be taken over itself and qualifications and experiences seen as important by the successors are the independent variables in this case. The fourth research hypothesis therefore goes as follows:

Hypothesis 4: The qualification and experience of the successor influences the perception of the satisfaction with the succession success and the further development of the company.

When examining the cross tabulations, a positive correlation between the satisfaction between the satisfaction with the success of the business succession and experiences from external businesses can be determined. Although this is not sufficiently confirmed by a $\chi^2$ test with $p=0.163$, the assumption is supported by an approximate significance of 0.042 (according to Pearson). Between the competence of an entrepreneur and the $DV_1$ there is a clear connection that is confirmed by a highly significant $p=0.000$ for a value of 47.701 ($\chi^2$). A very strong correlation ($p=0.000$) can be presumed for a value of 93.753 for the $DV_1$ and personality/charisma of the entrepreneur. An examination of the results with regard to satisfaction with the development of the business yields significant values of 14.529 ($p=0.006$) for the connection to the career choice, and with regard to management experience/competence there is a declared value of 47.142 ($p=0.000$). The same applies to the correlation with industry knowledge. A declared proportion of 36.128 ($p=0.015$) results here.

There is also a positive relationship according to Spearman to the experiences in external companies ($r=0.235; p=0.042$) and a negative relationship to strategic thinking ($r=-0.271; p=0.019$). The assessment of the development is positively correlated to career choice ($r=0.228; p=0.050$) and negatively related to industry knowledge ($r=-0.237; p=0.041$). Due to the mutually rectified coherence between the two dependent variables ($r=0.611; p=0.000$) further correlations also exist indirectly. For the purpose of enabling a better overview, these can be found in the following table.

---

For analyzing the metric variables a calculation according to Pearson would be possible, however, the correlation is calculated according to Spearman since not all examined variables are interval-scaled and mixing calculation methods within one hypothesis limits basic comparability options.
While calculating multiple regression in order to uncover the type of the relationship to the dependent variables, a variance analysis is performed in order to examine the applied model; the resulting significance value of $p=0.272$ indicates that the model is less suitable for making a forecast in this case. An individual comparison confirms this. Nevertheless, a positive significant case ($\beta=0.266$) results that confirms the correlation between the DV$_1$ and the experiences in an external business with a probability of error of $p=0.027$. With regard to the DV$_2$ the model does not turn out to be completely valid, however, at 0.062 the significance is much closer to the acceptance region. This is confirmed by a positive adjusted $R^2$ of 0.102. The coefficient matrix delivers a positive $\beta$ value of 0.225 ($p=0.050$). With regard to the career choice ($\beta$ also 0.255), strategic thinking ($\beta=0.223$) and the personality of the entrepreneur ($\beta=0.25$), the slightly increased probabilities of error make it inappropriate to speak of significant results, however, positive tendencies can be assumed due to the relatively high $\beta$ values.

In conclusion, it can be stated that, for the case just examined, the null hypothesis is to be rejected in favor of the alternative hypothesis for explaining the influence of qualifications and experiences on the DV. The results of the correlation analysis confirm the connection between the assessment of the successor with regard to the dependent variables and the experiences and qualifications.

**Conclusion**

According to a meta-analysis by Heckmann (2009), the criteria of gender and level of education both have a positive influence on the success of a business. Therefore, the result of the present analysis is surprising, which leads to the rejection of the former working hypothesis. With the data of the survey it could not be confirmed with sufficient certainty that there exists an influence of the socioeconomic variables and the degree of satisfaction with the success of the business. However, this need not necessarily be opposed to the results found in the academic literature. Quite contrarily, the deviations could be explained through the size of the sample, since first tendencies for connecting social occurrences of criteria to the dependent variables from crossing the criteria can be clearly distinguished and might only have developed a stronger significance in a data survey of a larger scale. It is not surprising that no confirmation of the influences on the examined dependent variables can be found,
since the distribution of data set at hand proportionately corresponds to the actual circumstances (Schlömmer and Kay 2007).

The results regarding the correlation between the degree of satisfaction with success of the succession can be presented similarly: In this case, too, no confirmatory insights could be found to uphold the hypothesis. It is remarkable that no correlations between the number of steps required to perform the transfer and the assessment of satisfaction emerged. A positive relationship was to be expected here, since reports of its influence can be found in the academic literature (Menzl 1988; Spielmann 1994). Similarly to the previous hypothesis, the lack of any confirmed connections could be connected to the size of the data set.

The influence of the predecessor can be connected to the assessment of the satisfaction with the success and development of the business. The results of the negative correlation between the success and problems with the predecessor are also plausible. Due to the rectified relationship between the independent variables as well as between the dependent variables, interdependencies also indirectly lead to a correlation between the intensity of problems that the senior may have with regard to retiring from the business and the further development of the business. The junior can generally be expected to be more satisfied if disputes and discussions with the senior are kept to a minimum and if the latter does provide advice in case of questions, but otherwise refrains from being involved in active business operations. This may be so because this lets the junior act freely and control the development autonomously. Keeping in mind the mentioned results regarding the influence of the predecessor, an evaluation of the stated working hypothesis can be performed to the effect that the mentioned criteria are to be seen as decisive variables when examining the generational change.

With regard to qualifications and experiences, a number of justified relationships are also established that coincide with the results of the academic literature (Spielmann 1994). Examples are the professional and managerial competences that a successor should possess under any circumstances. The majority advocates a solid knowledge base as a prerequisite for success and a positive future development of the business succession.

Surprisingly, international experience is rated quite low when compared to other qualifications. This could be traced back to the specific characteristics of the participating businesses. Since most of them are small, family-owned handicraft businesses that are rarely
active in a global environment (Röhl 2008), international and intercultural experience seems to be less necessary here than in the high-tech industry, for example (Heckmann 2009).

The large majority of respondents has worked in external companies and was influenced in their choice of career by the prospective succession. Although there are no significant values to support the relationship with the dependent variables in this case either, a tendency for a certain influence can be assumed here as well. A possible explanation for the lack of significance is again provided by the size of the sample, since a larger number of participants is expected to confirm the tendencies.

**Limitations and Further Research**

As the study is limited to German companies country-specific biases could have influenced the results. Thus, the findings can probably not be generalized for other countries.

Mainly successors of small and medium businesses participated in this study. The findings can, therefore, not be easily transferred to large family operated corporations. Further studies could examine the succession plans of large family operated business to identify differences and similarities between the groups.

A high proportion of successors of handicraft businesses participated in this study. This industry differs from other organizational characteristics and procedures. Hence, the findings of this study are biased to some extent by this misbalance in the study sample. Another limitation occurs from the fact that only successors were asked to participate within this study. Hence, a one-sided perception could influence the results. Further research could mirror the perception of successors and predecessors to avoid such a bias.

Cross-Cultural Management in Western Humanitarian Micro Firms
in Emerging Countries:
The Case of French Charities in Southern India

Sarah Hillion

Very small Western humanitarian associations can be compared, at a managerial scale, to micro firms (central place of the decision maker, size, and informal processes). Yet to approach such structures, cross cultural management cannot be occulted. After the often mistaken convergence theory and the more realistic divergence one, including mostly qualitative research, some scholars have opted for interpretive approaches through qualitative data. Our field being French charities in Southern India, we will focus on a comparison between the French national culture at work called “logic of honour” (d’Iribarne 1989) and the most famous Indian leadership models (J.B.P. Sinha 1984). Proximity seems to be at the heart of every one’s expectations.

Keywords: cross-cultural management, humanitarian activities, micro firms, Indian models

This paper aims at presenting a literature review to approach the theme of very small Western humanitarian associations in emerging countries and the cross cultural and managerial relations that develop in them. More precisely, we focus on French structures in Southern India, in and around the former French trading post Pondicherry. We rely both on an empirical study led in 2007 and the literature we have tried to gather since then. We want to have a constructivist approach, with, in the end, a confrontation between literature, its first hypotheses and the reality of the Indian field in 2010.
We assume in this paper that these small humanitarian structures, though not-for-profit by definition, resemble the micro firms studied in management sciences. We mainly refer to Olivier Torrès’ works (2008) as well as other French researchers.

What is more, the action being led on foreign territories (very often in so-called emerging or developing countries), decision makers and members being somehow dependant on local employees and beneficiaries, the field of cross cultural management is very relevant for our subject. Therefore we propose to review grossly some of the most famous cross cultural trends, specifying why Philippe d'Iribarne’s interpretive approach (1989, 2004) of national cultures sounds the most appropriate one for our case.

Last, our research field being precisely localized in India— that is a country, or subcontinent, with a culture unimaginably different from the French one—, we find it more than necessary to gather texts from local studies so as to refine our approach and understanding of the theme. We are mainly dealing with Durganand Sinha (1973), Jai B.P. Sinha (1984-2009) and their colleagues of the indigenization of the Indian psyche after the independence (1947), which they have been able to apply to management sciences.

Gathering these three fields enables us to venture the hypothesis that proximity may be a key to approach the international humanitarian micro firms in India.

1. **INTERNATIONAL HUMANITARIAN MICRO FIRMS**

1.1. **ASSOCIATIONS’ LITERATURE, WHAT ABOUT THE SMALLEST ONES?**

Very small humanitarian associations do not often benefit from academic studies in management sciences and have therefore no precise conceptual framework to be studied. In the French law, such structures are hardly framed either since they belong to the particular and vague status of
almost any kind of association in France belongs to this status, according to each citizen’s right to “gather without any previous authorization”. Thus, sports clubs, gambling, painting or acting ones have the same legal rights and duties as the humanitarian ones, whether international or not, that we are dealing with. Associative management or non-profit management does exist as an academic field in France. Researchers mainly rely on the fact that the juridical model of associations is supposed to give each stake holder (member, employee, beneficiary, volunteer, activist or donor) the same rights in terms of expression. According to Laville and Sainsaulieu (1997; 2008), this implies a particular control mode and approach; the latter should be as much about “the quality of interchanges and the modalities of discussing the associative project as about the appreciation of its story, context and evolution”. During the Conference on Association Governance (December 2009), researchers mainly wanted to enhance the legitimacy of associations, adding an institutional point of view to the managerial one. For Polanyi (1983) the main issue for associations as a whole is the “conceptualization of economy in contemporary societies not reduced to market phenomena only”. Therefore associative management does have specialists, but the very theme of small humanitarian associations is hardly dealt with in management sciences. In social sciences, approaches will be purely anthropological or ethnological within the field. Gathering management and associations is not a new attempt, especially in Anglo-Saxon countries. The “non-profit management” is widely studied in the US, with dedicated research laboratories, conferences and regular publications (for example Non profit Times). The trend and main recommendation in the Anglo-Saxon non-profit is to work as “conglomerates of multiple

---

1 This is the law of July, 1st, 1901 and freedom of association (www.associations.gouv.fr)
2 International conference on association governance (Paris, November 2009).
organizations” (Anheir 2001). Paradoxically for the French specialists of associative management, Anheir suggests to see issues beyond economical efficiency and take values more into account. In France, associations seldom create partnerships and values are more considered than efficiency (Hillion 2006).

To go further, some French academics have studied the management of NGOs. Quéinnec (2003, 2004) has even specialized in the management of humanitarian organizations for international solidarity (OHSI). For him two paradigms of humanitarian NGOs exist: emergency aid and development aid. Yet in 2004 ( Quéinnec and Igalens), he recognizes that both have been legitimately mixing since the 1980s and presents instead a typology in six categories for the existing NGOs:

- Humanitarian: medical action in emergency situations
- “Pure emergency”: help in situations of natural catastrophe
- Charitable: to struggle against poverty
- Sponsoring: taking care of children in situations of extreme poverty
- “developmentalist”: sustainable approach of populations’ development
- “Technical assistance”: conception and implementation of development projects with strong technical content.

Most of the structures we are studying were born during or soon after the 2004 Tsunami catastrophe (which had not happened yet when Quéinnec wrote his typology) and have lasted thanks to the progressive implementation of development actions (sponsoring and schooling programs, microcredit). If such activities can belong to the types “humanitarian”, “developmentalist” or “sponsoring”, the members always say about themselves that they are “humanitarians”.
Quéinnec insists on the proximity between the situations of NGOs and commercial firms. He cites the incredible managerial success that some of them have met, becoming real multinationals. For the author, three conditions are necessary for NGOs’ survival and durability:

- Strong strategic resources
- Being able to express clearly the concrete modalities of aid
- Incentive to punish, according to the conformity of results.

According to Quéinnec, three types of actors seem able to fulfil these conditions, including more or less obstacles: private donors, public silent partners and the very beneficiaries of the aid (who are quite seldom at the core of studies). The latter fulfil the second condition and in the case of a plethoric offer that would lead to competition between NGOs and therefore a possible choice, they could express an opinion about the quality of the offered service. For the author, this situation is not real (2004). Yet, our 2007 field study in Pondicherry, India (Hillion 2008), showed that it could indeed be real and lead to the sheer modern consumerist behaviour described by the author.

If we come back to the precise case of very small sponsoring humanitarian associations with developmentalist views, we have to recognize that they do not completely fit the frame of NGOs in management sciences. Through their size\(^3\), reduced financial means and not yet institutionalized functioning, they manage members, employees, beneficiaries and the whole structure in a great proximity headed by an omnipresent leader. Such characteristics are at the heart of what management sciences have called micro firms.

**1.2. SMALL HUMANITARIAN ASSOCIATIONS ARE MICRO FIRMS**

\(^3\) Often much less than ten members: a president, a treasurer and a secretary are the only necessary members to create an association according to the 1901 law in France.
Researchers have established the characteristics of micro firms: lack of specialization, central place of the leader, centralized decisions, weak resources, informal information and human resource management, and strong dependency to the environment (Torrès 2008). Most of these characteristics seem to fit our small humanitarian associations.

The structuring link of the characteristics is a full “mix of proximities” (Torrès 2008). Proximity will soon prove to be a central point for the majority of the theories we are gathering, whether from France or India. The themes of field anchorage, alliances, omnipotent leader and crises do structure the vision we want to give of very small French charities.

</tbody>
</table>

Our 2007 empirical study (Hillion 2007) showed the predominant part of associations’ leaders, who take care of their project as their “baby” and tend to decide any point, which may sometimes lead to malfunctioning if trust is not generated among all members and employees.
The whole structure is informally managed through almost familial relationships and extremely simplified processes (email and phone communication, decisions taken immediately, everything being based upon trust). French members all know each other, they use the French intimacy “tu” form and the leader often shows a paternalist attitude with the Indian employees and beneficiaries.

In the case of very small humanitarian associations, all actors should be taken into account. A report written for the French Red Cross (Hillion 2006) displays the motivations of volunteers, members and donors in front of such structures. Unlike their big market leaders rivals (whose customers are targeted through solid and widespread marketing campaigns and only offer a formal presence in local areas), the small ones offer a proximity service which reassures and encourages those who would like to give time and/or money. Wanting to get closer to poor and distant families is a triggering factor for donation. Their communication strategy is synthesized in Table 2.

</table>
For Moles and Mohler (1978), “what is close is, all else being equal, more important than what is far, whether an event, an item or a being”. The strength of small associations is to be close enough to their donors for them to feel involved in the association issues and feel acting with its leaders for other people’s sake. This is the reason why donors are called today “donactors”. Torrès often reminds us that micro firms mainly deal with local customers. The donors from the French associations we studied in 2007 mostly live (more than 80%) in the head office area. If proximity is necessary, its contrary paradoxically does exist, given that these associations have an international commitment.

1.3. ABOUT INTERNATIONALIZING HUMANITARIAN MICRO FIRMS

For Torrès, globalization “denatures micro firms” since it is contrary to its original characteristics. Internationalizing small structures implies to shift from a proximity management to a distance one through certain decentralization, clearer task division and more sophisticated IT Systems. These are exactly the problems that small associations have to face, all the more as some of them tend to grow and multiply local offices.

If “what is close [...] is more important than what is far” (Moles), what about what happens so far, on the humanitarian field? This question is available for both parts of the world: donors and members are away from (though not affectively) the poor countries, but local employees and beneficiaries are distant form the managerial and centralized heart of the structure.

For Moles and Rohmer, if the object becomes too distant, the “wall concept” psychologically emerges to protect what is close and to protect oneself from what is far by diminishing its importance. For French donors and members, the hypothesis is only partially valid because distance is supposed to be an accepted factor from the beginning. It is different with local employees. They are not as much interested in helping poor foreigners because they are wage
earners, they are not “foreigners” in their country and they are poor themselves. These employees, mostly women in associations dealing with abandoned, beaten or raped women, are indeed often from the same class as the beneficiaries, they are not volunteers. So when the visiting French members go back to their rich country, the wall phenomenon may appear. Our 2007 study showed that the work rhythm and rules imposed by French leaders tend to be considered less strictly and get closer to more traditional Indian rhythm and rules when French people are away. The only remaining contact when Westerners have gone is virtual: through the Internet. A 2010 field study should partly answer these questions: has geographical distance an influence over local employees’ activities? If so, to what extent?

Proxemics can be approached from another view, the anthropological one. In anthropology, researchers speak about social distance and reciprocity. Sahlins (1968, 2004) describes the notion of social distance as circles defining reciprocity relationships that people may have according to which circle they belong to. In most societies, the first circle is the house and the second one the family (“lineage”), where reciprocity is generalized (one gives, whatever the situation). As soon as one gets to the circle of the village, then of the tribe, reciprocity turns relative; the situation must be “nothing for nothing”. Last, if one gets in touch with someone from outside the circle, that is someone with no initial link (family, tribe, geography) with oneself, we have a fully different situation: it is a “something for nothing” situation. Moral commitment disappears and theft, mistrust, even indeed hostility are the main criteria of such relationships. In India, we could attend abuses from some employees and beneficiaries who obviously did not offer the same level of trust and respect (by refunding correctly) to French microcredit associations as to their neighbours, for instance, who would lend them money at much higher rates.

---

4 The author speaks about so-called primitive societies, but he insists upon the fact that modern societies are still influenced by these old and unconscious reflexes.
Now that we have displayed the characteristics of international humanitarian micro firms and some of the problems they may have to face, we cannot possibly go further in our reflexion without taking cross cultural issues into account.

2. CROSS CULTURAL MANAGEMENT, FOUNDATION AND EVOLUTIONS

2.1. FROM CONVERGENCE TO DIVERGENCE

Our subject can be integrated in the recent and sometimes criticized cross cultural management current. Historically, two opposite paradigmatic axes started the issue (Dowling 1999), though the internationalization of trade went faster than intercultural research (Adler, 1983). The first axis, mostly from North American theories, was called convergence. The convergence
hypothesis (or etic approach) dominated the 50s and 60s in the US (and in Europe too, given to a lack of studies); it mainly relies on a macro analysis of international and cross cultural relationships (like, for instance, technology tools). It argues in favour of economical and managerial universality principles, according to which agents react the same way to identical management processes, thanks to adaptation. The different practices should be adjusted so as to fit the American model.

The second axis, called divergence or emic approach tends to study the same relations through micro processes (like analyzing employees’ behaviour in a firm). Its representatives state that nations preserve, even indeed tend to assert their differences in front of globalization and modernization.

2.2. CROSS-VERGENCE AND INTERPRETIVE APPROACHES AFTER QUANTITATIVE DIMENSIONS: CREATING AND GIVING SENSE TOGETHER

A new and more recent lead (Ralston et al. 1997) suggests that the “cross-vergence” model (a “melting pot philosophy” of value creation) should be more appropriate to studying international relationships in management sciences. For Ralston, integrating values from a different culture, though conserving one’s own values, is the best way to manage international human resources (especially at local level). We consider this approach adapted to our subject, as well as Philippe d’Iribarne’s one, from the Gestion et Société⁵ group (CNRS).

Distancing themselves from American conceptions, some European researchers have been trying since the 1980s to enhance the necessity of taking into account cultural differences for successful organizations (Hofstede 1980). Dimensional and very often quantitative approaches (Hofstede 1980 and 1991; Trompenaars 1993) have displayed cultural differences at a world scale. Hofstede, for example, highlighted four famous dimensions: Power Distance Index,

⁵ Management and Society
Individualism, Masculinity, and Uncertainty Avoidance Index. He decided to add the Long-Term Orientation dimension when Asian studies proved that at least one more dimension did exist and was very relevant for Asian people.

Such studies precede interpretative and multidisciplinary approaches (Gestion et Société). Avoiding the trap of field shift (some opponents claim that management is no sociology and even less anthropology), d'Iribarne recommends qualitative empirical studies that should call upon management theories, but also economy, sociology, ethnology and anthropology (d'Iribarne 2004) in order to make sense together by knowing each other. The group researchers deplore a lack of studies in Asia and in more varied organizations.

Despite critics (Barbichon 1990, then Allali in 2001 about the Thomson study in Morroco – *La logique de l’honneur*, 1989), like the one for generally thin sampling and therefore difficult generalization, some authors do get involved in the approach: Tayeb (2001) starts from a critical analysis according to which management researchers do not take enough cultures’ heterogeneity into account; Deval et al. (1993) recommend that researchers should involve themselves totally and in a long-term approach among the members of the studied community... and should systematically have recourse to social sciences, even in management sciences.

Thus, if dimensional approaches\(^6\) are not excluded from our work, they are not our main references.

### 2.3. The French National Culture at Work and... the Indians

D’Iribarne studied the French at work in his famous book *La logique de l’honneur*\(^7\) (1989), and again in *L’Étrangeté française*\(^8\) (2006). His lead is that national cultural values underlie all social

---

\(^6\) To which one should add Edward T. Hall’s arguments. As an American anthropologist, he studied interculturality in management, enhancing differences between high-context cultures and low-context ones; between monochromic and polychromic cultures and their relation to space, which he called “proxemics” (Hall, 1984).

\(^7\) The logic of honour.
life in firms. He cites Montesquieu to explain one of the French key values, which is “the prejudice of each person and each condition”. Honour would be the heart of human processes in French firms, whatever the hierarchic guidelines, with pride for well-made work and rejected critics about it if they come from an outsider (to the task). The author goes further:

“One can find in France a conception of grandeur proper to a cast wedded to its rank, which senses like an unbearable attack any request for carrying out actions unworthy of it.” (2006, p. 49)

This “strangeness” thus mixes a great respect for posts and duties/responsibilities and a certain form of hostility, even indeed mistrust and suspicion between them. This is why individual relationships should be favoured to get collective harmony. Such behaviour can be found in any kind of organizations and we can definitely suppose that it does occur in humanitarian micro firms. A case study about a three-dimensional crisis in one of them (Hillion 2007) does show the drifts to which honour may lead, with diminishing trust until donors, members and even beneficiaries run away to rival associations. But let us not remain deaf any longer to the strange comparison (the reader will have undoubtedly noticed) made by d’Iribarne between the French culture and the cast system. We can indeed foresee a first connection between the two cultures.

Because what do cross cultural studies reveal about the behaviour of Indians at work? The dimension specialist (Hofstede) classified India as a country with a very high power distance index, a light masculine tendency, very low uncertainty avoidance index, (unexpectedly) tendency for individualism and long-term orientation. If we compare these results to France’s ones, we can notice some differences, but not as striking as expected:

---

8 The French strangeness.
9 We are citing these data for an easier approach of the subject; yet, like many Western and Eastern researchers, we consider that these dimensions tend to generalize too much and do not take into consideration complex local contexts.
- Indians rank higher on the power distance index (77 vs. 69; world average 57), but French rank higher than most Western countries (Austria 11, Ireland 28, Germany 35).
- The French would be less masculine than Indians (43 vs. 56) but not on a large scale.
- Indians would be less individualist than French people (54 vs. 71) but they rank higher than other poor countries (8 in Ecuador).
- Actually, the uncertainty avoidance index is the one that most differentiates the two cultures: both almost culminate at the opposite extreme (40 for India and 86 for France), revealing for India deep trust in circumstances and an exceptional adaptation ability when risks and reversals come out (Hindu beliefs like reincarnation would explain it), and a need for control often related to the imperial history and a repressive legislation for France.

To go further, in his last book (Penser la diversité du monde\textsuperscript{10}, 2008), d’Iribarne rephrases his comparison basis for national cultures as the most feared peril in a given society. In India, the worst is to become impure (the cast system, still very pregnant in spite of the 1950 Constitution which officially abolished it, would be a reference to impurity). In France, the big peril would be to be reduced to give in, out of fear or interest, in front of who can harm or give favours. The two behaviours or behavioural tendencies resulting from this for French and Indian people at work seem to be connected through a certain pride or honour, which may lead to mistrust, sometimes disdain.

But all this data cannot be relevant if we do not check what the first concerned, at the end of the world, think. Let us see what Indian researchers say.

3. \textit{The Indian Management and Its Representations, an Essential Key}

3.1. \textit{From Social Sciences to Management Sciences, from the Indigenization of Psyche to HRM}

\textsuperscript{10} Thinking the world diversity.
As many researchers from emerging economies, Indian academics have tried to get heard at least as much as the others when it comes to study how their own culture can coexist with others at work.

Before shifting to cross-cultural management as a management science, they started with psychology and philosophy in order to reclaim a common national psyche after independence and partition: this is the indigenization of the Indian psychology (Durganand Sinha 1973 and 1986). Sinha’s school of thought widely influenced psychology and social sciences more generally. It is interesting to note that many Indian management researchers, unlike most of French ones, come from social sciences. In sciences, there is no cast.

With more and more studies coming from the West about interculturality at work and the analysis of all countries on stage through globalization, Indian academics decided to question the ethnocentric approaches of researchers who do not know the Indian reality.

Srinivas (1966, 2000) puts his finger on the inadequacy of Western managerial models and the unsustainable results on the long run, given to a cultural decontextualization. Jai B.P. Sinha comes in 1980 with his famous “nurturant-task leader” (NTL) to make the world understand how Indians are at work, what they expect and cannot accept. He suggests the indigenization of leadership and organizational behaviour theories.

### 3.2. Leading in India, NTL and Other Models

Sinha, as many other Indian researchers, has been repeating for decades that Indian employees do not exactly perceive the relationship to a leader the same way as Westerners do. First, they have a high “context sensitivity” and are permanently and unconsciously looking for “balancing”. In practical terms, for example, they find it hard to contradict a superior and highly adapt their behaviour and answers to persons and context. Therefore, quantitative studies and
pure etic approaches are strongly advised against by the author. He recommends qualitative studies and approaches using a mix of etic/emic for the field.

Then, Indians perceive control and reprimands as a lack, even indeed a suppression of trust, which may lead to the worst drifts for the organization. Loyalty and personalized relationships are the main sources of efficiency and performance.

In such a context, the Indian leader has to “nurture” his professional relationships and his employees’ well-being and development as much as the firm’s results. Personalized and dependency relationships (Chhokar 2007) must be established, the leader taking part in their lives (weddings and functions, ceremonies, etc.) and giving them esteem. In India, a good leader must be an “authoritative” and trustable figure instead of a mere “authoritarian” one. On that account, he or she will for instance “supervise” his or her employees, expecting a well-made task. In such a case, the employee’s award is to be appreciated by his warm and benevolent superior.

On a long-term basis, this trust relationship should lead to a form of interdependency and consequently higher productivity, everybody’s growing skills and even, in the best cases, the employee’s autonomy before he or she becomes a charismatic and caring leader in turn.

This particular relationship can be compared to the one between a father and a son\textsuperscript{1}, a guru and his or her disciple, Gandhi and the Indians. This model should be adaptable regardless of sex, cast or any dividing reference, though they still underlie daily relationships and interpretations in the country. If we come back to our theme of very small humanitarian associations, the field showed us in 2007 that Indian employees and beneficiaries (none of whom being trained to management techniques) tend to put in practice this proximity relationship with French leaders.

\textsuperscript{1} Or a mother and her children, Sinha does not seem to see a specific gender in his theories. Besides, India is a woman (Mother India).
and treat them like family members (one director was nicknamed “Ayah”, which means “Grandma” in Tamil, and she was invited to many functions).

Since Sinha, India has presented numerous leadership models, most of them inspired from the original one. Subash Sharma (2002) publishes works to create a full Indian leadership model. He reviews authors and models, but also the purely Indian ideas and values, collected from sacred texts, mythology and customs without which no model should be conceivable:

1. Everyone’s well-being (*sarve bhavanthu sukhina sarve shantu niramaya, Loksangraha*)
2. The ethics of profit (*Shubb Labh*)
3. Detached action (*Nishkam Karma*, that is taking actions without expecting immediate results)
4. Work as a veneration (one should work like he or she worships a god)
5. Divinity in human beings (“any soul is potentially divine”; according to the philosopher Vivekananda, this is the core of personal development)
6. Family (*Kutumbh*, the whole world is seen as a family)
7. Avoid extremes (like Buddha’s middle path, in India, people look for adapted solutions rather than one for everybody).

Figure 2 synthesizes Sharma’s model and interactions between Indian values.
3.3. **Other Important Points**

Like the country, the Indian literature (whether scientific or artistic) is vast, varied and relevant because it gets sense from one of the most ancient human history in the world. Therefore the literature gathered here is reduced to a minimum in order to apprehend our subject. But to have as many keys as possible, we do think that one should not only focus on managerial texts. For instance, many authors insist upon the fact that intercultural studies only show one version of a country’s culture, without taking into account its possible internal diversity. India, immense and
terribly old subcontinent, is the second most populated country on Earth (almost 1.2 billion inhabitants); not less than 23 languages are officially recognized and more than 1,600 dialects would be spoken on the territory; all religions are present, including animism; it is a federation composed by 28 states and seven union territories, hosting billionaires and starving farmers. The list could be longer, it would maybe confirm that the Tamil culture and history might have to be studied further for our issue.

One should also exclude any cliché that sees Indian people, as well as all those from emerging or poor countries, as purely collectivist, without any place for individual aspirations. For Durganand Sinha (1994), Indians are vertically collectivist; that is they give a major importance to their family members but with a different status according to their age, gender or need. This is how they can be individualist in their personal development, all the more if they are educated because they are influenced by their Western counterparts, the countries they study in, the books they read.

**CONCLUSION**

Given the gathered literature of this paper, we think that the very small French humanitarian associations in emerging countries must be approached qualitatively, with an open and multidisciplinary view. We do know that there is a risk in such studies: getting lost in social sciences. But management sciences are social and human, all the more when they come to internationalizing generosity.

If we compare all our references, we can see that they are not opposed at all. They might even be complementary:

---

12 Pondicherry is a union territory in the middle of Tamil Nadu, said to be the most conservative Indian state.
- French people have honour in their skin and Indians have purity; all of them need respect for their work and no permanent questioning.
- In micro firms (even humanitarian ones), they work in proximity and informality; this is the core of the successful models in India.
- Work relationships must be very strong and imply personal development and family in India; the French want to succeed in their task without any constraint and be able to give their trust to avoid disappointment.

A field study will take place in India this year (2010) to confront literature and reality. Our main focus will be on local employees’ and beneficiaries’ interpretations of their situation. We hope we will be able to share the first fruits of our findings.

Sarah Hillion is a doctoral student in Management Sciences in Montpellier 1 University, France. She has been working on the internationalization of humanitarian activities and cross cultural management in the field for years, including two Mater degrees in Management and International Business. She works with the ERFI laboratory in Montpellier and has represented the Montpellier Business School in various international conferences. Her last research study was conducted in Pondicherry (India), under an affiliation with the IFP (French Institute of Pondicherry).

Internationalization of Small Firms – A comparative study of CEOs’ global mindset and their firms’ internationalization behavior

-Report of research-in-progress-

Abstract
The study aims at replicating a study done in 2006 with focus on the formation of a global mindset among small firm CEOs and the causal relationship between the global mindset and the firms’ internationalization behavior. The original study was done using a sample of Norwegian firms with between 10-50 employees. This is a report of the first stage of replicating the study in Portugal and Spain. While the findings so far indicate some differences between the samples, it is currently too early in the research to be able determine whether the model developed in the original study is valid also in Portugal and Spain. The report outlines the study’s conceptual foundation, research design, methodology and discusses the preliminary findings.

Keywords: small firms, internationalization, global mindset, firm behavior, managerial cognition

---

1 Corresponding author
Introduction

This research project defines internationalization as the process of adapting firms’ operations (strategy, structure, resources, etc.) to international environments. This is a holistic perspective of internationalization (Welch & Luostarinen, 1993; Fletcher, 2001) which leaves the door open for inward connections and processes, that is transactions into the country, or outward connections and processes that is transactions out of the country. The definition is similarly not restricted to the flow of physical goods, but includes information, exchange of technology, know-how and competencies (Havnes, 2001).

With the small firm (10-50 employees) as the unit of analysis, the focus in the following is on exploring variables related to the internationalization process and illustrate how also cognitive phenomena form an integral part of the internationalization process, as well as being central in the entrepreneurship- (Baron, 2004), networking- (Welch and Welch, 1996) and strategy literature (Knight, 2001; Hodgkinson and Sparrow, 2002).

Conceptual foundation

It appears to be generally accepted that the CEO’s entrepreneurial orientation and perception of opportunities and threats (Baron and Ensley, 2006) play an important role for small firms’ propensity to internationalize. In this perspective, internationalization-propensity may depend on the decision maker’s perception and interpretation, through the mindset, of resources and capabilities, psychic distance, the firm’s need to acquire new knowledge and its capability and willingness to share in-house knowledge with other firms or agents in the internationalization process. “How successful a company is at exploiting emerging opportunities and tackling their accompanying challenges depends crucially on how intelligently it observes and interprets the
dynamic world in which it operates. Creating a global mindset is central requirement for building such intelligence” (Gupta and Govindarajan, 2002, p. 125). With specific reference to small firms’ internationalization and the role of the decision-makers, Chetty and Campbell-Hunt (2003) identify the decision-maker’s determination, social networking skills and risk propensity as main driving forces. The authors conclude: “The implications for theory are that to improve understanding of the internationalization of SMEs (Small and Medium Sized Enterprises) researchers need to integrate internationalization theories with the characteristics of SMEs. Moreover, it is important to note that the attitudes and motivations of decision makers in the SMEs determine the path and pace of internationalization. The implications for managers are that they need to be aware of the importance of issues such as their own attitudes and motivations, timing, coherence, managed growth, business networks and learning in the internationalization process. In fact, managers need to be aware that the mental models they have could be their main barriers to internationalization” (ibid, p. 814, italics added).

Kyvik (2006) and Kyvik, Saris and Bonet, 2010 adopted a cognitive perspective on management in order to explore the formation of the global mindset among small firm CEOs and the relationship between the global mindset of the decision makers and their firms’ internationalization behavior. A conceptual model (Figure 1) and measurement instrument were developed based substantive theory. Using structural equation modeling, the theoretical conceptual model was estimated based on empirical data for Norwegian small firms and subsequently developed and partially confirmed. The objective of this research project is ultimately to verify whether the model developed may be categorized as a general model by replicating the study in two additional samples, respectively in Portugal and Spain. What
follows is a report of research in progress. The current stage of empirical research will be outlined, methodological concerns discussed and empirical findings highlighted and discussed.

The paper concludes with a discussion of the appropriateness of the research design and a brief review of future research related to this study.

**Research questions**

Much has been published regarding the global mindset construct and its relevance for multinational firms in an increasingly globalized world economy (Jeanett, 2000; Javidan, Steers and Hitt, 2007; Levy, Beechler and Boyacigiller, 2007). However, much less attention has been granted to the relevance of CEOs’ cognitive processes and their mindset as to how small firms perceive international opportunities or competitive threats (Chetty and Campell-Hunt, 2003; Kyvik, 2009). Also, much of the literature with a cognitive perspective on management (Hodgkinson and Sparrow, 2002) and with focus on internationalization and the managerial challenges of globalization in particular (Gosling and Mintzberg, 2003), is of conceptual nature. Relatively few studies discuss the formation of a global mindset and the theoretical measurement of the construct (Gupta and Govindarajan, 2002; Nummela, Saarenketo and
Puumalainen, 2004) and those that do frequently refer to multinationals. In response to this void in the literature, this research focuses on small firms’ internationalization and attempts to find out the reasons why some small firm CEOs have an international perspective when considering the strategic opportunities and threats of their firms while others appears almost oblivious to international markets.

By amplifying the original study’s Norwegian sample with observations from Portugal and Spain, cultural and industrial differences and possible consequences for the formation of the global mindset will contribute to determining whether or not the model developed by Kyvik (2006) is a general model describing the formation and effects of having a global mindset in small firms or not.

**Research design**

While opting for a quantitative approach to the data collection and data analysis, the research design is inspired by a constructivist research philosophy as the literature and theoretical constructs are solidly rooted in a cognitive management perspective.

The research follows the common research stages of developing a conceptual model based on combined inspiration from practice and theory and determining appropriate methodology based on a careful consideration of pros and cons of the

![Figure 2: Research-design](image-url)
available options and resources.

Population and sample were determined by considering what would be most suitable considering the research questions. Similarly, the preliminary data analysis was performed with conscious focus on the research objectives and its implications for theory and practice.

**Data collection and analysis**

The research was operationalized using an internet/web-based survey instrument to collect data and measure the global mindset and the firm internationalization behavior primarily based on Likert-scale measures.

The survey was specifically constructed for this type of research. Each of the item-constructs of the questionnaire is anchored in existing literature and the measurement of the individual constructs, have Cronbach alphas indicating good reliability.

The population for the study is limited to firms with between 10-50 employees while the sample was limited to sectors of the industry in each national market reasoned to be particularly exposed to international competition\(^2\) and thus either directly (exporting or importing directly) or indirectly (buying and selling to/from other importers or exporters) more or less active importers and exporters.

The data collection process, however, turned out to be considerably more complicated in Spain than in the other countries. A lot of time was required to get access to the individual CEOs’ e-mail addresses and eventually the only option was to call each firm in the sample randomly

---

\(^2\) **Norwegian simple**: Construction/real-estate, trade/commerce, maritime industry/shipping, off-shore/oil&gas industry, fishing industry, land-based industry, media/publishing, IT and research and development  
**Portuguese sample**: Construction/real-estate, trade/commerce, textile, footwear, chemicals/plastics, agriculture, IT and research and development  
**Spain**: Construction/real-estate, trade/commerce, industry, service, agriculture, IT and research and development
selected from the company-registry listing and simultaneously promote the research project and request the e-mail address of the CEO. The reasons the reluctance of the firms to participate in a research project, might be cultural (several CEO complained about receiving too many survey requests) or lacking understanding of the significance of participating in research (and this in spite of offering free copies of the research results + a small premium). In Norway sufficient responses were at hand within 2 weeks from “going live” with the survey while in Spain the process still continues after 4 weeks of sending out regular reminder e-mails. Eventually, 215 responses were received in Norway, 257 in Portugal while only 120 in Spain representing respectively a response rate of 50% in Norway, 9% in Portugal and 15% in Spain.

A stratified sample was used with expected only minor differences found between the size-ranges of the population and the stratified sample.

Towards the end of the data collection process, it is concluded that electronic data-collection (web-based survey) is very efficient, however, the difficulty of getting access to a random sample of CEOs e-mail addresses must be considered and the cost of getting access both the e-mail addresses and to a suitable data-program to manage the data-collection process must be taken into account when evaluating data-collection choices and expectant response rates.

After collecting the empirical data, this was analyzed using SPSS (version 16), while the analysis of causality will be performed using LISREL (8.80 student version).

With reference to the conceptual model (Figure 1), Table 1 below summarizes some of the descriptive variables of the samples (Norway and Portugal). The findings are for most of the variables quite similar. This may not be surprising; after all we are comparing two European countries, however, located on the extreme north and south of the continent with a slow convergence towards common European values reportedly on its way (Gooderham and Nordhaug, 2010). However, simultaneously, we are considering countries with very distinct history, culture and religious traditions and differences in values (Hofstede, 1991/1997, 1998) are certainly expected. With reference to Table 1, which in summary form illustrates variables related to the questions regarding the CEOs childhood ambience, education, demographics, personality characteristics of the CEO and firm- and work-ambience characteristics, noteworthy differences are highlighted\(^3\) and commented on as follows. As can be seen, a significantly higher number of Norwegian small firms’ CEOs has university-level education. Taking into account the difference in gross national income (GNI) per capita\(^4\) (Norway with US$ 87.067,- versus Portugal’s US$ 20.556,-), the difference in education level is not surprising granted that part of Norway’s GNI is allocated to mainly public universities and subsidized student-financing for students from all social levels. Portugal does not have a similar educational- and support system and this is most likely reflected in the lower score. Also the language skills (English) probably partly reflect the difference in the educational system, where the English skills of Norwegian CEOs are higher than their Portuguese colleagues.

---

3 Differences in score of more than 10% are highlighted. Values for Spain will be provided.
4 OECD 2009
However, somewhat surprising, the data indicate a much higher number of female small firm CEOs in Portugal than the case is for the Norwegian sample. According to Hofstede’s (1991/1997) research on cultural dimensions in management, both Norway and Portugal are countries scoring relatively low on the masculinity versus femininity score, however, Hofstede in his study from the 1990s reports a lower score in Norway than in Portugal. A possible explanation of the relative high number of female small firm CEOs in Portugal may be the rapid social changes that have taken place during the last 30 years and particularly during the last decade. Apart from a gradual liberalization of society, sequential governments have also on institutional level promoted equality between the sexes and supported women’s participation in politics, organizational life, as well as, in management. The noted high percentage of female small firm CEOs is probably an effect of this legislative climate and conscious gender policy.

The Portuguese CEOs are found to score higher than their Norwegian colleagues regarding their inclination to work in teams. This finding is considered to be in line with Hofstede’s overall conclusions of Portugal being a collectivist and consensus-seeking society with relatively stronger group adherence and less individualism. In comparison, Norwegian CEOs are generally much more individualistic in spite of society’s strong social democratic ideology. Empirical experience based on collaboration with Norwegian small firm CEOs also serves to confirm that Norwegian small firm CEOs appear to find team-work, external networking and collaboration with other firms challenging and tend to give social-oriented management activities relatively low priority in day-to-day management. Other dimensions, such as religion, climate, geography and population-density also may negatively impact Norwegian CEOs’ tendency to socialize
(also, with a population density of 12.5/km² compared to Portugal’s 114/km², the probability of a chance socializing with other CEOs across the mountain or fjord is relatively low).

Further, with reference to the CEOs’ pro-internationalization attitude and propensity to internationalize, the Portuguese CEOs are found to have a 16% higher international inclination than do the CEOs of the Norwegian sample. Explanations for this finding may be cultural-historic, it is for instance possible that contacts with the markets of former Portuguese colonies even today positively contributes to a higher consciousness of foreign markets also among CEOs of Portuguese small firms.

The proportion of small firms with one owner is larger in Norway than in Portugal. The reasons for this may be varied and possibly related to Portuguese CEOs’ higher score on the team-work variable. Higher collectivist and consensus-seeking values in Portugal than in Norway may positively influence Portuguese CEOs and managers in establishing joint-ventures and other types of joint-operations with other firms. The choice of ownership-structure will in any case eventually impact internationalization by making it considerable easier and quicker as a sole owner rather than with several, however, possible lack of funding by going alone may on the other hand counteract this potential benefit. Other variables in Table 1 will also influence and thus the causal direction and impact are uncertain at this stage.

It appears noteworthy that as much as 66% of the Norwegian small firm CEOs reports to engage in formal strategic planning while comparatively only 35% of the Portuguese CEOs reports to produce written strategic plans. This may be related to the relatively higher level of university
education among the Norwegian CEOs compared to the Portuguese sample. Further interpretation of this score is uncertain as according to Hofstede’s findings, Portugal scores considerably higher than Norway on the uncertainty avoidance index and one should, ceteris paribus, anticipate that this should result in a greater inclination to plans and norms in an attempt to reduce uncertainty. Also, in this case further interpretations and direction of causality are highly uncertain at this stage of the research.

Finally, and this may be related to the low tendency to make strategic plans, very few of the Portuguese CEOs report that the firm engages in research and development (R&D). While 66% of the Norwegian CEOs engages in R&D, only 4% of Portuguese CEOs do. Naturally, this finding may be related to the CEOs’ relatively lower educational level, while it may also be related to access to funding and other type of public or private support for R&D in small firms.

It is emphasized that all the reported scores are subjective scores as responded by the CEOs when filling out the web-based survey. The scores may even be influenced by the CEOs of the various samples’ interpretations and understanding of the wording of the questions. To counterbalance possible measurement-problems, all questions have been rigorously reviewed by native researchers in an attempt to limit the impact of cultural interpretative differences and translation to different languages (Norwegian, Spanish, Portuguese).

Future research
When the data for Spain become available, the next phase of this research is to empirically test the conceptual model on the samples from Portugal and Spain with the objective of determining whether or not the model is a general model or not.

The analysis will be extended with in-depth interviews with a selection of small firm CEOs from both internationally active and firms which not yet is contemplating internationalization to gain further understanding of the cognitive triggering mechanisms. What makes one small firm CEO include international markets in his or her strategic toolbox while another does not? What are the triggers for formation of a global mindset in a small firm and what hinders small firm CEOs international orientation? Which resources and capabilities are most important in the strategic contemplation of internationalization in small firms and how may this process be better facilitated?

Granted that the majority of firms in any nation is small firms and that all big firms started small, this appears to be a highly relevant line of research.

**Weaknesses in the present research approach**

The research design is cross-sectional and each national sample has a different selection of industries and sectors reflecting its economy. As a result of this and the use of a survey instrument for data collection, only a snapshot view of the targeted sample is obtained in each market – i.e. a snapshot view of the firms’ activities and status of processes at the time of the survey. This approach is in line with similar studies (Nummela, Saarenketo and Puumalainen,
2004; Baird et al, 1994; Andersson et al, 2004), however, one should be aware that this design may limit the strength of the conclusions about the (causal) relationships outlined in the conceptual model. Conscious efforts are made to firmly base all constructs on existing theory while at the same time extending past research with empirical testing of the conceptual model in new samples. This recognized weakness in design will be reduced by triangulating quantitative- and qualitative data and methodology in future extensions of this research.

Business ability of the client-organization’s manager(s) as a criterium for bank managers when they repute their client-organizations

Results from an empirical study

Abstract

Is the business ability of the client-organization’s manager(s) very relevant for the sample bank managers in their role to repute client-organizations?

The current paper tries to find an answer to this question.

An empirical research (438 respondents) enabled us to determine the main criteria adopted by bank managers from Aveiro and Porto and conclude that the business ability of the client-organization’s manager(s), although important, is not a critical criterium for this sample.

Such knowledge helps companies on decisions about policies and practices as concerns bank managers and informs bank managers about their colleagues perceptions on the importance of their client’s manager(s) business ability.

Keywords: bank managers, corporate reputation criteria, business ability of manager(s), organizations.
Emerging Market SME Turnaround and Growth in a Recession: Theory and Practice

The author of this developing paper, a senior industry practitioner, reviewed literature on SME turnaround with the aim of applying the learning in order to achieve a “first time right” outcome to a high profile turnaround initiative. The initial disappointment stemming from gaps in the research and vagueness of definition was replaced by excitement given its diversity and an unexpected outcome, where what was found would challenge the author’s thinking about SME turnaround to the point where he is beginning to question whether the subject of SME turnaround is a valid concept.

----------------------------------

Introduction

This developmental paper is an outcome of the author having been tasked with implementing the turnaround of a financial services SME on behalf of its shareholders in the role of CEO, and to grow the SME further into the markets it serves. These opportunities proved to be the perfect basis from which to consider turnaround theory with respect to the practical execution of the turnaround, and to consider SME growth and development theory against the practice of growing the SME both during and after turnaround.

As a result of the project above, gaps are beginning to be found in the literature in as far as turnaround in emerging market SME's are concerned, and also in as far as research into turnaround during a recession is concerned. These gaps highlight potential research opportunities as various aspects of turnaround are not equally researched. For example, Pandit (2000:51-52) notes that previous turnaround research questions have often highlighted the content of turnaround strategies, but work
relating to the context and the process of turnaround are rare. This is unfortunate as the requirements for turnaround – establishing accountability, conducting diagnostics, setting up information systems, preparing action plans, taking action and evaluating results – have been part of the literature since at least the 1980’s (Boyle and Desai 1991:33). The contextual matters Pandit refers to are topics such as the severity of the crisis, the attitude of shareholders, and the historical business strategy, while the process matters relate to topics such as the identification of triggers that begin the turnaround process and the identification of sequences of successful recovery actions (Pandit 2000:52), discretionary activity that can be taken to ensure that failure is not inevitable, and that turnaround can be effected (Chowdhury & Lang 1993:8).

From a practitioner perspective, the research gaps may add weight to learning from other's experiences, whether they be positive or negative. Even more, since the problems facing entrepreneurs in developing countries are often quite similar (Benzing, Chi and Kara 2009:63), there is perhaps an increasing transferability of knowledge and experiences across the borders of developing countries, where one of the biggest research gaps exist. However, practical insight in turnaround remains valuable because, as O’Kane (2006:118) notes, a criticism of turnaround research is that it offers results that are unconvincing and of little assistance to turnaround managers, offering support to the point made about gaps in the literature, in this case, in terms of their practicality. This paper may therefore begin to contribute to improvements in understanding the actual actions required for turnaround (Spremann 2004:14), a topic which has received little systematic attention (Latham 2009:182).

Finally, given the high incidence of small enterprise failure globally and the apparent failure of turnaround research in practice, could government support for SMEs be further enhanced as a result of research-practice oriented papers and shared experiences? Since SMEs are usually more vulnerable to financial distress when compared to large firms as is evident by their high mortality rates (Chowdhury
& Lang 1993:8, Boyle & Desai 1991:33), any interventions helping to reduce the failure rate of small business would be helpful. Indeed, it could be that practical experiences have a potentially more important role to play in SME development, if only there was an appropriate way to channel these experiences to practitioners? These are very important questions in practice when one considers that South African startup businesses are the least likely of developing countries to mature beyond three months, and only 25% of them make it beyond 42 months old, compared to 89% in Brazil, another developing country (Von Broembsen et al 2005:19-20).

**Purpose**

At the start of his turnaround process, the author simply expected that there might be value to be gained from reviewing the current academic literature on the turnaround landscape, that it would enable a greater chance of getting a “first time right” outcome as a result of applying the learnings gained from the research. However, as the author studied the literature, he instead found it lacking in both depth and content, at least in as far as his particular case was concerned – an emerging market SME in a recession – which gave rise to this paper in development, as an attempt to begin to highlight these gaps and to demonstrate the apparent failings of research in as far as their value to practitioners is concerned.

**Background**

The original strategy of the business (the SME was established in May 2005) was simply to create a viable micro-lender in South Africa. Micro-lending is a category of financial services to low income customers, ‘… where the unit of transaction is usually small …, typically lower than the average GDP per capita’ (Isern and Porteous 2005:1), while South Africa is a developing country and an emerging market (Smith 2006:168). To realise the strategy, the business sold unsecured micro-loans to a target market, at that point assumed to be homogeneous in their need for credit, by means of a
single channel – inbound telesales. The upper limit of the loans was about USD2,000 over a term of 24 months, while the target market was defined to be the mass middle market having an average monthly income of about USD650. Product-centric advertising was conducted in media that included press and television. At this time, the SME had a staff complement of 89.

The problem expressed by the previous management team, was simply to generate enough sales to reach break-even. The business already had about 14,000 customers, but it was highly unprofitable and had yet to break even. The author analysed the business in terms of both its operating model and its business model, summarizing the major organizational challenges to be addressed as follows:

- In an unsuccessful attempt to differentiate itself (from the perspective of being able to generate larger volumes), the unsecured personal loans were priced at 6% below the competition irrespective of the increased risk of default of the target market

- Advertising expenditure was significant, at about 40% of revenue

- The market was defined as the mass middle market, between The South African Advertising Research Foundation's (SAARF) Living Standards Measure (LSM) 3 and 6. Research conducted in conjunction with an international advertising agency indicated that our customers were actually LSM 5 to 7, meaning that management had been targeting the wrong customers

- The SME employed 89 people at the time, and none had job descriptions, performance contracts or key performance areas to perform against. Morale was low due to multiple restructuring initiatives, and there was no employee value proposition. Staff development opportunities were non-existent, and management was autocratic. There was no marketing role, and IT was relegated to a middle management role. Finally, there were significant cultural differences between the author as the new CEO and the current management team, with the major difference being in communication style of the new CEO, which was highly informal fitting the 'Generation Y' employment profile of the majority of staff

- No processes were documented. Turnaround times between loan application and loan decision took up to five days whereas the competition could do it within a day. There was no Information
Technology (IT) specification and its implementation was undocumented. Furthermore, the system was unstable, fraught with manual workarounds, and had reached capacity. The IT vendor was invoicing for 'work done', unchecked, resulting in over-billing. There were no systems change processes. Channel- and back office operations were indistinguishable, which meant that it would be difficult to add new channels to the business without major cost.

- From a facilities perspective, the buildings were large and expensive compared to the income being generated by the business, with plenty unused space. Backup power supplies were unreliable, and the facility was the target of regular break-ins.

- Funding was however secure, being provided by the SMEs shareholders, and legislative requirements were largely in order.

From the above, it became clear that the bulk of the challenge was in the operating model, with a secondary challenge in developing the business model. This is because the operating model, besides being highly inefficient, was already at capacity as was demonstrated at a board meeting, i.e. no matter how much better the business model would become, the operating model would be unable to deliver.

**Developing a Theoretical Context for Turnaround**

The theoretical context of this paper examines a number of important attributes in turnaround theory, although it is not a conclusive review at this point.

The review begins with a short exploration of what turnaround means. It became apparent that the term 'turnaround' does not have a clear definition in the literature. This vagueness makes it difficult to measure the success of turnaround. The review then moves on to consider the role of finance, probably the most important resource in the business as without financial resources, a business would not have the wherewithal to operate, and it has become almost traditional to speak of a lack of financial resources as being almost the ultimate barrier to SME development. The review continues, exploring some of the issues surrounding turnaround in developing countries and in a recession, noting gaps in...
the literature in as far as SME research in an emerging market in a recession is concerned. The review then proceeds to turnaround strategy, followed by a review of turnaround implementation. It will have been noted at this point that nothing can get done without people – without leadership and appropriate management, and without people doing what needs to be done to effect the turnaround. Finally, the review closes off with an emerging counter-argument for the concept of SME turnaround, perhaps beginning to shed light on why there seems to be limited research on SME turnaround. Let us now consider the literature.

**What Does Turnaround Mean?**

Finding a standard definition for 'turnaround' seems to be a difficult task because many authors have failed to provide appropriate definitions to guide their research, depending instead on the readers’ general understanding of the term (Pretorius 2009:4). For the purposes of this paper, Pretorius’ research aimed at determining the definitions of ‘decline’, ‘failure’ and ‘turnaround’ has been used, from which the following definitions of ‘turnaround’ and ‘decline’ have been proposed (Pretorius 2009:10-11):

_A venture has been turned around when it has recovered from a “decline that threatened its existence”, to resume normal operations and achieve performance acceptable to its stakeholders (constituents) through reorientation of positioning, strategy, structure, control systems and power distribution. Return to positive cash flow is associated with achievement of “normal operations”. A venture is in decline when its performance worsens (decreasing resource slack) over consecutive periods and it experiences distress in continuing operations. Decline is a natural precursor in the process to failure._

Furthermore, Pretorius adds that ‘decline’ implies operating under distress, which, if the causes are corrected, leads to continued operation. Associated terms include ‘underperforming firms’ and ‘technically insolvent’ firms (Pretorius 2009:11).

**The Role of Finance in SME Development and Turnaround**

While access to finance is often cited in the literature as a driving factor of SME growth (e.g.
Morgan 2010; Agrebi 2009; Watson, Newby and Mahuka 2009:46; Beck and Demirguc-Kunt 2006; Lafferty 2005), access to finance is often constrained due to lack of collateral or a trading track record that is too short (Rutherford et al 2001:67). However, McPherson and Rous (2010) for example show the importance of other factors to SME growth other than finance. Even a cursory review of the literature shows that the reasons for constrained growth could be almost anything from ownership structure (Niskanen and Niskanen 2010; Abor 2008), to gender discrimination (Watson, Newby and Mahuka 2009), to the development of a meaningful mission statement and a relevant strategic operating context (Analoui and Karami 2002), to how familiarity stifles SME development (Sears 2001) and even to the individual characteristics of the entrepreneurs (Širec and Močnik 2010).

As a case in point, this study is of an SME that has sufficient access to capital, yet that still found itself unable to grow. Lawrence (2008:89-90) notes that undesirable business outcomes are likely when there is a mismatch between how resources (such as finance) are deployed and the competitive priorities of the business, and also notes that this is an area of scarce research. Resources are described here are being the basic factors of production (Lawrence 2008:93) that are combined to produce knowledge and capabilities. Given the above, the challenge of finance exists, perhaps even to a greater degree, in the case of turnaround - Smith and Graves (2005:304-305) note that it would be useful to have a model “that could identify distressed companies that have recovery potential”, which would be useful to lenders to determine whether to continue providing credit to the company.

**Turnaround in a Recession and in Developing Countries**

The challenge of turnaround is more complex in a global recession, possibly one of the worst since the 1930s, with the world in a “prolonged slowdown of unpredictable duration” (Reeves & Deimler 2009:10). While turnaround in a recession is not a new area of study, little has been written on the topic (Latham 2009:180-181). Furthermore, little has yet been written about turnaround in the
context of the global economic crisis which peaked in the United States during September 2008, which saw the collapse of many US banks (Hinton 2009).

The global recession impacted developing countries through declines in flows such as foreign direct investment, export revenue and tourism income. The resulting economic contractions saw significant job losses, and also South Africa’s first recession since 1992 (Gable et al 2009:1). That the SME in question sold credit simply compounded the strategic complexity in an environment where credit was in crisis globally, with the latter fact resulting in significant change within the global financial services industry. For example, while Baumgärtner et al (2009:1) speak of some of the more permanent outcomes of the global financial crisis being higher capital costs and lower leverage, specifically in investment banking, it is probably true of banking in general. The immediate implications of a lower gearing is a higher equity structure and higher weighted average cost of capital, which in turn puts pressure on the Return on Equity expectations of the shareholders.

In ultimately wanting to collaborate theory with the actual practice of turnaround, the first challenge encountered was that primary data on turnaround is scarce for businesses in developing countries (Pretorius 2008:20). Furthermore, even though much has been written about the turnaround in general over the last three decades, Chowdhury (2002:263) suggested that there is still insufficient knowledge about turnaround. Findings like these challenge the author's objectives.

**Turnaround Strategy**

Turnaround strategies can be classified into two groups (Smith and Graves 2005:305, Harker and Sharma 1999:37) – efficiency strategies and entrepreneurial strategies (Smith and Graves 2005:305). Smith and Graves describe efficiency strategies as those rectifying inefficient operations, i.e. about cost-cutting and asset reduction, while they describe entrepreneurial strategies as those that
reposition it with respect to its current or even its new markets. Smith and Graves (2005:306) quote extensive research on efficiency-oriented strategies, where the common argument was that efficiency-oriented recovery strategies are essential for any successful turnaround. However, given the scarcity of equivalent research in SMEs, we get a hint of the added complexity of SME turnaround in a recession from Latham (2009:181-183) who states that the strategic response from business is more complex in a recession, with the consequences of that complexity often more dire for small business, and that small business responds differently to a recession compared to large business because large business tends to react by cutting costs while small business tends to react by market segmentation tactics. Boyle and Desai (1991:39), in their paper on SME turnaround, observe that most of the causes of failure seem to be internal to the firm, with a major reason for failure being lack of management practice (Lawrence 2008:89), with the key missing element being lack of control over operations, without which business has little chance of long term survival in a competitive market (Boyle & Desai 1991:40).

Complementary to the above, Pretorius (2008:21-22) writes that the cause of decline or failure is often classed as either strategic (external) or operational (internal) in nature. While it is easier to respond to operational challenges than to strategic positioning challenges, strategic challenges require quicker action. Furthermore, Pretorius suggests that turnaround is generally less severe if it is due to operational weaknesses, because they can be corrected with relative ease and visibility, while strategic challenges require directional change and high-risk expectations typical of new venture creation. An incorrect, albeit new strategy, could therefore have disastrous consequences for the business.

Beyond turnaround strategy, successful, sustainable turnarounds usually involve substantial strategic repositioning of the business (Gadiesh, Pace & Rogers 2003:42). The strategy is based on leadership having a clear point of view of the future, and by evolving the business model in line with this. Equally important however is that the operating model evolve to support the growth strategy
outlined by the business model (Kapur et al 2006:11).

**Turnaround Implementation**

Studies on strategy implementation are lacking (Getz, Jones & Loewe 2009:18; Sharma 2009:iii; Khadem 2008:29; Moore 2008:3, Parnell 2008:1278, Gumbus & Lussier 2006:407). This is a distinct gap because the effectiveness of a strategy depends on both its formulation and its implementation. Ulrich, Brockbank and Johnson (2009:25) even suggests that the implementation of strategy may be more important than the strategy. Indeed, Caruth & Humphreys (2008:24) not only point out strategy implementation as a source of competitive advantage, but also that the best planned strategy is ineffective without implementation.

The Balanced Scorecard is “one of the most touted management tools today”, with Harvard Business Review identifying the Balanced Scorecard as “one of the most significant management ideas of the last 75 years” (Gumbus & Lussier 2006:407) in terms of its aid in strategy implementation. While research on the implementation of the Balanced Scorecard in SMEs is rare (Gumbus & Lussier 2006:408), it is a valuable concept because it enables the measurement of total business performance beyond only financial measures as is common to SMEs (Birch 1998:43), and it addresses the concern that financial measurement alone is inadequate for measuring restructuring and turnaround (Chow, Haddad & Williamson 1997:21). The benefit of the Balanced Scorecard is that it provides a framework for translating strategy into action by measuring the progress towards achieving strategic goals (Gumbus & Lussier 2006:408-409). Furthermore, it can benefit SMEs as much as large corporates benefit from it (Birch 1998: 43, Gumbus & Lussier 2006:422).

While more research on the role of technology in turnaround is required, it is one of the primary means to execute and implement business strategy. Its role is more valuable than this though as most
business innovations occur as an interaction of market insight and technological know-how, making technology an important strategic input rather than just being an enabler (Berman & Hagan 2006:28).

**The Role of Human Resources**

Employee productivity is one of the most important predictors of small business turnaround (Lawrence 2008:93), as is employee morale (Gadiesh, Pace & Rogers 2003:42). For a strategy to succeed, it must begin with people with ability, i.e. a strong management team (Gadiesh, Pace & Rogers 2003:42), although a change in top management is not necessarily the cause of turnaround as is often presumed in the literature (O’Kane 2006:117). In terms of the role of people in the execution of strategy, Moore (2008:4) writes that people generally do what they are rewarded to do. When there is confusion, the link between strategy and execution is compromised.

Smith and Graves (2005:306) found significant research that suggested that changes to the senior management team were an important step towards enabling a successful recovery, since in many cases, it was found that the incumbent management were unable or unwilling to make the changes necessary to stem the decline. Further to this, Harker and Sharma (1999:37) refer to research that demonstrate that successful turnaround requires leadership that is not only transactional, but that is also transformational, the latter being a quality that may be required but that may not actually be present in the incumbent management team. Daft (1994:499) describes transformational leadership as that being able to take a company through revitalization or major strategic change, which, as we are seeing here, is an important component of turnaround. Harker and Sharma (1999:44) found that successful turnaround leaders were energetic and took action on many fronts, were disciplined in terms of measurement and analysis, and were open-minded and willing to experiment and learn. Abebe (2009) found empirical support for the upper echelons theory that emphasises leadership characteristics as predictors of organisational performance, but even more, that long tenure had a strong, adverse
influence on organisational performance. The adds weight to the general feeling that to take a business forward, top management needs to be changed.

Because of the need to address issues like reward, staffing and training in the process of strategy execution, HR are important contributors to the strategy process, as the market requires HR to also be aware of issues relating to customers, investors and communities in order to ensure that the strategy is correct (Ulrich, Brockbank & Johnson 2009:25).

From a culture perspective, while Choueke and Armstrong (2000:236) were aiming to find an answer to the question of whether culture is a missing perspective on SME development, there was also acknowledgement that this was a difficult area to research given that there is difficulty agreeing what “corporate culture” is. However, they did find research that supported the idea that culture is important in the success of their organizations. Associated with culture is the issue of improving company morale as an important part of business turnaround, communicating a simple and powerful set of messages to employees, repeatedly (Gadiesh, Pace & Rogers 2003:42), as successful turnarounds develop organization-wide conviction that translates intent into action (Kapur et al 2006:11).

Research has indicated that properly aligned human resources are key to the successful implementation of strategy, so it makes sense that a human performance appraisal process should meet the organizational needs of all stakeholders (Caruth & Humphreys 2008:24-25). This is again where the Balanced Scorecard concept has value, because it proposes a framework of measures applicable not only to financial stakeholders, but also to stakeholders such as employees, customers and employees.

**Business Life Cycle Theory**

Given that the business had reached productive capacity, could it be that the apparent turnaround project was actually less about turnaround and more about business growth? The
development and growth of businesses has been an area of interest to researchers for decades (Lester & Parnell 2008:540). Business life cycle theory is popular in the literature, reflected in as little as three stages to as many as ten, with life cycle models specific to both small and large firms having been developed. The strongest empirical support seems to support five stages or less (Lester & Parnell 2008:540-541). Business life cycle theory is interesting because it considers the problems businesses encounter as they grow, providing insight into the options facing businesses at various points in time (Hill, Nancarrow & Wright 2002:362-363). According to Lester and Parnell (2008:542-544), the major stages are:

- **Existence**, where the business is focused on viability, with decision-making and ownership in the hands of one or few, with a simple organizational structure

- **Survival**, where the business is increasingly formalized and distinctive competencies are established. The main goal is to generate sufficient revenue to maintain operations. Most are structured functionally, with decision-making increasingly decentralized

- **Maturity** sees business formalisation and control as the norm and increased red tape becoming problematic. Job descriptions, policies and procedures and hierarchical relationships become more formal. Some become more market defensive rather than maintaining market aggression. Top management focus is on planning and strategy

- **Renewal** has business wishes to return to leaner times, to innovation and to creativity. Decision-making is increasingly decentralized, with increased customer-centricity

- **Decline**, where business experiences a lack of profit and a loss of market share
Some of the major differences between large and small firms can be found in Mtigwe (2005):

**Table 1: Differences between large firms and small entrepreneurial firms from Mtigwe (2005:361)**

Building on Table 1, Appiah-Adu, K., and Singh, S., (1998:387) write that SME’s are characterized by simpler organizational structures and more cohesive cultures, a limited range of products and customers, minimizing the requirement for formal procedures for gathering and analyzing customer information. According to Eirich (2004:16), for a business to move from being small to being medium, it needs to overcome at least five hurdles:

- access to capital
- growing from a small market presence to a larger market presence
- increasing the skill of its labour force
- increasing its access to cutting-edge technologies
- developing a unique value proposition

An interesting question in business life cycle studies concerns the factors that drive a business out of one life cycle phase and into another. It seems that it depends on management’s ability to solve problems brought on by past levels of growth that allows a business to survive and to grow (Rutherford et al 2003:327). Chen and Hsieh (2005:157) state that it is management’s decisive actions taken on
specific critical issues that results in the transition from one stage to another, and that how these are addressed is key in the success or failure of the organisation. Expressed differently, Flamholtz and Hua (2002) speak growing pains that will be experienced by most businesses as they grow. Their belief is that these growing pains are experienced because the business infrastructure has not kept pace with the size and complexity of the growing business, with the size of the business measured as revenue. They suggest that for every doubling in size of a business, the business requires a different infrastructure to support its operations (ibid. 527,530). While these growing pains occur in businesses of all sizes, they are most characteristic of early stage entrepreneurial businesses, and have an impact on the financial performance of the business (ibid. 534).

Note that in spite of a proliferation of business life cycle models, while the metaphor provides a good conceptual base for explaining business development, the existence of a general life cycle model has not been proven (Beverland and Lockshin 2001:354).

**Customer Centricity**

Eirich’s proposal that a hurdle for moving from a small business to a medium business is developing a unique value proposition raises the point that we have spoken little about the customer, yet an increasingly competitive business environment has driven a focus on customers (Appiah-Adu & Singh 1998:387). Indeed, Appiah-Adu & Singh (1998:387) point out that for SMEs who have limited access to resources such as research and development, competitive advantage, low cost leadership or skilled staff to develop effective planning, customer orientation is likely to be a vital determinant of success. Indeed, “products come and go, but customers remain” (Hogan et al 2002:4). Lemon et al (2001:21) state that a significant determinant of the long term value of a firm is customer equity, and that customers, being intangible assets, need to be measured, managed and maximised in order to optimise business performance (Kumar and George 2007:157).
In closing the theory section, it seems that it is resource availability – financial, management, human and/or capacity – each of which depend largely on previous decisions, organizational learning and/or history, that is at the heart of turnaround. These resources, as well as the capacity of the business environment to accommodate the business, determines the turnaround options the business can choose from (Pretorius 2008:21).

**Commentary: Turnaround Theory versus Practice**

Using Pretorius' definitions, could it be that the SME was perhaps not entirely in turnaround, although its existence was threatened, its performance was not acceptable to its shareholders, and it experienced distress in its operations? The fact that it had never been profitable also probably makes it more likely that the business was more likely experiencing its growing pains. However, the fact that unless the business did something differently, it would never become profitable, and indeed, it would probably fail instead. That the business needed a repositioning and was experiencing ever reducing resource slack, would probably position the case as a borderline turnaround case.

Early in its evolution, the business had access to extraordinary financial resources from one of its shareholders. However, it seems the business was not able to apply these resources to the areas of the business that needed it most. Again, there seems to be no literature covering a case of SME development with effectively unlimited financial resources, so do we really know whether a business in similar circumstances will experience the business life cycle any differently from 'normal' SMEs?

That there seems to be so little research on turnaround in SMEs could be seen as a gap and a research opportunity. But is it really a gap, or is it logical that there should be an apparent gap? Do SMEs experience turnaround or are they merely experiencing growth as per business lifecycle theory, especially for a business that would qualify as being in growth phase? On the other hand, the gaps in
general turnaround research in developing economies and during recessionary conditions is another matter altogether, probably qualifying as real research gaps. Of greater concern is that turnaround research seems to have limited practical value, especially from a practitioner perspective.

In terms of turnaround strategy, it was noted that the research referenced efficiency strategies and entrepreneurial strategies, with the former essentially making reference to the operating model, and the latter making reference to the business model. As briefly noted, the priority context in this case was the operating model as it had reached capacity. Interesting also was research that discussed how important it was for the operating model to support the growth strategy, which is an important consideration in practice. This in turn underlined another important business practice – that without a sound operating model, the business model would suffer, no matter how good it potentially was. Further on the operating model, it was noteworthy how much research had been conducted in terms of the role of people, specifically the CEO in turnaround research, not much of which had been considered yet by the time this paper was being written. Also noteworthy was research covering the matter of management practice, especially in operations. Finally, while the operating model was the priority, considerable effort was simultaneously applied to the business model in a strategic repositioning intervention (Pearce 2008), all of which would serve to strengthen the business model, which, as could be seen in the background introduction to the case, was weak.

In terms of implementation, Ulrich, Brockbank and Johnson's suggestion that the implementation of strategy may be more important than the strategy itself rings especially true in this case, as an unfilled operations strategy, even in the midst of increasingly operational human resources-, information technology-, marketing- and financial strategies, almost resulted in the failure of the turnaround. In other words, one of the critical success factors of a turnaround strategy is ensuring active management and measurement of the process, in some instances, even on a daily basis.
Already in the theory section on the role of human resources, what becomes apparent is the depth and complexity involved in this important component of turnaround implementation. Possibly one of the most challenging tasks in the role of CEO in a turnaround is whether to keep the old management team, or to bring in a new one. Of the five-member senior team of the new CEO, within six months, three were new and two were old. Of the three new members, two were brought in to fulfill new senior portfolios in IT and marketing that never existed before, and the other replaced the old financial director who was clearly not up to the task from very early on. Of the two old members, only the HR executive remains now, while the COO left under pressure as change was not being implemented in operations as was required, which almost resulted in the turnaround not happening at all. In terms of the last surviving member of the old team, the HR executive, he has made significant changes to his performance over time. A few short months ago, however, he was almost pressured out of his role due to not performing up to the expectations of the role. The clear experience and learnings for this CEO then is that the old management team must almost certainly be replaced in order to ensure the proper execution of the strategy, failing which the risk of non-execution of the turnaround strategy begins to increase significantly. This experience also seems to hold at the management levels in the organisation, where managers holding on to the old could significantly constrain the execution of the strategy. Possibly one of the best ways to manage at this level is by proper performance management, which, as was mentioned in the background section, was not in place in this SME. It is now increasingly in place, and active performance management is now increasingly helping to thin out under-performing managers and supervisors, in line with the expectations held in the execution of the new strategy.

**Key Finding, Next Steps and Conclusion**

While the case for turnaround in this case may be in question, the larger question is whether an
SME can ever be in turnaround, or whether it simply experiences growing pains and that it requires transformational management decisions to be taken in order to pull it over the various impediments to growth it is likely to encounter. If this is true, then it becomes clear why there are gaps in the literature in terms of SME turnaround. However, when one realises the likelihood that the business could fail if significantly transformational decisions were not taken in time, then perhaps it is also true that some sort of turnaround has been affected. In any event, there seems to be an applicability of turnaround research to SME development, which may indicate possible value to be had in a convergence between these two streams.

The next steps are to continue with the literature review, expanding particularly on the role of people in turnaround, on the role of resources in the repositioning both the operating model and the business model, and on business development through its life cycle. It is probably unlikely that any value will be gained by continuing the search for SME turnaround research, given the assessment that SME 'turnaround' may actually be a red herring in the context of an SMEs development. The author suggests that a research paper, using the staff of the SME as survey participants, will provide invaluable insight into the process of turnaround and SME development, an element that was identified as a research gap in the theory section. This research should also provide a little more insight into whether turnaround is best conducted with a new management team, and if not, what needs to be done to ensure that the old management comes on board with minimum implementation risk.

In conclusion, a key question to be asked by practitioners is whether an investigation of theory has added any value to the task at hand. In the beginning, it was a little discouraging, with no relevant and useful information seeming to come forward to help with the task at hand. However, as the research scope started to expand, the world of turnaround and SME development seemed to take on a whole new life, with some quite insightful pieces coming through on strategy, implementation, human
resources, and the business life cycle. The latter has been such a positive experience that I would encourage other practitioners to consider a similar path whenever they come to address some of their greater business challenges.

**Bibliography**

Pearce, G.F., (2008). JDG NBD Business Plan and Budget, A presentation to the JDGT Executive Committee on 30 September

The research questions in this piece of research are the following: how do participants perceive their entrepreneurship-related learning experiences in terms of various emotional and motivational changes? How do learners tell us various stories about their lived experiences (Harmeling, 2006 based on Dewey, 1938; 1997) in a self-regulatory learning (SRL) perspective (Zimmerman, 1989; Zimmerman and Schunk, 2001)? The study shows how learning changes affect persons (and teams as well) during an entrepreneurship educational setting based on a situated learning framework; and particularly to the three core dimensions involved in effective ‘authentic’ learning (Brown et al., 1989; Donovan et al., 1999): knowing, acting and being. Findings discuss how SRL is a developmental process, how the “self” aspect is crucial, and how motivation plays a key role in SRL.

Abstract

In this paper we acknowledge the role of technology as an engine in fostering entrepreneurship. We examine the technological determinants of entrepreneurship performance in twenty three developed OECD countries during the period 2000-2007 using two measures of entrepreneurship performance: the number of newly registered corporations, which is introduced by the World Bank Group Entrepreneurship Survey 2008, and the number of new enterprises, which is introduced by the OECD Structural and Demographic Business Statistics. Results of the mixed-effects model suggest a positively and significantly relationship between the intensity of cellular phones, patent applications, and computer and communications services on entrepreneurship performance while the impact of personal computers ownership is found to be inconclusive.

Key Words: Entrepreneurship Performance; Technological Changes; Patents; Mixed Effects Model

I. Introduction

It has been widely recognized that successful entrepreneurship fosters the production of wealth for a nation, creates jobs, increases the standard of living of the society and contributes to political and social stability, innovation and economic development (Postigo and Tamborini, 2007). Many governments are trying to promote new business start-ups hoping for an economic well-being (Wennekers et al., 2005). Faria et al. (2008) stated that there exists a relationship between entrepreneurship and

unemployment. When new startups hire workers, unemployment will fall. When unemployment is high, startup activity will increase.

Recently, a great attention is placed on exploring the main factors that determine entrepreneurship performance. According to the OECD-Eurostat Entrepreneurship Indicators Program (2009), the determinants of entrepreneurship are: Regulatory framework, Market conditions, Access to Finance, R&D and Technology, Entrepreneurial capabilities and Culture.

In this paper, we examine the technological determinants of entrepreneurship performance in twenty three developed OECD countries during the period 2000-2007\textsuperscript{1}. Empirical results show that in the first model specification, where the number of new enterprises is used as a measure of entrepreneurial activities, shows that entrepreneurship performance responds positively and significantly to the intensity of cellular phones, patent applications, and computer and communications services while it is found to respond negatively to personal computers ownership intensity. The intensity of cellular phones is found to have the strongest impact over all other technology variables. On the other hand, the second model specification, where the newly registered corporations is used as indicator of entrepreneurial activities, shows similar results to the first model except that personal computers intensity turned to have a positive impact on the number of new corporations and also the strongest impact on entrepreneurship performance among all other technology variables.

\textsuperscript{1} The sample of study contains the following countries: Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Hungary, Iceland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, the Slovak Republic, Spain, Sweden, Switzerland, the United Kingdom and the United States.
The rest of the paper is organized as follows: section II discusses the literature, section III introduces the different measures of entrepreneurship performance, section IV presents the econometric model and the data, section V explores the empirical results, and the final section VI presents the concluding remarks.

II. Literature Review

Entrepreneurship is a complex and multidimensional concept (Si et al., 2007). In the past two decades, several studies focused on surveying the determinants of entrepreneurship and examining the impact of these determinants on entrepreneurship performance. For example, Sorensen and Chang (2006) extensively reviewed and evaluated the academic literature on how entrepreneurial performance depends on the characteristics of entrepreneurs and entrepreneurial teams. They have discussed a number of conceptual and methodological issues in the study of entrepreneurial performance.

Si et al. (2007) stated that there exist two categories of factors influencing entrepreneurship, namely, the factors that influence the industrial structure and the diversity of consumers’ tastes, such as technological development and the various structural characteristics of the population such as the labor market.

According to Gompers et al. (2008), first-time entrepreneurs have only an 18 percent chance of succeeding, and entrepreneurs who previously failed have a 20 percent chance of succeeding. Sandberg and Hofer (1987) examined the determinants of new venture performance. They found that industry structure, venture strategy and the characteristics of the entrepreneur are influencing the new venture. On the other hand, Hochberg et al. (2007) have shown that companies that are funded by more experienced (top-tier) venture capital firms are more likely to succeed.
Leitão and Franco (2008) examined the importance of human capital and organizational capital on entrepreneurial performance. They found that entrepreneur’s intuition and propensity for innovating activities are the significant human capital determinants of his success. Similarly, the results of Audretsch and Keilbach (2004) indicate that entrepreneurship capital is a significant and important factor shaping output and productivity.

Henriquez et al. (2001) have studied the factors that have had a major impact on the development of entrepreneurship in France within the period 1960-1998. They found that the high level of unemployment was accompanied by a lack of entrepreneurship opportunities, the government intervention tended to favour the large companies, and technological advancement helped large businesses to gain competitive advantage.

Grilo and Thurik (2004) have studied the determinants of entrepreneurship in 15 European countries in 2002 and 2003 from an eclectic approach. They found that the lack of financial support has no discriminative effect across the various levels of entrepreneurial engagement.

Fairlie (2005) have explored the relationship between computer ownership and entrepreneurship in the US between 10997 and 2001. His results provided evidence that exposure to home computer may make it substantially easier for a potential entrepreneur.

Van Stel et al. (2004) used the Global Entrepreneurship Monitor (GEM) database to explain cross-country variation in entrepreneurship. They found that nascent entrepreneurship depends various non-economic conditions in the domains technology, demography, culture and institutions, influencing opportunities, resources, skills and preferences.
Si et al. (2007) studied the factors influencing entrepreneurship in India. They found FDI and patent protection are the main factors influencing entrepreneurship and innovation. The added that India needs to take into account the role of entrepreneurs and innovation if it wants to improve its economy.

### III. Measurement of Entrepreneurship Performance

Kukoc and Regan (2009) stated that “Modern definitions of entrepreneurship emphasise a strong link between entrepreneurship and innovation. Entrepreneurship is seen as a critical link between new knowledge and economic growth as it facilitates the transfer of knowledge. These factors distinguish entrepreneurship from more simple forms of management and ordinary business activities.”

Desai (2009) discussed the challenges and difficulties associated with measuring entrepreneurship in developing countries which are further complicated by institutional environment. Parker (2008) discussed the existing measures of entrepreneurship for the purpose of making international comparisons. These measures are put in place according to the definition of entrepreneurship. The first definition (self-employment) can be implemented using the OECD Labour Force Statistics data. The second definition (the formation and operation of new firms) is implemented in the GEM. Other database we can cite COMPENDIA which contains two-yearly data on the number of non-agricultural business owners and the size of the labor force for twenty three OECD countries (Van Stel). Desai (2009) added to this list of databases the World Bank Group Entrepreneurship Survey (WBGES) which measures the number of new officially registered limited liability corporations (LLCs).
IV. The Econometric Model

Methodology

We apply a mixed-effects model to estimate the impact of the following technology variables on entrepreneurship performance: broadband access (broadband subscribers per 100 people), patent applications, computer and communication services as percentage of commercial services exports, personal computers intensity (personal computers per 100 people), cellular phone intensity (cellular phones per 100 people), and intensity of mobile and fixed-line phones (mobile and fixed line phones per 100 people). Entrepreneurship performance is measured in two ways: first, the number of new enterprises per year and, second, the number of newly registered corporations during a calendar year. The choice of the explanatory variables is partially based on the OECD Entrepreneurship Indicators Program measures of entrepreneurial performance.

The mixed-effects model is usually used when data is clustered in some manner, which is applied on data used in this paper since technology variables are clustered within country. The mixed effects model could be outlined using the following structure:

\[ y_i = X_i \beta + Z_i u_i + \varepsilon_i \]

for \( i = 1, \ldots , M \), independent panels consisting of \( n_i \) observations, \( y_i \) comprises the rows of \( y \) corresponding to the \( i \)th panel (vector of responses which is patent activities in this paper), \( X_i \) is \( n \times p \) covariate matrix for fixed effects (\( \beta \)), \( Z_i \) is the \( n \times p \) covariate matrix for the random effects (\( u_i \)), and \( \varepsilon_i \) is \( n \times 1 \) vector of errors which is assumed to be multivariate normal. This model allows us to construct a different random regression line (slope) for each country after testing for the need for different intercepts and different slopes. If

---

\( ^2 \) Because of data limitation on the number of newly registered corporations and the number of new enterprises, the period of study is limited to 8 years.
covariates are found to have random coefficients, then we can get these random coefficients by combining the random slope with the mean slope for each country under investigation. The following equations show a simple structure of bivariate random-intercepts and random-coefficients models:

\[ y_i = (\beta_1 + u_{1i}) + \beta_2 z_i + \epsilon_i \]  

\[ y_i = (\beta_1 + u_{1i}) + (\beta_2 + u_{2i}) z_i + \epsilon_i \]  

where \( u_{1i} \) is the deviation of country’s \( i \) intercept from the mean intercept \( \beta_1 \) and \( u_{2i} \) is the deviation of country’s \( i \) slope from the mean slope \( \beta_2 \). The intercepts \( u_{1i} \) and slopes \( u_{2i} \) are independent across countries. The random-intercepts model is shown in equation (2) where we have different intercept for each country but only one slope \( (\beta_2) \), while equation (3) explains the random-coefficients model as both the intercept and the slope are different in each country. The choice of random-intercepts versus random-coefficients model depends on the likelihood ratio test of the hypothesis that the random-intercepts model is nested in the random-coefficients model.

Data

As mentioned earlier, we use country-level data on technology variables in twenty three developed OECD countries over the period 2000-2008. Data is collected from three main sources: the World Bank Development Indicators (WDI), the World Bank Group Entrepreneurship Survey 2008 (WBGES), and the OECD Structural and Demographic Business Statistics (SDBS) Database. All variables are in logs. The first dependent variable, the number of new enterprises, is collected from the OECD Structural and Demographic Business Statistics (SDBS database). Due to data limitations, we use the number of new enterprises in the manufacturing sector in the twenty three developed
OECD countries under investigation. The number of newly registered corporations, the second dependent variable, is collected from World Bank Group Entrepreneurship Survey 2008. The choice of the twenty three countries under investigation depends on the availability of entrepreneurship data for each country in both databases (SDBS and WBGES). Table 1 contains the statistical description of the variables.

</table>

The main difference between the OECD Structural and Demographic Business Statistics and the World Bank Group measures is that in the later database, entrepreneurship activities are measured by the number of newly registered limited liability corporations only while the OECD measure defines a new enterprise as “a legal

---

[SDBS structural Business Statistics defines an enterprise as “a legal entity possessing the right to conduct business on its own; for example to enter into contracts, own property, incur liabilities for debts, and establish bank accounts. It may consist of one or more local units or establishments corresponding to production units situated in a geographically separate place and in which one or more persons work for the enterprise to which they belong”.

---

8
entity possessing the right to conduct business on its own”, which sounds to be a broader definition of entrepreneurship activities. Figures 1 and 2 show the trend of entrepreneurial activities in the countries under investigations according to the two measures mentioned above.

**Figure 1**

*The Newly Registered Corporations in 2007 (WBGES Measure)*

V. Empirical Results

The first model specification, where the number of new enterprises is used as indicator of entrepreneurial activities, is estimated using a random intercept framework as explained in equation (2). This is because the likelihood ratio test (LR test) shows that we fail to reject the hypothesis that the random intercept model is nested in the random coefficient model (the $p$-value of the LR test is 0.77). Empirical results show that the number of new enterprises is positively and significantly affected by cellular phones intensity, the number of patent applications, and the computer and communications services, with a point estimate of 0.58, 0.2, and 0.48, respectively. On the other hand, the model shows interesting results regarding the impact of broadband subscription and personal computers ownership on new enterprises. The number of broadband subscribers is found to have the expected positive sign but the impact is insignificant, while personal computers ownership is estimated to have negative and significant impact on new
enterprises with a point estimate of 0.36. This negative impact could be supported by the following explanation: as the rate of personal computer ownership and the skills associated with using them increase among people, the entrepreneurship activities of those people might decrease since their earned income is expected to increase significantly. Besides, workers who use the Internet for job seeking purposes are most likely to find better jobs with higher salaries compared to those who do not use the Internet which, again, makes those workers prefer the wage and salary sector and, thus, decreases entrepreneurial activities. This argument was introduced by many studies such as Betsey Stevenson (2008), Autor, Katz and Krueger (1998), Freeman 2003, Kuhn and Skuterud (2000), and (2004). Table 2 shows the empirical results of the first model specification.

</tr>
</tbody>
</table>

Note:
a. We apply the LR test to determine the best covariance structure for our model (restricted vs. unstructured). The LR test result shows that Prob > chi2 is less than 0.05 in all specifications which means that the unstructured model is more efficient compared to the restricted model and that random effects are correlated. So I apply the unstructured model.
b. Coefficients are significant at *** 1%, ** 5%, and * 10%
Although the individual impact of broadband subscribers on new enterprises is found to be insignificant, we are interested in examining the combined effect of the two complement variables, personal computer ownership and the number of broadband subscribers, on the number of new enterprises. To achieve this goal, we applied Wald test to estimate the impact of the sum of personal computer ownership and broadband subscribers’ coefficients on new enterprises. This test of linear combination of coefficients is examining the following restriction:

\[ H_0: \delta_{pc} + \delta_{bb} = 0 \]

Where \( \delta_{pc} \) and \( \delta_{bb} \) are vectors of coefficients on personal computer ownership and broadband subscribers. Wald test result shows that the combined effect of the two complement variables is negative and significant with a point estimate of 0.37. Again, this supports the same argument presented earlier: the higher the rates of personal computers ownership intensity and broadband subscribers, the lower will be the entrepreneurial activities. The following table, table 3, shows the random deviation and the random intercept for each country as indicated in equation 2.

In the second model specification, we use the number of newly registered corporations as a measure of entrepreneurial activities. As indicted in table 4, in contrast with our findings in the previous model, personal computer ownership turned to have a positive impact on newly registered corporations with a point estimate of (0.33), while the intensity of broadband subscribers is still found to be insignificant. In addition, the linear combination of these two variables is estimated to be positive and highly significant with a point estimate of (0.45). This result indicates that the impact of
personal computer ownership on entrepreneurship performance is still inconclusive and
depends on how the measure of entrepreneurial activities. The rest of technology
variables are found to have comparable effect to that indicated in the first model
specification except of computer and communications services which turned to have
insignificant effect. Table 5 shows the random deviation and the random intercept for
each country as indicated in equation 2.

Notes:

a. We apply the LR test to determine the best covariance structure for our model (restricted vs. unstructured). The LR test result shows that Prob > chi2 is less than 0.05 in all specifications which means that the unstructured model is more efficient compared to the restricted model and that random effects are correlated. So I apply the unstructured model.
b. Coefficients are significant at *** 1%, ** 5%, and * 10%

VI. Concluding Remarks

This paper investigates the impact of different types of technology variables on entrepreneurship performance in twenty three developed OECD using two measures of entrepreneurial activities: the World Bank Group Entrepreneurship Survey 2008 and the OECD Structural and Demographic Business Statistics. Empirical results of the mixed effects model indicate that entrepreneurship performance responds positively and significantly to the intensity of cellular phones, patent applications, and computer and
communications services. The impact of personal computers ownership and broadband subscribers is found to be inconclusive.

The study shed light on the importance of building a solid IT infra structure as a major determinant of entrepreneurial activities. Although the study is based on data from developed economies, the results of this paper can also benefit policy makers in developing countries as it shows the importance of technology variables as main determinants of entrepreneurship performance.

Business Support for Start-Ups:

How to Use the Balanced Scorecard as an Inter-Organizational Shared Tool

Florence Gangloff, Karim Meseghem, Gérald Naro, and Sylvie Sammut

The goal of this paper was to produce a shared instrument for evaluating business support in new business start-ups. Today, the public authorities try to supervise this business support and would like the dedicated bodies to gain in both professionalism and efficiency. Business support must now no longer be appreciated on the basis of a bilateral relationship but instead on that of a reticular dimension that connects those who are accompanied with a network of business support, itself in direct connection, perhaps even under the influence of, a group of public funding providers. New tools adapted to this context must be proposed. We chose the balanced scorecard developed in association with all the key players in business start-ups.

Our results show that business support structures wholeheartedly agree with evaluation as a means of improving control of their servuction process. With this in mind, we have built a strategic map which we present here as a key for the future development of the shared evaluation tool.

Florence GANGLOff is a PhD student in management sciences at the University of Montpellier 1, research group ERFI.

Karim MESSEGHEM is a professor of management sciences at the University of Montpellier 1, research group ERFI.

Gérald NARO is a professor of management sciences at the University of Montpellier 1, research group ERFI.

Sylvie Sammut is a lecturer in management sciences at the University of Montpellier 1, research group ERFI.
Introduction

Business support is booming in France, with more than 3,000 business support organizations and six main networks\(^2\). It is a positive thing that these networks exist, but one question nevertheless remains: do the creators\(^3\) of business consider these structures to be a major part of business support? In addition, and in a more central way, all this raises the questions of the collaboration between all these key players, on the one hand, and the relative performance of these structures, on the other.

Public authorities are currently trying to supervise this activity and would like the dedicated bodies to become more professional and gain in efficiency. From now on, business support should not be assessed only on the basis of a bilateral relation but within a reticular dimension. This brings together one accompanied business with a network of business support, which is itself in direct connection with (even under the influence of) public funding providers. The business support for creators can be defined as "a relational, cognitive process, structuring, legitimizing, co-constructed and existing in a punctual or more developed way between one accompanied structure and one (or some) business counselor(s)" (Sammut, 2009).

The goal of this communication is to produce a shared evaluation tool for business support in the field of a new business start-up. This paper presents the methodological and theoretical advantages. It effectively brings together two disciplines, entrepreneurship and management control, both in the field of management sciences, but which have rarely had the opportunity to interact. The environment of a new business start-up encourages such a link, as it is

increasingly sensitive to what is at stake with the evaluation. New tools adapted to this context must be proposed. We chose the balanced scorecard, associating all the key players in business start-ups.

The methodology is inspired by the grounded theory of Glaser and Strauss (1967). This study is exploratory and covers an interactive qualitative approach to contribute to the construction of an inter-organizational shared instrument. Several empirical methods were used: an on-line survey, interviews and a group meeting. The data obtained from interviews were analysed with the software ALCESTE.

In the first part, we will present the context of the study, business support for business start-ups, by emphasizing the reticular dimension. We will then expose, in the second part, the theoretical and methodological foundations of this research. The third part will be dedicated to the presentation of the evaluation tool based on the method of the balanced scorecard.

1. Towards interactive control of business support based on the balanced scorecard

The business support structure is built around a double logic. It has to respond simultaneously to the request made by public funding providers who expect measurable results, and to the request from people with projects who are expecting a servuction process. In this double logic, it is necessary to add another logic, specific to the business support structures, which are keen to have a piloting tool. This would allow them at the same time to monitor and control the key factors in the success of their mission and to undergo non-stop learning, making it easier to analyze and memorize the experience, as well as develop innovative business support practices. In that sense, business support has many processual dimensions
which show the need for piloting of the performance factors and learning processes, as well as an \textit{a posteriori} control dimension from result indicators.

Similarly, an integrative vision of business support, insourcing all the concerns of the various stakeholders (creators, public funding providers, business counselor) around a collective project, seems to require the development of piloting, in order to make easier the dynamic interactions between the various actors present, with the aim of developing collective learning.

From a simple evaluation process, based on \textit{a posteriori} measurement of results, it seems necessary to move towards a system of interactive control, in reference to Simon’s control levers model (1995). The need to take into account the diversified expectations of all the stakeholders present leads us to a well-balanced approach to performance: the model of the Balanced Scorecard (BSC). This model, used with the aim of interactive control, thus seems to us to be a perspective worth investigating.

1.1. Business support of a network: evaluation through interactive control

As previously observed, appraising performances is an essential part of the business support policy in a new business start-up. This supposes that performance indicators are defined and monitored, making it possible to measure the efficiency and effectiveness of the business support network regarding the expectations of the various stakeholders. The peculiarity of business support for a network lies in its inter-organizational nature. From that point on, any method for controlling and piloting the system must integrate a double dimension: \textit{collective} - the network is composed of actors with differentiated objectives and strategies and, at the same time, it answers to a common purpose; \textit{transversal} - the performances are bound in
particular to the quality of the coordination and information exchanges within the business support processes. The interactions within the network thus appear to be a determining variable in the success of the business support to such an extent that they represent a major stake in piloting.

Business support networks have a double stake: appraising performances and controlling of key performance variables on the one hand; piloting the learning and coordination processes within the system on the other. In the control lever model, Simon (1995) operates a distinction between two types of control that are particularly relevant to our problem: diagnosis control systems, which concern control of the critical variables and represent the most classic form of management control. It is based on a posteriori control of results, comparing them to objectives or standards, and adopting corrective measures. Interactive control systems focus on strategic uncertainties and are directed toward organizational learning, the search for opportunities and the emergence of new strategies.

In other words, the diagnosis control systems are focused on implementing deliberated strategies and interactive control systems are directed toward “adaptation to the competitive environment” and especially, toward emergent strategies: "interactive control systems are used to guide the bottom-up processes of strategy emergence" (Simon, 1995, p. 98). This distinction between diagnosis control and interactive control translates the opposition, henceforth classic, between two representation models for management control: cybernetic regulation and the organizational learning model. In very down-to-earth terms, diagnosis control systems appeal to the common devices of management control (plans, budgets, reporting, etc.). On the other hand, interactive control systems are established on the basis of participative management plans, which make interaction easier, as well as sharing information and learning, by processes of the “bottom-up” type.
This refers, for example, to committees, work meetings, progress groups, performance reviews, etc. “through the dialogue, debate and learning which go with the interactive process, a new strategy appears” (Simon, 1995, p. 102).

Business support structures invite us to think about the conception of tools for management control that respond to this double stake in evaluation, within the framework of control of the diagnosis type, and in piloting of the processes, directed toward interactive control. The BSC model, because of its methodology, has the double advantage of measuring performances and piloting strategic processes in a particularly promising experimental context.

1.2. The BSC, a control lever for interactive control for piloting business support processes

The balanced scorecard (BSC), introduced by Kaplan and Norton (Kaplan and Norton, 1998, 2001), is based on the idea of an equilibrium in performance piloting: a balance between the financial and non financial, monetary and physical, qualitative and quantitative indicators, of result (“outcomes”) and process (“drivers”), retrospective (“lagging indicators”) and forward-looking (“leading indicators”), of short and long-terms, tangible and intangible; functional balance (Finance, Marketing, Logistics and Management of Production, Human resources management, etc.); balance in the attention given to the various types of stakeholder (shareholders, customers, employees, etc.).

The model refers to a well-balanced representation of global performances which, around the center of gravity that is formed by the vision and strategy of the leaders, has four axes or perspectives: financier or shareholder; customer; internal processes; learning - innovation. The model consists of describing the vision and strategy of the leaders through a model of
“cause-effect” relations, also called the “strategic map”. This plan of causality in fact translates the representation that those in charge of the firm have concerning the strategy and the best way to achieve it.

As indicated by Kaplan and Norton (2001), the BSC can be used both within the framework of diagnosis control, making it easier in particular to adapt strategies from deliberated strategies, and as a control lever for interactive control, allowing the emergent strategies to develop. For the authors, this last approach appears very promising.

With regard to business support structures, designing and using a BSC would also make it possible to:

- facilitate an interactive formulation process for strategic objectives within the framework of a collective project. The BSC design phase offers the opportunity for reflection by the various actors involved on the strategic orientations and aims of the collective project. Similarly, collective construction of a strategic map and the choice of performance indicators can lead to sharing of the representations around a common performance model;

- measure and follow outcomes indicators, as well as process indicators (drivers), thus making it possible to appraise performances and pilot processes.

- estimate the performance of the structure within its capacity to perform its objectives with regard to the expectations of the various stakeholders.

The model which could result from this could appear as in Figure n°4, where four traditional perspectives of the BSC are replaced by:
− a "public funding providers” axis, translated by performance indicators that make it possible to satisfy their concerns regarding appraisal of the structure’s performances;

− a “project holder” axis, giving place to indicators making it possible to measure the efficiency of the structure with regard to their expectations;

− a “business support process” axis, where the process indicators “performance inductors” are defined, making it possible to estimate the efficiency and effectiveness of the various business support processes, compared to the expectations of the public funding providers and project holders;

− a “learning innovation” axis, which lists the indicators that make it possible to appreciate learning and innovation in the business support structure.

The design of the BSC and its strategic map, just like the performance indicators selected on each axis, may establish the opportunity for teamwork by a project group bringing together representatives of all the stakeholders. The resulting balanced scorecard can also be of use as a basis for performance reporting (in particular with public funding providers), but also in “performance reviews”, during which representatives of the various stakeholders interact around the results of the BSC.

**Figure 1 - A BSC model for business support**
2. A qualitative methodology for elaborating a shared evaluation tool

This research was conducted in France within the context of a research convention. In order to produce an assessment grid for business support in the field of business creation, we adopted an approach inspired by the grounded theory of Glaser and Strauss (1967). This research is of an exploratory nature and uses a qualitative approach to the field in which the researchers interact with organizational actors in order to contribute to the construction of a theory. For Ahrens and Chapman (2006), “qualitative studies [...] are not simply empirical, but result from a profoundly theoretical activity”.

Social reality was seen, from then on, as “emergent, subjectively created, and objectivized through human interaction” (Chua, 1986, p. 615). The observation phenomenon is, by nature, dynamic. It is part of a processual approach by which “it is a question of describing, analyzing and explaining the what, why and wherefores of a sequence of individual or collective actions, based on the hypothesis according to which social reality does not constitute a stable state, but results from a dynamic process” (Pettigrew, 1997, p.338). For the upholders of the process approach (Hinings, 1997; Pettigrew, 1997), qualitative methodologies and case studies seem to be particularly well-adapted.

If, as noted by Kasanen et al. (1993), such approaches are still very rare in research in management control, things seem to be changing, with the development of works today based on the methodology of the research action. In that sense, an interesting perspective is underlined by Kaplan (1998), who pleads in favor of a so-called “research action innovation” approach, consisting in developing new theories and practices through in the field
experiments of innovative practices. The author refers quite particularly to his works with Norton on the BSC. Our study aims to experiment through research action, an innovative perspective, and one that was little investigated by Kaplan and Norton: using the BSC within the context of evaluating and piloting an inter-organizational process.

The approach proposed here does not rely solely on the generic use of a tool (the BSC), but rather on its adaptation to the case of business support for new business start-ups. If the principles of the BSC correspond – from a theoretical point of view – to the needs of the situation studied, it is important that we confirm its relevance with regard to the key players.

The emphasis on the representations of the key players uses a methodology with a qualitative dominant. Taking into account discourse via interviews opens out on to a certain number of content analysis methods. In this case, a double methodology was envisaged. First, the study
aims to focus on the semantic universe of the various key players interviewed. During this first stage we used the statistical data processing software, ALCESTE.

However, and to approach these initial elements in greater depth, we chose to develop a second type of analysis, not to record the incidence of the terms used, but instead from an interpretation perspective, in order to consider the context. This methodological triangulation made it possible to carry out an in-depth study and to identify needs in terms of prospective tools.

The automated textual data analysis (TDA) method “concerns all linguistic components and essentially covers two types of approach: on the one hand, linguistic analyses which study and compare the formal structures of the language […] and, on the other, content analyses which study and compare the signification of speech in order to update the systems of representations conveyed by this discourse” (Blanchet and Gotman, 2001). This analysis makes it possible to bring obvious content to the foreground, as well as more implicit content in a specific context.

This methodology turned out to be particularly relevant for the study carried out here. The main applications for TDA in the present study were effectively:

- to make it easier to characterize and understand environments, situations, and specific contexts by means of conversations or even press reviews.

- to characterize the language so as to better adapt the vocabulary and style of communication.

- to characterize the speeches of the key players on their perceptions, beliefs, attitudes, motivations or behavior to facilitate the comparison between different categories of population.
- to compare the speeches and language of various categories of personnel to identify the representations.

Developed by Max Reinert in 1986, ALCESTE is software for lexical analysis through context. It concentrates on studying the structure of distributions from a corpus of homogeneous texts (a set of interviews, a collection of articles.). The aim is to quantify a text as a means of highlighting the structures that have the most sense. Various points of view are expressed by the actors on a given subject by means of discourse. The system “consists in cutting the text studied into segments of comparable length, [...] and studying variations in distribution of the full words in these segments” (Reinert, 2008).

Secondly, an analysis of additional content seemed necessary. The statistical data obtained from ALCESTE provided an initial outline of the representations of the key players by indicating the “semantic context”. However, it seemed necessary to go into further detail in this first version by using the whole sentence and speech. The approach used aimed to accentuate the themes and underlying themes evoked in the conversations. This method turned out to be particularly relevant for the creation of a shared tool and particularly within the context of the BSC.

3. Results and discussion

3.1. Results

The results of the corpus studies carried out with ALCESTE\(^4\) show that the semantic universes of the key players, be they public funding providers or business counselors for start-

\(^4\) The results from ALCESTE are presented in Appendix 1 in their original version.
ups, cross the various axes of the BSC. There are thus 4 themes that stand out clearly: an economic and social theme, a theme directed toward project holders, a theme directed toward processes and finally a learning theme.

**Economic and social theme**

The first theme refers to the economic and social dimensions. It is a question of putting into perspective business support structures, companies and the territory. The semantic analysis shows the roles of new business start-ups within the territory from the point of view of economic development but also regarding insertion and employment. We found various sub-themes in the corpus. Problems regarding accommodation and the cost of business support structures are one of recurring aspects in this first axis.

As ALCESTE's analysis shows, price is given considerable weight. A more detailed analysis confirms this: “we have, with regard to the specifications, various phases where we have to explain our results [...] we have indicators on the number of meetings, diagnosis, accommodation, outgoings and sustainable insertions” (business counselor). Also, “we manage to attain consolidation because there are always discussions about the cost of the person receiving assistance. There too, I think that we would all gain from being a little more clear” (public funding providers).

Besides the costs engendered by business support, public funding providers were revealed to be particularly attentive concerning the contributions made by these policies for the territory, in particular through the link between the company’s durability and employment: “the Direction for Territorial Action develops various actions in favor of insertion through the economy for everything concerning intermediate associations, insertion organizations and the creation of activity, as well as service jobs. All of which make it easier to gain access to
employment” (Public funding providers). Those who do the accompanying are conscious of the impact their actions have on employment (“the durability of the firm. Durability, and even the development and job creations which can result from it”) (business support provider).

**Theme of the project holders**

The second theme emphasizes the service rendered by business support. It underlines the statutory constraints (“specifications”, “agreements” (“conventions”), “labeling”, “obligation” (“bond”), “legal”), and quality constraints (in terms of “evaluation”, “requirement”, “professionalism”). The business support structures must be able to respond in a way adapted to the needs of those being accompanied. “With regard to certain kinds of service, […] we have phase reporting with a qualitative aspect, we make reports, but do words always mean the same regardless of what type of business support we are dealing with? Like I just said to you right now, we have social workers, etc., and we can see clearly that, depending on the social workers, we have very different cultures, hence the “depending on”… There has thus been no work done on designing an evaluation method” (business counselor). This adaptability requires strong contact between those being accompanied and the business support providers (in particular in the bereavement phase…).

In addition to these initial constraints, public funding providers raised the need of fame, image. We can in this context quote the comments of a financier, for whom “it is important for the Department that the image of the activity creation theme be strong, and effectively a positive image, even a brand of some kind”. For business support providers, the search for a reputation is ambivalent. While for some, it can be problematic (“now, we are more in the type of fame that will prevail, because in calls for tender, those who generally stand out are
big structures, and even structures with a national impact, and which are in tune with the logic of the market, where the economic criteria governing the prices of services are very low, thus we are more in the “established structure” reputation trend, as a means of making it easier for new and small structures to emerge” (business counselor). For others, it is source of overtaking and improvement (“I would say on the contrary, the more renowned we are, the more renowned we have to be… at the same time, it is not for nothing that we are renowned, plus we must take care that our reputation is not a hindrance to good realization of services, and that we do not rest on our laurels” (business counselor).

Process theme

This specificity should incite the proposal of supervised business support processes (“tool”, “data”, “balance sheet” (“assessment”)) through a ”methodology” that aims to “improve” the service for the beneficiaries. “[Performance indicators] are innovative, they […] push [business support providers] toward innovation because, each time, the criteria evolve and […] grow in the right direction. They open up exactly to services other than those at the heart of a profession; before, [they] were estimated solely on the basis of the actions at the heart of the profession, while now, [they][will] be estimated […] on what [they] may do around that central aspect, and that is encouraging”. The business support process includes several aspects: technological, commercial and administrational, with the help of a business plan that has been drawn up. A business counselor notes, “How many people obtained help with technological feasibility, commercial feasibility, because it seems to me that that could provide the factual elements that would show how things have changed”.

Similarly, access to adequate training is another important aspect in business creation: “later, there is what goes with business creation: possibly training courses, to try to find the nature of jobs, other sustainable means of insertion (let us say it like that), beyond this, afterwards,
administrative files which ask us for the number of men/women.” (Business counselor).

Finally, innovation appears to be a central axis in the reflection process of public funding providers for whom “innovation must be present in all business creation projects. If there is no innovation (not technological innovation, just innovation) in the projects there will be no competitiveness and thus no durability ”). (Financier).

Learning theme

Business support requires a particular framework (“specificity”, “specializing”) with a particular “culture” (“profession”, “craftsman”, “auto-entrepreneur”). Business support providers must thus work within a “projects” logic, and have wide-ranging knowledge in the fields of management, law and communication. Learning (“learn” (“teach”)), and an spirit open to novelty (“new”) confer business support providers with skills and particular experience (“Out of habit, I am quick to understand, to know if the work on the project has been done and is not still to be done, and if we can move on directly to the following stages, market research and documentary research, business plan, etc.”). (Business counselor).

This skill capital is enhanced by the learning process. For public funding providers, “training”, the “project” and the “holder” are part of a set of factors for “success”, or “confidence” (“trust”). The business creation process is not represented as an isolated act but as a “construction”, a balance that is part of the “duration”. This semantic set is particularly rich insomuch as it highlights the difficulty and the success of this undertaking.

Four axes appeared from the content analyses. They correspond to the various axes proposed in the prospective table. The remainder of this communication will focus on formalizing the results of the content analysis in order to obtain a piloting tool shared by the key players.
3.2. The strategic map

In our opinion, it was necessary to adapt the strategic map to the context of new business start-ups. From analyzing the interviews, an initial version of the map was drawn up. To have it validated by the key players in the business support sector, we organized a group meeting in association with:

- a financier, the Languedoc-Roussillon Region, represented by Kathya Rousson,
- a business support structure Context’ Art, represented by Claude Sapej,
- a business support network, a Synersud network, represented by Françoise Pasquier.

A 4-hour discussion allowed us to produce this tool based on the functioning logic of the BSC. A reflection was developed on the strategic vision of the key players in business support. An agreement was outlined around the question of territorial economic development. The strategic map links the performance factors which contribute to the direction of this strategy.

**Group meeting principles**

Step 1 – Presentation of the goals of the study and of the main characteristics of the BSC method.

Step 2 – Proposal of a strategic map based on analysis of the interviews (Appendix 2).

Step 3 – Discussion concerning the strategic vision of the key players in business support.

Step 4 – Construction of a new strategic map based on a blank map.

We explained the advantages of the four axes to our interlocutors and together drew up a set of indicators. The interviews were recorded in full.

In order to understand the relevance of the tool as well as the dynamics of construction, we present each of the axes via a bottom-up reading.

_The learning axis:_

This axis expresses the logic of producing a global vision: making territorial economic development easier in terms of efficiency, efficacy and effectiveness. To do so, it is important to use an essential performance lever in business support: the capacity for learning and the capacity for facilitating change within business support structures.

The three main points on which the various protagonists in our meeting asserted a pregnant interest were: human resources, informative and relational capital, and the organizational capital. After confrontation on the basis of each of the points, an exhaustive list of factors was established collectively. These are presented in Figure 5.
The business support process axis:

This axis refers to the processes of internal activity. It answers the question: “if we are to satisfy both the beneficiaries of business support (the creators of companies) and public funding providers, in which processes must we excel?” The participants at the meeting considered that three main fields were concerned: the operations management process, the management process for those accompanied, and the innovation process. Once these main ideas had been underlined, the question was to determine collectively on which indicators it was necessary to focus. Figure 2 (line process for business support) made it possible to do a complete scan of the actions that business support structures must perform in order to produce satisfying business support according to the idea established simultaneously by the key players specializing in business support and by public funding providers who contribute funds.

The axis for the accompanied project holder:

This axis corresponds to the customer axis in the balanced scorecard method. The holder is at the heart of the business support process. The performances associated with this axis can be appreciated in three ways:

- product/service attributes: business support is a servuction process that depends on both the business counselor and those accompanied. The project holder is a key player in this co-construction process which can result in a new business start-up or in bereavement for the project. Does he have enough information at his disposal to appreciate the nature and characteristics of the service? What tools support this performance?

- Relations: business support structures must contribute to the insertion of the project holder in his field of business. It must share with him privileged links which it weaves with
financing, consultancy, training structures … This link can be analyzed in a dynamic way. To what extent is the business support structure able to maintain this link with the project holder beyond the process of business creation?

- And finally image: the fame of the business support structure can be a control lever for the success of the new firm. It effectively plays a part in strengthening the legitimacy of the firm. What means are used to strengthen the firm’s visibility?

The economic and social development axis:

The last element in the strategic map corresponds to the fulfillment of the previous stages. For a firm, it can be described in terms of profitability and cost control. The analysis highlighted expectations in terms of efficiency, efficacy and effectiveness. The economic and social performance of the business support structure was described with regard to the expectations of the various stakeholders:

- The project holders: performance is appreciated in relation to both the company and the individual. What level of activity does the new firm have? What is the income of the project holder?

- Public funding providers: their requirements are in terms of territorial economic development. How many jobs have been generated by the new firms? How long-lasting are they?

- The business support structures: their performance can be evaluated with regard to business volume, but also with regard to the role played by the structures in terms of insertion. How many project holders have been accompanied? What is the return in terms of employment?
This group meeting was prolonged by the construction of a closed questionnaire intended to operationalize the performance measurement indicators and to test the relevance of the strategic map. It was submitted to the participants. A meeting was then organized on July 21, 2009 with the CRCI LR and the PFCA34 to validate the questionnaire. This questionnaire summarizes four dimensions in the strategic map and aims to validate the indicators used to estimate the performance of business support.

Conclusion

This contribution showed the importance of the link between management control and entrepreneurship, two management sciences disciplines, through use of the balanced scorecard; in that sense, it provided a theoretical contribution. Business support structures in new business start-ups are evaluated and the pressures facing public funding providers are increasingly heavy, while business creators require the implementation of tools adapted to the specificities of business support. We used the BSC by adapting it to the case of business support for new business start-ups and by validating, beforehand, its relevance with the various protagonists. Our results show that business support structures abound in the direction of evaluation as a means of improving the control of their servuction process. Drawing up the strategic map is the first stage in the finalization of this tool. It should be completed in the coming weeks.

This paper describes as a case study our initial experience in teaching a new class, Social Entrepreneurship: Arts Management.

We designed the class to encourage a partnership between our academic offerings and the communities in which local arts organizations are situated. We took advantage of the strong presence of large and small arts institutions in Cincinnati. Many are part of plans to re-develop Cincinnati’s urban core, such as Know and Ensemble Theatres; National Underground Railroad Freedom Center; and Cincinnati’s Symphony Orchestra, Museum Center, and Art Museum.

Cincinnati also has unique programs, including the Fine Arts Fund, a fundraising organization for the local arts designed to imitate the United Way model of collecting and distributing funds to a variety of institutions; Enjoy the Arts, which works with arts organizations to provide incentives to encourage young people to attend arts events inexpensively; and Learning Through Art, an organization that uses art to help disadvantaged children achieve educational/cultural objectives.

To encourage interdisciplinary participation, prior coursework in business classes was not required. The course attracted 24 students including entrepreneurship, communication, art, music, and theatre majors and minors. While all of the arts students had attended multiple arts venues, the great majority of business students had not attended any. As a result, they strongly benefited from the experiential component of the class, especially finding out that some arts venues offer not entertainment reserved for elites, but also for those who enjoy popular culture. A number of students enjoyed attending Reefer Madness, for example, where there was significant interaction between the players and the audience (See Meisieck, 2002).

Class goals

This class focused on analyzing nonprofit planning, budgeting, marketing, community engagement and fund raising. Given that non-profit boards frequently indicate that non-profits would operate more effectively if their leaders possessed business skills, it fills an important need. Its goal is for students to see the potential of learning, serving, and leading in the arts.
Description of student learning objectives and how they are enhanced through use of community engagement principles

In addition to textbook and lecture materials, student learning was enhanced by three assignments: serving on unpaid intern teams with arts organizations; hearing from guest speakers from the local arts community; interviewing, writing, and presenting biographies of arts practitioners to see the different careers paths they have followed.

These hands-on assignments helped this course achieve three sets of outcomes, including understanding of:

- how creativity, intellect, training, and experience can be channeled into an arts-related career
- non-profit business structures and how different types of nonprofit institutions require different responses to management issues
- what is expected of artists or arts managers in the marketplace; how economic and political events affect artists and arts culture; and challenges facing the arts, including community engagement, audience development, and financial support.

Description of learning activities as they relate to community engagement

Students heard ten 1-hour presentations from arts executives from such groups as Enjoy the Arts, Fine Arts Fund, Acclaim Awards, Taft Museum, Cincinnati Symphony Orchestra, Cincinnati Playhouse, Know Theatre, Learning through Art and Cincinnati Opera, as well as presentations from arts patrons and board members. Surprisingly, virtually every guest speaker, who was asked to read a textbook chapter, indicated their experience was at variance with the guidelines promoted in the text.

Surprising insights into arts management

This course proved to be a revealing experience, as students learned about the particular issues facing a variety of arts genres, issues often very different than those facing for-profit organizations. Of special significance was the almost universal reaction of guest speakers that textbook solutions are “cookie cutter” and not applicable to specific arts genres.

Economic Structures

Perhaps most importantly, arts organizations vary dramatically in their economic structures.

- **Performing arts organizations** indicated they needed to generate significant revenues from ticket sales to attract the private donations they needed to generate to find the ideal balance of ticket prices and sales to maximize box office revenues. Donors expected them to provide budgets that were neither
significantly in the black (are we donating too much?) or in the red (is my donation going to be a sunk cost in a failed endeavor?)

• **Signature shows**  In addition, one major theatre executive related that the entire season’s only profitable production was Dickens’ *Christmas Story*, so popular that it has an extensive run each year, at low cost, as costumes and sets can be re-used and rehearsals times are shorter as well. The story from the ballet was similar, with *The Nutcracker*, offered annually, generating profits that subsidized many other less popular productions.

• **Museums**  On the other hand, curators indicated museums can almost never charge admission prices to cover even a fraction of their expenses, as the cost would be too high to attract enough visitors to justify the museum’s presence.

**Marketing**

• **High culture organizations**, such as the opera and ballet, indicated their most important marketing goal was to attract an audience wider than the 3% of the typically high income population that had ever attended one or other venue; while some smaller organizations needed to attract more affluent customers who would be willing to purchase season subscriptions, a key to planning and budgeting for yearly events.

• **Aging audiences**  Many organizations were also concerned that their audiences were aging and were searching for ways to increase their appeal to a new generation of culture seekers, without losing their older audiences, especially those who purchase subscriptions, an decision relatively fewer patrons are making and a factor in making long term decisions more difficult for arts managers. For example, a museum revealed it went through a yearlong process to update its public materials, including changing the font it used from one that was very formal to one that was in their view communicated greater accessibility to the museum.

• **Internet presence.**  Students were also surprised at the significant investments virtually all the arts organizations made in an Internet presence. As Bernstein (2007) points out, the internet offers arts organizations the “power of instantaneous, comprehensive, and low-cost marketing tools,” a 21st century way of informing visitors of events and of selling tickets and gift shop items.

**Management**

• **Leadership:**  Another insight confirms Jim Collins’ (2005) that most nonprofits need to operate in terms of legislative leadership rather than executive leadership, in which “no individual leader—not even the nominal chief executive—has enough power to make the most important by decisions by himself or herself (p 11), especially as large donors often exercised significant influence at board meetings and volunteers often work for nothing but recognition and may not have the ideal talents for the roles they are assigned.
• **Human Resources:** On the other hand, we found many leaders who said motivating employees was easier in the nonprofit segment because of the dedication of the donors and the volunteers to the success of the enterprise—that is, a greater sense of commitment than some leaders experienced in the free enterprise sector.

• **Strategy:** Perhaps most importantly, arts leaders struggled with clearly identifying their community uniqueness so they could best connect with current and future donors and audiences, primarily through building their brand reputations. Qualitative judgments such as the reactions of audiences, the coordination of creative processes, and relationships with donors, volunteers, and employees played a significant role in strategic planning.

• **Career Progression:** The managers interviewed also revealed that unlike business management, arts managers do not have clear job descriptions and the biographies revealed many juggled multiple roles and found few counterparts in the community with whom they compared experiences.

**Lessons Learned**

**Textbooks for arts management need to highlight the distinctions among arts organizations as different arts genres require different management strategies: one size does not fit all.** Large arts organizations typically have access to larger amount of donor money and can provide permanent long term jobs to its management team. Small organizations typically depend more on relatively poorly paid workers and volunteers to support their efforts. Each requires a different type of management and human resources strategy to succeed.

**Additionally, different arts genres allot their time differently:** Museum directors spend a significant amount of time fund raising with large dollar patrons whereas performing arts groups spend more time attracting an audience to fill their auditoriums, an indication of success to patrons.

**Internship teams are excellent learning tools.** Most students worked directly with small, typically shoestring non-profit arts organizations, often with people of their own age, and gained hands-on experience in calling donors, directly selling tickets, cleaning venues, and executing short term strategies to drives audiences to arts events. This part of the class received the highest evaluations. In particular, students noticed a key difference between the institutional organizations, with their more formal organization structures with those which operated on a shoestring budget. They noted that the smaller organization devoted more time to creative effort and less to reports, forms, and what they saw as other impediments to the creative process (Hagoort, 2003).

**Interviews with and class presentations on artists and arts managers allowed students to understand the paths people took in the arts, often surprising ones.** They also learned collectively to understand a wider range of arts organizations, as
each student interviewed someone from a group other than where their internships were established. They also learned that many artists found opportunities as arts managers and some arts managers had little or no arts experience before finding work in that field.

**Conclusion**

In short, we designed a class with a community-engaged perspective in which students learned from the experience and knowledge of community experts and participated in community arts activities under the direction of arts partners.

The class met the four standards for effective community-engaged classes: it addressed important community needs; the service activity was tied to academic goals; students wrote papers reflecting on their experience; and students received and gave recognition to their community partners. (Abravenal, 2003).

Significantly, business students achieved an appreciation for the arts and the importance of good management practices in the arts. Arts students likewise saw they could maintain an interest in the arts by serving a role in an arts organization without being an artist and also of the issues facing arts organizations, especially the smaller ones which operate on year to year budgets and depend upon the generosity of donors to survive.

The community partners enthusiastically embraced their roles as expert resources for students and expressed appreciation for being allowed to direct the efforts of the student internship teams to put their talents to uses which were decided by each sponsoring organization.

As teachers, our most important learning was how the best laid plans do not survive “contact with the enemy.” We scheduled presentations from guest experts well in advance of the semester’s start. This put us in a vise. Each week after we lectured from a chapter in the textbook (Byrnes, 2008), we heard our guest experts indicate disparities between text book nostrums and what worked and did not work in their experience, something reflected in virtually every student evaluation.

In our next iteration of the course, we plan to organize the course down by genre such as museums and performing arts organizations, each subdivided into large and established organizations and small and shallowly rooted organizations. Our lectures will more closely follow the arts managers’ insight than those of a textbook.

We also plan to continue to follow community engagement principles as students most praised their contact with arts organizations, managers, and artists.

Nigeria: Entrepreneurship, Trade, Poverty, Gender and Sustainable Development

Olufemi Boyede

Abstract

Without gender equality and equity, national development will be stunted and lopsided. In Nigeria, poverty wears a woman’s face and the gender imbalance can only be addressed by Government policies and programmes, as the country remains a government-led economy.

The average Nigerian woman accounts for an estimated 60% of family’s income, especially on the lower strata of the societal ladder. There is therefore no doubt that any attention paid to improving the lot of the Nigerian woman through trade and entrepreneurship orientation will have a direct effect on the country’s quest to alleviate poverty and entrench sustainable development.

This paper assesses the interaction between entrepreneurship, trade, poverty, gender and sustainable development and concludes with a set of policy and strategy recommendations to help international aids providers on entrepreneurship development and poverty eradication in Africa as well as government at all levels in effective policy formulation.

Key words: Entrepreneurship, Trade, Poverty, Gender, Sustainable development

1.0 INTRODUCTION

Entrepreneurship, trade, poverty, gender, and sustainable development are broad-based contextual issues that elicit great concerns within and among nations. They play veritable roles in the socio-economic rating of a nation within the comity of nations because of their overwhelming impact on the overall wellbeing of the citizens of a state as well as on the national economy. However, there is a dearth of studies that focus on the interaction of these issues globally and in Nigeria more specifically. This paper thus seeks to establish the link between entrepreneurship development, perpetuation of poverty in Nigeria and poor gender consideration in national policy formulation with emphasis on Nigeria’s trade policy. It seeks to further assess the position of women entrepreneurs in Nigeria, government support programmes for women entrepreneurship development in Nigeria, trade promotion services to help Nigerian women
participate in international trade and the role of Nigerian women entrepreneurs in the country’s development and competitiveness. The paper concludes with a set of policy and strategy recommendations to help international aids providers on entrepreneurship development and poverty eradication in Africa as well as government at all levels in effective policy formulation.

This paper is written based on consistent findings and observations by the author over a few years of convening the KVL Export Roundtable in four geo-political zones in Nigeria. The KVL export Roundtable is a Public-Private Dialogue that creates a forum, periodically, for non-oil exports stakeholders’ interaction, sustainable export policy formulation and investment promotion. Findings from the dialogues have shown consistently, that non-gender consideration in trade policy formulation was a great impediment to export development and consequently, sustainable development. The findings also reinforced similar findings from the author’s consultancy stints with the Small and Medium Enterprises Development Agency of Nigeria (SMEDAN) as an entrepreneurship consultant. Hence, the author’s interest in evaluating the direct impact of these critical issues interacting together on the Nigerian economy and development potentials.

1.1 CURRENT TREND ON GENDER AND DEVELOPMENT

Gender consideration on national issues at all levels has become a constant agitation in the world today because of the established linkages between poor gender consideration in policy formulation and retarded development and economic growth of a country (Chen, Vanek, and Carr (2004). In the international aid circles, the promotion of gender equality and women’s empowerment is commonly referred to as a ‘cross-cutting’ issue, meaning that it has to be taken into account if results are to be achieved from investments in specific sectors such as health, agriculture or enterprise development. It is also a developmental goal in its own right – MDG 3.
But because policy priorities of governments and NGOs often reflect structural inequities in power relations within the wider society, the most difficult goals to reach and that need the most investment – i.e. gendering policies -, paradoxically, tend to be those that get the least attention (Urmilla Bob et al, 2008).

The World Bank Policy Research Report (2000) defines gender equality as that stage of human social development where there is:

...equality under the law, equality of opportunities (including equality of rewards for work and equality in access to human capital and other productive resources that enable opportunity), an equality of voice (the ability to influence and contribute to the development process) for both women and men.

This, the World Bank Report (2000) indicates, is a stage when both women and men realize their full potential. Several researchers and organizations agree that gender equality is far from being realized today (Casale, 2004; eThekwini Municipality, 2006; Fischer and Wood, 2003). Gender inequality manifests itself in society in various ways and has a range of negative consequences, especially for women (Walby, 2004; World Bank, 2006; World Bank, 2002). Gender-based practices and attitudes in the socio-economic sphere also place heavier burdens on women entrepreneurs when compared to their male counterpart (Botha, 2006; Clones, 2003; DTI, 2005, Lopez-Claros and Zahidi, 2005). There is therefore a desperate need to empower women, ensuring their involvement in mainstream activities through measures that will increase their social, economic, and political equity, and broader access to fundamental human rights (Lopez-Claros and Zahidi, 2005; World Bank, 2006).

“Gender equality is an issue of development effectiveness, not just a matter of political correctness or kindness to women” (World Bank, 2003). Thus, when discriminatory burdens are
removed, the capacity and earning power of women increases (World Bank, 2003) and consequently, the economy is positively impacted. Furthermore, women tend to reinvest these gains in the welfare of their children and families, multiplying their contribution to national development (Bossen, 2005; Botha, 2006; DTI, 2005; Lopez-Claros and Zahidi, 2005; World Bank, 2003). According to the World Bank (2002), although economic development tends to promote and improve gender equality, its impact is neither sufficient, nor is it automatic. Measures are still required at all levels (globally, nationally and locally) to ensure that women benefit fully from such development.

In Nigeria, despite the growing concern globally for gender-mainstreaming in national issues, gender discriminatory practices that are steeped in patriarchy are still widespread and deprive the economy of optimal usage of its human resources. Several gender sensitive legislations have been put in place nationally but, their implementation has been deterred by the patriarchal disposition of most cultures and tribes in the country. This prevents the economy from realizing its full potential (Clones, 2003; World Bank, 2000; World Bank, 2002; World Bank, 2003; United Nations, 2005).

Historically, women in Nigeria have played a significant role in society and the home. Women contribute significantly to the household income through their work in various areas like farming and commerce. Nigerian society upholds the traditions of marriage and family. Women are under enormous pressure to marry and bear children in order to have a place in society. Once married, a woman's status is under her husband's family and she has very few rights. Also, wives have little male support since Nigerian law does not enforce the husband's responsibility toward family. Many women labor in the fields as farmers, yet the males in Nigerian society commonly deny profits and appreciation for this labor. Inheritance is a repressive issue for many women in
Nigeria. Legally, a woman is entitled to a share of her husband's estate if he dies. However, women rarely receive anything because of a very strong extended family factor; women in most instances cannot even inherit from their fathers in Nigeria.

Customs and traditions have continued to oppress and marginalize women in Nigeria while lack of education has relegated women to unskilled and labour-intensive work. In the rural areas women constitute the workforce in agriculture and are solely responsible for the cultivation of vegetables, cassava and perennial fruits. In addition they also engage in trading on market days and weaving, dyeing and pottery making. In Nigeria there is a gender imbalance which is yet to be addressed by Government policies and policy implementation.

Without gender equality and equity, national development will be stunted and lopsided. A World Bank report reveals that countries with smaller gender gaps have less poverty and faster growth. Countries that promote women's rights and increase their access to resources have faster economic growth and less corruption than countries that do not. Thus, gender practices that undermine, overlook and/ or restrict women’s participation and empowerment in social, economic and political spheres, have resultant implications that impact negatively on the economic growth of countries as well as on the quality of life of women (DTI, 2005; Greene et al, 2003). In view of this fact, stakeholders in Nigeria have canvassed for mainstreaming of gender in policy issues such as international trade, economic partnerships, aids, national planning and budgeting. This was the outcome of a National Consultative Workshop on Gender, Trade and Poverty organized by Trade Network Initiative (TNI), an umbrella body of eleven Non Governmental Organisations (NGOs) dedicated to poverty reduction and overall development of Nigeria.
1.2 GENDER AND ENTREPRENEURSHIP

Entrepreneurship is the act of being an entrepreneur, a French word meaning "one who undertakes innovations, finance and business acumen in an effort to transform innovations into economic goods" (wikipedia encyclopaedia). Suleiman (2006) defined entrepreneurship as “the willingness and ability of an individual to seek for investment opportunities to establish and run an enterprise successfully”. Entrepreneurs therefore, are job creators and/or become self-employed rather than seekers of jobs in an overstretched public service (Adewumi, Mokuolu, and Longe 2009).

An appreciation of gender issues is important when considering strategies to enhance entrepreneurship and private-sector development the world over. There are three main reasons behind gender consideration in entrepreneurship development especially in Africa. First, women are major players in the private sector, particularly in agriculture and in informal businesses. It is estimated that women-owned businesses account for over one-third of all firms, and they are the majority of businesses in the informal sector in African countries (Bardasi et al, undated). Second, the ability of women to formalize and grow their businesses, to create jobs, and to enhance productivity is hampered where legal and institutional barriers exist that affect men’s and women’s enterprises differently. Third, there is evidence—especially at the micro level—to indicate that gender disparities not only disadvantage women but also reduce the growth potential of the region as a whole. The existence of gender related barriers can thwart the economic potential of women as entrepreneurs and workers, and such barriers have an adverse impact on enterprise development, productivity, and competitiveness in Africa. Thus, gender inequality plays a significant role in accounting for Africa’s poor growth and poverty reduction performance.
The basic requirements of an entrepreneur have been identified to include: hard work, teamwork, commitment, appreciation, listening, high expectations, setting achievable goals. Women, by nature and exposure to family relationships, possess most of these qualities that are essential and can be enhanced for entrepreneurial success.

Consequently, addressing gender-specific barriers to entrepreneurship and leveraging the full participation of both men and women in the development of Nigeria’s private sector together represent a significant opportunity to unleash Nigeria’s productive potential and to strengthen economic growth.

1.3 GENDER AND POVERTY

Poverty has traditionally been defined as insufficient access to enough commodities to meet basic needs and as such has been understood to be a state of being. This definition however, looks at poverty from a consumption point of view but, on a broader note, it is necessary to include more recent arguments that poverty is a dynamic, multidimensional process involving a lack of power, assets, human dignity, access to public resources and time and, above all, a lack of opportunity to choose freely how to invest in one’s future. It is also a “feminized” phenomenon that affects women more than it does men. As a consequence of structural inequalities across and within nations, this process is socially reproduced over time and from one generation to the next.

Poverty has been identified as a major obstacle to the realization of women’s human rights and one of the most surreptitious forms of violation of a woman’s rights. Not surprisingly, it came on top of the list of twelve critical areas of concern for the women of the world, adopted at the fourth world conference on women held in Beijing, China. It was estimated in the Beijing Declaration that more than one billion people in the world today, the great majority (about 70
percent) of who are women, live in unacceptable conditions of poverty, mostly in developing countries (Amaka, 2007).

With the severe economic shocks that rocked the Nigerian economy during the early 1980s came real and perceived increases in the level of poverty in the country. Among the factors contributing to the shocks were declining prices of oil, the country's main export, and rises in real international interest rates that compounded the external debt. The major underlying reason, however, was domestic policy mistakes. Economic reforms were introduced by the government of Nigeria in mid-1986 in a structural adjustment programme that included exchange rate devaluation, trade and financial reforms, and budgetary and monetary contraction. These reforms were expected to revitalize the economy's growth. In turn, growth was expected to contribute noticeably to improved equity in the country (Aigbokhan, 2000) but, studies have shown that these reforms had little or no impact in the poverty situation in the country.

The Human Development Report 2002 placed the number of people living on less than one dollar in sub-Saharan Africa at 300 million in 1999 a global share percent of 46.7 percent. According to the report” The declining share of people in extreme poverty is hopeful, but the level remains disturbingly high. And failure to reduce poverty in Sub Saharan Africa, the world’s poorest region, is a grave concern”. In fact, Sub Saharan Africa ended the millennium, 5 percent poorer than in 1990.

In terms of income poverty, Nigeria ranked 58 out of 88 developing countries. About, 70.2 per cent of the Nigerian population according to that report lives on an income of $1(one US dollar) a day, that is below the poverty line. The Human Development Index Ranking places Nigeria in 148th position out of 173 countries of the world in its year 2000 report.
1.4 GENDER AND TRADE

Neither trade as an economic activity nor attempts to manage trade in the form of policy are new concepts. However, attempts to manage trade at the international level in terms of policy and liberalization are relatively recent interventions. Trade is an activity of exchange that appears in different forms, and takes place in different locations. It is considered by most countries of the world including Nigeria as the major driver of sustainable economic development. It has the potential to create jobs, expand market, raise income, facilitate competition and disseminate knowledge (WTO 2005). However, trade has not really thrived effectively as a national development tool because trade policy in Nigeria is not gender sensitive and has not been given its statutory role in the national development policy. Until recently, women in entrepreneurship have been a neglected resource of development and growth. There is a positive and statistically significant relation between exports and women’s share of employment while there is a statistically significant and negative correlation between women’s share in employment and imports. This indicates that export-competing industries tend to employ women while import-competing industries tend to employ men (Duke, 2009).

Numerous reports conclude that trade liberalization is likely to create jobs for women and increase their relative wages. This can be summarized in the following conclusion

“... experience in open, low-income countries until now has clearly been that industrialization has been female-dependent as well as export-led, and many women in outward-oriented developing countries owe their livelihood to international trade expansion”

Joekes (1999).
1.5 GENDER AND SUSTAINABLE DEVELOPMENT

The integration of a gender perspective into a country's plan of action envisions a development that is sustainable. A Gender and Development Plan that focuses on empowerment of women to achieve equity and equality, active participation in the economic, social, cultural and political decision-making, social justice, inter- and intra-generational equity, ecological soundness and equal access to economic resources caters to the vision of sustainable development. There are several critical areas of concern that must be addressed in order to advance the welfare of women. The mainstreaming of gender in sustainable development entails promotion of women's rights and welfare, economic access, sustainable human development, ecological cognizance and greater participation in economic and political issues and decisions.

In Beijing during the Fourth World Conference on Women, participating Governments, recognizing that women's contributions and concerns were too often ignored in economic structures, committed themselves to promoting women's rights by ensuring a gender perspective in all their policies and programmes so that before decisions are taken, an analysis is first made of their effects on men and women, respectively (UNCTAD, 2007).

Now the question arises: what is the value added with respect to women's involvement in development? And while there may be a difference in the impact of development on women and men, the fact remains that:

- Women are not only affected by economic forces as are men, but also in a different fashion;
- Women have much to contribute;
- Women can play a crucial role in an economy's development and with recovery from an economic crisis;
- Women have as much stake in development as men.
Sustainable development therefore, can only be achieved through long-term investments in economics, human and environmental capital. At present, the female half of the world's human capital is undervalued and underutilized the world over. Better use of the world's female population could increase economic growth, reduce poverty, enhance societal well-being and help ensure sustainable development in all countries as is been seen in some Asian countries where this fact has been recognized.

**1.6 RELATIONSHIP BETWEEN ENTREPRENEURSHIP, TRADE, POVERTY, GENDER, AND SUSTAINABLE DEVELOPMENT**

It is crucial to factor women and gender into an understanding, analysis, monitoring and policy formulation of trade and sustainable development, as argued above. There are equity-equality arguments and efficiency arguments for understanding these links. Both gender equality and the right to development are universal rights for women and men, girls and boys and should reflect in all national, regional and international policy formulations in all facets of development. Gender is also an efficiency issue. Trade liberalization has gendered impacts on developing and industrialized countries, and affects the supply-side response of these economies. Research has shown that improved gender equality is more economically efficient, as the following examples illustrate:

(a) Reducing gender inequality could significantly increase agricultural productivity in Africa, for example by giving women farmers in Kenya the same agricultural inputs and education as men farmers.

(b) Failing to invest in gender-balanced primary and secondary education lowers GNP.
(c) Eliminating gender discrimination in occupation and pay levels would increase both women’s income and national income.

(d) Maintaining gender inequality hampers a positive supply response to structural adjustment measures by reducing women’s incentives to produce tradable goods and increasing women’s time burdens.

At the WTO’s Symposia on Trade and Environment and on Trade and Development in Geneva, March 1999, the international NGO network on trade and development, International Coalition for Development Action (ICDA), welcomed what appears to be a growing realization from some member states that trade is not an end in itself, that it is not an automatic panacea for solving the problem of economic growth and development and the challenge of sustainable development, and that it is therefore necessary to mainstream a number of cross-cutting concerns and policy objectives into trade policy and agreements in order to achieve sustainable development for and by developing and industrialized member countries (ICDA, 1999). In this manner trade could be turned "from an end in itself to a means to achieving sustainable human and social development which provides net benefits for poor people, women and men, and the environment." (WTO, 1999).

In view of these arguments and expositions, it can be concluded that entrepreneurship and trade are veritable and dynamic tools for effective poverty reduction and possibly eradication and consequently, major drivers for sustainable human and economic development. However, their effectiveness in achieving the desired output is dependent on the extent of their responsiveness to gender differences and disparities which must be taken into cognizance when formulating trade and entrepreneurship policies at national, regional and international levels and in all aids provisions and assistances.
Entrepreneurial forces are relatively strong in this country, as the lack of jobs and a rise in poverty leave few other options for the Nigerian people. Nigeria has always had a large and active local business population and recent Nigerianization policies have aimed to increase substantially, the role played by local entrepreneurs (Nafziger, 1977). To this end agencies such as the Small and Medium Enterprises Development Agency of Nigeria (SMEDAN), the National Directorate of Employment (NDE) and the National Poverty Eradication Programme (NAPEP) were empowered to provide entrepreneurship programmes and funding for entrepreneurs.

Entrepreneurship represents an opportunity for women all over the world, as entrepreneurship responds flexibly to entry, change and innovation (Kitching and Woldie, 2004). This potential has not yet been realized in an optimal fashion in most developing countries like Nigeria. Female entrepreneurs enjoy limited political and economic opportunities. A large number of women work in the informal sector but their contributions are not included in national accounts (UNIDO, 1995). A variety of constraints impair the ability of women to upgrade their production continuously (Kitching and Woldie, 2004). These constraints include poor access to market information, technology and finance, poor linkages with support services and an unfavorable policy and regulatory environment. The need to compete in an aggressive business environment with rapid technological changes and the globalization of production, trade and financial flows further compound these constraints (UNIDO, 2001). Despite these shortcomings and constraints, women have been able to create their own enterprises in Nigeria, where economic decisions would normally be taken by the male head of households (World Bank, 1995).
The needs and contributions of female entrepreneurs in the Nigerian economy seem to be very invisible and overlooked. Female entrepreneurs’ participation in the formal sector of the Nigerian economy is grossly undermined. In Nigeria, women generally have less access to formal education; consequently, they have low participation in the formal sector and thus, take up self employment.

Kitching and Woldie, (2004) in their interview of Nigerian women entrepreneurs in Abuja and Lagos found out that “for a female business owner in Nigeria, the process of starting and operating a new enterprise can be difficult because they lack the skills, education and support system that can expedite their business pursuit. They isolated the following problems, inadequate education, little or no training, lack of capital, too much competition, low opportunity for expansion, poor access to technology, unfavorable government policies, family commitments, old boys network and prejudice from men, as peculiar to the women entrepreneurs.

In the area of microfinance and women's access to credit, most microfinance institutions systematically provide decreasing percentage of loans to women. In most cases it has been found that women have a smaller loan size ostensibly because women are considered to have a lower capital absorptive capacity than men. Consequently, the women's loan packages, programmes, and services are smaller thereby limiting the range of their economic activities and returns.

There is hope however for women entrepreneurs in the formal sector especially with more women going to schools and acquiring competent skills. Nigerian women entrepreneurs are now active in export trade and own service firms supplying services to both local and foreign-owned firms (Riddle and Boyede, 2003). In addition, with support from ITC a National Network for Women Exporters of Services was established in 2006. A crop of high-profile Nigerian women
professionals also set up the highly rated Women-in-Business. Recently, a new association of Nigerian Women in Banking and Financial Services (WIBAFIN) was also launched in Abuja. The momentum is rising and many more women (self-help) associations are springing up.

### 3.0 GOVERNMENT SUPPORT PROGRAMMES FOR WOMEN ENTREPRENEURSHIP DEVELOPMENT IN NIGERIA

Recognizing the essential role of women entrepreneurs and women generally to poverty alleviation and national development, the Nigerian government, through the then National Commission for Women inaugurated the Nigerian Association of Women Entrepreneurs (NAWE) on 28th April 1993. On the 3rd June, 1993, the Nigerian Association of Women Entrepreneurs (NAWE) participated in the inaugural meeting of the Federation of African Women Entrepreneurs (FAWE) where Nigeria was elected the President for a two year renewable term.

Nigeria Association of Women Entrepreneurs is an economic, government initiated organization totally devoted to entrepreneurship development. It is a unique organization of women supervised by the federal government through the ministries of women affairs and commerce and industry. It has the objectives of serving as a Centre for Nigerian Women Entrepreneurs for the promotion of their interests and also providing a forum where Nigerian Women Entrepreneurs exchange ideas, discuss their problems, design and form strategies regarding their business.

The Nigerian government also established in 2003, the Small and Medium Enterprises Development Agency of Nigeria (SMEDAN) to provide governmental assistance to Micro, Small,
and Medium Enterprises (MSMEs). This organ has contributed immensely to the development of both men and women entrepreneurs in Nigeria by providing start-up capital for many entrepreneurs. Recently, SMEDAN went into partnership with the Microfinance Bank Association of Nigeria with the aim of increasing the accessibility of micro credit to both women and men entrepreneurs.

One of the promising solutions to Nigeria’s economic development and women empowerment today is granting credit facilities and training to rural women who are involved in agricultural activities to enable them to procure simple agricultural implements like hoes, knives, hiring of tractors and purchase of fertilizers. Credit facilities should also be extended to people involved in cottage industries, such as oil-palm extraction and palm kernel cracking and oil presses.

Microfinance strategies have been recognized by national governments, donor agencies, and NGOs as strategies for poverty alleviation, community development, and above all for gender equality and women empowerment.

4.0 TRADE PROMOTION SERVICE FOR WOMEN IN INTERNATIONAL TRADE IN NIGERIA

Nigerian women engage in international trade. However, only very few get national or international recognition (Riddle and Boyede, 2003). While businesswomen have the potential to supply services across borders, many businesses owned by women in developing countries are not exporting. Often, they do not take advantage of the opportunities open to them because they lack confidence or exporting knowledge — problems that can be solved by obtaining training in the skills they need to export their services successfully.
To enhance the increased participation therefore, there is a need to create an umbrella organization for the non-governmental organizations (NGOs) that deal with women entrepreneurs, in order to help coordinate both international assistance and training for women owners of service businesses so that they can organize themselves to be more visible; establish awards programmes; and publicize success stories of Nigerian women who own service firms (Riddle and Boyede 2003).

In addition to these, regular networking events with foreign companies and embassies, emphasis on gender issues in investment promotions, collation of a databank on women international traders should be religiously pursued to enhance the successful and increased participation of women in international trade. The Ministry of Women and youth development should work in collaboration with the Nigerian Investment Promotion Commission and other organizations to promote the potentials of women-owned firms in their literature and also ensure the availability of such literatures in international trade arena and at the Nigerian embassies all over the world.

**Below is a list of suggested Strategies that can be adopted to enhance gender-sensitive entrepreneurship Development and empower women by government and aids organizations/NGOs:**

- The complementary policy issues in entrepreneurship education should include increasing women enrolment in schools at all levels especially in the field of agriculture to reduce gender inequality. Budgetary allocation should be made to accommodate more continuing and vocational education.
• More seminars/workshops should be sponsored and extended to rural areas to increase women’s capacity to start and grow their businesses, prepare sound business plan/feasibility studies and increase their technical and managerial capacity in enterprise development.

• Modern processing plants/storage facilities should be installed for women groups on government/private joint partnership basis so that women can process and store their farm produce with ease for women in agro-enterprise.

• Enabling environment in terms of gender-friendly policies, good roads, pipe-borne water and electricity should be provided by the various arms of government.

• Cooperatives and women groups should be more formally instituted and encouraged to position themselves strategically to access fund and other inputs with ease.

• Banks to be mandated to produce more gender-friendly loan packages (low interest rates and more relaxed duration of repayment).

• Women in agro-enterprises should be exposed to the latest agro-technology from time to time.

• Nigerian women should be encouraged to network more, both at the national and international levels for more exposure, to access funds and export information.

5.0 CONCLUSION

In a globalized world with varying degrees of poverty within and across nations, there is an urgent need to pursue far reaching measures in improving the welfare of the human race. The overall wellbeing of a people plays a significant role in ensuring the security of their lives. It thus implies that security all over the world will be greatly improved through poverty reduction.
Following the discussion trend in this paper, we have been able to establish the invaluable role of entrepreneurship and trade in poverty reduction, possible eradication and subsequently, sustainable development. However, the developmental impact of trade and entrepreneurship cannot be fully maximized unless policies regulating their operations are gender sensitive, accommodating and religiously implemented. This forms the crux of this discussion and I believe that if the suggestions made above are considered, it will be of value in promoting the achievement of the MDGs and sustainable development in Nigeria specifically, and, hopefully, the world at large.

Olufemi Boyede is an international trade and strategy consultant, small business counselor and trainer. He is presently the CEO of Koinonia Ventures Limited, a leading non-oil export promotion and consulting firm in Nigeria. The firm also provides training and human capacity development services especially on attracting foreign investments, business improvement and policy formulation. He has accumulated vast experience in entrepreneurship development as Pioneer Director-General of Ekiti State’s Enterprises Development Agency, EEDA, and as Business Development Services Provider to the Small and Medium Enterprises Development Agency of Nigeria, SMEDAN. He pioneered the establishment of International Trade Centre’s Network of Nigerian Women Exporters of Services, NNWES, and has worked extensively on entrepreneurship and trade development in Africa. He is a trainer of high repute as well as a motivational speaker. He also pioneered and still remains the convener of the KVL Export Roundtable – a national policy advocacy forum for the promotion of non-oil exports in Nigeria.

Measuring the performance of business incubators

A critical analysis of effectiveness approaches and performance measurement systems

Johanna Vanderstraeten and Paul Matthyssens
University of Antwerp, Belgium
Johanna.vanderstraeten@ua.ac.be

Utilizing performance measurement theories, we critically examine performance measurement literature in the business incubator domain. Papers are identified and selected by examining peer-reviewed journals in entrepreneurship and small business research, publisher-independent databases, and an own literature review. Results are discussed both at the individual and the system level. At the individual level, existing performance measures are examined using the goal, stakeholder, internal process and system resource approach. At the system level, incubator performance measurement systems are evaluated using Tangen's (2004) output prerequisites. Building upon our findings, the contributions for managers, policy makers, educators and (future) researchers are discussed.

Key words: business incubator, performance measurement system, performance measure, goal approach, stakeholder approach, internal process approach, system resource approach

Introduction

The development of adequate performance measures (PMs) and measurement systems (PMSs) has been subject for debate for many decades (Argyris 1952; Drucker 1954; Ghalayini, Noble, and Crowe 1997; Tangen 2004). In particular the alignment of quantifiable measures and the often unanticipated consequences of quantification seems to be an enduring subject of inquiry for both academics and practitioners (Neely 2005). Drucker already highlighted the need for a “balanced” set of measures in 1954. More recently, Johnston and Kaplan (1987) criticize traditional price competition and cost reduction based models, and claim that they are one-dimensional and simplistic.

1 Johanna Vanderstraeten is a Ph.D. candidate at the Department of Management (Faculty of Applied Economics, University of Antwerp, Belgium). She is an I.C.M./C.I.M. fellow granting her a full-time research scholarship. With this scholarship, she currently works at Fundação Getulio Vargas (São Paulo, Brazil). Her research focuses on business incubators.

Paul Matthyssens is Professor of Strategic Management at the Department of Management (Faculty of Applied Economics, University of Antwerp, Belgium) and the Antwerp Management School (AMS, Belgium). His research focuses on market strategy and strategic innovation in international and business-to-business markets. His work has been published in journals such as Long Range Planning, Industrial Marketing Management, Psychology & Marketing, Journal of Business & Industrial Marketing, Journal of International Marketing, International Marketing Review, Journal of International Management, Advances in Business Marketing & Purchasing, Technovation and Journal of Purchasing & Supply Management.

The continuing quest for balanced performance measurement resulted throughout the eighties and the nineties in the development of several integrated measurement systems. Examples are the performance pyramid (Lynch and Cross 1991), the results-determinants framework (Fitzgerald et al. 1991), measures for time-based competition (Azzone, Masella, and Bertèle 1991), the performance measurement matrix (Keegan, Eiler, and Jones 1989), Brown’s (1996) inputs, processes, outputs and outcomes framework, and the balanced scorecard (Kaplan and Norton 1992). Franco-Santos et al. (2007), however, indicate that performance researchers did not yet reach definitive conclusions.

Not only in the broad business and management literature (Giannakis 2007), but also within various sub-disciplines, academics argue for a better understanding and development of adequate PMs and PMSs. In incubator literature, researchers stress the importance of performance evaluation. McMullan, Chrisman, and Vesper (2001) explain that “training and assistance programs for practicing entrepreneurs are expensive both in money for sponsors and in time for participants. [Consequently], there is a good reason to evaluate them” (p.37). Tornatzky, Sherman, and Adkins (2002) advocate that performance measurement is necessary for adequate benchmarking practices. Incubator performance measurement, however, is not an easy task. Measuring the effectiveness of start-up assistance programs is often difficult (Sherman 1999). Consequently, there does not (yet) exist consensus concerning incubator performance measurement (Phan, Siegel, and Wright 2005).

In the current paper, we aim at targeting this literature gap, and critically examine existing performance measurement research in incubator literature. For this, we follow Neely’s (2005) suggestion to examine performance measurement both at the individual and the system level, and apply these to incubator performance measurement.

Building upon this, the current paper provides insights for managers, policy makers, educators and researchers. Incubator managers using robust PMs and PMSs are able to better position themselves in the incubator landscape (Tornatzky, Sherman, and Adkins 2002). Moreover, it is widely
acknowledged that adequate PMs and PMSs are a prerequisite for strategy development, implementation and improvement (Giannakis 2007; Kaplan and Norton 1992). Guy (1996), for example, developed two frameworks for evaluating science parks. The first stresses the importance of sound strategic planning, while the second lays emphasis on controlling, retargeting and monitoring. Not only incubator managers, but also firm managers can benefit from robust incubator PMs and PMSs. Bigliardi et al. (2006) state that “firms [...] might benefit from the availability of reliable performance appraisal tools to evaluate [...] [and] guide them in choosing the [appropriate] location [...]” (p. 490). The results of our paper provide incubator and firm managers insights in and a basis for evaluating existing measures and measurement systems. Government-related organizations such as the European Commission (2002) use incubator PMs and PMSs for benchmarking purposes and resource allocation decisions. Drawing upon the results of this paper, they might be able to improve existing benchmarking models. General and entrepreneurship educators can use this paper’s results to underpin the importance of balanced PMs (Neely 2005) and adequate PMSs (Giannakis 2007). Finally, we aim at providing incubator researchers with a critical evaluation of existing performance measures and measurement systems. We argue that depending on the research goal (such as internal process evaluation or goal evaluation), future incubator researchers might apply different performance measures. Furthermore, they might start from our PMS evaluation when elaborating on existing PMSs or developing new ones.

The remainder of the paper is structured as follows: in the second section, we clarify the business incubator concept. Thereafter, a description of the methodology used in the paper is discussed. Following Neely’s (2005) suggestion to examine performance measurement both at the individual and the system level, we examine existing incubator PMs and PMSs in section four. A discussion, conclusion and future research section summarizes our main findings and highlights our contributions for managers, (future) researchers, policy makers and educators.
Theoretical background: business incubators

Small start-up firms contribute considerably to job creation, employment growth (Fonseca, Lopez-Garcia, and Pissarides 2001), and the development of innovative products and services (European Commission 2000). A recent OECD study (2002), however, indicates that on average, one third of new European enterprises does not survive its first year of existence. Moreover, 50-60% does not survive its seventh year of existence.

Stinchcombe (1965) explains the limited survival probability of start-up firms with the “liability of newness” principle. He argues that new organizations suffer a greater risk of failure than older ones, because they generally lack the necessary resources and legitimacy. Although new organizations relatively depend more on the cooperation with external actors, weak ties with these external actors result in ineffective competition against established organizations. Elaborating on the “liability of newness” principle, Freeman, Carroll, and Hannan (1983) examine the importance of size, and introduce the “liability of smallness” principle. Their empirical results on national labor unions, semiconductor electronics manufacturers, and newspaper publishing companies reveal that both age and size influence failure rates.

To counter the high failure rate of small start-up companies, the European Commission (2000) suggests the nurturing of start-up firms in business incubators. Even though results are not always consistent, academic research seems to confirm that start-up companies located in a business incubator have a higher survival rate (Ferguson and Olofsson 2004; Sherman 1999) and sales growth (Löfsten and Lindelöf 2001; 2002), compared to similar start-up companies not located in a business incubator.

2 In incubator literature, start-up companies located in an incubator are called “tenants” or “incubatees”. These terms will be used interchangeable in the present paper.
Even though it is widely accepted that a business incubator is a place where new firms are nurtured to help them survive and grow during their uncertain start-up phases (Bhabra-Remedios and Cornelius 2003), the term business incubator has become an “umbrella word” for a heterogeneous phenomenon (Aernoudt 2004). Hackett and Dilts (2004a) offer a comprehensive incubator definition to counter this heterogeneity problem. It is this definition that will be used during the present paper:

“A business incubator is a shared office-space facility that seeks to provide its incubatees [...] with a strategic, value-adding intervention system [...] of monitoring and business assistance. This system controls and links resources with the objective of facilitating the successful new venture development of the incubatees while simultaneously containing the cost of their potential failure. [...] The incubator is not simply a shared-space office facility, infrastructure and mission statement. Rather, the incubator is also a network of individuals and organizations [...].” (p. 57)

After a literature review, Bergek and Norrman (2008) summarize the services offered by an incubator as follows:

(1) “Shared office space, which is rented under more or less favorable conditions to incubatees,
(2) A pool of shared support services to reduce overhead costs,
(3) Professional business support or advice (“coaching”), and
(4) Network provision, internal and/or external”. (p. 21)

Each of the above incubator services has been examined by academics (Chan and Lau 2005; Hansen et al. 2000; von Zedwitz 2003). Haapasalo and Ekholm (2004), for example, state that the most important factor for incubator success is organised networking. Only a strong network of experts and business contacts can help a start-up company to launch and expand its business.

Methodology

While searching for published material on business incubator PMs and PMSs, articles were selected using the following search terms: (1) “incubator performance”, “incubator impact”,

5
“incubator assessment”, “incubator effectiveness” or “incubator efficiency” and (2) “measure”, “system”, “model” or “framework”. The wildcard symbol “*” was utilized to broaden the search. To avoid comparing research results aimed for different phenomena, Bergek and Norrman’s (2008) overview of incubator services was adopted for paper selection. Only papers in which researchers examined incubators offering shared office space, a pool of shared support services, professional business support or advice, and internal and/or external network provision are considered.

The adopted selection path was as follows. First, three publisher-independent article databases were checked: Web of Science (part of the ISI Web of Knowledge database), EbscoHost (Business Source Premier) and Elsevier ScienceDirect. Because this search resulted in a very limited amount of papers, the authors decided to search other articles based on existing incubator literature reviews (such as Aernoudt 2004; Bhabra-Remedios and Cornelius 2003; Hackett and Dilts 2004a) and their own incubator article database. Finally, after the papers from these selections were read, further articles were identified on the basis of their literature lists.

Specifically for incubator performance measurement systems, two additional paper selection requirements are added. First, papers should develop an “original” PMS. Papers using PMSs developed in earlier research are not considered for evaluation. Instead, the original model was identified and evaluated. Second, the assessment framework should at least incorporate more than one performance evaluation perspective. Tangen (2004) explains that in a PMS, “several separate PMs which correspond to diverse perspectives (financial, customer, etc.) are considered independently” (p.729). Therefore, we did not evaluate research in which only one perspective was considered.

3 In Web of Science, the following citation databases were consulted: social science citation index and conference proceedings citation index: social science and humanities. In Elsevier ScienceDirect, both journals and books were considered. In each of the three publisher-independent databases, all available years were searched.
Results

In what follows, an inventory of existing incubator PMs will be given and evaluated. Thereafter, existing PMSs are evaluated using Tangen’s (2004) PMS output characteristics.

Individual level: performance measures

As discussed by various academics (Johnston, Brignall, and Fitzgerald 2002; Neely et al. 2000; Neely 2005) performance research shifted its attention from traditional, cost accounting principles towards more “balanced” sets of measures. Incubator researchers acknowledge the shortcomings of only using financial measures. Voisey et al. (2006) stress that although business incubators are sometimes structured as traditional companies, the majority of incubators are non-profit entities. Consequently, business incubator outputs do not always appear in “traditional” statistical outputs. Examples of benefits not appearing in traditional, financial PMs are benefits from access to affordable office space (Chan and Lau 2005; Lyons 2000) or access to ideas and knowledge (Hansen et al. 2000).

Criticism towards the solely use of financial PMs led to the development of different approaches to measure organizational effectiveness. According to Daft (2009), these approaches can be subdivided into (1) the goal approach, (2) the stakeholder approach; (3) the system resource approach, and (4) the internal process approach. Each approach takes into account a different aspect of organizational effectiveness. Table one provides an overview of the underlying idea of these four approaches. Definitions are based on early performance measurement literature, such as Cameron (1980) and Yuchtman and Seashore (1967).

| TABLE 1 ABOUT HERE |

The subdivision between the goal, stakeholder, system resource and internal process approach can be related to Simons’ (2000) Inputs-Process-Outputs Model. He states that “performance measurement and control information can be understood only by reference to some model of
underlying organizational processes” (p.59). All organizational processes can be subdivided into three main parts: the input, output and process side. Moreover, a manager’s responsibility differs in each of these main parts. Managers are respectively responsible for (1) obtaining appropriate, sufficient and qualitative inputs, (2) maintaining an efficient transformation process, and (3) meeting output specifications. The first can be related to the system resource approach, the second to the internal process approach, and the third to both the goal and the stakeholder approach.

In what follows, a literature review concerning existing business incubator PMs is provided. As will become clear, there exist few validated scales for performance measurement in incubator literature.

**Goal approach.** “Success” refers to (Autio and Klöfsten 1998, p.32) “the degree to which the support arrangement is able to meet the objectives set for it”. Though business incubators seem to have a wide variety of objectives⁴, several incubator studies indicate that an incubator’s ultimate goal should be incubatee survival (Aerts, Matthyssens, and Vandenbempt 2007; European Commission 2002) and growth (Hackett and Dilts 2008). The incubator should be organized in such a way that firm survival and growth are enhanced. In its paper about technology business incubators, Lalkaka (1996) states that “the performance of a business incubator should be measured essentially by the survival and growth of the businesses it incubates” (p.270).

However, some thoughts about “survival” and “growth” should be made. First, there does not seem to exist consensus on how to measure firm growth. Academics use growth measures such as sales growth (Amason, Shrader, and Tompson 2006; Bamford, Dean, and McDougall 1999; Brush and Vanderwerf 1992), cash flow growth (Chandler and Hanks 1993), assets growth (Park and Lee 2000)

---

⁴ See Aernoudt’s (2004) incubator typology, based on incubator objectives. According to this author, incubator’s main objectives can be to (1) create start-ups, (2) enhance regional development, (3) create entrepreneurship, (4) integrate social categories, and (5) enhance Blue-Sky research. He labels the incubators respectively mixed, economic development, technology, social and basic research incubators. The latter’s main goal (Blue-Sky research) implies that the incubator tries (Aernoudt 2004, p.129) “to bridge the discovery gap by linking the incubation principle to fundamental research”.  

8
and growth in the number of employees (Stuart and Abetti 1987). Which measure is most relevant, is unclear.

Second, the definition of “success” and “failure” is not always used in a univocal way. Several degrees of “success” have been delineated. Avnimelech, Schwartz, and Bar-El (2007) explain that there exist two different degrees of success: “high” and “moderate” success. The first refers to “start-ups which had initial public offerings (IPOs) or were targets of significant acquisition” (p.1183), while the latter refers to “start-ups that did not have IPOs and were not targets of significant acquisition, but are still active” (p.1183). Failure refers to start-ups which were closed.

Perhaps the best developed goal-related measurement scale is developed by Hackett and Dilts (2008). These authors measure business incubation performance in categorical terms of both tenant growth and financial performance at the time of incubatee exit. Table two provides an overview of these categories. Hackett and Dilts (2008) indicate that historically, categories one, two and four were indicated as being “successes”, while categories three and five were “failures”. After analysis, Hackett and Dilts (2004b), however, conclude that outcome three should be considered as being a “success story”, and outcome five as a “failure”. Hackett and Dilts (2008) made this variable operational by asking incubator managers for the total amount of categorical incubatee exit outcomes for a five years period.

TABLE 2 ABOUT HERE

Stakeholder approach. Setting an organization’s objectives implies taking into account context-specific features (Autio and Klöfsten 1998). Neely et al. (2000) state that the wants and needs of stakeholders should be considered when selecting PMs. Incubator researchers, however, do not fully agree on which stakeholders should be taken into account. We detect two viewpoints: researchers claiming to incorporate the wide stakeholder community, and researchers opting for stakeholder limitation. According to McAdam and Keogh (2006), a university incubator’s stakeholders are the
university, local economic development organizations, entrepreneurs, their new firms and employees, investors, and support organizations and services. Mian (1997) further widens the incubator’s community stakeholders, arguing that also citizens, the public, and the private sector should be considered.

Researchers opting for stakeholder limitation do not agree on which stakeholders are most important. Academics opting for the tenant perspective (such as Abduh et al. 2007) examine tenant service satisfaction. Others emphasize that incubators should adapt their services and support to the tenant’s development stage (Chan and Lau 2005). Jungman et al. (2004) claim that besides entrepreneurs, also venture capitalists should be considered. Finally, Haapasalo and Ekholm (2004) and Sherman (1999) focus on government related PMs such as the average number of jobs created, local tax revenue or cost to create jobs.

Our literature review reveals that taking into account different stakeholder perspectives for incubator evaluation is very difficult – if not impossible. Stakeholder goals do not always coincide, which makes one wonder which weight should be attributed to each stakeholder. Entrepreneurs, for example, are primarily concerned with creating a sustainable or growing business, while sponsors are generally more concerned with socioeconomic impacts (Rice, 2002). In our concluding section, we make some suggestions to deal with this problem.

**System resource approach.** Various incubator studies examine an incubator’s resources. Examples are an incubator manager with a broad network (Studdard 2006; Bøllingtoft and Ulhoi 2005), the quality of the management team (Costa-David, Malan, and Lalkaka 2002; Mian 1997), the type and the quality of the incubator’s connection to a university (Tamásy 2007), a professional service network (Lalkaka 1996), initial government funding (Lalkaka 1996), institutional support (Mian 1997) or the incubator’s image/prestige (Mian 1997).
Examining the importance of resources implies studying whether they can result in a sustainable competitive advantage (SCA). According to Barney (1991) only resources which are valuable, rare, imperfectly imitable, and non-substitutable can result in a SCA. To the best of our knowledge, incubator literature does not explain how to measure whether these prerequisites are met. Many researchers fail in valuing the relevant importance of incubator resources. Instead, they restrict themselves to counting the amount of administrative, logistic, business support or networking resources (for example; Chan and Lau 2005; Smilor 1987).

*Internal process approach.* Lalkaka (1996) states that an incubator’s performance depends on “the careful planning and implementation of the incubation process” (p.270). It is not the incubator facility, but the incubation process itself which defines incubator success (Adkins 2001). Costa-David, Malan, and Lalkaka (2002) explain that “the adoption of a business-like approach to running incubators and monitoring clients” (p.8) is a prerequisite for incubator success. Unfortunately, our knowledge on what we know about the incubation process is still very limited, and is often considered as a “black box” (Hackett and Dilts 2008).

Even though early incubator researchers such as Campbell, Kendrick, and Samuelson (1985) and Smilor (1987) developed incubator-incubation configuration frameworks, only Hackett and Dilts (2008) seem to provide validated scales to measure the effectiveness of the internal incubation process. They develop scales measuring selection performance, monitoring and business assistance intensity, and resource munificence. Each of these construct is widely acknowledged as being important in the business incubation process (Bergek and Norrman 2008). Table three provides an overview of the constructs and their definitions.

TABLE 3 ABOUT HERE
**System level: performance measurement systems**

Only measuring inputs, processes and outputs is insufficient to gain control (Simons 2000). Therefore, researchers and practitioners should (1) develop a standard or benchmark, and (2) make sure that there exists an appropriate feedback channel (Simons 2000). The first allows for comparison, while the latter allows for communication and acting upon performance results.

Various performance measurement researchers provide guidelines for the development of such a performance measurement framework (Globerson 1985; Kennerly and Neely 2002; Neely et al. 2000). Neely et al. (2000) categorize these guidelines according to whether they relate to the PMS designing process, or its outputs. Tangen (2004) further examines PMS output characteristics, and provides six important PMS output characteristics. It are these prerequisites which are adopted in the present paper (see table four).

**TABLE 4 ABOUT HERE**

Our incubator literature review resulted in six PMSs in incubator literature. Important to note is that the ultimate goal of the selected papers is not always incubator performance assessment. Löfsten and Lindelöf (2001), for example, provide an incubation process framework, and O’Neal (2005) maps success elements. In their research, however, they make a clear link with possible performance and value added areas. Consequently, we decided to also evaluate them.

Four evaluation models focus on (university-based) technology incubators, one on business incubators in general, and one on science parks. It is remarkable that none of the PMSs focuses on social or economic development incubators. In what follows, each of Tangen’s (2004) PMS output characteristics are discussed.

First, analysis indicates that O’Neal (2005) does not provide an explicit link to the incubator’s strategic objectives. Even though he argues in the main body of the paper that an incubator’s goal is
to reduce “infant mortality among new ventures” (p.11) and three result areas are indicated in the conceptual framework (that is; companies, products, and people), the incubator’s strategic objectives for each of these result areas are not clear. In the other papers considered, the importance of strategic objectives is emphasized referring to management goals (Löfsten and Lindelöf 2001), meeting targets (Voisey et al. 2006), the science park’s real mission/strategy (Bigliardi et al. 2006), the business incubator’s business plan (Lalkaka 2000; 2003) and the fact that the university’s expectations should be taken into account when establishing the incubator’s goals, objectives or strategy (Mian 1997). Especially Bigliardi et al.’s (2006) suggestion to take into account an incubator’s real mission or strategy seems interesting. These authors advocate that it is “often hidden by the formal documents of the organization” (p.492). They highlight that this is necessary to examine an incubator’s actual behaviors (such as decisions and actions taken), instead of looking at formal documents.

Second, all papers focus on different areas of expected results, various stakeholders and various organizational levels. Concerning the difference between short, medium and long term results, only Lalkaka (2000; 2003) provides a possible timeframe for some of the performance measures indicated.

Third, analysis reveals that none of the assessment frameworks discussed provides a link with the impact on employees. Performance measures, however, can greatly impact an employee’s behavior (Fry 1995). When analyzing incubator research, it is striking that very few research focuses on incubator employees. This seems strange, because the importance of service quality and employee behavior in service organization such as business incubators is stressed by various academics. Babbar and Koufteros (2008), for example, examine the human element in airline service quality. Individual attention, helpfulness, courtesy, and promptness are considered being important determinants of customer satisfaction.
Fourth, performance measures are provided by the authors. Only Löfsten and Lindelöf (2001) restrict themselves to general performance and added value areas. As indicated in table five, measure lists are often rather long. Although this seems logical given the fact that many stakeholders and organizational levels are involved in an incubator’s activities, Tangen (2004) emphasizes that a limited number of PMs is necessary to create appropriate action. Using too many PMs increases the risk of information overload.

Fifth, an analysis of the assessment frameworks’ accessibility reveals that some of the performance measures suggested are difficult to obtain. Mian (1997), for example, suggests measuring the incubator’s impact on the university environment. However, due to the large amount of interested parties in the university environment (such as students, professors, technology transfer center), measuring such impact can be very time-intensive and complex. None of the papers provides information regarding how to present the information obtained. Even though a variety of measures is listed by most authors, it is unclear whether certain performance measures should be more emphasized than others. Finally, there exist great differences between framework complexity. While the frameworks from Bigliardi et al. (2006), O’Neal (2005) and Voisey et al. (2006) are straightforward and easy to understand, the other frameworks are rather complex. Of course, this complexity implies that they are relatively more comprehensive. It however also implies that results are more difficult to understand.

Sixth, none of the papers provide information concerning who should collect the data, with what frequency and how to act on the measure. Lalkaka (2000) stresses the importance of pre-identification of progress and performance “markers”, interpretation, and follow-up of the results. Specific targets, timeframes and feedback loops, however, lack in most of the papers.

In conclusion, applying Tangen’s (2004) output criteria to incubator PMSs reveals that – to the best of our knowledge – there does not yet exist an evaluation system fulfilling these criteria. In
particular the influence of measurement systems on employee behavior, system accessibility and its comprehensibility are under-researched domains.

**TABLE 5 ABOUT HERE**

**Discussion, Conclusion and Future Research**

The above discussion clearly indicates that there does not yet exist consensus concerning how to measure incubator performance. Most incubator researchers and practitioners seem to only use one or a few indicators for incubator evaluation (Schwartz and Göthner 2009). Moreover, integrated incubator performance measurement systems do not fulfill Tangen’s (2004) PMS output requirements.

Concerning the use of only one or a few indicators for incubator evaluation, incubator researchers indicate that the usage of only one measure is insufficient to grasp business incubator performance (Schwartz and Göthner 2009). Moreover, it limits the outcome’s explanatory power. Schwartz and Göthner (2009) try to address this problem by applying the PROMETHEE (Preference Ranking Organization Method for Enrichment Evaluation) method for incubator evaluation. In short, the authors use six criteria to statistically compare the performance of various business incubators. The criteria applied are (1) average incubation time, (2) share of start-ups, (3) share of high-tech firms, (4) client satisfaction, (5) overall survival, and (6) employment growth after graduation.

Applying the PROMETHEE method seems interesting for multicriteria evaluation. The criteria applied by Schwart and Göthner (2009), however, mainly focus on the output side of the organizational process model (Simons 2000). The internal process and system resource approach are not considered. Examining an organization’s effectiveness, however, requires in-sight in the goal, stakeholder, internal process and system resource approach (Daft 2009).
Although we agree with the fact that ideally, all four effectiveness approaches should be applied simultaneously, we argue that this also has its drawbacks. Using too many performance measures often results in information overload and ignoring data (Tangen 2004). Appropriate analysis and action is only possible when the amount of performance measures considered is limited to the most important measures. Therefore, we suggest future researchers, practitioners and policy makers to refer to Simons (2000) Inputs-Process-Outputs model and the effectiveness approaches when choosing appropriate incubator performance measures. When examining an incubator’s input effectiveness, they might focus on system resource PMs (such as the availability of an incubator manager with a broad network, or the quality of the incubator’s connection to the university). Measuring an incubator’s process effectiveness would imply using internal process PMs, such as Hackett and Dilts (2008) validated internal process scales. Finally, focusing on the output side of an incubator’s effectiveness would imply considering goal (such as firm survival and growth) and stakeholder (such as tenant satisfaction) PMs.

For each of the effectiveness approaches, we suggest future researchers to develop validated scales. As indicated, Hackett and Dilts (2008) seem to be the only incubator researchers who developed validated scales for the goal and internal process approach. Future researchers might use these scales, whereas academics focusing on the system resource and stakeholder approach might opt for scale development. For the stakeholder approach, they can start from Aernoudt’s (2004) incubator typology, after which the relative importance of each stakeholder might be researched separately for each incubator type. Economic development incubators, for example, might ascribe relatively more weight to government related measures than basic research incubators. For the system resource approach, we suggest future researchers to focus on the prerequisites for sustainable competitive advantages in the incubator context.

Concerning incubator performance measurement system development, we suggest future incubator researchers, practitioners and policy makers to apply Tangen’s (2004) PMS output
prerequisites. Developing a PMS fulfilling these requirements facilitates and enables benchmarking practices and stimulates continuous improvement (Neely et al. 2000). We argue that future researchers willing to develop an incubator PMS might start from the incubator’s objectives. Indeed, a first step in measuring performance is looking at the organization’s strategic objectives (Hudson, Smart, and Bourne 2001; Ittner and Larcker 2003). What makes up the content of success or effectiveness of an incubator should be clear before adequate PMSs can be developed (Mian 1996; Albert and Gaynor 2003; Phan, Siegel, and Wright 2005; Siegel, Westhead, and Wright 2003). Since Aernoudt (2004) developed an incubator typology based on incubator objectives, we suggest future researchers to develop separate PMSs for each incubator type. Our incubator PMS evaluation reveals that – to the best of our knowledge – there does not yet exist an evaluation framework for economic development and social incubators. Therefore, we suggest future researchers to simultaneously improve existing PMSs for technology, basic research or mixed incubators, and develop new PMSs for social and economic development incubators.

To conclude, we briefly summarize our contributions to educators, policy makers, managers, and researchers. The first can apply the results of this paper to underpin the importance of balanced PMs and adequate PMSs, while the last three can adopt our results to improve existing measurement systems and performance measures. This, in turn, can support policy makers in benchmarking studies and resource allocation decisions. Incubator managers might be able to better position themselves in the incubator landscape, and they might be better able to develop, implement and improve strategies. Finally, firm managers using the results of this paper can better choose an appropriate business incubator location.

</thead>
<tbody>
<tr>
<td>Selection performance</td>
<td>Selection performance refers to the degree to which the incubator behaves like an “ideal type” venture capitalist when selecting emerging organizations (options) for monitoring and business assistance and resource infusion</td>
</tr>
<tr>
<td>Monitoring and business assistance intensity</td>
<td>Monitoring and business assistance intensity refers to the degree to which the incubator observes and assists incubates with the development of their ventures, including helping them to learn from low-cost failures and containing the cost of potential terminal failure</td>
</tr>
<tr>
<td>Resource munificence</td>
<td>Resource munificence refers to the incubator’s resource availability, quality and utilization</td>
</tr>
</tbody>
</table>
Table 4
Performance measurement system output characteristics (Tangen, 2004)

<table>
<thead>
<tr>
<th>PMS output characteristic</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support strategic objectives</td>
<td>The PMS should support the organization’s strategic objectives, and should be flexible enough to allow for strategic changes</td>
</tr>
</tbody>
</table>
| Have an appropriate balance | The PMS should have an appropriate balance, and should incorporate:  
  - Short- and long-term results,  
  - Different types of performance (for example; cost, quality, delivery, flexibility and dependability),  
  - Various perspectives (such as the customer, the shareholder, the competitor, the internal and the innovativeness perspective), and  
  - Various organizational levels (for example; global and local performance) |
| Guard against sub-optimization | The PMS should guard for the “productivity paradox” (Skinner 1986)\(^a\). Avoiding sub-optimization can be done by establishing a clear link between the company’s top and bottom |
| Have a limited number of performance measures | The PMS should not constitute of too many performance measures, because this could result in ignoring data or information overload |
| Be easily accessible | The PMS should provide information “at the right time, to the right person” (p.728). The necessary information should be easily obtainable, it should be presented in an accessible way, and it should be easily understandable |
| Consist of performance measures that have comprehensible specifications | The PMS performance measures’ purpose should be clearly defined. It should be clear who will use and act upon the performance measure. This implies that appropriate targets and timeframes for target reaching should be developed |

\(^a\) Skinner’s (1986) “productivity paradox” refers to the fact that poor performance measures might have negative impacts on employee behavior.

Abstract:
This work empirically investigates the determining factors of the successful adoption of e-business by small and medium enterprises (SMEs) particularly, those in developing countries such as Morocco. According to the literature on technological innovation and country-specific features of the environment business in Morocco, several variables were identified, such as managers knowledge and attitude, organizational features, technological characteristics and environmental specificities were identified to conduct our six-month questionnaire survey carried out on 150 Moroccan SMEs. The study shows that the important critical success factors for the adoption of e-business by Moroccan SMEs are mainly the policies supporting e-business promotion and adoption, firms culture and managers’ knowledge of ICTs and e-business. Some best practices and guidelines required to succeed the adoption of e-business by SMEs in developing economies such as Morocco, are also presented in this report.

Keywords: Developing economies, E-business, Morocco, SMEs

I. Introduction
The aim of this paper is to identify the main factors leading to the adoption of e-business by small and medium enterprises (SMEs) in Morocco. Since its inception, the concept of “e-business” has triggered many passions, thoughts, actions and innovations
marked on one hand by the advent of the new economy, with its corollary, the emergence of high tech start-ups and, on the other hand by bursting of the bubble created ten years ago by the speculative euphoria engendered by the new virtual economy.

Many studies (OECD 2002, and OECD 2004) provide evidence of the positive impacts of ICTs and e-business strategies on the firm. Since SMEs currently represents 92% of companies in the productive Morocco, one quickly realizes that one of the greatest challenges of the early 21st century lies in the promotion of e-business among SMEs in developing countries.

Aware of this issue, the Moroccan Government established the legal basis to help and assist the promotion of ICT’s and e-business in SMEs ten years ago, however, as any developing country, some Moroccan laws are biased and ambiguous. Sometimes even though the law is clear, the implementation is absent or precarious.

Moreover, one cannot consider the Moroccan government as a scapegoat for the non-adoption of e-business nor the failure of its integration; because other barriers have been mentioned in several studies. The OECD report (2004) on ICT, e-business and SMEs for instance, listed many such barriers, as the unsuitability of the type of business (lack of awareness of the benefits of e-business), absence of enabling factors (SMEs generally lack the human technological skills and managerial knowledge needed for ICT and e-business implementation), cost factors and concerns about internet security and trust.

Thus, the implementation of effective strategies for developing e-business for SMEs in Morocco requires the identification of the main determinants of successful e-business adoption by small and medium enterprises in developing countries.

The main issue to be examined in this article is “How to succeed the adoption of e-business by SMEs in developing economies such as Morocco?”. The article is organized as following. Section II presents several factors considered by the literature as affecting the
adoption of e-business and adds diverse country-specific features of Morocco. Section III describes the methodology followed to lead our survey. In section IV, our survey results will be analyzed leading to the conclusion, in section V, on which are the determining factors for successful adoption of e-business and some best practices in the studied context.

II. Theoretical Foundation

The literature suggests many definitions of e-business. One of the first to use the term was the IBM company, which considers the development of intranets and extranets to be part of e-business. E-business is elsewhere defined as the use of electronic means to conduct an organization’s business internally and externally, such as business-to-business (B2B) and business-to-consumer (B2C) via internet. (Hook, F. 2000; OECD, 1999; Jelassi, T and Enders, A. 2004). A more comprehensive definition of e-business is: “The transformation of an organization’s processes to deliver additional customer value through the application of technologies, philosophies and computing paradigm of the new economy” (Andam, Z. Ruth. 2003).

E-business is an important form of technological innovation based on Information Technology (IT). Analyzing the adoption of e-business is linked with the adoption of innovation and IT. According to the literature on technological innovation, several variables have been identified as possible determinants of the adoption of an innovation. Kimberly & Evanisko (1981) listed three predictors of technological innovation adoption: individual, organizational and contextual factors. Lakhanpal (1994) has classified variables affecting innovation adoption into four categories: individual factors, organization factors, environmental factors and characteristics of the innovation itself. Motivated by the fact that decision-making in SMEs is dominated by the owners/managers (Thong & Yap, 1995),

---

1 e-Business definition sponsored by SearchCIO.com, powered by WhatIs.com an online computer dictionary.
Rogers (1995) proposed a model of the innovation-decision process that emphasizes the role of individual behaviour in the technology adoption process by introducing five factors necessary for adoption of innovation:

- **Relative advantage**: Maintaining or/and increasing profitability, improving product-service quality, raising flexibility and reducing costs push managers to adopt new techniques (Howard, 1977; Rogers, 1995; Geroski, 1995).

- **Compatibility**: How innovation is compatible with the firm values, beliefs and culture.

- **Complexity**: The degree of insight vis-à-vis an innovation. Some innovation are readily understood, other are more complicated.

- **Trialability**: Rogers (1995) defined it as new ideas that can be tried will generally be adopted more rapidly than innovations that cannot be given a small-scale trial.

- **Observability**: How much the results of innovations are visible to others (Rogers 1995).

Roger’s model relates actions and choices during which an individual evaluates a new innovation and decides whether or not to incorporate it by assessing those five variables.

On analyzing IT adoption by firms, several authors (Iacovou et al. 1995, Lin and Lin 2008, Pan and Jang 2008, Oliveira and Martins 2010) used the TOE framework, developed by Tornatsky and Fleisher (1990) as a set of three variables that may influence e-business adoption: technological context (technology readiness\(^2\) and technology integration), organizational context (firm size, expected benefits and obstacles of e-business) and environmental context (internet penetration and competitive pressure). La Rovere (1996) suggested that the ability of SMEs to innovate or adopt new IT depends on several variables: internal and external factors to the organizations, their countries’ culture and governmental policies. Thong (1999) listed four factors for the adoption of information system: manager

---

\(^{2}\) Mata et al. 1995 define technology readiness as “human resources that are complementary to physical assets”
characteristics, information system characteristics, environmental characteristics and organizational characteristics.

Based on the theoretical background, our study adopts four main variables influencing the adoption of e-business into small and medium enterprises: organization characteristics (size and expected benefits and obstacles of e-business), technological characteristics (employees’ knowledge of IT and e-business), environmental characteristics (Moroccan Government support for e-business) and manager/owner entrepreneurs knowledge and attitude regarding IT and e-business.

In addition, we include country-specific characteristics of Morocco which are thought to have affected e-business adoption by SMEs. The most of the IT activities take place in the cities of Casablanca and Rabat (Tourougui 2002) where the infrastructure is at its best and where most of the business and government decision-making takes place.

Several statistical reports (ANRT and ITU) allowed us to analyze the IT landscape in Morocco via which we look at factors’ strengths and weaknesses influencing the e-business adoption. Morocco's successful implementation of its liberalization reforms, its geographical location, the government initiatives to promote IT, the growing internet culture, the high mobile phone penetration, the political stability and the bilingual culture (Arabic and French) are the main strengths. Whereas the major weaknesses are the shortage of educated and skillful workforce, the weak banking system to support e-commerce activities and low literacy rates.

5 Morocco, Leaving the Others Behind; from Letters from the Field. Available on http://www.itu.int/ITU-D/ict/cs/letters/morocco.html
III. Survey Instrument and Method:

The population for the study consists of SMEs operating in Morocco. Small and medium enterprises have been defined by the Moroccan ministry of economy as follows. A small and medium enterprise is one that employs less than 200 employees with a turnover of less than five million DH (500,000€) in the creation phase, 20 MDH (2M€) for the growth phase and 50 MDH (5M€) for the maturity phase.

The sample size was fixed at 350 and selected from the SME database available from the chamber of Commerce and the Moroccan ministry of economy reports. These noted that there are more than 70000 SMEs in the country, with more than 60 percent located in the axis Rabat-Casablanca, hence, we have randomly chosen our sample from the axis.

A four-page questionnaire containing a total of 31 questions on firm-specific information, managers’ attitude and factors influencing the decision of e-business adoption, was prepared based on literature review and a pilot study in which eleven SMEs’ managers participated. Then, the questionnaires were mailed twice\(^6\) and e-mailed once—based on mail addresses and e-mails provided by the database—to the managers of more than 350 SMEs. Selected managers were asked to return the completed questionnaires within the week. A stamped return envelope was included with each mailing.

All the responses received were analyzed, then data entry and processing were carried out using the computer application Sphinx Lexica that allows for qualitative studies and the processing of textual data. It facilitates the design and formatting of questionnaires, online distribution, response gathering, processing and analysis. It combines quantitative aspects through the basic methods, multivariate analysis, decision trees, concept maps, and by qualitative textual analysis, lexical, syntactic and content. Finally, it allows the presentation and communication of results. (Wanlin 2007; Le Sphinx 2003).

---

\(^6\) A double mailing was used in order to increase the response rate (Moser and Kalton, 1971).
IV. Data Analysis

Of the 350 questionnaires posted and e-mailed, 46 were returned marked ‘wrong address’ or “Delivery Status Notification (Failure)”. A total of 93 completed forms were received from the first mailing and a further 69 were received from the second mailing. Of the 162 questionnaires that were returned after follow up, twelve questionnaires were either incomplete or returned blank, leaving 150 questionnaires for further processing. The overall apparent response was thus 42 percent (150 responses out of 350).

In order to resolve the issue of “non-responses” we adjusted the sample by the weighting method that allowed us to reduce some of the bias by correcting the distortion due to an under representation of the population.

Profile of respondents

Of the 150 SMEs managers who answered this questionnaire, 67 percent have their business located in Casablanca while 33 percent in Rabat. Three sizes of SMEs were listed: SMEs with less than 10 employees represent 13 percent, SMEs with a number of employees between 10 and 50 represent 33 percent, and finally SMEs with a number of employees between 50 and 200 represent 54 percent.

An other feature of participating SMEs is their limited turnover. Based on the definition of SME given by the ministry, we have segmented the participants in three categories. 53 percent of SMEs have a turnover of less than 500000€, 33 percent have a turnover between 500000€ and 2M€ and finally, only 13 percent have a turnover between 2M€ and 5M€.

SMEs participating in this survey operate into three main sectors: 59 percent are in commerce and trade and services, 27 percent are agribusiness companies, and only 14 percent are manufacturing enterprises.
IT Platform features

Our survey indicated that all SMEs have some sort of IT platform; concerning this aspect, two factors are noteworthy. First of all, collected data showed that 74 percent of SMEs have acquired this technology during the last five year, while 26 percent stated that they have had it for 10 years. The second factor is the number of computer that each SME has. More than 50 percent of SMEs have less than five computers, while 33 percent have less than 10 and finally only 13 percent of SMEs have more than 10 computers.

Moreover, the use of this platform is limited to the internal functions in 62 percent of the SMEs; only 38 percent indicated the use of IT platform for both internal and external activities.

Only 10 percent of Moroccan SMEs have an enterprise resource planning (ERP) and just two percent have an e-commerce application. This slight tendency for electronic commerce is due to the lack of legal safeguards and appropriate solutions online payment in electronic transactions.

Usage of Internet

Respondents were asked to indicate if they had internet, which type of device they used and if whether they had a web page. Our survey showed that only six percent of SMEs have no access to the internet. Among the 94 percent having internet, 50 percent were connected to the internet through GPRS devices, 28 percent via USB modems and 21 percent using Wi-Fi systems.

Out of 141 respondent that confirmed having internet, only 12 percent said they had a web page, while one respondent answered that he didn’t even know whether his SME had a web page or not.
E-business adoption factors

Various variables have been identified through our survey to give a general idea about factors motivating the Moroccan SMEs managers to apply ICTs in support of all the activities of business. E-business adoption variables were measured on a five-point Likert type scale (1 = least important, scarce and weak, 5 = most important, abundant and strong).

Satisfying customer demand and increasing market share are the major factor evaluated as most important by Moroccan SMEs managers, reducing operating costs comes in the second rank, fastening operations with suppliers is judged as moderately important to adopt e-business. On the other hand, improving quality offered to customer on line and reducing costs associated with sales and purchasing are considered respectively less important and the least important factor pushing managers to adopt e-business.

Managers’/owners and employees IT/e-business Knowledge

Respondents were asked to evaluate their knowledge regarding IT/e-business as well as the knowledge of their employees. Collected data showed that 73 percent of managers admitted that they had a low IT/e-business knowledge, while 20 percent had average knowledge and only six percent of respondents thought they had deep IT/e-business knowledge.

From our survey, we infer that generally employees are slightly more skilled than managers in term of IT/e-business, since employees with average knowledge were present in 33 percent of SMEs (against 20 percent of managers).

E-business learning programs

Since the fact that SMEs are characterized generally by a low knowledge of IT/e-business, we asked respondents if they implement e-business learning programs, if yes, who is in charge of that, otherwise justifying why not. Only 46 percent of SMEs who implemented an e-business learning program in order to manage well their IT/e-business platforms.
However, out of these 46 percent, 42 percent mentioned that the learning program is done by skilled people working inside company and only seven percent that benefit from governmental programs, which leads 50 percent of SMEs to appeal universities (21 percent) and private incubators (29 percent) to give them such learning programs. Those that don’t have any learning program justify their decision among three main factors. 53 percent related the non-implementation to the high cost, while 26 percent said that implementation complexity is the major issue. Finally 20 percent though it is not useful.

**E-Business adoption barriers**

Also in this case, the Non-adoption of e-business variables were measured on a five-point Likert type scale (1= least important, scarce and weak, 5= most important, abundant and strong).

Based on the Likert analysis, the top four ranked factors that more than 70 percent of Moroccan SMEs managers believed as the major obstacles to adopt e-business descending order, were as follows: technology costs associated with e-business development, IT skills and knowledge shortage among the workforce, weak public telecommunication infrastructure decreasing technological development and the lack of management willingness to adopt IT.

The remaining three factors were respectively e-business development offers no tangible benefits, the lack of triability and the risk of confidentiality and hacking. However, they were marginal variables and were considered as unimportant factors.

**Government support for e-business**

SMEs’ CEOs surveyed were asked about the role of the Moroccan Government to support them vis-à-vis the adoption of e-business. 53 percent of respondents said that the Government doesn’t play any role, while the rest confirmed that it is rarely that Government support them.
As asked about their opinion regarding the appropriate measures that should be taken at Government level to support the implementation and development of E-Business in their SMEs, CEOs have listed five main policies. 23 percent are seeking financial assistance measures, 21 percent are expecting the decrease of taxes in order to well implement e-business strategies and platforms, 19 percent believe that Government should support them by creating special fund for e-business learning programs, while seven percent think that Governmental support could be through incentive laws and policies motivating SMEs to successfully adopt and develop e-business. Moreover, 28 percent of respondents underlined the importance of competence centers and business incubator and their role on e-business adoption, which lead them to perceive that Government must encourage and widen the creation of these kind of organizations.

V. Conclusion and Best Practices

This study investigated the main determining factors for the successful adoption of e-business by SMEs in Morocco using survey data. From the literature review and some specific features related to Morocco we have identified a list of determining factors. Then we conducted empirical tests to extract the determinants and confirm their empirical evidence.

The empirical results indicate that the successful adoption of e-business in SMEs depends on many factors. The important determinants include SMEs’ managers’ characteristics, namely their knowledge of ICTs and e-business; the environmental characteristics basically the Government support and the organization characteristics, as the implementation costs and employees’ knowledge. While technological characteristics don’t seem to play an important role in the adoption of e-business by Moroccan SMEs.

In Moroccan SMEs, CEOs are reluctant to change their businesses because e-business often involves their organization and management of information. Thus, their approaches are
slow and their brakes are deep, and the uses are still in their infancy. However, they are aware that if they want to go beyond the existing domains, e-business today could be the only way to do it. However, adopting successfully e-business is not easy, only SMEs which have knowledgeable and wise CEO appreciate the real benefits and advantages of the e-business adoption, invest huge amounts of investments and receive significant Governmental support either financial support or non-financial one as learning programs for employees, and sometimes both kind of assistance are available. These lucky SMEs are very few in Morocco, but integrate e-business as strategic pillar for enhancing their market openness, and increase their competitive advantage.

From our study, several recommendations for best practices are suggested. First, the majority of Moroccan SMEs managers are unaware of the great benefit of e-business, that requires the promotion of this awareness via information and training programs. Second, successful adoption of e-business is related with knowledgeable managers and employees, which means that universities and private incubator should design learning programs well adopted with Moroccan SMEs culture and features. Third, the cost of e-business adoption (Initial investment, learning program costs, maintenance cost, etc.) plays an important barrier, then banks and financial organisms should target SMEs by offering them long-term credits with low interest. Finally, the Government has the responsibility to develop the IT infrastructure, widen the IT education in high school and universities, and of course, Government is expected to reduce the e-business adoption barriers by supporting SMEs through the creation of special funds to finance e-business adoption projects, and building more incubators not only in the Casablanca-Rabat axis but also in other cities.

Abstract

Much of the small business literature has shown that small businesses, particularly home-based businesses, are less likely to export than businesses that have greater than 20 employees. However, the growing internationalisation of small and home-based business (HBB) and advances in Information Communication Technologies (ICT) suggest that some HBBs may break the conventional wisdom of 'size matters' and access international markets. In this paper we discuss the characteristics of a sample of 978 home-based businesses in order to identify their propensity to export.

Introduction

A recurrent theme in the literature is that small businesses are less likely to be export orientated than businesses with more than 20 employees (ABS 2010; Majocchi, Bacchiocchi, & Mayrhofer 2005; Mittelstaedt, Harben, & Ward 2003; Singh 2009). In fact, Mittelstaedt, Harben, & Ward (2003 p.82) put forth some bad news for small-scale operators, particularly micro and home-based businesses (HBB) with export aspirations: “The bad news for most firms with fewer than 20 employees is that they appear to be too small to acquire the knowledge or experience necessary to engage in the exporting process. The good news for small firms with 20-100 employees is that they are not too small to access the export development process”.
However, the growing internationalisation of small enterprises and HBBs and advances in Information Communication Technologies (ICT) suggest that some HBBs may break the conventional wisdom of ‘size matters’ and access international markets.

Exporting is increasingly seen as an opportunity for corporate growth and increased profitability among small-to medium-sized firms in many industries (Namiki 1988). In particular, the potential markets that may be reached from home are increasing in number, particularly for firms that export from inception (Phillips 2002). While HBBs have received attention concerning their importance to local communities and employment generation, it should also be acknowledged that HBBs can also contribute to attracting export currencies (Gelderen, Sayers, & Keen 2008).

**Literature Review**

**What is a Home-Based Business?**

The term ‘home-based business’ generally refers to a business where most of the work of the business is carried out at the home of the operator or where the business has no other premises owned or rented other than the home of the operator. A HBB is different from a ‘home worker’ or ‘home labour’, which is someone who works for an employer in his or her home, or in other premises of his or her own choice, other than the workplace of the employer, and can be examined in Pearson (2004), amongst others.

Businesses operated in a home-based setting tend to be less visible than their counterparts located in commercial settings but are much more prevalent than might be first thought. Globally, HBBs are numerically a significant part of the economic landscape. In the USA, the world’s largest economy, approximately two-thirds of all small businesses, and about half of all businesses overall, are home-based (Beale 2004; Pratt 2000), and in the United Kingdom and Canada just under 10 percent of the population operate a HBB (Dwelly,
Maguire, & Truscott 2005; Federal Government of Canada 2002). In Australia, HBBs make up more than two-thirds of the small business population (ABS 2004). In the developing world, the importance of HBBs is even greater and numbers more predominant. For instance, approximately 15 percent of the households in Meuraxa, Aceh in Indonesia are both a workplace and a living space, typically involved in trade, production, services and coffee shops/small restaurants (ILO 2007). While in Laos, businesses operated by women tend to be mainly home-based (Enterprise Development Consultants. 2002).

**Small and Home-Based business Export Characteristics**

Past scholarship has focused on the firm characteristics useful for predicting export orientation and international performance. It has shown that small businesses differ significantly from large firms concerning export in the areas of export planning activity, organizational and attitudinal variables, and information-gathering activity (Samiee & Athanassiou 1998). Brouthers & Nakos (2005) investigated the importance of systematic international market selection. Their study suggested that older firms that altered their products prior to exporting them to foreign markets, companies depending on foreign markets for a large percentage of their sales and firms that concentrated in fewer foreign markets performed better internationally. They concluded that systematic international market selection appears to play a significant role in determining the success in international markets for small business and the use of a systematic methodology in selecting foreign export markets appears to play a role in export success (Brouthers & Nakos 2005). Araujo & Ornelas (2007) found that the probability that a firm will stop exporting decreases as its foreign sales increase with the export experience of the firm. The reason is that informational costs experienced by an exporter decrease as the exporter becomes more confident about the reliability of its distribution.
Rutihinda (2008) explored the factors influencing the internationalization of Canadian SMEs located in the Eastern Townships of Quebec and posited that four major factors explain the internationalization: owner manager’s international orientation, globalisation of the firm’s industry structure, established international networks, and foreign market potential. In his study successful firms were found to have owner managers with an international orientation and established international networks. Based on this finding Rutihinda (2008) concluded that a conducive domestic environment and an international orientation are important drivers of SME international success.

Julian (2003) found four factors contributing significantly to the variation in the export marketing performance of Thai export ventures: competition, commitment, export market characteristics, and product characteristics. The four variables together accounted for 29 percent of the variation in the Thai firms' export marketing performance. Firm-specific characteristics and export marketing strategy were found to have no effect on the Thai firms' export marketing performance.

Nassimbeni (2001) suggested that the propensity of small businesses to export is strictly linked to their ability to innovate the product and develop valid inter-organisational relations, and less related to manufacturing, quality control, management, design, communication, handling, storage technologies of the company.

Grondin & Grondin (1994) compared exporting and non-exporting female entrepreneurs regarding their information about export markets, their perceptions of the usefulness of export market information, and the helpfulness of government export stimulation programs. They identified formats women entrepreneurs believed to be most helpful in obtaining information about exporting their products and services. The results suggested that in New Brunswick, New Jersey, USA the majority of female entrepreneurs did not export their products and services. Furthermore, they did not plan to enter the export
market in the future. Their businesses were, for the most part, small, non-technology-based, labour-intensive, or cottage-craft industries. They were relatively new, with few employees, and had low annual sales revenues. However, they also had low overhead expenses and the owners had the freedom to coordinate their business activities around their family life and responsibilities. These findings suggest that, rather than export stimulation programs, the majority of female entrepreneurs in New Brunswick were more interested in and would benefit more from product or service quality programs (Grondin & Grondin 1994). While this is one of the few studies that have focused on export differences between males and females, more recent research has dispelled the conventional wisdom of women HBBs as non-expansionist (Breen, Paguio, & Bergin-Seers 2008).

Providing a breakdown of exporters amongst HBBs in the USA, Phillips (2002) reported that about three percent of HBBs (500,000) exported. Amongst this group, 11 percent of Black HBB owners, 21 percent of Hispanics, and 28 percent of Asians said they wanted to increase their exports, particularly within the wholesale trade sector, compared with six percent of women HBB owners. While, in Australia, a comparison of the number of employees in Australian small firms described as non-exporters found a difference in the mean number of employees between the two groups. According to size it was found that businesses with 1-4 employees were less likely to export than larger businesses, but as business size increased there was not a proportional increase in the probability of exporting (ABS 2010). The suggestion however, is not that HBBs and micro businesses do not export. In fact, a report from the Business Longitudinal Survey showed that over the three years, the number of exporting micro businesses (1-4 employees) increased from 5,500 in 1994-95 to 7,500 in 1997-98, representing an average increase of 11 percent per annum (ABS 2000).

Concerning e-commerce, characterised in terms of web presence, the same dataset showed that exporters were more likely to have a web presence (76 percent) than non
exporters (33 percent) (ABS 2010), supporting the thesis that ICT and e-commerce are a cross-national enabling medium that has become important for a range of small and home based businesses (Burgess, Sellitto, & Karanasios 2009; Moodley 2003; Phillips 2002; Walker 2003). Along these lines, performance of firms in international markets has been found to be better for those that have adopted more advanced e-business tools (Lal 2004).

Small Business Barriers to Export

Despite the globalized nature of business and the potential benefits, for many smaller-sized manufacturers gaining and maintaining access to export markets is problematic (Leonidou 2004). At the same time, some firms export in spite of barriers and firms who do not perceive barriers are not necessarily involved in export activity (Ramaseshan & Soutar 1996). Obstacles have been associated with internal weaknesses such as a lack of capital, while others relate to external factors such as customer habits and other market factors. Moreover, there are also problems that arise within the domestic environment such as a lack of government assistance and others that occur in the foreign market where the company operates or is planning to operate (Leonidou 2004). Leonidou (2004) further contends that in general, internal barriers found within the country base of the exporting firm are more controllable and are easier to manage, as opposed to external problems occurring abroad.

Leonidou’s (2004) analysis also revealed that the frequency, intensity, or importance of export barriers can vary according to different time, spatial, and industry contexts, suggesting that barriers to export are situation-specific, and dependent on a range of internal and external imperatives. However, he suggests that factors pertaining to information inefficiencies, price competitiveness, foreign customer habits, and politico-economic hurdles strongly influence the export behaviour of small business (Leonidou 2004). He also provides a number of recommendations in order to facilitate access to export markets, such as
increased government support, education on export markets and further research concerning barriers to export, managerial factors and the impact of export.

The cumulative literature presents a number of key themes 1) there are a number of barriers to export 2) that advances in ICT and globalisation are leading to the internationalisation of small business and conversely 3) that firm size is a predictor of exporting capability and export growth. However, this suggests that HBB are both operationally able and paradoxically restricted to reach export markets. This paradoxical position may be because few studies have focused on export in the context of HBBs. In order to expand knowledge on this important subgroup of small business we analyse data collected from a large sample of HBBs and investigate the characteristics of export orientated HBBs. In the next section we outline our study method and setting, we then present the findings from the data analysis and discuss the findings and their implications.

**The Study**

The results reported in this paper are part of an overarching study that examined the characteristics of HBBs in order to understand their growth, the motivations that led to home based self-employment, their export orientations and perceptions on operating a HBB. In order to achieve this, we developed a comprehensive questionnaire that focused on the dimensions of the HBB and used a range of non-comparative scale (Likert-type scale), pairwise comparison, and open-ended questions. A total of 7484 questionnaires were distributed, with 978 usable responses returned, representing a response rate of 13 percent.

To obtain this large sample with a broad range of HBBs, twenty Local Government Authorities and two support agencies across Metropolitan and Regional Victoria provided valuable assistance in the widespread online and mail distribution of the survey to their constituent HBBs. Victoria is Australia’s second most populous state, located in the south-eastern corner of Australia, with 5.4 millions inhabitants recorded in 2009 (ABS 2009).
obtain a statewide perspective, geographical dispersed councils were surveyed, limiting any bias from regional effects. The questionnaire design followed the process of a piloting and refinement phase in order to test its clarity, usability and responses. Data was analysed using SPSS, we relied predominantly on two forms of analysis, t-tests and cross-tabs, as suggested by McCrum-Gardner (2008).

**Results**

In total 9.6 percent of business were classified as export orientated, while the remainder were classed as domestic market orientated. Our classification was based on two criteria 1) the business indicated that they had overseas customers, and 2) they indicated that export sales were important to the business. This method of classification was selected to omit businesses that had narrow export frames of reference and allowed us to focus specifically on HBBs that were more ‘export orientated’.

Table 1 illustrates the industry breakdown of export and non-export orientated HBBs. The categories were condensed from a list of over thirty industries and computed into a manageable number. In observing the cell frequencies, it can be concluded that ‘Manufacturing’, ‘Accommodation and Food Services’, ‘Architectural, Scientific and Technical Services’ and ‘Other’ are the most common form of export oriented HBBs. While this shares some small resemblance with domestic market orientated HBBs, the domestic cohort were also heavily involved in ‘Construction’, ‘Management, Legal, Finance and Accounting Services’ and ‘Arts, Recreation and Other Services’.

A cross tabulation analysis of business category and export or domestic market orientated business revealed significant association $\chi^2(9, N=810)=43.920, p < .05$, indicating that industry plays a significant role in export direction of a HBB.

We examined the characteristics of the HBBs in order to determine which characteristics of HBBs were associated with its export orientation. In particular we focus on the hypothesis:

**H1: The greater the number of employees the more likely the HBB is to export.**

Cross tabulations revealed significant difference between export and domestic firms and the number of employees $\chi^2(5, N=772)=14.505, p<.05$, with over half (51 percent) of export orientated HBBs having more than three employees, while only 30.9 percent of domestic orientated HBBs had more than three employees. Therefore, in accepting the hypothesis we contend that HBBs with three or more employees are more likely to export.

We also focused on other characteristics of the HBBs – namely, the rural versus metropolitan location, number of hours worked per week, primary source of income, years in operation, age of operator, whether it was a franchisee, whether it had a carefully prepared business plan and education of the owner. No significant difference existed between the groups, except for the education of the owner. The analysis revealed that export orientated
HBB owners had a higher level of education than non-exporting HBBs $\chi^2(2, N=804) = 9.999$, $p<.05$.

We examined the importance placed on using the Internet as a conduit for conducting business by export and non-export orientated firms. Specifically we formed the hypothesis:

**H2**: Export orientated firms are more likely to place emphasis on conducting business over the Internet.

Using an Independent Samples Test we found a significant difference between the two types of HBBs and the importance they placed on conducting business over the Internet $t(948)=-8.625$, $p <.05$, indicating that export orientated HBBs place more emphasis on conducting business over the Internet than non-exporting HBBs. Therefore, we accept the hypothesis.

In order to determine the propensity of export orientated HBBs to growth we formed the following hypothesis:

**H3**: Export orientated firms have a greater propensity towards growth.

Cross tabulations revealed significant difference between export and domestic orientated firms and their initial growth aspirations $\chi^2 (2, N=814) = 15.633$, $p<.05$, showing that export orientated firms indicated greater initial aspirations for growth.

Moreover, analysis revealed significant difference between export and domestic orientated firms and their future growth aspirations $\chi^2 (3, N=816) = 28.555$, $p<.05$, showing that export orientated firms indicated greater future aspirations for growth. We therefore accept the hypothesis.

Building on this, we investigated the ambition of export and non-export orientated HBBs to move to commercial premises in the future and found that export orientated HBBs indicated a higher aspiration to move to commercial premises $\chi^2 (1, N=810) = 8.884$, $p<.05$. 
**Discussion**

In our study, almost 10 percent of HBBs were classed as export orientated. This is a larger proportion than other HBB studies, for instance Phillips (2002) indicated that three percent of HBBs were exporters. However, our study did not control for factors such as irregular and regular export, which has the potential to influence the findings. For instance, in the Australian Bureau of Statistics Business Longitudinal Survey (conducted over a four year time span) only one third of small business that were classed as exporters actually exported in every of the four years. However, we did attempt to mitigate this concern by limiting our classification of export HBBs to those that had overseas customers and placed importance on exports.

We began by examining the industry breakdown of export and non-export orientated HBBs. In line with other studies that have found that a firm’s industry category was an important factor in the export orientation of the HBB (Julian 2003; Rutihinda 2008), we found that HBBs in certain industries were more likely to export. The highest-ranking export orientated HBBs were:

1. Manufacturing
2. Accommodation\(^1\) and Food Services
3. Architectural, Scientific and Technical Services
4. Other

Domestic market orientated HBBs differed in that they were also heavily involved in ‘Management, Legal, Finance and Accounting Services’, ‘Construction’ and ‘Arts, Recreation and Other Services’.

This study lends support to the literature that suggests that exporting businesses tend to have more employees (Mittelstaedt, et al. 2003). However, the range of employee numbers

---

\(^1\) Accommodation is considered an export because it attracts foreign currencies
in our study is less than other small business studies – we found that HBBs with more than three employees were more likely to export. While this is because we only focused on HBBs, future studies however could investigate if this size threshold has been lowered in recent times due to the internationalisation of small business and the role of ICTs.

The literature suggests that firm characteristics, such as planning (Brouthers & Nakos 2005), are important in explaining the export direction of a firm. This paper explored the characteristics of exporting HBBs and compared export orientated HBBs with domestic market orientated HBBs concerning education, total number of employees, business plan, hours worked per week, primary source of income, years in operation, age of operator, and whether it was a franchisee. We found that the only significant difference existed between export and non-export orientated HBBs concerning education. That is, export orientated HBB owners had a higher level of education.

We tested the hypothesis that export orientated HBBs place more importance on conducting business over the Internet. The analysis unequivocally showed that export orientated HBBs place greater emphases on the Internet as a conduit for accessing foreign markets $t(948)=-8.625, p <.05$. This echoes the results of the Australian Bureau of Statistics (2010) study that showed exporters were more likely to have a web presence (76 percent) than non exporters (33 percent). Furthermore, it adds to the expansive body of literature that suggests ICT are enabling small businesses to access new markets (Burgess, et al. 2009).

Export orientated firms also indicated a greater aspiration for future growth and initial aspirations for growth from start-up. Furthermore, we found that export orientated firms are expansionist and desire to move to commercial premises. There is however little literature that links export orientation to growth aspirations to support this.

It is important to place some caution on the findings of this study. For instance, it should be noted that whilst Australia’s resources boom continues to bring in export income,
on the other hand the resulting strong dollar may see negative growth in the number of exporting HBBs (Outer Suburban/Interface Services and Development Committee. 2008). Nonetheless, this paper unequivocally suggests that HBBs are a significant player in the export market and should be considered as such and can contribute to the inflow of foreign currencies (Gelderen, et al. 2008). As underscored by a recent parliamentary inquiry on local economic development in Australia, while there has been some strategies to support small business reach export markets “more could be done to ensure businesses of all sizes and locations are fully informed of the potential export opportunities and the availability of government export assistance programs and grants” (Outer Suburban/Interface Services and Development Committee. 2008).

**Conclusion**

This paper adds to the body of literature concerning HBB and export markets. Whilst much of the literature has indicates that HBBs are less likely to export, this paper has shown that almost 10 percent of HBB are export orientated. We found that exporting HBBs are likely to have more than three employees, place greater emphasis on conducting business over the Internet and have greater initial and future aspirations for growth. This research helps to highlight the characteristics of an under-researched HBB sector according to those involved in export. This analysis will help to provide a better understanding of the drivers of export activity. The findings will provide information for support services and policy makers to enable them to offer focused support to HBB operators interested in increasing the level of their exports. Building on this research, future studies could examine in greater detail the managerial and firm characteristics of exporting HBBs. Beyond this, instructive lines of inquiry include the examination of income from revenue amongst export and non-export HBBs, deeper investigation of the industry and products and services exported, and the role of ICT in facilitating access to export markets.

Abstract

The overlap area of the three circles is the strategy of the organization, the overlapped desirable prospect circle of Feiyang College is entrepreneurship, the overlapped opportunity circle is entrepreneurship, and the overlapped strength circle is entrepreneurship.

According to the strategic choice and the three circles’ overlap theories, Feiyang College has determined the future strategy -- Entrepreneurship-Learning Entrepreneurship in 2009. The entrepreneurial strategy effects depend on the overlap area of the three circles; while the latter depends on the effective degree of various elements of the three circles.

Feiyang is exploring the entrepreneurial strategy in which the central points and three circles are enlarged synchronously.

Key words: Three Circles’ Overlap, Overlap Area, Strategic Effects
1. Summary

During the new development period of world economy and the post-financial crisis period in 2010, Chinese government takes positive measures and proposes the strategic decision to create an innovative country, entrepreneurial society and entrepreneurial talents, which transforms Chinese economic development mode from extensive to intensive and technology-intensive economy. The simple labor force is increasingly in inconformity of the social needs. Therefore the rapid cultivation of a great number of entrepreneurial, innovative and hard-working talents who can adapt to the transformation of economic development mode provides a good opportunity for Feiyang College’s choice of strategy.

Feiyang College’s desirable target is to build the cradle of entrepreneurs; Feiyang College has had ten thousand students in five years; among the 30 thousand Feiyang graduates in the past ten years, half of them have been engaged in either self-entrepreneurship, corporate entrepreneurship or social entrepreneurship.

Therefore, according to the principle of modern strategic choice: the overlapped public area of organization’s desirable prospect + exterior opportunities+ interior strength is the future strategy; the desirable prospect of Feiyang College: aiming to cultivate entrepreneurs, the opportunity: the country needs a great number of entrepreneurial talents, the strength: the college has cultivated over ten thousand excellent entrepreneurial talents, and the overlapped public area element of the three is “entrepreneurship”; therefore the strategic choice of Feiyang College is to build the most influential entrepreneurial college with the core of “learning by doing in entrepreneurship”.

As for the above strategic choice and effects, we apply mathematic model: the size of the
overlap area of the desirable prospect circle, the opportunity circle and the strength circle, to make research and analysis on the strategic effects of Feiyang “entrepreneurship”.

2. The Mathematic Analysis on Three Circles’ Overlap Area

In an ichnography, the three circles are positioned by their different center points and overlapped by different areas. The changing discipline of the overlap area is as follows:

1) The utmost limit situation of the three circles’ overlap:
   
   i. There is no overlap area for the three circles;

   ii. The overlap area is equal to the area of the smallest circle when the center points of three circles are overlapped.

2) The general situation of the three circles’ overlap:

   The center points of the three circles are positioned in the three vertexes of a triangle and the three circles are in a respectively initial size.

3) The changing situation of the three circles’ overlap:

   When the distance between the central points of three circles remains invariant:

   i. If the size of three circles doesn’t change, the overlap area doesn’t change;

   ii. If one circle becomes bigger and the other two don’t change, then the overlap area becomes bigger(there are three situations);

   iii. If one circle becomes bigger and the second becomes less bigger contrasting with the first one and the third becomes smaller, then the overlap area becomes bigger (there are 6 situations);

   iv. If two of them become bigger and the other one doesn’t change, the overlap area
becomes bigger (there are 3 situations);

v. If the three all become bigger synchronously, the overlap area becomes bigger.

There are altogether 14 situations for the above mentioned changing discipline. Supposing the distance between the three circles changes, and then it will have another seven situations. As a result, with the changes of the center position and the circle areas, there will be 112 changes for the regular overlap areas. Therefore, we can enlarge the overlap areas by means of changing the relative center position or the areas of circles.

3. The Foundation for the Strategic Choice of Three Circles’ Overlap

1) The Theory of Three Circles’ Overlap

The three circles’ overlap area is the personal and organizational strategy, and the overlap area represents the implementation effects of the personal and organizational strategy. The larger the overlap area is, the better effects are achieved. The central points of the three circles shall be much closer or the area of three circles shall be enlarged in order to increase the overlap area. The core content is: (1) The size of the circle is relevant to the number of elements in the circle. (2) The changes of some elements can make the circles bigger, some can make the circles smaller, some can make the distance between the central points closer, and some will make the distance between the central points farther. (3) The worst situation is that the distance between the central points becomes farther, the circle becomes smaller, and the circles have no overlap area, which indicates that it will retreat from the historical stage, such as the “pager”. (4) The distance between the central points, the size of circle and the overlap area all remain unchanged, and this situation is strategic fantasy. (5) The optimal situation is that the central points of the three circles
overlap, the three circles become bigger at the same time, and the overlap area reaches the maximum, while this situation is just ideal, and can hardly be realized. (6) There are 112 kinds of regular changes between the fantasy condition and the optimal condition, and these changes depend on the changes in various elements and the effective degree of the elements. The overlap area is between the strategic fantasy and optimal condition without regular changes. The basic model of the changes is as follows:

2) Strategic Effect Diagram

Desirable Prospect

Opportunity

Strategy

Strength

1-5 years

The center position unchanged

The circle areas unchanged

The overlap area unchanged

Strategic effective area unchanged

1 year to

Strategy fantasy
The three circles are close to concentric
The three circles become bigger at the same time

The overlap area reaches the maximum

Many years

The changes of the center position and the circle area cause 112 changes to the overlap area

The optimum situation for strategy implementation

3) The analysis on the changes of center points distances, the circle area and the overlap area of the three circles

i. The distances between the center points represent:

a) When the strength gets close to the desirable prospect: it proves that the effect of entrepreneur training is good;
b) When the desirable prospect gets close to the opportunities: it proves the entrepreneurs make full use of the opportunities;

c) When the opportunities gets close to the strength: it proves that the whole society recognizes the entrepreneurs need to be trained by universities;

d) When the strength gets close to the opportunities: it proves that building the cradle of entrepreneurs is recognized and supported by the society;

e) When the opportunities gets close to the desirable prospect: it proves that circumstances are suitable for development of the entrepreneurs;

f) When the desirable prospect gets close to the strength, it proves that the entrepreneurial training is very important.

ii. The circle area represents:

a) The distance from the realization of desirable prospect;

b) The probability of grasping the opportunities;

c) The level of full display of strength.

iii. The overlap area represents:

a) When the area remains unchanged: the strategic effect remains unchanged, the strategy turns out to be a fantasy;

b) When the area becomes a little bigger, the strategic effect improves, but it is not a fantasy, or not enough in level;

c) When the area increases to a certain level: the effect and the strategic ideal are good;

d) When the area changes greatly, the effect is obvious and the strategy turns out to
be ideal;

c) When the three circles become bigger and overlap: the strategy turns out to be the optimum situation.

4. Feiyang College Entrepreneurship Strategic Effect Design

1) The Model of Feiyang College’ Strategic Choice

The effect of entrepreneurship implement in Feiyang College
The three circles are close to concentric
The three circles become bigger at the same time
The overlap area reaches the maximum
All the elements contribute to closer center points and bigger circle areas.

Feiyang aims to be the most influential entrepreneurial college in China within 5 years and one of the most influential colleges in the world within 10 years.

Transform from manpower resource strong country to talent resource strong country

Tens of thousands of entrepreneurs

Optimum situation for the target implementation
2) Feiyang College Entrepreneurial Value Chain Model

In 2009, our college established the first Entrepreneurship Management School, and applied for the Entrepreneurship Management and Innovation Management directions. With the approval of the Ministry of Education, in 2010 our college can recruit students, and make the entrepreneurial subjects the public course, so every student will be able to make progress in the three cultivation modules, Entrepreneurial Mind, Entrepreneurial Capability and Entrepreneurial Practice. Every student can participate in the entrepreneurship incubation projects, which actually realize the strategy of “Learning by doing in Entrepreneurship”. In order to realize better implementation effects, our college has designed the feasible entrepreneurial value chain in which various elements complement each other.

Feiyang College Entrepreneurial Value Chain Model

5. *Feiyang College Entrepreneurial Strategy Implementation*

1) Recent Effects

   i. Providing platform for the entrepreneurs

   Under the influence of eastern traditional culture, politicians, bosses and students of famous universities, etc are favored by the public, but only a few people can make it. Then how should more university graduates choose after graduation? At present our country is advocating the realization of innovative country, entrepreneurial society and entrepreneurial talents, and has determined 80 cities as the first entrepreneurship pilot cities, in order to
promote the employment with entrepreneurship to solve the employment of a great number of university graduates, and help the people aspiring after entrepreneurship realize their own life value. After the exploration over so many years, our college is the first to systematically put forward the concept, classification, function, standard and system of entrepreneurship. We has established the largest entrepreneurship incubation center, invited many entrepreneurial experts and tutors, achieved outstanding results in the entrepreneurial education and provided a platform for the students and the social entrepreneurs.

ii. The global forum creates ten bests

On Nov 23, 2009, our college successfully held the “Lu Ban Entrepreneurship” Global Forum, which created the ten bests in Chinese entrepreneurial forums.

(a) The largest scale—about 1,000 people attended the forum. (b) Invited 100 most influential entrepreneurial experts and tutors all over the world. (c) The most levels--- the attendees included famous entrepreneurial experts at home and abroad, famous presidents of foreign universities, entrepreneurs from home and abroad, civil servants, entrepreneurial students, entrepreneurs, high-school principal, news media, etc. (d) The highest level—the president of Entrepreneurship Association of Global Medium and Small Sized Enterprises Ma Xiu came to China and addressed keynote speech for the first time; the president of Alaska University of the Pacific Professor Douglas Mackaye
North addressed the keynote speech titled “Entrepreneurial Incubation and Entrepreneurial Talents”; famous entrepreneurial marketing expert of Guanghua School of Management of Peking University Professor Wang Jianguo addressed the keynote speech of “Entrepreneurial Marketing”. (e) The first in China to propose scientific entrepreneurial concept, which overthrows the traditional narrow recognition of entrepreneurship. (f) The first to put forward the complete curriculum system for entrepreneurial talent cultivation. (g) Put forward the importance of the industry, study and research of entrepreneurship and the building of entrepreneurial value chain. (h) Over 100 enterprises have established entrepreneurial achievements alliance to realize large-scale production and promotion of incubation results. (i) Created various elements of the entrepreneurial value chain openly and effectively. (j) The first to propose the theoretical system -- The First Entrepreneurship to Lay the Foundation; the Second Entrepreneurship to Enhance the Career; Several Entrepreneurships to Pursue Excellence; Sustainable Entrepreneurship to Realize Evergreen Foundation.

iii. The entrepreneurship incubation center created five bests

a) The largest construction area—over 50,000 m2, the largest entrepreneurship incubation center in China.

b) It can accommodate the most incubation projects at the same time—the incubation center can incubate over 500 projects at the same time.

c) Most extensive people participating in the project incubation—the
incubation center has the construction area of over 50,000 m2, so over 10,000 people can participate in the project incubation at the same times.

d) It can realize the most large-scale production and promotion of the incubation results—100 enterprises have entered the incubation club to realize the large-scale production and promotion of the incubation results.

e) It invited the most tutors—100 entrepreneurial tutors become the members of the “Entrepreneurial Alliance” of the college.

The entrepreneurship incubation center can solve many problems related to the entrepreneurial system project for the all circles of the society who aspire for entrepreneurship, and meanwhile provide a good platform for the students to improve their entrepreneurial accomplishment and practice the entrepreneurial skills.

iv. The entrepreneurial funds approach ten million Yuan

The entrepreneurial funds can provide financial support and guarantee the success for the entrepreneurs. Feiyang Global Entrepreneurship Center has attracted the first entrepreneurship incubation fund of nearly ten million Yuan since the establishment.

v. The establishment of Entrepreneurship Management School

In order to build the entrepreneurial education brand major and cultivate a great number of entrepreneurial talents and entrepreneurial management staff, the college has established Entrepreneurship Management School and applied
for the Entrepreneurship Management and Innovation Management directions.

It is the only approved entrepreneurship management major among the similar colleges in Shandong.

vi. Put forward complete entrepreneurial curriculum system for the first time

The college puts forward complete entrepreneurial curriculum system for the first time, the entrepreneurial public courses include: Extensive Moralities, Marketing, Entrepreneurial Management, Strategic Management, Qualifications of Entrepreneurs, Employment Education, etc, which has outstanding effects for the cultivation of entrepreneurial talents and realizes the national reproduction and scale promotion of the entrepreneurial curriculum system of our college.

vii. Social Value

Chinese entrepreneurial education is far behind the social economic development, the social sustainable development and low-carbon society badly need entrepreneurial talents. Chinese education lacks leaders and leading colleges. The college successfully held the entrepreneurship forum, which promoted the entrepreneurial consciousness of Chinese people. The permeation of the entrepreneurial concept will inspire the entrepreneurial passion of Chinese people, activate the entrepreneurial minds, and enrich the entrepreneurial knowledge. More university graduates have become wealthy through entrepreneurship, which realizes the actual stimulation of employment through entrepreneurship.
2) Expected Effects

i. Over one thousand entrepreneurial members

In order to promote nationwide entrepreneurial education, our college prepares to establish 32 offices in various autonomous regions, municipalities and provinces, with the responsibility to develop reserve members, promote entrepreneurial career and realize over 1,000 members of Entrepreneurship Association of Global Medium and Small Sized Enterprises China Branch.

ii. The entrepreneurial incubation students account for 80%

After the systematic study of entrepreneurial theories, among nearly ten thousand students of Feiyang College, most students have fostered great interest in entrepreneurship. After the completion of entrepreneurship incubation center, they will plunge into the incubation practice of entrepreneurial projects, and tens of thousands of people will participate in the incubation of entrepreneurial projects in future to become the backbone of the entrepreneurial project incubation staff. Our college strives to make 80% students participate in the entrepreneurship incubation within five years.

iii. The self-entrepreneurship accounts for 30%

According to the initial analysis of the employment situation of the previous graduates of our college, the self-entrepreneurship students account for over 5% of graduates of every year, and after our college established the Entrepreneurship Management School and Entrepreneurship Management and Innovation Management directions, we recruit a great number of students
who are eager for entrepreneurship to study the relevant entrepreneurial theories systematically, and meanwhile other majors except the aforesaid will also have curriculum of the basic theories of entrepreneurial education. Therefore we have laid the entrepreneurship basis for the students with professional skills and are eager for entrepreneurship, and the establishment of Feiyang Global Entrepreneurship Center provides a good platform for the entrepreneurial practice and practical ability, and we strive to have 30% self-entrepreneurship students within five years.

iv. 500 entrepreneurial tutors

The extensive promotion of the entrepreneurial education shall be backed by powerful teacher resources. We have invited 100 most influential entrepreneurial tutors all over the world, and planned to establish 32 offices of Entrepreneurship Association of Global Medium and Small Sized Enterprises China Branch. Meanwhile the promotion of entrepreneurial education among our students and the social persons who aspire for entrepreneurship shall be completed by a great number of entrepreneurial tutors; therefore we strive to invite another 500 entrepreneurial tutors within five years.

v. 500 entrepreneurial experts

Our college has become the Preparatory Committee president unit of Entrepreneurship Association of Global Medium and Small Sized Enterprises China Branch, and our broad director Lu Feicheng has become the first Preparatory Committee president of China Branch. In order to continue with
the promotion of entrepreneurial education all over the country, Preparatory Meeting of Entrepreneurship Association of Global Medium and Small Sized Enterprises China Branch will be held in Qingdao People’s Government Conference Center from April 9-11, 2010; the reserve entrepreneur members who aspire for entrepreneurship or succeed in entrepreneurship will be absorbed through China Branch offices in various autonomous regions, municipalities and provinces. In order to better guide and development relevant entrepreneurial work, our college will invite another 500 entrepreneurial experts within five years.

vi. The entrepreneurial funds exceed 0.1 billion

Judging from the experience of entrepreneurs, it is hard for many entrepreneurs to obtain initial capital. In order to support the students who are eager for entrepreneurship, our college has specially established entrepreneurial funds to solve the initial capital for the students. Meanwhile in order to promote and develop entrepreneurial career nationwide, and provide financial support for the social people who aspire for entrepreneurship, our college has specially established entrepreneurial funds. Our college has attracted a batch of entrepreneurial incubation funds immediately after successfully held the first “Lu Ban Entrepreneurship Global Forum and established Feiyang Global Entrepreneurship Center; with the establishment of ICSB China Branch offices in autonomous regions, municipalities and provinces to promote the entrepreneurial career, more entrepreneurial funds
will be attracted and it is predicted that the entrepreneurial funds will exceed 0.1 billion within five years.

vii. The entrepreneurial incubation results exceed one thousand

After our college successfully held the first global forum, 100 enterprises have entered the entrepreneurial incubation club to realize the scale production and promotion of incubation results. They will bring the problems and imaginations of the enterprise to Feiyang College for the incubation research by the students and teachers. Meanwhile the successful incubation projects will return to these enterprises to realize large-scale production, which is also the practice of “Industry, Study and Research of Entrepreneurship” proposed by Feiyang. With the large-scale nationwide promotion of the entrepreneurial career, more entrepreneurial experts and tutors will participate in the Feiyang entrepreneurial family, a great number of entrepreneurial incubation projects will enter Feiyang Global Entrepreneurship Center, and the entrepreneurial incubation results will exceed one thousand within five years.

viii. Entrepreneurial value

At present our country is advocating the creation of innovative country, entrepreneurial society and talents, determines 80 cities as the first entrepreneurial pilot cities to promote the employment through entrepreneurship and solve the employment of a great number of university graduates, which is one of the reflection of entrepreneurial value. According to the latest international entrepreneurial theories, the entrepreneurial value is
mainly reflected that the entrepreneurship will create new opportunities, new employment vacancies and new social wealth, and promote social harmony, which is the tenor of our endeavor to create the entrepreneurial education.

6. Conclusion

The practice proves that: the overlap area of the three circles is in direct proportion to the effects of entrepreneurship strategy. If the overlap area of the three circles has no enlargement or decrease, the strategy will become a fantasy; when the three circles enlarge and the center points overlap synonymously, the target effect will be optimum; there are 112 regular changes between the two. Studying the overlap area of the three circles can help us predict the element changes in each circle and guide the strategic effect changes, which is of great significance to the society.

ABSTRACT
Recently CSR has been taking its momentum among the business society in Indonesia. The economic crisis and reformation era have brought up a new spirit of transparency, democracy, and social awareness. Initiated by multinational companies and CSR Forum, now, more and more companies operating in Indonesia are adopting CSR because they believe it is the right thing to do. However, its implementation is not always easy due to some external factors affecting business, especially in SMEs. This paper attempts to provide general analysis as a portrait of CSR implementation in Indonesia SMEs related to business environment, as well as how the owners of SMEs disclose their perception of CSR theme or topic and build good internal values to address such business challenges, e.g. product & service, labor, environment, etc. Based on the authors' observations in the last few years, and surveys conducted to 185 SMEs membered at IBL.

Entrepreneurial Origin and the Configuration of Innovation in Rural Areas:

The Case of Cumbria, North West England

Christos Kalantaridis* and Zografia Bika**

Abstract
This paper examines the incidence of innovation and the configuration of innovation systems in rural areas. Drawing on the results of a micro-level study in Cumbria, the paper shows that the actor-constructed regional innovation system stretches well beyond the confines of the locality. This can be explained – in large part – on account of entrepreneurial origin. New arrivals (especially immigrants) demonstrate the greatest propensity to innovate using innovation systems that cut across regional and national boundaries. Interestingly, returnees also demonstrate a high propensity to innovate relying heavily in the regional context, whilst locally-born entrepreneurs report low incidence of innovation. The paper concludes offering a distinction between regional innovation systems (as macro-level analytical units with a normative dimension) and actor-constructed regional innovation systems (as micro-level descriptive units). This divide allows for the introduction of entrepreneurial agency in innovation studies.

Introduction

Since the 1950s the population of rural areas in the US (Berry, 1976), continental Europe (Dahms and McComb, 1999; Panebianco and Kiehl, 2003) and the UK (Agarwal et al, 2004; Bosworth, 2006; Champion and Shepherd, 2006) begun to grow as a result of urban-rural migration. The ability of rural localities to attract migrants has significant implications upon their enterprise, and consequently economic development trajectories. This is because the new arrivals are relatively

* Professor Christos Kalantaridis leads the development of the Centre for Enterprise & Innovation Research, as well as Academic Enterprise at the University of Salford Business School, Greater Manchester (UK).
** Dr. Zografia Bika is a lecturer in entrepreneurship and small business management at Norwich Business School, University of East Anglia (UK).
affluent individuals (Shucksmith, 2001) equipped with networks of contacts formed over many years in different regional, or spatial, settings. Resources and information enable migrants to make a disproportionately positive contribution in the creation of new ventures in rural areas not only in the UK (Keeble, 1992; North and Smallbone, 2002; Kalantaridis and Bika, 2006), but also in continental Europe (Skuras et al, 2005; Kalantaridis, 2005; Stone and Stubbs, 2007) as well as in the US and Canada (Weber, 2006; Siemens, 2007). More importantly however, the contribution of migrants extends beyond numbers: they are often perceived as a means of strengthening the linkages of rural areas with the global economy (Raley and Moxey, 2000; Kalantaridis and Bika, 2006a).

Whilst there is a growing body of evidence regarding the impact of new arrivals on the incidence of entrepreneurship in rural areas, there is precious little research on their contribution to innovation and the configuration of innovation systems. This is despite the fact that there is a growing recognition of the importance of access to innovation inputs and a knowledge infrastructure (or the knowledge generating subsystem as commonly identified in the literature) in underpinning innovative activity within regional innovation systems (Cooke et al, 1997), as well as intra-regional innovation linkages (Howells, 2005). The latter are particularly important for rural areas, as they are often perceived disadvantaged (in comparison to metropolitan centres) in terms of their resource endowments and knowledge infrastructure.

Within this context, this paper sets out to explore the impact of migration on the incidence of innovation, as well as the configuration of innovation systems in rural areas. In doing so, the paper deploys a micro-level methodology that focuses on systems as viewed from the point of view of innovative firms: i.e. actor-constructed
regional innovation systems. In exploring the role of new arrivals, a distinction will be drawn upon patterns of population inflows and more specifically between in-migrants (defined here as those born elsewhere in the UK, moving to rural areas), immigrants (born abroad, moving to rural areas from elsewhere in the country or from overseas) and return-migrants (locally born inhabitant who lived and worked elsewhere – in the UK and/or internationally - but subsequently returned to the area of his/her origin). Given the broad conceptualisation of new arrivals, the paper utilises insights from studies examining international as well as domestic population mobility. Empirically the data used here are derived from a survey of one hundred innovative entrepreneurs in rural Cumbria (the term is used to denote the synonymous county excluding the urban centres of Barrow-in-Furness and Carlisle).

The evidence presented here shows that there are differences in the propensity to innovate by entrepreneurial origin, in rural Cumbria. It is immigrant and returnee entrepreneurs who record the greatest incidence of innovative activities. However, the configuration of innovation systems differs significantly in these two groupings. The former rely heavily on sources of innovative inputs and markets located elsewhere, and particularly beyond the national boundaries. The latter, in sharp contrast, emerge as the grouping that relies most heavily on localised innovation systems. These indicate the adoption of profoundly different strategies regarding the specificities of rural areas. Returnees appear to opt for strategies of adaptation, whereby need is defined within the parameters of existing resources, whereas immigrants demonstrate a propensity to break-out.

The paper is organised as follows: the next Section undertakes a purposeful review of the literature that leads to i) the development of a micro-level view of actor-constructed regional innovation systems, and ii) the development of a number of
research questions, whilst a detailed discussion of the methods used to collect and decipher the data is presented in Section three. Then the paper presents an overview of the case study area, and innovation in this setting. Lastly, there are some conclusions of the main findings.

The Literature

Regional Innovation Systems

Since the early 1990s, systemic approaches of innovation have dominated the debate on the interface between innovation studies and regional science (Cooke et al, 1997). This is partly because of the acknowledgement that innovations are carried out not within individual firms but a network of actors who are institutionally embedded (Edquist, 1997), and partly due to the growing realisation of the importance of proximity (both geographic and relational) for the promotion of innovativeness in enterprises (Asheim, 2007). Innovation systems can function at different scales, including regional, spatial, national and international ones (Sternberg and Muller, 2005). Within this context, particular emphasis was placed on innovation systems within the regional scale.

The importance of the region as a setting for innovation systems is on account of three reasons. Firstly, innovative activity is not distributed evenly across space, but is concentrated in certain regions whilst being more or less absent in others (Fritsch and Stephan, 2005). Secondly, the region constitutes an arena of economic interaction, that occurs within a specific institutional, political and social context (Storper, 1997). Lastly, partly due to specificities of context, a set of rules, conventions and norms that influence behavioural roles may occur within a regional setting. As a result, the concept of the regional innovation system has emerged as
central to the debate. Cooke et al (1998) define this as a system in which firms and other organizations are engaged in interactive learning, and these learning processes take place through an institutional milieu characterized by embeddedness. Therefore, it consists of a production structure (which comprise of techno-economic elements) and an institutional infrastructure (involving politico-institutional components) (Asheim and Isaksen, 1997). Exponents of this concept view it primarily as an analytical construct used in order to understand system dynamics and performance. This suggests that ‘the system in focus does not have to exist in reality as fully fledged’ (Berger et al, 2008, 408).

This view of regional innovation systems is manifested in the prevalence of top-down approaches in the operationalisation of the concept. The bulk of this literature draws upon key informant interviews and secondary data with the aim of capturing innovation systems as analytical units rather than as arenas of interaction between actors (MacKinnon et al, 2002; Doloreux and Parto, 2005). Thus, the emphasis is placed on the presence (or not) and mapping out of the regional production subsystem and the knowledge generation subsystem (as defined by Asheim (2007)) rather than actual interaction between the two. This operationalisation, would provide an accurate description of the regional innovation system under consideration only in a situation where the system is closed: i.e. the regional production subsystem taps exclusively into the regional knowledge generation subsystem, and the latter is not linked with other (outside the region) production subsystems. However, it is increasingly acknowledged in the literature that accessing knowledge from outside is of considerable importance for innovation (Boschma and ter Wal, 2007).
The conceptualisation and operationalisation of the regional innovation system has led to some confusion regarding the existence or not of a normative dimension. In large parts of the theoretical literature this concept is used to capture an ideal-type contextual setting for the advancement of innovative activities. Thus, Cooke and Morgan (1998) argue that a strict reading of the literature shows that only three regions are true regional innovation systems: namely the Silicon Valley, Emilia Romagna and Baden-Württemberg. Similarly, Asheim suggests that a regional innovation system ‘is in place when the following two sub-systems of actors are systematically engaged in interactive learning … first, the regional production structure of knowledge exploitation subsystem, which consists mainly of firms … second, the … knowledge generation subsystem which consists of public and private research laboratories, universities and colleges, technology transfer agencies and vocational training organizations’ (Asheim, 2007, 229). This led to the emergence of ‘system failure’ that captures instances when the system fails to develop or does so in a stunted fashion (Carlsson and Jacobson, 1997). This can only be captured in comparison to an ideal-type process of system development (developed in some detail by Bergek et al (2008)). However, the use of the concept in empirical studies is not value-laden: capturing a broad range of contexts with profoundly different innovative performance: from Austria (Gerstlberger, 2004) to China (Li, 2009) as well as cross-border regional innovation systems (Moodyson et al, 2008).

In response, this paper introduces a distinction between the regional innovation system (an analytical unit, captured through macro-level methodologies, and possessing a normative dimension) and a different – and complementary – concept: the actor-constructed regional innovation system. This divide can not only
provide clarity and eliminate confusion, but can also open new and productive lines of scholarly inquiry (discussed in the concluding Section of the paper).

The point of departure for the development of the new concept is the pioneering definition advanced by Lundvall: whereby an innovation system is ‘constituted by elements and relationships which interact in the production, diffusion and use of new, economically useful, knowledge’ (Lundvall, 1992, p. 2). Elements may include individual actors as well as a host of private and public organisations (which could be grouped into regional production and knowledge generation subsystems), whilst relationships are defined as ‘mutually oriented interaction between two reciprocally committed parties’ (Håkansson and Snehota 1995, 39). Of course relationships do not take place in a vacuum but occur within an established institutional context. Institutions, defined here as the multitude of formal and informal rules that govern the game, are thus, central to the innovation system. The advantage involved in innovation systems is that interaction of these elements produces pervasive and systemic effects that encourage enterprises (operating within the system) to develop forms of capital, and interactions that enhance their innovative capabilities (Doloreux and Parto, 2005).

This conceptualisation differs from that prevailing in the literature in three ways. Firstly, it aims to describe reality rather than provide an abstract analytical unit. Therefore, tracing actual relationships between actors is a key consideration. Secondly, in operationalising this concept a different methodological approach (from that adopted in the regional innovation systems literature) is adopted. This is a bottom-up approach that can utilise surveys, case studies and ethnographic research in order to trace existing relationships between actors and map-out the configuration of the system. Interestingly approaches like that are present in the literature (for
example Belussi et al, 2010). Lastly, partly as a result of the first point, it does not involve a normative dimension. Thus, all regions – irrespective of their innovative performance – have some kind of innovation system.

*The Implications of Rurality*

The conceptualisation of rurality in advanced market economies is increasingly problematic. This is because, following a long-term process of structural transformation, agriculture does not constitute the main economic driver of rural areas (Hodge, 1997; MAFF, 2001). This led to a new way of seeing rurality as a structural, symbolic, discursive or power terrain with wider socio-economic and ideological demands of consumption imposed onto it, no longer a neutral point of production. Rurality has thus been discussed either as a social representation (Halfacree, 1993), a territorial dimension (rather than geographical) of the countryside (Marsden et al., 1993), or a multi-functionality policy imperative (Potter and Burney, 2002). For the purposes of this paper rurality is defined as a spatial category dominated by large open spaces and, relative to the national context, small settlements. This conceptualisation of rurality has significant territorial implications for the knowledge generation subsystem, and by implication the prevailing innovation system. One outcome of low population densities upon the markets for factors of production is an increase in per unit costs of creating a local knowledge infrastructure. As a result, rural areas invariably lack higher education provision locally, as well as sizeable (private or public) R & D provision. This may create difficulties to entrepreneurial economic agents that rely exclusively upon local innovation inputs (Keeble and Vaessen, 1994). Moreover, the absolute number of enterprises present in most rural settlements is small, and often spread across a number of diverse industrial
sectors, limiting the scope for interaction as part of a local innovation system (Kalantaridis and Bika, 2006a). As far as output markets are concerned, market potential, which denotes the volume of goods sold per unit of landmass, is low. Thus, dynamic ventures may soon outgrow the confines of the local market and may be forced to expand nationally (Smallbone et al, 1999). This leads to the development of the first research question of the paper:

*RQ1: To what extent does reliance on elements (of an innovation system) that are rural based act as a constraint in the propensity of entrepreneurs to innovate?*

However, the territorial implications of rural space on the knowledge generating subsystem may or may not impact on the incidence or intensity of innovation. This can be partly explained because rural enterprises may be able to adapt to existing resources or broaden the geographical scope of the innovation system. Within this context, the potential role of migrants is instrumental.

*Population Mobility and Innovation*

During the past few years, there has been growing interest on the impact (actual or potential) of immigration on innovation. There are three reasons that underpin this body of research. Firstly, new arrivals – simply on account of their numerical significance - generate increased demand for goods and services in the country of destination. This, in turn, advances economic activity and fuels innovation. Secondly, immigration changes the human capital stock in the country of destination, by bringing in new skills, knowledge and ideas. Moreover, significant numbers of immigrants invest heavily in higher education. Thirdly, there is widespread
acknowledgement of the fact that new arrivals are not randomly selected samples of the population of countries of origin, but actually include their most dynamic and entrepreneurial elements (Borjas, 2006). Thus, they are more likely to engage in innovative pursuits and facilitate linkages between innovation systems in their places of origin and destination. This underpins the second research question of the paper:

*RQ2: Does the configuration of innovation systems differ by entrepreneurial origin?*

As a consequence, there has been considerable growth in that body of evidence examining the relationship between the inflow of new arrivals and its impact on the incidence of innovation. Most of these studies examine the impact of the immigrant human capital (i.e. the second reason identified in the preceding paragraph). More specifically, Peri (2007) shows that skilled migration increases patenting in the US – a thesis also supported by Maskus and Matt (2004). More recently, and in the same national context, Hunt (2008) shows that skilled immigrants innovate more than their native counterparts. This is particularly the case if the new arrivals are scientists or engineers. She goes on to seek an explanation of these findings in the higher education of immigrants within skill categories, and/or positive selection of immigrants in terms of their ability to innovate. In a European Union context, Nijkamp (2009) concludes that there is a positive relationship between the number of immigrants and innovation (measured in terms of patent applications). However, he goes on to suggest that it is particular groups of new arrivals (such as Americans, and other Europeans) that impact positively on innovation. Moreover, Niebhur (2006) shows that German regions with more diverse worker nationalities report a greater incidence of patenting.
Rather unexpectedly, there is precious little research on the ability of new arrivals to alter the incidence of innovation through the creation of entrepreneurial ventures (Sternberg and Muller, 2005). This is particularly surprising as entrepreneurial migrants may be of particular importance to innovation for two reasons. Firstly, they are more likely to take decisions about the introduction of innovations (as defined earlier), rather than merely engage in the process of invention (Sternberg and Muller, 2005). Secondly, they may influence the innovation system in their place of destination by virtue of their already existing networks of contacts – a point that has been of particular importance in the rural studies literature (Kalantaridis and Bika, 2006b). These lead to the formation of research question three below:

**RQ3: Are in-coming entrepreneurs more or less innovative than their locally-born counterparts?**

There is also some evidence suggesting that return-migration may influence positively the configuration of innovation systems (Stenberg and Muller, 2005). This draws from the experience of international return-migration, but may also provide suggestive lines of inquiry for rural areas and returnees from metropolitan centres. This literature suggests that return migrants may contribute significantly in the configuration of innovation systems in their place of origin, as they bring back knowledge and contacts when they return. This contributes in keeping the innovation system open to new knowledge and reduces technological lock-ins.
The Method

The adoption of a micro-level view in order to decipher the actor-constructed regional innovation system of rural Cumbria was central in determining the choice of method. Thus, this paper draws primarily on survey data from an EU funded project on rural entrepreneurship in Cumbria. The survey data used for the purposes of the paper are drawn from two datasets: one capturing the incidence and characteristics of entrepreneurship in the population and the second focusing on innovative enterprises. The population survey was used in order to explore the propensity of rural inhabitants to entrepreneurial activity. Based on the findings of desk-top research a stratified random sample of the population was identified. The sample was representative of the population in terms of age and gender (see Table 2). For the purpose of the survey a structured questionnaire was devised. The questionnaire included Sections on the personal details of the respondent (age, gender, socio-economic strata), educational and work experience, general perceptions of entrepreneurship, and (specific to those who display an entrepreneurial propensity) causes, processes and obstacles in the realisation of their enterprising potential. Some 2,000 inhabitants were randomly selected using telephone directories – which cover more than 95% of the total population. Some 500 questionnaires were completed in rural Cumbria between January and March 2001, corresponding to a response rate of 25% - which was deemed satisfactory given the means employed (telephone) and the national context.

A survey of innovative entrepreneurs was conducted in order to gain an in-depth understanding of the processes at work in the countryside. In order to monitor

*** The authors acknowledge support from an FP5 grant for the project “The Future of Europe’s Rural Periphery: The Role of Entrepreneurship in Responding to Employment Problems and Social Marginalisation” (HPSE-CT-00013).
the innovative propensity of the enterprise a number of screening questions were asked during a small telephone interview. An additional stratification criterion used in the selection of the sample was sector. Thus, the innovative entrepreneurs surveyed are broadly representative of the population (in terms of sector) in the study area. For the purposes of the survey a questionnaire that combined closed (mainly) and open-ended (to a lesser degree) questions was used. The questionnaire included sections on the enterprise, the start-up process, product/service innovation, market change, technological change, information, and the entrepreneur. Some 320 companies, identified using standard commercial directories, were approached. A total of 100 interviews were completed, each lasting between one and three hours, between February and September 2001. This corresponds to a response rate of nearly 31%, a figure twice than that reported in previous postal surveys of rural entrepreneurs (Keeble et al, 1992; Mason and Harrison, 1993; Westhead et al, 2000), and modestly above that of previous face-to-face surveys (Smallbone et al, 1999).

The Locality

Rural Cumbria occupies a position in the geographical periphery of England, in the Northwest government region. The distance between London and Carlisle, the main urban centre within the study area is some 440 kilometres. This is translated to a five hours train journey, or anything between six and eight hours by car. The nearest major urban conurbations are Newcastle to the East (some 88 kilometres away), and Manchester to the South (160 kilometres).

Rural Cumbria, like many other rural areas in England, benefited from counter-urbanisation. Indeed, (1981-1998) demographic trends (at the time the study was conducted) indicated a modest population increase of 3.2% (ONS, 1991-2001).
However, the increase of the rural population was combined with a rapid expansion in the number of individuals beyond pensionable age. The new arrivals, by virtue of their higher incomes – than the local population – increased the level of effective demand, however, this remained well below that registered in urban agglomerations. As a consequence, the scope for expansion of local market focused entrepreneurial ventures was limited.

The significance of agriculture was only of secondary importance at the time of the survey: employing 4.2% of the economically active population in the case study area, a figure well above that for England as a whole (0.9%) (MAFF, 2001). Outside agriculture the single largest employer in rural Cumbria is manufacturing, accounting for 21.9% of the workforce (as of 1998), a figure well above that nationally (ONS, 2001). The significance of manufacturing in rural Cumbria was maintained despite a process of industrial demise throughout the 1990s. During the same period, jobs were created in smaller numbers in health and social work, trade, and hotels and restaurants. Thus, at the time of the survey trading activities were responsible for 18% of the non-agricultural workforce, whilst health and social work employed some 12%. The contribution of tourism is supported by the significance of hotels and restaurants – employing one in ten of those working outside agriculture.

The knowledge generating subsystem of Cumbria was shaped by the defining characteristics of rurality. As a consequence, higher educational provision was limited. Cumbria was – at the time that the study was conducted - one of a handful of counties in England without a local higher educational institution. Existing provision was confined to business studies, and agriculture and related fields (provided by local campuses of the University of Central Lancashire). The local business support network, and especially the Business Link and the West Cumbria Development
Agency were other main providers of training and skill development. However, the relative cost of appropriate support in a rural context was probably higher than that in urban conurbations. The R & D infrastructure, was also limited. The British Nuclear Fuels Ltd nuclear station in Sellafield constitutes the single most important R & D provider locally.

**Enterpreneurship, Innovation and the Configuration of Innovation Systems**

*Entrepreneurial Origin & Innovation*

The incidence of entrepreneurship in rural Cumbria, when the survey was conducted, compared unfavourably with the national average—as measured by the SBS Household Survey. Overall, 68 respondents, or some 15.1% of the population aged 16-64 years of age, could be defined as entrepreneurs. This figure was below that reported for England as a whole in the SBS Household Survey. Moreover, the incidence of entrepreneurship varied profoundly by origin. Returnees recorded the lowest incidence of entrepreneurial activity (8.3%) followed closely by locally-born individuals (11%). This is well below the figure reported by in-migrants (16%) and immigrants (33%). However, the incidence of entrepreneurship among immigrants needs to be treated with caution on account of the small number of respondents in the population survey (a total of just nine—though this is not dissimilar to the percentage of immigrants in rural Cumbria).

An analysis of the data regarding the innovativeness of entrepreneurs surveyed as part of the population survey, using the four categories of entrepreneurial origin, is presented in Table 2. This shows that returnees were the most innovative grouping, followed by immigrants and in-migrants. Locally-born entrepreneurs who have never
lived outside the locality reported innovative activities in only 24% of the cases. However, this data must be treated with caution as the number of returnee and immigrant entrepreneurs included in the population survey was very small (two and three). Disparities in the innovativeness of firms by entrepreneurial origin also emerge in the entrepreneurs’ survey. This survey focused on enterprises that maintained an element of novelty – either in terms of products/services, processes, markets or the age of the firm (start-up). Therefore, a greater incidence of innovation, than the population survey, was anticipated. The findings (also shown in Table 2) suggest that locally-born individuals who never moved outside the area were the least innovative group. In contrast, returnees and immigrants were the most innovative group. In this survey, the number of individuals falling in these two grouping were eleven and four respectively. The combined findings of the two surveys presented here indicate that entrepreneurial origin may be of importance in determining the innovativeness of the ventures created.

The Configuration of Innovation Systems by Entrepreneurial Origin

A number of variables were used in order to examine the origin of resources used by innovative enterprises in the study area. These revolved around the supply of labour, capital and other inputs, output destination, as well as the geographical origin of information. As far as the former variable is concerned, this was captured in terms of the percentage of the total workforce coming from outside Cumbria. A dichotomous variable was developed in order to capture whether there was any capital investment from outside the region. In addition to those variables (labour, capital), commonly used in the literature, the importance of the region as a source of other inputs (again as a percentage of the total), such as raw materials and equipment, was
also examined. In order to measure the importance of local markets a variable recording the percentage of total sales destined to the regional setting was used. Capturing the importance of the existing knowledge infrastructure was more than usually problematic. Therefore, a variable capturing the propensity of rural entrepreneurs to exploit localised/non-localised knowledge was deployed. Lastly, the geographical origin of sources of market information was captured. Data regarding these variables, by entrepreneurial origin, are presented in Figure 1. A position towards the centre of the Figure – in all of the variables examined here – indicates use of local resources, whilst a position at the edges of the Figure indicates utilisation of distant resources.

The evidence presented in Figure 1 indicates an emerging divide between locally-born and returnee entrepreneurs, on the one side, and in-migrant and immigrant entrepreneurs on the other. The former rely heavily on the study area as a source of inputs and information and the main destination of outputs. Indeed, less than one in ten receive capital from outside the area, whereas non local inputs (other than labour) account for 30% of the total among locally-born entrepreneurs and just 18% for returnees. This dependence on the locality is also apparent regarding know-how and market information. The latter is linked to the fact that both locally-born and returnee entrepreneurs direct the bulk of their outputs within the study area. Interestingly, returnee entrepreneurs appear to rely even more on the locality than their locally-born counterparts, for non-labour inputs, market information, and output markets. In contrast, in-migrants and immigrant entrepreneurs draw inputs (apart from labour) and information, and direct their outputs nationally and even internationally. The latter is particularly the case regarding immigrant entrepreneurs.
Concluding Remarks

The evidence presented here suggests that this rural locality imposed constraints on the innovative activities of entrepreneurs. The relatively small size of the local market, and the weak knowledge infrastructure are two key challenges confronting all entrepreneurs in rural Cumbria. However, labour market issues appear not to influence adversely entrepreneurs. Thus, regarding RQ1, the papers shows that the locality imposes some constraints, but also confers some advantages to rural innovative enterprises. On the other hand, the survey data analysis illustrates considerable diversity in the configuration of innovation systems by entrepreneurial origin (RQ2). Another argument advanced in this paper shows that the incidence of innovation is higher for entrepreneurs who have spent at least part of their life elsewhere if compared with the locally-born ones (RQ3). To this extent, the impact of migration (both inward and return) on rural innovation in terms of available human capital is a positive one and incoming entrepreneurs are more likely to introduce something new and commercially useful. In the case of immigrant and in-migrant entrepreneurs this may be on account of pre-existing (i.e. before the migratory move) social capital that helps them establish relations with distant sources of innovative inputs and markets. This is not the case regarding returnee entrepreneurs.

The paper also advances a conceptual distinction between regional innovation systems (defined in the literature as an analytical unit, captured through macro-level methodologies, and possessing a normative dimension) and actor-constructed regional innovation systems (predominantly descriptive of real linkages between actors, captured through micro-level methods, and without a normative dimension). This divide is particularly relevant in the case of rural Cumbria, an area that possesses a weak knowledge generating subsystem, whilst the production subsystem demonstrates
considerable (more than the national average) reliance on manufacturing and agriculture. As a result, it does not conform with widely held views regarding regional innovation systems. This divide between a regional innovation system and an actor-constructed regional innovation system, raises a number of interesting questions for researchers in the field. In instances (like rural Cumbria) where reality appears to exceed normative expectations it posses the issue of how can entrepreneurial agents overcome the constraints imposed by the regional knowledge subsystem. Moreover, it also questions the impact of establishing an actor-constructed regional innovation system that goes well beyond the confines of the locality, on the ability of the regional research infrastructure to develop: i.e. is the ease of tapping into distant resources diminishing the demand for developing these locally? However, this divide can also be used to decipher instances where reality falls behind normative expectations. This could include regional setting with strong knowledge generating subsystems that fail to impact on the incidence of innovation in production subsystems. What are the factors that restrict the ability of the latter to utilise the former, and how can these obstacles be overcome? These issues turn the focus of inquiry on the interface between the organisation and its context, maintaining a strong territorial dimension but also offering scope for openness and centred around innovative actors.

Figure 1. The Configuration of Innovation Systems by Entrepreneurial Origin
Power of the Past and SME Competitiveness: A European Study

Abstract
Enterprise Cultural Heritage (ECH) is an innovative and complex concept combining the company’s own history and creations (technical contents, industrial design, organization, marketing, etc.) with the potential to transform information and materials into “extended products & services”. This paper drawing on the results of a review of the literature and a survey of 60 Small and Medium-sized Enterprises (SMEs) based in four European Union (EU) countries argues that effective ECH management can increase creativity in production and innovate knowledge management skills. The current study makes two distinct contributions: Firstly, it introduces the ECH concept and embeds it in a broad body of literature. Secondly, it provides evidence-based insights into the potential impact of using ECH in order to enhance competitiveness.

Introduction
The age of the firm has been an important consideration within that body of knowledge broadly defined as SME (small and medium sized enterprises) studies. Research within this context has focused primarily on the impact of size on the performance as well as constraints confronting small firms. This work followed two distinct trajectories: the first being primarily theoretical, involving the development of life cycle models; whilst the second being primarily empirical: drawing evidence of survival and growth rates in Europe and the United States.

Theories of SME life cycle are defined by the tenet that the growth of the firm is characterised by a number of predictable, discrete and consistent stages (Churchill and Lewis, 1983; Scott and Bruce, 1987; Parsons, 2006). These stages are sequential in nature and occur as a process of progressions that can not be easily reversed (Dodge and Robins, 1992). This is partly because each stage is both an effect of the previous
one and a cause of the next. An important aspect of these theoretical constructs is that transition from one stage to another requires considerable change – defined as ‘developmental crises’ (Greiner, 1972). Thus, there is considerable emphasis placed by researchers in examining the nature of these crises, and exploring how entrepreneurs need to revisit their strategies and behaviours and adapt to the emerging conditions (Quinn and Cameron, 1983).

Empirical research on the relationships between the age of the SME and performance has been extensive and inconclusive. There is a body of evidence supporting the thesis that it is new businesses that have a disproportionate impact on jobs (Birch, 1979). This argument – linked to a variant of Schumpeter’s view on entrepreneurship and innovation – is supported by empirical evidence showing the growth rate of SMEs in negatively associated with the age of the firm (Carroll, 1983; Freeman et al, 1983; Evans, 1987). However, there is also recognition that younger firms have a higher mortality rate than established ones (Hannan, 1989). Thus Dunne et al (1989) argued that holding size and ownership constant, increasing age was associated with lower failure rates. Thus, the second argument advances the thesis that it is established businesses that make the most important contribution in terms of employment in the long-term (Storey, 1994; Patel, 2005).

Both theoretical and empirical approaches recognise the importance of organisational learning in the evolution of SMEs. However, they place precious little importance on the impact that the cumulative body of knowledge and firm continuity and perception in the marketplace may have on firm competitiveness. This paper aims to address this gap in the literature by introducing the concept of enterprise cultural heritage, and
exploring how it is used and its implications for SME performance in four European countries (namely the UK, Greece, Finland and Italy). It is worth pointing out from the outset that this is an exploratory study aimed at introducing the concept and identifying some key issues. Thus, the number of SMEs involved is modest – fifteen in each country.

The paper is organised as follows. The next Section defines ECH and identifies a number of key research questions. The paper proceeds with an examination of the methods used in the data collection process, as well as providing an outline of the key issues explored in the questionnaire. This Section also discusses – in some detail – the limitations of the study. Then the paper proceeds in presenting the results of the survey of established SMEs in four EU countries. Lastly, the paper offers some conclusions – focusing particularly on the two research questions identified earlier on in this Section.

**The Concept and Research Questions**

Enterprise Cultural Heritage (ECH) is an innovative and complex concept combining the company’s own history and creations (technical contents, industrial design, organization, marketing, etc.) with the potential to transform information and materials into “extended products & services”. It is a company asset that is derived from its historical evolution. This asset is made up of tacit and explicit knowledge. This knowledge focuses on products/services (and the overall brand identity of the firm), processes (and technologies), functions, and organisational structures. It can be used to underpin future competitiveness through originality, innovation and quality.
The concept draws insight from a broad range of literature including: Marketing, Product Development & Innovation, Organisational Culture and Knowledge Management. However, to date, this has achieved precious little attention in the academic literature. It can be regarded as part of company’s knowledge capital, but as Sedera, Gable and Chan (2004) argue that the exploitation of knowledge of an organisation, resides not in the knowledge itself, but in the ways that knowledge is used and re-used.

This concept is important as it is relevant to large number of SMEs. More specifically, in Italy, there are more than 11,000 SMEs that are more than 40 years old (Enterprises Registry Dataset), some 290,000 SMEs in the UK also fall in this group (Federation of Small Businesses), whilst in Greece there are 6,140 enterprises. The number of such firms will be smaller in post-socialist regimes (such as the Czech Republic), however, there are similar opportunities for privatized firms as well as new SMEs that tap into the ECH of the socialist or even pre-socialist era.

The introduction of a concept/asset (ECH) that may enhance SME competitiveness the world over raises the question of awareness of this potential among entrepreneurs. To what extend do they view the firm’s repository of knowledge as meriting investment, and how does this influence their decisions? This prompted the development of the following research question:

*Research Question 1:* How do established SMEs (if at all) exploit the potential involved in their enterprise cultural heritage?
Establishing the degree to which entrepreneurs in SME sector are aware of the potential of ECH, takes us only part of the way in establishing the business practice implications of this paper. Indeed, what remains of paramount importance is the degree to which the ECH management may influence the survival and growth of the firm. This led to the development of the paper’s second research question, below:

Research Question 2: Is there any link between the exploitation of enterprise cultural heritage and SME survival and growth?

Methodology

A survey of established enterprises was conducted in early 2010 in order to gain an in-depth understanding of the processes involved in exploiting ECH. In order to identify established SMEs a number of selection criteria were used. These included: independence (i.e. the organisation in question was not a branch or subsidiary of another), size (using the EU definition enterprises employing only up to 250 people with annual turnover ≤ € 50 million or balance sheet total of ≤ € 43 million were selected) and age of the firm (identifying enterprises that have been in existence – at the time of the survey for a period of 40 years). The rationale behind the 40 years was that these companies are more likely to have had to pass on their product and services knowledge through at least one generation of employees. An additional stratification criterion used in the selection of the sample was sector. Thus, established SMEs surveyed were involved in craft activities. This is defined in the EU SME Observatory as artisan production in food, textiles, and other (ceramics & jewellery) industries. More specifically, regarding the sectoral breakdown of the established SMEs surveyed is concerned, the majority (just over half) were involved in the food sector, with just over a quarter engaged in textiles and clothing manufacture. The remaining
one fifth of the firms surveyed were in other craft activities. The choice of the craft sector is on account of the importance of cultural heritage (e.g. local products, traditional design etc) as a source of competitive advantage.

For the purposes of the survey a questionnaire that combined closed (mainly) and open-ended (to a lesser degree) questions was used. The questionnaire included sections on the firm’s awareness of ECH, the skills needed in order to exploit ECH in the firm, obstacles to the use of ECH, and general information about the SME and its performance. Some 370 companies, identified using standard commercial directories, were approached. A total of 60 interviews were completed, each lasting between 30 and 45 minutes, between January and April 2010. This corresponds to a response rate of just over 16%.

Before the presentation of the findings some key limitations must be noted. Firstly, the data used are self-reported responses to a questionnaire. This raises two important considerations: self-report bias and self-selection bias. Considerable efforts have been made in the design and implementation of the research to address these issues. Thus, a number of controlled questions have been introduced in the instrument to monitor the responses given. In some instances corrective action has been taken when individual respondents made contradictory statements. As far as the issue of the self-selection bias is concerned, the organization of the fieldwork and the ensuing satisfactory response rate provide a considerable degree of confidence in the results. Secondly, the survey instrument provides a snapshot of firms at the time of the fieldwork research restricting the ability to capture processes that evolved through time.
It is also worth pointing out that the data were collected in early 2010, a period of considerable economic adversity globally. This is a period of increased difficulty – for SMEs – to access finance and economic contraction. During the interviews the impact of hostile macro-economic conditions was raised extensively by interviewees. This may have affected findings somewhat, as levels of investment and growth levels may have been influenced as a result.

**Findings**

Despite the absence of published work on the use of ECH as a means of enhancing SME competitiveness, the great majority (some 89%) of the enterprises surveyed explored the use of their cultural heritage as a way of adding value. Given the rather abstract nature of this introductory question, interviewees were also asked if they have invested resources in order to preserve or manage their ECH for business purposes. Interestingly, just over one in every three SMEs responded positively to this question. There were some very interesting disparities in the incidence of investment in ECH by country. Established SMEs located in Greece reported the lowest incidence of investment in ECH – just 7% - whilst their counterparts in Italy the highest, some 56%. Just over one in four of responded in both the UK and Finland indicated investment in ECH. Rather unexpectedly, there were precious little difference in ECH investment by sector – ranging between 25%, for other craft sectors, and 30%, in textiles and clothing. The food sector, where we expected probably the highest incidence of investment on ECH – on account of the growing importance attached to local products – occupied a position between these two ends.
In order to identify the areas where established SMEs utilised their ECH, interviewees were asked a series of questions (each focusing on a specific area) using a Lickert type measure (ranging from 1 which indicates unimportant to 4 which indicates vital). Not unexpectedly, established SMEs overwhelmingly stressed the use of ECH on product quality (mean of 3.41) and brand image (3.13). Two other areas of importance revolved around the development of management competences within the organisation (3.03) and the development of personalised relations within the firm (2.95).

Similarities and disparities emerged between countries and sectoral contexts. More specifically, product quality was identified as the main area of utilisation of ECH in the UK, Finland, Italy and Greece. However, in the UK and Finland ECH was used in order to develop the skills of the employees, whereas in Italy this was linked with the development of personalised relationships within the firm, and in Greece this revolved around brand identity. As far as sectoral patterns are concerned, there was commonality in stressing the importance of product quality was identified as the main area of ECH utilisation. Brand image was stressed as the second most important area among established SMEs in the food sector and those firms working in textiles and clothing, whereas originality was stressed among enterprises in other craft industries.

Enterprises surveyed were then asked to identify the benefits conferred through ECH management. As expected some two thirds of the enterprises surveyed pointed at the importance of ECH as a means of building customer loyalty. Interestingly, the second most commonly reported benefit was an increase in employee commitment to the values and goals of the firm, identified by 65% of the total. Other responses included
enhanced innovativeness of the organisation (50%), increased sustainability of production (42%) and decreased costs (18%). There were precious few systematic differences in response by country and sector.

This brings to the fore the issue of the impact of ECH management on SME survival and growth. These two issues were dealt separately in the analysis. As far as SME survival is concerned, and in the absence of historical records going back long enough (the oldest SME surveyed was established in 1731, whilst around one fifth were created before 1900) an unconventional approach was followed. This was based on the view that the age structure of SMEs will take the shape of pyramid – whereby the percentage of firms will decline by age. Evidence from the established enterprises surveyed (see Figure 1 below) indicates that this is the case regarding established SMEs that did not invest in ECH management. Interestingly, however, this is not the case regarding established SMEs that did invest in ECH management. This lends some – though not conclusive – support to the thesis that investment in ECH management may enhance the ability of SMEs to survive.

Figure 1. Age Structure of SMEs by Investment (on not) in ECH management
As far as growth rates are concerned, given the importance of informality in the clothing industry – especially in Greece – it was decided not to pursue change in absolute numbers. Entrepreneurs were therefore asked to evaluate performance using a three point, scale (whereby 1 indicates growing strongly and 3 indicates not growing – including decline). Evidence shows that nearly three times as many established SMEs that invested in ECH management recorded strong growth in comparison to those that did not – 29% and 11% respectively.

Country and sector influence the intensity of the link between investment in ECH management and SME performance. More specifically, investment in ECH management was related to strong performance particularly in the UK (strong growth recorded by five times as many SMEs that invested than not). In terms of sector, investment is linked with strong performance in food, whilst the reverse is the case regarding textiles and clothing.

**Concluding Remarks**

Before drawing conclusions regarding the findings of this study it is worth re-iterating its exploratory nature. Therefore, the number of established SMEs surveyed is modest, the sectoral breakdown is limited – concentrated only on craft sectors – and it involves a snapshot in one point in time, rather than a longitudinal observation of the processes involved in exploiting ECH.

However, the paper identifies and develops a new dimension in that body of literature exploring the impact of the age of firm on SME development. This dimension is captured here with the concept of enterprise cultural heritage. This is an innovative
and complex concept combining the company’s own history and creations (technical contents, industrial design, organization, marketing, etc.) with the potential to transform information and materials into “extended products”. This definition can provide the point of departure of empirical research into ECH management and SME survival and growth.

At the outset the paper set out to address two key research questions. The first examined: how do established SMEs (if at all) exploit the potential involved in their enterprise cultural heritage? The results of the survey indicate a much higher, than originally anticipated, awareness of the advantages in exploiting ECH among established SMEs. Even though only a minority – around a third – actually invested in realising this potential, this shows that entrepreneurial views are leading scholarly understanding. The paper also shows the key areas of ECH use within established SMEs. This involves some areas that were widely anticipated by the researchers involved in the study from the outset (such as product quality and brand image). However, it also includes relational and human capital issues: such as skills, managerial competences, and relationships within the firm. This issue requires further investigation: examining particularly the impact of firm heritage on the prevailing organisational culture. Lastly, the paper indicates that further research in ECH management needs to be particularly sensitive to the specificities of the country and sector context.

The second research question of the paper focuses on the existence (or otherwise) of link between the exploitation of enterprise cultural heritage and SME survival and growth. There is some evidence supporting the thesis that ECH management may be
positively linked with both the ability of the firm to survive and grow in established SMEs. This can be understood conceptually in terms of exploiting an existing source of competitive advantage that may assist in differentiating established SMEs. Moreover, it links with the paper’s point of departure: understanding enterprise cultural heritage as an asset. Undoubtedly additional research is needed – using more sophisticated measures of growth and larger sample sizes – in order to provide conclusive results. Country and sector specificities also need to be taken into account in examining the link between ECH and SME survival and growth.

Bibliography

Factors on the perception of entrepreneurial opportunities and their influence on entrepreneurial intention – an empirical study
by M. Geissler and C. Zanger

This empirical study examines the impact of entrepreneurial opportunities on the formation of entrepreneurial intentions. Furthermore, factors which influence opportunity perception and intention creation were analyzed. The results show that opportunity perception is the main driver in the intention creation process and is influenced by entrepreneurial attitude and self-efficacy. Moreover, there are significant differences between women and men regarding the role of self-efficacy and opportunity recognition. While in the male sample opportunity recognition fully mediates the relationship between self-efficacy and intention the female sample indicates an additional effect of self-efficacy on intention. Furthermore, differences in the impact of entrepreneurial role models came to light.

Introduction

The identification of business opportunities, their selection and finally their exploitation are one of the main drivers of new business creation and entrepreneurship research (Ardichvili et al., 2003); Shane and Venkataraman, 2000). Bygrave and Hofer’s (1991) definition of the term entrepreneur illustrates this close relationship at best. Following these authors “An Entrepreneur is someone who perceives an opportunity and creates an organization to pursue it.” Furthermore, all actions which could be associated with the perception of opportunities and the creation of an organization to pursue them constitute the entrepreneurial process (Bygrave and Hofer, 1991).

1 Mario Geissler is a doctoral candidate in the Department of Marketing at Chemnitz University of Technology. His research focuses on entrepreneurship and technology transfer within academic institutions. Cornelia Zanger is Professor of Marketing and head of the Department of Marketing at Chemnitz University of Technology. Her research focuses on marketing communication and marketing for SMEs. Beyond doubt, understanding this process and its antecedents is one of the major topics in entrepreneurship. Hence, extensive research led to the development of different models aiming at deepening our understanding of this process - frequently stimulated by findings from different fields of psychology. Two approaches became main-influential within today’s entrepreneurship theory, namely the Entrepreneurial Event Model by Shapero (1982) and models inspired by the Theory of Planned Behavior (Ajzen, 1991).

Among both approaches, there is consensus that the intention to become self-employed is a strong predictor of entrepreneurial behavior. However, up to now a direct and explicit link between the research in entrepreneurial intention and the perception and exploitation of business opportunities seems to be missing.

This study aims to shed light on this interconnection and on factors which might be crucial for both, the perception of business opportunities and the development of self employment intentions.

We believe that integrating the perception of business opportunities within established and proven theory of entrepreneurial intention might be important for several reasons. First, knowing about factors which stimulate opportunity perception and intention creation might help to increase our understanding of the business creation process from the very beginning. Second, focusing the nexus of opportunity and intention creation promises further avenues for stimulating entrepreneurial behavior.

Our research proceeds as follows. Starting with reviewing the entrepreneurial intention literature (Carr and Sequeira, 2007; Degeorge and Roberts, 2008; Gird and Bagraim, 2008; Kolvereid and Isaksen, 2006; Liñán and Chen, 2009; Liñán, 2008) and the entrepreneurial opportunity literature (e.g., Baron, 2006; Krueger, 2000; Krueger, 2003; Shane, 2000; Shane and Venkataraman, 2000), we introduce the entrepreneurial opportunity within the intention
creation process and suggest an integrated model. Next, we discuss the sample, the employed measures and the methodology used to validate the model empirically. Finally, we report the results of our analysis and draw conclusions of these findings and their implications for further research, educators, policy makers as well as practice.

**Literature Review**

Previous research identified several factors which might affect the creation of strong entrepreneurial intentions. One important factor has been found in the degree the individual is attracted toward becoming self-employed. This point is represented by the psychological concept of **attitude towards self-employment** (Segal, Borgia, and Schoenfeld, 2005). Results of numerous empirical studies give evidence of the relevance of the attitude concept as a strong and reliable predictor of entrepreneurial intent (Carr and Sequeira, 2007; Degeorge and Roberts, 2008; Gird and Bagraim, 2008; Kolvereid and Isaksen, 2006; Liñán and Chen, 2009; Liñán, 2008).

Furthermore, the concept of **self-efficacy** was found to be a critical determinant of the intention (Bandura, 1997; Cooper and Park, 2008). For entrepreneurship research that implies that the individual judgment of one’s own capabilities required for self-employment might be an important factor of entrepreneurial intention (e.g., Carr and Sequeira, 2007; Cooper and Park, 2008; Kolvereid and Isaksen, 2006; van Gelderen, Brand, van Praag, Bodewes, Poutsma, and van Gils, 2008).

The existence of **role models** constitutes an additional factor affecting the entrepreneurial process, as it influences career expectancy. In addition, positive effects arrive from the simple present of a role model as well as its performance (Scherer, Carley, and Wiebe, 1989). Krueger et al. (2000) underlined, that the effect of entrepreneurial role models on intention can be increased if they have an impact on attitude and self-efficacy. Different authors analyzed these relationships and demonstrate significant positive effects from role models on
entrepreneurial self efficacy and attitude (Arenius and Clercq, 2005; Chen, Greene, and Crick, 1998; Crant, 1996). The results of Allen (2000) suggest that not only the presence of the role model and its performance are crucial for the entrepreneurial process. Moreover, the results give evidence that the role models’ origin (e.g., family or friends) might be a further factor.

Overall, entrepreneurial opportunities are defined as “situations in which new goods, services, raw materials, and organizing methods can be introduced and sold at greater than their cost of production.” (Casson, 1982; Shane and Venkataraman, 2000). Furthermore, Eckhardt and Shane (2003: 336) add that this could be enabled “through the formation of new means, ends or ends-means relationships. […] In addition, unlike optimizing or satisficing decisions, in which the ends that the decision maker is trying to achieve and the means that the decision maker will employ are given, entrepreneurial decisions are creative decisions, That is the entrepreneur constructs the means, the ends or both.”.

Based on these fundamental assumptions, recent literature provides two major approaches that try to explain the creation of new business opportunities. The first stream proposes that opportunities are recognized due to specific individual features distinguishing entrepreneurs from non-entrepreneurs. This literature supposes that entrepreneurs have specific search techniques and scanning behaviors or a specific ability that allows superior information processing (Baron, 2006). In this view, opportunities are constructed and intentionally perceived (Krueger, 2000; Krueger, 2003). The second stream gives evidence that opportunities are discovered (Shane, 2000). This research refers to the nature of an opportunity meaning that it is unknown by definition until its discovery. This seems to deny an intentional and conscious perception. It is argued that people can discover opportunities even without an active search for them.

However, there is evidence that both possibilities - described within the two streams - might happen in entrepreneurial practice. Bhave (1994) describes this phenomenon as internally and
externally stimulated opportunity recognition. His empirical study reveals that 59 percent of the analyzed business creations where stimulated externally and 41 percent internally.

However, while for externally stimulated opportunities the recognition of market or customer needs acts as a starting point for business creation it remains unanswered what factors might stimulate the internally stimulated opportunity exploitation process.

Overall, there is theoretical support and empirical evidence that factors which influence the formation of an entrepreneurial intention might influence people’s ability to perceive business opportunities as well. Existing literature suggests that the ability to perceive business opportunities differs among people (e.g., Venkataraman, 1997; Shane, 2000; Shane and Venkataraman, 2000; Baron and Ensley M. D., 2006; Baron, 2008). The work of Shane (2000) highlights that different knowledge about markets and market needs influence the opportunity discovery process. But knowledge might not only influence the discovery process. The acquisition, storage and use of knowledge are central for human information processing. The term knowledge represents information that is combined with a person’s own experiences, a specific context or interpretations and reflections. Its application guides peoples’ decision making and behavior consciously and unconsciously. Hence, the knowledge a person holds in memory can be crucial for the whole opportunity recognition process from the very beginning. Present studies indicate that the extent of domain-specific knowledge determines the fact if a person becomes aware of a specific opportunity (Haynie, Shepherd, and McMullen, 2009). Furthermore, Ozgen and Baron (2007) demonstrate that the individual judgment of one’s knowledge and skills regarding entrepreneurial tasks - entrepreneurial self-efficacy - influences the process of opportunity recognition to a high extent (e.g., Ardichvili, Cardozo, and Ray, 2003; Ozgen and Baron, 2007; Park, 2005).

In addition, research results in psychology highlight the importance of attitudes on perception, information storage and information retrieval (e.g., Basili 1996; Holbrook et al. 2005). Hence,
the fact that a person lacks a positive attitude towards entrepreneurship might inhibit that business opportunities will be perceived.

Finally, there is evidence that entrepreneurial **role models** might have positive effects on the perception of business opportunities (Aldrich and Cliff, 2003; Jack and Anderson, 2002).

Taking this into account, we propose an entrepreneurial process model which links opportunity perception with entrepreneurial behavior via the intention to become self-employed. Furthermore, we propose that the attitude towards self-employment and self-efficacy influences both, opportunity perception and intention. In turn, the perception of role model performance is assumed to affect attitude, opportunity recognition and self-efficacy.

**Figure 1: Conceptual model**

Finally, recent research suggests that there are differences within the entrepreneurial process between female and male. These results indicate that women and men have unique stocks of human capital that they use differently in the opportunity recognition process (Arenius and Clercq, 2005; DeTienne and Chandler, 2007; O'Connor, Hamouda, McKeon, Henry, and Johnston, 2006). Empirical studies in entrepreneurial self-efficacy and intention come to similar findings: there are gender differences within the entrepreneurial process (Lee and Wong, 2004; Wilson, Kickul, and Marlino, 2007).
**Method**

We collected data for this study through a survey at two German universities. In total, 271 students returned the standardized questionnaires. Of the respondents, 45.6 percent were female. Mean age was 24.4 (SD=3.56).

Respondents rated all measures on seven-point Likert-type scales (1=‘totally disagree’, and 7=‘totally agree’) or semantic differentials. Intention was measured with three (Lüthje, Franke 2003, \( \alpha=.94 \)), attitude with four (Bagozzi, Dholakia 2006, \( \alpha=.92 \)) and entrepreneurial self-efficacy with five items ((Chen et al., 1998, \( \alpha=.93 \)). For opportunity recognition we used three items (Ozgen and Baron, 2007; \( \alpha=.88 \)). First entrepreneurial behavior was measured by asking participants if they had performed several venture-creation related behaviors within the last year (de Clercq, Arenius 2006). The list contained behaviors such as organizing a spin-off team, looking for a spin-off location, or working on a business plan. Furthermore, referring to Scherer (1989) we asked participants if they came in touch with entrepreneurship among family or friends and how they rate the role models’ performance regarding financial return and satisfaction with the work. The means, standard deviations and correlations are provided in table 1. Factor loadings, composite reliability, average variance extracted, highest squared correlation between the model constructs, coefficient of determination, and predictive relevance reliabilities for all of our multi-item scales are listed in table 2 and 3.

NOTE: M = mean, SD = standard derivation, CR = composite reliability, AVE = average variance extracted, Corr² = highest squared correlation between the model constructs, R² = coefficient of determination, Q² = predictive relevance (Stone-Geisser criterion)

As reported in table 2 and table 3 all measurement models show values above the required thresholds regarding reliability, convergent and discriminant validity (Fornell and Larcker, 1981; Hair et al., 2006). Therefore, we suggest that our measures are reliable and valid. Furthermore, a Q² value greater than zero indicates that there is predictive relevance within the structural relationships (Fornell and Cha, 1994).

### Results

The structural models (see figure 2 and 3) for both sub samples demonstrate that opportunity recognition is the main driver for intention creation for both samples (female: β = .41; p < .01; male: β = .69; p < .01) and is strongly influenced by attitude (female: β = .30; p < .01; male: β = .40; p < .01) and self-efficacy (female: β = .33; p < .01; male: β = .34; p < .01) to nearly the same extent. Furthermore, in both samples attitude shows significant effects on intention (female: β = .26; p < .01; male: β = .26; p < .01) while self-efficacy fails in the male sample (female: β = .19; p < .01). For the female sample a significant effect from self-
efficacy on intention is obvious. In addition, role model performance influences self efficacy in both samples \( \text{female: } \beta = .31; p < .01; \text{ male: } \beta = .20; p < .01 \) and attitude \( \text{female: } \beta = .22; p < .01 \) in the female sample. According to theory there is also a strong link from intention to behavior \( \text{female: } \beta = .52; p < .01; \text{ male: } \beta = .60; p < .01 \).

**Figure 2: The structural models with path coefficients for female sub-samples (standardized values)**

![Diagram of the structural model for female sub-samples](image)

*Note: All paths with $\beta > .15$ are significant at $p < .01$; $N=123$*

Additional analysis following Baron and Kenny (1986) shows that opportunity recognition mediates the relationship between self-efficacy and intention.

**Figure 3: The structural models with path coefficients for male sub-samples (standardized values)**

![Diagram of the structural model for male sub-samples](image)

*Note: All paths with $\beta > .15$ are significant at $p < .01$*
We can identify several differences in the extent of the path coefficients when we compare female and male sample as shown in Figure 2. We used the following formula (Chin, 2000) to calculate whether the differences between both samples are significant:

\[
t = \frac{Path_{sample_1} - Path_{sample_2}}{\sqrt{\frac{(m-1)^2}{(m+n-2)} S.E_{sample_1}^2 + \frac{(n-1)^2}{(m+n-2)} S.E_{sample_2}^2}} \times \sqrt{\frac{1}{m} + \frac{1}{n}}
\]

with \( m \) being the cases in the female sample (123), \( n \) the cases in the male sample (148) and S.E. the standard error of the respective sample.

We identified significant differences regarding the effect of opportunity perception on intention and intention on nascent behavior (see Table 4) when we examined both groups. All other differences proved to be not significant.

Furthermore, if we consider the characteristics of the formative indicators of role model performance we recognize that for female students it might be more necessary that the family role model is successful. Male students in turn, seem to focus more on the success of friends and their entrepreneurial experiences.

Implications

The purpose of this study was, first, to shed light on the interconnection between the perception of business opportunities and the entrepreneurial intention and, second, to examine factors which might be crucial for both, the perception of business opportunities and the development of self employment intentions.

Thereby, the study reveals the link between opportunity recognition and intention towards self-employment and behavior. It turns out that both - attitude towards self-employment and entrepreneurial self-efficacy - have an important impact on opportunity recognition. In turn, the ability to recognize opportunities is strongly linked to entrepreneurial intention. Furthermore, the mediation effect found has important practical implications. Instruments aiming at fostering entrepreneurship may develop entrepreneurial self-efficacy and make positive attitudes toward entrepreneurship more salient. Furthermore, instruments enhancing opportunity recognition might be employed. For one important reason: If opportunity recognition is lacking there will be little chance for establishing a strong entrepreneurial intention although entrepreneurial self-efficacy exists.

In this light, our study has several important implications for educators and policy makers. Since opportunity recognition mediates the self-efficacy-intention link and that there are gender differences it seems that male students are best served by teaching them how to recognize opportunities, e.g. by teaching them to creatively interpret their everyday environment or to be aware of future trends within their study (DeTienne and Chandler, 2007). Although this is important to female students as well their intention might be stimulated even more effectively by increasing their self-efficacy which contributes to both - opportunity recognition and intention creation. At this point, communicating successful role models female students could identify with seems to be a worthwhile approach. Enhancing
self-efficacy seems to be even more crucial since women’s entrepreneurial intention is less stimulated by recognized business opportunities compared to men.

Moreover, we found that women are open to successful role models which have a significant effect on their attitude towards entrepreneurship. Thereby, successful entrepreneurs within the family seem to be most important.

**Limitations and Future Research**

As an initial exploration of the relationship between opportunity recognition and entrepreneurial intention, the study naturally entails several limitations. Many of them constitute interesting points for future research.

First, we acknowledge limitations to our sample. Although our sample contains students from various subjects with different views on entrepreneurship

Second, it might be interesting to include further cognitive variables such as perception of risk. Furthermore, entrepreneurial opportunity recognition was measured with a focus on quantity. It will be promising to develop and employ measurements that combine quantitative as well as qualitative aspects of entrepreneurial opportunities. Furthermore, especially for educators it may be worthwhile to include different kinds of actual knowledge such as domain-specific knowledge and knowledge regarding business foundation (e.g., estimation of market potential, financial aspects, and openness to market and customer needs).

Small Business Entrepreneurs and the Challenge of Handling Taxation:
An Empirical Investigation with Practical Implications

WORK IN PROGRESS presented at the ICSB World Conference 2010, Cincinnati, USA

Short Abstract: Nascent entrepreneurs after starting their business face multiple challenges. One is taxpaying. Entrepreneurs suddenly need to take care of taxpaying themselves, including the duty of implementing and running various tax relevant systems. Germany is known for one of the most complex legislations on taxation. In this explorative study, we try to identify the most challenging areas the field of taxation. Therefore we have questioned 56 tax consultants and eight tax inspectors. Descriptive results are presented. Entrepreneurs with no vocational training have more problems with taxpaying than all other educational groups. Migrant entrepreneurs do not face more difficulties than German entrepreneurs. Entrepreneurs in the gastronomy industry are most likely to get in conflict with tax legislation. Entrepreneurs need more advice on certain areas of taxpaying than on others. Detailed results will be displayed with the full paper.

Key words: entrepreneurship, entrepreneurs, difficulties with taxation, tax advisors, consultants, Germany.
Principal Topic and Introduction

Nascent entrepreneurs at the edge of starting their business face multiple challenges. One unpopular burden is the one of taxpaying. Different from what it was in their earlier occupational life (in regular employment), entrepreneurs suddenly need to take care of taxpaying themselves, including the duty of implementing and running various tax relevant systems: bookkeeping and drawing up balance sheets, calculating depreciations, paying taxes on wages, filing preliminary turnover tax return and declaring actual sales taxes to name just a few. Besides, some businesses require the design of an elaborated taxation model to avoid unnecessary taxations. Others apply for aid from the tax office, designed as governmental support for start-ups (e.g. virtual accelerated depreciation on future acquisition costs of tangible fixed assets or booking incorporation costs as an asset) – or fail to apply for such benefits. The area of potential wrong doing and mishaps ranges from filling in forms to more challenging tasks of managing taxation on a more strategic CFO-level.

Some entrepreneurs ask for advice from tax counselors during the planning process and have tax accountants and advisors ready to support them during the startup process and thereafter. However, especially small business start-ups often fail to pay sufficient attention to taxation and do not reach out for counselors’ tax advice in the first place. While mid-sized and large scale start-ups must frequently employ the services of chartered accountants and tax counselors, small business owners – who are not subject to such legal requirements – sometimes go for a “do it yourself”-approach, ending up in unprofessional mishaps.

The aim of our study is to reveal empirical information on such mishaps. What kinds of errors in the field of taxation occur frequently with small business start-ups? What kinds of mishaps are dangerous hazards for young companies? How many companies fail due to mishaps in the area of taxation? How many small business owners stick to the “do it yourself-approach”, how many get counseled during business planning and start-up process? Where do they get
information and advice from: online forums, official governmental web pages and citizens’ advice bureaus, or (costly) tax consultants? Does the lack of professional tax counseling necessarily result in mishaps? Are certain groups of entrepreneurs more likely to get involved in wrong doing than others, e.g. less educated individuals, or migrant and ethnic entrepreneurs?

**Method**

To address these research questions, in a first step we have studied discussions on the internet, monitoring relevant online forums and web based discussion boards. This approach generated first insides about what areas are addressed by entrepreneurs seeking for advice on the internet. In a second step we have conducted expert interviews with tax counselors and academics in the field of taxation. In addition we have analyzed information on taxation provided by official governmental web pages designed to support start-ups (www.existenzgruender.de). Based on the results of this exploratory approach, we have designed a questionnaire. After pre-testing, one questionnaire was distributed among tax counselors and tax inspectors. Thus, our empirical assessment on entrepreneurs’ mishaps in the area of taxpaying does not rely on entrepreneurs’ self-reporting.

Both questionnaires allow distinguishing the most frequent and the most dangerous mishaps. They also allow for tracking some potential influential factors, such as the entrepreneurs’ background (education, migration, ethnicity, age, experience, industry). The questionnaires were sent to a representative number of tax counselors and tax inspectors in a German county called “Bergisches Land”, an urban area with approx. 1 Million inhabitants. We received answers from 56 tax counselors and 10 tax officials. More than 50% of all counselors have advised more than 100 start-ups. Only 3% have dealt with less than 20 start-ups. We therefore assume that great knowledge and experience has accumulated in those individuals who answered to the questionnaire.
Results and Implications

As this paper reflects work in progress, it will basically focus on displaying descriptive results. The first diagram displays how frequently entrepreneurs seek for advice in certain areas of taxation. A four interval Likert scale was used to indicate frequency.

Diagram 1: How frequently do entrepreneurs search advice in the area of…. (see legend A to V)

To our surprise, consultations on how to interact and communicate with fiscal authorities was the most frequent issue for entrepreneurs. We asked to indicate areas in which entrepreneurs have done wrong before contacting a tax counselor. Results are displayed in Diagram 2. Not installing appropriate accounting systems, failing to issue correct invoices and a lack in proper start-up planning.
Diagram 2: In what areas do entrepreneurs make mistakes before contacting a tax counselor?

Not every mistake will lead to situation which put the new company on risk of further existence. Some mistakes can be corrected, but certain others may lead to serious situations. Not paying taxes of course can seriously harm a company, but also a lack of planning leading to unexpected costs, not declaring income statements, and a lack of accounting systems are among the most serious threats. We had an additional open question; consultants addressed a lack of entrepreneurial mindset, passion, and energy in some small business owners.

Diagram 3: In what areas are mistakes threatening the existence of the start-up?
If these results are compared with the answers of tax officials, it can be seen that tax officers indicated problems on a higher level. However, in general there estimation reassembles the shape of the spider web Diagram 3, just on a higher level, except for VAT, an area seen more critical by tax officials.

Diagram 4: Do tax consultants and tax officials have different perceptions of problematic areas?

70% of consultants believe that there are no distinct industries where entrepreneurs run into problems more frequently than in other areas. The other 30% named gastronomy and construction as the two industries where entrepreneurs run into problems with tax authorities more often. Tax officials agreed in 100% that certain industries or trades are more likely to get into conflict with taxation. They named gastronomy, construction, internet retailers, and car repair garages. To some surprise franchise start-ups were also mentioned.

The level of education is seen as an influential factor. The lower the education the more likely mistakes in handling taxations occur. Both, consultants and tax officials, reported this. While this result was expected, it was found that immigrant entrepreneurs are not reported by consultants to have problems in the area of taxation more often than non migrants. Tax officers have a different perspective; they pronounce that immigrant entrepreneurs have more problems to handle taxation.
A German governmental website (www.existenzgruender.de) gives advice to entrepreneurs. In a section that addresses taxation, the authors of the web site address certain areas. Tax consultants find these areas well chosen, except for inapt legal forms.

In an open comment section consultants pointed out that for many nascent entrepreneurs problems occur in their private life, because of all the unforeseen impact of such a movement, and that there is no support addressing such issues. It was commented that consulting a tax adviser may not make a company necessarily more successful, but at least it will open the entrepreneur’s eyes for problems that have not been recognized. Programs that encourage unqualified necessity entrepreneurs (in order to deal with the issue of unemployment) are blamed for an increase in problems with tax authorities. A lack of general business administrative knowledge and the need to run formalized procedures are addressed. Tax officers point out that most “entrepreneurs” who get into conflict with tax authorities execute only a small side business, so mistakes in taxation have no big impact and can be corrected easily.

**Discussion of results and implications**

Results address all interest groups of the ICSB World Conference: educators, researchers, practitioners, and policy makers. Educators and researchers gain insights from real world activities. In the area of teaching, especially German and Austrian educators find insights that can help to adjust contents of courses designed to practically educate small business entrepreneurs. Results seem to support our view that most courses are not designed in a “hands on manner” according to the empirically measured need for very basic and practical advice and lack of awareness. Academics will furthermore be provided with an empirical “point of origin” for further research. Practitioners are provided with check lists of areas
others have failed in. Results can help to avoid lacking awareness or replicating mishaps that have already occurred to others. Policy makers gain insights in how complicated tax systems occur to small business entrepreneurs, especially the less educated ones. From the viewpoint of policy makers, the tax system may seem to be inherently logical, well crafted, and very detailed serving a broad set of distinct cases individually, but it still (or outright therefore) overstrains many small business owners, especially less educated and inexperienced small entrepreneurs in the start-up stage. A less distinct case-based and detailed framework but more general rules to follow instead, a longer validity period of rules which have once been established, and a simpler approach in communication between taxpaying entrepreneurs and tax office are only three implications drawn from our results. It seems that simplicity could be the best way of governmental tax support for small business start-ups.

Abstract

In this paper we present a methodological approach aimed at analysing relationships between dynamic capabilities and innovation processes realized by SMEs. Starting from the concepts of dynamic capabilities developed by Teece et al. (1997) and the one of the antecedents developed by Borch and Madsen (2007), we analyze firm resources crucial for taking firms towards new innovation processes. We consider three types of dynamic capabilities: learning, coordination/integration and reconfiguration, and three types of antecedents, namely knowledge assets, organizational and managerial assets and position assets. Then, we tested the methodology in the course of case studies realized in the business area of Naples, Italy, and we drew the configuration of dynamic capabilities for each analyzed innovation trying to understand the evolution of resources activated by the entrepreneurs to take innovation processes.

1. Introduction

In the last few years many researchers have focused their attention on the problem of the definition and analysis of the capabilities of Small and Medium Enterprises (SMEs) for planning and undertaking successful innovations (Branzei, Vertinsky, 2006; Freel, 2005; Wiklund, Shepherd, 2005). Researchers highlighted that in SMEs, the innovative process starts from the entrepreneur’s perception of changes in the settings, as well as from the way in which, given such changes, it is possible to create opportunities for diversification of processes, products and markets.
According to resource-based theory, other researchers highlighted that innovation capabilities in SMEs are strictly connected to the kind and the amount of specific resources entrepreneurs are able to acquire, develop and manage in the course of a company’s lifetime (Amit, Shoemaker, 1993; Barney, 1991; Grant, 1991; Rumelt, 1984).

Recent theoretical developments suggest that innovation capabilities evolve over time, and several organizational and environmental levers contribute to their founding, development, maturation, and alteration (Helfat and Peteraf, 2003). Particularly, Dynamic capabilities can be defined as the ability to build, integrate and reconfigure both external and internal resources and routines (Eisenhardt and Martin, 2000; Teece et al., 1997; Zahra and George, 2002; Zahra et al., 2006).

Focus on dynamic capabilities is of special importance for entrepreneurial small firms. Zahara et al. (2006) claim that too little has been done until now to understand the types of organizational capabilities that are needed in pursuing new and innovative strategies within SMEs. In SMEs, entrepreneurs’ behaviors are acknowledged as some of the most critical antecedents of capability transformation: “unless the external selection environment is so constraining that it limits managers to only one possible option, different managers in different firms may make different choices” (Helfat and Peteraf, 2003: 1004). Empirical and theoretical evidence linking these aspects with innovativeness in small business is limited and mostly anecdotal. The question of whether or how firms select and maneuver bundles of strategic interventions to enhance their extant capabilities has remained unaddressed.

This study is aimed at examining which specific types of capabilities and resources sustain innovation processes in SMEs, and how such capabilities evolve over time as stated in the dynamic capabilities theory.

In particular, linking DCs to antecedents, the scope is to understand where is the locus of the antecedents to firm-level dynamic capabilities. We argue that, as a set, innovation processes are
sustain mainly by the entrepreneur especially in the first phase of the firm’s life. In the course of its life, the activation of extra resources and capabilities is needed where the firm aims at storing and increasing a competitive advantage, namely the activation of routines known as DC.

2. Methodological approach

Our methodological approach is founded on two main assumptions. One is the concept of dynamic capabilities (DC). The DC literature is concerned with how firms prepare for the exploitation of new opportunities in future markets. DC can be defined as those capabilities that help a firm revise their routines, mindset and action patterns to face turbulent environments (March, 1991). The availability of such capabilities may explain why some firms discover and exploit opportunities ahead of their competitors, thus achieving competitive advantage (Eisenhardt and Martin, 2000; Teece et al., 1997).

The second is the concept of antecedents, that can be defined as assets and capabilities that firm activate to reach the success in an innovation process. The activation of such antecedents will have an influence on a specific set of dynamic capabilities, thus the firm will acquire the ability to reproduce, in the course of the next innovation, the needed routines to innovate.

While important conceptual advancements have been made concerning the role of DC, empirical work in the area is scarce. So far research has not provided a compelling explanation for the ability of some new and established companies to continuously create, define, discover and exploit entrepreneurial opportunities (Zahara et al., 2006).

Based on Teece et al. (1997), Eisenhardt and Brown (1999) and Borch and Madsen (2007), we look at the antecedents of three type of DC: coordination and integration (of both internal and external activities), learning (seen as social and collective and defined as repetition and experimentation which enables tasks to be performed better and quicker), and reconfiguration and
transformation (of resources based on the ability to scan the environment to evaluate the markets and competitors).

2.1 Methodological steps

The aims of this explorative research were to help the entrepreneurs to reconstruct the history of the principal innovations undertaken by their firm and to bring to light the role that his capabilities and those of his collaborators, as well as the possible relationships of collaboration with subjects outside the enterprise, have had in the success of the innovation.

The ultimate goal was the identification of specific typologies of dynamic capabilities activated by entrepreneurs to develop and support the process of innovation, and the successful innovative behavior which, appropriately generalized, may act as a stimulus for entrepreneurs and their innovative behavior in other sectors.

To measure the dynamic capabilities, we considered the items reported in the hierarchical three as reported in the following table. We associated three set of assets (knowledge, managerial and organizational, and position assets), based on Teece et al., (1997) at each dynamic capabilities. Also we identified a list of antecedents to establish the relationship between each assets and the dynamic capabilities.

Table 1 – List of Antecedents to the Dynamic Capabilities

2.2 Methodological set

The exploratory nature of this study suggests the use of a qualitative methodological approach. Thus case study is a useful tool to understand the complex nature of entrepreneurship, as recommended by Gartner and Birley (2002). Aim of each case study was to understand, for each innovation processes, the impact of the antecedents on the activation of a specific DC.
The cases are based on semi-structured interviews with entrepreneurs. Starting from their personal story and career, the interview covered the following topics: story of the firm or previous work experience, products, market, innovation activities, internal organization, analysis of annual reports, website and other information available onto the web site.

A single case study for every enterprise has been developed by the researcher, in order to summarize and better fix the interviews and the entrepreneur words. A feedback mechanism has been used: every single case has been read, rectified or amended by the people who has been interviewed. Furthermore when cases are retrospective and interview based, there are many method issues that fundamentally threaten the validity of the findings come to the fore. We will not deal with the direct observation of behaviors, but their retrospective self reports. These reports are subject to memory decay, hindsight bias/rationalization after the fact and social desiderability problems (Davidsson, 2008). Cognitive psychology suggests that memory is constructive in nature (Anderson, 1990). The respondent of a survey or of an interview can be honest and careful, but it is likely that during the years he distort the image of what happened during the start-up process or during the particular temporal moments considered by the interviewer. This problem is remedied through triangulation (other informants, written documentation, secondary data, past reports, analysis of balance sheets and business plans).

3. Preliminary results

Since this paper is presenting a work in progress, only few results of the research will be presented in the following sections. As the interviews with the entrepreneurs have been realized, the analysis based on the methodological approach is still in development. For all these reasons, in the following section we will present the characteristics of the case studies, and some preliminary results based on the interviews. In particular, we will try to understand, based on the story told by all the entrepreneurs, which kind of specific DCs had been activated in the course of each
innovation process analyzed in the course of the firm’s history, and then we tried to relate such capabilities to a specific set of organizational routines.

Further development of the research will then provide the link between the DCs and the antecedents, in order to relate the nature of the activated antecedents and the DCs that enabled the innovation.

3.1 The case studies

The data was gathered within a list of innovative firms in the Campania Region, in Italy. Then, we selected the firms on the basis on the following criteria:

- undertaking of radical innovations involving significant changes in the performance of products and processes with respect to what was offered by competitors, and which resulted into substantial improvements in the company’s competitiveness;
- absence of resources exclusively devoted to research and innovation;
- entrepreneur’s orientation towards innovation;
- relations (also at informal level) with possible sources of external knowledge and orientation to interact with them;
- the family firm is at least at the second generation of entrepreneurs
- time to devote to the interview.

The following table provides a summary of the enterprises according to: their dimension; their average turnover in the last three years; the sector in which they operate; the territorial catchment area of their user base; the modality through which they relate to the external market (clients and suppliers); and the geographical market of reference.

For each case study, we realized an in depth interview with the entrepreneurs. The interview was aimed at revealing the main innovation processes realized in the last fifteen years, and we tried to re-built which specific routines were activated to enable the realization of the innovation. For this reason, for each case study, we will report the main innovations (both product/service and process innovation) realized by the firm, and the preliminary results where we tried to relate the DCs to specific typologies of organizational routines.

3.2 Case study 1

This company was started up in 1968 as a family run garage with a few employees organised on the model of the Ford production line: each employee was assigned to a specific production process. Today the Company has more than thirty employees and a total surface of about 10,000 m², and an average annual turnover of 1 million Euros.

The innovations analyzed in the case study are the three concerned as to be the most significant realized by the interviewed entrepreneur (who is the second generation in the firm). We associated those routines to a specific dynamic capability as shown in the following table:
Table 4 - Main Innovations of Company Two

The water-based painting technique innovation was implemented few years before the enforcement of the law on car paints which made the use of water-based solutions mandatory. The knowledge and the expertise gained by the entrepreneur, especially following trips abroad, represented a fundamental aspect in the acquisition of this innovation. It was extremely important to activate managerial and organisational assets so as to guarantee the introduction of a new and technologically evolved process like water-based painting. The activation of contacts with the suppliers was of great importance for the success of the innovation, in that this guaranteed training in the use of new machinery for colour painting of cars.

The quality certification approach was followed in the twenty’s although several small car body shop didn’t found interesting and profitable the solution of a certification. But the entrepreneur strongly believed that the certification was a crucial way to increase the level of quality of the service, and the ideal occasion to renew the whole organization of the factory.

With reference to the multi-service centre development, the entrepreneur’s capabilities were once again fundamental as he was able to interpret in advance the evolution trends within the sector. These trends moved towards concentrating within a single structure different processes connected to the
world of motorcars (from repair estimates for insurance, to painting and mechanical repairs, from breakdown assistance to trade agreements with important car manufacturers). In the expansion process of the productive activity, the constant growth of internal professional competencies also enabled to expand the range of products offered by the enterprise to services that were collateral to the repair of vehicles.

3.3 Case study 2

This is a company that operates in the sector of crushed-ice machines and cold drinks vending machines. Founded in the 1960s, today it has a total of 25 employees and an average turnover of about 3 million Euros. Its production is aimed at a prevalently Italian market (about 80% of the production), while distribution abroad mainly targets EU countries and North America. The innovations analyzed in the case study are the three concerned as to be the most significant realized by the interviewed entrepreneur (who is the second generation in the firm). We associated those routines to a specific dynamic capability as shown in the following table:

Table 5 - Main Innovations of Company Two

Reconfiguration |
The first innovation analyzed in the history of the Company was realized in 1996, with the development of the first crushed-ice maker with microprocessors. The 1996 crushed-ice maker with microprocessors was the first ice-maker with a high technological content. The entrepreneur’s training encompassed a basic knowledge of electronics, which gave him a clear understanding of the possible use of this technology in the sector of ice-makers. Also due to the commitment of the planning department, 3D design and all the computer design techniques in use today were successfully introduced into the company. The innovation was introduced in a gradual way into the market so as to reduce the risk of wasting a valid, but in any case innovative, product. Besides, a planning process was forming and the development times became notably shorter, from 5 to 2 years. The strong links with the suppliers enabled to finalize a product with a high electronic content.

In 2004, following the philosophy of the well-known Toyota way, the entrepreneur decided to adopt some interesting concept of this business approach starting from the introduction of a lean production, ending with the so called “kaizen week”, where all the employees meet each other to talk about problem and ideas.

With reference to the last innovation (high volume crushed-ice maker, 2006), the organisation and rationalisation of the planning process proved fundamental and was guaranteed by the competencies and the know-how developed by the entrepreneur. In this case, the impulse towards innovation came from an idea of a client, who had expressed a specific need to the Company. Therefore the client was the principal source of this innovation. Lastly, with the support of the new software, business procedures and the work of collaborators, in twelve months the project was designed and a prototype was completed and manufactured.
3.4 Case study 3

The origin of the Company Three may be traced to the end of the 19th century, to the start of a flourishing company which has now reached production levels able to turnover an average of 30 million Euros per annum. The company, with a current organisational structure of about 70 employees, operates in the production of condiments and seasoning products that are mainly exported. The innovations which have been examined with the entrepreneurs, and which shall be analysed in the following sections, are as follows:

Table 6 - Main Innovations of Company Three

The intention and will of the entrepreneurial group to uniform internal procedures and formalise the control systems in order to improve the quality of the products and services, as well as the availability to make investments, the attention towards clients’ requests and the capacity to motivate their collaborators, brought about the certification of the production process of the Company in 1995. The introduction of this certification undoubtedly represents an innovative aspect. In this respect, the willingness of the collaborators to learn the procedures of the Quality Control System led to the certification in a brief time. The capacity for redesigning the internal procedures and formalising the control systems to make them more compliant with the Quality Control System also represented critical elements for the realisation of this innovation.
In 2003, the Entrepreneurial Group understood the importance of offering a product whose characteristics could be objectively identified by means of scientific analysis. They managed to identify research centres having the right competencies for undertaking the project, in that a strong phase of scientific research was required to identify the organoleptic features of the product. The ability to realise an olfactometer within a shorter time span and at lower costs vis-à-vis the initial plans was due to the high project management skills. The suggestions provided by sales personnel and personnel of the Research and Development Centre of the company to the entrepreneurial group were critical in the project phase for experimentation of the system. In this phase, the collaboration with the Universities and the Research Centres proved effective.

The last innovation to be examined is the launch of a new product on the market. The entrepreneurial group worked to explore and create new possibilities to differentiate the products and make it more ‘attractive’ to different target consumers. Through extensive market analyses, a new product was designed. The flexibility of the personnel to rapidly adjust to the new production process, the capacity to coordinate an in-depth study of the different packaging methods of the new product (working in close contact with the suppliers), the ability to finalize the new product in 12 months as well as the realisation of new commercial and marketing policies guaranteed the success of this innovation.

4. Preliminary Discussion and Conclusions

The present study is one of the first attempts to explore the relationship between dynamic capabilities and entrepreneurial resources activated as antecedents of the DCs. In this paper we presented some preliminary results based on three case studies. Currently, we are further analyzing the results of those three interviews, and we are ending two extra case studies.

Preliminary results show how the continuity of innovation processes in SMEs is strictly related to the ability of the entrepreneur in activating a specific set of assets as antecedents of DCs. And
that in all the firms analyzed, all the entrepreneurs were able to activate specific routines to realize both process and product innovations.

If we look at the current situation, the firm shows emphasis on dynamic capabilities as routines and processes usually activated when approaching to a new innovation challenge. This means that entrepreneurs, in the course of the life-cycle of the firms, have been able to acquire and take care of different sets of resources that actually can be translated in DC.

This study also highlighted the linkage between some antecedents and specific dynamic capabilities. By extending the analysis to a wider set of firms, our final aim is to link a set of antecedents impacting a specific dynamic capabilities to a typology of innovation (product innovation, process innovation, etc…), in order to realize strategic decision making tool to help entrepreneur in the realization of innovation processes.

Future of Daedok Innopolis as a Global Science City in Northeast Asia

Sang-Chul Park

1. Introduction

Regarding the statistics of the International Association of Science Parks (IASP) in 2009, there are over 1,500 science parks in the world. Among these, over 70% of science parks are operating in advanced industrialized nations. In fact, it is a truly difficult task to become a successful science parks model. The reasons for it are as follows. Firstly, research has shown that it takes much longer time than expected and secondly, due to the various indigenous and external factor influences.

At the same time, newly industrialized countries (NICs) are aggressively building their high-tech oriented clusters, which are linked to strategies for national and regional technology development (Park, 2000a). This global trend has become stronger than ever with emerging a new global economic order that underlines the significance of a technology development capacity.

As one of many NICs, South Korean industries have developed most rapidly in the last thirty years. As the result, it became a major power in electronics manufacturing and some areas of information technology (Wakabayashi & Sumita, 1993). South Korea has continuously upgraded its technological foundation as well as the quality of its technical and engineering work forces. This successful story is based on providing necessary government support for industrial and communications infrastructure, labour training, credit and trade policy on the one hand and strong willing of South Korean companies to increase their competitiveness in the world.
market on the other (Bloom, 1993). At present, however, all of the industrial sectors suffer from a global financial crisis and a restructuring process that stems from unstable and exceeded short-term bank loans as well as sluggish global demands although South Korean economic situation seems to be relatively better than any other industrialized nations.

In order to strengthen its technology policy, the government established the Ministry of Science and Technology (MOST) in 1967 that was responsible for coordinating the technology programs of different ministries. However, this task cannot be carried out properly due to conflicts between ministries. Hence, the National Council for Science and Technology was established in 1973. In the council, the Prime Minister became the chairman and MOST served as the secretariat. This council developed into a new and more powerful institution under the chairmanship of the President of the Republic in 1982. It was named as the National Technology Promotion council, comprising of about 200 members including high-level officials, industrialists, and scientists (Park, 2000b). The council dealt with the implementation of the technology policy and played a critical role for technological development in South Korea (Castells, 1994).

The technology policy focused on targeted fields, which contributed to national economic development and at the same time Chaebol, conglomerate oriented economic policy based on heavy and chemical industries, which caused a severe regional imbalance in the territory. The government realized the need for regional decentralization and the upgrading of the industrial structure pursuing technological transference from imported technology to developing nation's own technology. For a symbolic value of national R & D facilities contributing to regional development as well as to upgrading national technology standards, former president Park Chung Hee
decided on building a new science town in central South Korea in 1973 (Park, 2000c). Since then Daedok Innopolis has developed in several phases.

This paper focuses on the performance of Daedok Innopolis (DI) based on R & D activity, technology innovation and future-oriented strategy. This also argues strategic point of views regarding why DI has been created and developed. Additionally, an input and output analysis based on the amount of capital investment and the number of patents is adopted in order to assess the results of DI.

2. Theoretical Debate on Innovation Theory and Regional Innovation System

Technology innovation impacts significantly on national and regional economic development. It is also safe to say that technology innovation contributes to further technology diffusion as well as technology change (OECD, 2000). Technology innovation is related with the processes of technological change, which consist of invention, innovation, and diffusion.

Regarding the accumulation of technical knowledge, Dosi (1982) already urged that the knowledge leads to the formation of a path of possible technical developments. Furthermore, the cumulative nature of the technological process narrows down the range of potential choices that is regarded as the evolution of the technology proceeds. David (1985) characterized this as the path dependency theory embodying strong prescriptions about which technological change should be pursued and which should be neglected. Where the cumulative nature of the process of technological development involves the narrowing of ranges of potential choices, national trajectories enable differentiation and diversification from the main development path (OECD 1992). However, Schienstock and Hämäläinen (2001) argue that a risk of path dependency exists when a specific development path in an
economy exhausts itself. This is indicated by a loss of competitiveness, retarding economic growth, and increasing unemployment. Therefore, Grabher (1993) and Schienstock (1997) insist that such a lock-in phenomenon suggests paying more attention to the aspect of path creation.

In fact, Schumpeter (1942) already stressed that innovation implies breaking out of the traditional path of technological development, which is regarded as the process of creative destruction. He urged the will of the entrepreneur as decisive for the creation of a new development path. As such, a theory of path creation can provide a way of understanding how entrepreneurs escape a lock-in situation. Garud and Karnoe (2000) explain that path creation is interpreted as a process of transforming a technological field in which different actors with different frames are cooperating. In the transformation process, the entrepreneur plays a main role as a stimulator and coordinator at a business level.

According to the path-creation perspective, all economic actors are regarded as knowledgeable agents with a capacity to react in ways other than those prescribed by the existing social rules and technological artifacts. However, David (2000) argues that a new path-creating innovation needs the development and coordination of a vast array of complementary elements that include new management techniques, new organization forms, new kind of workforce skills, new infrastructure, government policies, public organizations etc.

Path creation processes require the importance of trial and error. Stable processes of path creation and diffusion can generate positive results if all actors of an innovation system cooperate, review each other’s change processes and finally adapt to them. In addition, continuous exchange of information and knowledge in dialogues and multilogues is required for stabilizing a new development path. In this regard,
Schienstock (1996) explained that the government plays a key role in the path creation process. Furthermore, path creation also needs new forms of coordinating and various innovation activities such as vision creation and discursive coordination.

Schienstock (2007a) identify five factors that explain the emergence of a new techno-organizational development path. These are a window of new opportunities opened up by a new knowledge paradigm, a market promising long term profits, economic pressures to adapt to the new paradigm, change events that trigger and support the transformation process as well as courses of action that steer techno-economic development into a new direction and introduction of techno-organizational and institutional changes.

Concerning the technological aspect, the functions of the information and communication technology (ICT) represent a fundamental change even for new comers, while the network model focusing on intra- and inter-organizational knowledge flows can be regarded as a new logic of organizing businesses more effectively in the organizational aspect. This is a new techno-organizational trajectory in the globalization era. Bassanini and Dosi (2001) explain that by understanding the new trajectory it is not wise to focus only on objective factors such as new opportunities, economic pressures, change events etc. Instead of the objective factors it is also important to emphasize human will. The reason for it is that path creation is regarded as a process of cautious deviation by people understanding the opportunities that the new paradigm offers.

Accordingly, Schienstock (2007a) urges that the transformation process to a great extent use to be dependent on the engagement of social pioneers such as scientists, politicians and entrepreneurs who prepared to initiate and conduct anticipatory institutional change. Moreover, Teubal (1998) also stress that it is important to re-
establish a good match between the new techno-organizational paradigm and the institutions that facilitate its full deployment through the economy by unleashing a multitude of social and institutional innovations.

Additionally, Schienstock (2007b) distinguishes a theory of socio-economic development between evolutionary phases of path dependence and revolutionary phases of path creation. This means that the systemic benefits and historical success of the old business system can become a structural burden in rapidly changing environment. Therefore, local policy makers to create paths in new industries need to focus on long term success. Otherwise region’s transformation based on path creation may fail.

In line with path dependency and creation theory Chesbrough (2003a) develops closed and open innovation theories that are based on firm level. The paradigm of closed innovation uses to be said that successful innovation requires control for new product development cycle inside the company. By contrary the paradigm of open innovation is regarded that firms should use external ideas as well as internal ideas, and internal and external paths to market, as the firms look to advance their technology.

The paradigm of closed innovation had been eroded by the following four factors: increasing availability and mobility of skilled workers, growth of the venture capital market, external options for ideas and increasing capability of external suppliers. These factors have resulted in a new market of knowledge that resides in employees, suppliers, customers, competitors, universities etc. Under this circumstance other companies will use it if a company does not use the knowledge created. Chesbrough (2003b) explains this phenomenon that innovation has shifted from being closed to
being open. In sum, it seems to be a theoretical discursive relation between the closed and open innovation theory and the path dependency and creation theory. The current paper is based on the path creation theory and focuses on whether this theory can be applied to the South Korean approach to transform the existing science city into the innovative cluster or not. In fact, the path creation theory is a creation of the western context that results from a strong collaboration between innovative actors as well as initiatives of private sector to a high extent. By contrary, South Korea as one of the Northeast Asian countries mainly led by the central government is in a weak position that innovative actors can create their own innovative environment by themselves without a strong intervention of the central government. Therefore, it is rather natural that an academic research curiosity is caused by such a contextual difference.

3.1. Background

In December 1973, a master plan for Daedok Science Town (DST) construction was approved and a construction of basic facilities and institutes started in 1974. Moreover, Daedok Industrial Base Development Area was announced in 1977. By the end of 1978, the four institutes moved to the Science Town that was a relocation of government research institutes from Seoul.

Additionally, MOST opened its management office, and the basic planning of Daedok Industrial Base Development was also announced in the beginning of the 1980s. As the result, the west section of the Science Town was completed in 1985. It was the first stage of the project. In the second stage of the project, a land construction by a public development system was introduced. Finally, the basic construction for Daedeok Science Town was completed in 1992 and a year later, the Daedeok Science
Town Act was passed (Castells & Hall, 1994). Moreover, the former government revised the act to the Daedeok Science Town Special Zone Act in the end of 2004. Since Jan. 2005 Deadeok Science Town special Zone has been redesigned as Deadeok Innopolis.

Daedeok Science Town is located in Daejeon City, sixth largest city in South Korea and a transportation network hub located 170 kilometres south of Seoul. Originally, it covered 1,134 acres, of which 46 percent was for institutions for research and education, 7 percent for residence and community services, and the rest was for greenery. However, it has been enlarged up to 6,680 acres. The land is shared for three different functions by 47 percent, 9 percent and 44 percent respectively. People can reach there from Seoul in about two hours by car and in about 50 minutes by "KTX", Korean version fast train.

In 2009, 18,796 South Korea's leading researchers and engineers are working on R & D activities. The total residential population has reached 83,202 among who 40,338 are employees in R & D units, R & D support organizations. For them, about 16,000 housing units have been constructed. The numbers of in-town organizations have reached 977 institutes including private firms. (See fig. 1)

3.2. The Roles of High-Tech Oriented Private Research Institutes and Venture Businesses in Daedeok Innopolis

In Daedeok Innopolis, there are 977 institutes. Among these, 28 private research institutes and 898 venture businesses are operating. Although the private research institutes and venture businesses account for over 94 percent of the total institute numbers, its man powers is lower than in the national research institutes.
Among the 28 private research institutes, there are 4 research institutes with less than 30 employees and 10 research institutes with less than 100 employees. By contrary, the numbers of large sized research institutes with more than 100 employees account for 15 institutes. However, most of venture businesses have less than 30 employees (www.dasto.or.kr).

In terms of patent enrolments, the national and private research institutes have been very active. In a domestic patent enrolment, the private research institutes compete with the national research institutes strongly. However, the national research institutes are superior to the private research institutes in an international patent enrolment. The patent regardless domestic or international has been one of major driving forces in Daedock Innopolis because it can contribute to strengthening DI’s competitiveness as well as bridging commercialization. As a result, the total number of patents had increased rapidly since 1995. (See fig. 1) Periodically it is worth noting that the private research institutes applied for the industrial patent more than the national research institutes until 2002. (See table 1, 2, 3) Additionally, the private research institutes increased the ratio of patent enrolment continuously. Overall, the private research institute is overwhelmed in the domestic patents, while the national research institute is strong in the international patents in terms of patent pending as well as patent registration based on the accumulated calculation until the end of 2008. (See fig. 2)

As such, activities of both institutes have increased continuously. In the ratio of patent enrolments, the national research institutes show a higher efficiency than the private ones in the domestic patent. This indicates that the former focus on stable and long term oriented research activities for the national interests, whereas the latter concentrate on target oriented research activities for the company's interests.

In addition, the private research institutes have performed less active in an international patent enrolment than the national research institutes. It indicates that the former has concentrated on the domestic patents strategically, whereas the latter has attempted to increase its domestic and international patent enrolments at the same time. (See table. 4, 5)

The reason for it is very clear. The private research institutes must focus their research activity on specific areas in order to improve their production technologies directly that can generate a substituted effect of technology imports. By contrary, the national research institutes aim to upgrade a technological capacity for the nation as well as to compete with advanced industrialized nations in specific research areas, such as information and communications technologies.

Even in the ratio of international industrial patents enrolment, the national research institutes show a stable and continuous increase, whereas the private research institutes pose an extreme fluctuation. However, this view has changed since the financial crisis occurred in the end of 1997. After a restructuring period, the private research institutes increased their R & D activity and carried out successful results in achieving patents not only in domestic but also international patents.

The R & D activity of venture businesses is also strong in spite of their short business activities. Venture businesses started in 1993 around Daedeok Science Town. However, these businesses were not able to be located within the park due to the Law for Daedeok Science Town Management that resulted in weak spin off effects between R & D and manufacturing. Therefore, the government changed this law in 1999 in order to bring venture businesses within the park. Additionally, Daejeon city government started to build four industrial parks around Daedeok Innopolis in order to link the function of R & D and the production function that
enabled to spin-off effects for new venture businesses. As a result, venture businesses could receive 169 domestic patents and 23 international patents in 2002. Moreover, the number of venture businesses increased dramatically up to 898 in 2007 that resulted in 815 cases of technology transfers as well as 77,798 million won (c.a. 89 million US dollars) technology fees. The technology transfers and transfer fees had increased from 2005 to 2007 in a row. (See table 6, fig. 2)

Overall, DI has expanded rapidly in terms of its total output. In the end of 2005, the output in DI reached 2.56 trillion won and increased up to 11.2 trillion won in the end of 2008. The reason for the rapid increase is not only based on new venture businesses but also based on enlarging industrial areas including industrial sites of number 1 to 4. As a result, DI is able to create a comprehensive composition as an innovative cluster from R & D to production activities. (See fig. 3)

### 3.2. A Habitat of Daedeok Innopolis

The main actors of Daedeok Innopolis are national and private research institutes as well as universities. Additionally, venture businesses take part in R & D activity and manufacturing strongly. However, these actors seem to have limited power to act as independent actors. The reason for it is that the national research institutes and universities are controlled by the central government, while the private research
institutes have to adopt a centralized R & D policy carried out by their headquarters. Only venture businesses obtain their R & D activities relatively free. However, these are mainly small sized and heavily dependent on venture capital. The local government built four industrial parks in order to create spin off effects. (See fig. 4) The main role of these industrial parks is to link R & D results in Daedeok Innopolis with local industries. This means that industrial parks play a role in commercialisation of R & D results as soon as possible.

As the result, Deadeok Innopolis has completed its habitat from a R & D hub function to a production function. It may be safe to say that a core function as an innovative cluster has been fully completed.

**Figure 4: A Habitat of Daedeok Science Town**

### 3.3. Problem Analysis and Future Perspectives of Daedeok Innopolis

Daedeok Innopolis (DI) is mainly controlled by the central government particularly, the Ministry of Knowledge and Economy (MOKE). The host city Daejeon is only
responsible for building and maintaining access roads to DI. Besides, it is also in charge of providing and managing water and sewage services. As implied, DI has no local autonomy, and the Administration Office of DI is only carrying out its managerial functions.

In addition, the entire complex had no manufacturing activity as well as few connections between the research activities in DI and the productive activities in Daejeon until recently that has resulted in a poor local synergy. A main reason for the poor local synergy may be that most of the institutes and its agencies usually have a strong tendency to focus on national priorities in R & D activities instead of private company interests.

It must be also pointed out that most of the institutes seem to be pushed by the government to move in DI since the research programs are composed of various fields from Ginseng and Tobacco Research to Ocean Engineering. It indicates that a scientific plan to generate synergies between institutions has not been a priority for the government. Hence, it is clear that DI is a result of the government-led project to establish R & D centers, which could contribute to the improvement of technology standards and to the Koreanization of certain strategic high technologies.

DI is an entirely artificial creation. Nothing was in that area before the government started to build the town. With the beginning of the second stage of development in 1987, the government realized that without developing synergy effects technology development couldn’t be achieved efficiently. Thus, it focused on the synergy effects in a comprehensive plan in 1989. The plan is called the techno-belt concept that attempts to connect between research and industry through information and telecommunication technologies.
According to the plan, Seoul and Daedeok will be technological diffusion centers connecting networks along four major techno-belts. This techno-belt concept would contribute to the formation of productive structure for the 21st century, and at the same time, the role of DI will be strengthened due to its geographical location and innovative milieu as R & D center. Furthermore, the government set up a target for DI to build South Korean Silicon Valley in the fourth National Comprehensive Land Development Plan in 2001 (Daedeok Science Town Management Office, 2002a). In addition, a recent trend to build new high-tech oriented venture businesses within and around DI can also stimulate a further development of DI. Furthermore, DI experienced a restructuring process in 2004 by being nominated as R & D Special Zone. The government authorized DI by the Daedeok R & D Special Zone Act in 2005.

To become an R & D center and create synergy effects, DI has intensified cooperative relation between government supported industries, universities and industrial laboratories. For example, the Technology Innovation Centre (TIC) and Technology Business Incubator (TBI) at KAIST carry out industry oriented projects and will facilitate technological developments in the industrial sector. In 2009, there were 18 TIC and TBI in DI and 314 new started companies operating.

Until the end of 2007, DI created 898 venture businesses operating in the Daejeon City area. A new birth of venture businesses has been increasing continuously since 1993. (See table 7) Additionally, Daejeon City government has built two high-tech based industrial parks (Industrial Site No. 3 and 4) near to DI in order to generate spin-off effects from the research results of DI (Daedeok Science Town Management Office, 2002b).

Compared to the activity of DI before the financial crisis in 1997, the present situation in the year 2009 can be named as a restructuring process. After redesigned as DI in 2005, DI has improved its capability of R & D activities that resulted in high numbers of domestic and international patent as well as technology transfer. Additionally DI carried out its active strategy to nominate qualified high-tech venture businesses. As a result, several venture businesses could be registered in the Korea Stock Exchange (KOSDAX). (See table 8, 9)

Source: Daedeok Innopolis, 2009, Internal Statistical Materials
Despite the quality oriented development since the redesigned DI, most of high-tech venture businesses are rather small sized that are less than five million US dollars output. Additionally the number of qualified high-tech venture businesses accounts only for 5.3 percent of the total number of venture businesses in DI. In particular, the number of venture business has increased rapidly since the year 2005 as DI was designated as Daedeok R & D Special Zone. It means that many venture businesses need to overcome the period of a death valley. Therefore, it is still questionable how many venture businesses could survive if DI follows the Silicon Valley model.

It is worth noting that DI is likely to have built a high quality hardware oriented infrastructure such as research institutes, universities, housing, roads etc, while it still lacks software based infrastructure such as financing, accounting, legal services etc. Such a software based infrastructure is mostly concentrated in the Seoul metropolitan area. Therefore, it may be a delicate barrier for DI to cope with.

DI’s vision for 21st century is announced as to become one of the global innovative clusters until 2015. In order to realize this target, DI has intensified its role as a national innovation hub creating technology innovation as well as supporting other seven model innovative cluster nationwide. However, it may be easily criticized that DI’s technology portfolio is too wide spread from IT to Nuclear. Therefore, it needs to focus on its core technology areas strategically because there are no global innovative clusters in various technology areas coincidently although a technology convergence is a global trend.
4. Conclusions

All cities and regions produce specific forms of spatial organization of the production process and create new spatial formation after hit by economic decline and restructuring. At the same time, these territories become the social spaces producing new forms of industrial, social, and technical structures.

In a knowledge-based economy of the globalizing economic order, the role of regions is very significant in order to create and to disperse knowledge. Particularly, geographical clusters of firms in a single sub-national region may contribute to transmitting certain kinds of knowledge between and among firms. In addition, markets prefer to favor specialized firms with a coherent body of knowledge when knowledge creation and the use of new knowledge become increasingly important for maintaining and improving a firm’s competitiveness.

Furthermore, it is often said that globalization and localization are the two sides of a coin. Without a proper localization in a country, it will face difficulties in competing with other countries in global markets. Under these circumstances, competition between nations becomes more severe than ever and advanced industrialized countries tend strongly to control their technology transfers to other nations in order to maintain their technological competitiveness in strategic areas.

With the formation of hard competition between nations based on the principles of a free market economy, high technology became the most important factor in achieving national competitiveness. Thus, many countries strengthened their technology policy and invested vast amounts of capital in research and development (R & D) projects. In order to carry out the R & D projects properly, they show a strong tendency to build science cities. To pursue a technology policy is to achieve three goals. The first is reindustrialisation, which can create new jobs in new
industries. The second objective is regional development for those regions that are most in need. Last, but not least, is the creation of synergy resulting from technological and organizational innovations.

Under these circumstances, South Korea had launched its national project to build a science town in 1973. Daedeok Science Town was focused on upgrading technological capability and sustainable economic development at national and regional levels. Along with the national and local governments, industries and universities play important roles in the town in order to create networks based on mutual interests and technology innovation. Daedeok Science Town redesigned as Daedeok Innopolis in 2005 are keen to develop or to strengthen various specific strategic technological areas such as IT technology, biotechnology, life sciences, energy technology, and new materials etc. This strategic point of view has been advantage and disadvantage for developing DI at the same time.

The central government initiated approach to build a science city costs are immense regardless of which science cities are in East Asia. Due to such a vast capital investment and a need of highly qualified manpower, establishment of DI took a long construction period. At the same time, this approach does not result in the full effects expected such as technology innovation and regional economic growth although the number of domestic and international patent as well as venture businesses has been increased rapidly since 2005. Moreover, the numbers of technology transfer and the amount of technology fee have also increased continuously in recent years. Despite such a positive trend it is still weak to impact on national and regional economic growth.

DI’s new vision to become one of the global innovative clusters within ten years seems to be a future oriented strategy. As explained, its hardware based infrastructure
has been developed excellently so far. However, DI is still in a weak position in terms of software based infrastructure such as venture and angel capital, financial services, accounting, legal services etc. It is absolutely necessary for DI to create a comprehensive innovative environment that functions as the core factor for creating global innovative clusters such as Silicon Valley in the USA and Kista Science City in Sweden.

In sum, the government involvement in national projects is inevitable, particularly in the South Korean context. At the same time, however, a combined approach with private sectors is also significant in order to vitalize activities in DI. Furthermore, a fundamental strategy, which is based on either only R & D activity or combining R & D activity with production plays also important roles in developing and strengthening DI continuously.

Profiling High- and Low- Expectation/Growth Entrepreneurs – An Exploratory Study

Dr Naomi Birdthistle
Briga Hynes
Yvonne Costin
Sharon Lucey

In today’s rapidly changing world, nations need enterprising people who have the willingness and ability to take control of their own lives. This paper examines the characteristics and motivations for start-up of entrepreneurs of high- and low-expectation/growth companies in both Ireland and the United States. The methodology adopted was a mixed method approach which incorporated an online survey supported by a series of semi-structured interviews. The study found that there are little differences between high-and low-expectation/growth companies in terms of gender, martial status and birth order. Differences were also found in terms of industry sector, growth aspirations, with significant differences arising in terms of education. Little difference emerged in relation to the motivations for start-up. The paper provides recommendations for policy makers when formulating policy that affects this emerging cohort of entrepreneurs.

Introduction

While most new businesses focus on local markets, have relatively low growth aspirations, and imitate or replicate existing business strategies (products, markets and technologies) (Aldrich 1999; Cunningham 2008), there is an important subset of new businesses, that can be broadly classified as ‘high expectation/growth /high potential start-ups’, emerging globally. Encouraging greater numbers of individuals to start high expectation/growth businesses is high on the agenda of global governments as entrepreneurs are catalysts of growth; generating capital, innovation and skills. This exploratory paper focuses on the characteristics and motivations for start-up of entrepreneurs of high and low-expectation/growth companies, with a particular focus on entrepreneurs in both Ireland and the United States. In particular, an emphasis is placed on: the demographic profile of the entrepreneur and their business; occupational background; educational attainment; and motivational factors influencing new venture creation.

High-Expectation/Growth Defined
Varying definitions have emerged as to what constitutes a high expectation/growth firm (Buss 2002, Henrekson, and Johanson 2009). For instance, definitions vary according to how growth is measured: in profits, sales, book value, workforce, or even future expectations, and whether growth is attained through acquisitions or organically (White and Reynolds 1996). According to Autio (2007), author of the 2007 Global Entrepreneurship Monitor Report on High Growth Entrepreneurship, *high-expectation* entrepreneurs are those who are considered to be nascent and/or new entrepreneurs who expect more than 20 employees in 5 year’s time and *high-growth entrepreneurs* can be defined as those who have established a business and currently employ 20 or more. In the US context, Bloodgood, Sapiena, and Almedia (1996) define high potential ventures as new entrepreneurial ventures with high aspirations and potential for growth. In comparison, in the Irish context, the definition promoted by Enterprise Ireland (an Irish government agency) is largely adopted to describe a high potential start-up firm, which encompasses both nascent and established entrepreneurial firms. Enterprise Ireland (2008) define a high-expectation/growth firm as a business, which is based on a technological innovation; likely to achieve significant growth in 3 years (sales of €1.0m per annum and employment of 10 or more); is export oriented and ideally led by an experienced team, with a mixture of technical and commercial competencies.

As one can see from the contrasting definitions of high-expectation/growth firms, Enterprise Ireland uses two variables for measuring growth whereby Autio (2007) uses only one variable, that being growth defined by an increase in employee numbers. Bloodgood et al (1996) only alludes to growth without quantifying it in any terms. Furthermore the time scales established for the achievement of high growth differ, in that Enterprise Ireland uses a 3 year timeframe whereby Autio (2007) utilizes a 5 year timeframe. For the purpose of this study, the definition of a high-expectation/growth firm will be where the firm envisages significant
growth within 3 – 5 years with a significant increase in either sales, headcount or what other metric the respondent might use to measure growth.

**Profiling High-Expectation/Growth Firms**

There is no uniform, standardised definition of the entrepreneur, however, it is frequently contended that entrepreneurs display certain characteristics and traits (Kirby 2003). The problem however is that there is no agreement amongst theorists as to the number or form of these traits. For example, Hornaday (1982) found more than 40 traits associated with entrepreneurs whilst Gibb (1990) identifies 12. Hisrich and Peters (2002) propose that even though many aspects of an entrepreneur’s background have been explored, only a few have differentiated the entrepreneur from the general populace of managers. The background areas explored include; childhood family environment, education, age and work history (Hisrich and Peters 2002). Irish studies of entrepreneurs (O’Farrell 1986; Kinsella and Mulvenna 1993; Birdthistle 2006) have tended to explore the same background characteristics of the entrepreneur as proposed by Hisrich and Peters (2002), so as to understand motivations for start-up and characteristics of entrepreneurs (such as age, education, gender, work experience, industry sector). These traits and characteristics therefore form the basis of examining high-expectation/growth entrepreneurs within this study.

Entrepreneurs in general are viewed to possess a number of characteristics which distinguish them from the general populace. Equally, research by Autio (2007), Riley (2008) and Fitzsimons and O’Gorman (2008) would suggest that high expectation entrepreneurs can be identified by a number of common characteristics which relate to the personal profile and behavioural patterns of this subset of entrepreneurs.

**Age**: In terms of age profile, Storey (1994); Wiklund (1998) and Autio (2007) found that high-growth entrepreneurs are biased toward older individuals. Autio (2007) additionally found that high-expectation entrepreneurs are most heavily biased toward young individuals.
In his study, Autio (2007) found that 19 percent of high-expectation entrepreneurs were between the ages of 18 and 24 years old, whereas only 3 percent of established high-growth entrepreneurs were observed in this age bracket. In contrast, the two oldest age categories are overrepresented among high-growth established entrepreneurs and under-represented among high-expectation entrepreneurs.

**Gender:** Globally it would appear that females are underrepresented in establishing new ventures but are extremely underrepresented in the high-expectation/growth category of new venture creation. This is supported by a number of national and global studies. For instance, Zhang, Yang and Ma (2008) found that female entrepreneurs are in general underrepresented in China but are extremely underrepresented in the high-expectation/growth category of entrepreneurship. Similar finding were found by Fisher (2006) who found that only 7 percent of US high-expectation/growth entrepreneurs were owned by women and Fitzsimons and O’Gorman (2008) found that more men than female entrepreneurs have aspirations to be a high-expectation/growth firm in Ireland.

**Education:** In their studies, Autio (2007) and Riley (2008) have found that the majority of high-expectation/growth entrepreneurs have tertiary level qualifications. Riley (2008) found that 92 percent of high-expectation/growth entrepreneurs surveyed had undergraduate degrees, 31 percent held Masters and 10 percent had PhDs.

**Relevant Industry Experience:** Evidence has shown that high-expectation/growth entrepreneurs will have relevant management expertise within the industry sector that the new firm is established in and will generally have formalized professional networks within that industry sector (Siegel, Siegel, and MacMillan 1993, Fesser and Willard 1990).

**Number of Founders:** High-expectation/growth firms will typically be founded by a team of entrepreneurs rather than a single entrepreneur. A team of entrepreneurs can provide a
greater pool of resources, more idea sharing and broader diversity than ventures with a sole founder (Watson, Steward, and BarNir 2003, Barkham 1994).

**Industry sector of business:** The distribution of high-expectation/growth entrepreneurs across business sectors provides insight into the effect of industry structure on high growth entrepreneurship. High-expectation/growth entrepreneurs are underrepresented in the agriculture, fishery, forestry, and hunting sectors (for example primary agricultural output). High-expectation/growth entrepreneurs are slightly overrepresented in the manufacturing sector and in transportation, communication, and utilities. While *high-expectation* entrepreneurs are underrepresented in retail, hotel, and restaurant sectors, *high-growth* entrepreneurs are not. Interestingly, *high-expectation* entrepreneurs are overrepresented in the financial, insurance, and real-estate sectors, *high-expectation* entrepreneurs are underrepresented (Autio 2007).

**Parental influence:** Fitzsimons and O’Gorman (2005) found that having self-employed parents increase the propensity of individuals to engage in new venture creation in Ireland. O’Farrell’s (1986) study showed that 46 percent of new firm founders had fathers who were self-employed at a time when only 27 percent of the population was self-employed. This study will identify whether a similar finding will be attributed to the high-expectation/growth entrepreneur.

This study seeks to also examine the motivations and reasons for establishing the high-expectation/growth firm. Individuals start a new business for reasons which are classified as either opportunity or necessity driven a classification parallel to ‘pull’ and ‘push’ factors (Reynolds, Camp, Bygrave, Autio, and Hay 2001, Acs 2006, Hessels, Gelderen, and Thurik 2008). Opportunity entrepreneurship reflects a positive perception and attitude to self employment by the entrepreneur, whereas necessity entrepreneurship emerges where individuals start a new business due to negative reasons, mainly the absence of employment
opportunities. A number of studies investigated variances across individual motivations for starting a business and their impact on the growth of the business. Agreement existed within the majority of research that owner-managers who started their business for positive ‘pull’ factors such as to exploit an opportunity in the market achieved higher levels of firm growth compared to a business for which the primary reasons were negative ‘push’ factors such as unemployment, dissatisfaction with present employment (Kinsella, Clarke, Storey, Mulvenna, and Coyne 1994, Storey 1994, Smallbone and North 1995, Smallbone and Wyer 2000, Hamilton and Lawrence 2001, Reynolds, Camp, Bygrave, Autio, and Hay 2001).

In summary, the literature has found that relative to the broad population of entrepreneurs, high-expectation/growth entrepreneurs tend to be younger, more highly educated, male dominated, have previous employment in the industry in which they established their firm in and establish firms in higher added value industry sectors. In order to further build on these findings, this exploratory study will examine the characteristics and motivations for start-up of a sample of high expectation/growth entrepreneurs and compare the findings to a sample of low-expectation/growth entrepreneurs.

**Methodology Utilized in the Study**

The methodology adopted for this exploratory study is a mixed method approach incorporating an online survey and semi-structured interviews. An online survey approach was chosen as the principal means of gathering data for this research as it allows the researcher to conduct a national study at a reasonable cost and is less time consuming than those administered by an interviewer. The high-expectation/growth entrepreneurs (HEG) database was generated through the identification of annual reports from government agencies in both Ireland and the US. Extrapolating data from these reports resulted in the identification of 187 HEG companies for Ireland and 186 HEG companies for the US, which had email addresses identified for them thus enabling for the personalization of the emails. Even though
this was extremely time consuming for the research team, the pilot study showed that through the personalization of emails, there is the probability of a higher response rate. Concerning the formulation of the database for the low expectation/growth companies [LEG], this was done using databases from the Company Registration Office, Kompass, the Golden Pages and other online resources. The research team ensured that there were respondents from similar locations to the HEG companies. Both the HEG and LEG databases were then compared against each other to ensure that there was no duplication. A total of 189 LEG companies were identified for Ireland and 107 LEG companies for the US.

The questionnaire adopted for the study of HEG/LEG respondents was subject to extensive screening by the research team, tested on government representatives in both countries and pilot tested by 10 entrepreneurs representing both Ireland and the US, so as to take into account cultural variations. Based on their feedback some questions were condensed in size, options were reduced and it was recommended to send a personalized email to each of the potential respondents. With sampling complete, the pilot survey carried out and the questionnaire finalised, it only remained to administer the survey to the chosen sample. The questionnaire was administered through www.surveymonkey.com.

The interviewees for this study were identified from the final question on the online survey, which asked the respondents if they would be interested in taking part in an interview. An interview schedule was designed and focused on probing more deeply into the characteristics and personality traits of the entrepreneurs. The interviews were held between December 2009 and February 2010, at the premises of the interviewee in both Ireland and the US. Each interview lasted approximately 30 – 40 minutes and was recorded using a Dictaphone. In keeping with the method adopted for the qualitative study, multiple sources of data collection such as documents, website and archival records were also used to overcome
the limitations of any individual source if possible. Table 1 below identifies the online response rate and Table 2 identifies the number of interviews conducted in both countries.

**Findings**

As mentioned previously, the aim of this paper is to examine the characteristics of entrepreneurs of high- and low-expectation/growth companies in Ireland and the US and their motivations for start-up. In particular, emphasis is placed on: the demographic profile of the entrepreneur and their business; occupational background; educational attainment; and motivational factors influencing new venture creation.

**Demographic Profile of the respondents**

The findings of this study identify two cohorts of respondents: those classified as high expectation/growth (HEG) entrepreneurs of which there were 37 respondents and low expectation/growth (LEG) entrepreneurs of which there were 28 respondents. Table 3 below compares and contrasts the quantitative findings of the HEG and LEG respondents based on gender, marital status and birth order.
As is evident from Table 3, similar findings can be found concerning the profile of the HEG and LEG entrepreneurs whereby, the majority were male, married, and the eldest child. Respondents for the questionnaire and the interviews from Ireland tended to be younger in terms of age of start up when compared to the US. The findings of the interviews reflect the findings above as well. In the case of the HEG interviewees, seven were male and one was female. All LEG interviewees in Ireland and the US were male. In both LEG and HEG cases, there was a balanced view by respondents concerning their parents entrepreneurial background. For HEG respondents, it was found that 36 percent had a father who was self-employed, 8 percent of mother’s were self-employed and 11 percent had both parents who were self-employed. In the case of 45 percent of respondents, they identified that neither parents were self-employed. For LEG respondents, 46 percent have a father who was self-employed and 8 percent identified that both parents were self-employed. The remaining 46 percent identified that neither parents were self-employed. More notable differences existed in terms of the educational profile of the HEG and LEG entrepreneurs as described in Table 4.
As is evident from Table 4 above, three times as many HEG respondents have higher degrees (for example at Masters and PhD level) in comparison to LEG respondents. Some 30 percent of LEG respondents have no tertiary level qualifications whereby only 3 percent of HEG respondents do not. This was further substantiated by the HEG interviewees, who identified that their lowest level of qualification was a postgraduate degree. In the US, the HEG interviewees stated the highest educational qualification attained was a tertiary level award at Masters level, with a high incidence of non-business disciplines being studied. When questioned on the subject area of their qualification, the majority of online HEG respondents identified engineering and electronics, with business being the next most popular subject area. Conversely for LEG respondents, a business related qualification was the most popular amongst this group. Variations also occurred in terms of the number of years prior work experience online respondents had gained and Table 5 highlights the results.

As Table 5 indicates, the majority of HEG and LEG respondents had 10 or more years work experience prior to establishing their own business. However, the table indicates that there are a number of LEG respondents who went into business without any prior work experience. In the case of Irish HEG and LEG interviewees it was found that they all had 15+ years prior work experience. Interestingly, both the HEG and LEG interviewees in the US indicated slightly lower levels of prior work experience, though the majority had nine plus years experience. When one compares the positions of authority held by these respondents prior to establishing their own business it is evident that HEG respondents were in positions of greater authority and responsibility than LEG respondents. HEG respondents identified that they held President and Vice President positions, CEO’s positions, and/or Director of Sales and Marketing, whereby LEG respondents were Operational Managers, General Managers and team leaders. One line respondents were questioned as to whether this was their first business or not and 63 percent of HEG’s and 64 percent of LEG’s indicated it was their first venture. This was further supported by the interviewees as all interviewees in both countries identified that this was their first business venture.

In relation to how the businesses were established, similar findings were found for both HEG and LEG respondents. Some 74 percent of HEG’s and 68 percent of LEG’s highlighted that the business was founded by a team of entrepreneurs. The interviewees gave similar findings as well whereby out of the 13 interviews conducted all bar 3 were founded by teams of entrepreneurs. In relation to industry sector, this study found that high-expectation/growth firms are under-represented in the services sector as only 18 percent of online HEG respondents and one HEG interviewee operate within this sector. The ICT sector was the most prevalent sector for HEG respondents (45 percent of online respondents and four interviewees) and for LEG respondents (50 percent of online respondents and two interviewees). This was followed by the Electronics/Engineering sector as 36 percent of
online HEG respondents and four interviewees, two LEG interviewees and 19 percent of online respondents operating within this sector. The second most common sector for the online LEG respondents was the services sector (25 percent) along with one interviewee indicating this sector.

**Motivations In Establishing The Business**

Respondents were questioned as to the route they took to establishing their business. In the majority of HEG (77 percent) and LEG (68 percent) responses, the route to market was through the formulation of their own business idea. Of those that responded, the event that alerted HEG respondents (n=29) to their business opportunity was primarily based on observing new trends emerging in the market with 38 percent respondents indicating this as a route and 39 percent of LEG respondents (n=18) identified this as a route to market. A niche in the market was identified by 56 percent of respondents and 35 percent of HEG respondents also chose this as a route to market. Motivations for starting the business were also examined with various and numerous responses emerging through the research findings. Initially, respondents were presented with a listing (as seen in Table 6 below) of push and pull factors and asked to rate the factors based on their level of importance.

Evidently for HEG respondents, the highest level of importance was placed on “pull factors”, namely “Independence” (100 percent); “Freedom” (97 percent); “Realize a dream” (97 percent) and “Creating Something” (97 percent), followed very closely by other pull factors such as “Challenges in the job” (91 percent); “Enjoy advantages from your creative potential” (91 percent); and “Being your own boss” (85 percent). Conversely, the highest level of importance for LEG respondents was placed on both “pull and push factors”, namely “Independence” (100 percent); “Challenges in the job” (95 percent); “Freedom” (95 percent); “Creating something” (95 percent) and “Realize a dream” (85 percent), followed very closely by other pull factors such as “Enjoy advantages from your creative potential” (90 percent); and “Being your own boss” (70 percent). Both HEG and LEG respondents rated “Autonomy of decision” with a high level of importance, whereby 76 percent of HEG respondents and 67 percent of LEG respondents indicated that this was “important”. Both parties agreed that the least important factors were “Stable conditions on the job” (18 percent HEG and LEG 21 percent) and “Job security” (HEG 27 percent, LEG 33 percent). These findings were further supported by the interviews, whereby interviewees stressed the desire for control and/or the need to create something new.

In addition, the research continued to investigate the specific motivations of the entrepreneurs in starting the business by posing a question influenced by the GLOBE Culture and Leadership Scales (2006). Respondents were presented with 17 statements and invited them to agree or disagree with each of them and Table 7 indicates the results.

</tr>
</tbody>
</table>

For HEG respondents it emerged that the highest percentage of respondents indicated that they “wanted the freedom to adopt their own approach to work”, “wanted to make an idea or innovation happen” and “wanted to challenge themselves/prove that they could do it”, accounting for between 89 and 90 percent. These were followed very closely by “always wanted to be their own boss” which counted for 83 percent. These findings were further substantiated in the HEG interviews in both Ireland and the US with interviewees identifying that they “wanted to make an idea or innovation happen” and “wanted to be own boss” being stated as their motivation for starting up their business. Furthermore, 67 percent of HEG respondents indicated that they “wanted to make more money” than they were earning before.

For online LEG respondents and interviewee the greatest motivation in starting the business resulted from the respondents desire for “freedom to adopt my own approach to work” (89 percent), with “I always wanted to be my own boss” (84 percent) as the second most important reason in starting the business. The next most popular response for LEG respondents was that of “I wanted to challenge myself/prove that I could do it” with 67 percent of respondents answering this question. Both “I wanted to make an idea or innovation to happen” and “I wanted to make more money than I was earning before” were agreed by 50 percent and 56 percent respectively of the LEG respondents who answered this section.
In summary, the findings suggest a slightly higher tendency for HEG entrepreneurs to start their businesses for positive opportunity sensing reasons. That said overall, the motivations for start up for both HEG and LEG do not differ greatly. The respondents were questioned as to whether they were likely to achieve growth within a certain time period and whether the firm was capable of achieving that growth and Table 8 indicates the results.

<table>

The findings contained within Table 8 above identify that growth is a key imperative for HEG respondents when compared to LEG respondents. All HEG respondents indicated that this was a likely possibility in 3-5 years time when compared to LEG respondent’s views on this (only 74 percent of LEG respondents agreed with this). More HEG respondents are export orientated compared to LEG respondents and more HEG respondents enterprises are based on a technological innovation when compared to LEG respondents.

Conclusions

High-expectation/growth enterprises are gaining increased momentum in government policy. However, given their emerging nature, there is a lack of information profiling this subset of entrepreneur or the type of business they operate; separate to the more general population of entrepreneurs. This study has attempted to bridge this knowledge gap. The findings indicate that some clear differences exist between the HEG entrepreneur and the LEG entrepreneur at the individual level. Firms did not differ greatly in terms of motivations to start up however pronounced differences are identified in the areas of age; education; gender; work experience; industry sector; and each are discussed below.
Age: On a global basis, established high-growth entrepreneurs are biased towards older individuals and similar findings were found for HEG companies in this study. When one compares the LEG and HEG enterprises there is a similar age difference as well. When one extrapolates the data even more one finds that HEG respondents and interviewees in Ireland tended to be younger in terms of start-up when compared to the US. This indicates that high-expectation/growth entrepreneurs tend to be older in the US which reinforces the emerging nature of high-expectation/growth entrepreneurs in Ireland.

Previous studies support the idea that the age of the entrepreneur has an influence on the growth of the business, where firms owned by younger individuals displayed higher levels of growth. Other research suggests that with an increase in age, the entrepreneur will accumulate knowledge and experience, and will have greater access to and use of networks, which influence subsequent firm growth, thus supporting the idea that older entrepreneurs achieve higher levels of growth. According to the Irish GEM Report (Fitzsimons and O’Gorman 2007) and Autio (2007), individuals are starting businesses at a younger age, thus implying that they will have less previous work experience than older entrepreneurs who may have a greater wealth of experience, have more experience of operating and managing a business and have more established networks which can benefit them in growing a business, in turn impacting on growth of the business.

Education: Differences in the type and level of educational award were found within this study. As found by Autio (2007) and Riley (2008) the majority of high expectation/growth entrepreneurs have tertiary level qualifications. The findings of this study concur with these findings, as HEG entrepreneurs have higher educational awards with a noticeable number at postgraduate and doctoral level and in technical areas relative to LEG entrepreneurs. The benefit of having a tertiary level education results in entrepreneurs not only developing their technical skills but also develops contacts and social capital for the
business which can aid in the growth of the business. The results indicate that the majority of HEG respondents and interviewees are emanating from non-business disciplines in comparison to LEG respondents. There are implications here for educational policy makers in that it is imperative that tertiary level educators include entrepreneurship as a field of study within non-business fields. Furthermore, for the supports given by government agencies, they should be cognizant of the fact that HEG entrepreneurs may have no business education or background.

**Gender:** Females globally are under-represented in the high expectation/growth category of entrepreneurs and similar findings were found within this study. In this study it was found that females were sorely under-represented since only 11 percent of HEG online respondents and 3 percent of LEG respondents were female. Interestingly, in the interviews, 22 percent of HEG founders were female, and all LEG founders were male. Further research is required to examine why this is the case in Ireland, the US and/or globally.

**Work experience:** The results of this study highlight that both LEG and HEG respondents have prior work experience prior to establishing their own business. No significant differences were found in terms of the length of work experience. It was, however, interesting that both groups of respondents had 10 or more years work experience prior to establishing their own business. When further examined on their work experience, it was evident that HEG respondents had gained more experience at managerial levels than LEG entrepreneurs. When broken down further, the findings identify that respondents in the US started their high-expectation/growth firm with less prior work experience compared to Irish HEG entrepreneurs. This could be due to the entrepreneurial culture in the US where entrepreneurs start businesses earlier and there is engendered in people a more entrepreneurial culture in comparison to what is present in Ireland.

**Motivations:**
HEG respondents are more motivated to establish a business by ‘pull factors’ when compared with LEG respondents. The motivations for HEG are primarily independence; freedom; realize a dream; creating something new; being one’s own boss and enjoying advantages from creative potential. The key motivations for LEG entrepreneurs are independence, challenges on the job; freedom; creating something and realize a dream. Both HEG and LEG respondents appear not to be highly motivated by helping or supporting the environment, however, this needs to be further researched as a result of the emergence of ‘social entrepreneurs’. More HEG respondents have a greater desire to help and/or support other people more so than LEG respondents. Innovation was a greater motivation for HEG respondents than for LEG respondents. Interestingly, more HEG respondents were motivated to establish their business as a result of redundancy than LEG respondents. In light of the current economic climate it would be worthwhile investigating this further in future studies.

The positive aspirations from the pull factors are important from a policy perspective in that people are interested in establishing high-expectation/growth firms and these should be reflected upon by policy makers and further nurtured and supported by policy in creating awareness and opportunities in creating such firms.

On a broader perspective given the variations in the definitions and characteristics applied to the term high-expectation/growth entrepreneurs there should be ongoing debate about what this term means and how it is interpreted by the practitioner and if there is a policy-practitioner gap in terms of its meaning. This requires further deliberation. Given the variety of perceptions of what a high-expectation/growth firm is, policy makers should take consideration of the interpretations of the respondents when devising the definition so as to reduce the perceptual gap that exists.

Naomi Birdthistle

Dr Naomi Birdthistle is a lecturer in Entrepreneurship and MBA programme director at the University of Limerick. Naomi’s research expertise is in the area of family business management and entrepreneurship education. Naomi is a Government of Ireland Scholar having been funded by the Irish Research Council for the Social Sciences for a two-year study which is examining the characteristics and personality traits of high potential start-up companies in both Ireland and the US. Naomi was recently recognised as an outstanding higher education teacher by being awarded the ‘Shannon Consortium’s Regional Teaching Award’

Briga Hynes

Briga is a lecturer in Entrepreneurship at the University of Limerick and Programme Director for the MBS in International Entrepreneurship Management. Briga’s main research interests lie in entrepreneurship and SME business growth, with a principal focus on an evaluation of the determinants of small firm growth and the process strategy development in the SME. A second stream of complimentary research explores how best owner-manager skills and competencies can be enhanced through management development interventions and mentoring programmes. She has also published on the topic of entrepreneurship education, where the research investigates the different pedagogical approaches to teaching entrepreneurship across disciplines. Briga is also involved in a number of outreach activities with entrepreneurs and owner-managers and is also a Board member of Limerick City Enterprise Board, Southill Advisory Management Group, The Management Development Council, (Forfás), and is a project Evaluator for Social Entrepreneurs Ireland.

Yvonne Costin

Yvonne Costin is a Lecturer in Entrepreneurship in the Department of Management and Marketing, Kemmy Business School, University of Limerick. Yvonne is responsible for teaching Enterprise Formation, Enterprise Development and Business Consulting at an undergraduate and postgraduate level. She is currently pursuing a PhD study in the area of female entrepreneurship. Her main research interests include entrepreneurship education at both primary and tertiary levels, female entrepreneurship and growth achievement in entrepreneurial firms.

Sharon Lucey

Sharon Lucey is currently a PhD student in the Kemmy Business School, University of Limerick. Her PhD study focuses on how high growth entrepreneurship can be supported and sustained in Ireland. She holds a Masters of Business Studies in Entrepreneurship Management from the University of Limerick and has previous work experience as a socio-economic researcher and consultant. Her main research interests include; high growth entrepreneurship, small firm growth, economic growth, and enterprise policy.

Profiling High- and Low-Expectation/Growth Entrepreneurs – An Exploratory Study

Dr Naomi Birdthistle
Briga Hynes
Yvonne Costin
Sharon Lucey

Abstract

In today's rapidly changing world, nations need enterprising people who have the willingness and ability to take control of their own lives. This paper examines the characteristics and motivations for start-up of entrepreneurs of high- and low-expectation/growth companies in both Ireland and the United States. The methodology adopted was a mixed method approach which incorporated an online survey supported by a series of semi-structured interviews. The study found that there are little differences between high-and low-expectation/growth companies in terms of gender, martial status and birth order. Differences were also found in terms of industry sector, growth aspirations, with significant differences arising in terms of education. Little difference emerged in relation to the motivations for start-up. The paper provides recommendations for policy makers when formulating policy that affects this emerging cohort of entrepreneurs.

Introduction

While most new businesses focus on local markets, have relatively low growth aspirations, and imitate or replicate existing business strategies (products, markets and technologies) (Aldrich 1999; Cunningham 2008), there is an important subset of new businesses, that can be broadly classified as ‘high expectation/growth /high potential start-ups’, emerging globally. Encouraging greater numbers of individuals to start high expectation/growth businesses is high on the agenda of global governments as entrepreneurs are catalysts of growth; generating capital, innovation and skills. This exploratory paper focuses on the characteristics and motivations for start-up of entrepreneurs of high and low-expectation/growth companies, with a particular focus on entrepreneurs in both Ireland and the United States. In particular, an emphasis is placed on: the demographic profile of the entrepreneur and their business; occupational background; educational attainment; and motivational factors influencing new venture creation.
High-Expectation/Growth Defined

Varying definitions have emerged as to what constitutes a high expectation/growth firm (Buss 2002, Henrekson, and Johanson 2009). For instance, definitions vary according to how growth is measured: in profits, sales, book value, workforce, or even future expectations, and whether growth is attained through acquisitions or organically (White and Reynolds 1996). According to Autio (2007), author of the 2007 Global Entrepreneurship Monitor Report on High Growth Entrepreneurship, high-expectation entrepreneurs are those who are considered to be nascent and/or new entrepreneurs who expect more than 20 employees in 5 year’s time and high-growth entrepreneurs can be defined as those who have established a business and currently employ 20 or more. In the US context, Bloodgood, Sapiena, and Almedia (1996) define high potential ventures as new entrepreneurial ventures with high aspirations and potential for growth. In comparison, in the Irish context, the definition promoted by Enterprise Ireland (an Irish government agency) is largely adopted to describe a high potential start-up firm, which encompasses both nascent and established entrepreneurial firms. Enterprise Ireland (2008) define a high-expectation/growth firm as a business, which is based on a technological innovation; likely to achieve significant growth in 3 years (sales of €1.0m per annum and employment of 10 or more); is export oriented and ideally led by an experienced team, with a mixture of technical and commercial competencies.

As one can see from the contrasting definitions of high-expectation/growth firms, Enterprise Ireland uses two variables for measuring growth whereby Autio (2007) uses only one variable, that being growth defined by an increase in employee numbers. Bloodgood et al (1996) only alludes to growth without quantifying it in any terms. Furthermore the time scales established for the achievement of high growth differ, in that Enterprise Ireland uses a 3 year timeframe whereby Autio (2007) utilizes a 5 year timeframe. For the purpose of this study, the definition of a high-expectation/growth firm will be where the firm envisages significant
growth within 3 – 5 years with a significant increase in either sales, headcount or what other metric the respondent might use to measure growth.

**Profiling High-Expectation/Growth Firms**

There is no uniform, standardised definition of the entrepreneur, however, it is frequently contended that entrepreneurs display certain characteristics and traits (Kirby 2003). The problem however is that there is no agreement amongst theorists as to the number or form of these traits. For example, Hornaday (1982) found more than 40 traits associated with entrepreneurs whilst Gibb (1990) identifies 12. Hisrich and Peters (2002) propose that even though many aspects of an entrepreneur’s background have been explored, only a few have differentiated the entrepreneur from the general populace of managers. The background areas explored include; childhood family environment, education, age and work history (Hisrich and Peters 2002). Irish studies of entrepreneurs (O’Farrell 1986; Kinsella and Mulvenna 1993; Birdthistle 2006) have tended to explore the same background characteristics of the entrepreneur as proposed by Hisrich and Peters (2002), so as to understand motivations for start-up and characteristics of entrepreneurs (such as age, education, gender, work experience, industry sector). These traits and characteristics therefore form the basis of examining high-expectation/growth entrepreneurs within this study.

Entrepreneurs in general are viewed to possess a number of characteristics which distinguish them from the general populace. Equally, research by Autio (2007), Riley (2008) and Fitzsimons and O’Gorman (2008) would suggest that high expectation entrepreneurs can be identified by a number of common characteristics which relate to the personal profile and behavioural patterns of this subset of entrepreneurs.

**Age:** In terms of age profile, Storey (1994); Wiklund (1998) and Autio (2007) found that high-growth entrepreneurs are biased toward older individuals. Autio (2007) additionally found that high-expectation entrepreneurs are most heavily biased toward young individuals.
In his study, Autio (2007) found that 19 percent of high-expectation entrepreneurs were between the ages of 18 and 24 years old, whereas only 3 percent of established high-growth entrepreneurs were observed in this age bracket. In contrast, the two oldest age categories are overrepresented among high-growth established entrepreneurs and under-represented among high-expectation entrepreneurs.

**Gender:** Globally it would appear that females are underrepresented in establishing new ventures but are extremely underrepresented in the high-expectation/growth category of new venture creation. This is supported by a number of national and global studies. For instance, Zhang, Yang and Ma (2008) found that female entrepreneurs are in general underrepresented in China but are extremely underrepresented in the high-expectation/growth category of entrepreneurship. Similar finding were found by Fisher (2006) who found that only 7 percent of US high-expectation/growth entrepreneurs were owned by women and Fitzsimons and O’Gorman (2008) found that more men than female entrepreneurs have aspirations to be a high-expectation/growth firm in Ireland.

**Education:** In their studies, Autio (2007) and Riley (2008) have found that the majority of high-expectation/growth entrepreneurs have tertiary level qualifications. Riley (2008) found that 92 percent of high-expectation/growth entrepreneurs surveyed had undergraduate degrees, 31 percent held Masters and 10 percent had PhDs.

**Relevant Industry Experience:** Evidence has shown that high-expectation/growth entrepreneurs will have relevant management expertise within the industry sector that the new firm is established in and will generally have formalized professional networks within that industry sector (Siegel, Siegel, and MacMillan 1993, Fesser and Willard 1990).

**Number of Founders:** High-expectation/growth firms will typically be founded by a team of entrepreneurs rather than a single entrepreneur. A team of entrepreneurs can provide a
greater pool of resources, more idea sharing and broader diversity than ventures with a sole founder (Watson, Steward, and BarNir 2003, Barkham 1994).

**Industry sector of business:** The distribution of high-expectation/growth entrepreneurs across business sectors provides insight into the effect of industry structure on high growth entrepreneurship. High-expectation/growth entrepreneurs are underrepresented in the agriculture, fishery, forestry, and hunting sectors (for example primary agricultural output). High-expectation/growth entrepreneurs are slightly overrepresented in the manufacturing sector and in transportation, communication, and utilities. While *high-expectation* entrepreneurs are underrepresented in retail, hotel, and restaurant sectors, *high-growth* entrepreneurs are not. Interestingly, *high-expectation* entrepreneurs are overrepresented in the financial, insurance, and real-estate sectors, *high-expectation* entrepreneurs are underrepresented (Autio 2007).

**Parental influence:** Fitzsimons and O’Gorman (2005) found that having self-employed parents increase the propensity of individuals to engage in new venture creation in Ireland. O’Farrell’s (1986) study showed that 46 percent of new firm founders had fathers who were self-employed at a time when only 27 percent of the population was self-employed. This study will identify whether a similar finding will be attributed to the high-expectation/growth entrepreneur.

This study seeks to also examine the motivations and reasons for establishing the high-expectation/growth firm. Individuals start a new business for reasons which are classified as either opportunity or necessity driven a classification parallel to ‘pull’ and ‘push’ factors (Reynolds, Camp, Bygrave, Autio, and Hay 2001, Acs 2006, Hessels, Gelderen, and Thurik 2008). Opportunity entrepreneurship reflects a positive perception and attitude to self employment by the entrepreneur, whereas necessity entrepreneurship emerges where individuals start a new business due to negative reasons, mainly the absence of employment
opportunities. A number of studies investigated variances across individual motivations for starting a business and their impact on the growth of the business. Agreement existed within the majority of research that owner-managers who started their business for positive ‘pull’ factors such as to exploit an opportunity in the market achieved higher levels of firm growth compared to a business for which the primary reasons were negative ‘push’ factors such as unemployment, dissatisfaction with present employment (Kinsella, Clarke, Storey, Mulvenna, and Coyne 1994, Storey 1994, Smallbone and North 1995, Smallbone and Wyer 2000, Hamilton and Lawrence 2001, Reynolds, Camp, Bygrave, Autio, and Hay 2001).

In summary, the literature has found that relative to the broad population of entrepreneurs, high-expecation/growth entrepreneurs tend to be younger, more highly educated, male dominated, have previous employment in the industry in which they established their firm in and establish firms in higher added value industry sectors. In order to further build on these findings, this exploratory study will examine the characteristics and motivations for start-up of a sample of high expectation/growth entrepreneurs and compare the findings to a sample of low-expectation/growth entrepreneurs.

**Methodology Utilized in the Study**

The methodology adopted for this exploratory study is a mixed method approach incorporating an online survey and semi-structured interviews. An online survey approach was chosen as the principal means of gathering data for this research as it allows the researcher to conduct a national study at a reasonable cost and is less time consuming than those administered by an interviewer. The high-expectation/growth entrepreneurs (HEG) database was generated through the identification of annual reports from government agencies in both Ireland and the US. Extrapolating data from these reports resulted in the identification of 187 HEG companies for Ireland and 186 HEG companies for the US, which had email addresses identified for them thus enabling for the personalization of the emails. Even though
this was extremely time consuming for the research team, the pilot study showed that through the personalization of emails, there is the probability of a higher response rate. Concerning the formulation of the database for the low expectation/growth companies [LEG], this was done using databases from the Company Registration Office, Kompass, the Golden Pages and other online resources. The research team ensured that there were respondents from similar locations to the HEG companies. Both the HEG and LEG databases were then compared against each other to ensure that there was no duplication. A total of 189 LEG companies were identified for Ireland and 107 LEG companies for the US.

The questionnaire adopted for the study of HEG/LEG respondents was subject to extensive screening by the research team, tested on government representatives in both countries and pilot tested by 10 entrepreneurs representing both Ireland and the US, so as to take into account cultural variations. Based on their feedback some questions were condensed in size, options were reduced and it was recommended to send a personalized email to each of the potential respondents. With sampling complete, the pilot survey carried out and the questionnaire finalised, it only remained to administer the survey to the chosen sample. The questionnaire was administered through www.surveymonkey.com.

The interviewees for this study were identified from the final question on the online survey, which asked the respondents if they would be interested in taking part in an interview. An interview schedule was designed and focused on probing more deeply into the characteristics and personality traits of the entrepreneurs. The interviews were held between December 2009 and February 2010, at the premises of the interviewee in both Ireland and the US. Each interview lasted approximately 30 – 40 minutes and was recorded using a Dictaphone. In keeping with the method adopted for the qualitative study, multiple sources of data collection such as documents, website and archival records were also used to overcome
the limitations of any individual source if possible. Table 1 below identifies the online response rate and Table 2 identifies the number of interviews conducted in both countries.

Findings

As mentioned previously, the aim of this paper is to examine the characteristics of entrepreneurs of high- and low-expectation/growth companies in Ireland and the US and their motivations for start-up. In particular, emphasis is placed on: the demographic profile of the entrepreneur and their business; occupational background; educational attainment; and motivational factors influencing new venture creation.

Demographic Profile of the Respondents

The findings of this study identify two cohorts of respondents: those classified as high expectation/growth (HEG) entrepreneurs of which there were 37 respondents and low expectation/growth (LEG) entrepreneurs of which there were 28 respondents. Table 3 below compares and contrasts the quantitative findings of the HEG and LEG respondents based on gender, martial status and birth order.

As is evident from Table 3, similar findings can be found concerning the profile of the HEG and LEG entrepreneurs whereby, the majority were male, married, and the eldest child. Respondents for the questionnaire and the interviews from Ireland tended to be younger in terms of age of start up when compared to the US. The findings of the interviews reflect the findings above as well. In the case of the HEG interviewees, seven were male and one was female. All LEG interviewees in Ireland and the US were male. In both LEG and HEG cases, there was a balanced view by respondents concerning their parents entrepreneurial background. For HEG respondents, it was found that 36 percent had a father who was self-employed, 8 percent of mother’s were self-employed and 11 percent had both parents who were self-employed. In the case of 45 percent of respondents, they identified that neither parents were self-employed. For LEG respondents, 46 percent have a father who was self-employed and 8 percent identified that both parents were self-employed. The remaining 46 percent identified that neither parents were self-employed. More notable differences existed in terms of the educational profile of the HEG and LEG entrepreneurs as described in Table 4.
Table 4. Highest Educational Qualification Obtained

</tr>
</tbody>
</table>

As is evident from Table 4 above, three times as many HEG respondents have higher degrees (for example at Masters and PhD level) in comparison to LEG respondents. Some 30 percent of LEG respondents have no tertiary level qualifications whereby only 3 percent of HEG respondents do not. This was further substantiated by the HEG interviewees, who identified that their lowest level of qualification was a postgraduate degree. In the US, the HEG interviewees stated the highest educational qualification attained was a tertiary level award at Masters level, with a high incidence of non-business disciplines being studied. When questioned on the subject area of their qualification, the majority of online HEG respondents identified engineering and electronics, with business being the next most popular subject area. Conversely for LEG respondents, a business related qualification was the most popular amongst this group. Variations also occurred in terms of the number of years prior work experience online respondents had gained and Table 5 highlights the results.

Table 5. Number of Years Prior Work Experience

<td>69%</td>
<td>61%</td>
</tr>
</tbody>
</table>
As Table 5 indicates, the majority of HEG and LEG respondents had 10 or more years work experience prior to establishing their own business. However, the table indicates that there are a number of LEG respondents who went into business without any prior work experience. In the case of Irish HEG and LEG interviewees it was found that they all had 15+ years prior work experience. Interestingly, both the HEG and LEG interviewees in the US indicated slightly lower levels of prior work experience, though the majority had nine plus years experience. When one compares the positions of authority held by these respondents prior to establishing their own business it is evident that HEG respondents were in positions of greater authority and responsibility than LEG respondents. HEG respondents identified that they held President and Vice President positions, CEO’s positions, and/or Director of Sales and Marketing, whereby LEG respondents were Operational Managers, General Managers and team leaders. Oneline respondents were questioned as to whether this was their first business or not and 63 percent of HEG’s and 64 percent of LEG’s indicated it was their first venture. This was further supported by the interviewees as all interviewees in both countries identified that this was their first business venture.

In relation to how the businesses were established, similar findings were found for both HEG and LEG respondents. Some 74 percent of HEG’s and 68 percent of LEG’s highlighted that the business was founded by a team of entrepreneurs. The interviewees gave similar findings as well whereby out of the 13 interviews conducted all bar 3 were founded by teams of entrepreneurs. In relation to industry sector, this study found that high-expectation/growth firms are under-represented in the services sector as only 18 percent of online HEG respondents and one HEG interviewee operate within this sector. The ICT sector was the most prevalent sector for HEG respondents (45 percent of online respondents and four interviewees) and for LEG respondents (50 percent of online respondents and two interviewees). This was followed by the Electronics/Engineering sector as 36 percent of
online HEG respondents and four interviewees, two LEG interviewees and 19 percent of online respondents operating within this sector. The second most common sector for the online LEG respondents was the services sector (25 percent) along with one interviewee indicating this sector.

**Motivations In Establishing The Business**

Respondents were questioned as to the route they took to establishing their business. In the majority of HEG (77 percent) and LEG (68 percent) responses, the route to market was through the formulation of their own business idea. Of those that responded, the event that alerted HEG respondents (n=29) to their business opportunity was primarily based on *observing new trends emerging in the market* with 38 percent respondents indicating this as a route and 39 percent of LEG respondents (n=18) identified this as a route to market. A *niche in the market* was identified by 56 percent of respondents and 35 percent of HEG respondents also chose this as a route to market. Motivations for starting the business were also examined with various and numerous responses emerging through the research findings. Initially, respondents were presented with a listing (as seen in Table 6 below) of push and pull factors and asked to rate the factors based on their level of importance.

</tbody>
</table>
Evidently for HEG respondents, the highest level of importance was placed on “pull factors”, namely “Independence” (100 percent); “Freedom” (97 percent); “Realize a dream” (97 percent) and “Creating Something” (97 percent), followed very closely by other pull factors such as “Challenges in the job” (91 percent); “Enjoy advantages from your creative potential” (91 percent); and “Being your own boss” (85 percent). Conversely, the highest level of importance for LEG respondents was placed on both “pull and push factors”, namely “Independence” (100 percent); “Challenges in the job” (95 percent); “Freedom” (95 percent); “Creating something” (95 percent) and “Realize a dream” (85 percent), followed very closely by other pull factors such as “Enjoy advantages from your creative potential” (90 percent); and “Being your own boss” (70 percent). Both HEG and LEG respondents rated “Autonomy of decision” with a high level of importance, whereby 76 percent of HEG respondents and 67 percent of LEG respondents indicated that this was “important”. Both parties agreed that the least important factors were “Stable conditions on the job” (18 percent HEG and LEG 21 percent) and “Job security” (HEG 27 percent, LEG 33 percent). These findings were further supported by the interviews, whereby interviewees stressed the desire for control and/or the need to create something new.

In addition, the research continued to investigate the specific motivations of the entrepreneurs in starting the business by posing a question influenced by the GLOBE Culture and Leadership Scales (2006). Respondents were presented with 17 statements and invited them to agree or disagree with each of them and Table 7 indicates the results.

<td>18</td>
<td>22%</td>
</tr>
<tr>
<td>I wanted to be able to work from home</td>
<td>21</td>
<td>19%</td>
</tr>
</tbody>
</table>

For HEG respondents it emerged that the highest percentage of respondents indicated that they “wanted the freedom to adopt their own approach to work”, “wanted to make an idea or innovation happen” and “wanted to challenge themselves/prove that they could do it”, accounting for between 89 and 90 percent. These were followed very closely by “always wanted to be their own boss” which counted for 83 percent. These findings were further substantiated in the HEG interviews in both Ireland and the US with interviewees identifying that they “wanted to make an idea or innovation happen” and “wanted to be own boss” being stated as their motivation for starting up their business. Furthermore, 67 percent of HEG respondents indicated that they “wanted to make more money” than they were earning before.

For online LEG respondents and interviewee the greatest motivation in starting the business resulted from the respondents desire for “freedom to adopt my own approach to work” (89 percent), with “I always wanted to be my own boss” (84 percent) as the second most important reason in starting the business. The next most popular response for LEG
respondents was that of “I wanted to challenge myself/prove that I could do it” with 67 percent of respondents answering this question. Both “I wanted to make an idea or innovation to happen” and “I wanted to make more money than I was earning before” were agreed by 50 percent and 56 percent respectively of the LEG respondents who answered this section.

In summary, the findings suggest a slightly higher tendency for HEG entrepreneurs to start their businesses for positive opportunity sensing reasons. That said overall, the motivations for start up for both HEG and LEG do not differ greatly. The respondents were questioned as to whether they were likely to achieve growth within a certain time period and whether the firm was capable of achieving that growth and Table 8 indicates the results.

### Table 8. Growth Aspirations

<table>
<thead>
<tr>
<th></th>
<th>HEG (n=27)</th>
<th>LEG (n=19)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Based on a technological innovation</td>
<td>92%</td>
<td>84%</td>
</tr>
<tr>

<td>78%</td>
</tr>
<tr>
<td>Led by an experienced team with a mixture of technical and commercial competencies</td>
<td>100%</td>
<td>100%</td>
</tr>
</tbody>
</table>

The findings contained within Table 8 above identify that growth is a key imperative for HEG respondents when compared to LEG respondents. All HEG respondents indicated that this was a likely possibility in 3-5 years time when compared to LEG respondent’s views on this (only 74 percent of LEG respondents agreed with this). More HEG respondents are export orientated compared to LEG respondents and more HEG respondents enterprises are based on a technological innovation when compared to LEG respondents.

**Conclusions**

High-expectation/growth enterprises are gaining increased momentum in government policy. However, given their emerging nature, there is a lack of information profiling this subset of entrepreneur or the type of business they operate; separate to the more general population of entrepreneurs. This study has attempted to bridge this knowledge gap. The
findings indicate that some clear differences exist between the HEG entrepreneur and the LEG entrepreneur at the individual level. Firms did not differ greatly in terms of motivations to start up however pronounced differences are identified in the areas of age; education; gender; work experience; industry sector; and each are discussed below.

**Age:** On a global basis, established *high-growth* entrepreneurs are biased towards older individuals and similar findings were found for HEG companies in this study. When one compares the LEG and HEG enterprises there is a similar age difference as well. When one extrapolates the data even more one finds that HEG respondents and interviewees in Ireland tended to be younger in terms of start-up when compared to the US. This indicates that high-expectation/growth entrepreneurs tend to be older in the US which reinforces the emerging nature of high-expectation/growth entrepreneurs in Ireland.

Previous studies support the idea that the age of the entrepreneur has an influence on the growth of the business, where firms owned by younger individuals displayed higher levels of growth. Other research suggests that with an increase in age, the entrepreneur will accumulate knowledge and experience, and will have greater access to and use of networks, which influence subsequent firm growth, thus supporting the idea that older entrepreneurs achieve higher levels of growth. According to the Irish GEM Report (Fitzsimons and O’Gorman 2007) and Autio (2007), individuals are starting businesses at a younger age, thus implying that they will have less previous work experience than older entrepreneurs who may have a greater wealth of experience, have more experience of operating and managing a business and have more established networks which can benefit them in growing a business, in turn impacting on growth of the business.

**Education:** Differences in the type and level of educational award were found within this study. As found by Autio (2007) and Riley (2008) the majority of high expectation/growth entrepreneurs have tertiary level qualifications. The findings of this study
concur with these findings, as HEG entrepreneurs have higher educational awards with a noticeable number at postgraduate and doctoral level and in technical areas relative to LEG entrepreneurs. The benefit of having a tertiary level education results in entrepreneurs not only developing their technical skills but also develops contacts and social capital for the business which can aid in the growth of the business. The results indicate that the majority of HEG respondents and interviewees are emanating from non-business disciplines in comparison to LEG respondents. There are implications here for educational policy makers in that it is imperative that tertiary level educators include entrepreneurship as a field of study within non-business fields. Furthermore, for the supports given by government agencies, they should be cognizant of the fact that HEG entrepreneurs may have no business education or background.

**Gender:** Females globally are under-represented in the high expectation/growth category of entrepreneurs and similar findings were found within this study. In this study it was found that females were sorely under-represented since only 11 percent of HEG online respondents and 3 percent of LEG respondents were female. Interestingly, in the interviews, 22 percent of HEG founders were female, and all LEG founders were male. Further research is required to examine why this is the case in Ireland, the US and/or globally.

**Work experience:** The results of this study highlight that both LEG and HEG respondents have prior work experience prior to establishing their own business. No significant differences were found in terms of the length of work experience. It was, however, interesting that both groups of respondents had 10 or more years work experience prior to establishing their own business. When further examined on their work experience, it was evident that HEG respondents had gained more experience at managerial levels than LEG entrepreneurs. When broken down further, the findings identify that respondents in the US started their high-expectation/growth firm with less prior work experience compared to Irish
HEG entrepreneurs. This could be due to the entrepreneurial culture in the US where entrepreneurs start businesses earlier and there is engendered in people a more entrepreneurial culture in comparison to what is present in Ireland.

**Motivations:** HEG respondents are more motivated to establish a business by ‘pull factors’ when compared with LEG respondents. The motivations for HEG are primarily independence; freedom; realize a dream; creating something new; being one’s own boss and enjoying advantages from creative potential. The key motivations for LEG entrepreneurs are independence, challenges on the job; freedom; creating something and realize a dream. Both HEG and LEG respondents appear not to be highly motivated by helping or supporting the environment, however, this needs to be further researched as a result of the emergence of ‘social entrepreneurs’. More HEG respondents have a greater desire to help and/or support other people more so than LEG respondents. Innovation was a greater motivation for HEG respondents than for LEG respondents. Interestingly, more HEG respondents were motivated to establish their business as a result of redundancy than LEG respondents. In light of the current economic climate it would be worthwhile investigating this further in future studies.

The positive aspirations from the pull factors are important from a policy perspective in that people are interested in establishing high-expectation/growth firms and these should be reflected upon by policy makers and further nurtured and supported by policy in creating awareness and opportunities in creating such firms.

On a broader perspective given the variations in the definitions and characteristics applied to the term high-expectation/growth entrepreneurs there should be ongoing debate about what this term means and how it is interpreted by the practitioner and if there is a policy-practitioner gap in terms of its meaning. This requires further deliberation. Given the variety of perceptions of what a high-expectation/growth firm is, policy makers should take
consideration of the interpretations of the respondents when devising the definition so as to reduce the perceptual gap that exists.

Dr Naomi Birdthistle is a lecturer in Entrepreneurship and MBA programme director at the University of Limerick. Naomi’s research expertise is in the area of family business management and entrepreneurship education. Naomi is a Government of Ireland Scholar having been funded by the Irish Research Council for the Social Sciences for a two-year study which is examining the characteristics and personality traits of high potential start-up companies in both Ireland and the US. Naomi was recently recognised as an outstanding higher education teacher by being awarded the ‘Shannon Consortium’s Regional Teaching Award.’

Briga Hynes is a lecturer in Entrepreneurship at the University of Limerick and Programme Director for the MBS in International Entrepreneurship Management. Briga’s main research interests lie in entrepreneurship and SME business growth, with a principal focus on an evaluation of the determinants of small firm growth and the process strategy development in the SME. A second stream of complimentary research explores how best owner-manager skills and competencies can be enhanced through management development interventions and mentoring programmes. She has also published on the topic of entrepreneurship education, where the research investigates the different pedagogical approaches to teaching entrepreneurship across disciplines. Briga is also involved in a number of outreach activities with entrepreneurs and owner-managers and is also a Board member of Limerick City Enterprise Board, Southill Advisory Management Group, The Management Development Council, (Forfás), and is a project Evaluator for Social Entrepreneurs Ireland.

Yvonne Costin is a Lecturer in Entrepreneurship in the Department of Management and Marketing, Kemmy Business School, University of Limerick. Yvonne is responsible for teaching Enterprise Formation, Enterprise Development and Business Consulting at an undergraduate and postgraduate level. She is currently pursuing a PhD study in the area of female entrepreneurship. Her main research interests include entrepreneurship education at both primary and tertiary levels, female entrepreneurship and growth achievement in entrepreneurial firms.

Sharon Lucey is currently a PhD student in the Kemmy Business School, University of Limerick. Her PhD study focuses on how high growth entrepreneurship can be supported and sustained in Ireland. She holds a Masters of Business Studies in Entrepreneurship Management from the University of Limerick and has previous work experience as a socio-economic researcher and consultant. Her main research interests include; high growth entrepreneurship, small firm growth, economic growth, and enterprise policy.

Business Innovation Triggered by Business Successions:  
Case Studies of Japanese Small and Medium Family Enterprises  

Norio Kubota  

Abstract  
This paper aims to investigate ten cases of Japanese small and medium family enterprises with long business histories, which illustrate business innovation after business successions.  
These case studies make two following contributions.  
First, successors carried out reforms such as organizational changes more focused and updated company visions or management policies or reforms of decision-making and communication processes.  
Second, successors exercise different types of leadership from those of founder’s top-down type to accomplish organizational reforms despite their justified business successions and authorities. The characteristics of the leadership peculiar to successors are “open” management and encouraging employees voluntarily involvement.  
Successors initiate management innovation which has been triggered by business successions, getting supports and understandings among stakeholders while they exercise the leadership peculiar to them and accomplish organizational reforms.  

Introduction  
Business successions are becoming problems in many small and medium-sized enterprises (SMEs) because most entrepreneurs are aging. Promoting business successions smoothly is important not only keeping jobs but skills, technological competence, and know-how.  
Under such circumstances, SMEs that have long business histories are attracting international attentions because they seem to manage business successions.  
Japan is well-known for a number of companies which record long business histories.
According to a survey in August 2009 by Tokyo Shoko Research, that is one of the largest credit research institutions, the number of Japanese companies in business for more than 100 years is around 21 thousand out of 2,130 thousand enterprise database. And 96.0 percent of those companies are SMEs with 300 or fewer workers. One of the reasons why there are so many time-honored companies in Japan is that those companies inherit unchanged traditions, as well as initiate businesses innovations that are suited to times (Yokozawa 2000).

Many Japanese SME owner-managers transfer their businesses to family members. According to a survey on business successions of SMEs in June 2007 by Japan Finance Corporation for Small and Medium Enterprise (JASME), 81.1 percent of the total Japanese SME owner-managers (excluding founders) are family members of previous proprietors (JASME, 2008).

This paper aims to investigate a number of actual cases of Japanese small and medium family enterprises, which illustrate business innovation after business successions.

The case studies show that there are common characteristics that successors carried out organizational reforms before completing business innovation.

---

1As the survey shows, most of Japanese SME’s owner-managers tend to choose their successors from their family members. And SME Agency uses the word “Business Successions” in White Paper on Small and Medium Enterprises in Japan. So this paper also uses the term “Business Successions”.
Finally this paper shows the reason why successors carried out organizational reforms. Because successors need to exercise different types of leadership from those of top-down in order to get collaboration among employees and external stakeholders.

**Research Background**

In discussing family business and the business succession, Bird, Welsch, Astrachan, and Pistrui (2002) evaluated importance in the family corporate management with the number of the journal articles about the family business.

The most frequently mentioned subject was about management and strategy. And the second most was about business successions.

Barach and Ganitsky (1995) pointed out that business successions are chances in pursuance of bold innovations and that successors have authorities to perform innovations as owners of the family companies.

On the basis of these previous studies this paper focuses on successions of the management rather than those of ownership and focuses on management innovations triggered by business successions in small and medium family enterprises.

In discussing family business and organizational managements, Sorenson (1999) showed that the most effective way in order to manage conflict within family businesses was high levels of collaboration including relations with family members and business stakeholders.

This previous study teaches that the conflict management is important in family
business and that it is effective to receive collaboration among stakeholders, both inside and outside. On the basis of the study this paper focuses on organizational management in order to get collaboration among stakeholders when observing processes of the management innovations triggered by business successions.

In discussing organizational characteristics of family businesses, their strengths are organizational flexibilities and their limitations are rigid and exclusive organizational cultures and difficulties in organizational changes (Carlock and Ward 2001).

This previous study shows that the organizations of family business have both flexible and rigid characteristics. So this paper has the viewpoint that successors need to brake down organizational rigidity in order to initiate business innovation triggered by business successions.

According to the already-described survey by JASME, the percentage of the Japanese SME owner-managers who established new management system within 10 years is higher in successors (non-founders) than in founders and higher in owner-managers who succeeded their businesses after 2001 than in those who did before 2000 (JASME 2008).

On the basis of these previous studies the basic proposition of this paper is that successors need to make organizational changes in order to initiate business innovation triggered by business successions.
Research Methodology

This paper mainly draws on evidence from two qualitative research projects, sponsored by the Japan Finance Corporation (JFC) (the name of the organization was changed from Japan Finance Corporation for Small and Medium Enterprise (JASME) in October 2008), Tokyo, which were carried out in 2007 and 2009. Each consisted of 17 and 6 case studies based on interviews with owner-managers who initiated business innovation after business successions. Their reports were published in Japanese (JASME 2008) (JFC 2010).

10 cases were extracted from the cases described above. Conditions for the extracted 10 cases were that their business establishments with 300 or fewer workers (100 or fewer in wholesaling and services, 50 or fewer in retailing and restaurants) as defined under the revised 1999 Small and Medium Enterprise Basic Law in Japan, their business histories are for more than 50 years, and that the successors are family members of previous proprietors.

| Cases A | Socks Manufacturer | 22 | 1960 | Second Son |

| Cases I | Printer | 50 | 1921 | Son-In-Law |
| Cases J | Common Carrier | 98 | 1935 | Son-In-Law |

Table 1
A List of Cases
Case Studies

Three typical cases out of ten cases that successors initiated business innovation after business succession are shown with paying attention to their organizational changes.

Cases B

This company produces and sells gear wheels. It is a successful company for standardization of the production of gear wheels which are build-to-order manufacturing.

The present owner-manager is the fourth of the company and is the eldest son of the second one and is a nephew of the third one who was younger brother of the second owner-manager. It means that the present owner-manager is in the third generation. The present owner-manager succeeded its presidency in 2001 when he was 39 years old due to the age and health reason of the third one.

After becoming its president, he carried out a large scale renovation of the main office factory. The purpose of the renovation was to introduce a new production method in order to diversify its products, not only standard gear wheels but also build-to-order ones. And he started a sort of the after-sale service which offers after sales improvements of products.

Under the second and the third owner-manager’s management, decision making of
the management was made by hunches. The approach was not based on concrete
grounds such as laws, logics and numerical values.

Under the fourth owner-manager’s management, many family members participate in
the management and employees in the previous generation remain, too. It means that the
more in-company human relations become the more generations are. Therefore
transparent and persuasive way is necessary for decision making of the management.

The present owner-manager is aware of the necessity of open organization
administration based on data and of power sharing with other administrators. For
example he explains the managerial decisions in front of all employees three times a
year. He holds meetings with managers after having shown financial statements
although the former owner-manager did not show even its profits. He tries to have direct
communication with many employees and show the business plan or his own schedule
to employees openly.

Cases F

This company began operation in 1910 and ran a clothing store. It began to sell
various kinds of products to be used *Matsuri* (Japanese downtown festivals) during
special events of the department store in 1960's but those products were only the
seasonal goods which were sold only for the limited period of the festival.

The present owner-manager is the third of the company and is the eldest son of the
second one and is a grandchild of the founder. He entered the company in 1987
intending to succeed its presidency. The textile industry was chronic recession in those days.

He paid attention to Japanese downtown festival goods when he was the executive director. First he began to produce the festival goods on its private-label basis in suppliers and sell them at its own stores or by mail orders, instead of laying in a stock and selling them. He adopted the business model of the apparel maker to plan and design its private brands and to produce in suppliers.

Then he thought that he could switch its merchandise from seasonal goods to those which were sold all year round by targeting festivals all over Japan. So he collected the schedule of the national festivals for the data and built a database managing goods, customer information, purchasing records according to each festival.

In 1991 he established the communication sales department and began a full-scale mail order of the festival goods. By this action, the sale spread out in the whole country. He changed the company’s main business from the clothing retailer to the specialized store of Japanese festival goods when his father was the owner-manager.

He succeeded its presidency in 2003 when he was 48 years old due to health reason of the second owner-manager.

The main bank and clients welcomed the change of the owner-manager because they appraised the management innovation that the present owner-manager performed in his executive director times.
Under the former owner-manager’s management, he dictated its business. It was a problem that management was not based on plans or figures.

On the other hand the present owner-manager made a management plan based on figures and pushed forward rules of the accounts processing standard and organizational rules. He also pushed forward reforms of the personnel system such as work rules and the holiday system. In addition, he held business meetings with monthly trial balance reports and tried to share the management information. And he tried to foster the executives whom they could make decisions by themselves.

**Cases G**

This company produces and sells modular rosettes and various connection terminal boards for the telecommunication industry.

The present owner-manager is the fourth of the company and is the second son of the second one and is a younger brother of the third owner-manager who is the eldest son of the second owner-manager. It means that the present owner-manager is in the third generation.

The present owner-manager succeeded its presidency unexpectedly in 1991 when he was 42 years old due to health reason of the third owner-manager.

This company had performed the original equipment manufacturing (OEM) of main bodies of telephone since the first half of 1980's. However, when he succeeded its
presidency, the OEM business was very hard because cost competition intensified by deregulation.

The present owner-manager opposed to the OEM of main bodies of telephone from the beginning. When this company began the OEM business, his father who was the second owner-manager had still a big influence on the company although his elder brother was the owner-manager. Because his father wanted to promote the OEM business, his opinion was not taken at all. Therefore he had nothing else to do but following his father's policy.

However, he wanted to show his own leadership once he succeeded the business. Therefore he became the owner-manager under the condition that his father retired from management.

He decided the withdrawal from the OEM business in 1991 just after he became the owner-manager. He disposed of its production facilities and the unused assets for about one year and a half.

Instead he started a modular jack business in 1992 in order to put up the pillar of a new business because a modular of the telephone connection started just at that time.

He tried to switch to research and development type business after having succeeded in the mass production of the modular jack.

He publicly stated of disposing of assets and launching a modular jack business to employees as a Five-Year Plan just after he became an owner-manager. Because that
helped information-sharing in the company, the disposal of assets advanced smoothly.

He shared crisis awareness with employees and pushed forward reform together and it led to smooth business change.

He was an engineer originally, but he stopped being a technical expert after he became the owner-manager. He transferred his own technical know-how of the production to employees and transferred authority and he devoted himself to management such as the finance. He succeeded in changing employees into people to act voluntarily by transferring authority.

**Results: Overall Characteristics of the Cases**

From the cases of SMEs, several factors can be singled out.

In business successions between families, it is likely that successors intend to succeed businesses in the future. And in many cases, successors enter the same company of the previous proprietors and sometimes work with them. So successors are easy to be accepted about succeeding its presidency by employees, banks, and clients.

However, successors of the cases, who initiated business innovation such as changing in their business models as the successors of small and medium family enterprises, carried out the following organizational reforms despite their justified business successions and authority.
1. **Organizational Changes More Focused and Updated Company Visions or Management Policies**

   Successors made organizational changes more focused and updated company visions or management policies to employees and other stakeholders and showed strong determination to management innovation when they succeeded businesses.

2. **Minute Communication with Employees and Outside Stakeholders**

   Successors performed minute communication with employees and outside stakeholders before and after business successions. And successors showed concrete grounds based on theories and numerical values during communication.

3. **Reforms of Decision-Making and Communication Processes**

   Successors reformed decision-making and communication processes with business successions to perform organized decision making.

4. **Training and Awareness Raising among Employees**

   Successors trained their middle managements or core engineers and encouraged awareness.

5. **Clarification of the In-Company Rules**

   Successors clarified in-company rules with business successions and built the mechanisms to enforce the rules.

   Then why did successors carry out organizational reforms when they initiate business innovation triggered by business successions? The answer is related that ways of
leadership exercising by successors are different from that of leadership exercising by previous proprietors.

Founders and owner-managers in the second generation who can be said to be virtual founders tended to have characteristics such as "typical charisma", "autocratic leadership", and "leadership of the top-down type".

It is rational that founders or virtual founders have such characteristics when they push their ideas into organizations, showing their creativity and foresee ability.

However, successors do not generally hold the power and control of all companies in comparison with founders who founded the company from the beginning. And it is necessary for successors to get supports and understandings among in-company stakeholders such as senior employees who know about their companies well and among outside stakeholders such as banks and clients.

Thus, the style of the leadership of successors becomes peculiar to them while they initiate business successions and carry out organizational reforms.

Unlike the founders or virtual founders having shown autocrat or top-down type-like leadership, the following characteristics were seen in the leadership of successors.

1. “Open” Management

Successors made organizational changes more focused and updated management policies to employees, digitized management information, and shared management information with employees. They aimed at the “open” management based on shared
management information.

In addition, decision-making and communication processes were changed by “open” management, too. Once, managers’ roles were to confirm the judgments of the owner-managers and to transmit them to the organizations. In “open” management, on the other hand, managers controlled the situation of their charge posts and shared the information with other departments.

2. Encouraging Employees Voluntarily Involvement

Successors did not perform all by themselves. They transfer power to employees. They carried out organizational reform that changed the atmosphere of obeying the instructions of autocratic founders by encouraging employees voluntarily involvement.

According to visions, policies, and ideas that successors showed, employees thought voluntarily and brought about new ideas. And this became the base of new management innovation.

Conclusions and Implications

In these case studies, there are several management innovation triggered by business successions in Japanese small and medium family enterprises that have long business histories.

These case studies make two following contributions.

First, it showed that successors carried out organizational reforms when they initiate management innovation such as changing in their business models. The characteristics
of organizational reforms are organizational changes more focused and updated
corporate visions or management policies, minute communication with employees and
outside stakeholders, reforms of decision-making and communication processes,
training and awareness raising among employees, and clarification of the in-company
rules.

Second, successors exercise different types of leadership from those of founder’s
top-down type to accomplish organizational reforms despite their justified business
successions and authorities. The characteristics of the leadership peculiar to successors
are “open” management and encouraging employees voluntarily involvement.

Successors initiate management innovation which has been triggered by business
successions, getting supports and understandings among employees and among outside
stakeholders such as banks and clients while they exercise the leadership peculiar to
them and accomplish organizational reforms.

Social Capital as a Catalyst: Enabling Effect on Organizational Levers for Corporate Entrepreneurship

by François Goxe and Céline Viala

Dwelling on entrepreneurship, organizational and social capital literatures, this paper explores the effects of structural, relational and cognitive social capital upon organizational levers (HR management, culture, structure, control, resources, communication, information system) at different stages of the corporate entrepreneurial process (opportunity recognition, project design and implementation). We argue that different kinds of social capital will impact different organizational levers at different stages of the corporate entrepreneurship process. We conclude with implications for theory, limitations and perspectives for future empirical research.

Corporate entrepreneurship (CE), defined as the birth of new businesses within organizations (corporate venturing) and the transformation of organizations through the renewal of the key ideas or assumptions on which they were built (corporate renewal) (Chung and Gibbons 1997), used to be the exclusive territory of engineers and top managers in large firms. It is now increasingly encouraged among managers, regardless of their position and the size of the organization. Among small firms, where resources are scarce, such initiatives appear crucial (Baron and Markman 2003) yet remain mostly unexplored by research. Specifically, Dess et al. (2003) suggested that the role of social exchange, including the importance of social capital, represents one of the major issues scholars can pursue to further understanding about CE. The critical importance of social networks – social capital – on the development of CE has been acknowledged in large firms (Starr and McMillan 1990; Zahra et al. 1999) but there is still little evidence in smaller ones. Moreover, a distinct literature (Guth and Ginsberg 1990; Covin and Slevin 1991; Lumpkin and Dess

1 François Goxe is a PhD student in Management Science and lecturer in Strategy at Université Paris-Dauphine, France. His research focuses on small business entrepreneurs’ networks and social capital with particular emphasis on networking among small business entrepreneurs for the internationalization of their firms.

Céline Viala is an associate researcher and lecturer in Strategy at Université Paris-Dauphine, France. Her research examines corporate entrepreneurship and creativity.
1996; and Antoncic and Hisrich 2001) has also identified various organizational levers inspiring and enabling CE: culture, structure, HR management, control, information system, communication, resources. The relation between organizational and social literatures is still to be established. Dwelling on existing studies (Hornsby et al. 1993) suggesting there may be consistent organizational and social characteristics that lead to intrapreneurial behavior, this study seeks to explore the effects of social capital on organizational levers for CE. Extant literatures and empirical evidence from SMEs on social capital and CE are employed in order to investigate one primary research question: How can social capital contribute to CE? Specifically, how can structural, relational and cognitive dimensions of social capital (Nahapiet and Ghoshal 1998) facilitate and enhance organizational levers for CE? First, we propose to review prior research on organizational levers for CE and on social capital and CE through three dimensions: structural, relational and cognitive. Potential impacts of these dimensions on organizational levers for CE are then empirically observed and analyzed at different stages of the process: opportunity recognition, project design and implementation. We eventually provide a clearer understanding of social capital dimensions and CE and offer a framework relating social and organizational elements enabling CE.

**Corporate entrepreneurship as an organizational process**

**Defining corporate entrepreneurship stages**

Extant literature defined the creation of new ventures, outside or inside existing organizations, as a stage process (Wilken 1979; Greve and Salaff 2003; Shane and Venkataraman 2000). Wilken (1979) recognizes three phases: 1) the *motivation phase*, where entrepreneurs discuss the initial idea 2) the *planning phase*, where they get the necessary knowledge and resources to test ideas and get support to set up a firm, and 3) the *establishment phase*: where they establish and run a venture. Similarly, Shane and Venkataraman (2000) suggested three stages: 1) the *existence of entrepreneurial opportunity* 2) the *discovery of entrepreneurial opportunities*, and 3) the *decision to exploit entrepreneurial opportunities*. In the same way, we can identify three stages for CE: 1) the
opportunity recognition phase, where intrapreneurs identify ideas and business opportunities 2) the design phase, where they prepare for the new project and acquiring information, knowledge, resources and network to, and 3) the implementation phase, where they deploy the project within the organization.

**Figure 1: Corporate entrepreneurship stages**

Levers for corporate entrepreneurship

During these stages, organizations resort to “levers” for CE, that is organizational dimensions, elements that are vital parts of forming and effectively using a CE strategy. Ireland et al. (2006) identify four levers (human resources management, culture, structure and control) that enable an organization to develop sustainable entrepreneurial behavior as the path to improved performance. We previously augmented this model by adding communication, resources and information system to the existing levers (Viala et al. 2009) (Figure 2).

**Figure 2: Organizational levers for CE (Ireland et al. 2006 and Viala et al 2009)**
The model takes into account two units of analysis: the corporate entrepreneur in relation to other members of the organization (social capital) (in particular within communities of practice), and the extended organization (in interaction with customers, suppliers and other stakeholders). Descriptions of these levers are presented in the following paragraphs.

**HR management**

HR Management comprises four themes: HR orientation, management support, training and rewards. HR orientation corresponds to the principles of HR management and managerial values and translates into the recruitment and promotion of employees that are flexible, risk-taking, committed to innovation (Ireland et al. 2006) and oriented towards efficiency (Pinchot 1984; Burgelman 1983). Recruitment is based on the principle of diversity, which fosters creativity (Milliken and Martins 1996; Amabile 1996). Management support consists in building trust and the development of employees' creative and innovative potential (Mohanty 2006; Cooper 1988; Cumming 1999) through empowerment (increase in workers' responsibility and involvement), openness (Eesley and Longnecker 2006), continuous learning (Carrier 1997) and the inclusion of innovative and risk-taking initiatives in evaluation and recognition criteria (Ireland et al. 2006). Managers' commitment is essential as the likelihood of success and the impact of innovation are related to their involvement in the CE process (Manimala et al. 2005, Kelley et al. 2005). Those managerial characteristics have a strong influence on the “organizational climate which favors creativity” (Ekvall et al. 1995). Training enables employees to broaden their knowledge and skills, position themselves in a change dynamic that is essential to creativity and innovation (Kuratko and Montagno 1989; Mohanty 2006;). Knowledge sharing fosters a strong interest in improving performance among individuals and the organization as a whole (Amabile 1997; Hamilton 2008). Those practices pave the way for collective learning and foster an open and continuous dialogue, which favors creativity (Botcheva et al 2002) and CE. The celebration and reward process, acknowledging progress and performance at different stages, encourages individuals to develop creativity for the sake of the organization (Mohanty 2006; Cumming 1999; Kelley et al. 2005;
Rewards can be extrinsic (wages, bonuses...) and/or intrinsic (public or private recognition...) (Wunderer 2001). The intrinsic rewards are generally more efficient, personal achievement (Carrier 1997) often being the main motivation for employees' actions (Cummings and O'Connell 1978). In a nutshell, the diversity of skills, the development of training schemes and a policy that rewards risk-taking help build trust and foster CE (Amabile and Gryskiewicz 1989).

**Culture**

Organizational culture can foster CE (Wunderer 2001; Carrier 1997) by encouraging some flexibility in the organization (Russell and Russell 1992; Amabile et al. 1996) and the removal of bureaucratic barriers (Stephen et al. 2008). It can foster innovation and continuous improvement (Russell and Russell 1992; Ireland et al. 2006; Kelley et al. 2005), the search for innovative opportunities, risk taking (Russell and Russell 1992; Mohanty 2006; Cumming 1999) and the promotion of autonomous behaviors (Burgelman 1983). It can also inspire to accept setbacks and errors (Burgelman and Sayles 1986; Tushman and Nadler 1986; Hornsby et al. 1999; Singh 2006) and put an emphasis on future results (Ireland et al. 2006).

**Structure**

Organizational structure can significantly foster CE (Tushman and Nelson 1990; Covin and Slevin 1989; Dess et al. 1999) provided it is decentralized and distinguishes different business units (Taylor 2001) for more autonomy and initiative (Burns and Napier 1994). Ireland et al. (2006) advocate for horizontal rather than vertical structures, enabling cross-fertilization processes. Theoretically, organizations adopting a CE strategy should thus be decentralized, limit formal procedures and encourage flexibility (Covin and Slevin 1989; Barrett and Weinstein 1998).

**Control**

Control is closely linked to structure. As part of CE, control processes should emphasize control over outputs (by assessing the number of new projects launched for instance) as the controllers (managers) may not have complete knowledge of what corporate entrepreneurs / employees do. Indirect control over inputs such as self-monitoring should be encouraged (Singh 2006). MacMillan
(1986) and Zahra (1991) insisted on the inhibiting effect of excessive formal controls. Positive control is linked to measurements of performance and focus on the generation and sharing of knowledge/information that enables employees and managers to identify problems before they crop up. Control should strike a balance between flexible, indirect, control of inputs encouraging action and tighter direct control of outputs fostering consistency (Ireland et al. 2006). Ireland et al. (2006) recommend an emphasis laid on control so as to encourage employees to accept risk related to corporate entrepreneurial behavior. Ireland et al. (ibid.) also suggest that control be based on the absence of surprise, self-monitoring and information sharing. Likewise, Sathe (1988) recommends constructive control, avoiding irresponsible behavior and acknowledging CE-related risks. Control should encourage the corporate entrepreneur to move on with his/her ideas while limiting the risks incurred by the enterprise through a number of non-negotiable rules.

*Communication*

Communication is an essential element to promote CE (Zahra 1991; Tushman and Nadler 1986; Kanter 1989; Russell 1999 Kelley et al. 2005). It is important to broadcast clear messages and have fluid and open communication at all levels in order to foster knowledge capitalization, learning and innovation (Kanter 1984; Pinchot 1985). Internal and external communication help promote and spread entrepreneurship.

*Resources*

Human, financial, tangible and intangible (time, information, knowledge,….) resources are essential to conduct innovation (Tushman and Nelson 1990; Mohanty 2006; Kuratko and Montagno 1989). Corporate entrepreneurial projects consume resources (Covin and Slevin 1991) and a company's ability to develop innovative projects will be restricted by available assets. Organizations have to recruit and/or promote creative personalities (Brand 1988; Mnisri 2007), as people are the essential resource for detecting opportunities. Material and financial resources play a role rather in the implementation of ideas.

*Information systems (IS)*
IS can help bring about ideas and progress (Eesley and Longenecker 2006) or share information (Covin and Slevin 1989; Barrett and Weinstein 1998). Technological interactions can foster information sharing (Kao 1996; Cooper 2003). IS facilitate interactions through computerized communication networks, groupware, management systems... Limited research has yet been conducted on the influence of IS on CE (Hamilton 2008).

**Corporate entrepreneurship as a social process**

Organizational aspects do not take place in a vacuum, corporate entrepreneurs are embedded in a social context / relationships. These relationships / social capital can provide entrepreneur wannabes with business ideas and opportunities (Krackhardt 1995; Dacin et al. 1999), but also impact business development and growth (Aldrich and Zimmer 1986; Greve and Salaff 2003). The following section therefore offers to link organizational and social factors of CE.

**Corporate entrepreneurship and social capital**

The driving idea of social capital theory is that “relationships constitute a valuable resource for the conduct of social affairs” (Nahapiet and Ghoshal 1998). The literature on social capital in entrepreneurship (Hoang and Antoncic 2003) generally argues that social relationships may present social capital, “the sum of the actual and potential resources embedded within, available through, and derived from the network of relationships possessed by an individual or social unit” (Nahapiet and Ghoshal 1998: 243), providing benefits to individuals and their organization. Although, in the context of (corporate) entrepreneurship, researches have investigated the potential impact of social capital upon various facets / stages of the process, the emphasis is almost systematically on the influence of social relationships on the overall process and its performance. Studies have indeed emphasized social capital (often considered broadly as social relationships), as promoting individual creativity, creative business strategies, solutions to business problems, or changes to processes (Perry-Smith and Shalley 2003). Other researches (for example Amabile et al. 1996; Woodman et
al. 1993) have explained these influences as part of a larger “social context”, promoting risk taking, autonomy and competition (Amabile 1988; Woodman et al. 1993) and potentially providing resources and support for individual creativity, acting as a “conduit” for the communication of ideas, knowledge and information (Amabile 1988; Woodman et al. 1993), alternatives, solutions and ideas (Amabile et al. 1996; Kanter 1985), penetrating the organization through individuals' social networks. Although the general causes and effects of social relationships upon the overall (corporate) entrepreneurship process have therefore been investigated, little is known about the mechanisms at work during the process, notably how social capital and organizational levers may interact. Some studies have introduced the idea that only specific ties may be beneficial to creativity and subsequent corporate entrepreneurial stages (project design and implementation). For example, Floyd and Woolridge (1999) proposed that structural characteristics such as centrality account for an individual's ability to acquire novel information). Others have proposed to investigate how social networks / social capital can contribute to later stages of entrepreneurship, namely project design and development, focusing on the selection of ideas and their transfer into projects (Brown and Eisenhardt 1995). However, this literature hardly addressed the social processes involved (Kijkuit and Van den Ende 2007: 864) and the role networks play in (corporate) entrepreneurship remains largely unexplored (Jones 2005). Models addressing some specific facets or the general influence of networks and social capital on CE exist but a comprehensive framework combining the influence of these elements considered along the dimensions defined by the literature on social capital and organizational aspects of CE is yet to come. As research on corporate entrepreneurship and social capital remains highly fragmented, we propose to deploy Nahapiet and Ghoshal's (ibid.) synthetic framework of analysis in order to better understand the potential influences of social capital upon organizational levers designed to foster the corporate entrepreneurial process, at different stages of this process.

**Dimensions of social capital (Nahapiet and Ghoshal's framework)**
Dwelling on Granovetter's distinction between structural and relational embeddedness (Granovetter 1985), Nahapiet and Ghoshal (1998) have defined social capital along three dimensions: structural, relational and cognitive.

**Structural**

The structural dimension of social capital refers to “*the overall pattern of connections between actors*” (Nahapiet and Ghoshal, ibid.: 244). This dimension determines the presence or absence of ties between actors, the network configuration in terms of measures such as density, connectivity and hierarchy, and the strength of ties (strong vs. weak, depending on frequency, intensity and reciprocity of interactions) (Granovetter 1973; Marsden and Campbell 1984; Moran 2005; Hite 2005).

**Relational**

The relational dimension of social capital describes “*the kind of personal relationships people have developed with each other through a history of interactions*” (Nahapiet and Ghoshal, ibid.: 244), the quality of actors’ personal relations formed and maintained mostly on a discretionary basis and only partially affected by the formal hierarchy in the organization. The relational dimension typically comprises trust and trustworthiness (Galunic and Moran 2000; Tsai and Ghoshal 1998) developed through particular relations such as friendship.

**Cognitive**

Cognitive social capital comprises “*those resources providing shared representations, interpretations, and systems of meaning among parties*” (Nahapiet and Ghoshal, ibid.: 244). The cognitive dimension of social capital describes the perceptions made by individuals on others as well as the perceptions that they receive from others: “*the shared vision and goals, and the collectively held values that underlie them, help promote integration and create a sense of shared responsibility and collective action*” (Leana and Pil 2006, 354).

The three dimensions interact among themselves. Tsai and Ghoshal (1998) found, for instance, that the structural and cognitive dimensions positively influence the relational one (strong ties can foster
the development of trust and actors' perceived trustworthiness, major manifestations of the relational dimension. Besides, common values and a shared vision, major manifestations of the cognitive dimension, can encourage the development of trusting relationships). The following figure (figure 3) shows some p interactions.

**Figure 3. Social capital dimensions** (adapted from Tsai and Ghoshal 1998)

![Diagram of social capital dimensions](image)

1. Trust and trustworthiness can create new ties and/or strengthen existing ones
2. Centrality and strength of ties can foster trust and perceived trustworthiness
3. Frequent interactions can foster shared understanding, interpretations and visions
4. Shared visions can strengthen existing ties
5. Trust and trustworthiness can foster the development of shared visions
6. Shared visions strengthen trust and trustworthiness

**Methodology**

Based upon this extensive literature review, we question how the different dimensions of social capital facilitate and enhance organizational levers for CE. The empirical part of this study draws on qualitative case-study methodology (Eisenhardt 1989). Our research was exploratory in nature and rooted in Eisenhardt’s (1989) interpretive methodology, which allows theory and data to interact and influences methodological choices. This study began with a review of literature and the construction of the conceptual framework from Ireland et al.’s model (2006). As Jones (2005) notes, detailed qualitative studies examining how social capital facilitates or restrict the activities of corporate entrepreneurs are scarce although “systematic qualitative research” is frequently advocated (for example Hitt and Ireland 2000). Our research question on how social capital contributes to CE requires a qualitative method based on case studies which take the context into account (Yin 1989; Miles and Huberman 2003; Eisenhardt and Graebner 2007). Three extensive
case studies were conducted in small-sized organizations (SMEs and associations) in the banking and finance industry in France during three years of participant observation. The first case was a consulting firm specialized in finance launching a new offer designed by operational managers. The second case was an association, comprising a thousand members in the financial field, implementing a CE policy and that developed eight CE projects in three years. The third case consisted in the set up of a three-year strategic plan for CE by another financial association. To enhance validity, data were collected through multiple sources: thirty-six-month participating observation, semi-directive interviews, questionnaires and internal documents. The content analysis was performed in a thematic way (Romelaer 1999) with research software Nvivo, themes coming from literature and on-site studies. As no formal structural analysis of social networks was conducted here, only partial propositions based upon researchers' observations and literature reviews will be made. As direct relationships may be absent between actors, indirect ways of obtaining information such as monitoring become a preferable information-gathering conduit (as opposed to the structural approach), researchers may rely on observations and second-hand information-gathering techniques to obtain information (Shah 1998).

Results

HR management

Observations show that the relational dimension of social capital has a particular influence on HR Management at all stages of the CE process. During the Opportunity Recognition stage, relational social capital, considered as the quality of the manager's personal relations with his/her employees (potential corporate entrepreneurs), manifested by friendship ties and trust, promotes creativity and employees' detection of opportunities. Relational social capital acts notably upon employees' perception of HR orientation, organizational values, and reward system. Employees are likely to seek novel ideas as they are intimately convinced that innovation and risk taking will be rewarded (not punished) and that the organization recognizes and values novel ideas. These
perceptions are strongly influenced by informal discussions with coworkers and managers considered as trustworthy, acknowledging and embodying the effectiveness of an HR policy valuing entrepreneurial initiatives. To a certain extent, managers considered as friends, act as role models and advisers. Likewise, at project design stage, employees are more likely to communicate new ideas and participate to CE trainings in so far as they have developed strong, trusting relationships with managers. Conversely, managers are more likely to champion projects from collaborators they have established friendship, trusting relations (relational social capital) with and use their superior (that is more central) position within the organization (structural social capital) to leverage internal network ties in order to support the project, gain acceptance from at least a few decision makers. Managers will also be more likely to curb (administrative, institutional, technical...) restrictions that might inhibit project design and implementation. At this stage, the quality of ties between employees and their managers and/or other members of the organization (colleagues, experts,...) enable the former to gather (material, financial and non material) resources –information, time, network and knowledge (expert skills), test and consolidate their idea, craft a business plan, if needed, to implement the project. At project implementation level, the quality of the relation of the corporate entrepreneur (and/or their manager) with the champion (a leading member of the organization) is essential. The champion acts as a facilitator to limit (technical, relational or institutional) hindrances and foster the development of the project.

P1: Relational social capital promotes HR management at all stages of the CE process.

P1a: At Opportunity Recognition stage, relational social capital, trusting relations with managers, fosters employees' positive perception of HR orientation, organizational values, and reward system

P1b: At Project Management stage, relational social capital contributes to build management support (and therefore resource acquisition, idea validation and acceptance)

P1c: At Implementation stage, relational social capital contributes to build management support (and therefore limit (technical, relational or institutional) hindrances)
Culture

The cognitive dimension of social capital has a particular influence on organizational culture during the opportunity recognition and project design phases. Cognitive social capital generates shared representations which underlie CE values. At opportunity recognition level, shared beliefs in the organization's support (beliefs reinforced by relational social capital developed with managers) and success stories (transmitted and legitimized by trusted managers) encourage employees to suggest new ideas without fear of sanctions. Hamilton (2008) offers to create an open environment which would encourage responsibility and where corporate entrepreneurs would control the contents of their projects and the processes. The development of a corporate entrepreneurial culture lies in the development of a common vision that favors synergy, personal investment, participation and thus creativity and innovation (Burns and Napier 1994). Shared beliefs and vision encourage information sharing which in turn has an influence on idea generation (Cummings and O’Connell 1978; Woodman et al. 1993). Besides, at later stages, shared beliefs and vision foster exchanges, cooperation (Wunderer 2001) and teamwork (Ireland et al. 2006; Manimala, Jose and Thomas 2005). Culture is thus a social structure (Chung and Gibbons 1997) in so far as it usually comes together with standards, values and creeds (cognitive social capital) that a community develops over time (Marcoulides and Heck 1999; Schein 1985), a "social glue" that links organizational participants to one another, even in the absence of direct ties. It allows them to increase their knowledge on the way technologies, products and organizational dynamics interact to provide opportunities (Bogner and Thomas 1994). Cognitive social capital generates a culture, an ideology, that socially underlies the adoption of a corporate entrepreneurial dynamic.

P2: Cognitive social capital forms the basis of CE organizational culture, particularly determinant in the Opportunity Recognition and Project Design phases.

P2a: At Opportunity Recognition stage, cognitive social capital fosters organizational trust and information sharing

P2b: At Project Design and Implementation stages, cognitive social capital foster exchanges,
cooperation and teamwork Structure

Formal structure partially reflects the structure, configuration, of informal social networks, that is the structural dimension of social capital. If managers' formal hierarchical position accounts for a major part of their centrality in informal social networks (Krackhardt 1990), individual's power and centrality in the organization are conversely partly determined by their power and centrality in informal networks (structural social capital). Formal structures assign people to different roles and positions in order to reap the benefits of division of labor, to reduce uncertainties and to improve efficiency and coordination whereas informal interpersonal relationships are more driven by individuals’ attributes, resources and purposes, which may differ from the formal organizational goals and relationships (Podolny and Baron 1997; Ibarra 1993). The prescribed nature of formal structures and formal relationships should (ideally) align with the flexibility of informal structures and relationships (Tong 2003). The organization structure is the enterprise's skeleton while the informal one is its central nervous system (Krackhardt and Hanson 1993). The formal structure manages known process, while the informal structure, highly adaptable, can help deal with uncertainty and unexpected problems (Krackhardt and Hanson, 1 1993).

Structure plays a particularly determinant role in the 1st and 3rd phases of the CE process by allowing employees' autonomy and increasing resource sharing (Kanter 1984). Employees are more able to detect opportunities through the various weak links established with people they may not be formally connected with (structural dimension of social capital). In addition, the limited number of rules and procedures in those structures increases autonomy, allowing people to try innovative solutions and exchange information within the organizational borders (Zaltman et al. 1973). Horizontal interactions are encouraged, which makes the organization more easily adaptable (King 1990).

At CE project implementation level, a decentralized organizational structure, relying on informal relations rather than formal ones, fosters participation from managers concerning the decision-making process of innovative projects and the allocation of resources, which in turn contributes to
increase their commitment to CE and thus makes implementation more efficient (Cohn 1981; Kim 1980).

The informal structure makes it possible to exchange information more easily and go beyond organizational hindrances. It impacts learning, information exchanges and initiative (Chung and Gibbons 1997; Floyd and Wooldridge 1999; Kijkuit and Van den Ende 2007). It favors CE 1) by encouraging information exchanges to detect opportunities 2) by improving organizational learning through obligations and generated trust, 3) by fostering entrepreneurial action taking through standards and sanctions (Chung and Gibbons 1997). Weak links with other organization members and outsiders fosters creativity and the detection of opportunities (Perry-Smith and Shalley 2003) provided the organizational structure is decentralized. However, having too many weak ties is harmful to the development of ideas as individuals then spend too much time maintaining their network instead of integrating and deploying them. CE can, a priori, be developed in any structure, however, it will be strengthened by a decentralized formal structure and informal interactions enabling to uncover and deploy ideas at various organizational levels (Ireland et al. 2006).

P3: The informal structure makes up for the shortages of the formal one: sparse social networks (with low density, numerous weak ties) increase the flexibility of formal structures.

P3a.: At Opportunity Recognition stage, weak ties (structural social capital) facilitate opportunity recognition provided the organizational structure is decentralized.

P3b: At Implementation stage, weak ties (structural social capital) fosters managers' participation and commitment provided the organizational structure is decentralized.

P3c: At any stage, a balance has to be established in the number of weak ties to avoid an overload of (formal and informal) relations.

Control

Control plays a particular role in the last two stages of CE: in the validation of ideas / project design and the implementation of the project. Relational social capital influences control. The
organization's and managers' trust in employees impacts control both qualitatively and quantitatively. Structural social capital also impacts control given the subordination and/or validation links it entails. For instance, the corporate entrepreneur's idea is not automatically checked by his direct supervisor/manager but can rather be checked by experts, competent on the suggested idea or by a steering committee made up of members from different fields and hierarchical levels. This method prevents potential opportunistic behaviors from supervisors (bridging structural holes, Burt 1992), tempted to claim paternity for successful projects (that is to take advantage from their bridging position between creators and decision makers). In order to promote CE, managers must leave some freedom to corporate entrepreneurs: freedom to come into closer contact with other employees and/or suppliers (Hamel 2002; Seshadri and Tripathy 2006), freedom in the planning and implementation process (Taylor 2001). Formal organizational control provides stability to companies which need to benefit by competitive advantages simultaneously with enough flexibility to let employees develop a corporate entrepreneurial behavior. Cognitive social capital can act as a regulator of corporate entrepreneurial activity through the system of values shared between organization members. In that respect, Ouchi (1990) suggest that such “clan control” can be efficient in the management of uncertain social processes (like innovation) as it operates through internalized values and informal rules. The CE process should thus be based on rather broad, informal, control processes.

P4: Control plays a particular role in the last two stages of CE: in the validation of ideas / project design and the implementation of the project

P4a: At later stages, control processes should help bridge structural holes

P4b: At later stages, cognitive social capital can foster/substitute for informal control processes

Communication

Communication intervenes mainly at the CE implementation stage and to a lesser extent at opportunity recognition stage. Cognitive social capital influences communication as communication is based on a system of shared representations. This allows to transmit consistent messages about
the company's values, strategy and past results of CE (example of successful projects, symbolic or financial rewards for corporate entrepreneurs, qualitative or quantitative gains obtained). Communication brings a positive signal to employees on the beneficial effects of the CE for both the company and individuals and on the favorable symbolic and/or financial consequences they can obtain from it. According to Eesley and Longenecker (2006), corporate communication encourages employees to communicate more, to share information, coordinate activities, as well as to develop a culture of trust and support. Therefore, corporate communication helps develop exchanges between employees and, as a result, enhances relational social capital. Likewise, social networks and knowledge networks (Mohanty 1999) are a way to broadcast information and creative ideas (Granovetter 1982). Communication on CE can be done internally and/or externally to encourage clients, suppliers and other stakeholders to develop new ideas.

P5: Cognitive social capital enhances the effectiveness of communication at Opportunity Recognition and Implementation stages.

Resources

Resources play a role at all stages of the CE process. The structural dimension of networks and social capital, here the position of individuals in the network, strongly influences corporate entrepreneurs access to resources (knowledge and skills, economic capital, machines, systems, time and information that the organization makes available for innovation (Russell 1999)), the network acting, from this perspective, like a pipeline. The configuration of the network (structural dimension of social capital) impacts mainly the quantity of resources while trust (relational dimension) affects the quality of resources (Podolny and Baron 1997). Corporate entrepreneurs' centrality in networks (that is the number of direct connections with others) will strongly determine their potential access to resources. The quality of ties, trust existing between entrepreneurs and resource providers, will determine the latter's willingness to cooperate.

P6: Resources play a role at all stages of the CE process
P6a: Structural social capital will determine the quantity of resources accessible to corporate entrepreneurs

P6b: Relational social capital will determine the quality of resources accessible

P6c: Relational capital will determine the suppliers of resources' willingness to cooperate

Information system

The information system is essential for opportunity recognition (collaborative platform to exchange ideas) and, to a lesser extent, to CE project design (knowledge capitalization base). Relational social capital (trust) and cognitive social capital (shared vision, beliefs, narratives) encourage people to adopt and use the information system. Conversely, the implementation of IS may be considered as a means to bridge structural holes, creating link between individuals who up until then had not been in direct contact. The IS can therefore contribute to modify structural aspects of social capital. IS can help extend and strengthen ties between individuals by increasing interactions between them and conveying representations shared by cognitive social capital. It allows individuals to detect ideas, reproduce good practices, invigorate and steer the CE process. It thus has to be at the same time decentralized and integrated in order to match employees' needs while giving a global view of the process at organization level.

P7a: At Opportunity Recognition and Project Design stages, cognitive social capital can encourage people to use IS

P7b: At Opportunity Recognition and Project Design stages, the use of IS can help bridge structural holes

P7c: At Opportunity Recognition and Project Design stages, the use of IS can strengthen organizational cognitive social capital

The various interactions proposed are summarized in the following figure (Figure 4):

Figure 4: Interactions between social capital dimensions, CE levers and CE stages
Discussion and conclusion

This paper provides explanations for how dimensions of social capital – structural, relational and cognitive – mediate organizational levers for corporate entrepreneurship at different stages of the process. We integrated concepts from three distinct literatures. From (corporate) entrepreneurship theory, we identified three stages – opportunity recognition, project design and implementation. From organizational theory, we identified seven levers – Structure, HR, Culture, Control, Resources, Communication and I.S. From social capital theory, we identified three dimensions – structural, relational and cognitive. Based upon this literature review, we related levers to the stages of the CE process. We then related social capital dimensions to the CE process. Combining organizational and social elements, we suggest that structural, relational and cognitive social capital mediate the use and usefulness of levers at different stages of the CE process. For example, we observed and propose that structural social capital (that is network configuration and tie strength) fosters notably the use and performance of levers for opportunity recognition and design and implementation of projects (structure, resources). Relational social capital (trust and trustworthiness) mediates HR management throughout the CE process. We highlight the reciprocal influence of interpersonal trust (relational social capital) and policies designed to promote creativity (idea recognition) and innovation (design and implementation). Trust in colleagues and supervisors' encourages potential entrepreneurs to share and implement novel ideas provided such initiatives are clearly acknowledged and valued by the organization. Cognitive social capital (shared norms,
representations and narratives) mainly mediates culture and communication, two levers playing a critical role respectively at the Opportunity recognition and Implementation stages. Mutual understanding and shared interpretations contribute to build a culture of innovation, encouraging and demonstrating strong support for novel initiatives and set a virtuous circle in which ideas are constantly identified, translated into projects and implemented. These results/propositions contribute to existing theory in the area and holds implications for research and practice. Both structural and relational aspects of social capital considered suggest a focus on individual actors within the context of the organization's social arrangements (Floyd and Woolridge 1999) while the cognitive aspect puts an emphasis on groups, departments and the whole organization. We suggest that CE is a process that can be simultaneously considered from organizational and social perspectives. The interactions between organizational levels, organizational and social dimensions analyzed here partly explain the complexity of CE and that “throughout the process a measure of serendipity remains” (Floyd and Woolridge 1999: 138) as the process success depends on the alignment of various factors, some of which may not be controlled.

This research makes three contributions. From a theoretical perspective, it sheds light on how specific dimensions of corporate entrepreneurs' social capital interacts with organizational levers and provides a “corporate entrepreneurship dynamic” model. From an empirical perspective, as qualitative studies examining how social capital facilitates or restrict the activities of corporate entrepreneurs are scarce (Jones 2005), it contributes to answer the call for “systematic qualitative research” (Hitt and Ireland 2000). From a managerial perspective, this study may serve to refocus attention on individuals and their social capital as key determinants of the organizational levers executives use to stimulate entrepreneurial behavior and deploy corporate entrepreneurial initiatives. Future research may extend the present study and test the various propositions made, notably through alternative data collection methods.

HUMAN CAPITAL OR SOCIAL CAPITAL –
A DETERMINANT OF ENTREPRENEURIAL CHOICE AMONG INDIAN IMMIGRANT ENTREPRENEURS IN AUSTRALIA.

Dr Meena Chavan
Macquarie University
meena.chavan@mq.edu.au

Key word: Human capital, social capital, propensity for entrepreneurship, immigrant entrepreneurs.

Abstract

The aim of this research is to conduct an in depth analysis of the role that variables like education, previous work experience, family business background, social and family relationships and ethnic networks, links to the country of origin play in determining an entrepreneurship career.

This study reviews the role and significance of Human Capital Vs Social capital as a determinant of entrepreneurial choice in a group of Indian immigrant entrepreneurs in Sydney in order to investigate and test the following hypotheses.

H1 There is a positive and significant relationship between the entrepreneurial choice and the social capital enjoyed by members of a common Indian ethnic group in Sydney.

H2 Choice to become an entrepreneur has been negatively correlated with human capital.

Data was collected from 52 Indian business firms, who owned, subways, post offices, KFC’s, Indian food stores, restaurants, car wash etc. This research highlights that the role of human capital as a determinant of entrepreneurship cannot be overlooked.
Achieving academic, market and political legitimacies: the “extreme case” of a French higher education institution entirely dedicated to entrepreneurship development

Miruna RADU, Dr.
Head of the Master in Entrepreneurship, Advancia – CCIP

Renaud REDIEN-COLLOT, PhD
Deputy Director, Advancia – CCIP

Abstract
The aim of our paper is to study the long and complex legitimization process of Advancia, a business school of the Paris Chamber of Commerce entirely dedicated to entrepreneurship. In the context of higher education, the purpose of quality assurance management is to produce legitimacy (Rindova, Pollock and Hayward, 2006). What happens when an entrepreneurship business school works on simultaneously achieving academic, market and political legitimacies? Our research illustrates the tensions among these three specific legitimization processes and questions their impacts on the school’s quality assessment objectives and indicators.

Introduction
French entrepreneurship education is increasingly gaining ground for the last ten years, with more and more universities and many flourishing Bachelors and Masters offering courses and diplomas in entrepreneurship. At a macro level, these educational initiatives are well integrated into the national and the European policy frameworks aiming to stimulate entrepreneurial spirit and to increase the number of start-ups all over the continent (EFMD 2006). At a micro level, these programs are regularly facing a similar dilemma: achieving academic legitimacy according to quality assurance indicators, while at the same time reaching market and political recognition (Verstraete 2002). According to Binks and his colleagues (2006), scientific and technical higher educations have to demonstrate both academic and market legitimacies. In order to achieve academic legitimacy, higher education institutions focus on national and international accreditations systems (Van Damme 2001). In
order to achieve market legitimacy, higher education institutions focus on firms’ expectations concerning students’ skills acquisition and practice-oriented information (Starkey and Tiratsoo 2007). Entrepreneurship education has also to build political legitimacy, as French and European political actors expect entrepreneurship curricula to significantly contribute to economic growth and to the development of the “knowledge-based society” as ascribed by the Lisbon Agenda (2006).

How a French higher education institution entirely dedicated to entrepreneurship deals with quality assurance indicators in order to achieve academic, market and political legitimacies? A recent survey of EFMD (2008) identified sixteen major European business schools dedicated to entrepreneurship and examined their strategies in achieving academic legitimacy. Among them, Advancia may be analyzed as an “extreme case”, as this business school is the only French higher institution completely committed to entrepreneurship education. Empirical inquiries investigating “a contemporary phenomenon within its real-life context” (Yin 2003: 13), case studies may be particularly appropriate for analyzing the dynamics present within particular settings. According to Eisenhardt (2007), the choice of a single case study may be appropriate when one wants to explore new phenomenon, on a longitudinal basis. We used various sources of data - schools archives, programs curricula and syllabi, interviews with key actors, participant observation, in order to explore and explain the legitimization processes of Advancia over a period of six years, from 2004 to 2010.

Our research highlights the tensions that a higher education institution entirely dedicated to entrepreneurship encountered when building academic, market and political legitimacy and explore their potential impact on quality assessment. This extreme case may be informative for other business schools in the field of entrepreneurship, willing to reach

---

1 Advancia developed a strong synergy between its Bachelor and Master in entrepreneurship, the school Incubator, its Research Centre in entrepreneurship, and the Club of Entrepreneurs’ of the Paris area. These programs function in close interaction in order to provide an innovative and effective educational environment for students interested in entrepreneurship.
The first section examines the quality assurance issue in higher education in relation with accountability and legitimacy concerns; the second section raises the issue of the quality management in entrepreneurship education and the importance of acquiring academic, market and political legitimacy; the third section shed some light on a number of convergent and divergent interactions among these three different legitimization processes and discuss their potential and actual impact on quality assurance. We will thus observe these tensions in terms of legitimacy-acquisition and their impact on pedagogical contents, methods, teams and overall pedagogical organisation and we will point up various "answers" that Advancia developed in an attempt to respond them adequately. We conclude our analysis with an emphasis on the way in which these tensions and the collective challenge to respond them effectively within quality standards produced an unexpected yet positive outcome: entrepreneurialism was strongly stimulated among the schools' curricula and teams.

**The Quality Assurance Issue in French Entrepreneurship Education**

**Accountability vs. legitimacy**

Several authors addressing the quality assurance issue in an educational context emphasize the importance of *accountability* (Grant & Aly, 2002; Blackmur, 2004; Mukherjee, 1995). Over the past eighteen years, quality control has become the key word of European government policies aiming to transform education into a market, with increased efficacy and efficiency. Therefore, higher education is increasingly "managed in accordance with the same criteria as any other economic undertaking" (Milliken and Colohan 2004: 382). The emergence of the quality assurance in the 1990s reflects a paradigm shift towards "performance indicators" (ibid.: 385), "conformance to requirements" (Crosby 1984), and
"total quality policies" envisioned as the cornerstone of the management in higher education (Mukherjee 1995: 573). This new emphasis on accountability encouraged both standards conformity and a search for excellence. However, besides these positive outcomes, the quality issue also produced several unintended negative consequences, with higher education organizations being "locked into a Weberian iron cage of overprescriptive rationality, given ends and operationalism" (Barnett 1994). This may be partially due to the fact that one tried to directly implement total quality principles and methods previously elaborated and successfully tested in industry to the higher education organizations, in order to enhance their academic and market legitimacy. Quality assessment thus became much more than an "ideological symbol" (Milliken and Colohan 2004: 389) legitimizing a "post-bureaucratic governmental control" (ibid.). It became one of the primary engines of legitimacy construction in the higher education market.

Legitimacy has been depicted as a generalized perception that the actions of an individual or those of an organization are desirable and appropriate within the current system of social norms and values (Suchman 1995). From the standpoint of a higher education organization, legitimacy is the combined outcome of various legitimization processes whereby the organization tries to increase congruence between its activities and socially defined standards, as well as market expectations (cf. Anderson and Smith 2007: 486-488).

Additionally, quality assurance turned out to be even more critical for those academic disciplines that were younger than the traditional well-established ones. Among them, entrepreneurship is a young player in the academic field, with just several decades of existence and a limited legitimacy in terms of educational specificity, quality assessment and public utility recognition. According to Katz (2008), Aldrich and Fiol (1994), entrepreneurship education carry out all-over the world a large amount of efforts in order to fully achieve three main kinds of legitimacies: cognitive, that is the level of acceptance of a
new curriculum, moral, that is the level of conformity of a new curriculum to the social norms and values, and regulatory, that is the level of conformity of a new curriculum to the rules and regulations of authority institutions. These three kinds of legitimacies were first identified in the industry and then applied as such to the educational market, a transfer whose relevance and rigour may be seen as problematic. First, because the genuine function of universities and business schools do not only consist in "selling" good "products" (students, diplomas) or "services" (learning experiences). Educational institutions play a major role in shaping students' minds and future behaviours, with students actively interacting with teachers and administration not only as "clients" but also as key actors of the educational system. Second, because universities and business schools are primarily knowledge-based organizations focusing on experiential and scientific added value in a different way when compared with new industries. The latter may indeed also rely on practices and representations common to the knowledge-based post-modern society, but they are primarily centred on producing financial added value. Third, the legitimacy issue of universities and business schools is not exclusively about quality assurance and assessment, as it is the case of most new industries, but also about academic knowledge management and social accountability.

Therefore, there may be risks in restraining the quality assurance issue in higher education to the sole measure of educational accountability, market and employers' positive feedback and students' satisfaction.

**Acquiring academic, market and political legitimacies**

In the context of higher education, the primary purpose of the quality assurance management is to produce legitimacy. Rindova, Pollock and Hayward (2006) emphasize that organizations build internal and external legitimacy with the intention of enhancing their influence on various stakeholders, attracting future clients and employees, and gaining
financial and public support. However, when it comes to higher education organizations, legitimacy is more than just about acquiring notoriety and reputation on a highly competitive national and international market (Van Damme 2001). Moreover, building legitimacy in higher education is about conveying a quality message relative to pedagogical contents and processes, pedagogical methods and teams, in an attempt to improve both the organization's market positioning and its ability to produce impact on society, culture and educational policies.

One may identify different types of legitimacies, according to the specific position an academic discipline occupies in the general academic field, as defined according to particular criteria, such as the discipline's centrality, maturity, expansion, etc. We introduce here an analytical distinction between the legitimacy-building process in scientific and technical higher education, in management education and in entrepreneurship education. According to Binks and his colleagues (2006), scientific and technical higher education needs to demonstrate a double legitimacy - academic and market legitimacies. Concerning the academic legitimacy, national and international accreditation institutions focus on the consistence of the pedagogical processes linking pedagogical contents and methods to the faculty composition and to the higher institution organizational design (Van Damme 2001). Concerning the market legitimacy, enterprises and clusters focus on the conformity of the business schools' pedagogical contents and skills development to the needs of the market and firms (Meuleau 1992; Nouschi 1881; Kipping and Nioche 1997; Starkey and Tiratsoo 2007). Conversely, management education has to demonstrate a similar double legitimacy. Academically, management education institutions made consistent efforts over several decades to show that their curricula respect just the same standards as the well-established prominent scientific, technical and social science disciplines. In order to illustrate its conformity with the market requirements, management education also needs to demonstrate
that students enrolled in management curricula are able to efficiently transfer management theories and models into managerial practices (Locke 1989; Stewart and Ross-Smith 2003; Starkey and Tiratsoo 2007). Moreover, the French management education has additional characteristics in terms of legitimacy acquisition. In the early XIXth century, major French economic actors - such as the executive committees of Chambers of Commerce - offered universities the opportunity of developing joint adapted curricula for future entrepreneurs and managers. French universities declined this offer, therefore determining Chambers of Commerce to open their own autonomous business schools, mainly professionally-oriented (Servan-Schreiber 1994; de Fournas 2007). Later, after achieving market legitimacy, French business schools gradually conquered academic legitimacy, whose foundation was the recognition by national accreditation institutions that assessed the quality of the business schools' diplomas. Recently, an additional legitimacy issue began to challenge the management of French business schools in the context of Chambers of Commerce, this is the political legitimacy. During the last decade, the executive committees of Chambers of Commerce made explicit demands that business schools' activities and curricula effectively respond to the economic priorities of the Chamber's region, as identified by the national and European political agendas. French business schools were nevertheless rather reluctant in building political legitimacy. To do so, they would need to measure the mid- and long-term impact of their curricula on the economic development of their region, which is a difficult quality assessment requirement, mainly because of methodological and practical complexity.

According to Lorange (2008), even though most universities and business schools all-over the world strive to acquire these two kinds of legitimacy - market and academic, they still have some work to do in order to increase their mutual coherence and convergence, because academic and market legitimacies may sometimes require different quality criteria to be meet, and different quality assessment procedures to be implemented. The overall
pedagogical quality of higher education organizations may therefore consist in the harmonization of academic and market legitimacy-building processes.

If scientific, technical and management education focus mainly on academic and market legitimacy, entrepreneurship education has also to build political legitimacy. Nowadays, entrepreneurship is given strong impetus both by national and European political actors, with entrepreneurship curricula facing thereby intense political pressures to demonstrate ability in producing short- and mid-term results, *i.e.* substantially increase the number of start ups, create new employment opportunities, and contribute to the young enterprises' growth and internationalization (Radu and Redien-Collot 2008). As one may notice, academic and market legitimacy rely mostly on process and content-based quality indicators, whereas political legitimacy is about the short- and mid-term outputs of the educational system, *i.e.* precisely those quality indicators most difficult to address by a higher education organization (Grant, Mergen, and Widrick 2002). More broadly, French and European political actors expect that entrepreneurship curricula not only significantly contribute to economic growth, but also to the development of the "knowledge-based society" as ascribed by the Lisbon Agenda (2006). Tensions and contradictions between academic, market and political legitimacies may thus became more apparent as entrepreneurship curricula strive to *simultaneously* acquire the three of them.

*Convergent vs. divergent legitimization processes and their potential impact on quality assurance*

**Advancia, an “Extreme Case” in the French Higher Education Landscape**

Entrepreneurship education strives to simultaneously achieve academic, market and political legitimacies. Sometimes, the three processes of legitimization through which these legitimacies are acquired happen to be convergent, while other times they may become rather
divergent and thus be at the origin of strong tensions within entrepreneurship curricula and higher education organizations. These tensions are often the result of the continuous improvement process that entrepreneurship curricula need to implement in order to effectively prepare students to detect business opportunities and to develop new ventures. In entrepreneurship education, pedagogical contents and methods are frequently questioned and reviewed so as to enhance their efficacy in terms of entrepreneurial skills acquisition. Furthermore, these tensions can also be the result of various organizational contradictions and paradoxes when attempting to articulate simultaneously three legitimization processes towards different targets, and through different quality criteria acquisition strategies.

Five years ago, Advancia, a business school of the Paris Chamber of Commerce, became a business schools entirely dedicated to entrepreneurship education, which is a unique positioning in the French higher education landscape. During the last five years, Advancia carried out a profound transformation of its Bachelor and Master programs, and launched new vocational learning programs for managers and entrepreneurs, a research centre in entrepreneurship, a club of entrepreneurs, a business angels network, and a school incubator where novice entrepreneurs start up sixty to eighty new ventures every year. This repositioning had manifold implications in terms of legitimacy acquisition. The school had to gain over very short laps of time a triple legitimacy: academic, market and political legitimacies. While trying to acquire each one of these legitimacies, Advancia put into practice several strategies aiming to demonstrate the quality of its processes and outcomes as a higher education institution. The business school entered last December the Conférence des Grandes Ecoles, one of the most prestigious quality labels in the French higher education market. Tensions may yet be observed between the three legitimating processes, and the quality criteria the business school uses to assess its legitimacy with reference to three different actors:
- the other French business schools and the Ministry of Education, when striving to achieve academic legitimacy;
- the French private and public sectors, when striving to achieve market legitimacy;
- the French government and the EU institutions, when striving to achieve political legitimacy.

At Advancia, the tensions among these three processes of legitimacy-acquisition had a powerful impact on the evolution of pedagogical contents and methods, pedagogical teams and on the overall pedagogical organization. Since then, constant efforts have been made to enter national and international accreditation systems, thus to comply with higher education quality standards as Kumaravadivelu (2001) identifies them:

- pedagogical contents, that is the relationship between academic disciplines, entrepreneurship curricula, and research (EQUIS emphasizes the central role of research activities in business schools, as well as the importance of transferring knowledge from research to the pedagogy);
- pedagogical methods, that is the relationship between traditional pedagogical methods and the new experiential learning paradigm, that is the relationship between reproductive and constructive learning;
- pedagogical teams, that is the relationship between academics and experts in entrepreneurship curricula, that is their specific role-distribution as facilitators and gatekeepers within a higher education context;
- higher education organizations, that is the relationship between the organization's management and its market strategy.

**Pedagogical Contents in Search of Academic and Market Legitimacies**
Many scholars stress that entrepreneurship education and research have not yet been stabilized. There is a clear tension in the articulation of the different aspects that characterize the entrepreneurial process and its social, cultural and political contexts. In spite of a small number of debates on this issue (Krueger 2000), sociological, philosophical and anthropological contributions are still marginal in the entrepreneurship literature, with a limited introduction of recent Deleuzian and Foucauldian theories. Actually, the dialogue of entrepreneurship with other disciplines seems quite chaotic and dominated by the key confrontation among, on the one hand, those scholars who claim for the field's autonomy and unity with regard to management studies, and, on the other hand, those scholars that defend the field's genuine interdisciplinarity. Consequently, there are two different visions of what an "appropriate" pedagogical content should be about in entrepreneurship: for those who defend the field's autonomy and specificity, entrepreneurship education should focus on preparing and assessing the students' "entrepreneurial performance" (Pretorius, Nieman, and Van. Vuuren 2005); for those who defend the field's interdisciplinarity, entrepreneurship education should focus on studying the interaction between entrepreneurial performance and its "social, cultural and political contexts" (Kyrö and Carrier 2005). These two different scientific and pedagogical approaches may potentially exert a direct effect on the students' entrepreneurial skills development, and as a consequence impact the entrepreneurship curricula’s market legitimacy.

Historically, entrepreneurship education and research are a several decades younger than management education. The emergence of new disciplines at the end of the XXth century brings out a number of deep epistemological challenges in the conception and elaboration of what was called a "discipline". According to the positivist tradition of XIXth century, a discipline had to demonstrate its autonomy in relation to other disciplines that it had stemmed out. Therefore, since the very beginning of the discipline, several entrepreneurship scholars
made important efforts to assess its autonomy, with direct reference to management (Grant and Perren 2002). In their attempt to develop entrepreneurship education as an autonomous field of practice and knowledge, these scholars conceived entrepreneurship curricula that programmatically integrated the four questions raised by Stevenson and Jarillo (1990) and Filion (1997):

- What happens when an entrepreneur acts? (a typical question for economy and political sciences)
- Why does an entrepreneur act? (a typical question for humanities and social sciences)
- Who is the entrepreneur? (a typical question for humanities and social sciences)
- How does the entrepreneur act? (a typical question for management theory and practice).

At the opposite, an alternative group of scholars in entrepreneurship education and research stressed the importance of respecting the diversity of approaches addressed in the realm of entrepreneurship. This interdisciplinary position echoes the vision of entrepreneurship as heterotopia, which is a discipline whose specificity is in being genuinely «in between spaces, where the possibilities of not being overthrown by habits and dominant modes (strategies in de Certeau’s sense) are kept alive» (Hjorth and Steyaert 2003: 294). In other words, according to this group of scholars, entrepreneurship as a heterogeneous discipline welcomes all kinds of knowledge produced elsewhere, i.e. in other fields, without intending to become a discipline in the traditional sense, and thus refusing to introduce any hierarchy between notions and theories borrowed to other disciplines, such as economy, management, humanities, or social sciences.

It is therefore not a surprise to notice than within this complex and sometimes contradictory discipline, it is difficult for entrepreneurship curricula to achieve academic legitimacy and, in some cases, to defend it. Frequently, academic positions in
entrepreneurship are cancelled and the development of entrepreneurship education is often circumscribed to the limits of entrepreneurship centres and business incubators that have regularly grown in number and size during the last ten years, whereas many entrepreneurship academic programmes were closed (Katz 2008). At the same time, the difficult construction of entrepreneurship academic legitimacy had an impact on the development of its market legitimacy. The tensions between the two theoretical schools of entrepreneurship produced various turbulences in entrepreneurship curricula and, by extension, in the process of entrepreneurial skills acquisition. The four above-mentioned questions - who, what, why, how? - of the tenets of autonomy (Scott, Rosa, and Klandt 1998; Fayolle 2000; Fiet 2001; Solomon, Duffy, and Tarabishy 2002) focus on the issue of entrepreneurial performance, and assign to entrepreneurship education a key role in rising entrepreneurial intentions, and developing entrepreneurial and business skills. At the opposite, Hjorth and Steyaert (2003), as well as Kyrö and Carrier (2005), Alberti (1999), Gartner and Vesper (1994) put a major emphasis on social, cultural and political contexts because they think contexts are intrinsically linked to entrepreneurial performance.

At Advancia, several curricula revisions have been undertaken since 2004. At the beginning of the school repositioning as an entrepreneurship institution, the vast majority of Bachelor and Master contents focus on entrepreneurial skills development, with little emphasis on entrepreneurial contexts, such as female and minority entrepreneurs, public entrepreneurship, social entrepreneurship, etc. The same was true for novice entrepreneurs entering the school's business incubator: they showed little concern about the more general social, cultural and political context of their entrepreneurial project, and they were for the most part exclusively interested in "performing well" (raising money, starting up their venture, hiring their first employees). It took three years to change this learning orientation and to implement pedagogy more sensitive to entrepreneurial contexts. Today, the learning
objectives of Advancia's undergraduate and graduate programmes are about fostering entrepreneurial performance, whereas, at the same time, addressing the issue of social, cultural and political French and European contexts as being of similar importance.

**Pedagogical Methods in Search of Political and Market Legitimacies**

Pretorius (2005), Binks (2006) and their colleagues indicate that entrepreneurship curricula started only recently to use new pedagogical methods in an attempt to reconcile entrepreneurial contents focusing on entrepreneurial performance and those focusing on entrepreneurial contexts. A pedagogy that recognizes the role of cultural, social and political contexts in shaping entrepreneurial performance put a great emphasis on the interaction between learner and teachers, analyzed as a dyad whose common goal is to question existing situations, problems, and solutions through critical thinking so as to finally elaborate new answers or solutions, contextually-driven (Caffarella and Burnett 1994; Mietenen 2000). Experiential learning is therefore increasingly employed in entrepreneurship programs, with the purpose of enabling students to launch truly innovative ventures. The main learning benefit of experiential methods is to enhance the students' ability to become actors of their own learning processes and, consequently, of their entrepreneurial behaviours (Kyrö 2005; Rae 2006). As a result, these pedagogical methods encourage students to act and think more autonomously and responsibly.

Experiential learning can motivate students to see how their entrepreneurial projects impact the surrounding social, cultural and economic contexts. However, the dialectics between the entrepreneurial project and its various contexts can be sometimes developed only for a very short-time, such as the course duration. And, hence, the learning outputs of experiential methods may possibly reveal disappointing in terms of skills acquisition. At Advancia, we noticed a perverse effect of using an experiential pedagogy in a venture creation
context. Indeed, students appreciated the learning experience of working on innovative projects simulation in the school incubator ("venturing machine"), but this learning experience had not enhanced entrepreneurial intentions, nor developed their effective entrepreneurial skills, since students preferred to enjoy the learning experience per se, without focusing on further personal business developments. In this case, there is a very small probability that students entering the incubation process end up with a venture creation. This kind of pedagogical process, if repeated, could be a risk for the school's perceived political legitimacy, i.e. the number of start ups launched by students after graduation. Additionally, experiential learning methods are a challenge for quality assessment in higher education, since the relationship between learning objectives and learning outcomes may be more difficult to evaluate because of the holistic approach of the pedagogical situation. Thus, using experiential methods in entrepreneurship curricula may well actually delay the organization's academic and market legitimization processes.

More broadly, concerning the use of experiential methods, Advancia was faced with a dilemma in terms of academic legitimacy: on the one hand, the school intended to test new pedagogical methods so as to achieve political legitimacy and demonstrate its ability to consistently increase the number of venture creation in young population; on the other hand, the school had to comply to national (Conférence des Grandes Ecoles) and international accreditation systems that ask for strong and consistent correlations between learning objectives and outcomes (efficacy), organizational resources and outcomes (efficiency), market needs and learning objectives (relevance). In order to fulfil political expectations of venture creation, during the first two years of functioning, the Advancia's incubator had to reallocate resources in order to progressively re-design a pathway that allows incubatees to radically transform their projects and their learning objectives throughout the six-months of the incubation process. Initially conceived as the final step before venture creation, the
Advancia's incubator became an entrepreneurship specific program aiming to allow potential entrepreneurs to foresee their venture creation and development as a life-long experiential learning process rather than as simply the acquisition of a desirable economic and social status that ends up a period of personal exploration and experimentation.

All over the world, Béchard and Toulouse (1991) noted a persistent dominance of case studies and lectures in entrepreneurship curricula, with traditional pedagogical approaches still dominant in use. The common teaching methods are business plans, lectures, case studies, reading programs, a situation that seems to prevail in France (Fayolle 2003) and in Europe (Wilson and Twaalfhoven 2005). Kyro and Carrier (2005: 25) called for an “action-based pedagogy” in an open learning environment, with more computerized and behavioural simulations, games, role-playing, films, experiential approaches, more original and unconventional teaching methods. Students enrolled in entrepreneurship curricula need to develop their ability to think critically and to revise existing stores of knowledge and abilities through knowledge production in “real life” situations (Binks, Starkey, and Mahon 2006, 15). However, this "pedagogy of transforming" may be difficult to evaluate through commonly shared management quality indicators, and thus the academic legitimacy of entrepreneurship curricula making extensive use of experiential methods may be ultimately endangered.

**Pedagogical Teams in Search of Efficacy**

Well-established entrepreneurship literature claims that entrepreneurial teams should respect three main requirements in order to produce effective learning outcomes in terms of entrepreneurial skills acquisition:

- entrepreneurship educators should be positive models to imitate (Léger-Jarnioux 1999; Leich and Harrison 1999; Formica 2002; Kuratko 2005);
entrepreneurship educators should be genuine facilitators to enhance students' entrepreneurial motivations and behavioural intentions (Fletcher 1999; Duchénaut 2001; Siok and Frank 2006);

entrepreneurship educators should be focused on students' skills development and on entrepreneurial specific contexts (Nonis and Hudson 1998; Kyrö and Carrier 2005).

Moreover, Pretorius and colleagues (2005) argue that entrepreneurship education challenged the functioning of traditional management programs’ pedagogical teams, who classically distinguished between academics and business experts. Entrepreneurship pedagogical teams introduce a new role, that of the facilitator standing at the core of the entrepreneurial educational system. Ideally, a good facilitator should increase the students' motivation and entrepreneurial intentions, as well as develop students' entrepreneurial and business skills according to market, social and cultural requirements. In reality, the facilitator's role is often achieved not by a sole isolated individual but rather by an entire group of academics, experts and coaches, as in the Advancia's incubator, for instance. More interestingly, over the last five years, we noticed a progressive and profound hybridization of the original profiles, with professors becoming entrepreneurs, experts becoming professors, and the head of the entrepreneurs' network preparing a thesis in entrepreneurship. Other additional economic and political actors joined the entrepreneurship pedagogical team of Advancia: business angels evaluating students' performance in business planning, European lobbyists evaluating the students' ability to elaborate and defend position papers on entrepreneurial issues, etc.

Still, the reality is more complex and flexible than classical management education distinctions kept alive in entrepreneurship literature: teachers are supposed to be more concerned with theory and mentors with practice; very little is said about teachers who become entrepreneurs, then mentors, or about teachers who become mentors or facilitators.
without being first entrepreneurs, nor having prior experience in business venturing. Although the role and the quality of pedagogical contents and methods are systematically discussed in the field of entrepreneurship education, entrepreneurial pedagogical teams are repeatedly described as "inputs" in the entrepreneurial teaching machine and rarely pictured as living actors, with potentially multiple and heterogeneous professional choices and experiences. To some extent, this may be an unintended outcome of international accreditation requirements. One key quality indicator in higher education concerns the faculty qualifications that have to be documented with information relative to the professors' diplomas and publications. From an academic standpoint, it is obvious that the legitimacy of this kind of heterogeneous entrepreneurial pedagogical teams may sound dubious: their various expertises and their status flexibility could be beneficial for the students' skill acquisition, but they may also puzzle the quality standards of accreditation institutions.

Moreover, the members of the Advancia's pedagogical team changed their roles and status several times since the schools' repositioning: at the very beginning, ten professors in entrepreneurship launched the Master program and the Research centre in entrepreneurship. Over the years, two of them became coaches in the school incubator, one of them became entrepreneur, one of them became consultant in corporate entrepreneurship, two of them became pedagogical managers, and one of them became business angel. This exceptional professional flexibility may have had both positive and negative consequences in terms of pedagogical efficacy and quality assessment. In any case, for national and international accreditation systems, these educators and their role-elasticity can be perceived as a potential risk for the schools' academic and market legitimacies.

Additionally, soon after the schools' repositioning, the pedagogical team integrated new actors, mainly political ones, such as various members of the Paris Chamber of Commerce delegations, administrative representatives of the French Chambers of Commerce
in Brussels, local representatives of the city hall, a number of coordinators of social and business networks, etc. According to the national and international accreditation criteria, these newcomers may be hardly categorized as "participating" or just "supporting" contributors. Nevertheless, in an entrepreneurial context, their contribution appears as crucial for achieving academic, market and political legitimacies. To conclude on this topic, Advancia took the risk of diminishing its academic legitimacy when it decided to integrate regional, national and European actors in its pedagogical teams. Moreover, the school developed new innovative programs for some of these political actors: for instance, in partnership with a Parisian university, Advancia launched the first French vocational learning program for entrepreneurship sensitization agents, \textit{i.e.} the current and potential business start up counsellors of the Paris Chamber of Commerce; at the same time, the school got involved in an European network aiming to train European entrepreneurship sensitization agents. One year ago, an additional program for political actors was launched, in partnership with ENEA, this is a training program for coaches and business angels.

In the context of entrepreneurship education, Advancia is facing a supplementary confrontation, this time with the market itself. Indeed, Bachelor and Master students enrolled in entrepreneurship curricula often intend to start up their own business after graduation. But in the meantime, they also have to find part-time jobs or internship offers in French large corporations, rather reluctant to their potentially disruptive profiles, as the number of large corporations willing to develop corporate entrepreneurship is still limited.

\textbf{A pedagogical open environment linking business schools to business incubators}

The organization and functioning of higher education programs specialized in management traditionally juxtaposed business schools and enterprises as the two faces of a binary system. Entrepreneurship curricula challenged this model and progressively replaced it
with an educational paradigm whose intention is to systematically articulate business schools with enterprises and business incubators into an "open learning environment". Kyrö and Carrier (2005: 29) noticed that, in many cases, new university structures are needed for entrepreneurship education. These structures allow students to circulate within an entrepreneurial environment conceptualized as an "open environment" (ibid.). Ideally, entrepreneurship scholars imagine this "open environment" as a pedagogical setting where there would be no boundaries between the classroom and the surrounding reality, or between academic disciplines and economic actors. Learning in such an open environment could therefore consist in “increasing and supporting competences for enjoying and acting in complexity and insecurity and recognizing as well as creating opportunities involved in it” (ibid.: 28).

Business schools entirely dedicated to entrepreneurship are therefore not only in a partnership relation with various enterprises; these schools effectively and directly contribute to business creation and development. Consequently, they need to continuously optimize their incubating approaches and design specific pathways between their academic curricula and school incubators. For instance, at Advancia, Bachelor and Master students have the opportunity to do their internship in the school incubator, and can therefore launch their own venture while still at school. However, in terms of academic legitimacy, business schools are facing a strong dilemma when they are asked to explain the role of their incubator in the educational organization, or when they need to prove the efficacy of articulating classroom approaches with incubating processes in terms of entrepreneurial skills acquisition. National and international accreditation institutions do not take into account the incubators' pedagogical contribution because they do not deliver degrees, even though they can deliver credits. This is yet a paradoxical situation, since the pedagogical model of Advancia is built around the school's incubator. Many international universities and French business schools,
rather than developing their own incubator, preferred therefore to work in partnership with already existing private and public incubators and nurseries. However, Advancia is not an unique, neither an isolated case, as the European Commission noticed the growing emergence of new independent centres specialized in entrepreneurial education, as well as the launching of new networks and business schools with integrated business incubators (European Commission 2002; Wilson and Twaalfhoven 2003).

**Conclusion**

The Advancia's case may be analyzed as an illustration of the various tensions a higher institution dedicated to entrepreneurship may face when simultaneously trying to achieve academic, market and political legitimacy. In this context, acquiring academic legitimacy is about challenging the field of management and its capacity to welcome a new discipline, that is new pedagogical contents, methods, faculty, and organization, and to elaborate new quality objectives and indicators. The business schools' efforts in acquiring academic legitimacy are not exclusive, as Advancia is involved in two additional complementary legitimizing processes so as to achieve market and political legitimacies. Tensions are expected since the three legitimizing processes have distinct targets - the accreditation institutions, when it comes to academic legitimacy, the public and private organizations and firms, when it comes to market legitimacy, the French government and the EU institutions, when it comes to political legitimacy. Several authors had already emphasized the importance of acquiring market and political legitimacies for higher education curricula (Stewart and Ross-Smith 2003; Starkey and Tiratsoo 2007; Lorange 2008). However, little is known about the way in which entrepreneurship education may re-articulate these three types of legitimacies that management education frequently presents as uniquely stemming out of the market of higher education. For instance, the analysis of the Advancia's case indicates that the school does not
always comply with market requirements when it acts in accordance with political requirements. Conversely, it also indicates that academic and political legitimacies may clash when trying to use the same quality assessment criteria.

In order to equally and simultaneously respond to these three legitimizing processes, entrepreneurship education may need to re-examine several major educational categories, such as the notions of pedagogical contents, pedagogical methods, pedagogical teams, and educational environment and organization. Additional research is crucial so as to address the following questions: what pedagogical theory and/or method for reconciling pedagogical approaches focusing on entrepreneurial performance and those focusing on entrepreneurial contexts? What potential evolution of entrepreneurship education in relation with management? What quality assessment for entrepreneurship education in a context of profound deconstruction of traditional pedagogical representations and practices?

Authors bios

Miruna Radu is Professor in Entrepreneurship (PhD in Social Psychology), and the Head of the Master in Entrepreneurship at Advancia – CCIP. Her research topics of interests are the social and psychological antecedents of entrepreneurial intentions. She conducted research on the social representations of entrepreneurs and entrepreneurship as conveyed by press discourse, the impact of symbolic role models on students’ self-efficacy beliefs, and the impact of various communication strategies on young entrepreneurs’ cognitions, emotions and decision-making in formal mentoring and coaching relations.

Renaud Redien-Collot (Ph.D. of Columbia University) is Professor of Entrepreneurship and the Deputy Director of Advancia - CCIP. As a member of the Board of Administration of the E. Roosevelt Foundation (1994-2000), he was in charge of several projects that stimulated the development of entrepreneurship education and the emergence of innovative start-ups in the USA and in Europe. His research interests include minority entrepreneurship, theories of innovation, leadership and intrapreneurship, entrepreneurship education, and the development of public and private discourse about entrepreneurs and entrepreneurship.

Corporate Transparency and Firm Performance: Evidence from Korean Ventures

by Younghwan Kim, Jungwoo Lee, and Taeyong Yang

Corporate transparency has attracted the interest of many researchers and entrepreneurs during the past decade. In this paper, we propose a new corporate transparency index which consists of four sub-indices: financial, governance, operational, and social transparency. Using our transparency index, we assess the corporate transparency of 237 Korean ventures. In addition, we examine the effect of venture firms’ transparency on firm performance. The results show that corporate transparency can enhance firm profitability and sustainability. In particular, financial transparency plays an important role in firm profitability. Social transparency can also increase a firm’s profits, and operational transparency heightens firm sustainability.

**Introduction**

Corporate transparency has been massively highlighted by academics, policymakers and entrepreneurs since the East Asian financial crisis of 1997. Highly developed countries, such as the United States, Japan and Western European countries, have also newly recognized the importance of corporate transparency after several accounting scandals involving world-famous enterprises.

These interests in corporate transparency have stimulated many researchers to study its characteristics and effects on corporate business and management performance. However, various methods for measuring corporate transparency exist and are not unified in the existing literature due to the abstract nature and invisibility of corporate transparency. Many researchers have considered corporate transparency to mean how timely and how properly a firm transfers its intrinsic information to profoundly related outsiders such as investors or stockholders. Therefore, to measure corporate transparency, they have assessed the sincerity of the disclosure activity of the corporation, which is aimed at dissolution of information asymmetry at the firm level (Bushman, Piotroski, and Smith 2004). In terms of the contents of corporate transparency, many studies have treated financial transparency and governance transparency as two main components of corporate transparency (Patel, Balic, and Bwakira 2002; Aksu and Kosedag 2006; Cheung et al. 2008). In addition, previous studies have limited the object of corporate transparency to stockholders and investors. From the literature review, we can find that previous studies have focused corporate transparency on relations within an enterprise or between a firm and its stockholders and have highlighted financial transparency and governance transparency, while ignoring the general public and regional communities as objects for corporate transparency and overlooking other aspects of corporate transparency in terms of contents.

On the other hand, many studies have shown evidence that corporate transparency leads positively firm performance at the individual firm level. Many researchers have revealed that corporate
transparency and its sub-indices positively and significantly affect various performance factors such as Tobin’s q, price-to-book ratio (PBR), and return on assets (ROA). However, they merely selected single or multiple factors of firm performance, without distinguishing the characteristic of performance, such as firm value, firm profitability, and firm sustainability, on the structural and holistic concept.

Therefore, in this paper, we expand the definition of corporate transparency to include the accurate delivery of corporate information for various stakeholders, such as customers, and potential investors, as well as regional society and community, and transparent operation of decision processes within a firm. Based on the Transparency and Disclosure Index (T&D index) compiled by Standard & Poor’s (S&P), the most popular index of corporate transparency, we suggest a new corporate transparency index, adding some evaluation items from previous indices such as the Corporate Governance Ratings by Credit Lyonnais Securities Asia B.V. (CLSA index), the Korean Corporate Governance Index (KCGI), the Matrix of Ethical Management by the Federation of Korean Industries (FKI), and the indices proposed by Kang et al. (2007) and Cheung et al. (2008), and classify them into four sub-indices: financial transparency, governance transparency, operational transparency, and social transparency.

In addition, we assess the corporate transparency of individual Korean venture firms by our corporate transparency index, and examine the effect of corporate transparency on firm performance. We estimate the effect of four sub-indices of corporate transparency and sub-components of the sub-indices as well as that of the overall corporate transparency index on firm performance. In addition, we classify firm performance into firm value, firm profitability, and firm sustainability in order to examine the effect of sub-indices and sub-components of corporate transparency on various aspects of firm performance. For our analysis, we selected 237 Korean firms listed on the ‘Korean Securities Dealers Automated Quotations (KOSDAQ) Venture Index’ of the Korea Exchange (KRX) at the end of the year 2008. In addition, we investigated and evaluated the corporate transparency of 48 large companies listed on the ‘Korea Composite Stock Price Index 50 (KOSPI 50)’ as a comparison group.
Consequently, by emphasizing the importance of corporate transparency on firm performance and revealing the relationship between performance factors, such as firm value, firm profitability, and firm sustainability, and the sub-indices and sub-components of corporate transparency, our study seeks to cultivate the interest of entrepreneurs and policymakers in enhancing corporate transparency. It also seeks to encourage them to establish plans to promote corporate transparency for venture performance.

**Measuring Corporate Transparency and Firm Performance**

Though various studies have examined corporate transparency, the definition and measures of corporate transparency have differed according to the study. Corporate transparency means how timely and how properly a firm transfers its intrinsic information to related outsiders such as investors or stockholders. In other words, corporate transparency denotes the level of activity for dissolution of information asymmetry at the firm level (Bushman, Piotroski, and Smith 2004). Therefore, corporate transparency has been equivalent to the disclosure of firm-related information in much of the literature that has studied corporate transparency. According to these papers, corporate transparency can be measured as completeness, timeliness, consistency and accessibility in the disclosure activity of the firm (IMF 1998; Han and Bae 2001). However, disclosure is a procedure aimed at realizing invisible corporate transparency rather than a true measure of its nature. Accordingly, it is problematic that traditional measures of corporate transparency have focused on the level of information disclosure.

In order to study corporate transparency in a substantive manner, not viewing it as simply the level of disclosure activity, previous research works have focused on financial transparency and governance transparency (Bushman, Piotroski, and Smith 2004). Most studies that referred to corporate transparency have regarded it as financial transparency (Han and Bae 2001), governance transparency (Black, Jang, and Kim 2006), or the combination of these two transparencies (Patel, Balic, and Bwakira 2002).

Many studies that have treated financial transparency and governance transparency as two main
components of corporate transparency have a common feature that the object of corporate transparency which is realized by disclosure activity is limited to stockholders and investors. However, the object of disclosure can be expanded to include various stakeholders related to the firm such as customers and potential investors, as well as regional society and communities. With this broader definition of corporate transparency, some researchers have sought to examine a number of provocative issues related to corporate transparency. Bushman, Piotroski, and Smith (2004) defined corporate transparency as the level of widespread utilization of corporate-related specific information that is disclosed to the public outside the firm in the economy, distinguishing this information mechanism into three divisions: corporate reporting, private information acquisition and communication, and information dissemination. Furthermore, Dubbink, Graafland, and van Liedekerke (2008) maintained that corporate transparency is a necessary condition of corporate social responsibility (CSR) and emphasizing the role of CSR as an open type of corporate governance.

Among the measures of corporate transparency in the previous research works, the T&D index of S&P has been broadly known. The T&D index consists of 98 questions for the evaluation of corporate transparency in three major sections: ownership structure and investor rights, board structure and process, and financial transparency and information disclosure. Each question is a binary type which has only two answers: yes or no. The level of corporate transparency can be measured using a total score of 98 questions where one point can be given to a yes for each question at the firm level. For evaluation, the researchers of the T&D index basically investigate a corporate annual report of the firm. In the case of U.S. firms, they also consider other important disclosed documents such as 10-Ks or proxy statements which should be submitted to the U.S. Securities and Exchange Commission (SEC). They score the companies of the S&P Global 1200 Index and the 300 companies of the S&P/IFCI Emerging Market Index (Patel and Dallas 2002; Patel, Balic, and Bwakira 2002). Patel, Balic, and Bwakira (2002) compared the corporate transparency scores of the companies in Asian, Latin American,
Eastern European and Middle Eastern emerging markets using S&P’s T&D index. As a result, Asian emerging markets have higher corporate transparency scores compared to other emerging markets. Among Asian emerging markets, Korea is the fastest-growing country in terms of the level of corporate transparency.

The CLSA index is also well known as an index of corporate transparency (Durnev and Kim 2005). This index includes 57 questions in seven major parts: discipline, transparency, independence, accountability, responsibility, fairness, and social awareness. All questions are also binary types. The index requires an interview, because some questions require subjective answers. Therefore, it is difficult for the CLSA index to be objective because of the characteristics of the questions it uses. In particular, it contains questions on social awareness as well as questions about financial transparency and governance transparency, allowing corporate transparency to be synthetically evaluated.

In Korea, one of the fastest-growing countries in terms of corporate transparency, the Corporate Governance Service (CGS) assesses the corporate governance of listed companies on the Korea Exchange (KRX) by questionnaire and survey, and annually announces its KCGI. All assessment items of the KCGI are included in five major parts: protection of stockholder interest, board of directors, disclosure, auditing body, and distribution of the proceeds of operation. Based on the results of the corporate governance assessment, CGS publishes a governance assessment grade which is evaluated using a scale of eight grades from "Excellent" to "Very Weak". Most of the leading companies in Korea expose this grade to the public through their corporate website.

Using these several developed indices of corporate transparency, many researchers have investigated the relationship between corporate transparency and firm performance at the firm level. Because the most popular corporate transparency index is S&P’s T&D index, the majority of corporate transparency researchers have used the intact T&D index as an instrument to evaluate corporate transparency (Patel, Balic, and Bwakira 2002; Khanna, Palepu, and Srinivasan 2004; Durnev and Kim 2005; Chen et al. 2007). Meanwhile, another group of researchers has simply added and adjusted some
items in the context of the specific country, keeping the T&D index as a base (Aksu and Kosedag 2006). The others have made a new corporate transparency index in a specific national context adapting the T&D index by changing a large part of the questions (Park et al. 2006; Kang et al. 2007). Patel, Balic, and Bwakira (2002) found a positive relationship between a firm’s T&D score and its PBR. Park et al. (2006) discovered that their developed transparency index has a positive and significant effect on the firm’s Tobin’s q. Particularly noteworthy is their finding that transparency of ownership structure, transparency of the board of directors, and transparency of accounting among the sub-indices are positively and significantly associated with firm value, while return on investment (ROI), return on management (ROM) and ROA are not related with corporate transparency. On the other hand, Durnev and Kim (2005) used both the T&D index and the CLSA index in order to estimate the effect of corporate transparency on Tobin’s q as a measure of corporate value, concluding that corporate transparency positively affects corporate value. However, they mentioned that the insignificant relationship between corporate value and the social awareness part of the CLSA index can be controversial.

On the other hand, the scope of corporate transparency has been limited to governance transparency by many researchers. Black, Jang, and Kim (2006) discovered that there is a positive and significant relationship between the KCGI index and the Tobin’s q of a firm in Korea. In another study on the effect of a Korean chaebol’s governance on its value and performance by Choi, Kang, and Lee (2008), corporate governance composite index, board structure sub-index, board procedure sub-index, and transparency sub-index among five indicators of corporate governance are positively correlated with market-to-book value (MBR) which represents individual firm value. In addition, they found that management performance, measured by return on equity (ROE), has a positive relationship with the corporate governance composite index, shareholder rights sub-index, board procedure sub-index, and transparency sub-index. However, in the case of China, one of the fastest-emerging markets, there is no relation between corporate governance and firm value. This result shows that a high level of individual
corporate transparency is not well reflected on a firm’s market value in China (Cheung et al. 2008).

The previous research works that we introduced have focused on how a corporate transparency index should be made for objective and precise evaluation and whether corporate transparency leads to the firm value and performance. However, such works have defined corporate transparency narrowly as affecting only shareholders and investors, and have focused financial and governance disclosure excluding other aspects of corporate transparency. Therefore, in this paper, we expand the scope that corporate transparency affects from the investor or the shareholder to other stakeholders and regional society. We propose a new corporate transparency index that adds the part of operational transparency (Park et al. 2006; Kang et al. 2007) and social transparency to a pre-existing part of financial transparency and governance transparency. In addition, we compare the corporate transparency scores of venture firms listed on the KOSDAQ with those of large companies listed on the KOSPI 50 in Korea. Finally, we conduct an empirical analysis in order to examine the relationship between corporate transparency and firm performance such as firm value, firm profitability, and firm sustainability in Korean ventures. As a consequence, we suggest some policy implications to enhance corporate transparency of Korean ventures for their performance.

**Suggestion of Corporate Transparency Index**

**Composition of Corporate Transparency Index**

We devise a new corporate transparency index after investigating the items of transparency indices from various previous studies, screening out appropriate items, and adding some new items for our classification of corporate transparency. To compose this index, we divide corporate transparency into four subsections: financial transparency, governance transparency, operational transparency, and social transparency. Based on S&P's T&D index, the most popular index of corporate transparency, we
supplement it with some evaluation items from various previous indices.¹ We combine *ownership structure and investor rights* and board structure and process of the T&D index into *governance transparency*, and the items under financial transparency and information disclosure are re-sorted into financial transparency and operational transparency. In addition, *social transparency*, which is not in the T&D index, is newly defined according to related previous research works (Kang et al. 2007; Cheung et al. 2008). In addition, new items not mentioned in previous studies are invented and added to the index. Appendix 1 lists the questions from the corporate transparency index.²

**Scoring Corporate Transparency**

We evaluate individual corporate transparency by using corporate annual reports as a basis for our analysis. The T&D index of S&P used only annual reports, 10-Ks or proxy statements as sources for evaluation, while our study covers annual reports and various sources.³ All kinds of reports have the one year of 2007 as their time period.⁴ On the other hand, information on a corporate website is available through the web-site at the end of the year 2008.⁵ All kinds of information sources should be available online and acceptable to everyone in order to fairly evaluate the sincerity and credibility of a firm’s disclosure activity for investors, stakeholders and the public.

We give a score of *zero or one* for each item on the transparency index: a *yes* answer gains *one* point, while a *no* answer means *zero* points, the type of binary-type question. If we cannot answer *yes*

---

¹ Various previous indices are such as the CLSA index, the Korean CGS index (KCGI), the Matrix of Ethical Management by the Federation of Korean Industries (FKI), and the index of Kang et al. (2007) and Cheung et al. (2008), and classify them into these four subsections (sub-indices)

² The overall index contains 149 questions: 36 on financial transparency, 76 on governance transparency, 17 on operational transparency, 19 on social transparency, and single independent question which does not belong to any subsection.

³ Various sources that we investigate are such as audit reports, consolidated audit reports (if they exist), sales reports, articles of incorporation, information on the corporate website, information of Investor Relations (IR) activities, corporate sustainability reports or social responsibility reports, corporate environment reports, e-brochures, corporate governance charter, code of conduct or guideline for business ethics, and official disclosed documents through the Korean DART (Data Analysis, Retrieval and Transfer) system which is an official web-based disclosing system for all public companies on Korean stock markets.

⁴ Some items on the evaluation index can cover besides the year 2007.

⁵ The items that do not follow these two rules about the period of our study are marked at the index of Appendix 1.
or no, in other words, if a specific question is not related with a specific firm, we do not give a score. However, because we cannot fairly compare the levels of individual corporate transparency unless we can answer yes or no to all questions, we devise a transformational score.\(^6\)

In addition, the scores of our four sub-indices - financial transparency, governance transparency, operational transparency, and social transparency are transformed by the same way. Finally, we use these transformed scores of corporate transparency for our analysis: Sub-index F, Sub-index G, Sub-index O, Sub-index S, and Overall index (total score). T&D scores of S&P (T&D Index) are also calculated for a robustness check of our empirical model (Patel, Balic, and Bwakira 2002).

**Samples and Variables**

In order to examine the relationship between individual corporate transparency and firm performance, we selected 237 Korean firms listed on the ‘KOSDAQ Venture Index’ of the KRX at the end of the year 2008.\(^7\) Venture firms on the KOSDAQ Venture Index are those businesses that satisfy the requirements established in Article 2, Item 2, and Clause 1 of the ‘Special Law for the Promotion of Venture Business.’ This public verification system of the venture firm is unique to Korea. Venture businesses are divided into venture capital investment firms, research & development firms, technical evaluation certification firms, technical evaluation loaning firms, and preliminary venture firms. The Venture Index is published based on constituents composed of venture business. We selected the firms on the KOSDAQ Venture Index for our analysis because corporate annual reports and disclosed information of the firms listed on a public stock market are easy to access. On the other hand, we investigate and evaluate the corporate transparency of 48 large companies listed on the ‘KOSPI 50’ as a comparison group, so that we can try to

---

\(^6\) Accordingly, if we can answer yes to all 149 items for a firm, the firm can have a score of 149. However, if a firm has 29 items unanswerable among total 149 items and 60 questions have a yes answer, we can calculate the total transformed score by the formula: \(60/(149-29)*100=50\) (full mark of 100).

\(^7\) Among 268 firms included on the “KOSDAQ Venture Index” at the end of year 2008, 27 firms that were newly listed on KOSDAQ in 2008, three firms that were delisted and one firm that changed its name were excluded from our analysis due to a lack of information.
distinguish the differences in corporate transparency between these two groups.\(^8\)

In this study, we conduct an empirical analysis through multivariate regression methods in order to examine the relationship between corporate transparency and firm performance. Performance-related factors are dependent variables, and individual corporate transparency scores are explanatory variables. We conceptually divide firm performance into firm value, firm profitability and firm sustainability. First, we select \textit{price-to-book ratio} (PBR) as a measure of firm value. Firm profitability can be explained by \textit{return on assets} (ROA) and \textit{operating profit rate} (OPR). While we can find some papers examining the effect of corporate transparency on firm value, empirical explorations for the relationship between corporate transparency and firm profitability are hard to find. \textit{Age of the firm} (Age) represents firm sustainability.\(^9\) In the previous literature, no study has examined the effect of corporate transparency on firm sustainability or firm survival. These firm performance related factors can be obtained from the FnGuide\textsuperscript{TM} Database, one of the largest content providers for the Korean stock market, in the year 2007, and the descriptions are shown in Table 1.

To control the effect of corporate transparency scores on firm performance, we selected several control variables: \textit{assets},\(^{10}\) \textit{equity/assets},\(^{11}\) \textit{liability/equity},\(^{12}\) \textit{R&D expenditures/sales},\(^{13}\) \textit{cash/assets},\(^{14}\) \textit{foreign ownership},\(^{15}\) \textit{sole ownership},\(^{16}\) \textit{duration of being listed on stock market (Listed)}\(^{17}\) and \textit{industry dummies}.\(^{18}\) The detailed descriptions of control variables as well as transparency indices are also represented in Table 1.

---

\(^8\) Among 50 firms included in the ‘KOSPI 50’, one firm is excluded from our analysis due to the stock exchange and transfer in 2008, and one firm is excluded from our analysis due to being acquired.
\(^9\) The unit of ‘Age’ is a month.

* FICS: FnGuide Industry Classification Standard. FICS has a three-level hierarchical classification system: 1) FICS sector, 2) FICS industry group, and 3) FICS industry. We distinguish industries where venture firms are at the sector level. In the case of the total group of 237 venture firms, they consist of 149 information technology (IT) firms, 28 health care firms, 25 consumer discretionary firms, 24 industrial products firms, six material firms, three energy firms, and two consumer staples firms. Because the data of large companies is not used in the regression between corporate transparency and firm performance, we do not classify them by industry.

**NOTE:** The fiscal year of most firms is from January 1st to December 31st. In that case, we use the data of control variables at the end of 2007. However, some firms have different fiscal years. In the case of firms that have April 1st, July 1st, and October 1st as the beginning day of their fiscal year, we use financial data on March 31st in 2008, June 30th in 2007, and September 30th in 2007, respectively.

### Empirical Results

**Comparison of Corporate Transparency between Large Companies and Venture Firms**

Before examining the relationship between corporate transparency and firm performance in Korean ventures, we explore the level of corporate transparency of 237 Korean ventures through a comparison with 48 Korean large companies. Table 2 shows the descriptive statistics of our samples. The total corporate transparency score of large firms and ventures is significantly different. As the case of the overall index which we suggested, the average T&D scores of large companies and ventures differ significantly.

* In the case of ROE, we have 235 results of venture firms, because two firms are in the condition of impaired capital.

b Unit of currency in Korea

Among the sub-indices of corporate transparency, the average of the social transparency scores is lowest, and the average of the governance transparency score is also lower than that of the financial transparency score and the operational transparency score, in the total sample. The largest difference between large companies and ventures is shown on the score of social transparency, and that is 40.023. From the comparison of corporate transparency scores of the large companies with those of the ventures, we can conclude that the level of corporate transparency between large firms and ventures is significantly different. In addition, except for operational transparency, the average score of all sub-indices of corporate transparency is different between large companies and ventures. Basically, in financial
transparency, the difference between large companies and ventures is not huge, because the disclosure item and procedure of financial information is strictly stipulated when a firm prepares an annual report. On the other hand, governance transparency, which has fewer compulsory items than financial transparency, so that governance transparency differs more between large companies and ventures. In particular, social transparency which has annexed characteristics, such as autonomic disclosure of corporate information, social contribution and ethical management, has a large difference between large companies and ventures.

In the case of performance factors, PBR, which represents firm value, is not significantly different between large firms and ventures, while ROA, operating profit rate and age of the firm has significant difference between these two groups. The difference in the operating profit rate is more obvious than the case of ROA. Therefore, we expect a positive relationship between corporate transparency and firm profitability and firm sustainability from the results of the comparison between large companies and venture firms. However, it is not probable that corporate transparency has a positive effect on firm value according to the result of the descriptive statistics.

The descriptive statistics of our control variables are also shown in Table 2. As a result, large companies generally have much more assets, much more liability relative to equity, larger foreign ownership, and a longer history on the stock market than venture firms. On the other hand, venture firms try to invest much more money on R&D activities, and retain much more cash relative to their assets in order to secure liquidity.

Table 3 shows the distribution in the overall score and sub-indices score of corporate transparency, and the T&D score of the large companies and ventures. In the comparison of large companies and ventures, we can find that the gap in the overall corporate transparency score is about 20 points, and that the difference in the sub-indices score of corporate transparency is at least about 10 points (Sub-index F) to about 40 points (Sub-index S). From the distribution of corporate transparency scores for large companies and ventures, we can definitely distinguish the difference in terms of the level of corporate transparency between large companies and ventures.

Relationship between Corporate Transparency and Venture Firms’ Performance

This study aims to examine the relationship between corporate transparency, as measured by the corporate transparency index that we suggested, and the firm performance of 237 Korean ventures. We use price-to-book ratio (PBR) as a proxy for a company’s market valuation. Firm profitability can be explained by return on assets (ROA) and operating profit rate (OPR). Age of the firm (Age) represents firm sustainability. To deal with the endogeneity problem between firm performance and corporate transparency indices, we insert a comprehensive set of control variables from previous studies into the regression model. These control variables help to reduce the omitted variable bias, as well as the potential endogeneity problem (Cheung et al. 2008). Before conducting the regression analysis, we examine the correlations among corporate transparency indices and control variables (Table 4).

In Table 5, we regress PBR, ROA, OPR and Age against the overall corporate transparency index, industry dummies, and control variables by the Ordinary Least Squares (OLS) regression method. We calculate White robust standard errors adjusted for heteroscedasticity, if it exists in the regression model. In addition, we conduct regressions between these firm performance factors and the T&D index to check robustness and compare them with the results of our index. In the case of PBR, which represents firm value, both of the overall transparency index and the T&D index is not significantly associated with PBR. However, ownership concentration (sole ownership) negatively affects a firm’s market valuation, as we predicted. The two models of PBR have relatively low values of R-squared.

In the case of firm profitability, our corporate transparency index positively affects ROA and OPR. A one point increase in the corporate transparency index of a firm can raise its ROA 0.412 percent and its OPR 0.819 percent. However, we cannot find significant effects of the T&D index on ROA and OPR.

19 The overall index has positive and significant correlation coefficients, which ranged from 0.51 to 0.66, on its sub-indices. In addition, the overall index is positively correlated (0.84) with the T&D index. On the other hand, we cannot find a coefficient which is more than 0.30 in the relations among sub-indices. Therefore, we conclude that our sub-indices are well-composed without an overlapping effect among sub-indices and our transparency index can replace the T&D index. We also cannot find significantly high correlation coefficients among the control variables.
which represents firm profitability. Among our control variables, assets, equity/assets, R&D/sales, and duration of being listed on the stock market (Months Listed) are selected as the determinants of ROA. The positive effect of assets on ROA is reasonable, because venture firms generally have a small amount of assets, so that they cannot all have chances of high-return business. Therefore, the firm which has much more assets can have much more business chances, allowing it to have a higher ROA. The proportion of equity in assets is also positively correlated with ROA. This finding explains why equity has cheaper funding costs than liability, because liability has interest expenses. On the other hand, R&D expenditure is negatively correlated with ROA. Because R&D is a kind of long-term investment for future profit, the short-term effect of R&D expenditure on ROA can be only negative. The negative effect of Months Listed on ROA reflects the fact that fast-growing firms are usually newly listed on the stock market.

The results of control variables in the model of OPR have important things to explain the determinants of firm profitability. Equity/assets, R&D/sales, and Months Listed have the same signs of coefficients, as in the case of ROA. On the other hand, liability/equity negatively affects OPR. This result means that liability weighs heavily upon a firm’s financial condition because of its interest expenses. The positive and significant coefficient of foreign ownership shows the fact that foreign investors generally force management to make a short-term profit more than the Korean investors. In addition, we find the opposite effect of sole ownership on OPR to that on PBR. This finding shows that even though ownership concentration reduces a firm’s market valuation, it enhances firm profitability, because it helps to manage the venture firm in a more stable manner.

Finally, a firm’s corporate transparency score is positively and significantly associated with its age, a measure which represents firm sustainability, as we predicted. In addition, we also find that ownership concentration helps the firm to sustain itself for a long time. This fact is consistent with our expectation. A firm with high ownership concentration has the power to resist external attacks for management rights through such means as a hostile M&A, so that the owner of the venture can make a firm sustainable.

**NOTE:** Significant results at *10 percent, **5 percent, ***1 percent are shown in **boldface**. T-statistics, based on White’s heteroscedasticity-consistent standard errors, except for ‘Age’ model, are reported in parentheses.
From the regression analysis about the relationship between corporate transparency and firm performance in Korean ventures, we can find that overall corporate transparency positively affects firm profitability and firm sustainability, even if it is not related with a company’s market valuation. On the other hand, the T&D index is not a determinant of firm performance factors. Therefore, we can conclude that the corporate transparency index we suggested explains the relation with firm performance factors better than S&P’s T&D index.

Table 6 contains our OLS results for four sub-indices of our corporate transparency index. In the case of firm value, there is no significant sub-index that affects corporate PBR. This result is consistent with the case of the overall corporate transparency index. On the other hand, in the case of firm profitability, ROA is positively and significantly affected by financial transparency. In addition, OPR is positively associated with social transparency as well as financial transparency. According to these results, financial transparency plays an important role in enhancing individual firm profitability. A one point increase in the financial transparency score can raise ROA by 0.390 percent and OPR by 0.674 percent, respectively. However, the positive relationship between social transparency and OPR should be examined in detail, because the social transparency sub-index includes three different aspects: public relations, business ethics, and social contribution. In the case of firm sustainability, operational transparency has a positive and significant effect on the age of the firm, while the other three indices are not related with Age. This result reveals that a clear definition of the products and services which the firm produces, providing a proper understanding of the markets and industrial environments in which the firm does business, can form the foundation for firm’s sustainability. In all of the cases examined, the significant factors among control variables are the same as in the case of the overall corporate transparency index.

NOTE: Significant results at *10 percent, **5 percent, ***1 percent are shown in **boldface**. *T*-statistics, based on White's heteroscedasticity-consistent standard errors, except for 'Age' model, are reported in parentheses.
In conclusion, we can find no significant relationship between the sub-indices of corporate transparency and firm value. In addition, the level of operational transparency positively affects the age of the firm which represents firm sustainability. On the other hand, financial transparency is a key factor in firm profitability. OPR is also associated with social transparency. We will investigate the reasons for these results in detail through the segmentation of our four sub-indices (we call these segments ‘sub-components’) in the next section.

**Relationship between Sub-components of Corporate Transparency and Firm Performance**

We investigated how our corporate transparency and its sub-indices affect firm performance so far. In this time, we classify four sub-indices into several sub-components respectively, and we examine whether these sub-components significantly affect firm performance, in detail.

Table 7 shows our four sub-indices and sub-components of our corporate transparency index, and their important related stakeholders. For convenience, each sub-component is coded into ‘F1’, ‘F2’, …, ‘S2’, ‘S3’. Each sub-component consists of 5 to 24 items, and the way to score the sub-component is the same as the case of the overall index and sub-index. However, in the case of Sub-index F and Sub-index S, the sum of the number of items in the sub-components comprising the sub-index is not equivalent to the total number of items in the sub-index, because the items that could not be included in our sub-components, by characteristics, are not counted.

Each sub-component of the corporate transparency index can directly or indirectly affect various groups of stakeholder (Table 7). Most of the sub-components are related with shareholders, investors, and creditors, while certain sub-components can be associated with governments, customers, suppliers, local communities, and the public.

</table>

Table 8 contains the regression results of the sub-components and firm performance factors. Before going into further detail on the results, we explain the procedure for this regression analysis. In order to examine the effect of individual sub-components on firm performance factors as dependent variables, we replace the overall index in the previous regressions by the score of sub-components. We represent these results in the columns “Alone” that are located on the left side of each performance factor’s column in Table 8. Same set of control variables in the previous regressions are included in the regression model, however the coefficients of the control variables are omitted in Table 8.

The regressions in “Alone” may overstate the power of individual sub-components, most of which correlate with the (omitted) rest of the overall corporate transparency index. Therefore, following the study of Black, Jang, and Kim (2006), we gain a more precise effect from the sub-component, adding two control variables: (i) a “Reduced Index” (overall index - the sub-index to which the sub-component belongs); (ii) a “Reduced Sub-index” containing the other sub-components of the sub-index to which
the sub-component belongs. For example, in the regression for the sub-component *Accounting Information* (F1), we include controls for (i) the overall score of governance, operational, and social transparency; (ii) the firm’s score on a reduced financial transparency sub-index consisting of *Accounting Policy & Method* (F2) and *Additional Financial Information* (F3). The resulting effect of an individual sub-component is represented in the columns “With Controls”, on the right side of each performance factor. As in the “Alone” regressions, we include the same set of controls in the “With Controls” regressions, and omit the coefficients of the controls, because the result of each sub-component should be shown in each row of Table 8.

With regard to the results in Table 8, the significant sub-components for firm performance factor by “Alone” are equivalent to those by “With Controls”, even though the values of coefficients from these two approaches differ only slightly. In the significant factors that affect firm performance from Table 8, we find some interesting results. While PBR is not affected by the overall corporate transparency index and its sub-indices, *Social Contribution* (S3) has a positive and significant effect on PBR. The insignificant relationship between social transparency and PBR is caused by two other sub-components of the social transparency sub-index, except for *Social Contribution*. This finding explains that corporate activities for social contributions and their sincere disclosure to the public enhance firm value in the stock market. However, we find that the other sub-components have no relationship to PBR.

On the other hand, ROA and OPR are positively and significantly correlated with *Additional Financial Information* (F3). This fact explains that the positive coefficients of financial transparency on ROA and OPR in Table 6 are induced by F3, because most of the items in *Accounting Information* (F1) and *Accounting Policy & Method* (F2) are compulsory disclosure items for the writing of a corporate annual report. In addition, because F3 contains items about additional information such as earnings forecast, investment plans, and dividend policies, we can find that the competences for forecasting and managing future earnings and investment plans positively affect firm profitability.

**NOTE:** Significant results at *10 percent, **5 percent, ***1 percent are shown in boldface. T-statistics, based on White's heteroscedasticity-consistent standard errors, except for 'Age' model, are reported in parentheses. Industry dummies are included.
OPR is positively affected by Public Relations (S1). This result is the reason for the positive relationship between social transparency and OPR in Table 6. Business Ethics (S2) and Social Contribution (S3) are the factors that have a long-term effect, rather than a short-term effect, meaning that S2 and S3 have no relationship with a firm’s short-term profitability. On the other hand, S1 is composed of items that affect profits in the relatively short term, such as firm’s investor relations activity and corporate website. We expect that this inference may be proved by inserting average long-term profit rate.

Board Process (G4) and Industry & Business Environment (O2) as well as F3 have significant effects on ROA, and Ownership & Governance Structure (G1) is correlated with OPR. The negative effect of G4 on ROA is not consistent with our expectation. This finding explains that the complexity of operating organizations and various committees in the board of corporation hinders the right and speedy decisions for corporate profitability. On the other hand, the positive coefficient of O2 for ROA shows that the firm can enhance the firm’s profit rate through a clear understanding and sincere disclosure of the competition in the market and the industry. In the case of OPR, the positive relationship between G1 and OPR implies that the more transparent the corporate governance and ownership structure are, the higher the firm’s profit rate becomes.

The age of the firm is affected by both internal and external operational transparency sub-components (O1 and O2). There is no significant factor among the other sub-components of our corporate transparency index.

In conclusion, corporate value is clearly connected with firms’ activities for social contribution. In addition, firm profitability can be enhanced by disclosing a wide range of financial information. Finally, operational transparency guarantees the firm sustainability.
Conclusion

Expanding the scope of the parties affected by corporate transparency from the investor or the shareholder to include other stakeholders and regional society, we propose a new corporate transparency index adding the part of operational transparency and social transparency to financial transparency and governance transparency. Based on the T&D index developed by Standard & Poor's, the most popular index of corporate transparency, we add some evaluation items from various indices in the previous literature, and classify them into these four sub-indices.

We select 237 venture firms listed on the ‘KOSDAQ Venture Index’ and 48 large companies listed on the ‘KOSPI 50’ in Korea, and evaluate individual corporate transparency, investigating annual reports and other various sources. As a result, large firms are more transparent than ventures in terms of our corporate transparency index as well as the T&D index. In addition, the scores of the sub-indices of our corporate transparency index show differences between large firms and ventures. In particular, the social transparency score of large firms overwhelms that of ventures.

Having the transparency scores of 237 venture firms, we conduct an empirical analysis in order to investigate the relationship between corporate transparency and firm performance. We consider firm value, firm profitability, and firm sustainability, and select price-to-book ratio (PBR), return on assets (ROA) and operating profit rate (OPR), Age of the firm (Age) as dependent variables, respectively. Corporate transparency scores are independent variables. We also include various control variables.

From the regression analysis, we can find that an overall corporate transparency has positive effects on ROA, OPR, and Age. These results show that corporate transparency can enhance firm profitability and firm sustainability, while it cannot raise a company’s market valuation. On the other hand, the T&D index is not a determinant of firm performance factors. Therefore, we can conclude that a corporate transparency index we suggested explains the relation with firm performance factors better than the
T&D index of S&P. In the case of the sub-indices, we can find that there is no significant relationship between the sub-indices of corporate transparency and PBR. However, operational transparency positively affects the age of the firm (Age) which represents firm sustainability. This result explains that a clear definition of the products and services which the firm produces and provides, and a proper understanding of markets and industries, are important for a firm’s survival. On the other hand, financial transparency is a key factor in firm profitability (ROA and OPR). OPR is also associated with social transparency. By classifying four sub-indices of our transparency index into 13 sub-components in order to examine the effect of these sub-components on firm performance, we find some interesting results. From our analysis, we find that corporate transparency can enhance corporate profitability and sustainability. Especially, financial transparency plays an important role in firm profitability. In addition, social transparency can increase a firm’s profit, and operational transparency heightens a firm’s sustainability.

The evidence from Korean ventures, we conclude that venture firms should try to take the following actions in order to enhance their firm performance. First, they should strive to perform activities for corporate social responsibility in order to raise their corporate value. Second, for firm profitability, they should disclose a wide spectrum of corporate financial information and maintain a transparent ownership and governance structure. In addition, they should deliver information about their industry and business environment in a precise and accurate manner, and try to perform public relations activities. Finally, the firm should be eager to heighten operational transparency in order to make the firm sustainable.

Exploring the determinants of entrepreneurship among new graduates: implications for an effective entrepreneurial marketing

Principal Topic and Research Question

Entrepreneurs are key contributors to the growth and dynamics of the economy and one possible solution to overcome underdevelopment. Several researchers focused on this key-role of entrepreneurship and the dynamics it creates (Vesper, 1983; Davidson, 1988; Smith et al, 1989; Gartner, 1990; Vankataraman, 1997; Shane et Vankataraman, 2000; Bush et al 2003). In several emergent countries, this matter of fact led governments to develop national programs to encourage citizens to innovate, create firms, and henceforth contribute to reducing unemployment. One of the major policies oriented towards reaching this end is the development of an appropriate education system that would train future risk-takers and give them the necessary knowledge (Barney, 1991; Grant en 1995), skills and know-how in order to succeed in their initiatives. Another way of fostering entrepreneurship is to guarantee the access to funding and assistance during and after the firm creating process. Tunisia is an example of those countries which adopted both of these priorities. In this country, several laws have been promulgated so as to give all the necessary opportunities to potential entrepreneurs and several institutions have been created to coach them and assist them to materialize their project. However, in spite of all these governmental efforts, new graduates are reluctant to create their own firms even if “entrepreneurship” is their specialty. Many of them tend to look for a job in a company, preferring a security option to a hazardous one. This research study aims at understanding inhibitors and motivations of newly graduated citizens to create their own firm and identifying on which major elements entrepreneurial marketing should focus to lead citizens to put a lot of themselves into a business creation activity.
Methodology

In order to reach this objective and to better understand the reality of entrepreneurship in the Tunisian context, semi-directive in-depth interviews were conducted among 26 informants. Half of the sample was made of entrepreneurs, and the other half of newly graduates in entrepreneurship that didn’t go through the business creation process. During the interviews, we aimed at obtaining testimonies and opinions about the factors that led some informants to create their own business, the obstacles they have undergone as well as the impediments that were faced by the non-entrepreneurs. The interviews were tape-recorded, and then transcribed, in order to proceed to a thematic analysis using the Nvivo software.

Contributions

The conducted interviews enabled to draw out a significant number of inhibitors and motivations, some of them echoing those already emphasized in the literature, and some others specific to a context of an emergent country. The most important obstacle to going through the entrepreneurial process is linked to the lack of funding. Several other major inhibitors have been highlighted during the thematic analysis: beyond psychological factors such as risk aversion and a low level of self-esteem, more specific inhibitors have been found: the administration heaviness and the complexity of the formalities that should be gone through, as well as the economic and political situation. As far as the motivations are concerned, several of them are linked to the individual profile of the informant: the educational background, the will to have higher revenue, and reach self-realization, as well as self-confidence. Several others are rather sociological factors such as social recognition, the family context, the strength of family links and regional considerations. A third group of motivations is linked to the governmental efforts done to foster entrepreneurship: the
opportunities materialized by state grants-in-aid and supports and learning opportunities (Wood & Pearson, 2009) in the field of firm creation. Furthermore, by creating their own firm, informants declared that they were motivated by creating favorable working conditions: going beyond the dissatisfaction they lived in their former job, protecting themselves from the ubiquitous shadow of unemployment, and being their own boss. The last part of this paper is a reflection on how entrepreneurial marketing should be implemented in order to achieve effectiveness while trying to foster entrepreneurship and encourage new graduates to venture to create their own business (Morris et al., 2002; Hills et al., 2008).
Evaluating Indian women entrepreneurs in the informal sector: marginalization dynamics or rational economic choice?

Colin C Williams
University of Sheffield, Sheffield, United Kingdom
C.C.Williams@sheffield.ac.uk

Anjula Gurtoo
Indian Institute of Science, Bangalore, India
anjula@mgmt.iisc.ernet.in

Abstract -
Studies on women entrepreneurs in the informal economy no longer view them as a residue of a pre-modern regime that is disappearing. Instead, they are either read through a structuralist lens as marginalised populations engaged in low quality work or through a neo-liberal lens as engaged in relatively higher quality endeavour more as a rational choice. The aim of this paper is to evaluate critically these contrasting explanations. To do this, the results of face-to-face interviews with 323 women entrepreneurs operating in the Indian informal economy are analysed. The findings show that although the structuralist representation is largely appropriate for women engaged in informal waged work, it is not so valid for women informal entrepreneurs working on a self-employed basis where incomes are higher, they receive more credit from formal institutions, union membership is higher and such work is more likely to be a rational choice on the part of these women. The outcome is a call to move beyond using only one of these explanations as universally applicable and instead to recognise that a more comprehensive understanding is needed to capture the diversity amongst women in the informal sector.

Keywords: self employed women; entrepreneurship; informal economy; India
Introduction

Since the turn of the millennium, it has been widely recognised that informal employment is a sizeable and expanding feature of the contemporary global economy (Charmes 2009; Feige and Urban 2008; ILO 2002 a,b; Jütting and Laiglesia 2009; Rodgers and Williams 2009; Schneider 2008). Indeed, a recent OECD report finds that out of a global working population of some 3 billion, nearly two-thirds (1.8 billion) are informal workers (Jütting and Laiglesia 2009). Conventionally, such work was assumed to be low-paid waged employment. Recently, however, a large proportion has been shown to be conducted on a self-employed basis: 70 per cent in sub-Saharan Africa, 62 per cent in North Africa, 60 per cent in Latin America and 59 per cent in Asia (ILO 2002b). Rather than depict informal workers as low-paid waged employees, therefore, such workers have started to be portrayed as entrepreneurs and as displaying entrepreneurial attributes, traits and qualities (ILO 2002a,b; Small Business Council 2004; Venkatesh 2006; Volkov 2002; Webb et al. 2009; Williams 2006, 2007). The aim of this paper is to further contribute to this literature on informal entrepreneurship by reporting a study of women informal entrepreneurs in India. Until now, a widespread assumption has been that such women engaged in informal entrepreneurship are necessity-entrepreneurs engaged in low-paid, menial, exploitative work in the absence of alternative means of livelihood (Chen et al. 2004; ILO 2002a). In this paper, the intention is to evaluate critically whether this is always the case.

In the first section, therefore, the literature will be briefly reviewed that has so far been written on entrepreneurs operating in the informal economy in general and women informal entrepreneurs more particularly. The second section then outlines the methodology used to study women informal entrepreneurs in India followed in the third section by the findings and then a discussion of the findings. The outcome will be to reveal that it is too simple to depict all women
operating in the informal economy to be engaged in low-paid poor quality work out of economic necessity. Our results show that both necessity and choice are co present motives for the women entrepreneurs. While the women entrepreneurs may have entered the informal system due to economic necessity, they operate within this sector as a rational economic choice.

Before commencing, however, it is necessary to define what is here meant by informal entrepreneurship. Given that entrepreneurship has been a problematic and elusive concept for a long time and, as Anderson and Starnawska (2008: 222) state, ‘entrepreneurship means different things to different people’, a working definition is here employed appropriate to the task. Here, an entrepreneur is defined as somebody actively involved in starting a business or is the owner/manager of a business (Harding et al 2006; Reynolds et al 2003), and informal work as monetary transactions not declared to the state for tax and/or benefit purposes but which are legal in all other respects (e.g., European Commission 2007; Evans et al 2006; Williams 2006).

**Women and entrepreneurship in the informal sector**

For most of the last century, it was widely assumed that there was an extensive and growing formal economy and a separate small and gradually disappearing informal economy. Entrepreneurs operating in the informal economy, such as street hawkers and peddlers, were thus widely depicted as simply a residue or leftover from an earlier mode of production and as rapidly disappearing with modernity as activities previously conducted in the informal sector became incorporated into the modern formal economy. Conceptualised in this manner, the persistence of informal entrepreneurs signalled ‘under-development’, ‘traditionalism’ and ‘backwardness’
whilst the advent of the formal economy represented ‘progress’, ‘development’ and ‘advancement’ (Geertz 1963; Carr and Chen 2002, 2004).

Since the turn of the millennium, however, a small but expanding tributary of thought has transcended this traditional depiction of informal entrepreneurship as a residue and disappearing. Instead, a growing number of studies have revealed that both the informal economy in general (Charmes 2009; Feige and Urban 2008; ILO 2002a,b; Jütting and Laiglesia 2009; OECD 2002; Schneider 2008; Schneider 2008; Williams 2006), and informal entrepreneurship more particularly (De Soto 2001; Minard 2009; Small Business Council 2004; Venkatesh 2006; Volkov 2002; Webb et al. 2009; Williams 2006, 2007; Williams and Round 2007, 2008; Williams et al. 2009), is extensive, persistent and even growing in many populations. The outcome has been the advent of various new explanations for the continuation and expansion of informal entrepreneurship.

On the one hand, and perhaps the most dominant representation of informal entrepreneurship is that which depicts it as a form of low quality work conducted under poor conditions for low pay by populations marginalised from the formal economy and who conduct such endeavour out of necessity in the absence of alternative means of livelihood. In this view, informal entrepreneurship is often seen to have emerged as a direct by-product of the advent of a de-regulated open world economy (Amin et al. 2002; Castells and Portes 1989; Gallin 2001; Hudson 2005; Portes 1994;Sassen 1997). From street-sellers in the Dominican Republic (e.g. Itzigsohn 2000) and Somalia (Little 2003), through informal self-employment in garment businesses in India (e.g., Das 2003; Unni and Rani 2003) and the Philippines (Doane et al. 2003), to home-based micro-enterprises in Mexico (e.g., Staudt 1998) and Martinique (Browne 2004), the consensus is that this is a sphere which people enter out of necessity as a survival strategy.
and that it is low paid insecure work conducted under poor conditions (e.g., Itzigsohn 2000; Otero 1994; Rakowski 1994). Informal entrepreneurs, in other words, are portrayed as unwilling and unfortunate pawns within an exploitative global economic system in which work is becoming ever more precarious and poorly paid.

Such a structuralist explanation is particularly prevalent when examining the informal economy in India in which some 93 percent of India’s working population is employed and of this workforce, some 30 percent are women (ILO 2002a,b). Seen through this lens, such entrepreneurship is seen as an absorber of surplus labour, provider of income earning opportunities for the poor, a provider of goods and services that are often unavailable in the formal sector and a primary means of maintaining a low cost of living by providing cheaper goods and services than would otherwise be the case (Bhatt 2006; Kapoor 2007; Pradhan 1998; Williams 2005; Nelson and Bruijn 2005). Indeed, jobs like cart vending, hawking, small store vendors, road side cobbling, pedal rickshaw driving and domestic home-help are commonly depicted by this structuralist perspective as the types of jobs conducted by informal entrepreneurs in developing nations, and although the correlation is not perfect, informal work is seen as inter-related to poverty and such entrepreneurship is portrayed as comprising highly insecure and unstable work, long hours of work, poor conditions, no legal or social protection, limited access to credit and very limited bargaining power (ILO 2002a,b; Lund and Srinivas 2000; Kapoor 2007).

On another hand, however, a rather different representation of informal entrepreneurship has emerged which explains its continuation and expansion in a rather different manner akin to the rational choice framework of Ostrom (1999).¹ For a group of neo-liberal commentators, that is, the growth of informal entrepreneurship clearly displays how large numbers of people have

voluntarily exited the formal economy. For these neo-liberals, therefore, informal entrepreneurs are not the product of involuntary exclusion but instead are heroes throwing off the shackles of a burdensome state (e.g., Sauvy 1984; De Soto 1989) and the direct result of the over-regulation of the market (Minc 1982; Sauvy 1984; de Soto 1989). Informal entrepreneurs thus voluntarily choose to operate off-the-books so as to avoid the costs, time and effort of formal registration (Cross and Morales 2007; de Soto 1989, 2001; Perry and Maloney 2007; Small Business Council 2004). For De Soto (1989: 255) in consequence, ‘the real problem is not so much informality as formality’.

Informal entrepreneurship is thus viewed as the people’s ‘spontaneous and creative response to the state’s incapacity to satisfy the basic needs of the impoverished masses’ (De Soto 1989: xiv-xv), emerges as a populist reaction to over-regulation and government oppression, and is seen to offer potential benefits not found in formal economy, including flexible hours, job training, and entry to the labour force, opportunity for economic independence and better wages and avoidance of taxes and inefficient government regulation (Maloney 2004). It is a rational economic strategy pursued by entrepreneurs whose spirit is stifled by state-imposed institutional constraints.

Until now, although some studies have evaluated the validity these contrasting explanations in relation to western economies, and transition economies, such as East-Central European nations ((See Williams and Winderbank 2003; Williams 2009a,b; Aldrich 1999; Aldrich et al. 1989; Nelson and Bruijn 2005; Jütting and Laiglesia 2009), few if any have evaluated the validity of them in relation to developing nations and even fewer have evaluated which of them is more relevant in relation to women informal entrepreneurs. Indeed, the only instance in which this has been investigated, which was in the transition economy of Ukraine,
found that women were largely ‘reluctant’ entrepreneurs and men more commonly chiefly ‘willing’ entrepreneurs (Williams 2009a). Here, in consequence, the validity of these contrasting explanations is evaluated in relation to women informal entrepreneurs in India.

In India, previous studies have identified how many women engaged in the informal sector participate in entrepreneurial endeavour (ILO 2006a,b; Bhatt 2006; Mehrotra and Biggeri 2002). However, most of this literature on women engaged in informal entrepreneurship has concentrated on measuring the amount and nature of their access to credit, welfare funds, insurance and so forth. These studies reveal four key findings. Firstly, their work typically operates at very low levels of organization and scale. The reliance on day-to-day profits for survival is high as they have little or no access to institutional credit (Schneider and Bajada 2003). Secondly, they lack formal space for operations, and have to protect themselves from harassment by local authorities (ILO 2002a, 2006a; Bhalotra 2002; Nelson 1997). Moreover, they face a number of serious health and safety risks including dangerous working conditions and gendered violence. Thirdly, often their work is not constituted as a separate legal entity, independent from the household (Chen et al. 1999, 2004; Bhatt 2006; Charmes 1998a,b). However, these transactions are totally market based, conceded by any formal system or government intervention (Williams and Windebank 2003; Williams 2009a; Carr and Chen 2002,2004). Fourth and finally, their activities tend to get locked within the traditional roles such as selling flowers at the temple, keeping a basket of fruits etc. Furthermore, mobility in search of better location and customers is difficult as they balance vending with taking care of the children alongside (Bhatt 2006; Kapoor 2007). Hence they often contend with insufficient infrastructure and a range of time and space constraints for productivity (Lund and Srinivas 2000; Chant 2007a,b; Gates 2002).
Until now, in consequence, such work has not been studied to evaluate the validity of these contrasting explanations and to begin to unravel the heterogeneity within this sector. In this study we add to this emergent literature on the heterogeneity within the sector through the following:

- Exploring occupational variations for women within this sector, in general.
- Investigate the self employed /entrepreneur women and their work life perceptions, in specific.
- Deliberate on the adequacy of the existing explanations to understand the informal sector and propose alternate explanations.

**METHODOLOGY**

The informal sector heterogeneity was explored through a questionnaire survey, conducted in 2006-07, over a period of seven months. The questionnaire was administered to nearly 323 women working in the Indian informal economy in the form of a face to face interview. The interview became essential mainly because of low literacy levels of the respondents and the sensitivity of the subject matter under investigation. The questionnaire explored workplace structures, economic status, characteristics of operations, the socio-business environment, fears and nature of concerns.

The sample design was stratified random sampling, with convenience sampling at the local level. The sample was taken from cities (1, 2 and 3 tier) from different parts of India. The sample cities were Tier 1 - Mumbai, Bangalore, Delhi, Tier 2 – Nagpur and Jhansi, Tier 3 - Jodhpur and Gulbarga. Four occupational categories are common among informal sector women and were the significant sample, namely, vendors, house helpers, office helpers and shop helpers.
Two of these occupations, namely, vendors and house helpers, reflected some evidence of unionization. While women vendors were common across locations, we found very few women working in commercial and office establishments in the Tier 2 and Tier 3 cities.

Frequency distribution and Kendall's W was used to compare and contrast women entrepreneurs with other occupations. Kendall's W is interpretable as the coefficient of concordance, which is a measure of agreement among raters. As the data captured respondent agreements and perceptions, and the samples were limited and did not meet the condition of normality, this test was considered appropriate for the analysis. In Kendall’s each case is a judge or rater and each variable is an item or person being judged. For each variable, the sum of ranks is computed.

We acknowledge that, considering the cultural and geographical spread of the informal sector in India, the survey may not be representative of either the Indian women workforce or the informal sector at the national scale. Nevertheless, it does provide cross sectional data of various types of informal work and is one of the first surveys to explore workplace heterogeneity and differences in informal work in India.

**RESULTS**

Before examining the results, the validity of the data collection method needs to be discussed. Collecting work life data from the informal economy women was a difficult task. Separating work issues from their family issues was tough for the respondents. For example, in their perception, personal insurance for them was not delinked from their family insurance, and infants and small children were integral part of the workplace (for several vendors and house
What characteristics define the informal sector women as entrepreneurs and in other occupations?

The face of face interviews results of the survey revealed existence of several women entrepreneurs in the Indian informal economy. As illustrated in Table 1, of the people surveyed, about twenty four percent were self employed women. About sixty six percent of these self employed /entrepreneur women were migrants who had moved to their current city of residence. Reasons for migration were better opportunities and marriage. Comparing these women with other professions indicated ‘employment’ as a significant reason for migrating to another city. Moreover, the education level of these women was significantly lower than women in other professions. These entrepreneurs/self employed women were largely uneducated. They had not experienced any formal schooling.

Studies on migration show the impact of this on women. Many of those who migrate to cities in search of jobs find work in the informal (rather than the formal) economy (Carr and Chen 2002, 2004; Charmes 1998a,b, 2009; Government of India 2001). This is due to mainly due to lack of formal opportunities for uneducated women, more so since national economic reforms of 1992 (Government of India 2001; ILO 2006a, b).

Analysis of response to economic and social support confirmed the lack of social, economic and political power for all women. This has been highlighted by several studies. One, our results highlighted the lack of any market based or government led social and economic security for these women. Two, few of them had access to credit from standard institutions. Friends and informal money lenders were the main creditors. This informal lending setup, however, does not follow standardized interest rates and open these women to severe economic vulnerability (Singh 2005; Fawzi 2003; Kapoor 2007). Since 1990s, Central and State governments in India have promoted several social and economic support schemes for the informal sector and formalized this support through the Micro, Small and Medium Enterprises Development Act, 2006. However, evidently, no benefits have reached the women. This could be either due to lack of access, lack of awareness or cultural constraints which discourage women to go for any social or economic self-support (Singh 2005; Bhatt 2006; Chan 2003; Bhatt 2006). Three, unions were not a popular representation body. While primary reason for lack of
union membership was lack of union presence, the ineffectiveness plaguing the current trade union movement was not lost on the respondents (See Gurtoo 2008a, 2008b). More than fifty percent self employed and shop helps found the unions ineffectiveness as reason for not joining a union. Table 2 illustrates these results.

Studies by Martha Chen and Marilyn Carr (2002, 2004) have highlighted the complexities which keep the informal sector people to remain without basic social facilities despite their contributions to the economy. A mix of factors help explain the persistence and expansion of the informal sector in different countries: the rate and pattern of growth, including the labor-intensity and sectoral composition of growth; economic restructuring or economic crisis, including privatization of public enterprises and cut-backs in public expenditures; and global integration of the economy, including the restructuring of global production characterized by outsourcing or subcontracting (Carr and Chen 2002, 2004; Chen et al. 1999, 2004). Women get over emphasized in these factors due to several reasons: relatively low levels of education and skills, and time and mobility constrains due to social and cultural norms that assign the responsibility for social reproduction to women and discour-age investment in women’s education and training (Carr and Chen 2002, 2004; Chen et al. 2004).

Do the entrepreneurs differentiate with other professions and how?

Analysis of economic variables highlighted subtle but significant differences between occupations. Table 3 illustrates the results. One, the income of the self employed or entrepreneur women was significantly higher than the other groups. The average monthly income of these self employed vendors was nearly fifty percent more than the other groups. Two, these women had no access to funds from any bank or government lending institutions. They depended on friends
and money lenders. This would significantly limit their growth as ventures need capital to expand (ILO 2006a, b; Government of India, 2001).

Analysis of their perception on work, revealed three interesting differences. One, work-life attitude of self-employed women clearly distinguished them from the rest of the informal economy participants. These women did not mark job insecurity as a very significant concern, were significantly confident about their earning potential, and wanted formal training and sought support structures to improve on their work. This was not found significant in other professions. Two, they sought support structures based more in the local community and local professional groups, than traditionally institutionalized trade unions. Three, and significantly, they marked lack of alternate employment as a significant concern (as did house helpers). Tables 3 and 4 illustrate these results.

These differences clearly illustrated the depiction of informal sector women entrepreneurs in the same way as informal sector waged workers was too simplistic and ignored the heterogeneity existing within this sector. Contrast to structuralist depiction of marginalisation, informal sector entrepreneur women were not so poorly off in their living conditions as well as attitude towards work. Rather, entrepreneurship dynamics had got into play along with their necessity driven initial situation, to generate a rational economic orientation and attitude for work. While they may have entered the informal system due to lack of alternate opportunity, they were positive about the future and were happy to work in this profession. The dynamics inherent in entrepreneurship may have changed the situation and outlook for them. The popular depiction of informal sector using the marginalization approach clearly ignores this agency orientation or how agency influences people and work situations to create its own significant dynamics.
DISCUSSION: WOMEN ENTREPRENEURS

These results clearly presented multi dimensionality in the work-life issues of the women entrepreneurs in this economy. While overall social and welfare based vulnerabilities were significant, economic and attitude variables reflected pragmatism and dynamism in these entrepreneurs. In this they were significantly different from their counterparts in other professions.

Indeed, jobs like cart vending, hawking and road side cobbbling do absorb of surplus labour, provide income earning opportunities for the poor, and provide cheaper goods and services to a large part of the population (PRADHAN 1998; Williams 2005; Nelson and Bruijn 2005). However, the typical depiction of these self employment jobs, through the structuralist perspective, as comprising highly insecure and unstable work, with no formal legal or social protection and limited bargaining power (ILO 2002a,b; Lund and Srinivas 2000; Kapoor 2007), may not be the whole truth.

Continuation and expansion of the informal entrepreneurship can also be explained in a manner akin to the rational choice framework of Ostrom (1999). Informal entrepreneurship is also the people’s ‘spontaneous and creative response to the state’s incapacity to satisfy the basic needs of the impoverished masses’ (De Soto 1989: xiv-xv). It continues as a populist reaction to over-regulation and lack of government support. It is seen to offer potential benefits not found in formal economy, including flexible hours, entry to the labour force for non educated, opportunity for economic independence and opportunity for earning better wages (Gurtoo and Williams, 2009). It is a rational
economic strategy pursued by entrepreneurs whose spirit is stifled by lack of state-institutional support.

The interplay of structuralist and rational choice rules and features can be observed in the analysis of the women entrepreneurs of the informal economy. The women entrepreneurs may have entered this economy and entrepreneurship due to lack of opportunities for uneducated, migrant women in India. The larger Indian social system (social rules) does not allow uneducated, non-local women to have easy access to formal opportunities like a formal job or formal institutional credit (Singh 2005; Mehrotra and Biggeri 2002; Xaba et al. 2002). However, the informal sector self employed women participants had turned this ‘marginalized’ situation into an opportunity. The ‘institutional system’ of entrepreneurship had facilitated this conversion of an adversity into an opportunity.

Thus we see two set of rules (social and entrepreneurial) interacted with each other to influence their decision making. Entrepreneurship is seen to be a combination of entrepreneurial actions, determined by interpretation of opportunities. (Stinchcombe 1965; Aldrich 1999; Pradhan 1989). And we see this through the informal sector self employed, women entrepreneurs.

CONCLUSION

The findings of the study on self employed women, or entrepreneurs, reflected the understanding that actors are seen to take rational decisions based on local socio-politico-
economic understandings of the world. These decisions are, however, at multiple levels and at multiple action spaces. Hence, often at first glance, they seem contradictory.

These results also put the one dimensional and simplistic explanation of ‘marginalization’ of informal sector women under the scanner. They challenge the traditional understanding of small and women entrepreneurs as marginalized and controlled only by socio-economic hierarchies.

Over the past decade or so it has been revealed that a large proportion of informal work is conducted on a self-employed basis: 70% in Sub-Saharan Africa, 62% in North Africa, 60% in Latin America and 59% in Asia (ILO 2002). Moreover, such workers have been widely re-conceptualized as entrepreneurs displaying entrepreneurial attributes, traits and qualities. This more entrepreneurial re-reading of the informal sector first emerged in a majority (Third) World context (Cross 2000; Cross and Morales 2007; De Soto 1989, 2001; ILO 2002). As the ILO (2002, p 54) asserts, the informal sector represents ‘an incubator for business potential and…transitional base for accessibility and graduation to the formal economy’ and informal entrepreneurs display ‘real business acumen, creativity, dynamism and innovation’. A fresh and wider debate on the informal sector dynamics and women led informal entrepreneurship, therefore, is needed to comprehensively understand informal sector and entrepreneurship.
REFERENCES

Women entrepreneurs in the informal sector: marginalization dynamics or rational economic choice?

Under the Theme: Women and Minority Entrepreneurship

ABSTRACT
Informalization of the economy is a widely accepted phenomenon. It covers 35 to 40 percent of the national GDP for several developing economies and plays a major role in the employment creation (ILO, 2002). It absorbs labour surplus, provides income earnings opportunities for the poor, provides goods and services unavailable in the formal sector and helps in maintaining low cost of living by providing cheaper resources of food and services (Chaudhari and Banerjee, 2007; Williams, 2005; Nelson and Bruijn, 2005). These jobs include cart vending, hawking, assistant-ship in small stores, road side cobb ing, pedal rickshaw driving and providing house-help. Though the correlation is not perfect, informal work is linked to poverty due to highly insecure and unstable jobs, long hours of work in poor conditions and no legal or social protection (ILO, 2002; Kapoor 2007).

Ninety three percent of India’s working population is part of this informal sector and out of this workforce about 30 percent are women (ILO, 2002). This paper is an exploration of the work life of these women, with specific focus on the women entrepreneurs of this sector. How do economic liberalization processes sit alongside the socio-economics of the women entrepreneurs in the informal sector? To what extent has it impacted the women entrepreneurs? Specifically, what vulnerabilities, adaptation and attitudes signify their existence? The answers to these questions are deliberated putting the structuralist assumption of “marginalization” under the scanner and exploring the rational choice framework given by Ostrom (1999)1.

Methodology/Key Proposition
The questions were explored through a questionnaire survey, conducted in 2006-07, administered nation wide, taking eight occupational categories. The questionnaire explored workplace structures, economic status, characteristics of operations, the socio-business environment, fears and nature of concerns. The results revealed three significant trends. One, post reform, entrepreneurship and risk taking behaviour had paid better. Women entrepreneurs were earning significantly more than women working in formal established organization. Two, work-life concerns and workplace attitude of entrepreneurs clearly distinguished them from the rest of the informal economy

---

participants. Women entrepreneurs did not mark job insecurity as a significant concern, had higher formal education and were confident about their earning potential. Three, the women wanted formal training and sought support structures based more in the local community and local professional groups, than traditionally institutionalized trade unions.

Overall the results gave contradictory explanations of women entrepreneurs. While overall social and welfare based dynamics came as significant, economic and attitude variables became more important in several contexts. What could account for this contradiction? Was there an explanation that could take in both these apparently contradicting results to draw a reliable understanding of women entrepreneurs? Searching for explanations led to an understanding that analyzing both results individually neglected the politics of institutional dynamics, that is, decision making through one set of rules that is part of a system also depends on which other rules are in effect. This configural nature of decision making drives larger group choices.

**Contributions**

This paper challenges the traditional understanding of small and women entrepreneurs as marginalized and controlled by socio-economic hierarchies, and discusses the results in the light of the institutional rational choice framework.

The paper concludes by calling for a fresh and wider debate on the decision making dynamics in women led informal entrepreneurship and also deliberates whether India is witnessing a longer term indirect developmental outcome of empowerment which actively started with government
initiatives like formation of women empowerment cells, formal demarcation of electoral seats for women candidates in several posts, and subsidizing education for the girl child.
Leveraging on networks for the internationalization of SMEs in developing countries: the case of the export consortia in Peru, Morocco Tunisia and Uruguay

Principal Topic and Research Questions

The paper focuses on export consortia of SMEs in developing countries as a tool for the development of intangible resources for internationalisation. The objective is to shed light on the type of resources that are developed within these network arrangements and the processes through which these resources are developed.

The international activities of smaller firms are constrained by several barriers, including their limited endowment of resources and capabilities to invest in exploiting growth opportunities abroad. This is particularly true of SMEs in developing countries, which are characterized by fewer managerial resources, experience and support services in comparison with their counterparts in developed countries. In addition, given their unsophisticated domestic markets, SMEs in developing countries are not used to strong competition and satisfy as needy customers as those that are typically present in developed markets.

It is increasingly acknowledged that firms can increase their export potential by leveraging on networks or collaborative strategies, and combining their resources, knowledge and experiences can lead to more rapid internationalisation. Export consortia are typical examples of such collaborative arrangements, and understanding the impact of these relationships on the firms’ international activities is crucially important.

The main research questions the paper aims to address are the following: to what extent do export consortia help SMEs from developing countries to overcome export barriers? What kind of resources and capabilities do these networks contribute to develop (and how)? What factors do affect the success of export consortia (at both firm-level and consortium-level)? What role is played by network facilitators in enhancing resources and competences transfer among member firms?
The paper starts from a literature review on the factors affecting internationalisation of SMEs, with a particular focus on developing countries. Two theoretical perspectives are particularly useful for the analysis of SME internationalisation: network theory and resource-based view. Then we focus on the characteristics of export consortia as specific network arrangements for the internationalisation of SMEs.

The second part is dedicated to the presentation and discussion of empirical evidence. We specifically focus on the strategies of export consortia and the intangible resources developed by them, from both a static and a dynamic view.

Methodology/Key Preposition

The paper builds on the analysis of nine export consortia - in total involving 56 small to medium sized firms - promoted by UNIDO (United Nations Industrial Development Organization) in developing countries between 2004 and 2007: four in Peru, three in Morocco, and one each in Tunisia and Uruguay.

Data were collected by means of interviews with the consortia managers and entrepreneurs, and cover two levels of analysis: a) consortium; and b) member firms. Two questionnaires were used. The first was submitted to the top manager of each consortium and designed to collect data concerning its characteristics and history, funding and members’ contributions, activities, objectives and strategies, relationships between the consortium and its members, and performance in terms of the opening of new markets for member firms and increasing export sales. The second was submitted to the entrepreneurs to collect information about the member firms.

Our analysis shows that international activities of member firms largely benefit from their participation in export consortia. Greater knowledge of foreign markets, a higher reputation
vis-à-vis foreign customers, development of new business contacts abroad are some of the main results that firms report they have achieved.

A someway unexpected evidence of research is also that benefits of cooperation are not only limited to skills and competencies for competing abroad. Consortia in many cases proved to be a means to develop intangible assets and social capital, which helped their members become more competitive also in their domestic markets.

In some cases, consortia members pooled together their resources for the joint acquisition of equipment, supplies and services (marketing, logistics, training, technical advice, etc.) and thus achieved, as a group, increased bargaining power that allowed them to obtain products and services at better conditions. Furthermore, permanent information exchange between associated SMEs on, for instance, production and human resources management practices contributed to collective company upgrading. This reinforces the idea that networking activities, like those that take place in export consortia, can have positive effects on SMEs in various ways.

**Contributions**

The contributions of the paper are on three levels:

- From the *theory standpoint*, the paper contributes to filling a gap: among different types of SMEs networks, consortia are perhaps the least studied; at the same time, they seem to be effective in meeting the needs of SMEs from developing countries.
- From the *managerial standpoint*, the paper contributes highlighting the key issues to enhance cooperation within consortia: the empirical evidence is that personal and frequent interactions among firms are relevant for the development of trust, which is, in its turn, crucial for cooperation and cohesion of the network.
• At the third level, the paper is relevant for policy makers: the main implication of the study is that policy makers should favour cooperation and that the presence of a network facilitator (which was played by UNIDO in our case) is crucial.
Innovation culture as a crucial role of corporate entrepreneurship and its contribution to entrepreneurial success

Prof. Dr. Andreas Ziltener
Michael Forster

Swiss Institute for Entrepreneurship (SIFE), University of Applied Sciences HTW Chur, Switzerland
michael.forster@htwchur.ch

ABSTRACT. In order to identify innovation culture measures which foster entrepreneurial success, a survey was conducted including 1200 enterprises located in Swiss alpine regions. It proved that a higher amount of new ideas in the innovation pipeline guarantee a higher innovation output, which contributes positively to the increase of sales, and small companies are more likely to succeed through these outputs. Likewise, by actively controlling specific aspects of the innovation culture, the same companies can improve the spirit of corporate entrepreneurship. Determining elements that correlate with growth in sales are tolerance of failure, readiness for change or non-financial staff appreciation.

KEYWORDS. Corporate entrepreneurship, corporate culture, innovation management; entrepreneurial success, innovation culture, innovation structure, dynamic capabilities, alpine regions
We examine the history of a medium sized family firm in rural Hungary, tracking the changes in strategy that have turned it from a near-derelict and bankrupt fish farm in the aftermath of Communism to a highly innovative fishery around which have been built a series of related businesses that together comprise a successful ecotourism destination. The business reflects not only Hungary’s transition from Communism to EU membership, but at the same time reasserts and reinterprets far older farming and cultural traditions in a modern way. The firm is biodiversity friendly – dependent, even – and tries hard to deliver not just economic benefits but also social and environmental ones, but the balance is changing over time.

Keywords: Post Transition, biodiversity, fish farming, Hungary, SME Strategy, Triple Bottom Line

Introduction

We examine the history of the Aranyponty fisheries, a medium sized family firm in rural Hungary, tracking the changes in strategy that have turned it from a near-derelict and bankrupt fish farm in the aftermath of Communism to a highly innovative fishery around which have been built a series of related businesses that together comprise a successful ecotourism destination. The business reflects not only Hungary’s transition from Communism to EU membership, but at the same time reasserts and reinterprets far older farming and cultural traditions in a modern way. The firm tries hard to deliver not just economic benefits but also social and environmental ones; here the balance is changing over time.

1 The early part of this paper draws heavily on material collected by the author and Tim Jones of DJEnvironmental, a UK-based consultancy, as part of an EU project entitled Probioprise. (FP 6: 1.1.6.3/018356.) This was an initiative of Fauna and Flora International, European Bureau for Conservation Development and EFMD (formerly European Foundation for Management Development) on behalf of DG Research which was intended to inform policy towards biodiversity-based entrepreneurship. The public summary report is available as Dickson et al. (2007).
However, the associated businesses which have been stimulated by the fishery and its natural environment are now of equal interest - and perhaps of greater future potential. Since the family took over the ownership of the farm a heritage museum has been developed using original artefacts to display the development of inland fish-farming since early modern times. This formed the nucleus of a complex which now includes a restaurant, hotel and spa. The restaurant features local products – particularly the fish. The buildings are constructed as exemplars of eco-friendly production and low-carbon maintenance. For example, heat pumps are used to tap a geothermal source and the owners are now also examining micro-hydro generation. An increasing market for this part of the business is foreign naturalists (particularly bird-watchers) and sport fishermen. However, to cater for a more local market, festivals are organised throughout the year when local people come to catch fish which then are cooked in the open air to the accompaniment of traditional folk entertainment.

One of the business drivers pushing the diversification is paradoxically the increased costs of operating the farm itself in a Ramsar/Natura 2000 site, where the ‘stewardship’ function is estimated by the Lévais to have increased costs by up to 50%. Producers in protected areas often see expansion into tourism services as an obvious move. However, it is not always easy to achieve success. At Aranyponty there has been considerable investment in diversification, with more people now employed on this side of the business than with fish. Yet the original business still forms the rock on which the enterprise is built, not just conceptually but in terms of income streams.

*Origin and Development of the Fisheries*
The tradition of inland fish production in fishponds, particularly of carp, goes way back into the Middle Ages in Central and Eastern Europe, and nowhere more so than in Hungary. These agro-fishery practices did not die out under communism – indeed, much valuable research work was undertaken at that time and Hungarian advisors helped other countries to establish fisheries of their own. However, that era did see a sustained lack of investment in Hungary’s national infrastructure, including that in fishponds.

There has been fishing along the valley of the Sárvíz River since humans first come to Hungary, and fishponds have been in existence here for more than a century. At that time the present site was part of an estate owned by an important Hungarian landowner, Count Zichy, some of whose family lived in what is now the Fisheries Museum. However, the story of the present incarnation of the Aranyponty and the Rétszilas Fishponds Nature Reserve goes back to 1989, when the predecessor of today’s company – the Association of Small Aranyponty Fish Farmers – was formed by Ferenc Lévai Sr. This was the first private sector fish farming enterprise anywhere in Hungary.

The new company’s initial business areas were domestic and international fish trading, consultancy and the growing of spawn. A head office was set up at Százhalmobatta, with the trading activities carried out from a business park in Gödöllő. It had instant credibility, even in the difficult time of transition, because of the reputation that Ferenc Lévai Sr had already established.

Ferenc Lévai Sr was born in 1950. In 1972 he joined the TEHAG Warm Water Fish Hatchery at Százhalmobatta, where he was central to the major developments that took place in modern farm fishing techniques in Hungary at that time. By the time he left in 1988 he had risen to the post of Assistant Director of the facility. His expertise was
internationally recognised, and he often worked abroad in a consultancy role, establishing new hatcheries in Greece, Sudan, Iraq and – particularly – in Algeria, where he set up a national fresh water fishing system from scratch.

Under Communism, the fishponds were operated by the Mezőfalva Agricultural Combine. After the transition, the first private firm to try farming the fishponds soon went into liquidation. In 1993 the Lévai family took over the lease. A year later, the operation was privatised in an open auction. The Lévais by then thought they knew the potential of the ponds and bid considerably more for the freeholds – 40 million Florints, about €150,000 – than any of their competitors, taking on substantial loans at interest rates of 30% per annum to do so. Many thought them mad to pay this much, and even given their superior, ‘insider’ knowledge, it was still a substantial risk. Under Communism, investment had been neglected. The ponds were overgrown. All the buildings had been stripped out. It took five or six years of hard work and infrastructure investment to put the fishponds back into efficient production. The bank loan taken out to purchase the fishponds in 1994 has now been repaid in full, though the company continues to service a planned level of debt.

The firm now owns about 1000 hectares of fishponds, but the main activity remains at the Örpsuszta-Rétszilas Fishponds, which comprise some 760 hectares. This is also the centre for research and experimentation, as well as for the diversification into a range of related tourism / eco-tourism activities.

---

2 At this point the business environment generally was highly uncertain, with elements taken for granted in Western Europe, such as a stable tax regime and well resourced business support agencies, in flux. For example, chambers of commerce initially had public law status on the German model, including obligatory membership introduced from 1994. In 1998 this obligation was removed, although around 60% of firms remained in membership; chambers were also given additional powers from January 1st 2004 in vocational training and other spheres to prepare for EU accession. Similarly, the balance between local and national taxation has changed over this period, which Ferenc Snr noted as having adverse effects. For a critical account of the state of SMEs in Hungary pre- and post-accession see Tibor (2006).
A wide range of fish farming activities is carried out on the basis of polyculture, with carp, Chinese schemer, bighead carp, grass carp, pike, catfish, pike-perch and tench being the main types of fish produced, as well as ornamentals. There is also a deliberate emphasis on the breeding of fish indigenous to the Carpathian Basin, for example: tench, yellow crucian carp, bream, golden orfe, perch and asp.

**Present Structure and Operations**

The business is still headed by Ferenc Lévai Snr and is 95% family owned with just one other shareholder. Within the family, Ferenc Snr controls 50% of shares, with the remainder divided between Ferenc Jnr and his sister. Although now a success in the ‘free-market’ economy, Ferenc Snr’s approach was conditioned by working for 19 years in the state sector where there was never any prospect of additional reward for extra effort or hours worked. Because of this he came to believe that the intrinsic worth of any job was the main reward, an attitude that he transferred into the monetised economy. “Success,” he says, “is when I feel good inside my skin. The best gift is to do what you love to do.” However, this should not be taken as a sign of business naivety; Ferenc Snr can be far sighted and aware of cost trends. He began investing in alternative energy sources in 1990 – as much as a defensive measure as for ecological reasons – when he foresaw energy prices would rise. The first such investment was to use heat pumps to tap a geothermal source. He has subsequently expanded the use of heat-pumps and is now also looking at micro-hydro generation. Ideally he would like the business to be completely independent of external energy suppliers for reasons of both cost reduction and energy security.
Ferenc Jnr came of age during the transition and so was always subject to a wider range of influences than his father. He studied business and economics in the US in 1993-94, and again in 1996-98, and only later obtained a second diploma in fishery management in Hungary. On his return from the States he worked in local government and in the development of industrial parks, only joining his father’s firm in 1999. Although he felt it was “always his destiny” to work with fish, and to do so within the context of the family business, he was not necessarily enthusiastic to do so at first and still speaks about the personal compromises that need to be made in a family firm. Although now central to the business, he still seems keener than his father on maintaining outside interests, such as his consuming hobby of motor sports, where he is a leading rally driver nationally and is known as a very competitive driver.

The business is currently undergoing something of a reorganisation, with a recognition that it is no longer possible or desirable for everything to be run directly by Ferenc Snr. Ferenc Jnr says: “The key strategic decisions are still in my father’s hands, but day-to-day operations will change. Now we often do what is easiest, cheapest or fastest, but these don’t necessarily make the most business sense. We need better cooperation between the different areas of operation”. Recently, responsibility for the three main areas of the business has been allocated to different family members. Ferenc Jnr concentrates on running the technical side of things, ensuring that equipment, machinery and facilities are kept in working order, while his sister is taking charge of tourism development. However, Ferenc Snr is only 60 and shows little sign so far of wanting to withdraw from the business.
There are three principal elements to the business: fish farming, sports fishing and tourism. Farmed fish production and the associated activities still account for around 80% of turnover, with sport fishing accounting for about 10%, as does tourism. However, the balance is expected to change over a 10 year time horizon if current expectations are met. Fish farming will stay much the same in volume terms, although moving to products with a higher added value, while sport fishing is expected to be stable or perhaps grow just a little. The main growth is expected in tourism, which could account for 30-40% of total income in 10 years time. However, people visit Aranyponty for many reasons and to achieve this may require the identification and pursuit of particular niches. Aranyponty currently employs a total of 70 people, including those at satellite locations as far away as Hortobágy. No area of the business is making a loss, but Ferenc Jnr recognises the need for more careful analysis to determine how significant the profits are in relation to the time and effort invested in generating them. More people are employed on the tourism side of the business than in the fishery sector, even though the profits generated by the latter are far greater. Although there is no formal plan, the general strategy is clear and the hope is that the tourism side will eventually prove as profitable.

Labour supply is a challenge throughout the fishery sector, and in the Hungarian economy in general, with a shortage of unskilled/manual labour. The business busses in workers from up to 15km away. The Lévais have learned the hard way that unless they do so employees don’t bother to come in or arrive late. The going rate for employees in the business is typically €1.5 per hour. Pay for men and women is equal, with female staff being perceived as being more reliable than the men. The labour problem became more severe when the authorities clamped down on illegal migrant workers (especially
from Romania and Ukraine), but the recent eastward expansion of the EU may reverse the trend. Unsurprisingly, Aranyponty is looking at mechanisation and automating production wherever possible. In particular it aims to take the physical labour out of tasks in order to recruit more women. These labour issues are another business driver towards the expansion into tourism rather than continuing to grow the fisheries side of the group.

Hungary’s relatively recent accession to the EU increased regulation and to that extent has made running the business more complex. But to set against this there are benefits such as access to some new kinds of grant aid.

The Core Fisheries Businesses

Aranyponty’s principal business is not furnishing fish for the table but rather the supply of live fish for stocking sport-fishing lakes. This accounts for 70% of its fishery production, with the balance going into the human food chain. The sport-fishing market breaks down as follows: 70-75% common carp, 5% carnivorous species (pike, pike-perch, catfish), with the remainder being grass carp and silver carp. The general aim is to provide fish-ponds in Hungary and wholesalers with a wide stock of fish, including plant-eaters, predators and ‘accessory’ fish such as crucian carp and miniature catfish. The export market is concerned primarily with predators, spawn, and materials for use in the organic breeding of fish. Fish are transported in twelve specially adapted lorries, some of which are equipped with liquid oxygen systems, thus enabling the firm to offer delivery of live fish throughout most of Europe all year round regardless of external temperatures.

The fish production side of the business is now well established and stable, with both volumes and prices the same for several years now. In fact, for the Lévais it is too

---

3 See Tibor op cit.
stable! Particularly in the market for table fish there seems to be a perception in the marketplace that carp is not a ‘modern’ fish like the ubiquitous salmon and the recently fashionable sea bass; indeed, some analysts feel that demand will actually decline. Fish production for the table has been stagnant in Hungary for some years now. Freshwater fish consumption is relatively low on a national scale, except for the traditional consumption of carp at Christmas. It is seen not only as an old-fashioned foodstuff but an inconvenient one owing to its boniness. Average Hungarian fish consumption is only 3kg per person per year compared with the Western European average of 24kg per person per year. Although 2-3% of the meals consumed in Hungary contain fish, only 1.5% of those eaten by the indigenous population do so.

Prospects for Developing the Core Business

This situation has led to a number of innovations, including an attempt to move to organic production, driven by a search for both higher quality and higher margins; adding value by de-boning; and a hunt for new species which might be farmed successfully for the first time.

The movement towards organic production has been the fastest growing branch of agriculture all over Europe. Inland fisheries are no exception, and the firm has been at the forefront of developments, playing a leading role in the establishment of national standards for organic fish production. Technical procedures were codified and tested in 2001, and the final versions were submitted for international audit. Organic inspections under the new standards regime took place alongside the first conversions to organic production in 2002. Full transition of a pond to organic production takes two years.
Reception in the marketplace was very favourable in terms of quality, but the Hungarian market for organics is not yet well enough developed to bear the price premium. While production costs are comparatively high (the organic feed is of a grade suitable for human consumption and is therefore very costly), the retail premium for organic products is comparatively low and the market (principally exports to Austria and Germany) is small. Organic fish therefore currently represents only 2-3% of the company’s turnover from fish production. Preparation of fish for direct consumption is outsourced, but this is then sold under the Aranyponty brand.

The company is currently experimenting with the farming of pike. Pike are notorious predators, and this is one reason why no one has successfully farmed them before. If successful, this innovation would represent an important commercial breakthrough. Ferenc Lévai Snr also has ideas to experiment with new ‘modern’ fish products that are boneless and able to compete with the trend towards fast or convenience foods. He sees this as a defensive measure which will maintain the existing market but not necessarily expand it, except in niche areas such as hospital food.

**Conservation and Ecotourism Potential**

The Rétszilás fish ponds are located in an area of special environmental interest. At the time the business was being established the area was in the process of being designated as a National Park under Hungarian law and as a Ramsar site under the intergovernmental Convention on Wetlands. It was therefore clear from the outset that the company would have to operate and develop in an eco-conscious manner. This accorded with Ferenc Snr’s values, but were by no means the driving force in developing the business. For this

---

4 The area was officially designated a nature reserve, part of the Duna-Ipoly National Park, in 1994.
business, on this site, operating on sound ecological principles normally also makes good economic sense, and the founder is vocal in his identification of the conflicts that do occur. One EU-level issue that rankles with Ferenc Snr is the way in which agri-environmental payments are allocated. At issue is the fact that Aranyponty, as a landowner at a Natura 2000 site, receives exactly the same agri-environment payment as a fish-farm owner at a non-Natura 2000 site although the costs of operation are likely to be higher. Ferenc Snr puts these at 20 to 40% more. He perceives this to be a twofold problem. First, inland fisheries are weak and poorly co-ordinated nationally and internationally compared to marine fisheries. Second, wetlands businesses tend to be small and are poorly able to resist the lobbies of the agricultural and livestock lobbies which are dominated by large MNCs. Since the incentive system does not reward good stewardship, he feels too much is left to his own personal motivation and commitment – which other owner-managers may not share. Thus, because of the designations, Aranyponty cannot always drain out its ponds at the optimum time for fish farming since this may disrupt the life cycle of birds on the site. Although Aranyponty receives some Natura 2000 funds for on-site conservation work, these constraints represent a real cost to the firm.

Although there is a state monitoring system for water quality, Aranyponty has established its own laboratory and undertakes frequent testing. This facility is run by Ferenc Jnr’s wife, Michelle, who is a microbiologist by training. Ferenc Jnr claims that the quality of water leaving the site is usually higher than that coming in and more generally believes that the company has a positive environmental impact. The

---

5 While this may in practice be more to do with the Hungarian Government’s allocation of the national envelope, the perception at the firm level is clearly that this is an EU issue.
management of the fishponds prevents them from silting up and becoming progressively vegetated, so that biodiversity would actually be lower without the natural operation of the business.

The area is very important for breeding water birds and for migrating geese and cranes – thousands of geese use the site in autumn. However, the natural endowment covers not just the ponds, fishery and birdlife, but also the production of reeds and willow twigs, and the rearing of indigenous farm animals. There are now thirty grey cattle, fifty racka sheep and ten mangalica swine on site which graze on the grass-covered islands between the ponds. There are also water buffalo.

This rich natural environment, and the protected area status designed to secure it, are used in promoting the site, but this is only beginning to be done in a targeted way. The tourist business attracted so far has only a small eco-tourism component in relation to the burgeoning market and the potential of the site on which the firm is located.

**Diversification into Tourism**

If the Lévai had had rested on their laurels when the fish farming activity was securely in place, the business would have been successful, but little known outside its own locality.

However in 1999, with the production infrastructure in place, the business began to diversify into tourism related activities. As the story is now told, this was not a conscious decision: indeed, Ferenc Lévai Jnr describes his father as an instinctive manager but not a planner. In that year, through personal contacts, the Dutch government offered to part-finance the first (and indeed only) fishing museum in Hungary. This grant amounted to about 30% of the one million Forint cost. It seems that at the time the
motivation for establishing the museum was not tourism related; it was rather a desire to record and celebrate the traditional way of life of the inland fishermen and their families at a time when this was fast disappearing. However, when the museum was completed, it was clear that this was also a tourism asset in its own right. At this point the fishing ponds were opened to a wider public than the serious sport anglers, who were previously the only people fishing them directly. A series of ‘fairs’ was established which included fishing competitions, entertainment, and food and drink. These are now held three times a year and attract approximately 2500 people each time. The most significant fair is that held on St. Peter’s Day. This now includes a ‘Fish Olympics’ in which various fish-related games are organised. Although the site could accommodate far more people the main constraint is the lack of overnight rooms on site or in the vicinity. Consequently almost all participants are from those parts of Hungary where one can travel to and from the fisheries within the day. The business now plans to develop a number of low-priced cabins that families can rent with the aim of attracting visitors to stay for a longer period and increase the spend per head.

Foreign visitors are extremely rare, but no real attempt has been made so far to attract them either to the fairs – or for that matter for longer periods to explore the fishing and wildlife attractions. With one eye to this possibility a spa or ‘Wellness Centre’ has recently been constructed in an attempt to further diversify the range of attractions on offer. The opening of the centre was delayed because of teething problems which the Lévais put down to the difficulty of obtaining good quality basic trade services such as plumbers and electricians in their locality. No real research on how to attract foreign visitors has been undertaken as yet, but there could be good potential for this, because
some people have sought out the site without any real promotion beyond the locality. The fishponds site offers comfortable accommodation and good food with straightforward road links to Budapest airport. Foreign visitors, especially small groups of birdwatchers or other naturalists, artists, photographers, and those with an interest in Hungarian history, culture and music could be attracted to pay a premium price (by local standards) that would still be perceived by the client as representing good value for money (by international standards).

The popularity of the fairs has led to some local companies running ‘family days’ for their employees. Other firms visit the site to combine working conferences with fishing and other touristic pursuits in the afternoon. The existence of markets like this has led to the successive identification of further opportunities such as the development of the fish restaurant (which had started life as a staff restaurant and a place to entertain clients), conference meeting rooms, and the overnight accommodation mentioned above. Recently the facility has also become popular for wedding receptions, birthdays and other celebrations. Most people now visit as part of a group rather than as individuals.

So rather than a planned expansion into tourism, developments have taken place on an ad hoc basis as opportunities have arisen and further needs of existing customers have been identified. The owners describe this as ‘gap filling’: thus the predominance of day fishing led to the provision of cheap accommodation so people can fish for longer; the use of the wellness centre in the summer threw up the idea of making an artificial beach, and so on. The unifying principle seems to be keeping people on site for longer to increase the spend per customer. Future plans seem to confirm this: wine-tasting events; provision of bikes and trails; summer camp activities for the children, etc. Although other
inland fishery establishments in Hungary have followed Aranyponty’s lead into tourism and have some elements of the firm’s marketing offer, the Lévais feel that they have several strengths which will keep them ahead: first mover advantage, which they reinforce through regular innovations such as those above; a more diverse range of services; and the unique quality of their surroundings.6

The Evolving Strategy of Aranyponty

SMEs often do not have a formal planning approach to their development. Sometimes strategy develops as a less formal process, with a post hoc rationalisation of what powerful individuals wanted to do anyway. Equally, successful entrepreneurs are oriented towards identifying and exploiting opportunities as they arise (the ‘gap filling’ that the Lévais describe as one key to their success). Entrepreneurship in the fish farming sector seems rarely studied in a formal way, although Kendree and Stucker (1983) is an interesting early exception and is also case based.

Identifying and analysing strategy in SMEs is notoriously difficult. Whittington (2003) gives an appealing systematisation of different models business strategists have proposed. He suggests strategic management insights can be classified into four main ‘Schools’: Classical, Evolutionary, Processual and Systemic.

Bhalla, Lampel et al. (2009) and Basuki and Watkins (2005) suggest adding the Resource Based View as a distinct ‘School’. They also attempt to test out the validity of these ‘Schools’ — developed largely to analyse strategy within the context of large organisations — to smaller and family based firms. In this they claim some success, while

6 The Lévais are well placed to judge. Another of their business activities is concerned with the technical side of maintaining the quality of other people’s fisheries through their Aranyponty Club Lake Service.
also counselling that it is very difficult to interpret strategic behaviour retrospectively when examining any business cases, where a ‘reading’ of the situation may say more about the analyst’s mental models than the firm’s actual behaviour Bhalla, Henderson et al. (2005).

But however provisional it may be, it is instructive to attempt using this framework – which embraces and structures almost all the ‘classic’ insights into to strategic management – to assess the development of the Aranyponty business from fishponds alone into the basis of a diversified group which sees most future potential in tourism rather than production and processing. In order to do so, we first need to examine in a little more detail what each of these ‘Schools’ actually means. The ‘Classical School’ sees the world as logical, with markets pre-eminent, and profit maximisation as the only goal. Within this context it is possible to plan with some realistic prospect that it will be possible to follow the plan through to completion. This view is represented by the work of Chandler (1962), Ansoff (1965), and the earlier writings of Porter (1980). In direct contrast, the ‘Evolutionary School’ adopts an essentially Darwinian approach in which markets are all-powerful but unpredictable, strategy can only be short term, so any real planning is not only futile but wasteful of resources. This view is represented in the work of Hall and Hitch (1939), Alchian (1950) and Williamson (1975, 1991). The ‘Processual School’ goes beyond traditional economic rationality and contests profit maximisation as the genuine target of firms, which it sees as having multiple objectives reflecting the goals of multiple stakeholders rather than just those of the owners. Behaviour tends to be satisficing rather than maximising, and strategies ‘emerge’ rather than are planned. This view is associated with scholars such as Cyert & March (1963), Simon (1957, 1979),
Pettigrew (1973) and Mintzberg (1978). The ‘Systemic School’ sees strategy as a manifestation of corporate culture. It encompasses planning, but sees the context – and therefore the goals – as not necessarily determined by a purely market perspective. This view is represented in the work of Marris (1964); Granovetter (1985); Swedberg and others (1987). Finally, the Resource Based View – which has been quite prominent in recent years – emphasises strategic intent. It argues that firms can obtain a competitive advantage in the medium term through identifying and developing core competencies, and dynamically harmonising these with market opportunities. This view is associated with Grant (1991), Hamel & Prahalad (1989, 1990), and the later work of Porter (1985).

When Ferenc Snr began his professional career it was under the rigid state-planning system associated with Communism. Although philosophically this was diametrically opposite to the uber-capitalistic world-view of the strategists from the classical school, in formal terms it was paradoxically equivalent in the sense of putting ‘The Plan’ at its heart. Ferenc Snr would have learned through his early experiences that delivery of the plan for the enterprise and business success were by no means equivalent outcomes… So it should come as no surprise that, since Hungary became part of a more marketised economy, the firm has never exhibited the explicit planning characteristics suggested by the classical school.

But nor does the extreme opposite perspective posited by the evolutionary theorists fit terribly well. Although in a general sense extreme market uncertainty was certainly a factor in the immediate post-Communist period, Aranyponty had few effective competitors because of its unique geographical factor endowments (and recall that in less able hands even these had not guaranteed business success). Perhaps the framework
suggested by the evolutionary theorists does not apply well to firms such as Aranyponty in niche markets where entry costs are high? Furthermore, there were clearly ‘plans’ in Ferenc Snr’s mind in a generalised sense, although these were not always business directed in a traditional manner.

Consider next the Resource Based View. It is a truism that any firm relies on its resources, and those at Aranyponty are certainly difficult to replicate, if not totally unique. However, the term ‘resource’ is used by RBV theorists in a more technical sense. It relates to the identification and development of unique competencies within the firm which are difficult to replicate and therefore generate sustained competitive advantage. In this sense the key ‘competencies’ of the firm are wholly technical, deriving initially from Ferenc Snr’s expertise in inland fish farming. The RBV would suggest that in a family firm this competence should be maintained by sending Ferenc Jnr to learn about the most recent technical developments in fish farming and that the firm would remain focussed on this business. Instead, Ferenc Snr sent his son to the USA to learn about modern business methods first, and only later to study aquaculture. Moreover, it has been the physical resources of the firm – in particular those related to its location – which have driven business growth, particularly the diversification into tourism related activity.

The view adopted by the ‘Processual School’ seems to fit the development of Aranyponty much more closely. Throughout, Ferenc Snr has had the multiple objectives one might expect to see and has not attempted to maximise short-run profit. In particular, environmental considerations were well to the fore long in advance of this becoming fashionable. He demonstrated classical satisficing behaviour in trying to live ‘the good life’ in a rural setting with his family rather than maximising his income, for example by
developing his international consultancy opportunities. Overall, in less jargonistic terms, the company’s development strategy under Ferenc Snr appears to have been: wait and see what happens and respond accordingly. This archetypal ‘emergent’ approach has served the business well throughout Ferenc Snr’s tenure in control, although as Aranyponty approaches the key challenge of transition from one generation to another even he is now applying business analysis in a more formal way. He has thus begun to adopt some of his son’s vocabulary and now talks about the firm as “…needing to develop higher value-added products”, such as organic fish. In terms of the Whittington framework this seems to indicate an incipient change in behaviour to one which would be more readily acknowledged by adherents to the ‘Systemic School’. Aranyponty is becoming more planning oriented, but this is firmly rooted in the evolved context, reflecting not just the culture of the locality, but the organisational culture which has developed within the firm itself. This is best demonstrated by the conscious decision to plan a shift in the balance between the different areas of the business, which took place around 2007. The table shows the balance between the three main operating areas some eight years earlier, and the projections a similar period in advance.

These figures represent the targeted percentage share of income, with the fisheries business static in real terms and income growth seen as coming from tourism, at 40% of a larger projected income.

*General Lessons for SME Development in Rural Areas*

It is always dangerous to try generalising from one very specific case study, but the experiences of Aranyponty do suggest a small number of general lessons.

The first has to do with out-region education. Aranyponty’s founder very early on recognised that the general business skills available to the firm were weaker than the technical ones, which were – and remain – internationally competitive. He therefore sent his son to study not locally but in a location likely to maximise the introduction of new information and thought patterns. It was an added advantage that in so doing his son did not develop close competitive social networks within Hungary, which might have encouraged him to stay in – say – Budapest if he had studied there. In retrospect this seems to have greatly strengthened the likelihood of a successful succession within the firm. This is a much more sophisticated approach than one sees usually in successful rural enterprises where the education and training task is often seen as ensuring succession by ‘cloning’ the founder.

The second has to do with labour supply. The local supply of willing male labour dried up well before the shift towards tourism and was a real constraint on growth. But it
is clear that in comparison to heavier work in all weathers in a ‘fishy’ environment, many of the new jobs on the tourism side of the enterprise – although traditionally equally low paid – are more attractive, and more labour has become available. This seems to be as a result of greater participation in the labour market and is therefore ‘real’ growth rather than displaced activity.

Thirdly, the move into tourism also, in the clichéd language of the SWOT analysis, turns the idyllic location from what was a ‘weakness’ (for a fish farm) into a ‘strength’ (for a sustainable tourism destination). What was formerly a constraint in terms not just of constricted labour supply, but also access to industrial services and elevated logistics costs, now becomes a competitive advantage.

Finally there is a lesson for advisors. Too often advisors come to the rural enterprise sector from a training or consulting background where the norms are to privilege the development of a detailed business plan to achieve financially driven goals around a single business focus: behaviour categorised as falling very much within the classical school of strategic thought above, let alone any of the more recent and sophisticated paradigms. Aranyponty, as the discussion above hopefully shows, does not wholly fit any of the kinds of model developed in the Anglo-Saxon world and in the context of much larger firms. Nevertheless, it has been internationally successful in aquaculture and seems set to repeat this success in tourism.

Fighting against the fear of failure in young potential entrepreneurs:

Learning to climb as a metaphor of starting up a new business

Director of the Research centre in innovative pedagogy, CCIP

Abstract
Identified as one of the main obstacles to new business creation, fear of failure significantly impacts entrepreneurial self-efficacy beliefs, and therefore entrepreneurial intentions. We examine the role of emotions in the development of entrepreneurial self-efficacy, and emphasize the impact of entrepreneurial education in enhancing students’ ability to cope with stressful negative emotions when confronted with risky situations. Over a period of two years, we studied a cohort of 30 female and male graduate students enrolled in an experiential “climbing and entrepreneurship” program designed to investigate the role of positive and negative emotions on risk propensity and entrepreneurial self-efficacy. The climbing metaphor invited participants to transcend their physical and mental limitations in an attempt to uncover their entrepreneurial potential.

Introduction

Fear of failure was identified as one of the main psychological and cultural obstacles to new business creation, particularly for young potential entrepreneurs (SOFRES 2003; Zhao, Seibert, and Lumpkin 2010). Starting up a new business is often associated with high levels of risk taking, as well as with income and job uncertainty, which may generate a substantial amount of anxiety, and therefore prompt a delay in performing critical behaviors (Atkinson and Birch 1970) or even impede acting in the long-term (Patzelt and Shepherd 2009). Fear of failure is a multidimensional construct, with emotional, cognitive and identity implications: anticipations of failure bring into memory past experiences of shame and embarrassment, and entail the risk of disappointing important others (Conroy 2001). A threat to self-worth (Segal, Chipman, and Glaser 1985), fear of failure may hinder the achievement of one’s potential through generating counter-productive behaviors and thoughts such as self-handicapping and defensive pessimism. When making career decisions, young people
significantly rely on self-efficacy beliefs, which are subjective and sometimes biased perceptions of personal abilities to successfully deal with difficult or stressing situations (Bandura 2001). Entrepreneurial intention models (Krueger, Reilly, and Carsrud 2000) emphasized the central role of self-efficacy beliefs in removing perceptual barriers and helping potential entrepreneurs to effectively cope with their fear of failure so as to handle the complexity of new business creation. Positively associated with entrepreneurial career intentions, self-efficacy and risk-propensity increase when individuals learn to regulate their fear of failure (Vereshchagina and Hopenhayn 2009).

Before living the “excitement, happiness, and flow” that one may experience during the adventure of new business creation (Schindehutte, Morris, and Allen 2006), potential young entrepreneurs may first need to deal with their fear of failure, which is to manage their emotions when confronted with risk-taking situations while trying to achieve their career goals. How do young potential entrepreneurs learn to regulate their negative emotions related to new business creation? How do individuals in stressful and highly-involving situations in order to regulate their fear of failure while simultaneously dealing with physical, psychological and interactional stimuli and issues? What pedagogical situations and methods we may use in order to reduce fear of failure, stimulate risk propensity and increase individual and collective entrepreneurial self-efficacy in student populations?

This paper examines the role of emotions in the development of entrepreneurial self-efficacy, and emphasizes the impact of entrepreneurial education in enhancing students’ ability to cope with stressful negative emotions when confronted with risky situations. Over a period of two years, we studied a cohort of 30 female and male graduate students enrolled in entrepreneurship curricula in two French business schools of Paris region. We elaborated an original research design in order to explore the role of positive and negative emotions on risk propensity and entrepreneurial self-efficacy: a “climbing and entrepreneurship” training program, with ten three-hours sessions of artificial indoor rock climbing and debates on entrepreneurial risk-taking, followed by a one-week gathering of Mountain and ice climbing at Chamonix. We choose rock climbing as a metaphor of entrepreneurial behavior, which involves both technical skills and knowledge, and emotional self-regulation abilities. Starting up a new business may be analyzed as a “limit situation” in Karl Jaspers’ terms: in limit
situations, “we uncover the true depth dimension of the self” (Corrington, 1987). The climbing metaphor invited participants to transcend their own physical and mental limitations in an attempt to uncover their entrepreneurial potential.

After a short literature review on emotions, self-efficacy and entrepreneurship, we present our exploratory research design and methodology, we present our first results and discuss their implications for entrepreneurship education.

**Literature Review**

There is evidence strongly indicating that interactions between emotions and cognition are "continuous and pervasive" (Baron 2008: 328). However, according to Berezin (2003), emotions have been "in disciplinary exile" for a long time, and they are now "reentering sociological and economic analysis" as more consensus has been reached concerning their major role in shaping both the means and the ends of action. Recent research places more emphasis on the role of emotions in the entrepreneurial process at the individual, interpersonal, and organizational level (Baron 2008). In entrepreneurial contexts, emotions influence opportunity recognition, decision-making and problem-solving, as well as coping and working relations (Isen and Labroo 2003; Cropanzano and Wright 1999; Podsakoff and MacKenzie 1997). In student populations, emotions impact entrepreneurial intentions, self-efficacy beliefs and career choices (Baron 2008; Cardon, Wincent, Singh, and Drnovseck 2009).

According to the relational (Lazarus 1991) and the functionalist (Campos and Barrett 1984) models of emotions, affective states reflect the "individual’s goal-directed encounter with the environment", whether an aroused emotion appears as positive or negative depending on whether the individual perceives that the environment “enhances or inhibits goal achievement” (Pfau 2001: 6). Emotions are generated by person-environment relationships that vary over time and contexts, with motivational consequences in triggering processes of establishing, maintaining, or disrupting the relations between the individual and his/her environment (Patzelt and Shepherd 2009).

Our aim is to shed more light on the emotional obstacles that young potential entrepreneurs are confronted with, and to explore the hypothesis that they may progressively learn to overcome these
obstacles through specific pedagogical interventions, initiated in an outdoor, non-conventional classroom environment.

**Enhancing Potential Entrepreneurs’ Self-efficacy**

According to Fayolle and Gailly (2007), entrepreneurial intentions and students’ self-efficacy beliefs are the best indicators of the effectiveness of entrepreneurship education programs, which should therefore focus more extensively on improving the key sources of entrepreneurial self-efficacy (performance accomplishments, vicarious experiences, verbal persuasion, emotional and physiological arousal). Mastery experience is the most influential source of self-efficacy: personal accomplishments increase self-efficacy, whereas personal failures undermine it. Vicarious experience, that is observing other succeed, may bring confidence about personal ability to complete similar activities in order to attain desired goals; vicarious experience is enhanced by perceived similarity between the model and the observer (Kazdin 1976; Schunk 1991) in terms of sex, age and occupation (Schunk 1991). Verbal persuasion may strengthen self-efficacy, by boosting individuals’ motivation to mobilize greater effort and overcome obstacles so as to persist longer and succeed. Emotional and physiological arousal may also become important sources of information influencing self-efficacy beliefs: individuals often analyze their stress reactions and anxieties as signs of vulnerability to poor performance; this is why reducing stress reactions or learning to regulate them is likely to make a difference in challenging entrepreneurial situations.

Pfau and colleagues introduced the notion of “emotional self-efficacy” (2001) to describe the perceived ability to cope with stressful, threatening or difficult situations. Emotional self-efficacy plays a central role in anxiety arousal and regulates risk-taking decisions and behaviors. Pedagogical situations may be structured in ways to build coping skills and enhance students’ beliefs that they can exercise control over their negative emotions when confronted with risky contexts. Guided mastery experiences appear to be an appealing way to help potential entrepreneurs to manage stress and develop their ability to control it, so as to become more effective in their career goals-striving behavior.
The elaboration of pedagogical situations that really enhance entrepreneurial self-efficacy is still at the beginning (Barbosa, Kickul, and Smith, 2008), our hypothesis is that *experiential learning* can assist students in developing their self-confidence and risk-taking propensity while also improving their ability to regulate negative emotions. Experiential education may be useful in identifying and testing pedagogical situations whereby teachers encourage students to *become aware* of their physiological arousal, emotions and moods, and to *detect the effects of their emotions* on their willingness to take risks and their actual goal-performances, and, last but not least, help students to develop concrete strategies to exercise control over their physiological states, moods and emotions.

**Fear of Failure and Risk-taking in Potential Entrepreneurs**

Fear of entrepreneurial failure was identified by the OECD (2003) and the European Commission (2003) as amongst the most important obstacles to engaging in entrepreneurial activities. Entrepreneurial literature indicates a positive correlation between entrepreneurial activity and social tolerance of entrepreneurial failure (Landier 2004). In Europe, apart from the legal and financial consequences implied by bankruptcy, entrepreneurs have to face the “social stigma of failure” which increases the perceived risks associated by young potential entrepreneurs with starting up a new business and produce a dissuasive impact on entrepreneurial intentions.

Economic and psycho sociological literature indicates that risk-taking propensities vary with socioeconomic characteristics, age, sex, education, and professional experience (Vaillant and Lafuente 2007). From a cognitive standpoint, evidence exists that motivations and emotions impact individuals’ risk-taking propensity. McClelland (1961) explained that individuals with high achievement motivation were willing to take moderate risks in order to improve their chances to reach their personal goals, whereas individuals with low levels of achievement motivation were more risk-averse. This hypothesis was confirmed by the affect-as-information theory (Schwartz and Clore 1996) who called into attention the two components of the achievement motivation, the hope for success and the fear of failure, and discovered that individuals with strong hope for success and a weak fear of failure tended
to take moderate risks, whilst individuals with a strong fear of failure were willing to take either extreme risks or low risks.

A consistent finding is that positive moods lead to increased risk aversion, whereas negative moods would increase the likelihood of risk-taking behavior (Nygren, Isen, Taylor, and Dulin 1996). However, recent research stressed that different negative emotions produce distinct effects on decisions and behaviors associated with risk-taking: for example, fearful individuals make pessimistic risk assessments and are systematically risk-avoiding, whereas angry individuals make optimistic risk assessments and express a high risk-taking propensity (Lerner and Keltner 2000); this is because angry individuals may experience a stronger sense of certainty and control, and therefore deploy a risk-seeking behavior, while fearful individuals may rather experience a sense of uncertainty and lack of control triggering a risk-averse orientation (Lerner and Keltner 2001). Similar findings indicate that positive moods enhance individuals’ perceived ability to self-control, and therefore lead to accomplishment behaviors that have short-term costs but long-term benefits; at the opposite, negative moods interfere with performance on self-control behaviors (Fishbach and Labroo 2007).

Fighting against the fear of failure in young potential entrepreneurs and helping them to regulate both their tendencies towards risk aversion and excessive risk-taking is a critical issue for entrepreneurial education, particularly if we take into account the consubstantial link between business and personal risks in an entrepreneurial venture (Watson and Robinson, 2003). According to Weick (1990), fear of failure produces stress that consumes information-processing capacity, with decreasing effects on cognitive efficiency and counter-productive behavioral consequences. However, these emotions can be regulated, and students may learn to do it through structured coping experiences in structured pedagogical environments (Shepherd 2003).

**Developing Emotional Competence in Potential Entrepreneurs**

Emotions encompass “innate action tendencies” (Frijda, Kuipers, and Schure 1989), which can be regulate by the process of *coping* that enables individuals to manage their thoughts and behaviors “according to the demands of situations that are appraised as stressful” (Folkman and Moskowitz
When important personal goals are in danger, coping allows individuals to deal with negative emotions so as to diminish their stress level. Research indicates that the effectiveness of coping strategies depends on whether the stressful situation is perceived as a “threat, loss, or challenge” (McCrae 1984), and whether individuals consider it as “controllable and changeable” (Conway and Terry 1992). Coping strategies are learned cognitive and behavior approaches, which are repeatedly activated when individuals are confronted to fear (which motivates avoidance) or to anger (which motivates attack). Not all coping strategies are favorable to goal-striving; some of them have mainly a self-protecting function, such as denial or rationalization. Entrepreneurial education may improve students’ ability to use effective problem-solving and emotion-regulating coping strategies, in order to both help them manage their anxiety and enhance their goal-persistence (Folkman and Moskowitz 2004).

When confronted with stressing situations, potential young entrepreneurs may be overwhelmed by fear and anxiety (Flett, Blankstein, and Obertinsky 1996), or they may express negative emotions inappropriately, such as anger and hostility (Eisenberg 2001). Recent work on self-efficacy beliefs draw attention to a new hypothesis: individuals deal with their negative moods and feelings more or less effectively because they differ in their perceived capabilities to regulate stressful emotions (Bandura, Caprara, Barbaranelli, Gerbino, and Pastorelli 2003; Caprara 2002). According to Caprara and colleagues (2008), differences in emotional self-efficacy explain inter-individual variation in initiating, avoiding, inhibiting, maintaining, and adjusting personal emotions. In educative settings, authors translate the concept of emotional self-efficacy into the notion of “emotional competence” (Saarni 1999), that is the ability to recognize, express and manage one’s emotions, and the ability to recover after experiencing adversity (resilience). Emotional competence is a main feature of the “personal capital” theorized by Tomer (2003), which designates individual’s self-perception, attitudes, representations and beliefs that “contribute to his/her productivity” (Goldsmith, Veum, and Darity 1997), influence work creativity and is one essential source of economic value creation (Tomer 2003). Improving personal capital is about expanding one’s achievement possibilities, with emotional
competence acknowledged as a key dimension to be developed through learning activities and lifelong experience.

Research Design and Methodology

Over a period of two years, we studied a cohort of 30 female and male volunteer graduate students enrolled in entrepreneurship curricula in two French business schools of Paris region. We elaborated an original field research design in order to study the development of students’ emotional self-efficacy and its effects on the entrepreneurial fear of failure: a “climbing and entrepreneurship” training program, with ten three-hours sessions of artificial indoor rock climbing and debates on entrepreneurial risk-taking and entrepreneurial commitment, followed by a one-week gathering of Mountain and ice climbing at Chamonix. We choose rock climbing as a metaphor of entrepreneurial behavior, which involves both technical skills and knowledge, and emotional self-regulation abilities. Three professors in entrepreneurship were involved in the research, along with a team of five professional rock-climbers. The aim of this exploratory research was to test three main hypotheses:

H1: Entrepreneurial fear of failure in young potential entrepreneurs may be reduced through appropriate pedagogical settings focusing on the development of students’ emotional self-efficacy.

H2: Entrepreneurship education may help students to develop their emotional self-efficacy through progressively confronting them with high-involving and risk-taking situations.

H3: Diminishing fear of entrepreneurial failure may increase entrepreneurial intentions in young potential entrepreneurs, enhance entrepreneurial self-efficacy, and trigger positive attitudes and representations towards an entrepreneurial career choice.

The pedagogical setting was structured in order to enhance students’ situational and personal involvement: prior to the program launching, two debates were organized on the topic of fear of entrepreneurial failure, and participants were strongly encouraged to express their opinions and beliefs, while reacting with respect and tolerance to the others’ views and remarks. We selected participants with no previous rock climbing know-how, and we insisted on the main objective of the program:
enhancing participants’ emotional self-awareness and facilitating self-regulation techniques acquisition in a stressing but secured learning environment. During the two years of field research, we used participant observation, film analysis, questionnaires, and interviews with trainers and participants so as to gather qualitative and quantitative information on individual, inter-individual and group processes. We studied students’ risk perceptions and self-efficacy estimations, attitudes and intentions towards risky behaviors, as well as inter-individual verbal and behavioral interactions and debates linking risk-taking to the decision of starting up a new business.

At the beginning of the first training session, participants were administered Rosenberg Self-esteem scale (Rosenberg, 1960) and they were asked to note down their objectives and expectations about the climbing experience and its perceived relevance regarding entrepreneurship. After each of the training sessions, participants were administrated a self-report questionnaire combining Beck Anxiety Inventory (1979) with questions about their current mood, and the strategies they used during the session in order to regulate their emotions and adjust to the sessions’ objectives in terms of climbing performance. To analyze data, we employed discourse analysis for verbal reports, and we used ANOVA to compare female and male respondents’ variation in self-esteem, self-reported anxiety, entrepreneurial self-efficacy and entrepreneurial intention. We present our first results in the following section.

**Results**

Our findings indicate that entrepreneurial fear of failure in young potential entrepreneurs may be reduced through appropriate pedagogical settings focusing on the development of students’ emotional self-efficacy (H1 confirmed). At the beginning of the program, all participants reported a moderate (male students) to strong (female students) fear of entrepreneurial failure; the main reason of this was either the “fear of negative evaluation of others” or “the fear of losing one’s self-confidence”. At the end of the program, male and female students addressed the issue of the fear of entrepreneurial failure in a different way: they did no longer focus mainly on others’ perceptions and expectations about entrepreneurship, but instead put forward their willingness to take autonomous career decision
and regulate their social fears so as to accomplish their career goals. Participants also highlighted the idea that confronting oneself with risky situations in a group environment facilitate emotions self-regulation, and “give more time and space to build self-confidence”. The program contributed to students’ emotional self-efficacy enhancement through progressively confronting them with high-involving and risk-taking situations (H2 confirmed), but the diminishing of the fear of entrepreneurial failure did not increase entrepreneurial intentions in all participants (H3 partly rejected).

Learning to self-regulate one’s emotions. The ten three-hours sessions of artificial indoor rock climbing and debates on entrepreneurial risk-taking and entrepreneurial commitment were structured as high-involvement pedagogical situations, combining stress and public exposure. Participant observations indicate that male and female students reacted differently in order to self-monitor their behaviors and regulate their emotional states. As a group, male students were more aggressive, competitive, and narcissistic, whereas female students were more prudent, conservative, modest, and risk-avoiding. Results indicate that emotions influenced students’ risk propensity and risk-taking behaviors: consistent with previous literature (Kuvass and Kaufmann 2004), positive emotions triggered risk-avoiding behaviors, whereas negative emotions were associated with risk-seeking decisions, especially in anger or frustration situations. “Fear of falling down” was stronger in female students, whereas male students were systematically worried about their performance level, their main apprehension being that of “not doing things right”, “fast enough”, or “high enough”.

In order to enhance students’ ability to deal with risk-taking situations, trainers decided to use two particular strategies of verbal persuasion: they encouraged female students to trust their own feelings, and to be confident about both their body and their mental strength, while they pushed male students to focus first on their inner thoughts and emotions and be less sensitive to the idea of “competition”. At the end of the ten training sessions, participants were able to identify their emotions and to speak overtly about their fears. Male students understood that fear is a natural reaction and a gatekeeper in dangerous situations. Two key solutions were tested and recognized as resourceful in improving participants’ emotional self-efficacy: reinforcing one’s self-confidence and trusting climbing partners.
Reinforcing one’s self-confidence may be a long process; as for trusting a climbing partner, “that can be even more difficult when the other is a complete stranger or a girl (sic)”.

In terms of coping abilities, students became aware of the fact that both positive and negative emotions can be experienced simultaneously (Fong, 2006), which may render the effort of self-regulation relatively time-consuming and complex. During the final one-week gathering of Mountain and ice climbing at Chamonix, both male and female students demonstrated effective abilities in using positive reappraisal and distancing to reduce stress. At the end of the program, participants’ self-reports indicate increased self-efficacy in managing negative affect and avoid being overcome by irritation, discouragement, or anger; also, we noticed a progressive improvement in students’ well-being and comfort in expressing positive emotions, such as “joy”, “enthusiasm” and “pride”.

The role of the group support in regulating adaptive vs. maladaptive risk-taking propensity. The one-week gathering of Mountain and ice climbing at Chamonix brought into attention an unexpected finding, which is the group influence on emotions regulation. If at the beginning of the program male students were more likely to take risks than female participants, at the end of the training sessions they became aware of the maladaptive consequences of their lack of discernment in pursuing competitive objectives. The male-female interactions and the group discussions about risks perceptions and outcomes made more salient for participants that they regulated their decisions and behaviors according to sex-types normative beliefs that restrained somehow their autonomy and self-determination (Wood, Christensen, Hebl, and Rothgerber 1997). Male students noticed that they, as a group, were more prone to choose performance goals and to express self-control even in perturbing situations in order to preserve their self-image associated with “power, dominance and independence” (ibid.). At the opposite, female students observed that they, as a group, were more oriented towards emotional communication and caring for others. Mixing female with male students in climbing teams was difficult at the beginning of the program, whilst at the end male and female students became aware of their complementary strengths and showed a significant preference to work together rather than in same-sex duos.
Learning to regulate risk-taking behavior challenged therefore some of the stereotypical views about sex-roles, and invited students to increase their sensitivity to the relational dimension of the emotional experience: they realized that one’s emotional expressive behavior may produce an impact on others, they enhanced their ability to discern stress, fatigue and frustration in others, and they learned to share their negative and positive emotions with the group, without fearing to challenge the stereotyped sex-role expectations relative to emotions expression.

*Diminishing the fear of entrepreneurial failure raises entrepreneurial intentions?* At the end of the program, we measured entrepreneurial self-efficacy beliefs and intentions, along with attitudes towards entrepreneurs and entrepreneurship. Male students declared stronger entrepreneurial intentions than female students (p<.04; mean=4,1 vs. mean=2,3; Likert scale with five points), but similar self-efficacy beliefs (mean=3,5 vs. mean=3,2). For female students, the program was extremely beneficial in diminishing fear of entrepreneurial failure, as their anxiety level (measured by the Beck anxiety inventory) was significantly higher at the beginning of the experience than the male students’ anxiety level: they were more scared, feared the worst, and felt nervous; male students expressed their anxiety by the fear of losing control, they felt irritable and unable to relax. A significant finding is the shift we observed in the representations and attitudes towards entrepreneurs and entrepreneurship. At the beginning of the program, students envisioned entrepreneurs as “warriors”, “supermen”, “exceptional human beings”, “able to deal with all kinds of situations”. This heroic image was challenged during the program: at the end, students thought entrepreneurs “are just like you and me”, “passionate people, rather dynamic and ambitious, but also reflection-oriented”, “humble and firm”, “as in rock climbing, an entrepreneur builds a plan before acting, and adjust his/her behavior to the changes in environment”. The heroic image of the lonely entrepreneur was equally challenged by the intense group experience: participants emphasized that “entrepreneurs need the others’ support and trust to succeed” and that they have to” decide what risks to take or to avoid, without knowing for sure that they made the good choice”. Courage, optimism and group support were recognized as the most important coping tools when confronted with stressful situations.
Conclusion

The extent to which entrepreneurship educators emphasize the fear of entrepreneurial failure, and stimulate students’ emotional self-efficacy in order to enhance their ability to cope with stressful situations and take appropriate decisions in risky situations remains one of the major challenges for entrepreneurship education. According to Katz (2003) and Kuratko (2005), there is a lack of accepted paradigms in entrepreneurship education. Moreover, there is a debate in the entrepreneurship community about “whether we can actually teach students to become entrepreneurs” (Fiet 2000). Entrepreneurship educators are testing a wide range of pedagogical approaches and methods in order to increase students’ knowledge and skills to start up a new business after graduation (Carrier 2007; Hindle 2007). However, the use of real-life or virtual cases, as well as role playing and problem-solving may not be the most appropriate tools for helping students to learn how to deal with their own emotions when confronted with risk-taking situations. Experiential learning may be an interesting response to this issue: characterized as “education that occurs as a direct participation in the events of life” (Houle 1980: 221), experiential learning focus on how individuals acquire and transform new experiences in order to produce personal knowledge (Kolb 1984), where “experience is often synonymous with emotions and their deeper meaning” (Kayes 2002: 6-7).

In this paper we emphasized the role of emotions in the development of entrepreneurial self-efficacy, and examined the impact of an original program of entrepreneurial education on students’ ability to cope with stressful negative emotions when confronted with risky rock climbing situations, as a metaphor of entrepreneurial behavior. The strongest limitation of our research is the small sample of 30 female and male graduate students enrolled in entrepreneurship curricula in two French business schools of Paris region, which restrains the generalization of our findings. Additional quantitative research on larger samples is necessary so as to assess the impact of emotional self-efficacy on entrepreneurial intentions, and to measure the effects of various experiential learning methods in stimulating coping abilities in uncertain or dangerous environments.

Her research topics of interests are the social and psychological antecedents of entrepreneurial intentions. She conducted research on the social representations of entrepreneurs and entrepreneurship as conveyed by press discourse, the impact of symbolic role models on students’ self-efficacy beliefs, and the impact of various communication strategies on young entrepreneurs’ cognitions, emotions and decision-making in formal mentoring and coaching relations.

After 15 years of international experience within a worldwide top ten automotive supplier, François Fourcade got his Doctorate in Management Science from the Ecole Polytechnique (Paris). He is co-director of the International Project Management Specialized Master at ESCP Europe, and director of the Research centre for innovative pedagogy at CCIP. Based on his long experience of Mountain climbing, François Fourcade is working on the integration of a higher content of outdoor experiential learning activities in French management and entrepreneurship programs.

Bibliography

Comparison of Student Foundation Propensities Before and During the Economic Crisis
by Walter Ruda, Thomas A. Martin, Rubén Ascúa, and Benjamin Danko

The article arises from the empirical project “Starting up Businesses and Entrepreneurship by Students” (GEST-study) and compares start-up propensities and entrepreneurial criteria of students surveyed before the economic crisis with students questioned during the crisis. The results highlight that the economic crisis obviously has influencing effects on the students’ entrepreneurship perceptions, diminishes remarkably their start-up propensities and, thus, expectedly also entrepreneurial activities. The students polled during the crisis require stronger elementary start-up sensitizations via courses and show stronger necessity-driven start-up motivations—with hardly positive effects on economic development. Hence, the universities should stimulate more intensely student opportunity entrepreneurship during recessions.

Introduction

The business condition has developed badly since fall 2008 when the financial markets experienced their biggest crash since the world economic crisis 1929. This financial crisis comes along with an economic crisis around the globe, with a long and painful worldwide cyclical downturn, a second world

economic crisis (Schäfer 2009). During this economic slump the economic situation has been hampered substantially. Mainly the strong negatively affected employment necessitates the most recovery time in the context of crises compared to the other recession indicators, namely industrial output, consumer expenditure, and gross domestic product. End of 2001, for instance, industrial output and gross domestic product increased—although slowly—what indicated the official end of the recession. However, the labor market situation worsened furthermore. In Germany—although without real estate bubble—the export trade declined, and independent research institutes forecast the worst recession since the Second World War. In order to compensate the break of private spending, Europe necessitates a fiscal stimulus by a coordinated conjoint governmental effort of the biggest members of the European Union (Krugman 2009). The German unemployment rate in 2008, indeed, reached its lowest amount since 14 years, but it is expected to increase significantly—like this was the case during the first world economic crisis—, especially if the government and the financial managers fail (Schäfer 2009). Since the 1990’s Europe, an thus Germany, suffered—also in times of a continuous boom—from “eurosclerosis”, that is enduring high unemployment which affected especially the young generation (Krugman 2009).

Besides recommending the German Government what should be undertaken to control the recession, it is beneficial to derive conclusions how to advance entrepreneurial activities that result in job creation. In this connection, the paper aims to investigate the effect of the economic crisis on foundation propensities (start-up propensities) and entrepreneurial criteria of students in Germany, in order to derive conclusions about their requirements and adequate entrepreneurship support measures within a changed economic framework. “Since the difficulty of the labor shortage in a community—exposed in an enduring structural pressure to change within a competitive globalization—particularly affects the generation of young people processing or just having finished their (collegiate) education and looking for work, self-employment as an earning alternative should be directed to this target group in
particular” (Ruda, Martin, and Danko 2009b). However, the actual economic situation and labor shortage should be understood as an opportunity to impart more beneficially entrepreneurial sensitization and competencies particularly to students—mainly in the fields of business administration, engineering, and informatics—as work seekers and potential founders of high potential enterprises that generate steady and skilled employment through seminal innovations (Martin, and Ruda 2001; Koch 2002; Braukmann 2003; Uebelacker 2005; Ofstad 2008; Ruda, Martin, Ascúa, and Danko 2009b; Ruda, Martin, and Danko 2009a), especially because in times of crises a shift from dependent to independent work exists in Germany (Weber 2009; Ruda, Martin, and Danko 2009b). But this shift should not be based on founding motivations from economic necessity but rather on founding motivations from economic self-realization, because of the beneficial effect of precisely opportunity entrepreneurship on economic development (Acs, and Varga 2005; Acs, Desai, and Hessels 2008). When, in this country with—compared to other nations—low entrepreneurial activity quotas (Bosma, and Levie 2010), more students and graduates perceive self-employment as occupational alternative to realize their own business ideas, instead of focusing only on a dependent work, it could thwart this labor scarcity and make an impact on the appropriate reallocation of resources in this economy. On the one hand, the teachability and learnability of entrepreneurial competencies within academic education seem to be empirically confirmed (Kolvereid, and Moen 1997; Tkachev, and Kolvereid 1999; Noel 2001; Varela, and Jimenez 2001; Fayolle 2005; Volery, and Müller 2006), on the other hand influences of the personal career choice as self-extension can be measured, so that individuals who are open-minded and reserved to entrepreneurship are distinguishable (Sinclair 2008). “Only an individual-oriented analysis about constructive or obstructive proceedings within the pre-start-up process will identify how to raise business start-ups in the manner of quantity and quality based on adequate entrepreneurial encouragement, given that finally the students themselves develop their entrepreneurial intention and are the decision-makers regarding their potential start-up activity” (Ruda, Martin, Ascúa, and Danko
 Consequently, comparing students’ entrepreneurial criteria before and during the economic crisis indicates its effect on their propensities to found their own enterprises and, thus, facilitates insights how to accelerate appropriately entrepreneurial intentions of students.

**Research Design**

With a standardized questionnaire, derived from a literature-based and theoretical reference framework of student foundation/start-up propensity (Ruda, Martin, and Danko 2008), more than 2,700 students—both undergraduates as well as postgraduates with several years of work, leadership and start-up experiences—, especially of business administration, engineering, and informatics, have been questioned during their lessons. This methodology counters the weaknesses of internet-based questionings because it facilitates a higher return rate (Müller-Böling, and Klandt 1993; Schnell, Hill, and Esser 1995; Driescher 1999) and deletes self-selection effects of the surveyed students (Brockmann, and Greaney 2006) and, thus, highlights more realistic results.

The survey has been conducted every semester at four German universities (of applied sciences) between the winter term 2006/2007 and the summer term 2009. From this follows that one can contrast students’ entrepreneurial criteria before the economic crisis (1,445 students) with those during the recession (1,281 students), namely the students questioned since fall 2008, when the biggest crash of the financial markets since 1929 started and effected drastically the economies around the globe (Schäfer 2009), who form the group of crisis period.

In order to analyze the start-up propensity in the narrow sense, the *Foundation Ambition Types-Model* has been developed (Ruda, Martin, Ascúa, and Danko 2008). It “shows that a more intense examination of foundation over time enables a gradual or volatile emergence of a stronger foundation

---

1 The data of the winter term 2009/2010 has been omitted in order to avoid biases, because in the meanwhile the end of the economic crisis has been communicated in the community so that the student start-up intentions and entrepreneurial criteria could have been influenced again into the other direction.
intention” (Ruda, Martin, and Danko 2009b). Solely such a procedural approach facilitates an appropriate analysis of structural and situative influencing factors on the potentially emerging start-up intention in the scope of the pre-start-up process and considers the necessary target group specification (Ruda, Martin, and Danko 2009a; Ruda, Martin, Ascúa, and Danko 2009a).

Results and Interpretation

The pre-crisis sample (pcs) consists mostly of business administration students (44 percent), followed by engineering (32 percent) and informatics (24 percent) students, whereas in the during-crisis sample (dcs) with 35 percent the majority studies informatics, 32 percent engineering, 26 percent business administration and the rest further subjects. In both samplings beneath one third are females. Students of the pcs tend to be older, 55 percent are between 20 and 25 years old, in the dcs this is case for two thirds. Accordingly, the latter are enrolled in lower semester groups. At this, 23 percent of the pcs are postgraduates and only 14 percent of the dcs.

In view of the Foundation Ambition Types of Ruda, Martin, Ascúa, and Danko (2008) and, thus, of the start-up propensity, the Foundation-layman (has dealt with business venturing not at all) covers in each case the biggest fraction, namely 47.2 percent in the pcs and 55.4 percent in the dcs—a remarkable difference. 11.7 percent of the students surveyed before the crisis can be classified as Foundation-sensitized (has considered business venturing not yet), what is case for 10.3 percent of their during-crisis questioned counterparts. The disparity is again bigger concerning the Foundation-interested (has already considered business venturing but has not started to prepare a business) who represents three tenth of the pcs and 25.9 percent of the dcs. In the former sample the Foundation-preparer (is already engaged in the start-up process) reaches 5.6 percent, in the pcs 4.1 percent. The Founder (has already started a business) eventually, covers 5.5 percent of the pcs and 4.3 percent of the dcs. Altogether the start-up propensity of the students surveyed before the economic crisis is higher
than in the dcs (Figure 1).\textsuperscript{2} Hence, it seems that student start-up propensities are negatively affected by the economic downturn.

**Figure 1**
Foundation Ambition Types

In contrast, two thirds of the students surveyed during the economic crisis estimate the start-up climate in Germany as rather start-up friendly, compared to the half of the pcs.\textsuperscript{3} Despite their lower start-up intentions, the former assumedly perceive the framework for self-employment better than the students surveyed before the crisis. However, 42.5 percent of the dcs are risk averse, compared to 39.1 percent of the pcs—a not significant discrepancy. In contrast, one third of the pre-crisis-surveyed

\textsuperscript{2} The existent divergences are statistically most significant ($p \leq .001$).

\textsuperscript{3} The existent divergences are statistically most significant ($p \leq .001$).
students have a business idea in mind, compared to only one quarter of their counterparts of the dcs.\(^4\) Moreover, the pcs students estimate in average a higher start-up probability\(^5\) (38.5 percent) and shorter founding time\(^6\) (4.5 years) than the dcs students (36.0 percent and 5.0 years). However, when interpreting these results one has to keep in mind some sample differences like age and semester.

In respect of start-up motives, to the students of the pcs realizing own ideas, income and self-actualization are most important, whereas to the students of the dcs beside the latter two the way out of unemployment (the start-up motivation from economic necessity) belongs to the three most relevant start-up motives. Consequently, in times of recessions the push factors may play a more decisive role than in prosperous times. High income and being one’s own boss are further relevant founding motivators to both samples, followed by miscellaneous in the pcs and flexible hours of work in the dcs. Prestige and having power seem to be constantly inconsiderable motivators to found an enterprise. (Figure 2). Table 1 depicts that solely the way out of unemployment, being one’s own boss and miscellaneous differ in statistically significant magnitudes between the two samples. Coinciding with the literarily assumptions, to the students of the dcs the necessity-driven start-up motivation is de facto more important, whereas autonomy and miscellaneous factors are more decisive to the students of the pcs.

36.5 percent of the students polled before the economic downturn have dealt one year or more with entrepreneurship, compared to 27.1 percent of those from the dcs.\(^7\) In addition, the former usually have used more sources of entrepreneurial information (1.9) than the latter (1.5)\(^8\) and comprise with 37.9

\(^8\) The existent divergences are statistically most significant ($p \leq .001$).
percent to a higher extent leadership experience than the dcs students (28.4 percent). Thus, it is not surprising that the latter strive more for team start-ups (59.4 percent) than the pcs students (58.2 percent). Furthermore, 36.1 percent of the dcs tend to self-employment on sideline basis, compared to 30.6 percent of the pcs, what is in accord with their lower start-up propensities and higher start-up motivation from economic necessity. The pcs students estimate needing 4.8 years of self-employed activity to be established on the market and approximately 191,000 euros as seed capital, whereas the dcs students expect needing 5.1 years and only about 148,000 euros to start up their business. With 64.0
percent students of the pcs are more willing to pay for business start-up consultation, in opposite to 60.5 percent of the dcs students.

Concerning start-up difficulties, the students of both samples evaluate missing equity definitely as most start-up hindering, followed by own financial risk, missing outside capital and missing customer contacts. Considerable differences exist referring low profit and low turnover expectations as well as the cyclical state, whereupon these factors, particularly the latter, are specified obviously as more start-up restricting by the students questioned during the economic crisis—a not surprising result. Further important start-up barriers—approximately with the same intensity in both samples—are extensive official channels, missing start-up partners, fear of failure and missing business ideas. Fewer start-up difficulties are the politico-economic environment, missing entrepreneurial qualifications, know-how deficit and missing courage. However, the former two are stronger pronounced within the dcs. In both samples missing available time and especially support of family and friends are assessed as low start-up difficulties (Figure 3). Table 2 highlights that the six start-up barriers low turnover and low profit, the cyclical state and the politico-economic environment as well as missing entrepreneurial
qualifications and finally missing available time differ in statistically significant magnitudes between the two samples, all of them are more start-up hindering to the dcs students. Therefore, the polled students experience the state of the economic framework obviously to be encumbered as a result of the economic crisis. Moreover, the dcs students seem to lack more entrepreneurship education—a signal that start-up support measures have to be intensified at the universities. In addition, the stronger time deficit of the dcs students lets assume that the new Bachelor study courses neglect stronger start-up-relevant issues during studies.

courses are the most preferable educational start-up aids. To the pcs students, furthermore, contact bourses with enterprisers comprise an essential support factor, what is considerably more nonrelevant to the dcs students. In times of crises it is not surprising that the surveyed students assume impulsion financings as more important than the pcs students who, however, consider specific contact points as clearly more relevant. The dcs prefer stronger business games than their counterparts who instead favor meetings and discussion with professors and slightly more business plan workshops. To both samples incubators and especially miscellaneous are the most dispensable university support measures, whereupon they are conspicuously more insignificant to the dcs students. Altogether, to the pcs students, entrepreneurship encouragement can be summed up as more important, assumedly due to their higher start-up propensities and start-up interest respectively (Figure 4). Table 3 points out that courses, business games, business plan workshops and miscellaneous differ in statistically significant

magnitude between the two samples. While the three latter support factors are more crucial to the pcs students, courses are stronger preferred by the dcs students, what shows that the latter first of all need a start-up sensitization and procurement of entrepreneurial basis knowledge that can be attained assumedly best on the basis of entrepreneurship lessons. In contrast, the pcs students with their higher start-up intentions are more intensely ready for entrepreneurial education that should be offered in a later phase of the start-up process.

Implications

Summarized, the findings show the students surveyed during the economic crisis to represent significant lower start-up propensities and probabilities than the pre-crisis student sample and assume to create an own enterprise later in future. Moreover, the dcs students have collected to a lesser extent entrepreneurship information, have dealt less time with it and have fewer business ideas in mind. In contrast, the dcs students represent remarkably stronger a start-up motivation from economic necessity and value the entrepreneurship climate better than their counterparts from the pre-crisis sample. The polled students experience the state of the economic framework obviously to be encumbered by the economic crisis. In addition, the dcs students lack more entrepreneurship education—a signal that start-up support measures have to be intensified at the universities—and estimate a stronger time deficit. Hence, it can be assumed that and should be checked if the new Bachelor courses have integrated less start-up-relevant issues into their study modules. This could be reflected in the conspicuously higher fraction of foundation-laymen in the dcs. Based on their desired university support, it can be concluded that the dcs students first of all need a start-up sensitization and procurement of entrepreneurial basis
knowledge that can be attained assumedly best on the basis of entrepreneurship lessons.

Taken as a whole, the students questioned during the economic crisis seem to be less prepared for their potential self-employment during and after their studies respectively. Admittedly, while interpreting these findings some sample differences have to be considered—for instance the age and semester differences as well as the fractions of postgraduates. However, from the results it can be concluded that the universities have to impart more intensely—in a stepwise and procedural manner—general entrepreneurial competencies to the students within their studies so that they are able to mature as potential entrepreneurs during their educational process. Given that more than 55 percent of the dcs students are *foundation-laymen*—that is persons who have dealt with business venturing not at all and, thus, are not opposed to their potential entrepreneurial activity—one has to take advantage of the option to stimulate students with all start-up ambition values to entrepreneurship. All students should consider their universites—the place where they are prepared for professionalism—as competence centers and contact points regarding dependent work as well as self-employment.

Assuming a positive start-up climate does de facto not mean having a strongly pronounced entrepreneurial intention. In this connection, the students surveyed during the crisis indeed represent—coinciding with the literarily assumptions—a stronger necessity-driven start-up motivation but tend to a lower extent to autonomy—a not positive signal for attaining more student opportunity entrepreneurship with its beneficial effect on economic development. Therefore, the universities are postulated to support the necessary advance of their students’ and graduates’ start-up motivation from economic self-actualization with an adequate conception of entrepreneurship programs that has to be derived from further knowledge about an appropriate assistance of student business start-ups within the scope of a global economic crisis that shifts unemployed to self-employed work—a fundamental reason for the governments to enact purposive prerequisites for the arrangement and establishment of a start-up-supportive entrepreneurial culture at universities. Hereby, students could be qualified and enabled
better to develop entrepreneurial understandings and competencies in order to be already during their
studies sensitized for the recognition of entrepreneurial opportunities and also willing to realize them
eventually.

The Frames of Interpretation in Biotechnology New Venture Creation

Heidi Rajamäki

University of Eastern Finland, Finland

Abstract

The purpose of this study is to explore the unlike frames of interpretation present at university spin-off creation. The article asks: What are the unlike frames of interpretation in university spin-off creation and how do they affect the creation process? The findings of this research show that in university spin-off creation there are a multiplicity of frames of interpretation present and that they are engaged in a very complex and multilayered interplay. These multiple frames of interpretation pose a serious challenge to a successful spin-off creation by producing systematic misunderstanding.

Keywords: biotechnology, new venture, spin-off, frame of interpretation

Introduction

Commercialization of technology developed in academic institutions has been widely regarded as important considering the regional economic development, employment creation and the creation of new knowledge. Hence, the process of university spin-off creation has attracted increasing interest of researchers as well as policy makers (Djockovic & Souitaris 2008, Wright et al. 2007). Consequently, governments and universities have established policies and support systems to promote the commercialization of university research. However, in Europe, the question remains that in spite of increasing patenting activity, why has the rate of new company formation in bio-
technology been steadily declining throughout this decade in Europe and the USA (Critical I)? To reap the promises and possibilities of biotechnology it is important to explore the challenges and obstacles in new venture creation and especially in the early development phase.

Prior research in the area focuses mainly on governments and universities as well as the preferred support mechanisms and policies to enhance university spin-off creation (Djockovic & Souitaris 2008). Despite the commonly recognized importance of the entrepreneurial team in new venture creation, the research focusing on the spin-off process at team or company levels is very scarce (Clarysse & Moray 2004, Djockovic & Souitaris 2008). This narrow stream of research on the company level has adopted a view that spin-offs have excellent scientific capabilities and knowledge, but they generally lack basic business skills, capabilities and experience (Vohora et al. 2004, Hermans, Kulvik & Tahvanainen 2004). To gain complementary capabilities and resources, the spin-offs collaborate with partners such as university technology transfer offices and governmental commercialization programs (Debackere & Veugelers 2005, Siegel et al. 2003). While previous research has examined the issue from the resources and capabilities (Clarysse & Moray 2004), entrepreneurial orientation (Roberts 1991) and relationship point of view (Perez & Sanchez 2003), this paper adds another approach, a cultural approach and frame analysis, to the study of spin-off processes.

This approach is a response to the recent increasing attention for research that would rather acknowledge the societal contexts that organizations operate in and the need for research strategies that would capture the role of societal culture in organizations (Creed at al. 2002). This article argues that the cultural contexts and more specifically the different frames of interpretation (Geertz 1973) present challenges worthy of study in spin-off creation processes. There is evidence that the conflicting objectives of academics, venture capitalists, stakeholders and the management team may adversely affect the business (West & Noel 2009, Vohora et al. 2004). This is no surprise as it is
well documented that people from different thought worlds use different meanings in their functional setting and cannot easily share ideas or may ignore one another’s central ideas or reject them outright (Dougherty 1992). In spite of that, the research on university spin-offs has largely ignored this view. The purpose of this study is to explore the unlike frames of interpretation present at university spin-off creation. The article asks: What are the unlike frames of interpretation in university spin-off creation and how do they affect the creation process?

**Theoretical Background**

The purpose of this paper is to explore the frames of interpretation present at science-based university spin-off creation in the field of biotechnology. This is an especially suitable context for studying university spin-offs as the industry has originally emerged at the intersection of scientific interest and commercial potential (Powell & Owen-Smith 1998), the science-commerce linkage has remained as a special characteristic of the industry (Stokes 1998, Zhang 2009) and because the industry has since its emergence continuously relied on scientific innovation (Zhang 2009). In addition, biotechnology has been considered to be the most promising technological frontier for the coming decades. The biotechnology industry is made up of companies which apply biotechnology techniques to produce goods and services as well as companies which employ the technologies, applications and products concerning industries such as health care, pharmaceuticals, environmental protection, agriculture, food production and industrial chemicals (Hall & Bagchi-Sen 2007, Pisano 2006, Hine & Kapeleris 2006, Rader 2005). Affecting such great variety of industries and areas of living, the biotechnological applications are expected to revolutionize the lives of individual people and influence whole economies and ecosystems.
The previous research on university spin-offs has mainly focused on the policy and support mechanisms as well as on the role on universities in the new venture creation process. In addition, the research has touched upon the relationship between USO, industry and university. However, there is surprisingly little research on the level of the entrepreneurial team and how it evolves into an established business (Clarysse & Moray 2004, Djockovic & Souitaris 2008). Still, a few challenges have been identified in recent literature. Firstly, spin-off companies lack market-oriented focus and therefore face a challenge to transform the initial idea, evolved in a non-commercial environment, into an established profitable firm that is oriented towards the markets (Hermans et al. 2004, Radosevic 1993). The founder can myopically focus on science and disregard any recommendations of the managers intended to help to run the business (West & Noel 2009). The scientists’ entrepreneurial motivation can be low and they are thus reluctant to leave their positions in academia. Instead, they would rather be part-time entrepreneurs, which evidently affects the development of the company (Fontes 2001, Roberts & Malone 1996, Roberts 1991). There is evidence that university spin-offs have difficulties accessing capital and other critical assets such as manufacturing competencies and distribution channels (Fontes 2001).

The biggest challenge for any new venture is to transform the founder’s personal knowledge or idea into a crystallized idea of the business opportunity (Brush et al. 2001, West & Noel 2009). In biotechnology this might be more difficult than on the average. What comes to science-based businesses, the diversity of the social worlds of scientists and business practitioners raises significant challenges for translating the knowledge from the basic science into new technological innovations. Traditionally there has been a contrasting difference between knowledge produced for fundamental scientific interest and knowledge produced primarily for commercial gain (Powell & Owen-Smith 1998). Knowledge production in Pasteur’s quadrant i.e. at the intersection of scientific achievement and commercial potential is essentially a characteristic of biotechnology business
Before the emergence of biotechnology business, science and business operated in separate spheres.

Working in Pasteur’s quadrant, where scientific and commercial opportunities converge, involves several conflicts. Consequently, there is evidence that the conflicting objectives of academics, venture capitalists, stakeholders and the management team may adversely affect the business (Vohora et al. 2004). In general, it is well documented that people from different thought worlds use different meanings in their functional setting and cannot easily share ideas or may ignore one another’s central ideas or reject them outright (Dougherty 1992). One reason for this, which has not been considered in recent literature on new ventures, may be that actors from different cultural contexts are using different frames of interpretation. These frames guide the actors’ attention and thus determine what aspects they consider noticeable or meaningful. Accordingly, while frames call attention to some aspects of reality, they disregard other elements as being not significant (Entman 1993, Benford & Snow 2000).

Framing is an activity of sorting out elements of social experience and shared construction of meaning in a certain situation. The origin of frame analysis is primarily in the work of Goffman (1974) who regards framing as a “day-to-day sense-making technique” (Creed at al. 2002). Framing refers to a process where actors collectively negotiate and construct meanings. Framing in nature is an active and dynamic reality construction process. As a result of the framing process, the actors generate shared interpretive frames (Benford & Snow 2000).

Frames can be described to act in social life like the default values in a computer (Agar 1994). For example, the default size of a Microsoft Office Word page in the USA is “letter” and in Europe it is “A4”. Frames operate as default values and organize the expectations of an actor. When
he uses a computer in Europe, he expects the page format to be A4. In daily interactions the frames organize our expectations i.e. what we expect that should be going on in a situation and how we are expected to act (Benford & Snow 2000). It can happen that there seems to be something wrong in the situation. That is when the default values do not work and the actor needs to decide whether he is using a wrong frame or if the frame needs to be changed (Agar 1994). Thus, frames “render events and occurrences meaningful and thereby function to organize experience and guide action” (Benford & Snow 2000).

Another metaphor illustrating the frames of interpretation are “picture frames” or “window frames” to highlight the issue that frames direct our attention into some aspects and at the same time limit our view to only a part of the complex world around us (Creed et al. 2002). A frame defines a boundary around the details and guides which events are more relevant to an issue or situation. These events or occurrences, highlighted by a frame, are perceived more noticeable and meaningful than others (Agar 1994, Entman 1993, Benford & Snow 2000). Like a window, we see the world through frames that determine our perspective while limiting our view to only a part of the complex world around us.

A third metaphor to illustrate the nature of a frame is a “frame of a house” or “a skeleton” (Creed et al. 2002). The idea is that the frame acts as a structure that holds a set of idea elements, beliefs and meanings together (Benford & Snow 2000) and highlights how those beliefs and meanings are related to each other (Agar 1994). In this way frames simplify the sense-making of everyday life enabling individuals “to locate, perceive, identify, and label” (Goffman 1974, 21) the mundane occurrences. According to Creed et al. (2002) “the goal of frame analysis is understanding how certain idea elements are linked together into packages of meaning, potentially encoded into
soundbite-like signifiers that stand for those packages of meaning, and deployed in situated discursive activity.”

Frame analysis has been mainly used in the study of social movements and policy debates. However, it offers fruitful applications in organizational research as well (Creed et al. 2002). It offers several aspects that are missing in the recent studies of university spin-off creation. Firstly, the frame analysis adds a cultural layer to the body of research in this area as culture can be regarded as a stock of commonly invoked frames (Entman 1993). Secondly, frame analysis enables the capturing of the role of social context rather than treating topics as stand-alone managerial problems (Creed et al. 2002).

**Methodology**

This research builds on the results of an 18-month empirical study focusing on the creation of a university spin-off company in the field of biotechnology. The observed team consisted of a university professor and some members of his research group at the pharmaceutical chemistry department, a university technology transfer officer and a business researcher who acted in the project as a commercial advisor. Hence, in the study, the author acted as an insider participant observer and actively engaged in negotiating the shared understanding of the business opportunity. The collected field notes consist of transcriptions of informal discussions. Telephone discussions have been transcribed as accurately as possible after every call. Also, the contents of personal one-on-one discussions have been transcribed as accurately as possible after every encounter. Skype chats and e-mails were saved as text files.
This study explores university spin-off creation from a cultural perspective. Following Geertz (1973) and Smircich (1983), culture is considered in this study as a network of meanings that provide its members a shared and accepted reality. A frame is a basic structure that holds a set of meanings together. The basic proposition in this paper is that the challenges of university spin-off creation are rooted in the different frames of interpretation. According to Agar (1994) “a mistake means that other frames are operating, frames you aren’t using, frames you may never have imagined existed.” The analysis in this paper starts by identifying those “rich points” where mistakes happen or things are not working as they are supposed to. Hence, the analysis was started by reading the notes line by line and encoding the incidents of mistakes.

At the next stage of the analysis the mistake incidents were taken into closer examination. Creed et al. (2002) presented a suitable way to perform frame analysis in organization studies which was adopted in this study as well. Elements of punctuating, elaborating and motivating functions were sorted out into a matrix. These elements act as established codes. When a person familiar to that frame comes across any of these elements, they act as a code telling that this certain frame is applicable in this situation. It is important to note that a single element can be attached to several frames but it can have a different meaning in each frame. It is important to sort out why a single element is meaningful in that certain frame.

In the following, I describe one situation to illustrate what sorts of frames there can be present at the new venture creation and how they affect the process.
I am sitting in the professor’s small office room with him and a researcher. We have just completed writing the business plan and discuss about starting the business. I say “I think that what we need first are customers. If we could get even one customer, we would not need that capital to start the business.” The professor is feeling seemingly uneasy and frustrated. He is nodding his head and raises his palms at me as if he was about to surrender and give in to what appears to seem to him like my personal fixation about customers. “Yes, yes, yes. We need customers, but what we need right now is money. This molecule... what I need is 10 000 € to patent it for this company.” They have told me all about those molecules that have been patented by the university, which does not have money to support all its patents anymore. “So we could get those very cheap. I think it would be a good business idea”, the Professor explained. Because of my training and working experience with SME companies I instantly felt in my guts that it was a dead wrong idea. It would be against the basic rules I have internalized: crystallize your business idea, focus on your core business etc. The idea of this company is to provide hit-to-lead services to other companies, not to develop own leads or candidates. And if we develop our own candidates it would create a conflict of interest with our customers. In my everyday business life these are self-evident things that do not need to be discussed. I was extremely uncertain how should I explain it to the professor and the other scientists. It was like suddenly you would be asked to prove that world is round. I told him what our mentor, provided by the government Funding Agency for Technology and Innovation, had told me: “There are investors interested to invest in service companies and there are other investors interested investing in companies with IPR, mixing those two could cause that none of the investors would give us money. So we agreed not to patent any own molecules. We have agreed on that several times. Now that patenting again is brought up, I am getting a feeling that there is some invisible barrier which prevents us from connecting.
Later I will find out that I am wrong. The university basically demands that the company takes some of its patents for development in exchange for the permission to spin-off. In addition, we will learn that if we want to get money to start the business, the company needs a convincing set of IPR. Luckily we have an opportunity to patent some very promising molecules. It does not seem to bother anyone else but me that those patents have absolutely nothing to do with the business idea of the company.

Our meeting continues and the researcher tries to clarify my earlier point about getting customers: “But if we sell something we get money.” The professor turns to me like I was a child who is whining for a new toy and soothingly says: “Heidi, you can sell something if you want to. I will come and help you any time you need. I even buy the airline tickets with my own money and come with you...” To me it is such an incomprehensible idea that I get speechless. How could I possibly sell these services if I barely understand the science behind our service packages! Later our mentor would also suggest a similar idea that I would “be in charge of the Nordic countries and northern Europe.” And I still would not understand how I could do it. The thing that bothers me even more is that the professor seems to think that selling is something I want to do because I like it, but it really is just something that has to be done to get customers and turnover. With my entrepreneur friends we call it “shoveling-work” referring to a kind of shoveling you would do in a barn.

I am not giving up with this issue about customers. To get the business up and running we either need small outside investment or one customer agreement. I have seen the lists of all funding raised by the professor and his team and I know that they are successfully used to seek funding from various sources. So they might consider it easier to seek investors to this business. On the other hand, I am used to new customer acquisition so I think that an easier way would be to get one cus-
tomer. The scientists have showed me lists of rather impressive company agreements that the professor has arranged for the department. I remind “didn’t you already have agreements you can just transfer to this company?” This issue has been already discussed with the university Technology Transfer Office as well. The researcher mentions a contract with one company that is under negotiations right now. They engage in a heated conversation about a molecule that the company is developing. They talk about such specific chemistry that I do not understand a word they are saying. From their body language I interpret that for some reason they resent that company and what they are doing. The professor concludes the discussion: “They are such vicious snakes that I don’t want to have anything to do with them. I really do not like how they do business.”
Results

Even from this very short incident several frames of interpretation can be sorted out. Those frames are summarized in Table 1.

<table>
<thead>
<tr>
<th>Model</th>
<th>Science frame</th>
<th>Generic business frame</th>
<th>Survival frame</th>
<th>Opportunistic frame</th>
</tr>
</thead>
<tbody>
<tr>
<td>Punctuation: What is the problem?</td>
<td>University is about to sell out patents that are based on our discoveries. It would mean that we can no longer develop them further.</td>
<td>We have a good business idea but need some solution for the company to survive the first year.</td>
<td>University has patents it no longer can support. It needs an easy way to cash them out.</td>
<td>There is an opportunity to acquire promising but cheap patents, develop them and collect the revenue. How to utilize this opportunity?</td>
</tr>
<tr>
<td>Elaboration: Who is responsible? What outcomes can be projected with or without interventions?</td>
<td>We need some way to retain the possibility to develop the molecules further. Founding a company is a way to buy the patents to ourselves.</td>
<td>We need to get the business up and running as fast as possible. The sooner the company is able to generate turnover the shorter the time in the death valley would be.</td>
<td>Technology transfer office who governs the patents also governs the permissions to spin-off. Solution is to have the scientists who are founding companies to buy the patents that are based on their own work.</td>
<td>Best way to profit is to found a company with a business idea that somehow includes these patents.</td>
</tr>
<tr>
<td>Motivation: What action should be taken?</td>
<td>We need to raise money to buy the patents and to cover the operating costs of our laboratories.</td>
<td>We need to acquire customers as soon as possible.</td>
<td>Support the spin-off creation and demand that every spin-off buys some patents.</td>
<td>We need to create convincing pitches for investors to raise money for the development work.</td>
</tr>
</tbody>
</table>

Table 1: The frames of interpretation

The purpose of this sorting is not to comprehensively describe each frame of interpretation. On the contrary, the aim here is to show that there are several different frames of interpretation and the general business frame. Their simultaneous presence in a situation causes mistakes, misunderstanding and difficulties as in the earlier description. For example, the concept of “customer” is
relevant only in the general business frame and therefore it makes sense how the actors sponsoring
some other frames would ignore the issues regarding customers and turnover generation. Another
example is the concept of “business idea” that means very different things in each frame of interpre-
tation. Accordingly, founding a company serves very different kinds of goals in each frame. In the
science frame, the company is a means to continue the scientific work. In the survival frame, the
spin-offs are a convenient way to the university to cash off their patents. And at the same time, an
actor sponsoring the general business frame considers having a great business idea and aims to get
the business up and running as fast as possible.

Conclusions

Firstly, this research makes a contribution to the research on science-based business by
showing that the widely accepted statement - that the challenges of especially biotechnology are
rooted in the conflict between scientific interest and commercial gain (Powell & Owen-Smith,
Stokes 1998) - is too simplistic. The findings of this research show that in university spin-off crea-
tion there are a multiplicity of frames of interpretation present and that they are engaged in a very
complex and multilayered interplay.

Secondly, this research makes a contribution to the research on university spin-off process
by showing how the multiple frames of interpretation pose a serious challenge to a successful spin-
off creation by producing systematic misunderstanding. In addition, the research shows that the
difficulties in the spin-off creation are not caused by the scientists being lacking or incompetent.
Instead, the mistakes and confusion occur because “other frames are operating, frames you aren’t
using; frames you may never have imagined existed” (Agar 2002, 243).
Thirdly, this research also makes a methodological contribution by showing that the cultural approach and frame analysis to university spin-off research holds a great promise to explain phenomena that may be difficult to grasp for the traditional approaches is this research area. An important aspect for further research is to take into account the notion that a large part of new venture creation is done in some other frame than in the generic business frame. Therefore, the research that considers only the generic business frame will produce a very incomplete and possibly incomprehensible picture of the phenomenon.

2. Summary

In development of the underlying research project, the research team on family owned business detected the convenience for exploration—and initial validation—of the process for Planning of Generational Takeover in Family Owned business, as a factor of unique pertinence for the stability of Corporate Governance and Perdurability of Family Owned Business.

Noteworthy is the fact that such exploration of the process for Generational Take-over constitutes a fundamental step for purposes of research conducted on the impact of Family Protocols on Corporate Governance of companies of family profile, given the fact that initial findings, as presented herein, provide evidence on trends for management of family owned business, organizations that are commonly characterized by very high levels of informality in their inner administration and governance procedures.
3. Key Words

Family Owned Business, Generational Takeover, Succession, Corporate Governance, Perdurability, Planning.

4. Introduction

Succession in Management of a family business is nowadays one of the aspects calling for greater attention as a component of factors for success or failure of Family Owned Business Worldwide. This fact is hereinafter in the section of Theoretical Framework for the present research. Investigators Guinjoan and Llaurado (2000), are of the opinion that “Planning of the succession adds to the possibility of survival of a family business, to the extent that the Succession Plan is an exercise on the anticipation of future events of personal, family and corporate nature, oriented to exert influence over such events and shape them according to certain pre-established interests.” These authors underline two key factors for the success in the transmission of command in the management of Family Owned Business. These factors are: (one) That whoever is to surrender control of company management is cognizant of the need for the anticipated preparation of the transmission; and (two) That the successor is well informed of the structure of the company.

The above, also, when facing the reality that the great challenges of the processes of generational switch in family owned business are universally recognized. It is so that from each new 100 family business created, only 30
survive the change from the first to the second generation and only 13 reach the stage of being managed by the grandchildren of the founders.

In our environment, studies on the problematic of succession in the management of family owned business are rather precarious. In this regard, we must mention the findings of the Research Group on Family Owned Business of the School of Business Administration of Universidad Externado de Colombia (2002-2003), in which, out of a sample of 400 “Pymes” (small and medium size companies – as per Spanish initials) only 13 percent of them have declared to have an agreement for the management of the family business, commonly denominated a “Family Protocol”, which usually conveys the agreement reached by the owner family for the process of generational takeover as a mechanisms to provide stability and perdurability to the family company.

Aiming to achieve domestic validation of universal trends regarding succession in the management of family owned business, the Research Group on Family Owned Business of Universidad Externado de Colombia structured a tool for exploration of Generational Takeover processes, with some 138 Colombian organizations of family profile, as a first approach.

It is important to mention that such exploration of Generational Takeover processes does constitute a fundamental step for purposes of research of the impact of Family Protocols on the Corporate Governance of Companies with family profile, given the fact that initial findings, as presented herein, provide evidence on tendencies in Management of family owned business,
organizations that are often characterized by high levels of informality in their administration and governance.

The purpose of this investigation is to achieve findings of interest for those members of family owned businesses that have been, are or will be involved in processes of Generational Takeover, as well as for those who act as counselors in such processes.

The conclusions we expect to reach after culmination of this research shall constitute a reference framework of sound practices by those companies that have successfully completed a succession experience and a guide for those companies in the midst of or in course of involvement in a similar process in the short run.

Likewise, it will be the best way in which to establish contrast with the Succession Theory nowadays known worldwide and to determine the level of its applicability to Colombian enterprises, supporting them if such were the case, or to complement them if resulting in different value added from entrepreneurs and companies interviewed.

The underlying work has implied the establishment of direct contact with members of the first and second generation and, in some instances, with other members of the entrepreneurial family or organization who play a preponderant role in the process.
5.1 Theoretical Framework on Generational Succession and Takeover

Fred Neubauer and Alden G. Lank, mention, in already a classic work “The Family Business” (1999), - that the succession of the manager of family companies is one of the most studied and analyzed aspects and also one of the most relevant determinants, if not the most important, for company to remain – or not-in the hands of the founder family. These authors assert that professors, investigators, advisors and members of the entrepreneurial families assign to succession the first place in the level of importance of the planning role of organization with family profile.

Other authors such as Gersick, Davis and Lansberg, (1997) - state that, in family owned business, the matter of succession is a process of transition along the dimension of the property, the family and the company itself and outline that, for this process to be successful, the entrepreneurial family must examine, align and disclose its shared dreams and, from such dreams, create a coherent dream for the family company.

Peter Leach (1996), - comments that Generational transition involves challenge above other types of defiance regarding perdurability of the organizations, to the extent that “the founder of the company must stand up to strong psychological barriers pursuant to planning his/her retirement”…. , and underlines factors such as fear to surrender control and power, loss of its own identity, incapability to choose between the children, uncertainty as to its own retirement, and jealousy and rivalries within the entrepreneurial family.
In the vision of *Craig E. Aronof and John Ward (1999)*, the success of the process for generational transition lies, in high proportion, on the continued learning process of the successor and its good coordination with whom is surrendering the “Command Stick”, as a complement of a policy of assimilation of corporate strategies, history and family culture.

The conceptual framework of this investigation may then be stated under three main elements – that we deem to be vital at the instance of studying Succession as a complex event, and that approach all main aspects related to the process; these elements are:

**5.1.1. Preparation of the Predecessor or Founder**

One of the main reasons for which a successful takeover is often not achieved is the lack of preparation for retirement of the founder of the family business. This is caused by different motives amongst which we may include financial security plans for the retiree, referent to secure economic means available to the person at the moment of departure from company’s management. We also find, most frequently, lack of planning for the succession in terms of family wealth when successors take over the family business and there are no clear policies in this area. In addition to the above, the founder of the company many times tries to hang on to the position in fear of departing from a routine or by reason of not finding an interesting alternate activity in which to invest available time.
5.1.2. Preparation of Successors

Another most common problem amongst those that come up at the time of facing the process of generational switch is the lack of preparation of the Successor. Authors such as Ward and Aronoff (1992) recommend to start by transmitting to the elected Successor (whether within the family or outside) the values of the family and organization since these are the basis for continuity of the company. In a similar manner, authors Leach (1996), Neubauer and Lamk (1999), and Gersick, Davis and Ivan Lansberg (1997), suggest that family must endeavor to provide the elected successor with an adequate formation, enabling facing of the new challenges that the process will bring up as well as to favor acquiring prior experience inside of the family business or, even better, outside the company. The same authors indicate that, in the event the Successor does not have the ideal skills and competences for takeover of the underlying responsibility with total professional suitability, or maybe when not of an age adequate for accepting control of the organization, it is feasible to think of someone outsider the entrepreneurial family as possible successor, provided that the very family verifies fulfillment of a series of personal and professional attributes that may be specified in the Family Protocol.

5.1.3. Preparation of Partners and Shareholders

Of one most latent fears in processes of Generational Transition is that of surrendering “when alive” a significant participation in the property to the
successor or successors. For this purpose, the above mentioned authors state that it is necessary to engage in the previous preparation and education of a team of responsible partners and/or shareholders who are in capacity to answer to both the family and the company.

It is our posture that, in the Colombian case, succession in family owned companies in this country, must be converted into one of the most relevant fields of investigation as a result of the significant incidence born by a planned process of secession over the continuity and perdurability of organizations with family profile. It is so that statistics mentioned by relevant authors such as John Ward, (2006), from 100 percent of family owned companies created throughout the World, approximately 30 percent survives the second generation. This is the same situation of third generation family companies; that is, those controlled by the grandchildren of the founders, who represent a low 13 percent of initially created family owned companies.

A research study prepared in Colombia by Andres Gaitan Rozo and Jose Danilo Castro on family companies (Superintendence of Corporations – 2001) underlines that the principal factor of mortality of this type of companies is the aspect of Succession in the management of the company. Effectively, said investigation determined that only 12 percent of the individuals interviewed had included in their companies aspects such as planning of generational takeover, out of all individuals interviewed as components of the universal sample for the referred investigation.
According to this same study, there is an aggravating factor that turns the challenge of succession an even more complex aspect. In effect, the authors of this study mention that approximately 75 percent of family companies that integrate the productive sector of the country were created in the 1970s; that is to say, most probably the largest majority of the surviving companies still operational is currently facing the time for succession or will be facing it within a short period of time. This reality allows us to infer that a large portion of the companies in the country (large companies, PYMES and micro-companies) face the risk of non survival of Generational Takeover, which could cause some sort of negative impact over the performance of economic variables such as employment and the dynamics of Gross Domestic Product (GDP) growth, amongst other.

5.2. Methodology of Research

The present investigation on local trends in the planning of succession in Family Owned Business has been conducted with the cooperation of companies in the different sectors of the economy and in different scales of the corporate sector (large, (PYMES) and micro-companies), focusing attention on the behavior of each company regarding aspects related to the planning process to be engaged by any family company in order to accomplish a successful transition and generational takeover, the latter understood as an organized and planned process that positively contributes to the perdurability of the family company, and to the harmonic relationships that must prevail between all members of the family society.
Once the Investigation Group on Family Owned Business adopted a position regarding the importance of a prior exploration of trends in the planning of generational transition in family companies in our own environment, next step was to initiate identification, on the basis of studies, bibliographic review of the topic, International polls (London Business School, Fundacion Nexia and the Course on family Companies at IESE Business School), amongst other sources, of the most relevant factors for analysis as components of the processes for Planning of Generational Succession, and ending with the design of a 29 question instrument, The Survey, that would allow inquiries over the following aspects:

- Company Profile
- Profile of the Interviewed (the entrepreneur)
- Generational Takeover of the family company
- Planning of preparation of the managing predecessor
- Planning of preparation of Management Successors
- Partners and Shareholders

On the other hand, coherent with the policies of the School of Business Administration of Universidad Externado de Colombia, meaning to involve students, teaching staff and entrepreneurs, pertinent training was given to 190 ninth-semester undergraduate students, groups 009C and 009D, who took the course denominated “Emphasis on Management of Family Companies” during the first and second semester of 2008 and the first and second semester of
2009, in the fundamental concepts and problematic of governance and administration of companies with family profile, seeking to interview and question each manager of the 190 family owned companies previously endorsed by the teaching staff. Needless to say, this methodology included personal presentation, by each student, of the result of its own investigation, to the teaching staff including analysis and interpretation, an exercise that constituted the final paper for the course.

Information included in the survey was then processed for interpretation of answers, becoming the support of preliminary findings of the investigation, as will be commented hereinafter.

5.3. Working Hypothesis

The working hypothesis support of this investigation is described in the following terms:

“Pursuant to strategies for perdurability, Colombia family Owned Business evidence tendency not to plan the Generational Takeover process”.

5.4. Findings from the Investigation

Below please find most relevant findings from this investigation.

5.4.1. Company Profile
5.4.1.1. Activity Profile

It was possible to determine that a large portion of companies in the sample under analysis are concentrated in the development of production of goods (79 companies), followed by production of services (68 companies) and – at the same level- distribution of services (68 companies).

5.4.1.2. Economic Sector

It was found that the industrial sector, with 59 companies, is the leading sector when compared to other sectors included in the sample. Second place is that of services with 56 companies.

5.4.1.3. Number of Employees in Family Owned Business
The sample allowed determination that most part of the companies has between one and ten employees, accounting for 42 percent, and a second group representing 20 percent, employs between 21 and 50 persons.

5.4.1.4. Asset Size

A sound 42.1 percent of the sample corresponds to small companies, falling well under the definition of the Law SMBEs (small and medium size companies), with total assets between two hundred and thirty one million Colombian pesos (Col$231MM) and two thousand three hundred and seven million pesos (Col $ 2,307 MM).

5.4.2. Profile of the Interviewed (Entrepreneur)

Chart No. 2 - Profile of the Interviewed (entrepreneur)

5.4.2.1. Average Age of the Manager of the Family Owned Business

Most common age range of the managers interviewed is 51 – 69 years, accounting for 36.8 percent of the sample.
5.4.2.2. Position Within the Family

It may be concluded that first generation individuals –father and/or mother- accounting for some 70 percent, approximately, are the leading managers of the family company.

5.4.2.3. Other Relevant Aspects

In the sample under consideration it was found that 80.5 percent of individuals in control of company management hold a stable spouse. In a similar manner, it was possible to establish that 35.78 percent of entrepreneurs in the sample have, as an average, two children. On the other hand, it was detected that 16.84 percent of the sample has two siblings.

5.4.3.1. Companies that Consider Generational Takeover / Established Strategies
A high 70 percent of companies included in the survey do consider generational takeover a matter of importance but have not implemented clear strategies for the underlying generational transition process, as revealed by 78.9 percent of the sample.

### 5.4.3.2. Identification of a Successor for Management of the Company (within internal or external)

From the sample under analysis, some 54.7 percent has clearly identified a successor for management of the family company upon decision to retire by predecessor. 87.4 percent of the companies contemplate succession by a member of the entrepreneurial family.

### 5.4.3.3. Relevant Aspects for Definition of a Successor

Current manager does consider that relevant attributes for election of a successor include – in this order: experience in the family company, high level education and experience in companies outsider family company.

### 5.4.3.4. Mechanisms for Selection of a Successor

Those currently holding the management position indicated to prefer (46.3 percent) reaching family consensus for selection of the successor, while
32.6 percent prefer to reach a consensus between family members, the board of directors and key managers in the organization.

5.4.4. Planning of Preparation of the Management Predecessor

5.4.4.1. Financial Preparation of the Predecessor and Timing of Retirement

Outcome of the survey yields evidence that 73.2 percent of current managers of family owned business surveyed are in process of financial preparation for retirement. Regarding timing for retirement, 81.6 percent has not yet decided on the moment to do so.

5.4.4.2. Prospective Projects of the Predecessor - After Retirement

52.1 percent of managers surveyed states to have a project for new activity (entrepreneurial or personal) to be pursued after retirement from the company.

5.4.4.3. Acceptance by Predecessor of Corporate Risk Management by Successor
Most individuals interviewed, 77.9 percent, accept that the Successor will assume risks for preservation of the entrepreneurial efforts of the family.

5.4.4.4. Acceptance of Leadership Style of the Successor

Surveyed entrepreneurs - 64.7 percent of the sample, expressed to feel comfortable with a new leadership style by their Successor, accepting new criteria and policies for Management of the company.

5.4.5.1. Successor’s Experience Acquired Outsider the Family Owned Business

In this sense, 74.7 percent of managers surveyed expressed concern for the lack of significant and sufficient working experience of the Successor outsider the family business, for suitable assumption of responsibilities in the management of the organization.
5.4.5.2. Planning of the Professional Development of the Successor

Regarding this aspect, most family owned companies do not have concrete plans for the professional development of that warrant professional training and growth of management successors; 65.8 percent of the sample, as depicted by the survey.

5.4.5.3. Professional Competences and Skills of the Successor

It is most interesting to outline that 68.9 percent of surveyed entrepreneurs relieve their successor does indeed have professional competences and skills necessary for due assumption of the responsibilities inherent to the position of the senior executive of the organization.

Nevertheless, and despite the above, they accept that their successors yet lack sufficient experience for sound performance in their Management functions.

5.4.5.4. Transmission of Policies and Strategies from the Current Leader to the Successors

Some 46.8 percent of entrepreneurs surveyed accepted the fact that they do not engage in activities geared to the adequate transmission of company policies and strategies to their successors.

Source: Authors of the Investigation

5.4.6.1. Individual Ownership of the Family Owned Business

The one - three range of entrepreneurs fall into this form of family ownership being the most frequent throughout the investigation (69.5 percent), while the four - five range account for a lower 20 percent.

5.4.6.2. Extra-Family Partners

A high 80.5 percent of entrepreneurs interviewed expressed not to have any partner outsider their family, which allows us to conclude that there is high concentration of family capital resources in the sample under analysis.

5.4.6.3. Concentration of Equity Holdings in the Manager of the Family Owned Business
Equity concentration (21 – 50 percent range) in the hands of the manager is the most frequent in the sample under analysis, with a 40 percent participation, which allows us to conclude that there is a relatively high proportion of equity control by those in charge of the management of the family business.

5.4.6.4 Shareholder Awareness of Entrepreneurial Goals and Participation in the Definition of Strategies of the Family Company

There is a significant percentage of companies in the sample under analysis (58.9 percent) in which shareholders are aware of the entrepreneurial goals set by the owner family and are also participants in the definition of business strategies (62.1 percent).

6. Conclusions

As a first instance, in light of findings from this investigation and the above analysis, there is confirmation of the working hypothesis in the sense that there are visible local trends reflecting lack of planning for generational transition in family owned companies.

The above reality is a reason for concern to the extent that the present world economic crisis posts new and high challenges for the survival of family companies. For this same reason, it is paradoxical that acceptance is granted to the importance of planning generational takeover while at the same time
accepting that no specific actions are being pursued to prepare candidates for management succession in the family owned business.

In practically 60 percent of known cases it is acknowledged that identification has taken place of the immediate management successor but, without existence of a concrete program for its professional training, a strategic mistake is undertaken that amplifies in a scenario of generalized economic crisis as the one we live in.

The above is even more relevant when taking into consideration the fact that over 40 percent of companies included in the sample have managers in the 51-60 years age range, which allows envisagement of the need for a soon to happen and unavoidable generational transition.

The current world economic crisis is causing the return to Colombia of many local national professionals as a result of downsizing by large corporations of international scope. It is an opportunity for many Colombian companies to reinitiate processes of generational transition interrupted r failed as a result of migration of candidates to succession. But the success of this effort will be largely dependent of the planning of punctual training and education policies for those who return with illusions focused on the motherland.

7. Bibliography

TRENDS IN SMALL FAMILY BUSINESS SUCCESSION PLANNING IN COLOMBIA

RESEARCH GROUP: FAMILY BUSINESSES

A. IDENTIFICATION OF THE PROBLEM

It has been traditionally acknowledged that in Colombia, family owned businesses tend to underestimate the importance of a timely training and preparation of the successors for the task of managing the business, and that this reality may have negative effects on the sustainability of family businesses. This is a matter of the utmost relevance considering that in Colombia 70% of companies are family-controlled businesses, according to an investigation conducted by the Colombian Superintendence of Companies in 2001.

Succession in family business management is nowadays one of the issues drawing great worldwide attention within the study of success and failure factors in Family Businesses. Authors such as Guinjoan and Llauradó (2000) argue that “planning succession increases the chances of survival for the family business, inasmuch as a Succession Plan is an exercise anticipating future personal, family and business events, aimed at influencing those events and shaping them according to specific interests”. Fred Neubauer and Alden G. Lank state in their now classical work The Family Business (1998) that senior management succession in family businesses is one of the most analyzed and studied issues as well as one of the main factors, if not the single most important one, affecting the chances that the business continues in the hands of the founding family. According to these authors, academics and researchers as much as advisors and members of family firms consider management succession to be the most important factor in planning family businesses.

Other authors, such as Gersick, Davis, Hampton and Lansberg (1997), suggest that in family businesses, the question of Succession is a transition process involving property, the family and the business itself.
On the other hand, Peter Leach (1996) notes that the problem of Succession is a greater challenge to the sustainability of organizations than most others, inasmuch as “the founder of a firm [...] faces powerful psychological deterrents to planning his retirement”, influenced by factors such as the reluctance to let go of control and power, the loss of identity, the inability to chose among children, the fear of retirement, and the jealousy and rivalry towards potential succeeding members.

B. RESEARCH QUESTION

¿Is it possible to perceive the existence of planning processes for generational change in small family businesses in Colombia?

C. HYPOTHESIS

There is a tendency in small family businesses in Colombia not to plan generational change.

D. OBJECTIVES

Studies in Colombia relating to the problem of succession of management in family businesses are rather scarce. Thus, it is relevant to validate locally the general worldwide trends regarding diagnosis and prognosis of management Succession in family businesses. We consider that the findings of this research can have strategic value for members of family businesses that are, or will be, going through a Generational Transition process as well as for those who are advising them on these processes.

E. METHODOLOGY

Between August 2008 and November 2009, a simple random sampling of 138 family businesses throughout Colombia was interviewed. Of these, 44 firms were in the industrial sector, 42 in the services sector and 44 in the commercial sector. Classified by their assets, 58.7% were, as per the distinction made by the Colombian legislation, small
companies and 41.3% were microenterprises. The random sample included First and Second Generation family businesses. They answered a questionnaire with 29 questions; additionally, an interview was held with the leading family executive of each organization.

F. FINDINGS

Among the many findings of this research, we would like to highlight the following:

1. In 60% of cases, the Successor has been identified, but is not being prepared.
2. In 40% of cases, the company leader is 51 to 60 years old, indicating the imminence of a future succession.
3. In 80% of cases, the Successee has not established when he or she will retire.
4. In 66% of cases, it is acknowledged and accepted that the probable Successor does not have enough experience outside the family business to take over Management.
5. In 64% of cases, it has been admitted than there are no concrete plans to train the Successor.
6. In 46% of cases, it has been acknowledged that policies and strategies are not adequately handed down to future successors.
7. In 79% of cases, there are no extrafamilial business partners.
8. 70% acknowledge the importance of planning generational transitions and 77% admit they have not implemented any strategies to facilitate this process.
G. CONTRIBUTION

First of all, the Working Hypothesis was confirmed, indicating that small and micro Colombian family businesses tend not to plan generational change. This is of concern for their sustainability since in the near future they will be unavoidably confronted with generational change.

Secondly, it is a paradox, and an indication of some pervading irrationally, that most heads of small family businesses acknowledge the importance of planning generational change, yet, at the same time, admit that they are not taking any steps to prepare the future Successors for the task.
“Learn or Die”:
The Development of an Assessment Framework for SME Entrepreneurial Learning Programs

55th ICBS World Conference: June 24-24, Cincinnati, Ohio, U.S.A.

Pontus Bergh and Mattias Jacobsson
pontus.bergh@usbe.umu.se, mattias.jacobsson@usbe.umu.se
Umeå School of Business, Umeå University
SE 901 87 Umeå, Sweden

Abstract

The unique features of entrepreneurial learning, that involves multiple dimensions, are not easily captured and today few appropriate assessment frameworks exist. The aim of this paper is therefore to put forward an evaluation assessment framework for entrepreneurial learning and empirically illustrate its potential on a specific SME learning program. Based on a survey of owners/managers who took part in the government supported learning program krAft, an exploratory factors analysis and a regression analysis were conducted. The paper proposes a two dimensional framework of cognitive and social/emotional learning outcomes where both are strongly correlated to internal efficiency but only the social/emotional outcomes are correlated to external effectiveness. The paper therefore concludes that the mere focus on cognitive learning outcomes is not enough in order to successfully act upon business opportunities. Hence, the social/emotional learning dimension is of great importance, and should be utilized, in the development of arranged SME learning groups.
Introduction

Small and medium sized firms (SME) depend to a large extent on their ability to recognize and act on business opportunities. In small firms the owner and the manager is often the same person and has the responsibility to act on business opportunities which can lead to major strategic changes in the business (Duncan and Weiss, 1979; Storey, 1994). Thus, if SME owners/managers are to successfully provide goods and services to markets, they need the capability to exploit business opportunities (Reynolds et al., 2002) involving the introduction of new goods, services, raw materials, and organizing methods (Shane and Venkataraman, 2000). One possible way to increase venture performance may be through the specific learning SME owner/managers acquire and develop for handling the exploitation process (Choi and Shepherd, 2004; March, 1991; Sanchez 1996; Shane, 2003). Wick and León (1993, p.19) even stated that organizations must either “learn or die”. Recognizing the importance of learning, this paper focuses on government supported learning programs with the purpose to increase the owners/managers ability to develop a successful business. Entrepreneurial learning outcomes can broadly be understood as the knowledge and ability to identify and exploit business opportunities (Polities 2005). SME owner/managers who can develop this kind of learning from participating in learning programs have an increased ability to successfully develop and run businesses. Methods for assessing the outcomes from SME learning programs are an important issue for the design and evaluation of such programs. However, the unique features of entrepreneurial learning, that involves multiple dimensions, are not easily captured (Cope 2005; Rae 2000, 2006; Rae and Carswell 2001). The specific learning outcomes from arranged learning groups comprised of SME owner/managers, academics, and other experts are under debate and the need for an appropriate measure of such arrangements is therefore extensive. What
entrepreneurial learning outcomes may be developed in SME learning programs and how it affects the venture performance is both highly topical and very important. Considering this background the aim of this paper is to put forward an evaluation assessment framework for entrepreneurial learning and empirically illustrate its potential on a specific SME learning program.

In order to reach the aim of the paper an understanding of the potential aspects that may be included in such an assessment framework, as well as the relationship between the assessed individual entrepreneurial learning and associated changes in firm level performance outcomes, needs to be outlined.

**Theoretical framework**

**Individual- and organisational learning outcomes**

Learning is generally defined as the processes, as well as the identifiable and relatively permanent changes in knowledge and abilities that result from human interactions in specified contexts (compare, Brown and Dugid, 1991; Kolb, 1984; Lave and Wenger, 1991). In the SME context it is first and foremost the individual owners/managers who learn (Argyris and Schön, 1978; Dodgson, 1993) and thereafter transfer their learning to their ventures (Bontis et al., 2002; Duncan and Weiss, 1979; Kim, 1993; Sun and Scott, 2003). Changes in how business opportunities are identified and exploited would thus be considered a learning outcome related to their venturing (Politis, 2005; Sanchez, 1997). This paper focuses on the entrepreneurial learning.

However, it should be noted that entrepreneurial learning, which builds up the ability to exploit new business opportunities, consists of both individual as well as organisational learning processes. The individual owners/managers spur their learning outcome via a changed ability to make strategic decisions, in terms of delineating and
assessing the potential of new projects, analyze the efforts and risks involved in entrepreneurship, bestow legitimacy, and pursue entrepreneurial actions (Crossan et al., 1999; Jones and Macpherson, 2006; Quinn, 1992). This means learning outcomes result in changed routines, diagnostic systems, rules, or procedures (Argyris and Schön, 1978; Crossan et al., 1999) regardless if they consider a higher speed in developing a product, or ideas for developing new products or services to new markets. On the organisational level (i.e. organisational learning) Huber (2004) states that learning occurs when the organisation’s members revise their beliefs in ways that, when the beliefs are acted upon, improve the organisation’s performance. Prior research, for example, Bontis et al. (2002) has demonstrated that organizational learning at all levels has a positive impact on business performance. In this paper we do not aim at separating the intertwined processes of individual and collective learning but merely establish the relation between the individual entrepreneurial learning that occurs as a part of the learning program and specific aspects associated with venture performance. Thus, entrepreneurial learning would reflect an improved ability to manage the novelty and uncertainty in exploiting business opportunities which can be identified and described in terms of venture performance.

Entrepreneurial knowledge, or the ability to identify and exploit business opportunities (Polities, 2005), is considered vital for the survival and growth of small enterprises (Hoang and Antoniicic, 2003; Macpherson and Holt, 2007; Penrose, 1959). Such knowledge can be built, for example, on networking skills, the ability to analyse market conditions, and the courage to implement one’s ideas. Owners/managers face many different types of problems on the path of learning and creating entrepreneurial knowledge. Engaging in relevant competence-enhancing and development programs is one promising way to improve the situation. However, contemporary critics suggest that
general competence development programs are neither appropriate nor well functioning for these entrepreneurs. The criticisms are for example based on the understanding that owners/managers in small firms often play multiple roles and therefore are generalists, not specialists (Florén, 2005). As a result, conventional courses and specialist management training (with relatively high costs) may be impractical for owners/managers in small firms (Fuller-Love, 2006; Sadler-Smith et al., 2000). Hence, owners/managers need alternative programs to develop their entrepreneurial knowledge and competence.

While there has been extensive research to investigate pedagogical models in formal education, there is little knowledge about how owners/manages can learn, in ways other than traditional formal education (Gibb 1997; Storey, 1994). Scholars and practitioners have thus noted that external relations in learning programs can be a noteworthy possibility for entrepreneurial learning. External sources are often needed to initiate and stimulate improvements and tangible effects (Street and Cameron, 2007; Zang et al., 2006). Help from outsiders may also enable owners/managers to gain both explicit and tacit knowledge with the potential to influence their firms’ long-term ability to survive, grow, and innovate (Chrisman and McMullan, 2000; Jones and Macpherson, 2006; Lockett et al., 2008; Macpherson and Holt 2007). On way of involving outsiders in the entrepreneurial learning process is through learning groups (or programs) comprised of SME owners/managers, academics, and other experts. That is, in line with the empirical focus of this paper.

However, the distinctive nature of learning of owners/managers and the appropriateness of programs to support learning and development in small and medium-sized enterprises have been largely unexplored, and today there are no empirically based assessment frameworks for evaluating learning outcomes from SME learning programs.
In order to be able to evaluate such programs we need deeper knowledge of what owners/managers might learn in order to improve their ability to exploit business opportunities. To achieve this deeper knowledge multi-empirical evidence is needed (Hoang and Antoncic, 2003). Consequently, there is a need for a framework that can clarify changes in the groups of participating entrepreneurs and their businesses, a framework which in the future may be used to evaluate, classify, and measure learning outcomes in a multidimensional way.

Summarizing the previous discussion it can be claimed that the owners/managers participating in the learning group develop entrepreneurial knowledge (on the individual level). When later interacting with colleges, entrepreneurial knowledge (on the organisational level) is developed. Such entrepreneurial knowledge facilitates the ability to identify and exploit business opportunities which have shown to be the basis for the development of successful business, in this paper described as venture performance.

A first step in order to be able to outline such a framework is thus to create an understanding of previous research on entrepreneurial learning outcomes from SME learning programs.

**Learning outcomes from entrepreneurial learning programs**

Following the argumentation of Illeris (2002) and building on Bergh et al (2009), individual learning outcomes can be categorised into three broad dimensions; 1) a cognitive, 2) an emotional, and 3) a social learning dimension.

**The cognitive learning dimension**

The first of these dimensions is the cognitive dimension which represents changes in the entrepreneur’s thinking pattern. Following Neisser’s (1967) classical definition of cognition, this implies changes in how sensory input is transformed, reduced,
elaborated, stored, recovered, and used. As exemplified by the situations enumerated in Table 1, these cognitive changes can be important for decision making as they introduce new heuristic-based logics, improve alertness, and develop unique knowledge and effectuation (see for example, Mitchell et al., 2007). Hence, based on Bergh et al. (2009) it can be argued that cognitive changes that result from participating in a learning group may have significant implications for how entrepreneurs exploit business opportunities.

The cognitive learning could however be of different types (Aryris and Schön, 1978; Piaget 1959; Senge, 1990). Ellstöm (2001) make a distinction between adaptive and innovative learning where adaptive learning, on the one hand, concerns changes that occur within a given framework, for example, within a given set of norms, values, or structures. Innovative learning on the other hand break with the past and go beyond the given. Based on the comprehensive case study of Bergh (2009), focusing on the individual entrepreneurs’ learning processes, cognitive changes (involving both adaptive and innovative learning) can be exemplified with entrepreneurs expressing the benefits of getting others’ views and insights of how they work and why, in order to be able to take a step outside their own company.

**The emotional learning dimension**

The second dimension is the emotional changes which represents emotional changes in terms of changed affective states (compare, Russell and Barrett, 1999) for the entrepreneurs. This dimension of learning includes new motivation, excitement, and an increased self-efficacy (Bandura, 1986) in relation to various accomplishments related to being an entrepreneur. Prior research also indicates that a positive affect (i.e., emotions and feelings) influences creativity (see for example, Estrada et al., 1994).
Given the role creativity plays in recognizing new opportunities, it is suggested that that this is also the case regarding influences on entrepreneurial processes (Baron, 2008). Moreover, considering the link between emotional factors and business opportunities, prior research has, for instance, indicated that emotions can be important for acquiring resources (Baron, 2008), persistence (Bird, 1989), motivation (Bierly et al., 2000), and realizing dreams (Ma and Tan, 2006). As exemplified in Table 1, emotional changes could therefore be useful for developing ideas, recognizing complex patterns, organizational design, and employee mobilization among other things. Thus, emotional changes for entrepreneurs in learning groups may have implications for their capacity to exploit business opportunities. Based on Bergh (2009) it is also clear that participating in the learning group seemed to generate energy and courage to try new ideas and inspire changes when needed.

**The social learning dimension**

The third dimension related to social changes is a dimension thoroughly examined in prior literature and often argued to be an important aspect of entrepreneurship (see for example, Ariño et al., 2001; Ariño and Torre, 1998; Baum et al., 2000; Borgatti and Foster, 2003; Casson and Giusta, 2007; Macpherson and Holt, 2007; Street and Cameron, 2007). The social learning dimension is related to social changes for the owners/managers, to how social networks within the learning groups evolve and how the owners/managers develop their social skills. As shown in Table 1, changes in how entrepreneurs view their social network can play a significant role in situations where they need to acquire resources and information; build legitimacy of suitable partners for joint production, develop products, and conduct marketing activities (see for example, Lundvall and Johnsson, 1994; Lui, 2009). This means that social changes among the
networking entrepreneurs may have implications for how the entrepreneurs use the social network to improve their capacity to act upon business opportunities. Thus, the social changes that participating entrepreneurs may experience can have significant implications for how they use the interpersonal network to build an interorganisational network to achieve and organize resources and legitimacy necessary to exploit business opportunities.

In the following table a summary of the three dimensions of learning outcomes are grouped together with examples of opportunity exploitation activities where this learning is particularly useful. In the table a short description is also given of how the changes empirically materialise themselves.

**Table 1. Summarising table of the three learning dimensions (Bergh et al 2009)**

Following the previous discussion on entrepreneurial learning and its relations to organisational outcomes, as well as the three dimensions proposed as a part of the learning outcomes from entrepreneurial learning programs, the next section will first
describe the empirical setting and then focus on the development of the assessment framework.

Methods

Sample and Data

The Swedish krAft-program (acronym based on the Swedish translation of competence, reflection, business development, and growth) provided the empirical setting for this study. The krAft-program was a policy-supported program carried out between 2000 and 2005 designed as a forum to exchange experiences among owners/managers working in firms with up to 250 employees. Typically, ten to fourteen owners/managers from five to seven enterprises participated in each learning group. University experts and consultants helped the owners/managers establish and manage the groups to reach learning and business development goals. Generally, the participants came from the same geographical area in Sweden and met in person on several occasions. During a one-year period, the group members met for twelve days (divided into six sessions) where they discussed problems that the group believed were interesting and meaningful. The sessions were scheduled from lunch on day one until lunch day two. The meeting location was usually an isolated area, which meant participants stayed on-site and had time to interact informally with other network members in the evenings and during meals. The program was financed 50 percent by the state and 50 percent from a fee paid by the attending firm (each firm paid around 4300 euro). The krAft project aimed to achieve both individual competence and business development among SMEs, which the program sponsors hoped would eventually lead to economic growth.
An initial scanning of membership lists and registers revealed that the overall program included 101 separate networks, populated by 991 participants. Although there were many of these that did not actively participate in the program (that is, the register was overly inclusive), all participants were targeted for this research. In a later research stage (described below) the participants who were not active were excluded.

Almost three years after the krAft project was completed, data were collected for this paper and assessment of the concrete learning outcomes obtained; that is, to what extent the participant’s capacity to exploit business opportunities had improved. Supported by previous research (Clement, 1982; Kirkpatrict, 2006), a three-year time lag was estimated to be necessary for valid estimates of the program. Data were collected through sending a survey by mail to all listed participants from the initially provided registers. Attached with the mail was a prepaid return envelope addressed to the university and ensured confidentiality. After the questionnaires were sent out, we were directly informed that some of the former participants could not be reached because they were not engaged in venturing. Many of these had not been actively engaged in venturing during the program and notified us of this fact. Moreover, we were informed that some owners/managers had never actively participated nor enrolled in the program and should be excluded from the list of possible companies in the krAft program. All of these exceptions (adding up to a total of 206) were excluded from the study because we only targeted owners/managers who could evaluate the effects of participating in the network for the venture they represented. We ended up with a final sample of 785 participants. In total, 109 usable responses were returned, for a response rate of 14 percent.
To assure the generalizability of this study’s conclusions the risk of biased data was examined. A random sample of 10 percent of the non-response individuals were selected and contacted by phone. The participants were asked why they did not participate in the study in order to classify whether non-respondents were passive or active. It was found that a vast majority could be classified as passive, suggesting that there is a low risk for a non-response bias. Roger and Stanton (2007) state as a general rule, passive non-respondents do not differ from respondents.

Measures

The survey instrument was based on self-reported data from the questionnaires on a 5-point Likert scale, ranging from “strongly disagree” (1) to “strongly agree” (5). Scale scores were calculated by averaging responses of the related items. Exploratory factors analysis suggested that the construct measures displayed discriminant and convergent validity; whereas scale alphas of 0.9 and higher indicated they also displayed high levels of reliability (Nunnally, 1978).

Individual learning outcomes were assessed using 16 items (see Table 2). The items were derived from Bergh et al. (2009) multidimensional conceptualization framework on learning outcomes. This set of survey items started with “By attending krAft…” in order to relate the changes to the participation of the learning program. Sample items included: “After attending krAft you have developed knowledge and skills which could be used in your work”, “After attending krAft you are able to see your work from different perspectives than before”, “After attending krAft you developed your ability to cooperate with others”, and “After attending krAft you developed a feeling that you are more capable”.

12
Associated changes in firm level performance was assessed using 11 items measure, inspired by Bontis et al.’s (2002) strategic learning assessment map, Marsick and Watkin’s (2003) research on learning and businesses and Wu et al (2003) measurement of business performance (see Table 4). The measure assessed specific aspects of performance on the strategic business unit level and as an effect of the participation in the learning program. The ability to exploit business opportunities is shown by the performance outcomes which are captured both in terms of internal efficiency development and external effectiveness market development. Sample items included: “After attending krAft the firm has been able to develop a strategy that will provide future advantage”, “After attending krAft the firm developed management methods for a more effective work”, “Attending the krAft helped the firm to develop new products or services”, and “After attending krAft the market share increased.”

Control variables. Data was also captured on potentially confounding variables that could influence the learning-performance relationship. A control has been conducted for the effects of venture size (Lyles and Salk 1997; Nason, 1994; Wincent, 2006) measured by the number of employees before attending the learning network. The argument to control for size is that an entrepreneur involved in a larger venture will have more difficulty sharing knowledge from the network to the firm than an owner/manager from a firm with only a few employees (Bontis et al., 2002). It may also be more difficult to implement what has been learned due to a more complicated decision structure involving more partners. These conditions should reduce the effects of learning. We also controlled for the participants position in the firm by separating owner from top managers as we believed that an owner had better influence of changing the firm than a top manager. Finally, the study controlled for the effect of the participants’ industry experience (Gnyawali et al., 1997). An owner/manager with more
industry experience devise a strategy faster than a novice (cf. Glaser and Chi, 1989; Larkin, 1983), which can increase the capacity to act upon business opportunities. Experience was measured by the participant’s years of work experience in the industry.

**Results**

The 16 learning outcomes items, presented in *Table 2*, were factor analyzed. The question one “through participation you reinforced what you already had known” was removed as it did not correlate with any of the other 15 items. With the first item removed, the data showed measure of sampling adequacy of .946; the correlation matrix differed significantly from the identity matrix ($\chi^2=1395.50$, df=109, p<.00). Each variable’s MSA was in excess of .9.

*Table 2 – see appendix*

Application of the principal components extraction method, with eigenvalue of more than one as criterion for determining the number of factors, resulted in a two-factor solution. After VARIMAX rotation, the first factor accounted for 37.15% of variance, the second for 34.85%. The cumulative variance extracted was 72%. *Table 3* show factors and factor loadings. Given the sample size of 109, factor loading below .5 could be considered insignificant. The alpha reliability of the Cognitive scale is .94 and of Social/emotional is .93, both well in excess of the .7 cut-off recommended for the explorative research.

\(^a\) Responses on a five-point scale 1='strongly disagree' to 5='strongly agree'.

The same procedure, principal components, was applied to the firm level outcomes. The factor-loadings and factors extracted are presented in the Table 4. With MSA measure of .92 and the test of sphericity significant at \(p<.00\), the variables are well suited for the factor analysis. The resulting two-factor solution accounted for 73.34% of the variance. The Cronbach alpha of the related scales are .93 and .92, respectively.

<sup>a</sup> Responses on a five-point scale 1=‘strongly disagree’ to 5=‘strongly agree’.

A regression analysis was thereafter used to examine the relationship between individual learning outcomes and business-level outcomes. In the analysis both dependent and independent variables are equally-weighed summated scales corresponding to the extracted factors. The descriptives and correlation matrix of the scales are summarized in Table 5. While a structural equation model, with full confirmatory factor analysis measurement component would be more appropriate to establish and test the hypothesised relationships, the sample size of 109 does not meet the assumption of such procedure, even if we use the lowest maximum likelihood requirement of 2 observations per estimated moment. Thus, subsequent analysis focuses on the summated scales.

In Table 6 the results of the regression analysis is presented. The first model has Internal Efficiency as dependent variable, and COGNITIVE, SOCIAL/EMOTIONAL, Industry experience, Position, and Firm size as independent variables. The model is significant overall and accounts for 50% of the variation in the dependent variable (adj R2=.5). Both cognitive and social/emotion, outcomes are significant and positive. The industry experience is also positive and significant.

The second model produces somewhat different results. The dependent variable isEXTERNAL, and the independent variables are the same as in the first model. The equation again is significant overall at p<.00, and explains 43% of variation in the dependent variable. The COGNITIVE effect turned out as not significant, while SOCIAL/EMOTIONAL is still significant. Firm size was also positive and significant.

Discussion

The first part of the aim of this paper was to develop a multidimensional assessment framework for SME learning programs. In line with previous research a three factor framework incorporating cognitive, emotional, and social outcomes was suggested (Illeris, 2002; Bergh et al 2009). However, the results suggested the presence of only a two-factor framework and do not allow differentiating between the emotional and social outcome dimension. Therefore, these dimensions were integrated and referred to as social/emotional outcomes. Furthermore, previous researchers divided the cognitive dimension in two sub-dimensions; adaptive and developmental learning (Ellström, 2001). Adaptive learning represents an extension of knowledge, while innovative learning represents a radically new knowledge. While our survey items were a mix of both sub-dimensions representing two types of learning (see Table 4 for more information of the items comprising the framework), we again could not differentiate between these two aspects.

The second part of the aim of the study was to test the relation between the developed learning assessment and associated changes in venture performance. The regression analysis showed a positive relationship between the cognitive learning
outcome and internal efficiency, for example the development of an advantageous strategy, culture etc. (compare, Cohen and Levinthal, 1990). The social/emotional learning was also shown to be positively correlated to internal efficiency, although not as strongly as for the cognitive learning dimension. The social/emotional learning is instead strongly correlated to external effectiveness (for example, the development of new markets, products, etc). Interestingly there was no association between the cognitive learning dimension and external effectiveness.

Consequently, it could be concluded that a mere focus on cognitive learning outcomes is not enough in order to reach external effectiveness. Acting on business opportunities demands a focus on social/emotional outcomes as a part of the learning process. Even if cognitive learning outcomes can create both knowledge and ability to identify and exploit business opportunities, “something” in the social/emotional learning outcomes is needed in order to create or facilitate action to peruse new opportunities. Our interpretation is that some of the questions used to assess the emotional part of social/emotional learning are similar to questions used by researchers to assess self-efficacy. Previous research show that beliefs about one’s own abilities to successfully execute work at a desired level of performance (Bandura, 1986), are likely to affect the ability to acquire knowledge and apply it to a venture (Baldwin and Ford, 1988; Holton, et al., 2000; Kraiger et al., 1993; Noe, 1986). People with higher self-efficacy are more likely to act upon advice they are given because they believe they have the ability to use the knowledge gained and deliver changes for the organization (Tams, 2008). Self-efficacy (as a part of the social/emotional learning outcomes) is thus important in order to go beyond mere changing strategies, internal structures, management methods, or culture. This understanding also helps in explaining why formal programs – mainly focusing on cognitive learning outcomes – are not beneficial
for owners/managers in exploiting business opportunities and achieving increased venture performance. However, while these findings by no means suggest that the cognitive aspects are irrelevant or unimportant; what we want to point out is that other forms of learning outcomes may be more influential in enhancing a venture's external performance.

Based on the analysis, and as shown in the figure below, the cognitive aspects contribute with the knowledge but not to the personal characteristics (self-efficacy) needed in order to achieve the external effectiveness required to act on opportunities. Hence, the social/emotional learning outcomes are of great importance in arranged learning groups.

**Figure 1.** *Learning dimensions in relation to internal efficiency and external effectiveness.*
The final part of the aim of this study was to address the potentials of the measurement framework for the design of learning programs addressed to SME owners/managers. Based on the findings it can be concluded that this understanding have potential implications for entrepreneurial endeavours, mainly for three different reasons. First, the findings offer insights to how academics and governmental initiators, on a policy level, could improve the development and implementation of such learning arrangements and entrepreneurial training in general. Second, the presented framework gives insights and tentative guidelines for actors who, on a practical level, intend to arrange learning groups for SME managers. Third, in doing so, the findings also give practical implications on how to improve the outcome of the programs from a participant perspective and contribute to the SME managers’ ability to successfully develop and run business. That is, to integrate social/emotional learning dimension into the learning process in a deliberate way.

To conclude, the study provides both theoretical as well as practical implications. In terms of theory development, the study contributes by presenting an assessment framework for entrepreneurial learning that captures important aspects of cognitive and social/emotional changes at the level of the participating SME owner/manager. The findings moreover suggest that entrepreneurial learning outcomes needs to be discussed in relations to self-efficacy (Bandura 1986) as it is a central characteristic among successful SME managers (see for example. Poon et al. 2006; Clercq and Arenius, 2006). We therefore argue that self-efficacy as a learning outcome – as well as a part of the multidimensional construct presented – is an important objective in order to reach learning program effectiveness (Holton 2002; Martocchhio and Hertenstein 2003).
Limitations and suggestions for future research

Finally, there are some limitations to the present study that should be addressed in future research. First, in this study we used self-reported data and although consistent with past research practices (see for example, Colvin and Slevin, 1989; Lyles and Salk, 1996) there can be doubts that perceived outcomes represent actual learning outcomes. Therefore we suggest the development of measurements of cognitive and social/emotional pre-tests and post-tests (for example, Price and Randall, 2008). This type of learning assessment data should then be tested against objective financial venture performance data. Second, future research should use a confirmatory factor analysis to establish the discriminant and convergent validity of the proposed framework. Finally, it is also important to recognize that this study focused on arranged SME learning programs. Thus, the results cannot be generalized to other kinds of SME learning arrangements which have other purposes than the ones studied here. The measurement framework developed in this present study may however be worthwhile to test in similar type of learning programs.

Differences between Turkish Entrepreneurial Teams with or Without Start-Up Experience

Dilek Tuten and Semra F. Ascigil

This paper aims to search differences between novice and experienced entrepreneurial teams from human capital and social capital perspective. The findings revealed that not demographics but firm and entrepreneurial team sizes differ between two types. Moreover, it is found that the networking preferences differ in that experienced teams establish more linkages with suppliers. Another comparison on environmental scanning activities showed that entrepreneurial teams with prior start-up experience engages in more explicit tracking of activities and tactics from competitors, special market research studies, information exchange with academia, and utilized monitoring and surveying to identify potential investors compared to that of novice teams.

Introduction

Entrepreneur as an individual is selected as the unit of analysis in most studies. This may be the tradition in studies exploring venture’s foundation stage. Some research exploring venture’s success after it comes to existence focus on individual entrepreneur with an assumption that the new business is an extension of the founding entrepreneur (Chandler, and Hanks 1994). There is limited number of research done to explore the outcomes of efforts in starting a business i.e. whether they could succeed in staying in business. Moreover, types of entrepreneurs such as novice and experienced entrepreneurs have become a variable in these studies only recently. Research distinguishing these types bases definitions on whether entrepreneurs have start-up experience or not.
However, Wiklund and Shephard (2008) underline the existing disagreement over definition of novice and habitual entrepreneurship types. In this study, we focus on novice and experienced entrepreneurship from the perspective of entrepreneurial teams. An entrepreneurial team is a novice if there are no members with prior founding experience. A novice individual, therefore can fill the experience gap by the experiences of other members in the team, which makes the team as a whole an experienced one.

Our approach therefore rests on the Upper Echelon Theory which emphasized that top management teams exert a great influence on strategic choice in their organizations and argued that the managers’ cognitive bases are the mental guidelines which support their decisions and which accordingly affect the results in their companies (Wiersema, and Bantel 1992; Finkelstein, and Hambrick 1990). The shared cognitions of team members were found to influence the company results (Hambrick, and Mason 1984; Wiersema, and Bantel 1992; Knight, Pearce, Smith, Olian, Sims, Smith, and Flood 1999; Canella, Pettigrew, and Hambrick 2001; Camelo-Ordaz, Hernandez-Lara, and Valle-Cabrera 2005).

Similar to top management teams, most definitions consider entrepreneurial teams as comprising of members who hold significant ownership stakes in the venture and/or involved in strategic decision making (Ucbasaran, Lockett, Wright, and Westhead 2003). Evidence based on the superior performance of ventures owned by entrepreneurial teams relative to those owned by a solo entrepreneur suggests that entrepreneurial teams matter as in top management teams (Cooper, and Bruno 1977; Roure, and Maidique 1986; Weinzimmer 1997). In contrast to the top management team literature, however, the study of entrepreneurial teams has been constrained by methodological problems. For
instance, unlike the earlier studies based on publicly available data on the demographic characteristics of the top management team governing large established firms, such data on entrepreneurial team members are unavailable. Therefore, despite recognition of the importance of entrepreneurial team composition, research in the area is still in its infancy. With the present study, an important need will be partially met concerning existing literature.

**Novice and Experienced Firms: Theory and Hypothesis**

Organizational demography suggests that group demographic characteristics or social compositions can affect group decision making, which then influences organizational outcomes. Pfeffer (1983) suggested that organizational demography was an important construct, and that the entire organization’s demographic composition may partially explain organizational outcomes. Organizational demography may account for various organizational outcomes, such as change, adaptation, innovativeness and performance. For instance, long tenured work groups would be less adaptive and innovative, since they would develop rigidity to established practices and become insulated from critical areas (Pfeffer 1983). Moreover, cohort studies (e.g. McNeil, and Thompson 1971) suggest that tenure gaps in an organization would create conflicts between newcomers and veterans.

Relationships between the demographic composition of the top management team and organizational outcomes such as innovativeness have been searched. It is found that young, short-tenure and highly educated teams are relatively more innovative independent of the type of industry (Bantel, and Jackson 1989, O’Reilly, and Flatt 1989). Top management team members’ organizational tenure, on the other hand, was found to
be significantly associated with strategic persistence, or absence of change (Finkelstein, and Hambrick 1990; Grimm, and Smith 1991; Wiersema, and Bantel 1992).

The differences between novice and experienced entrepreneurs are explored by other researchers at individual level. Baron (2008) studied two groups and found dissimilar age, life history, educational background, etc. Davidsson and Honig (2003) and Diochon, Menzies, and Gasse (2008) found education being unrelated to starting and sustaining a new business. Taking together, these findings lead to the following hypothesis;

\[ H1: \text{Novice and experienced firms’ entrepreneurial teams are different with regard to average age, education, average tenure, and average organizational tenure.} \]

Wiklund and Shepherd (2008) argued that experienced entrepreneurs more often organized subsequent actions by creating independent organizations unlike novice entrepreneurs who are more likely to organize portfolio entrepreneurship within existing firms. Considering the differences highlighted in literature, we hypothesize that;

\[ H2: \text{Entrepreneurial teams in novice and experienced firms are different with regard to how they form their businesses, e.g. firm size, entrepreneurial team size, and team formation modes.} \]

Small businesses have limited capacities in terms of resources; therefore, they outsource certain parts of the value chain and cooperate with other economic actors with complementary assets. External linkages have an important role in the acquisition of these assets and identification of innovative opportunities. Referred to the need for establishing external networks Hakansson and Snehota (1990) defined network as “the web of relationships of an organization with identifiable counterparts”. In order to
enhance innovative activities, firms should be embedded in socioeconomic networks consisting of long-term webs of relationships with customers, suppliers, financiers, competitors, universities, trade associations, etc. (Granovetter 1985). The strategic actions take place within the framework of these relationships (Fletcher, and Hardill 1995). Firms enter into relationships with these parties for variety of reasons. The most important one is to obtain information and resources necessary in the adoption or development process of innovation (Hendry, Arthur, and Jones 1995). Organizational learning theory suggests that external integration and boundary learning expansion efforts, for instance; bringing in knowledge from outside the organization, enable firms to explore new theory-in-use (Argyris, and Schon 1978) and knowledge which at the same time facilitates radical innovation (Shu 2005). Social capital theory also highlights the importance of relations whereby social capital creates a context for social interactions and facilitates the formation of new linkages (Spence, Schmitpeter, and Habisch 2003) to boost innovative activities.

Entrepreneurial team’s involvement in networking activities suggests an advantage from resource dependency perspective. Entrepreneurs leverage their business contacts to access resources needed and networking might at the same time minimize costs of acquisition of such resources. The resultant contacts may present opportunities to obtain particularly information which may be crucial for small businesses. Baron and Henry (2006, 2008) suggested that the experience acquired in time helped entrepreneurs to develop their effective network building skills. Among these, cognitive approaches exist aiming to find out how both types respond to typical decision-making problems when creating a new business (Dew, Read, Sarasvathy, and Wiltbank 2008).
research findings particularly are of interest with regard to identified difference in establishing partnerships. Experienced entrepreneurs are found to develop partnerships with stakeholders and brought on board more frequently by experienced entrepreneurs. Also, Westhead, Ucbasaran, and Wright (2005) suggested that experienced entrepreneurs have accumulated skills and experience that enable them to discover additional business opportunities. Thus;

$H3$:  *Experienced firms engage in networking more than novice firms.*

Firms have to gather information by scanning and controlling their environments in order to adapt the changes, survive and flourish, because environments create both threats and opportunities for firms (Hambrick 1982; Daft, Sormunen, and Parks 1988). Since the environment is full of unstable and unpredictable events, organizations are affected from the environment more than any other factors (Duncan, 1972). Yet, the processes of scanning and interpreting environmental changes provide the external intelligence for the people who have the authority for decision making in order to formulate strategies and implement them successfully (Elenkov 1997). According to Auster and Choo (1993), managers function as an “information processing systems” that receive information, direct its flow and take action based on information acquired. In order to explain the need for environmental scanning in more detail, it is necessary to define environmental layers and strategic uncertainty.

As defined by Duncan (1972), environment is the relevant physical and social factors outside the boundary of an organization that are considered while making organizational decisions. According to Bourgeois (1980), the environment can be conceptualized as having several sectors that exist in two layers. The first layer closest to
organization has direct impacts on business strategy and is called task environment. The task environment includes environmental sectors such as competitors, suppliers and customers with which the organizations have direct transactions. The second (outer) layer is called the general environment and refers to the sectors such as social, demographic and economic which indirectly impacts the organization. Sectors in the task and general environment are expected to influence scanning and other information gathering activities since they differ in uncertainty. Moreover, Miles, Snow and Pfeffer (1974) theorize that managers respond basically what they perceive. Strategic actions depend on managers’ perceptions and interpretations of the environment (Schneider, and De Meyer 1991). If the match between managers’ perceived environmental uncertainty and true environmental volatility is high, then the economic performance of a firm is also high (Bourgeois, 1985). Therefore, it is important for decision makers to notice the changes and interpret them correctly in order to make the needed adjustments to organization’s strategy or structure (Pfeffer, and Salancik 1978).

Perceived environmental uncertainty is defined as the absence of information about organizations, activities and events in the environment (Huber, and Daft 1987) or the difference between the amount of information necessary to perform a task and the amount of information which has already been obtained (Galbraith 1977). However, perceived environmental certainty by itself does not result in scanning behavior. If the external events are not considered as important for organizational performance, managers may not be interested in them (Pfeffer, and Salancik 1978). Information from important sectors of the environment may become a source of competitive advantage (Dutton, and Freedman 1984). Daft, Sormunen and Parks (1988) also mentioned that perceived sector
importance translates perceived environmental uncertainty into strategic uncertainty. Essentially, strategic uncertainty reflects the strategic value of environmental information for organizational performance.

The combination of perceived environmental uncertainty and sector importance is expected to generate a need for managers to scan events in selected environmental sectors (Elenkov 1997). As described by Hambrick (1982), environmental scanning is the means through which managers perceive external events and trends and it reduces the strategic uncertainty. According to Daft, Sormunen and Parks (1988), executives can learn about environmental sectors in various ways. They may scan the environment directly or learn from other in the organization. They may increase or decrease the frequency with which they scan, and they may select information among information modes or channels. Scanning frequency is the number of times executives receive data about environment (Hambrick 1981). Scanning mode, on the other hand, is the source or medium through which executives learn about the environment. Since managers have limited time and capacity to evaluate the all information in the environment, they tend to choose among scanning alternatives. In this research, market, technological environment and potential investors were chosen to be inspected and frequency of scanning will be used as a measure to understand the level of firms’ environmental scanning activities. Finally, we hypothesize;

\textbf{H4:} \textit{Novice and experienced firms’ entrepreneurial teams are different with regard to environmental scanning activities.}
In sum, the contribution of this paper therefore will be to show the differences between novice and experienced entrepreneurial teams with regard to entrepreneurial team characteristics, team formation modes, networking, and environmental scanning.

**Research Method**

**The Sample**

The study was conducted in the largest Organized Industrial Site of Bursa, Turkey. SMEs are defined as the economic units that have less than 250 employees and less than 25 million TL net annual sales or financial statement (http://tr.wikipedia.org/wiki/KOBI). A total of 136 companies from different sectors were determined as SMEs using the websites of Bursa Organized Industrial Site and KOSGEB (Small and Medium Industry Development Organization). Although 119 firms agreed to participate, only 77 of them returned the questionnaires. Three of these were eliminated since they were either managed by an individual rather than a team, or most of the questions were left blank. Finally, remaining 74 usable responses indicated a response rate of 62.18%.

Demographic information about entrepreneurial team members were obtained from a single respondent in each firm who was either a top level manager or owner. In literature it is argued that it is justifiable to use organization’s CEO as a single source of information if the firm is small, specialized or not diversified (Bowman, and Ambrosini 1997) More specifically, in the case of SMEs the views of a single respondent may, in fact, reflect those of the firm (Lyon, Lumpkin, and Dess 2000). Carter (2000) also defended use of single source since trying to collect information through multiple response increases cost while lowering response rate. Therefore, we collected information
on team members from a single person (general manager or an owner) from each of the entrepreneurial teams.

The entrepreneurial team is defined as two or more members who were in the firm from early stages like foundation and start-up, contribute with their efforts, ideas, or money, take managerial responsibility, work to the benefit of the firm, feel responsible to one another, as well as those who perceive themselves and are perceived by others as a social entity. Teams were regarded as novice if no member had a prior experience of founding a firm. Teams are considered as experience if at least one member had a prior start-up experience.

The top management teams of the SMEs studied ranged in size from two to twelve members, with average size being 4.04 (SD= 2.49). Totally, there were 299 members in 74 teams.

Measures

As part of the survey, demographic questions such as age, gender and education were asked firstly. Education is measured by number of years of schooling. Two items are used to measure experience; tenure in the company and general employment experience. Type of the firm was asked concerning whether the firm is a producer, seller, exporter or an importer. Firms that operate in more than one category crossed more than one boxes. Lastly, the status of the firm was asked and participants described their companies as sole proprietorship, open partnership, incorporated company, ordinary partnership and limited company.

Entrepreneurial team composition information was obtained from either managers or owners responding to the questionnaire. Questions on how they’ve got acquainted with
team members and number of team members were asked first. Afterwards, for each team member the following information was collected: age, gender, education, tenure in the company, general work experience, and occupation. Team variables that were used in the analyses such as average age, average organizational tenure and average number of years of education were calculated by summing the members’ values and dividing it by the number of members in the teams.

Using Freel’s (2003) instrument, five questions were directed to respondents to learn whether firms involved in networking activities with different stakeholders. Cooperation with customers, suppliers, competitors, universities and public agencies (such as EU, TUBITAK, KOSGEB, government offices, and other supporting agencies) for innovation-related activities are determined by forming binary dummy variables. This question is coded as one if the firms cooperated with their customers for innovation related activities during the last three years; if otherwise they are coded as zero. Same procedure is applied for the questions related with suppliers, competitors, universities and public agencies.

The firms’ environmental scanning activities are measured with nine items using a rating on a seven-point Likert-type scale in which “one” stands for “never used”, “four” stands for “occasionally used” and “seven” stands for “always used” (Henneke, and Lüthje 2007). Of the nine items, four of them are related with the activities to gather market information, three of them are referred to scanning of the technological environment and two of them are associated with the external exploration of funding for the capital required to develop innovative products or processes. These items are obtained from the scales developed by Miller and Friesen (1982) and Crick and Jones (1999).
Cronbach’s $\alpha$ for the environmental scanning scale is $\alpha_{ES} = 0.865$ which is sufficient to support of the reliability of the scale (Nunnally 1978).

**Findings**

**Descriptive Statistics of Firms and Entrepreneurial Teams of Novice and Experienced Firms**

Out of 77 firms, there are 74 SMEs found appropriate for the purpose of this study. The sectorial distribution of firms forming the sample are; 20.3% in textile sector, 28.4% in automotive sector, 10.8% in chemical groups sector, 8.1% in information technologies sector, 8.1% in metal/rubber/packaging sector and 24.3% in other businesses such as construction, printing, heating-cooling systems, logistics and consultancy.

The aim of this research is a comparison of novice and experienced firms’ entrepreneurial teams. The sample involves 41 novices, and 33 experienced small businesses. When the team members are considered, novices have 162 and experienced firms have 128 members. Among these, 217 male, 73 female members in a total of 290 members whose breakdown with respect to the types studied is given in Table 1 below together with other demographics information. The educational level comparisons are of particular interest in that more elementary school graduates are among entrepreneurial team members in novices than that of experienced firms. The entrepreneurial teams of experienced firms are slightly younger (43.09) than experienced firms (44.82) as shown by average ages. Average tenure in company for novices is 10.54 years, whereas it is 11.94 years for experienced teams. Again, average work experience of team members appears slightly lower for novice firms’ teams. However, the comparisons of novice and
experienced teams along average age ($F=0.944$, $\text{sig}=0.334$), organizational tenure average ($F=0.785$, $\text{sig}=0.379$), and average number of years of education ($F=1.996$, $\text{sig}=0.162$) showed no statistically significant differences, therefore H1 is not validated.

Formation of Business Firm and Entrepreneurial Teams

In order to test second hypothesis, we carried out successive tests. We found no difference with regard to activity areas preferred by both types (Table 2). Approximately 44% firms with novice entrepreneurial teams have micro enterprises whereas only 15% of experienced firms have the same size. Two sub-samples are detected to be significantly different with regard to size of firms ($\chi^2=12.552; p<0.05$) as can be seen in Table 3. Novices preferably found micro firms with employees less than and equal to nine. However, experienced teams mostly formed organizations with sizes ranging between 10 and 24. Concerning the legal status of firms, there is no statistically significant difference between two groups (Table 4).
The proportion of different team formation modes in both samples are illustrated in Table 4. More than half of the teams (51.2%) were formed drawing upon family members and friends in novice sample. 36.4% of experienced teams stated that they contain members particularly from family members. Experienced teams are formed among friends in general (27.3%), against 17.1% for novices. Colleagues from prior work are preferred more in novices (22.%) than experienced teams (9.1%) in forming the team. The resulting trust for family members revealed in novices are in consistent with previous research which showed that Turkish SMEs chose their top management team members with whom they have emotional kinship rather than emphasizing professional relations (Westhead, Cowling, and Howorth 2001). Chi-square test carried out shows a significant difference between two types with respect to how the entrepreneurial teams met one another ($\chi^2 = 13.683; p< 0.05$).

Since foundation, half of the entrepreneurial teams underwent changes in membership. Table 6 shows the number of entrepreneurial team members that has
changed since foundation. 41% of the novice teams have changed at least 2 members compared to 21% of experienced teams making the same number of member change.

**Networking**

Respondents’ are asked whether they were engaged in networking with customers, competitors, public sector agencies, universities, and suppliers for innovative activities in the last three years using the questions prepared by Freel (2003). The two groups of entrepreneurial teams studied differed in terms of networking with suppliers whereby experienced entrepreneurial teams cited utilization of supplier networking more strongly ($F=4.075$, $p<0.05$) as shown in Table 7.

---

Insert Table 7 approximately here

---

**Environmental Scanning in Both Novice and Expert Teams**

Environmental scanning was measured with nine items four of which were related with the activities to gather market information, three were referred to scanning of the technological environment and two were associated with the external exploration of funding for the capital required to develop innovative products or processes (Henneke, and Lüthje 2007). The overall environmental scanning activities significantly differed between two groups ($F=3.881; p<0.10$). It is found that entrepreneurial teams with prior start-up experience revealed more explicit tracking of activities and tactics from competitors, special market research studies, information exchange with academia, and utilized monitoring and surveying to identify potential investors compared to that of novice teams (Table 8).
The overall environmental scanning in novice and experienced teams are found to be statistically different \((F=3.881, p<0.10)\).

**Discussion**

Our way of defining novice and experienced firms differ from the rest in the sense that we defined firms in terms of the experience or inexperience of the current entrepreneurial teams. Since it takes more than two to carry out entrepreneurial activities, the paper contributes to entrepreneurship literature with a new definition of these types. In analysis Chi-square tests are used to test hypothesis. We hypothesized and found significant differences between novice and experienced entrepreneurial teams with respect to firm type, firm size, and an inclination for difference in number of members in the current entrepreneurial teams \((p<0.10)\).

The experienced entrepreneurial teams pay particular attention to networking with suppliers. It is apparent that experienced firms value the enormous impact of suppliers in their performance and thus they are more engaged in networking with suppliers. Supplier linkage may aim developing strategic linkages with suppliers, involving suppliers in design stage in new product introductions, in production planning and management of inventory, developing a rapid response order processing system with suppliers, placing a supplier network that guarantees reliable delivery and exchanging information with suppliers (Lee, Kwon, and Severance 2007). Consequently, supplier relationship has an
important role in determining competitiveness and ultimately, innovative capability (Ramcharran 2001; Lee, Kwon, and Severance 2007) that are critical for survival.

Moreover, nearly half of the experienced firms (14/33) in the sample operate in automotive industry. Our findings concerning the importance given to supplier relations are supported by previous works of Ramcharran (2001) who explored the degree of linkages between automotive parts suppliers and automobile manufacturers. He found significant linkages demonstrated by high correlation coefficients of the P/E (price-to-earnings) ratio of auto parts suppliers and auto manufacturers.

Prior experiences of experienced teams leverage effective information search behavior shown by environmental scanning activities. In line with the arguments in Westhead, Ucbasaran, and Wright (2005) research, experienced teams in our research revealed more engagements in tracking of competitors, market research studies, and exchanging information with academics. Collaboration with universities is critical for small enterprises as it enables them to develop technological knowledge which otherwise cannot be accomplished alone (Bower 1993). It is argued that university research is a source of significant innovation-generating knowledge which diffuses initially through personal contacts of neighboring firms (Acs, FitzRoy, and Smith 1994). Secondly, small firms may fill the internal resource deficiencies by reaching university resources (Westhead, and Storey 1995). Small firms are able to gain access to complicated technology and technical expertise whose direct employment is obstructed by internal resource limitations (Freel 2000). Such potential benefits may increase interest of entrepreneurial teams in what academicians can add to their business.
Experienced firms can be said to have a stronger tendency to engage in monitoring to identify potential investors compared to novices but with a weak significance of difference found. Identifying potential investors may aim finding new partners to the existing business or starting other businesses as in portfolio entrepreneurship. The findings show that business ownership experience in the past increases the information needs as well as information search behavior evident in networking and scanning activities.

Both networking and environmental scanning are strategic activities that influence firm outcomes. In the light of above findings, entrepreneurship programs may be designed to involve themes such as strategic partnerships, networking, and environmental scanning as part of the curriculum. Diverse networks ties enable firms to access information on potential markets and investors. Moreover, networks may also facilitate commercialization of products.

The insights gained from this research are that; with experience entrepreneurial teams develop more concern on social capital. This was evident in networking as well as scanning related engagements which may possibly target elimination of the structural limitations of small size or human capital deficiencies. Such a research identifying demographic intricacies requires more collaboration with Small Business Associations who might collect such data on an ongoing basis.

DIFFERENCES BETWEEN TURKISH ENTREPRENEURIAL TEAMS WITH OR WITHOUT START-UP EXPERIENCE

PRINCIPLE TOPIC AND RESEARCH QUESTION

Numerous researches are available in literature exploring the differences between novice and experienced entrepreneurs. Among these, cognitive approaches were employed to find out how they respond to typical decision-making problems when creating a new business (Dew et al, 2008). Baron (2008) also studied two groups and found dissimilar age, life history, educational background, etc. Baron and Henry (2006, 2008) suggested that the experience acquired in time helped entrepreneurs to develop their effective network building skills. Experience entrepreneurs are found to develop partnerships with stakeholders and brought on board more frequently by experienced entrepreneurs. Wiklund and Shepherd (2008) argued that experienced entrepreneurs more often organized subsequent actions by creating independent organizations unlike novice entrepreneurs who are more likely to organize portfolio entrepreneurship within existing firms. These findings are particularly inspirational in exploring the differences in the way these groups establish partnerships.

However, all these above have focused the issue at the individual level. On the other side, the Upper Echelon Theory denoted that top management teams exert a great influence on strategic choice in their organizations and it was argued that the managers’ cognitive bases are the mental guidelines which support their decisions and which accordingly affect the results in their companies (Wiersema and Bantel, 1992; Finkelstein and Hambrick, 1990). The shared cognitions
of team members are also found to influence the company results (Hambrick and Mason, 1984; Wiersema and Bantel, 1992; Knight et al., 1999; Canella et al., 2001; Camelo-Ordaz et al., 2004).

The research question of this paper therefore is “what are the differences between novice and experienced entrepreneurial teams with regard to demographics, networking and environmental scanning activities?”

**METHODOLOGY/KEY PROPOSITION**

SMEs from different sectors located in Bursa formed the sample of the present study. The average age of the companies, sector, size, educational levels, tenure in company, and tenure in general are among the demographics explored. Out of the 74 businesses included in the sample, 41 are identified as novice entrepreneurial team and remaining 33 firms having members in entrepreneurial team with prior start-up experience. In novice teams the average age was 43.09 (SD= 8.32) and in experienced teams the average age was 44.82 (SD=6.63). Members holding graduate degrees are more in novice teams. Females are more in novice teams (27.2%) as compared to experienced teams (22.7%).

The proportion of different team formation modes are also identified in the research.

**Networking in Both Novice and Expert Teams**

Small businesses have limited capacities in terms of resources; therefore, they outsource certain parts of the value chain and cooperate with other economic actors having complementary assets. External linkages have an important role in the acquisition of these assets and identification of innovative opportunities. Hakansson and Snehota (1990) referred to this need for establishing
external networks by saying “no company is an island” and they defined network as “the web of relationships of an organization with identifiable counterparts”. In the research respondents’ were asked whether they have engaged in networking with customers, competitors, public sector agencies, universities, and suppliers for innovative activities in the last three years using the questions prepared by Freel (2003). The two groups of entrepreneurial teams studied differed in terms of networking with suppliers whereby experienced entrepreneurial teams cited utilization of supplier networking (F=4.075, significance=0.047).

**Environmental Scanning in Both Novice and Expert Teams**

In literature it is argued that supplier relationship has an important role in determining competitiveness and ultimately, innovative capability (Ramcharran, 2001; Lee et al., 2007). Environmental scanning was measured with nine items four of which were related with the activities to gather market information, three were referred to scanning of the technological environment and two were associated with the external exploration of funding for the capital required to develop innovative products or processes (Henneke and Lüthje, 2007). The overall environmental scanning activities significantly differed between two groups (F=3.881; significance=0.051). Using comparative techniques, it is found that entrepreneurial teams with prior start-up experience revealed more explicit tracking of activities and tactics from competitors, special market research studies, information exchange with academia, and utilized monitoring and surveying to identify potential investors compared to that of novice teams.

**CONTRIBUTIONS**

The main contribution of this paper is to show the differences between novice and experienced entrepreneurial teams not only with regard to demographics, but extend comparison to networking
and environmental scanning activities that largely determine small business’ innovative capabilities. Since small businesses are important in bringing regional development their role is vital in developing countries like Turkey. The findings have policy implications to government and educators. Moreover, unlike prior research true novice entrepreneurial teams (not MBA students) are used as sample from which the data is collected.
The Social and Environment Responsibility of SMEs Potrait

**Track:** Social, Environmental, and Ethical Responsibility and Sustainability Development on SMEs

The research objective is to analyse social and environmental responsibility among SMEs in Indonesia. It focuses on social and environmental disclosure’s form such as public theme, labor theme, product & service theme and environmental theme. Also average differences of disclosure topics among business types groups are focused.

Survey conducted on SMEs listed at Jakarta SMEs promotion center on October 2009 to Januari 2010. The annual report as secondary data were analysed using content analysed method with Kruskall Wallis’s non parametric statistical to test the average differences disclosure topics within those business types groups.

Based on the test conducted, there are some significant differences among SME groups in disclose environmental and employment, while society and product & service tend to be the same form. Each of groups have a different perceptions about the disclosure topics in their annual report.

Some implications of this research are need to be considere such as methodology, aspect image management and corporate social responsibility emporcement.
Influence of Managerial Accounting Skills and Business Owner Characteristics on the Success and Growth of Small and Medium Enterprises in Kenya.

Abstract
Several studies have shown that most small and medium businesses fail in the first three years. Although a number of factors such as access to funds have been attributed to this failure, the influence of entrepreneurial capability of the business CEO has received little attention from the literature. Therefore the purpose of this paper is to investigate the influence of business owner/manager characteristics such as managerial accounting capabilities, education level, business skills and ICT experience on the success and growth of small and medium enterprises in Kenya.

Methodology
Data will be collected from SMEs in Nairobi through a self administered questionnaire and structured interviews and analyzed using descriptive statistics. In order to maintain comparability with most previous studies, the items of all latent constructs will be measured by 7-point Likert type scales (1 – Very strongly disagree; 7-very strongly agree). The items for the measurement of managerial accounting capabilities, education level, business skills and ICT experience constructs will be adapted from previous studies.

Contributions
The findings are expected to reveal the nature and extent of the influence of the factors on the survival and growth of SMEs in Kenya, and possible interventions that can be practiced by SMEs to mitigate the negative influence that usually result in business failure.

Although findings will be based on perceptions of managers rather than actual impact analysis, the paper is expected to promote development of policy and practice in the SME sector by designing management empowerment and training programs that increase entrepreneurial and managerial capabilities of SME managers in developing economies like Kenya. This will in turn increase the
rate of successful SMEs and consequently their contribution in wealth creation and poverty alleviation. Findings will also be of value to owner/managers in practice and policy making and useful to future researchers.

**Key words:** Small and Medium Enterprises, owner/manager, managerial accounting, business skills, ICT.
FINANCIAL SELF-EFFICACY AMONG WOMEN ENTREPRENEURS

ABSTRACT

As the number of women businesses owners grows worldwide, it is increasingly important to understand the factors which contribute to their success. While entrepreneurship research identifies access to human and financial capital as being important, fewer studies explore the role of sociocognitive factors such as self-efficacy or confidence in one’s abilities to perform a particular task. This research examines gender-related attitudes toward financial management. The empirical study creates a measure of financial self-efficacy (FSE) and highlights the importance of age and racial differences among women entrepreneurs. It further suggests the need for more research and possible interventions for women entrepreneurs to increase financial self-efficacy.

INTRODUCTION

In 2008 there were an estimated 10.1 million firms that are women majority-owned (50% or more), up from 7.7 million in 2006. According to the Center for Women’s Business Research, women own 20 percent of all firms exceeding $1 million in revenues. (Center for Women’s Business Research, 2008.)
A number of researchers have addressed the success factors for small firms. Less frequently mentioned is the role of sociocognitive factors in the success of small firms. Attitudinal factors include such things as a willingness to embrace the entrepreneurial lifestyle with all its attendant risks, persistence and drive, and probably most important, self-efficacy, i.e., confidence in oneself and one’s own abilities. These are characteristics that emerge in almost any case study of a successful entrepreneur, yet the research literature does very little in the way of defining or measuring these characteristics.

This research focuses on one of those characteristics – the role of self efficacy with regard to financial management - and will explore prior research that may provide insights. Weakness or discomfort in this area of management may translate into neglect of key areas or errors in judgment that can be fatal to the firm. Thus, the key research question address is “How does self-efficacy related to financial management influence entrepreneurial success among women entrepreneurs?”

First, we examine existing research related to financial management self-efficacy in education, cognitive psychology and entrepreneurship. Second, we describe an empirical study examining women entrepreneurs and their attitudes towards math-related topics and financial management. Finally, we discuss the conclusions from this analysis and implications for future research.

LITERATURE REVIEW

Education

Although relatively few articles from prior research specifically address women entrepreneurs’ attitudes toward finance, there are several articles in education that examine the attitudes of girls and women toward quantitative disciplines in general. These reveal that
women’s anxiety about quantitative subjects and lack of confidence in their abilities to deal with quantitative matter begins at a relatively early age. This in turn, influences their performance in quantitative courses, their selection of college major, and their ultimate career choices (Altman, Crothers and Blair, 2007; Jensen and Owen, 2001; Benedict and Hoag, 2002; Ballard and Johnson, 2005; Turner and Bowen, 1999; Correll, 2001; Staniec, 2004; Catalyst, 2000.)

Based on scientific evidence concluding that boys and girls learn differently, advocates propose that single-sex settings can help break down stereotyping at early ages. The goal is to help girls improve their academic performance in math and science and help boys improve their reading and writing (Weil, 2008; Perlman, 2008; Sax, 2005.) However, a separate and contradictory study funded by the National Science Foundation tested seven million students in ten states in the United States and concluded that the gap between boys and girls regarding math scores had closed although the stereotype prevails (Hyde, Lindberg, Linn, Ellis and Williams, 2008.)

**Self-Efficacy**

The term “self-efficacy” was first introduced by Bandura (1977) in social learning theory and refers to one’s confidence in ability to perform a particular task. Ten years later, it was introduced to the organizational behavior literature and was found to be associated with work-related performance, faculty research productivity, career choice, and learning and achievement (Gist and Mitchell, 1992; Gist, 1987.) Self-efficacy and stereotype threat are related in that negative stereotypes may erode confidence (perception of self-efficacy) and create a self-fulfilling prophecy that an individual is incapable of performing a task. In a study of U.S. teens, Marlino and Wilson (2003) found that girls had lower confidence (self-efficacy) in math and
finance than boys. In entrepreneurship research, “entrepreneurial self-efficacy” has been examined and is described in the next section.

**Entrepreneurship**

This phenomenon may be particularly salient as the number of women entrepreneurs continues to grow. While these numbers continue to rise, women owned business are still faced with obstacles such as start-up capital and access to networks. Many researchers question whether or not these obstacles are real or simply negative myths surrounding women entrepreneurs.

A small number of studies have focused specifically on the attitudes of women entrepreneurs toward quantitative tasks, and, in particular, financial skills and financial management (Pellegrino and Reece, 1982; Hisrich and Brush, 1984; Brush, 1991; Jones and Tullous, 2002.)

In a follow-up to the Diana Project, Brush, et al, (2004) address the question “Do women (business owners) have the requisite financial knowledge, skills and experience?” They acknowledge that historically women were less likely to study mathematics, finance and accounting but, contrary to the aforementioned research, they assert that times have changed. Citing 1998 statistics from the National Science Foundation (NSF), there is evidence that female high school graduates were more likely than males to have taken geometry, algebra II and trigonometry, and almost as likely to have taken calculus. They state “The math skills hurdle is one of perception (emphasis added) rather than reality, yet its persistence continues to plague women seeking capital.”

Several studies in entrepreneurship have investigated the relationship between entrepreneurial self-efficacy (ESE) and the intention to start a new venture (Wilson, Kickul,
Marlino, Barbosa, Griffiths, 2009; Barbosa, Gerhardt and Kickul, 2007; Wilson, Kickul and Marlino, 2007; Zhao, Seibert and Hills, 2005; Boyd and Vozikis, 1994.) ESE is a measure of the confidence an individual has in one’s ability to be an entrepreneur. Wilson, Kickul and Marlino (2007) examined the relationships between gender, entrepreneurial self-efficacy and entrepreneurial intentions among adolescents and MBA students. Entrepreneurial self-efficacy was measured with a 6-item self-assessment 5-point Likert scale that included “being able to solve problems,” “making decisions,” “managing money,” “being creative,” “getting people to agree with you,” and “being a leader.”

Given the increased attention toward ESE as an explanatory variable for entrepreneurial intentions, McGee, Peterson, Mueller and Sequeira (2009) further refined the construct by developing a multi-dimensional measure of ESE. The ESE construct is consistent with Bandura’s (1977, 1997) assertion that self-efficacy has greater predictive power when it is domain specific. Few studies have further disaggregated the ESE construct (managerial, marketing, financial, etc.) but there is some research to support that even ESE may be too general and, therefore, less rigorous than concentrating on some of its core dimensions (Barbosa, Gerhardt and Kickul, 2007; Mueller and Goic, 2003.)

**RESEARCH METHODOLOGY**

In this research we disaggregate entrepreneurial self-efficacy by examining the role of self-efficacy in financial management. Our construct corresponds to “managing money” in the Wilson, et al. studies and “implementing financial” items in the McGee et al. ESE construct. To explore the attitudes of women entrepreneurs’ financial management, we collected data via the Internet using SurveyMonkey. The research team attempted to adhere to the principles for constructing Web surveys outlined in Dillman (2000). The survey was initially administered to
several cohorts of women in an entrepreneurship training program, and then a convenience sample of women entrepreneurs. We elected not to collect a comparative male sample since the research objective is to understand women entrepreneurs’ views and not how they compare to men (Ahl, 2006, 2004.) To increase the sample size we utilized the snowball technique by leveraging our professional contacts and networks. Firm-level questions solicited information about how long respondents owned their business, type of business, how they acquired their business, number of employees, annual sales, profitability and sources of funding. Individual-level questions asked for information about the respondents’ financial management skills, attitudes toward quantitative academic courses, and awareness of the perception that women are not proficient in financial management, education, age, and race.

RESULTS

Of the fifty-one respondents, 47.1% owned their businesses for less than 5 years and 63.0% were start-ups. These percentages only include respondents who started their businesses themselves and not with a partner or family member. Three quarters (74.5%) had never owned a business previously, and more than half (53.9%) had no full-time employees other than themselves. Of the thirty-seven respondents who had a business that was up and running 35.3% reported annual sales of $50,000 or less and over a third indicated that their business were profitable. Respondents were primarily split between the following two age groups 40-49 (39.2%) and over 50 (37.3%). Additionally over a third had a graduate degree (39.2%). While the majority of the respondents identified themselves as White over a third of the respondents identified themselves as woman of color (i.e. African American or Hispanic) (35.2%).

Table 1 summarizes responses to an open-ended question regarding attitudes and past experiences with math-related topics and current level of confidence with their financial
management skills. In the anecdotal comments in Table 1, it is noteworthy that many respondents had difficulty with math-related subjects in school, but enjoy the bookkeeping function for their firms. This suggests a disconnect between women’s experience with math-related academic subjects and financial management within the context of their companies. Although several consider finance to be uninteresting and boring, they are confident that they have the ability to learn what they need to know and, if not, they will get outside assistance. The Center for Business Women’s Research states that two-thirds of all women business owners with firms with over $1 million in revenues seek outside assistance for financial advice (Center for Women’s Business Research, 2006).

With regard to rating their skills in financial management, the sample was almost evenly divided into three groups; about a third indicated that this was an area of weakness for them (29.4%), a third indicated that they had adequate skills (33.3%) and slightly less than a third perceived their skills as very good or excellent (31.4%). In evaluating confidence in their financial management skills, about a fifth of the women had no confidence or little confidence (19.6%) while more than a third (35.3%) were confident or very confident with the majority being somewhat confident (45.1%). Moreover, when asked about their confidence regarding their abilities to undertake to the successful financial management of their company slightly over a third of respondents (35.3%) were somewhat confident in their abilities with the majority (60.8%) either confident or very confident in their financial management skills. When asked to describe their attitudes towards quantitative subjects in high school or college, almost half of the
respondents (48.9%) said they avoided them or didn’t like them. Conversely, over a third (34.7%) stated that they enjoyed quantitative subjects and/or took as many as possible. Of the fifty-one respondents over half (68.0%) took care of their family finances alone. Additionally over a fifth (22.0%) participated in this activity with a spouse or partner. Almost two-thirds of the women business owners (60.8%) said they are confident or very confident about their ability to undertake the tasks related to the successful management of their firms.

Correlational analyses were conducted to determine the relationship between the level of firm sales, respondents’ perceived financial management skills, overall financial management skills confidence, confidence in their ability to undertake the financial tasks related to their business, their age and education. As shown in Table 3, findings indicate that age was positively related to respondents’ perception of their financial management skills ($r=.330 \ p<.05$) and confidence in their financial management skills ($r=.320 \ p<.05$) such that older women entrepreneurs were more likely to rate their skills as excellent and more confident in these skills. Age was also significantly related to the amount of years of business experience respondents had prior to owning their business ($r=.380 \ p<.01$). Additionally, all three of the variables asking respondents to comment on their financial management skills were highly correlated with each other.

------------------------------------------

| Insert Table 2 here |

------------------------------------------

Factor analysis. An exploratory factor analysis was conducted on the variables assessing respondents perception of the financial management skills, (How would you rate your financial skills; How confident do you feel about your skills in financial management; How confident do
you feel regarding your ability to undertake the tasks related to the successful financial management of your company) to determine if the observed correlations could be explained by a smaller number of factors. A principal components extraction was used with a varimax rotation. A one factor solution accounting for 73% of the variance was obtained. Table 3 lists the factor analysis results.

------------------------------
Insert Table 3 here
------------------------------

Reliability. Reliability analysis conducted on the three variables indicated a Cronbach’s alpha of .81. Given this strong measure of internal consistency, we created a financial self-efficacy scale where high numbers indicate that the respondents express confidence in their financial management skills.

Comparison of means. One-way analysis of variance (ANOVA) was performed to test whether there is a meaningful difference between respondent’s race and their financial self-efficacy. Results indicated a significant difference between respondents on the financial management skills variable. White women entrepreneurs were more likely to rate their financial management skills higher than respondents of color F (1, 49) = 2.744, p < .10). Additionally, there was a significant difference between financial self-efficacy and age. Older respondents were more likely to rate their financial self-efficacy higher than younger respondents F (2, 48) = 3.747, p < .05). Table 4 lists the ANOVA results.

------------------------------
Insert Table 4 here
------------------------------
DISCUSSION

The results in the previous section present several noteworthy findings. First, we developed a robust measure of a financial self-efficacy (FSE) construct which is more task-specific than broadly aggregated constructs of general self-efficacy (GSE) and entrepreneurial self-efficacy (ESE.) Additionally, results suggest that age and racial differences are significantly related to FSE with Caucasians and older respondents reporting higher levels. The differences related to race are consistent with earlier research on self-efficacy and entrepreneurial intentions among teenage girls (Marlino and Wilson, 2003; Wilson, et al, 2009, 2004.)

Taken together, the empirical findings discussed above only partially attest to a lack of confidence combined with anxiety about dealing with financial management on the part of women entrepreneurs. However, this sample represents a limited group of women entrepreneurs participating in an entrepreneurial training program or already owning a business. Participation in such support programs may partially alleviate women’s anxiety regarding the quantitative aspects of management. It should also be noted that the majority of these firms had no employees aside from the entrepreneur herself. Thus, it is very likely that these entrepreneurs faced fewer financial challenges and complexity than would have been the case with larger firms. In the realm of entrepreneurship, anxiety about the quantitative aspects of management and finance may cause women to start small and relatively simple types of businesses having limited opportunities for profitability and growth. Discomfort or lack of experience with financial matters may lead them to avoid seeking external sources of financing such as banks, angel investors, or venture capitalists that would fuel new venture growth. If this is the case, women are truly at a disadvantage.
As noted above, very little research has been done on women entrepreneurs and financial self-efficacy, and our preliminary findings suggest more research needs to be done. Further study of nascent entrepreneurs and actual entrepreneurs would shed light on women’s attitudes toward finance as well as interventions that might help them to be better prepared and increase self-confidence. Some of the obvious interventions might include mentoring relationships, networks and organizations, and training and advisory programs that would help women entrepreneurs develop their financial skills. Even earlier, younger female students should be encouraged to enroll in quantitative classes and advised not to be discouraged if the material is difficult. Female teachers and faculty in quantitative disciplines could serve as role models as could female guest speakers who are either successful entrepreneurs or who play some type of financial role in an entrepreneurial organization. There is also a desperate need for more case studies focusing on women in financial roles in either corporations or entrepreneurial organizations.

In summary, although women are choosing entrepreneurship for a career path, they are not taking advantage of the full range of economic and personal opportunities that it could provide to them until they are willing to launch larger, more complex ventures in high growth industries. More research is needed to determine if this is the case, and if it is, appropriate interventions targeted toward girls and young women are warranted.

AUTHOR BIOS

Dr. Frances M. Amatucci is an Associate Professor at Slippery Rock University of Pennsylvania in the United States. She has served on the Board of the United States Association of Small Business and Entrepreneurship for several years. Her research interests are women and minority-owned businesses, social entrepreneurship, entrepreneurship finance, and innovation.
Dr. Daria C. Crawley is an Associate Professor at Robert Morris University in Pennsylvania. She earned a Ph.D. in Organizational Psychology from the University of Michigan. Her research examines the career experiences of ethnic minority expatriates, the impact of technology on student learning, and issues centering on diversity and pedagogy.

ACKNOWLEDGEMENTS

An earlier version of this paper was presented at the 2007 ICSB Conference in Turku, Finland. The authors gratefully acknowledge the research contributions of Dr. Susan Coleman, University of Hartford.

FINANCIAL SELF-EFFICACY AMONG WOMEN ENTREPRENEURS

ABSTRACT

Principle Topic and Research Question

As the number of women businesses owners grows worldwide, it is increasingly important to understand the factors which contribute to their success. While entrepreneurship research identifies access to human and financial capital as being important, fewer studies explore the role of sociocognitive factors such as self-efficacy or confidence in one’s abilities to perform a particular task.

This research focuses on self efficacy with regard to financial management - and will explore prior research that may provide insights. Although possibly one of the less glamorous aspects of entrepreneurship, nevertheless, financial management is necessary for the successful launch and operation of a small firm. Weakness or discomfort in this area of management may translate into neglect of key areas or errors in judgment that can be fatal to the firm. Thus, the key research question address is “How does self-efficacy related to financial management influence entrepreneurial success among women entrepreneurs?” This research examines gender-related attitudes toward financial management drawing from existing studies education, cognitive psychology and entrepreneurship.

Research Methodology

To explore the attitudes of women entrepreneurs’ financial management, we collected data via the Internet using SurveyMonkey. The research team attempted to adhere to the principles for constructing Web surveys outlined in Dillman (2000). The survey was initially administered to three FastTrac-NewVenture cohorts of women entrepreneurs, and then a convenience sample of women entrepreneurs. We elected not to collect a comparative male sample since the research objective is to understand women entrepreneurs’ views and not how they compare to men (Ahl, 2006, 2004.) To increase the sample size we utilized the snowball technique by leveraging our professional contacts and networks.
Firm-level questions solicited information about how long respondents owned their business, type of business, how they acquired their business, number of employees, annual sales, profitability and sources of funding. Individual-level questions asked for information about the respondents’ financial management skills, attitudes toward quantitative academic courses, awareness of the perception that women are not proficient in financial management, education, age, and race.

Correlational analyses were conducted to determine the relationship between the level of firm sales, respondents’ perceived financial management skills, overall financial management skills confidence, confidence in their ability to undertake the financial tasks related to their business, their age and education. An exploratory factor analysis was conducted on the variables assessing respondents perception of the financial management skills, (How would you rate your financial skills; How confident do you feel about your skills in financial management; How confident do you feel regarding your ability to undertake the tasks related to the successful financial management of your company) to determine if the observed correlations could be explained by a smaller number of factors. One-way analysis of variance (ANOVA) was performed to test whether there is a meaningful difference between the respondent’s race, age and financial self-efficacy.

**Contribution**

The results present several noteworthy findings. First, we developed a robust measure of a financial self-efficacy (FSE) construct which is more task-specific than broadly aggregated constructs of general self-efficacy (GSE) and entrepreneurial self-efficacy (ESE.) Additionally, results suggest that age and racial differences are
significantly related to FSE with Caucasians and older respondents reporting higher levels. The differences related to race are consistent with earlier research on self-efficacy and entrepreneurial intentions among teenage girls. These findings further suggest the need for more research and possible interventions for women entrepreneurs to increase financial self-efficacy.
START-UP ACTIVITIES AND NEW VENTURE FORMATION AMONG U.S. NASCENT ENTREPRENEURS

Diana M. Hechavarria, University of Cincinnati, USA

ABSTRACT

The process whereby formal organizations emerge from the actions and interactions of entrepreneurs has long held a privileged place in social theory (Ruef, 2003). This study contributes to existing understandings by more thoroughly investigating how team structure and venture type influence entrepreneurs' engagement in start-up activities. Applying the institutional perspective and Weick's theory of organizing enables insight into the influence structural pressures on these early start-up activity choices. This research finds that both new venture type and team structure influence the choice and intensity of start-up activities. Moreover, the data suggest that start-up activities influence new firm founding. As a result, this work may inform nascent entrepreneurs how to successfully emerge from the nascent entrepreneurial process. Findings suggest how entrepreneurs might select the type of new venture and structure of their founding team to raise the probability of success.

Keywords: Nascent entrepreneurship, start-up activities, institutional theory, Weick's theory of organizing, sensemaking

INTRODUCTION

New firms do not emerge suddenly or spontaneously, but require a great many activities and substantial effort on the part of the start-up team (Reynolds and Curtin, 2008). Individual behaviors are the principal necessary ingredients for organizational formation to occur (Gartner & Carter, 2005). Individuals, in the process of opportunity exploitation, engage in start-up activities, or actions pursued to organize and implement a new firm (Gartner, Carter, and Reynolds, 2004). Specifically, among nascent entrepreneurs, there is considerable evidence that it is what founders actually “do” that is most influential in affecting outcome status (e.g. new firm, quit, or continuing efforts) during the emergence period (Aldrich, 1999; Katz & Gartner, 1988, Shane & Delmar, 2002; Reynolds & Curtin, 2008). Therefore, the objective of this assessment is to understand how contextual features, such as type of firm and start-up team relational structure influence early choices in start-up activities.

In an effort to extend prior findings, this study examines what differences exist among the various relational “structures” of start-up teams (sole proprietor, spouse team, family team, or non-family team) and “firm types” (innovator versus reproducer firms) (Aldrich & Ruef, 2006) in regard to start-up activity execution. For instance, this investigation addresses the questions: Does it take a team or can an individual sustain start-up activities over time despite the challenges and setbacks that are germane to the entrepreneurial process? Is a closer team structure composed of family members better suited to sustaining activity or can a team of non-family colleagues sustain activities that lead to new venture formation just as well? Investigating the impact of team structure, or composition, and firm type will inform practitioners and scholars on how these factors impact start-up behaviors.

Our second area of analysis focuses on the types of activities being pursued. As there are dozens of options in regards to start-up activities, the exact mix depends on the nature of the firm, market, and how the start-up evolves. Furthermore, start-up activities can be developed into numerous typologies and taxonomies (Katz and Gartner, 1988; Carter, Gartner, and Reynolds, 1996; Delmar and Shane, 2003; Liao and Gartner, 2009), depending on the paradigmatic perspective employed. While the fundamental task of organizational creation requires the assembly and coordination of tangible and intangible resources to achieve business objectives, a large number of distinct activities are involved. Some activities are only done once (e.g., opening a bank account, or an EIN application); while other activities may continue for some time (e.g., business plan revisions, financial projection updates, or hiring employees) as the business is established and expands (Gartner, Shaver, Carter, & Reynolds, 2004; Reynolds, 2007; Reynolds & Curtin, 2008). Thus, identifying differences of engagement among classes or groups of activities can shed light on the process of organizational emergence (see Figure 1).

Most of the organizational theories take the existence of organizations for granted. Many attempts to understand success and failure at the nascent firm stage have often been conducted without an underlying theory to explain why some nascent firms succeed in becoming new firms while others do not. This analysis applies the institutional perspective in order to understand how team relational structure, and firm type interrelate in the start-up process to attain legitimacy among those actively involved in the pursuit of a new venture. The strength of the institutional perspective is that it does not have restrictive scope conditions with respect to the rationality of actors, historical time, and level of analysis. It has breadth in the sense that the socially constructed nature of “actors” can be rational individuals or seemingly irrational organizations and their environments (Scott 1987, Scott 1995; Thorton, 1999). Since behavior in organizations is motivated by the context associated with informal as well as formal structures, the institutional paradigm
affords a powerful tool to ground arguments for differences in behaviors among various types of team and firms within the start-up process.

**INSTITUTIONAL THEORY & NASCENT ENTREPRENEURSHIP**

Institutional theory is inherently difficult to explicate, because it taps taken-for-granted assumptions at the core of social action (Zucker, 1987). Institutional theory asserts that normative pressures, both external and internal, are the driving force behind why firms make decisions. These pressures often create *structures*, or patterns and rules for behavior. There are two processes that define *institutional*. First, an organization implements imitative or mimetic structures, adopting others’ successful elements when uncertain about alternatives. Secondly, the organization engages in the normative transmission of social facts, generally from external sources such as the professions (DiMaggio & Powell 1983; Zucker, 1987).

These processes of institutionalization can be formal or informal in nature. Formal structures are the official guidelines, documents or procedures setting out how the organization’s activities are divided and coordinated. Such structures are transmitted via formal rules (e.g., constitutions, laws, economic rules, property rights, and contracts). Informal structures are the undocumented relationships between members of the organization that inevitably emerge as people adapt systems to new conditions and satisfy personal and group needs. Such structures are transmitted via human interaction and relationships (e.g., values, norms, sanctions, taboos, customs, traditions, and codes of conduct).

Meyer and Rowan (1977) argue that the process of institutionalization via formal and informal structures often generates “institutional myths.” There are multiple sources of myths: public opinion, laws, courts, educational systems, etc. Organizations adopt the “vocabularies of structure” prevalent in their environment such as specific job titles, procedures, and organizational rules. These myths are applied and accepted ceremoniously within the organization in order for it to gain or maintain legitimacy in its environment. Legitimacy in the institutional environment helps ensure organizational survival. Therefore, in order to succeed, nascent organizations need to reflect so-called legitimated elements conformed by the social institutions.

In sum, the formal and informal structures of many organizations in postindustrial society dramatically reflect the myths of their institutional environments. Organizations that incorporate societally legitimated rationalized elements in their formal and informal structures maximize their legitimacy and increase their resources and survival capabilities (Meyer and Rowan, 1977). In the case of start-ups, the teams themselves would be an informal source from which these processes of institutionalization would arise. Team structure is an informal element since it captures the nature of undocumented relationships. The early stages of team formation are crucial to the development of the firm. This is because the organizational values will be based on the attributes of its members. Similarly, firm type captures the formal structure of the nascent firm. Thus, firm type serves as a signal to reassure external groups, as well as organizational constituents that the organization is legitimate. Therefore, the structure of relationships and the nature, or type of firm itself, are fundamental to understanding how people interact in a social context toward creating boundaries for a new social entity. In sum, behavior is a function of the particular context in which the actors are embedded (Zucker, 1977; Scott, 2001) and particularly useful to understand start-up activity choices.
START-UP ACTIVITIES AND NEW VENTURE CREATION

Entrepreneurial scholarship has increasingly become more focused on the examination of start-up activities in order to understand the emergence processes for nascent ventures (Gartner, 1988; Gartner and Carter, 2003). Focusing on the activity itself led researchers to look closely for those actively engaged in the start-up processes, nascent entrepreneurs. Among nascent entrepreneurs, conception of the start-up initiative is often measured by the execution of activities aimed to exploit opportunities towards organizational creation. Specific activities linked to organizational conception can include: serious discussion about starting a new organization, the formation of a founding team, public announcements regarding the intention to organize, or the public naming of a new collective identity (Ruef, 2003).

Since the basic task of organizing a new firm requires the coordination of human and financial resources to achieve business objectives, it is understood by scholars and practitioners that a large number of activities are involved (Reynolds, 2007). Reynolds and White (1997) summarize the results of two surveys tracking organizations from conception to adolescence, with each survey addressing no less than seventeen potential startup activities. The survey data suggest considerable diversity in the number of startup activities undertaken by entrepreneurs, the sequencing of activities, and the rates with which these activities are accomplished. Given this variation, the apparent pattern whereby organizations emerge has been referred to as a chaotic and disorderly by many entrepreneurial scholars (Aldrich 1999; Ruef, 2003; Audretsch & Acs, 2003). Thus, the contingent founding process can be characterized in various ways depending on the nature of the theoretical perspective employed.

For example, Katz and Gartner’s (1988) proposed typology of start-up activities, which classifies actions into (1) intentionality, (2) resources, (3) boundary, and (4) exchange relationships. Intentionality is “an agent’s seeking information that can be applied toward achieving the goal of creating a new organization” (Katz & Gartner, 1988, p. 431). Resources are the endowments that the entrepreneur brings to the start-up process, such as personal funds, time, and experience (Brush, Greene, & Hart, 2001). They include human and financial capital, property, and equipment (Katz & Gartner, 1988, p. 432). Boundary is the “barrier condition between the organization and its environment” (Katz & Gartner, 1988, p. 432). It is the space where the organization exerts some control over the resources in its environment. Exchange refers to cycles of transactions that occur within the organization (Katz & Gartner, 1988, p. 432). Katz and Gartner (1988) argue that all four properties are necessary for continuing the organizing effort. Since their original work, many scholars have applied this typology often with minor modifications.

For instance, Delmar and Shane (2002) draw on institutional (Meyer & Rowan, 1977) and evolutionary theories (Schumpeter, 1934) by classifying the various forms of start-up actions in four broad categories: (1) planning, (2) resource transformation, (3) developing marketing relations, and (4) legitimacy garnering. Shane and Delmar (2004) found in there analysis that the earlier planning and legitimating activities were initiated the higher is the probability for the new venture to survive and get established. Their findings emphasize the importance of legitimacy garnering in the new venture creation process.

Subsequently, Ruef (2003), applies an organizational ecological approach (Hannan and Freeman 1989) and categorizes activities along the lines of: (1) initiation, (2) resource mobilization, (3) legal establishment, and (4) social organization. Ruef (2003) suggests a general pattern in which the sequencing of start-up activities and the salience of contextual environmental influences interact with one another. While structural factors affect the timing of start-up activities throughout the founding process, strategic factors are more
relevant early in the sequence (especially, with respect to resource mobilization) and environmental factors become more relevant later in the sequence.

However, when Manolova, Brush, and Edelman (2009) explicitly tested Katz and Gartner’s (1998) typology they found that only three of the four properties were significant: resources, exchange and intentions, and that “boundary” was not significant to continuance of start-up efforts, after controlling for industry, the nascent entrepreneur’s demographic characteristics and human capital. These results also lend support to Ruef’s (2003) finding that environmental activities (e.g. – social organization or boundary activities) become more important later in the start-up process in order to maintain legitimization. Moreover, this also coincides with Delmar and Shane’s (2002) work that finds initiation (or intentionality) influences founding.

Although Katz and Gartner’s approach has proven useful to advance neascent scholarship, our analysis will follow Weick’s (1979) theory of organizing. Weick’s (1979) perspectives views an organization as an ongoing process of sensemaking interactions among individuals. This is because the institutional context is a necessary part of sensemaking (Weber and Glynn, 2006). Therefore, it is an appropriate perspective that aligns fittingly with institutional theory. Institutions prime, edit and trigger sensemaking through formal and informal structures. Moreover, institutions are both antecedent to, and emergent from, sensemaking processes (Weber and Glynn, 2006). Weick (1995: 35) himself calls sensemaking the ‘feedstock for institutionalization’, a view shared by Scott (2001: 96), who sees collective sensemaking activities as early processes in the emergence of new institutions (Weber and Glynn, 2006).

Carter, Gartner, and Reynolds (1996) applied Weick’s (1979) theory of organizing in their analysis of nascent start-up behaviors. Carter, Gartner, and Reynolds(1996) employ an inductive approach to categorize organizing behaviors as (1) discriminating activities, (2) precursor activities, and (3) start-up indicators. Findings from Carter, Gartner, and Reynolds’ (1996) analysis provide evidence that nascent entrepreneurs should aggressively pursue opportunities in the short-term, because they will quickly learn that these opportunities will either reveal themselves as worthy of start-up or as poor choices that should be abandoned. Thus, nascent entrepreneurs need to be keen sensemakers utilizing, perceptions, interpretations and actions to effectively exploit opportunities. As a result, we will categorize activities based on a similar inductive procedure first employed by Carter, Gartner, and Reynolds (1996) as well as Reynolds and Curtin (2009). Through this approach eight distinctive activity classes are identified from our data: (1) business presence activities, (2) product implementation activities, (3) business planning activities, (4) financing activities, (5) sweat equity activities, (6) intellectual property right activities, (7) resource activities, (8) and business registration activities (see Table 1) (Reynolds, 2007).

Business presence activities represent a class of activities that include infrastructural and legal aspects for the emerging venture. Product implementation activities are activities aimed at establishing an refining the product or service being offered. Business planning activities include activities aimed at identifying competitive environment. Financing activities center on items related to asking for and receiving first funding. Sweat equity activities include items around the personal investment of time and funds into the start-up initiative. Intellectual property right activities include items related to the protection of proprietary knowledge. Resource activities include items about the first cash flow and hiring of employees. Finally, business registration activities are related to the start-up contacting legal and national registries to list the business. Therefore, it is hypothesized that:

(H1) New firm emergence is positively influenced by the average percentage of activities
completed within the start-up activity classes of (a) business presence, (b) product implementation, (c) business planning, (d) financing activities, (e) sweat equity activities, (f) intellectual property right activities, (g) resource activities, and (h) business registration.

Although the majority of the prior research discussed controlled for team size, demographic characteristics, and gender, they did not fully explore the role team relationships/structure and venture type as antecedents to start-up activities. Institutions supply a contextual influence for sensemaking activities. Since informal and formal structures are the substance of sensemaking, the relationships among the start-up team members, as well as firm type will likely influence the frame for start-up activity execution. In turn, we can expect considerable variation in the forms of activities being pursued among the various permutations of these two factors. The subsequent discussion will elaborate on how these contextual features help shape the scope of action for nascent entrepreneurs from the institutional sensemaking perspective.

**Firm Type**

Aldrich and Ruef (2006) argue the majority of nascent entrepreneurs start small reproducer rather than innovative organizations. Reproducer organizations are defined as those organizations started in an established population whose routines and competencies vary only minimally if at all, from those of existing organizations (Aldrich and Ruef, 2006). These types of firms bring little to no incremental knowledge to the populations they enter because they organize activities in the same way as their predecessors. Conversely, innovative organizations are those organizations started by entrepreneurs whose routines and competencies vary noticeably from those of existing organizations (Ruef, 2002a; Aldrich and Ruef, 2006).

Innovative organizations face adversity because they typically depart considerably from existing routines and competencies, or their organizational field. Organizational fields are organizations that, in the aggregate, constitute a recognized area of institutional life (e.g., key suppliers, resource and product consumers, regulatory agencies, and other organizations that produce similar services or products) (DiMaggio and Powell, 1983). For instance, an attempt to combine resources in new ways may be perceived as illegitimate by outsiders, and thus negatively impact the likelihood of new firm founding. Thus, entrepreneurs whose business plans or ideas lie outside scope of understanding within their industry may not gain acceptance. However, some innovative foundings use routines and competencies that vary favorably to the outcome of new firm creation. This is often the case when innovation involves improvements that build on existing routines and competencies within a product/service class and can be adopted by existing organizations, such as process innovations (Aldrich and Ruef, 2006).

Legitimacy can be garnered via conscious assessment, also known as *cognitive legitimacy*. Additionally, legitimacy can also be attained via cultural processes, also known as *sociopolitical legitimacy*. Cognitive legitimacy refers to acceptance of a new kind of ventures as a taken for granted feature of the environment. Sociopolitical legitimacy refers to the acceptance by key stakeholders, the general public, key opinion leaders, and government officials, of a new venture as appropriate and right (Aldrich and Ruef, 2006). Since the types of actions undertaken are crucial in garnering legitimacy, specifically among innovator firms, it is important to investigate and identify differences in various activity classes among nascent entrepreneurs.

From an institutional perspective, the formal structure of reproducer to innovative firms is of critical importance because it influences sensemaking. Depending on the type of innovation, nascent firms need to garner legitimacy at different degrees through various
activities in order to effectively emerge from the founding process. For example, Honig and Karlsson (2004) found that formal structures are important predictors influencing the propensity of new organizations to write business plans. Thus, illustrating how firms attempt to attain legitimacy according to their situational context. Engagement in activities related to property rights, regulatory contracts or social security systems can make the creation of a new firm more attractive or more risky depending on the type of firm. Thus, can expect innovator firms to more readily engage in overall activities than reproducer firms to ensure survival, or new firm emergence. Therefore it is hypothesized that:

(H2) There a relationship between firm type, such that innovator firms will have a higher average percentage of activities completed within the start-up activity classes of (a) business presence, (b) product implementation, (c) business planning, (d) financing activities, (e) sweat equity activities, (f) intellectual property right activities, (g) resource activities, and (h) business registration activities than reproducer firms.

Viewing startup activities as steps toward gaining legitimacy within the environment by continually aligning organizational structure, strategy, and values with institutional norms and expectations, it is of interest to investigate if certain classes of start-up activities are also influenced by team structure.

Team Structure

In addition to a growing interest in the actual behaviors pursued, recent research also reflects a growing attention to the entrepreneurial team, which can be defined as the group of people involved in the creation and management of a new venture (Cooper & Daily, 1997; Kamm, Shuman, Seeger, & Nurick, 1990). There is no question that individuals or teams of individuals are considered to be the major factors that lead to the creation of a "new" venture, product line, or organization. The emergence of a new formal organization invariably entails a decision regarding who will participate and what they will contribute (Aldrich and Ruef, 2006). However, it is the structure of founding teams that may act as an antecedent influencing organizational creation. This is because team structure is an informal element that shapes organizational culture, and thus human behavior in the nascent venture. Consequently, how an organization begins and whether others are recruited to join the effort can have lasting consequences for the organization's survival and performance (Ruef, Aldrich and Carter, 2003).

Within this area of inquiry, Ruef, Aldrich, and Carter (2003) found that the composition of entrepreneurial founding teams reflect the tendency toward gender, ethnic, and occupational homophily in the contemporary United States. In other words, founding teams tend to be very homogenous. Founders are inclined to form teams with members who share similar characteristics along demographic attributes. Reynolds and Curtin (2008) identified that the average team is comprised of about 1.7 nascent entrepreneurs. Yet about 50% of start-ups are actually being implemented by one person. Moreover, among teams, about 45% are a spouse or an intimate pair and another 13-16% involve more than half of the ownership within a single family group. About 40% of start-up teams, or about 20% of all nascent enterprises overall (including sole proprietors), are composed of individuals with no marriage or family relationships.

From the institutional perspective, Zucker (1977) stressed the micro-foundations of institutions, as fundamental to the process by which cultural understandings are communicated to a succession of actors. Thus the team can be a considerable informal structure that drives cognitive beliefs toward behavior. Particularly, among family and spousal teams, legitimization may not be a central driving factor behind start-up activities, because members may perceive the start-up as legitimate among family stakeholders, and in
turn may engage in start-up activities differently than non-family teams and sole proprietors. Therefore, organizational myths and rituals may play a less significant role in directing start-up activities for family and spousal teams. In other words, spousal pairs and family teams perceive themselves as highly cognitively legitimate, and are not as concerned with social political legitimacy. On the contrary, sole proprietors and non-family colleagues are equally concerned with cognitive and social political legitimacy. As a result, it would be of relative importance to learn more about how types of teams complete start-up activities, and if any differences exist among them. Therefore it is hypothesized that:

(H3) There is a relationship between team structure such that sole proprietors and non-family teams will complete a higher average percentage of activities within the start-up activity classes of (a) business presence, (b) product implementation, (c) business planning, (d) financing activities, (e) sweat equity activities, (f) intellectual property right activities, (g) resource activities, and (h) business registration than spousal pairs and family teams.

Firms Type and Team Structure: Formal and Informal Sensemaking

The process of institutional sensemaking described by Weick (2005) can be studied via action. The process of sensemaking is situated in specific social-economic context, specific to each individual nascent firm. Particularly, in the earliest stages of new venture formation, the relationships among founders considerably influences sensemaking. Therefore, we could expect differences between how non-family colleagues attempt to legitimate through action versus a sole proprietor. Again, this the informal structure is crucial component that guides behavior. Formal structures are more explicit, and also guide behavior. Therefore, one can expect innovator firms to be more concerned with garnering legitimacy than reproducer firms. However, if nascent organization is an innovator firm, and seeking to garner legitimacy, does the structure of team also influence what actions are pursued to gain of such legitimacy? Conversely, if an nascent organization is reproducer firm will they more or less likely seek legitimacy according to the team relational structure? If a start-up is a reproducer sole proprietorship, will he/she not be concerned with legitimization because the sole individual deems themselves cognitively legitimate. Or, will they be more concerned with sociopolitical legitimization and thus be more concerned with engage certain activities over others to signal outsiders. In turn, this assessment seeks to determine the character of such relationships. Therefore, it is hypothesized that:

(H4) There a relationship between team structure and firm type such that there are differences in the average percentage of activities completed within the start-up activity classes of (a) business presence, (b) product implementation, (c) business planning, (d) financing activities, (e) sweat equity activities, (f) intellectual property right activities, (g) resource activities, and (h) business registration for each group.

The postulation of these hypothesis will serve as a foundation towards identifying if team structure and firm type influence the context of activity execution of in regards to institutional environments. Identifying such differences will help scholars understand why certain forms of teams and firms would more likely engage in certain classes of activities over others. Moreover, it can help discriminate possible outcome categories for start-ups based on contextual attributes.

**METHODS**

In order to investigate these relationships the Panel Study of Entrepreneurial Dynamics II (PSED II) will be utilized. The PSED II is a detailed longitudinal survey with
information on a cohort of 1,214 individuals that were identified while they were in the process of starting new businesses in 2005. Since most studies of firm organizing activities have been retrospective explorations of the startup behaviors of individuals who are already in business, there is an inherent selection bias that may confound findings. Through examining individuals actively involved in the process of organizing a new firm, our work using the PSED II addresses this selection bias limitation. Furthermore, this analysis will apply techniques univariate and bivariate statistics to describe the sample. Moreover, multivariate statistics such as Kruskal-Wallis test and multinomial logistic regression will be utilized to test the hypotheses.

**Dependent Variables**

*Activity Class.* Activity class is a taxonomic system developed from the PSEDII questionnaire, which provides information on start-up activities. Questions related to start-up actions were utilized to understand the types of behaviors respondents undertook in order to exploit the opportunity of the nascent venture. An inductive approach was employed in order to develop classes of activities. Types of behaviors were grouped into respective classes based on EFA of the PSEDII cohort. Factor analysis is a procedure for determining which activities might be pursued together and considered an interrelated domain of focus (Reynolds, 2007). The analysis indicated eight domains based on 32 start-up activities from PSEDII cohort. Subsequently, for each domain an index was created by computing the average number of total number of activities that had been initiated with in the time period of analysis. For each index the values range from 0-100%. The groups for activity classes are outlined in Table 1, along with respective reliability measures.

*Outcome.* For this assessment outcome status has three possibilities for nascent start-ups. A firm can quit the start-up process, reach new firm status, or continue in the start-up process. A firm is classified as a new firm if the respondents answers that the firm is up and running, and furthermore the ventures has experienced at least 6 months of positive cash flow.

**Independent Variables**

*Team Structure.* Team in a nominal measure that was constructed from the measures in the PSED II data set aimed at capturing the start-up team relational configuration for the prospective new venture. This information is found in section H of the PSED II codebook under “Owner Demographics.” Relational counts were computed for all combinations of start-up teams from information provided based on section H of the PSED II data set. After this procedure was completed a new variable was generated to capture the broad categories of start-up team relational structure. The new variable for team aimed to capture this structure. This variable consists of four broad categories. Individuals who were solely undertaking the start-up initiative were classified as sole proprietors. Teams that had two members and were currently married to each other while undertaking the start-up initiative were classified as spousal pairs. Teams where at least 50% of the group was related in some capacity were classified as family teams. Finally, all other combinations of individuals were classified as non-family teams.

*Business High Tech Index.* In order to measure the degree of innovator versus reproducer firms, three item index was constructed from the PSEDII questionnaire. This scale measure based on EFA of items AS4, AS5, and AS6 of the PSEDII cohort. These items are concerned with the degree of innovative focus for the prospective firm. The questions pertain to whether the product or service was not available five years prior, whether R&D spending is a major priority, and finally whether the founders consider this start-up high tech or not. The business high tech index (Cronbach α=.48) is an additive scale of responses to these questions (1= yes, 0= no). The minimum score is 0, the maximum is 3, and in turn this
construct is as an ordinal scale. In subsequent analysis, this scale is utilized as a dummy variable to facilitate interpreting specific statistical techniques. The median of the sample is utilized as the demarcation for classifying cases as either reproducer (median < 1) or innovator (median >= 1). Moreover, if such is the case, an explication will be made in the subsequent text of this assessment.

**Control Variables**

*Time.* Another factor of interest is time. Because as ventures continue to engage in the start-up process, the intensity of the effort may become a factor that influences the types of actions undertaken, as well as number of actions. As such, the lag in months from conception is utilized as a control measure in subsequent analysis.

*Team Size.* Finally, a factor of interest that may affect the degree of actions and types of actions undertaken is team size. The minimum number is 1, and the maximum amount of team member is 5. Thus, since team size has been used previously a control variable in strategic management research and organizational behavior as well, team size will be used as a control variable in this assessment.

**Sample**

The sample (N=972) for this analysis is drawn from the PSEDII cohort, from which complete case information is available among the variables of interest. From this sample, on average, the sample is about 20 months from conception and on average has two team members. The business high tech index shows that the majority of firms have a low focus towards innovation. For example, fifty-six percent of the cases are considered reproducer firms, while forty-four percent of the cases are considered innovator firms. In regards to classes of start-up activities we find that at about forty to fifty percent of the activities possible to undertake within sweat equity activities, product implementation, and business planning are activity classes have been undertaken (see Table 2). Overall, sixty-three percent of the cases are continuing their start-up efforts, while thirteen percent of cases reached new firm status, and twenty-three percent of cases quit the start-up process. Sole proprietors, represent about fifty-four percent of the cases, thus, sole proprietors undertake the majority of start-up initiatives. Subsequently, followed by spousal pairs at twenty-three percent, and non-family teams representing fifth teen percent of the cases. Finally, family teams represent eight percent of all cases in the sample.

**RESULTS AND ANALYSIS**

Bivariate analysis was completed to identify if multicollinearity was present among the set of interval and continuous measures that are part of this assessment. Findings for this analysis shows that multicollinearity may be an issue (all $r<.8$) that may affect subsequent statistical analysis (see Table 2) between business presence activities and product implementation activities. Moreover, preliminary analysis of Table 3 shows that there are significant positive linear relationship between conception (lag in months) and business presence activities resource activities ($r=.089 p=.007$), product implementation activities ($r=.130 p<.0001$), intellectual property rights activities ($r=.112 p=.001$), sweat equity activities ($r=.083 p=.012$), and business registration activities ($r=.227 p<.0001$). Thus, providing preliminary evidence that conception date may influence the degree of activity engagement. Team size is positively linearly related to business presence activities ($r=.270$.
$p < .0001$), business planning ($r = .083$ $p < .0001$), financing activities ($r = .187$ $p < .0001$), intellectual property right activities ($r = .083$ $p = .012$), resource activities ($r = .017$ $p = .031$), and business registration activities ($r = .135$ $p < .0001$). However, team size is negatively linearly related to sweat equity activities ($r = -.087$ $p = .008$). The business high tech index shows a positive linear relationship to financing activities ($r = -.071$ $p = .031$) and a positive linear relationship to intellectual property rights activities ($r = .236$ $p < .0001$). Among the classes activities we can further infer how these groups may be related to one another through bivariate analysis. For example, all the classes of start-up activities show significant relationships to one another (see Table 2), except sweat equity activities to business planning activities ($r = .015$ $p = .120$), financing activities ($r = .037$ $p = .260$) and property right activities ($r = -.039$ $p = .242$). Moreover, the percentage of participants that were innovator firms did not differ by team structure, $\chi^2(3, 972) = 463$, $p = .201$.

In order to investigate the influence of activity class, on new firm emergence (H1), multinomial logistic regression was utilized. The model fitting criteria (2LL for the overall model) shows a $p <= .0005$, therefore, we reject the null hypothesis that degree of average activities completed makes no difference in predicting the new firm emergence (see Table 3). Results for this analysis are presented in Table 3. The referent category for this analysis is new firm status. Examination of Table 3 in regards to start-up continues versus new firm shows business presence activities ($p = .030$). Therefore, a 1 unit increase in business presence activities decreases by 1% the odds of being in the start-up continues status category, controlling for other variables in the model. Product implementation ($p = .004$) is also a significant, increase in business presence activities decreases by 2% the odds of being in the start-up continues status category rather than new firm category, controlling for other variables in the model. Finally, resource activities ($p < .0001$) significantly influence outcome status, such that nascent ventures who engage in such behaviors will more 2% less likely to be in the continue as start-up compared to new firm category, controlling for other variables in the model. Furthermore, comparing new firms to firms that quit, similar patterns emerge in regards to class of activity engagement. For instance, business presence activities is significant ($p < .0005$), such that increase in business presence activities decreases by 3% the odds of being in the quit category rather than new firm category, controlling for other variables in the model. Finally, product implementation activities ($p = .025$), significantly impact outcome status, such that one unit change business presence planning decreases by 1% the odds of being in the quit category rather than new firm category, controlling for other variables in the model. Therefore, support is found for H1a-b and H1g.

To test if there are differences between reproduce firms and innovator firms in regards to the degree of start-up activities classes engaged (H2) a $t$ test was employed. This method was utilized because it is possible to assess differences among means in regards to types of activities engaged in as well by firm type. The results form this analysis finds, that among nascent entrepreneurs, innovator firms and reproduce firms engage at similar levels among classes of activities, except for intellectual property right activities which shows a significant difference ($t = -5.20$; $d.f. = 629.27$; $p < .0005$) between innovator and reproduce, such that innovators firms are 3.5 times more likely to engage in such activities than reproduce firms. Therefore, support is found for H2f.

In order to test H3, a Kruskal-Wallis and median test was employed to evaluate differences in medians among forms of teams (sole proprietor, spousal pair, family team, and non family team). The median test is a contingency table analysis that involves assessing whether the column variable (the factor) and the row variable (the continuous dependent variable) are related. In other words, the results of the median significance test are identical to those obtained by recasting the data as a two way contingency table and conducting a contingency table analysis using the crosstabs procedure. Moreover, the Kruskal-Wallis test is used when assumptions of ANOVA are not met, which is the case in this assessment since
the dependent variables are not normally distributed. Therefore, this test answers the question if the populations really have the same median. Furthermore, since the analysis for the Kruskal-Wallis test is conducted on ranked scores, the population distributions for the test variable (the scores that the ranks are based on) do not have to be of any particular form (e.g., normal). However, these distributions should be continuous and have identical forms.

A Kruskal-Wallis test was conducted to evaluate the differences among the four categories of team structure on the median completion of activities as a percentage of activities within each respective class. The test, which corrected for tied ranks was significant for seven of the eight activity classes. The results from the analysis are shown in Table 4a-4b. The Kruskal-Wallis test indicates that there is a significant difference in the medians of business presence activities \( \chi^2(3, 972) = 23.56, p < .0005; \eta^2 = .02 \); for product implementation activities \( \chi^2(3, 972) = 11.73, p = .008; \eta^2 = .01 \); for business planning activities \( \chi^2(3, 972) = 20.61, p < .0005; \eta^2 = .02 \); for financing activities \( \chi^2(3, 972) = 19.00, p < .0005; \eta^2 = .02 \); for intellectual property right activities \( \chi^2(3, 972) = 15.94, p = .001; \eta^2 = .02 \); and for resource activities \( \chi^2(3, 972) = 14.90, p = .002; \eta^2 = .02 \) among the various forms of team structure, so no significant difference was found among the sweat equity activities \( \chi^2(3, 972) = 3.53, p = .317 \) and business registration activities \( \chi^2(3, 972) = 4.74, p = .058 \).

Follow-up tests were conducted to evaluate pairwise differences among the four types of teams, controlling for Type I error across tests using Holm’s sequential Bonferroni approach. Between sole proprietors and spousal pairs, significant differences were found in business presence activities \( p = .024 \), product implementation activities \( p = .046 \), and business planning \( p = .012 \). Spousal pair team were more likely to complete a higher percentage of business presence activities, product implementation activities, and business planning activities. Between sole proprietors and family teams, significant differences were found for business presence activities \( p = .010 \), such that family teams were more likely to complete business presence activities than sole proprietors. Finally, for sole proprietors and non-family teams, significant differences were found among business presence activities \( p < .0005 \), business planning activities \( p = .001 \), and financing activities \( p = .020 \). Non-family teams were more likely to complete business presence activities, business planning activities, and financing activities. Between spousal pair and family teams, a significant difference was found for product implementation activities \( p = .013 \). Spousal pairs were more likely to complete a higher degree of product implementation activities. A significant difference was also found between spousal pairs and non-family teams among product implementation activities \( p = .035 \) and business planning activities \( p = .047 \). Spousal pairs were more likely to complete a higher degree of product implementation activities. Conversely, non-family teams were more likely to complete a higher degree of business planning activities. Finally, between family and non-family teams a no significant differences were found. Therefore, there is not complete support for H3a-h.

Subsequently, another Kruskal-Wallis and median test was employed to evaluate differences in medians among groups for H4. In order to complete this test, firm type and team structure were transformed into a single factor, representing the eight combinations of possible firm categories: (1) reproducer sole proprietor, (2) innovator sole proprietor, (3) reproducer spousal pair, (4) innovator spousal pair, (5) reproducer family team, (6) innovator family team, (7) reproducer non-family team, (8) innovator non-family team.

A Kruskal-Wallis test was conducted to evaluate the differences among the eight categories of firm combinations by team structure and firm type on the median completion of activities as a percentage of activities within each respective class. The test, which corrected for tied ranks was significant for six of the eight activity classes. The results from the analysis are shown in Table 5a-5b. The Kruskal-Wallis test indicates that there is a significant difference in the medians of business presence activities; \( \chi^2(7, 972) = 25.17, p = \)
.001; \( \eta^2=0.03 \); for product implementation activities \( \chi^2(7, 972) = 21.13, p = 0.004; \eta^2=0.02 \) for business planning activities \( \chi^2(7, 972) = 23.64, p = 0.001; \eta^2=0.02 \); for financing activities; \( \chi^2(7, 972) = 26.73, p < 0.0005; \eta^2=0.03 \); for intellectual property right activities \( \chi^2(7, 972) = 54.52, p < 0.0005; \eta^2=0.06 \); and for resource activities \( \chi^2(7, 972) = 17.06, p = 0.017; \eta^2=0.02 \). Among the various combinations of firm categories by team structure and firm type. Furthermore, no significant difference was found among the firm categories (team structure by firm type) and sweat equity activities \( (\chi^2(7, 972) = 9.75, p = 0.203) \) and business registration activities \( (\chi^2(7, 972) = 9.01, p = 0.252) \). Therefore, there is sufficient data to conclude that there is a relationship between firm category and the amount of activities completed as a percentage of total activities in each activity class except sweat equity and business registration activities.

Follow up tests were conducted to evaluate pairwise differences among the eight combinations, controlling for Type I error across tests using Holm’s sequential Bonferroni approach. The results indicated a significant difference between the reproducer and innovator sole proprietors for product implementation \( (p=0.031) \) intellectual property right activities \( (p<0.0005) \). Such that innovator sole proprietors where more likely to execute a higher degree of intellectual property right activities than reproducer sole proprietors. Conversely, reproducer sole proprietors will complete a higher degree of product implementation activities than innovator sole proprietors. Similarly, significant differences were also found between reproducer sole proprietors and reproducer spousal pairs among business presence activities \( (p=0.11) \), and financing activities, \( (p=0.056) \), such that reproducer sole proprietors were more likely to execute more action in each respective activity class than reproducer spousal pairs. Between reproducer sole proprietors and innovator spousal pairs, again, intellectual property right activities show that innovator spousal pairs execute more activities in this category \( (p=0.25) \). Moreover, reproducer sole proprietor showed significant differences to reproducer family teams among business presence \( (p=0.052) \), product implementation and \( (p=0.001) \), sweat equity activities \( (p=0.11) \). The data provides evidence that reproducer sole proprietors complete more product implementation and sweat equity activities than reproducer family teams. However, reproducer family teams complete more business presence activities compared to reproducer sole proprietors. Additionally, reproducer sole proprietors show significant differences among intellectual property right activities \( (p=0.002) \) and resource activities \( (p=0.037) \) to innovator family teams. Innovator family teams complete considerably more of these activities than reproducer sole proprietors. The data also provides evidence that there is a significant difference between reproducer sole proprietors and reproducer non-family teams among business presence activities \( (p<0.0001) \), business planning \( (p=0.006) \), financing \( (p<0.0001) \), and resources \( (p<0.0001) \). The data shows the reproducer non-family teams are more likely to complete more business presence, financing, and resource activities, while reproducer sole proprietors are more likely to complete more business planning activities. Finally, between reproducer sole proprietors and innovator non-family teams, significant differences are present in the classes of business planning \( (p=0.027) \), intellectual property rights \( (p<0.0005) \), and resources \( (p=0.046) \). Innovator non-family teams more readily execute activities in the resource, intellectual property class, and reproducer sole proprietors in the business planning activity class.

Likewise, comparing innovator sole proprietors to other forms of teams, similar patterns emerge. Between innovator sole proprietors and reproducer spousal pairs, significant differences are present in the categories of business presence \( (p=0.010) \), product implementation \( (p=0.004) \), business planning \( (p=0.036) \), intellectual property rights \( (p=0.002) \) and business registration activities \( (p=0.046) \). The data shows that reproducer spousal pairs will more readily engage in business presence, product implementation, business planning, and business registration activities than innovator sole proprietors. Conversely, innovator sole proprietors engage in more intellectual property right activities than their counterparts.
Between innovator sole proprietors and innovator spousal pairs, we see significant differences in product implementation (p=.014), business planning (p=.007) and business registration activities (p=.039), such that innovator spousal pairs are more active in each category. Innovator sole proprietors are also significantly different to reproducer family teams in business presence activities (p=.045), product implementation (p=.051), and sweat equity activities (p=.042). Such that innovator sole proprietors complete more sweat equity and product implementation activities than reproducer family firms. However, reproducer family firms complete more business presence activities. Similarly, innovator sole proprietors and innovator family teams show a significant difference for business planning activities (p=.035), such innovator family teams execute more business planning activities than innovator sole proprietors. Additionally, innovator sole proprietors and reproducer non-family teams show significant differences among business presence activities (p<.0005), business planning (p=.001), financing activities (p<.0005), and resource activities (p=.002). The data provides evidence to suggest that reproducer family teams are more likely to complete these activities than innovator sole proprietors. Finally, between innovator sole proprietors and innovator non-family teams, significant differences are found between business planning (p=.003) and intellectual property rights (p=.001) because innovator non-family teams are executing more activities in these classes.

Examining the relationship between reproducer spousal pairs and innovator spousal pairs there are significant differences between the completion of property right activities (p=.017). Innovator spousal pairs are more likely to complete these activities than reproducer spousal pairs. Additionally, between reproducer spousal pairs, and reproducer family teams, significant differences are found for product implementation activities (p=.001), where reproducer spousal pairs are more likely to complete a higher degree of such activities. Furthermore, for reproducer spousal pairs and innovator family teams a significant difference in median ranks is present among the intellectual property activities (p=.002). The data shows that innovator family teams are more likely to engage in these activities over reproducer spousal pairs. Between reproducer spousal pairs and reproducer non-family teams significant differences are found among business planning (p=.034), financing(p=.017), and resource activities (p=.002). Reproducer non-family teams are more likely to complete a higher percentage of activities than reproducer spousal pairs. Finally, among reproducer spousal pairs and innovator non-family teams, the only difference in activity classes is for intellectual property rights (p<.0005), such that innovator non-family teams will complete more activities in this class than reproducer spousal pairs.

Accordingly, between innovator spousal pairs and reproducer family teams significant differences were found among product implementation (p=.001), sweat equity investments (p=.031). Innovator spousal pairs are more likely to complete product implementation activities than reproducer family teams, and reproducer family teams are more likely to complete sweat activities than innovator spousal pairs. However, between innovator spousal pairs and innovator family teams there are no significant differences in the completion rate of activity classes according to median rank. Conversely, reproducer non-family teams are more likely to complete a higher percentage of financing activities (p=.006) versus innovator spousal teams. Finally, among innovator spousal pairs and innovator non-family teams, there is a significant difference in intellectual property right activities (p=.003) such that innovator non-family teams are more likely to complete more activities in this class than innovator spousal pairs.

Comparing reproducer family teams and innovator family teams, the data provides evidence of a significant differences in sweat equity activities (p=.050) and intellectual property right activities (p=.048). Where innovator family teams are more likely to complete activities in these classes versus reproducer family teams. Subsequently, between reproducer family teams and reproducer non-family teams there is a significant difference in
sweat equity activities \((p=.042)\), where reproducer non-family teams are more likely to complete more activities in this class than reproducer family teams. Finally, as one would expect, there is a significant difference between reproducer family teams and innovator non-family teams among intellectual property right activities \((p=.002)\), such that innovator non-family teams more readily engage in this activity class over reproducer family teams.

However, between innovator family teams and reproducer non-family teams, no significant differences are found among activity classes. This is also the case, between innovator family teams and innovator non-family teams. Finally, there is a significant difference between reproducer non-family teams and innovator non-family teams in regards to intellectual property right activities \((p=.001)\), such that innovator non-family teams more readily engage in this activity class over reproducer non-family teams. Therefore, these results provide sufficient evidence to support \(H4a-d\) and \(H4f-g\).

**DISCUSSION**

The findings from this analysis provide preliminary insights into how team structure and firm type may influence activities undertaken in the start-up process, and in turn new firm emergence. Particularly, it was found that business registration, product implementation, and resource activities distinguish new firms from quits and continuing start-up efforts. Consequently, there is initial evidence that certain types of activities can influence new firm emergence more considerably than other activities.

Moreover, the data provides evidence that the context for sensemaking, and subsequently action, is shaped by formal and informal structures. Innovator firms more readily engage in activities related to intellectual property rights versus their reproducer firm counterparts. Sole proprietors, spousal pairs, family businesses, and non-family business differ considerably among business presence, product implementation, business planning, financing, intellectual property right, and resource activities. Spousal pairs engaged in business presence, product implementation, and business planning activities at higher rates than sole proprietors. Spousal pairs also engaged in higher rates of product implementation activities than non-family teams. Also family teams engaged in more business presence activities when compared to sole proprietors. However, non-family teams engaged at higher rates in business planning. No significant differences were found for family teams when compared to non-family teams.

Furthermore, there are differences in the medina rank of the average percentage of activities completed business presence, product implementation, business planning, financing, intellectual property activities and resource as a function of team structure and firm type. No significant differences were found for sweat equity activities and business registration activities as a function of teams structure and firm type. The non-significant findings for sweat equity activities and business registration activities may be a consequence of how the structure of the institutional environment is clearly defined to guide action among entrepreneurial actors. The social and political structure has rules and norms that emergent forms must complete in order to legitimate to the nation-state as an economic entity, and in turn to meet these requirement time and money, or sweat equity investments, are required. However, their is a less explicit guide for how to engage within the other start-up activity classes. Therefore, we can identify tangible differences between the type of team and type of firm and activity class engagement. As a result, the data provides evidence that different team structures and firm types work together to influence the context of start-up actions aimed at garnering legitimacy from outsiders.
The road a start-up takes on its way to emergence never well paved or clearly marked. But for a innovator firm that road can be more treacherous due to new routines that are not pre-established. Therefore, through completion of start-up activities, nascent ventures attempt to legitimate to outsiders their purpose and value through activities. An organization is deemed to be legitimate by the extent to which its means and ends appear to conform to social norms, values and expectations (Dowling & Pfeffer, 1975). Legitimacy is attributed to an organization by its constituents (Perrow, 1970). It helps the organization attract resources (Parsons, 1960), and can be assessed by the level of resource transactions flowing into an organization (Terreberry, 1968). Most importantly for the field of entrepreneurship, legitimacy is a valuable resource which enhances an emerging organization’s odds of survival (Aldrich & Fiol, 1995; Rao, 1994; Singh, Tucker & Meinhard, 1991; Suchman, 1995). This study has found that indeed there are differences among innovator and reproducer firms and team structure in regards to start-up activity completion. For instance, the finding that reproducer sole proprietors and reproduce spousal pairs seem to spend significantly more time business planning than their counterparts may exemplify that smaller teams are more likely to be more meticulous about identifying ways to legitimate, than teams with more members, who can act more quickly to exploit opportunities. Also, it can be that for sole proprietor and spousal reproducer firms the actions needed tp emerge are more explicit than tacit. Supporting Myer and Rowan (1977) argument that firms conform by mimicking legitimate firms are granted legitimacy which enhances the resource flows to the firm and in turn the firm’s chances of survival. Therefore, for smaller reproducer teams omission of business planning can be seen neglectful. Since the omission of some of the prevailing practices and procedures institutionalized by society makes the firm vulnerable to claims it is negligent, irrational or unnecessary and being denied legitimacy (Meyer & Rowan, 1977), and subsequently hindering emergence probabilities for the start-up.

Limitations

There is preliminary evidence that team structure and firm type influences class of start-up activity engagement, but, subsequent analysis of follow-up wave data is need to better comprehend such differences, and identify emerging patterns in activity completion. Also, a weakness of this assessment is that in certain instances the measures constructed show low reliability. Although, EFA analysis was completed by using both PSEDI and the PSEDII cohort to avoid construction of measures that were sample dependent, certain measures in the activity class domain were below the standard conventional Cronbach α=.80. This may be a function of generating measures from an interview schedule, with out having a prior notion about the construction of the desired measures of interest. Therefore, it is recommend that future research within this domain of inquiry pre-test and develop more reliable measures. Resolving these issues will require more information over a longer proportion of the start-up window and must wait until more follow-up interviews are completed. Furthermore, analysis over subsequent waves may also reveal a more nuanced picture of the start-up processes where the degree of engagement and class of activity changes significance based on sequencing of events. Finally, future research should examine more closely smaller windows of start-up periods to examine how tangible formal an informal structures are on start-up activity execution.

Contributions

This research makes four important contributions. First, it extends our understanding of legitimacy by developing a predictive and descriptive model of how firms attempt to gain legitimacy through the execution of start-up activities. Second, we extend prior research by linking legitimacy to a desired organizational outcome, new firm
emergence. Third, we examine the impact of contextual features for firm type and team structure upon individual firms in regards to their legitimization efforts. Finally, we provide nascent entrepreneurs with practical suggestions on actions they might take to maximize their emergence probability during the tenuous start-up phase.

The question of what actions a nascent entrepreneur can take to increase the legitimacy of his particular firm has yet to be addressed in an empirical study. We have identified that business presence and product implementation are the most fundamentally important activities towards legitimacy garnering between firms which reach new firm status versus firms still trying and those who quit. Also, resource activities significantly differentiate those who reach new firm status and those who continue in the start-up phase. Therefore, nascent entrepreneurs should pay careful attention to planning, although it does not significantly influence outcome status, it guides activity appropriately toward legitimacy garnering based on firm structures, as exemplified by reproducer sole proprietors and spousal pairs who engage more readily in these activities.

CONCLUSION

In sum, this research addresses the contextual factors that prompt and sustain start-up activities, and will inform entrepreneurs and scholars about the limitations and advantages of different start-up team relational structures as they relate to different types of new ventures. Insofar as we find relational structures predict both short and longer term activity levels, our research sheds light on the team dynamics and institutional theory literatures as well. Finally, this work provides insights into how teams should be composed so that team members prioritize wisely and sustain activities that lead to new venture formation. Since, there is no one particular way in how organizations emerge because there is no one particular kind of organization that results as an outcome of the start-up processes (Weick, 1979; Gartner, Mitchell, and Vesper, 1989). Research that can both recognize variation in the phenomena of organization creation, while also offering insights into how these diverse activities might lead to patterns of successful formation of organizations is needed and required.

Figure 1. Theoretical Model
Effective SME development depends on both strategy and its implementation. Indeed, implementation may be more important than the strategy as strategy is ineffective without implementation. Most SME performance management is financial. However, total business performance depends on more than this, because resources are not only financial, and also because there are complex causal relationships between resources, operations and customers that drive the achievement of an SME’s objectives. The CEO of a medium-sized SME will lead an interactive and practical workshop sharing his experiences on how multi-level performance management can help SMEs to overcome its barriers to growth and performance.
SaaS as a Growth Enabler for SME Software Companies

Lessons Learned from Finnish Software Companies

Software as a Service (SaaS) has been one of the biggest hypes in the software industry during the past few years. SaaS is a business model where the developer offers the software as a hosted service. Customers do not have to care about technical details or software maintenance, and can start using the software with a web browser almost immediately. Other key characteristics usually connected to the SaaS business model are: on-demand nature, scalability, usage based pricing models and reduced need for technology investment- and maintenance costs. Size of the global SaaS business was 6.6. billion dollars in 2009, with a growth rate of even 30% per year.

While a large part of the SaaS market comprises of large well established SaaS providers, the SaaS business provides many opportunities also for SME software companies. There are many SaaS characteristics functioning as factors for growth:

1. The service nature of SaaS products, their scalability and flexibility to customers' needs, and usage based pricing model provide the customers value that typical software products cannot offer.

2. The high "productization" rate of SaaS products, enabling a single SaaS product to cater various customer groups, and the global and immediate sales channel via Internet expand the potential customer base of SaaS products, especially compared to IT services.

3. SaaS model enables efficient one to many service model: single codebase and single instance of a SaaS product serve all its customers. This greatly reduces maintenance cost.
on the provider side, yet providing mass tailoring through parametrization. This lowers the cost per customer, enabling profitable growth for providers and also savings for customers.

4. Focusing on core software offering provided via Internet offers opportunities for provision of true value adding services. This create yet new business opportunities, for example third party service providers to offer the support services lacking from the original offering and, thus, pave way for growth of SaaS-based business ecosystems.

However, SaaS is not a silver bullet. Deep understanding of the SaaS business model and hard work are required to gain the full benefit from the SaaS business model as a growth enabler. An SME who plans to utilize the SaaS business model has also to understand the fundamental requirements and limitations of the business model. Achieving low cost per user is critical in SaaS business, and requires an attitude shift from on-premise model. Also, in many cases the SaaS business model does not only enable but also require growth in terms of large customer base.

In this paper, we present a qualitative study where the SaaS potential of several Finnish SME web-software companies are analyzed. The analysis was done by evaluating the companies' products through their web sites and publicly available product demos. The details of the offering was studied by identifying which growth enabling SaaS characteristics the offering contained. The subjective analysis on the maturity and growth potential of the SaaS offering was also done.

The results of the study show that many of the companies utilize the principles of SaaS when developing their technical product architecture. This allows them to offer the software with usage-based pricing models and with otherwise flexible terms. However, surprisingly large number of
companies were reluctant to give exact information on how to buy the product and what are the pricing terms on their web sites. Based on the analysis, many of the companies do not fully meet the characteristics of the SaaS model and, therefore, have lowered growth potential. This may lead problems when companies grow larger and especially when they enter the international market. The result of the study provides valuable lessons for SME software companies aiming at growing using the SaaS business model.

The paper is part of a larger research project, which aims at analyzing SaaS opportunities for both software vendors and buyers in Finland. The paper uses entrepreneurship/growth literature as basis for analysis for the SaaS literature is almost non-existing in the SME/entrepreneurship field. Therefore, the paper adds to the academic literature in a new research area. Additionally, academic business model literature is rare in entrepreneurship/SME fields. Practical implications can assist existing software SMEs in their growth aspirations and prevent them from making the same mistakes as their predecessors have undergone.
Scaling social impact: An open innovation perspective
by Benedetto Cannatelli and Brett Smith

This paper presents a theoretical model connecting three strategies for spreading social innovation – branching, affiliation and dissemination – to an organization’s confidence in achieving expected social impact and revealing new potential value. To this aim, we leveraged the open innovation paradigm as a theoretical lens to explain how the adoption of porous organizational boundaries affects on the likelihood and magnitude of social value created through scaling. Our model predicts that a strong relationship exists between the adoption of an open organizational structure and the likelihood to reveal potential social value. In addition, the similarity of the context where the social innovation will be scaled moderates this relation. Our paper contributes to the growth of knowledge in the social entrepreneurship field by suggesting new directions for further inquiry and to the extension of the explanatory power of the open innovation paradigm in the social sector.

Keywords: Social entrepreneurship, scaling, value creation, social innovation, open innovation.

Introduction

Scaling social impact has been identified as one of the most important variables within the social entrepreneurship field (Bradach, 2003). According to existing literature on this issue, social entrepreneurs can spread their social innovations to scale-up their impact by adopting different strategies (Taylor, Dees and Emerson, 2001). In particular, previous contributions succeed in relating each strategy to the nature of the innovation and the degree of control exerted by the parent organization on the social solution to be spread (Dees, Anderson and Wei-Skillern, 2004). While scholars have identified different paths to scaling, relatively little is known about the likelihood and magnitude of social value creation through various scaling approaches.
Precisely, what is missing is the extent to which social innovation’s likelihood to fulfill stakeholder expectations and to reveal potential value varies among the different scaling strategies. Understanding how different paths to scaling may affect the likelihood and magnitude of social value creation is important for social entrepreneurs, funders, policy makers and beneficiaries.

In order to address this issue, we recall the notion of open innovation from the technology management field (Chesbrough, 2003). We borrow some constructs that assume central importance within this theory and use them as lens to advance some propositions. In particular, constructs like boundaries permeability (or boundaries openness) and false negatives, constitute useful tools to bridge the degree of control exerted by the parent organization on the social innovation through scaling and the likelihood of revealing potential value.

To bridge this gap we focus on social value as an outcome of the scaling process by addressing two interrelated constructs: expected and potential value creation. Our argument suggests that the extent to which these two sub-dimensions of social value created can be predicted depends on the boundaries permeability of the parent organizations. Hence, social organizations adopting scaling strategies implying high control over the innovation to be spread (consistently to a closed innovation approach) will be more likely to accomplish for expected value but will be less disposed to unmask potential value, as it happens by adopting scaling strategies more prone to open innovation.

In this work we advance some theoretical propositions predicting relationships between scaling strategies and social value in terms of expected and potential value creation. Later on, the mediating effect of the environmental conditions will be introduced to deepen the analysis.
Finally, insights stemming from these propositions will be advanced in the discussion session in order to assess their relevance for the social entrepreneurship field.

**Literature review**

**Scaling impact in the social sector**

In the last decade, the notion of social entrepreneurship has been widely considered as one of the most promising means that human society can put in action to challenge long-standing problems that affect needy communities (Nicholls, 2006). In his seminal work, Dees (1998) defined social entrepreneur as that actor who “plays the role of change agents in the social sector, by: adopting a mission to create and sustain social value (not just private value); recognizing and relentlessly pursuing new opportunities to serve that mission; engaging in a process of continuous innovation, adaptation, and learning; acting boldly without being limited by resources currently in hand; exhibiting a heightened sense of accountability to the constituencies served and for the outcomes created.”

Previous research on this filed conceptually positioned social entrepreneurial activities between commercial entrepreneurship and government policies domains (Weerawardena & Sullivan Mort, 2006). On one side, the particular target of customers and the prominent focus on value creation for society rather than on economic value capture for the organization, approaches social entrepreneurship to governmental actions (Peredo & McLean, 2006; Santos, 2009). On the other, the entrepreneurial process that leads social entrepreneurs to opportunity recognition, innovation, resources mobilization and performance measurement draw up it with its commercial counterpart (Mair & Marti’, 2005; Austin, Stevenson & Wei-Skillern, 2006; Zahra, Rawhouser, Bhave, Neubaum, & Hayton, 2008).
As a largely phenomenon-driven research field, social entrepreneurship offers several areas of inquiry and calls for accomplished explanatory approaches from other disciplines, such as organization science, strategy and innovation management (Mair & Marti’, 2005; Peredo & McLean, 2006; Weerawardena & Sullivan Mort, 2006). One of the most relevant topics within the social entrepreneurship domain is the issue of scaling social impact (Bradach, 2003). That is, the entrepreneurial mindset of social organizations leaders often pushes them to spread their social innovations, enhancing their impact to needy communities. According to previous research, two main directions have been detected as viable patterns to scale social impact, namely scaling deep and scaling up (Taylor, Dees and Emerson, 2001). While the first refers mainly to achieve greater penetration of the target client population by improving the quality and the range of the services offered (Taylor, Dees and Emerson, 2001), scaling up pertain those efforts to spread social innovation in dispersed geographical areas, so increasing the number of target beneficiaries around the globe (Dees and Anderson, 2004).

The global-oriented attitude of social entrepreneurship studies field has been probably the main reason that led research focusing primarily on scaling up dynamics, so shifting research efforts from scaling deep. Being well conscious of that, we don’t take exception from the main research stream: even if it is a more beaten track than the deep dimension, we retain that several gaps still exist in the breadth dimension that premise for relevant contributions in expanding knowledge within the field.

Previous research on scaling up can be classified according to three directions. The first stream focused on capabilities required by social organizations to scale up their impact (Bloom & Chatterji, 2009; Bloom and Smith, forthcoming). In these works, authors deductively formulated and empirically tested a model (named SCALERS model) to predict which
capabilities should be developed by social ventures to effectively promote a social change in geographically dispersed areas. The second direction is the one taken by Gregory Dees and others to detect strategies undertaken by social ventures to spread their social innovations to broaden their impact geographically (Taylor, Dees & Emerson, 2001; Bradach, 2003; Dees, Anderson & Wei-Skillern, 2004). In these studies different forms of social innovation – principles, programs and organizational models – are spread among new contexts according to three main strategies – dissemination, affiliation and branching – that differ mainly for the degree of control exerted by the parent organization on the innovation process and on the key elements of the theory of change replied in the new context. The third dimension refers to the interaction between the social organization and the ecosystem in which it is embedded (Bloom & Dees, 2008). To be more precise, this stream of research stands in the social entrepreneurship field independently from the issue of scaling; nevertheless, the ecosystem (or the context) has been considered as a key dimension across capabilities and strategies streams (Bloom & Chatterji, 2009; Bloom & Smith, 2010; Taylor, Dees & Emerson, 2001).

The aim of this paper is to deepen knowledge on strategies and ecosystem streams. More specifically, some theoretical propositions will be advanced to link each scaling strategy – as conceptualized by previous research – to its potential for fulfilling organization’s expectation on value created by spreading social innovation. Indeed, a deeper understanding on how and why different scaling strategies lead to different confidence by the parent organization on value created and for unmasking potential social value in a new context is of great relevance for social ventures looking for spreading their innovation abroad.

In formulating those propositions some paradigms belonging to both the social and commercial entrepreneurship spheres will be recalled as explanatory logic. Among the latter, the
The notion of open innovation assumes a main role as theoretical argument on which connection among constructs is built.

**Open Innovation**

The notion of open innovation was introduced by Henry Chesbrough in his seminal work (2003) to explain successful innovation stories from Silicon Valley. The main idea underlying open innovation is that firms operating in fast developing markets must favor an increasing flow of knowledge across the organizational boundaries to enhance success, by challenging the traditional assumption that “innovation requires control” (Chesbrough, 2003).

By observing how successful firms operating in the information and communication technology ICT industry in the Silicon Valley like Xerox and IBM changed their attitudes in developing and commercializing innovation, he proposed some new assumptions underlying the innovation process in high-technology and high-speed-changing industries. Open innovation was defined by Chesbrough and colleagues (2006) as “... the use of purposive inflows and outflows of knowledge to accelerate internal innovation, and expand the markets for external use of innovation, respectively”, has been later on used as a valuable paradigm to explain innovation dynamics in industrial sectors characterized by a less degree of technology, such as chemical, banking and consumer packaged goods (Chesbrough, 2003; Chesbrough & Kardon Crowther, 2006).

Open innovation contributes to the fields of technology and strategic management by suggesting and exploring some elements such as boundary permeability, intermediate innovation markets, active intellectual property management, open business model, inbound and outbound flow of knowledge and innovation ecosystem (Chesbrough, 2003; 2007; Lichtenthaler 2009;
Enkel et al. 2009; Almirall & Casadesus-Masanell, 2010). Among them, some constructs seem promising for the development of knowledge in the social entrepreneurship field, too.

In particular, three reasons can be accounted to justify our attempt. First, its particular focus on value creation rather than just on value capture (Chesbrough, 2007) constitutes an overlapping area with previous research in the social sector (Austin, Stevenson & Wei-Skillern, 2006; Mair & Marti’, 2006; Santos, 2009). Second, approaching innovation at both product and process levels as unit of analysis is consistent with some conceptualizations previously advanced in the social innovation field (Phills Jr, Deiglmeier & Miller, 2008; Dees , Anderson & Wei-Skillern, 2004). Lastly, the notion of “organizational boundaries permeability” or “boundaries openness” (Chesbrough, 2003; Laursen and Salter, 2006) matches the organizational settings underlying most social ventures engaging in spreading innovation strategies.

Indeed, open innovation constitutes by itself a relevant field of inquiry. By adopting it as theoretical lens explaining the relationships that follow, some theoretical contributions to this field also emerge as outcome of this study. In particular, the applicability of the open innovation paradigm to scaling strategies advances knowledge on open innovation in two ways. First, it extends its explanatory power to new sectors characterized mainly by the offering of services rather than products (Gassmann, Enkel & Chesbrough, 2010). Second, by focusing mainly on how the social innovation flows from inside the organization toward external actors, this study responds to the call for further studies to advance knowledge on the outbound process of open innovation (Lichtnthaler, 2009; Gassmann, Enkel & Chesbrough, 2010).
Scaling strategies and value creation

Scaling-up strategies and social innovation

Strategies adopted by social organizations to spread their innovation in geographical dispersed areas constitute the independent variable of the model. Relying on previous studies on scaling social impact, three main strategies – branching, affiliation and dissemination – emerge along a continuum as the most common patterns undertaken by social organizations willing to broaden their social value creation (Taylor, Dees & Emerson, 2001; Bradach, 2003; Dees, Anderson & Wei-Skillern, 2004).

Social innovation has been defined as “a novel solution to a social problem that is more effective, efficient, sustainable, or just than existing solutions and for which the value created accrues primarily to society as a whole rather than private individuals” (Phills et al., 2008). The general acceptation of the word “solution” suggests that social innovation can assume different forms according to the theory of change underlying the actions taken by the organization. Consistently, Dees, Anderson & Wei-Skillern (2004) detected three forms that social innovation can assume when spread in new contexts, namely principles, programs and organizational models.

**Branching** – To a higher degree of control over the social innovation to be spread among new contexts, branching strategy is the option that guarantees the higher potential for central coordination and that requires the greatest investment of resources by the central organization (Dees, Anderson & Wei-Skillern, 2004). According to previous works within the domain, branching is intended as the scaling strategy in a strict sense ranging from franchising
agreements to centrally owned branches that share a particular organizational model (Taylor, Dees & Emerson, 2001; Bradach, 2003).

**Affiliation** – This approach – that fall in the middle of the scaling strategies continuum – offers the higher degree of flexibility for replying innovative solutions to social problems. Affiliation assumes the existence of a network of organizations that share principles, learned lessons or programs to enhance impact among different regions (Taylor, Dees and Emerson, 2001). Compared to branching, scaling impact through affiliation strategies implies a lower degree of control over the innovation process (Dees and Anderson, 2004). Another distinction between the two patterns lies in the dynamics according to the innovation is spread: while in branching the innovation is “pushed” by the parent organization toward new contexts, “affiliation” assumes the presence of local actors that “pull” the innovative solution from the original context and reply it to benefit their target community.

**Dissemination** – At the other end of the continuum, operating principles and lessons learned by a social venture through its previous experience are allowed to reach a number of organizations around the globe to suggest suitable patterns to create social impact (Taylor, Dees & Emerson, 2001). Dissemination is the scaling strategy that guarantees the lower degree of control over the social innovation spread: according to this pattern, social actors located all around the world can easily gain access to the innovator knowledge and reply it, similarly to an “open source” approach (Dees, Anderson & Wei-Skillern, 2004).

A key-aspect that is worth highlighting is the extent of control that each strategy exerts on the components of the theory of change that has to be replied through scaling, in particular on the inputs and the activities considered by the innovator to foster social change. The degree to which
control on input and activities is held by the parent organization, impacts seriously on output, outcome and, finally, on value created for target community (Childress, 2008). To notice this interrelationship among components of social organizations’ theory of change is worth as it will be recalled further as supporting element of our model.

**Value created by scaling-up**

Issues related to value orientation have been typically accounted as main source of difference between commercial and social organizations. While some authors advance a distinction between economic and social value (Dees, 1998; Certo & Miller, 2008) – by meaning the former as pertaining the sphere of profit oriented firms and the latter as main goal of the social organizations – others solves such a dichotomy by relying on a trade-off between value capture/appropriation and value creation (Austin, Stevenson, & Wei-Skillern, 2006; Mair & Marti’, 2006).

In the development of this article we rely on the latter distinction. In making this choice, we substantially agree with the arguments brought about by Santos (2009), who suggests that economic value creation is inherently social and that the notion of “social” poses inevitable measurement problems. Instead, relying on the notion of value creation has a two-fold advantage toward the goal of this study. First, such a notion helps building a valuable criterion in drawing a boundary between commercial and social entrepreneurship domains. Second, the notion of value creation is of central importance also in the open innovation paradigm: relying on similar constructs contributes significantly to theory generation in terms of consistence.

The value creation construct is implemented as main dependent variable of our model. Nevertheless, compare to previous theories advanced in the field, we explore two sub-
dimensions that are included in the notion of value creation and that assume great relevance for
the organization management dealing with decisions about scaling impact.

**Confidence on expected value created** – Regardless of the strategy adopted to scale-up its
impact, a social organization holds some expectations on the magnitude of value that will be
created by spreading its social innovation. Whether the scaling process is promoted directly by
the parent organization or is it put in act by a local organization replying a solution that was
successful in another context, the innovator (i.e. the actor that conceived the innovation) aims to
assess in advance to what extent the new target community will benefit from his innovation.
Indeed, this construct refers to the innovator’s expectation on the value to be created by
spreading his social innovation.

**Unmasking potential value created** – As it is replied in new geographical context, a social
innovation is sometimes likely to generate even greater value than in the context in which it was
originally conceived. This is particular relevant to those organizations that aims to foster local
experiments to increase their potential for providing social benefits. When put forward in new
contexts a particular solution can meet even greater consensus and mobilize more resources as it
did in the original context, so revealing a potential elsewhere masked. Unlike confidence on
expected value created, this construct aims to catch to what extent a social innovation – that was
spread through any strategy – is able to exceed the value expected by the innovator.

Confidence on expected value and likelihood for unmasking potential value created vary
according to the strategy adopted to spread social innovation. In the following sections some
theoretical propositions explaining interaction among these variables are formulated and discussed.

**Expected and potential value in branching strategies**

Social organizations scaling their impact by means of branching strategies exert a high degree of control over the innovation process run among the new target community (Dees, Anderson & Wei-Skillern, 2004). Indeed, by successfully replying its organizational model in a new context, a social venture manages to keep under control both the inputs and the activities included in its theory of change, so guaranteeing uniformity in the procedures (Bradach, 2003). Precisely, branching strategies are consistent with the closed innovation paradigm, by privileging the adoption of *impermeable organizational boundaries* to keep direct control on the innovation process (Almirall & Casadesus-Masanell, 2010). Thus, the only way the social innovation can be delivered to the target community is through channels presided or allowed by the parent organization. Low external influence leads to low variance among the inputs considered and the activities put in act in the original and in the new context. It follows that a low gap between the outputs and, finally, the value created is to be expected. So, the first proposition states as follow:

**P1: Spreading social innovation through branching strategies is associated to high confidence on the expected social value created.**

According to the open innovation literature, open and closed innovation paradigms differ substantially in their ability to unmask *false negatives* (Chesbrough, 2003). By that, Chesbrough refers to those technologies that, regardless to their apparent limited potential, reveal an unhoped-for success by being implemented in out-of-target markets by other actors able to foresee the opportunity. In spreading social innovation, unmasking false negatives means
identifying viable inputs or activities in the new context that can increase organization’s theory of change potential for impact. Since branching strategies are characterized by rigid theory of change structures, the likelihood to which different inputs or activities will be taken in consideration is low. Hence, control exerted over the social innovation process through branching strategies prevents social organizations considering different inputs and activities available in the new context to generate a greater impact. Consequently, proposition # 2 states:

**P2:** *Spreading social innovation through branching strategies is associated to a limited likelihood of unmasking potential social value.*

**Expected and potential value in dissemination strategies**

Whereas branching strategies imply a closed innovation attitude, dissemination strategies respond to an open innovation paradigm. According to open innovation, organizations adopt *porous organizational boundaries* reducing control over the innovation process (Chesbrough, 2003). In dissemination, a social venture allows external (not being part of the original organization) actors access to its innovation process and autonomy in implementing the innovation in a new context (Dees, Anderson & Wei-Skillern, 2004). This way, the effectiveness of the social innovation strictly depends on how the elements (input-activities-output) of the new organization’s theory of change are close to the original. Low control on the social process by the parent organization increases uncertainty on how innovation will be used by the new provider. Consequently, variance of outcome and social impact created is widened, reducing the degree of confidence on the expected social value. Hence, proposition # 3 states:

**P3:** *Spreading social innovation through dissemination strategies is associated to low confidence on the expected social value.*
Consistent with open innovation, dissemination strategies imply low control over the innovation process. Open innovation challenges the traditional assumption that successful innovation requires control by acknowledging that “not all the smart people work for us” (Chesbrough, 2003). It follows that probabilities to unmask false negatives are high if people from outside the organization get access to internal knowledge. In fact, by allowing external actors implement social innovation autonomously, there is high probability that even different inputs and activities that are viable in the new context will be considered and implemented in the original theory of change increasing its outcome and its impact. The wider variance of outcome and social impact expected allows for exceeding desired social value. So, proposition # 4 states:

P4: Spreading social innovation through dissemination strategies is associated to a high likelihood of unmasking potential social value.

Lastly, affiliation strategy for scaling impact contains a wide range of viable patterns that differ in the strength of the relationships between the innovator and the entities implementing the social innovation in the new areas. Precisely, social organizations aiming to scale-up their impact through affiliation usually rely on inter-organizational networks to deliver successfully their innovations (Taylor, Dees & Emerson, 2001). Presiding over a network allows the innovator to exert control over network members to a lesser degree than it happens in branching strategies. In particular, information flowing within the network is likely to foster homogeneity between organizations with regard to the activities led but it can afford less control over the input selection process, given the absence of rigid mechanisms in loco to guarantee uniformity. On the other side of the coin, adopting porous organizational boundaries opens for a higher likelihood for unmasking potential value. Affiliation should be hence positioned in between branching and
dissemination strategies with regard to both confidence on expected value and likelihood for unmasking potential value.

Table 1 Scaling strategies and expected/potential value

In summary, effectiveness of scaling patterns strictly depends on the degree of control that the innovator aims to keep on the innovation and the goal that he aims to achieve through value creation. Indeed, figure 1 synthesized dissemination, affiliation and branching attitude toward expected and potential value. In particular, it can be easily detected that, assuming neutral propensity toward expected and potential value, a social organization will chose its strategy – among the x axis – that maximizes the sum ($Y_1 + Y_2$), that is the amount of value created.

![Figure 1 Scaling strategies and expected-potential value creation](image)
Environmental conditions as moderator variables of the model

The model illustrated until now predicts how the strategy undertaken by a social organization is likely to fill expectations on the magnitude of value created through spreading its social innovation.

Nevertheless, scaling social impact implies dealing with external conditions that vary – even significantly – among different environments (Alvord, Brown & Letts, 2004; Smith & Stevens, forthcoming). As consequence of their hybrid nature – standing in between the entrepreneurship and the social domain – a social innovation spread in a new geographical area must be consistent with different settings that depend from political, economic, geographical and cultural dimensions (Bloom & Dees, 2008).

Political conditions – Policy exerts influence on suitability of a social innovation by shaping the opportunity structures in a particular region (Marquis & Huang, 2009). In particular, by settling regulatory effects on entry, exit and market structure it contributes in defining to what extent a particular need can be satisfied by traditional market mechanisms (Wholey & Sanchez, 1991). Indeed, by stating rules, regulations and public support, policy shapes the boundaries of the domain in which the social entrepreneur operates.

Economic conditions – Economic contingencies affect the extent to which a social solution is valuable in a given context as they determine if a particular service can be delivered to the customers without compromising organization’s financial sustainability (Dees & Bloom, 2008). For example, community’s income per capita is an economic condition that decides on the potential of success of the service provided (Nohria, Dyer & Daltzell, 2002).

Geographical conditions – Geographical location plays a relevant role in assessing solutions implementation across different areas. Geographic dimension affects entrepreneurial behavior by
determining to what extent it is seen as being at work for society (Steyaert & Katz, 2004; Smith & Stevenson, forthcoming). Moreover, conditions of existing infrastructures play a key-role in determining service deliverability and usefulness (Dees & Bloom, 2008).

**Cultural conditions** – Cultural factors influence organizational and forms (Marquis & Huang, 2009). Several studies have been conducted to demonstrate how organizations tend to embody the institution in which they are embedded (Haveman & Rao, 1997; Haveman, Rao & Paruchuri, 2007). In particular, in his seminal work, Hofstede detected how four sub-dimension of culture influence organizational structure and motivation of people within organizations (Hofstede, 1980).

When a social organization evaluates scaling strategies by spreading its social innovation, it must consider in advance to what extent the new target context presents similarities to the ecosystem in which the innovation was originally conceived. According to the political, economical, geographical and cultural settings, a target area can be more or less supportive to run a particular theory of change. Such variability is taken into account in our model by introducing the *context similarity* construct.

Precisely, low similarity between the original and the new target context imply a significant difference in the inputs available to run and support the innovation. Whether such diversity in input availability leads to an apparently more supportive or more restrictive environment, low context similarity reduces innovator’s capability of control over the components of the theory of change, regardless of the spreading strategy adopted. In fact, low context similarity has a significant effect on widening variance among the expected value created for society through scaling. This is particularly relevant, especially for branching strategies as it exerts a moderating
effect by lowering confidence on the expected value created. Thus, proposition # 5 states as follow:

*P5: Low similarity between the original and the new target context reduces the confidence on the social value expected through branching strategies.*

![Figure 2 Scaling strategies and expected-potential value creation – Low context similarity](image)

On the other side of the coin, the moderating effect of a high context similarity should be explored. In particular, the extent to which a social innovation benefits (i.e. generates more social value than expected) from an open innovation process depends largely on the likelihood new users replay it by implementing new inputs and activities that can increase outcome and social impact. Assuming that the innovator is close to maximize value created upon the original context, there are low probabilities for new users to exceed desired social impact if there are not supplementary viable inputs and activities in the new context. So, similarity between the original and the new context moderates the extent to which new users can “do better” than the original organization. It follows that, when political, economical, geographical and cultural conditions
among the two contexts converge, dissemination strategy’s power for unmasking potential value is significantly reduced:

\[ P6: \text{High similarity between the original and the new target context reduces dissemination strategies’ likelihood for unmasking potential value.} \]

As represented in figures 2 and 3, context similarity influences organization’s decision making with regard to the scaling strategy to be pursued. In particular, as political, economic, geographical and cultural conditions diverge between the original and the new setting, branching strategies are likely to decrease their power for delivering the social value expected. This contingency challenges particularly those organizations planning to scale-up their impact internationally, for example in developing countries where different religions and cultural background can engender different reaction to the solution proposed. Or, again, it could be the case of an innovation to be scaled in developed regions in which political legislations in force commit themselves to significant different degrees to support that cause. In this case the amount
of value that could be created \((Y_1 + Y_2)\) is likely to be maximized relying on more open strategies: by empowering local actors through dissemination or affiliation, potential value can be easily unmasked by implementing new inputs and activities in the theory of change.

As anticipated, the choice concerning the scaling strategy to be adopted could change radically when the new target context presents similarities with the one in which the innovation was originally conceived. The availability of inputs overlapping those of the original context reduces the likelihood that more powerful solutions to the same social problem could be designed through the same innovation. It follows that giving up control over the innovation could breed no advantages, reducing attractiveness of open strategies. Graphics 3 shows how value created \((Y_1 + Y_2)\) is significantly low upon dissemination strategies due to the flattering of the likelihood for unmasking potential value function.

**Discussion**

The propositions advanced in the previous section suggest a relationship between the level of control exerted by the parent organization on the social innovation and the confidence on expected and potential value creation. Indeed, similarity of the context to be reached through scaling must be taken into account as it affects each strategy attitude toward value creation by moderating such relations.

Awareness of such relations assumes primary relevance in the field of social entrepreneurship as they predict the extent to which stakeholder expectations of social impact likelihood and maximization can be successfully fulfilled. In fact, as a social organization attempts maximizing its social impact through scaling, it is of critical importance for it evaluating the spreading innovation process to assess effectiveness of its plan.
Expected and potential values lend themselves to different degrees of measurability. While expected value is likely to be forecasted and, consequently, stakeholders may already hold suitable tools to measure its social value, the nature of the potential value created can often not be accurately predicted in advance.

This issue leads to problems in assessing correctly the impact exerted through scaling. This is particularly true for scaling strategies close to the dissemination end of the continuum, where the innovation is handled by local organizations and the control exerted by the parent organization is limited. In these situations, organizations spreading their impact through dissemination should also develop open measurement scales that can be shared and co-developed with the local organizations running the innovation in new contexts. That is: when adopting porous boundaries an open approach is needed also at the measurement level in order to correctly account for the whole impact created. On the contrary, scaling plans implying strong control over the social solution – like branching strategies – often results in outcomes that can be easily assessed through standard measurements already developed and tested by the innovator. Accordingly, effective and proven measurement techniques will be adopted by each branch.

The extent to which social impact generated is predictable and measurable assumes great significance also at the funding level: social organizations relying – even partially – on donations and grants usually need to present their desired social impact to potential funders willing to assess in advance the social return on their investment. As consequence of the low predictability of the open innovation outcome, social entrepreneurs adopting dissemination strategies could face some difficulties in effectively communicating their potential impact to potential investors. On the other side, social organizations relying on more closed strategies would face fewer
constraints planning a detailed social return on their investment but may face unique challenges in offering sufficient social value potential to investors who are trying to change the world.

However, investors’ decisions to finance a scaling project do not depend only on predictability and measurability of the impact, but also on its magnitude. Indeed, when investors’ attitude to risk increases – so that, they are willing to assume a greater amount of risk for a higher potential return – dissemination could be a preferable option than branching strategies: this is the case of well-recognised curses that affect society to a great extent (for example AIDS/HIV), for which solutions need to release a great extent of value to be effective. In addition to that, it must be underlined that social organizations depending on open innovation can rely on funding streams activated by local organizations implementing their innovation. This way, they lighten the burden of liabilities of the central organization. The choice between strategies at the two ends of the continuum strictly depends on the nature of the social innovation to be spread, to the goals that stakeholders aim to achieve and, as predicted by proposition 5 and 6 by the similarity of the context to be reached. In fact, context similarity has to be taken into account to deal effectively with both measurement and funding issues, as they mitigate in turn benefits of both branching and dissemination strategies.

Recalling the notions of boundaries permeability and false negatives was critical to explain relationship between scaling strategies and the two dimension of value creation. However, we acknowledge that the open innovation paradigm could still provide contributions to the social entrepreneurship field at different level of analysis. First, in our argument we focused just on scaling-up strategies without addressing mechanisms related to scaling deep strategies. Research questions in this stream would need to address questions like: which role open and closed innovations play in scaling deep strategies? How do they affect predictability of expected and
potential value? Which factors do moderate these relations? Second, in our work we discussed open innovation mainly as outbound process – that is, dynamics according to innovations flow out of the organizations boundaries to be implemented and developed by other actors. In other words, we stood just from the innovator perspective (the one who conceived the innovation and share it with others): how do open innovation works when intended as strategy to embody knowledge coming from the external environment? Under which conditions local organizations and start-up social ventures can benefit by opening their boundaries to implement successful social innovations in their context? Third, even if we concentrate mainly on value creation, open innovation offers interesting insights on how a balance between value capture and value creation can be achieved: how this balance can be reached in the social field? How can it be useful for those organizations struggling to achieve financial sustainability? Lastly, in our work we explore the consequence of the adoption of porous boundaries: further studies could focus on this construct as dependent variable: this would be particularly important to detect motives that lead to the adoption of open innovation in the social field: are these the same as in the commercial entrepreneurship field? Under which points are they similar? To what extent they differ? Such a study would contribute to the field of entrepreneurship by highlighting connections between its commercial and social modes.

**Conclusion**

This paper advanced theory on social entrepreneurship by formulating ten propositions linking three viable strategies for scaling social impact – namely, branching, affiliation and dissemination – with their propensity to emphasize expected and potential value creation. Precisely, two main contributions emerge as direct outcome of this study.
First, a model explaining how different strategies for spreading social innovation fulfill the organization’s priority in terms of expectation on value created has been developed. Moreover, by introducing context similarity as mediator variable it has been possible to predict under which situation the three strategies maximize their potential for value creation. These findings have great significance in terms of contribution to social organizations management.

Second, some constructs that assume a key-role in this model like organizational boundary permeability, external control over the innovation process and potential for unmasking value creation are borrowed from the idea of open innovation. Even if without taking into account all the constructs underlying the original model, this study contribute to open innovation by extending its explanatory domain to social entrepreneurship.

Lastly, we are well conscious that this model is far from being exhaustive of the factors that have to be taken into account for formulating successful scaling strategies: nevertheless we hope that it can be useful to suggest a prominent direction for further contributions to the field.

Abstract
Tourism with a truly strategic importance it has for any future national or regional economy, together with the reasons justifying the immense interest in the area of clusters and their assumed impact on corporate economic performance seems to justify the fundamental need to investigate this issue. Given the recent changes to the law of tourism areas, this study aims to identify and map clusters of tourism in Portugal, as well as evaluate their performance. Based on a multivariate analysis, three clusters were identified with different performance levels: low, medium and high performance.

Keywords: Tourism, Clusters, Mapping, Economic Performance, Portugal.

Abstract

Tourism with a truly strategic importance it has for any future national or regional economy, together with the reasons justifying the immense interest in the area of clusters and their assumed impact on corporate economic performance seems to justify the fundamental need to investigate this issue. Given the recent changes to the law of tourism areas, this study aims to identify and map clusters of tourism in Portugal, as well as evaluate their performance. Based on a multivariate analysis, three clusters were identified with different performance levels: low, medium and high performance.

Keywords: Tourism, Clusters, Mapping, Economic Performance, Portugal.

1. Introduction

Tourism is recognized as one of today’s most important economic and social phenomena. In this millennium, is this sector a structuring element of the dynamics of global economy, so that it has been affirmed as a sector of bigger importance and spread world-wide (PITER, 2005).

*NECE / Research supported by: Programa de Financiamento Plurianual das Unidades de I&D da FCT - Fundação para a Ciência e Tecnologia, Ministério da Ciência, Tecnologia e Ensino Superior, Portugal.*
According to Confederation of Portuguese Tourism - CTP (2005), the tourism sector registered in the last few decades, in the whole world, a significant increase, assuming an increasing importance in the global economy and consisting a structuring element of its dynamics. At the beginning of this century, tourism represented, in Portugal, about 10 percent of the Gross National Product and shows as a sector-key in the transformation of the national economy. Opperman (1993) states that at regional level is this sector presented as an essential tool in the development and regional economic growth, believing to be a weapon to prevent the desertification and the economic stagnation of the regions, namely in the interior. In this perspective, the competitiveness contributes largely for the construction of social, cultural and economic variable that affects the performance of a country in international markets.

Wealth creation is the engine of economic growth and an important lever of innovation (Dwyer and Kim, 2003). For Dwyer et al. (2004), competitiveness of a nation is not a proper result, but a way to reach an end, a final aim of industry development to increase people’s wealth. Due to the great unanimity that clusters increase competitiveness (Porter, 1990; Porter, 2002; Rocha 2004) and innovative capacity (Baptista and Swan, 1998; Nordin, 2003; Sölvell et al., 2006; Hospers et al., 2009) of a regional industry and due that tourism constitutes a powerful instrument of regional development (Engelstoft et al., 2006; Santos, 2007) are pertinent and crucial to argue the paper of clusters in the tourism sector. The discussion about tourism clusters is still in an embryonic phase (Rosenfeld, 1997; Nordin, 2003; Capone, 2004), justifying the reduced number of inquiries that approach that problematic. Perhaps therefore, is the concept of cluster frequently criticized for having a vague and not universal definition (Martin and Sunley, 2003; Asheim et al., 2006). Most of the cases the existence of cluster is anecdotally evaluated and only based way on case studies without any support methodology (Engelstoft et al., 2006).

The mapping of clusters, the creation of systematic data sets on the presence of clusters through many regions, allowed the accomplishment of systematic tests of the relations between clusters and the economic performance (Porter, 2003; Folta et al., 2006; Gilbert et al., 2007; Porter et al., 2007). The effects of clusters in the performance of a regional economy have been analyzed in some studies (Wennberg and Lindqvist, 2008). Porter (2003) found out that the regional economic performance is strongly influenced by local clusters strength.

In this context, essential contribution of the present inquiry is of methodological and instrumental scope, trying to consider a quantitative methodology to survey the existence of clusters in Portugal, in a relatively little explored sector by literature - tourism. After some more conceptual considerations on clusters, we will approach the topic about clusters in the tourism sector and will do a brief revision of literature namely pointing some specificities of clusters’ mapping and
economic performance. Then, we will consider and test a methodology, in a rigorous and quantified way, in order to identify, to map and evaluate the economic performance of tourism clusters in Portugal. Finally, in the conclusions we will synthesize the main points and results of the present inquiry.

2. Literature Review

2.1 Definition of Clusters

Clusters have been defined (implicit or explicitly) for some as a set of close companies in geographic terms (Swanw and Prevezer, 1996; Rosenfeld, 1997; Porter, 1998; Cooke and Morgan, 1998; Crouch and Farrel, 2001; Cooke, 2001), or situated in a specific area (Swanm and Prevezer, 1996; Cortright, 2006) that produce a product or similar service (Rosenfeld, 1997), for others as a group of interrelated industries (Simmie and Sennet, 1999; Porter, 2000, 2003), without neglecting the importance of institutions (Porter, 1998), of synergies that establish between the companies located in cluster (Roselfed, 1997) and the possible competition between them (Feser, 1998; Bergann and Feser, 1999; Ketels and Memedovic, 2008), or still as catalysts of politics for the competitiveness (Shakya, 2009).

The concept of clusters, has been, in general applied to the transforming industry (Jackson and Murphy 2002; Steinle and Schiele 2002; Nordin 2003; Cunha e Cunha, 2005), but its applicability to the services sector have been reduced, in particular in tourism. However, it has been seen in the most recent years, an exponential growth (Jackson and Murphy, 2002; Breda et al., 2004; Flowers and Easterling, 2006).

According to Porter (2003), the regional economic performance is strongly influenced by the local clusters strength, for the vitality and plurality of the innovation. Literature on clusters establishes that the agglomeration creates cheaper externalities in terms of access to the production factors (static externalities), as well as promotes the learning and innovation (dynamic externalities) through the interactive learning (Porter, 2003; Folta et al., 2006; Gilbert et al., 2007; Titze et al., 2008). Titze et al. (2008) they go farther when stating that the success of clusters in the developed countries spread quickly for the developing countries from the professional researchers’ interest, and political makers.

It is a basic conclusion that the economic activity is focused in the space and, after this, has an increasing attention for the strength of agglomeration and the local role in the economic development.
From the seminal work of Becattini (1979), that defended the use of industrial regions as basic unit of analysis, many researchers have considered industrial clusters or industrial regions, as own entity. Case studies in specific regions had framed some of the most perspicacious and remained works in industrial clusters. Among these studies there are researches of known clusters - Silicon Valley (Saxenian, 1994), the cinematographic industry of Hollywood (Scott, 2004), Kentucky Cluster Chalupa (Rosenfeld et al., 2000), Minnesota Cluster of the snowmobile industry (Munnich et al., 2002) among others. For example, Huggins (2008) presents studies of case of four clusters of knowledge, to understand how the way operandi of these clusters evolves. It studied the case of the Valley Silicon clusters (United States), Cambridge (the United Kingdom), Ottawa (Canada), and Helsinki (Finland). Ganne and Lecler (2009) edited a set of researches using three models - industrial regions, industrial clusters and polar regions of competitiveness - through a general vision on the case of Japan, China, Vietnam and Thailand.

Business Europe (2009) is optimistic when assuring that clusters are a source of job creation that stimulates innovation allowing the allotment of information between the different actors and the creation of strong synergies between the complementary sectors throughout the value chain. They are still a tool essential to foment the enterprise spirit, helping the companies to find resources, knowledge and technology and to facilitate ideas to be transformed into business-oriented chances (Porter, 2003). Clusters can reduce barriers to the entrance in the market and also foment the creation of new companies and business-oriented models. This fact is underlined by well-succeeded experiences, as the center of biotechnology in Wallonia and Solar Valley in the East Germany, where these groups appeared in the sequence of the closing of the mines and steel workshops. Clusters are part of the strategies to increase the regional competitiveness and the regional development (Business Europe, 2009).

However, there are studies that contradict these evidences related to the fact of new companies to be positively affected, not affected, or exactly negatively affected for the localization in economic cluster (Wennberg and Lindqvist, 2008). Other aspects are criticized, namely the ambiguity of the concept of cluster, the conceptual absence of social networks inside and outside clusters, as well as the lack of identity of the dimension of cluster (Asheim et al., 2006).

2.2 Clusters in the Tourism Sector

The majority of the studies on clusters falls again into the analysis of the transforming industry, existing a gap in terms of studies that lean over the services, in particular on tourism (McRae-Williams, 2002; Capone, 2004). Tourism constitutes an engine of economic development
with particular incidence at regional level, but whose national impact is also significant (Jackson et Murphy, 2002). The same authors state that the application of the cluster concept to the tourist industry is extremely appropriate due that the product interacts with the local basis, promoting shares joint of interrelated companies, leading to the formation of clusters.

Despite Porter (1998) developing studies particularly in the scope of the most traditional industries, this author relates the importance of the belonging elements to tourism clusters, stating that the satisfaction of the tourist does not depend only on appeals of the principal attraction of the place, but also of the quality and the efficiency of correlated companies - hotels, restaurants, shopping centers and means of transport.

Due of being not much the studies in this area they are also scarce, in contrast of what happens with the concept of cluster in general, the definitions of tourism cluster (Santos, 2007). Monfort (2000) defines a tourism cluster as a complex group of different elements, including the services carried through for business-oriented companies of tourism or (lodging, restaurants, travel agencies, the wealth of aquatic and thematic parks), supplied by experiences of vacation tourism; multidimensional meeting of interrelated companies and industries; communication and transport of infrastructures and complementary activities, services and the natural resources and institutional politics.

For Beni (2003) cluster tourist is a set of attractions with tourist detached distinguishing, concentrated in a delimited geographic space endowed with equipment and services with quality, collective efficiency, social cohesion and politics, joint of the productive chain and associative culture, and with excellent management in company nets that create comparative and competitive advantages. Capone (2004) states that tourism cluster is a geographic concentration of companies and institutions interconnected in tourist activities, including suppliers, services, governments, institutions, universities and competitors.

Noveli et al. (2006) add that the aim of tourism cluster is to take companies, that generally work isolated with the purpose to construct a tourist product of success in a certain region. Cunha e Cunha (2005) in its study on the impact of tourism cluster in the local development, point out with respect to a concrete definition of tourism cluster as a group of companies and on institutions to a product that is tied with its local basis and the joint share of an accumulation of entailed companies to the tourist products of the region. The participation of other actors and not only the suppliers to develop tourism cluster (Brown and Geddes, 2007). For these authors government must stimulate and finance programs to attract private investments and to invest in infrastructures, as well as promoting the tourist region once tourism cluster allows to exceed crises.
Jackson and Murphy (2002) had established an analytical framework to improve the understanding of successful tourist destinations and Flowers and Easterling (2006) had applied the theory of Porter’s cluster and the strategies of competitiveness for the industry of trips and tourism in the country of South Carolina Low Country and Resort Islands Region, where it examines the growth of tourism cluster.

2.3 Mapping of Clusters

The mapping of clusters is a relatively new approach that allows a better perception of the presence, profile and economic performance of clusters. The use of the word “mapping” mentions two basic aspects from this research method (Ketels and Sölvell, 2006): first, the mapping of clusters is based on the mapping of the classification code of industrial clusters. And secondly, the mapping data of clusters allow locating them geographically.

Sölvell et al. (2009) state that the mapping of clusters is an important step for the scientific research and clusters’ policy. According to Ketels and Sölvell (2006) the main advantage of the approach of clusters’ mapping is the comparability between its roots in the behaviour of the real company. The data of a cluster survey is an important element to understand the composition of a regional economy and the standards of geographic distribution of the economic activity of a determined category of cluster.

However, for Sölvell et al. (2009) there are discussions on the quality of the users´ data, especially in the disaggregation of the available indicators, this because they are below of the desired level for professionals and politician deciders. The following reasons are evidenced: (i) professionals need more data on its clusters to suit themselves better to the individual definitions of its clusters; (ii) there are not enough data on the impact of the politics of clusters, to give general support to the political deciders according to clusters; and (iii) the political deciders need more data to be translated in share recommendations, on what about to do and which the focus areas.

There are clear limitations that can be only faced through the slow process to improve the way as the statistical data are collected or to adopt a total different approach for the collection of data. In general, the cluster mapping has to be transformed from a tool that is useful for researchers and assessor ship of high level for an instrument with direct applicability to the clusters’ professionals (Sölvell et al., 2009).

Some research on clusters mapping has used the methodology of Porter (2003), namely on the role of clusters and the competitiveness in the stimulation of regional economies (Karen et. al., 2008), as well as in case studies of innovation clusters in Europe (COM, 2007; COM, 2008). Also
the European Cluster Observatory identified more than 200 clusters regional through this methodology.

2.4 Clusters and the Economic Performance

The economic development based on clusters became a subject each more popular for investigators and professionals of economic development (Ketels, 2003). For Gilbert et al. (2008) geographic companies located inside clusters reach a better performance in terms of innovation, of growth taxes and survival, than geographic companies not located inside clusters. Gugler and Keller (2009) add that there are substantial differences in the economic performance between the regions in all countries. This suggests that the majority of the main determinants of the economic performance is found at the regional level. Porter (2003) proposed a complementary regional approach of the regions or cities. In his investigation analyzes general indicators of the economic performance, the composition of the regional economies and the role of clusters in the economy of the United States in the period of 1990 the 2000. It offers an interesting picture for the analysis of economic performance of the regions in other countries.

So clusters can create economic benefits. Porter (1998) evidences the economic benefits of cluster in three dimensions. Firstly, clusters allow a bigger productivity. The companies can operate much more with bigger efficiency, on the basis of more specialized actives and suppliers with lesser times of reaction, than when working alone. Secondly, companies and investigations institutions they can built connections learn and to innovate better, this because the tacit information and knowledge are better developed and local interchange (OECD, 2001; Porter, 2001). Thirdly, the formation of the business tends to be bigger in groups. Start-ups are more dependent on external suppliers and partners - everything to be found in cluster. Clusters can distribute the cost of a failure, as the entrepreneurs can fall again on chances of local job into many other companies in the same field (Wennberg and Lindqvist, 2008).

These benefits are important for the cluster participants, as for the public policies. For companies, because they create additional value that many times exceed the highest costs of intense competition of property, techniques and of the customers in the place. For the public policies, bigger productivity and innovation in clusters are critical, because they are the factors that in long term, define the level of sustainable prosperity in a region (Ketels, 2003). The author adds that clusters are of professionals of economic development interest and for executives of the companies; because the conceptual thought suggests that they affect strongly the performance.
Lindqvist and Wennberg (2010) strengthen this idea stating that the located companies in strong clusters can create more jobs, greater tax collection and the wages are higher. These authors in its study had found evidences that the localization of strong clusters is highly related with the economic benefits for new companies. The enterprise strength of cluster has a strong important effect in the survival of the companies, in the creation of job, the payments of VAT and payments of wages. These effects vary in accordance with geographic level with what data are aggregated, justifying the reason for the conflicting evidences in previous studies. For the payment of wages, the results of the effect of cluster are stronger if measured at a bigger geographic level, while for the company’s survival, the results are more prominent if we group the measured effects at a lesser geographic level.

According COM (2008) it is rational to suppose that clusters are among the most excellent microeconomic factors that influence the levels of prosperity of a region. Regional Clusters and specializations are empirically associated to higher levels of prosperity. The European Cluster Observatory and other attempts of mapping of clusters - as the characterization of standards of specialization in categories of clusters (groups of empirically co-situated industries) in regional economies in Europe, North America and other countries - had given systematic tests on these links.

The role of clusters in the explanation of the economic performance of the regions was widely confirmed also for other studies, even so many are specific cases, and commented in depth and empirical scale they are extremely rare. Porter (2003) studied clusters of the United States (E.U.) where showed that the regions of the E.U have an higher ratio of its total labour located in “strong” clusters and benefit of a high level of economic development, under the way of average wage and growth of job, as well as of an high degree of patents.

Other studies had evidenced that clusters can improve the performance of new companies. Stough et al. (1998) had investigated the economic development of Washington DC in the biggest area of the United States during some decades, and found out that the creation and growth of new companies can be associated to a high concentration of qualified technique population, with high degrees of business-oriented engineering and technology. Rosenthal and Strange (2005) had investigated in 2001 all the new companies in the great metropolitan area of New York and they had evidenced that the specialization, measured with job quotients in a local area, was positively related to the job creation among the new companies. Pe'er and Vertinsky (2006) had investigated new enterprise operators in the sectors of Canadians manufacture 1984-1998 and had evidenced that the grouped companies had higher survival taxes than not grouped companies. Lima et al. (2009) had found, in an empirical study on footwear clusters, that the position of a company in cluster has positive impact in the performance of companies. According to these authors the differences in
performance between companies that integrate a cluster can be explained by the resources that are shared by these companies.

However, these results contradict other studies where they suggest that the new companies are adversely affected by the localization of cluster. A longitudinal study detailed of Dumais et al. (2002) on the plants of the United States showed in five year intervals 1972-1992, found out that new companies in clusters had greater survival probabilities, but had not positively strengthened the job creation in a region. Ketels (2003) alert to, that although cluster based on economic policy can have a great potential, it is not a panacea. In fact, the biggest danger for this approach can be its current use as a fashion that comes of “newness” in the economic development. The high imprisoned hopes when bound to economic cluster in the development can give results, however all that investigation and practice to reach this stage according to the most rigorous requirements of this new age will take long time.

Currently, the European enterprise community is convinced that the development of cluster is an important chance to follow the necessary economic changes in the next future (Business Europe, 2009). The crisis must be a catalyst for the change, a chance for a leap forward in a more enterprising and innovative society. Otherwise we have to accept that the prosperity of Europe, cohesion and position in the world will decrease gradually throughout the time. To define a strategy of an ambitious cluster, that subsists until the global challenges of competition, and that supports the emergence of clusters of world-wide class and helps to regenerate European territories to supply an essential motivation for the growth and job creation in Europe (Business Europe, 2009).

In Portugal, had been identified regional clusters as a “sub product” of a study with the aim to contribute for the development of international competitiveness of the Portuguese industry (Porter, 1994). The study detaches that the Portuguese industries have an exportation tax comparatively high. A characteristic of those industries is its frequent geographic concentration. The examples indicate, however, that several of these industries hardly constitute clusters, or they only compensate “undeveloped” clusters with a low level of interaction between companies and industries.

Gouveia and Duarte (2001) and Santos (2002) had carried out analyses of the tourist activity in Portugal, despite to neglect relative conceptual aspects to the definition and characterization of clusters. The authors, in general do not relate how they had identified tourism clusters, they hadn’t quantified them nor rigorously located. He also does not have any reference to the respective future evolution, policy measures to potentiate and to develop these clusters, as well as a rigorous evaluation of its impact in terms of environment and sustainability. Santos (2007) had presented a methodological and quantitative proposal of general character, of identification of tourism clusters,
testing it in the Region of the Algarve in which policy authorities and public in general believe to exist a tourism cluster. The author concluded from the applied methodology that there was no tourism cluster in this region, at best, based exclusively on agglomeration pointers, would constitute a tourism cluster in a relatively restricted niche of hotel sectors - the tourist apartments and resorts.

Observatory of European SMEs (2002) states that different changes appeared in the last years as result of a governmental strategy as aim to stimulate more cooperations between enterprises, to create technological infrastructures and promote image of some products in Portugal and foreign countries. These efforts had created the basis for the implementation of a national politics of cluster.

3. Methodology and Research Data

3.1 Methodology

When an investigator does a work of research, he has, in front of him, several doubts and, many times, little information to solve them. Such decision depends on some factors, as the aim of the study, nature of variables, among others (Perez et al. 2006). Many methodologies have been adopted in the identification and evaluation in the performance of clusters using some indicators, since variables related with wages, growth of job, degree of patents, collection tax (Porter, 2003; Lindqvist and Wennberg, 2010). According to Sölvell et al. (2009) the European Cluster Observatory represents the state of the art in supplying a European scale of clusters to the service of organizations, but for these authors it is evident that it is much more necessary to become a complete information service complementing with studies with other variables.

Sölvell (2009) states that a new model of clusters must be constructed in such a way involving the evolution strength as well constructive, it still suggests a little more complex understanding of the question about cluster involving a series of different characters, playing different roles having a mixture of different relations. In the future the European Cluster Observatory longs to use some levels of enterprise data in clusters identification, namely: geographic coordinates, complete identification of the regions, turnover, detailed classification of the economic activities, among others (Sölvell, 2008; 2009).

In this sense, we follow the methodology proposed by Sölvell (2008, 2009) to investigate new models of identification and performance of clusters and to inhale, someway, for the contribution of the future aims considered by the European Cluster Observatory, having as basis the turnover of 2008 of the companies of Continental Portugal and Islands, based on data of the
National Institute of Statistics (INE), distributed by the Portuguese regions and the respective economic activities (CAE). This way we will get the information on the final number of clusters, frequencies of clusters and the descriptive statistics of each cluster, of CAE and region. The adopted methodology was based on the use of secondary data supplied by INE and was chosen for the application of the quantitative method of multivariate analysis (analysis of clusters) in SPSS software.

The continuous variable corresponds to the turnover of 2008 and consists of the liquid amount of the sales and services (including compensations) according to the normal activities of firms, consequently after the reductions in sales and not including nor the value added tax nor other taxes directly related with the sales and services.

Two categorical variables were used: The characteristic activities that constitute the tourism account satellite defined by WOT et al. (2001) and it will be used a disaggregated level of economic activity (CAE Rev. 3) 5 digits to analyze the degree of space agglomeration of the 53 defined activities, as shown in the following table:

The other categorical variable consists of 30 regions of Nomenclature of territorial Unit – 2002 of the research geographic area, later mapped and analysed according to regional areas that constitute tourism in Portugal, as shown in the following figure:

**Figure 1 - Map of Tourism Regional Portuguese Areas**
3.2 Analysis Statistics and Discussion of Results

According to Norusis (2004) the analysis of clusters is a multivariate procedure to detect homogeneous groups in data, the groups can be constituted by variables or cases. The cluster analysis intends to organize a set of cases in homogeneous groups, in such way that the individuals that belong to a group are most similar possible between them and differentiated from the other. This analysis tries to classify a set of objects (individuals, products, etc.) in groups or categories using the observed values of variables, without being necessary to define criteria that classify the data that integrate a certain group (Norusis, 2004)).

Therefore we will use the TwoStep Cluster Analysis, an explanation tool that allows to disclose natural groupings of a data set that on other hand would not be evident (Aldenderfer and Blashfield, 1984). The algorithm used for this procedure has diverse options that differentiates it from other techniques of groupings:

i) The ability to create groupings (clusters) based on categorical and continuous variables;
ii) Automatic Selection of the number of clusters. It compares the values of the model of choice of creation throughout different solutions of groupings. This procedure is able to determine automatically the excellent number of clusters;
iii) The ability to analyze efficiently a high number of data. Carries out an escalation - “tree of grouping” summarizing the registers.

In order to analyze in set the continuous variable (in the present analysis, the turnover and the categorical variable (region and CAE), the TwoStep analysis uses the distance of likelihood measure that assumes that the variable in cluster model is independent. At the same time, the continuous variable (turnover) is identified as having normal distribution and each categorical variable (region and CAE), having multinominal distribution. In this analysis we will get the information on the number of clusters, the final frequencies of clusters, and the descriptive statistics for cluster. This analysis involves four steps:

1) We get the measures of distance of the similarities and the separation (differences) of clusters;
2) We combine the two more closed clusters to form the new cluster;
3) We calculate, again, the distances with the same “existing similarities” of the existing clusters for the new cluster;
4) We repeat the procedure of step two until building the cluster.

This process show us a hierarchic solution of clusters. Higher clusters contain more integrated clusters of low level. In each level clusters are separated (each item belongs to a single cluster). This analysis identifies, sequentially, clusters in the joined solution. The process of auto-clustering
allowed to select the number of clusters, where the smallest values in \textit{BIC} (Bayesian Information Criterion) indicate better models. The best solution of cluster is the lesser value of \textit{BIC}. A good solution has a high ratio of the changes of \textit{BIC} and distance measures (Table 2).

\begin{table}
\centering
\begin{tabular}{|c|c|c|c|c|}
\hline
Number of Clusters & Schwarz's Bayesian Criterion (BIC) & BIC Change(a) & Ratio of BIC Changes(b) & Ratio of Distance Measures(c) \\

\hline
\end{tabular}
\caption{Auto-Clustering}
\end{table}

\textit{a} The changes are from the previous number of clusters in the table.

\textit{b} The ratios of changes are relative to the change for the two cluster solution.

\textit{c} The ratios of distance measures are based on the current number of clusters against the previous number of clusters.

The solution of TwoStep clusters found 3 clusters, the first that represents 43.7 percent of the sample (N=519 registers), the second representing 28.3 percent (N=336) third with 28 percent (N=333) (Table 3). due to the fact that there are no registers in some regions in certain CAE (turnover= 0€) had been considered 1188 registers and excluded 2131, however the necessity had been treated as missings cases in the database not being necessary to exclude them from the same one, since it have to fullfil the methodology of the register of all regions and CAE (even when there were no values and they had been expressed in 0€ by INE), as showed in table 4.

Through the reading of these results we show that cluster 1, 2 and 3 have an average of turnover 11,709 thousands/€ (43,7 percent), 15,242 thousands/€ (28,3 percent) and 51,885 thousands/€ (28 percent), respectively. Based on these results and for a better interpretation of the performance evaluation of the identified clusters, we consider the following typology of clusters:

Cluster 1 – Low Performance Cluster
Cluster 2 – Medium Performance Cluster
Cluster 3 – High Performance Cluster

Identified clusters through the above described methodology; we proceed for the mapping and positioning of clusters identified by different Portuguese tourism areas, as the following figure:
For the analysis of the realized mapping, we can observe that cluster of low performance is predominantly concentrated at North and Interior Center of Portugal, while clusters of medium and
High performance dominate the Coast Center, South and Islands. They are distinguished despite the tourism regions of Porto and North of Portugal, of the Algarve, the Coast of Alentejo, Douro and West are exclusively included in an only type of cluster. The remaining regions are constituted by differentiated clusters. It has to highlight that the Interior of Portugal predominates cluster of low performance while in the Coast the medium and high performance.

We can highlight that the regional area in the Center and the one of Alentejo is constituted by three types of cluster. In the regional area of the Center the one belongs to cluster of high performance (12 percent) is situated in the Coast, that fact can be related for being an alternative tourist sun region with sea and gastronomy (the known sucking pig of Bairrada). In Alentejo, and as we go along from North to South of this region, we are seeing an increase of the performance of the region.

Although the regional area of Leiria-Fátima belong predominantly to cluster of low performance (81 percent), 19 percent is included in cluster of high performance. This could be related to the fact that this region is situated in the municipality of Fátima, an area with strong bet in religious tourism (Sanctuary of Fátima). The same happening with the regional area of Serra da Estrela where 64 percent belong to cluster of low performance, the other 36 percent is included in cluster of medium performance, probably justified for the fact to be included in the region that bets in Tourism Mountain and snow (Serra da Estrela).

In relation to the regional area of Lisbon and Vale do Tejo despite to predominate cluster of medium performance (64 percent), 36 percent of this region are characterized of high performance. This event can be related with the fact of the capital (Lisbon) being situated in this area and being a city that is constituted by a set of tourist activities that attract a wide and diversified tourism, also stimulating by the brand image, internationally known.

In the following map it is possible to identify CAE that most contribute to the formation of a cluster of Low, Medium and High Performance:
Low Performance Cluster:

Analyzing this map we verify that the travel agencies and historical activities of the small farms and monuments have a significant weigh in this type of cluster, is also to mention the same in the activities related with restoration. In this cluster it has some points that evidence that we are before regions of historical and cultural interest and with strong gastronomic evidences.

Medium Performance Cluster:

In this map we can see that the tourism activities of bigger weight for medium performance cluster are activities related with lodging. It has also to highlight the activities with marines as well as of transport of passengers for navigable ways, reporting these activities mainly for the region of the Algarve. Still the bullfighting activities are evidenced, justified for the inclusion of the areas where there is a strong tradition in bullfighting in this cluster.
In this cluster there is a mix of economic activities that contribute for the high performance that it has got, namely activities of the zoological, botanical gardens and aquariums; transport and renting of aerial ways, organization of activities of animation, being exclusive between identified clusters. The activities of lodging are also evidenced, as well as the activities of recreation ports (justified for being a cluster to a large extent in coastal area). The activities of the museums are intrinsically related with the area of Lisbon for the great number of museums that it has.

4. Final Considerations

In terms of continental Portugal the performance of the tourism regions is increasing from North to South of Portugal and in the Interior of Portugal exists a cluster of low performance while in the coast of medium and high performance. The results are not many times coincident with the opinions that we formalize at first sight and the level of the common sense. This because, the empirical evidences support that the tourism Region of the Algarve although known internationally by the strong tourist activity related with the tourism of sun and sea, not including cluster of high performance as we could eventually deduce, but yes in cluster of medium performance. This situation can be due to the fact of the influence that the international crisis of the last years has had in the tourism in all the destinations of reference in world, not being exception for this region.

The region of tourism of the Coast of Alentejo, the South of the tourist region of Alentejo the islands of Madeira and the Azores represent a high performance in tourist terms in Portugal. In relation to Alentejo, these results can be related with the new
trends of alternative tourist destinations of sun and sea in relation for example to the Algarve and the taste for the nature tourism. About to the islands, the performance can be explained by the brand image of this region known as “Pearls of the Atlantic”. To point out that despite the region of Oporto and North of Portugal and Interior Center being areas endowed with odd landscape conditions, of unique natural resources, full of culture and history, not yet duly developed to contribute for the performance of the tourism in Portugal.

Analyzing the weigh of turnover of CAE for each cluster, we verify that cluster of low performance it is the one that has a bigger variety of economic activities, followed by cluster of high and medium performance. There are activities that are exclusively in certain clusters: the activities of small farms and travel agencies and historical monuments - to cluster of low performance; tourist resorts with restaurant and other lodging places - to cluster of medium performance; air transportation of passengers, air transports renting and zoological, botanical gardens and aquariums - to cluster of high performance. Still to relate that the activities of the recreation ports, campsites and caravan, inns with restaurant, pensions without restaurant also share cluster of average and high performance. The same happens for other hotel establishments without restaurant for clusters of low and high performance.

These findings have important implications for both academics and policy makers. In general, a competitive and dynamic region is characterized by the simultaneous presence and combination of several factors which can attract an increasing number of tourism activities. Our findings show those high performance clusters are regions which detain a set of distinctive resources contributing for their competitiveness.

Any study has inevitably limitations. The “perfect study” was never, and will be never reached. The limitations of any study vary depending on the choices, deliberated and unconsciously made. In a general way, the limitations of the present study, result in two basic aspects: i) the quality and availability of the database, especially in the disaggregation of the pointers, and i) for the fact that the methodology is pioneering in terms of creation of a new model of identification of clusters and not to have been tested empirically. However, we are convinced that this study contributed for the advance of economic performance of clusters tourism. According to the results it would be interesting to know if there was a direct relation between the performance of clusters
identified with other indicators namely the monthly average profit and the dimension of the firms in terms of employees. Another suggestion in terms of future researches would be the creation of a competitiveness model and to verify its applicability in several tourism clusters in order to identify which indicators and variables mostly contribute for the regional development and possibly to state implications on its potential competitiveness.

Introduction

The financing of small firms has been a matter of enormous interest to policymakers and academic researchers alike (e.g. Berger & Udell, 1997; Robb & Wolken, 2002; Beck et al., 2008; Cole & Mehran, 2009 etc). This is even more so in developing economies where market imperfections are high and the information asymmetry is stronger between small and large firms. Small firms, especially those in developing economies, generally lack proper record keeping, have poor management and do not have a structured business plan. These characteristics make the risk of lending to these firms much higher (Berger & Udell, 1997). The situation however, becomes grimmer when the issue of gender is thrown into the analysis. The body of literature looking at gender and entrepreneurship shows that indeed, there are differences in the financing behaviour of male and female owned firms (Brush, 1992; Cole & Mehran, 2009; Carrington, 2006). It is this finding that has motivated this study. A clearer understanding of how female-owned firms differ
from male-owned firms in their financing behaviour is critical for policymakers and investors who are interested in providing financing for small firms.

Indeed, the literature on gender and entrepreneurship suggests that the proportion of males involvement in entrepreneurship is higher than that of females in almost all countries (GEM, 2008). The situation in Jamaica is no different. In 2008, GEM revealed that 54 percent of Jamaican entrepreneurs were males while 46 percent were female. Critically, more males were involved in start-ups than females. More males got involved in what is called opportunity entrepreneurship. Eight percent of males started business which could be defined as opportunity seekers while only 6 % of females did. In terms of risk profile, studies also show that female entrepreneurs take risk after carefully analyzing the situation compared to men. This gender difference however is diminishing rapidly. Researcher have recognized that in efficiency driven economies, more women are becoming involved in entrepreneurial activity and undertaking the risk involved ( Master and Meier, 1988).

Study Aim

This paper aims to test the hypothesis that gender is a critical variable that can explain the credit behaviour of small firms from developing economies. While the literature on gender and entrepreneurship is extensive, very little work exists on this area in the developing world. As far as we are aware, this is the first study to look at the issue in Jamaica, a small, developing economy. There are other reports or studies which touched on gender and small business but no serious attempt is given to the issue of financing. Further, because of the idiosyncratic features of the
Jamaican economy (high debt burden, anaemic economic growth, high interest rate, large imbalance between male and females in tertiary education etc), the need for a context specific study of this nature is important to generate baseline stylized facts to help policymakers design better credit programmes for these enterprises.

**Method**

This study relied on survey data collected from over 260 small firms in the Jamaican economy. These data were analyzed using univariate statistical techniques. The study examined variables relating to firm and owner characteristics and, the credit behavior of the firms. These variables were correlated with gender to determine whether or not there exist variations among the various firms in the sample.

**Findings**

The preliminary results from the analyses revealed that, regarding variables relating to owner characteristics, female run business have less college educated owners compared to male run businesses; of the total sample, only 17% of females had a college education while 40 % of principals in male-owned had college education. This is surprising as more females are registered in higher education compared to males. In terms of work experience, more principals in male-owned firms (36%) had over 10 years of experience compared to female-owned firms (17%).
In terms of firm characteristics, the size of the firm remained relatively the same. Twenty percent (20%) of female-owned firms and 24% of male-owned firms had between 5-15 percent. Also, female-owned firms are much younger than male-owned firms. Thirty three percent (33%) of male-owned firms have been in operations for more than 20 years while on 8% of female firms have been in operation for the same period. As it relates to organizational form, more male-owned firms were listed as limited liability companies compared to female-owned firms. Also, a relatively high percent (12%) of female-owned firms are operated as sole proprietorship.

As it relates to financing behaviour, a number of correlates were identified. Firms were analyzed on the services obtained from Banks, the method of financing for growth and start-up. Regarding services obtained, male-owned firms generally obtain loans while female-owned firms obtained banking services such as bill payments, money transfer etc. For the financing of business growth, more male firms used bank loan (39%) compared to female-owned firms (11%). Critically, more female-owned firms used business cash flow to finance business growth (10%) compared to male-owned firms (6%). For financing business start-up, more male-owned firms (29%) used a bank loan compared to female-owned firms (7%). In terms of the use of own savings to finance start-up the difference between male and female-owned firms was not that stark. Twenty three percent (23%) of female-owned firms used own savings while 30% of male-owned firms used own savings to finance start-up.
Conclusion and implications

This preliminary analysis used univariate comparisons to look at the difference in financing behavior of male-owned and female-owned firms. The results show that there exist differences in owner characteristics, firm characteristics and financial behavior of these firms. These findings have serious implications for the designing of loan programmes to assist entrepreneurial activities. These programmes will have to first acknowledge that male-owned firms and female-owned firms are not similar in their approach to raising financing for growth and starting their business. Since female-owned firms are less likely to take on large loans, financing institutions must package their loans in sizes that will be attractive to female owned business. The one-size-fits-all approach to lending will not do it. To cure some of these issue with financing behaviours, policymakers have to put programmes in place incentivize females to re-organize their firms in more professional manner such as limited liability corporations. The credit programmes design must fit the idiosyncrasies of male vs. female-owned firms. The results from this study will also add to the body of work on gender, financing and entrepreneurship given insight from a new geographic locale.

RETHINKING THE CASE METHOD

Abstract

The case method was introduced almost a century ago under the assumption that to be effective, learning must reflect actual practice. Today, casebooks are standard in many of the world’s 10,000+ business schools. Drawing on the field of complexity studies, this paper argues that the case method rests on an outdated model of strategic decision-making, one suitable for situations characterized by clear foresight horizons, but not the kind of complex, dynamic and nonlinear situations facing the modern organization. Realigning the case method with actual practice requires a fundamental rethinking of its purpose, theoretical underpinnings, means of production and orientation to the world. This is the impetus for ‘Case 3.0’, a nascent social enterprise whose goal is to build entrepreneurial capacity, in the classroom and out in society.
1. The Case Method

The Merriam-Webster online dictionary defines a profession as “a calling requiring specialized knowledge and often long and intensive academic preparation.” From the very beginning, professional schools inculcated the requisite body of specialized knowledge using highly standardized methods. For example, law was taught using the Dwight Method (named after a professor at Columbia) -- a combination of lecture, recitation, and drill. Students studied dense treatises that interpreted the law and were tested on their level of memorization and recall. But by the late 19th century, the academy began to question the efficacy of lecture and drill as a means to prepare students for the world of practice. In 1870, a newly appointed dean at Harvard Law School, Christopher Columbus Langdell, broke with tradition by introducing cases. Influenced by the prevailing philosophy of inductive empiricism, Langdell viewed law as a science and appellate court decisions as the specimens from which generally applicable principles could be induced. He assembled a representative set of court decisions to create the first legal casebook.

Inducing general principles from a small selection of cases was a challenging task for which a new pedagogy was required (Garvin 2003:58). Langdell developed what later came to be known as the Socratic method: an interrogatory style in which instructors question students closely about the facts of the case, the points at issue, judicial reasoning, underlying doctrines and principles, and comparisons with other cases. Students now prepared for class knowing that they would have to do more than simply recite back material they had committed to memory; they had to present their own interpretations and analysis, and face detailed follow-up questions (Garvin 2003:58).
Langwell’s method initially met with great resistance from students and alumni, but by 1920 it had become the dominant pedagogy in legal education. It was then that Harvard Business School (HBS), presided upon by Law School graduate Wallace P. Donham, adopted the case method. Donham saw that the use of cases in law schools was made possible by several factors: (1) the vast number of published legal decisions, (2) classification of subject matter by instructors, (3) published case books, (4) the elements in the typical law case, and (5) the development of general principles from the discussion of individual cases. However, lacking access to public records of business decisions, business faculty had to research and write their cases from scratch, using anecdotal and other information.

Business cases, Donham reasoned, should be pragmatic in nature, describing real problems in need of real solutions. Both relevant and irrelevant material would be included, so that students would obtain practice in selecting the applicable facts. There would be less emphasis on theories or principles, because in business these were viewed as inapplicable. What mattered were the particulars of each business situation, which were to be understood and analyzed in detail. Melvin Copeland, a professor of marketing, produced the first collection of business problems, and in 1921 ‘the case method’ was ratified by a faculty vote. The Bureau of Business Research was established to develop and write cases for multiple courses until faculty were able to work independently. By 1922, 85 more institutions had adopted casebooks. By publishing books and offering seminars and case-teaching workshops with support from major institutions such as The Ford Foundation, Harvard faculty members accelerated the diffusion of the case method to business schools around the globe (Garvin 2003:58).
Typically consisting of 10 to 20 pages of text and 5 to 10 additional pages of exhibits – often augmented with audio, video and other resources -- the modern business case is intended as an analog of reality, a substitute for the direct experience of a business situation. The business case, according to William Ellet, who has more than twelve years’ experience teaching students how to read, analyze, and write about business cases at HBS, is the equivalent of the laboratory used to educate scientists and doctors. To perform its prescribed role, a case must have the following three characteristics: (1) a significant business issue or issues, (2) sufficient information on which to base conclusions, and (3) no stated conclusions (Ellet 2007).

Four types of situations tend to occur repeatedly in cases says Ellet: (1) Problems — a situation in which something important has happened, but we don’t know the cause(s); (2) Decisions — a situation in which options, evaluative criteria and relevant evidence must be identified; (3) Evaluations — a situation in which the worth, value or effectiveness of a performance, act or outcome requires assessment; and, (4) Rules — a situation in which the right rule (e.g. break-even analysis) must be applied to obtain the required information.

Whereas textbooks are logical and coherent in their presentation, cases attempt to introduce more realism by adding uncertainty, fluidity and contingency. Thus, many cases have complicating properties: information that includes ‘noise’ (irrelevancies, dead ends, and false, biased or limited testimony by characters in the case), unstated information that must be inferred, and a nonlinear structure in which related evidence is scattered throughout the text and is often disguised or left to chance.
The dilemma facing all students beginning a new case is that they don’t know what to look for. For this reason, an active, purposeful, interrogative and structured approach to case analysis is recommended. According to Ellet, this should have five phases:

1) **Situation:** First, the student should spend 5 minutes reading the first and last sections of the case to identify the type of decision situation.

2) **Questions:** Armed with this information, the student should spend about 15 minutes performing a content inventory, building a mental map of the case, marking up high-value sections, facts, numbers and statements pertinent to the problem, decision or evaluation at hand, and recording thoughts and new questions along the way.

3) **Hypothesis:** Lasting approximately 45 minutes, this third and most important phase is to formulate hypotheses. For example, if the case involves a problem, the student might hypothesize that the protagonist (usually a corporate officer) is the cause.

4) **Proof and action:** The next 40 minutes should be spent searching for quantitative and qualitative evidence to support the hypothesis, and thinking through the implications (tangible actions and a detailed plan of implementation).

5) **Alternatives:** Finally, 15 minutes should be spent scrutinizing the hypothesis by asking, for example, whether the problem could be defined differently, what the biggest downside of the recommended decision might be, and whether other pertinent facts may undermine the recommended course of action.

Students are expected to come to class with a recommended decision and implementation plan, and extensive supporting analysis. They often work in study teams to
share the workload and refine their ideas. Then in class — under the questioning and guidance of the professor — they probe underlying issues, compare different alternatives, and finally, suggest courses of action in light of the organization's objectives. Classroom interaction is often enriched by a diverse group of students representing many industries, functions, countries, and experiences.

Proponents of the case method argue that in contrast to a lecture-based approach, time is more productively spent discussing cases about actual business problems and solutions. A recent study of the state of the MBA degree by HBS professors Srikant Datar and David Garvin – based on interviews with 30 deans and associate deans, 28 executives and recruiters, students and leading academic critics, as well as detailed analyses of eleven business school programs and other pertinent data, found that schools that had made the case method the cornerstone of their curriculum produced students better able to think and act across disciplinary and functional boundaries and understand the real challenges faced by practicing managers. Competing schools, on the other hand, had lost touch with reality after re-organizing themselves along disciplinary lines--the chief recommendation of a 1959 Ford Foundation report (Thompson 2008).

Defenders of the case method argue that in contrast to a lecture-based approach, time is more productively spent discussing cases about actual business problems and solutions. Students strengthen their diagnostic skills in a world where markets and technologies are constantly changing, developing the ability to quickly characterize both the common and the distinctive elements of business problems. They develop leadership skills by learning to make difficult decisions with limited information and significant uncertainty, as well as learning to
cope with ambiguity. They enjoy a safe environment in which to learn other skills critical to business success: the ability to persuade and inspire others, reconcile differing viewpoints, prioritize objectives, and identify and capitalize on opportunities. Over time this builds a strong commercial frame of reference, along with a broadened perspective. In summary, “a steady diet of cases leads to distinctive ways of thinking—and acting” (Garvin 2003: 61).

2. Critique

All theory presents a simplified abstraction of processes in the ‘real’ world, and in the process of simplification, violence is necessarily done to its complexity and multi-faced nature (Webb 1995). Still, as Kurt Lewin said, nothing is as practical as a good theory, and to structure my critique I have chosen an insightful framework developed by Lane and Maxfield (1997). To start with, any business domain may be construed as a space consisting of agents (including firms, teams within firms, customers, trade associations, and so on) and artifacts (objects or services designed, produced and exchanged by economic agents), structured by various relationships: between agents, between artifacts, and between agents and artifacts. ‘Vision’ and ‘mission’ together determine a firm’s directedness in agent/artifact space by selecting a particular kind of artifact that the firm commits itself to create, identifying the kind of agent(s) to whom the firm intends to sell these artifacts, and establishing the directions in which the firm would like the current structure of agent/artifact space to change. ‘Goals,’ on the other hand, specify the desired outcomes for the firm: resources, financial or social returns, or particular reconfigurations of agent/artifact space; while ‘tactics’ determine how the actions in which the firm intends to engage will actually be executed by its various component agents. ‘Strategy’ lies
between directedness and execution in that it lays down ‘lines of action’ that the firm intends to initiate and that are supposed to bring about desired outcomes. Since outcomes depend on the interactions with and between many other agents (inside and outside the firm’s boundaries), strategy is fundamentally an attempt to control a process of interactions, with the firm’s own intended lines of action serving as control parameters. But how much control is achievable, and how to achieve it, depends upon the ‘foresight horizon’: how far and how much can be foreseen.

When the foresight horizon is clear, all the consequences of any possible course of action, including the responses of all other relevant agents, may be anticipated, permitting the strategist to chart out a best course that takes account of all possible contingencies. This is the classical conception of strategy as ‘optimizing precommitment.’ When foresight horizons become a little more complicated, control can still be exercised from the top down in a predetermined fashion, even if ‘adequate’ must substitute for ‘optimal’. But as the foresight horizon becomes even more complicated, is becomes impossible to map out courses of action that guarantee desired outcomes, and strategy must therefore include provisions for actively monitoring the world to discover unexpected consequences, as well as mechanisms for adjusting projected action plans in response to the unexpected. Strategic control is no longer exercised exclusively from the top-down, but distributed among multiple agents.

I contend that the ‘distinctive ways of thinking and acting’ inculcated in business school students via a steady diet of case analyses are really only suitable for clear foresight horizons in which optimization techniques may be deployed to choose from a set of already-specified alternatives based on an evaluation of the value and the probability of their consequences.
Lane and Maxfield draw an analogy with the eighteenth century general perched atop a hill overlooking the plain on which the battle will be fought at dawn. Our general is able to clearly discern the features of the landscape and the cavalry and infantry positions on both sides; and though he cannot exactly predict the outcome of the orders given, the subsequent battle movements or various contingencies, he can be reasonably sure that one of a few scenarios already envisioned will come to pass. The time horizon of relevant uncertainty has a clear terminal date (tomorrow, when the battle will be fought and either won or lost); and, the general is knowledgeable of all the relevant possible consequences. He knows what he is uncertain about: not only the ultimate winner, but also what will determine the outcome: how troops move, how they engage the enemy, and the terms and conditions of engagement.

The conventional case study puts students in the boots of the general on the hill. They study and makes sense of the business landscape and its likely evolution (‘situation’, ‘questions’); formulate an idea of the optimal strategy given the situation at hand (‘hypothesis’); gather supporting evidence to develop a battle plan (‘proof and action’), which, if it survives the due diligence phase (‘alternatives’), gets the green light. The time horizon of relevant uncertainty has a very clear terminal date (e.g. next week’s board meeting) and while there is uncertainty built into each case, the protagonist knows what he or she is uncertain about, since there is always sufficient information on which to base conclusions.

There is growing consensus among leading practitioners that this kind of situation represents the exception rather than the rule. Humans are planning creatures and the future is never something that is vacuous or empty, but filled with expectations, hopes and fears, and corresponding strategies to maximize or minimize them (Webb 1995). Nevertheless, when a
firm’s ‘foresight horizon’ is more complicated, constraining how far ahead and how much we can see, then the old notion of strategy as an optimized precommitment to a particular course of action no longer makes sense. Today’s decision maker is more likely to face a situation akin to that faced by a commanding officer of a U.S. cavalry column marching through an uncharted section of Montana in the early 1870s. Unlike the general atop the hill, our commanding officer doesn’t know the landscape, the positions, capabilities or likely movements of the enemy. He knows the general direction he wants to take his men, but scenario building is fraught with issues because there are simply too many possibilities (geographical, social, meteorological, etc) for the unexpected to happen. He relies instead on his scouts to keep him informed about what lies just beyond the horizon, and he is confident that based on past experience, he will recognize whatever situation he encounters and take the appropriate action. His time horizon of relevant uncertainty is less clear (it could be a matter days, but also possibly a weeks before he reaches his destination) and while he could probably list the variables relevant to the completion of his mission, this would amount to a very long list and most of the items would probably end up not mattering anyway.

Because of the limited knowledge of relevant possible consequences or the time horizon of relevant uncertainty, Rajiv Dutta (former president of eBay marketplaces, Skype and PayPal and Executive in Residence at the Peter F. Drucker and Masatoshi Ito Graduate School of Management) recommends we abandon the traditional approach to strategy, based on building detailed scenarios of the future and planning for alternatives based on sensitivity analyses. “Luck beats strategy any day,” he says. “A far better approach is to maximize your chances of luck. Execute against a variety of promising avenues. Open the company to information from
outside. Stay close to start-ups in your industry.” (Darroch 2010: x).

Entrepreneurs typically face a foresight horizon that is orders-of-magnitude more complex than that of the commanding officer. Unpredictable and rapidly changing (Lichtenstein, Dooley, & Lumpkin, 2006), theirs is a world under active construction. To paraphrase Lane and Maxfield, they are part of the construction crew, but there isn't any blueprint. The cavalry commander must negotiate a landscape of presently unknown features, but at least the landscape is relatively fixed. The social landscape through which entrepreneurs move, on the other hand, is in constant flux as it deforms in response to the actions that they and others take; as new and often unforeseen agents appear in the unfolding drama, and as the boundaries between them are reshuffled. This environment is characterized by complex crosscutting networks of collaborative and competitive relationships—although the allegiances are constantly shifting and aren’t always clear. Furthermore, the artifacts around which economic activities are organized (tangible objects and intangible services) are hard to categorize. Indeed, their very identities may be up for grabs.

In the entrepreneurial domain, more is changing than the structure of its agent/artifact space. As Lane and Maxfield point out, what’s also changing are the ways in which agents perceive their own and each other’s functionality, i.e. who does what, to and with whom and what. As the entrepreneurial spirit penetrates traditionally stable domains, incumbent agents who once had the luxury of acting like generals are forced to become more like cavalry commanders. US energy utilities, for example, are being compelled to rethink their entire business models because of a wave of new innovations, and must decide whether to remain energy providers or get into the data management business.
To complicate matters, agents must not only interpret what’s in front of them, but also reinterpret many things that were previously regarded as fixed, but whose character has been changed by their relation to emergent features. Since their destination is always temporally beyond their current foresight horizon, the connection between what entrepreneurs do and where they are going is always tenuous and thus ambiguous.

What does it mean to act rationally in the face of a complex foresight horizon, when the very structure of the firm’s world is capable of undergoing cascades of rapid change? In contexts like this, the relation between strategy and control is very different from the classical conception implicitly taught via the case method. Strategy is not a plan to assert control, explain Lane and Maxfield, but a process to understand and leverage it. Strategy can thus be thought of as a set of practices—partly exploratory, partly interpretative, and partly operational—that can generate insight into the structure of the relevant agent/artifact space and how control is distributed through that space, and guide meaningful action.

The implications are twofold:

(1) Cognitively, agents should construct a representation of the structure of their world that can serve as a kind of road map on which to locate the effects of their actions. Since what is happening results from the interactions between many agents, all responding to novel situations with very different perceptions of what is going on, interpretation and reinterpretation at every locus of distributed control is essential. Lane and Maxfield call this task ‘populating the world.’ But this intelligent sense-making function is just the first step.

(2) Structurally, “Agents act—and they act by interacting with other agents. In complex
foresight horizons, opportunities arise unexpectedly, and they do so in the context of generative relationships. In this context, the most important actions that agents can take are those that enhance the generative potential of the relationships into which they enter.” As new opportunities emerge from these relationships, agents must learn to set aside prior expectations and plans and follow where the relationships lead (as Rajiv Dutta puts it, “Execute across a variety of avenues”). While there will be regions of relative stability in a firm’s agent/artifact space when it still makes sense to engage in optimizing (or at least satisficing) pre-commitment and to organize processes of exploration and adaptation, it is difficult to know where those regions are, or to which relationships pre-committed actions may be entrusted, without the sense-making and relationship-building practices described above.

David Noer, emeritus professor of business leadership at Elon University, argues that we are doing to our students what automobile manufacturers did to their cars; rendering them ineffective by operating according to an outdated model that is no longer relevant to the environment. The conventional case study operates according to an outdated view of strategy as a plan to assert control. Its unit of analysis is a decision situation at a particular point in time, which fails to capture the structurally emergent, cognitively ambiguous and perpetually novel nature of far-from-stable business domains. Furthermore, it provides very little insight into the cognitive and structural processes described above—how agents make sense of the world around them, and foster generative relationships. The method as currently practiced is therefore of questionable use, especially to the increasing number of students with a burning
ambition to build something innovative from scratch that makes a meaningful impact on society. Because they are going to be facing the most complex foresight horizons imaginable, they need deep insight into the entrepreneurial process, i.e. how the entrepreneur navigates the agent-artifact space. What is their general approach and philosophy of life? How do they make and learn (or fail to learn) from mistakes? How do they persevere? What strategies do they employ? What role do change and serendipity play? When and why do they choose or are forced to put things on ice, or even give up? Students need to understand why, facing the same economic circumstances, some entrepreneurs get through the knothole, survive and succeed, whereas others founder.

Business schools, argues Roger Martin, have produced a generation of graduates with an overdeveloped sense of the power of their models and an underdeveloped sense of their limitations (Martin 2009). This may be true, but the same criticism might be leveled at their teachers. Karl Popper distinguished between the ‘bucket’ theory of knowledge and the ‘searchlight’ theory of knowledge, arguing that there can be no observation without self-conscious perception, and no perception without a prior theoretical expectation (Webb 1995). Our outdated model of strategic decision-making, developed at a time of clear foresight horizons, has led to the false belief that an issue is only worthy of attention if it is big enough, and there is sufficient certainty with respect to inputs, options and choices. This has blinded us to a crucial fact about non-linear systems: their sensitivity to small and subtle changes in initial conditions (for example, the chance encounter in an aircraft which sows the seeds for some global enterprise). Because we are not looking for them, the vast majority of small yet often significant changes escape our attention. But then again, if our data set consists only of a
couple of interviews, supplemented with a mass of secondary data, then capturing the subtleties of the entrepreneurial process is impossible in any case.

With a change of theoretical framework, and a corresponding change of methodology—one that is longitudinal rather than cross-sectional, one that favors real-time content generation over retrospective storytelling, and one that captures the emergent nature of business as a complex adaptive system—we may begin to build a new foundation for the case method, one that better describes reality. But re-alignment may not be enough. What’s needed—and what more and more students also seem to want—is engagement. By making engagement with real firms facing real problems an integral part of the case experience, students can gain valuable first-hand insights into the sense-making, relationship-building and value-creating practices of contemporary organizations. The following section reports on the pilot test of ‘Case 3.0,’ a nascent social enterprise whose aim is to bring the case method into the 21st century by rethinking its purposes, means of production and orientation to the world.

3. **Case 3.0**

Whereas ‘Web 1.0’ was about static one-way communication and ‘Web 2.0’ was about dynamic two-way communication among the general public, ‘Web 3.0’ is all about professionals taking the lead in content generation (Whitehead 2008). Content generation is the first stage in the Case 3.0 model (see Figure 1).\(^1\) Specifically, entrepreneurs generate content in exchange for focused research conducted by MBA teams that help them solve practical business problems. These teams are supervised by professors, who are matched with entrepreneurs, preferably in

---

\(^1\) In November 2009 the Case 3.0 concept was presented at the annual Satter Conference on Social Entrepreneurship held at the Stern School of Business, New York University.
the same locale. Content is gathered over a period of weeks or months. Going into the pilot study, which commenced in January 2010, we did not specify a particular method or frequency of data collection, nor did we put constraints on the topics to be covered or questions to be answered, preferring instead a culture of open-ended experimentation. The expectation was that through a process of trial and error, some approaches would be retained or modified and some would be ruled out. All content is uploaded to the password-protected cloud content management service called box.net, and is accessible 24/7 by all parties.

Figure 1: Case 3.0 model

In the second stage (now in progress), raw content is cleaned up, imported into a purpose-built digital template capable of holding any type of data (text, documents, transcripts, podcasts, videos, etc), and woven into a narrative co-written by professors and Case 3.0 researchers. The idea is to break down the narrative into discrete study units, each spanning a
defined period of time (e.g. January-February 2010), each of which will be accompanied by questions for use in an educational setting, as well as a brief Teaching Note. As time goes on, more study units may be added, and even after the ‘Live Case’ is closed, there may be periodic updates. This is not only to maintain relevance and interest, but also to enable professors to compare ‘what was planned’ with ‘what actually happened,’ which is of educational value.

Accompanying the live case is a ‘Base Case’, whose objective is to bring students and professors up to speed on the firm (its founding, history, vision, goals, objectives, strategies and tactics) and industry (definitions of terms, history, competitive structure and various political, economic, social, technological and ecological drivers). Content for the Base Case may consist of internal and external secondary sources (subject to copyright laws), as well as primary research with various stakeholders. Like the Live Case, the Base Case may be periodically updated to ensure relevance.

The plan is to distribute cases through a dedicated web portal. A percentage of sales will fund case development at business schools in developing countries. Robert Zoellick, World Bank President, recently observed that we are seeing a shift towards a new multi-polar global economy, with better prospects in developing countries than in developed ones. Yet there remains a deficit of cases from within these economies, and furthermore, they are produced by a relatively small number of schools. A core premise of Case 3.0 is that content generation should be decentralized to capitalize on the local knowledge, connections and expertise of

---

2 Professors will be able to amend the list of questions for each study unit, customizing them for their specific needs. Students may be asked, for example, to relate the case to an independently assigned reading.
professors on the ground, anywhere in the world. This is not only to build up a critical mass of cases, but also to build grassroots entrepreneurial capacity where it is most needed.

The first complete case will be beta tested in fall 2010 by a small group of professors. The objective is to obtain feedback on the approach and ideas for improvement. From there it will be possible to develop an active, purposeful, interrogative and structured approach to case analysis using the new approach.

4. **Pilot Study**

Commencing January 2010, the pilot phase has tracked the five real-world cases, described in brief below.

**Ocean Energy Systems:** OES is a nascent wave energy company that has completed sea trials of a first-generation 40-meter prototype over nine years and is currently seeking funding for a second-generation ‘Wave Energy Converter’ (WEC). According to company documents, an investment of approx $10 million in year 1 may yield 5-year accumulated net profits of $52 million after tax. Under certain conditions, each WEC is projected to generate 250,000 gallons of potable water/day; or, enough electricity to meet the daily needs of 6,000 people. However, while the principle of converting kinetic to mechanical energy had been proven, not a kilowatt of electricity or an ounce of water had been produced, which because it became an issue for investors, plunged the company into the ‘Valley of Death.’ The other factor working against the company was that no one has yet made any money in wave energy, and the path to profit is still far from clear. When we began tracking this case in January 2010, the company was preparing
for a business trip to Ireland to meet with the government, contractors, investors and others—an example of what Lane and Maxfield call ‘fostering generative relationships.’ What follows is an excerpt from an interview conducted with Mr. Cunningham shortly upon his return.

**Q:** President Obama recently pledged $8 billion dollars for new nuclear reactors, and he also stressed the need to invest in other carbon neutral energy technologies. But it seems that wave energy isn’t even on the radar here in the U.S. What are you planning to do to draw attention to this untapped opportunity?

**B. Cunningham:** Unfortunately, your observation is absolutely correct. One of the big problems that we face in the wave energy industry is that it’s not on anybody’s radar screen. The industry hasn’t achieved commercial success yet, even though the idea has been discussed since Archimedes’ time. There are records of Archimedes attempting to harness wave energy. Nobody has made a commercial success of the product, and that’s why it’s such an opportunity and such a big challenge. There simply is no wave energy industry at this point for venture capitalists to see that there truly is a profit opportunity here.

Just last month The Wall Street Journal quoted some data from Bloomberg New Energy Finance saying that as of the fourth quarter 2009, wave energy is the most expensive energy source, leaving subsidies out of the equation. That’s compared to coal, natural gas, biomass, solar, onshore and offshore wind, biomass, geothermal and others. They said wave energy costs between $250 and $500 per megawatt hour to produce, with the likeliest cost being about $375 per megawatt hour. Well, we conservatively project that we can produce for $75 per megawatt hour, which is an order-of-magnitude reduction. Now we need to get that message across, so wave energy isn’t prematurely written off.

At my former company, a public computer company, we were competing with IBM, NCR and Burroughs, and it was much easier for us to demonstrate the potential for success. This is because everybody already knew how well those companies were performing. A new company need only show how it could carve out a niche by offering more “QIV” [Quality, Innovation and/or Value], with 20% greater success, and investors would come running. But in the wave energy industry, investors have no such reference point, by which I mean companies making money consistently over three to five years. It hasn’t happened yet. A big reason is that engineers have tried to build far too complicated systems for one of the harshest operating environments in the world – the sea!

I was on a submarine for three years and I can tell you from personal experience that even at 400 feet below the surface you’re tossed around quite a bit. The ocean is terribly powerful and terribly corrosive, so the product that’s going to win must be simple, must be robust and must be capable of withstanding this environment for 20 years. Keep it simple and robust is our
answer! In fact we unintentionally proved this during sea trials of our first generation 40-meter prototype. During one trial, someone doing routine maintenance left a hatch open in the center section. It filled up with water and the entire unit sank to the bottom of the sea. Three months later divers were sent down to pump out the water and bring the unit back to the surface. And amazingly, after that ordeal, the unit still worked, still was able to convert kinetic to mechanical energy. That’s robust for you!

Relationships only bear fruit when they lead to concrete commitments. This came in the form of a preliminary take-off agreement from Energia, Ireland’s largest independent supplier of energy, with a potential value of €1m annually for each WEC over its 20 year operating life. MBA teams assigned to this project performed an analysis of global investments in wave energy from 2008-2010 (this data was incorporated into a presentation to a potential investor), surveyed published reports on wave cost of energy versus other energy sources, surveyed published cost of energy calculations (wave versus competing sources), and explored the potential for wave energy in China (also taking advantage of Chinese expertise on the team).

Content generated by the CEO, Brian Cunningham, was gathered via periodic in-depth interviews, supplemented with company documents. Mr. Cunningham’s preferred approach was to jointly work out the interview questions in advance. An experienced entrepreneur, during each interview he also took pains to draw out general business principles, such as ‘go where the pain is’ (for example, Ireland is under pressure to meet mandatory EU targets for renewable energy production and views wave energy as a key component of its strategy). The base case for OES will serve as a primer on global warming, energy consumption, energy policy, renewable energy, wave energy (technology, competition, etc), and the founding and history of OES.
Worrell Water Technologies: Established in 1993, Worrell produces the Living Machine®, a nature-inspired system that uses living plants and beneficial microorganisms to turn wastewater into clean water that may be recycled for irrigation, sanitation (e.g. toilets) and other on-site uses (industrial, agricultural, acid mine drainage, storm water, landfill leachate, and urban and airport runoff). The system is cleaner and greener than conventional water treatment methods, with significant savings in energy and infrastructure costs. However, artificial wetlands represent but a small fraction of the wastewater treatment industry. What Worrell wanted—but didn’t have the resources to produce itself—was a study of the forces working for and against the development of a sustainable wastewater treatment infrastructure (such as the green building movement), a competitive analysis using criteria worked out with the client, and an exploration of emerging innovations in the constructed wetland sector (patented, prototyped, commercialized), including portable constructed wetland systems.

Much of the content for the base case was gathered during interviews with and presentations by executives and engineers, which gave students unique insight into how agents make sense of their domain and foster generative relationships with customers, municipalities, trade associations, state and federal agencies, universities, investors and communities. Additional resources have been provided by organizations such as the Water Environment Research Foundation (WERF), the U.S. Environmental Protection Agency and the Decentralized Water Resources Collaborative. For example, WERF’s Decentralized Wastewater Stakeholder Decision Model (Excel spreadsheet) educates students on the ‘triple bottom line approach’ and gives them an appreciation for the trade-offs that have to be made when choosing from various wastewater options for a community. A thoroughly researched base case thus serves as a
‘Trojan horse’ for getting critical environmental and other issues in front of students. This aim is broadly consistent with The Principles of Responsible Management Education recently developed by The UN Global Compact with input from The Association to Advance Collegiate Schools of Business, The European Foundation for Management Development, The Aspen Institute, the Globally Responsible Leadership Institute, The European Academy of Business and Society, and Net Impact (United Nations Global Compact 2008).

**NW Works:** Now in its 40th year, NW Works employs people with intellectual and/or physical disabilities, either in-house or via placements with local employers. The agency recently received a $1m federal stimulus grant and is in the process of retrofitting a 58,000 sq ft facility complete with autism center. MBA students working on this project developed a marketing plan to grow take the nascent paper and CD shredding business, and explored potential sources of employment for the new facility (baking, weaving, gardening, woodworking, etc) that have proven successful elsewhere. To this end, a field visit was made to Innisfree, a similar community in central Virginia with established programs in place. One of the lessons of this case is that social enterprises have different goals from conventional enterprises, and that is takes time to perfect a business model. For example, Innisfree’s bakery, which serves Charlottesville, substituted fresh baked bread for granola because the demands of producing a quality, standardized product in a timely fashion was too stressful for its co-workers. The case also provides an opportunity to address stereotypes about intellectual disabilities, and open students’ eyes to employment opportunities, challenges and rewards in this sector. Content has been generated mainly through interviews with John Brauer, CEO. What has proven
particularly instructive is to compare the progress of the agency against its strategic plan, documenting how the management team and board of directors make corrections, not only to their operations but also to the plan itself, in the process fine-tuning their business model—a process discussed at length by Mullins and Komisar (2009).

**Mathalicious:** Mathematics education is in crisis because children lack the motivation to learn. Abstract procedural rules leave them asking, “what does this mean?” and “why am I learning this?” However, broader contextual factors may also play a role in shaping attitudes to learning.

In their book *Identity Economics*, for example, Akerlof and Scranton (2010) argued that people’s identity—their conception of who they are and of who they choose to be—are not only important determinants of achievement but may also be strongly influenced by social norms.

Founded by Karim Logue, a former math teacher and math coach, Mathalicious brings meaning and context to math through creative real-world applications. For Case 3.0, Mr. Logue is producing a series of insightful podcasts charting his progress across a number of fronts, including product development, business model development, board recruitment and market development. The following podcast excerpt (March 21, 2010) captures Mr. Logue’s thoughts on the board of directors and the nascent business plan:

“As I remember in the last video, I was talking about how I considered myself a math teacher and sort of felt as though I was having to—force upon myself this mantle of businessperson in order to manifest Mathalicious. To some degree I still feel like that although this past month and a half really has been exclusively about business, so let’s hit some of those. So a status update: since we last spoke, I have started to put together the board of directors, and they really are a very hard-hitting, deep-bench group of people that include marketing specialists, people with strong relationships with school districts around the country; one in particular a really hard-hitting educational consultant; a friend of mine who works for Ideo, and whose an expert in user interface which is going to be really useful going forward as we develop the
content for multi-platform—not just web but also iPad and whatever else; someone whose an expert in online learning, and then the head of the board who was a former president of Toys R Us and who has just an incredible amount of executive experience that is really going to benefit Mathalicious—not only executive experience but he is also the most positive Scotsman I’ve ever met, and his joviality is good in and of itself. So the board of directors is coming along—couple of spots I still want to fill but I want to be diligent and conscientious about that. Last week I finished the first draft of the business plan, which was a very useful process for me to put everything on paper, to commit myself to a real strategy and timeline—and also really to consider the revenue streams. Right now we’re giving content away for free, which obviously is not sustainable.”

The Mathalicious case provides unique insights into ‘entrepreneurial affect’—the impact of feelings and emotions on cognition (something excluded from Lane and Maxfield’s model).

Based on an extensive literature review, Baron (2008) posited that affect influences many aspects of cognition and behavior; that such effects may be especially likely to occur in the domain of entrepreneurship because the environments in which entrepreneurs operate are unpredictable and uncertain and because affect influences many of the tasks entrepreneurs perform in launching new ventures (such as opportunity recognition, acquiring needed resources, and the capacity to respond effectively in highly dynamic environments). The following podcast excerpt (April 14, 2010) captures the struggles facing this social entrepreneur as he tries to reconcile his personal goals with those of investors.

“Not much has happened businesswise since my last entry. I’m still refining the business plan, which I’ll get to in a moment. I continue to develop content, and earlier this week Teach for America began promoting Mathalicious to all of its core members and alumni. This weekend I’m heading to San Francisco, and next weekend will attend an entrepreneurship workshop at the Stanford Business School. I’ll also be meeting with various ed-related organizations including Inkling, a start-up that digitizes educational content for devices like the iPhone and the iPad. In my first conversation with them, they expressed interest in potentially incorporating Mathalicious into their fold, which would certainly facilitate the distribution model, and provide for e-learning much earlier than I’d expected, but right now I’m not sure of the details, or whether it would make sense more generally.
But indeed all of this—the business plan, marketing—it’s all just ... details. Last night I watched a NOVA documentary on other galaxies. Someone forwarded me an old Carl Sagan video on earth and its relative insignificance. These are good reminders. I’m good at writing math lessons. I’m bad at a lot of things. But I’m very good at this. I approach a math lesson the way I imagine Michelangelo approached the Sistine chapel. How much did he get paid for that? Do you have any idea? Maybe he did it for free, who knows. The thing is, it exists. He is gone, but it exists. And that’s what I’m really struggling with right now. In the business plan I specifically said that profit maximization was not the goal; that the mission was to influence education as far and as widely as possible, but of course once you get private investment, do you really get to make those calls?”

One of the MBA teams assigned to this case conducted two focus groups at local middle and high schools to explore teacher perceptions of mathematics education and the Mathalicious concept, and also identify potential barriers to adoption. The high school teachers lacked confidence in the Standards of Learning, and while they were interested in alternative materials, their schedule permitted little time for experimentation. Some of the middle school teachers, on the other hand, had abandoned their textbooks (which are written to Texas and California standards), revealing an opportunity for Mathalicious to develop materials specifically for Virginia teachers. They were enthusiastic about what Mathalicious had to offer and made recommendations for improvement, including choosing more relevant real-world applications (celebrities, sports, shopping) and building greater interactivity to the lessons.

**Amandla Awethu Africa:** Amandla Awethu Africa (named after the rallying cry of the South African freedom fighters) is a nascent social enterprise pioneering a holistic, sustainable approach to African agricultural and community development. In January 2010 co-founder Daniel Isner summarized the philosophy thus:

“Long-term success is dependent on numerous factors. The most important of which is the willingness of people to trust each other and work together. Cooperative industry is in many ways a revolutionary step forward. Our holistic, grassroots approach strives to prioritize our initiatives in phases to ensure that the needs of the community are being addressed. Continual dialogue with community leaders and youth is essential to our success. Simply providing an institute to mentor and encourage sustainable growing practices, alone, will not be able to
empower a community. Projects must be economically viable, communities must benefit
directly, families will have to be encouraged to engage in its development, and foreign
volunteers must respect and understand the needs and desires of the community. With this as
our foundation, Amandla Awethu Africa has begun the process to build the Crimson Dawn
Center in Ghana.”

However, establishing this center proved more difficult than he had anticipated. A few weeks
later Mr. Isner wrote:

“Formally, we had focused our efforts on acquiring land in Amfaso, Eastern Region. Due to
complicated familial issues regarding the proposed project site, we've made the decision to go
back to the drawing board and conduct project feasibility studies in other areas. Since coming
to Ghana, I have learned that familial disagreements regarding land ownership determine the
complexity of land acquisition. For example, when a grandfather or family head passes away,
there are often quarrels between surviving family members on land rights and borders. Such
was the case in Amfaso. Unfortunately, these kinds of challenges are by no means uncommon
in Ghana. So, as mentioned, we are currently looking at all our options.”

For several weeks Mr. Isner toured Ghana, investigating potential farm sites and
producing video reports from the field. At the time of writing, he is still looking for a suitable
site. The organization recently reached a major milestone, obtaining 501(c)(3) status from the
IRS. Two MBA student teams are working on this project; one researching web-based non-profit
fundraising strategies, and the other best practices in organic agriculture, drawing on case
studies from Tanzania, Ethiopia and other African nations. This case reiterates the importance
of sense making and fostering generational relationships, but this may be easier to do in theory
than in practice.

While there have been relatively few empirical studies of decision-making in nonlinear
settings, in their experiments Richards & Hays (1997) were surprised at the extent to which
players could not figure out the simple response rule of the opponent, whose signal appeared
to have been confounded by a complex environment (probably accentuated in Amandla’s case
by cultural differences). Following Charles Lindblom, these researchers also found that the best strategy in complex and unknown environments, where ramifications of actions are unclear and may be sensitive to small changes, is incremental search—precisely the strategy Mr. Isner has adopted. “In short, when navigating any nonlinear environment,” these researchers state, “the basic rule of navigation applies: attempts to paddle in a swift and complex current just amplify the current’s effects and may result in a loss of control. Much more effective are small adjustments informed by longer periods of observation.”

5. Discussion

What’s missing from the Case 3.0 approach is a standardized protocol for data collection. To reiterate, facts are not just waiting to be picked up; it is theory or expectation that guides perception and hence observation. However, the theoretical basis on which to proceed is not fully clear. Should each entrepreneur be left to choose their own principle of selectivity with respect to the real world, based on what’s important to them (as practiced by Karim Logue and Daniel Isner)? Should issues, topics and questions be agreed upon by researcher and entrepreneur (as practiced by Brian Cunningham and John Brauer)? Or is there a middle position, which would set guidelines and metrics that merely direct what is worth paying attention to? The latter is attractive in the sense that it allows for equivalent cases (a prerequisite for theory-building), while also preserving the pluralism that Kuhn would argue is a source of strength and richness.

Unfortunately, the case method as currently practiced leaves little room for theory. Perhaps this is because theory idealizes by abstraction and is therefore not ‘practical’ enough.
This is a missed opportunity since theory is of value not just as an intellectual activity in its own right, but also as a means to make sense of the world at a time of rapid and continuous change, and may help in the development and achievement of practical business objectives. The case method as currently practiced also leaves little room for academic researchers to get more exposure to the real world, which is a missed opportunity to develop more useful theories.

Academics and practitioners may have more in common than meets the eye. As we have seen, strategy in complex environments is not about optimized precommitment but informed trial and error (“maximize your chances of luck,” as Rajiv Dutta put it). This has parallels with the scientific doctrine of falsification, which holds that we can never know with certainty what is true; only what is false. The process of science is thus the progressive elimination of what is false through trial and error, with the intention of bringing us ever nearer to the truth.

One way of bringing the academy and industry closer together is to bring theoretical ideas from a wide range of disciplines directly to bear on each case study (i.e., as part of the Live Case or Base Case), which would help make sense of observed events and processes. This step would also benefit the research community, since progress is more likely to be made when there is a healthy competition between theories or research programs, the premise being that the assessment of any one theory or research program (such as the complexity-based perspective used in this paper) cannot be adequately done from within that perspective (Webb 1995). The case method as currently practiced illustrates the dangers of self-confirmation (i.e. selecting facts that confirm a chosen theory), which might be avoided by introducing greater theoretical eclecticism. Various social media could be harnessed to facilitate the healthy exchange of ideas.
6. Conclusion

Lakatos’ criterion of ‘fruitfulness’ holds that our theories should not only be assessed according to where they have been and what they have explained, but also in terms of where they are going and what they are stimulating (Webb 1995). In this respect the inherited assumptions about strategic decision-making, which have shaped not only case analysis and discussion but also selection and production, are found wanting. To understand the world more fully we need to go to a different kind of analysis, one more dependent on how agents perceive, assess and navigate the world within which they are acting. Based on the pilot study, Case 3.0 shows promise as a means by which to re-align the century-old case method with today’s world, a world in which complex foresight horizons have become the norm. A more longitudinal, granular approach, which more evenly distributes the burden of content generation among researchers, entrepreneurs and other stakeholders, may yield deeper insights in the cognitive, structural and other dimensions of the emergent entrepreneurial process. The proposed approach rests on the principles of reciprocation (entrepreneurs generate content in exchange for actionable research and fresh insights into pressing problems), decentralization (content generation is pushed to the periphery to take advantage of local knowledge), dynamism (digitization enables continuous updating), collaboration (cases become a vehicle by which to bring the academy and real world closer together for mutual benefit) and social action (more than a pedagogy, the case method also may be a catalyst for building entrepreneurial capacity in the real world). The immediate challenge is to standardize the process to ensure equivalency between cases, thereby establishing a firm foundation for teaching and theory building.
References

**Case 3.0: The Pilot Study**

**Principal Topic & Research Question**

The question is no longer whether entrepreneurship can or should be taught, but rather how to continually improve its content and delivery to meet the needs of our current students (Gendron & Greene, 2004). This paper reports the findings of a pilot study whose aim was to test and refine the operating principles of ‘Case 3.0,’ a proposed web-based method for learning entrepreneurship in which entrepreneurs themselves generate much of the content using multiple modalities (video, interviews, voice-to-text software, written reports, etcetera). The objective is to improve the quality and integrity of information by reducing retrospective bias and revealing entrepreneurial processes – what Sarasvathy (2008) calls the “microfoundations of entrepreneurship” - that until now have been largely hidden from researchers. Specifically, the pilot study sought to shed light on the following research question: how can Case 3.0 become a win-win solution for entrepreneurs, students, professors, experts and other stakeholders?

**Methodology/Key Proposition**

This study drew upon two related bodies of knowledge to develop the conceptual framework. First, in the pragmatist tradition, theories of effectuation, improvization, bricolage and combinations thereof. Second, in the process philosophy tradition, perspectives from the emerging Process Organization Studies (POS) school. Our basic proposition is that entrepreneurial education would benefit from a shift in emphasis, from examining entrepreneurial decisions at a snapshot in time, to a more in-depth and longitudinal approach able to capture the entrepreneurial process in all its complexity.
Data for this project was generated by tracking the evolution of five entrepreneurial ventures commencing January 2010: (1) Ocean Energy Systems (early-stage wave energy technology), (2) Living Machines (ecological solutions to wastewater management), (3) Amandla Africa (sustainable development, food security), (4) NW Works (employer of persons with disabilities), and (5) Mathalicious (creative solutions to K-12 math education). Graduate students in two MBA classes participated in the study, each given specific research assignments.

**Contributions**

This research makes three specific contributions to research focusing on the principles of effective entrepreneurship education. First, it provides insights into the value of making entrepreneurs, professors, students and experts, co-creators of case content, and the practical challenges in doing so. Second, it provides insights into the functional requirements of the web-based interface planned to manage and extract value from all this data. Third, it opens up new avenues for research at the nexus of entrepreneurship and pragmatist and process philosophies.
Success profiling of students in entrepreneurship and small business management: a methodological perspective on the interactive nature of success predictors on student performance at an open and distance learning institution

Elana Swanepoel, Hélène Müller and Andreas de Beer

Abstract

This study evaluated the interaction effect of satellite classes and additional, potential success predictors on academic performance of first-year students, by applying the Chi-square Automatic Interaction Detector (CHAID) methodology. This decision tree methodology described the interactive driving forces (satellite class intervention and biographical student attributes) that impacted on student success. The CHAID analysis enabled the profiling of successful and at-risk students. The decision tree algorithm mimics true life situations where various effects interactively and jointly influence and predict an outcome. The results showed that the critical interacting nature of satellite class attendance and additional co-predictors, such as population group and type of matriculation certificate, considerably strengthened performance prediction.

Introduction

The success rate of first-year diploma students in some courses in the Department of Business Management at the University of South Africa (Unisa), an open and distance learning institution (ODL), is of great concern. An unacceptably low pass rate of between 40 and 50 percent in the courses Business Management I and Management I was reported between 2003 and 2007 (Swanepoel, De Beer, and Müller 2009). Student failure is costly to both the institution (in terms of eventual throughput rate and associated subsidy quotas) and the students (in terms of time and accumulated study expenses). The added financial burden is often carried by overburdened parents, sponsors or the students themselves incurring escalating study loans. The
financial implications for South Africa, as a developing country in need of a skilled workforce, are thus pertinent.

Student academic performance at ODL institutions, as at residential universities, is linked to student-lecturer knowledge communication and interaction (Ansari 2002). In an attempt to increase students’ academic performance, satellite classes, as a blended learning component (Marx 2007), were investigated and implemented by the relevant department in 2006. Satellite classes mimic physical face-to-face student-lecturer tutoring and interaction by means of a series of networked, virtual real-time verbal communication and tutoring sessions. Satellite classes are costly to Unisa and return on the investment therefore has to be continually evaluated.

In the evaluation process, success-indicator measures had to be defined. Improvement in students’ examination or year marks or the pass/fail ratio of students attending and not attending satellite classes could act as success indicators.

The effectiveness of the satellite class intervention can furthermore be evaluated with different analysis methodologies. For example, in an initial analysis strategy, the research objective could focus solely on determining whether satellite class attendance significantly improves student performance. The same authors (Swanepoel et al 2009) conducted research to this effect in 2009. The rationale followed in this approach is that research into intervention effectiveness should not continue if the intervention per se does not prove to be effective. Once the effectiveness of the intervention has been established, a subsequent analysis strategy into the joint interactive effect of intervention and other success indicators should be followed. An in-depth analysis strategy should then recognise the fact that no single intervention or attribute influences an outcome (such as performance) in isolation. A combination of interacting forces
usually affects outcome. The research discussed in this article focuses on the analysis methodology applied during the second phase of the research project.

In the initial research by the same authors (Swanepoel et al 2009), determination of a pass rate and satellite class intervention dependency was formulated as the research objective. The analysis results of the initial study identified a statistically significant relationship between the attendance of satellite classes and the pass rate of students.

In the subsequent study, on which this article reports, the statistical significance was explored of the contribution of satellite classes in relation to the magnitude of the contributions of other predictors in jointly and interactively predicting performance success. The joint and interactive nature of predictors (which include satellite class attendance) modulating a success/failure prediction model became the main focus of the study. Student biographical information on population group, age, type of formerly traditional South African (SA) matriculation board certificate obtained, and language properties describe these predictors.

If the contribution of satellite class attendance in the joint/interactive prediction model proved to be substantial, initial research would be validated. Favourable results would furthermore strengthen research and justify tutoring expenses on satellite class implementation. The interactive nature of the analysis strategy has the added advantage of incorporating the effect of satellite class attendance into profiles of successful and at-risk first-year Business Management and Management diploma students.

Although ODL and the impact of satellite classes (not necessarily at ODL institutions) have been researched internationally (Collins 2002; Albright 2007; Zawacki-Richter 2009), limited research in this regard (except for previous research by the authors Swanepoel et al 2009), has been conducted in the field of Business Management at ODL institutions in SA. The
present research therefore aimed to fill the knowledge gap on the effect of the satellite class intervention on improved academic performance, while simultaneously eliciting biographical profiles of successful and at-risk first-year students. From these at-risk profiles, in particular, it should be possible to develop student support strategies to ensure an increased student pass rate.

The importance of psychographic and other possible contributing factors (such as student motivation, persistence, drive and other forms of support) was, however, not negated by this approach. These factors will be researched in the third stage of this continuing research project.

**Theoretical Background**

Unisa is rated the fifth largest ODL institution in the world, with approximately 280 000 registered students for the first semester of 2009 (Subotzky 2009). ODL approaches focus on opening access and flexibility to education and training, freeing learners from restrictions imposed by time, geographical disposition, socioeconomic and other constraints, and offering flexible learning opportunities to learners (Louw 2007). These approaches imply that learning and support are facilitated by someone removed in time and space from the learner and that student-lecturer knowledge communication is through an artificial medium (such as interactive satellite classes) (Moore, Perlow, Judge, and Koh 2006). The approach further implies that new patterns of virtual teaching and learning evolve when technology and traditional tutoring methods are intermingled in the learning process (Unesco 2002). Effective blended learning approaches that facilitate the pass rate and reduce tuition costs are vital to the sustainable growth of universities (Unisa 2009) following this tuition model. Satellite class intervention, the focal learning approach of the research under discussion, constitutes a blended learning technique.

The element of an artificial communication and support medium underlies the concept of blended learning and forms the essence of most authors’ definition of blended learning. The
Royer Center for Learning and Academic Technologies (2004), for example, defines blended learning as an ‘intermingling of multiple learning strategies or methods with a variety of (communication) media’. Markus (2008) agrees. Strategies or media would typically include aspects of face-to-face instruction and online (or distance) learning. Marx (2007) echoes Driscoll’s (2002) opinion that blended learning combines any form of instructional technology with face-to-face instructor-led training. Blended learning strategies have several distinct advantages which are conducive to performance, such as a sense of community among student learners (Garrison, and Kanuka 2004), exposure to open dialogue, critical debate, reflection and broadening of the learning experience. In developing countries such as South Africa, certain blended learning techniques, such as satellite classes, have the added advantage that the implementation cost of the strategy, in relation to the proportion of students who can be serviced by the teaching approach, is relatively low (Mathur, and Oliver 2007).

Although Oliver and Tigwell (2005) claim that blended learning increases student performance, Prinsloo and Van Rooyen (2007) point out that the successful introduction of a specific blended learning approach at one institution does not necessarily guarantee the effectiveness of the strategy at another institution. In selecting blended learning options, cognisance should be taken of the accessibility of the proposed strategy to students. A large proportion of the Unisa student population comes from historically disadvantaged backgrounds and often from remote rural areas with poor infrastructure (Visser, and Hall 2006). These logistic realities require serious consideration when the various types of technologies that are available to facilitate learning are evaluated.

External indicators and biographical characteristics (and combinations of these factors) that affect or predict academic performance translate into profiles of successful and at-risk students
(Wojciechowski, and Palmer 2005). Influential characteristics, the way they interact and their ‘influence priority’ on performance have been widely researched from various analytical perspectives. An overview of research trends to this effect has been reported by Du Plessis, Prinsloo, and Muller (2005). Numerous potentially influential success predictors are mentioned, such as cultural background as expressed via the population group, age, gender, English language proficiency, tutoring language of the institution, home language, admission policy, type of matriculation exemption, repeaters, comprehension and reading skills, to name but a few.

The importance of a sound decision on the type of applicable blended learning intervention is far reaching. The primary aim of intervention is to improve performance, but this comes with a price tag in terms of the financial survival of the ODL institution, the academic standing of the institution and input of the student, financially, mentally and physically. Hence the efficiency of the intervention can therefore not be left an unknown.

**Research Methodology**

**Research Objectives**

The initial research by the authors established that first-year students’ attendance of satellite classes in first-year Business Management and Management courses was significantly related to academic performance and markedly improved performance (Swanepoel et al 2009).

In the present study the research objectives aimed to:

- validate the significance of the identified relationship in the initial research via an alternative analysis methodology
- create an exploratory prediction model (expressed as a student success profile) for the success rate of students which takes cognisance of the interactive nature of predictor
variables, and, evaluates the contribution of satellite class attendance in conjunction with other possible biographic predictors in the model

- present the prediction model as a provisional profile for successful and unsuccessful first-year Business Management and Management students at Unisa

**Research Design**

The data that were analysed were retrieved from 2007 first-year Department of Business Management student records. Data fields extracted include information on examination marks (continuous data), satellite class attendance figures (categorical data) and biographical attributes (categorical data). For the purpose of the present research and analysis strategy, examination marks were categorised into ‘pass’ and ‘failure’ categories (categorical data) according to whether a pass rate of 50 percent was attained in the 2007 examinations. The nature of the collected data therefore required a quantitative research design (De Vos, Strydom, Fouche, and Delport 2005).

The non-parametric and categorical analysis technique applied as part of the analysis methodology, namely a decision tree data partitioning analysis approach (described in the analysis strategy section), aligned with the data type and data structure and also satisfied the underlying analysis assumptions set by the statistical analysis technique (Kass 1980).

In the planning stage of the research, it was decided to base the evaluation of the effectiveness of satellite class attendance on student records that indicated full participation in the relevant modules. Records indicating outstanding results, or re-admission to sub-examinations, or non-attendance, or withdrawals, or cancellations and other exemptions, were excluded from the database. This design decision could possibly inflate the actual pass-fail ratio if it was argued that all students not participating in the examinations actually ‘failed’, but the
reasoning was founded on inclusions of ‘true’ pass and failure cases in the analysis. In this way, a pure database was established without ambiguous cases.

**Sampling**

The examination results on 2007 first-year student performance in two Business Management and two Management modules were extracted from the official Unisa Student Database. Age, population group, home language, tuition language (Afrikaans or English), type of matriculation certificate and satellite class attendance furthermore constituted the biographical components.

To contextualise the inclusion of the type of matriculation certificate as a possible influential effect in the study, the following background information seems relevant: under the previous government (prior to 1994) various matriculation certificates were issued in South Africa up to 2007. The certificates were issued according to provincial, private, homeland and population group classifications. In addition, study admission is granted to older students (+23 category exemption), to foreign students and to Senate-approved cases. Unisa policy, as an ODL institution, grants open admission to all matriculation certificates holders. Against this background it was argued that the type of matriculation certificate held by students could, in conjunction with the effect of satellite class attendance, impact on student performance. Certificates were therefore classified according to the Unisa 2008 Student System Codes Guideline (Wilson, and Du Toit 2008):

- category 1: formerly traditionally white, private and Indian schools
- category 2: previously traditionally black or coloured schools
- category 3: special exemption, 23+, Senate-granted exemption, foreign, etc
Compared to South African residential universities with a very young student population, student-age distribution at Unisa has a larger proportion of older students, which implies that older types of matriculation certificates impact on the student population over a more extended period than at residential universities.

In total 5 740 records of student who had written exams were sampled out of a total of 12 321 registered students in 2007. The number of records analysed in the current research is slightly less than the 5 864 records included in the initial research by Swanepoel et al (2009). The biographical characteristics of the respondents were not included in the initial research. In the current study, incomplete records of biographical attributes had to be excluded, thereby reducing the sample size to 5 740 records.

**Satellite Classes as a Blended Learning Intervention**

Satellite classes were presented simultaneously at 25 auditoriums geographically spread across South Africa and Namibia. These venues were linked to one another and to the recording studios of the Department of Communication at Unisa via a network. At the studio, the lecturer presented subject content matter and students could communicate live with the lecturer via telephones at the venues. Presentations were also recorded on DVD and made available to students on request. Five satellite classes were presented over the duration of the semester. In total, 4 608 module attendance entries were recorded (some students attended more than one satellite class – up to five classes – and others more than one of the modules, as reflected in the attendance figures: MNG1M14 950; MNG1M25 480; BSM1M1P 1 653 and BSM1M2P 1 535 attendees).

Survey data were collected once the final examination marks had been recorded. This implied that no student was subjected to any ‘treatment’, which could have been to the advantage
or detriment of any student or subgroup of students. Data were collected from Unisa’s official databases, which ensured data integrity.

**Analysis Strategy and the CHAID Analysis Methodology**

As a first step in the analysis strategy, frequency distributions on all variables were calculated. This was followed by a decision tree data partitioning analysis methodology referred to as Chi-square Automatic Interaction Detection (CHAID) technique (AnswerTree 3.0 User’s Guide 2001).

The frequency tables were used to validate the dataset and describe the sampled population. Distributions are presented in Table 1. It was established that 55 percent of the sampled students passed their examinations, and that 31 percent attended (at least one) satellite classes. The majority of students, nearly 70 percent, were younger than 35. Eighty-one percent were African/black students and 78 percent spoke an African language at home. The results indicated that the tutoring language was predominantly English (95%). Fifty-five percent of the students were in possession of matriculation certificates of either traditionally white, Indian, private, African/black or coloured matriculation boards. A substantial number of students (45%) had other types of matriculation exemptions. The sampled population proved to be a good representation of Unisa students. Official Unisa statistics indicate that the majority of students are young (46.4% younger than 29 years and 50.6% older than 29 years), black/African students (64%) who speak an African language at home and are tutored in English (Subotzky 2009).

Frequency distributions assisted in identifying and condensing category levels of potential success predictors that proved to be sparsely populated. Sparsely populated predictor variables entered into the decision tree model (very low frequencies) could add bias to the eventual
prediction. The levels of categories of the age and type of matriculation certificate variables, were, for example, condensed into fewer more populous categories.

In the second phase of the analysis (CHAID), the pass/fail rate of the students was regarded as the dependent variable and satellite class attendance, along with the available biographical variables, were entered into the decision tree model as independent variables to investigate the interactive contribution of the independent variables on the students’ pass/fail
The technique mimics real-life situations in that several effects generally jointly influence an event such as performance.

CHAID methodology was first developed by Kass (1980). CHAID is a relatively simple multi-variate classification and data partitioning technique (Eherler, and Lehmann 2001) and was introduced to study the interactive nature of the predictors of a dependent variable. The technique automatically selects those predictor variables that jointly, interactively and optimally predict the dependent variable. The technique works extremely well on large datasets with many predictor variables – which fit the data description of the current research.

The data partitioning process is based on the following principles:

- The prediction model that emerges is presented in the form of a classification tree referred to as a decision tree.
- The method is a stepwise process and starts off with the root as the set of all respondents partitioned according to the levels of the dependent variable. In the current analysis the ‘pass’ and ‘fail’ levels of the examination results variable represent the dependent variable levels. The step is illustrated in the Step 1 diagram depicted below (BM 1 = Business Management 1 and M1 = Management 1).
In the second step in the data partitioning process, the list of probable predictors is automatically evaluated to establish whether a ‘best’ predictor variable (referred to as a ‘splitting agent’) can be identified that will split the initial dataset into subsets. Partitioning is conducted in such a way that the most distinctive and significantly different subsets, with respect to the pass/fail categories of the dependent variable, emerge once partitioned. The partitioning of the data into subsets is referred to as ‘branching’ and the subsets as ‘branches’ or nodes. The Step 2 diagram below illustrates the principle as set out in the text.

In subsequent steps, the preceding step’s subsets are again investigated to determine which predictor variable then acts as optimal splitting agent (if such an agent exists) to once again
split the subset into the most distinctly different and significant subsets with respect to the pass/fail levels of the dependent variable.

- At each step in the process, chi-square tests are calculated to determine whether the splits are significant.
- The process continues until one of a number of stopping mechanisms is encountered.
- Before embarking on the partitioning process described above, CHAID evaluates the categories of each potential predictor variable (such as the categories of population group and matriculation certificate) and merges categories if judged to behave in a similar fashion with respect to the dependent variable. Dissimilar categories are maintained. The complete decision tree is depicted in Figure 1.

Why resort to segmentation or partitioning? Segmentation analysis proves to be useful in the current research in answering questions such as the following:

- which predictors most strongly define the segmentation of first-year diploma student success, and once established,
- which combination of the levels of the selected predictors defines student groups most likely to pass first-year Business Management and Management modules (identified as student subsets with a high pass/fail ratio) as opposed to
- which combination of levels of these predictors defines student groups at risk of failing first-year Business Management and Management courses (identified as student subsets with a low pass/fail ratio)?

The structure of the decision tree assists in this regard: by following branches of the tree from any given point back to the root of the tree, different combinations of characteristics that best define specific target groups can be derived.
The predictor selected for the first split of the trunk represents the most critical success predictor. The importance of predictor contribution to the model decreases with lower levels of the decision tree.

**Results and Interpretation of the CHAID Analysis**
