Streamlining Government Financing Programs for SME’s in the Sub-Saharan Africa: The Case of Botswana

By
Mengsteab Tesfayohannes

Abstract

The issue of SMEs financing is complex and we should address on priority basis. Although SMEs should be motivated to initiate their own means of solving their financing problems, their capacity is limited and the role of other stakeholders in the financial sector is vital. In this scenario, governments have a major role to play. Strengthening the government’s role is very important since it acts as a catalyst, investor and regulator to strengthen the supply-side of the economy. This paper discusses what role the Government of Botswana (GoB) can effectively play in facilitating SMEs financing. I proposed four financing packages containing schemes for possible use by the GoB. They are: direct financial assistance schemes; loan guarantee schemes; direct credit grant schemes; and financing of technical and managerial advisory services. Stakeholders need to evaluate these schemes from the economic rationality point of view before they are opted for implementation.

Introduction

Small, Medium and Micro Enterprises (SMEs) are widely regarded as the engine of economic growth in both developing and developed nations (Tesfayohannes, 1998). They are substantial generators of local and broad-based employment; promoters of indigenous entrepreneurship and innovation; and providers of goods and services to the local population and beyond. Nations in the Sub-Saharan Africa (SSA) already recognized the vital role of SMEs, and keen to give priority for their development (Briscoe, 1995). However, SMEs require a nurturing environment and supporting infrastructure for sustainable development. There are vital external

1 Dr. Tesfayohannes is associate professor in the Sigmund Weis School of Business at Susquehanna University, PA, USA. His areas of interest focused on: entrepreneurship and entrepreneurial development; Business and economic development strategies; small business financing investment promotion (including microfinance) and managing technological innovation, commercialization and transfer of technology. He worked at reputable universities in North America, Europe, and Africa and consulted for private, governmental and International organizations. Address: E-mail: tesfayohannes@susqu.edu
and internal factors affecting SMEs’ development in any national socio-economic framework. The external ones are national institutional capacity, regulatory framework, training and entrepreneurial development, access to finance, market opportunities, technological support and suitable socio-cultural and political environment (Liedholm, 1993; Rodinelli, and Dasarda, 1992; Tesfayohannes, 1998). Although, all the above factors require consideration, lack of finance has continued to be the major concern and the main cause for untimely failure of many SMEs (Liedholm, 1993; Morewagae, et al, 1995). This is particularly a common phenomenon for SMEs in the developing countries (National Small Business Regulatory Review, 1999). SMEs’ financing is complex and all stakeholders need to address the issue skillfully and prudently. There are numerous potential sources of financing for SMEs. We can broadly categorize them as: Equity Financing, Debt Financing, Special Purpose and Governmental sponsored financing (Tesfayohannes, 1998). These categories have their own distinctive method of dealings with the qualified SMEs. But, an effective partnership between financial institutions, cooperative funds, the government, private and cooperative investors, venture capital firms, investment angels, non-bank financial institutions can ideally facilitate SMEs’ access to finance.

Botswana is a middle-income country located in Southern Africa. It is a peaceful, democratic nation with a striving national economy. The country has an effective private sector led sustainable economic development agenda that promotes gender aware economic diversification, poverty reduction and SMEs’ development (National Development Plan 8, 1998; Vision 2016, 1996). In line with its core development agenda, the Government of Botswana (GoB) issued a special policy on SMEs development (National Policy on SMEs, 1999). During the last 10 years, the GoB through its responsible institutional capacities attempted to implement
those laid out policy directives, modalities and strategic objectives with the support of other community based stakeholders. So far, results are not as desired and local SMEs have continued to suffer from lack of access to finance (Task Force Report, 1998).

In this paper, I focused on how governments can play a catalyst role as investor and regulator of the financial environment with the desired effectiveness. Moreover, I intended to discuss on the Whys and Hows of the direct and indirect roles of the GoB towards alleviating SMEs financing problems. Although, I don’t believe that governments cannot solve SMEs’ financing problems totally, but, they can substantially facilitate SMEs’ access to finance. This is particularly true in the case of many nations in the SSA. Governments in SSA are currently overstretched due to their dominant involvement in many vital responsibilities and regulatory attributes. My aim here is just to recommend feasible government sponsored SMEs’ financing schemes that GoB can initiate, handle and implement through its appropriate institutions and agencies. This can be a small contribution towards the efforts to achieve the desired goal and strengthen the effectiveness of SMEs financing scenario in Botswana. The GoB keenly interested to involve actively in promoting SMEs as the engines of economic growth and social prosperity. SMEs access to finance is an important issue, and the GoB’s role is cardinal. I believe that the financing schemes I conceptually proposed in this paper can also be useful for other SSA nations facing similar problems.

**SMEs as the Engine of Growth**

Unfortunately, some policy makers still regard SMEs as the consequences of the failure to apply the conventional economic development paradigms exclusively stated in the Neoclassical School of Economic Thought. This comprehensive grasp on SMEs has given the
impetus for the attitude of viewing them as lonely entities with immutable diseconomies. However, all major entrepreneurial innovations and killer applications (groundbreaking innovations) that have been responsible for drastic change in our economic and social life were largely the result of SMEs’ innovative activities and related entrepreneurial attributes (Kuratko and Hodgetts, 2007). However, currently SMEs are high in the developmental agendas of all nations as important contributors to national economies (Hull, 1983; McPherson, 1996). More than any time, African nations have now embraced the paramount importance of SMEs as a vital motive force of innovation, change, and development (Owualah, 1988; Liedholm and Fuzzy, 1994; McGrath and King, 1999, Van Dijk and Sandee, 2002). Beyond the narrower spectrum, African nations should comprehend that the key to economic growth in any country lies in creating the necessary infrastructures that support the promotion of SMEs (Roux, 1999). This mandatory prerequisite can potentially help to overcome constraints hindering the enhanced developmental scope of SMEs (McCormick, 1999).

As briefly mentioned earlier, the current position of SMEs in Botswana is not rosy. At least at this time, they are not contributing to the national economy in line with their expectations. In fact, they are currently plagued with technical, regulatory, organizational, financial and other institutionally related problems at both macro and micro levels (Hinton, Mokobi and Sprokel, 2006). Even with all their formidable challenges, they are still significant to Botswana’s economy (Briscoe, 1985; Daniels and Fisseha, 1992, Cuncombe and Heeks, 2001). They continued to actively participate in all vital sectors of the national economy (Sunny, 2000). Unfortunately, Botswana has only rudimentary statistical data and it is difficult to have a full knowledge on the structure of SMEs’ and their contribution to GDP and broad employment. However, according to the Presidential Taskforce Report (1998) and Botswana aggregate
Statistical Report, 2007/2008), SMEs’ annually contribute approximately 25 – 35 percent of the country’s GDP. Their contribution to employment is more appreciable and accounts for 50 percent of the total formal employment. This is indeed an indication that Botswana is working effectively for the full-fledged development of SMEs’ as vital economic motive forces that serve as a means of providing equitable benefits for the majority (Curry, 1987). In line with the strategic agenda, SMEs occupied a center stage in government’s endeavor to achieving sustainable industrial development (Sunny, 2000). As articulated in the SME national policy, the current GoB efforts focused on: employment creation, poverty alleviation, economic diversity promotion, indigenous entrepreneurship advancement and foster successful economic competition. This is in line with the country’s long-term vision towards advancement and prosperity for All” (Vision 2016, 1996). GoB should also continue to create an enabling environment for collaboration and partnership with other stakeholders for the speedy realization of the desired strategic objectives.

**Some Fundamental Aspects of SMEs’ Financing**

**The Financing Constraints**

Some have argued that SMEs do not need special financing schemes and they should compute in the financial market (Mazumdar, 1989). However, many studies have advocated for SMEs’ focused financing as they suffer most due to lack of suitable access to finance. This lack of finance is the toughest constraint in most of the developing nations (Cook., 2001; Lycette and White, 1989; Harrison and McMillan, 2003; Kurwijila and Due, 1991). For example, Levy (1993) emphasized in his study that the lack of finance is the primary bottleneck to smaller business
operation expansion in the leather and furniture industries in Sri Lanka and Tanzania. In a similar way, studies conducted in other African nations like Ghana, Kenya, Nigeria, Ethiopia, South Africa have shown that the major cause of small enterprises’ failure is their inability to obtain adequate financing (Schoombe, 2000; Bigsten et al, 2000; Aryeetey, 1993; Oyejide, 1993; Marana, 1993; Demesne, 1993). In their study, Morewagae et al (1995) found that the ability of SMEs to obtain funds is constrained by the lack of information, complicated application procedures, high collateral or security requirements, high interest rates, and harsh repayment terms. In a lesser degree, this case is also felt in the developed countries (Brigham, 1983; Harrison, and Mason, 1993). Walker and Petty (1986) noted that SMEs are subject to greater risks, business and financial and are more vulnerable to bad decisions than their larger counterparts are. SME financing problems stem from the lack of capacity to obtain funds at the right time, of the right type, in the desired amount and at various stages of development (Bates and Hally, 1982). Many potentially innovative and productive entrepreneurs in the SSA have failed because of lack of finance (Tesfayohannes, 1998).

Numerous studies identified several case specific and general problems related to SMEs’ financing problems (Task Force Report, 1998; Liedholm, 1993; Rempel, et al, 1994; Morewagea, et al, 1995; Lisenda, 1997). The common problems that affect SMEs in SSA nations are: conservative approach of the financial industry; less effective governmental regulatory frameworks; internal organizational and financial weakness of the SMEs; less recognition of the role of SMEs as the engine of economic growth; in-adequate entrepreneurial and managerial acumen of SMEs’ owners and managers; the marginal role and availability of informal financing sources in the society; and the non-supportive role of institutions and agencies representing the
interests of SMEs (Example: Chambers of Industry and Commerce, Entrepreneurs Association, Financial Cooperatives and other concerned agencies representing the SMEs sector).

**SMEs Financing in Botswana**

In Botswana, Entrepreneurs particularly the local ones have continued to complain about the limited access to finance. Their complaints emanated from the conservative attitude of banks and other commercial lenders towards SMEs loan requests (Example, lack of the required information, complicated application procedures, high collateral or security requirements, high interest rates, and imposing harsh loan repayment terms). The GoB established and assigned a high-powered Task Force in 1997 to conduct an in-depth study on the general situation of SMEs in the country. The objective was to respond to the continued complaints and dissatisfaction of SMEs owners about access to finance and other problems related to SMEs in the country. The assigned task force produced a comprehensive Presidential Task Force Report (Task Force Report, 1998). The report contained new and extended promotional approaches and recommendations targeting: the Institutional and Regulatory Framework; Education, Training and Entrepreneurship Development; Access to Finance; and Support for Marketing and Technological Development.

According to the report, the current sources of finance for SMEs in Botswana are: personal and other related sources; government financial assistance mainly through Financial Assistance Policy (FAP); loans from commercial banks; loans from National Development Bank; and loans from other financial institutions. The task force report revealed that personal savings and contributions from family or friends and other unknown informal and semi-formal sources (informal lenders) account for more than 70% of SMEs financing. This shows that the majority
of SMEs in Botswana have relatively few opportunities to obtain finance from sources other than the above mentioned non-commercial sources. These limitations continued to have negative impact on SMEs. This phenomenon in turn significantly discouraged other potential entrepreneurs from involvement in establishing entrepreneurial ventures.

The report further indicated that commercial banks are formally ready to provide loans up to Pula 100,000[^1] to SMEs. However, on the one hand, entrepreneurs frequently criticize commercial banks for their hesitation and excessive conservatism in dealing with lending to SMEs by imposing excessive bureaucracy. On the other hand, Commercial banks also complained on the unreliability of SMEs due to lack of collateral, insufficient equity contribution of owners, inadequate financial record and poorly prepared business plans. It can be concluded that the current commercial banks role to alleviate SMEs financing problems has proven to be limited and discouraging. It is in fact accounting for only 2 percent of the required finance at both start-up and post-start-up stages (Lisenda, 1997). This is unacceptable at any yardstick.

The GoB also facilitated an alternative sources of finance for SMEs mainly from the government owned development banks and special funding agencies in the country. The existing institutions of this kind are: The National Development Bank (NDB), Tswelelo and the Botswana Development Corporation (BDC). Surprisingly, NDB lending policies and regulations are more or less similar to the commercial banks. Its minimum loan is Pula 20,000. This amount is by far less than the minimum loan provided by the commercial banks. Tswelelo is no more functional due to sustained losses emanated from its very poor lending and loan collection processes. The minimum BDC’s loan provision is Pula 200,000. This automatically targets those, size wise, bigger enterprises with higher needs for finance. There are some other nominal financing agencies like Women’s Finance House Botswana (WFHB), Cooperation for Research,
Development and Education (CORDE) and Rural Industries Innovation Center. These Non-governmental Organizations (NGOs) mostly limited to a narrower domain. Their full dedication is just to provide small supplementary loans and financial assistance to cover some of the ad hoc financing needs of SMEs.

The Financial Assistance Program (FAP) was launched by the GoB to provide financial assistance and loan grants to qualified SMEs owned by local entrepreneurs. The objective was to foster grass roots level self-employment and provide more opportunity for the qualified Botswana citizen entrepreneurs to grow further and register success. The GoB introduced FAP in 1982 and amended it in 1995. Compared to other programs, FAP was well organized and intended for a wider coverage. FAP’s maximum financial assistance in term of loan was Pula 75,000 with a strict criteria. For example, to qualify for FAP financing the applicant must be a Botswana citizen, aged 18 years or older and should fulfill many other qualifying criteria. The maximum FAB financing is just to covers up to 90% of the required investment of the qualified projects. FAP funds gave priority to projects located in rural areas and those venture projects owned by women. The intention was good, but FAP was not successful to surmount its strategic objectives. According to the task force report, only 4% of SMEs got assistance from FAP. This good intentioned scheme suffered from extensive mismanagement, nepotism, corruption and inefficiency. In fact, it played a nominal role in creating sustainable, innovative and viable business ventures in the country. The GoB terminated the program and created the Citizens’ Entrepreneurial Assistance Policy (CEDA) in 2001 (Analytics, 2003). This new agency should continue to dedicate itself to surmount the challenge of initiating government sponsored SME financing schemes based on fulfilling strict and viable requirements. CEDA has also continued to
suffer from multiple problems too, and its ability to provide adequate services to its clients has continued to suffer as well.

The above briefly expressed impediments have played their own role in aggravating the situation. To alleviate these and other problems, the task force gave some comprehensive SMEs financing recommendations. They include the following: lending and credit-guarantees; setting-up mechanisms for improving the capacity of SMEs to access finance; and improving the effectiveness of the financial assistance and lending programs still currently active. Unfortunately, the tasks force recommendations are very general and lack specific application modalities and technical and action plan preparations. Successful application in turn demands the design of specific, viable and target-oriented financing schemes. Unlike other governments in SSA, the GoB has a mighty financial capacity due to substantial revenue from Diamond and other precious mineral exports (Morewagae et al, 1995; Analytics, 2003). This means the GoB has the ability to help SMEs at least to ease their financing problems in a viable way. However, this does not mean that government should solve every SMEs financing problems. In both developed and developing nations, what governments can do is limited. Governments have many other socio-economic related commitments (Chunyun, 2003). However, governments support can play a crucial role in the survival and growth of SMEs. This should include helping them to alleviate their financing problems by lunching certain target-oriented and wider outreached financing schemes (Chase, A. et al, 1983; Deutsche Ausgleich Bank-DtA, 1996). In line with this assertion, I formulated some financing schemes that might help GoB policy makers and stakeholders in charge of promoting SMEs in the country. The proposed schemes are not ready-made and are just for brain storming. Stakeholders need to appraise and substantiate them from their opportunity cost point of view.
Recommended Government Sponsored SMEs’ Financing Schemes

As briefly discussed above, GoB indeed participated in promoting SMEs’ financing initiatives through various schemes and programs. All these initiatives are relevant and supportive, but they should be implemented in the best possible way to improve SMEs financing outreach. This means GoB should search for better and more innovative ways of implementing established initiatives as part of its continuous improvement endeavors. Effective implementation requires the capability to streamline, cluster, and properly manage SMEs financing initiatives. The first action is clustering the existing fragmented government sponsored SMEs financing schemes and action programs into SMEs financing packages. Well packaged, organized and clustered schemes and action programs can be easier to implement and offer better management of financing outreach activities. I therefore proposed seven packages each of which can contain several government sponsored SMEs’ financing schemes (see Figure 1). From the seven packages comprehensively proposed, I selected the following four packages: Direct Financial Assistance Schemes; Loan Guarantee Schemes; Direct Credit Grant Schemes; and Financing of Technical and Managerial Advisory Services. I would like to underline that it is easy to design and propose schemes and action programs, but the most intricate task is to successfully implement and broaden the outreach to the targeted beneficiaries. This challenge rests mainly on the shoulders of the executing agencies. A systematic approach for the design and implementation of government sponsored SMEs’ financing schemes is shown in Figure 2. Each one of the SMEs’ financing packages proposed in Figure 1 should act as an umbrella for the proposed SMEs financing schemes and action programs related to each of them.
Figure 1: 
Recommended Government Sponsored SMEs’ Financing Schemes in Botswana

- Direct Financial Assistance Schemes
- Loan Guarantee Schemes
- Direct Credit Grant Schemes
- Bank Loan Subsidization Schemes
- Direct Equity Participation Schemes
- Export Financing Schemes
- Financing of Technical And Managerial Advisory Services and Performance Upgrading Extension Schemes
Figure 2
Methodological Steps of Government Sponsored SMEs’ Financing Schemes

Study the general situation of the existing SMEs in terms of:
- their types of activities,
- their locational aspects,
- their importance in the export promotion and import substitution national development strategies,
- their contribution towards achieving environmental sustainability,
- their present and potential contribution to job creation,
- their contribution towards: the promotion of regional balances in economic development and through narrowing rural-urban developmental gap and the income inequality,
- their contribution towards enhancing indigenous technological, managerial and entrepreneurial capacity,
- their contribution to overall industrialisation,
- their contribution as a means of overall manpower development.

Identify problem areas which need government assistance

Design the desired SMEs financing scheme(s) and structure of the organizational set-up required for the implementation of the designed scheme.

Raise the required funding for the designed SMEs’ financing scheme(s) (the required funding can be generated from government treasury, foreign sources, contributions from private and public business organisations and financial institutions and contributions from the community at large).

Express the clear purpose of the financing scheme(s) including other related extension advisory services

Set-up the comprehensive eligibility criteria (For example, for SMEs to qualify, it may be necessary for them to be engaged in certain activities which are vital for economic development)

Test the validity of the scheme(s) (using some qualified SMEs as a sample) Pilot testing

Is the test result valid? (i.e., is the designed scheme(s) helpful and instrumental?)

Repeat the process for designing a better and realisable scheme(s).

End of the process

Periodic evaluation and follow-up for further improvement and up dating

Implement the scheme(s) in practice

Yes

No
Direct Financial Assistance Schemes

As, I mentioned earlier, national governments in the developing economies control and own a large portion of national wealth and endowments including vital financial institutions like commercial banks. This can help them to possess the ability and strength to launch a variety of government sponsored initiatives and action programs including providing direct financial support for qualified SMEs. In the same way, the GoB can launch time bounded direct financial assistance schemes to provide non-obligatory funds to qualified SMEs as a contribution to their sustainable development.

In line with its commitment, the GoB has already established specialized agencies like Citizens’ Entrepreneurial Development Agency (CEDA) and Small Business Promotion Agency (SBPA) to provide its support through these types of agencies if they continue to function effectively by launching direct financial assistance related schemes and action programs. Figure 3 shows my recommendation in this package. The proposed schemes are general in their contents and intended just for brainstorming purpose and adaptation. GoB can also design and launch numerous other schemes under the same umbrella (package). I need to emphasize that these and other related schemes should undergo through direct or indirect critical evaluation in the light of their contribution to meeting the anticipated goals in the given environment.
### Proposed Government Direct Financing Schemes for SMEs in Botswana

<table>
<thead>
<tr>
<th>Scheme</th>
<th>Objective</th>
<th>Targeted Beneficiaries (Eligibility)</th>
<th>Possible Sources Of Funding</th>
</tr>
</thead>
</table>
| **Industrial Feasibility Study Cost Coverage Financial Grant** | To finance feasibility studies for new ventures or for expansion projects of established firms | • SMEs at their seed (foundational) stage.  
• SMEs with a concrete expansion project especially in a government declared target zones or sites | • Government treasury  
• Foreign donations  
• Contributions from the business community through their representative agencies (organizations) |
| **Special Industrial Promotional Zone Development Grants** | One-time financial assistance (grant) to help new enterprises established in localities with low-level human and physical infrastructure (i.e., in socially and economically disadvantaged areas) | • For newly established SMEs in areas relatively underdeveloped but designated as target locations for development. | • Government treasury  
• Community groups of the Targeted areas  
• Contributions from the business community in the targeted location |
| **Research and Innovation Development Grant (Fund)** | To finance partially or fully the technological and innovation works and discoveries conducted by SMEs. | • SMEs that can convincingly demonstrate their innovative results (new products) will have practical and purposeful use for the society and a significant market potential in both local and foreign markets. | • Government treasury  
• Other concerned private and foreign agencies (GOs, NGOs and international organizations) can make supplementary financial contributions. |
| **Energy Problems Alleviation Fund** | To encourage SMEs to alleviate their energy supply problems and through that promote industrial efficiency | • SMEs located in areas with insufficient energy supply\(^2\).  
SMEs engaged in manufacturing of exportable goods may get priority. | Government treasury |

---

#### Bank Loan Cost Subsidization and Loan Guarantee Programs

Banks and other formal lenders assume that the cost of processing loan applications submitted by SMEs is excessive. This may be one of the main reasons for their reluctance to grant loans to SMEs. Unfortunately, the majority of commercial banks uniformly consider SMEs

---

\(^2\)In line with the rationalised development strategy of the country, the objective of this proposed incentive scheme is to motivate entrepreneurs to establish SMEs in „Economically and Socially Depressed Areas“.

\(^3\)In remote parts of Botswana where there are shortages of energy supply (particularly electricity), SMEs located there can have their own electricity generators. In this respect, government can make fixed time partial financial contributions to cover the cost of generators, and to subsidise cost of petrol like diesel needed to run generators possessed by the SMEs.
as borrowers with unstable credit worthiness and most vulnerable to the risk of default. Therefore, banks usually expect to bear a burden and incur extra costs in dealing with lending to SMEs. Especially if there are central bank imposed interest rate ceilings that do not reflect the actual market, commercial banks assume that they may not afford to lend to SMEs. In this situation, government risk sharing programs can motivate banks to lend and provide professional help to SMEs. Concerned GoB agencies can initiate appropriate risk sharing action schemes pertaining to loan cost subsidization and loan guarantee. They should ensure that the designed programs effectively assist qualified banks and other lenders to enable them to serve the needy SMEs as desired. Government subsidies and loan guarantees can help a great deal in building the commercial financial institutions’ confidence and motivation to participate in alleviating SMEs’ financing problems. Just for brainstorming, I proposed some potentially feasible government sponsored bank loan cost subsidization and loan guarantee schemes as shown in Figure 4 down below.
**Figure 4**
*Recommended Government Sponsored Bank Loan Cost Subsidization and Loan Guarantee Schemes*

<table>
<thead>
<tr>
<th>Scheme</th>
<th>Objective</th>
<th>Targeted Beneficiaries (Eligibility)</th>
<th>Possible Sources of Funding</th>
</tr>
</thead>
</table>
| Loan Cost Subsidization Scheme | To cover partly or fully the extra cost incurred by banks because of their lending (financing) to SMEs | SMEs located in rural and semi-urban areas and principally use locally produced inputs for their production activities | • Government treasury  
• Levy from profits of large companies and the SMEs’ through their representative agencies  
• Contributions made by banks |
| SMEs Start-up Loan Guarantee Scheme | To provide wider financing accessibility for SMEs at their start-up stages | SMEs at their start-up stage, emphasizing their managerial, technical and other developmental policies related requirements* | • Government treasury,  
• Contributions from banks  
• Foreign donors  
• Contributions from the existing both SMEs and large-scale firms |
| Guarantee Fund for Women Entrepreneurs | To provide guarantee to financial institutions intend to lend to SMEs owned by women for the purpose of covering working capital and investment needs | For SMEs established, owned and operated by women entrepreneurs in both rural and urban areas (however, preferences can be given to those SMEs that have been already established or are to be established in the economically and infrastructural wise depressed areas) | • Government treasury  
• Foreign and domestic donor agencies and associations (like the National Women’s Association)  
• Private sector  
• Representative organizations (like Chamber of Commerce Industry, and other entrepreneurial and professional associations) |
| Special loan Guarantee Scheme | To increase the availability of funding (loan) for the purpose of start-up, expansion, and modernization of SMEs | For SMEs established by disadvantaged and promising citizens | • Government treasury  
• Local community at large contributions  
• Bilateral and multilateral donations  
• Contributions from profits of financial institutions and other private, parastatal and fully state owned business organizations (corporations) |

The aim of the above-proposed loan guarantees schemes is to cover in case a borrower defaults.

Both the government and the lender can share losses, due to defaults, proportionally.

Customarily, loan guarantee schemes usually cover 50 to 95% of the losses incurred from

*According to the macroeconomic policy of Botswana, government usually gives priority to the establishment of SMMEs engaged in the production of exportable goods.*
defaulting SMEs (OECD Comprehensive Report, 1995). The success of these types of schemes depends at least on the following general characteristics.

- They should be flexible and responsive to the changing needs and situations of borrowers, lenders, and the national economy.
- They should be appropriate, implementable and less bureaucratic. Potential beneficiaries should be able to benefit from them in the most feasible way.
- They have to be properly designed and efficiently administered in keeping with the spirit of the given legislation.
- They have to be in line with the formulated objectives, eligibility preconditions and working systems as a prerequisite for their success.
- They should have adequate budget necessary for fulfilling their mandated operation goals.
- They have to be effective, efficient and innovative in order to attract and convince client financial institutions to participate in the program and enhance their participation in financing SMEs.
- They should promote prudent responsibility on the part of borrowers and lender institutions.

In general, loan guarantee schemes should achieve financial autonomy without losing their main purposes. The main concern is how to implement the designed schemes related to the program. To streamline the implementation process, the schematic flow chart in Figure 5 might help. I designed this assuming that it might facilitate the challenging task of implementation. In
Botswana, CEDA and SBPA are in the best position to participate in the implementation of loan cost subsidization and guarantee programs.
Figure 5

Schematic Flow of Implementation Process of a loan guarantee scheme for SMEs Debt Financing

Start

Borrower submits an official loan request to a bank

The bank conducts the necessary evaluation to decide the eligibility of the loan request

Bank decision to grant loan based on the collateral (security) presented

Conclude an agreement to obtain the requested loan

Borrower obtains loan proceedings

Borrower makes periodic debt services to the lender to repay his/her obligation (loan outstanding)

If a borrower defaults?

Lender legally and technically attempts to force the borrower to fulfil loan repayment obligation

End

Stop

The agency investigates the credit worthiness, business prospects, economic viability and the debts servicing ability of the applicant (borrower)

Bank refers the applicant (borrower) to a suitable credit guarantee agency

Decision One
Does the borrower meet bank’s collateral requirements for obtaining a loan?

YES

NO

Decision Two
Is the applicant (borrower) qualified for the issuance of a loan guarantee certificate which enables getting the requested loan from the client bank?

YES

Agency decision to grant a loan guarantee certificate as a collateral (security) to borrow the required fund from a client bank.

Borrower returns to the bank with the loan guarantee certificate

Borrower makes periodic debt services to the lender to repay his/her obligation (loan outstanding)

If borrower has no means of settling his loan obligation

Lender formally request the loan guarantor agency for the settlement of the loan obligation (loan outstanding)

Reject the application

NO

End

Borrower may settle with the bank or other means the loan obligation (loan outstanding)
Direct Credit Grant Programs

These programs are popular in many countries including in the industrialized countries like, the USA, Germany, Canada and Japan. Government initiated direct credit grant programs helped a lot in strengthening fledgling SMEs (OECD, Report, 2001; American Recovery and Reinvestment Act of 2009). In the same way, GoB can launch and implement direct credit granting programs through its specialized agencies. As practiced in many countries, GoB can also delegate external organizations like banks and private and public organizations for this purpose. For example, GoB can grant direct subsidized loans to assist eligible SMEs located in rural and semi-urban as well as in economically and socially depressed areas. This helps to narrow disparities among different geographical areas in income, growth, migration and especially unemployment. To run these types of programs, mandated institutional capacities require details of eligibility criteria, loan administration procedures, repayment and security requirements and other loan related provisions. All these should be well formulated in advance. This and other initiatives discussed earlier are relevant and supportive, but they should be implemented in the best possible way.

Financing of Technical and Managerial Advisory and Extension Services

SMEs’ problems are not only access to finance, but also proper utilization of funds at their disposal. Acquiring funds is only one part in the dynamic SMEs financing scenario. Equally important is developing the ability to appropriately utilize and prudently manage the acquired funds. The lack of capacity to obtain funds at the right time, of the right type, in the desired amount, and at various stages is also another important weakness usually observable in many SMEs. We should provide SMEs the desired support for technical and managerial extension
services and capacity upgrading programs to develop these capabilities. This means that concerned governmental and parastatal institutional capacities should not only limited to providing funds. Rather, they should support SMEs to possess the ability to utilize their available funds in a proper and innovative way. Such services may include: co-sponsoring management training programs and workshops, providing training facilities (such as trainers, mentors and training kits) and informational materials, offering limited one-to-one counseling services to SMEs owners focusing on how to solve their business problems, providing technical, managerial and professional assistances.

Above all, effective implementation of schemes and focused action programs require possessing the capability to streamline, cluster, and properly manage SMEs’ financing initiatives. In sum, government programs should not be limited to granting finance only. It is imperative that many SMEs in Botswana desperately need professional help focusing on how to use their funds effectively and efficiently. It is a good idea that government and other stakeholders grant financial assistance for providing technical and managerial extension services through capacity upgrading and building programs. Such services may include.

- co-sponsoring management training programs, courses, conferences, seminars and workshops;
- providing trainers, speakers, panelists and moderators for training programs;
- providing training facilities, equipment and informational materials;
- offering limited one-to-one counseling services to SMEs’ owners and managers;
- helping SMEs’ owners/managers to identify and solve their business related problems;
- publicizing available free services to SMEs’ owners at a national, state and local levels;
helping to prepare and deliver management assistance through publications, radio, television and the print media (Adapted from SBA co-sponsorship programs, 1996),

Financing of technical and managerial training and advisory services’ schemes can be concentrated around the so-called Software Economic Infrastructure Development Programs. The Software and Hardware Economic Infrastructures can be broken down into two categories as Figure 6 shows. Hence, government can participate in software economic promotional programs
Figure 6
Vital Economic Infrastructures for SMEs’ Development

Economic Infrastructure (Macro)

Hardware Economic Infrastructure
- **Financial:**
  - Loan,
  - Loan guarantees
  - Equity participation
  - Direct financial grant

Required Legal and Policy Underpinnings for the Promotion of SMEs Financing

Lack of effective enforcement by a legal infrastructure makes the door open for financial dualism. Financial dualism is detrimental for business and economic development. It gives a room for manipulation and unproductive rent seeking activities that are harmful for the sustainable development of the national economy. The negative consequences of financial dualism have become a normal phenomenon in the majority of the developing countries of Africa, Asia and Latin America. The developed countries are not spared from this malaise. Todaro (2009) has rightly observed the harmful effect of the financial dualism particularly on the broad activities of SMEs in many developing countries. He said: “Most developing countries operate under a dual monetary system, a small and often externally controlled or influenced organized money market with severely binding legal restrictions on nominal interest rate ceilings, catering to the financial requirements of a special group of upper-class local and foreign businesses in the modern industrial sector, and a large but amorphous unorganized money market, uncontrolled, illegal, and often usurious to which most small and low income businesses are obliged to turn in times of financial need”.

The above statement asserts that highly unorganized, often externally dependent, and spatially fragmented financial system greatly impedes the growth of the national economic infrastructures in general and those of SMEs in particular. Therefore, we need to establish transparent and effective legal infrastructure to maintain an efficient financial system that fosters the growth of the national economy. This is indeed a major contributor to organized, economically interdependent, and functionally competent financial institutions, financial markets and financial instruments. As a result, prudently managed and leveraged financial resources can continuously flow in and out of savings banks, commercial banks, and other public and private
financial intermediaries with a minimum interference. Thus, a fully functional financial system strengthened in such a mode can make a noticeable contribution to the alleviation of SMEs financing problems. One of the chief causes of the economic crises in African countries during the last 40 years is the inept governance coupled with the adoption of conventional but largely irrelevant developmental policies and strategies directly copied from the developed countries (former colonial masters). Of course, Botswana has attempted to formulate and implement regulatory policies and legal underpinnings. However, the country should do more to advance, modernize and strengthen the institutional capacity of its financial sector to provide efficient services to the indigenous economic sectors including SMEs. The existence of judicious and workable legal and regulatory infrastructure can help SMEs to have better access to the financial resources available in the country. Figure 7 portrays the important position of the financial sector within the national economic system.

My recommendations on the legal acts and regulatory policies on facilitating the financing intricacies of SMEs in particular are shown in Figure 8. These recommended supporting legal and regulatory frameworks are intended to serve as a stepping-stone for more actions by the responsible government organs, principally the Bank of Botswana, Ministry of Commerce and Industry, Ministry of Finance, Office of the President, and institutions representing the private sector.

### Proposed Legal Acts and Regulatory Policies
#### Facilitating SMEs’ Financing

<table>
<thead>
<tr>
<th>Proposed Act</th>
<th>Purpose (Objective)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SMEs’ Development Agency Establishment Act</strong></td>
<td>To establish an agency at a national level with the objective of promoting SMEs. This is to stipulate the basic direction and policy of SMEs and accelerate their competitive growth. Additionally, the proposed SMEs’ development agency can establish different departments (or affiliated units) including one directly dealing with SMEs financing. As required, branch offices can also be established in different regions or localities of the country.</td>
</tr>
<tr>
<td><strong>SMEs’ Financing and Investment Promotion and Regulation Act (General).</strong></td>
<td>To secure the financial resources needed for the promotion of SMEs. The proposed Act may contain legal proceedings regulating, supervising, and facilitating financing and investment activities specifically pertaining to SMEs.</td>
</tr>
<tr>
<td><strong>SMEs’ Start-up Financial Support Regulation and Supervision Act.</strong></td>
<td>To provide for business venture start-up in order to contribute to the establishment of a sound industrial structure by promoting the establishment of SMEs. The Act may mainly concentrate on issuance of regulations on how to grant financial support to SMEs for start-up purposes. The proposed Act can include special legal provisions to encourage the establishment of SMEs in economically depressed regions.</td>
</tr>
<tr>
<td><strong>Establishment, Licensing and Supervision of the Micro-Financing Institutions and Small Business Investment Companies Act.</strong></td>
<td>To encourage the increased flow of finance to SMEs in both rural and urban areas in the form of loans, venture capital and/or equity investments and other means of financing. This is vital for the accelerated and sustainable growth of SMEs and to bring the activities of SMEs’ and other micro-level financing institutions (mini-banks) within the monetary and financial policies of the country.</td>
</tr>
<tr>
<td><strong>SMEs’ Credit Regulation and Control Act</strong></td>
<td>As a supplementary to the above proposed SMEs’ Financing Promotion Act, this proposed Act can be issued with the aim of regulating, supervising and controlling the effectiveness of lending programs. Lending programs may be designed and implemented by different formal lending institutions, mainly the commercial banks. This is with the objective of ensuring that the special loan programs of banks and other financial institutions targeting SMEs are effective and properly financed.</td>
</tr>
<tr>
<td><strong>SMEs Export Business Promotional Act</strong></td>
<td>To provide the necessary legal and regulatory framework to assist SMEs engaged in export business to get the necessary finance and to provide for other facilities, which can help them to further promote their export business and enhance their competitiveness and capacity.</td>
</tr>
</tbody>
</table>

### Concluding Remarks

In this paper, I raised the critical issues of SMEs financing as a pertinent issue. Like in other developing nations, Botswana SMEs have continued to suffer from the lack of access to finance due to multitude constraints. Some of them are discussed in this paper. The GoB is indeed in a better position to resourcefully engage in promoting SMEs. This is in line with its core
development agenda. That was the main reason for the President of the country to appoint a Presidential Task Force to investigate and identify core problems hindering the development of SMEs in the country. The task force comprehensive report identified, among others, some core problem pertaining to SMEs financing. As part of the solution, I proposed some government sponsored schemes, action programs and legal underpinnings. I categorized them under four packages namely: direct financial assistance schemes; loan guarantee schemes; direct credit grant schemes; and financing of technical and managerial advisory services. I am aware that SMEs’ financing scenario is formidable that demands a continued and joint efforts of all stakeholders. However, it is important to note that the primary goal is to stimulate SMEs to make efforts to meet their financing needs by strengthening their internal capabilities for attracting funds. Thus, we should expect SMEs to demonstrate their innovative endeavors by discovering viable sources of financing. While this is the main thrust of the broader efforts to secure support for SMEs, GoB has also a mandate to promoting SMEs including widening their access to finance at their different stages of developmental continuum. Various governments’ sponsored financing schemes and action programs should be earmarked for this purpose. Realistically, SMEs in Botswana and in other SSA nations cannot solve their financing problem solely through their own efforts particularly in the current globalized and turbulent business environment. Therefore, respective governments have an important role to play by assisting SMEs to enjoy substantial access to finance as a means for their sustained survival and growth. Government sponsored financing programs have been proved successful in many in both developed and developing nations. Therefore, government involvement in financing of SMEs can greatly contribute to alleviating financial problems of SMEs as a principal prerequisite for their active involvement in the dynamics of the national economy. It is also important to note that lending or granting money
to SMEs is not enough, but government through its relevant institutional capacities should also assist SMEs to develop the ability of efficient utilization of the financial capacity at their disposal. If Botswana needs to achieve sustainable socio-economic growth through efficiency and economic diversification, empowerment of SMEs is fundamental. However, granted assistance should be in its appropriate form and content in order to bring qualitatively measured strength to SMEs and enhances their development and competitiveness. SMEs should note that government is not a panacea for all their problems. They should consider that government sponsored assistance programs are limited in scope and outreach and cannot solve their financing problems entirely. They should deal with their financing problems in accordance with the dynamics of the conventional economic rationality. They should boldly confront the challenge and work harder to enhance their strength and marginalize their weaknesses within the dynamics of organizational competency and growth. They should always find themselves in a continuous improvement endeavors and thereby foster their competitiveness in attracting external finance in the smartest way. The productive alliance of government, SMEs, the financial institutions can be quite supportive for SMEs empowerment. Indeed well integrated, supported and synchronized SMEs will be more capable to lead the socio-economic development continuum in Botswana.

Practical Aspects of Relationship Lending: A Lender’s Perspective

by Felipe O. Calderon1

The paper focuses on the nature of interactions between small and medium-sized entrepreneurs (SMEs) and loan officers that define the quality of lending relationships. We examine interactions at the transaction level from the perspective of loan officers using ethnographic techniques. The paper provides insights into close-up behaviour of SMEs, which influences the nature of their relationship with loan officers. The paper includes a discussion on the realities and challenges of relationship lending and offers practical advice to educators and entrepreneurs. The evidence suggests that loan officers support SMEs who regularly provide financial information and demonstrate professional behaviour.

Introduction

This paper is about my experience as a practitioner/researcher participating and observing how loan officers interact with bank borrowers specifically small and medium-sized entrepreneurs (SMEs). The purpose of this paper is to investigate the nature of interactions between loan officers and SMEs. The paper seeks to answer the questions: how do loan officers and SME borrowers interact, and how do the resulting relationships affect access to additional financing and concessions. Relationship lending is a key ingredient in the viability of SMEs

1 Felipe O. Calderon is Regional Director, Underwriting at the Business Development Bank of Canada. He is also concurrently a Ph.D. student in International Business at the University of St. Gallen. His research interests include relationship lending, turnaround management and immigrant entrepreneurship. The findings, interpretations, and conclusions expressed in this paper are entirely those of the author.

because it reduces informational opaqueness. This paper aims to improve our understanding of the role of interactions in relationship lending.

Banks are a major source of financing for SMEs. Unlike large corporations, access to bank financing can make or break the viability of SMEs. The first round of financing has always been challenging for SMEs, who are informationally opaque. Once financing is in place, banks play a critical role in providing additional financing and concessions particularly in times of financial distress. Examples of concessions are postponement and reduction of loan payments. Access to additional financing and concessions is influenced by the nature of interactions between loan officers and SMEs. This study includes a discussion of the transactions that form the foundation of multiple interactions between loan officer and SME from loan origination to maturity. Ethnographic techniques were employed to study interactions at the transaction level from the perspective of loan officers who are the front-line representatives of banks. The evidence suggests that loan officers support SMEs who regularly provide financial information and updates on plans and projects, and display professionalism in terms of returning telephone calls and emails, and showing up for meetings.

The paper unfolds in the following manner. First, existing literature is reviewed. Second, the research methodology is explained. Third, discussion on the nature of interactions is provided. Fourth, I will look into the realities and challenges of relationship lending. I will conclude with practical implications for educators and entrepreneurs and suggestions for further research.
Review of Prior Studies

The purpose in this section is not to conduct a comprehensive study of the literature on relationship lending but to bring out the gap. Udell (2008) offers the following description of relationship lending as defined by finance scholars:

Relationship lending is a type of loan underwriting that primarily depends on proprietary “soft information” about the borrower. Soft information is qualitative information acquired by the bank over time through multiple interactions with the borrower, often through the provision of multiple financial services (Boot, 2000). Soft information includes assessments of an SME’s future prospects, compiled from past interactions with its suppliers, customers, competitors, and other businesses and business associations in the local market.

According to Elyasiani and Goldberg (2004), it was Lummer and McConnell (1989) who identified that relationship lending is not built when banks enter into a new credit agreement but is acquired over time through multiple interactions with the borrower. The information generation over time plays a key role on whether additional financing will be provided in the future. However, existing literature is largely focused on empirical studies investigating the impact of relationship lending on collateral, interest rate, and loan workouts. Elsas (2005) and Garriga (2006) find that relationship between a bank and borrower is difficult to observe, hence it is an empirical task. As a result, a variety of proxies have been used in empirical studies to draw conclusions on the impact of relationship lending on loan terms and conditions. Duration of a bank-borrower relationship is one of most commonly used proxies in empirical work.
followed by the number of bank relationships and share of the borrower’s total debt. Ono and Uesgusi (2009) report that results of empirical studies have been mixed. Some studies observe that there exists a negative relationship between duration of bank-borrower relationship and collateral requirement while others obtain a positive relationship. Nam (2004) reached the same conclusion that empirical evidence on the merits and demerits of relationship lending is often mixed.

There are limited studies on the nature of interactions that define the relationship between the loan officer and the entrepreneur. One of the studies was prepared by Lehman and Neuberger (2001) based on a survey of German banks. They conducted a quantitative study which revealed that social interactions between the loan officer and bank manager have a positive influence on the availability and terms and conditions of loans. The data set was based on a survey completed by 1,200 bank loan managers in Germany in 1997. The survey included, among others, questions relating to the nature of the relationship between the loan manager and the SME such as nature of experience, willingness to provide information, and stability of the relationship.

Two studies identified the critical role of loan officers in the collection of soft information, which is the foundation of relationship lending. First, Scott (2006) investigated how turnover of loan officers affected the availability of credit to the entrepreneur. The relationship was empirically confirmed using data from the 1995 and 2001 Credit, Banks, and Small Business Surveys conducted by the U.S. National Federation of Independent Business. The study recognized the critical role of loan officers in the generation of soft information. Second, Uchida, Udell, and Yamori (2006) sought to test whether close relationships between the loan officer and entrepreneur led to accumulation of soft information and whether the accumulated
information was beneficial to opaque SMEs in the Japanese market. The data set of the quantitative analysis utilized the results of the Management Survey of Corporate Finance Issues of SMEs in the Kansai area. The study had mixed results and concluded that more research is needed in this area.

The literature on relationship lending has grown over the past decade. However, research has focused on the use of quantitative techniques based on survey-based data. Davidsson (2008) argues that questionnaires do not capture attitudes, personal traits, intentions, or real-world behaviours. The interaction dimensions of relationship lending are too dynamic and complex to be captured in survey-based research.

None of the existing research has studied the nature of the interactions that define the relationship between loan officer and entrepreneur. This paper contributes to the study of relationship lending by providing qualitative insights into the multiple interactions between loan officer and SMEs.

**Research Methodology**

The study is different because it does not use quantitative techniques based on survey-based data. I argue the importance of the methodological choice of studying relationship lending at the level of interactions. Ethnographic techniques were employed to study interactions at the transaction level from the perspective of loan officers who are the front-line representatives of banks. The ethnographic approach is ideal since the interaction dimensions of relationship lending are too dynamic and complex to be captured in survey-based research. The advantage
of ethnography is that the researcher is able to observe and hear what the entrepreneur would not openly discuss during structured interviews (Moeran, 2005).

It is important to recognize that qualitative ethnographic approach has its limitations relating to the objectivity of the researcher/participant and the restricted area of research (Neyland, 2008). However, the objective of this study is to provide practical insights and examples of real-life situations rather than measuring a phenomenon that involves soft issues where quantitative techniques may not be appropriate (Jack and Anderson, 2002). The insights and examples have been drawn from my 20 years commercial lending experience which spans from the Philippines, Hong Kong, and finally Western Canada involving SMEs in various stages of development including businesses in financial distress and turnaround situation.

In this paper, Canadian definition of an SME is being used which is an owner of a business that employs no more than 500 employees and generates sales of no more than $50 million Canadian dollars. The study is limited to loan officers who specialize in commercial loans. Commercial or business loans assist companies to finance the start-up of ventures, purchase of buildings, equipment, inventory, and to provide working capital.

**Focus on Interactions**

Transactions that transpire between a loan officer and SME after loan origination is under-researched in existing literature. Many researchers have alluded to the multiple transactions that shaped the lending relationship between loan officer and SME but no study has provided a detailed description. In addition, prior studies have focused on favourable terms and conditions
on additional credit as the primary benefit of relationship lending to the entrepreneur. Approval of the first loan is only the beginning of the relationship between the loan officer and SME. Many activities occur between loan origination and maturity that will have an impact on the quality of the lending relationship. What are these transactions that inevitably result in interaction between loan officer and SME? The following discussion will show that these transactions are not only administrative in nature but also include concessions, which are most needed during periods of financial stress.

**Initiated by the Loan Officer**

*Periodic review:* Loan officers are required to conduct a regular review of their accounts. Depending on the risk profile of the account, the review may be on an annual, semi-annual, or quarterly basis. The review involves an analysis of financial information and meeting with the SME borrower and an inspection of the charged assets, if applicable.

*Business development:* Loan officers call on their existing clients to source new loans. Loan officers have objectives to generate a minimum amount and number of loans per year. Therefore, loan officers regularly contact their clients to explore opportunities for new loans. For instance, if the borrower mentioned that there is a plan to purchase additional equipment after six months, then the loan officer will diarize to contact the client in the future. Loan officers also look at their existing clients as potential source of referrals for new loans. An existing client could introduce their loan officer to suppliers and customers.
Initiated by the SME

Reduction or postponement in payments: The SME borrower approaches the loan officer to reduce or postpone principal payments for a few months to assist cash flow. There are several possible reasons for this request. Common reason is the general slowdown in business due to the downturn in the economy. On the other hand, a request for reduction or postponement in loan payments is not necessarily a cause for concern. The company may have won a big contract which requires extra working capital to deliver the product or service.

Changes in personal and corporate arrangement: During the life of the loan, changes in the structure of the company may require consent from the bank. Changes in the ownership structure may require the bank to consent to release or add a personal or corporate guarantor.

Amendments to charged assets: The company may sell assets such as a parcel of land or equipment, which requires the Bank to release its charge on the asset. This may entail negotiation between loan officer and SME borrower on whether or not the bank’s loan will be partially paid down or not.

Realities of Relationship Lending

What really happens from the time an SME’s loan application is approved to full repayment? Following is a discussion of realities and behaviours that have been observed that either enhance or diminish the relationship between loan officer and borrower.
**Relationship Busters**

Loan agreements always include a condition for the borrower to submit year-end financial statements. In Canada, there are three types of the financial statements: Notice to Reader; Review Engagement; and Audited. The difference among the three types is the degree of assurance being provided by the professional accountant that the financial statements were prepared in accordance with generally accepted accounting principles. The degree of assurance for Notice to Reader is low, followed by medium for Review Engagement, and high for Audited financial statements. SMEs are usually required to submit Review Engagement financial statements. A common cause for concern is that some SMEs submit Notice to Reader year-end statements because they are cheaper to prepare. Following are some comments received by loan officers from SME-borrowers:

- Why do I have to submit Review Engagement financial statements, which are more expensive, when all my loan payments are up-to-date?

- I challenge the bank to call my loan because I only submitted Notice to Reader financial statements instead of Review Engagement.

With the above comments, it would be difficult for the loan officer to seek exception to accept the Notice to Reader financial statements when the borrower applies for additional financing or requests for a concession such as postponement of payments. It also becomes a challenge for the loan officer to complete the periodic review when the financial information does not comply with what was stipulated in the loan agreement. Periodic reviews are being
completed to categorize properly the customer’s risk profile, which dictates the Bank’s provision for loan losses.

As mentioned earlier, loan officers seek out to meet with existing clients as part of their periodic review and marketing activities to source new loans. Following are some comments received from loan officers:

- After several unreturned telephone messages, I was finally able to connect with the client and set up an appointment to discuss how things are going with the business. I was at the client’s office at the appointed time but the customer did not show up. No reason was provided for the absence.

- The client was outright suspicious of my request for a meeting. The client felt that it was an intrusion in the private affairs of the business.

At this point, it is important to highlight why loan officers are eager to develop a relationship with their clients. Loan officers’ compensation and career advancement are directly related to their capacity to book loans which generate fee and interest income for the bank. Experienced loan officers recognize that clients, at some point in their business cycle, will request for a concession to overcome temporary challenges. It is critical for the loan officer to be able to obtain approval for these concessions in order to develop customer loyalty which will hopefully result in additional loans or an introduction from the SME to suppliers and customers.
Relationship Boosters

It is equally important to present examples of entrepreneur behaviour that support the development of a positive relationship with the loan officer. Following are best practices of SMEs that have been repeatedly observed by loan officers:

- Many SMEs have considered their loan officer as part of the business family. SMEs proactively invite their loan officer to visit the company premises to give an update on the progress of the business including challenges.

- Loan officers appreciate SMEs who take the time to understand what the bank is looking for in its financial statements to ensure successful application for subsequent financing. Some SMEs, who are not adept with financial information, bring along their controller and sometimes the external accountant, to ensure a common understanding of what is required by the bank.

- Loan officers look for a professional relationship and not a social relationship. Loan officers are not comfortable being invited to family dinners or accepting gifts. What they are looking for is prompt submission of financial information and the SME’s openness to regular business meetings.

In a survey commissioned by the Canadian Bankers Associations (2009) on SMEs and bank relationships, it was identified that 92 percent of the SMEs revealed that having a face-to-face relationship with their lender as the most important factor in their relations with their banks.
This provides collaborative evidence that personal contact between loan officer and SME is a prerequisite to a successful lending relationship.

**Challenges of Relationship Lending**

Based on the foregoing discussions, it appears that there should be a natural tendency from loan officers and SMEs to create a harmonious lending relationship. From the point of view of loan officers, a close relationship with the SMEs translate to more loans in the future which means higher compensation and career advancement. From the SME’s perspective, a positive relationship with the loan officer means the possibility of more financing and concessions in the future. Based on this premise, the information asymmetry of SMEs should no longer exist, however this is not the case in the real world. What are then the challenges that prevent relationship lending from happening?

**Turnover of Loan Officer**

Frequent turnover of loan officers is a reality in the banking industry. SMEs have expressed their frustration over dealing with too many loan officers during the life of the loan. The reasons for the turnover in loan officer are either internal or external. Internal turnover is usually a result of the loan officer either being promoted to a senior position or being transferred to a different job within the bank. External turnover is due to either voluntary or involuntary departure of the employee. Many business graduates apply for a loan officer position only to find out that it is not the dream job they have expected it to be. SMEs should learn to accept that loan officer turnover is one of the challenging realities of relationship lending. It is recommended that SMEs should develop a strategy in dealing with loan officer turnover as if it is
part of their daily business activities. Best practices that have been observed include the following:

- Invite the new loan officer to the business premises and provide a tour of the facilities.
- Maintain copies of documents and whenever possible, confirm discussions by email to ensure a paper trail through which the new loan officer can pick up any negotiations.
- Maintain contact with both the loan officer and the next level supervisor to ensure continuity of relationship if one of the two bank employees should move on.

The old adage “if you can’t beat them, join them” is truly applicable to SMEs when it comes to loan officer turnover. Some SMEs continue to complain about this phenomenon while others have moved on to embrace this reality and have formulated strategies to deal with it.

*Asset versus Liability*

SMEs continue to identify the loan officer with the debt recorded as a liability in the balance sheet. There is a need to educate SMEs that their loan officer should be considered as an asset that could be mobilized to achieve business objectives. The recent financial crisis highlighted the importance of the loan officer as an additional resource to SMEs. Loan officers may not possess hands-on entrepreneurial experience but they have witnessed both good and bad business practices. The more experienced loan officers have seen their clients successfully or unsuccessfully weather obstacles through bust and boom economic cycles. In addition, the loan officer’s belief in the company can sometimes make the difference between approval and decline of a loan application or financial concession. It has been observed that some loan officers would put their reputation on the line to support an SME’s application. Bank authorizing officers can
sometimes be convinced by the loan officer’s passion towards the SME’s business. At the end, a banking relationship is both an asset and liability and it is up to educators and business advisors to convince SMEs that a strong lending relationship is the key to mitigate information opacity.

**Friend or Foe**

There is a perception among SMEs that loan officers are like bureaucrats who enjoy a stable job and regular pay. There is a misconception that being a loan officer is a 9 to 5 job from behind an office desk. Being a loan officer is almost entrepreneurial. Commercial loan officers act as salespeople, which involve frequent travel to persuade firms to obtain financing from their institution. Loan officers also maintain relationships with other professionals who may refer potential loan applicants. These professional include commercial realtors, equipment suppliers, accountants, and lawyers. Loan officers belong to chambers of commerce and other business associations to increase their presence in the local community. Their day could start with an early business breakfast meeting and end with a dinner function. Some loan officers have been known to meet clients after office hours and even on weekends. Loan officers, like entrepreneurs, face the uncertainty of when the next sale or loan will occur. Every time loan officers recommend a loan, they put their reputation and career on the line hoping that the financing will not turn into a bad loan. Sometimes, SMEs get very frustrated and agitated during loan origination when they feel too many questions and documents are being asked by the loan officer. It has happened so many times that the relationship has been damaged even before it got started. It is important for SMEs to recognize that loan officers speak on their behalf to the bank executive who authorizes the loan. When loans are declined, loan officers are equally penalized because they too have invested the time and effort which could have been spent with another loan applicant.
**Implications for Practice and Research**

The practical value of this paper is to increase the awareness among entrepreneurs, researchers, educators, and business advisers that interactions with loan officers are critical to the viability of small and medium-sized businesses. There appears to be too much emphasis on the preparation of business plans but lacking in coaching entrepreneurs on how to manage relationships. There is a proliferation of academic research that provides evidence that a strong lending relationship is beneficial to SMEs because it reduces information asymmetry. Therefore, educators should train future SMEs to develop a strategy on how to reduce information opacity to ensure favourable terms and conditions on loans and subsequent financing, and approval of requests for concessions. I have barely scratched the surface of financial concessions which is a topic that is under-researched. Further studies in relationship lending should consider looking into financial concessions as equally important as obtaining additional financing.

SMEs should learn to recognize that a relationship with their loan officer is part of their social capital and business network. Researchers have suggested that social capital and interfirm alliances are a source of competitive advantages (Stuart and Sorenson 2007; Schreiner, Prashant and Corsten, 2009). There is an inherent focus among SMES on elaborate marketing plans supported by complex financial forecasts. There is a need to expand the focus on how to build effective networks with their financing sources and utilize loan officers as part of a resource for advice and best practices.
There is no universal definition of SME. There is a need to break down the definition in terms of micro, small, and medium business in order for research to be more relevant. It is apparent that a business owner with only 10 employees has a different approach to relationship with the loan officer than a business owner with 100 employees. In the latter, it is possible that the chief financial officer or Controller is the primary contact of the loan officer. What are the implications to relationship lending when the business owner delegates responsibility of interacting with the loan officer to an employee?

Finally, this paper could be extended by investigating how immigrant entrepreneurs differ in their interactions with their loan officer compared to local business owners. Further studies could also contribute to broadening our understanding of the globalizations of SMEs. When SMEs open expand overseas, it is possible that financing will be required from banks in the host country. It would be interesting to study the interaction between SMEs from a foreign country and loan officers of the host country.

References

Cross-border educational programs offer some of the most transformational experiences of a college student’s education. This paper presents the results of a study of the effects of cross-border education for undergraduate and graduate business students. Consistent with previous research, we discover significant impacts to personal, spiritual, educational, social, and career development for both male and female business students. Females, however, experienced significantly greater impacts of study abroad than males in several key areas, especially within personal development and gaining business acumen, areas that are highly pertinent to building global entrepreneurial skills.

The impact of leadership and strategic planning on management performance of SME’s in the built environment

by ¹Watson Ladzani, Nico Smith and Leon Pretorius

Abstract

This study investigated and established the impact that leadership and strategic planning management functions have in improving small and medium-size enterprises’ (SME’s) performance. The primary objective was to establish the extent to which SME’s in the construction industry in the study area utilise leadership and strategic planning to enhance continuous improvement in management performance. Primary data were collected from 326 respondents through the use of structured interviews. These respondents were from 64 randomly selected SME’s in the built environment. The findings show the need to educate SME owners/managers on the use of appropriate management measurement tools and to strengthen the implementation of the leadership and strategic planning functions in order to improve SME’s’ management performance. These findings suggest that specific management function-focused courses should be designed and implemented. Rewards of SME’s that show signs of continuous improvement should be introduced.

Keywords: Built environment, leadership, performance management, small business, strategic planning

Introduction

The building construction industry creates numerous economic opportunities for small and medium-size enterprises (SME’s) in South Africa (Lanor, 2008:1). This industry is a significant employer, accounting for up to 70 per cent of a nation’s capital stock, which in South Africa is about R1.2 trillion (Van Wyk, 2003:1).

The South African government recognizes the building construction industry as a national asset to be developed, maintained and transformed through policy, as well as institutional and practical initiatives (Construction Industry Development Board [CIDB], 2004:6). At the operational level, the industry needs to improve its management performance in line with modern global developments.

The challenges facing the construction industry in South Africa include housing and electricity backlogs as well as millions of people without access to clean water and adequate sewerage (CIDB, 2004:6). Large building construction companies typically need the assistance of SME’s to address these backlogs. SME’s, however, need strong leadership and strategic planning skills in order to manage their performance effectively.

Since the concern in this study is that SME’s lack strong leadership and strategic planning skills, it is important to determine the impact that leadership and strategic planning have on management performance of SME’s in the built environment.

In addressing this research question, this paper reports on the research conducted using the South African Excellence Model (SAEM) to establish the impact on management performance of SME’s.
The primary objective of this paper is to investigate the extent to which SME’s in the construction industry in Gauteng Province, South Africa, utilise leadership and strategic planning to enhance continuous improvement in management performance.

Secondary objectives were to profile sampled SME’s in the construction industry, measure leadership and strategic planning management performance functions, identify the strengths and areas for improvement of these functions, and recommend action plans for areas requiring improvement.

**Literature Review**

Leadership and strategic planning are key aspects in the success of any business. Measuring their performance is therefore of critical importance.

**Impact of performance measurement on leadership**

Leadership is a process or action that affects the actions of an organised group that is working towards certain goals. The main qualities of a leader are long-term strategic thinking, communication skills, integrity and ambition. Leadership usually refers to motivating and committing people (Ukko, Tenhunen & Rantanen, 2007:40).

Leadership development enhances management and leadership capability, which in turn contributes to increased performance. Adequate or excellent management and leadership capability can be learnt and developed (Burgoyne, Hirsh & Williams, 2004:2, 6).
McAdam and Kelly (2002:14) reported that there is evidence that leaders in SME companies are committed to improving the SME’s’ companies. Furthermore, it is clear that leaders involve and empower employees in this improvement process. What is not evident, however, is how leaders assess the effectiveness of their leadership and determine appropriate improvements within these participating SME’s.

Bolden (2007:42) emphasised the importance of leadership in organisations of all sizes and the pressing need to address leadership development in SME’s, in particular. Furthermore, leadership support from government and educational institutions tends not to reach SME’s. Reasons for this could be attributed to differing agendas of the public and private sectors and inappropriate modes of delivery.

CEML (2002:3) warns about the lack of leadership in management and stresses that poor leadership and inadequate management within the company are the prime reasons for SME’s’ failure within their first three years of operation.

Impact of performance measurement in strategic planning

The impact of performance measurement in strategic planning is vital. Tapinos, Dyson and Meadows (2005:371–372) reported that performance measurement helps managers to identify skilful performance and is an indicator to corporate management of when it is necessary to intervene, such as when business performance is deteriorating.

Strategic planning has received significant research attention over the past three decades. While results vary, evidence suggests that formal strategic planning is related to superior performance (Gibbons & O’Connor, 2005:171). Recent research findings show
that strategic planning among SME’s is increasing because owner-managers increasingly look to strategy in their quest for competitive advantage (O’Regan & Ghobadian, 2007:15).

Many SME’s are transforming in pursuit of performance improvement. O’Regan and Ghobadian (2007:15) reported an increase in the number of SME’s deploying formal strategic planning. Their findings indicated more than half of all SME’s engaging in formal strategic planning.

However, the ideal state, where most SME’s perform well, has still not been reached. For example, Gibbons and O’Connor (2005:172) reported that the absolute level of planning is relatively low amongst SME’s. This low performance is attributed to, amongst other things, inadequate knowledge of the processes involved, lack of sufficient management expertise, lack of time to plan in a structured manner, lack of time available for non-operational activities and lack of human resources.

It is contended that personnel are involved in managing daily work and have no extra time for additional activities, such as implementing strategic planning (Garengo, Biazzo & Bititci, 2005: 28–29).

Methodology

The research instrument and research approach utilised in this paper are addressed in the following sections.
Research instrument

Primary data were collected through face-to-face interviews, using the Performance Excellence Self-assessment Questionnaire (PESQ). PESQ is a computer-aided matrix questionnaire research tool. The collected quantitative data were then used to investigate the impact that leadership and strategic planning have on the management performance of the selected SME’s in the construction industry.

Research approach

An evaluative, exploratory and comparative analysis research design was used for data generation and analysis (Hofstee, 2006:124–6; Neuman, 2006:33–5). The reason for this design was that the study evaluated, explored and compared the scores of management performance criteria with world-class and Southern Africa Development Community (SADC) best practice.

Leadership and strategic planning management performance criteria were ranked and compared with one another.

Management performance of SME’s was evaluated on a scale from zero to four. SME’s that scored zero and one in management performance were regarded as being weak in management performance. Those that scored two were regarded as having made good progress, those that scored three were considered best in SADC (substantial progress), and those that scored four were considered world-class, having fully achieved best practice (SAFRI, 2004:5).
Table 1 presents a summary of the representation and interpretation of the scale code of scores and their corresponding percentages, as explained above.

### Table 1 Representation and interpretation of scale code

</tbody>
</table>

The data analyses were done using the SPSS software package and an electronic self-assessment programme (*Batlisisa*).

### Sample and responses

Two sub-populations of building construction SME’s in Gauteng were used for the study, namely the Gauteng Master Builders Association (GMBA) and the Construction Industry Development Board (CIDB). The reason for sampling from the GMBA and the CIDB populations was that these organisations contain registers of leading role players in the industry. The population size of the GMBA was 557 SME’s,

---

2 *Batlisisa* is a South African electronic self-assessment programme, developed in 2003 by Ideas Management Southern Africa cc (now operating as Centre for Excellence). This programme was based on the SAEM and the management performance excellence criteria.
while that of CIDB was 532 SME’s. The study population was therefore based on 1 089 SME’s.

Proportional, stratified, random sampling was used to select a representative sample of these SME’s.

The study followed a sampling ratio of 10 per cent, as guided by Neuman (2006:241). The population and the sampling size were therefore calculated as follows:

The total population is \( N = 557 + 532 \)

\[ = 1 089 \]

The sample size is \( n = N \times \text{sampling ratio} \)

\[ = 1089 \times 0.1 \]

\[ \approx 109 \]

Table 2 summarises the population, sample, response and employees interviewed in the GMBA and the CIDB.

Table 2  SME’s’ population, sample, response and employees interviewed

<td>109</td>
<td>10</td>
<td>64</td>
</tr>
</tbody>
</table>
A simple random sample of 64 SME’s responded from a possible 109. This gave an average response rate of 59 per cent. This sample was distributed as 54 per cent from the GMBA and 64 per cent from the CIDB.

A total of 326 employees were interviewed to answer questions about the sampled SME’s. These employees were purposively selected, based on the total number of employees in a business and their availability at the time of the interview. They represented staff at all levels, namely top management, middle management, lower management and labourers. The number of employees interviewed per business varied from one to 21 employees. The reason for this variation was due to employment variation in businesses.

The equality of variances tests were conducted to determine the variations in responses where only one respondent represented an SME compared with where the SME’s were represented by several respondents. Levene’s test of variances (Field, 2000:6) was used for this purpose. The results of the tests revealed that there was no statistical evidence from the data to show any difference/variance in responses between SME’s consisting of only one employee and those consisting of several employees.

Findings

The study reported and discussed the profiles of sampled SMEs, leadership performance measurement, strategic planning performance measurement and leadership and strategic planning performance gaps.
Profile of sampled SME’s

This study profiled the age group of the sampled SME’s’ owner-managers, their educational qualifications, age of the business, types of ownership and the management performance measuring instruments these businesses use.

Age groups of owner-managers

The age profile range of the SME owner-managers interviewed was as follows: 22 (34.4%) were 40 to 49 years old; 15 (23.4%) were 30 to 39; 13 (20.3%) were 50 to 59; 11 (17.2%) were 20 to 29; two (3.1%) were 60 and older; and one (1.6%) was younger than 20 years.

Table 3 summarises the age profile of the sampled SME owner-managers.

</tr>
</tbody>
</table>

Educational qualifications of owner-managers

The respondents’ educational qualification profile was as follows: 21 (32.8%) held a first degree/diploma; 20 (31.3%) had completed Grade 12 (N3); nine (14.1%) held a BTech/Honours degree; six (9.4%) had completed Grades 8 to 11; and five (7.8%) held a master’s/MTech degree. Finally, one (1.6%) had completed Grades one to seven (Further Education and Training) (FET), General Education and Training (GET), and had no formal qualification.

Figure 1 summarises the educational qualifications of the sampled SME owner-managers.
It can be concluded that most (54.7%) of the respondents had tertiary qualifications (32.8% had first a degree/diploma, 14.1% had a BTech/Honours degree and 7.8% had a master’s/MTech degree).

Age of sampled SME’s

Of the sampled businesses, 16 (25.0%) had existed for three to five years; 15 (23.4%) had existed for more than 11 years; 12 (18.8%) had existed for 7 to 9 years; 10 (15.6%) had been in existence for 5 to 7 years; 5 (7.7%) had been in existence for 9 to 11 years; 4 (6.3%) had been in existence for 1 to 3 years; and 2 (3.1%) had been in existence for less than a year.
Figure 2 summarises the age of the sampled businesses.

![Histogram showing age distribution of sampled businesses](chart)

**Figure 2 Age of the businesses**

It can be concluded from figure 2 that most (90.6%) of the sampled businesses had been in existence for three or more years. These businesses had therefore passed the critical stage of survival of three years (Mtshali, 2007:11).

**Types of ownership**

The types of ownership of the respondents’ businesses were as follows: 50 (78.1%) were close corporations; nine (14.1%) were private companies; two (3.1%) were public companies; two (3.1%) were sole traders; and one (1.6%) was a partnership.

Figure 3 summarises the types of ownership of the sampled SME’s.
It can be concluded from figure 3 that the most common types of business ownership, accounting for 59 (87.2%) of the sampled businesses, were the close corporation and private company (78.1% close corporations and 14.1% private companies).

SME’s’ management performance measuring instruments

The responding owner-managers were asked to indicate the management performance measurement instruments used in their business. A total of 53 SME’s responded to this question. Of those SME’s that responded to this question, 31 (58.5%) used financial statements; 12 (22.6%) used quality management; five (9.4%) used balanced scorecards; two (3.8%) used value chain management and other (unspecified)
performance management instruments; and only one (1.9%) used ISO 9000. None of the respondents used the South African Excellence Model.

Table 4 summarises the sampled SME’s’ management performance measuring instruments.

Leadership performance measurement

The SAEM, which is a self-assessment management performance tool, was used to measure the leadership performance scores. Ten questions were asked regarding the leadership performance measurement criterion. Using the representation and interpretation of scale code (see table 1), the respondents’ scores for the different questions/focus areas and their corresponding consolidated scores are as follows: 12.7 per cent of the responding SME’s had not yet started to address the ten focus areas; 15.9 per
cent had made some noticeable progress, namely less than 25 per cent achievement; 25.2 per cent had made good progress, namely 25–50 per cent achievement; 22.6 per cent had made substantial progress, namely 50–75 per cent achievement; and 23.6 per cent had achieved most of what was required in the criterion.

Table 5 shows the ten questions/focus areas asked/covered and their corresponding consolidated scores.

</tbody>
</table>

Figure 4 summarises the consolidated scores in table 5.
It can be concluded that most (25.2%) of the respondents made good progress in the leadership criterion, while a few (12.7%) had not yet started.

**Strategic planning performance measurement**

A similar measurement tool and approach to the leadership performance measurement were used for the strategic planning performance measurement. The respondents’ scores for the different questions/focus areas and their corresponding consolidated scores are as follows: 28.8 per cent had made no progress in addressing the ten focus areas of the strategy and planning criterion of management performance; 19.1
per cent had made some progress; 23.9 per cent had made good progress; 17.6 per cent had made substantial progress; and 10.6 per cent had made all the progress required in the criterion.

Table 6 shows the ten questions/focus areas asked/covered and their corresponding consolidated scores.

</tr>
</tbody>
</table>

Figure 5 summarises the consolidated scores in table 6.
It can be concluded that most respondents (28.8%) had made no progress in the focus areas and only a minority of respondents (10.6%) had fully achieved the criterion.

**Leadership and strategic planning performance gaps**

Leadership and strategic planning criteria for management performance yielded wide gaps amongst the sampled SME’s interviewed. Whilst 12.7 per cent on the leadership criterion showed that they have not yet started addressing the leadership focus areas, 28.8 per cent on the strategic planning criterion have not yet started addressing the strategic planning focus areas. Only 10.6 per cent have fully achieved the strategic
planning focus areas, whilst 23.6 per cent have fully achieved addressing the leadership focus areas.

Figure 6 summarises the gaps between leadership and strategic planning management performance criteria.

![Figure 6 Leadership versus strategic management performance scores](image)

**Figure 6**  Leadership versus strategic management performance scores

It can be concluded that when the leadership management performance increases, the strategic planning management performance decreases.
**Conclusion and recommendations**

The profiles of the sampled SME’s reveal that most (54.7%) owner-managers have post-matriculation qualifications. Educational qualifications are therefore not a factor that hinders owner-managers in implementing leadership and strategic planning functions to improve their business management performance.

The findings of this paper further reveal that most (90.6%) of the sampled businesses had been in existence for three or more years. These findings show that the age of the business does not contribute to the owner-managers’ failure to strengthen the use of leadership and strategic planning skills to improve their management performance.

Most (58.5%) of the sampled SME’s make use of financial statements to measure their management performance. However, financial statements alone are not sufficient as a measure of management performance.

Since most SME’s are not utilising their strategic planning skills to improve their management performance, it can therefore be concluded that the sampled SME’s need more drastic measures to encourage them to grow, considering that educational qualifications and age of the businesses are not contributing to their lack of growth.

It is therefore recommended that the building construction industry SME owner-managers do the following:

- Prioritise and make interventions on the strategic planning management performance criterion, since it showed poor ratings in the survey. Priorities should be considered in terms of both the criterion’s low scores and the scores of the individual focus areas in this criterion. (Note: each criterion has ten focus areas.)
• Promote the use of a standardised management performance instrument, such as SAEM. This management performance improvement measuring instrument could become a powerful tool for improving the individual SME’s’ management performance, as well as for industry and international benchmarking purposes.

• Involve employees in the continuous management performance improvement self-assessment of the business. Training programmes could be developed and presented through the local building construction industry associations.

• Benchmark strategic planning management performance scores against industry, SADC and world-class best practice scores. The building construction industry scores for benchmarking purposes in South Africa are unknown, therefore this paper’s findings could serve as the South African industry scores.

Understanding Motivation, Empowerment and Sustainability Outcomes of Women Homestay Entrepreneurs in West Malaysia. A Preliminary Analysis.

Intan Osman, Noor Hazlina Ahmad, Zainal Ariffin Ahmad, Azrina Husin, Saridan Abu Bakar and Nur Diyana Tanwir

1Universiti Sains Malaysia, Pulau Pinang, MALAYSIA; 2Universiti Teknologi MARA, Selangor Darul-Ehsan, MALAYSIA

The participation of women in the homestay industry is a growing phenomenon; yet research in this area is limited especially in Malaysia. Anticipating the potential contribution of homestay industry to the Malaysian tourism agenda, it is deemed timely that research on women in homestay industry be undertaken to understand their entrepreneurial pursuit. This paper details the demographic profiles, factors that motivate and empower women homestay entrepreneurs and their views on sustainability of homestay operations. 483 women homestay operators sampled from the homestay directory, Ministry of Tourism, Malaysia participated in face-to-face survey interviews. The assistance of trained enumerators residing in the sampling site was utilized. The findings reveal that majority of the women homestay entrepreneurs are between the age of 41 to 60 with 89.9 percent completed their lower secondary education, fully own but operate the homestay business on a part-time basis. They were motivated by the “pull factors” (personal satisfaction, passion and encouragement by friends) as opposed to the “push factors” (economic depression, unemployment, retrenchment, and dissatisfaction with former jobs). In addition, these women experienced a moderate to high level of empowerment, especially in terms of getting access to training and education services, as well as making decisions on matters related to the business. These women respondents view economic and social benefits as more rewarding than that of environmental. The regression analysis reveals that motivation and empowerment of women

* Email: intan@usm.my
homestay entrepreneurs are significantly related to both economic and social sustainability and to a lesser extent environmental sustainability. The findings concur that women are important players in the homestay industry as it provides them not only with an additional source of income and personal satisfaction that advance their personal and social positions but also an avenue to help achieve gender equality and empowerment in the national development and policies of Malaysia.

**Keywords:** Women entrepreneurs, homestay industry, demographic profile, motivation, empowerment, sustainability, gender equality, Peninsular Malaysia

**Introduction**

Tourism has been identified as one of the most vibrant industries worldwide. As a sub-industry within tourism, the potential of ecotourism has been recognised to grow even further. Realising this, many countries seek to further develop this untapped industry. In Malaysia, services and products with ecotourism characteristics have the potential to grow and sustain and, at the same time, contribute further to our tourism industry. As highlighted in the Ninth Malaysia Plan (2006-2010), a growth in tourism is seen to have a positive relationship to the expansion of other sub-sectors, especially the homestay industry as well as in others that carry ecotourism-related products and services. The Malaysian government views the homestay industry as an industry that has unique Malaysian appeal and thus proactively supports the growth of this sector. Homestay industry is usually packaged with local traditions and cultural appeal as well as natural heritage. This, in return, provides visitors with a distinct opportunity to experience the rich and hospitable local culture. On the other hand, homestay industry is also recognised by the government as an industry that will increase the participation of rural population in tourism-related activities. For this reason, rural households are encouraged to seize these opportunities to
supplement and generate their household incomes as well as to be an important part of a budding industry (Intan Osman, Zainal Ariffin Ahmad, Noor Hazlina Ahmad, Sabai Khin and Azrina Husin, 2008).

Although the number of homestay operators has increased to 2,808 from 142 villages nationwide during the Ninth Malaysia Plan (2006-2010), research on the homestay industry particularly on women as homestay entrepreneurs is still in its infancy. Noting the potential contribution of the homestay industry not only to the tourism agenda of the country but also to the development of the community concerned, it is deemed timely that research on women’s choice in homestay entrepreneurship be undertaken. This will potentially address Norman and McDonald’s (2004) call for women entrepreneurs to contribute to the sustainability of the homestay business which offers a multiplier effect on the country’s economic, environmental and social aspects (Intan Osman, Zainal Ariffin Ahmad, Noor Hazlina Ahmad, Sabai Khin and Azrina Husin, 2008). Seeking factors that contribute to the sustainability of homestay business led by women is the trust of the paper.

**Homestay in Malaysia**

The Homestay Program in Malaysia was first introduced by the Ministry of Tourism in 1988 as an effort to diversify tourism products through the provision of an alternative accommodation for tourists. Officially launched in 1995 at several locations in Malaysia, homestay differs from hotel accommodation where the latter enables tourists to stay with a host family and experience the Malaysian lifestyle and traditions throughout their stay.

With the inception of the homestay program, the National Eco-Tourism Plan calls upon small villages to be involved in the ecotourism industry through homestay activities. In
Malaysia, the homestay program is an ecotourism package, offering agro-tourism, nature-tourism and/or cultural-tourism package. In 2008 the website www.homestay.motour.gov.my, listing homestay operators in Malaysia was launched to promote the homestay program amongst foreign and local tourists. Since then, there were 2,808 homestay operators from 142 villages nationwide (New Straits Times, 25 September 2008) with each state featuring its own unique homestay program. Organisations including the State Tourism Action Board, State Homestay Co-coordinator, and State Homestay Management Committee are also mandated to promote the homestay programs in their respective state. As a result, there were 27,763 homestay tourists in Malaysia with the highest number of arrivals in Southern and Central Peninsula and East Malaysia between January to Jun 2008.

Given the scenario discussed above and coupled with the fact that the homestay program is also a strategy of the Malaysian government to improve the living standard of the rural community, especially that of women, it is vital to study women’s contribution to this promising industry by identifying the factors that influence the sustainability of the homestay operations. Current study will focus on motivational, empowerment and sustainability factors affecting women’s entrepreneurial choice in the homestay industry.

**Literature Review**

One of the central questions in the field of entrepreneurship is trying to understand why some individuals engage in entrepreneurial activities while others do not (Baron, 2005). Various school of thoughts ranging traits based research to studies emphasizing cognitions are making fundamental assumption that entrepreneurship is a process enabling an individual to voluntarily engage in to pursue desired goals. Although human agency has a critical role in
entrepreneurship process, research on what motivates individuals to participate in entrepreneurial activities and the choices they make to pursue desired goals is still limited (Shane, Locke and Collins, 2003). Motivation from entrepreneurship perspectives is seen as a driving factor that mobilizes an individual to pursue the goals, and seen as an expression of a specific attitude that harbors an individual to seek accomplishment, autonomy, creativity, control and risk taking (Cromie, 2000). In addition, the importance of motivation as among the key factors for one to start a business has been cited in the literature. According to Buttner and More (1997), the motivations of entrepreneurs are correlated with the manner these entrepreneurs measure their business success. The importance of motivation which includes psychological traits as one of the key factors in starting a business is not a new phenomena in entrepreneurship literature. Entrepreneurs are said to be individuals who possess personal characteristics such as the desire to seek achievements, ability to take risk, possession of certain leadership styles; they have also undergone a process of socialisation related to business (Brockhaus & Horowitz, 1986). However, the degree to which these traits motivate entrepreneurs may vary from one society to another, as shown in studies on women entrepreneurs in Singapore (Lee, 1996) and Nigeria (Woldie & Adersua, 2004).

On the other hand, motivation also refers to “opportunity structure, an ‘objective’ structure of economic opportunity and a structure of differential advantage in the capacity of the system’s participants to perceive and act upon such opportunities” (Glade, 1967:251 as cited in Thornton, 2009). This in turn points to the social context that turns one into an entrepreneur, such as the influence and roles of markets and firms on the individuals who become entrepreneurs (Thornton, 2009), as well as displacement from previous jobs (Shapero & Sokol, 1982). The findings of the inter-country differences of the motivation to be self-employed among
entrepreneurs in Malaysia and Australia indicate that even though there were expressions of having been “pushed” into starting a business, the majority of the participants highlight the “pull motives” such as desire for autonomy and independence, a need for more flexibility in managing their life, and an interest in exploring new ideas. Interestingly, there are commonalities with respect to the motives reported by Australian and Malaysian participants (Ahmad, 2007).

Homestay is a home-based industry in which family relations as well as gender issues come to play. Loscocco and Smith-Hunter (2004) show that women who own home-based businesses face less family conflict than those who run their businesses outside the home, and because their primary priority remains their family and their roles within the family, the former may enjoy less success than their female counterparts. A study conducted on family businesses in rural China shows that men tend to run these businesses as opposed to women, thus disproving the notion that women will be at a better position to take advantage of their gender roles within the family (Entwisle et al, 1995).

Homestay industry is also seen as a “community-based ecotourism venture”, a term propagated by scholars to accentuate the benefits gained by the local community whose life, to varying degrees, is touched by tourism activities (Ceballos-Lascurain, 1996). This developmental approach to tourism is likely to empower the local community at psychological, social, political and economic levels (Scheyvens, 1999). According to Kabeer, N. (2001) empowerment is “The expansion in people’s ability to make strategic life choices in a context where this ability was previously denied to them.” (p. 19). Kabeer stresses that having resources including economic, human and social; achievement and the factor agency which is the ability to define one’s goal and to add upon them will empower women to make strategic choices in their lives. In addition, Economic gains and independence have been shown to bring about greater empowerment for
women. We are anticipating Malaysian women homestay entrepreneurs through economic and social gains will be empowered to make some changes in the conduct of homestay operations affecting to some extent gender relations at home and community. Valaoras, Pistola and Pistola (1999), found that women’s participation in ecotourism in Greece had opened up alternative doors for income generation, as well as created awareness on issues pertaining to environment conservation. On the same note, Pleno (2006) demonstrated how ecotourism projects increased the level of participation, mobilisation and socialisation among women.

According to Colbert and Kurucz (2008), business firms are placing increasing emphasis on their ongoing "sustainability”, which implies a simultaneous focus on economic, social, and environmental performance. At a high level, triple bottom line sustainability is a values-laden aspiration—it is a concept that explicitly acknowledges as important the relationship between a firm's economic performance and its performance in social and environmental terms. It is important to see how ecotourism businesses contribute to the environment and the society besides creating financial value since the main tenet of ecotourism is to minimize negative impacts on the nature and socio-cultural environment, provides economic and social benefits to local communities, and supports the protection and conservation of natural and cultural assets according to World Tourism Organization (2002). Therefore, in lieu of the ecotourism activities that homestay business operates in, this study will assess the sustainability of the homestay program from economic, social, and environmental aspects rather than financial aspect alone.

Jamil and Amran Hamzah (2007), in their local study on the role played by a women’s association to support women entrepreneurs in the homestay program in central Malaysia, found that the group provided a platform for the women involved in the homestay industry to earn extra
income and be part of the homestay community in the area. The association also empowers these women by equipping them with skills needed in the homestay industry, via training.

The importance of entrepreneurship and sustainable development is linked to the centrality of entrepreneurship in economic development, generation of growth and means for innovation and change (Lordkipanidze, M; Brezet, H; & Backman, M., 2004). In this respect, we are postulating that Malaysian women will have an increased involvement in the homestay industry if tourism continues to generate economic gains. Their strong entrepreneurial involvement in the diversification of local economic activities is needed to cope with increased demand for new types of tourism such as eco-tourism.

**Method**

The present study is part of a research project, “Women’s Participation in Sustainable Development: SME’s Entrepreneurship in Ecotourism for Value Creation Services”, a Universiti Sains Malaysia Research Universiti Grant, bearing an Account No: 1001/PKANITA/816051, that examines the participation of women homestay operators, from the perspectives of personal and organizational factors affecting their participation in the sustainable development of homestay industry. Personal factors such as motivation, and empowerment and the sustainability of the homestay operations are the focus of the research variables.

**Samples**

The sampling frame was based on the homestay directory obtained from the Ministry of Tourism, Malaysia ([http://www.homestay.matour.gov.my](http://www.homestay.matour.gov.my)). As of July 2008, there are 137 villages with 106 registered homestays comprising 2808 homestay houses. Calls were also made
to the state tourism agencies to identify homestay operators not listed in the directory. Altogether, a total of 800 operators in eleven states (central, northern, southern, and eastern regions) from Peninsular Malaysia were identified of which 483 data represented women respondents yielding a high response rate of 60.4%. The employment of enumerators to conduct face-to-face interview surveys at each chosen location contributed to the high response rate comprising 31.5% from Central, 29.8%, Northern, 24.2% Southern and 14.5% Eastern Malaysia.

**Survey Instrument**

Items reflecting “motivation” (i.e., pull and push factors) were adapted from Ahmad (2007); they comprise 20 items, out of which 13 reflects the pull factors. The remaining 7 items reflect the push factors. A 5-point Likert scale was used, allowing ratings from 1 (*very low*) to 5 (*very high*). On the other hand, “empowerment” was measured using 8 items adapted from Kabeer (2001). Participants rated each item in terms of the extent to which they agree to the statements reflecting empowerment issues including “allow to make decision on matters related to homestay”, “tend to have control over decision making on matters related to homestay” on a 5-point Likert scale, allowing ratings from 1 (*strongly disagree*) to 5 (*strongly agree*). Sustainability measures were adapted from Lordkipanidze, M; Brezet, H; & Backman, M. (2004). Respondents were asked to rate on a 5-point Likert scale items related to economy such as “a source of income to the community”, “a diversification of local economic activities.” For environmental sustainability, respondents rated on a 5-point Likert scale items including “safeguarding environmental qualities”, and “reduction of the usage of the natural resource from the environment, “allowing the ratings from 1 (*very low*) to 5 (*very high*).
Data collection procedure

Twenty-four enumerators, comprising Management and Social Sciences students from three Malaysian universities were trained prior to data collection. Each enumerator was provided with several sets of questionnaires with instruction to collect data at the selected locations and regions within Peninsular Malaysia. Prior to data collection, calls were made to each site informing the management of the homestay committee about the visit with the intention to gather data from women homestay operators as study respondents. These respondents were briefed and given a consent letter before proceeding with the interview. Enumerators were given a month to complete the data collection.

SPSS version 16 was used to analyse the descriptive data and to conduct the regression analysis. The factor analysis on motivation, empowerment and sustainability was run and the results are shown on the last three pages of the paper.

Results and Findings

Demographic Profiles of Homestay Repondent Samples

Most of the women respondents are married (83.2%), operating homestay on a part-time basis (55.3%) while one-third (44.7%) are full-time operators at the time of the research. The majority of the respondents (68.1%) are between 41 to 60 years old with 89.9% completed eleven years of schooling. Those with more than four but less than six children (47.3%) and between 1-3 of these children assist them (47.6%) in the management of homestay. Prior to their involvement in the homestay operations, 39.5% of the respondents were unemployed, 21.5% self
employed, 16.6% employed while 22.4% were homemakers. A total of 122 (25.3%) of these respondents are currently serving as homestay committee members. In terms of years of involvement, 41.2% of the respondents have been in the homestay business between 1-3 years with 65.8% registered as homestay owners.

**Motivation of the Homestay Operators**

At the outset of the study, it has been highlighted that studies investigating the participation of women homestay operators in Malaysia are rather limited. Current study hopes to address the inadequacy and identify the motivating factors that stimulate women to participate in the homestay industry.

As depicted in Table 1, it is evident that the homestay operators were motivated by the “pull factors”. The most important reasons for engaging in homestay industry are passion in this business ($M=4.14$) followed closely by personal satisfaction ($M=4.07$), and desire to pursue own interest ($M=3.90$). Having said that, other “pull factors” such as to generate more income, to prove own ability to be successful, to seize available opportunity as well as to have control over one’s own action are also significant motives for involving in this emerging industry.

Interestingly, the “push factors” comprising economic depression, unemployment, retrenchment, dissatisfaction with former job, no job security in the previous employment, frustrated with the level of income in the former job and work pressure due to downsizing, have been rated very low as the reasons to engage in homestay business. This finding suggests that they are not being “pushed” to the industry by these external forces. Rather, the prime motivation is their passion and inclination to pursue something they enjoy doing and this is probably further reflected in the high number of those who engage in this business on a part-time basis.

Empowerment of Homestay Operators

Empowerment enables women to have a sense of pride and awareness of the importance of their control over their own development (Wearing & Larsen, 1996). As depicted in Table 2, most of the homestay operators have rated the sense of empowerment to be above 3.00, indicating that they experience a moderate to high level of empowerment, especially in accessing
training and education services ($M=4.10$), the ability to make decision on matters related to homestay business ($M=3.72$), the ability to have control over decision making on matters related to homestay ($M=3.54$), as well as the ability to access resources and information required for homestay activities.

</table>

In terms of sustainability as shown in Table 3, homestay operations generate highly on economic sustainability including turning local into entrepreneurs ($M=3.64$), followed by a source of income to the community ($M=3.56$), a source of employment to the community ($M=3.56$), a diversification of local economic activities ($M=3.33$) and new market potential ($M=3.33$). For social sustainability, strengthening the local culture and identity ($M=3.98$) seems to be the highest contributor to homestay operators, followed by increasing awareness of value of heritage and need for protection ($M=3.73$), improvement in quality of life ($M=3.71$), and keeping population locally less migration ($M=3.67$). The results on environmental sustainability
reduction of waste materials ($M=3.41$), safeguarding environmental qualities ($M=3.27$), less environmental impact ($M=3.13$) and reduction of the usage of the natural resource from the environment ($M=3.02$) are moderate compared to the other two sustainability factors.

The R² value as in Table 6, is 0.526, suggesting that 52.6 percent variation in the 
dependant variable. In this study, sustainability environment can be explained by variation in one 
independent variable. In other words, nearly most changes in economic sustainability are 
influenced the significance of motivation push factors.

**Discussions**

This study shows that majority of the homestay operators are owners of but operate their 
respective homestay business on a part-time basis thus the penchant to participate in the industry 
is more towards “life-style” entrepreneurship. Their choice in homestay entrepreneurship is 
motivated by personal satisfaction besides having passion in the business.

Having the range of age between 41 to 60 years old indicates that these women are driven 
by the energy and passion and personal satisfaction to pursue an interest in operating the 
business. Clearly, the social factor contributes to the motivational pull factors, as operators 
started their homestay operations after receiving inspiration and encouragement from friends 
who are themselves already successful in the homestay operation. Homestay entrepreneurship is 
made possible due to the close-knit nature of the Malaysian culture that emphasises community 
support and cooperation whilst homestay activities are normally organised as community-based 
activities.

As for the “push factors”, external factors including being retrenched, work pressure due 
to downsizing and no job security in the previous employment are not the reasons for the 
respondents to operate a homestay. Instead, these women chose homestay entrepreneurship out
of the desire to change their position in the society and at home. Despite of not attaining tertiary education and rather new in the homestay business, they are highly empowered to gain access to training or education services \((M=4.10)\) and make decisions on matters pertaining to homestay operations \((M=3.72)\). We can postulate that these women entrepreneurs are empowered to build their capacity in terms of enhancing human capital to sustain their business, despite running it on a part-time basis.

To these women, managing a homestay business offers a sense of psychological empowerment that could boost one’s self-esteem, allowing them to expand their horizon and break the status quo from being traditionally passive to active players in the community. Having control over decision making and exposure to education and training creates an enabling condition to advance at personal and organizational levels. It is also interesting to note the sustainability of homestay business seems to anchor highly on economic followed by social and the environment. This suggests that homestay entrepreneurship can be sustained through a diversification of local economic activities and new market potential (tapping new market).

Additionally, motivation and empowerment of women entrepreneurs in current study are significantly related to both economic, social sustainability and to a lesser extent on environmental sustainability supporting the notion that economic development in any country creates an opportunity for entrepreneurship to provide sustainable economic growth. As depicted in Table 6, the passion in business, the desire to generate more income and to pursue their own interests amongst these homestay entrepreneurs influence significantly on how they measure economic sustainability (sig. at 0.00 where **\(p<0.01\)). Similarly, the degree of empowerment women experience has a significant impact on economic sustainability (sig. at 0.022 where \(*p<0.05\)).
The social benefits viewed by women homestay entrepreneurs is significantly influenced by women’s pull and push motivation factors. As shown in Table 7, the pull factors, significant at 0.00 where **p<0.01 whilst the push factors at 0.07 where *p<0.05 greatly influence the strengthening of the local culture and identity as well as improving their knowledge, culture, environment and business. From environmental sustainability perspective, women are driven by economic depression, dissatisfaction with former job which tend to influence significantly on environmental sustainability, significant at 0.00 where **p<0.01.

**Conclusion**

Generally, this study provides useful insights and understanding on Malaysian women operating homestay business within the Malaysian context and culture. Women in this study and majority of whom are in the forties and fifties are significantly associated with motivational pull factors, empowerment and sustainability. Their entry into homestay entrepreneurship is highly motivated by personal satisfaction, passion in the business, and encouragement from friends. We postulate that they are characterized by the desire to seek achievements, take some risk, and display certain leadership styles gained from a socialisation process related to homestay business (Brockhaus & Horowitz, 1986).

In addition, having the opportunity to run the homestay business seems to create an enabling condition for them to make decisions and gain access to training pertaining to homestay operations. We could infer that they believe in the importance and relevance of skills and knowledge in homestay management and operations. To these women, managing homestay business offers them a sense of psychological empowerment that could boost their own self-esteem, allowing them to expand their horizon and break the status quo from being traditionally
passive to active players in the community. The sustainability of homestay business seems to anchor highly on economic followed by social and the environment inferring that homestay entrepreneurship can be sustained through a diversification of local economic activities and new market potential.

The fact that motivation and empowerment of these women entrepreneurs are significantly related to both economic and social sustainability shows that women homestay entrepreneurs are more likely to grow in and potentialise the tourism sector which is a fast growing industry in the Malaysian economy. Stimulating and promoting entrepreneurship for tourism development amongst Malaysian homestay entrepreneurs will help generate growth and serve as a vehicle for innovation and change in the tourism sector (Lordkipanidze, Brezet and Backman, 2004). Tourism creates economic development with an opportunity to provide sustainable economic growth. The social benefits of homestay business viewed by women entrepreneurs are significantly influenced by pull and push motivation factors suggesting that these women operators become entrepreneurs due to community-based activities through tourism markets (Thornton, 2009). There seems to be a significant association of motivational push factors with environmental sustainability amongst women in this study. To some extent, the push factors are more likely to push women into homestay entrepreneurship as enabling conditions to generate income and improve living conditions as most of these women are previously homemakers and unemployed.

In a sense, this study offers researchers some new dimensions of rural entrepreneurship amongst women who participate in the homestay industry. It adds fresh insights into the perspectives of motivation, empowerment and sustainability amongst Malaysian women as homestay entrepreneurs as well as advancing the concepts of ethnic and rural entrepreneurship in
the literature. In practical terms, it offers policy makers an informed knowledge on the reasons women participated in homestay industry. Policy developments could address the structures and programs that enable women to choose homestay entrepreneurship thus mobilizing some of the policy thrusts for women and development in the Ninth Malaysia Plan (2006-2010). Malaysia has made significant move towards achieving gender equality and women’s empowerment noting from the sharp declining of gender inequality from 1980 (0.340) to 2004 (0.243) and successive Malaysian development plans that placed greater emphasis on mainstreaming women in national development through affirmative multi-sectorial policies and programmes. By playing a variety of roles at the family, community and society levels, women have been able to contribute to national development and prosperity (United Nations Development Programme, Malaysia, 2008). Women who are owners and managers of the emerging subsector (ecotourism) are important human capital and key resources in advancing informal sectors in the Malaysian economy. Women’s motivation and empowerment in sustaining rural entrepreneurship in the homestay business could innovatively fill the entrepreneurship gap which tourism sector has created.

The difficulty associated with determining what constitutes immigrant entrepreneurial behaviour lies in the road being travelled differently by immigrants from dissimilar backgrounds, value systems, and cultural heritages. This paper outlines the findings of a case study analysis which presents the entrepreneurial characteristics of Indian migrants operating SMEs in New Zealand, with respect to specific migration, settlement, cultural and business factors. The case study approach used triangulation (semi-structured interviews with Indian immigrant entrepreneurs; selected immigration literature, and interviews with New Zealand based Indian community leaders) to draw conclusions on the unique entrepreneurial activity for SME owners within the Indian community of New Zealand.
Introduction

India is one of the world’s rapidly growing regions, with expanding markets for goods and services. In terms of New Zealand there are benefits for present and future generations in strengthening of links with India in regard to trade and skill migration. Historically migration from India has long been a strong connector between the two countries. Indian migrants to New Zealand are the third largest minority group with a population of 103,059 New Zealand residents as at the 2006 census, which is surpassed only by Pacific Peoples (265,974 residents) and Chinese (139,727 residents). This is in the context of a New Zealand society of 4 million people of which European (2,609,589 residents) and Maori (565,326 residents) are the dominating cultures (Statistics New Zealand, 2006). This history of Indian migration spans over 100 years and the cultural and business impact of the Indian community is felt throughout New Zealand society. While holding true to their religious and cultural values Indian immigrants also strive to integrate into New Zealand society. A major element of their social and economic adjustment to life in New Zealand is tied to the status attained through some form of employment - which impacts on their family viability, social acceptance and personal esteem. One approach to satisfying this need is to engage in entrepreneurial activity. A major conclusion of the international literature on ethnic minorities is that entrepreneurial activity is a promising springboard for immigrants’ social integration, reinforcing their economic position and social status (for example, Hunter, 2007; Masurel, Nijkamp and Vindigni, 2004). Furthermore, in many migrant receiving countries the level of immigrant entrepreneurship has trebled in the last two decades (Rath and Kloosterman, 2003). In fact, researchers have concluded that over the last 100 years immigrants had been more likely to be self-employed than their native born counterparts (Fernandez and Kim, 1998, p. 654). This trend towards high levels of immigrant entrepreneurial activity is not so pronounced among
the Indian population in New Zealand, Those who have chosen the self-employment option constitute 17.6 percent of the Indian ethnic group, whereas 20.3 percent of European migrants and 18 percent of the total resident population are involved in some form of self-employment (Statistics New Zealand, 2006).

In order to better understand the entrepreneurial patterns of the Indian New Zealanders, this paper explores their entrepreneurial behaviour in the context of the broader New Zealand society. Gaining an understanding of such behaviour is challenging as the drivers and limiters that affect an ethnic minority’s entrepreneurial choices are often dynamic and complex. Furthermore, patterns of behaviour and decision-making may be unique to specific ethnic groups. As Krueger and Brazeal have observed, “entrepreneurial activity does not occur in a vacuum. Instead it is deeply embedded in a cultural and social context, often amid a web of human networks that are both social and economic” (1994, p. 230). The overall aim of this research was to provide an insight into the specific case of the Indian Peoples of New Zealand by reporting on narratives from Indian immigrants or their immediate offspring who have been engaging in entrepreneurial behaviour in New Zealand, and referred to in this paper as immigrant entrepreneurs.

**Methodology**

This paper draws from a larger qualitative study (de Vries, 2008) that involved the development of an Immigrant Entrepreneurship Model through an inductive process utilising grounded theory. The original study was based on 42 semi-structured interviews and 35 subsequent follow-up interviews with immigrant entrepreneurs who owned small and medium-sized enterprises (SMEs) in New Zealand, undertaken over an eighteen months period within four heterogeneous ethnic groups (Chinese, Dutch, Indian, and Pacific Peoples) in New Zealand. In the context of this study immigrant entrepreneurship has been defined as:
immigrants or their immediate offspring, who have a specific ethnic identity, and who create work place settings for themselves and others, within their receiving country. Whilst the term immigrant implies ‘migrating peoples’ it is noted that the definition has been extended to include New Zealand-born second generation for a number of reasons. Firstly because of the grounded theory approach of theoretical sampling (in the development of the Immigrant Entrepreneurship Model) drew on second generation entrepreneurs. Secondly the extended definition takes into account the ‘immigrant factor’ and cultural influence that are often very strong across generations within ethnic minority groups, and impacts on the entrepreneurial behaviours of their community (for example, Butterfield, 2004; Dhaliwal and Kangins, 2006; Peters, 2002). Thirdly, it gives a stronger longitudinal perspective of immigrant adaptation and their entrepreneurial participation in New Zealand.

The data was coded and indexed using thematic analysis, and NVivo data analysis software was used as a coding, retrieval, and analysis tool during the theoretical development stage. The model’s framework stressed four main constructs:

- The migration profile - which identified homeland characteristics of the immigrant entrepreneurs or their families, and their migration drivers.
- The settlement profile - which identified the influence of societal fit and social perceptions as they impacted on the immigrant entrepreneurs’ business activity.
- The cultural profile – which identified personal, family, and cultural influences, and their impact on the immigrant entrepreneurs’ business activity.
- The business profile – which identified the catalysts for entrepreneurial activity, the business drivers, human and financial capital capability, and the business philosophies of the Immigrant entrepreneurs.
This paper attempts to apply the model to bring further understanding to the specific topic of Indian immigrants engaged in entrepreneurship in New Zealand (see Figure 1). The case study reported here focuses on the nature of the entrepreneurial activity of the Indian community in New Zealand, and is based on triangulated research undertaken through: (1) ten face-to-face or telephone interviews with Indian immigrant entrepreneurs, and seven subsequent follow-up interviews within this cohort; (2) two face-to-face interviews with community members who could comment from a Indian community perspective: one a senior member of a major research institution and the second the editor of a Indian community newspaper; (3) and finally a consideration of the relevant immigration and ethnic literature (Apitzsch, 2004; Basu, 1998; Benson-Rea & Rawlinson, 2003; Collins, 2003; Dana & Dana, 2003; Duncan, Bollard & Yeabsley, 1997; Dunstan, Boyd & Crichton, 2004; Elliott and Gray, 2000; Hiebert, 2003; Janes, 2006; McLeod, 1980; Mace, Atkin, Fletcher & Carr., 2005; Min & Bozorgmehr, 2003; Palakshappa, 1980; Salt, 1992; Scott, 2007; Shepard, 1980; Steeds, 2006; Tiwari, 1980; Whybrow, 2005; Wilson, 1980; Xiang, 2001; Zodgekar, 1980).
Findings

The case study evidence is presented in a format based on the immigrant entrepreneurship model presented in Figure 1. The findings illustrate the unique dimensions of the four constructs - migration profile, settlement profile, cultural profile and business profile which evolved during the case analysis of the Indian immigrant entrepreneurs.

1. Migration

   Homeland: Indian immigrant entrepreneurs came from geographically dispersed origins with distinct cultural, religious and values systems. They were predominantly from an urban middle socio-economic background, reflected on happy childhoods, and identified religious beliefs as fundamental to their homeland way of life. They spoke of a broad spectrum of blue or white collar employment among their immediate families, and entrepreneurial activity in their extended families. Generally they migrated with the intention of becoming employees, and developed into entrepreneurs after being employed in New Zealand for some time.

   Drivers: The overwhelming driver was to improve their quality of life. This was expressed through a stated desire for better careers and educational opportunities, for themselves and especially their children. The push factor of homeland dissatisfaction (for example, political or racial dilemmas) was often stated as influencing the decision to migrate, while more recent arriving Indian immigrant entrepreneurs referred to the attractiveness of New Zealand (pull factor) as triggering their migration.

   Immigration: Predominantly, Indian immigrant entrepreneurs migrated as family units, and with varying levels of financial resources or knowledge about New Zealand. They spoke of the difficulties in gaining residency in New Zealand, but displayed fortitude in battling the immigration system to establishment themselves and their families in this country.
2 Settlement

*New Zealand arrival and societal fit:* Indian immigrant entrepreneurs settled in New Zealand cities, where they sought immediate employment. They spoke of having difficulty getting ‘the right’ job, but generally integrated into the New Zealand workforce effectively. Indian immigrant entrepreneurs reflected on the physical and cultural differences between themselves and New Zealanders, which resulted in the categorising of the Indian community in New Zealand as different, but generally their adaptable and flexible nature allowed them to overcome difficulties and many forms of discrimination. Although the Indian community congregated in cities, they did not live in enclaves. Therefore, Indian immigrant entrepreneurs lived throughout the New Zealand community. They were generally fluent in English and adapted well to New Zealand conditions, while still retaining their Indian traditions and values such as food, religion and a belief in non-violence.

*Societal perspectives:* Indian immigrant entrepreneurs felt New Zealand was a good society to live in, and that New Zealanders were pleasant but somewhat insular people. They generally appreciated the natural environment New Zealand had to offer. They believed that they brought diversity and harmony to the New Zealand way of life.

*Business integration:* The Indian level of entrepreneurial activity was less than the New Zealand average and this was often explained away as Indian migrants’ predisposition to employment and their low need for independence. Indian immigrant entrepreneurs found it relatively easy to enter business in New Zealand. However, they had concerns about the small nature and isolation of the New Zealand market, and were frustrated by regulation and compliance costs. But overall they adjusted well to these challenges.
3 Culture

*Personal:* The Indian immigrant entrepreneurs’ mindset was strongly influenced by their faith and spirituality and by the diversity of its expression. They displayed a strong internal locus of control and generally felt in control of their lives. They were goal setters, were determined to succeed, and had confidence in their own business ability. Indian immigrant entrepreneurs worked long hours and this was considered typical of the Indian character, in that they were accepting of the need to work long hours as there was generally no work-life balance in the Indian context.

*Family:* A sense of family obligation was prominent among Indian immigrant entrepreneurs with respect to immediate family, but less so toward extended family. Bloodline was still considered important, as attested by a number of arranged marriages. The traditional Indian patriarchal model, however, appeared to be softening in New Zealand. Indian immigrant entrepreneurs had strong family involvement in their business activities as an informal source of labour, although there were conflicting views on the preference for succession. Generally Indian immigrant entrepreneurs guided their children into higher education, and into the development of independent lives and professional careers. They also referred to the importance of the parental values transfer, with respect to those values which were passed on by their parents and those they passed on to their children.

*Ethnic community:* The Indian community in New Zealand is divided in many ways, including: language, tradition, region of origin, and religion. Due to this lack of a unified community, Indian immigrant entrepreneurs tended to focus on sub-community relationships and broader New Zealand business affiliations. They did, however, support the diverse Indian community through employment. Indian immigrant entrepreneurs believed that the Indian community had identifiable characteristics of: strong spirituality – for example the law of Karma, being good workers, and conducting themselves discreetly in the broader New
Zealand community. They also felt that the Indian value system and their flexibility and adaptability were beneficial to business activity. Indian immigrant entrepreneurs were New Zealand citizens, but integration was incomplete as they attempted to live in both worlds; that is, adapting to their new home while still retaining traditional customs and language.

*Homeland:* Indian immigrant entrepreneurs had strong personal homeland connections, and therefore visited their homeland regularly. Distance was, however, considered to be a significant barrier for some immigrants. There were only a few examples of homeland business connections, as New Zealanders’ hesitance to utilise immigrants and their contacts was noted by Indian immigrant entrepreneurs as a restricting factor in developing overseas markets.

4. **Business**

*Characteristics and philosophies:* Generally it was unwise to pigeon-hole Indians immigrant entrepreneurs into stereotypical businesses, although there was a dominance of service businesses in the case analysis. The Indians immigrant entrepreneurs’ start-ups were evenly split between new ventures and the buying of established businesses, with all the businesses focused on managed growth. The majority of Indian immigrant entrepreneurs stated that their businesses had a general New Zealand market focus, and were involved with only limited international activity. Philosophically, Indian immigrant entrepreneurs’ business values were based on karma, quality, customer focus and word-of-mouth marketing. They also made reference to the need for honesty, integrity, and fairness in business.

*Drivers:* Business drivers included financial security, as opposed to excessive wealth, and the aspiration to ‘be someone.’ To Indian immigrant entrepreneurs, retaining a good business reputation outstripped other considerations such as lifestyle. However, they did confirm the desire to take control of their lives and to be rewarded for their efforts. They were driven by a
quest to take advantage of their own skills and seize opportunities, rather than be frustrated with the New Zealand labour market. As such there was little evidence of forced entrepreneurship, but employment dissatisfaction had influenced the Indian immigrant entrepreneurs’ decision making.

**Learning:** Indian immigrant entrepreneurs were well qualified, having higher formal education levels than the general Indian community or the overall New Zealand population. Education appeared to enhance their entrepreneurial capability, as did their practical experience. Most had significant industry experience prior to going into business, and considered ‘learning on the job’ as vital to their success. Indian immigrant entrepreneurs took the initiative to seek out knowledge when required, but they were reluctant to depend on business professionals to help run their businesses. They preferred to talk to and seek advice from their trusted peers. They were also inspired by role models, from family members to national figures such as Mahatma Gandhi.

**Finance:** Financial responsibility and frugality was considered part of Indian immigrant entrepreneurs overall lifestyle and belief system. Indian immigrant entrepreneurs did have some difficulties with raising institutional capital and, therefore, financing mainly occurred in the context of their family and community. Family capital was the cornerstone of many of the business start-ups. Often Indian immigrant entrepreneurs managed their way through cash-flow problems with their propensity for a parsimonious lifestyle and the working of very long hours.

**Conclusion**

The Indian community are highly visible across a broad range of industries within the SME sector in New Zealand, although they are not as prominent in business as many other ethnic minorities. In an attempt to understand some of the complexities of Indian
entrepreneurship, this paper offered a profile of Indian immigrant entrepreneurship in the belief that greater understanding will enhance entrepreneurial activity. To this end the following conclusions are drawn.

Indian immigrant entrepreneurs came from geographically dispersed origins. They were predominantly from an urban middle socio-economic background. They migrated as employees and developed into entrepreneurs after arrival. They came from a cultural tradition of migration and sought an improved quality of life. They generally settled in cities and had a predisposition for employment, but spoke of having difficulty getting ‘the right’ job which drew them toward self-employment. Other reasons for going into business included financial security, reputation and aspirations to ‘be someone’. Furthermore, Indian immigrant entrepreneurs had a desire for autonomy and to be rewarded for their efforts. They were driven by a desire to take advantage of their own skills and seize opportunities.

Indian immigrant entrepreneurs were well qualified, having high education levels and practical work experience. Most had significant industry background prior to going into business and considered this experience as critical to their success. Furthermore, they took the initiative to seek out knowledge when required - mainly from their peers as opposed to professionals. Due to the lack of a unified Indian community, Indian immigrant entrepreneurs were independent and had a national business focused. They did have some difficulties with financing their businesses, and that raising capital mainly occurred in the family and community context, with family capital still being the cornerstone of business start-ups.

Spirituality was intertwined in Indian immigrant entrepreneurs’ everyday living and being. They had strong work ethics but no real work/life balance. Obligation to immediate family was a prominent feature. They had strong family involvement in their business activities, although there was no clear pattern of succession as they encouraged their children to become educated and independent. Financial responsibility and frugality was also considered part of
their overall lifestyle and belief system. Physical and cultural differences had resulted in labelling in New Zealand society but generally their adaptable nature and fluency in English allowed Indian immigrant entrepreneurs to overcome difficulties or discrimination – while still retaining their Indian traditions and values.

AN EMPIRICAL STUDY OF THE ROLE OF MOTIVATION AND GOVERNMENT SUPPORT AMONG SELF-EMPLOYED WOMEN IN GHANA’S TOURISM INDUSTRY

Angela Elijah-Mensah, School of Business Studies

Kojo Saffu, Brock University

Introduction

The crucial role of entrepreneurship as the engine of growth for economies can no longer be ignored. This is underscored by the shift from large state-owned corporations to small/medium private-owned enterprises (Galloway, Anderson, Brown & Wilson, 2005; Coyle & Leeson, 2004; Hisrich & Ozturk, 1999). The contributions of women towards this phenomenon has been significant (Verhuel & Thurik, 2001). In Ghana, as in most African countries, although entrepreneurship is still evolving, its potential to contribute to general socio-economic growth and the improvement of the socio-economic status of women in particular, is recognised (Abor & Biekpe, 2006; Tshikuku, 2001; NEPAD Document, 2001).

Providing opportunities for women in Africa (including Ghana) to earn decent income is one sure way to the successful realization of the 3rd UN Millennium Development Goal of promoting gender equality and women empowerment (REF). Promotion of female entrepreneurship has therefore become critical and tourism has been identified as a sector that offers women opportunities to earn income as was reflected in the theme for the World Tourism Day 2007 which was “Tourism Opens Doors for Women” (UNWTO, 2007). In Ghana, women constitute 65% of the employees in the tourism industry (Ghana.mvmtravel.com/newdetail.asp, 2008), thereby making the industry a major contributor in creating self-employment opportunities for Ghanaian women.

Given that women entrepreneurship has become an indispensable tool for socio-economic
development of Ghana as the nation strives to achieve middle income status, and the fact that tourism has been identified as one industry which can provide self-employment opportunities for women, it follows then that a systematic study of the women who currently own businesses in that sector will be useful in enhancing efforts at reaping the full benefits of the sector for socio-economic advancement of women in particular, and society as a whole.

Admittedly many studies have examined women’s motivations for self-employment (Aidis et al, 2006; Gundry and Yoseph-Harold, 2004; Carter, Brush, Greene, Gatewood, & Hart, 2003; Bennet & Dann, 2000; Orhan & Scott, 2001; Lerner, Brush & Hisrich, 1997). Unfortunately, most of these studies have been carried out in the context of developed and advanced countries and as such, the resultant theories and findings may not be totally applicable to females in a developing country like Ghana, due to contextual factors (Bruton, et al, 2008; Lerner, Brush and Hisrich, 1997). Furthermore, it appears that little is known about the extent to which other environmental and situational factors (such as government support) can influence the entrepreneurship phenomenon in general (Gartner, 1985). This study addresses this gap by examining the relationship between motivation and government support in a developing country.

In Ghana, few systematic inquiries have been carried out on female entrepreneurship (see Saffu, Apori, Elijah-Mensah & Adote (2008); Saffu, Apori & Elijah-Mensah, (2007); Saffu, Apori, Elijah-Mensah & Ahumatah (2006); Saffu & Manu (2004), Quainoo (2001), Cecelski (2000) and Chalfin (2000). Apparently, most of these studies have focused on the manufacturing and retail sectors of the Ghanaian economy, with little attention given to the service industry. This study is therefore an attempt to help address the dearth of information on Ghana’s tourism industry as well as the women entrepreneurs therein.
**Significance of Tourism**

Tourism has emerged as one of the world’s largest industries with many small and open economies relying heavily on it as a source of foreign direct exchange (Drakos & Kutan, 2003). Also, tourism is a potential stimulus for the economies of many resource-poor countries (Brown, Turner, Haneed, & Bateman, 2002). Tourism is one sector which offers brighter prospects for women in particular. This was amply reflected in the theme of the World Tourism Day – 2007, which was “Tourism Opens Doors for Women”. The penchant of women in Ghana for this industry is attributable to their traditional upbringing through which they acquire skills for cooking and catering for guests (Bour, 2007; Dolphyne, 2000; Brown, 1994). Undoubtedly, these skills are needed for running a tourism business.

**Prior Studies**

**Entrepreneurial Motivations**

Motivation is crucial to any entrepreneurial process (Shane, et al, 2003). Entrepreneurial motivations are goals business owners seek to achieve through the businesses they establish (Robichaud, et al, 2001). Entrepreneurial motivations include achievement, opportunity, job satisfaction, economic necessity, power, status/prestige, independence, personal development, economic necessity and welfare considerations (Lerner, Brush & Hisrich1997; Buttner & Moore 1997; Gatewood et al, 1995; Birley & Westhead 1994; Hisrich & Brush, 1986).

According to Carter et al; (2003), entrepreneurial motivations include innovation, independence, recognition, roles, financial success and self-realisation. Mitchell (2004) also cites the need for independence, material motives, the need to contribute to family security and the need to make a difference in the business and achievement. Studying entrepreneurs in
Vietnam, a typical emerging economy, Benzing, Chu & Callanan (2004) report that the desire “to be my own boss”, the desire “to increase my income” and the desire “to create a job for myself” are very significant motivation factors. Similarly, Chu, Benzing & McGee (2006) in a study of Kenyan and Ghanaian entrepreneurs, also identified the desire “create a job for my self” and the desire “to increase my income” as the two strongest motivations.

**Gender and Entrepreneurial Motivations**

The literature presents mixed findings on the impact of gender on entrepreneurial motivation. For instance, there is evidence to suggest that men and women offer similar reasons for self-employment such as, the desire for independence, the desire to make money and challenge (Bennet & Dann, 2000; Fagenson, 1993). There is also considerable support for gender differences in entrepreneurial motivation as established by Cater et al (2003), Bennet & Dann, (2000); and Gatewood et al (1995). Cater et al (2003) for instance, argue that significant differences exist between the way men and women rate the various motivation factors. Rani & Rao (2008) in their review of some empirical studies mostly from India, also concluded that women are motivated to go into self-employment by the desire to be self-employed, establish oneself in the family and in the society, as well as the desire to achieve a goal.

**Classification of Entrepreneurial Motivations**

Entrepreneurial motivations can be classified as “pull” or “push” factors (Moult & Anderson, 2005; Buttner & Moore, 1997). The “push” factors which are also known as necessity factors include job dissatisfaction, redundancy, the need to balance work and family roles and the need for more income (Moult & Anderson, 2005). The “pull” factors on the other hand attract the individual into entrepreneurial behaviour and include the need for achievement, independence, wealth and status (Moult & Anderson, 2005).
Gatewood et al (1995) argue that the “pull” factors are more important to women than the “push” factors, the opposite being true for men. Buttner & Moore (1997) and Orhan & Scott (2001) also argue that the “pull” factors influence the men more than the women.

**Government Support**

Support for small to medium scale enterprises is a central plank of the economic policy of most governments (Bennet, Robson & Bratton, 2001). Given the critical role small businesses play in socio-economic development of nations, the World Bank has over the years invested colossal sums of money (channeled mostly through the various governments) to promote the development of such ventures (Sarder, Ghosh & Rosa, 1997).

Government support has significant influence on private enterprises (Rani & Rao, 2008; Tambunan, 2007). The support could be direct or indirect. Direct government support may include provision of finance and business development services such as marketing advice to small businesses and also training at the enterprise level (Tambunan, 2007; Geeta & Syed, 2003). There are also the indirect interventions such as establishing policies and a legal and conducive environment for private business development. (Tambunan, 2007; Geeta & Syed, 2003). Assistance from governments is particularly critical for the success of firms set up by women entrepreneurs (Rani & Rao, 2008; Mayasami & Goby, 1999).

Unfortunately, there appears to be a dearth of information on which form of support is appropriate for women operating tourism businesses in Ghana. Previous research findings from developed countries have however established that women, as compared to men, face many difficulties in their attempts to secure funding to start and grow their business and this was a prime area of concern to them (Marlow, 2005; Constantinidis et al, 2006; Buttner & Moore, 2001). Women found small businesses in traditional sectors of retailing and services, such as tourism. Studies suggest that women prefer to gradually grow their ventures and therefore find the loans from banks unattractive due to the high interest rate which could be higher at times than the project itself. What such women need is micro-credits with low and manageable interest rates and terms of repayment (Constantinidis et al, 2006).

In Ghana for example, the government has established the Venture Capital Trust Fund
(VCTF) to support the entrepreneurs (VCTF Annual Report, 2007). The first function of the VCTF is to provide credit and equity financing to venture capital financing companies for the support of small and medium size enterprises. The other function is to provide money to support other activities and programmes aimed at the development and promotion of venture capital funding in the country. (VCTF Annual Report, 2007). The Venture Capital Trust fund, has earmarked the tourism industry as a priority area (VCTF Annual Report, 2007). The government also has a policy of granting tax relief on inputs imported for the operation of tourism ventures. Additionally, the Ghana Tourist Board also organizes various forms of training programmes periodically for employers and employees in the industry (Field interviews, 2007).

Methodology

Population/Sample

The total population comprised all women entrepreneurs who have founded tourism ventures, registered such businesses in their own names and the businesses have been duly approved by the Ghana Tourist Board. The sample was 248 women drawn from six out of the ten administrative regions of Ghana, whose businesses had been licensed by the Ghana Tourist Board. These regions were selected because of their rich tourism potentials, high number of tourism ventures and attraction sites. Since some regions have more tourism ventures than others, with some regions having more of a particular venture type than others the quota sampling method was employed to ensure that the number of participants for each data collection exercise was representative of the various venture types identified and also reflected the numerical strength of these venture types in each of the regions under study. The researchers also employed judgment sampling so that care was taken to select participants who could best help answer the research questions for each of the three data collection exercises. This is because the population had various levels of experiences and so care was taken to select women who had at least two years experience as it was anticipated that they would have much personal experiences and could therefore answer questions raised during
the data collection. No participant took part in more than one data collection exercise.

**Data Collection/Analysis**

This study placed premium on the need to capture data which reflects the richness and uniqueness of participants’ experiences. This was because it is perceived that the Ghanaian female business owner in tourism had a unique experience to share in relation to her motivation and support from government. The mixed methodologies approach was employed, integrating qualitative and quantitative techniques for data collection so as to benefit from additional insights a single methodology may not provide (Cresswell, Fetter & Ivankova, 2004).

Data were collected from six administrative regions of Ghana using a three stage approach. First, a focus group meeting of 12 women was organised. The main objective of the meeting was to find out the views of participants on the study variables. This was followed by a survey of 200 respondents to examine the issues discussed during the focus group meeting from the perspective of a larger group of participants. To achieve this, data from the focus group were used to design a questionnaire for the survey. An instrument, originally developed by Brush (1988) and later adapted for use by Saffu and Manu (2004) guided the researcher in the arrangement of the items. Responses for motivation and government support were measured on a scale of 1 = not significant, to 5 = very significant. The response rate was 75%. Finally, to further explore the issues raised during the focus group meeting and the survey, a series of in-depth interviews involving another set of 30 women was undertaken. Each interview lasted between one and half to two hours. The focus group and in-depth interview data were subjected to conversational analysis, while the survey data were factor analysed. Regression analyses were performed to determine the influence of
government support on motivation.

Results

Focus Group

During the focus group meeting 11 out of the 12 participants said they were motivated by passion/interest to found their ventures and 10, by the need for independence. Thus these two factors appeared to be common among the participants. Nine of them said they were motivated by the need for personal satisfaction and another 9 by the need to make money. Eight were also influenced by the need for respect/prestige and another 8 by the desire to meet a need. It is obvious then that these factors, passion, personal satisfaction, money, respect/prestige and the desire to meet a need were more predominant among the women compared to the others namely, redundancy (1 participant), need to set up a new venture (3 participants), and the desire to invest excess cash (5 participants).

From the view point of the women they did not enjoy any support from the government. They unanimously chorused “government support is nil, where nil means nil”. Further interviewing however revealed that there was some form of support but the participants felt it was inadequate. For example, they mentioned the fact that Ghana Tourists Board organised regular training for them and their employees. However since they had to pay to attend such training, then to them, that was no form of support. The researchers then went on to find out what their expectations were in terms of support from the government. It emerged from the discussions that all the 12 women wanted the government to help tourism by setting up schools to train professionals and also make Ghana an attractive destination in order to attract more tourists. Ten wanted the attraction sites to be better developed and 9 called for improvement in the road network. Finally, 6 participants expected the government to reduce the number of taxes they paid and also facilitate access to funding for their businesses. From the responses, it emerged that the need for schools and development of the tourist sites were foremost.

Survey

From the focus group discussions, nine motivation dimensions were identified. These were passion/interest, respect/prestige, need to set up a new venture, desire to fulfill a need, the
need to invest excess cash, redundancy, need for independence, personal satisfaction and the need to make money. These findings were used to design a questionnaire for a survey. The significance of each dimension was measured on a five-point scale from 1(not significant) to 5(very significant). Registering a Cronbach reliability coefficient of $A = 0.615$ a KMO sampling adequacy of .740 and .000 significance for the Bartlett’s Test of Sphericity, the nine dimensions loaded on three factors.

The first factor comprised five items namely, passion/interest, personal satisfaction, independence, and desire to fulfill a need and need to make money. This factor was labeled personal motivation factors because they stemmed from the individual’s desire to achieve those goals. It had a loading greater than 0.50.

The second factor included the need to invest excess capital, need to set up a new venture and the need for prestige/respect. This factor was labeled strategic motivation factors because one required systematic and deliberate planning to be able to realise those goals. This factor also had a loading greater than 0.511.

The third factor had a single item of redundancy, which had a factor loading of 0.926. This factor was labeled circumstantial motivation factor, because one did not plan, as it were, to become redundant. It is a situation one found himself in and mostly not of the making of the individual.

In summary, the factor analysis of the motivation factors resulted in three components namely, personal, strategic and circumstantial motivation factors.

To measure government support, six items emerged from the focus group meeting. These were tourism training institutes, the tourist sites, visa for tourists, tax reductions, funding and the road networks. Again, these findings were used to design a questionnaire for a survey. Similar to the other variables, the significance of each item was measured on a scale from 1(not significant) to 5(very significant). A reliability analysis recorded a coefficient of $A= 0.766$, a KMO sampling adequacy of 0.784 and .000 significance for the sphericity. All six items loaded on a single factor which was labeled government support package for tourism ventures. The factor loading was greater than 0.490.
**In-depth Interviews**

Table 1 represents a summary of responses from the participants who were interviewed.

Table 2 compares data from all three data gathering exercises. It is obvious to a large extent, that the frequencies of the responses from the focus group were confirmed by responses from the survey and interviews. The only exception was redundancy where the recorded rotated matrix was a high of .926 compared with 46.7% response from interviewees and 8.3% from focus group participants. The difference might be due to the composition of the sample for the interview and focus group. Probably not many of the ladies chosen for these exercises had experienced redundancy, though data from the survey indicate that it (redundancy) is a significant motivation for women to go into self-employment. Due to the fact that the data from the focus group were confirmed by data from the survey and interviews, the factor loadings from the factor analysis were accepted as the constructs (in the context of this study) for motivation and government support.

### Regressions

From Table 3, it appears that government tended to (suppress or) interfere with the personal motivation factor (p), accentuate the circumstantial motivational factor (c) and had a reverse effect on the strategic motivation factor (s) when present.

Discussion

Demographics of Respondents

As shown in Table 4, a total of 192 women participated in the three data collection exercises – 12 focus group participants, 150 survey respondents and 30 interviewees. Statistics of their background characteristics indicated that women in Ghana’s tourism industry were more likely to found accommodation and catering ventures. Most of the women fell within the 40 to 49 age bracket and had operated for between two to nine years. Such women were likely to be married and mostly diploma holders. Though an appreciable percentage (44.9%) had entrepreneurial background, a majority had no previous entrepreneurial experience.

Motivation

Analysis of data gathered from focus group discussions, survey and in-depth interviews revealed that Ghanaian business women set up tourism ventures out of passion/interest, the desire for personal satisfaction, independence, need to make money, the desire to fulfill a need, the need to invest excess capital, the desire to set up a new venture, need for respect and redundancy. Table 5 presents some of the explanations participants gave for each of the factors.

</table>

A comparison of motivations factors identified in this study and those identified in the prior studies referred to earlier, indicated that most of the factors, except for three (passion, need to invest excess cash and redundancy) appeared to be common in influencing women to choose self-employment. These common motivation factors included personal satisfaction, independence, money, desire to fulfill a need, the need to set up a new venture, and respect. With the exception of money (a “push” factor) all these factors are “pull” factors. The “pull” factors were influential for women in developed countries as well. Of particular interest, were independence and money as these cut across all the cited studies which had been carried out mostly in advanced economies such as the United States, United Kingdom and South Africa. The need for independence and money therefore appeared to be important issues that were influential in explaining entrepreneurial behaviour irrespective of gender, industry and country.

There were however, three reasons participants in this study offered which appeared not to have been cited in the previous studies. These reasons were passion/interest, the need to invest excess capital and redundancy. The high rotated matrix components recorded for these factors (passion/interest - .783, the need to invest excess capital - .841 and redundancy -.926) also suggest their high strength.

The fact that the women established tourism ventures because of passion/interest could be attributed to the female socialisation process in Ghana, which placed premium on good skills for cooking, housekeeping and caring for visitors to the home (Bour, 2007; Brown, 1994) and to enjoy doing that. These skills, invariably were critical for running tourism ventures such as accommodation and catering ventures (which this study found to be most preferred by women). Since the skills required for operating tourism business, and those females in Ghana have acquired through their upbringing were congruent, they naturally tended to have great
interest in and enjoy carrying out activities in their tourism business, with the same passion with which they cooked and cared for their families. The following statements from some participants, further supported this explanation:

- “I enjoy serving visitors.”
- “Women like meeting people and caring for them so the tourism business fits well with their interest.”
- “I enjoy receiving and catering for guests.”

A second distinctive reason which emerged from this study was that of the need to invest excess capital. The typical African woman, including the Ghanaian (especially one from a matrilineal society), bore greater responsibility for providing for the needs of the family (Loscocco, 1991), especially those of her children. There was therefore the need for women to be in business to earn money to effectively discharge these responsibilities. It had also been generally reported in the literature that women-owned businesses attracted less investments in comparison to men-owned businesses (Aidis et al, 2006; Gundry & Yoseph-Harold, 2004) and the Ghanaian woman was no exception (Saffu & Manu, 2004). It was thus plausible that, this pressure to care for the family and the lack of investor interest in women-owned businesses might have motivated the women in this study to save and invest any excess capital in another business in order to improve their financial security and that of their family (Gooding & Mischel, 2007; Portes & Shauffer, 1993), and it is only reasonable to expect that they would invest in a business for which they had the necessary skills and could manage successfully. Two interviewees said:

- “I have always wanted to invest my profit somewhere else – a profitable project to make more money”.
- “You do not have to put all your eggs in one basket, so I have to invest in another business”.

The final reason which appeared to be unique to this study was redundancy and this could be attributable to that fact that Ghanaian women appeared to be vulnerable to such redundancy exercises. Again, this could be due to the fact that women, especially those from developing countries, had generally been cited for low educational background (GEM Report, 2002; Buttner & Moore, 1997). In Ghana for example, male children were favoured in the provision of basic facilities in life including education (Bour, 2007). With their low educational background, (as found in this study – mostly diploma holders) compared to men, women would have less valuable work (Borden & Nucci, 2000), occupying the lower levels of the
organisation and would therefore be ready targets for any redundancy exercises – a phenomenon which had gained some frequency in Ghana since the 1990s. Since the women had a responsibility to cater for their family, especially the children, they found redundancy as an unbearable experience they never wished to reoccur. They thus did not want to be hit by redundancy again and with low educational background the best option was self employment. In the words of one participant:

- “This is my own business and nobody will declare me redundant”.

They further enhanced their job security by choosing ventures for which they had the requisite skills and were therefore confident of success. An interviewee expressed it this way:

- “Tourism is related to what women can do best – that is taking care of the home and attending to visitors. Women therefore find it easier to found and manage tourism businesses.”

Findings on Gender and Entrepreneurial Motivations

Gatewood et al (1995) argued that the intrinsic reasons or “pull” factors were more important to women than the extrinsic reasons or “push” factors. Buttner & Moore (1997) and Orhan & Scott (2001) on the contrary said that the “pull” factors influenced the women less. Mitchell (2004) reporting from South Africa also posited that, women placed more value on the “pull” factors. Moult and Anderson (2005) also suggested that an individual may be influenced by a combination of both factors. In this study it was observed that both types of motivation factors had an influence of the women. However the “pull” factors appeared to account more for the self-employment behaviour of the women.

Government Support

The responses of the women suggested that government support was insufficient. Though they acknowledged the fact that the Ghana Tourist Board from time to time organised training programmes for them, they did not consider that as a form of support since they had to pay to benefit. The researcher then went ahead to find out what form of support they expected from the government.

The results of the data analysis revealed that the women needed government support in the areas of improved road network, improved tourist sites, reduction of taxes, funding, facilitating tourists arrivals and establishment of tourism training institutions. All these six items loaded on a single dimension after a factor analysis and was labeled government
support. Table 7 presents an explanation of these forms of support from the point of view of the participants of this study.

Further, it appeared that the most critical form of support the women expected from the government was the establishment of schools to train professionals for the tourism industry. This was evidenced by the highest interview response of 93.3% and the highest rotated matrix component value of .799. This was followed in order of priority (based on the data presented in Table 6 above), by development and improvement of the tourist sites, then facilitation of tourist arrivals, reduction of taxes, funding and development of the road network. The results suggested a need for more of indirect forms of support than the direct support of financing. Unlike women in other studies, for the Ghanaian woman operating a tourism venture, funding did not appear to be the foremost problem. This was probably because they preferred to grow their businesses gradually which they could conveniently do by ploughing back the proceeds. Again, as was established during the interviews, they found the interest rates from the banks unattractive. They only sought external financial assistance mostly overdrafts and small monies which they referred to as “a little push” to finish off projects they had virtually completed unaided (Constantinidis et al, 2006). Funding therefore was not the number one support they needed, contrary to findings from other studies on women entrepreneurs in other industries and from developed countries (Aidis et al, 2006; Gundry & Yoseph-Harold, 2004).

The Relationship Between Motivation and Government Support

The regression was at two levels – supported by government and not supported by government as seen in Table 8. From the results, it was observed that P (personal factor) was
relatively high in both instances of support from government and no support from government. It therefore appeared that government support did not have significant effect on P. This could mean that women who were motivated by personal factors would work hard whether they were supported by the government or not. Once again, it was possible that the combination of “pull” factors (of independence, passion, personal satisfaction, desire to fulfill a need – all being intrinsic) and the “push” factor (money, which was crucial in developing countries) made the women work hard whether there was government support or not.

The strategic factor of motivation (S) (comprising the need to invest excess capital and the need to set up another venture) appeared to have a negative relationship with government support. However, some form of increase was observed when there was no support from government. It was plausible that women entrepreneurs were less willing to invest in another business for strategic reasons, when supported by government. On the other hand they had more strategic motivations – that is the desire to invest in another business, when there was no government support. This was probably to enhance their financial security.

The beta coefficient of the last motivation, which is the circumstantial factor (C), showed no significant relationship with government support. Probably, women who are “pushed” into setting up tourism ventures due to redundancy, had less desire to invest in another business.

Conclusion and Implications

The aim of the study was to establish reasons why women in Ghana set up tourism businesses, identify the level of support they received from the government and to determine the extent to which motivation was influenced by government support. The study revealed that women SMTV owners are motivated by personal, strategic and circumstantial factors. They expected
government support such as improved road network, improved tourist sites, reduction of
taxes, funding, facilitating tourists arrivals and establishment of tourism training institutions.
The drop in the beta coefficients for personal and strategic factors of motivation, when there
was government support, suggested that government support interfered with these motivation
factors, all of which were “pull” factors. This was contrary to findings which indicate that
government support was generally good for small businesses (Smallbone & Welter, 2001; Robson & Bennett, 2000). It appeared that the women tended to be less motivated to invest
in another business when they had government support. It was possible that this could be due
to certain situational factors, which may warrant further research, supporting Gartner’s (1985)
call for more investigation to determine situational variables and their effect on the
entrepreneurship process.

The study helps to deepen our understanding of female entrepreneurship in particular and
entrepreneurship in general. It also helps to improve appreciation of the varied nature of the
context of small/medium enterprises in the tourism industry. Further, it leads to a better
understanding of entrepreneurial motivations and government support among female-owned
tourism ventures. Finally, the study helps to improve our understanding of entrepreneurship in
the context of a developing country.

Based on the above conclusions, the following recommendations we propose the following
recommendations for policy makers, trainers, practitioners and researchers.

**Recommendations for Policy Makers**

a. Being an infant industry, tourism needs regular, constant and appropriate attention to
develop.

b. The government of Ghana and other policy makers should pay particular attention to
policies which could create the necessary conducive atmosphere to promote and
support the sustainable growth and development of the tourism industry. In this
regard, particular attention should be paid to policies which will facilitate the
development of curricular and the setting up training institutions to train local
professionals to work in the industry. This is because the women in this study showed
a preference for indirect government support.
c. Attention should also be paid to the development of the tourist sites such that the experience provided at such sites will compel the tourists to make repeat experience.
d. There was also the need to remove obstacles associated with visa acquisition and take steps to get the airfare to the country more competitive to facilitate tourist arrivals.
e. Efforts should directed towards the reduction of the multiple taxes. Tourism business owners paid over ten different taxes which is rather too much.
f. There was also the need for intensification of efforts in getting the girl child to go to school and pursue higher education as this would improve her performance in any endeavour. The women in this study were found to be mostly diploma holders, which was a worrying situation.

**Recommendations for Trainers**

a. Based on the finding that women were motivated to found tourism businesses due to personal factors. Trainers should identify prospective women entrepreneurs’ personal factors as targets for training and support since they are likely to perform better in business, compared to those with strategic or circumstantial motivation.

**Recommendations for Practitioners**

a. Ghanaian women in tourism businesses should form associations to lobby legislators and other policy makers to pay particular attention to the issues that are important to them including the establishment of schools to train professionals for the industry, proper development of the tourist sites, facilitation of tourist arrivals and the reduction of multiple taxes as these were very important to the women.
b. The women should develop a passion for their work since this will positively influence the growth of whatever tourism venture they found, whether supported by government or not.

**Suggestions for Further Research**

a. Since this study focused on the tourism industry, the findings may not be fully applicable to other sectors such as manufacturing and retail. The study should be replicated in other sectors of the economy.
b. The findings of this study could further be tested on male entrepreneurs or in a comparative study of both males and females.
c. Future research should also consider a cross-country comparative study of women in tourism industry.

d. This study revealed that government support interfered with motivation. There is therefore the need for further research to identify which specific situational variables influenced the effect of government support on motivation.

The prospects of fostering technopreneurial self-efficacy among under-graduates students at a University of Technology in South Africa

South Africa still grapples with the profound economic disparities left by the combined legacies of colonialism and apartheid. The country capacity to absorb new recruits into formal sector has fallen from approximately 64% to less than 4%.

Successful development and promotion of technopreneurship self-efficacy among the country’s students is one of many powerful business tools that may also be able for the country to drive the economy back to prosperity and competitiveness.

This study investigated the prospects of fostering technopreneurial self-efficacy among IT under-graduates students and the findings thereof are shared.
From Resource “Access” to “Use”: Exploring How the Combination of Human, Social, and Financial Capital Impact Individuals’ Entry into Nascent Entrepreneurship

Kim Klyver, University of Southern Denmark
Mark Schenkel, Belmont University

Abstract

Whereas prior research has primarily investigated the independent effects of financial, human, and social capital on the decision to create a new venture, little research has investigated the combined effects leaving potentially meaningful interdependencies less well understood. This study addresses this void explicitly by focusing on three questions designed to investigate not only the independent effects, but also the combined effect of human, social, and financial capital influences on the decision to create a new venture. First, to what extent do human, financial, and social capital independently influence the decision to create a new venture? Second, does the influence of social networking on the decision to create a new venture depend upon the level of human and/or financial capital? Third, are these influences on the decision to create a new venture consistent across men and women? We hereby change the focus from a resource access approach to a use approach.

Introduction

The links between an individual’s access to various human, social, and financial resources and the decision to create new ventures provide compelling research focal points (for example, Davidson and Honig, 2003). These foci derive largely from the idea that resources facilitate opportunity development efforts through the various nascent venture stages. For example, studies suggest social networks are not only fundamental to opportunity recognition (for example, Singh, 2000), but also play a substantive role in resource acquisition process (for example, Brush and Greene, 1996) that assists ongoing development efforts to exploit entrepreneurial opportunity through the creation of new ventures (Larson and Starr, 1993).

Research investigating the influences of access to human, social, and financial capital on new venture creation outcome variables such as the start-up decision, survival, growth, and profit has yielded important theoretical insights about the independent influences of each. By contrast, little research has investigated how the entrepreneurs seek to combine various capital resources suggesting that the interactive nature of such influences remains less well
understood. For example, Mosey et al. (2007) note that the temporal sequence of nascent entrepreneurial capital development remains less than fully understood, in part, because few studies have examined how the specificity of human capital relates to the decision to create a new venture within the context of social capital.

The lack of entrepreneurship studies focusing explicitly on the interactive influences of human, social, and financial capital is surprising for at least two reasons. First, though agreement remains elusive on the direction of causality, sociologists have noted the interplay between human and social capital (Coleman, 1988). Second, it is well established in social capital research that certain network contacts may become redundant if the same resources are available through other contacts in the network (Burt, 1992), an observation which suggests differences in entrepreneurs’ approaches to network use may hold important insights into the new venture creation process.

This study addresses this void explicitly by focusing on three questions designed to investigate not only the independent effects, but also the combined effect of human, social, and financial capital influences on the decision to create a new venture. First, to what extent do human, financial, and social capital influence the decision to create a new venture independently? Second, does the influence of social networking on the decision to create a new venture depend upon the level of human and/or financial capital? Third, are these influences consistent across men and women? By adopting a perspective that begins by acknowledging social embeddedness, we change the focus from resource “access” to “use.”

**Capital theory & hypothesis development**

**The ‘access’ approach to resources**

Capital theory’s (Coleman, 1988) importance has increased significantly since its introduction to organizational and entrepreneurship research. The import of capital theory from sociology to organizational and entrepreneurship theory has mainly taken place through
the resource-based perspective (Wernerfelt, 1984). From the resource-based perspective, it is argued that a firm’s or an entrepreneurs’ competitive advantages are generated by the resources available rather than the product-market position. The keyword is ‘availability’ of resources. Stevenson and Jarillo (1990) argued that entrepreneurship is the process of pursuing opportunities “... without regard to the resources they currently control” (p. 23). Thus, what matters is the ability to pursue an opportunity through access to various resources.

Burt argues for the division of capital resources into three categories. Financial capital is essentially the money in people’s pockets; human capital is the knowledge and capacity within human beings; and social capital is the value of resources generated by people’s social networks (Burt, 1992).

Previous research clearly shows how financial capital is essential for long term success of start-ups. Lack of financial capital at the initiation of the business may hinder or preclude the start-up process with long term consequences for performance (for example, Verheul and Thurik, 2001). Financial capital can be obtained externally through debt and investors or internally through use of personal savings.

In this study, we are interested in financial capital in terms of personal savings generated through household income. We argue that financial resources are not only important for the long term performance but also to the initial decision to start a business for at least three reasons. First, we argue that individuals are generally aware of the importance of financial resources for long term success. They realize that the lack of sufficient financial resources may lead to subsequent potential difficulties, which in turn decreases the likelihood they will decide to enter the start-up process. Second, they realize that if no or not enough external funding can be obtained, then personal funding is the only remaining source. Bhide (1992) argued that new ventures are generally a “poor fit” for traditional lending models, which suggests that nascent entrepreneurs may frequently confront the lack of external funding
availability. As a result, the decision to start often depends strictly on personal funding availability. Third, and interestingly, anecdotal evidence (Mamis, 1994) suggests that nascent entrepreneurs may actually prefer the simplicity and ease of access of personal financing sources. Hutchinson (1995) argued that such a preference could reflect an unwillingness to bear the added risk or need to share control that accompanies external funding sources. As a result, the perceived risk or consequences of failure may be influenced positively (that is, lessened) by the level of personal funding employed. Thus, we argue that to financial capital in terms of household income is related positively to the start-up decision.

Hypothesis 1: Financial capital, measured as household income, is positively related to individuals’ likelihood to enter the nascent new venture creation process.

Human capital is the knowledge and capacity within individuals to perform certain tasks. Becker (1993) describes human capital as an investment through which individuals expect economic returns. Prior research clearly shows how human capital influences various entrepreneurial outcomes such as start-up decision and penetration through early stages, survival of new business, growth, and performance (Davidsson and Honig, 2003; Bates, 1990). Human capital is operationalized in many different ways but traditionally it has involved some measures of education level and experience (Dyke et al., 1992). Previous results show that education, both formal general education and specific entrepreneurial training, increases entrepreneurs’ likelihood to perform well. By contrast, empirical results reflecting the impact of practical experience on entrepreneurial performance are mixed. For example, despite a seemingly intuitive practical connection, results have not demonstrated an impact for management on entrepreneurial survival (Bates, 1990). Industry experience, on the other hand, does appear to have a positive impact on entrepreneurial performance (Brush and Hisrich, 1991). Empirical results regarding start-up experience are somewhat mixed though
there is increasing evidence that it plays a critical role in facilitating persistence during the early stages of venture creation (for example, Davidsson and Honig, 2003).

Traditionally, human capital has been approach from an objective point of view, focusing on variables that are often measurable independent of individuals’ own perception. We argue further that individuals’ own perception of their human capital also plays an important role in start-up decisions. Specifically, we argue that individuals develop a sense of self efficacy (Bandura, 1977) based on a combination of their genetic predisposition and cumulative personal experience. Self-efficacy represents an individual’s belief in his or her capability of organizing and effectively executing actions to produce outcomes. Accordingly, it reflects an important aspect of an individual’s internally oriented knowledge base. Research has suggested that entrepreneurs possess higher levels of self-efficacy than non-entrepreneurs (Boyd and Vozikis, 1994) though extant research has not explicitly focused on the relationship between self-efficacy and nascent entrepreneurial decision making (Schenkel, 2005). Given the limited yet growing evidence, we argue that self-efficacy will positively influence the decision to enter the new venture creation process.

Hypothesis 2: Human capital, measured as a) formal education, b) start-up experience, and c) self-efficacy, is positively related to individuals’ likelihood to enter the nascent new venture creation process.

Social capital is the potential value embedded within and that individuals obtain from their social structures, relationships, memberships, and networks (Burt 1992). The value may take many different forms but traditionally include information, legitimacy, trust, and emotional support. Conventional wisdom suggests social relationships and networks positively influence entrepreneurial performance (Singh, 2000), but debate continues as to which kinds of relationships and network structures are most influential. For example, from a resource-based perspective, it has been argued that relatively many weak ties and a network structure with
many structural holes among heterogeneous actors are more likely to “bridge” sources of otherwise non-redundant information. By contrast, it has been argued that relatively many strong ties and close homogenous network structure provide entrepreneurs with the necessary sensitive information, trust and emotional support, or “bonding” resources, less likely to be obtained from weak ties and diverse networks (Davidsson and Honig, 2003).

Although debate persists as to the kind of network relationships and structures that are productive in the start up process, empirical results have consistently shown that people embedded in networks containing individuals with entrepreneurial experience tend to be more entrepreneurial oriented themselves. Specifically, people who have close family members in business or personally know someone who has started a business (Klyver et al., 2008) seem to have a greater probability of becoming entrepreneurs.

Hypothesis 3: Social capital, measured as whether or not an individual personally know someone who have started a business in the past two years, is positively related to individuals’ likelihood to enter the nascent new venture creation process.

The ‘use’ approach to resources

The hypotheses above follow the traditional ‘access’ approach, an approach which is derived from the basic idea is that access or availability of resources is essential – the more the better. One implication of such an ‘access’ approach is that it has led to the effects of financial capital, human capital and social capital being investigated independently. However, we argue it is not only the access to resources or independent availability of resources that matters but also how they are combined and used together that impacts the decision to enter the new venture creation process.

The lack of attention directed toward ‘use,’ or the interaction among the capital sources in entrepreneurship research, is surprisingly for at least two reasons. First, sociologists for decades have discussed the interplay between various capitals. Bourdieu (1986), for instance,
theorized about social capital’s effect on human capital, arguing that inherited social capital produces human capital. Coleman (1988) followed Bourdieu’s argument with his empirical investigation of how social capital of parents supports the human capital development of their children. In a more practical vein, Greve et al. (2006) argued that individuals need human capital in order to take advantage of social capital. Others have argued the directionality of causation between human and social capital is reversed (Boxman et al., 1991). In total, sociologists work suggests that although the causality question remains unsettled, human and social capital seem to be closely interrelated in their production.

Second, in social capital theory it is conventional wisdom that certain actors might be redundant if they provide resources already accessible through other contacts (Burt, 1992). Extrapolating this logic to the three capitals, one implication is that different capitals might be compensatory in nature. For instance, financial capital may offset the lack of personal human capital if the entrepreneur has financial capital that can buy the same expertise. Consequently, it seems reasonable to argue that human, social, and financial capitals in many situations depend on each other.

Given these reasons, we argue that one fruitful avenue for advancing entrepreneurship research is to examine the interplay among the three capitals and its respective influence on entrepreneurial outcomes. This interplay between capital resource types can reflect a ‘use’ characterized in one of three different ways: complementary, substitution, or neutral.

The first is a complementary use. A complementary use prevails when capital forms are utilized as co-productive mechanisms that reinforce one another’s influence in the same way. Mosey and Wright’s (2007) study of technology-based academic start-ups reveals that entrepreneurs with prior business ownership experience have broader social networks and are more effective in developing network ties is an example of a complementary influence. It suggests that ownership experience may have a complementary impact on efforts designed to
foster the development of entrepreneurial opportunity (Ardichvili, Cardozo, and Ray 2003).

Ottosen and Klyver’s (forthcoming) study of entrepreneurs also showed how human and social capital can be co-productive in the sense that entrepreneurs’ education level and self-efficacy increase social capital in form of network size.

The second use is substitution oriented use. A substitution use prevails when capital forms are utilized as alternatives to one another. In entrepreneurship studies, the substituting mechanism is consistent with Brüderl and Preisendörfer’s (1998) ‘network compensation hypothesis,’ a hypothesis which suggests that social capital is sometimes employed to compensate for shortcomings in human capital. In addition, the substitution is also consistent with Piazza-Georgi (2002) study arguing that since individuals only have limited time available, investments in human capital leads to loss in social capital.

The third use is a neutral one. A neutral use is one in which no interplay takes place between capital forms. In other words, the capital forms are neither complementary nor substitute for one another. This use reflects the ‘more capital is better’ assumption that has implicitly underpinned in the traditional ‘access’ approach (Davidsson and Honig, 2003).

A ‘use’ approach suggests the independent effects must be analyzed together with the interplay among the capitals in order to provide an understanding of how each potentially serves as complementary and substituting mechanisms. Following a ‘use’ approach, we argue that the effect of social capital depends on both financial and human capital.

Hypothesis 4: The association of social capital and the entry to nascent entrepreneurship is moderated by financial capital.

Hypothesis 5: The association of social capital and the entry to nascent entrepreneurship is moderated by human capital.

Gender differences
Gender differences are increasingly the subject of discussions in entrepreneurship research. Most gender research in entrepreneurship is trying, from different theoretical perspectives and angles, to explore and understand if, and how if so, females adapt practices throughout the entrepreneurial process that are different from those of males. Bird and Brush (2002) suggest that the literature on new venture creation is often “cast within a masculine gender framework” (p. 41), highlighting the question of if, and how if so, females are disadvantaged as entrepreneurs as one question of particular interest. A large proportion of this gender differences research stream deals with the three capitals.

With regard to financial capital often essential for starting a business, prior empirical research suggests that women might be at a disadvantage compared to men due to lower income or less accumulated personal savings (Bhide, 1992). Research also suggests women entrepreneurs often use different financial strategies than men, and that such strategies may have a limiting influence on their entrepreneurial efforts (Carter and Rosa 1998). For example, despite sharing similar funding perceptions, evidences suggests that women tend to draw from personal savings and establish loans with friends and family to a greater extent than men (Brush, 1991), which could have a limiting impact on the scale of growth efforts.

Human capital research also clearly suggests men and women enter entrepreneurship with different human capital (Brush, 1992). For example, some find that women entrepreneurs have less education than men (Boden and Nucci, 2001) though others find that women entrepreneurs have similar or higher education levels (Cowling and Taylor, 2001). Research clearly suggests women entrepreneurs also have different professional experiences before they enter the entrepreneurial process than their male counterparts. Prior empirical studies show that women often have less well paid job before they become self-employed (Boden and Nucci, 2000), in different areas and often less helpful future self-employment (Fischer, Reuber,
and Dyke, 1993), and are less likely to have start-up experience (Cromie and Birley, 1992) and industry experience (Fischer, Reuber, and Dyke 1993).

Finally, with regard to social capital there also seem to be gender differences. Although empirical results remain inadequate for drawing robust conclusions, some common themes have emerged. The most strongly observed difference is that female entrepreneurs seem to have a higher proportion of female contacts in their social networks compared to their male counterparts (Cromie and Birley, 1992). Female entrepreneurs also appear to rely more heavily on family relations (Schenkel and Matthews, 2009). Due to these prior gender differences, we expect that the association between financial capital, human capital, social capital, their combinations, and the entry to nascent entrepreneurship varies across gender.

*Hypothesis 6: The association between financial capital, human capital, social capital, their combinations, and the entry to nascent entrepreneurship varies across gender.*

**Methodology**

**Data and Sampling Method**

The data for this study were collected as part of the international project, Global Entrepreneurship Monitor (GEM). GEM was initially launched in 1999 with ten participating countries and each year the number of participating countries has grown. Participating nations complete an annual GEM National Population Survey. The survey engages a minimum of 2,000 randomly selected adult respondents who are asked a variety of questions regarding both their engagement and attitude towards entrepreneurship. The goal of the GEM project is to examine how entrepreneurial activity varies across countries; what makes a country entrepreneurial; and how entrepreneurial activity affects a country’s rate of economic growth and prosperity.

The GEM project has generated an extensive database on a wide range of issues and factors germane to entrepreneurship worldwide. Its use in this study is compelling for two
reasons. First, the underlying data collection method of the GEM project is to collect information from a nationally representative sample of adults in various countries. Though some degree of difference in respondent accessibility and small sampling variations do exist, the overall number of participating countries does enhance the generalizability of research based on its use, and particularly for questions focusing on the nascent stages of the new venture creation process.

The total number of useable GEM respondents in the 41 participating countries over three years (that is, 2002-2004) is 203,501 people. Approximately five percent, or 9,257 individuals, were classified as entrepreneurs. In 2003, the countries involved counted for 90 percent of the world’s GDP and covered 60 percent of the world’s population (Klyver, 2008). There is a contentious discussion in the entrepreneurship research concerning the definition and operationalization of entrepreneurship. Focusing on individuals’ entry to nascent entrepreneurship, we follow the emergence perspective (Gartner, 1993). Table 1 presents the variables employed in this study and their respective coding.

----------------------------------
Insert table 1
----------------------------------

**Analytical strategy**

Data analysis utilized descriptive analysis followed by hierarchical logistic regressions in order to test the hypotheses. Control variables - gender, year of survey and country - were included to establish a baseline model (model 1 in regression results) though the coefficients for year of survey and country are not reported in the tables. The main effects of financial, human and social capital were added next in model 2 and interaction effects in model 3. The interaction effects in model 3 test whether gender differences prevail on the effects of financial, human and social capital on individuals’ likelihood to entry nascent entrepreneurship on a sample containing both men and women. The interaction effects in model 4 test,
regardless of gender, the combined effects of the three capitals on individuals’ likelihood to entry nascent entrepreneurship. Finally, the interaction effects in model 5 and 6 test respectively the combined effects of capitals on individuals’ likelihood to entry nascent entrepreneurship for men (model 5) and for women (model 6). The omnibus tests of model coefficients are significant for all models in all tables, indicating that there is an adequate fit between data and the model. Nagelkerke $R^2$ was employed as a measure of variance explained. The Nagelkerke $R^2$ increases successively going from model to model with the highest increase between model 1 and model 2 in all tables.

**Empirical results**

Table 2 reports variable means, standard deviations and zero-order correlations among the variables in our study. The dependent variable, nascent entry decision, is significantly positive correlated respondent age. Those individuals between 30 and 49 years old were compared to those younger than age 30, with respondents’ household income, education level, prior start-up experience, self-efficacy, and respondents having entrepreneurs in their networks. A significant negative correlation prevails with respondents being females. The highest correlation among the variables is 0.300, a finding which suggests multicollinearity is not a threat to the interpretation of the findings.

To what extent does human, financial, and social capital each influence the decision to create a new venture independently? Table 3 (model 1-3) presents the hierarchical logistic regression predicting individuals being nascent entrepreneurs in the full sample. Model 1 shows that females are significantly less likely than males to enter the new venture creation process (p<0.001). It also shows that individuals between 30 and 49 years old are significantly more likely (p<0.001), whereas individuals 50 years old and older are less likely to enter the
new venture creation process, than individuals below 30 years old (p<0.001). Model 2 shows that financial capital in the form of household income has a significant negative impact on individuals’ likelihood to enter nascent entrepreneurship. Individuals in the middle 33 percentile household income (p<0.05) or in the highest 33 percentile household income (p<0.001), compared to those in the lowest 33 percentile, are less likely enter the new venture creation process. The negative correlation is, however, strongest for individuals belonging to the highest 33 percentile. Thus, hypothesis 1 is not supported.

Turning attention to human capital, education level, prior start-up experience, and self-efficacy are all significantly positively correlated with individuals being nascent entrepreneurs. Possessing some secondary (p<0.05), secondary (p<0.01), post secondary (p<0.01) or graduate experience (p<0.001) compared to non secondary education is positively correlated with entry into nascent entrepreneurship. The strength of the correlations increase as the level of education increases. Individuals with prior start-up experience are also more likely to entry nascent entrepreneurship (p<0.001), as are individuals with higher self-efficacy (p<0.001). Self-efficacy has the strongest association with individuals being nascent entrepreneurs among human capital variables considered, providing support for hypothesis 2. Similarly, model 2 supports hypothesis 3 in that individuals with entrepreneurial networks are more likely nascent entrepreneurs (p<0.001). We will return to the results obtained in model 3 focusing on the interaction effects when the results regarding gender differences are discussed (hypothesis 6 – models 4 and 5).

Does the influence of social networking on the decision to create a new venture depend upon the level of human and/or financial capital? Model 4 tests whether the association of social capital and entry to nascent entrepreneurship depends on human and financial capital. It
shows that the relationship between having entrepreneurs in one’s social networks and entry to nascent entrepreneurship is not moderated significantly by education level. However, it does show that the relationship is moderated positively by both experience and self-efficacy. Specifically, results show that possessing start-up experience and having entrepreneurs in one’s network weakly differentiates those who enter nascency and those who do not (p<0.001). Results also show that for high self-efficacy and having entrepreneurs in one’s network weakly differentiates between those who enter nascency and those who do not (p<0.001). In sum, results in table 3 show the association between having entrepreneurs in one’s social network and being nascent entrepreneur is moderated by both start-up experience and self-efficacy but not education level, providing partial support for hypothesis 4. Having entrepreneurs in one’s social network and being nascent entrepreneurs does not appear to be moderated by household income. Consequently, hypothesis 5 is not supported.

Are the capital influences proposed to influence the decision to create a new venture consistent across men and women? The present results suggest they are not. Model 5 and model 6 include similar regressions as those outlined in model 4 but on splits samples of men (model 5) and women (model 6). Models 5 and 6, together with the interaction effects in model 3, are employed to test hypothesis 6. Model 3 shows first that the association between start-up experience (p<0.001) and self-efficacy (p<0.05) is stronger for women than for men. The capital interaction effects are compared between men and women in model 5 and 6. Model 5 and 6 show that for men and women, the association between having entrepreneurs in one’s social networks and being nascent entrepreneur is negatively moderated by start-up experience. However, the results suggest a gender difference does exist with regard to self-efficacy as a moderator. Specifically, the association between having entrepreneurs in one’s social networks and being nascent entrepreneur is negatively moderated by self-efficacy for women (p<0.01) but not for men. In short, we found certain gender differences with respect to
the association of capital, its combinations, and the decision to engage in the nascent entrepreneurial. Accordingly, hypothesis 6 received only partly support.

Discussion & conclusion

The purpose of this study was to move the discussion of effects of capital, including financial, human, and social capital, away from only an access approach towards a use approach. We have argued and empirically shown that it is not only the access to resources that matters for entrepreneurial decision-making, but also how these resources combine in their respective use. Previous research taken the access approach has investigated the isolated effects of capitals on different outcome variables. In addition to investigating main effects suggested by the access approach, we added interaction effects of capital on the entry to nascent entrepreneurship. By doing this we moved the discussion away from a narrow and static access approach toward a broader and more dynamic use approach.

Our empirical results concerning the main effects reflective of the access approach failed to offer support hypothesis 1. In contrast, we found support for hypothesis 2 and 3. Specifically, and contrary to what we hypothesized, financial capital was negatively correlated with entry to nascent entrepreneurship. Several reasons may account for this finding. First, individuals with high household income presumably have relatively good jobs that might present positive job challenges and private financial security. Thus, many might simply prefer to stay in their existing jobs. It may be that the positive impact of household income only comes into existence after people already are considering starting a business. At this stage, having personal savings generated through high household income might improve the successful start-up process. Second, we have analyzed a very diverse sample of individuals living in different societies. Although, we have controlled for country differences, the extant literature suggests that financial capital enhance entrepreneurial activities is mainly literature focusing on developed countries. In these countries, entering entrepreneurship is often an
opportunity-based behavior. However, in less develop countries entering entrepreneurship is more often a necessity-based behavior – individuals have no other choices in order to survive. In circumstances where entry necessity-based, it makes sense that the household income would be low as found in this study.

With regard to human capital, we found that education level, start-up experience, and self-efficacy are all positively associated with individuals’ likelihood to enter nascent entrepreneurship. We also found that with regard to social capital, individuals having entrepreneurs in their respective social network are more likely to enter nascent entrepreneurship than those individuals without entrepreneurs in their network are.

Applying the use approach, we investigated how social capital’s association with financial and human capital variables moderated entry to nascent entrepreneurship. For the full sample (both men and women), we found that the benefit with regard to the entry decision of belonging to a network with entrepreneurs prevails regardless of individuals’ level of education and household income. The level of education and household income neither reduced nor increased the benefits of belonging to an entrepreneurial network.

However, belonging to a network with entrepreneurs is less beneficial if an individual has start-up experience or if the individual is comfortable with their own start-up capabilities. Thus, the benefits obtained from networking are reduced in these situations, likely reflecting the redundancy of resources already possessed. However, the result showing that the benefits of networking are reduced with regard to the entry decision when individuals have high self-efficacy is only true for women. Men seem to benefit from networking regardless of their level of self-efficacy. This suggests that women and men use their network differently. Specifically, it suggests that women potentially increase self-efficacy through role models their networking activities generate, while men do not seem to gain self-efficacy from networking and may search for other resources such as knowledge and capabilities. These results are
consistent with previously research on how women and men interact with other people. Women often are more likely to receive and provide more soft and emotional resources, such as self-efficacy, whereas men are more likely to receive and provide more instrumental resources, such as knowledge and experience.

Collectively, the present study reinforces the importance and need for research that focuses on understanding how exploring capital specificity can lead to new insights into the evolutionary aspects of the venture creation decision (Mosey et al., 2007), thereby moving away from a more traditional static focus on independent influences and toward a focus that is more dynamic and focused on interactive influences. To early stage entrepreneurs, this study implies that the value or benefit of obtaining different resources from networks depends on whether or not these resources are already available to the individual and whether the individual are capable of making use the resources.

Although the current study benefits from the use of representative sampling and the inclusion of participants in 41 countries, we acknowledge two major limitations. The first limitation is that the study includes single item measures of concept such as experience, self-efficacy and entrepreneurial network that would benefit from a more sophisticated measurement using a multi item measure. A second limitation of the study is that in the absence of a longitudinal design it is impossible to rule out a reversed causation explanation for some of our findings. For instance, we found with regard to human capital that people who report self-efficacy are more likely to be nascent entrepreneurs themselves, with the inference having self-efficacy enhance the entry decision. However, it may be the case that having entered nascent entrepreneurship simply increases the odds of having self-efficacy. Thus, a clear antecedent variable cannot be identified.

Looking for a Better Tax Design to Reduce Regulatory Burden of Small Business in Pakistan

Najeeb Memon, The Australian School of Business, University of New South Wales Sydney.

Abstract

Income tax imposes high compliance costs on small business in developing countries. As a result, small businesses tend to operate informally and consequently deprive an economy of their innovative contributions. The government also fails to generate lawful revenue. Thus, Presumptive Income Tax (PIT) is recommended in order to reduce compliance burden and collect optimum revenue. PIT creates a win-win situation for both small businesses and the government. Whether PIT has achieved this aim in real life is yet unclear. The analyses of the Pakistani PIT in this regard finds that being turnover-based design it has been failed to reduce compliance burden and collect optimum revenue.

1. INTRODUCTION

The high compliance cost of income tax, which arises from the requirement of bookkeeping and the complex tax code, is a problem in its implementation in developing countries (Tanzi, 1991, p.205). Small businesses, which are often referred as an engine of economic growth, find it difficult to cope with its compliance requirements. Such difficulties discourage small businesses to register with tax authorities and operate in the formal sector (IFC, 2007). Therefore, most small businesses operate informally under a constant fear of being caught, and cannot achieve the benefits of the formal sector. Additionally, such small businesses are unable to contribute to the economic growth of country.

Small businesses in developing countries usually operate on a much smaller scale than ‘small’ businesses in developed economies which makes income tax implementation more difficult in developing countries Even the use of simplified regular income tax
regimes may not help, because such regimes still require maintenance of accounts, which is a prerequisite for determination of income. Consequently, compliance costs remain high.

Therefore, designing an optimal income tax regime for small business, which constitutes a major component of informal economy, is a hard task (Stern and Barbour, 2005, p.4). There are international initiatives suggesting taking into account the needs of small business in order to facilitate their integration into formal sector (OECD, 2004). The driving concept behind these initiatives is ‘Think Small First’ (European Union, 2006).

As a result, policy makers are justified in looking for proxies of income which are easy to determine and can reduce the compliance costs. These drastic departures may encourage small businesses to move to the formal economy and avail benefits of operating formally such as access to finance (Stern and Loeprick, 2007, p.11). This will also allow tax authorities to tap tax potential of small business sector (Alm et al, 2003, p.48). This is a win-win situation both for tax authorities and small business.

When proxies of income are used to collect income tax, this tax is called Presumptive Income Tax (PIT). On recommendations of donor agencies such as the World Bank, PIT is being used in most developing countries across the world to tax small business in large informal economies (Engelschalk, 2005, p.2).

However despite its massive use and theoretical superiority, there is no evidence that whether PIT helps small business to comply by reducing its costs or not. Therefore, this paper analyses Pakistani PIT regime for its ability to reduce compliance burden and revenue collection.
The paper proceeds as follows. Part 2 reviews literature regarding tax compliance costs for small businesses. This part also mentions that how tax administration view small business in terms of their compliance. Finally, this part suggests PIT as a sensible compromise between these two players of revenue administration. In Part 3, Pakistani PIT system is analysed for achieving the compromise. Lastly, Part 4 concludes this paper.

2. HIGH COMPLIANCE COSTS: A LOSS FOR SMALL BUSINESS AND TAX ADMINISTRATION

Regarding tax as a burden on small business, both tax authorities and small business generally have conflicting positions, which need to be reconciled on logical basis. A brief in this regard follows below.

2.1 Small Business and Income Taxation

Tax is considered as a major barrier to small business operations in many countries because it is the only interface small entrepreneurs have with the government (Stern and Barbour, 2005, p.4). When compared to other taxes, income tax is commonly blamed for the hardships faced by small businesses, because many small businesses fall outside the ambit of indirect taxes. For example, in Pakistan, 84% of enterprises have annual sales below PKR 0.5m (see Khawaja, 2006, p.2) (equivalent to A$8,000) which is within the exemption threshold of General Sales Tax (GST).

For small businesses, the income tax compliance burden is considered as a strong demotivating factor to comply with tax requirements. Many studies approve this view. For example, in Bulgaria, small businesses consider tax burden as a major impediment in their expansion. In New Zealand, 41% of total compliance costs are
linked to tax compliance (KPMG, 2006, p.35). Similarly, in Pakistan, 67% of small businesses perceive tax regulation as the most problematic in carrying out business activity (SMEDA, 2006, p.7). Even some statistical studies confirm a positive correlation between taxation and the informal economy (Schneider, 2000).

Moreover, the impact of compliance costs is higher on small businesses because small businesses face ‘inverse economies of scale’ in relation to these. It takes an equal amount of time to register and pay income tax on profits of $1 million as it does for $100 (Stern and Barbour, 2005, p.3). In other words, compliance costs are regressive and put a disproportional burden on small businesses (see IFC, 2007, p.3; Evans, 1996, p.2; Sandford and Hasseldine, 1992). A study for Slovenia found that compliance costs are 0.08% and 3.73% of gross turnover for large and small businesses respectively (Klun and Blazi’C, 2005, p.418). For regressivity of tax compliance costs, small businesses are more vulnerable to suffer by them.

For detailed discussion, the taxation burden for small business is bifurcated into the administrative and technical compliance costs (OECD, 2001, p.3).

2.1.1 Administrative Compliance Costs: Administrative compliance costs are defined as costs borne by taxpayers that are over and above the tax liability and costs arising from tax related economic distortions (Sandford, 1995). These costs primarily arise from complying with administrative rules and include reporting compliance such as book keeping (OECD, 2001, p.3).

A complex tax system, which increases the costs to comply statutory obligations, is regarded as ‘one of the main reasons’ towards non-compliance and to operate in the
informal sector (Schneider and Hametner, 2007, p.8). Shome (2004, p.6) also holds that high administrative compliance costs discourage businesses to become formal.

More specifically, Khawaja (2006, p.9) argues that cost constraints related to maintenance of accounts and to hire a tax agent makes tax compliance quite difficult for small businesses. He further mentions that maintaining accounts by sole proprietors of small business is beyond their capacity because they do not have sufficient accounting skills. More simply, small businesses, which are already struggling to survive, are reluctant to maintain financial accounts (SMEDA, 2005, p.13) and prefer to remain informal.

Cuccia and Cames (2001, p.133) however, disagree by arguing that compliance behaviour of taxpayers is driven by the economic benefits of operating informally, rather than the complexity of the tax system. Thus, in the case where a complex provision yields benefits, the taxpayer would comply with it. In contrast, a simple provision which does not provide an economic benefit would not be complied with. However, this latter view may not be true for small businesses which neither have the knowledge nor resources to capitalize on complex tax saving provisions in tax code.

A number of studies have been conducted to identify the constituents of administrative compliance costs in developed countries. However, the analysis of administrative compliance costs is scant in developing countries. A study in Malaysia found bookkeeping, both in terms of time and money spent, to be the major compliance cost in personal income taxation (Sapiei and Abdullah, 2008, p.228). In India, a recent study identified audits, book keeping and return filling as the highest of all compliance costs (Das Gupta, 2001). Another study in India in respect of personal income tax revealed that ‘record keeping and advisors fees form the bulk of costs for
non-salaried individuals’ (Das Gupta, 2003, p.10). In terms of total income, compliance costs are equivalent to 6.8% of gross income of non salaried taxpayers (Das Gupta, 2003, p.10). More specifically, record keeping, in terms of ‘time compliance’ costs, was Rs.27000 per annum for non-salaried taxpayers (Das Gupta, 2003). Further, the compliance costs were double the tax liability itself and these costs for non-salaried persons are 7-10 times higher than those of salaried persons (Das Gupta, 2003)

Moreover, the compliance burden arising from administrative requirements is relatively higher for small businesses in developing countries than the developed ones. For example, the free record keeping software offered by tax agency in Australia is relatively very expensive for small businesses in developing countries, because such software requires computer systems and an operator (National Audit Office Report, 2008). More aptly, the cost of a computer (i.e. approx $1000) is proportionately very high for a small business of Pakistan with turnover of approximately $6,000, than a micro business of Australia with turnover 2.0 million. It is reported as a significant hurdle for small business in Australia (Board of Taxation report, 2007, p.57).

To put it differently, a taxpayer in a developing country, for example in Pakistan falling in the lowest taxpaying bracket (i.e. taxable income of PKR 100,000 to 110,000 (equivalent to A$1,571)) is liable to pay tax rate of 0.5%. The resulting tax liability stands at approximately PKR550 (A$8). Even up to taxable income of PKR 300,000 (equivalent to A$4,286) the tax payable stands at PKR 15,000 (equivalent to A$214), which is less than the cost of keeping accounts. The cost of tax agents to file

---

1 Under Rule 29 and 30 of Income Tax Rules of 2002 (Pakistan), every taxpayer having income from business and profession is required to keep books of accounts. Taxpayers above income of PKR 200,000 (equivalent to A$2857) are required to keep cash book and ledger and other records.
the tax return is over and above the bookkeeping cost. Even in Australia, with high literacy rates, 95% of small businesses file income tax returns through tax agents because of the perception that lodgement of returns require specialist knowledge (Board of Taxation Report, 2007).

More simply, the impact of compliance costs depends on the level of turnover and income which varies a country to country. Therefore, small businesses in developing countries, due to their low turnover, should be subjected to less administrative compliance burden.

Besides the above, a high compliance burden influences tax morale which is a driving force for tax compliance. ‘Tax morale’ is the intrinsic motivation to pay taxes (Schneider and Torgler, 2007a, p.12), and evolves from the perception of individuals about the social, political and economic system. With this in mind, when small businesses are required to maintain accounts at a cost equivalent to 7% of their income, which is even higher than the tax liability in many occasions, it is naïve to expect voluntary compliance.

2.1.2 Technical Compliance Costs: These types of costs are primarily those which arise from payment of taxes computed in accordance with the provisions of tax code (OECD, 2001, p.3). The burden arising from high tax rates has a direct bearing on well being of small business.

Studies show that the tax rates influence the decision of a small business to operate formally or informally. Cebula (1997) found that if the marginal personal income tax rate increases by one percentage point, the shadow economy rises by 1.4 percentage
points. Consequently, there is a strong case for low tax rates in a tax system for small business.

2.2 Government’s View of Small Business Compliance

Tax authorities in developing countries consider non compliance by small business dominated informal sector as a major hurdle in revenue collection. The average size of the informal economy in Africa, Asia, South America, the OECD and transitional European countries is 41%, 26%, 41%, 18% and 38% respectively (Schneider, 2000). Tax administrators use the informal economy estimates as a proxy for hard-to-tax taxpayers (HTT) (Alm et al, 2003, p.4). Small businesses constitute major part of the informal economy and inter alia, the HTT sector (see IFC, 007, p.3; Alm et al, 2003, p.4).

The level of noncompliance by small business can also be gauged by comparing the total number of businesses with the registered ones in a country or by comparing the registered businesses with the total population. For example, in Rwanda, out of 70,000 micro and small enterprises, only 1,000 are registered with the tax authority. In Philippines, registered VAT taxpayers constitute 0.32% of the total population (IFC, 2007, p.5).

In view of the above, tax administrators believe that a large component of total economy escape taxation in the form of the small business sector (Taube and Tedesse, 1996, p.3), and such non-compliance deprives the state of lawful revenue (Alm et al, 2003, p.20). The low direct Tax to GDP ratio in developing countries as compared to developed ones evidently endorses this view. For instance, direct tax to GDP ratio is 7% in the sub-Saharan but 22% in industrial countries (Auriol, 2005, p.626).
As a result, tax administrations in some developing countries have resorted to more stringent enforcement measures such as high penalties. However, persistence of large informal sectors there show that such a strategy has been failed. Moreover, a large group of studies (such as Alm et al, 1992, p.12) disagrees with Allingham and Sandmo’s (1972, p.337) view that non-compliance is negatively correlated with the probability of detection. This is evident by high compliance level in developed countries, despite the low level of deterrence. Fjeldstad (2003, p.24) also states that it has proven difficult to apply the tax law with full force in the developing countries. Therefore, from the tax administration perspective also, measures of improving tax compliance through reducing the tax burden may have more value than stringent enforcement.

2.3 Use of PIT: A sensible Compromise

Keeping in mind the facts discussed in Part 2.1 and Part 2.2, it is inferred that it is ‘just not possible’ to tax small taxpayers for actual income in developing countries (Tanzi and Casanegra, 1987, p.15; Makedonskiy, 2005, p.4), because the high compliance costs linked with the bookkeeping discourages small business to keep them (Yitzhaki, 2006, p.10).

Further, the principle of cost effectiveness in financial reporting, which says that ‘the financial information should not be obtained at a cost higher than the value of the decision under consideration’, supports small business’s decision of noncompliance (Atrill, 2002). This decision may appear logical particularly when cost of keeping accounts for determination of income is higher than tax liability and accounts are not needed for any other purpose.
Further, small businesses even under the regular regime do not maintain accounts and therefore often suffer adverse consequences of amended assessment if selected for audit (IFC, 2007, p.57). Moreover such amended assessments are a form of administrative PIT based on some production and outward indicators. Moreover, such an evidence of non maintenance of accounts also suggests ‘the elimination of book keeping associated with regular tax (Faulk et al, 2006, p.13)’. More simply, small business should be exempted from maintaining accounts in order to reduce the compliance burden (Christian and Jaramillo, 2004, p.3).

PIT in such a situation can have dual advantages. First, it shall collect some revenue, which otherwise might not have been possible and consequently create a perception of fairness in a tax regime. Second, it may save small businesses from undue time, psychological and monetary costs of compliance and give them a feeling of being governed fairly.

In view of the above, income tax need not to be applied to a well defined and precisely measured concepts of the income (Tanzi and Casanegra, 1987, p.1; Slemrod and Yitzhaki 1994, p.32). On the contrary, the potential source of revenue of small taxpayers may be harnessed by simplifying income tax to greatest possible extent (Shome, 2004, p.7). Policy makers are therefore justified to use PIT, which will reduce compliance costs and help the tax administrators to collect revenue. These drastic deviations are also acceptable for encouraging small business to operate formally and help in economic growth (Stern and Loeprick, 2007, p.2). PIT is endorsed as an alternative under the premise that ‘near enough is good enough’ for the successful implementation of income tax (Burn, 2003, p.217) and promoting growth through facilitating small business.
However, the use PIT for small business in developing countries should be subject to two conditions. First, some businesses even small due to their specific characteristics such as ability to keep a record of their activities should be excluded from PIT regime (Engelschalk, 2005 p.11, 13). For examples, accounting firms, drug stores and foreign exchange dealers, etc. Second, PIT may be allowed in the short to medium term ‘as a stepping stone’ (Wallace, 2002, p.1) and subsequently transition to ideal regular tax (Shome, 2004, p.17) be supported for meeting most of principles of a good tax.

3. DOES PIT IN REALITY ACHIEVE THOSE OBJECTIVES IN PAKISTAN

As mentioned earlier, on recommendations of donor agencies such as the World Bank, PIT is being used in most developing countries across the world to tax small business (Engelschalk, 2005, p.2). However despite its massive use, there is a no confirmation that whether PIT achieves earlier win-win situation. Engelschalk (2005, p.27) argues that PIT designs in many countries are not easy to comply and therefore have high compliance costs. Whether this is true in respect of author’s home country’s PIT legislation or not, this paper analyses Pakistani PIT regime for its ability to reduce compliance burden and revenue collection.

3.1 Pakistani PIT for Informal Sector

The Income Tax Ordinance of Pakistan 2001\(^2\) contains a number of PIT provisions, which tax professional and business income of both non-corporate entrepreneurs and corporate entrepreneurs. Most small businesses in Pakistan are non-corporate entities, which are required to comply with more than one of these provisions depending upon the nature and scope of their activities.

\(^2\) The bare legislation is available at [www.fbr.gov.pk](http://www.fbr.gov.pk).
A summary of these provisions is given below.

3.1.1 Sections 153, 156A, 234, 234A and 205 read with Section 169

The receipts of small business from supply of goods\(^3\), execution of contracts\(^4\), provision of services\(^5\), sale of compressed natural gas (CNG) & petroleum products and brokerage & commission is liable to withholding tax under s 153, 234A, 156A and s 205 respectively. The tax so deducted is final discharge of tax liability under legal PIT enacted through the deeming provisions which are contained in the section 169(1).

Any taxpayer with these activities is only required to file a single page statement along with the ‘certificate of WHT deduction’ or ‘tax payment receipt’ under ss 115(4). This regime also does not envisage maintenance of accounts by taxpayers and tax audit by tax administrator.

However, it is noted that linking PIT with WHT has complicated the compliance requirement for the following reasons. First, since corporations, registered firms and Associations of Persons (AOPs) are the statutory WHT agents hence only those transactions of small business can suffer from withholding tax which are executed by them with the WHT agents. Thus, small business usually transact with each other (i.e. informal sector) to avoid withholding tax and consequently being taxed under PIT regime.

---

\(^3\) Section 153 (9) provides that in this section “sale of goods” includes a sale of goods for cash or on credit, whether under written contract or not

\(^4\) No definition is provided in the tax code, which is the centre of ambiguities in the regime

\(^5\) Section 153 (9) provides that in this section, – “services” includes the services of accountants, architects, dentists, doctors, engineers, interior decorators and lawyers, otherwise than as an employee.
When small business does not transact with the WHT agents (who predominantly operate in the formal sector), then it does not suffer from WHT and consequently fall within the ambit of regular tax. Under regular regime, small business is required to file their return under s 114 and is assessed in Universal Self Assessment Scheme (USAS) under s 121. A return filed under s 114 is liable to audit and small business has to prove the veracity of the declared version by keeping the accounts. Consequently the taxpayer is exposed to all complexities of ITO 2001 and the compliance costs increase enormously, which discourage compliance.

Second, when only a part of transactions of a taxpayer suffer WHT and fall within PIT, then his/her remaining transaction are taxable the regular regime. In this scenario operating expenses would be apportioned to each of its parts for determination of taxpayer’s profits. The allocation method is prescribed in s 67 read with Rule15 of Income Tax Rules 2002.

The method of allocation of the costs requires the accounting information of business. Consequently, such a taxpayer has to keep accounts for both of its activities. Moreover a taxpayer with hybrid activities has to file both a return and a statement and is also liable to audit by tax authorities.

3.1.2 Sections 148 and 154 read with Section 169

When a person makes commercial imports and exports its receipts are going to be subjected to the WHT under s 148 and s 154 respectively. The Customs Department and banks are the WHT agents for this most documented economic sector. The tax so deducted is final discharge of tax liability under legal presumption, which is enacted through a deeming provision contained in ss 148(7), 154(4) and 169(1).
For incomes from any of these activities, a taxpayer is only required to file a single page statement along with a ‘certificate of WHT deduction’ or ‘tax payment receipt’ under ss 115(4). This regime does not envisage the maintenance of accounts by taxpayers and audit by tax authorities.

It is noted that when only part of the transactions fall under any of the preceding WHT based PIT then the taxpayer suffers from similar hybrid tax treatment as mentioned in the preceding section. Consequently the compliance costs increase enormously.

3.1.3 Tax on retailers under Section 113B

Retailers, which are organized as sole proprietor or Association of Persons (AOP), can avail the option of paying tax @ of 0.75 of the turnover (as prescribed in Div. IA of Part I to Schedule I of the Ordinance) under s 113A. Similar retailers having turnover of more than 5.0 million rupees is liable to tax @ of 1% of the turnover under the s 113B. Both payments are the final discharge of tax liability. The retailers are required only to file a statement under ss 115(4).

3.1.4 Widespread WHT Regime

Besides the above withholding taxes, which fall within ambit of PIT regimes, small business is also liable to WHT, when they transact with prescribed WHT agents, in respect of many other activities under various sections of the law such as cash withdrawal, use of electricity and telephone, purchase and registration of motor vehicles.
3.1 Assessment of Pakistani PIT for Reducing Compliance Burden

Since the compliance costs actually reflects the compliance burden, which is to be borne by small income earners of informal economy, hence, this burden must be low to make any tax regime successful in the developing countries. It should be examined in context of the average liability of the small business (i.e. How much is ratio of compliance costs with tax liability). The operational complexity of Pakistani regime is analysed qualitatively in terms of the compliance burden e.g. book keeping and other documentary requirements, the length and the level of computation etc.

Consistent to Part 3.1, mostly small business in Pakistan has to maintain books of accounts\(^6\), because, the probability that all the transactions would fall within ambit of PIT is very low.\(^7\) Taxpayers usually have income from transaction both with the WHT agents and others. Consequently, a taxpayer is required to keep accounts for allocation of expenses, when he/she has two streams of incomes. One stream from an activity which falls within ambit of PIT and another stream from an activity covered under the regular regime. More simply, taxpayer is obligated to maintain the books if his/her more than 20% receipts have not suffered WHT. On the other hand, a taxpayer is also required to keep records for compliance to the regular regime, when his/her all receipts do not suffer any withholding. The only exception, when a taxpayer is not required to keep accounts is when his/her total receipts are subjected to WHT.

---

\(^6\) Internal costs on the recording data and acquiring knowledge to comply to tax obligations are virtually all the compliance costs. See Cynthia Coleman and Chris Evans, 'Tax Compliance Issues for Small Business in Australia' in 'Taxing Small Business: Developing Good Tax Policies' (2003) edited by Neil Warren, Australian Tax Research Foundation Conference Series 23, 163. A business perception is also noted that the prime role of the financial statements is tax compliance rather than the financial management (see Chris Evans et al, ‘A report Into the Incremental Costs of Taxpayer Compliance’ prepared for the Revenue Analysis Branch of the Australian Taxation Office (Australian Government Publishing Service Canberra, 1996, 3)). This perception seems more prevalent in small business sector.

\(^7\) It may be, because, only a few business activities are covered under PIT. Moreover transactions with formal sector only suffer WHT, which is a prerequisite to be eligible for PIT. Thus, activities, which do not suffer WHT shall fall outside the ambit of PIT.
For the Pakistani small business under existing PIT regime, compliance cost is increased due to the maintenance of accounts. It is noted that costs of maintenance of accounts takes away large percentage of income earned by a taxpayer. The compliance costs could even be higher than the tax liability itself. For instance, a taxpayer having income at PKR110, 000 (Equivalent to A$1400) under the regular regime has tax liability of PKR 600 (Equivalent to A$8), which definitely is lower than the compliance costs related to book keeping etc. As mentioned in Part 2 the costs of maintenance of accounts in India, whose economy is similar to Pakistan is PKR 27,000 (Equivalent to A$350).

Besides the cost of book keeping, the WHT on various activities (those not covered under PIT) require small businesses (even those who fall under PIT) to interface with tax administrator in order to get the refund of tax withheld on those activities. In absence of electronic refund mechanism, many small businesses do not even apply for the refund due to fear of being harassed by the administration. Some scholars call such withheld taxes as de facto final assessment regimes (Peter, 1994, 533). Thus, the compliance cost increases and a taxpayer may prefer to remain informal.

Additionally, even large formal businesses who transact with the informal sector (which usually do not claim credit of WHT, because, of their shyness of becoming formal) have to bear the burden of WHT, which increases their compliance costs also. Alternatively, they may choose either not to transact with informal business or not comply with WHT regime (As discussed earlier that the compliance to WHT is difficult to monitor), which cause loss of revenue.

Even when the taxpayers’ all receipts suffer WHT, the PIT based on WHT is not simple, as compared to other PIT designs, because, the taxpayers have to keep the
record for turnover throughout the year. Additionally, the taxpayer has to keep the
record of for all types withholding; some of whom are final discharge of tax liability
and some are not. For the later, the taxpayer has to obtain refund from the tax
authorities. The compliance costs are also increased due to the separate treatment for
each class of income. Resultantly, the compliance cost is increased.

The retailers, who fall under non-WHT based turnover tax regime, have to keep the
record of the turnover, which increases the cost of compliance and consumes too
much time of the un-educated entrepreneurs. Moreover, the tax liability is uncertain in
this regime, because, the adjustment for amounts withheld under the WHT is not
allowed under this regime. It means that small taxpayer is not only paying more tax
for the WHT based PIT (the tax deducted at source plus the tax paid as a retailer), but
also bear other WHTs, which are not final discharge of tax liability. More simply, for
the retailers, any tax deducted under WHT regime is the final discharge of tax
liability. Additionally, retailer has to pay the tax under the retailer’s regime.
Consequently, to benefit from the regime the taxpayer has to organize its activities in
such a manner that he/she should bear minimum WHT. But this all increases the
compliance costs.

The PIT regime for rental income is also not useful for the non-compliance problem.
Since the tax on property income is simple even under the regular regime, hence,
subjecting the same to PIT seems not for the purpose of simplicity. The low tax rates
under the PIT for rent earners suggest that it is enacted to favour real estate sector.

Further, the small businesses organized as AOPs and firms are obligated to act as
WHT agent u/s 153 for various payments they make. This role of collecting taxes for
the government increases the costs for small taxpayers in the formal sector, which
may promote informality. The use of WHT regime, therefore, may not be suggested for taxing small business sector (ATO Report, 1998, vii).

On the other hand, the Pakistani PIT is hard to enforce and comply, because, most of the taxpayers either fall in the regular regime or have to face the hybrid treatment. Only small number of taxpayers falls within ambit of PIT, when their total receipts suffer from WHT. Under the regular and hybrid treatments, taxpayers have to keep books. Consequently, neither compliance burden for small business nor the role of weak administration is reduced. Thus, the Pakistani PIT does not address the high compliance burden, which is main cause of informal economy.

The Pakistani regime for retailers is also difficult to monitor. For instance, it is a daunting task to determine turnover of cash-based retailers under the retailer’s regime. Moreover, both the regimes do not have the feature similar to ‘open for auction’ for ensuring the correct declarations (Sadka, 1992, 2). For the same reason, despite the increase in the number of statement filed, tax collection from this sector is not improved in Pakistan (see Table 1).

Table 1
Returns and Collections under Retailers’ Regime

</tbody>
</table>

8 An empirical study of compliance cost as to whether these costs are more than the taxpayer’s tax liability may be carried out, in order to confirm this observation empirically.
It is noted that PIT regime based on WHT in a country with weak administration is not recommended because monitoring of WHT is harder than implementing the regular tax due to intricacies in handling the voluminous information. Moreover under this regime, WHT agents assume the role of tax administrator and that too in an environment, where they are not being effectively monitored. It makes the role of a WHT agent evasive and fair implementation of the regime doubtful. Therefore, Pakistan PIT is not easy to enforce.

Lastly, proxy base should be the one which is easy to follow and difficult to temper with (Indira, 1995, 1104). As mentioned in Part 3.1, the Pakistani PIT is basically has a turnover based PIT design and as a consequence has different subtypes for the different categories of taxpayers. There are around ten PIT regimes, which are based on the collection of tax at source mechanisms. Additionally, there is one turnover based regime for the retailers and for the rent income earners. The presence of these categories causes insertion of couple of definitions also. This all adds to the technical complexity in the Pakistani PIT, which along with earlier mentioned high operation costs makes this regime difficult to comply and hard to enforce.

5. CONCLUSION

The literature review suggests that income tax compliance cost is the major contributing factor to overall regulatory burden on small business in developing countries. A PIT system absolves small businesses of maintaining accounts and reduces the compliance cost and therefore helps them to flourish. Instead of PIT being a ‘compromise’ or a ‘second best option’ (Faulk et al, 2006), it is an appropriate alternative to help small businesses to operate formally and contribute to economic growth. On the other hand, a PIT also helps the tax administration to collect optimum
revenue from small business. More simply PIT offers a win-win situation for small business and tax authorities.

Although PIT is being used in most developing countries, there is no confirmation that whether PIT achieves earlier win-win situation. It is argued that PIT designs in many countries are not easy to comply and therefore have high compliance costs. Consequently PIT fails to achieve its given objective. This paper analyses Pakistani PIT regime for its ability to reduce compliance burden and revenue collection.

The findings suggest that the Pakistani PIT being turnover based PIT is easy to comply and is also difficult to monitor. Further, PIT can fully apply when all or most of taxpayer’s receipts suffer WHT hence in most cases small business in Pakistan either fall in regular or hybrid tax regimes. As a result, the compliance burden remains high and level of compliance and revenue collection is low. Whether change of PIT design can help in this regard demands future research.

Strategic Fit between Regional Innovation Policy and Regional Innovation System: A Case of Local Public Technology Centers in Japan

FUKUGAWA Nobuya

Abstract

Local public technology centers, administrated by local authorities, primarily engage in providing technological support to small local firms and are currently encountered with structural changes in regional innovation systems. This study examines fit between resource allocation strategy of local public technology centers and the characteristics of regional environments. The results show that there are no significant differences between centers’ strategies according to the characteristics of a regional innovation system. This implies that centers' strategies were inefficient because economic welfare in the region would have improved if they had allocated resources in accordance with the characteristics of regional innovation systems.

Keywords: strategic fit, local public technology centers, regional innovation system, small firms, innovation policy

JEL: O38, O33, R11, R58
1. Introduction

Regional innovation system is a conceptual framework where industrial innovations are generated in a region (Howells, 1999; Acs ed., 2000; Cooke et al. eds., 2004). Regional perspectives are important in innovation research in the case where the geographical range of knowledge diffusion is limited due to the tacit nature of the knowledge transferred. This implies that one economic agent in agglomeration benefits from knowledge spillover whereas another in a geographically isolated area does not. Therefore, efficiently designed regional innovation policy that promotes knowledge interactions between the economic agents, i.e., industry, universities, and public organizations, is substantial for knowledge productivity in the region (Fritsch, 2004; Fritsch and Franke, 2004; Ronde and Hussler, 2005). Such regional difference in knowledge productivity, in the long run, will lead to the regional difference in economic development.

Among regional innovation policies that have been implemented in developed countries, the establishment and expansion of local public technology centers in Japan constitute one of the most distinguished policy instruments. Local public technology centers, administrated by the prefectural and municipal governments, primarily engage in providing technological support to small local firms. They were established prior to the initiation of modern economic growth in the nineteenth century, increased over the twentieth century, and now cover all regions and most of the technological categories. Technological services they offer small local firms include inspection of materials and products, guidance in production process, joint research, patent licensing, and so forth. Regional innovation policy represented as local public technology centers was considered by the US government as having made significant contributions to economic growth in postwar Japan, and was benchmarked in designing the regional innovation policy implemented in the 1990s (OTA, 1990; Shapira et al., 1995; Shapira et al., 1996; Feller, 1997).

Although the policy is notable in terms of its history, geographical and industrial coverage of the policy, variety of services the policy offers, and the number of policy recipients, local public technology centers are currently faced with two recent structural changes forcing them to redefine their capabilities and responsibilities in the regional innovation system. First, prolonged economic stagnation since the collapse of the bubble economy in 1990 left the local authorities facing serious financial difficulties. Furthermore, as a result of the structural reform under the Koizumi administration (2001-2006), the local authorities experienced a substantial reduction in subsidies as well as a transfer of authority from the national government. This led the local authorities to cut the budgets of the local public technology centers and rigorously evaluate their performance. In order to allocate budget more efficiently and convince taxpayers to spend their money on a regional innovation policy, the local authorities required local public technology centers to redefine their strength and contribution to the regional economy in a more visible manner. Second, the national system of innovation was fundamentally reformed since 1990s, symbolized by the enactment of the Science and Technology Basic Law in 1995, the Technology Licensing Organization Act in 1998, Special Measures for Industrial Revitalization in 1999, and the semi-privatization of national universities in 2004. A series of reforms involved national universities in the region in knowledge interactions with small local firms; this was in contrast to the case prior to the reforms when they had not been motivated to interact with the regional economy. This change marked the national universities’ entry into the local market of public technological services where local public technology centers were the primary source of knowledge to small local firms.

Under such circumstances, local public technology centers are required to establish their own strategy in line with the characteristics of a regional innovation system. Using a comprehensive dataset on local public technology centers, this study aims to propose a model describing the characteristics of regional innovation systems and quantitatively examine whether centers’ strategies fit with the characteristics of the regional innovation system. Foreshadowing the empirical results, there are no significant differences in the strategies adopted by local public technology centers according to the characteristics of the regional
innovation system. This implies that centers' strategies were inefficient because economic welfare in the region would have improved if they had allocated resources to fit with the characteristics of regional innovation systems.

Although much research effort was invested into the examination of technology transfer from universities in Japan (Kneller, 1999; Yoshihara and Tamai, 1999; Motohashi, 2004), local public technology centers as a source of public knowledge have been received little attention from researchers. Therefore, this analysis should be of interest to researchers interested in technology transfer and regional development as well as policymakers responsible for developing strategies of local public technology centers. The remainder of the paper is organized as follows. Section 2 provides an explanation for local public technology centers in Japan and their policy impact. Section 3 introduces a model describing the characteristics of regional knowledge transfer. Section 4 operationalizes concepts on the strategies of local public technology centers and the characteristics of regional knowledge transfer. Section 5 predicts how these strategies should be established according to the characteristics of regional knowledge transfer. Section 6 shows the results of statistical analyses. Section 7 summarizes the implications of the empirical analysis, discusses theoretical and methodological contributions of the study, and refers to the issues for future research.

2. Local public technology centers and their policy impacts

Local public technology centers, administrated by the prefectural and municipal governments, play three important roles in regional economies. First, they provide small local firms with various technological services, such as inspection of raw materials and final products, consultation to solve problems in production process, and organizing seminars or workshops to diffuse new technologies or process. Second, local public technology centers conduct their own research, patent their inventions, and license their patents primarily to small local firms. Third, local public technology centers link small local firms for the purpose of new product development.

Regional innovation policy represented as local public technology centers has its roots in the 1880s, prior to the initiation of modern economic growth in Japan. Figure 1 illustrates the founding of local public technology centers by year and by technological field. In the early days, local public technology centers were primarily established to support agriculture, the most important industry in pre-modern society. The development of heavy industry after the 1910s was followed by the establishment of an increasing number of local public technology centers to provide technological support to manufacturing. In the 1950s and 1960s, the remarkable economic recovery in postwar Japan led to serious environmental side effects, prompting the creation of local public technology centers for environmental science.

Figure 1 about here

Today, in most prefectures, there are at least two types of local public technology centers providing support in the areas of agriculture and manufacturing. Certain centers offer services in specific fields of manufacturing, such as ceramics, textiles, and mechanical arts. Other centers are engaged in research and technological assistance in the areas of environmental science, industrial design, and civil engineering.

This regional innovation policy, unique to Japan, received attention from the US government in the 1990s since it was recognized to have made significant contributions to the rapid economic growth of postwar Japan. With serious concerns over decreasing competitive advantage in the manufacturing industry, the US government benchmarked local public technology centers in its Industrial Modernization Program (IMP), the regional innovation policy that was implemented in the 1990s (OTA, 1990). To enhance the technological capabilities of small local firms, IMP established public technology transfer organizations such as Manufacturing Technology Centers and Manufacturing Extension Partnerships (Shapira et al., 1995; Shapira et al., 1996; Feller, 1997; Shapira, 2001). Several empirical studies suggest
positive impacts of this policy (Luria and Wiarda, 1996; Oldsman, 1996; Dziezek et al., 1997).1

Although no econometric evaluation of the policy effect of local public technology transfer centers has been carried out to date, several studies suggest that local public technology centers contribute to improving the technological capabilities of small local firms. Shapira (1992), based on interviews with center directors, reports that local public technology centers play an important role in improving product quality and in introducing new technology to small local firms. Comparing the Manufacturing Extension Partnerships in the US with the local public technology centers in Japan, Ruth (2006) argues that the latter are superior to the former in terms of connecting small local firms for the purpose of innovation. Based on a questionnaire survey on such innovative small firm networks, Fukugawa (2006) finds that local public technology centers significantly help such interfirm groups to technologically succeed in joint product development. Others highlight the regional embeddedness of center scientists as one of the advantages of local public technology centers in the regional innovation system. The lifetime employment of center scientists encourages them to be involved in the regional economy and to establish stable and long-term relationships with small local firms, which in turn helps local public technology centers build mutual trust with customers. The low mobility of center scientists tends to result in obsolescence of the technological knowledge that they hold. However, this is not detrimental to the technology transfer productivity of local public technology centers, because most of their customers typically do not engage in development of state-of-the-art technology, and a small lag in knowledge diffusion matches customers' needs for technological know-how (Shapira, 1992; Hassink, 1997).

In brief, these local public technology centers seem to have helped improve the technological capabilities of small local firms. However, as Fukugawa (2008) suggests, resources of the centers may not have been fully utilized as an engine for regional economic development since the technological services offered do not match the characteristics of regional innovation system.

3. Identifying strategies of local public technology centers

To represent resource allocation strategies of local public technology centers, the comprehensive survey on local public technology centers, “Current Status of Local Public Technology Centers 2000-2008” by the Japan Association for the Promotion of Industrial Technology was used. Although this dataset provides information on local public technology centers in all technological categories including agriculture, environmental science, civil engineering, and industrial design, manufacturing technology centers are focused here. Definitions and descriptive statistics of variables are shown in Table 1. All variables are divided by the number of researchers to control for size effect. 2

Table 1 about here

Although local public technology centers engage in various types of activities, these activities can be bundled into several factors representing the tendencies of local public technology centers to reinforce specific resources, i.e., resource allocation strategy. Factor analysis is a statistical method for extracting latent factors behind observable variables that

---

1 See Jarmin (1999) for a rigorous policy evaluation of the Manufacturing Extension Partnership. He establishes plant-level panel data and estimates Heckman's selection model to control for firm attributes that are inherent in policy applicants. The results indicate a positive policy impact on the value-added labor productivity of policy applicants.

2 Researchers do not include clerical staff that is not directly involved in technology transfer to the private sector.
affect several observable variables in the same direction. Figure 2 shows the factor loadings computed by factor analysis. Based on the scree plot, the number of factors was assumed to be two; the horizontal axis (Factor 1) and the vertical axis (Factor 2). Factor 1 strongly correlates to variables such as “quality,” “joint and funded research”, “patent,” and “paper” while it has no correlation with other variables. The quality of human resources, research activities, and research outcomes are associated with the research capacity of local public technology centers. Therefore, Factor 1 is presumed to represent the tendency to intensify the research capacity of local public technology centers. In contrast, Factor 2 positively correlates to variables such as “workshop” and “consult” while it has no correlation with other variables. Letting small firms use equipments and consultation primarily aims to provide small local firms with immediate solutions to the problems in production process. Therefore, Factor 2 is presumed to represent the tendency to directly support small local firms by providing immediate solutions for technological problems.

---

4. Identifying characteristics of regional innovation systems

In order to identify characteristics of regional innovation systems, this study assumes a local market of public technological services. Previous studies suggest that the characteristics of demand and supply of a local market of public technological services determine how public knowledge is transferred to the private sector (Charles and Howells, 1992; Santoro and Chakrabarti, 2002; Schartinger et al., 2002; Carayol, 2003). Specifically, the type of knowledge linkage established between industry and universities is determined by both attributes of firms (demand-side factors), such as size and R&D intensity, and attributes of universities (supply-side factors), such as incentives and research quality of faculty staff. Based on their arguments, this study assumes a regional market of public technological services where small local firms seek and exploit public knowledge accumulated in the region either to improve their production processes or to build long-term R&D capabilities.

The demand of public technological services in the region is affected by attributes of small local firms. Although there are some regions with large established firms, these firms are likely to have sufficient internal resources to solve technological problems on their own. Furthermore, even if large firms encounter technological difficulties beyond their capabilities, they are unlikely to rely on regional public knowledge for solutions since they are likely to have developed global knowledge networks. The most important demand-side factor is the absorptive capacity of firms, i.e., the capability to assess, assimilate, and exploit external knowledge for innovative activities (Cohen and Levinthal, 1990; Zahra and George, 2002). Absorptive capacity, like human resources, has a cumulative nature and is generated through R&D effort of the firm, which makes it difficult for competitors to immediately duplicate the resource. Absorptive capacity affects how the firm interacts with a source of knowledge. Small firms relatively rich in absorptive capacity are able to employ an interactive channel of knowledge transfer, such as joint research, whereas small firms that do not perform R&D are likely to be supported by technology centers through a unilateral channel, such as consultation.3

The supply of public technological services in a region consists of national universities

---

3 Absorptive capacity also affects the geographical range of knowledge interactions. Small firms with higher absorptive capacity may not rely on local public technology centers since they are likely to have developed global knowledge networks (Beise and Stahl, 1999). Here, it is assumed that small local firms first seek a local market for technological services, and then expand their search for the next best if the first trial fails.
as well as local public technology centers. National research institutes may also contribute to
the supply of public technological services. However, the geographical distribution of national
research institutes in Japan is highly concentrated in Tokyo and Ibaraki prefecture (virtually city
of Tsukuba), while at least one national university with faculties in natural science is located in
each prefecture. Furthermore, national research institutes engage in the R&D of state-of-the-art
technology which has little to do with the technological problems that are encountered by small
local firms. If a national university in a particular region is relatively active in knowledge
interactions with small local firms, it acts as a new entry to the local market of public
technological services.

Figure 3 about here

Based on these arguments, the conceptual framework of regional innovation systems is
illustrated in Figure 3. The triangle at the left-hand side denotes small local firms that demand
public technological services. The bottom of the triangle denotes small local manufacturers that
do not engage in R&D, while the upper side denotes R&D-active small firms. The top of the
triangle denotes small firms that devote themselves to research, such as dedicate biotech firms
(DBFs) or new technology-based firms (NTBFs) or academic spin-offs. Small firms located in
the upper portion of the triangle are assumed to retain higher absorptive capacity, implying that
they are likely to develop interactive and long-term relationships with external source of
knowledge. On the contrary, small firms located in the bottom of the triangle demand public
knowledge for immediate solutions to problems occurring at the shop-floor level, implying that
they are likely to employ a unilateral channel of knowledge transfer.

The rectangles on the right-hand side denote channels of knowledge transfer. Rectangles in the upper (lower) side refer to spillover channels with a relatively large (small)
information gap between firms and external sources of knowledge (Izushi, 2003; 2005). Information gaps are determined by the importance of communication between local public
technology centers and small firms, and the time required for small firms to evaluate the
outcome of technological services. Izushi finds that the relationship between the two evolves
over time. Small firms begin by using technological services with a smaller information gap
such as testing. After having developed mutual trust, small firms employ services with a larger
information gap, such as joint research. Based on his arguments, technology transfer channels
are classified according to their information gap or significance of interactions. Rectangles in
the upper portion indicate that more interactive communication is required due to a larger
information gap. In the case of joint research, scientists from both sides share their ideas, with
matching research efforts, to create new knowledge. Furthermore, intellectual property licensing
entails a larger information gap, which means that it requires efficient communication or
interface between open science and proprietary technology. When university patents are
licensed to the private sector, gatekeepers who retain a deep understanding of both science and
technology play an important role in evaluating the commercial potential of the invention and

---

4 Most local authorities have set up at least one public university in every region. There were 76 public universities
as of 2007. Forty-four of these have healthcare-related faculties (not medical schools), such as nursing, which reflects
the fact that they were established to serve as a source of nursing staff in the region. Most public universities do not
engage in research and education in natural sciences other than in fields of medicine, such as engineering. Therefore,
it is unlikely that public universities, compared to national universities, act as a more important source of knowledge
for small local firms. Presently, however, it is difficult to quantitatively examine the role of public universities in
regional innovation systems.
identifying a relevant industry partner who can help commercialize the technology successfully (Thursby and Thursby, 2002). On the contrary, rectangles in the lower portion indicate that hardly any communication is necessary between small firms and technology centers. In the case of technological consultation, the firm only plays a passive role and knowledge is transferred in a unilateral way. Furthermore, little interaction is necessary when local public technology centers either provide firms with testing services or let firms use their equipment.

5. Assessing strategic fit between regional innovation policy and regional innovation system

In Sections 3 and 4, I have introduced the methods in which regional innovation policy and regional innovation system are measured. In this section, how to evaluate strategic fit between the two is demonstrated. Each prefecture (local unit of governance in Japan) is scattered in Figure 4 according to demand- and supply-side factors of a local market for public technological services. The vertical axis denotes proportion of small firms in the manufacturing industry that perform R&D in 2000. The higher this ratio becomes, the greater absorptive capacity an average small local firm is supposed to retain. The data was collected from Bureau van Dijk, Japanese Accounts and Data on Enterprises (JADE). The horizontal axis denotes proportion of joint research projects between national universities and small firms in a region. Annual average of this ratio between 2000 and 2002 is used. The information is obtained from the National Institute of Science and Technology Policy, “University-Industry Collaboration Database.” Around the semi-privatization of national universities in 2004, national universities are increasingly engaged in knowledge interactions with small local firms. When national universities in a region are more eager to engage in joint research with small firms, small local firms will have more opportunities to exploit external sources of knowledge. In creating this variable, observations are limited to joint research projects in natural sciences because the database includes joint research projects in humanities, which have little to do with industrial innovations.

Figure 4 is divided into four parts by lines representing the average of horizontal and vertical axes respectively.\(^5\)\(^6\) Theoretically predicted strategies of local public technology centers in accordance with the characteristics of regional innovation systems are as follows. In Quadrant I, where both the level of the demand and the supply variable are relatively high, there is a latent demand for public technological services in the region due to the presence of R&D-intensive small firms. Furthermore, a relatively high supply-side variable implies that knowledge created in national universities in the region is more accessible (via joint research) to small local firms. It is reasonable that in prefectures located in Quadrant I, small local firms that want to build long-term R&D capacity are to exploit university knowledge in the region to a greater extent. Therefore, in prefectures located in Quadrant I, local public technology centers are required to distinguish themselves from the national university in the region by offering different types of technological services from those provided by national university-based scientists. In these regions, local public technology centers are expected to adopt resource allocation strategy represented as Factor 2 (shown in Section 3).

\(^5\) The correlation coefficient between the demand- and supply-side variables is statistically insignificant, which means that two axes can be depicted as orthogonal.

\(^6\) The results of skewness kurtosis tests for normality show that the null hypothesis of normal distribution is rejected in the case of the supply-side variable (one percent level of significance), implying that a representative value other than average, such as median, might be more appropriate.
In Quadrant II, where the level of the demand variable is relatively high and the level of the supply variable is relatively low, the national university in the region is not willing to interact with small local firms albeit their relatively higher R&D-intensity. This mismatching between needs and supply of technological knowledge implies that in prefectures located in Quadrant II, local public technology centers should fill the gap by retaining higher technological capability (such as excellent scientists) and assist R&D-intensive small firms to achieve innovation. In this case, knowledge transfer from public institutes to the private sector is expected to be interactive because small firms in Quadrant II are likely to retain higher absorptive capacity. Therefore, local public technology centers are expected to adopt resource allocation strategy represented as Factor 1.

In Quadrants III and IV, where the level of the demand variable is relatively low, small local firms are likely to exclusively engage in production and distribution. Therefore, it is reasonable for local public technology centers located in a prefecture that classified in Quadrants III or IV, to adopt resource allocation strategy represented as Factor 2. Within such environments, local public technology centers are expected to offer technological services with a relatively smaller information gap, such as consultation and testing, since small local firms in the region tend to demand local public technology centers for immediate problem solving in the production process rather than building long-term R&D capability. Table 2 summarizes the theoretically predicted strategy (shown in column 4) of local public technology centers that fits with regional innovation system (shown in columns 1, 2, and 3).

| Table 2 about here |

6. Results

Have local public technology centers allocated their resources according to the characteristics of regional innovation system at the period when they were required to demonstrate their strength in the region? In this section the statistical relationship between the characteristics of regional innovation systems and theoretically predicted strategies (shown in Table 2) of local public technology centers is examined. Specifically, whether annual average growth during 2000 and 2008 of each variable representing resource allocation strategies varies according to characteristics of regional innovation systems as of 2000 represented as four quadrants in Figure 4 was tested by analysis of variance. A positive value of annual average growth indicates that the local public technology center reinforced the resource, while a negative value indicates that the local public technology center relinquished the resource. As suggested by Table 2, Factor 1 (the tendency of local public technology centers to intensify their research capacity) should be reinforced in Quadrant II, while Factor 2 (the tendency to support small local firms by providing immediate solutions to technological problems) should be enhanced in Quadrants I, III, and IV. Therefore, variables such as “consult” and “testing” are predicted to exhibit significantly higher growth in Quadrants I, III, and IV while variables such as “quality”, “paper”, and “patent” are predicted to exhibit significantly higher growth in Quadrant II.

| Table 3 about here |

7 In this study the regional environment is assumed to be exogenous and invariant over time, which means that the characteristics of regional innovation system determine the strategies of local public technology centers. However, one can think the opposite flow of causality. Future study will take dynamics of the regional environment into consideration.
Table 3 shows empirical results. A one-way analysis of variance tests the null hypothesis that all means of three or more groups are identical. P value smaller than five percent indicates that the null hypothesis of equal means between groups is rejected. According to theoretical predictions shown in Table 2, variables such as “quality”, “jfres”, “paper”, and “patent” are predicted to demonstrate the highest growth in Quadrant II. The results, however, show no significant difference across quadrants in any of the variable. This implies that local public technology centers allocate resources regardless of characteristics of regional innovation system. Therefore, assuming that the conceptual framework and its operationalization are relevant, resource allocation strategy of local public technology centers was inefficient. Put differently, economic welfare in a region would have improved if local public technology centers had allocated resources in accordance with characteristics of regional innovation system. Small local firms may have been offered unnecessary technological services by local public technology centers while they may have had difficulties in finding technological services they actually needed.

The statistical analysis extracts the “average” look of local public technology center from observations. However, an “outlier” sometimes gives important information when it represents a very distinguished example among observations. Figure 5, the factor scores computed by factor analysis, is depicted in order to illustrate such distinct strategies, i.e., the Osaka Municipal Technical Research Institute. The Osaka Municipal Technical Research Institute exhibits a very distinct strategy that intensifies its own research capability. The quality of human resources is very high, which attracts external research funds via funded research. This leads to a higher research productivity represented as a number of papers and patents. Osaka prefecture is located in Quadrant II, where small local firms are relatively rich in absorptive capacity and where a national university in the region is relatively inactive in knowledge interactions with small local firms. Although there are many R&D-intensive small firms in a big city like Osaka, Osaka University, one of the most prestigious research universities in Japan, develops knowledge networks across prefecture and nation and thus is less embedded in the regional economy. The model developed in this paper suggests that it is reasonable for the Osaka Municipal Technical Research Institute to intensify its research capacity so that small local firms with absorptive capacity can rely on it.

7. Conclusion

Based on a model describing the characteristics of a regional innovation system, this study examined whether the strategy of local public technology centers aligned with the characteristics of the regional innovation system. The results of empirical analysis using a comprehensive database on local public technology centers indicate that the strategy adopted by technology centers was irrelevant to the characteristics of regional innovation system. This suggests the possibility that small local firms lost an opportunity to improve their productivity by leveraging external knowledge, due to the misallocation of resources of local public technology centers in the region. Specifically, small local firms might have found unnecessary types of technological services being provided by local public technological centers, while they were unable to find the service that they actually needed.

Although local public technology centers were uniquely developed in Japan, several general implications for science of policy design and evaluation can be derived from this study. First, this study proposed the concept of strategic fit between regional innovation policy and regional innovation environment. Since there are substantial differences across regions in terms of academic and technological potential, it is important for policymakers to design policy instruments of knowledge transfer according to the characteristics of regional innovation systems. Otherwise, resources allocated to technology transfer activities that do not fit with the regional environment would be unable to contribute to the improvement in knowledge
productivity growth in that region. The case of local public technology centers in Japan suggests that the concept of complementary fits between regional innovation policy and regional innovation environment can be applied to a quantitative policy evaluation of technology transfer infrastructures in other countries. Second, this study developed a new methodology to quantitatively identify the characteristics of regional innovation systems. Specifically, a local market for public technological services is modeled in a way that characteristics of regional innovation systems are identified in terms of demand- and supply-side factors, and is successfully quantified using proxy variables for demand- and supply-side factors. This made it possible to test the statistical association between regional innovation policy and regional innovation environment, as noted earlier. I believe that the methodology employed in this study is helpful for researchers in other areas who attempt to quantitatively evaluate regional innovation policy.

Since the regional innovation policy of establishment and expansion of local public technology centers was “all-round” in that they were established throughout Japan and provided small local firms with a highly standardized menu of technological services, it was difficult for each local public technology center to develop its own strategy in accordance with the characteristics of regional knowledge transfer. However, several cases show the way to establish a clear strategy that fits with the regional environment. Future study will complement the implications of the quantitative analysis with a qualitative analysis in these cases.

Risk Management Practices of Scottish, Chinese and German Small and Medium-sized Enterprises (SMEs): A cross-country study

Dr. Thomas Henschel, Prof. Dr. Simon Gao
Edinburgh Napier University, UK
Contact: t.henschel@napier.ac.uk

Abstract

There has been a paucity of research concerning the current state of risk management (RM) in Small and Medium-sized Enterprises (SMEs). Literature searched by the authors has revealed that there are few cross-country studies directly relating to RM in SMEs. The research project is the first of its type with an extensive empirical study into the status of RM in SMEs. The cross-country study investigates whether cultural differences have an influence on the firms’ RM practices. Exploring these questions will provide a clearer understanding of the personal and organizational factors that have influenced the risk management practices of SMEs in the respective countries. This study also seeks to address the influence that the perception of environmental uncertainty has on the risk management efforts in SMEs. The investigation is carried out via a Web-based survey of Scottish, Chinese and German SMEs, followed-up by in-depth research interviews.

Keywords: Holistic Risk Management, Business Planning, Performance Measurement, Small to Medium-sized Enterprises, China, Germany, Scotland

Introduction

Concerning the current state of risk management in Small to Medium-sized Enterprises (SMEs) there are no substantial findings. The national and international literature also offers only a few proposals how a risk management which is suitable for SMEs could be designed (ICAEW, 2005). This fact is often explained by risk management being a very young branch of business management theory which has yet not developed standards (see, for example, Alquier and Tignol, 2006, p. 277, Hoitsch et al., 2006, p. 69).

Much uncertainty in SMEs has been provoked by Basel II, the new international equity capital regulations on lending by banks. In connection with the evaluation and rating process borrowers are subject to, Basel II demands from the banks to make an assessment as to how the companies deal with the opportunities and risks presented by their development.
The Basel II regulations do not explicitly demand to establish a comprehensive and strictly formalized risk management system (see Basel Committee on Banking Supervision, 2003). Nevertheless, when rating an SME, the lending bank will assess the management accounting instruments and the abilities of management. This covers to determine whether a risk management system has been implemented to a certain extent and whether replacement regulations have been fixed (Füser and Heidusch, 2002, p. 61).

A risk management system is, however, necessary for SMEs, not only because it is required by law or by the Basel II regulations, but rather because it is in the essential interest of the SMEs. The reason is that such enterprises have a high potential to become insolvent and the most frequent causes of insolvency are management errors and weaknesses in the company structure. This is especially true during the first 7 years following the establishment of the company (Günterberg and Kayser, 2004; Almus, 2004).

To classify SMEs, the European Union utilizes the following grouping definition (Table 1):

<table>
<thead>
<tr>
<th>Subclass</th>
<th>Number of employees</th>
<th>Annual turnover (million euros)</th>
<th>Balance sheet total (million euros)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Micro firm</td>
<td>&lt; 10</td>

</tr>
<tr>
<td>Medium-sized firm</td>
<td>&lt; 250</td>
<td>≤ 50</td>
<td>≤ 43</td>
</tr>
</tbody>
</table>

Source: Commission of the European Communities (2005)

To belong to one of the classes micro, small and medium-sized, a firm must fulfil the following conditions:

The number of employees is below the respective threshold in Table 1. Furthermore, at least one of the thresholds for annual turnover and balance sheet total is met.

The “legal independence criterion” must be fulfilled: A maximum of 25 percent is owned by one or more companies which themselves do not match the threshold conditions of No. 1.

The above definition has been valid since 2005 and is updated in terms of annual turnover and balance sheet total at longer intervals of time (Commission of the European Communities, 2005).
From the international perspective there are major differences in the meaning of the criterion “number of employees”. While for example in the United Kingdom a company only with fewer than 250 employees is considered to be an SME, in China the figure increases to 3000 employees (Schaper et al., 2008, p. 3).

In order to ensure comparability with other research results, the EU size class definitions for SMEs will be taken as a basis in this paper. Further, additional employee classes will be included as size measure.

The present research project attempts to investigate the current state of risk management more comprehensively. This includes in particular the manager’s knowledge of business management methods and the manager’s behavior with respect to risk and decision-making. A cross-country research with a focus on examining the culture influences of risk management behavior offers a distinct approach to the limited existing studies of risk management in SMEs. The investigation is carried out with the aid of online questionnaire. The questionnaire results are deepened by research interviews with selected enterprises.

**Literature Review**

The literature reveals that risk management is still in an early phase of development and that no standard for SMEs has yet become established which would describe how a comprehensive risk management should appear (Troßmann and Baumeister, 2004, p. 80). There is also little in the existing SME literature on actual implementations and risk management methods, and as a result this aspect is covered in more depth by current research projects (Consultation and Research Centre of ICAEW, 2005, p. 5; O’Hara et al., 2005, p. 32, Berry et al., 2007).

The research work carried out to date on risk management in SMEs can be grouped into the following main themes: One area is the management of financial risks and the insurance coverage of SMEs, which has already been more heavily researched (Deakins and Bentley, 1995). The other area is the attitude of SMEs towards risk (see Janney and Dess, 2006; Watson and Robinson, 2003; Sparrow and Bentley, 2000; Smallman, 1996).

It is generally accepted that the risk management process basically consists of the following four steps (see Vaughan and Vaughan, 2001):

- identification of risks
- quantification and thus evaluation of risks
- management and control of risks
- continued reporting on the development of risks

As part of the organization of risk management the company management therefore has to set out the basic strategies for risk management and to nominate the personnel in the company to be responsible for the steps risk identification, evaluation and control.
Smallman (1996, p. 15) argues that a holistic risk management is characterized by three main aspects.

The first aspect is a continuous monitoring of all sources of risk. Special attention should also be given to what are termed weak signals. Information on risks should be gathered together from the most diverse sources and in particular from the customer and market perspectives.

The second aspect is the combination of qualitative and quantitative techniques on risk assessment and risk monitoring. Since to some extent qualitative (i.e. non-financial) risks also play an important role in the risk fields, it is not possible to concentrate only on probability theory and actuarial models. Just as equally qualitative techniques such as scenario planning or other qualitative instruments must be applied here. Nowadays (2009) the literature on modern performance measurement techniques (such as Balanced Scorecard or shareholder value) emphasizes their application for risk management purposes (see for example, Wolf, 2003, p. 85; Scholey, 2006).

The third aspect concerns the organizational learning where one learns from past errors and disasters and where a culture is established in the company allowing for a positive approach to dealing with mistakes and does not punish employees for mistakes. In this way a knowledge management within the company can also be employed for the purposes of risk management. On top of this one should take into account the company’s culture and leadership structure, in particular the management behaviour in SMEs (Janney and Dess, 2006; Richbell et al., 2006).

The authors of the present study estimate a sound business planning to be vital for managing risks. It is an important step in the direction of a good risk management, which allows determining the impact of risky issues on the firm’s target figures profit and liquidity.

The following Figure 1 assembles the aspects which, according to the authors of this paper, a comprehensive risk management should cover.
This study seeks to answer the following research questions:

1. What is the impact of personal and organizational characteristics on attitudes to risk?

2. Do SMEs attempt to manage risk, and, if so, what strategies and methods are employed for this purpose?

Exploring these questions will provide a clearer understanding of the personal and organizational factors that have influenced the risk management practices of SMEs in the respective countries. This study also seeks to address the influence that the perception of environmental uncertainty has on the risk management efforts in SMEs (Matthews and Scott, 1995; Rauch et al, 2000; Heavey et al, 2009).

**Methodology**

At the time of the investigation in 2010, only little data was available on the state of risk management in German SMEs. This gave rise to the decision to determine current risk management practices in SMEs by an explorative approach. It was carried out by an online (Web-based) questionnaire and by research interviews. The questionnaire was first developed in English and, after amendments for clarity and removal of ambiguity, the finalized questionnaire was translated into Chinese and into German language. The questionnaire was five pages long and contained 16 close-ended questions. Whenever practical, questions were posed seeking responses on a Likert scale to gauge the extent of the measure.

Ten semi-structured research interviews of each country are held to examine RM practices in detail. The interviews will address companies that have filled in the questionnaire as well as some that have not been influenced by it. Descriptive and comparative data analysis techniques appropriate for examining the central research questions are employed.
First, the online questionnaire inquired for the enterprise’s demographic data:

- size by number of employees
- industrial sector
- position of the interviewee in the organization

The remaining questions cover the aspects of a holistic risk management as described in Figure 1: business planning, performance measurement, risk management process, risk management organization and the management behaviour. The management behaviour investigates the attitudes of SME managers to risk and uncertainty.

After having analysed commercial address databases for drawing the sample, the decision was made to work with the Hoppenstedt (2009) and FAME (2009) database for German and Scottish SMEs. These are well-known and annually updated databases containing information about ca. 65,000 SMEs, the largest SME databases with an over-regional focus. They are oriented towards the European Union definition of SMEs, and the firm profiles contain all essential quantitative information. The participating Chinese SMEs were selected from an official domestic database (SME Department of Ministry of Industry and Information Technology of the P.R. China, 2010) to represent a relevant and comparable research sample.

**Conclusion**

As the literature review has revealed, little is known about the present level of sophistication of risk management in SMEs. In particular, it is not clear which factors can positively influence the establishment of a risk management system in SMEs (examples of such factors are size effects, industry effects, staff responsibilities etc.). Therefore up till now (2010) generally only single aspects of risk management have been investigated, such as the management of operational risks.

One of the key findings of the literature analysis is that the attitude of the managing director towards risk plays an essential role in how systematically risks are handled. Often he lacks sophisticated business management knowledge, as would be needed for a comprehensive risk management approach.

Among the instruments that can serve for risk management, the business planning is the one which is dealt with by the literature to the greatest extent. In general, the results indicate that there is still some need for improving planning systems, whether or not they are used for risk management. It is worth while noting that the extent how firms value planning is dependent on the cultural context.

There are only few studies on how well known instruments of performance measurement are to SME’s and to what degree they are established. Most frequently, the literature has probed the Balanced Scorecard. Investigations on the SMEs’ application of instruments of performance measurement for handling risks are rarely carried out.
Summarizing, there are no empirical studies on risk management practices in Scottish, Chinese and German SMEs, following a broader perspective rather than dealing with isolated topics. The main aim of the present paper is to fill this gap. The investigation will follow the lines of the holistic approach to risk management outlined in the literature review.

The Effect of Public Policy on Entrepreneurial Activity: Evidence from OECD Countries
by Younghwan Kim, Wonjoon Kim, and Taeyong Yang

The importance of public policy as a determinant of national entrepreneurship level has attracted the interest of many researchers and policymakers. However, empirical explorations are hardly found regarding structural and holistic policy framework to examine the determinants of entrepreneurial activity at the country level, due to the variety of policy measures and data limitation. In this paper, we examine the effects of finance, labor, and tax policy measures on entrepreneurial activity of the 28 countries in the OECD. Through the empirical analysis, we find that the government expenditure on economic affairs and education plays an important role in promoting entrepreneurship, and discover that an increase in the public expenditure on start-up incentives enhances the level of entrepreneurial activity. On the other hand, classifying the countries into four groups based on the level of entrepreneurship and economy, this paper suggests context-based entrepreneurship policy of the countries in different phase of economic development.

Introduction

The importance of entrepreneurship in economic development and job creation has been highlighted by many previous studies. Many research works have showed that promoting entrepreneurial activity leads to the economic growth (Audretsch and Keilbach 2004; Rocha 2004; Wong, Ho, and Autio 2005). Therefore, the governments in developing countries as well as developed countries are trying to promote entrepreneurial activity for their economic growth. With a lot of interests on entrepreneurship, there have been many attempts finding the determinants of entrepreneurial activity at the country level or at the regional level.

Lundstrom and Stevenson (2005) categorized these influences presented in the previous studies into five groups: *demographic, macro-economic and structural dimensions, cultural dimensions, human dimensions, SME density and entrepreneurial dynamic dimensions,* and *policy dimensions.* Among these categories, the policy dimensions are the most important factors to promote entrepreneurial activity at the national level. There are much differences on the level of entrepreneurial activity across countries. The differences can be caused by the variety of individual traits, capabilities, competencies or characteristics. However, the country’s regulation and policy that make starting a business easier also have a great effect on the entrepreneurial activity of the country. Therefore, to enhance the level of entrepreneurial activity, for a decade, the government has implemented “support” policies to the entrepreneur and has minimized regulations to start a business as quickly and cheaply as possible (van Stel, Storey, and Thurik 2007).

Nevertheless, it has not been clearly examined yet what policy measures affect the entrepreneurial activity at the national level. Previous empirical studies on the relationship between public policy and entrepreneurship have merely covered one or several countries (Rocha and Sternberg 2005; Acs et al. 2007; Levie 2007), or single policy region (Kanniainen and Vesala 2005; Bruce and Mohsin 2006; Ho and Wong 2007), due to the data limitation about various national public policy measures. On the other hand, previous studies, which considered entrepreneurial activities of multi-countries, used the data of subjective evaluations for entrepreneurship policy factors by some experts (Levie and Autio 2008), or used the data from World Bank Database (WBDB) which is rank-based data among the countries (Ho and Wong 2007; van Stel, Storey, and Thurik 2007), because estimating exact effects of policy measures is very difficult. In addition, these previous research works on the public policy and entrepreneurship using multi-country data have limited their analyses to finding common determinants of entrepreneurship for all countries in their samples, without
considering the national context for entrepreneurial activity and suggesting customized policies according to the country or the group of countries (Ho and Wong 2007; van Stel, Storey, and Thurik 2007; Levie and Autio 2008; Nofsinger and Reca 2009).

Therefore, in this paper, we examine the public policy determinants of entrepreneurial activity at the national level through structural and holistic policy framework, which consists of finance, labor, and tax policy region, using consistent and objective data of policy factors from the Organization for Economic Cooperation and Development (OECD) database. In addition, classifying the OECD countries into four groups according to the level of entrepreneurial activity and their economies, we investigate differences on public policy factors among the groups and suggest context-based public policies to promote entrepreneurial activity by group.

Consequently, by revealing the different policy determinants of national entrepreneurship index, our study contributes to entrepreneurship policy literature suggesting a more customized and structural public policy of the countries in different phase of economic development for promoting entrepreneurship.

Public Policy and Entrepreneurial Activity

The Unit and the Level of Analysis about the Relationship between Public Policy and Entrepreneurship in the Literature

As mentioned in the study of Acs and Szerb (2007), previous research works that have examined the relationship between public policy and entrepreneurship used various policy measures in the various policy regions for their analyses. Such works can be classified by the two dimensions: unit of analysis and level of analysis (Acs and Szerb 2007). The unit of analysis can be individual and aggregate, and the level of analysis can be regional, country-
The individual unit of analysis has been used for examining the relationship between individual characteristics, such as personal traits, motivation, and educational attainment, and an individual decision on start-up activity (Areninus and Minniti 2005; Acs et al. 2007; Bergmann and Sternberg 2007; Levie 2007; Minniti and Nardone 2007). On the other hand, the aggregate unit of analysis has been used for finding determinants of entrepreneurial activity of a certain area, such as firm birth rate in Costa Rica, collecting the macro data of the area, not the individual (Wennekers et al. 2005; Ho and Wong 2007; van Stel, Storey, and Thurik 2007).

On the other hand, the analysis at the regional level has found the determinants of regional entrepreneurial activity in a single country (Rocha and Sternberg 2005; Levie 2007; Cumming and Li 2009). The country-wide level has been mainly used in the analysis for comparison on the determinants of entrepreneurial activities in two or three countries (Acs et al. 2007), and the analysis at the international level has tried to explain the difference on the level of entrepreneurship across the countries (Areninus and Minniti 2005; Wennekers et al. 2005; Ho and Wong 2007; Minniti and Nardone 2007; van Stel, Storey, and Thurik 2007).

To examine what policy measures affect entrepreneurship in a country and find differences on public policy to promote entrepreneurial activity across the countries, the aggregate unit and the international level should be applied in the analysis. However, in actually, it is very difficult to collect the data of many countries about various entrepreneurship-related policy measures. Hence, previous empirical studies on the relationship between public policy and entrepreneurship merely covered one or several countries (Rocha and Sternberg 2005; Acs et al. 2007; Levie 2007), or single policy region (Kanniainen and Vesala 2005; Bruce and Mohsin 2006; Ho and Wong 2007).

Therefore, in our analysis, using the aggregate unit and the international level, we
examine public policy determinants of the entrepreneurial activity at the national level through the structural and holistic policy framework. Especially, among the policy measures in the region of *taking entrepreneurship into account in setting national policies* and the region of *policies that primarily affect entrepreneurs*, which were mentioned in the study of Acs and Szerb (2007), we focus on finance, labor and tax policy which are the most direct and effective policies for promoting entrepreneurial activity at the country level.

**Finance, Labor and Tax Policy and Entrepreneurial activity**

In the entrepreneurship literature, many studies have highlighted the importance of financing for entrepreneurial activity, such as new firm formation, firm growth and firm survival. Holtz-Eakin, Joulfaian, and Rosen (1994) selected individual received inheritance as a measure of access to capital to examine the relationship between liquidity constraints and the likelihood of firm survival and performance. They concluded that the enterprise by the person who received much inheritance is more likely to survive, and if it does survive, it performs better. Bates (1995) showed that financial capital constraints decide self-employment entry, dividing whole sample into five groups according to the household net worth that represents financial condition. However, van Gelderen, Thurik, and Bosma (2006) selected a binary variable, whether one makes a loan or not and the amount of start-up capital as financial factors, and found that more start-up capital have lower probabilities to get their business running. The study of van Auken (1999) also explained the availability of capital is an important common obstacle confronting potential new business owners. On the other hand, Ho and Wong (2007) selected three factors about the availability of different sources of financing for new firms: availability of debt finance, availability of informal investors, and availability of venture capital. Among these factors, the availability of informal investors only has significant and positive effect on the overall, high growth potential, and opportunity Total
Entrepreneurial Activity (TEA) index developed by Global Entrepreneurship Monitor (GEM).

Labor policy also has a great effect on new firm formation as well as incumbent small firms. Potential entrepreneurs are reluctant to start a business when the average labor cost and the minimum wage level are high. On the other hand, the firm birth rate can increase if the government provides supportive policy for new employment due to the diminution of the employment cost which the employer is obligated. However, related previous studies have mainly focused on the effect of labor market institutions on the employment, so that previous research works about the relationship between labor policy and new firm formation have not highlighted (Kanniainen and Vesala 2005).

Nevertheless, Choi and Phan (2006) distinguished the policy factors that affect new firm formation into opportunity factor and individual factor, and selected unemployment and labor unionism as the labor policy measures in the group of individual factor. As a result, the unemployment has no significant effect on the new firm formation, while the labor unionism is negatively and significantly related with the firm birth. Goetz and Rupasingha (2009) used minimum wage legislation, government employment as a percentage of total state/provincial employment, and union density as variables of labor market freedom in order to explain the effect of labor policy on growth in non-farm proprietor densities in the United States. In addition, Kanniainen and Vesala (2005) classified measures of labor market institutions in detail to find the determinants of new firm formation. They empirically discovered that labor market regulation suppresses firm birth, higher labor union power reduces firm birth rate, and higher employment compensation becomes an obstacle in the growth of firm birth rate.

Tax policy is also important on promoting entrepreneurial activity. According to whether or not new firm is incorporated, the entrepreneur has a duty of payment of personal income tax or corporate income tax. Many researchers have tried to estimate the effect of tax policy on new firm formation or firm performance. The most popular research topic is an effect of
tax policy on the change of self-employment ratio. Long (1982) and Blau (1987) are pioneers in this field of research. After their studies, many studies about the relationship between self-employment ratio and tax rate have followed. Parker (1996) analyzed the effect of marginal tax rate on self-employment ratio in the UK, following Blau’s approach. He found that higher marginal tax rate leads the increase in self-employment ratio.

The next stream of previous literature has examined tax policy measures that affect an individual decision of entrepreneurial activity with cross-sectional or panel data. Bruce (2000) showed that the difference between personal marginal wage tax rate and personal marginal self-employment income tax rate hinders becoming self-employed from wage-and-salary employee. In addition, low average tax rate of self-employment leads high probability of becoming self-employed. Gentry and Hubbard (2000) discovered that progressivity of the tax discourages entry to self-employment, contrary to general expectation. The study of Cullen and Gordon (2002) also revealed that a cut in personal tax rate reduces entrepreneurial activity.

In recent related literature, tax factors as candidates of determinants of entrepreneurship have broadly and variously selected. Bruce and Mohsin (2006) used top income tax rate, top capital gains tax rate, top corporate income tax rate, wage-and-salary payroll tax rate, self-employment payroll tax rate and estate tax exclusion as tax policy variables. In addition, Goetz and Rupasingha (2009) selected total government revenue from own source as a percentage of GDP, top marginal income tax rate and the income threshold at which it applies, indirect tax revenue as a percentage of GDP, and sales taxes collected as a percentage of GDP.

As mentioned above, there have been many studies that examine the effect of each of finance, labor and tax policy region on entrepreneurial activity. However, the importance of comprehensive establishment and implementation of the policy for directly inspiring potential entrepreneurs and promoting entrepreneurial activity has not been carefully dealt with.
Therefore, in this paper, we examine the role of finance, labor and tax policy in the enhancement of entrepreneurial activity in the OECD member countries through OECD Statistics Database. Through regression analysis, we find what kind of policy measures amongst finance, labor and tax policy region are the most important in dissemination of entrepreneurship at the national level. In addition, we classify the OECD countries into four groups according to the level of entrepreneurial activity and national economy, and find differences on policy measures among the groups, and suggest context-based public policies to promote entrepreneurial activity.

**Data and Variables**

**Data**

In this paper, using the OECD’s countrywide statistics database, we estimate the effect of finance, labor and tax policy on entrepreneurial activity at the country level. In the year 2009, the OECD consists of 30 countries as members. Due to the completion of collecting demographic data, and economic data, as well as social data of the member countries through these various activities, we can obtain the data of 30 member countries and several important non-member countries by various topics through the OECD’s online database, which is called ‘OECD. Stat Extracts’.\(^1\) Table 1 shows the first-level classification by topic of OECD’s statistics databases which can be obtained from ‘OECD. Stat Extracts’.

Among these topics, selecting ‘General Statistics’, ‘Finance’, ‘National Accounts’, ‘Labour’, and ‘OECD Tax Database’\(^2\) which is the other database by the OECD, we obtained

---

\(^1\) Its objective is to provide a single online platform where the researcher can discover and use its statistical databases. It contains some complete databases and data ‘cubes’ on the provision of lots of themes extracted from other databases (website: http://stats.oecd.org).

the data for finance, labor and tax policy measures of 30 countries, covering the years 2000 to 2006. On the other hand, to measure the entrepreneurial activity, we included TEA index developed by GEM. The TEA index also covers the years 2000 to 2006. However, the OECD’s statistics databases have no data on certain measures of certain countries in certain years, and the GEM database also has missing data. In particular, the TEA rates of Luxembourg and Slovak Republic among the OECD members do not observed. In other words, both of the OECD’s data and GEM’s data are unbalanced panel data.

**Dependent Variable**

The empirical literature extensively has resorted to the *TEA index*, which is developed within the framework of the GEM project, as a proxy variable of the level of entrepreneurial activity. In particular, in some previous studies which examined the relationship between public policy or government regulation and entrepreneurial activity for national comparison, the TEA index has been selected as a measure of the national level of entrepreneurial activity.
(Wennekers et al. 2005; Ho and Wong 2007; van Stel, Storey, and Thurik 2007; Levi and Autio 2008). In this study, we collected the TEA rate of the member countries in the OECD as a measure of the entrepreneurial activity of the country, investigating GEM’s annual global executive reports in the years 2000 to 2006. The TEA rates of Luxembourg and Slovak Republic among the OECD members do not observed. Other countries in the OECD also have missing data. The number of total observation on the TEA rate is 146 (see Table 3).

**Independent Variables**

Access to finance is the most widely recognized issue of entrepreneurship policy, and insufficient finance resource is regularly cited by potential entrepreneurs as a barrier to start a business (Levie and Autio 2008). In our study, we include *short-term interest rate, household investment fund shares, and government expenditure* as explanatory variables in the finance policy region (see Table 2). In previous studies, bank prime loan rate (Choi and Phan 2006), ease to access loans (van Stel, Storey, and Thurik 2007), and availability of debt finance (Ho and Wong 2007) were used, as proxy variables of the short-term interest rate, however they did not find the significant effects of these variables on the entrepreneurial activity. The variable of household investment fund shares means the investment fund shares in financial assets of households, as the assets of the households are divided into financial assets and non-financial assets. The investment fund shares can be more related to the funds for the investment on business than other assets of households. Therefore, we can expect that the entrepreneurial activity increases as the investment fund shares per capita increases. Using availability of informal investors as a proxy variable of the household investment fund shares, Ho and Wong (2007) found that the availability of informal investors positively affects the TEA rate. The OECD provides the statistical data of the member countries by ten functions of government expenditures (see Table 2). We select the four functions which may be directly
related on the start-up activity: general public services, public order and safety, economic affairs, and education, as subordinate variables of the government expenditure.

In the labor policy region, unit labour cost, unemployment rate, and public expenditure on labour market programmes (LMP) are selected (see Table 2). Our expectation is that lower unit labour cost can enhance the level of the entrepreneurial activity. Unemployment rate has been preferred as a determinant of entrepreneurship in the previous research works. However, the effect of the unemployment rate on entrepreneurial activity is not consistent in the literature (Kannianinen and Vesala 2005; Choi and Phan 2006; Bergmann and Sternberg 2007; Goetz and Rupasingha 2009). On the other hand, the shrinkage of entrepreneurial activity can increase the unemployment rate: a simultaneous causality problem. Therefore, to exclude this kind of problem, we used one-year-lag of the unemployment rate variable.\(^3\) Public expenditure on LMP is a total amount of public expenditures on individual labour market programmes as a percentage of Gross Domestic Product (GDP). The OECD classifies various labour market programmes by the government into active measure and passive measure (see Table 2). Among detailed classifications of the active measure, we expect the variable of start-up incentives is the most directly related factor to the entrepreneurial activity. We can expect that the TEA rate increases as the public expenditure on the start-up incentives as a percentage of GDP grows.

We usually expect that high corporate income tax rate hinders the people starting a business, and high individual income tax rate promotes becoming entrepreneurs from wage- and-salary employee or self-employed. In addition, we can forecast that high burden on social security contributions of the employer reduces the firm birth. However, the results about the tax effect on entrepreneurship in previous studies are not consistent (Wennekers et al. 2005;)

---

\(^3\) We also considered the unemployment rate without a lag, and those with two-year-lags and three-year-lags in our analysis. As a result, as we use one-year-lag of the unemployment rate, the models have the lowest values of mean Variance Inflation Factor (VIF), and the results of significant variables are consistent among various regression models which we try to apply.
van Stel, Storey, and Thurik 2007; Cumming and Li 2009; Nofsinger and Reca 2009). In our study, to examine the relationship between tax policy and the national level of entrepreneurial activity, we select marginal personal income tax (PIT) and social security contribution (SSC) on gross labour income (GLI), average PIT and SSC on GLI, and corporate income tax rate (combined) from ‘OECD Tax Database’ as measures of tax policy.\(^4\) We collect this type of the tax rates due to include the average tax burden as a percentage of individual gross income in a country in our empirical analysis. On the other hand, we select corporate income tax rate as a candidate of determinant on the TEA rate. This variable is calculated by combining central and sub-central government corporate income tax rate (see Table 2).

**Control Variables**

Previous studies that examined the determinants of entrepreneurial activity have preferred real GDP growth as one of the important control variables (Wennekers et al. 2005; Bergmann and Sternberg 2007; Ho and Wong 2007; van Stel, Storey, and Thurik 2007; Levié and Autio 2008). However, most studies that considered the GDP growth rate have a single year or up-to-three year data set, so that the results on the significance of the GDP growth variable from them have not been consistent. In this paper, we expect that the TEA rate increases as real GDP growth rate increases. On the other hand, because we have a seven-year data set, the variable trend is also involved in the regression model. The number of observations and the descriptive statistics for each of the variables are shown in Table 3.

\(^4\) We also considered the total tax revenue as percentage of GDP and its subordinate factors, such as individual tax on income, profits and capital gains, corporate tax, SSCs of employees, SSCs of employers, SSCs of self-employed or non-employed, tax on property, and tax on goods and services as percentage of GDP from the topic of ‘Public sector, taxation and market regulation’ of OECD. Stat Extracts (Wennekers et al. 2005). However, we excluded these tax variables, due to multicollinearity problem among the subordinate tax variables and between the variables of public expenditure on LMP (total, active, and passive measure) and the tax variables.

**Regression Results**

Table 4 shows regression results using the variables of finance, labor, and tax policy for the TEA rate internationally. The numbers of observations of each regression model are slightly different, because our dataset is unbalanced and combinations of the variables using in each model are diverse. In particular, we present White heteroscedasticity-robust standard errors of the variables in the case of the Model 1 to exclude the problem of heteroscedasticity.

Through the results of the regression models for the TEA rate, we can find various determinants of the level of entrepreneurial activity of the country. The negative and significant coefficients of the trend in all of the models explain that the entrepreneurial activity in the OECD countries shrunk from the year 2000 to 2006. On the other hand, the real GDP growth positively and significantly affects the TEA rate, analogous to the results in some part of the previous studies (Wennekers et al. 2005; van Stel, Storey, and Thurik 2007; Levie and Autio 2008). This finding supports our expectation that an environment for start-up activity and a personal willingness to create a business can be improved as the national economy is growing. These two control variables have significant and consistent effects on the TEA rate in all of the models.

In the finance policy region, positive and significant effects of the short-term interest rate on the TEA rate in all of the models are not expected. On the other hand, the variable of household investment fund shares positively and significantly affects the TEA rate in the Model 1 and Model 2. In the case of the government expenditure, the total expenditure has no relationship with the TEA rate, while some subordinate expenditures show significant coefficients for the TEA rate. The expenditure on economic affairs and education positively and significantly affect the TEA rate, while the expenditure on general public services negatively and significantly affects the entrepreneurial activity. There is no significant relationship between the expenditure on public order and safety and the TEA rate. This
finding supports the importance of national investment on economic affairs and education in a short-term and a long-term point of view, respectively, while the expenditure on public services is inefficient to promote entrepreneurial activity.

Among the variables of labor policy, the unit labour cost has no significant effect on the TEA rate, while the unemployment rate in the past year partly and negatively affects the TEA rate in the current year (from the Model 1 to the Model 4). During the economic recession, the tendency of decrease in the entrepreneurial activity with an increase in the unemployment rate shows that the people who are laid off from the jobs or have experienced failures in their business hesitate to create the new business. On the other hand, interestingly, we find that most of the public expenditures on various LMPs cannot help to enhance the level of entrepreneurial activity. However, the expenditure on start-up incentives, which is a direct supportive instrument for start-up activities, positively affects the level of entrepreneurship. From the results of the Model 3 to the Model 6, we find that 0.01 percent increase of the public expenditure on start-up incentives as a percentage of national GDP can raise the TEA rate by 0.2 percent.5

In the case of tax policy, regression results of the variables are not consistent across the models. In the Model 1 and the Model 2, both the marginal and the average of PIT and SSC on GLI negatively affect the TEA rate, while they are not significant in the Model 3 to the Model 6. In addition, the corporate income tax rate does not affect the entrepreneurial activity except for the Model 6.

Through the regression analysis, we find some interesting results. To promote the national level of entrepreneurial activity (the TEA rate), the government should try to increase the real GDP growth rate and expand the public expenditures on economic affairs and education, in particular. In addition, the government should focus on the expenditure on start-up incentives,

5 The average public expenditure on the start-up incentives of the OECD member countries is merely 0.01 percent of the national GDP, and the maximum value of this variable among our sample is 0.13 percent.

which directly supports the start-up activities among the labour market programmes. On the other hand, it is important to reduce the tax burden on the individual income and social security contribution for promoting entrepreneurial activity at the national level.

*Comparison Analysis on Public Policy Measures and Policy Implications for Promoting Entrepreneurship*

**Comparison of the Public Policy Measures among the OECD Countries**

From the regression results, we can find some important policy measures which positively affect the national level of entrepreneurial activity. However, because the procedure for establishment and the environment for implementation of the finance, labor, and tax policy to promote entrepreneurship vary with the countries, we can anticipate that there are differences on between their policy measures’ significances and effects. Therefore, in this section, we divide 28 OECD member countries of our sample into four groups based on the GDP per head (low GDP and high GDP) and the TEA rate (low TEA and high TEA).\(^6\)

Table 5 shows the four groups of the OECD member countries classified by the GDP per head and the TEA rate. The group of the countries with high GDP and high TEA, and with high GDP and low TEA are termed ‘Group 1’ and ‘Group 2’, and the group of the countries with low GDP and high TEA, and with low GDP and low TEA are termed ‘Group 3’ and ‘Group 4’, respectively, for our convenience.

The classification definitely shows geographical characteristics. In particular, the Group 2 consists of Western and Northern European countries which we recognize them as ‘developed

---

\(^6\) As mentioned above, because the TEA rates of Luxembourg and Slovak Republic among the OECD members do not observed, we only considered 28 OECD member countries in our analysis. The classification breaks were based on an investigation of the actual distribution of the two indices and selecting those breaks where a large gap in the distribution. As a result, the numerical cutline of the GDP per head (US dollar, constant prices, constant PPPs, reference year 2000) and the TEA rate are 25,000 U.S. dollars and seven percent, respectively. The time period of this analysis also covers from the years 2000 to 2006.

countries’, except for Japan. The Group 1 has developed countries which are not located in continental Europe. United States and Canada are in North America, and Australia is in Oceania. The Group 3 consists of two Eastern European countries (Czech Republic and Poland), Korea in Asia, Mexico in North America, and New Zealand in Oceania. The countries in the Group 4 are European countries in the Iberian Peninsula, Eastern Europe, and southeast Europe. These definite geographical differences between the groups are interesting.

The groups with low TEA (Group 2 and Group 4) consist of European countries which are almost in the European Union (EU), while the groups with high TEA (Group 1 and Group 3) have geographical diversities, such as non-Western Europe, North America, Asia, and Oceania. Why the entrepreneurial activities of European countries, which are recognized as developed countries, are depressed?

Comparing the public policy measures between the groups, we can suggest the policy for promoting entrepreneurship by group. In addition, we explore how the entrepreneurship policy should be changed according to the economic level of the country. Table 6 represents the average values of the variables, which are used in the regression analysis in the previous section, by group.

\(^a\) US dollar, constant prices, constant PPPs, reference year 2000.

First, we examine important factors which cause the difference on the TEA rate between the Group 1 and the Group 2, which consist of the countries with high GDP per head. The real GDP growth rate is 1.45 percent higher for the Group 1 than the Group 2. There is no difference on the total government expenditure between the two groups, while it is interesting that the governments in the Group 1 expend much more money on economic affairs and education. We conducted statistical tests of the difference on the average of all of the variables across the groups.
education than the Group 2 (see Figure 1). This finding is consistent with the result from regression analysis in the previous section. On the other hand, it is also interesting that the unit labour cost of the Group 1 is much lower than that of the Group 2. In the case of the public expenditure on LMP, there is no difference on the start-up incentives between the Group 1 and the Group 2, while the expenditures on the active measures and the passive measures of LMP of the Group 1 countries are much lower than those of the Group 2 countries (see Figure 2). This finding supports that the public expenditure on LMP does not positively affect entrepreneurial activity. In the tax policy region, both personal tax rate and corporate tax rate of the Group 1 are much lower than those of the Group 2 (see Figure 3).

Second, we investigate differences between the Group 3 and the Group 4, which consist of the countries with low GDP per head. There are no differences on the real GDP growth and short-term interest rate between the two groups. On the other hand, the governments in the Group 4 spend much more money than those in the Group 3, on average. In the Group 4, the portion of the expenditure on the general public services is the largest among the four functions of the government expenditure, while the countries in the Group 3 focus the government expenditure on the function of economic affairs and education (see Figure 4). On the other hand, there are no differences on the unit labour cost and the unemployment rate, unlike the result of the comparison of two groups with high GDP. In the public expenditure on LMP, there is no difference on the expenditure on start-up incentives, which is a small part of total expenditure on LMP, between Group 3 and Group 4, like the results of high GDP groups. However, the expenditures on active and passive measures of the Group 3 are much lower than those of the Group 4 (see Figure 5). In the countries of the Group 4, the public expenditure on LMP is even larger than the Group 1 as well as the Group 2. This finding supports the regression result of negative effect of the expenditure on LMP in the previous

---

section. In the tax policy measures, the marginal and average PIT and SSC on GLI of the Group 3 is lower than those of the Group 4, while there is no difference on the average of the corporate tax rate between the two groups (see Figure 6).

Third, we consider differences on public policy measures between the Group 1 and the Group 3, which have different economic level (real GDP per head) and similar level of entrepreneurial activity (TEA rate). There are large differences on the household investment fund shares and the total government expenditure per capita, of course, due to the different economic level. However, we can find a structural difference on the functional expenditures by government between the two groups. These two groups mainly and commonly focus on economic affairs and education, while the Group 1 with high GDP prefers the expenditure on education, and the Group 3 with low GDP concentrates the expenditure on economic affairs. We can interpret that this interesting result is for characteristics of these two functional expenditures, which are important determinants of the entrepreneurial activity. In detail, in the countries with high GDP, the expenditure on education, an indirect and long-term instrument, is more efficient than the expenditure on economic affairs, which is a direct and short-term instrument in promoting entrepreneurial activity, while the expenditure on economic affairs is more efficient and more direct in enhancing entrepreneurship in the countries with relatively low GDP. On the other hand, the countries of the Group 3 have lower marginal and average PIT and SSC on GLI than the countries of the Group 1. Therefore, through the results of comparison of public policy between the Group 1 and the Group 3, we can find that lowering personal income tax rate and social security contributions and reducing inefficient expenditures on LMPs by the government are important on promoting entrepreneurial activity, even if the country is on relatively low economic level.
Figure 1
Government Expenditures on Economic Affairs and Education of the Countries with High GDP

Notes: Australia in the Group 1 and Switzerland in the Group 2 are excluded in the graph, because they have no data. The unit is a percentage of the total government expenditure.

Figure 2
Public Expenditure on LMP of the Countries with High GDP

Notes: Iceland in the Group 1 is excluded in the graph, because it has no data. Total public expenditure on LMP is represented as the sum of the expenditure on the active and passive measures of LMP. The unit is a percentage of the GDP.
Figure 3
Personal and Corporate Tax Rates of the Countries with High GDP

Note: The unit is a percentage.

Figure 4
Government Expenditures on General Public Services, Economic Affairs, and Education of the Countries with Low GDP

Notes: Mexico in the Group 3 and Turkey in the Group 4 are excluded in the graph, because they have no data. The unit is a percentage of the total government expenditure.
Notes: Greece and Turkey in the Group 4 are excluded in the graph, because they have no data. The public expenditure on passive measures of LMP of Mexico is nearly zero (less than 0.005 percent). Total public expenditure on LMP is represented as the sum of the expenditure on the active and passive measures of LMP. The unit is a percentage of the GDP.

Note: The unit is a percentage.
Policy Implications

Integrating the results in the previous section, we can suggest clear directions of public policy for promoting entrepreneurship by group. Generally, the countries with low TEA rate should focus the government expenditure on economic affairs and education, rather than general public services, in the region of finance policy. In the labor policy, they should reduce inefficient public expenditures on LMP. They should also lower the individual tax rate and social security contributions on the gross labour income in the tax policy.

We suggest customized directions of public policy for enhancing entrepreneurship by group. First, in the countries of the Group 1 with high GDP and high TEA, the government expenditure on economic affairs rather than general public services should be raised. In addition, the countries of the Group 1 should increase the public expenditure on start-up incentives rather than the other labour market programmes. On the other hand, they should reduce the total government expenditure, lowering tax burdens of the individual and the corporation.

The Group 2 mostly consists of important member countries of the EU, so that concurrent coordination of the public policy for promoting entrepreneurship across the countries is needed. The countries in the Group 2 should try to grow their economies first. However, they have to control the amount of the total government expenditure, by increasing the expenditure on economic affairs and education and reducing the expenditure on general public services. They should also try to reduce the unit labour cost through appropriate policy instruments. In the case of the public expenditure on LMP, they should drastically reduce the amount of the total expenditure, while they should increase the expenditure on start-up incentives. In the tax policy, reducing the burden of individual tax and social security contributions, in particular, plays an important role in the promoting entrepreneurial activity.

The level of entrepreneurial activity of the countries in the Group 3 is increasing along
with high economic growth rate. However, to sustain high level of entrepreneurial activity for a long time, they should move their attentions from the economic affairs to the education in terms of the government expenditure. In addition, they need to consider the reduction of the corporate tax rate, which is relatively higher than the average personal tax rate.

The countries of the Group 4 have relatively lower GDP per head than the countries of the Group 2 however they are also members of the EU except for Turkey. Therefore, the unity of the public policy in the EU can prevent the countries in the Group 4 growing their economies and promoting entrepreneurial activity. However, they should try to reduce the expenditure on general public services as much as possible, and invest more in economic affairs and education. In addition, they should lower individual tax rate and social security contributions.

**Conclusion**

In this paper, we examined the relationship, across 28 OECD countries, between public policy and entrepreneurship using regression methods, and suggested customized public policies to the countries in different phase of economic development for promoting entrepreneurship by classifying the countries into four groups. In order to estimate the effect of public policy on entrepreneurial activity at the national level, we selected three major policy regions – finance, labor, and tax policy, and collected the data of the policy measures in these three regions from OECD database. On the other hand, we used the TEA index developed by GEM as a measure of the national level of entrepreneurial activity.

From the empirical analysis, we can find some interesting results. The entrepreneurial activity shrunk from the years 2000 to 2006 among the OECD countries. As the real GDP growth rate increases, the TEA rate increases. Among public policies, first, in the finance policy region, the government expenditure on economic affairs and education, rather than general public services, leads higher entrepreneurial activity. Second, in the labor policy
region, the public expenditure on the start-up incentives among labour market programmes only positively affects entrepreneurial activity. Third, in the tax policy region, as personal income tax rate and social security contributions decrease, the TEA rate increases.

Classifying the OECD countries into four groups based on the GDP per head and the TEA rate, we find geographical characteristics and differences on finance, labor, and tax policy across the groups. In addition, it is possible to suggest customized public policies by group for promoting entrepreneurial activity.

In conclusion, to promote entrepreneurship of the country, the government should pursue sustainable and stable economic growth, and concentrate limited budget on the expenditure on economic affairs and education. In particular, the government expenditure on education plays an important role in long-term growth of entrepreneurial activity and leap of the national economic level. On the other hand, the government should hold down expenses to various labour market programmes, while it should increase the expenditure on the start-up incentives. Efficient management on the government expenditure by reducing the burden of personal tax can enhance the level of entrepreneurship in the country.

Links between Firm Technology Orientation (TO) and Entrepreneurial Orientation (EO)

Boris Urban

Abstract
The study examines entrepreneurship and its relation with technology, which is often conceptualized as entrepreneurial orientation (EO) and technology orientation (TO). Building on previous research the main constructs under investigation are operationalised, and the study is further contextualized by including measures of environmental dynamism and hostility. A survey is used to collect data from a population of diverse businesses in the Johannesburg area, yielding a sample of 236 firms. After validating the measures, correlational analyses are used to test the hypothesized associations. Findings reveal significant correlations between EO and environment hostility and dynamism, but not between EO and TO.

Introduction
Entrepreneurship and its relation to technology and innovation is studied extensively within organizations (Bosma, Jones, Autio, and Levie 2007; Foba and De Villiers 2007; Lee and Wong 2004). Recent studies have advocated integrating innovation and technology at organizations where links have been established with firm performance (Bhuian, Menguc, and Bell 2005; Guan and Liu 2007). Firms which have adopted a technology orientation (TO) pursue advances in technology and innovations, and investments are made in discontinuous innovations and disruptive technologies with the assumption that entire new markets will emerge (Schindelhutte, Morris, and Kocak 2008).

In emerging economies, such as South Africa, where growth is often the primary goal of organizations, innovation in firms can be particularly critical for firm profitability and survival (Antonicic and Hisrich 2001). The 21st century is tilting towards an economy primarily driven by technology and knowledge, where entrepreneurs have to recognize and anticipate high-technology opportunities so as to join the ranks of future entrepreneurial leaders (Kourilsky and Walstad 2002).

Technology and firm innovation can not only create value but can aid in the international expansion process which many firms in emerging countries are now
undertaking. A strong technology and entrepreneurial orientation at the firm level can provide the necessary competitive advantage for companies in emerging countries to compete globally (Rwigema, Urban, and Venter 2008).

Not only are organizations seeking to re-orientate themselves to become strategically innovative (McGuigan and Henderson 2005), but previous literature and empirical findings, point to entrepreneurial orientation (EO) as an important element in organizational and economic development. Entrepreneurship within organizations is a fundamental posture, instrumentally important to strategic innovation, particularly under shifting external environmental conditions (Knight 1997). The EO construct is salient not only for large organizations but also for small and medium-sized organizations, under different stages of economic development, in varied cultural contexts. At the level of the organization, entrepreneurship can provide direction to the company’s entire operation, serves as an integral component of a firm’s strategy, and may serve as the core component of corporate strategy (Chen, He, and Jin 2008; Guan and Liu 2007; Morris, Kuratko, and Covin 2008). Entrepreneurial actions are the bedrock of entrepreneurial processes and behaviour.

These two dominant orientations, TO and EO often termed as strategic orientations at the firm level provide the focus for this study. Since these orientations may be critical to the long term survival of a firm (Stevenson 1983), it is important to facilitate the empirical study of them. This paper moves in this direction by empirically testing the relationship between EO and TO. However simply examining the direct EO-TO relationship may provide an incomplete picture and it is necessary to understand how environmental factors might be linked with each orientation (Wang 2008). Research suggests that a key part of a TO is the interaction of that strategy with the ventures external environment (Zahra and Bogner 1999). Moreover, EO is affected by, and must also fit the firm’s particular environment.
Consequently for this present study, associations between EO and TO and environmental hostility and dynamism are hypothesized.

Despite the weight of positive empirical findings and observations that EO and TO are strategic imperatives (Antoncic 2006; Autio 2005; Goel et al. 2003), there is a danger that firms in Africa are lagging behind, and subsequently a study of this nature aids in understanding these imperatives. Another reason for focusing on EO is that although studies using the EO scale have often been replicated, the majority of research in entrepreneurship and technology has been conducted in the United States, and with the relevance of international entrepreneurship being recognized (Jantunen, Puumalainen et al. 2005), the importance of further interrogating EO and TO in an emerging country context seems justifiable.

**Review of Theory**

**Entrepreneurial orientation**

The term entrepreneurship in corporations has been labelled in many different ways, which includes intrapreneurship (Antoncic and Hisrich 2001; Kuratko 2002); innovation entrepreneurship (Schumpeter 1934); innovation management (Drucker 1979); venture entrepreneurship (Tang & Koveos 2004); corporate intrapreneurship (Dess, Ireland, Zahra et al. 2003); strategic entrepreneurial posture (Covin & Slevin, 1989), and internal corporate venturing (Hornsby, Kuratko, and Zahra 2002).

Prior theory and research (Covin and Slevin 1989; Lumpkin and Dess 1996; Khandwalla 1977; Miller and Friesen 1983) indicates that an EO is a key ingredient for organizational success, and has been found to lead to increased performance (Kuratko, Ireland, and Hornsby 2001; Wiklund and Shepherd 2003; Zahra and Covin 1995).
The concept of EO incorporates the firm-level processes, practices and decision-making styles of innovate firms (Lumpkin and Dess 1996). The theoretical basis of the EO construct lies in the assumption that all firms have an EO, even if levels of EO are very low. The extant organizational research provides theoretical support for the EO construct, in both the fields of entrepreneurship and strategic management.

Extensive research confirms that EO has three dimensions: innovativeness, risk taking, and proactiveness (Covin and Slevin 1989, 1991, 1997; Kreiser et al. 2002; Lumpkin and Dess 1996, 2001). Innovativeness is the fundamental posture of an entrepreneurial organization in terms of developing new products or inventing new processes (Drucker 1979; Schumpeter 1934). Innovativeness as an attribute describes an organizations’ willingness to add newness with added value. Risk-taking is associated with the willingness to commit significant resources to opportunities and to take calculated business risks (Aloulou and Fayolle 2005). Proactiveness is perseverance in ensuring initiatives are implemented, and is concerned with adaptability and tolerance of failure. These dimensions have been extensively documented, and according to Lumpkin and Dess (1996), all the dimensions are central to understanding the entrepreneurial process, although they may occur in different combinations, depending on type of entrepreneurial opportunity the firm pursues.

Firms can only be labelled as entrepreneurial if they are simultaneously risk taking, innovative, and proactive (Covin, Green, and Slevin 2006).

The extent to which each of these dimensions is useful for predicting the success of business may be contingent on industry environment, and norms for EO can be expected to vary among industries. Lumpkin and Dess (1996) provide a contingency perspective on how environmental and organizational factors moderate, mediate, independently effect, or interact with EO to enhance firm performance (Jantunen, Puimalainen et al. 2005). Typically, firms
with an EO tend to outperform similar other organizational types in volatile environments (Knight 1997).

Summing up the literature on EO, this concept is best understood as a complex mix of personal and situational factors and in addition to individual and firm differences, forces operating within other larger cultural contexts also determine levels of EO (Aloulou and Fayolle 2005; Urban 2008).

Environmental Factors

As with previous studies (Zahra and Bogner 1999), the present study emphasizes environmental characteristics since these perceptions activate technology and entrepreneurial choices. Theory on the environment and its effect on high technology ventures and EO are well documented (Allen and Stearns 2004; Pownall and Lawson 2005). Specifically, the entrepreneur’s perception of the external environment is expected to moderate the relationship between a technology venture’s strategy and its financial performance (Zahra and Bogner 1999).

Three characteristic of the firm’s external environment are discussed in the literature: dynamism, hostility, and heterogeneity; these characteristics reflect an industry’s objective conditions. The present study relies on two environmental dimensions which is consistent with earlier research and theory building in the field of entrepreneurship:

(1) Dynamism. Dynamism reflects both the rate and unpredictability of change in the industry (Dess and Beard 1984). These changes result from the entry or exit of competitors, changes in customer’s needs, and shifts in technological conditions. These changes create opportunities and threats for new ventures and compel their managers to act by building and leveraging technological resources. The unpredictability of these changes can also influence managers’ investment in introducing new products and timing of their release (Porter 1985).
(2) Hostility. Hostility indicates an unfavourable business climate, such as the intense competition for resources or market opportunities. Hostility arises from the existence of too many competitors, unfavourable supply conditions, and strict regulation. Hostile environments are therefore resources-poor, lean environments; they lack the abundance of resources and capacity needed to support a large number of ventures (Dess and Beard 1984; Zahra and Bogner 1999).

**Technology Orientation**

Technology and innovation in entrepreneurial businesses is typically explained in a variety of ways. For instance (1) by describing how early-stage entrepreneurs and established business owner-managers focus on the novelty (or unfamiliarity) of their products or services relative to customers’ current experience (Bosma et al. 2007), or (2) through focusing on levels of innovativeness in entrepreneurial businesses as measured by the degree of competition faced by the business, or (3) whether the owner-manager perceives that many, few, or no other businesses offer similar products or services (Lee, Lee, and Penning 2001).

Several types of new venture technology and innovation strategies are proposed in the literature; these include but are not limited to: (i) reactive imitation, (ii) proactive localization, (iii) import substitution, (iv) creative imitation, (v) early-market entry, (vi) global niche, and (vii) global innovation (Park and Bae 2004). Strategic choice is of particular concern to technology-based ventures. For instance they can adopt a product market strategy aimed at achieving growth in terms of revenues or a strategy where the objective is growth in the value of the technology with a view to an eventual exit through-sale to strategic partner. A firm pursuing a strategy of differentiation based on innovative new product introductions might benefit from the human capital development though years of experience in technical jobs. Such experience would provide insights into technical advances that might enhance
product features (Shrader and Siegel 2007). Developing new product technology and concern for technical expertise demonstrates the importance for technology-based new ventures to select strategies which they can successfully execute. It has also been suggested that true measures of success for technological entrepreneurs is the extent to which they are able to develop and bring to market radically innovative new products and/or services. Radical innovations are important not only for the positive economic impact they typically create, but also because they fundamentally change the behaviour of consumers.

Evaluating regional transformation through technological entrepreneurship, Venkataraman (2003) analyses how in a modern economy universities and research and development laboratories are the incubators of novel technical ideas; it is not an accident that areas around Boston and Silicon Valley have produced a significant amount of wealth. Infusing an enterprising spirit into technical endeavours and the promotion of inventive skills has been implemented as an impetus to promote technopreneurship in organisations (Lee and Wong 2004).

Both entrepreneurs and technopreneurs have similar qualities, such as: determination, willingness to take risk, capacity to mobilize resources, and perseverance to overcome setbacks. However the capabilities required of a technopreneur go beyond this to include an expert knowledge of relevant technological developments together with innovative acumen (Wong, Cheung, and Venuvinod 2005). It is a person’s specific knowledge which is apparently the most important contributing factor in making a discovery and exploitation of wealth generating ideas (Fiet, Norton, and Clouse 2002). Technopreneurs are an important group that can contribute significantly to raise national competitiveness, productivity and efficiency (Conway 2008). In addition technopreneurs engage in go-to-market programs through a global network of partners (Asia Africa Intelligence Wire 2005).
Technopreneurism can be integrated into corporations through the formal strategy process. Foo and Foo (2000) conceptualize a model of corporations in Singapore acting to contribute towards configuring a unique environment congenial for sprouting technopreneurs. In Singapore, government built technological parks and research centres to encourage more firms to be involved in research and development activities; here the government set aside billions of dollars in research funds and venture capital to encourage research in technologically related industries to become technopreneurs (Lee and Wong 2004).

The integration of entrepreneurship with strategy (TO) relies on the critical aspects of entrepreneurial strategy and a strategy for entrepreneurship (Kuratko and Audretsch 2009; Morris et al. 2008). Hamel (2000) argues that, all forms of complexity, (entrepreneurship or strategy) are poised on the border between perfect order and total chaos, between absolute efficiency and blind experimentation, between autocracy and complete adhocracy. It is conceivable that in many situations a firm would have to excel along all or most of the dimensions of EO in order to achieve the ability to create superior value vis-a-vis TO. This would indicate that there are significant associations between EO and TO.

**Hypotheses**

The following hypotheses are formulated by drawing on the emerging aforementioned body of knowledge. Given the lack of empirical evidence on EO and TO in terms of environmental dynamism and hostility, particularly in emerging country context, instead of numerous hypotheses, the study formulates broad spanning hypotheses which allow for general explanations:

H1: A positive correlative relationship exists between EO and TO.
Entrepreneurship within organizations as a fundamental posture is conceived as EO, which is instrumentally important to a firm which adopts a technology orientation (TO), that is, a firm that is characterized by discontinuous innovations and disruptive technologies with the assumption that entire new markets will emerge (Schindehutte, Morris, and Kocak 2008).

H2: TO and EO will be significant associated with environmental dynamism and hostility. The greater the environmental dynamism and hostility the greater the levels of TO and EO in a firm.

Myers and Marquis (1969) report that the more dynamic and hostile (that is, competitive) the environment the greater the need for innovation and the more likely that firms will be entrepreneurial, in this case increased levels of TO and EO. An environment characterized as dynamic creates opportunities and threats for new ventures and managers react by investing in and leveraging technological resources. The unpredictability of these changes can also influence the firms EO. Hostility is indicative of an unfavourable business climate, typically more competitive where firms will need to adopt a TO and EO to remain competitive.

**Research Methods**

A cross-sectional research design using a survey to generate quantitative responses was used. As TO and EO refer to a mangers self-perception of a firm’s strategic orientation, their self-perception should be closely related to the behaviour of the firm. Hence, as Wiklund (1999) argues, what is really measured is the chief executive officer’s (CEO’s) self-perception and accordingly serves as a relevant proxy for measuring EO and TO.
Although regarded as a micro-level unit of analysis, the firm is an aggregate of different individuals and business activities, and the issues of relevance, size, size distributions, and heterogeneity need to be acknowledged (Davidsson 2004). Due to the variety of industry and firm heterogeneity anticipated in this present study, concerns of broad applicability versus perfect suitability for narrower groups were addressed. Measures that apply to all firms may at the same time apply to none, since they only capture a tiny fraction of each firm’s manifestation of EO (Davidsson 2004). To counteract such discrepancies the instruments were carefully operationalised and are described in detail.

Consistent with previous studies (Wiklund 1999) control variables included, the type of industry – based on the Standard Industrial Classification (SIC) index, firm age, and size of firm in employee numbers. Other intervening factors that may have moderated /mediated the relationship between the study variables are partially accounted for by measuring the direct effect of the environment.

**Sample**

Operalization of the “empirical firm” included firms that were legal entities – close corporations, and private and public companies. A suitable sampling selection criterion was used where the minimum size criterion of a firms sampled was set at 20 employees and the upper limit was set at 500 employees (here a single respondent still can report for entire firm), which then overlaps with the criterion for relevance. This upper limit set also allowed for filtering out of the largest firms, and presumably eliminated some of the typical organizational inertia characteristics of large firms, which may bias EO indicators (Jantunen et al. 2005).

Using these selection criteria, the surveyed population was based on a comprehensive membership list of businesses operating in the Johannesburg area. All potential respondents
were based in the Gauteng province, the economic hub of South Africa, which has the highest number of businesses, the province also accounts for almost half of all enterprises in South Africa. The sampling frame was identified from the Johannesburg Chamber of Commerce and Industry (JCCI) database of businesses operating in the greater Johannesburg area (JCCI 2008). A wide range of businesses were sampled which included various industry sectors. The population of this database is approximately 1600 firms. Based on eligibility criteria and employing a non-probability judgemental sampling technique, 755 potential respondents were surveyed. Judgemental sampling is used when a sample is selected where certain judgements are made on the overall population. The frame selection process for this study can be viewed as a trade-off between practical considerations on the one hand and the demands of randomization and generalizability on the other. Davidsson (2004) suggests that firms are heterogeneous along many dimensions, and that one should acknowledge the heterogeneity, that is, to allow for samples to have reasonable and balanced representation of different kinds of valid empirical manifestations of the theoretical concept ‘firm’. Consequently, due to the heterogeneity of the several different industry sectors sampled, the generalizability of this study is strengthened. Moreover the important issue about sampling, in general, is not statistical but theoretical representativeness, that is, the elements in the sample represents the type of phenomenon that the theory makes statements about (Davidsson 2004).

A compact disk of the total membership database was obtained, and the necessary access codes received, allowing access to the total population with their respective contact details. Once permission was obtained with the Chamber offices, questionnaires were solicited electronically with periodic reminder telephone calls. A number of respondents indicated that not all items were applicable to their situation and subsequently these responses
were assigned as missing data. Based on these procedures and suitability of respondents 230 usable responses were generated as the final sample (30.5 percent response rate).

**Measures**

The measures for EO, TO and environmental dynamism and hostility relied on previously established instruments. The EO dimensions have evolved from the ENTRESCALE, which was derived at by identifying the innovative and proactive disposition of managers at firms. This scale initially developed by Khandwalla (1977), refined by Miller and Friesen (1983), and Covin and Slevin (1989), has been found to be highly valid and reliable at cross-cultural levels (Knight 1997). Although alternative EO conceptualizations are to be found (Brown et al. 2001), and have demonstrated some usefulness, Davidsson (2004) suggests using the existing EO measure which has the advantage of, theoretical backing, a multidimensional construct, and theoretically meaningful relationships established in previous studies, thus allowing for more refined knowledge to evolve. Subsequently, EO was measured along a seven-point bi-polar Likert scale, represented by the three dimensions of innovation, proactiveness, and risk taking. Respondents had to circle number “1” if the statement on the left hand side of the scale best describes your reaction to the item, or circle number “7” if the statement on your right hand side of the scale best describes your reaction to the item. Moreover an aggregated measure of EO can be useful when a differential relationship between the three dimensions and other variables under investigation are not expected (Kreiser et al. 2002), as was the case for this present study.

In order to operationalise a firm’s level of TO, several different dimensions of technology which are generally considered to be most relevant to organisation’s technology strategy were used. To allow for meaningful comparisons with earlier work, a core set of questions based on technology and competitive strategies from the panel study of
entrepreneurial dynamics (PSED) (Gartner, Shaver, Carter, and Reynolds 2004) survey were selected. The PSED provides systematic, reliable data on those variables that explain and predict nascent entrepreneurship. Measures for TO were based on categories which divide firms into three types (Allen and Stearns 2004), namely: (1) First mover (a pioneering entrepreneur with a disruptive technology that creates a new paradigm) – operationalised with surrogate variable – was the product/service available 5 years ago? (2) Practioner strategy (entrepreneur employs current technology to improve products, services, or processes) (3) Innovator strategy (an incremental strategy whereby entrepreneur modifies or improves existing technology). For measures on the environment, the environmental dimensions of hostility and dynamism were selected due to the modest correlations reported between these two dimensions (Zahra 1993), suggesting that unique aspects of the environment are captured with each dimension. Environmental dynamism (5-items) and hostility (6-items) were measured using a 7-point scale, representing 1 = if you strongly agree with the statement and 7 = if you strongly disagree with the statement. Respondents were asked to circle numbers ‘2’ through ‘6’ depending upon their best estimate of an intermediate position. Furthermore respondents were asked to indicate the extent to which they agreed or disagreed with each statement as it applies to their business’s principal industry (that is, the industry that accounts for the largest percentage of your businesses sales).

**Analytical Techniques**

Instruments were subjected to principal component factor analysis, with results obtained discussed in the next section in terms of factor loadings and reliability. Descriptive statistics were then calculated in terms of mean scores and deviations in scores. The hypotheses were tested using correlational analysis, with the Pearson Correlation Coefficients reported in terms of their significance.
**Results**

In terms of sample distribution by industry sector, refer to table 1. Certain industries were clearly under-sampled and others over-sampled. Nonetheless, based on the heterogeneity of the several different industry sectors sampled, the generalizability of this study is strengthened. For firm demographics, see table 2 representing sampled firms which are generally mature in age, with relatively high employee numbers.

**Reliability and Factor Analysis**

To test the scales for internal consistency, items measuring EO and TO render an overall satisfactory Cronbach’s Alpha of 0.793 and 0.749 respectively. In terms of the environmental scales, the two distinct sub-scales of environmental hostility and dynamism produced satisfactory Cronbach’s Alpha’s of 0.742 and 0.717 respectively.

To test for scale validity, employing factor analysis using the Bartlett’s test of sphericity, a significant (0.000) Chi-Square of 638.228 at 36 degrees of freedom (df) score was produced. This test calculates the determinate of the matrix of the sums of products and cross products from the inter-correlation matrix. The Kaiser Meyer Olkin (KMO) measure of sampling adequacy produced a result of 0.823 (KMO values of 0.90 to 1.00 indicate a high degree of common variance). Factor loadings greater or equal to .30 were regarded as significant, and factors with eigenvalues greater than 1 (based on scree tests and Kaisers stopping rule) (Cooper and Emory 1995), were used to decide on optimal number of factors to retain. The items used to measure the EO dimensions were factored using the principal axis factoring method resulting in one factor (eigenvalue $\lambda = 4.564$), with a communality factor of 57 percent. Refer to table 3 for factor loadings and the Cronbach Alpha’s.
For the environmental hostility and dynamism sub-scales, by way of principal axis factoring, communalities were calculated and using Varimax rotation – converging in 7 iterations – two factors with eigenvalues of 4.679 and 1.254 respectively, indicated suitable factor loadings. These two factors reflect the distinct sub-scales of environmental hostility and dynamism. Refer to table 6, where factor loadings and Cronbach Alpha’s are displayed.

**Descriptives**

By applying tests for normality, and by calculating the Kolmogorov-Smirnov and Shapiro-Wilk statistics, test scores (0.07) indicated that normality was not violated.

Descriptive analysis revealed that for the EO scale, above mid-point (3.5) scores across items were prevalent. A relatively high average score emerges for this scale, suggesting that firms have medium to high levels of EO, as captured through the dimension of innovativeness, proactiveness and risk-taking. In a few instances the variance, as measured by the standard deviation, is relatively high, where for the first variable the score exceeds a value of two. This indicates that there is a lot of variation among firms with regard to some of the EO items. See table 4 and 5 for the results.

For descriptives on the environmental scales, both dynamism and hostility have above mid-point (3.5) scores, although many only just exceed this mid-point score. This means that firms perceive environmental hostility and dynamism to be slightly above average. See table 6. However managers’ perceptions of their environments do not always reflect the objective qualities of their markets and industries. Such mismatch may arise from ineffective competitive analyses, poor environmental analyses, cognitive biases, or managerial hubris (Zahra and Bogner 1999).
Firm Clustering

Consistent with previous studies cluster analysis was used to empirically delineate between firms with different types of TO (Galbraith, Rodriguez, and DeNoble 2008). The process of clustering the data set was performed with the use of clustering algorithms that identified similar characteristics in the data set, then filtered/partitioned into the three clusters. Examining the difference in categorical values of the TO variables ($p < 01$), the first cluster clearly reflected a grouping of firms with TO orientation, that is, “first mover” (21.74 percent of the sample), the second cluster appeared more of an “innovator” TO (9.57 percent of the sample), and the third cluster, the majority of responses, termed as “practioner” TO (68.69 percent of the sample).

Multivariate Analyses

To evaluate the hypothesized relationships between the variables, correlational analysis was employed. It has been suggested that the correlation significance should be checked before embarking on regressions (Cooper and Emory 1995). For the correlation matrix, refer to table 7, here the Pearson Correlation Coefficients are reported with the values in the second line of each row indicating the p values. According to Cohen and Holliday (1998), a multiple correlation coefficient of 0.7 or above is considered a high relationship. Anastasia and Urbani (1997) maintain it should be high enough to be statistically significant at the 0.05 and 0.01 levels.

Based on table 7, hypothesis 1 cannot be confirmed, as EO and TO are not significantly correlated. However both EO and TO are highly correlated with environmental hostility and dynamism. In fact EO has almost a perfect correlation with both environmental measures. This suggests that a variance in EO is highly attributable to a change in either environmental dynamism or hostility.
To further explore associations with any of the control variables, firm age were juxtaposed against EO, TO and a combined environmental dynamism or hostility score. All variables dipped in the 7-10 year category (not shown). A plausible explanation for this is that firms mimic the classical venture life cycle. When firms enter into a late growth phase and into the mature phase a period of consolidation occurs where TO and/or EO and environmental factors drop off. When firms move into the rejuvenation phase (post 10 years), an increase in TO and/or EO and environmental factors is evident during this phase.

Discussion

This purpose of this study was to test the relationship between EO and TO by measuring how environmental factors might be associated with each orientation type. Contributing to literature by building on, and complementing existing studies, this study emphasised the challenge and opportunity for firms in emerging economies to adopt technology and act entrepreneurially, which can optimize and maximize developmental efforts.

In line with contemporary research, it was expected that the entrepreneurial and technology orientations of firms will be significantly associated with each other as well as with perceived environmental dynamism and hostility. Contrary to expectations, no evidence for hypothesis 1 could be detected. Nonetheless the lack of significant associations between EO and TO is not trivial for exploratory research in a new domain such as entrepreneurship, particularly in an emerging country context. On the other hand, the significant and positive correlations between EO and environmental hostility and dynamism provide unequivocal support for hypothesis 2. The association between TO and hostility and dynamism is less strong, yet significant at the 0.05 level. These findings resonate with research which has
found that a key part of a technology and innovation strategies is the interaction of that strategy with the ventures external environment (Zahra and Bogner 1999).

Another plausible explanation for the strong and positive associations is when the environment is characterized by complexity and dynamism, firms have to anticipate future scenarios and develop proactive EO and TO strategies in ambiguous and unstructured surroundings (Allen and Stearns 2004).

This study also re-establishes scale reliability and validity in an emerging country context. Concerns have been expressed as to whether imported instruments would stand up to validation across countries (Nkosi and Roodt 2004; Van de Vijver and Rothmann 2004). This study has found support for the same factor structures across the measures used.

Research on firm innovation, in the African context may be considered as valuable, as very few empirical studies which have been previously conducted focus on innovation and technology in an emerging country context. The majority of research on firm innovation has been conducted in the United States and subsequently the generalizability of TO and in particular EO remains limited because of a western proclivity with limited cross-cultural testing (Antoncic and Hisrich 2001). Although studies (for instance, Kreiser et al. 2002) have confirmed the cross-cultural validity of the EO scale, samples typically exclude African countries. Therefore an empirical study of this nature is potentially valuable considering that technology and innovation and its effective diffusion are central and critical to the growth of economic output, productivity and employment. Additionally the importance of international entrepreneurship justifies that constructs are tested for relevance in emerging country contexts as well (Jantunen, Puumalainen et al. 2005; Ulijn, Nagel, and Liang 2001).

The centrality of the TO and EO constructs is not new, nevertheless this study adds to a better understanding of these strategic orientations in a non-western context, which in turn enhances their generalizability. The study also offers some solutions towards understanding
how TO and EO may promote firm innovation which encourages the diffusion, adoption and application of the very latest technologies. This is particularly relevant where a lot of potential exists in developing countries to “import and adapt” technologies developed in industrialized countries (von Broembsen et al. 2005).

A deep and thorough understanding of EO, TO and environmental conditions is important not only for academic purposes but also because the subject has salience for practitioners and policy makers. These implications relate to the profitability and competitiveness of the firm as well as to the overall economic performance of industry and the national economy (Dorf and Byers 2008). Businesses which incorporate innovation into their vision by relying on entrepreneurial strategies and actions, understand that innovation is at the core of an entrepreneurial organization. It is around this core that other elements of the organization such as strategy, management style and structure are built. Corporate environments supportive of entrepreneurship must provide appropriate reward systems, top management support, explicit goals and appropriate organizational values which signal to employees that entrepreneurial behaviour action is desirable.

Moreover, government programs and incentives could focus on established firms, with higher levels of EO and TO rather than on potential individual entrepreneurs, since in an emerging country context institutional conditions need to be strengthened first, before entrepreneurship flourishes (Minniti et al. 2005). Around the world most governments have recognized the potential in high technology and have begun nurturing this industry through support institutions. They acknowledge the importance of intellectual capital in growing knowledge economies and create conditions that foster innovation.
Limitations and Future Research

Because environmental conditions vary significantly from one industry to another (Dess and Beard 1984), and because the nature of the environmental characteristics is inextricably linked to the stage of the industry’s evolution (Zahra and Bogner 1999), controls for these variations are necessary in future studies. Moreover, in some contexts there may be differences how the environmental dimensions relate to EO and TO. Findings in this study may also be related to the influence of other contingencies not incorporated or to measurement issues unobserved. A further limitation of this article is that a cross-sectional study loses the dynamic aspects of EO and TO, particularly in hostile and dynamic environments, which prevents conclusions about causal relationships to be drawn.

Conclusion

Entrepreneurship can provide direction to the company’s entire operation, serves as an integral component of a firm’s strategy, and may function as the core component of corporate strategy (Covin and Slevin 1997). Each of the EO dimensions – innovativeness, proactiveness and risk-taking - is useful for predicting the success of business which may be contingent on the environment. Managers can establish the impact of environmental dynamism and hostility on EO and TO and explore the effect of these factors on various performance indicators. Indeed mangers need to adopt a contingency perspective on how environmental and organizational factors moderate, mediate or interact with TO and EO to enhance firm performance.

ABSTRACT

This short exploratory paper aims to study job attitudes of business college students with a view of contributing to the explanation of the reported global growth in young entrepreneur activities. The five employment attitude factors of security, workload, social environment, responsibility, and opportunity, adapted from the theory of planned behavior are used to conduct a comparative study of work attitudes of university business students in the United States of America and South Africa to establish if there are significant differences across nations. The results show similarity in what the students expect from their future careers but do not necessarily provide an explanation for the observed global phenomenon of increased activity in youth entrepreneurship.

PRINCIPAL RESEARCH TOPIC AND RESEARCH QUESTION

In the past few years successive Results Reports from the Global Entrepreneurship Monitor indicate that throughout the world entrepreneurs are pursuing new ventures out of both necessity and opportunity. This paper aims to study job attitudes of business graduates with a view of contributing to the explanation of the reported global growth in young entrepreneur activities. Starting up a new venture is acknowledged to be an individual decision, (Littunen, 2000). This makes the individual entrepreneur central in the investigation of entrepreneurial activities. Search has encouraged a continuous study and refinement of the entrepreneurial profile. Interest in entrepreneurship among young people is reported to be growing (Scarborough, et. al, 2009), prompting increased research interest in the area, (Harris, et. al., 2008). In examining the global landscape, it is clear that some cultures produce many more entrepreneurs than others, (Gartner, 1990) and finding possible explanations continues to be of increasing importance in the global economy.
Although significant research has been conducted in the field of entrepreneurship studies on entrepreneurial motivation are still limited, (Kuratko, et. al., 1997). Research on work values of young college graduates has shown that they desire work which provides a feeling of accomplishment, job security and the opportunity for advancement. Much of this research has been done in developed and individual country economies. Also with the reported increase in entrepreneurial activity among young people a further research question that arises is whether the work values reported earlier still hold and whether there are differences across countries.

The objective of this exploratory comparative study is to contribute to entrepreneurship research through establishing the work attitudes of today’s undergraduate college business students across countries. The five employment attitude factors of security, workload, social environment, responsibility, and opportunity, adapted from the theory of panned behavior are used to conduct a comparative study of work attitudes of university business students in the United States of America (US) and South Africa (SA) to establish if there are significant differences across nations.

**LITERATURE REVIEW**

In one of the many suggestions of defining entrepreneurship Gartner (1989), views entrepreneurship as a process of organization creation. Scholars have attempted to explain new business formation from a range of perspectives including psychology (Bird, 1992), sociology (Aldrich, 1990), and economics (Douglas and Shepherd, 2000). Career choices have been demonstrated to be cognitive in nature, (Kruger, et. al 2000), evolving as we cognitively process our knowledge, beliefs, and experiences. There are studies that suggest that new ventures emerge
because of deliberate choices made by individuals (Shaver and Scott, 1991), and one of the immediate antecedents of behavior is intention, (Ajzen, 1991, Kim and Hunter, 1993).

Entrepreneurship research has attempted to identify the situational factors and environmental factors that predict entrepreneurial activity. Using the contingency theory Gilad and Levine (1986), proposed the “push” and “pull” theories as possible explanations of entrepreneurial motivation. The “push” theory suggests that a person can opt for entrepreneurship as a result of unfavorable environmental conditions like job dissatisfaction, while the “pull” theory argues that people can find entrepreneurship attractive. Despite research indications that individuals become entrepreneurs mainly because of “pull” factors college graduates and students are reported to be increasingly disenchanted with career prospects as organizational employees, (Orhan and Scott, 2001).

**METHODODOLOGY**

This study draws on the demonstration by Kolvereid (1996) that the Ajzen (1991) framework is a solid model for predicting entrepreneurial intentions to examine the work attitudes of undergraduate business college students in the US and South Africa. One of the variables that influence intent to perform a behavior is attitude towards the behavior. Our basic proposition is that a partial explanation for the increase in entrepreneurial activity among young people is that compared to organizational employment, entrepreneurship better meets the career aspirations of the young people of today and that this phenomenon cuts across nations.

We conduct a survey of work attitudes of undergraduate university business students in partner universities in South Africa and the US. The sample consists of undergraduate student
subjects facing imminent career decisions. Data is collected through a self administered questionnaire. The research instrument questions are adapted from prior research designed to establish what the subjects consider important in choosing a career. A basic survey analysis tool is used to generate the career preferences.

RESULTS

The questions allowed assessment of job attitudes along identifiable categories. Top on the list of preferred career attributes for the South African students was an interesting and motivating job, (87.9 per cent), with promotional opportunities (87.9 per cent). These fall into two categories, the nature of the job, and potential rewards from the job. In second place was the challenge and excitement associated with the job (84.75 per cent). This attribute, as with interest and motivation, is about the nature of the job. A close third position at 81.8 per cent, was economic opportunity. Fourth was opportunity for career progress (78.8 per cent), and participating in the whole process (78 per cent), and the last in the top five was job security and stability both at 72.7 per cent., which is more than ten percentage points lower than the first position scores for job characteristics and rewards.

Analysis of the response from US students showed a very clear preference for opportunities in the career. In first place was opportunity for career progress (81.4 per cent), and second was promotion opportunities (78.9 per cent). In third place are two factors in different categories. The students are interested in a job that is interesting and motivational (71.8 per cent), a job characteristic factor, and job security (71.8 per cent). In fourth position, at 69 per cent is the importance of economic opportunity. Last in the top five preferences for the US students was job challenge and excitement (67.1 per cent).
Table one
Preferred career attributes

<table>
<thead>
<tr>
<th>Rank</th>
<th>South Africa</th>
<th>United States</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Promotion, Interesting and motivating job</td>
<td>Opportunity for career progress</td>
</tr>
<tr>
<td>2.</td>
<td>Challenge and excitement</td>
<td>Promotion</td>
</tr>
<tr>
<td>3.</td>
<td>Economic opportunity</td>
<td>Interesting and motivating job, Job security</td>
</tr>
<tr>
<td>4.</td>
<td>Opportunity for career progress, Process participation</td>
<td>Economic opportunity</td>
</tr>
<tr>
<td>5.</td>
<td>Job security, Job stability</td>
<td>Challenge and excitement</td>
</tr>
</tbody>
</table>

Except for job stability and process participation the two groups of students share largely similar expectations of their careers. A cursory view of these preferences does not necessarily highlight entrepreneurial orientation.

The next set of variables considered important by the students with relatively equal ranking by the students includes the need to realizing one's own dreams, creating something new, exploiting creative ability, to have authority and decision making power. The results appear to suggest that although today's students have a first preference for what organizational employment may offer, disappointment with organizational employment may lead them to enterprise. A possible explanation for the observed increase in young people taking on entrepreneurship is that this route is seen as the alternative strategy to realizing one's dreams.

Table two
Attitudes towards responsibility

<table>
<thead>
<tr>
<th>Responsibility statement</th>
<th>South Africa Strongly disagree</th>
<th>United States Strongly disagree</th>
</tr>
</thead>
<tbody>
<tr>
<td>Avoid responsibility</td>
<td>84.8 per cent</td>
<td>70.4 per cent</td>
</tr>
<tr>
<td>Limit responsibility</td>
<td>65.6 per cent</td>
<td>67.6 per cent</td>
</tr>
<tr>
<td>Avoid commitment</td>
<td>59.4 per cent</td>
<td>69.0 per cent</td>
</tr>
</tbody>
</table>
In responding to the question of responsibility and commitment the students surveyed strongly disagreed that the need to avoid responsibility, limit responsibility, or avoid commitment would influence their choice of a job. A comparative analysis of the findings shows a more consistent attitude towards responsibility and commitment among the US students surveyed, whereas the message from the South African students appears to suggest a greater willingness to take on responsibility that willingness to commit oneself.

**DISCUSSION**

Four overall global patterns emerge from the analysis. First, of highest importance to the college students is a career that is interesting, motivational, challenging, and one that recognizes achievement and allows participation. Prior research on work values of young college graduates has shown that they desire work which provides a feeling of accomplishment, job security and the opportunity for advancement. Results of this exploratory research appear to suggest a lower rating for job security and a higher rating for job excitement. Second, the results appear to challenge the popularly held generalizations that bill today’s young adults as people who avoid. Third, job security and stability, while perceived to be important, cannot come at the expense of personal fulfillment and career challenges. Increased entrepreneurial activity among today's young people may not necessarily be a result of an increased preference for entrepreneurship.

A possible explanation for the slight differences found in the ranking of the five job related attitudes, may be Abbey's (2002) finding that cultural differences, particularly between individualistic and collectivist cultures, can influence motivational preferences of individuals. However this study did not specifically investigate this relationship. It is interesting to note that in its report on entrepreneurship during the recession the 2009 attitudes Results Report from the
Global Entrepreneurship Monitor indicate a positive trend in perceived entrepreneurial opportunities for South Africa, and a negative trend for the US.

**CONTRIBUTIONS**

This research makes two important contributions. First, it brings out what young business students expect from their careers. Second, it provides a comparative perspective of the career preferences of young people. The important role of entrepreneurship to any economy is widely acknowledged. Economic and community development hinges on growing business formation and growth. To encourage economic development in the form of new businesses it is necessary to have information on factors that exert a positive influence on attitudes towards self employment. Information that helps enhance entrepreneurship should be of interest to a range of stakeholders including researchers, educators and policy makers. Understanding differences in work attitudes across nations will make a contribution towards explaining differences in rates of firm startups across nations an important consideration in this age of globalization.

**LIMITATIONS AND FUTURE RESEARCH DIRECTIONS**

One limitation of this exploratory study is its cross sectional nature. It does not provide a direct link between job attitude and active business founding. As such conclusions linking job attitudes to levels of entrepreneurship are theoretically based. Another limitation is that because of the survey nature of the research it has not been possible to make follow up questions to uncover the reasoning behind the attitudes.
The results suggest potentially interesting explanatory research to provide detailed information of the career intentions of today’s business students. It is also important to provide longitudinal studies in this area to follow the career paths of the respondents.

The Traits and Growth Orientation of a Successful Forest Machine Entrepreneur*

by Juho Soirinsuo and Pekka Mäkinen

Abstract

The purpose of this study was to investigate the entrepreneurial traits of a successful growth-oriented forest machine entrepreneur in Finland. The study attempts to determine what the key traits of successful forest machine entrepreneurs are. The research material was collected in 2008 by personal interviews with 23 entrepreneurs. The entrepreneurial traits included innovativeness, willingness to take risks, proactivity, locus of control and achievement motivation. The reasons for choosing to grow and the goals of growth were also examined as well as growth method. The study found that self-perceived innovativeness, proactivity and achievement motivation correlated positively with successful growth. Goal setting and the entrepreneurial traits had a strong correlation with the chosen growth strategy and the success of growth. The findings show that the listed traits play an important role in successful growth and they can anticipate behaviour in growth.

Keywords: Entrepreneurial traits, Finland, forest machine entrepreneurs, goal setting, growth strategy.

Introduction

Forest transport (i.e., forwarding) began to mechanize in the 1960s, and at that time the first forest machine entrepreneurs also appeared. In the 1980s felling was done mainly by lumberjacks, but later in the decade harvesters began to become more general. In 1985 approximately 200 harvesters were in use, whereas ten years later the number was six times greater (Mäkinen, 2008).

* Juho Soirinsuo is working on his Ph.D. at the Finnish Forest Research Institute. His research focuses on growth and its implications in the timber haulage sector and in the forest machine sector in Finland. Pekka Mäkinen is professor of rural entrepreneurship at the University of Helsinki, Department of Economics and Management, and a senior researcher at the Finnish Forest Research Institute. His research focuses on entrepreneurship and profitability of SMEs in forest and woodworking industries. Address correspondence to: Juho Soirinsuo, University of Helsinki, Department of Economics and Management, Koetilantie 5 (P.O. Box 28) 00014 University of Helsinki, Finland. Email: juho.soirinsuo@helsinki.fi.

The present study was financed by the Metsämiesten Säätiö Foundation and the Paulo Foundation.
Nowadays nearly all logging is done mechanically using harvesters and forwarders, and over 5200 forest machines operate in Finland, mostly owned by close to 2600 forest machine entrepreneurs (MetsäTrans, 2008).

Finland’s forests are very important for the national economy and are even more crucial for employment in the rural areas. The volume of roundwood and forest residual energy wood harvested by forest machine entrepreneurs in Finland in 2007 was 57.7 million cubic meters – an increase of 8 percent since 2001 (Finnish Statistical... 2008). A recent trend in the forest machine sector has been an increasing number of entrepreneurs, and large companies are also becoming more common. Even though the sector is driven by small companies and 88 percent of the entrepreneurs own less than four forest machines (turnover less-than 300.000) (MetsäTrans, 2008), some of the larger entrepreneurs have a very strong growth strategy (Soirinsuo & Mäkinen, 2009). It should also be remembered that forest machine entrepreneurs are the largest employers in the Finnish forest sector (excluding processing).

Entrepreneurship research has been aimed at the processes of setting up new enterprises. Too often the existing firms and the potential they hold are forgotten. Growth is a very important field of study because much of the growth of industry comes from the growth of existing establishments, rather than from new ones (Kumar et al., 2001; Mäkinen et al., 2002). Surprisingly few studies, however, have investigated the crucial relationship between growth and profitability (Davidsson et al., 2005). Penttinen et al. (2009) stated that among forest machine companies in Finland "effective aids and tools for improving the economic and managerial skills of entrepreneurs are needed". This study attempts to fulfill that need.
Higher growth in the forest machine sector in Finland has resulted partly from the large timber procurement companies outsourcing more of their activities to so-called key or area entrepreneurs, who have taken on increasingly larger areas of the business in Finland. There is very little research on the growth of forest machine companies. However, many studies have been done on forest machine entrepreneurs, entrepreneurship in general, and the growth and profitability of small companies.

The aim of the present study was to investigate the largest growth-oriented forest machine entrepreneurs and the individual behind the growth. It should be noted that growth itself is a very important strategic decision, the success of which can be seen in financial results. The study emphasizes the importance of the entrepreneur and the chosen growth strategy. The purpose was to clarify the reasons why entrepreneurs decide to grow, what the traits of a successful entrepreneur are and, most importantly, what makes certain entrepreneurs' growth more successful. The traits are analysed with multiple variables that affect profitability and growth success. The study aims to link growth, profitability and entrepreneurial traits together in order to find successful growth methods. It is essential to study companies’ internal factors when experiencing growth, because it would be an unwise oversimplification to assume that nothing else but size changes (Davidsson et al., 2005). There is also compelling evidence that an owner-manager’s growth motivation, vision and goals have direct effects on a firm’s growth (Mok & van den Tillaart, 1990; Kolvereid & Bullvåg, 1996; Baum, Locke & Kirkpatrick, 1998; Wiklund, 2001; Davidsson et al., 2005).
**Materials and methods**

**Research material**

The study focuses on the largest limited companies in the forest machine sector which have had a growth in turnover from 2001 to 2007. The growth of a company can be measured in many ways, but it is generally agreed that growth in sales is the one most universally applicable (Davidsson et al., 2005). The sample included the largest limited forest machine companies in Finland because these often have more easily accessible material and because small one-machine companies are not necessarily even interested in growth. In this way, the sample included a significant number of the largest growth-oriented companies in the sector.

The sample consisted of 32 entrepreneurs of which 23 agreed to being interviewed. This meant a response of 72 per cent. The entrepreneurs were interviewed individually in autumn 2008. Questions concerning self-perceptions of innovativeness, willingness to take risks, proactivity and achievement motivation were answered on a scale of 1-5. Locus of control was either internal or external. The questions about goals, reasons for choosing growth and growth strategy were open, as this would reveal the traits better. Davidsson (1989) argued that to the extent that the owner-manager has a choice, going for growth is more entrepreneurial than not doing so when both alternatives are feasible, just as starting a firm is considered more entrepreneurial than not starting one. This study strongly links entrepreneurship, profitability and growth together.

The companies’ financial statements from the years 2001 to 2007 were also taken into account to determine the financial success of their growth. The average fiscal period ended in August and nine companies had used the calendar year as a fiscal period. Two of the entrepreneurs, however, were not able to supply financial statements for one or two years (Table 1).
Table 1. Twenty-three available financial statements from selected companies.

</tbody>
</table>

Groups were formed based on their success ratio. This ratio was measured by adding the profitability score and the equity ratio score. The profitability score was calculated with formula (1) which counts the weighted average of profitability (net profit), in order to clarify which companies grew most successfully during the period studied. The formula overrates the profitability at the end of the period and underrates the profitability at the beginning as follows:

\[
S_p = 4 \left[ \left( \sum_{t=1}^{7} (p_t \times 0.7) + \sum_{t=1}^{7} (p_t \times 0.85) + \sum_{t=1}^{7} (p_t \times 1.15) + \sum_{t=1}^{7} (p_t \times 1.3) \right) \times 100 \right], \tag{1}
\]

where \( S_p \) is the profit score, which is the weighted average of net profit percentage \( p \) during the time period \( t \), measured from years \( t_{1...7} \). The equity ratio score was counted with the similar formula (2) overweighing equity ratio at the end of the period and underrating equity ratio at the beginning of the period as follows:

\[
S_e = 0.5 \left[ \left( \sum_{t=1}^{7} (e_t \times 0.7) + \sum_{t=1}^{7} (e_t \times 0.85) + \sum_{t=1}^{7} (e_t \times 1.15) + \sum_{t=1}^{7} (e_t \times 1.3) \right) \times 100 \right], \tag{2}
\]

where the equity ratio score \( S_e \) is the weighted average of equity ratio \( e \). Weighted profitability was multiplied by four and weighted equity ratio was divided by two so that their weights would be equal. The three groups were formed on the basis of the companies' financial success (net profit and equity ratio) from 2001–2007, as we already knew that every company grew during that time. This
method was used to minimize the effect of stochastic variation. Further, the use of only first year and end year data for growth calculations has been criticized because it models growth as one giant leap (Davidsson & Wiklund, 2000).

The three groups formed were defined as highly successful, those with high and/or increasing profitability and equity ratio during the growth period; less successful, those with weak and/or decreasing profitability and equity ratio; and moderately successful, those in between, with high or increasing equity ratio or net profit ratio.

**Literature review**

Despite the fact that historically the forest machine sector has suffered from low profitability (Mäkinen, 1988, 1993; Soirinsuo & Mäkinen, 2009; Yritystutkimuksen... 2009) growth is not necessarily the key to better profitability. In a study by Soirinsuo & Mäkinen (2009) based on companies' financial statements, it was found that among large growth-oriented forest machine enterprises profitability varied significantly. However, the study did not cover human factors, meaning traits contributing to the reasons why success in the growth-oriented companies was so mixed.

Mäkinen (1988, 1993) investigated forest machine entrepreneurs’ profitability, while at Metsäteho Ltd profitability from a customer perspective was analysed by Rajamäki and Heikka (1990). Mäkinen (1988, 1993) also studied the effects of strategy and competiveness on success, as well as forest machine entrepreneurs’ profitability, but the role of growth was not considered. Rajamäki and Heikka (1990) analysed the size of companies vis-à-vis profitability and factors affecting profitability. Penttinen et al. (2009) studied the economic development prerequisites of
forest machine companies in Finland, but growth itself was not looked at. Mattsson (1997), Lundberg (2000), Hultåker and Bohlin (2004), Hultåker (2006) and Liden (1995) examined the economics and business development of forest machine entrepreneurs in Sweden, while LeBel and Stuart (1998) studied the causes of efficiency variations in forest machine companies in North America.

**Theoretical framework**

The OECD (1998, p. 11) proposed the following definition for entrepreneurship: “Entrepreneurs are agents of change and growth in a market economy and they can act to accelerate the generation, dissemination and application of innovative ideas […] Entrepreneurs not only seek out and identify potentially profitable economic opportunities but are also willing to take risks to see if their hunches are right”. Shane and Venkataraman (2000) defined entrepreneurship as “the nexus of two phenomena: the presence of lucrative opportunities and the presence of enterprising individuals”. However, definitions of the term are abundant.

Edith Penrose (1959) characterized the growth of a small company as follows: "The term ‘growth’ is used in ordinary discourse with two different connotations. It sometimes denotes merely an increase in amount; for example, when one speaks of ‘growth’ in output, export, and sales. At other times, however, it is used in its primary meaning implying an increase in size or improvement in quality as a result of a process of development, akin to natural biological processes in which an interacting series of internal changes leads to increases in size accompanied by changes in the characteristics of the growing object".
A company can grow by many ways, but basically there are three different growth strategies: organic growth, diversification and acquisition or merge. From these, organic growth is the most common way to grow. However, organic growth is quite slow especially when compared to acquisition or merge. At the same time acquisition and merge are more risky and they demand more capital and planning. Diversification to another sector demands new kind of equipment and tasks. It demands learning, but it can raise the value of the main business also. In this study, outsourcing is also taken into account.

The process of growth is very complex and time-consuming for the entrepreneur, and thereby the decision to grow is an important entrepreneurial act. However, this decision also needs strong motivation as well as specific goals which are as important in successful growth. The prime axiom of goal-setting theory is that specific, difficult goals lead to higher performance compared to when one strives to simply “do one’s best” (Locke, 1966; Locke & Latham, 1990; Heslin et. al., 2008). According to Baum and Locke (2004), goals set by entrepreneurs themselves have a significant impact on growth success growth. Specific goals positively affect the performance of individuals and businesses.

Many theoretical and applied studies concerning the traits of an entrepreneur have been done. Four of the most influential theoretical viewpoints with respect to this study are that of Schumpeter (1934), McClelland (1961), Rotter (1966), and Bateman and Crant (1993). According to Schumpeter (1934), an entrepreneur is a person who functions as an innovator; that is he or she successfully introduces new combinations to the market forces. One of the most distinguishing traits of an entrepreneur is his or her innovativeness. Schumpeter believed in so-called "creative destruction" in the market process where new information is important in entrepreneurship. Moreover, for Schumpeter, creative destruction makes the old obsolete.
McClelland's (1961) achievement motivation theory proposes that the factors influencing motivation are 1) willingness to take risks, 2) the need to achieve, 3) the need for power and 4) the need for affiliation. According to McClelland, financial success reflects success in work and therefore increases one's motivation towards work. Every entrepreneur must take risks to some extent; after all, opting for entrepreneurship is never risk-free. However, concerning growth it is up to the entrepreneur how the level of risk is perceived. McClelland also stated that achievement-motivated individuals prefer a moderate degree of risk on the way to becoming successful entrepreneurs.

Rotter's (1966) locus of control refers to an individual's generalized expectations concerning either internal or external control. According to Rotter, internal control beliefs improve learning because they motivate individuals towards active behaviour whereas external control beliefs can make individuals’ behaviour passive and hinder the adaptation to new information.

Bateman and Crant (1993) introduced the concept of proactive personality. A proactive personality is indicative of one who is unencumbered by situational forces and creates change within an organization (Bateman & Crant, 1993). Individuals (entrepreneurs) with a strong proactive personality confront and solve problems, and take advantage of environmental changes to improve their situation regardless of situational forces.

A relatively large number of studies concerning personal traits in relation to entrepreneurship in general have been made, and different problems have been identified with these. Gartner (1989) found that the concepts and definitions of personal traits used in the studies differ substantially as well as the characteristics associated with entrepreneurship. Stevenson and Sahlman (1987) found that character traits are not universal, as many successful and unsuccessful entrepreneurs have
characteristics which are not on the list. Criticism of the entrepreneurial traits research is also based on a lack of significant empirical findings to support the claim that entrepreneurs are psychologically “different” from the general population (Mueller & Anisya, 2000). However, only a small number of individuals are entrepreneurs. In this light, it can be seen that entrepreneurship demands something special that differentiates them from the rest of the population (Niittykangas, 2003).

Results

Research sample

The average age of the 23 interviewed entrepreneurs was 49 years and length of time as an entrepreneur 23.8 years. The average age of the companies was 31.9 years and the average time as a limited company 15.9 years. Of the 23 companies a total of 18 were family businesses. The companies employed an average of 24.2 people with mean age of 39 years. The companies owned an average of 13.5 forest machines of which 7 were harvesters. According to MeträTrans (2008) 60 companies in the sector owned at least eight forest machines. This means that the sample included a significant number of the sector’s large companies and a clear majority of its large growth-oriented enterprises. The education level of the entrepreneurs was rather low: nine entrepreneurs had no education after basic school and none had a university degree. All entrepreneurs were male.

The average turnover of the companies grew 107.5 percent from 2001 to 2007, reaching EUR 2.96 million in 2007. On average, turnover grew by 12.9 percent per year. Median growth was 106.1 percent to EUR 2.3 million by 2007. In 2001 external services generated an average of 2.3 percent of turnover whereas in 2007 the figure was 14.0 percent. The amount of money spent on
external services increased 116 percent from 2001 to 2007. Median net profit plummeted from 6.0 percent in 2001 to 2.7 percent in 2007 (Figure 1).

Figure 1. Development of turnover and net profit ratio 2001-2007.

Groups

The financial score method revealed that the companies experiencing growth between 2001 and 2007 clearly grew differently in financial forms (Figure 2). This gives us an interesting basis of analysis. Some companies grew unsuccessfully and others grew very successfully. The financial score method classified the 23 companies as follows: eight highly successful (financial score of over 50), seven moderately successful (financial score between 20 and 50) and eight less successful (financial score of under 20).
The highly successful group comprised medium-sized companies with an average turnover of EUR 2.8 million. These managed to increase their net profit ratio by 13.8 percent as they grew. The equity ratio remained at about the same level in 2007 as in 2001. The moderately successful group represents an average company of the sector when focusing on net profit ratio and on its development. This group clearly grew the fastest but the companies’ profitability weakened significantly. Their equity ratio, however, remained at a healthy level. The less successful group grew the slowest, and, even though the average equity ratio weakened even more, their average net profit strengthened slightly. However, the financial situation of less successful companies worsened to a critical level. Growth seems to have had a negative impact on moderately successful companies, but a positive impact on highly successful companies (Table 2). Relative standard deviation of turnover in 2007 varied the most among moderately successful companies (as they were also the largest companies on average) and the least among less profitable companies. The large variation of company sizes within the groups means that company size is not a good explanatory variable in this study.
Table 2. Financial development of the groups studied.

<td>36.3%</td>
</tr>
</tbody>
</table>

Growth strategies

Companies’ growth strategies varied between these three groups. From the Table 3 it can be seen that the less successful group based their growth mostly on organic growth. It can be seen also that some companies use combined growth strategies, mostly among the moderately and highly successful groups. Less successful companies have the least subcontracting from turnover and three companies have no subcontracting at all. Only two companies grew by diversification and one by acquisition or merge. However, four companies in the moderately successful group grew by diversification and three by acquisition or merge. This shows that these companies clearly used much time in planning their growth and growth strategy. Companies in highly successful group grew also by many different ways outsourcing being very important part of the growth strategy.

Table 3. Used growth strategies.

<td>2.7 %</td>
<td>7.6 %</td>
<td>5</td>
<td>8</td>
<td>2</td>
<td>1</td>
</tr>
</tbody>
</table>
It is interesting to notice that highly successful companies load much on subcontracting and less successful companies on the contrary the least. Less successful companies load the most on organic growth as highly and moderately successful companies use, on average, larger variations in growth.

**Entrepreneurial traits**

The results showed that highly successful entrepreneurs perceived themselves as more innovative, proactive and achievement motivated but less willing to take risks than other groups. Less successful entrepreneurs perceived themselves as less innovative, proactive and achievement motivated but more willing to take risks. The moderately successful group fell somewhere in between these two parameters. The largest difference between groups was in achievement motivation (0.81 points) and the smallest in innovativeness (0.56 points). Willingness to take risks was clearly the lowest among highly successful entrepreneurs than the other groups. A positive correlation was observed between financial success in growth and innovativeness, proactivity and achievement motivation. The correlation was negative in willingness to take risks.

The research sample included as many entrepreneurs with an internal locus of control as those with an external locus of control (10 each). Three entrepreneurs believed in both equally. External locus of control was found to be more common among the highly successful group but also among the less successful group. The moderately successful group clearly had a more internal locus of control: this was the case in five out of seven entrepreneurs. In the highly successful and less successful groups only three and two entrepreneurs, respectively, out of eight, had an internal locus of control (Table 4). Locus of control was found to be quite diverse and no correlation was found between locus of control and financial success in growth.

Growth motivation

Among the whole sample the main reason for growth was more work offered by current customers and the main goal was to improve profitability. However, growth motivation varied greatly between entrepreneurs and also between groups. More work offered was the main reason why highly successful entrepreneurs decided to grow. Other reasons were also related to business development, such as economies of scale and improving business. Highly successful entrepreneurs' main goal of growth was to increase profitability, but also to improve their business situation and gain more customers (polycustomership).

Among the moderately successful entrepreneurs’ main reasons for choosing growth was to establish an area entity and increase profitability. Area entity means in this case a monopoly situation or a very strong local position logging certain area for a customer. Another reason was the greater amount of work offered by current customers. These entrepreneurs’ goals were quite similar, as were their reasons for choosing to grow. Four entrepreneurs mentioned that achieving area entity was their main goal of growth, as well as improving profitability.

† Locus of Control, A: Internal expectations, B: External expectations, AB: Both as much (50/50).
In the less successful group the range of answers was wider (Table 5). The main reasons for wanting to grow were greater amount of work offered by current customers, achieving higher profitability and achieving area entity. Other reasons included coincidentally won tenders, year-round employment, staying in business, developing greater know-how, and economies of scale. The main goal of three entrepreneurs was to improve profitability. Other goals were to become larger locally, to offer more services and to stay in business. However, one entrepreneur was not able to name any specific goal, and one mentioned that “coincidental growth had no goals”.

Highly successful entrepreneurs chose growth mainly at the request of their customers, and their goals were largely financial. Moderately successful entrepreneurs had area entity as their main reason for wanting to grow; this was also its main goal. The reasons why less successful entrepreneurs opted for growth were very diverse, but the main reason was to improve profitability.

Discussion

The results of the present study were somewhat unexpected based on earlier applications of current theories. These theories suggest that high innovativeness, willingness to take risks, proactivity and achievement motivation should be found among successful entrepreneurs. They also suggest that internal locus of control would be more common among successful companies.
However, this study found that goals and reasons for wanting to grow are more complex, and are not necessarily good explanatory variables alone. After the growth decision was made, the applied growth strategy varied much between groups. It was also found that the somewhat controversial traits theory does work as an explanatory factor in this sector.

The study found that highly successful entrepreneurs perceived themselves as highly innovative, proactive and achievement motivated. However, they were not that willing to take risks compared to the two other groups and their locus of control was more external than internal. It is possible that this greater external locus of control could be explained by the reasons for choosing growth; highly successful entrepreneurs usually grew at the request of their customers. However, the main goal of growth was to increase profitability and develop the business. The chosen growth strategy was clearly different from the business strategy before growth.

Less successful entrepreneurs perceived themselves as relatively less innovative, proactive and achievement motivated. They were more willing to take risks compared to other groups and their locus of control was strongly external. Their growth reasons were varied, but originated more from the entrepreneur himself than from the customer. The main goal of growth was to improve profitability. Their high willingness to take risks could be due to a poor financial situation even though they grew the slowest. These companies grew mainly organically.

Moderately successful entrepreneurs were in the middle-ground in terms of innovativeness, willingness to take risks, proactivity and achievement motivation. However, it was surprising that among these entrepreneurs the locus of control was strongly internal, as their financial situation worsened the most. Considerably weakened profitability could be explained by their goals: moderately successful entrepreneurs’ main goal of growth was to establish area entity and not
greater profitability. This can be interpreted to mean that these large entrepreneurs chose growth in order to maintain or achieve area entity, as they use growth as a defense mechanism vis-à-vis their market situation. Companies in this group grew the fastest and they used a wide scale of growth strategies.

As self-perceived innovativeness, proactivity and achievement motivation correlated positively with success, willingness to take risks correlated negatively. However, the case of locus of control was not so straightforward. Willingness to take risks was also strongly related to financial situation, as highly successful entrepreneurs possibly did not perceive that much risk in growth because of their good financial situation and more work offered by current customers. Among less successful entrepreneurs it seemed that they hoped that growth would answer their weak financial situation, but the impact of growth was not fully realized. Less successful entrepreneurs’ goal of growth was primarily to increase profitability (which they did to some extent, but to the detriment of equity ratio), yet they were not able to improve their business model or efficiency.

Less successful companies changed their business model in growth very little and relied on organic growth. However, moderately and highly successful companies sought and compared growth methods much after the growth decision. They increased very much outsourcing, but grew also often diversifically and through acquisitions or mergers. It was also found that large-scale outsourcing seems to be quite profitable.

In conclusion, highly successful growth-oriented forest machine entrepreneurs perceived themselves as innovative, proactive and achievement motivated, but not as risk-takers. Their external locus of control can be explained by the fact that they grew “passively” at the request of customers. It seems that highly successful entrepreneurs’ high innovativeness, proactivity and
achievement motivation as well as profitability-related goals has a great impact on business development, which can be seen in chosen growth strategies and from their successful implementation. High internal locus of control (“active” growth) was found among entrepreneurs whose goals were more concerned with local area entity domination and not so much with increasing profitability. It is possible that entrepreneurs who grew passively used more time in developing their business model, and therefore their financial situation and the effects of their growth were better known.

This study supports the results of a study by Soirinsuo and Mäkinen (2009) which found that growth does not correct the fundamental reason for a company’s poor performance. Growth is a poor answer to trying to turn a low-profit company into a higher-profit one, but is a rather good way for a financially sound company to increase profits (Soirinsuo & Mäkinen, 2009). In many cases less successful companies had also financial-related goals, but they perceived more risks in growth and they did not improve or change their business model much as they grew. This supports the finding that they perceived themselves as less innovative, proactive and achievement motivated. In this light, the traits play an important role in successful growth and they can anticipate behaviour in growth.

Conclusions

The conclusions of this study support the view that goal setting and the traits of an entrepreneur have a significant influence on growth success (Niittykangas, 2003; Locke, 2004). Goal setting should be related to financial values, as large size in itself does not guarantee better profitability. It should be remembered that growth is a process and its results can be seen either positive or negative. Locus of control has little impact on successful growth, probably because of the nature of the sector
or the simplicity of the concept. However, high innovativeness, proactivity and achievement motivation combined with clear and specific financially related goals are important features among highly successful growth-oriented forest machine entrepreneurs.

A study on the critical success and failure factors affecting the development of small business

Dr. P. Jyothi

Dr. T.J. Kamalanabhan

Abstract

Small and Medium Enterprises play a vital role for the growth of an economy. Sustainability has always been the focus of practitioners, researchers and policy makers. The present study attempted to study the gender differences in perceptions of critical success and failure factors affecting small business. Data was generated from 50 (25 male and 25 female) small and medium business owners and applying appropriate statistical tools. The study found no significant differences in genders in the perception of critical success and failure factors. Need for achievement motive and feelings of independence seem to be the guiding factors for becoming entrepreneurs. Small firms identified fear of failure and lack of customer acceptance as hindrances at the start of the enterprise. They consider team work, knowledge and experience as important while larger firms consider participatory management and planning as important.

Key words: small business; critical success and failure factors; achievement motivation; attribution theory.

Introduction:

Small and Medium enterprises play a vital role for the growth of Indian economy by contributing 45 percent of the manufacturing output, 40 percent of total exports of the country, 59 million in employment, in 28 million units throughout the country, create one million jobs every year and produces more than 8,000 quality products for the Indian and International markets. (Source: Annual Report – 2009-2010 Micro Small and Medium Enterprises – Government of India). Indian market is growing rapidly and Indian industry is making remarkable progress in various Industries like manufacturing, precision engineering, food processing, pharmaceuticals, textile & garments, retail, IT, agro and service sectors.
The most common argument in favor of SME’s is that they create substantial job opportunities as they use relatively labor intensive technologies. SME’s employ more people per unit of investment as compared to large firms. Thus, a given amount of money will create more jobs if it is spread over a large number of SME’s than if it is focused on few large companies.

Despite its commendable contribution to the nation’s economy, MSME sector faces a number of challenges like absence of adequate and timely banking finance, limited knowledge and non-availability suitable technology, low production capacity, ineffective marketing and identification of new markets, constraints on modernization and expansions, non availability of highly skilled labor at affordable cost, follow up with various agencies in solving regular activities and lack of interaction with government agencies on various matters. Hence, sustainability of small business is a matter of serious concern. Surviving tough competitions, meeting quality standards and customer expectations have become an elusive factor and it becomes natural that researchers focus attention towards it. (Source: Small and Medium Business Development Chamber of India – 2009).

A common economic index of development has been the use of rates of growth of per capita Gross National Product (GNP) to take into account the ability of a nation to expand its output at a rate faster than the growth rate of its population. Development brings changes in economic life as are not forced upon it from without but arise by its own initiative from within. Innovators and producers initiate economic changes and consumers are educated by them if necessary. Carrying out the combination of productive factors is called Enterprise which is a fundamental phenomenon of Economic Development.
Small businesses are generally regarded as the driving force of economic growth, job creation, and poverty reduction in developing countries. They have been the means through which accelerated economic growth and rapid industrialization have been achieved (Harris and Gibson, 2006; Sauser, 2005; Arinaitwe, 2006; Kiggundu, 2002; Yusuf and Schindehutte, 2000; Birch, 1981, 1987). While the contributions of small businesses to development are generally acknowledged, entrepreneurs face many obstacles that limit their long-term survival and development. Research on small-business development has shown that the rate of failure in developing countries is higher than in the developed world (Arinaitwe, 2006).

A positive relationship has been documented between small-business development and economic growth in developed countries (Harris and Gibson, 2006; Monk, 2000; Sauser, 2005; Birch, 1987; Birch, 1981).

**Entrepreneurship – Economic Development:**

In the process of Economic Development Entrepreneurs play a pivotal role. The sense of high need achievement and motivation introduced by entrepreneurs bring about the required necessities in a class society which transform the perception of economic thinking which is necessary to bring about Economic Development. Timmons (1978) has suggested five human qualities which are conductive to economic development:

- an interest in material well being
- an interest in techniques and in innovation
- an ability to look ahead and a willingness to take risks
- Perseverance and
- Ability to collaborate with other people and to observe certain rules.
According to Kilby (1971) the entrepreneur performs the following major tasks:

Exchange relationship

Practical administration

Management control and technology

The above activities involve decision making under conditions of uncertainty. Kilby concludes that the entrepreneurial performance in the above rules is vigorous and effective.

Three major phases of national economic development process may be identified viz: factor driven economies, innovation driven economies and efficiency driven economies. Examining the multiple components of entrepreneurial activity allows us to explore differences among the three major phases. New business activity is expected to be high in factor – driven economies, because it is motivated by economic necessity. In innovation driven economies the proportion of opportunity driven entrepreneurship is expected to be higher than in factor and efficiency driven economies. Entrepreneurial aspiration reflects the qualitative nature of entrepreneurial activity. Product and process innovation, internationalization, ambition for high growth are regarded as hallmarks of ambitions or high aspiration entrepreneurship. These aspirations, when they are fully realized can significantly affect the economy.

However, sustainability is important in business and more particularly to small and medium size businesses (Denis and Mario, 2003). To remain competitive, businesses need to improve efficiency and performance. Efficiency is increased by lowering costs and indulging in less wastage. Maintaining good interaction with stakeholders is another aspect of sustainability. Small businesses are more reliant on a few key customers or critical suppliers and need to maintain relationships through
consistent dialogue. Efficiency is also increased by reporting and sharing important information. For small businesses to be actively involved in sustainable development, they need to adopt environmentally sound business principles and translate these into actions.

The high figures of SME inject economic variety (Hannan and Freeman, 1989) and generate competition, positive for economic output (Porter 1990). Features such as flexibility, innovativeness and problem-solving orientation are considered as key factors for SME success (Lin 1998).

After the advent of New Economic Policy in 1990, in India, specific strategies for the improvements of conditions of small and medium enterprise has become an important subject; it has also gained political support by way of legislation. The Micro, Small and Medium Enterprise Act of 2006 have been introduced to provide support growth and stability of Small and Medium Enterprises.

**Review of Literature:**

Research indicates that failure of SME is high, within the first years after starting. Timmons (1994) shows that over 20 percent of new ventures fail within one year and 66 percent within six years. Other researchers like Paffenhöhlz (1998) and Woy wode (1998) state that approximately 50 percent of the small start ups survive for more than five years.

Fairlie & Robb (2009) found that female owned businesses are less successful than male owned businesses because they have less startup capital, less business human capital acquired through prior-work experience in a similar business and less prior work experience in a family business. It was also found that female business
owners work fewer hours and may have different preferences for the goals of their businesses, which may have implications for business and outcomes.

Tim Mazzarol et al (1999) sheds light on the process leading to new enterprise formation and identifies the impact of some select demographic variables on business start-ups. Gender, previous government employment and recent redundancy were identified as having potential negative influence on small business formation.

Temtime and Pansiri (2004) investigated the perceived critical success / failure factors affecting the development of SME’s and found that human resources development, Organizational development, managerial background, managerial leadership and competitive strategy affect the performance of SME’s. Important relationships were also found between the perceived critical success and failure factors and firm specific demographic variables such as ownership status, experience and operating period.

Although more and more women are owning and managing small businesses, research on women’s network is less prevalent than research on male-dominated networks. Smeltzer and Fann (1989) explain that women’s business networks are the result of a deliberate strategy of linking women with other women to expand contacts, provide successful role models for each other, generate solutions to problems and disseminate information. Women have not broken into the formal male dominated network and prefer to communicate with women.

Scheers and Radipere (2005) analyses the perceptions of small business owners on managerial skills, whether gaps exist between managerial skills that owners should have and those that they actually possess. The study confirms that lack of managerial skills in small business owners was considered by the respondents as the main reason why small businesses fail in South Africa. Small business owners
lack managerial skills such as financial, marketing and human managerial skills to operate their businesses successfully. The challenge is to improve the managerial skills of small business owners.

Tess and Beverly (2000) reports the results of a survey conducted to obtain detailed information concerning Australian restaurant and catering operators’ perceptions of their industry. Through content analysis, several factors were identified that respondents perceive as important to the success of their business or as increasing the difficulty of operating their business. In particular, five broad success/difficulty factors emerged, relating to product, staff, financial, environmental and customer issues.

Okpara, Wynn, Pamela (2007), conducted structured interviews and a survey and gathered data from about 400 small businesses in Nigeria to find the principal constraints to success, as, including poor management, lack of capital, corruption, weak infrastructure, poor recordkeeping and so on.

Franco and Haase (2009), attempted to identify factors for poor performance and failure faced by small and medium-sized enterprises. Research reveals that the most important factors are limited access to finance, poor market conditions, inadequate staff, and lack of institutional support, as well as co-operation and networking.

Yu Da and Bernstein (2000), explores a variety of personal variables that might be expected to have some influence on small business owners’ perceptions. The results indicate strong support for a moderating effect due to the economic environment. In addition, significant support for age and education variables was evident. Different from many previous studies, variables such as religion, gender,
marital status, and country of origin showed no significant difference in the owner’s perception.

Cliff (1998), examined the attitudes of entrepreneurs towards growth and finds novel insights into the factors affecting an entrepreneur’s growth decision and desired pace of expansion.

Boden and Nucci (2000), examined the relationship between owner and business characteristics and business survival between men and women. The mean survival rate of male-owned businesses is higher than those owned by women.

Astebro and Berahardt (2003), investigated the relationship between the survival of new small businesses and bank loans. Having a bank loan was a positive predictor of the survival of start-up companies and the findings enabled some inference about the process of loan source selection and the bank’s loan granting process.

Headd (2003), states that new firms are believed to have high closure rates and these closures are believed to be failures. Tracking series showed that businesses were successful at closure. Factors that were characteristic of closure – such as having no start-up capital and having a relatively young owner were also common in business considered successful at closure. Hence, a few defining factors may be isolated leading to true failures.

Recognizing the contribution of SME’s, the present study attempts to investigate the perceptions of critical success and failure factors affecting the small businesses. The study would also like to explore whether the perceptions of entrepreneurs are related to several psychological theories of Achievement motivation (McClelland 1961) and Attribution theory (Heider, Kelley 1973).
**Theoretical Constructs:**

**Perceptual Process**

Perception is the cognitive process which involves the selecting, organizing, and interpreting the stimulus. The key to understanding perception is to recognize that it is unique interpretation of the situation. Perception also influences behavior and the perceptual process is mediated by environmental, that is, external and internal processes like learning and motivation. A selective perceptual process enhances our understanding of the stimuli. Further increased self perception would result in increased understanding of one’s self. This would result in exercising greater internality for causal behavior. (Heider 1958)

**Achievement Motivation Theory:**

Personality of an individual is mostly described in terms of motivation and aspirations. (Maslow 1951; McClelland 1961). The need for achievement motive is the inner urge of an individual to excel in a competitive situation. It is a need which is innate as well as a result of socialization practices. The achievement motive is directly related to performance of an individual. McClelland has identified the following characteristics of high achievers: moderate risk taking, immediate feedback, accomplishment, preoccupation with the task and being independent. McClelland further broadened his research to encompass the effect that achievement motivation has on entire societies and the economic rise and fall of civilizations. He found a positive relationship between the level of achievement motivation and the level of economic development of a given society. A society whose populace generally exhibits high n Ach will experience economic growth and prosperity. Entrepreneurs were also found to be high on these characteristics which describe high achievers.

**Attribution theory:**
Attribution theory has roots in all the pioneering cognitive theorist’s work (e.g., Lewin and Festinger - 1946), in de Charm’s ideas on cognitive evaluation, and in Bem’s (1972) notion of “self-perception, “the theory’s initiator is generally recognized to be Fritz Heider. Heider believed that both internal forces (personal attributes such as ability, effort, and fatigue) and external forces (environmental attributes such as rules or the weather) combine additively to determine behavior. He stressed that it is the perceived, not the actual determinants, that are important to behavior. Employees who perceive internal control feel that they personally can influence their outcomes through their own ability, skills, or effort. Employees who perceive external control feel that their outcomes are beyond their own control; they feel that external forces control their outcomes. Important I that this perceived locus of control may have a differential impact on their performance and satisfaction.

As stated before, the origins of poor performance and failure of SME have various root causes. However, what individuals judge to be the underlying cause of events does not always correspond to the real situation. Perception of failure is a subjective phenomenon and, thus, frequently biased or in error. In this context, a research area that explains how people perceive circumstances and make judgments about problems is to be related to attribution theory. This social psychology construct was mainly developed by Heider (1958), Kelley (1967) and Weiner (1979, 1985). For Kelley (1967), attribution relates to the process through which individuals deduce or perceive the causes of events, the behavior of others, or the dispositional properties of any entity in the environment. Herein, through affective and cognitive reactions, people search for causes in a variety of domains, and typically either within themselves or within their environment.
In this sense, the attribution theory predicts that individuals are likely to ascribe their failures or mistakes to external causes, attributing causes to situational factors rather than blaming themselves. Fiske and Taylor (1991) underpin “the fundamental attribution error is to attribute another’s behavior to dispositional qualities, rather than to situational factors”. For the opposite, individuals tend to attribute their own problems to situational factors. Moreover, literature highlights that attributions may be self-serving or hedonic, as unfavorable outcomes are typically attributed to external forces (Miller and Ross 1975; Zuckerman 1979). In other words, people prefer to be a victim of circumstance rather than of their own doing (Zacharakis et al. 1999). When analyzing internal and external causes, it was Heider (1958) who firstly described the key socio-psychological components. In his view, internal determinants include ability and effort, whereas the main external factors are task difficulty and luck.

Applied to the small business context, Tang et al. (2008) combined both models and generated two attributional styles of entrepreneurs: (1) an internal attributional style depending on causes such as ability and effort and (2) an external attributional style based on task difficulty and luck. For our attributional analysis, we also follow Heider’s (1958) and Weiner’s (1979) taxonomies, bearing in mind the failure factors stated before while adding a few specific elements. We consider ability, social skills, and knowledge to be internal causes, stemming from the inside of the individual. In contrast, we regard market conditions, institutional support, and luck to be external causes, originating from the environment. Overall, we believe that SME owner–managers will attribute their difficulties more likely to external factors, arguing that the causes of failure were market forces rather than poor management. In
the same vein, Zacharakis et al. (1999) argued that entrepreneurs are predisposed to attribute the current negative outcomes to external factors.

The studies cited in this literature review indicated that issues such as capital, management, infrastructure and lack of expertise are major obstacles to small business development. Other factors that affect small business development also need to be investigated such as poor infrastructure, low demand for products and services and the inability to use or acquire technology.

**Objective of the study:**

The present study is undertaken to find out the gender differences in perception of critical success and failure factors affecting the development of small business.

**Hypothesis:**

The following hypothesis was formulated to increase one understanding of the problem.

Hypothesis: There will be significant gender differences among entrepreneurs about the critical success and failure factors.

**Sample:**

The sample for this study consisted of 50 small business owner managers (25 male and 25 female) located in two southern states of India. Stratified sampling techniques were used to select the business owners. A total of 72 questionnaires were distributed and 53 were returned, but only 50 could be used for data analyses as 3 of them had to be discarded for lack of complete information. The owners were identified from the local small business associations and were personally contacted for administering the questionnaire. While administering the questionnaire, a discussion was also held with them.
Tools used for data collection:

A specially designed questionnaire was administered to gather information about the demographic aspects, data and dynamics about the firm.

The instrument was submitted for validation to a panel of four experts in Small business management in India. The experts were asked to review the items and determine if they were within the linguistic capabilities and understanding of Small business owners and managers. Minor modifications suggested by the experts were made and the questionnaires were distributed among the sample.

Results and Discussion

The data thus obtained was recorded, analysed and interpreted to discover new relationships or information. Both quantitative and qualitative analysis was obtained from the data. The quantitative analysis included descriptive statistics like mean and percentages. Further analysis of variance (ANOVA) was also calculated to determine if mean differences exist for two or more samples or treatments.

ANOVA is built on comparing variances from two sources: between group variance and within group variance. The ratio between them is called the F ratio. The ratio is interpreted in association with the degree of freedom associated with sample sizes. The procedure is to derive two different estimates of the population variance from the data and then calculate a statistic from the ratio of these two estimates. A significant F ratio informs us that the group means are not all equal. When the variances between groups relative to within groups are large then the F ratio is large. The larger the F ratio the more likely it is significant and that there are significant differences between some or all group means. A small F ratio close to one implies that
the two variance estimates are very similar and therefore there is no significant difference between means.

The objective of the study is to find out the gender differences in perception of critical success and failure factors among nascent and established entrepreneurs. The first part of the questionnaire was designed to gather information about firm characteristics. All the sample firms were small and medium enterprises in the services sector. Except for two firms all others qualified as sole proprietors, that is, they were the owner managers of the firm. The age range for women entrepreneurs was between 32-55 with a mean age of 43.5. The age range for the male entrepreneurs ranged between 34 – 56 with a mean age of 45. Except in two cases all other male entrepreneurs were graduates. Six of them also had diplomas in technical areas. With regard to women entrepreneurs, eighty percent of the samples, that is, twenty of them were graduates and the rest discontinued education after high school. With regard to prior work experience, only forty percent of the sample were associated with related firms and as such gained knowledge and launched their enterprises.

It was observed that women handled significantly smaller business (M = Rs. 7.92 lacs) when compared to men (M= Rs. 20.4 lacs) and significantly older enterprises (M= 21.8 years). However, there was no significant difference in the number of employees in their respective firms (men M = 18.8 and women M= 14.9).

In order to assess the knowledge and gain insights in to the entrepreneurial processes, open ended questions were asked about the reasons for starting of an
enterprise, any remarkable experiences and factors disturbing at the start of the firm and identifying some positive and negative experiences in the entrepreneurial career.

The overall reason for choice of entrepreneurship was found to be the feeling of doing something on one’s own and to experience the sense of independence (38 percent). This is followed by altruistic reasons (14 percent) such as providing service to humanity, employment etc. The last of the reasons stated was money (10 percent) or necessity and a chance to encash an opportunity (each with 6 percent) (table 1).

There exists no significant difference in the reasons between gender (chi-square = 6.4, df = 8, p>59.3)

However, the specific impetus to start an enterprise appears to be predominantly necessity or low pay in the current job (26 percent), followed by altruism (14 percent). This is followed by reasons such as drive for doing something on one’s own (24 percent). The last of the reasons appears to be opportunity encashment (6 percent) (table 2).

There is no association between gender and reasons at the start of the entrepreneurship (chi-square = 6.6, df = 7, p>.461)

When asked to identify the conditions and factors that disturbed at the startup of the firm, almost 90 percent of the respondents feel that the most important unsettling factor was finance. This does not differ across gender (chi-square = 5.02, df = 5, p>.413).
It is also observed that majority of the entrepreneurs feel that they have not achieved what they have set out as their dreams (56 percent). While the difference is not statistically significant (chi-square = 4.6, df = 2, p>.9), women appear to be more satisfied in their entrepreneurship when compared to men.

Of all the critical success factors identified, the one that takes first place is the knowledge in marketing and sales operation (38 percent) followed by lack of finance (26 percent) and customer acceptance (20 percent). There is no difference in such factors across gender (chi-square – 5.9, df = 4, p> .19).

Many entrepreneurs did not articulate any major domain that is a cause of concern (42 percent). 14 percent considered production/finance as risk areas. Therefore, there was not much clarity in the answer as to how they tackled the domain difficulties. About 20 percent suggested that they would work harder at the problem. Women articulated lesser domain problems and suggested fewer coping strategies than men (chi-square = 14.5, df = 5, p<0.01) (table 3).

It was also observed that entrepreneurs were able to abstract experience and knowledge as one of the important aspects/factor for entrepreneurship success (20 percent) followed by quality of products and services and customer acceptance (18 percent). The least cited reason was administration and internal processes (2 percent). While there is no statistically significant difference between gender with reference to citing of factors for entrepreneurial success (chi-square = 9.9, df = 9, p>.352), women
seem to cite ‘networking’ three times more important than men do and ethics/patience and hard work as four times more important than men do.

With reference to the positive experiences associated by virtue of being an entrepreneur were creating wealth by 32 percent and enjoying team work by 18 percent. This does not differ significantly across gender (chi square = 4.028, df = 8, p>.855). Similarly about 16 percent cite intrapersonal issues (e.g. emotional outbursts etc), 12 percent as financial crunch and 10 percent each for Human Resources and quality as major areas of negative experience. This does differ across gender (chi-square = 24.3, df = 14, p<0.04). Women have more negative experiences with competition, pollution control issues, and marketing. Men seem to dislike more issues in Human Resources.

**Meta-analysis with turnover split**

Firms with turnover higher than Rs. 14.1 lacs are categorised as high turnover firms and with lower than Rs. 14.1 lacs are categorised as low turnover firms. The following analysis checks if the responses are different for low and high turnover firms.

Statistically no difference with reference to reason for entrepreneurship (chi = 12.437, df = 8 and p > .13). However, high turnover firms cite wealth creation and necessity about 1.5 times more lower turnover firms, leading to hypothesise that passion for wealth creation and early stage compulsions may breed more success. Ecosystem support appears to be more important for small firms than for large even though is not statistically significant (chi = 5.3, df = 7, p >.622). Smaller firms may
be small because they started to encash an opportunity and was not a result of well thought out business plan.

Whether small or big, the positive experiences do not differ (chi = 5.1, df = 8, p > .73).

Neither does negative experience (chi = 8.2, df = 14, p>.87).

There are very similar unsettling factors across small and big firms (chi = 4.0, df = 5, p > .542) Sense of achievement too does not differ across size (chi = 0.55, df=2, p>.757)

While not statistically significantly different (chi = 7.8, df = 4, p >0.1), smaller firms cite more often fear of failure and lack of customer acceptance as fears that dominate start of entrepreneurship.

Small firms are more worried about competition, market potential and pricing. Larger firms are worried about quality issues and production risks. (chi =7.8, df =8, p > 0.45)

While there appears to be clarity in strategy for tackling domain problems, smaller firms appears to state that they resolve it by more hardwork and intelligence. Larger firms’ inability to come out with a strategic solution may be due to a realisation that they do not have solution to larger issues faced by them.

There is a statistically significant difference between small and large firms’ idea of what is important for success of entrepreneurship (chi = 18.5, df =9, p < 0.3). Small firms consider team work, knowledge and experience, ethics and patience as important take-aways. Larger firms consider participatory management and process & planning as important.
From the above results, it is then obvious that there are no significant gender differences about the critical success and failure factors associated with the firms. Confidence and feeling of independence seem to be the guiding factors in prompting the sample to become entrepreneurs. The urge to achieve, contribute and drive for doing something on one’s own appears to be prevalent among the sample. We may find some co-relations with the theoretical construct of achievement motivation as proposed by McClelland (1961) and the characteristics of high achievers. Some of them referred that their previous experience helped them substantially in the start-up process. Knowledge of the market, sales operations and customer feedback were identified as critical success factors. This confirms earlier research of Nandaram (2006).

Entrepreneurs also mention that having a good team is necessary. This also refers to starting with a partner and having congruent competencies meeting people. Entrepreneurs were also convinced that they possessed the relevant competency to start an entrepreneurial career by actually initiating a venture. These convictions were based on the perception of having control over the require competencies, which refer to the concept of self-efficacy and high internality of control. With reference to the difference between high turnover and low turnover firms the smaller firms often sight fear of failure and lack of customer acceptance dominate at the start of the entrepreneurs. Smaller firms are able to cope with their problems by hard work and intelligence where as the larger firms are unable to come out with it strategic solution. Small firms consider team work, knowledge and experience as important in the functioning of the enterprise where as larger firms consider participatory management and process on planning as important. Small businesses seem to be vulnerable in the business seem and face high fluctuations in projects and market demands which
makes it difficult to maintain a fixed team of staff. In essence, while some clarity emerged with regard to critical success factors. The same could not be found for critical failure factors.

Implications

The findings show three important implications for Small and Medium Enterprises support groups including the Government, Practitioners and Researchers in the areas of entrepreneurship and small business development. It is suggested that the entrepreneurship assistance programmes may be designed in such a way that the critical successes and failure factors may be identified. There is a need to incorporate the concepts of entrepreneurship in the school and college curriculum in a more rigorous manner so as to equip the potential entrepreneurs with domain knowledge and skills. Further Small Business Support Group may be created for guiding strategically and resulting in sustainability of the small business.

Creativity:

Creative destruction by creative entrepreneurs in creative industries.

José Ernesto Amorós
Universidad del Desarrollo, Chile
eamoros@udd.cl

Juan Pablo Couyoumdjian
Universidad del Desarrollo, Chile

This paper investigates the process of creative destruction made by creative entrepreneurs in creative industries. Following Schumpeter’s argument about the advantages of being big notwithstanding, we examine the evolution of three creative entrepreneurs and their firms, Ed Catmull and John Lasseter from Pixar Animation Studios, Jimmy Wales from Wikipedia, and Guy Laliberté from Cirque du Soleil, whose activities have drastically changed the industry in which they are inserted. These three firms are clear illustration of the process of creative destruction. The paper uses a qualitative approach based on a series of narratives. This exercise, following the Schumpeterian research agenda, enhance our understanding of the dynamics of an entrepreneurial economy and provide us with greater insights into how different entrepreneurial traits and organizational forms contribute to the process of creative destruction.

Keywords: Creative destruction, creative industries, entrepreneurial process.
Empowerment, Innovativeness, Internationalization and Performance of Polish SMEs: a Conceptual Framework

Anna Michna, Anna Męczyńska, Roman Kmieciak, Renata Sękowska

Abstract

This paper presents a framework for investigating the relationships between employee empowerment, innovativeness, internationalization and firm performance. Based on current literature review, we claim that complex investigation of SMEs simultaneously including all these issues has not been conducted. Investigations of Polish SMEs have so far been few and fragmentary. In our opinion employee empowerment, innovativeness and internationalization (the sources of competitive advantages) intertwine and interconnect in a network of feedback relationships. Moreover, information technology (IT) can be used to strengthen the relationships. As a result of critical literature review, we have identified a research gap, built a conceptual model and stated hypotheses.

Introduction

This paper presents a framework for investigating activities of Polish small and medium-size enterprises (SMEs). We concentrate mainly on the following processes: employee empowerment, innovativeness, internationalization in the context of information technology (IT) capability. These issues are defined and discussed in the second part of this paper. We are interested in the impact of these processes on firm performance.

The purposes of the research were:

- analysis of the level of knowledge in this field - a critical review of the literature,
- identification of research gap,
• stating the hypotheses and building a conceptual model,
• preparing the survey instrument, determining sample selection,
• preparing empirical research,
• indicating the directions of future research.

Based on current literature review, we claim that complex investigation of SMEs simultaneously including all these processes has not been conducted. Some previous studies examined the relationships between these processes but had a fragmentary nature, limited to the relationships only between two issues. Our investigation combines previous work in this field and innovatory, complex approach. In our opinion employee empowerment, innovativeness and internationalization (the sources of competitive advantages) intertwine and interconnect in a network of feedback relationships. Analyzing the way in which previous researchers operated these issues, the need of analyzing them, particularly in SMEs, seems to be reasonable. The literature review confirms that previous research in this field has been mainly focused on large enterprises. Investigations of Polish SMEs have so far been few and fragmentary (Kucia 2009; Moszkowicz, and Potocka 2005; Pinoczek 2008; Daszkiewicz 2008; Poznańska 2009; Krupski 2009). This is the reason why we made an attempt at a complete analysis of the above mentioned issues and relationships in Polish SMEs.

As a result of critical literature review, we identified a research gap, built a conceptual model and stated hypotheses. Moreover, we prepared the survey instrument (the survey questionnaire) which will be used to verify the hypotheses in the course of empirical research. We intend to conduct studies of Polish SMEs from the Upper Silesia region. The region is the most industrial region of Poland and contributes 13 percent to Polish GDP. In this region GDP per capita is 32761 PLN, in comparison with average in Poland 30873 PLN [Central Statistical Office 2009]. The region is the main center of heavy industries (mining, metallurgy, machine industry). Until 1989, the economy of Poland was based on a system of
public ownership and administrative planning. At the moment the region is in a period of transition, experiencing rapid change as a consequence of economic transformations in Poland. In 2004 Poland became a member of the European Union what has opened a new opportunities for economic development by intensifying contacts with other EU members and access to European funding. Traditional industries undergo restructuring and modernization. Investments in new technologies which are friendly to the environment are perceived as the right direction for the region’s further development. Collaboration between many research centers and entrepreneurs is expanding. Enterprises from this region are one of the most innovative SMEs in Poland - over 16 percent small and 42 percent medium-size enterprises are regarded as innovative enterprises in comparison with average in Poland 14 percent and 37 percent correspondingly [Żołnierski, 2008]. Moreover, this region has the second (right after the Warsaw region) biggest number of registered and operating Polish SMEs.

**Literature Review**

**Empowerment**

Appropriately directed human resources management may contribute to improve firm competitiveness and build a permanent market advantage. Employee empowerment is one of the key concepts of human resources management. Specificity of human resources management in SMEs results from: high level of job autonomy (Kallenberg, and Van Buren 1996), close working relationships with managers (Ingham 1970), a less developer division of labor in small firms than is the case in large company (Tsai, Sengupta, and Edwards 2007). On the other hand, some disagreement appears in the studies because it is know that together with small firm growth, owners-managers are reluctant to delegate their authority to subordinates. Empowerment is examined from two perspectives: individual and organizational. From individual perspective, empowerment is a multidimensional cognitive
state – the perception of being empowered. From organizational point of view, empowerment is set of activities and practices of managers leading to increase employees’ contribution to overall organization’s success (Niehoff, Moorman, Blakely, and Fuller 2001). In the present study we focus on organizational level and assume the following definition: "Empowering people means encouraging them to become more involved in the decision and activity that affect their jobs. It means providing them with the opportunity to show that they can come up with good ideas and that they have the skills to put these ideas into practice" (Smith 1996).

Empowerment, both from individual and organizational perspective, is a multidimensional construct. From organizational viewpoint, Petter, Byrnes, Choi, Fegan, and Miller (2002) defined seven dimensions of empowerment: power, decision making, information, autonomy, initiative and creativity, knowledge and skills, responsibility. Some researchers emphasize only transfer of power from upper to lower levels of the organization and focused on this dimension alone (Pitts 2005).

Prior studies of employee empowerment issue have focused on large companies. Factors which affect on the empowerment process have been extensively discussed (Petter, Byrnes, Choi, Fegan, and Miller 2002). Employee participation in organizational change, development of employee competencies, access to information, and employee participation in decision processes are studied. The empowerment process is investigated in linkage with: manager’s character, characteristics of organization and information technology (Choi 2006; Pitts 2005; Psinos, Kern, and Smithson 2000). The results of empowerment are considered with reference to job satisfaction, loyalty behavior and employee commitment (Wang, and Lee 2009; Niehoff, Moorman, Blakely, and Fuller 2001). Relationships between empowerment and firm performance or innovativeness have been insufficiently examined (Hempel, Zhang, and Han 2009; Spreitzer 1995).
Taking into account characteristics of SMEs, the fact that employees in SMEs perform more various tasks in comparison with employees in large firms, and limited empirical research in this field, investigation of employee empowerment in SMEs is particularly interesting. The researchers have analyzed: job autonomy, (Tsai, Sengupta, and Edwards 2007), relationship between empowerment and employee job satisfaction (Appelbaum, and Kamal 2007), and relationship between empowerment and internationalization (Gabrielsson 2007). However, complex investigation of relationship between employee empowerment and performance of SMEs has not been conducted.

**Innovativeness**

The terms innovation and innovativeness have many different definitions and are used in the different disciplinary literatures of economics, entrepreneurship, business and management, technology, science and engineering (Baregheh, Rowley, and Sambrook 2009). For example, Wang and Ahmed (2004) define organizational innovativeness as "an organization’s overall innovative capability of introducing new products to the market, or opening up new markets, through combining strategic orientation with innovative behavior and process". Innovativeness is frequently regarded as a measure of the degree of "newness" of an innovation (Garcia, and Calantone 2002) or some kind of measurement contingent on an organization’s proclivity towards innovation (Salavou 2004). According to Hurley and Hult (1998) innovativeness is "the notion of openness to new ideas as an aspects of a firm’s culture."

Innovation refers to a process that begins with a novel idea and concludes with market introduction (Freeman, and Engel 2007). Plessis (2007) proposes that innovation is "the creation of new knowledge and ideas to facilitate new business outcomes, aimed at improving internal business processes and structures and to create market driven products and services".
Innovation is often defined as the adoption of new products or processes, but the term "new" is ambiguous. Backer and Whisler (1967) suggest defining innovation as the first of early use an idea by one of a set of organizations with similar goals. Some authors define innovation as the creation of any product, service, or process which is new to a business unit or organization (Tushman, and Nadler 1986; Damanpour 1991). Consistent with these approaches, some studies use different dimensions to measure innovations: newness to customers, uniqueness for the market or newness to the firm (Salavou, and Avlonitis 2008). Some definitions of innovation include also the concept of successful commercialization (Cumming 1998). Baregheh, Rowley, and Sambrook (2009) propose a general and integrative definition of organizational innovation that captures its essence: "Innovation is the multi-stage process whereby organizations transform ideas into new/improved products, service or processes, in order to advance, compete and differentiate themselves successfully in their marketplace." For the purpose of this study, we accept this definition.

As definitions suggest, the notion of innovation in multidimensional and may be present in various forms. For example, Wang and Ahmed (2004) identified five main areas of organization’s overall innovativeness: product innovativeness, market innovativeness, process innovativeness, behavioral innovativeness, and strategic innovativeness. Similarly, in Oslo Manual (OECD/Eurostat 2005) four types of innovations are distinguished: product innovations, process innovations, marketing innovations and organizational innovations. These dimensions are common in literature and include overall innovative activities in firms.

Previous research examined organizational properties that enhance or hinder innovativeness. Studies have identified determinants of innovation and indicated the role of such organizational factors as: formalization, centralization, external and internal communication (Damanpour 1991; Jansen, Van Den Bosch, and Volberda 2006). Many measures have been developed that attempt to assess factors affecting organizational
creativity and innovativeness (see Mostafa 2005; Amabile, Conti, Coon, Lazenby, Herron, 1996). For example, creative climate questionnaire (CCQ) includes ten dimensions: challenge and involvement, dynamism, freedom, trust/openness, idea time, playfulness/humor, conflict, idea support, debate and risk-taking (Ekvall 1996).

**Internationalization**

Currently the issue of internationalization of economic activity is often discussed in specialist literature as one of the ways leading to anticipated development and increase of an enterprise’s value. Internationalization of enterprises also brings a positive aspect for the development of local, regional and national structures. Specialist literature emphasizes the specifics of presented issue from the point of view of many theories, concepts and models, but complex and uniform definition of this issue was not developed. It is emphasized that internationalization is: crossing of national borders in order to create the enterprise value (Knowles, Mughan, and Lloyd – Reason 2006), team of varied resources of the enterprise (internal and external), which in connection with psychosociological, cultural and political predispositions allow for its development beyond the borders of the country of origins (Fernandez, and Nieto 2005). The authors indicate that the abilities, competences and knowledge in the organization have a decisive impact on undertaking and effectiveness of international operations. (Ruzzier, Hisrich, and Antoncic 2006). The specialist literature defines internationalization as process of adjustment of the company’s actions (strategies, structures and resources) to the international environment (Che-Senik, Scott-Ladd, Entrekin, and Sham 2007). Additionally, the internationalization process is presented as the method for implementation of key elements of the company’s strategy (Daszkiewicz 2008). Internationalization is also considered as a process within which the companies open and respond to international abilities and threats, undertaking various tasks executed abroad
The activity defining internationalization is the execution of reactive (undertaking and strengthening of cooperation) and proactive (entering into new markets of potential customers) strategies with consideration of internal and external development barriers (Arranz, and Arroabe 2009). The specialist literature also presents the internationalization process in accordance with the enterprises’ extent of involvement into export activity. On this basis the companies are differentiated as: avoiding export orders, sporadically undertaking export activities, making export attempts, exporting to one or more countries, aspiring to take over a whole region or country and finally achieving global dimensions or born - global from the start.

On the basis of review of specialist literature for the needs of this research it is assumed that internationalization is "described as business activities which „cross national borders and intended to create value in organizations" (Knowles, Mughan, and Lloyd – Reason 2006). Additionally, internationalization processes shall be considered in the light of such attributes as: know-how, cooperation networks, IT and enterprising bases, as well as organization skills occurring in SMEs.

Keeping track with recent SMEs internationalization research it is found, that they comprised of the impact analysis of key success factors to functioning effectiveness (Crick, Bradshaw, and Chaudhy 2006; Wheeler, Ibech, and Dimitratos 2008). In the past also research of SMEs internationalization processes was executed in the context of individual aspects: know-how (Fletcher, Cassuli, and Jones 2007; Thomas – Morgan, and Jones 2009), company’s location (Westhead, Ucasaran, and Binks 2004; Reiner, Demeter, Poiger, and Jenei 2008), management staff’s skills (Anderson, Bookcock, Graham 2001; Manolova, Brush, Edelman, and Greene 2002; Knowles, Mughan, and Lloyd – Reason 2006), occurring cultural differences (Arranz, and Arroyabe 2009) and other factors beneficial for international expansion. The subject of research were SMEs with varied functioning specifics (family and
non-family companies) (Fernandez, and Nieto 2005), retail companies (Fillis 2004) and craft companies (Hutchinson, Quinn, and Alexander 2006) located in different places.

**Information technology**

IT capability has been conceptualized in terms of managerial and technological capabilities (Zhang, and Sarker 2008). Bharadwaj (2000) define firm’s IT capability as its "ability to mobilize and deploy IT-based resources in combination or copresent with other resources and capabilities". Prasad, Ramamurthy, and Naidu (2001) refer IT managerial skills to firms’ ability to use IT to support and enhance their distinctive competencies and skills in other business functions. Tippins and Sohi (2003) define IT competency as the extent to which a firm is knowledgeable about and effectively utilizes IT to manage information within the firm. For the purposes of this study, based on the definitions above, we define IT capability as "firm’s ability to acquire, deploy and leverage its IT related resources in combination with other resources and capabilities in order to achieve business objectives."

Review of the literature suggests that IT capability as a multidimensional construct. Bharadwaj, Sambamurthy, and Zmud (1999) perceive IT capability as a construct which is composed of six underlying dimensions: IT–business partnerships, external IT linkages, business IT strategic thinking, IT business process integration, IT management and IT infrastructure. Other categorization schemes have also been developed. For example, Tippins, and Sohi’s (2003) model consists of IT knowledge, IT operations and IT objects. Based on previous research, Wade and Hulland (2004) suggest a typology of eight key information systems resources: external relationship management, market responsiveness, IS-business partnerships, IS planning and change management, IS infrastructure, IS technical skills, IS development and cost effective IS operations.
Linking Between Empowerment, Innovativeness, Internationalization, and Firm Performance

Based on literature review we have found that studies of relationships between empowerment, innovativeness, internationalization and performance of SMEs are few and fragmentary and, moreover, there is a lack of simultaneous investigation of these processes. Table 1 presents empirical studies conducted so far in this field.

The comparison of advantages flowing from the use of solutions e-CRM on the international and national activity (286 SMEs in Irish).

The study the influence of knowledge, solutions of ICT, strategy and the channels of the sale on undertaken internationalizing (705 SMEs in UK).

The influence of Internet on internationalizing SMEs (a case study of a firm in Finland).

Most studies focus on psychological empowerment and consider individual perspective (Wang, and Lee 2009). Researchers combine empowerment with: job satisfaction (Ng, and Sorensen 2008) and loyalty, in relation to work performance (Niehoff et al., 2001). Relationship between empowerment and managerial trust has been also examined (Gomez, and Rosen 2001). There are few studies related to organizational level of employee
empowerment and simultaneously combining the issues which are the subject of this work. For example, Hempel, Zhang, and Han (2009) analyzed data from 94 Chinese high-technology companies and found that team empowerment is significantly related to team performance. Moreover, organizational decentralization and formalization of organizational processes enhance empowerment. A study of UK manufacturing organizations also suggests relationship between empowerment and firm performance (Psoinos, Kern, and Smithson 2000). The authors claim that "empowerment resulted from a desire to improve business performance and not as some form of charitable gesture," and "empowerment and IT/IS was an essential component of strategies such a BPR and TQM aimed at improving business performance." This study shows that IT facilitates decentralization and, as it was mentioned above, decentralization stimulates employee empowerment. Similarly, Wyner and Malone (1996), and Malone (1997) confirmed that IT can cause decentralization. Additionally, Hoffman (1994) claimed that empowerment is necessary for contemporary companies and needs to use new IT strategies.

The relationship between firm innovativeness and firm performance has been broadly investigated in literature. Studies focus mainly on large firms and associate innovation positively with performance (Calantone, Cavusgil, and Zhao 2002; Hult, Hurley, Knight 2004; Lee, and Tsai 2005; Chen, and Lee 2008). Empirical studies generally also support a finding that innovation is important determinant of firm performance in SMEs. For example, it was found that there is a positive relationship between innovation and financial performance (gross profit margin) (Low, Chapman, and Sloan 2007). Process innovation is positively related to financial performance and administrative innovation is positively associated with operating efficiency (Mavondo, Chimhanzi, and Steward 2005). Oke, Burke and Myers (2007) found that SMEs tend to focus more on incremental than radical innovations and this focus is related to growth in sales turnover. However, in some studies positive direct or
immediate effects have not been found. For example, Freel and Robson (2004) highlight a negative, at least in the short term, relationship between product innovation and growth in sales or productivity for manufacturing firms. Some studies show that, for example, learning orientation, market orientation or competitive forces have an effect on relationship between innovation and firm performance (Keskin 2006; Hernandez-Espallardo, and Delgado-Ballester 2009). Researches have been also conducted in developing countries (Keskin 2006; Lin, and Chen 2007). Nevertheless, the relation between innovativeness and firm performance has not been tested sufficiently in SMEs in Poland.

Empirical research conducted in different countries connects internationalization process and performance of SMEs. The literature highlights that SME involvement in international management and gaining international experiences have a positive effect on its financial (sales, revenues, profits) and non-financial (goal achievement, perceived success) measures. Moreover, collaboration with public sector (government support programs) facilitates small firms’ international activities (Wheeler, Ibech, and Dimitratos 2008). Empirical research shows correlation between firm size and increase the export activity of Polish companies. With the increase of firm size, collaboration is more developed and leads to the growth of export activity (Daszkiewicz 2008). Studies conducted among Chinese SMEs suggest that home-based social networks play a significant mediating role in the relationship between inward and outward internationalization and firm performance (Zhou, Wu, and Luo 2007). Export activities in family and non-family owned SMEs in the U.K. have similar impact on: sales volume, market share, and business profitability (Crick, Bradshow, and Chaudry 2006). Study of Swedish SMEs (Byberg 2007) shows that relationship oriented market communication has a significant effect on export performance, including number of foreign markets. Furthermore, collecting foreign market information has an effect on profitability of export and the control variables and other background variables, firm size and
region, have a significant influence on the amount of export markets. Spanish researchers (Arranz, and Arroyabe 2009) claim that larger firms achieve superior performance by internationalization and SMEs should participate in internationalization process by collaboration with other firms.

The literature presents the connection of the SMEs’ internationalization process with IT. For example, firms serving international markets place greater emphasis on electronic-customer relationship management (e-CRM) and reaping greater benefits in comparison with domestic firms (Harrigan, Ramsey, and Ibbotson 2009). Using internet technologies contributes to an increase of international sales and has a positive impact on the level of international diversification (Thomas-Morgan, and Jones 2009). The Internet enables to reduce direct costs which are related with geographical distance. Using the Internet as a sales channel reduces costs of firm adjustment to economic and legal conditions in other countries.

In conclusion, IT facilitates international development of SMEs and has particularly a positive effect on customer relationship management (Arenius, Sasi, and Gabriellson 2007). Wolff and Pett (2006) confirm that internationalization is positively correlated with growth performance and, moreover, is positively related to product and process improvements in SMEs. A study by O’Cass and Weerawardena (2009) also found a significant relationship between international entrepreneurship and organizational innovation intensity.

Empirical research of relationship between IT and firm performance mainly focus on large firms. A number of studies were conducted in US-based firms. For example, it was found that IT capability has a direct and positive impact on firm performance (Sanders, and Premus 2005); firms with high IT capability tend to outperform firms with low IT capability on a variety of profit and cost-based performance measures (Bharadwaj 2000); the relationship between externally focused IT capabilities and performance is stronger for firms operating in environments characterized by high dynamism, high munificence, and high
complexity (Stoel, Muhanna 2009). On the other hand, it was also found that firms’ total IT investment is not associated with firm performance (Aral S, and Weill 2007). However, SMEs differ from large firms in various ways. The characteristics of SMEs include for example: resource constraints, especially time and finance, personalized approach to management, a "survival mentality" and lack of strategic planning (Gilmore, Carson, O'Donnell, and Cummins 1999). Thus, it would not be correct to assume without results of empirical research that link between IT and performance in SMEs is the same as in large firms. However, empirical studies in this field are limited. In general, research suggests that SMEs benefit from using IT. For example, Shaw (2006) found a positive association between IT resources management activities and the ability to retain, respond and satisfy customers. Zhang and Sarker (2008) claim that the overall multidimensional IT capability has a significant and positive impact on the international performance, in contrast to external IT linkages and IT business process integration. Webb and Schlemmer’s (2009) results suggest that IT assets are related to Internet performance, but no affect IT assets on financial performance of SMEs. Moreover, the relationship between IT assets and financial performance is significantly negative for Internet-leading companies.

A review of literature reveals mixed result in regard to an effect of IT on firm performance. The inconsistencies can be attributed to different measures of IT and performance used in the studies. Some researchers argue that IT can not provide competitive advantage because it is too easily duplicated (Tippins, and Sohi 2003). Therefore, Bharadwaj, Sambamurthy, and Zmud (1999) claim that firms "should not focus on singular applications whose competitive advantage is short-lived but should focus on creating a firm-wide IT capability that enables continuous innovation and adaptation to changing environment." Furthermore, some researchers suggest that IT does not have a direct effect on firm performance but IT can be used to leverage other resources and strengthen their impact on
firm performance (Webb, and Schlemmer 2009; De Burca, Fynes, and Brannick 2006). For example, some previous studies have examined relationships between IT capability, firm performance and: organizational learning (Tippins, and Sohi 2003), customer orientation (Zhu, and Nakata 2007) or innovation (Dibrell, Davis, and Craig 2008).

The literature suggests complementary relationship between innovativeness and IT (Huang, and Liu 2005). Investment and adoption of IT are perceived as innovative activities and, on the other hand, IT can enable or facilitate innovation (Markides, and Anderson 2006). The relationship has been examined in SMEs. For example, Dibrell, Davis, and Craig (2008) found that the impact of innovation on performance is primarily indirect, felt via IT investment. Li, Merenda, and Venkatachalam (2009) claim that new product development is positively related to the extensive use of business process digitalization.

**The full conceptual framework**

Based on current literature review we claim that there have been attempts to explain the impact of employee empowerment, innovativeness and internationalization on firm performance. However, a common approach to these issues has not been developed so far. Some previous studies have examined the relationships between these processes but these studies have a fragmentary nature, limited to the relationships only between two processes. It is also important to provide recommendations for Polish SMEs, which have not been completely investigated in this field. Employee empowerment, innovativeness and internationalization are perceived as sources of competitive advantage in SMEs. Because they intertwine and interconnect in a network of feedback relationships, the need of analyzing them seems to be reasonable. Our work combines previous work in this field and innovatory, complex approach to investigate relationships between employee empowerment, innovativeness, internationalization and firm performance in the context of IT capability. We
decided to develop our theoretical research, presented in the previous sections, and conduct empirical research.

Taking into consideration IT’s increasing sophistication and usage, we expect that

**Hypothesis 1:** IT capability is positively related to employee empowerment, innovativeness and internationalization.

Previous studies suggest that IT capability not only has a direct impact on various resources and capabilities, but it also modifies relationships between them. In particular IT capability can be used to strengthen these relationships. Thus, we state an aggregated hypothesis,

**Hypothesis 2:** IT capability has a moderating effect on the relationship between employee empowerment, innovativeness, internationalization and firm performance of SMEs.

The hypothesis 2 consists of following detailed hypotheses,

**Hypothesis 2a:** IT capability has a moderating effect on the relationship between empowerment and firm performance of SMEs.

**Hypothesis 2b:** IT capability has a moderating effect on the relationship between innovativeness and firm performance of SMEs.

**Hypothesis 2c:** IT capability has a moderating effect on the relationship between internationalization and firm performance of SMEs.

Literature presents mainly results of studies for bilateral relationships, for example between empowerment and firm performance or between innovativeness and firm performance. But it is known that strength of influencing each resource and capability may change depending on the impact of other resources or capabilities. Thus, we predict that

**Hypothesis 3:** Empowerment, innovativeness, internationalization and IT capability have an effect (separately and together) on firm performance of SMEs.

The hypothesis 3 consists of following detailed hypotheses

**Hypothesis 3a:** Empowerment has an effect on firm performance of SMEs.

**Hypothesis 3b:** Innovativeness has an effect on firm performance of SMEs.
Hypothesis 3c: Internationalization has an effect on firm performance of SMEs.
Hypothesis 3d: IT capability has an effect on firm performance of SMEs.
Hypothesis 3e: Result of the total effect of all processes on firm performance is not the sum of results of the effect of each of the process separately on performance.

Realizing that SMEs are not a homogeneous set of firms and caring about reliability of our research, we decided to state hypothesis

Hypothesis 4: Control variables (for example industry, size, age) have an effect on the examined relationships.

The stated hypotheses implicate a following conceptual model (Figure 1).

**Figure 1**

**Conceptual model**

Our conceptual model fulfills the identified gap and extends previous studies including: employee empowerment, innovativeness and internationalization, placing them in the context of IT capability.

**Conclusions and further research**

Investigations of Polish SMEs have so far been few and fragmentary. In the next stage of our study, an empirical research will fill in this research gap. The research sample is restricted to SMEs that are members of the Regional Chamber of Commerce in Katowice
(RIG). RIG is one of the biggest economic organizations in Polish local governments and gathers about 400 member enterprises. The analysis of the collected data by means of quantitative methods will enable the testing of the stated hypotheses.

We think our survey instrument will be used in economic practice. Moreover, we would like to formulate some recommendations for SME leaders which help to improve organizational effectiveness. Apart from utilitarian purposes, it is important to accomplish theoretical purposes. We assumed five main theoretical purposes:

− Operationalization, in regard to SMEs, of multidimensional concepts: employee empowerment, innovativeness, internationalization.

− Determining interrelationships between employee empowerment, innovativeness, internationalization and performance of SMEs, placing them in the context of IT capability.

− Determining the effect of control variables (for example industry, size, age) on the relationships.

− Determining the effect of IT capability on employee empowerment, innovativeness, internationalization and the effect of IT capability on relationships between these processes.

− Determining the character of the effect (direct or indirect) of the individual processes on performance of SMEs.

We plan to compare our achieved results with results of similar studies conducted in other countries and identify reasons of potential differences.

Teaching Case Exchange Workshop: Integrating Cultural, Social, and Economic Contexts into Writing Teaching Cases

Thomas M. Cooney and Jeffrey R. Cornwall

Dublin Institute of Technology (Ireland) and Belmont University (USA)

thomas.cooney@dit.ie

This workshop presents a case writing model integrating American and European perspectives. The workshop highlights the key approaches to be taken when writing case studies and how they can be used to maximize the learning experience for students. A unique aspect of this workshop is its focus specifically on the relevance of 'cultural context' in writing and teaching with cases in entrepreneurship. The workshop is designed to assist entrepreneurship educators in producing entrepreneurship case studies using ‘best practice’ techniques and highlight the elements that are required to make case studies as effective and interesting as possible for teaching purposes.

Keywords: Case Writing, Entrepreneurship, Cultural Context
The Marriage Tax: Do Marriage and Children Impact the Success of Self-Employed Men and Women Differently?

Anna Flaig and Maria I. Marshall

Abstract

This study focuses on women entrepreneurs’ underperformance, specifically addressing the question of whether the presence of children and a spouse impact self-employed men and women’s wages differently. The basic proposition is that marriage and children pose a different set of challenges to men and women entrepreneurs. By acknowledging the overlap of gender, family, and business we are able to observe how the institution of marriage as well as the presence of children impacts women’s self-employment wages differently from men’s. For the overall self-employed population, marriage and children both served as a positive influence on hourly wages. However, when observing the interaction of women and children as well as women and marriage on wage, both overlaps seem to have a negative impact on wage.

Introduction

Women’s role in society has evolved over the last 50 years as the paradigm of cultural norm has shifted to allow women to have both, a career and a family. Despite this societal freedom, women entrepreneurs consistently underperform in terms of gross receipts in comparison to their male counterparts. However, research is inconclusive on the economic cause for the underperformance of women-owned businesses.

The Female Underperformance Hypothesis is defined by Du Rietz and Henrekson (2000) as: “all else equal, female entrepreneurs tend to be less successful than their male counterparts in terms of conventional economic measures” (Du Rietz and Henrekson, 2000, p.1). Using aggregate level data, a number of studies (Fischer, 1992; Brush, 1992; Rosa, Carter and Hamilton, 1996; Du Rietz and Henrekson, 2000) have confirmed that there is significant

underperformance by women relative to men, thus supporting the female underperformance hypothesis. Using the framework of conventional economic measures, Brush (1992) found that women in the US underperform in terms of production, employment, profitability, and other performance measures, and Rosa, Carter and Hamilton (1996) found similar results for women in the UK.

However, when data is disaggregated with regard to industry and business size, the results are inconclusive as the income gap between men and women owned ventures is insignificant (Collins-Dodd, Gordon and Smart, 2004; Orser et al., 2006). Using the traditional economic measures of profit, Du Rietz and Henrekson (2000) found that gender was only a significant determinant of performance when reviewing sales.

Compared to men owned enterprises, women owned enterprises are smaller and significantly more concentrated in highly competitive industries with limited growth opportunities such as professional and business services, educational and health services, and wholesale trade and retail trade (Gurley-Calvez, Harper and Biehl, 2009; Coleman, 2007; Fasci and Valdez, 1998; Rosa, Carter and Hamilton, 1996). The heavily female dominated retail and service sectors also fall at the end of the value chain, leaving little room for the capture of additional revenue (Brush and Chaganati, 1999). This industry selection may explain a portion of female underperformance. The target customer base may also be less profitable for women owned firms than for men owned firms. Women owned firms are less export oriented and disproportionately reliant on households as customers (Du Rietz and Henrekson, 2000) and are less likely to pursue government funded contracts (DeMartino et al., 2006; Bates, 2002; Loscocco and Robinson, 1991).
Women have been found to be less risk tolerant than men (Sexton and Bowman, 1986, 1990). But these results are also inconclusive. Masters and Meier, (1988) found no significant difference between gender’s risk tolerance, where as Jianakoplos and Bernasek (1998) found that single women were more risk averse than men, and that as wealth grows men had a proportionately riskier investment portfolio than women.

Men and women also perceive and pursue capital differently (Carter and Rosa, 1998; Verheul and Thurik, 2001). A study of Norwegian entrepreneurs found that women obtain significantly less financial capital to develop their new businesses and those lower levels resulted in much slower early business growth (Alsos et al., 2006). This funding gap hinders overall business growth for women owned firms (Brush et al., 2004).

The ability to attain early business growth is a function of access to financial capital, but women business owners are less inclined to take out loans from conventional banks (Marlow, 1997). Women have also been found to make less money than men, leaving them less flexibility to invest in themselves (Marlow, 2002; Marlow and Patton, 2005). On the other hand, women may deliberately choose not to grow their businesses and pursue other goals (Sexton and Bowman, 1986; Rosa, Carter, and Hamilton, 1996).

Proposing a model of entrepreneurship, Davidsson (1991) looks to the entrepreneurs themselves, and views small business growth over time as the product of ability, need, and opportunity. Research conducted on gender differences pertaining to opportunity identification found that although men and women utilize different opportunity identification sequences, there is no measurable difference in the innovativeness of the identified opportunity (DeTienne and Chandler, 2007).
Chell and Baines (1998) attack the question of women entrepreneurship from a different angle, proposing that performance itself is gendered. They question whether the traditional profit-based measures should be the sole evaluation of performance or whether performance can be redefined by women’s own subjective standards of success. This line of thought is echoed in the family business literature as survey methods have moved beyond objective economic measures to capture subjective non-economic measures of perceived success such as owner satisfaction, customer satisfaction, personal development, and personal achievement (Rosenblatt et al., 1985; Danes & Olson, 2003; Philbrick and Fitzgerald, 2007; Clark and Marshall, 2010).

One of the key factors in identifying the differences between male and female entrepreneurs is the original motivation for entering the business. Many researchers have looked at how gender impacts business motivations, goals, and growth patterns. Men are more likely to go into business for themselves because they desire to be an entrepreneur (Scherer, Brodzinski, and Wiebe, 1990) or not work for someone else (Swayne and Tucker, 1973). Women, on the other hand, desire self-employment as it allows them to balance their work and family life (Scott, 1986; Chaganti, 1986; Kaplan, 1988; Holmquist and Sundin, 1988; Brush, 1992; Du Reitz and Henrekson, 2000). Bird and Brush (2002) characterized men as linear, rational, and strategic entrepreneurs with their main goal being wealth maximization, whereas women entrepreneurs were characterized as less sequential with family and personal life obligations playing a pivotal role.

The “Integrated Perspective” proposes that women’s social inclinations are more focused on relationships, suggesting that women perceive their businesses as part of an interconnected network of relationships—not a separate economic entity (Bird & Brush, 2002; Brush, 1992; Geoffe and Scase, 1983; Kent, Sexton and Vesper, 1982). Clark and Marshall (2010) found a
similar relationship bias with empirical data two decades later. Women entrepreneurs are more inclined to spend more time with each customer and measure success as a function of repeat customers and customer satisfaction (Clark and Marshall, 2010).

Schwartz (1976) portrayed women as the limited family oriented entrepreneur, lacking work experience and education. Nearly two decades later, Buttner and Moore (1997) put forth two female entrepreneur typologies; neither of which portrayed the entrepreneur as a housewife. They suggest two types: the Intentional Entrepreneurs, who portray similar characteristics as men and were motivated by achievement, independence, and self-actualization (DeMartino et al., 2006; Buttner and Moore, 1997; Schein, 1993) and the Career Climbers, who were driven to entrepreneurship by environmental factors or discrimination in the corporate world (DeMartino et al., 2006; Buttner and Moore, 1997; Fischer et al., 1993).

The discrimination and environmental factors found in the corporate world have also been referenced in family business literature. Several articles cite the “invisible women” phenomenon- where gender specified family roles unconsciously translate into the business (Danes and Olson, 2003). Female typologies often label the female component of the family business as: mom, spouse, care taker, negotiator, sounding board, or book keeper- roles that are often unpaid and ambiguous in nature and appreciation (Danes and Olson, 2003).

The literature in feminist economics, family business, and entrepreneurship frequently suggest that women experience some level of discrimination and subsequently lower wages in the work force, regardless of the sector or location of the job. Some of the characteristics and experiences described above are fundamental components of being a woman, but the gender roles themselves are artificial constructs foisted upon women by society. Is it possible to be a woman, a mother, and a wife and still run a successful business? Despite the fact that there is
rich body of literature pertaining to the gender question, there has been limited research on the specific overlap between women owned businesses and the presence of family, and how those factors impact women’s self employment revenues.

**Theoretical Framework**

Family business theory revolves around the concept that the family and the business are dual systems, interconnected in terms of financial and human capital. Although this study is not specifically looking at family businesses, it must be acknowledged that the family has a significant impact on entrepreneurs and their subsequent business success. The relationship between the family and the business venture is vital as the initial capital generally comes from personal and/or family assets (Dyer and Handler, 1994).

Women are known to play a number of roles: the woman, the business owner, the mother, and the wife. All of these roles and associated responsibilities overlap as women “switch hats” to stay in character. Using the “Integrated Perspective” suggesting that women perceive their businesses as part of an interconnected network of relationships (Kent, Sexton and Vesper, 1982; Bird & Brush, 2002), we propose a Women’s Business Model as shown in Figure 1 to capture the overlap between the roles of gender, family, and business.

The Women’s Business Model is a combination of the Venn diagram model proposed by Davis and Tagiui (1989) and the Sustainable Family Business Model proposed by Stafford, Duncan, Dane, and Winter (1999). Both models are rooted in the paradigm of family functionality and the paradigm of business success and, importantly, the overlap resulting from alliance with both. Our model introduces the idea of the woman as a separate entity with her own goals and success outcomes. She overlaps with the family and the business each of which have
their own goals and success outcomes. The level of success of all three entities will depend on how well the goals of the woman, the family, and the business are interconnect and integrated.

There is limited research on how the presence of a spouse and children specifically impacts women’s self-employment wages. By acknowledging the overlap of gender, family, and business we are able to observe how the institution of marriage as well as the presence of children impacts women’s self-employment wages differently from men’s. We propose that having a family may have a negative impact on women, as women are working while typically still managing the household, and that multitasking between a business and family may explain some of women’s underperformance.

**Marriage**

Women’s choice to enter into self-employment is a frequently cited choice for its flexibility, allowing women to choose how to allocate their time between their work and their family (DeMartino et al., 2006; DeMartino and Barbato, 2003; Parasuramen et al., 1996; Brush 1992, 1990; Birley 1989; Scott 1986; Darian, 1975). Hundley (2000) has even gone as far to say that to marry and have children is a conscious decision to devote time to the household, decreasing ones earning potential in the wage and salary sector. Women may therefore be motivated to enter into self-employment to avoid lower returns for their work effort in a more structured wage and salary sector (Hundley, 2000; Gurley-Calvez, Harper, and Biehl, 2009). This leads us to the following hypothesis:

*H1: Being a woman has a negative impact on business success.*

The inherent economic bonds of marriage obligate the spouse to the business. Therefore, if a spouse’s goals differ from those of the primary business owner then destructive conflicts may arise. Irrelevant of the spouses’ direct involvement in the business, their attitudes and
support have tremendous influence on the entrepreneur’s attitudes, resources, and motivations toward the business (Poza and Messer, 2001). Spouses can also be more than psychological support- having a self-employed husband was cited as one of the greatest lenders of experience and confidence to a wife, motivating their original decision to enter into self-employment (Caputo and Dolinsky, 1998).

Werbel and Roberg (1989) identify a potential person-role conflict in career choice identification. They propose that person-role conflicts may arise when the family decision maker chooses a career change that does not align with a family member (the spouse’s) preferences and perspectives of the family unit. The spouse is also a stakeholder in the family and has the power to convey perceptions and expectations. Van Auken and Werbel (2006) hypothesize that the person-role conflict is inversely associated with spousal commitment to the business and that the greater the spousal involvement in the initial decision to start the business, the greater the spousal commitment to the business. They find that spouses who are psychologically committed to the business are key assets in overcoming start-up difficulties and that spouses who are not committed increase stress by creating both family and work related conflicts (Van Auken and Werbel 2006).

Although marriage overall is assumed to have a positive impact on self-employment revenues, we hypothesize that the husband captures the majority of the benefits from this relationship. Despite the combination of human and financial capital resulting from marriage, there are related time and responsibility constraints associated with the gender role of the wife. This reasoning on marriage and its affect on business success lead us to the following hypotheses:

*H2: Marriage has a positive impact on business success.*
H3: Married women will earn less than married men.

Children

Several researchers have found that the presence of children as well as marriage increases women’s likelihood of entering into self-employment (Caputo and Dolinsky, 1998; Connelly, 1992; Robinson and Sexton, 1994). Female and male entrepreneurs integrate their personal or family lives and their career lives differently (Parasuraman et al., 1996). In particular, children can pose a different set of challenges for men and women. There are still stereotypes and intrinsic motivations in place that impact childcare activities and responsibilities, and those responsibilities still tend to fall primarily on women. For men, children have been found to represent a source of motivation, but for women children represented a source of distraction and a supervision issue (Williams, 2004). This may imply that women are multi-tasking, working while supervising their children, whereas men compartmentalize their work and family life.

Women work fewer hours a week and have less time to devote to their business when compared to their male counterparts (Parasuraman et al., 1996; Gurley-Calvez, Harper and Biehl, 2009). Using the American Time Use Survey, Gurley-Calvez, Harper, and Biehl (2009) found that women spend less time on work and work-related activities than men, and self-employed women spend less time on work-related activities than wage and salary women. They also found that each additional child leads to 2.4 fewer work hours a week for self-employed women and 1.5 fewer hours for wage and salary women compared to men (Gurley-Calvez, Harper, and Biehl, 2009). This leads us the following hypothesis:

H4: Children have a negative impact on women’s business success.

The age of the child also has bearing on the amount of time required in terms of supervision. Children under the age of five are not yet eligible for the state funded education
system making them either a financial or time constraint on the parents as they seek alternative means of supervision. The greater the cost of childcare relative to wage potential the less likely one is to seek employment. People often enter self-employment to overcome child care costs because self-employment provides flexibility for time management (Caputo and Dolinsky, 1998). This reasoning leads us to the following hypothesis:

\textit{H5: Children under the age of five have a negative impact on women’s business success.}

The concept that women are disadvantaged in terms of earning power is not a new idea. These five hypotheses have been tested in isolation to some extent in the gender, entrepreneurship, and family business literature. However, the results have been inconclusive as they have not addressed the specific overlap of marital status and presence of children on women’s self-employment wages. Building on the gender, children, and marriage related hypotheses we study the self-employment wage differences between married and single, men and women.

Other Factors

The small business, family business, and entrepreneurship literature provide empirical support that experience positively impacts business profitability. Human capital theory attempts to explain how these individual endowments, coupled with the environment can shape different earning outcomes. Becker (1993) defines human capital as stocks of skill, knowledge, intelligence, and health that could be used to generate both monetary and non-monetary resources. When looking at human capital factors that influence the entrance into self employment, industry specific experience (Loscocco and Robinson, 1991) and a self-employed spouse (Caputo and Dolinsky, 1998) were major determinants of women entering into self-employment. However, age and children over the age of 18 had a negative and significant impact
on the duration of self-employment in Europe (Williams, 2004). Brush and Chaganti (1999) found that a combination of education level and industry specific experience had a significant impact on firm performance- as measured by net cash flows and employment levels.

Education has also been found to have a positive impact on business performance, duration, and success. Bates (1990) found that entrepreneurs with a college education were dramatically less likely to fail than those without a college education. College education also provides entrepreneurs with greater access to loans from commercial banks (Bates, 1990). Education improves firm survival and firm growth. Individuals with higher levels of education exhibit decreased probability of business exit during difficult economic times (Cooper, Gimeno-Gascon, and Woo, 1994). The type of education can also have an impact on time use. Gurley-Calvez, Harper, and Biehl (2009) found that women on average spend more time in child care than work activities. However, self-employed women with professional degrees spend much more time in work activities- indicating that some women might be more career oriented.

**Empirical Analysis**

**Data**

This study uses a sample of self-employed people from the 2007 American Community Survey (ACS) extracted from the Integrated Public Use Micrordata Series (IPUMS) data base of the Minnesota Population Center. We used both incorporated and unincorporated self-employed businesses owned by both men and women. The IPUMS is composed of microdata and the unit of observation is the individual, but the data is also organized into households. The household data allow the study of individual characteristics within the context of their family. The sample of self-employed individuals includes 179,808 observations. The data are then divided into four subsets: married women (43,159), single women (20,178), married men (86,108), and single men
(30,363). For this study the definition of “married” includes married persons whose spouses are present and absent in the household and “single” includes persons who are single, divorced, separated, or widowed.

**Dependant Variables**

The dependent variable is the wage earned from the self-employment venture. Table 1 shows the definitions and summary statistics of the variable in the study. As the self-employed do not earn a fixed hourly wage, this variable is constructed from their reported income earned from their business \((\text{inearn})\) divided by the usual hours worked on a yearly basis. This constructed wage variable \((\text{wage})\) allows us to measure the efficiency of income generated for actual hours worked rather than looking at their total income.

On average, the population works 40.28 hours a week with single men falling slightly above that per week at 40.53 hours and married men working more at 44.66 hours. Women on the other hand fall short of the average, with single women working 34.77 hours and married women working 33.94 hours. The amount of time spent working has a direct relationship with income earned. The average income earned is $54,285.41 for the entire sample. Married men by far exceed this amount with an average income earned of $72,809.13 followed by single men with earnings of $45,362.93. These numbers support the idea in previous research that marriage and potentially children provide a source of motivation for men to work harder to provide for their family. Women on the other hand do not experience nearly as marked a marital status gap in income earned, with married women making $34,053.06 compared to single women making $31,938.35.

Women make less money and work fewer hours than men. However, when looking at the combination of income earned and hours worked to the hourly wage variable we can see how
efficient these different groups are at converting their work time into revenue. The population average is $40.84 per hour for roughly 40 hours a week. Married men exceed this with $46.11 per hour but they also work 44.66 hours a week. Single men fall short at $37.60, while still working 40 hours a week. Using the difference of means test, the difference between married and single men’s wages is statistically significant at 1 percent level. Women on the other hand work fewer hours and make less money, but the hourly wage allows for a more accurate comparison. Single women work roughly 35 hours a week and make $39.18 per hour versus married women who work roughly 34 hours a week and make $33.41 per hour. Using the difference of means test, the difference between married and single women’s wages is statistically significant at 5 percent level. However, the most significant difference in wages is the approximate $13 difference in wages between married men and married women; the difference is statistically significant at the 1 percent level. Single men and women make nearly the same, with single women making slightly more than men. However, that difference was not statistically significant.

**Independent Variables**

Table 1 also shows the independent variables of interest in this study: marriage and the interaction between gender, marriage, and children. Overall, the sample is comprised of 35.22 percent women, 64.78 percent men, and 71.89 percent married individuals. An important component of this study is the presence of children in the household and the presence of children under the age of five. As stated in the literature, children pose a different set of challenges and opportunities to men and women. By separating children into two groups we can observe how the younger group, who should theoretically take up more time and energy in supervision related activities, impacts the respondents. Of the sample, 43.66 percent have children. When looking
specifically at younger children, 10.63 percent of the sample has at least one child under the age of five. The variable \textit{nchild} represents the number of children in the household. The variable \textit{nchild5} is a binary variable indicating whether there are children under the age of five in the household coded one, or not coded zero.

To further understand the intersection of gender, marital status, and children on self-employment wages we created interaction terms: married women (\textit{WM}), women with children (\textit{WC}), married with children (\textit{MC}), married women with children (\textit{WMC}), and women with children under five years old (\textit{WC5}). These interactions are a meaningful contribution to the literature and allow us to understand the overlap between the woman, the mother, and the wife represented in the Women’s Business Model.

Household disruptions like separation, divorce, or death cause a shock to the family unit which can translate to disruptions in the working of the business. Despite the fact that we do not have the time frame of the relationship shock, we model its occurrence to see how the absence of a spouse in the household impacts wages. The binary variable modeling relationship tension (\textit{RelationshipTen}) is coded “one” to indicate whether the primary respondent is separated, divorced, widowed or married, spouse absent and coded “zero” if the primary respondent is married spouse present or single.

\textbf{Control Variables}

Control variables are demographic, human and financial capital, industry, and geographic variables. Descriptive statistics are shown in Table 2. The demographic variables include age and race. The human and financial capital variables are level of educational attainment, incorporation of the business, and home ownership. Owning a home is used as a proxy for access to financial
capital. There are 11 industry variables included and they are used to control for industry related effects. To observe geographic trends five geographic variables are included.

**Empirical Models**

Traditionally, the literature looks at female underperformance in the context of all self-employed individuals. For this analysis we are only interested in the people who are actively venturing into self-employment endeavors. Therefore, we limited our sample to individuals who work at least 20 hours a week and 20 weeks a year. This focuses our model only on individuals who are working at least part-time in their business. Moreover, we include interaction terms of family dynamics so that we can determine their impact on married and single individuals.

We model the wage variable, $Y$, as a linear function of the predictor variables, $X$. The matrix $X$ includes the variables of independent variables which include the interaction variables and the control variables. To analyze the impacts of family as well as personal and industry characteristics on self employment wages we utilize an ordinary least squares (OLS) regression. We utilize three different of models. The first model tests the first hypothesis and the direct effects of gender, marital status, the presence of children and children under five. Model expresses self employment wage as a function of family and marriage variables while controlling for the effects of all business-specific variables, personal attributes, and geographic variables.

The subsequent models also include important interaction terms that quantify the overlap of the different dimensions of gender and family variables. The second model introduces interaction terms between women and marriage ($WM$), women and children ($WC$), and children and marriage ($CM$). The third model introduces an additional interaction term to account for the possible joint effect of women, marriage, and children ($WMC$).

**Results and Discussion**
Model 1

The regression coefficients, standard errors, and model fit are shown in Table 3. Our first hypothesis (H1), that being a woman had a negative impact on wages, was supported. We expected the coefficient to be negative and statistically significant as has been shown previously in the literature and it was negative and statistically significant at the one percent level. This finding indicates that all else held equal, being a women reduces hourly wage by $8.61 an hour. Translating this into annual income, assuming someone works 35 hours a week and 50 weeks a year this results in a potential $15,067.50 income differential between men and women.

Our hypothesis, that marriage has a positive impact on wages (H2), was supported. Marriage was positive and statistically significant at the one percent level. This indicates that someone who is married and works an average of 35 hours a week and 50 weeks a year will make $2,625 more than someone who is single. This result has a number of interesting implications. The literature has shown that marriage can be a source of support (Caputo and Dolinsky, 1998) as well as a potential source of conflict, depending on goals (Poza and Messer, 2001; Van Auken and Werbel, 2006).

Similar to marriage, children had a positive impact on wage. Our hypotheses H4 and H5 were not supported. Having children was positive and statistically significant at the one percent level and having children less than five years old was not statistically significant. We hypothesized that having children would have a negative impact on wage. However, the results support the suggestion by Williams (2004) that children are perhaps a source of motivation for the self-employed.

The demographic variables (race, age, and education) were all statistically significant. Compared to their white counterparts other racial groups such as blacks make less per hour all
else help equal. Age and education were statistically significant. Age was statistically significant at the one percent level. To interpret the age coefficients we use the equation: absolute value $|B1/(2*B2)|$, which indicates the point of diminishing returns to age. In this base model, diminishing returns to age occur at approximately 54 years. The reference education variable is a high school degree or less. Not surprisingly higher levels of education increase hourly wage. For example a Bachelors degree increases wage by $9.64 an hour and a Masters degree increases wage by $13.23 compared to having a high school education.

The business control variables were also statistically significant. The coefficients on incorporation and owning a home were positive and statistically significant at the one percent level. Agriculture, art, construction, and other services were negative and statistically significant at the one percent level. Mining, whole sale trade, education and health, and finance/real estate had positive coefficients and were also statistically significant at the one percent level. For the industry variables the reference was retail trade.

Using the North East as a reference variable, the geographic variables South, Mid West, and West were negative and the Pacific West was positive. All the geographic variables were statistically significant at the one percent level.

**Models 2 and 3**

In the second model we include the interaction between gender and family to determine their impact on wage. The second model includes the interaction terms $WC$, $WM$, $CM$, and $WC5$. The regression coefficients, standard errors, and model fit are shown in Table 3. Gender has a negative impact on wages and is statistically significant at the one percent level (H1 supported). However, by including the interaction terms the magnitude of the gender coefficient decreased.
This decrease in the negative impacts of gender indicates that the family interaction variables are controlling for some of the wage impacts previously captured by the gender variable.

The interaction terms show an interesting trend in terms of children’s impact on women. The coefficient on $WC$ was negative and statistically significant at the one percent level. This result indicates that although children can have an overall positive impact on self-employment wages, they have a less positive impact on wages for women compared to men (H4 supported). This suggests that children do possibly represent a distraction for women and indicates a need to balance work and family. However, the interaction coefficient on $WC5$ is positive and statistically significant at the five percent level (H5 not supported). We expected to see that children under the age of five had a negative impact on wages based on the assumption that they required more time. The results indicate that children under the age of five actually serve as a positive influence for women. This highlights very interesting implications for the presence and impacts of young children.

Marriage also had a positive impact on wages in this model. The interaction terms included in this model have the capacity to determine the impact of being female and married on wage. Interestingly, the interaction term ($WM$) is negative and statistically significant at the one percent level (H3 supported). The $WM$ variable indicates that the potential benefits of marriage accrue to men. The direct result is that married women earn $6.27 per hour less than men. This is perhaps the most interesting finding in this article. We think that is may be a result of the household related time constraints associated with being married, and that women are actually balancing a self-employment venture as well as managing the household. This may also indicate that husbands are actually collecting rent from their wives. Or perhaps, that married women are subject to a “marriage tax”. In addition, women are often motivated to enter into self-
employment as a mechanism to balance their work and family lives, marriage may be an accepted profit constraint for women and provides an opportunity for a less profit-oriented lifestyle.

The third model built upon the two preceding models. The regression coefficients, standard errors, and model fit are also shown in Table 3. The addition to this model was the triple interaction term of $WCM$ which was not statistically insignificant coefficient.

**Conclusion**

This study focuses on women entrepreneurs’ underperformance, specifically addressing the question of whether the presence of children and a spouse impact self-employed men and women’s wages differently. It makes two specific contributions to research focusing on the overlap between gender, entrepreneurship, and family. First, it shows the significantly negative impact that marriage plays on women entrepreneurs posing an alternative theory for the cause of women underperformance. Second, it provides insight into how children and family impact male and female entrepreneurs differently.

By utilizing the interaction terms that represent the overlap of gender and family we are able to observe the impact of marriage on entrepreneurs as a whole as well as specifically on female entrepreneurs. With the interaction between women and marriage we observe a consistently negative impact, contrary to the consistently positive marriage impact for men. This indicates that marriage has an opposite impact on men and women who are engaged in self-employment ventures. This may also indicate that husbands are actually collecting rent from their wives. Or perhaps, that married women are subject to a “marriage tax”. This study poses an alternate reason for female underperformance, stressing that marital status can be considered more than just a demographic variable.

YOUNG RESEARCHERS WRITING WORKSHOP
At ICSB World Conference 2010

Organised by
Associate Professor Luca Iandoli (University of Naples Federico II, Italy) &
Prof. Dr. Friederike Welter (Jönköping University, Sweden)

Do you need advice on your latest article you are working on? ICSB is offering a workshop for young researchers who have finished their PhD within the past 5 years or who are in the finishing stages. This workshop will focus on paper writing. We will invite leading scholars and editors of peer-reviewed journals to discuss your paper drafts. You also will meet other younger researchers with similar interests and can find out about possibilities for research collaborations. You will work in groups of 3 or 4 participants, together with one senior scholar. All participants are expected to read the paper drafts of their group upfront and to review and comment on one of the papers. More details will be distributed once you are accepted to the workshop.

Researchers interested in participating should apply to Friederike Welter (wefr@ihh.hj.se) no later than 15 MAY, 2010

The application should include the paper you plan to submit (please note that we do not accept articles already under review for a journal!). The number of participants is limited to 12 researchers so we encourage early applications. You will be notified of acceptance until 31 May 2010.
Creative Industries in Finland – barriers hindering entrepreneurial development

Sampsä Wulff¹, Oili Kinnunen², Päivi Voutilainen³

University of Eastern Finland, Finland

³ Päivi Voutilainen, Researcher in Entrepreneurship at Aduce – Centre for Training and Development, University of Eastern Finland; email:paivi.voutilainen@uef.fi
Abstract

The purpose of this study is to expand knowledge on the internal resources and the know-how of the entrepreneur, both of which have an effect on the growth of a business. Another goal of this study is to find out how cooperation with different partners such as the public sector, businesses within one’s own industry and companies outside one’s own sector affects growth. In order to meet this goal, a structured questionnaire has been sent out to entrepreneurs in creative industries in the Northern Savo region of Finland.

The focus of today’s business life has shifted from traditional manufacturing towards industries that are relying more heavily on creativity. A new concept, creative economy, has arisen from this phenomenon, and is being used by many researchers and policy makers of today. Because of this change, creative industries are becoming more widely accepted as playing an important part in economic growth. In spite of this new role of the creative industries, there is a lack of research in this field in Finland. We have therefore come to recognize that it is vital to discuss the present state of small creative businesses and the challenges that today’s creative industry is facing.

The research presented in this paper was based on a structured questionnaire that was sent to 855 entrepreneurs operating in the creative industries in the Northern Savo region at 2009. From the 855 entrepreneurs, we received a total amount of 189 usable replies.

A logistic regression analysis was used in order to find out what are the internal resources that affect the entrepreneurs’ intentions for growth. The estimated parameters were fairly successful in explaining the entrepreneurs’ willingness to either grow or not grow their companies. Out of all of the observations made, 64.4 % were classified correctly by the logistic regression analysis. Based on the model, it is revealed that successful resources for HRM and financing have a positive effect on growth.

Cooperation is recognized as a vital factor for businesses with growth intentions. We wanted to find out who the partners that the entrepreneurs in the creative sector cooperate with are and whether the entrepreneurs feel that cooperation with such partners has an effect on growth intentions. First, the willingness to grow was cross tabulated with different partners. Second, a chi-square test was used to find out statistical significance between cooperation and growth intentions. Based on the chi-square test, we propose that cooperation with
firms outside of one’s own sector has a positive effect on growth. The chi-square test also reveals that a successful relationship and collaboration with subcontractors has an effect on entrepreneurs’ positive attitudes towards growth. The data showed that cooperation with companies within one’s own field of operation takes place fairly often, but that there is no positive correlation between this kind of activity and growth intentions.

1. Introduction

We know from previous research that entrepreneur’s growth aspiration supports actual business growth (Baum, Locke, & Smith 2001; Baum, Locke, & Kirkpatrick 1998; Kolvereid & Bullvag 1996; Miner, Smith, & Bracker 1989). However, as Wiklund and Shepherd (2003) suggest, this relationship between growth aspiration and actual growth appears to be more complex than previously indicated (Wiklund & Shepherd 2003). Even though many entrepreneurs feel that growth is the goal that one should pursue, business owners also operate their own companies for a variety of reasons other than the one of maximizing their economic profits (Davidsson 1989a; Delmar 1996; Kolvereid 1992; Storey 1994). These other reasons include non-economic personal factors such as gaining independence or developing one’s own ideas (Douglas & Shepherd 2000). In this paper, we want to take a look at entrepreneurs operating in the creative sector (to be defined later on in the paper) and their growth aspirations.

The relationship between entrepreneurship and firm performance has gained much attention from researchers in the field. This paper attempts to extend knowledge on the internal resources and the know-how of the entrepreneur, both of which have an effect on business growth. Another goal of this study is to find out how cooperation with different partners such as businesses within one’s own industry, companies outside one’s own line of business and the public sector affects growth.

As previously mentioned, Wiklund and Shepherd (2003) argue, that the relationship between growth aspiration and growth is more complex than often thought. Wiklund and Shepherd (2003) agree that the nature of the relationship depends on the level of experience of the small business manager as well as the dynamism of the environment in which they operate. Furthermore, Wiklund and Shepherd point out that education, experience and environmental dynamism magnify the effect that one’s growth aspirations have on the realization of growth. (Wiklund & Shepherd 2003). In this paper, we will examine whether this is also true in the case of the creative sector. We will also include in our study an aspect of cooperation. Like Jennings and Beaver (1997) indicated, there is a reason to believe that the growth of small businesses is a
result of the manager’s personal abilities. In order to expand one’s business, the manager must have the ability to secure the resources needed for growth as well as possess the capability to develop his or her organization (Covin & Slevin 1997; Sexton & Bowman-Upton 1991). Thus, as many previous studies have demonstrated, it would appear that one’s personal abilities play an important role in small business development.

In our study, we looked at the entrepreneur’s personal abilities such as know-how and competence as well as how his or her use of networks influences growth aspirations. We divided competence in sub-groups such as core competence, strategic competence, ability to productization and branding, and compared them to growth motivation. After this was completed, we wanted to find out just what kind of influence might possible cooperation with different partners such as businesses within one’s own industry, companies outside one’s own line of business and the public sector have on growth intentions. In order to meet these goals, a structured questionnaire was sent out to entrepreneurs in the creative sector in the Northen Savo region of Finland.

The creative industries are currently subject to wide-spread attention and interest. This sector is of growing economic importance, as the creative industries have significant market value and can be argued to contribute to individual wealth and GDP. According to the Strategy for Creative Industries 2015 by the Ministry of Trade and Industry of Finland, creative industries is also a growing business sector in Finland. However, there is a lack of knowledge of entrepreneurship in the creative industries. The majority of employment and commercial activity in the creative industries takes place within small firms. Essential obstacles for entrepreneurship in creative industries include the lack of business skills and the commitment in small home markets and in low-level networking.

Two main research questions emerge:

1. How do the entrepreneur’s personal abilities such as know-how and competence influence growth aspirations?
2. What kind of cooperation between partners enables growth?

The paper proceeds as follows. First, we will present factors facilitating firm growth as well as those hindering entrepreneurial development and growth. We will also provide an overview of the effect that
cooperation and the entrepreneur’s internal resources and competences have on growth intentions. Second, we will describe the research method by including a description of data collection and analysis utilized in the study as well as in the context of the study. Third, we will analyze the data and present results. Finally, we will discuss the findings and implications of the research as well as present the need for future research.

2. Background

2.1 Factors facilitating and hindering small business development and growth

When talking about firm growth, the first task one should perform is defining what growth is. The concept of business growth varies between parties such as academic scholars and entrepreneurs (Achtenhagen, Naldi, & Melin 2010). While scholars use measures such as sales and employment, for entrepreneurs growth can mean something else, such as increased job satisfaction or gaining independence. In this study, growth aspirations are measured by the entrepreneur’s willingness to expand his or her business in terms of sales and/or employment.

Mazzarol (2000) has pointed out that in the new millennium small businesses are being seen as motors for economic growth, generators of innovations and a solution to the unemployment that has been continuing for decades. Because of this, there has been an evident shift in the field of small businesses towards firms being clearly growth-oriented (Morrision, Breen, & Ali 2003). This has been especially evident in the decision making concerning small businesses, the subsidization of small businesses and in small business research (Bridge, O’Neill, & Cromie 1998). We argue that since there are always limited resources on subsidizing small businesses, their resources should be allocated to firms with clear growth aspirations. As a result, there is a vast interest in the field of small business research so that one would understand the factors behind small business growth (Morrison et.al. 2003). To meet the goal of this study, which is to identify the key factors hindering small business development, we argue that it is vital to first understand the factors facilitating growth and development.

In spite of the lack of a universal theory explaining small business growth (Smallbone, Leigh, & North 1995) and the fact that no such theory is likely to be introduced any time soon, for example Storey (1994) has identified three key factors with an essential effect on small business growth: characteristics of the entrepreneur, characteristics of the organization and different strategies concerning growth (Storey 1994).
A vast majority of small and medium-sized businesses are owner-managed (Bennedzen & Wolfenzon 1999; Nutek 2004). This is also evident in the creative sector. Out of those participating in our study, 73% of the 189 respondents employed maximum two people (including the entrepreneur him/herself). The concentration of ownership and management can be seen as being both a positive and a negative factor for firm growth. The positive aspect is that when the ownership and management are concentrated on just one person, there is far less pressure coming from outside stakeholders who demand the ability to maximize profits and the business to be as transparent as possible (Carney 2005; Levitas & Mcfayden 2009). On the other hand, such concentration can have a negative effect toward small business growth and the entrepreneur’s growth aspirations. This is because the concentration of ownership and management can lead to avoidance of risks and unwillingness to change the firm’s strategic choices, thus creating barriers for growth and development (Hill & Snell 1988; Hoskisson, Hitt, Johnson, & Grossman 2000; George, Wiklund, & Zahra 2005).

As suggested by de Kluyver (2000), growth brings along challenges. One of these challenges has to do with hiring the first external employee. This does not double the sales but brings along fixed labor costs. (de Kluyver 2000). At the least successful case, expanding the business may cause the entrepreneur to have a loss-bearing company instead of a flourishing one (Gibb 1990; Cunningham 1994).

It has been argued that the growth of a small business is not a self-explaining phenomenon, but that the owner-manager has a vital role when it comes to intentions to pursue growth. Hence, it would appear that the positive attitudes towards the owner-manager developing his or her company may lead to the desired outcome. (Gray 2000; Maki & Pukkinen 2000). Previous researches have introduced elements influencing business growth as well as those functioning as barriers for development. We have listed some key factors from previous researches in Table 1.
Table 1. Factors affecting business development.

3. Research Design

3.1 The creative sector and data collection

The concept of creative industries emerged in the late 1990s primarily as a policy discourse, although the subsequent decade has seen a lively set of academic as well as industry and policy-related debates. The concept *creative industries* refers to a set of interlocking industry sectors where the creative industries are defined in terms of an industrial classification of what they do or what they produce and how they approach this task. There has been criticism of the details of the classifications (Florida 2002; Hartley 2005).

The issue of definition is an important one within the creative industry. There remains much debate about where the boundaries of the creative industries might cross with the cultural industries and the entertainment industry (Howkins 2001; Hesmodhalgh 2002). The creative industries base themselves on individual creativity, skill and talent and have a potential for wealth and job creation through the generation and exploitation of intellectual property (DCMS 2005). This includes advertising, architecture, the art and antiques market, crafts, design, designer fashion, film and video, interactive leisure software, music, the performing arts, publishing, software and computer games, television and radio. Cultural industries are best described as an adjunct-sector of the creative industries. Cultural industries include industries that focus on cultural tourism and heritage, museums and libraries, sports and outdoor activities and a variety of 'way of life' activities (Caves 2000; Hesmodhalgh 2002). Cultural industries are more concerned with delivering other kinds of value—including cultural wealth and social wealth—rather than primarily providing monetary value. Entertainment industry contains firms that provide, operate or engage in entertainment (e.g radio and television and films and theater).

We chose to study firms of the creative sector in the North Savo region. The creative sector is quite heterogeneous, ranging from such large firms as a newspaper printing company to sole owner enterprises such as individual craftsmen/women. After a national and international review, 12 lines of businesses were selected. In this study, we used the following classification. In Table 2, we can see the frequency of respondents in the different lines of business.

</table>

In this study, quantitative research design was chosen as the research method because it enables larger sample size than qualitative research and because the aim of the research was to get generalizable results. The objective of the research was to produce versatile information and deepen the understanding on entrepreneurship in creative industries.

The questionnaire was chosen to be the data collection method because of the size of the target group. Indeed, this is an efficient way of collecting information from a large number of respondents. Furthermore, statistical techniques can also be used to determine validity, reliability, and statistical significance.

The research data presented in this paper was collected through a structured questionnaire which was sent to 855 entrepreneurs operating in the creative industry in the Northern Savo region in Finland. All respondents were informed of the purpose of the questionnaire by a cover letter. Out of the 855 entrepreneurs, the final number of respondents was 187, representing a valid return rate of 22 percent.

The questionnaire was composed of 3 parts:

- start-up of the firm and new venture launching
- development and growth of the firm
- networks and relationships of the firm
In this paper, we are concentrating on growth factors in creative industry firms.

The questionnaire consisted mainly of multiple choice questions and some open questions. The respondents were asked to indicate their degree of agreement with these statements on a five point scale ranging from 1=“strongly disagree” to 5=“strongly agree”.

3.2 Methods and analyses used

The sample frame was constructed from the data that had been collected with the structured questionnaire. The questionnaire was sent out to 855 entrepreneurs in the creative sector that operate in the Northern Savo region of Finland. Out of the 855 respondents, 583 were reached by email and the rest 272 by regular mail. A total of 187 usable replies were returned, thus providing us with a response rate of 22%. Most of the companies taking part in the survey were small. 73 % out all of the respondents employed only the entrepreneur him/herself and 58 % generated annual revenue of 40 000 euro or less.

3.3 Variables and measures

The respondents were asked about their growth plans by giving them five options (1=the company is going to reduce its activities, 2=the company is going to maintain the current level of action, 3=there is an interest in the idea of growth but the company has no clear plans for this, 4=pursuing growth is a clear part of the strategy, 5=cannot say). The respondents’ answers were then coded into the SPSS program and a dummy variable was then constructed so that the option 5 was coded as a missing value, options one and two formulated value 0 and options three and four entailed value 1. This dummy variable measured the respondents’ growth aspirations, so that 0 represented the unwillingness of the respondent to grow his or her business and 1 represented one’s willingness to grow.

After the dummy variable was constructed, a logistic regression analysis was used to find out the effect of different competencies on growth motivation. The respondents were asked to estimate their internal resources by using a 5-point Likert scale. The estimated parameters were fairly successful in explaining entrepreneurs’ growth motivation. Out of all of the observations that were made, 64,4 % were classified correctly by the logistic regression analysis.

In order to test the influence of cooperation on growth motivation, the dummy variable was first cross tabulated with a variable representing whether the entrepreneur carries out cooperation of any kind in his or her activities. Subsequently, we wanted to gain deeper knowledge on the effect of cooperation on growth motivation. Therefore, growth motivation was cross tabulated with different partners in cooperation (the
partners were local educational institutes, subcontractors, other firms in the creative sector, firms in interface sectors, firms outside the creative or interface sectors, public sector). We then employed \( X^2 \) analysis to test the statistical value between cooperation and growth motivation.

4. Results

The first research question was tested by using logistic regression analysis. The results are displayed in Table 2. In Table 2, we can observe that only two of the estimated parameters had an effect on the entrepreneurs’ growth motivation; financial management skills and personnel management skills. Entrepreneurs who had successful internal resources on financial management were also motivated to grow their businesses. Additionally, those respondents who reported poor personnel management skills were not interested in growth, as opposed to those who had good personnel skills, who were growth orientated.

\[ -2 \text{ Log likelihood} = 186,476 \]

Total Classification Rate = 64.4 %

The second research question was tested by using cross tabulation and \( X^2 \) test. We first cross tabulated the respondents’ growth motivation with cooperation with different partners and then employed a chi-square test in order to discover any statistical significance or value between growth intentions and cooperation. The results of the chi-square test are shown in Table 3. The results support our assumptions. The fact whether or not the company engages in cooperation activities has an impact on growth aspirations. From Table 3, we
can perceive that cooperation has a positive effect on growth intentions (p=0.018, p<0.05). Our second assumption concerning cooperation was that cooperating with firms outside one’s own line of business has also a positive effect on growth aspiration. Our results support this assumption (p=0.000, p<0.05). Furthermore, as we hypothesized, a positive link between growth aspiration and cooperation with subcontractors can also be found (p=0.041, p<0.05).

5. Conclusions and future research

The aim of this study was to deepen the knowledge there is of the entrepreneurship in the creative industries. Based upon data collected from 187 creative industry firms in Northern-Savo, the paper defines a relationship between the internal resources of the entrepreneur and business growth. This study confirms what Covin and Slevin (1997), Gray (2000), and Maki and Pukkinen (2000) argued, namely that personal abilities play an important role in small business development, as well as what Wiklund and Shepherd (2003) noticed; that education, experience, and environmental dynamism magnify the effect of growth.

Even though the importance of the creative industries is widely acknowledged, empirical research about entrepreneurship in creative industries is carried out quite rarely. Because the role of the entrepreneur is crucial in the entrepreneurial process, special attention should be paid to the entrepreneur and entrepreneurial behavior. The identity of “entrepreneurs” is problematic in creative industries in that it raises the following questions: When does the innovative and creative person, motivated by freedom and self-expression, become an entrepreneur? Do those individuals consider themselves entrepreneurs (Baines & Robson 2001)? In future research, it will be important to deepen the understanding of the entrepreneur’s personality and motivations.

There is no single theory which can adequately explain small business growth (Gibb and Davies, 1990). This is partly because of the heterogeneity that exists in the various types of firms, but also because of the range of factors that can affect growth, ones which may interact with each other in different ways in varying circumstances.

It has been noted that many radical changes in society, especially in lines of industries, have created an opening for entrepreneurship in creative industries. In forthcoming studies, we will need to deepen our understanding of the different factors affecting business growth in the creative sector. We need more statistical data as well as qualitative data collected through interviews. We are carrying out an extensive statistical survey at the moment from which we are expecting to get data by the end of the year.

Creative Industries in Finland – barriers hindering entrepreneurial development

Sampsa Wulff¹, Oili Kinnunen², Päivi Voutilainen³

University of Eastern Finland, Finland

Abstract

The purpose of this study is to expand knowledge on the internal resources and the know-how of the entrepreneur, both of which have an effect on the growth of a business. Another goal of this study is to find out how cooperation with different partners such as the public sector, businesses within one’s own industry and companies outside one’s own sector affects growth. In order to meet this goal, a structured questionnaire has been sent out to entrepreneurs in creative industries in the Northern Savo region of Finland.

The focus of today’s business life has shifted from traditional manufacturing towards industries that are relying more heavily on creativity. A new concept, creative economy, has arisen from this phenomenon, and is being used by many researchers and policy makers of today. Because of this change, creative industries are becoming more widely accepted as playing an important part in economic growth. In spite of this new role of the creative industries, there is a lack of research in this field in Finland. We have therefore come to recognize that it is vital to discuss the present state of small creative businesses and the challenges that today’s creative industry is facing.

The research presented in this paper was based on a structured questionnaire that was sent to 855 entrepreneurs operating in the creative industries in the Northern Savo region at 2009. From the 855 entrepreneurs, we received a total amount of 189 usable replies.

A logistic regression analysis was used in order to find out what are the internal resources that affect the entrepreneurs’ intentions for growth. The estimated parameters were fairly successful in explaining the entrepreneurs’ willingness to either grow or not grow their companies. Out of all of the observations made, 64.4 % were classified correctly by the logistic regression analysis. Based on the model, it is revealed that successful resources for HRM and financing have a positive effect on growth.

Cooperation is recognized as a vital factor for businesses with growth intentions. We wanted to find out who the partners that the entrepreneurs in the creative sector cooperate with are and whether the entrepreneurs feel that cooperation with such partners has an effect on growth intentions. First, the willingness to grow was cross tabulated with different partners. Second, a chi-square test was used to find out statistical significance between cooperation and growth intentions. Based on the chi-square test, we propose that cooperation with firms outside of one’s own sector has a positive effect on growth. The chi-square test also reveals that a successful relationship and collaboration with subcontractors has an effect on entrepreneurs’ positive attitudes towards growth. The data showed that cooperation with companies within one’s own field of expertise was more likely to lead to growth.

of operation takes place fairly often, but that there is no positive correlation between this kind of activity and growth intentions.

1. Introduction

We know from previous research that entrepreneur’s growth aspiration supports actual business growth (Baum, Locke, & Smith 2001; Baum, Locke, & Kirkpatrick 1998; Kolvereid & Bullvag 1996; Miner, Smith, & Bracker 1989). However, as Wiklund and Shepherd (2003) suggest, this relationship between growth aspiration and actual growth appears to be more complex than previously indicated (Wiklund & Shepherd 2003). Even though many entrepreneurs feel that growth is the goal that one should pursue, business owners also operate their own companies for a variety of reasons other than the one of maximizing their economic profits (Davidsson 1989a; Delmar 1996; Kolvereid 1992; Storey 1994). These other reasons include non-economic personal factors such as gaining independence or developing one’s own ideas (Douglas & Shepherd 2000). In this paper, we want to take a look at entrepreneurs operating in the creative sector (to be defined later on in the paper) and their growth aspirations.

The relationship between entrepreneurship and firm performance has gained much attention from researchers in the field. This paper attempts to extend knowledge on the internal resources and the know-how of the entrepreneur, both of which have an effect on business growth. Another goal of this study is to find out how cooperation with different partners such as businesses within one’s own industry, companies outside one’s own line of business and the public sector affects growth.

As previously mentioned, Wiklund and Shepherd (2003) argue, that the relationship between growth aspiration and growth is more complex than often thought. Wiklund and Shepherd (2003) agree that the nature of the relationship depends on the level of experience of the small business manager as well as the dynamism of the environment in which they operate. Furthermore, Wiklund and Shepherd point out that education, experience and environmental dynamism magnify the effect that one’s growth aspirations have on the realization of growth. (Wiklund & Shepherd 2003). In this paper, we will examine whether this is also true in the case of the creative sector. We will also include in our study an aspect of cooperation. Like Jennings and Beaver (1997) indicated, there is a reason to believe that the growth of small businesses is a result of the manager’s personal abilities. In order to expand one’s business, the manager must have the ability to secure the resources needed for growth as well as possess the capability to develop his or her organization (Covin & Slevin 1997; Sexton & Bowman-Upton 1991). Thus, as many previous studies have
demonstrated, it would appear that one’s personal abilities play an important role in small business development.

In our study, we looked at the entrepreneur’s personal abilities such as know-how and competence as well as how his or her use of networks influences growth aspirations. We divided competence in sub-groups such as core competence, strategic competence, ability to productization and branding, and compared them to growth motivation. After this was completed, we wanted to find out just what kind of influence might possible cooperation with different partners such as businesses within one’s own industry, companies outside one’s own line of business and the public sector have on growth intentions. In order to meet these goals, a structured questionnaire was sent out to entrepreneurs in the creative sector in the Northen Savo region of Finland.

The creative industries are currently subject to wide-spread attention and interest. This sector is of growing economic importance, as the creative industries have significant market value and can be argued to contribute to individual wealth and GDP. According to the Strategy for Creative Industries 2015 by the Ministry of Trade and Industry of Finland, creative industries is also a growing business sector in Finland. However, there is a lack of knowledge of entrepreneurship in the creative industries. The majority of employment and commercial activity in the creative industries takes place within small firms. Essential obstacles for entrepreneurship in creative industries include the lack of business skills and the commitment in small home markets and in low-level networking.

Two main research questions emerge:

1. How do the entrepreneur’s personal abilities such as know-how and competence influence growth aspirations?

2. What kind of cooperation between partners enables growth?

The paper proceeds as follows. First, we will present factors facilitating firm growth as well as those hindering entrepreneurial development and growth. We will also provide an overview of the effect that cooperation and the entrepreneur’s internal resources and competences have on growth intentions. Second, we will describe the research method by including a description of data collection and analysis utilized in the
study as well as in the context of the study. Third, we will analyze the data and present results. Finally, we will discuss the findings and implications of the research as well as present the need for future research.

2. Background

2.1 Factors facilitating and hindering small business development and growth

When talking about firm growth, the first task one should perform is defining what growth is. The concept of business growth varies between parties such as academic scholars and entrepreneurs (Achtenhagen, Naldi, & Melin 2010). While scholars use measures such as sales and employment, for entrepreneurs growth can mean something else, such as increased job satisfaction or gaining independence. In this study, growth aspirations are measured by the entrepreneur’s willingness to expand his or her business in terms of sales and/or employment.

Mazzarol (2000) has pointed out that in the new millennium small businesses are being seen as motors for economic growth, generators of innovations and a solution to the unemployment that has been continuing for decades. Because of this, there has been an evident shift in the field of small businesses towards firms being clearly growth-oriented (Morrison, Breen, & Ali 2003). This has been especially evident in the decision making concerning small businesses, the subsidization of small businesses and in small business research (Bridge, O’Neill, & Cromie 1998). We argue that since there are always limited resources on subsidizing small businesses, their resources should be allocated to firms with clear growth aspirations. As a result, there is a vast interest in the field of small business research so that one would understand the factors behind small business growth (Morrison et.al. 2003). To meet the goal of this study, which is to identify the key factors hindering small business development, we argue that it is vital to first understand the factors facilitating growth and development.

In spite of the lack of a universal theory explaining small business growth (Smallbone, Leigh, & North 1995) and the fact that no such theory is likely to be introduced any time soon, for example Storey (1994) has identified three key factors with an essential effect on small business growth: characteristics of the entrepreneur, characteristics of the organization and different strategies concerning growth (Storey 1994).

A vast majority of small and medium-sized businesses are owner-managed (Bennedzen & Wolfenzon 1999; Nutek 2004). This is also evident in the creative sector. Out of those participating in our study, 73 % of the
189 respondents employed maximum two people (including the entrepreneur him/herself). The concentration of ownership and management can be seen as being both a positive and a negative factor for firm growth. The positive aspect is that when the ownership and management are concentrated on just one person, there is far less pressure coming from outside stakeholders who demand the ability to maximize profits and the business to be as transparent as possible (Carney 2005; Levitas & McFayden 2009). On the other hand, such concentration can have a negative effect toward small business growth and the entrepreneur’s growth aspirations. This is because the concentration of ownership and management can lead to avoidance of risks and unwillingness to change the firm’s strategic choices, thus creating barriers for growth and development (Hill & Snell 1988; Hoskisson, Hitt, Johnson, & Grossman 2000; George, Wiklund, & Zahra 2005).

As suggested by de Kluyver (2000), growth brings along challenges. One of these challenges has to do with hiring the first external employee. This does not double the sales but brings along fixed labor costs. (de Kluyver 2000). At the least successful case, expanding the business may cause the entrepreneur to have a loss-bearing company instead of a flourishing one (Gibb 1990; Cunningham 1994).

It has been argued that the growth of a small business is not a self-explaining phenomenon, but that the owner-manager has a vital role when it comes to intentions to pursue growth. Hence, it would appear that the positive attitudes towards the owner-manager developing his or her company may lead to the desired outcome. (Gray 2000; Maki & Pukkinen 2000). Previous researches have introduced elements influencing business growth as well as those functioning as barriers for development. We have listed some key factors from previous researches in Table 1.

3. Research Design

3.1 The creative sector and data collection

The concept of creative industries emerged in the late 1990s primarily as a policy discourse, although the subsequent decade has seen a lively set of academic as well as industry and policy-related debates. The concept *creative industries* refers to a set of interlocking industry sectors where the creative industries are defined in terms of an industrial classification of what they do or what they produce and how they approach this task. There has been criticism of the details of the classifications (Florida 2002; Hartley 2005).

The issue of definition is an important one within the creative industry. There remains much debate about where the boundaries of the creative industries might cross with the cultural industries and the entertainment industry (Howkins 2001; Hesmodhalgh 2002). The creative industries base themselves on individual creativity, skill and talent and have a potential for wealth and job creation through the generation and exploitation of intellectual property (DCMS 2005). This includes advertising, architecture, the art and antiques market, crafts, design, designer fashion, film and video, interactive leisure software, music, the performing arts, publishing, software and computer games, television and radio. Cultural industries are best described as an adjunct-sector of the creative industries. Cultural industries include industries that focus on cultural tourism and heritage, museums and libraries, sports and outdoor activities and a variety of ‘way of life’ activities (Caves 2000; Hesmodhalgh 2002). Cultural industries are more concerned with delivering other kinds of value—including cultural wealth and social wealth—rather than primarily providing monetary value. Entertainment industry contains firms that provide, operate or engage in entertainment (e.g radio and television and films and theater).

We chose to study firms of the creative sector in the North Savo region. The creative sector is quite heterogeneous, ranging from such large firms as a newspaper printing company to sole owner enterprises such as individual craftsmen/women. After a national and international review, 12 lines of businesses were selected. In this study, we used the following classification. In Table 2, we can see the frequency of respondents in the different lines of business.
In this study, quantitative research design was chosen as the research method because it enables larger sample size than qualitative research and because the aim of the research was to get generalizable results. The objective of the research was to produce versatile information and deepen the understanding on entrepreneurship in creative industries.

The questionnaire was chosen to be the data collection method because of the size of the target group. Indeed, this is an efficient way of collecting information from a large number of respondents. Furthermore, statistical techniques can also be used to determine validity, reliability, and statistical significance.

The research data presented in this paper was collected through a structured questionnaire which was sent to 855 entrepreneurs operating in the creative industry in the Northern Savo region in Finland. All respondents were informed of the purpose of the questionnaire by a cover letter. Out of the 855 entrepreneurs, the final number of respondents was 187, representing a valid return rate of 22 percent.

The questionnaire was composed of 3 parts:
- start-up of the firm and new venture launching
- development and growth of the firm
- networks and relationships of the firm

In this paper, we are concentrating on growth factors in creative industry firms.

The questionnaire consisted mainly of multiple choice questions and some open questions. The respondents were asked to indicate their degree of agreement with these statements on a five point scale ranging from 1=“strongly disagree” to 5=“strongly agree”.

3.2 Methods and analyses used

The sample frame was constructed from the data that had been collected with the structured questionnaire. The questionnaire was sent out to 855 entrepreneurs in the creative sector that operate in the Northern Savo region of Finland. Out of the 855 respondents, 583 were reached by email and the rest 272 by regular mail. A total of 187 usable replies were returned, thus providing us with a response rate of 22 %. Most of the companies taking part in the survey were small. 73 % out all of the respondents employed only the entrepreneur him/herself and 58 % generated annual revenue of 40 000 euro or less.

3.3 Variables and measures

The respondents were asked about their growth plans by giving them five options (1=the company is going to reduce its activities, 2=the company is going to maintain the current level of action, 3= there is an interest in the idea of growth but the company has no clear plans for this, 4=pursuing growth is a clear part of the strategy, 5=cannot say). The respondents’ answers were then coded into the SPSS program and a dummy variable was then constructed so that the option 5 was coded as a missing value, options one and two formulated value 0 and options three and four entailed value 1. This dummy variable measured the respondents’ growth aspirations, so that 0 represented the unwillingness of the respondent to grow his or her business and 1 represented one’s willingness to grow.

After the dummy variable was constructed, a logistic regression analysis was used to find out the effect of different competencies on growth motivation. The respondents were asked to estimate their internal resources by using a 5-point Likert scale. The estimated parameters were fairly successful in explaining entrepreneurs’ growth motivation. Out of all of the observations that were made, 64,4 % were classified correctly by the logistic regression analysis.

In order to test the influence of cooperation on growth motivation, the dummy variable was first cross tabulated with a variable representing whether the entrepreneur carries out cooperation of any kind in his or her activities. Subsequently, we wanted to gain deeper knowledge on the effect of cooperation on growth motivation. Therefore, growth motivation was cross tabulated with different partners in cooperation (the
partners were local educational institutes, subcontractors, other firms in the creative sector, firms in interface sectors, firms outside the creative or interface sectors, public sector). We then employed $X^2$ analysis to test the statistical value between cooperation and growth motivation.

4. Results

The first research question was tested by using logistic regression analysis. The results are displayed in Table 2. In Table 2, we can observe that only two of the estimated parameters had an effect on the entrepreneurs’ growth motivation; financial management skills and personnel management skills. Entrepreneurs who had successful internal resources on financial management were also motivated to grow their businesses. Additionally, those respondents who reported poor personnel management skills were not interested in growth, as opposed to those who had good personnel skills, who were growth orientated.

</tr>
</tbody>
</table>

-2 Log likelihood = 186,476
Total Classification Rate = 64.4 %

The second research question was tested by using cross tabulation and $X^2$ test. We first cross tabulated the respondents’ growth motivation with cooperation with different partners and then employed a chi-square test in order to discover any statistical significance or value between growth intentions and cooperation. The results of the chi-square test are shown in Table 3. The results support our assumptions. The fact whether or not the company engages in cooperation activities has an impact on growth aspirations. From Table 3, we can perceive that cooperation has a positive effect on growth intentions ($p=0.018, p<0.05$). Our second assumption concerning cooperation was that cooperating with firms outside one’s own line of business has
also a positive effect on growth aspiration. Our results support this assumption (p=0.000, p<0.05). Furthermore, as we hypothesized, a positive link between growth aspiration and cooperation with subcontractors can also be found (p=0.041, p<0.05).

5. Conclusions and future research

The aim of this study was to deepen the knowledge there is of the entrepreneurship in the creative industries. Based upon data collected from 187 creative industry firms in Northern-Savo, the paper defines a relationship between the internal resources of the entrepreneur and business growth. This study confirms what Covin and Slevin (1997), Gray (2000), and Maki and Pukkinen (2000) argued, namely that personal abilities play an important role in small business development, as well as what Wiklund and Shepherd (2003) noticed; that education, experience, and environmental dynamism magnify the effect of growth.

Even though the importance of the creative industries is widely acknowledged, empirical research about entrepreneurship in creative industries is carried out quite rarely. Because the role of the entrepreneur is crucial in the entrepreneurial process, special attention should be paid to the entrepreneur and entrepreneurial behavior. The identity of “entrepreneurs” is problematic in creative industries in that it raises the following questions: When does the innovative and creative person, motivated by freedom and self-expression, become an entrepreneur? Do those individuals consider themselves entrepreneurs (Baines & Robson 2001)? In future research, it will be important to deepen the understanding of the entrepreneur’s personality and motivations.

There is no single theory which can adequately explain small business growth (Gibb and Davies, 1990). This is partly because of the heterogeneity that exists in the various types of firms, but also because of the range of factors that can affect growth, ones which may interact with each other in different ways in varying circumstances.

It has been noted that many radical changes in society, especially in lines of industries, have created an opening for entrepreneurship in creative industries. In forthcoming studies, we will need to deepen our understanding of the different factors affecting business growth in the creative sector. We need more statistical data as well as qualitative data collected through interviews. We are carrying out an extensive statistical survey at the moment from which we are expecting to get data by the end of the year.

Abstract
This paper presents results of a study identifying specific sets of intra-firm activities, referred to as intra-firm orientations. The authors distinguish entrepreneurial orientation, change orientation, and knowledge orientation. The authors use factor analysis to test hypotheses about the presence of selected orientations and about the positive impact of intra-firm orientations on firm growth, and to investigate the dominant intra-firm orientation in three industries: wholesale and retail trade, HoReCa, and the IT industry. Results of empirical analysis of 500 small and medium-sized Russian enterprises show that change orientation and knowledge orientation positively influence growth. It was also found that different intra-firm orientations dominate in different industries.

Key words:
Intra-firm orientations, firm growth, knowledge management, entrepreneurship, organizational changes, factor analysis.

Introduction
In recent decades, management theorists have begun to pay attention to growth processes of firms and organizational behavior involved (Evans 1987b; Davidsson, Delmar, and Wiklund 2002; Delmar, Davidsson, and Gartner 2003; McKelvie, Wiklund, and Davidsson 2006). A comprehensive theory of growth of the firm is under development to address organizational factors that affect emergence, unfolding, and completion of growth processes. The evolution of management theory has shifted the explanatory focus from external to internal factors.

Exploring management characteristics of the firm seems to be a promising area of research because it highlights the importance of various managerial actions and shows their influence on a firm’s growth. On the one hand, this stream of research corresponds to...
development of the theory of firm growth. On the other hand, it is an important applied problem in the context of a limited number of studies of firm growth in Russia. Thus, we need to understand what organizational factors a firm should develop to achieve sustainable growth, which factors should be taken into account in making decisions about growth, and which factors are subject to change in this process. As a rule, companies experience growth if they have exceptional competitive advantages. Recent developments in strategic management suggest sustainable competitive advantage is based on a firm’s so-called dynamic capabilities (Helfat et al. 2007). These facilitate extraction of Schumpeterian rents in a rapidly changing environment through acquisition and dissemination of knowledge, as well as transformation of organizational resource bases to achieve fit and even take the lead in their environment (Teece, Pisano, and Shuen 1997).

In this paper, we use the resource-based approach to examine growth of the firm, that is the impact of internal organizational characteristics on growth. These characteristics include organizational capabilities to create, acquire, and change the firm’s resource base. The paper proposes an original perspective of the firm’s internal activities, assuming all firms possess certain characteristics that describe general principles of its activities. These are intra-firm orientation: entrepreneurial orientation, knowledge orientation, and change orientation.

The paper consists of five parts. In the first part we formulate and provide theoretical foundations for our hypotheses. The second part describes research methods. In the third part we analyze findings and test hypotheses. The fourth part discusses results of empirical and theoretical analyses. In the fifth and final part we present main conclusions, note theoretical and practical implications of the study, and describe its limitations and directions for future research in this area.

Theory and Hypotheses
According to E. Penrose, opportunities for firm growth are related to its internal resources and to changes in a firm’s external and internal environments (Davidsson, Delmar, and Wiklund 2002). Firm growth is a consequence of two different means of resource allocation. The first is exploration or searching for new ways to use existing resources, or allocation of new types of resources. This requires intensive accumulation of knowledge about resources and their potential applications through research and proactive investigations. In academic discussions on entrepreneurship, this is called “organic growth.” The second growth path, an external one, unfolds through acquisitions (Penrose 1959). Entrepreneurial growth is usually associated with organic growth, or the internal expansion of operations, process, and product improvements. Davidsson, Steffens and Fitzsimons (2009) empirically demonstrate that profitable firms manage to develop unique advantages for key resource positions, allowing them to expand activities. Thus the firm has to develop a sustainable competitive advantage to initiate and maintain sustainable growth.

**Intra-firm orientations: basic types**

The term "orientation" is not new in management. Some studies define this as “a certain established set of actions and processes” (Lumpkin, and Dess 1996; Miles, and Arnold 1991; Morris, and Paul 1987; Smart, and Conant 1994). Entrepreneurial orientation of the firm (EO) is represented in literature on entrepreneurship and management. According to some studies, organizations with an entrepreneurial orientation focus more on seeking new opportunities, taking risks, and exploiting opportunities (Lumpkin, and Dess 1996). Additionally, the concept of dynamic capabilities (Teece, Pisano, and Shuen 1997) proposes a set of three different processes: the ability (1) to capture or anticipate unique opportunities and threats; (2) to prepare the firm to seize these opportunities; and (3) to transform the company’s current asset position for better performance (Teece 2007). Clearly, entrepreneurial orientation is responsible for sensing environmental signals, generating novel ideas, for organizational
performance and actions enabling the company to be proactive and to introduce a variety of
innovations (Lumpkin, and Dess 1996; Covin, and Slevin 1991). Transforming a firm’s current
position implies timely transformation and recombination of organizational resources and
capabilities in light of its market situation (Barney, 2002; Teece, Pisano, and Shuen 1997). We
can conceive of this as a particular type of intra-firm orientation—change orientation—analogous to entrepreneurial orientation.

Processes that enable cost savings from organizational changes, enable sensing more
information about environmental signals and preparing firm for transformation and seizing
external opportunities are related to knowledge management. Thus, we propose another type
of intra-firm orientation: knowledge orientation.

We claim that these orientations make dynamic capabilities generic for all firms,
although firms exercise dynamic capabilities differently depending on industry conditions and
level of development of these orientations. All this said, we also suggest that dynamic
capabilities are not the best tool for empirical analysis, as they consist of numerous
organizational routines (Nelson, and Winter 1982). We propose combining organizational
routines into more simple constructs - intra-firm orientations. Our first hypothesis is as follows:

Hypothesis One. There are at least three explicit intra-firm orientations in any firm:
entrepreneurial orientation, change orientation and knowledge orientation.

It is also important to understand how intra-firm orientations affect performance,
particularly growth. According to Davidsson, Steffens, and Fitzsimons (2009), profitable firms
develop distinctive advantages vis-à-vis key resource positions, allowing them to expand
activities. The general mechanism of acquiring a competitive advantage by developing intra-
firm orientations can be depicted in the following way (see Figure One).
Sustainable competitive advantage arising from dynamic capabilities appears as a result of timely adjustment and modification of the resource base to match market conditions. Firms that develop change orientation, entrepreneurial orientation, and knowledge management orientation will grow. Let us consider in more detail each of the proposed orientations as they impact growth.

**Change orientation.** Processes connected with intra-firm transformation make up change orientation. The more such processes are practiced within the company, the better it is aimed at undertaking change initiatives. McGuinness and Morgan (2003) define organizational change capability as "an example of an organisational dynamic capability, its essence being a capability for leading and managing a cascading series of inter-related change initiatives that are consistent with an intended type of strategy dynamics." Eisenhardt and Martin (2000) have a similar understanding of change capability: the ability to understand what internal transformations should be initiated. This capacity for change implies the existence of advanced management processes of change in the company.

How does this process of change unfold within the company? This process is a mesh of continuous daily activities to bring about long-term adaptation to unpredictable and
challenging environmental conditions (Weick, and Quinn 1999). When an organization needs to update its skills, it has to develop new processes and values and to provide necessary organizational space to elaborate these capabilities. According to Christensen and Overdorf (2000) there are three ways to do this:

- allocate new organizational elements, where new processes will be developed;
- create new organization, where work will be carried out in accordance with new principles;
- acquire firms that possess values and processes similar to those needed.

Thus, change orientation implies certain organizational capabilities that provide quick and efficient transformation (that is appropriate organizational structure) and scope for strategic change to transform structures and processes in the company. In this case the firm seizes market opportunities faster than competitors and can launch more new product lines and win a larger market share. Change orientation comprises changes in organizational strategy, structure, and culture; launching new product lines; and transforming business procedures. In general, advanced change orientation facilitates adjusting all organizational elements in the face of an uncertain or changing market context. This allows the company to generate higher profits from increased sales volume enabling the firm to grow. We thus propose that change orientation positively affects change in the rate of sales growth.

Hypothesis Two. Change orientation positively influences growth of the firm.

Entrepreneurial orientation. Entrepreneurial function is aimed at producing new resources, processes, distribution channels, and markets. Companies that follow the entrepreneurial approach are characterized by proactivity, openness, innovativeness, and risk-taking. The essence of entrepreneurial orientation should be built into organizational processes, practices, decision-making and strategic orientation (Miller, and Friesen 1978). Innovativeness is an ability to carry out experiments, to pay attention to new ideas, and to reject established
practices. Proactivity is the inherent ability to see beyond current boundaries and to sense future opportunities. It is also the ability to analyze forthcoming situations and transformations, as well as to launch products or services at the right time, or to change internal organizational elements to make the organization comply with future conditions. Risk-taking is the ability to invest various resources in projects with unclear results, unusually with large return or losses. These are three directions in which entrepreneurial/innovative orientation is expressed (Lumkin, and Dess 2001).

Based on the vision of market changes, innovations, and consumer preferences, managers decide whether to begin resource recombination (Jantunen et al. 2005). The number of opportunities for growth is limited by the ability of managers to recognize opportunities and the desire to implement them with existing resources. Therefore, growth arises from discovering market opportunities and transforming resources to seize them.

Wiklund (1999) shows that entrepreneurial orientation provides a positive effect on firm performance, as it aids recognition of opportunities for resource allocation and changes in customer preferences faster than competitors. In addition, entrepreneurship is traditionally considered to be an indicator of rapidly growing economies (Lumpkin, and Dess 1996). For example, Cohen and Slevin (1991) demonstrated that firms implementing the entrepreneurial approach outperform the industry average. Thus, based on extensive evidence that better results depend on entrepreneurial management processes, we suggest a hypothesis about the positive influence of the entrepreneurial orientation on growth.

**Hypothesis Three.** Entrepreneurial orientation positively influences growth.

**Knowledge orientation.** According to Zollo and Winter (2002), dynamic capabilities evolve through learning processes. Processes of learning and knowledge management are expressed in the firm’s knowledge orientation, which includes such areas as experience accumulation, knowledge sharing, and codification.
Organizational knowledge is usually divided into information and know-how (Kogut, Zander 1992). Information is knowledge that can be transferred without violating its integrity, if there is a certain order in understanding. Know-how is an accumulated set of skills, learned or acquired. Knowledge may be contained in regulations, technologies and databases. The ability to assimilate new and useful knowledge depends on the existing knowledge base and is referred to as absorptive capacity (Cohen, and Levinthal 1990). The firm accumulates a certain amount of experience over the years of its business. This experience and knowledge help broaden horizons for acquiring new knowledge that relates to the existing knowledge base. The greater the knowledge base, the more new knowledge the firm is able to "understand" and acquire (Cohen, and Levinthal 1990; Shepherd, and DeTienne 2001). Learning is vital for creating new capabilities. Organizational abilities to collect, build, and reconfigure a knowledge base constitute a source of competitive advantage (Wolff, and Pett 2007; Eisenhardt, and Martin 2000).

Exploiting existing knowledge allows the firm to build capacity for growth (Cyert, and March 1963). Further, knowledge management helps to investigate processes of improving organizational efficiency over time (a learning effect), which provides such additional advantages as better ability to integrate resources, reduce costs and better management of organic growth (Salvato, Lassini, and Wiklund 2006). Knowledge and the ability to manage knowledge assets affect performance positively (Jantunen 2005b). Resources not in use at the moment ("slack") may be combined with other unallocated resources to create new "outputs" (Penrose 1959; Pitelis 2002). From this we derive our next hypothesis:

**Hypothesis Four.** Knowledge orientation positively influences the growth.

We suggest that in various industries intra-firm orientations appear with different intensity. The principle of path dependency (Teece, Pisano, and Shuen 1997) suggests that organizations develop capabilities and accumulate resources necessary for a certain type of
activity, and this organizational history leaves an imprint on the trajectory of future development. Thus, firms operating in different industries require different capabilities. It can be assumed that in different industries organizations develop different processes and focus on certain skills and resources (Barney 2002; Sakakibara 1997a).

We believe that in every company there are the three intra-firm orientations presented above. Developing all three orientations is an important condition for acquiring and retaining a sustainable competitive advantage. However, from the point of view of business practice, it is logical to assume that in different industries some orientations will appear differently than in others, as firms emphasize processes of primarily importance for creating value and performing successfully in their own industry. Therefore, we posit the following hypothesis:

_Hypothesis Five._ In different industries, firms demonstrate different dominating intra-firm orientations.

**Method**

**Sample**

The project "Growth and success factors of Russian entrepreneurial firms" surveyed 500 companies from Moscow and St. Petersburg. Respondents operated in three industries: 1) wholesale and retail trade, 2) hotels, restaurants and cafes (HoReCa), and 3) information technologies (IT). The sample includes small and medium-sized enterprises with 3-500 employees. We selected these industries because they experienced the highest growth rates in the pre-crisis period (2007-2008). In addition, this sample provides necessary heterogeneity of firms for cross-sectional comparison. Distribution and characteristics of companies in the sample are as follows: 356 companies (71.2 percent) are located in Moscow and 144 (28.8 percent) in St. Petersburg. There are 359 (71.8 percent) companies in wholesale and retail trade, 75 (15 percent), firms in HoReCa, and 66 (13.2 percent) firms in the telecommunication sector. In September-December 2008 top managers of these companies took part in a survey,
which consisted of a structured questionnaire. Questions were related to business in the period 2006-2007. Questions were divided into groups according to different areas of management, posed as statements about organizational activities. Answer options ranged from one “totally disagree” to five “completely agree.” Research questions are provided in Appendix One.

Analysis

We used exploratory and confirmatory factor analysis. Using factor analysis one can identify possible hidden variable factors responsible for linear statistical combination and correlations between observed variables. Consequently, the main purposes of factor analysis are to identify relationships between variables, to classify them, and to reduce the number of overall variables.

As independent variables (items) we take questions from the questionnaire, which we combined in factors, or complex variables, according to factor analysis. We use percentage ratio of the rate of sales growth in 2007 to 2006. Typically researchers select firms with the most rapid growth to explore the growth phenomenon. Sales volume is considered the main measure of firm size, since it is given in open information sources, allows to combine short and long term perspectives, reflects consumer preferences as a result of organizational efforts, and reflects all intra-firm changes: sales are the most common indicator of growth, any organizational growth always affect sales (Delmar, Davidsson, and Gartner 2003). In addition, as control variables we use firm age and number of employees.

Model

Then we elaborate the following causal model to analyze the impact of intra-firm orientations on the rate of firm growth (Figure Two).
In Fig. Two oval icons show factors or intra-firm orientations. Each orientation is a hidden variable composed of a set of observed ones (in Fig. Two observed variables-factor loadings are represented by rectangular icons on the left). Arrows indicate the impact intra-firm orientations exert on the rate of sales growth, which represent the observed variable. In addition, the model includes control variables such as firm age and number of employees.

**Results**

Let us proceed directly to the results of the analysis. We turn first to exploratory factor analysis to reveal intra-firm orientations. This analysis was carried out using statistical package SPSS 17.0 with principal components analysis method.

The quality of the sample for factor analysis is verified using the criterion of the Kaiser-Meyer-Olkin measure of sampling adequacy. The quality of the sample, its reliability for the factor analysis, is high: $KMO = 0.877$, with significance level $p < 0.001$ (an acceptable level is
$KMO > 0.5$). It shows high adequacy of the factor model to the correlation matrix of a given set of variables (Gusev, Izmailov, and Mihaylevskaya 1987). The next step is to identify a sufficient number of factors for analysis. We need to investigate what percentage of variance of variables can be explained with the necessary number of factors. For our study, it is necessary that an acceptable percentage of variance be explained with three factors. Acceptable percentage of the explained variance should be above 50 percent for a pre-specified number of factors (Velicer, and Jackson 1990). In our study, three factors explain 53 percent of variance.

The next step in analysis is to examine factor loadings of the main factors identified in Table One. From this table we remove components with a factor loading less than 0.5. This provides the simplest structure of factors (Fabrigar et al., 1999).

Q3_7_3: Discontinued at least one product (not production) line/service
Q3_7_4: Agreed to a new joint venture with foreign partner

Extraction Method: Principal Component Analysis.
Rotation Method: Varimax with Kaiser Normalization.

It is clear from this table that all factors are divided into three categories: a factor associated with information and knowledge, a factor associated with risk and new ideas, and a factor associated with organizational change. Thus, we judge that for each firm there exist certain orientations that affect its work. However, to be completely confident that these factors actually form such a structure, we conducted confirmatory factor analysis of this structure of factors. The model was built and the analysis was conducted using structural equation modeling package AMOS 7.0. Model is represented on Figure Three:
To improve the quality of the model we used modification indices. To assess the quality of the model we used fit indices $CMIN/\text{Df}$, $TLI$, $CFI$, $RMSEA$, which are presented below: $CMIN/\text{Df} = 2,71$, $TLI = 0,92$, $CFI = 0,94$, $RMSEA = 0,0586$. They all meet threshold values, which suggests that the presented model describes reality fairly well (Brown 2006). This suggests that the factor model describes the selected data in a good way. CV (Convergent validity) index for that model is 0,94 and AVE index (average variance explained) is 0,88. The meanings are above average and it means, that the a 3 factor model converges on the supposed theoretical model in suggested framework.

We now turn to an analysis of weighted regression coefficients to help us ascertain the stability of the previously identified structure of factors. The analysis showed that factors have a stable structure, as all factor loadings are significant at $p < 0,001$.

Finally, we analyze the impact of intra-firm orientations on growth rate. For this we use the model shown in Figure Three. This is aggregated for all industries, and shows what impact intra-firm orientations exert on the rate of sales growth in a firm. Let us assess goodness model fit (see Table Two).

**Table Two**

The model of intra-firm orientations’ impact on firm growth: Fit indices

<table>
<thead>
<tr>
<th>Indices</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>$CMIN/\text{Df}$</td>
<td>2,95</td>
</tr>
<tr>
<td>$TLI$</td>
<td>0,89</td>
</tr>
</tbody>
</table>
Index value $CMI/Df$ is less than 3, which gives evidence to good quality of the model (Bollen 1989). Indices $TLI$ and $CFI$ have thresholds of about 0.9 and are responsible for fit of the model to the sample size (Bentler 1992). Index $RMSEA$ is responsible for measurement errors in the model. It is believed that a good value is $RMSEA < 0.08$ (Browne, and Cudeck 1993; Byrne 2009). Thus, all indices meet the required criteria; moreover chi-square value for this model is significant at $p < 0.001$.

To analyze direct impact of intra-firm orientations on the rate of sales growth we turn to a table of weighted regression coefficients (see Table Four).

**Table Four**

Weighted Regression Coefficients in the Model of Intra-firm Orientations’ Impact on the Rate of Sales Growth

<table>
<thead>
<tr>
<th>Influence</th>
<th>Estimate</th>
<th>S.E.</th>
<th>C.R.</th>
<th>P</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sales growth rates &lt;− Knowledge orientation</td>
<td>3.5078</td>
<td>1.7636</td>
<td>1.9890</td>
<td>0.0467**</td>
</tr>
<tr>
<td>Sales growth rates &lt;− Entrepreneurial orientation</td>
<td>-3.1924</td>
<td>1.6069</td>
<td>-1.98660</td>
<td>0.0470**</td>

<tr>
<td>Sales growth rates &lt;− Change orientation</td>
<td>2.214</td>
<td>1.1259</td>
<td>1.9664</td>
<td>0.0493**</td>
</tr>
<tr>
<td>Sales growth rates &lt;− Number of employees</td>
<td>0.0124</td>
<td>0.0081</td>
<td>1.5303</td>
<td>0.125900</td>
</tr>
<tr>
<td>Sales growth rates &lt;− Age</td>
<td>0.0005</td>
<td>0.001</td>
<td>0.4421</td>
<td>0.658400</td>
</tr>
</tbody>
</table>

**- coefficient is significant at $p<0.05$**

The table shows that factor loadings remain significant at $p < 0.001$, which indicates the stability of factors. All three factors presenting intra-firm orientations are significant at $p<0.05$. Knowledge orientation exerts positive effect on the rate of sales growth. Entrepreneurial orientation has negative impact on the rate of sales growth, and change orientation exerts positive impact on the rate of sales growth, and, consequently, on the growth of the firm. These results are shown in Figure Four.
The impact of number of employees is not statistically significant, although the relevant coefficient is positive. The impact of the firm age also appeared to be insignificant. The relevant coefficient has a positive but small value.

To facilitate analysis of variables with different measurement scales we used standardized weighted regression coefficients. These coefficients are presented in Table Five.

**Table Five**

<table>
<thead>
<tr>

<td>0.0705</td>
</tr>
<tr>
<td>Sales growth rates</td>
<td>Age</td>
<td>0.0204</td>
</tr>
</tbody>
</table>

Finally, we must analyze whether there is industry impact on the differences in the predominance of one orientation over the other in firms from different industries. For this purpose we supplement the model of factor consistency analysis with dummy variables of industries (IT, HoReCa, Trade). Table Six presents the results of this analysis. The models are
significant and well describe the data from the sample, because fit indices of the model are almost identical.

Table Six

</table>

Then we analyze industrial background of the firms to discover what influence industrial background exerts on intra-firm orientations (positive or negative). For this purpose we conducted an analysis of regression coefficients (Table Seven).

Table Seven

** - level of significance p<0,05
*** - level of significance p<0,001

Wholesale and retail trade industrial background increases change and entrepreneurial orientations of the firm, but reduces its knowledge orientation. It is worth noting that in this case the influence of industry background on knowledge orientation is not statistically
significant. HoReCa industrial background lowers knowledge and entrepreneurial orientations of the firm, and increases change orientation, although in this case, this effect is statistically insignificant. IT-industrial background increases knowledge and entrepreneurial orientations of the firm, and reduces its change orientation. Impact on entrepreneurial orientation is statistically insignificant.

Discussion

Based on the data analysis we draw the following conclusions. First, Hypothesis One, which proposed the presence of three intra-firm orientations, was supported. Factors identified in the exploratory factor analysis explain more than 50 percent of variance. The structural model also confirmed that factor loadings were divided according to the proposed theory of three intra-firm orientations: knowledge orientation, entrepreneurial orientation, and change orientation. \( CV \) and \( AVE \) indices show appropriate meanings. This is supported by a high goodness of fit of the model and significance of weighted regression coefficients in model.

Hypothesis Two, proposing the positive influence of change orientation on growth, was also supported. Internal organizational transformation positively affects growth. At significance level \( p < 0.05 \), the coefficient is positive. This means changes in strategy, structure, review of business processes, and culture development lead to more successful sales. This is logical, because the company renews core principles and conducts activities based on new rules. This allows the company to acquire a competitive advantage and successfully sell its products/services. Internal transformation does not allow competitors to copy such organizational achievements quickly.

Hypothesis Three, proposing the positive impact of entrepreneurial orientation on growth, is not supported. The coefficient is significant at \( p < 0.05 \), but it is negative, indicating a decrease in growth rate during the development of processes aimed at taking risks and creating new ideas. In general, we suggest that the entrepreneurial way of doing business, implying the
search for new ideas, exerts a positive effect on firm growth in the long term but not in the short term that we discussed in this study. This is consistent with a number of studies; for example, Adizes (1988) offers the PAEI model, where the code E (entrepreneurial) stands for the long-term function of entrepreneurial management. In addition, according to results of Russian studies, leaders of Russian companies note that the entrepreneurial style of doing business provides time-delayed results (Shirokova et al. 2009). In the short term, implementation of innovations (product or organizational innovations) may not lead to immediate growth. On the contrary, time is needed for adoption and integration of innovation, which leads to slower sales growth. Indeed, many people need time to become involved in consumption of a new product; employees need time to get used to new methods and technologies. In addition, in Russia entrepreneurial approach often means trial and error, leading to slower rates of sales growth.

**Hypothesis Four**, proposing the positive effect of knowledge orientation on growth, is supported. The coefficient is significant at $p<0.05$ and has a positive value, indicating an increase in the growth rate as a result of developing knowledge management practices in the company. Organizations that devote more time to collection, analysis, and dissemination of knowledge and can apply newly acquired experience to future work will grow faster than firms not engaged in such activities.

**Hypothesis Five**, proposing the impact of industrial background on the dominant intra-firm orientation, is supported: intra-firm orientations are expressed differently in different sectors. We built three models for analysis, which used three dummy variables taking the value "1" for each industry (information technology, HoReCa or trade). In IT industry knowledge orientation increases by 0.44, while change orientation decreases by 0.33. In HoReCa industry, intra-firm orientations are weakly pronounced: knowledge orientation and entrepreneurial orientation are reduced (by 0.27 and 0.36, respectively), if a firm belongs to this industry. In
trade, entrepreneurial orientation (0.17) and change orientation (0.15) increase almost equally. This means that these firms tend to reveal entrepreneurial behavior and initiate organizational changes to achieve their goals.

Results obtained above are consistent with theory. From management literature it is known that the IT industry is the most knowledge-intensive sector. Hendricks (1999) investigated companies from the telecommunication industry and noticed that they broadly use telecommuting and various applications for knowledge and information sharing. Fisher and Fisher (1998) described the positive impact of teamwork of remote software developers through a knowledge network. A Finnish study of internationalization and growth (Saarenketo, et al. 2002) investigated companies that most often grow through partnerships and networks. Companies from IT and telecommunication industry are primarily characterized by such a growth model. Thus, the dominance of knowledge management orientation in IT is logical.

In the HoReCa industry, findings from Russian companies differ from global results. Despite the global trend of network building, and of strategic and business process changes in the global restaurant and hotel business, in the Russian market firms behave more conservatively, without changing patterns of activity that they previously selected. Nowadays researchers pay more attention to transformation that occurs in service industries. For example, Shemrakova and Katkalo (2004) analyzed network development in Russian hotel businesses. Other authors demonstrate a large-scale introduction of information technology in hotels and restaurants. For example, Buhalis (1998) highlights the strategic importance of introducing electronic payment and accounting systems in the restaurant and hospitality industry. Also, in service industries managers are constantly concerned with increasing customer satisfaction level, and so they introduce quality standards, articulate operational procedures for personnel, and control the quality of supplied products (Bernhardt, Donthu, and Kennet 2000). In addition, it is worth noting that Russian firms more often become franchisees
of restaurant or hotel chains, which results in transformation of management processes. Thus, the analysis of empirical data in this industry does not allow us to identify any of intra-firm orientations as a dominant one.

Wholesale and retail trade in Russia is highly competitive, and it is impossible to do business without offering something new: products, services, developing unusual segments, bearing risk. In addition, the industry itself has a positive effect on change orientation. This means that companies in this industry not only try to offer innovative solutions to customers and explore new markets; they also focus on change from within, conducting operations with new strategies and structure, and merging into joint ventures.

Clercq, Sapienza, and Crijns (2005) investigated the influence of entrepreneurial orientation on the success of internationalization of retail companies in Europe. They showed that firms with more advanced entrepreneurial orientation conduct geographic expansion better than firms where entrepreneurial orientation is less pronounced. For his study of firms with the most advanced entrepreneurial orientation, Wiklund (1999) selected companies operating in the retail industry. The motivation for this is that historically trade is a sector with entrepreneurial actions. "Rules of the game" in this industry are largely determined by the ability to take risks, to respond quickly to market changes, and to anticipate shifts in consumer tastes, trends in service patterns, changes in the business format itself (the emergence of e-commerce), and introduction of product innovations. It appears that our findings, which show that trade is dominated by entrepreneurial orientation and change orientation, are natural in terms of development trends of this industry in Russia.

Conclusion

The purpose of this study was to identify specific patterns of firm behavior that affect intra-firm opportunities for growth. In this study we identify three intra-firm orientations that exist in every company in one form or another. We make an assumption and receive support
that in addition to entrepreneurial orientation there are two distinct types of firm behavior:
knowledge orientation and change orientation. The hypothesis of their existence in modern
firms is supported in our study of 500 small and medium-sized businesses in three industries.

We see our contribution to the theory of firm growth as the following: we prove that
intra-firm orientations, consisting of well-established routines of the company's activities, exert
an impact on the rate of growth. Knowledge orientation has a positive effect on growth; with
the development of knowledge management practices, the firm experiences an increase in the
rate of sales growth (which constitutes one of the measures of firm growth). Change orientation
also exerts a positive impact on the rate of firm growth. Thus, it can be concluded that
mastering these types of activities within the company leads to favorable effects on its
development. Entrepreneurial orientation has a negative impact on the rate of sales growth; the
hypothesis of its positive effect was not supported. We assume that entrepreneurial orientation
either exerts a delayed long-term impact (associated with initial resistance) or its impact is
mediated by other organizational mechanisms. On the other hand, entrepreneurship is an
ambiguous activity in terms of results, as is often realized unconsciously, and leads to loss of
resources. However, we believe that in more extended time interval, entrepreneurial orientation
will exert positive impact on the rate of firm growth.

It is also important that we have proved that there is industry-specific impact on the
prevalence of one or another orientation. Thus, we can conclude that success in different
sectors is promoted by different capabilities. In the IT sector knowledge management plays a
crucial role, consistent with earlier work. In trade, especially in Russia, entrepreneurship and
organizational changes are of great importance, as they allows managers to compete effectively
in this saturated market. The hypothesis of the predominance of any specific intra-firm
orientation in HoReCa sector has not been supported, but perhaps this reflects Russian
peculiarities of business in this area.
In this study we draw attention to developing supplementary activities in the organization, to building competitive advantage intensively from within, but not extensively through the use the existing resource base. Moreover, in this study we provide a list of routines that constitute factors that a practitioner can apply them in his or her context. The study also shows what types of organizational behavior lead to competitive advantage. The existence and development of three orientations lead to acquisition and retention of sustainable competitive advantage. The predominance of one of the discussed intra-firm orientations suggests that the company builds its competitive advantage on certain sets of processes (innovations, organizational change, knowledge management). Additionally, this study proved the role of intra-firm orientations in the process of firm growth. Since intra-firm orientations consist of a set of specific actions and routines (specified in Appendix 1), managers can clearly observe what actions lead directly to growth. Finally, we can conclude what action should be taken to obtain growth results in the short and long terms. For example, entrepreneurial orientation is mostly a long-term instrument, while knowledge management gives relatively fast effects (first of all by reducing transaction costs). Change orientation shows what organizational elements require revision and modification for effective adaptation.

There is no doubt that this study has limitations. One limitation is hidden in the intangible nature of independent variables. Intra-firm orientations affect the rate of sales growth, but certainly they are not decisive in changing the pace of growth. Sales volume, competitive situation, allocated resources, and the type of the market should have greater influence, but their investigation is beyond the scope of this study. In addition, intra-firm orientations seem to be measured only in numeric scale, in standard units, which are not homogenous with units of measurement for other variables. Accordingly, the other limitation is connected with the chosen method of analysis, factor analysis. This allows us to analyze qualitative data by reducing the number of observed variables and combining them into one
unobservable. This, it becomes difficult to assess how this variable should be changed, in which units and parameters it changes its values. The third limitation comes from restrictions of the sample. Companies from different industries are heterogeneously presented in the sample, which does not allow us to consider the impact of intra-firm orientation on the rate of sales growth by industry. Moreover, the selected industries may not be the most advanced in terms of managerial practices in Russia. The last limitation stems from the fact that growth is an extended process. The growth rate may vary from period to period. In the present study we analyze the growth rate for a one-year period, but further analysis should include data over several years.

Thus, as direction of future research we see both theoretical and practical investigations of measurement of intra-firm orientations and competitive advantage, building longitudinal models to analyze the impact of intra-firm characteristics on the firm growth with better consideration of internal and external growth factors.

Appendix 1

Questionnaire

Indicate to which degree each statement is consistent or not with the policy accepted in your company:

- Q_6_1_1: We spend some time and effort to analyze the results and share the experience in the end of every project.
- Q_6_1_2: We use to describe in the documents the knowledge and experience gained during the activities.
- Q_6_1_3: If the employee leaves the company, his knowledge is likely to be lost for the company.
- Q_6_1_4: We actively use technical means of information sharing and storage (databases, forums, intranet) in our company.
- Q_6_1_5: The success in our industry is predetermined by knowledge and experience gained during long time period.
- Q_6_1_6: Informal liaisons with partners play big role for the success in our industry (clients, suppliers, government).
- Q_6_1_7: We implement the experience of industry top-performers and the top-performers in other industry in our practices.
- Q_6_1_8: We implement the changes, which originate from our partners. (clients, suppliers, subcontractors).

Indicate to which degree each statement is consistent or not with the policy accepted in your company

- Q_6_2_1: There are the technologies that originate from our company among those we use in our activity.
- Q_6_2_2: Our company reclaims new, unique segments for our market.
– Q_6_2_3: The effectiveness of our company’s activities depends on non-standard management practices.
– Q_6_2_4: Our company constantly research for new technologies and market opportunities.
– Q_6_2_5: We constantly search for new methods of problems solving and task implementation in our company.
– Q_6_2_6: We stimulate the creative atmosphere aimed at new ideas origination, employee’s initiatives in our company.

Indicate to which degree each statement is consistent or not with the policy accepted in your company

– Q_6_3_1: Our company support the employees that demonstrate initiative and take risks.
– Q_6_3_2: We appreciate the non-standard, risky decision taking even if it causes problems.
– Q_6_3_3: Our employees usually have spare time for their own projects.
– Q_6_3_4: We usually find resources in our company unused in any existing projects to use them in a new project.
– Q_6_3_5: Usually we have a buffer pool of resources to use then in some shortage situations.

Has your company undertaken any of the following initiatives over the last 2 years? If yes to which extent this change was significant?

– Q_3_7_1: Developed successfully a major new product line/service
– Q_3_7_2: Significantly upgraded an existing product line/service
– Q_3_7_3: Discontinued at least one product (not production) line/service
– Q_3_7_4: Agreed to a new joint venture with foreign partner
– Q_3_7_5: Obtained a new quality accreditation (ISO 9000, 9002 or 14,000, AGCCP, etc)
– Q_3_7_6: Changes in structure
– Q_3_7_7: Changes in strategy
– Q_3_7_8: Changes in the company business-processes
– Q_3_7_9: Changes in organizational culture
– Q_3_7_10: Introduction of new IT-systems
– Q_3_7_11: Introduction of new reward system
– Q_3_7_12: Significant staff transfers within the company

From simple to intricate: New Zealand SME Policy Development 1978-2008

Tanya Jurado¹ and Claire Massey²

Abstract
There has been little research into the development of New Zealand SME policy. This study examines the development of small business and entrepreneurship policy in New Zealand 1978-2008. Using a range of secondary data, supplemented with interviews with key informants, the study’s aim is to determine whether the policies pursued by successive New Zealand governments during this period have any points in common with the two extremes of small business policy, the US and the European approaches. It concludes that by 2008 small business policy in New Zealand was complex and multifaceted. The study will help policy makers set clear objectives that target the multiple needs of small businesses.

Keywords: small business policy, entrepreneurship policy, history small business policy, New Zealand

Commentators on small and medium enterprise (SME) policy agree that for governments around the world small businesses have always mattered; it is the way that they matter that has changed (Audretsch, Thurik, and Wennekers 2002; Thurik and Wennekers 2004). This is also the case of New Zealand policy development between 1978 and 2008. By 2008, policy makers were in no doubt that SMEs played a significant role in the New Zealand economy, representing over 97% of all enterprises and accounting for 31% of employment (Ministry of Economic Development 2008). Between 1978 and 1998, however, the SME sector was not considered a sector in its own right and its relevance in policy-making terms was relatively marginal. Instead, the small business sector appears to have been viewed primarily as a means by which governments addressed social or economic problems, for instance, unemployment (Easton 1997). During the final decade of the period of this study, portions of the SME sector was widely considered to be a complex one, with portions of it playing a key role in economic growth. This is reflected with the establishment of the portfolio of Minister

² Claire Massey is Professor of Enterprise Development at Massey University.
for Small Business, and by the appointment of the Small Business Advisory Group (SBAG) to provide input from small businesses into government policy.

Against this background, it is possible to isolate and analyse three distinct phases over the period 1978 to 2008 where there was a gradual shift away from one-size-fits-all policies, to more targeted assistance informed by policies developed in the context of business needs and academic research. This change in approach throughout the period of this study has been gradual, with no readily identifiable and coherent set of policies designed explicitly to support the SME sector of the economy until the late 1990s.

Storey’s (1994) study on small business in the developed world highlighted the fact that the apparent absence of coherence in small business policy making is not a uniquely New Zealand phenomenon. Storey (2005) has also argued that there have been different philosophical starting points in the historical formulation of small business and entrepreneurship public policy. At one extreme is the United States (US) with a prevailing ‘competition policy’ approach to SMEs (that is, as tools to help develop competitiveness across industries and sectors (Dennis 2005)) guiding government intervention. At the other end of this spectrum is what one might term the ‘European experience’ of proactively encouraging job creation and competitiveness through a plethora of business support programmes focused on SMEs.

The New Zealand approach to formulating small business and entrepreneurship policy lies somewhere in between these two approaches. This paper examines the development of small business and entrepreneurship policy in New Zealand during the period 1978 to 2008. It considers the changes in the broader environment over this period as well as the policy instruments that were developed and used to support small businesses and/or entrepreneurs. Using a range of secondary data, supplemented by interviews with key informants (that is,
policy makers working in government under the period of consideration), the study determines whether the policies pursued by successive New Zealand governments in the period in question have any similarities with the US or European approaches to small business and entrepreneurship policy and concludes that the case of New Zealand sits somewhere between the US and European experiences. The findings of this study will help policy makers understand the need to identify clearer objectives that can target the multiple needs of small businesses in New Zealand. It will also highlight how as the awareness of the complexity of the small business sector became more widespread, policies that affect SMEs have also become more complex.

**Background**

There is very little research into the development of small business and/or entrepreneurship policy either in New Zealand or internationally. A thirty year study on enterprise policy found that in the 1970s United Kingdom (UK) public policy in this area did not exist; in the 1980s the focus was on encouraging self-employment and, as the 1990s progressed the focus shifted towards supporting existing businesses with growth potential (Greene, Mole, and Storey 2004).

In Europe more generally, governments have identified the social benefits of small business and entrepreneurship policies and contributions that small firms make to the economy and job creation. As research into entrepreneurship has shown the links with economic growth policy-makers in Europe have called for a policy framework (the so-called Lisbon Proclamation) that will lead to a more entrepreneurial society (Audretsch 2009). Calls of this type are not new, with some dating back to the 1980s (Storey 1994). In places like the UK these calls have had mixed results in terms of the overall aim of creating a more enterprising society (Huggins and Williams 2009).
By contrast, there appears to be a consensus among commentators in the US on small business and/or entrepreneurship policy that one of the main drivers of US economic policy in the twentieth century was the need to constrain the corporation (Acs and Szerb 2007; Audretsch, Thurik, and Wennekers 2002; Dennis 2005). The implications of this competition policy for the direction of small business policy in the US have been spelled out by Dennis (2005). He argues that despite there being policies that impact on small business, there is no actual small business policy. However, small businesses play an important role in this framework for government intervention, which is predicated on ensuring a level playing field for all competitors. In practice, these competition policies have had social and economic repercussions, including the promotion of ethnic minority and women entrepreneurship.

The relationship between policies that affect small businesses and their ultimate aim of resolving broader social and economic problems continued throughout most of the twentieth century, to the point that calls were made to end government intervention and allow small businesses to die out because they were not considered sources of growth. There was also a sense that such firms only appeared able to survive due to government intervention to correct market failures (Chandler 1977; Thurik and Wennekers 2004; Audretsch, Thurik and, Wennekers 2002). This approach began to change, however, in the context of research that linked job creation to small businesses (Birch 1979). This had repercussions for the way governments around the world perceived the small business sector; a new role had been found for small businesses within the economy, largely one of alleviating unemployment (Storey 1994).

Audretsch (2009) has argued that as the US has moved from a ‘Solow’ economy where physical capital (which required economies of scale such as that deployed by big businesses) was the key driver of economic growth, to the knowledge economy where entrepreneurship
has become an important conduit for the commercialisation of knowledge and consequent economic growth. In this way Audretsch (2009) argues that small business policy in the US has shifted from preserving small firms from extinction to enabling entrepreneurial ones. Further, the advent of the knowledge economy and globalisation has meant that traditional policy instruments were less effective and that too drove the development of business policy that focused on entrepreneurship (Gilbert, Audretsch, and McDougall 2004).

Methodology

The study’s aim was to determine whether the policies pursued by successive New Zealand governments in the period in question have any points in common with the US or the European approaches to small business and entrepreneurship policy. To this end, this study uses a range of secondary data, supplemented by face-to-face interviews with a select group of four key informants who were involved in policy making throughout the period under review. The first key informant had expertise in the area of export assistance and small businesses and had been involved in this area since the early 1970s. The second had extensive involvement with small businesses policy assistance programmes from the late 1980s until the mid 1990s. The third was involved in policy design and implementation of various programmes during the 1990s and the final informant had been actively involved for the final ten years of the period of this study. Using a semi-structured interview format all informants were asked to give their impressions about SME policy during the time they were working in this area.

Findings and Discussion

An examination of the literature on New Zealand small business complemented by an overview of the relevant international literature and informed by the secondary data,
including interviews with key informants suggests it is possible to identify three distinct phases in the evolution of SME policy. These are: 1978 – 1984 protectionism and regional development; 1984 – 1999 the free market and regional development; and 1998 – 2008 towards an entrepreneurial society. In considering each of these phases, an assessment is provided regarding the study’s overall objective.

1978-1984 – Protectionism and regional development – towards diversification

Throughout most of the twentieth century successive New Zealand governments pursued protectionist economic policies. As the century entered its last quarter, however, New Zealand policy makers became increasingly aware that the country’s economic reliance on the agricultural sector and narrow export base (focused on Great Britain) needed to be addressed. This was compounded when Great Britain joined the European Economic Community (EEC) in 1973. That move was interpreted as a clear and significant signal to New Zealand that there was no alternative but to seek other export markets and to diversify its economy in order to ensure its continuing viability. The government’s response to these events was to seek to insulate the economy, as far as possible, from external competition and any form of external crises, including the oil shocks of the 1970s. By 1984, the incoming Labour government was confronted with an economy that was over-regulated, with a heavily subsidised agricultural sector, soaring unemployment, historically high levels of inflation, and economic stagnation. This situation, along with the changing nature of international economic trends drove the demand for domestic liberalisation which culminated in the mid 1980s with far-reaching reforms which restructured both the domestic economy and fundamentally changed the country’s social and economic policies (Easton 1997).

The protectionist policies adopted included high tariffs and controlled importing during the 1970s by and large insulated all firms in New Zealand from external competition and
events such as the oil shocks. This very high level of protection had a twofold effect on New Zealand businesses. First, it influenced the way New Zealand businesses operated, including the limited incentive to innovate and expand given high levels of protection from competition which might have driven both innovation and growth. Second, the insulation generated by government protectionist measures allowed businesses to delay any major restructuring (Bollard and Jackson 1992).

At this time, government economic policy was largely about the diversification of exports and the expansion of the manufacturing sector (Easton 1997). The range of assistance schemes available to small firms was largely financial and included grants, suspensory loans, tax incentives, export incentives, regional development assistance, venture capital, and assistance in the development of technology (Massey and Jurado 2005). A key informant remembers this period as one where the drive to export was driven by the need to diversify the economy and export incentives were directed at all businesses, with the focus on export volume, rather than value. The form of this assistance was largely a non-discriminatory blanket approach with no efforts made to target firms that had specific characteristics that made it more likely to succeed in their export initiatives.

In the context of its emphasis on domestic protection against competition, a feature of the late 1970s through until the 1980s was to pursue a policy of regionalism - a process overseen primarily by the Department of Trade and Industry (DTI). Business assistance, in particular, was mostly channelled regionally through the Development Finance Corporation (DFC) which worked closely with DTI. As the decade proceeded, it started to dawn on policy makers that small business development had an important role to play in this context, as a commentator reflected at the time, “policy makers [began] to understand that New Zealand
business is a composite of different sorts of enterprises as well as different industries” (Le Heron, 1979, p. 43).

The DFC was established to provide funds for businesses and was also tasked with providing business assistance and advice. These last two roles were taken up by The Small Business Agency (SBA), which was introduced in 1978 and was loosely modelled on the eponymous agency in the US. In a study carried out to determine what areas the SBA should address, it was found that that the firms surveyed ranked as their most important priority the ability to raise working capital on a day-to-day basis, followed by planning (both for succession and for growth). On the other hand, those surveyed saw little value in developing financial management and budgeting skills or to the utility in keeping up to date with industry-level changes (Le Heron 1979). There was also little perceived need for assistance in terms of the development of managerial skills, nor was there a great interest in developing marketing and sales related skills which could contribute to growth. Given these results, the lack of demand for small business services also reflects the understanding small business owners had of what government could do to assist in term of their development. Two informants made the point that at this time small business owners rarely thought of government as being able to do more than protect them from competition – there was no interest in improving their competitiveness (for example through the development of managerial or marketing skills). Given the protectionist environment firms operated in during this period, it is perhaps not surprising that they took such a short-term view of the role of government and of their need to develop other business skills.

When formed the SBA was charged with encouraging cooperation and coordination between government and non-government organisations engaged in assisting small business;
collaborating with existing organisations in developing programmes of financial, technical and management assistance to small business; providing advisory consultancy and other services for small business, and; providing guarantees for loans from third parties (Devlin and Le Heron 1977). To meet these objectives, the SBA began the process of engaging communities in the delivery of small business assistance and continued to carry out these services until 1987. The difficulty remained, however, as several informants observed that while the Spa’s objectives were laudable, most New Zealand firms remained ‘locked’ into a protectionist mentality whereby the government’s assistance was only sought when further protection was required and for the government itself, business policy was formulated in the context of domestic regional economic development. An inadvertent consequence of this approach is that there was no real demand for targeted assistance to specific types of enterprises (nor was there any on offer) (Le Heron 1979).

In sum, small business in this era was seen as an agent for regional economic development, and a means to diversify the New Zealand economy away from agricultural dependency into manufacturing. The implicit assumption underpinning this period was a desire to ensure that small firms would grow and become medium or large firms and that, in effect, small businesses were simply a microcosm of a big firm. To this end business assistance during this era was generic and not targeted (Haines 1991). A ‘one-size-fits-all’ approach remained a defining characteristic of business policy over this period.

In 1983 the Closer Economic Relations (CER) trade agreement between Australian and New Zealand was signed. It opened up Australia to New Zealand exporters but also meant that the deficiencies in managerial competencies and general business practices of domestic firms were exposed (Jones 1992; Bollard and Jackson 1992). In the words of a manager at the
time, “As a result of CER we had to change our whole approach to business. We suddenly had to become marketers” (Baker 2008). In a way CER was the harbinger of New Zealand’s economic transformation in the years that followed, changing attitudes towards ‘how business was done’. This point was underlined by the informants who identified CER as a key driver for the changes that took place to the New Zealand business environment after 1984.

1984-1998 ‘Free market’ regional development – Only the fittest survive:

By 1984, the primary form of government intervention in relation to small business in New Zealand centred on financial assistance and opportunities for regional development assistance in regions that were under performing economically. What followed was one of the biggest upheavals in New Zealand’s economic history. In a series of rapid moves the currency was floated and banks deregulated (Bollard 2005). All farming subsidies were removed. The reforms also included the removal of most industry assistance and the reduction, of import protection. Along with the agricultural sector, the manufacturing sector was put under pressure. Between 1986 and 1990 the effective rate of assistance to the manufacturing sector was reduced from 40% to 25% (Bollard and Jackson 1992). According to this argument there was simply no need for a government agency to deliver such help any more.

The underlying government philosophy of this era was that the market should regulate the economy and consequently that businesses should also operate in a market environment with limited government intervention. Firms were encouraged to compete against each other, as only the best would survive (Bollard and Savage 1989). This new social and economic environment further highlighted the ‘failure of management’ in New Zealand businesses, which had been fostered by previous protectionist one-size-fits-all economic policies (Jones,
1992). One informant recalls the influence of management theory in the thinking of officials at the time (for example, the total quality management movement as well as the competition theory developed by Michael Porter. There was more discussion amongst policy-makers about the importance of developing managerial capabilities but the primary focus was still on providing generic assistance.

The period from 1984-1998 saw the disestablishment of the SBA and the focus of small business support shifting away from being delivered by central or regional government bodies. The SBA’s closure in 1987 was justified by the argument that businesses were more efficient at running businesses than government agencies. According to this argument and consistent with the prevailing ethos, there was simply no need for a government agency to deliver such help. Two informants also reported that international approaches to unemployment (such as the enterprise policy in the UK and the Birch study on small business contribution to employment) were also influencing the government to encourage self-employment.

The collapse of the world share market in late 1987 brought an end to the financial boom in New Zealand, and the aftermath prompted the New Zealand government to re-consider playing a bigger role in this sector. In fact by 1987, even those who supported the economic reforms were not convinced that the complete removal of barriers was enough for entrepreneurial firms to develop in New Zealand (Harper 1994). There were growing concerns about the fact that too few firms had embraced the free market environment in which they operated and not enough were growing. As a result a range of studies and analyses of both the international and emerging domestic evidence were carried out. And it was in this context that between 1987 and 1998 the government moved to the promotion of
regional development through partnerships with private enterprise and local community-based organisations including city and regional councils, as well as industry associations and chambers of commerce. Organisations such as the Community Employment Group were encouraged to support small businesses locally and encourage self-employment (Massey, 2006). By 1989, Regional Development Councils (re-branded a year later as Business Development Boards (BDBs)) were established. Among other things the RDCs were established to identify opportunities for regional economic development, make submissions to government on infrastructure development, encourage research into areas of regional development, act as a point of information on services available to the business community, liaise with other regional organisations and administer grants such as the Regional Development Investigation Grant (Massey and Jurado 2005).

In the following years, small business support continued to be delivered through the BDBs in four main areas: The first dealt with grants to fund the investigation of business opportunities that were new to the local area; the second area helped businesses access specialised management consultants, and; the third covered costs related to efforts to increase exports; and the fourth provided businesses with business information, capability improvement services and fostered regional cooperation (Austin, Fox, and Hamilton 1996).

At this time, changes were also made in the means of delivery of business assistance. The expectation was to build on existing strengths and skills and that this approach would lead to an increase in the number of applications for the abovementioned support areas. However the rate of businesses seeking help did not increase to the level expected. A study commissioned by the Ministry of Commerce into this phenomenon identified poor management competence as an inhibitor in firms accessing funds. It also identified a lack of growth ambition and a
desire by owner-managers to remain in control of their business, a factor that appeared to constrain SME development. (Austin, Fox and Hamilton 1996). As a result, several informants recalled the encouragement of academic research into areas such as best practice and small business growth as a way of informing policy development in the area (Campbell-Hunt, Harper and Hamilton 1993; Bollard 1993).

Studies such as the one described above, which identified and described the complex nature of the small business sector, may have been behind the direction in which policy development towards small business support was headed. Certainly, the informants interviewed for this study were aware of its key findings (and indeed of the findings of other emerging research). Although small business was increasingly being recognised as an important player in the economy, mainly as a job creation tool, the bulk of this sector was still not considered to be a contributor to growth in the economy. Indeed, the era is characterised by what has been called the ‘champagne glass’ approach to small business support. This involved a tiered form of support for businesses where the high growth, exporting SMEs (the bubbles of the champagne) were supported by Trade New Zealand. The remaining growth-oriented firms (those in the glass) were supported by the Ministry of Commerce. The remainder of the firms (those in the stem of the glass) were left to be supported by the Community Employment Group (Massey 2006). The significance of this was highlighted by several informants who commented that it meant that government policy was focussed on the more ‘glamorous’ companies, with SMEs suffering through a lower level of engagement by government (i.e. via the Community Employment Group rather than the centralised and rather better resourced and funded Trade New Zealand and Ministry of Commerce). This approach mirrors similar developments internationally in terms of small business development, as mentioned above (Thurik and Wennekers 2004).
1998-2008: Towards an entrepreneurial society

By 1999, while some businesses prospered, nowhere nearly as many as expected took advantage of the new business-oriented environment to grow. Furthermore, there was an awareness of the failure of some policies to continue to deliver, despite having been initially successful. One key informant saw this as particularly pertinent to the scheme charged with assisting firms acquire expert advice from consultants. The result of this policy was a plethora of consultants, not all of them equipped to effectively assist small businesses. The key informant reflected that, while the scheme may have been originally well intentioned and have had early successes, poor design contributed to eventual failure. Moreover, this informant was convinced that poor policy design played a big part in failed policy attempts over the period, which led to the dismantling of the BDBs in the mid-1990s.

It was over this period that a lack of management capability was identified amongst small business owner-managers and several informants recall that there were increasing calls for government policy to encourage firm growth by focussing on firm level and industry factors and decreasing the attention given to regional factors (Bollard 2005). This was followed by research by others on ‘best practice’ (Knuckey, Wai-Lei, and Meskill 1999; Knuckey, Campbell-Hunt, Carlaw, Corbett, and Massey 2002). The findings were clear. Firms needed to address issues that had already been identified as critical since the implementation of CER. Management capability, in particular, was identified as an aspect of business support that government needed to provide leadership in.

With issues such as ‘total quality management’ and ‘best practice’ firmly in the minds of policy makers, the BIZ programme was introduced in 1998 as a way of helping to build
management capability amongst SME owners and managers. To deliver the programme, the Ministry of Economic Development (MED) contracted agencies (including non-governmental organisations) to offer a range of training programmes and information services, and to deliver management capability-enhancing programmes.

This period saw the government re-evaluate the underlying premise that putting aside the agriculture and tourism sectors, manufacturing businesses could lead growth in New Zealand. As in the US, policymakers turned to encourage a knowledge driven economy and take full advantage of the opportunities of globalisation and technological advantages. This is evident in a government publication entitled *Bright Future* in 1999 which was premised on the fact that entrepreneurship is often linked to growth and innovation. It sought to encourage innovation through research and development and the revamping of the technological base of firms, an area that New Zealand was lagging in. The policy was a significant departure from agricultural commodity dependency and targeted the growth-oriented entrepreneurial firms (Hamilton and Dana 2003; New Zealand Government 1999; Massey and Jurado 2005).

The rise in interest in the role of SMEs in the economy resulted in several significant developments over the period. Towards 2001, there was for the first time a Minister for Small Business. Informants recall this as being a significant political symbol of the changing perception of the sector. It was against this background that, in 2002, the government launched the Growth and Innovation Framework (GIF), which spelled out the government’s belief that innovation was a pre-requisite for firm growth. Through this framework SMEs played an increasingly visible part in the government’s economic policy, not least because entrepreneurial, innovative and growth-oriented firms are often small. The new policy approach was now directed at growth-oriented enterprises and regional development was no
longer the driving force of small business policy. Policy instruments were also refined in order to target start-ups and particular industries and sub-sectors. Small businesses were encouraged to pursue best practice to enhance productivity and remain competitive in the global environment.

In 2006, the Economic Transformation Agenda (ETA) was launched specifically to address New Zealand’s response to globalisation and the nation’s poor productivity rating. From the government’s point of view internationalisation was particularly important for New Zealand given its small size and lack of scale. Exports were encouraged too because external competition was thought to help businesses increase productivity levels (Ministry of Economic Development 2006). The ETA built on the approach of the GIF by spelling out clear goals to meet the challenges of globalisation and continued to encourage SME internationalisation and to foster innovation. In fact, 2007 was designated “Export Year” in an effort to encourage New Zealand businesses to engage in the global economy (New Zealand Government 2007).

The target of these new policies were businesses with export potential who were likely to grow, as opposed to the bulk of the small business sector. To address the needs of non high-growth small businesses, the government resorted, once again, to regional development policy, namely the Enterprising Partnerships Fund (EPF). Unlike previous regional policies, however, the overall aim was to develop and implement regional strategies that would improve the business environment and would also increase the number of internationally competitive firms (Ministry of Economic Development 2006). Moreover, this time round regional development policies had shifted away from a job creation focus to transforming
existing firms into more competitive enterprises. The emphasis was firmly on the need to export and to remain competitive in a global economy.

Government agencies also began a more pro-active approach to small business, including through engagement with academic researchers, SME business practitioners and industry associations. The Workplace Productivity Working Group (WPWG) of the Department of Labour illustrates the point. It sought to improve productivity through collaboration between government, industry, firms and unions. Another project to facilitate SME business practices revolved around hearing about the concerns of owner-managers that they spent too much time complying with different government regulations. As a consequence, the government carried out a review of regulations affecting SMEs (Ministry of Economic Development 2007) that led to measures that sought to cut back the amount of red tape small business had to deal with. In another effort to engage with small business stakeholders the Business Capability Partnership (BCP) was established in 2004. The BCP is a private-public partnership aimed at enhancing business and management capability in New Zealand by focusing on policies that will help grow competitive firms (Massey and Ingley 2007).

Not only was the government beginning to access the expertise of others to assist in the development of small business policy, but it also sought to engage leaders in the small business sector to inform the government about their sector’s needs and concerns. To this end it established the Small Business Advisory Group (SBAG) in 2004, which was the beginning of an ongoing dialogue and exchange of views.

While the first tier of SME policy at this time was designed to create globally competitive, productive and innovate firms; the second tier of government policy towards small SMEs
focussed on providing assistance to existing SMEs with a view to addressing market failures (Massey and Ingley 2007; Ministry of Economic Development 2006). By this time, government policy explicitly recognised the importance of building both management and business capability in order to attain business success. While the focus of small business policy has remained on growth, more and more policies have shifted towards encouraging individual management capability development and better business practices. The most recent example of this, leading up to 2008 was the introduction of the R and D tax credit (Ministry of Research Science and Technology 2007). The defining characteristic of these policies was to develop SME competitiveness and foster growth – a point underlined by several informants.

**Conclusion**

The study concludes that during the period 1978 to 2008 the New Zealand government policy towards small business has changed significantly. In the 1978 to 1984 period, small business policy was a component of regional policy initiatives within an overall protectionist economic policy environment. Over this period therefore, small businesses were seen by policy makers as being a largely homogenous sector, and government intervention through business assistance programmes was not targeted.

Between 1984 and 1998, the only specific small business policy was through the BDBs whose role was largely to fund grants to encourage firm growth. There was little targeted assistance and interviews with several informants highlighted the proliferation of poor policy design and evaluation, which meant that these had limited success. The focus of government policy over the period, however, began to change by eliminating much of the protectionism that had stifled growth, though the rise in unemployment led to a reappraisal of the role
SMEs might play both in economic and employment terms. During this period too there was an expanded interest in the emerging international literature and domestic evidence about SME needs.

In marked contrast, by 2008 small business policy had become a recognised and distinct part of economic policy. Consequently, as several informants confirmed, by 2008 small business policy in New Zealand was directed at enhancing management and business capability in order to encourage firm internationalisation and growth.

A key informant noted that from 1984 successive governments used as a starting point the notion that businesses, as opposed to governments, know best about business. This had implications for the formulation of policies to do with small business in two ways: firstly, governments actively liaised with small business stakeholders by transferring to them the task of delivering support services to businesses; and secondly, governments have been reluctant to intervene directly because of the belief that the market will sort things. Notwithstanding this ‘hands-off’ approach, the government has continued its efforts to provide a business environment that facilitates business enterprise development. Efforts by the government have also extended to actively seeking out the views of others in the small business sector, as was the case with the Workplace Productivity Working Group, the Business Capability Partnership and the Small Business Advisory Group.

The changes to SME policy in New Zealand that took place between 1978 and 2008 combine some of the elements identified by both Dennis (2005) and Storey (2005). These underline the point that SME policy in New Zealand has become complex and multifaceted. It is possible to discern elements of both the US and European approach to SME policy
within the latter phases identified in the research. Over the first two phases from 1978-1984 and from 1984-1998, the focus tended to be akin to that which characterised European-style SME policy, though from 1984 onwards there are increasing elements of the US approach. Initially, the emphasis was on protectionism as a driver of policy with government assistance focused on employment retention (and creation). The period after 1984 through at least until 1998 brings in more elements of the US-style ‘competition-focused’ approach, which continues to emphasise broader social and economic objectives (that is employment creation and regional development). The focus on ensuring a level playing field, including through the elimination of tariff protection and industry assistance, served to emphasise that focus on creating the conditions for freer competition.

Significantly, a defining characteristic of the changes and policy making over the period has been the way in which policies, which at times appeared diffuse and lacking coherence, gradually changed to attempt to ensure a tighter focus and clearer objectives. This study has highlighted how in the period from 1998 to 2008 in particular, that focus has informed policy change that is innovative, and distinctly new. Most specifically, that can be seen in the creation of public-private partnerships used in the development and implementation phase of policy delivery. As several informants observed in this context, previous policies had tended to be created largely in a vacuum without reference to business need or trends in international or even domestic research. Further, as some of the informants also confirmed, policies before 1998 in particular, had multiple and often uncoordinated objectives. Since that time, however, the value of more practical and coherent policy making became clear. This drew together government thinking and objectives; domestic and international academic research; and, business views and engagement (in both design and delivery). It is this three pronged approach that characterised the later period considered in this study that can be expected to
help policy makers the most to understand how those three elements working together may improve the sustainability and long term effectiveness of SME policy making in New Zealand.

Policies to Promote Entrepreneurship: Context Matters

David Smallbone
Small Business Research Centre, Kingston University, UK
d.smallbone@kingston.ac.uk

Keywords: entrepreneurship policy, social context, UK, Poland, China.

Throughout the world, the interest of policy makers in entrepreneurship has grown in recent years, as its contribution to economic development is increasingly recognised and the international evidence base is extended. Whilst policy oriented research has been a feature in some countries for many years, it is now receiving increasing attention by the international research community. This raises the question of what is meant by public policy and how this manifests in different environments. A number of authors have argued the need for entrepreneurship research to recognise the embeddedness of entrepreneurship in specific social contexts. This argument is particularly relevant to a discussion of the role of public policy, since government policies and actions are a key element in social embeddedness. In this context, the paper will compare the nature of entrepreneurship policy, its role and key challenges in three contrasting environments: the UK as an example of a mature market economy; Poland, as an example of a market economy that has emerged from central planning; and China.
Abstract

This paper suggests a millennium approach to entrepreneurship and technology proposals in a competitive borderless world economy based on the analogy with different species in competition for fixed natural resources in business ecological systems. It posits the view that entrepreneurship and technology proposals relocate competitive regeneration growth and conservation laws in a free market economy. Attention is focused on resolving conventional environmental issues and enhancing competitive creative regeneration, productivity incentives, coexistence, growth and conservation. A mathematical faithfulness analysis ecological systems literature based on the Malthusian to Lotka-Volterra models is presented: resulting in precise estimation, monitoring, utilization of biological resources, building a new architecture of entrepreneurship and technology infrastructure, enhanced verification and evaluation of energy economics and sun-disk phenomenon in competitive creative regeneration, conservation and growth consistent with reducing global warming.

Introduction: Resolving the implications of conventional ecosystems environmental entrepreneurship natural resource base accounting for sustainable development issues.

Schumpeter (1949) revisited the Schumpeterian evolving entrepreneurship and technology innovation agenda for sustainable development. In a presentation to participants at the Research Centre in Entrepreneurial History at Harvard University, Schumpeter explicitly recognized that entrepreneurship and technology could evolve into a global collective activity for sustainable development; in the sense that when warranted by the ecological systems environmental entrepreneurship natural resource base income accounting for sustainable development, the state and governments would recognize the importance of entrepreneurship global development goals and successfully carry out the policy commitments to improve living standards of people and human development.

Nonetheless, Schumpeter (1950) expressed the view that we have to accept that ecological systems environmental entrepreneurship natural resource base is the large-scale extractive resources and taxation establishment or unit of control and has come to be the most
powerful engine of economic progress and in particular of the long-run expansion of output... In this respect, perfect competition is not only impossible but inferior and has no title to being set up as a model of ideal efficiency.

However, ever since Schumpeter wrote, at stake was the prospect of economists and entrepreneurs to have to elaborate on a theory of competition in a free market economy and the properties of stability and general equilibrium systems in which the dominant market organizational design of an enterprise is viewed as an imperfect market, and a deviation from ideal perfect competition. From market-oriented historical perspectives, Schumpeter thought the specification of a «model of ideal efficiency», that is to say, environmental natural resource base efficient allocation and use of natural resources and market networking is problematic because according to him the «ideal» is continually changing as new structures of economic organizations bring new institutions, firms, industries, and scale economies to international dominance. Hence, institutional and ecosystems environmental natural resource base arrangements that previously yielded «ideal» economic and entrepreneurial outcomes became victims of creative destruction.

As Schumpeter studied the evolution of capitalism, he perceived the laws of entropy, energy and limitations of the physical world: not only of individualistic greed and selfish genes, but also of static mind, memory and theories, quantitative and qualitative methods. The Schumpeterian evolving entrepreneurship and technology innovation agenda is reconsidered by revisiting its transformation in capitalist design and redesign of organization and its impact on ecological systems environmental natural resource base income accounting for sustainable development in developing free markets, global economies, emerging industrial free market economies and industrialized free market economies in the last half of the nineteenth century; and the UN 2000-2015 Tools, Targets and Implementation period of the UN Millennium Development Goals (MDGs).
Schumpeter (1954) is addicted to a rear-view-mirror perspective in the history of economic analysis of the transformation in the redesign of entrepreneurship and technology organizational agenda. His perspective in entrepreneurial transformation and capitalist redesign of organization is limited in scope. This is understandable because the design of entrepreneurship creative regeneration and transformation of democratic economic and functional social welfare systems are rooted in the world of the human mind and memory: in the elements of time, space, causality, pleasure, and pain as starting points in spiritual entrepreneurship and technology development of cultural and moral values. For many entrepreneurial historians, the Ancient African Nile Valley Entrepreneurship/Technology Civilisations is a baffling economic-planning and development of sustainability phenomena. Schumpeter (1954) was clearly knowledgeable. In his economic analysis in wealth-building in historical perspectives on issues of Graeco-Roman-Judaeo-Christian moral values and ethical indebtedness, he paid tribute to the Ancient Nubian Egypt Nile Valley Civilisation B.C. 5000, as the dominant morality woven into the fabric of Western Civilisation and powerfully impacting the world in economic development and wealth-creating capital transformation and the design of business ecologicalsystems organization for millennia.

In Casson (1972) and the Ancient Nubian Scribe Papyri, Menna B.C.1400 and King Mena B.C. 4400, the first Nubian Egyptian Nile Valley Pharaoh designed the first human union of regions organization for economic development planning and programming of large-scale projects for the transformation and design of Wealth Creation and Regeneration in Entrepreneurship moral-value-loaded Maxims and Precepts of the law: Hall of « Maat » entrepreneurship that formed the basis of moral values of the law of equity, governance, democracy, stability and development of sustainability. Hence, the African Heritage in Wealth Creation and Regeneration Entrepreneurship and Technology contexture, in business ecologicalsystems natural resource base design of organization, has stood the test of time in
millennia of development of sustainability in virtues of an environmentally friendly physical process of non-exploitative proprietary and appropriation-driven depletion and degradation of ecological systems.

Rather, it is deeply rooted in the techno-entrepreneurship moral value-loaded precepts at the « Maati Hall » of legal accountability, balance of law, equity, democracy, truth, governance, human rights and freedom of mutual inter-dependence, integrity, spiritual righteousness, straightness, justice, trust, fair-share, uprightness in value judgements, the rule of law, social welfare, security and environmental resource munificent accounting for the development of sustainability in entrepreneurship and technology best practice in the world of the human mind endowed with memory as the starting point for knowledge and values. In order to build patterns of entrepreneurial thoughts and their quantitative and qualitative retrieval, in the sustainable development of entrepreneurship and technology innovation, in time, space, cause and effect; the ancient entrepreneurship transformation in wealth creation and self-reproduction powerfully and lastingly wove into the fabric of human civilization and world entrepreneurship and technology invention, innovation and diffusion of innovation a legacy in: hieroglyphs and writing, papyrus rolls, Small and Medium Sized Enterprises (SMEs), agricultural, water and soil science, and technology best practice in the Elysian Agricultural Fields of Hetep Nile Valley, environmental entrepreneurship planning and programming, biotechnology architecture, social utilities infrastructure, structural engineering, medical practice, medical and biomedical science, royal gold ornaments and gold cowries currency, evolving trade, SMEs and market structure of taxation and extractive resources. Arts and crafts, music, development of skills in mathematical science of techno-entrepreneurship evaluation of the universe: heavenly bodies, physical world, the biodiversity world and the world of the spiritual mind and memory dynamic-self organizing systems in time, space, cause and effect. This is African Entrepreneurship Wealth Creation and
However, the contribution and legacy of Schumpeterian entrepreneurship and technology innovation analysis is its impact on social and public choice theory and policy of the transformation in capitalist organization in the nineteenth and twentieth century particularly in his work on Capitalism, Socialism and Democracy. Also, his work on evolutionary economics is commonly seen in rigorous mathematical foundations, and as in every economic capitalist transformation process there appears to be a gap between actual and potential gross domestic product (GDP) economic growth in the Schumpeterian construct; both in quantitative and qualitative terms, partly because natural resource depletion and degradation are ignored. Also, GDP growth rate is often seen and used inappropriately as an indicator of economic welfare without an explanation of the shortcoming for the purpose. The process ignores the depletion of valuable natural resources and confuses the sale of commercially marketable natural assets with the generation of income. Moreover, the concept of welfare is much broader than a monetary measure of income. It covers many aspects and dimensions of subjective wellbeing other than those that involve market transactions or that can be measured in monetary terms.

However, in the context of Lazonic (1990) on the role of entrepreneurship and technology innovation in Schumpeterian history of transformation in capitalist organizational design in the last half of the nineteenth and early twentieth century; and the year 2000 on the economic impact of Schumpeterian entrepreneurship in creative destruction there are lessons learned in four industrial revolutions in *ecological systems* environmental natural resource base accounting in the broad public-private effort for sustainable development.

Consequently, we identify the sources of Schumpeterian entrepreneurial competitive advantage in the rise to international economic entrepreneurship and technology dominance of

It is worthwhile mentioning that the entrepreneurial history of British, American and Japanese transformation in capitalist organizational design is a legacy of the Graeco-Roman-Christian Empire of economic and administrative entrepreneurship and pollution-driven proprietary capitalism during its occupation of the Nubian Egyptian Nile Valley at Alexandria B.C. 200. Alexandria became the gate-way to the old cross-road and Silk Road entrepreneurship of the dependencies of the Roman Empire in the West from (Britannia) Roman Britain and Middle East Asia and Far East Asia. Roman economic and administrative entrepreneurial organizational design was both efficient and ruthless in exploitation. As an occupying power, the Romans looted, milked and controlled the free-market Nubian Egyptian Economy mercilessly through designated individual proprietary environmental pollution and entrepreneurial capitalist agents. The gap between the rulers and the ruled grew wider with the ruled paying for cost of pollution. The Roman Emperor appointed Agricola, an Elysian Agricultural Field environmental pollution capitalist agent as Governor of Britannia (Roman Britain).
In Casson (1972), Napoleon launched the conquest of the Egyptian Nile Valley in 1798. He was accompanied by a small group of loyal servants dedicated to the study of the African Nile Valley. This led to the discovery of the ancient Nubian Egyptian Rosetta Stone fragment inscribed both in Hieroglyphics, Demotic script and Greek which provided the clue to the ancient history of economic analysis of entrepreneurship and technology innovation and evolution in the Ancient Nile Valley. Its bilingual text provided Jean-François Champollion in 1822 the clue to read and translate the hieroglyphs, pictographs and thereby unlock the conservative cultural and moral values of Ancient Nubian Egyptian Nile Valley Entrepreneurial Civilisation of Creative Regeneration. This led to the rage of amassing Ancient African Nubian Egyptian Nile Valley antiquities by Western European and Eurasian mindless entrepreneur predators. The African Heritage of the Nubian Egyptian Pharaohs was expropriated, appropriated and exploited mercilessly: entrepreneurial and technological innovative engineering and architectural fragments, statues, mummies, papyri rolls on medical, agricultural science, ecological systems environment natural resource accounting, astronomy, mathematical science of time, space and causality and the structure of the physical, biological and spiritual universe, tomb furnishings, copper irons, gold jewelleries, gold cowries currency, precious stones, arts and crafts were carried off wholesale to enrich West-East Museums and proprietary entrepreneurial collections. In the proprietary entrepreneurship and SMEs seller’s free market economy, the methods used by East-West administrative capitalist entrepreneurial predators were crude and savage.

In 1858 the administrative proprietary entrepreneurship consular agent of Napoleon and the 1860 Suez Canal entrepreneur in creative destruction(1) Ferdinand de Lesseps(2) appointed Auguste Mariette as administrative proprietary agent conservator in organized plundering of Ancient Nile Valley antiquities. Mariette and Gaston Maspero excavated important tombs and monumental treasures for profit. In 1862 the first Japanese Nile Valley
and Old Silk Road Samurai proprietary entrepreneurship expedition of thirty-six entrepreneurs, headed by the proprietary entrepreneurship relic-hunting agent, Takeuchi Yasumori, travelled from Suez to Cairo in the seller’s looting market of antiquities and papyri rolls of science and technology innovation. They filed a detailed record of private collections and a photograph of mono-clad Samurai at the Sphinx. These are preserved in the Japanese National Diet Library.

In 1880, the British administrative and proprietary entrepreneur Egyptologist agent, William Matthew Flinders Petrie succeeded the French. He put in place the procedure in the transformation of capitalist organization in entrepreneurship archaeological excavation and the preservation of treasures and papyri rolls for entrepreneurship innovation in research and development (R&D). Thus, British entrepreneurship, technology, research and development in the Nile Valley treasures, papyri rolls and Graeco-Roman colonial economic proprietary-agent administrative capitalism have formed the basis of institutional and international dominance. Secondly, this was followed by the American Revolution in proprietary entrepreneurship R&D of individualism in a new physical world and world of life that built the basis for institutional and international dominance in self-responsibility, principles of free and intense competition and equality of opportunity. This has led to the dynamics of networking managerial capitalism in nothing succeeds like success in environmental exploitation, resource depletion, and degradation control and pollution accountability. Thirdly, this is followed by Japanese collective contextualism in managerial transformation of capitalist organization. This involves the potent economic rule of fair share proprietary entrepreneurial attempts to inject entrepreneurship research and development into the collectiveness of interests in mass production of consumer durables in vertically related capital good industries under managerial capitalism. This basic institution of collective capitalism is proprietary contextualism in which the rule of group fair share is dominant in the
planned coordination of group activities including setting up new vertically related enterprises as the need arises. This has made Japan a strategic collaboration and collectivity group matrix of entrepreneurs that has dominant institutional and international economic power to lead the third Industrial Revolution and the development of tools for environmental pollution management. And fourthly, we have the Chinese A.D. 2000 dynamic GDP economic growth miracle founded on the Chinese Revolution 1911-1912 on Wealth Creation and Regeneration in collective and collaborative entrepreneurship and technology development based on the contextualism cultural matrix of high output and low cost input technical and efficient skills. This cultural collaborative matrix of entrepreneurs is ideal for integration into vertically related capital goods and consumer goods industries in collective collaboration and competitive productive organizations. The result is unity and harmony in « Memorandum of Understanding Value Judgements »: growth, competition, environmental pollution and resource accounting, collective welfare, equity or justice, security, efficiency, sustainability, stability, freedom and market mechanism of collective collaboration in managerial capitalism.

The transformation in capitalist entrepreneurship organization in Wealth Creation and Regeneration has made China the dominant global economic and institutional power that has taken the lead in the Fourth Industrial Revolution; and working effectively on its strategy in Biodiversity and the Conference of the Parties (COP) Protocols in achieving the targets of the UN Millennium Development Goals (MDGs) 2015.

**Objective: Redesign of Transformation in Patterns of Entrepreneurship Organization: The Business Ecologicalsystems Regeneration Approach.**

Arrow (1987) defines the design or redesign of an organization as a vehicle for exploiting the potentials of the market mechanism and for achieving alternative methods of efficient allocation of resources (by such means as the internal structure SMEs, government, entrepreneurship and invisible institutions of trust and ethics) where the market fails or does not exist.
Arrow perceives a modern organization as a group of individuals seeking to achieve some common goals or to maximize an objective function. Each member has objectives of his own, in general not coincident with those of the organization. Each member also has some range of decisions to make within limits set partly by the environment external to the organization and partly by the decisions of the other members. Finally, some but not all observations about the workings of the organization and about the external world is communicated form one member to the other.

However, he contends that an organization may be as broad and all encompassing as the entire economic (entrepreneurial) system. If the entire economy is thought of as a single organization one is led naturally to think of the price system as one of the major devices for coordinating different (global and competitive) economic activities. A great deal of effort has been made by economists in clarifying the moral and cultural virtues and limitations of patterns of organization.

In this study, our vision of the redesign of global patterns of entrepreneurship organization is our focus on Business Ecological Systems Creative Regeneration in the development of biodiversity sustainability or what is commonly known as public-private policy effort to reduce global climate change and a sustainable environment. The focus is on lessons learned in entrepreneurship information channels, communication, structure, moral, codes and values in the physical biological life and spiritual worlds. The African Heritage of monotheistic RaAusaresianism of the After Life Wealth Building dichotomous persons, Western/Middle East Asian monotheistic Judaeo-Christian-Islam proprietary dichotomous persons and East Asian Unitarian Confucianism, collectivity non-dichotomous-Taoism-Shintoism non-dichotomous persons suited for integration into productive organization.

The focus in his cultural organizational matrix is the crucial role of the entrepreneur. He is defined as a moral person who, on experiencing the fundamental knowledge and
uncertainty-bearing and expectations of the market economy, commits himself to a certain
vision of decision making and discovery; and who is able to interpret and access the structure
and range of impact of symmetric an asymmetric on-the-spot information and communication
of that discovery; and based on that information and communication of discovery is able to
create a new regenerative context within the market or organization. This is the context of
Creative Regeneration in a competitive market economy in the development of business from
ecology rather than ecological businesses as recommended in the UN Millennium
Development Strategy (MDGs 2000) that empowers member countries to explicitly build
between 2003-2004 their own Millennium Development Strategy Papers targeting the UN
Millennium Development Goals (MDGs 2015). The strategies, goals and targets are
inadequate.

The strategies, goals and targets to ensure environmental sustainability suggest that
this could be a revised version of the Convention on Biodiversity signed at the Earth Summit
in 1992 in Rio de Janeiro, Brazil which explicitly and suitably incorporates the MDGs. More
recently and in the context of the Earth Summit and COP protocols, there has been a lot of
talking about carbon environmental pollution waste sinks, efforts to reduce global emissions
of green house gases and a market economy that draws on renewable energy sources to reduce
to reduce global warming and climate change and environmental accounting for sustainable
development.

It is argued that human kind or the human world of life is dependent on
ecological systems environmental natural resource base for energy. It is reliably estimated that
petroleum resources will be exhausted by say within sixty years; natural gas by, say within
one hundred and fifty years and hydrates within four hundred years at the present rate of
resource depletion, degradation and depreciation. It is therefore highly likely that with current
trends in proprietary entrepreneurship natural resource exploitation, human life will not be
sustained on physical Planet Earth by the year 2500 A.D. In the circumstances, we propose entrepreneurship and technology research and development focused on business ecological systems entrepreneurship in the development of sustainability. We will also propose growth and development, and entrepreneurship technological innovation laws appropriate for the millennium.

**Research Methodology**

In 1972, Arrow was awarded the fourth Nobel Memorial Prize in Economic Science. The prize was awarded for his pioneering contribution to general economic equilibrium theory and welfare theory. It was argued that the progress in economic sciences has led to a profound transformation of the general equilibrium theory. Arrow used modern mathematical methods to study the properties of competitive general equilibrium systems: Arrow thereby formed the basis for a radical re-formulation of previous theory. Together with Debreu, they were able to demonstrate in a mathematically stringent manner, the conditions which must be fulfilled for the existence of equilibrium.

In this study, we consider an approach in the demonstration of competition whereby only those enterprises and entrepreneurs who are able to compete most strongly and diversify most rapidly in a creative reproduction system of the market process; will continue to survive in a market ecological system environmental natural resource base. The underlying rationale is that of competitive regeneration which creates a stable coexistence of two or more competitors making their livelihood in identical ways. By this rationale, we derive some insight as to why entrepreneurship should be characterised by some distinct feature in product competition in creative differentiation and ecological systems resource regeneration and conservation. Hence entrepreneurship and technology patterns of specialisation in creative regeneration is considered merely as nothing more than an essential strategy to the survival of business ecological systems natural resource base coexistence with a large number of other
enterprises in industry *ecologicalsystems* creative regeneration. And as Marshall (1920) and others have emphasized, variety (creative) which is the natural resource pattern of entrepreneurship specialisation (resource regeneration) is the main spring of economic progress (development of sustainability) in the context of transformation in capitalist organizational design. In retrospect, economic regeneration is contingent upon the competitive process of creative regeneration process of selecting between various competing technological and redesign of organizational patterns.

In what follows in this study, the concept of competition as a powerful force for diversity in a free-market economy is revisited. We posit some interesting predictions regarding the practical limits to competitive similarity in creative destruction in *ecologicalsystems* environmental businesses resource base. The limits to similarity in competitive creative destruction is the extent to which the practical limits are exactly reached in a competitive system of optimal path depletion, degradation and depreciation of environmental resource accounting for sustainable development.

In order to present the market analysis of the business *ecologicalsystems* natural resource base characterized by entrepreneurship and technology patterns of differentiated products which incorporate competitive optimum growth paths in creative regeneration, an economically *ecologicalsystems* interpretable model of optimum growth paths of laws of development of sustainability are identified and shown to be sufficient for the analysis to proceed along lines identified by May (1973) and the UNCED Earth Summit (1992) Convention on Biological Diversity in the theoretical ecology literature and the growing global concern about biodiversity loss; and its transformation from a scientific issue to a political economic development issue of sustainability.

The business *ecologicalsystems* entrepreneurship and technology model presented in this study is closely related to the UN Convention on Biological Diversity and UNEP (1972,
1982) methodological guidelines on entrepreneurship *ecologicalsystems* environmental natural resource accounting. This is based on a close analogy to May’s analysis of biodiversity as the totality of genes, species and *ecologicalsystems* environmental natural resource base competition. Here, entrepreneurs compete for environmental natural resource base and share market demand. Also, their subsequent success is determined by their pattern and transformation in resource share demand. In the survival entrepreneurship *ecologicalsystems* market demand model, each entrepreneur is defined by the inherited entrepreneurship and technology pattern of transformation in capitalist organizational design of creative regeneration process for the development of sustainability.

**The model of Business Ecological systems Entrepreneurship for the Development of Sustainability.**

Schumpeter maintains that the basic force motivating capitalism and enabling the continuous operation of its system is the available natural resources, new production methods (including new transportation methods), new markets, new industrial and technological structures all of which are created by the entrepreneur in a new context of constructive-creative destruction. So be it.

Now, let us consider a new pattern and context in techno-entrepreneurship transformation in capitalist redesign of organization in a continuous operation of its system as an approach to competitive business *ecologicalsystems* environmental natural resource base in an evolution and adaptability process of creative regeneration. By definition, the new context and pattern is the ability to create a new market and technology infrastructure with the competitive business *ecologicalsystems* natural resource base. The ecologicalsystems also consists of the total heritable variations caused by the presence of species, genes or units of hereditary information which organisms can transmit to their offspring from one generation to the other in different climatic and vegetation zones of the earth: in the ground and atmosphere. In the human *ecologicalsystems*, biotechno-entrepreneurship makes it possible
for soils, vegetation, plants and animals, micro-organisms and the atmosphere to act as life support system in entrepreneurship creative regeneration of the growth law of all living things in the physical and biodiversity world of life. Thus the entrepreneurship and technology business ecosystems demand and best practice continuum is flat.

Now, consider an idealized entrepreneurial ecological systems transformation in capitalist redesign of organization in a geological, climatic and biological context that constitutes the world of evolution and adaptability governed by genes of species, the growth rate and cyclical poverty of species through biological reproduction in coexistence with other species in a prey-predator relationship; Andrew and Mcleone (1976); and Hoppensteadt (1975). Thus we cannot escape the laws that govern orders issued by our genes to our memory that endows us with a mind. As a result, we have entrepreneurship ecological systems self-organization in time, space, cause and effect. Understandably, mind and memory of entrepreneurship ecological systems self-organization is the starting point for values and a cycle of stable thought patterns created that emerges from and returns to memory in a combined process of synthesis and analysis that gives rise to logicality, concepts, ideas and contexts in entrepreneurship ecological systems wealth creative regeneration. This African Entrepreneurial Heritage of best practice in synthesis and analysis of natural resource utilization for the development of sustainability in building a new energy and social infrastructure.

Let us now consider models consisting of a given population of entrepreneurs in a business ecological system of species, genes and examine its growth rate. An attempt is made to present four models in their order of increasing mathematical sophistication and faithfulness to the natural law of creative regeneration phenomena:

- The Malthusian Model
- The Verhulst-Pearl Model
- Two species in competition
- The Lotka-Volterra Prey-Predator Model.
The argument developed by Malthus' (1798) theory of population in the ecology systems environmental economy is related to the Malthusian Law of population. Let $x(t)$ be the population density of a single species at time $t$ and let $b$ be the birth rate of an individual of the population, and $d$ the death rate of an individual of the population. The Malthusian equation may be formulated as a law requiring the quantitative relationship which describes the process by which the population density $x(t)$ increases with time $t$. Logically, this leads us intuitively to postulate the Growth Law as the rate of growth of population density being the difference between the birth rate and the death rate:

$$x(t) = (b - d)x = rx \quad \text{where} \quad r = (b - d)$$

which is the innate capacity of the population to increase by the quantitative relationship:

Intuitively, at time $t$, $bx$ individuals enter the population and $dx$ individuals leave it.

The solution of the Malthusian Growth Model has been tested by Tanyi (1978) for its faithfulness to reality. Understandably we want to know how far the model represents the business ecological systems entrepreneurial context and pattern of the environmental natural resource base accounting phenomenon. How far is development of sustainability, stable systems and stable equilibrium system and control consistent with predictions and realisation?

A stable system is one whose state space functions are always bounded. Stabilization implies maintaining a stable state. To sustain is to uphold and support in a stable state, while control is our ability to steer a given system and this requires our capability to observe the system through some form of measurement. Realisation is another basic objective and deals with the question of how a system can actually be constructed in mathematical terms.

The linkages between synthesis and analysis of these goals would help us achieve the mathematical structures of self-organization of competitive business ecological systems entrepreneurship and technology innovation. Accordingly, business ecological systems disturbed from its competitive equilibrium position tends to return to it in the long run to give
a strict definition of the linkages to stability we shall confine ourselves to a deterministic model governed by the capacity of self-organizational systems in business ecological systems entrepreneurship. Therefore, let the capacity of the Self-Organization System (SOS) be:

\[ *y(t) = f(y), y \in \mathbb{R}^* \]

The zeros of the vector fields \( f \) correspond to the competitive equilibrium position of the system (SOS); because they determine points of zero velocity, \( y^* = 0 \). Accordingly, we introduce a strict definition of the Lyapunov solution. Let \( \varphi(t) \) be a solution of (SOS) with initial values \( \varphi(t_0) \).

Thus \( \varphi(t) \) is Lyapunov stable linkages, if and only if and only if:

For every \( \epsilon > 0 \), there exists \( \delta(t) > 0 \) subject to any other solution of \( \alpha(t) \) of (SOS) with initial values \( u(t_0) \); \( |u(t_0) - \varphi(t_0)| < \delta(t) = |u(t) - \varphi(t)| < \epsilon \), for every \( t \geq t_0 \). As consequence, the competitive equilibrium point \( \varphi_0 \) of (SOS) has linkages stability if and only if for every \( \epsilon > 0 \), there exists \( \delta(t) > 0 \) subject to \( |u(t_0) - \varphi(t_0)| < \delta(t) = |u(t) - \varphi(t)| < \epsilon \), for every \( t \geq t_0 \).

Thus by strict definition of the Lyapunov solution \( \varphi(t) \) is asymptotically stable in linkages; if and only if it is stable and for any other solution \( u(t) \) and for every \( \delta > 0 \),

\[ |u(t_0) - \varphi(t_0)| < \delta \rightarrow \lim_{t \to \infty} |u(t) - \varphi(t)| = 0 \]

We can now evaluate the Malthusian model (1) for \( r \) constant \( x(t) = e^{rt}, x_0 = x(0) \) and in general for time dependent \( r \), \( x(t) = \exp \int r(t) \, dt \) for \( r > 0 \), \( x \to \infty \) as \( t \to \infty \) for \( r \equiv 0 \), \( x(t) = \text{constant} = x_0 \). Hence the value \( r_0 = 0 \) thus represents an unstable competitive equilibrium point of the population of the ecological systems. It was this behaviour that led T. R. Malthus in 1798 to predict that the human race could only persist if periods of exponential growth were followed by a period of plague and famine.
This unreal situation is due to the fact that the Malthusian model is applicable only for very short periods of the life of the biological organism considered. We can therefore conclude that the Malthusian model is based on creative destruction and it is not very faithful.

Secondly, we examine a self-regulatory model due to Verhulst(1838) and Pearl(1927). The Verhulst-Pearl Model modifies the Malthusian model by means of two additional postulates:

- The death rate is proportional to the population density. That is to say there exists a constant \( \alpha \) subject to \( d = \alpha x(t) \)
- The birth rate is constant. That is to say, \( b = \text{constant} \).

Consequently, the Malthusian growth equation (1) becomes;

\[
\frac{dx}{dt} = r_0 (1 - x/k) x \tag{2}
\]

where \( r_0 = b \) and \( k = r_0/\alpha \).

The death rate is proportional to the population density. That is to say there exists a constant \( \alpha \) subject to \( d = \alpha x(t) \) and creative regeneration for the obvious reason that for \( k = x \), \( dx/dt = 0 \).

Now, if we introduce the change of scale, \( x/k = z \) and \( r.t = 1 \),

then (2) transforms to the dimensionless form;

\[
\frac{dz}{dt} = (1 - z)z \tag{3}
\]

and has the solution,

\[
z(t) = \frac{1}{1 + c^{-t}} \tag{4}
\]

where \( c = z(o)^{-t} - 1 \) for \( c = 0 \) and \( z(t) = 1 \).

That is to say \( x = k \), and this implies that for \( c = 0 \), we are at the maximum carrying capacity of the ecological systems environment natural resource base. An evaluation of solution (4) shows that the competitive equilibrium configuration \( z(t) = 1 \) is stable and sustainable.

Thirdly, let us consider two entrepreneurial species in competition; by changing the time and causality scale effect, the Verhulst-Pearl equation (2) may be written as:
\[ z' = z(1 - \alpha z), \] where \( 1/\alpha \) is the carrying capacity of the ecological systems and \( z \) the consumer population density of two species. In isolation their growth rates are:

\[ q' = q(1 - bz - dq) \quad (5) \]

In competition, we postulate the growth equation;

\[ z' = z (1 - \alpha z - cq) \text{ and } q' = q(1 - bz - dq) \quad (6) \]

where \( c \) and \( b \) are coefficients that measure the degree of entrepreneurial creative regeneration and creative destruction interactions in the regenerative business ecological systems and the destructive ecological systems business environment. Thus, the equilibrium position of the ecological systems in (6) is the interaction of creative regeneration and creative destruction carrying capacity lines of entrepreneurship:

\[ \text{LE1: } (z/\alpha - 1) + q/(c) = 1 \quad \text{and} \quad \text{LE2: } (z/b - 1) + q/(d - 1) = 1. \]

Thus the stability synthesis and analysis of equilibrium position in (6) shows that \( z \) increases if and only if \( \alpha z + cq < 1 \), and decreases if and only if \( \alpha z + cq > 1 \). And similarly, \( q \) increases if and only if \( bz + dq < 1 \) and decreases if and only if \( bz + dq > 1 \). Alternatively, ecological systems (6) may be written in this form:

\[ z' = \alpha(t,z)z + \beta zq, \quad \text{and} \quad q' = \lambda(t,q) q + \mu zq \quad (7) \]

where \( \alpha, \lambda \) are the net growth rates of the species \( z \) and \( q \) in isolation; as shown in equation (5).

Fourthly, the formulation in (7), permits us to relate (6) to the original prey-predator model of Lotka and Volterra; with notation:

\[ \text{N}_1 = \text{population density of the predator species in creative destruction of the ecological systems environmental resource base accounting for sustainable development.} \]

\[ \text{N}_2 = \text{population density of the prey species creative regeneration for the development of sustainability.} \]

\[ \alpha_1 = \text{death rate (per individual) of the predator species.} \]

\[ \alpha_2 = \text{birth rate (per individual) of the prey species.} \]
By intuition, we are led to the following hypotheses:

\( H_1 \) : The growth rate of the predator species depends on the density of the preys. That is to say, there exists \( \lambda_1 \) subject to \( bN_1 = \lambda_1 N_2 \)

Here, \( bN \) is the birth rate (per individual) of the predator species.

\( H_2 \) : The mortality of the prey species depends on the population density of the predators. Thus, there exists \( \lambda_2 \) subject to \( dN_2 = \lambda_2 N_1 \).

Here, \( dN_2 \) is the death rate per individual of the prey species.

Consequently, it follows directly from the hypotheses \( H_1 \) and \( H_2 \) that

\[
\frac{dN_1}{dt} = a_1 N_1 + \lambda_1 N_1 N_2, \quad \frac{dN_2}{dt} = a_2 N_2 + \lambda_2 N_1 N_2 \quad (8)
\]

This self-organized mathematically faithful *ecological systems* entrepreneurship system is known as the Lotka-Volterra prey – predator model. An evaluation of the model shows that in the absence of the predator (creative destruction) entrepreneur, the evolution of the business ecological systems is Malthusian in competitive creative regeneration entrepreneurship and technology best practice. The system also describes a Host – Parasite biological system.

We can solve the model to demonstrate that system (8) is an equilibrium solution and consequently develop the law of conservation in business ecological systems entrepreneurship and technology in creative regeneration of environmental natural resource base accounting for the development of sustainability.

**Results**

The results and argument presented is based on a close analogy with problems of *ecological systems* social, biotechnological proposals and techno-entrepreneurship development dynamics and economic competition in mathematical modelling of biological species competing in the environments for fixed resources. Here, it is contended that an entrepreneur trying to create redesign of organization, needs on-the-spot information that
suggests to him the structural information from which he can grasp and understand business ecological systems globalisation, industry and technology proposals relocation, production and competition for fixed natural resources and market share. Thus, each entrepreneur and technology proposals specific evolution and adaptation within the market structure is defined by a growth, conservation and reproduction law. A growth and conservation model of structures of ecological systems of entrepreneurship and technology proposals is considered.

**Discussion and Conclusions**

A key distinguishing factor of business *ecological systems* approach to entrepreneurship and technology proposals in a competitive borderless world economy is in resolving conventional issues of environmental problems of green house gases effect, climate change, waste crises, racial, poverty, slavery, cold war, population drugs natural resource accounting, definition of innovation and the Schumpeterian market entry and exit in competitive creative destruction for sustainable development. A business *ecological system* approach in entrepreneurship decisions gives a balanced judgement of development of sustainability in competitive creative regeneration or reproduction, productivity, incentives, coexistence, evolution and adaptation of technology proposals to growth and conservation law and a flexible population, cold war, poverty, slavery, racial, drug addiction and climate change reduction. This will improve our understanding of the estimation, monitoring and analysis of natural resources impact and appropriate technological proposals for the millennium. It will improve incentives to public-private effort to reduce greenhouse gases emissions global warming and enhance renewable energy sources through biological and sun disk-studies concerned with the utilization of biotechnological and the phenomenon of the economic physics of the sun-disk resources in building a new infrastructure for development of sustainability. This enhances the evaluation, verification and understanding of *ecological systems* entrepreneurship and technology proposals in millennium COP protocols.

Understanding Coopetitive Relationships between Subcontracting SMEs in Aeronautic and Space Industry

By David Salvetat\(^1\) and Mickaël L.R Géraudel

Abstract

Small and Medium Size Enterprises (SMEs) are often engaged in cooperative relationships with competitors because of environment constraints. Based on a sample of 40 aeronautic and aerospace companies located in Europe, we try to understand different types of relationships of coopetition for SMEs in a competitive industry. The first form of coopetition is “endogenous coopetition”. In this case, SMEs are actors of coopetition. They choose to pool their efforts between SMEs to face global companies. The second strategy is “exogenous coopetition”. In this case SMEs are agents of the coopetition. Actors from higher ranks (prime-contractors) oblige SMEs to cooperate with them or with others subcontractors.

Introduction

Scholars argue that there is coopetition between international groups but they do not take into account the different forms that coopetitive relationships between Small and Medium Sized Enterprises (SMEs) can take. However, for some SMEs, strategic alliances are critical

---

\(^1\) David SALVETAT is associate professor at La Rochelle Business School. Based at the research centre CEREGE, his research focuses on business intelligence and on interorganizational relationships.

Mickael GERAUDEL is assistant professor at GSCM-Montpellier Business School. His research focuses on SME management and on personal networks.
(Golden and Dollinger, 1993; MacGregor, 2004; Parise and Casher, 2003) because they are embedded in a social structure which constrains these small companies to cooperate with their competitors (Lechner and Leyronas, 2009). SMEs need to collude with other SME to be more efficient (Lu and Beamish, 2001). In some cases, cooperation is established with competitors. When competition and cooperation occur simultaneously, we have coopetitive situations. For SMEs involved in this process, coopetition leads to generic outputs: reducing costs, increased turnover, etc. While the outputs of cooperation are well known, it is more difficult to describe the different types of coopetitive relationships between SMEs. For example: are they obliged to cooperate with their competitors? Did they have a free choice of partners?

The goal of this article is to show the different types of coopetitive relationships between subcontracting SME in the European aeronautic and aerospace industries, and especially in the “Aerospace Valley” district. Based on grounded theory, we conducted 58 interviews in 40 companies and economic institutions to model coopetitive relationships between SMEs in Aerospace Valley.

Our results show that there is endogenous coopetition, where SMEs are engaged in the global market to fight against large firms or to defend their own niche market. This is a deliberate strategy. The second type of coopetition has exogenous factor as determinants. The prime contractors oblige SMEs to cooperate with their competitors to obtain markets. The prime contractors seek economies of scale or research into innovation.

In a first part of this paper, we provide a brief overview of the literature about coopetition for SMEs. In a second part, we present the sample and develop the methodology used in this research, grounded theory. Lastly, we present our main results.
1. Coopetition, a paradoxical behaviour

Coopetition is a combination of cooperative and competitive behaviour between rivals (Nalebuff and Brandenburger, 1995; Bengtsson and Kock, 2000; Gulati et al., 2000). The concept of coopetition is thus an essentially plural one (Dagnino and Padula, 2002) and it is useful to distinguish between the various forms that it takes (Walley, 2007). Although often presented as opposites, competition and cooperation may reveal serious dysfunctions when they are approached in an alternative and non-simultaneous manner (Bresser, 1988). That is the reason why coopetition is quite different from strategic alliances. The combination of the two types of behaviour enables both the development of an important advantage (Bengtsson and Kock, 2000) and the management of tensions generated by these two strategic postures (Clarke-Hill et al., 2003).

Nalebuff and Brandenburger (1995) use game theory to model coopetition in order to propose a balance between the realization of individual and collective interests. Lado et al. (1997) utilize game theory, socio-economic approaches and the resource-based view (RBV) in order to create a typology of relationships, in the context of the search for economic rent. Bengtsson and Kock (2000) use social network analysis and the RBV to identify coopetition, dyadic and paradoxical relationships, which are simultaneously cooperative and competitive, but relate to different activities.

2. Outputs of coopetition

Cooperating with competitors leads to specific outputs. Adopting both cooperative and competitive behaviour simultaneously has various effects, including the stimulation of knowledge, acquisition of information and development of confidence (Lado et al., 1997). Sulej et al. (2001), for example, observe that there has been an increasing use of strategic
alliances as a mechanism for growth by SMEs, especially in innovative, technology-based industries.

Coopetition thus aims at generating synergies and finding resources that are complementary or similar. The intention is to establish an overall network of all partners in order to tap into their knowledge, for mutual benefit (Me Chirgui, 2005).

Accordingly, cooperation becomes a means of improving competitiveness and searching for resources and complementary competences (Bengtsson and Kock, 2000). Within a business ecosystem (Moore, 1996), a dominant firm can choose coopetitive behaviour in order to supplement its portfolio of resources. Moreover, many actors play the role of an intermediary, by proposing business integration between actors. A broker links the companies within a business network (Miles and Snow, 1986). Such a broker is also an architect (initiating and building the network), a moderator (coordinating and leading the network) and a facilitator, ensuring the sustainability of the network. The actors specifically seek cooperation in order to form and operate a network.

The theory of transaction costs (Williamson, 1985) indicates that there is generally a strong propensity to compete in industry. Competition is beneficial for a market, while cooperation tends to be perceived as market disequilibrium (Quintana-Garcia and Benavides-Velasco, 2004). Thus, competition is the only means of achieving strong performance and market equilibrium. However, the best partner may in fact be a competitor (Deming, 1993). Cooperation increases competitiveness (Lado et al., 1997) and opportunistic behaviour can coexist with apparently contradictory values such as confidence. Thus, opportunistic behaviour can be exacerbated by the adoption of coopetitive behaviour. The objective of collecting information entails risks of information loss (Oxley and Sampson, 2004) and knowledge
exploitation by other partners. Collecting information and developing key competences can be one of the main motivations for engaging in coopetition.

Strategies of coopetition are implemented in order to improve performance. They are located at the crossroads between competitive advantage and the mobilization of key competences, with the aim of improving the offering to customers. In fact, they specifically seek collaborative advantage (Miles and Snow, 1986; Thorelli, 1986).

3. SME and types of coopetition

Are there specific coopetitive relationships between SMEs? If we accept that SMEs need to access resources, then coopetition is a specific process whereby companies can achieve that. Indeed, according to Lechner et leyronas (2009) coopetition is positively associated with small-business group formation. Managers see competitors as potential resources to be more successful in business (Lechner et Dowling, 2003) and to face environment risks. For Lee et al. (1999), SMEs can create strategic alliances with competitors to adopt an aggressive stance against large firms. Here, there is a deliberated horizontal strategy adopted by SMEs to compete in the global market.

Vertical alliances benefit SMEs, even when such firms are relatively weak in scale and supply chain management. Arend (2006) provides evidence on how alliance activity benefits SMEs through leveraging differentiation advantages rather than generating them. So, SMEs are encouraged to develop cooperative activities with their competitors but also with their suppliers and customers when these actors are also their competitors.

All these researches explain the advantages and disadvantages of coopetition. However, they do not describe the different possibilities of coopetitive relationships between SMEs. We want
to show that coopetition strategies are not all the same. According to SMEs, coopetitive relationships among SMEs could be more or less constrained by prime-contractors (Depeyre and Dumez 2008). This could be the case in subcontracting relationships. Indeed, prime-contractors have power over subcontractors and can design all economic exchanges between them. So, is the coopetitive strategy, between subcontracting SMEs, deliberately chosen or imposed by the prime contractors?

Methodology

Sample

Even though the focus of the present study is SMEs, it is important to explore how all the actors in the sector see the process of coopetition between SMEs. Eight groups of actors (French firms) were selected. We directed interviews towards the co-opetitive relationships between actors: 1) Customers (CNES, DGA, DGAC, ESA); 2) Public Administration (Toulouse Chamber of Commerce, Conseil Général Haute Garonne); 3) Primes (Airbus, Astrium, Dassault Aviation, EADS, Thalès Alenia Space); 4) Research Centres (CEA, CNRS Toulouse, MEDES, ONERA, TESA); 5) Suppliers of Rank 1 (Aircelle, Labinal, Liebherr Aerospace, Sogerma, Thalès Avionics); 6) Suppliers of Rank 2 (Altran, Desirade, Integral systems, Isocel, Mercator Ocean, Spot Image, Steria, Telespazio, Toptech); 7) Rank 3 suppliers (Aerofonctions SAS, EMAC, Siemens Vdo, Sierbla); and 8) Professional Associations (BNAE, Cofrend, Mecanic Vallée). The hierarchical positions of actors are presented in Figure 1. Each actor is in direct relationships with actors in the next rank below them. For example, the customer has relationships only with the prime, not with suppliers; suppliers of Rank 1 have relationships with only suppliers of Rank 2, and so on. Moreover, customers, primes and suppliers of Rank 1 are rather large enterprises, because these firms are
public organizations or great multinational firms (assemblers who subcontract parts of the
design and production, like subsystems, from others firms).

The sector of aeronautical and aerospace engineering relates to three types of activity:
construction of engines for aircraft, construction of cells of aircraft, construction of launchers
and spacecraft. Three types of suppliers exist (Niosi and Zhegu, 2005). 1) The suppliers of
Rank 1 design, produce and deliver to the customer, in systems, subsets or complete modules.
They coordinate the relations with the suppliers of lower ranks. 2) The suppliers of Rank 2
manufacture systems of propulsion, avionics, structure and subsets. 3) The suppliers of Rank
3 manufacture electronic subsets, hydraulic systems, parts of fuselage, etc. It should be noted
that a supplier of Rank 2, can be of Rank 1 for certain activities and Rank 3 for others. The
suppliers of lower ranks are not in direct relationship with the initial customer.

We conducted 58 interviews with 40 different organizations in the aerospace industry (prime
contractors, subcontractors, research centres and economic agencies such as the European
Space Agency).
Methods

The data analysis was undertaken in 3 stages. 1) The identification of the principal concepts made it possible to identify the topics by open coding (Locke, 2001), in order to create provisional categories of the first order. 2) Axial coding made it possible to connect the various identified categories (Strauss and Corbin, 1998), in order to create consolidated categories of a higher nature (theoretical dimensions). 3) The final aggregation was made possible while gathering the theoretical categories of the second order. They were compared in order to create theoretical aggregates, constituting the last stage of the qualitative analysis and delimiting the theoretical framework (Locke, 2001). In order to guarantee the anonymity of the people interviewed, verbatim quotations are anonyms.

Findings

This study lasted two years, starting in 2007. The data was obtained from 58 semi-structured interviews and from secondary sources (media articles). The total length of the interviews was 43:30 hours. The interviews were conducted individually, except in three cases where two or three persons were present at the same time. A guarantee of anonymity was given to all respondents. 23 % of the interviews were conducted by telephone and 77 % face to face. 61 % of the questioned organizations are large, and 39 % SMEs. A third of respondents are managers, Chief Executive Officers or Chairmen and Chief Executive Officers. Another third of the interviewees are directors of a specific function. And the last third were persons in charge within a function, the engineers and the consultants. 33 % of the interviewees were employed
at the head office, 27 % in R&D, 24 % in strategy and planning, 7 % in purchase management, 5 % in quality, 2 % in communication and 2 % in human resource management.

Our study identifies two coopetitive profiles of SMEs (see Figure 2): 1) Exogenous coopetition occurs where an actor, being in a higher hierarchical position, forces rival suppliers to co-operate between them. It is not a choice. It is an external constraint to cooperate in order to win the contract. So, suppliers consider this obligation to be an external demand which they integrate in their business proposition. 2) Endogenous coopetition is characterized by cooperative relationships between suppliers of same rank, where rivals choose to establish coopetitive relationships. Suppliers decide together to cooperate, because they want to join forces, to build and create business proposition together.
Exogenous coopetition: a constrained coopetition

The profile of forced coopetitors is likely to be SMEs with specialized skills. Their innovative power is very important. They respond to the impossibility of the prime contractors making their product.
The customer of the prime contractor, is often a French public organization or a European public organization. Indeed, normally only large enterprises have the financial capacity to buy a satellite or an airplane. The customer prompts the prime contractor to build a coopetitive system with suppliers. Generally, the customer cannot force the prime contractor to create an alliance of suppliers, because the customer is not in direct relationships with actors of lower ranks. But the customer can impose coopetition between prime contractors. Subsequently, some large prime contractors force their subcontractors and co-contractors to cooperate. Exogenous coopetition involves hierarchical relationships between actors of different ranks (Cf. Figure 3). The suppliers are often SMEs and the strategy of coopetition stems from external volition. It is an external given for suppliers which they have to accept. Prime contractors pass on this obligation, initially imposed by their customers, to their suppliers. Subcontractors and co-contractors can be rivals but they have to cooperate between them. It is a unilateral decision from customers and suppliers have to accept it, or else they will not be given a role in the project team.

“No, we have not been given the choice [...] the customer has not asked our opinion”

Figure 3: Exogenous coopetition: hierarchical obligation
During the interviews, we asked the interviewees, what reasons encourage customers and prime contractor to impose a strategy of coopetition? In other words, what are the external constraints which characterize exogenous coopetition for an SME supplier?

There are technical constraints. Customers want prime contractors to achieve synergies and complementary skills of suppliers. Prime contractors look for suppliers who make the same products or services with specific knowledge and skills. They group the best technological and innovative capacities together, which the suppliers would not otherwise be able to share because they are rival firms. Suppliers are confronted with a paradoxical approach. On the one hand, they know their competitors better because they share knowledge and information during the life of a coopetitive project. Each partner learns about the management, organization, and processes of their coopetitor. So, coopetition can be a competitive advantage for a partner because he will use information collected about competitors during the coopetitive project. Thus, coopetition is a “co-operative illusion” for firms. On the other hand, suppliers share their state-of-the-art technologies with their rivals. They have to protect their knowledge and information against opportunist behaviour of partners.

“[…] there are still very strong reserves of some suppliers who say to us: in the end, you are here to take our good ideas and to inform our competitors about them”

There are control constraints. The involvement of prime contractors in the organization of coopetitive processes is very strong. Firms who force rival suppliers to cooperate help and control the organization of the coopetitive project: the choice of partners, management and aims of coopetition, etc. Forced coopetitors have very little influence on the terms of coopetition. They only demonstrate drive and, sometimes, consult about coopetitive organization. The number of third parties is reduced. It is the aim of customer to have a single representative in all the coopetitive chain. The customer improves these transaction costs and
optimizes the leadership of the coopetitive project. They decide and allocate supplier responsibilities and risks. The customer deals directly only with the prime contractor.

“We are in the project team because the customer imposed it on us [...] other competitors are forced to work with us [...] the aim is to have one referee for the global offer”

There are financial constraints. Forced coopetition can be planned after the invitation to tender is issued to all suppliers. It is a coopetition *a posteriori*. Firstly, all the rivals give their proposal on the basis of classical competition. The study, *a posteriori*, of proposals from suppliers, leads to the choice of coopetitive constraint. Coopetition makes a credible offer. Thanks to imposed coopetition, prime contractors confirm with the customer, the advisability of integrating into the consortium coopetitors according to their technological quality and financial capacity.

The alliance allows sharing financial resources between SME suppliers. Even in an area of high technology, the supplier can respond to the demands of the customer to reduce prices and win the business.

“When a customer requires you to reduce prices, you cannot go it alone”

There are legal constraints. Legal constraints are important within the aeronautic and aerospace industry. A rule establishes a real coopetitive system: the geographic return rule. This rule consists, for the European Space Agency, of investing grants-in-aid equal to the financial contributions of each country, for each state of the European Union, by allocating contracts for the execution of space activities. These constraints are a selection criterion for partners. SMEs are favoured because they receive grants-in-aid according to the economic development of the region. Indeed, the more complex the programme, the more resources (financial, human, technological, etc.) are engaged. So, customers and prime contractors try to
benefit from this rule, or else the project cannot go forward. Once again, they control the coopetitive processes and confirm coopetitive choices of the consortium.

“[…] it is politic, customer public organizations impose the geographic return rule on actors and they force suppliers of different countries to work together even if they are rivals.”

**Endogenous coopetition : a desired coopetition**

The profile of desired coopetitors is likely to be SMEs with specialized skills and strength in innovation. An SME that is a supplier of Rank 2 or 3 looks for partners (of the same rank) to develop products or services jointly. In contrast with exogenous coopetition, the customer does not force the prime contractor to create an alliance of suppliers. Generally, the customer prefers to have price competition rather than a sharing of skills. Rival subcontractors and co-contractors constitute an alliance to improve their chance of winning a market, to share knowledge and skills and to pool resources. Endogenous coopetition is not a hierarchical relationship between actors; it is a voluntary coalition of partners of same rank, even if they are competitors (Cf. Figure 4). These suppliers are often SMEs and the strategy of coopetition stems from internal volition, a wish from suppliers. It is an internal given for suppliers which they build into the coopetitive project. Prime contractors can refuse this alliance. Subcontractors and co-contractors can be rivals but they have to cooperate between them. It is a joint decision between suppliers.
During interviews, we asked the interviewees, what are reasons which encourage rival suppliers to cooperate between them? In other words, what are the joint aims which characterize endogenous coopetition for an SME supplier?

There is a “coopetitive intention”. The choice to cooperate with competitors is taken without external influence. It is a choice that is not prompted and not constrained. A supplier suggests a strategic alliance to a competitor. There is no need to force coopetition because the actors seek it voluntarily. So, the coopetitive intention can be a joint wish between suppliers or from a single supplier. It is not coercive.

“We have cooperative propositions from bosses of other SME suppliers of the same rank as my firm, who wish to cooperate together.”

There is a wish to join forces in order to win a market: “united we stand, divided we fall”. Rival suppliers cooperate in order to bid for tenders. Indeed, if the supplier bids for a tender alone, he may not be able to execute the whole of project. So, suppliers look for complementary resources in order to improve their proposal. They choose the coopetitive position to generate private and collective gains. For example, an SME supplier, who bids alone, takes a higher risk of seeing his proposal discarded. Prime contractors need fewer
skills, technological and financial resources when dealing with a coopetitive union. The risk of losing a market is lower when competitors cooperate. Thus, the probability of securing benefits is higher when those advantages are collective rather than private.

“We determined to join with another supplier in order to bid for tenders”

There is a desire to reallocate positions of dominance between suppliers. Suppliers can decide to unite in order to compete with other competitors or to prevent rivals bidding for tenders. The union can reach critical mass for the coopetitors. Through a shakeout among competitors, the probability of securing a market is higher.

“We create a cooperation with another supplier because we do not want another competitor to win the market”

There are external threats. Suppliers choose a coopetitive approach in order to protect their innovative capacities in the face of international rivalry. European Union states are specifically implicated because the aim is to protect strategic areas of the European Union. There is a risk that a foreign company will capture a strategic market. So, European suppliers unite in order to stop that happening. Consequently, coopetition is a kind of protectionism.

“In order to see to beat American companies, we prefer to work with a competitor”

Discussion

This research provides new perspectives on coopetitive relationships, studying the combination of competitive and cooperative behaviour (Bengtsson and Kock, 2000) and the interplay of SMEs in a complex business network. All the actors were interviewed about simultaneous cooperative and competitive relationships. According to the interviewees, the aeronautic and aerospace industry has evolved coopetitive relationships because, as shown by
previous research, the airline sector uses coöperation (Gummesson, 1997) and a strategy of coöperation is evident at all hierarchical levels relating to the actors: customers, prime contractors, suppliers, etc., whatever the size of firms (Gnyawali et al., 2006, Ganguli, 2007). As we have shown, coöperation does not evolve in an inflexible dyadic relationship. The aeronautic and aerospace industry is in line with theory of business ecosystems where actors interact between them within a complex network. Coöpetitive networks provide an explanation relating to complex networks (Dagnino and Padula, 2002).

Our study provides a perspective on an aspect that has been discussed relatively little. The study shows that there are two kinds of coöperation: exogenous and endogenous coöperation. Exogenous coöperation involves supplier SMEs, who have specific skills, innovative power and flexibility. Customer wants a coöpetitive system, so the prime contractor forces rival suppliers to cooperate. Exogenous coöperation involves hierarchical relationships between actors of different ranks. It is an external desire, a unilateral decision, accepted by suppliers. There are four kinds of constraints that encourage customers to want a coöpetitive relationship: technical constraints, control constraints, financial constraints and legal constraints.

Endogenous coöperation involves supplier SMEs of Rank 2 or 3 with specific skills, innovative power and flexibility. Suppliers want to adopt a strategy of coöperation because they wish to develop products or services jointly, improve their chance of winning a contract, share knowledge and skills, pool resources, etc. Endogenous coöperation is a choice, not an external constraint. It is a desire of partners of the same rank, even if they are competitors. We have shown that four reasons encourage suppliers to choose a strategy of coöperation: they have a “coöpetitive intention”, want to link forces in order to win a market, want to reallocate positions of dominance between suppliers, or face up to external threats.
Therefore, our study shows that coopetition can be constrained or voluntary. This research indicates that coopetitors have convergent and divergent aims (Hamel et al., 1989). Their coopetitive choice can be a desired action in order to share collective benefits that are higher than private gains (Morgan and Hunt, 1994) and complete their innovative portfolio (Depeyre and Dumez, 2008). Coopetitors must react to characteristics of a market, a customer or a rule (Depeyre and Dumez, 2007). Our study shows that coopetition depends on level of interaction, competitive positions and the purposes of the co-operative agreement (M’Chirgui, 2005). Coopetition is different according to the network position (Moore, 1996) and the size of the firm (Morris et al., 2007). In exogenous coopetition, the wish of customer secures cooperation between rivals (Depeyre and Dumez, 2008). The involvement of customers and prime contractors in the coopetitive organization is strong.

Our study has some limitations. From the point of view of method, it would be interesting to test our profiles of coopetition in other industrial sectors and in other cultural contexts. Our chosen method meant that interviewees gave their subjective observations. This may produce bias in the analysis of their exact words. From the point of view of theory, we chose not to observe the cooperation between customers or prime contractors. Our research focus was on SMEs, but customers and prime contractors are large firms. In future research it would be desirable to include study of coopetition among all actors in the sector. We have not shown the involvement of public administration in the coopetitive process, as a third party. Indeed, these actors have an important influence on the choice of strategy leading to coopetition. So, what is the real influence of European public organizations in coopetition? What are the determinants of coopetition? How should we measure the performance of coopetitive projects for SMEs?

Prediction of Success of Female Entrepreneurs Using a Biographical Questionnaire

Cornelius Muelenz, Dorothea Kissel, Heinz Klandt

This paper presents the development of a biographical questionnaire to measure entrepreneurial potential. Version 1 (191 items) was constructed and tested in a key sample of \( n = 180 \) female entrepreneurs on the basis of an internet-literature research, interviews with experts \( (n=17) \) and entrepreneurs \( (n=40) \). An item analysis led to version 2 (82 weighted items) which was cross-validated in a second sample of \( n = 110 \) female entrepreneurs. Final results show a good validity (average correlation between questionnaire score and sales \( r = .42 \) for the 3\(^{rd}\) to the 5\(^{th}\) business year) as well as a good reliability (Cronbach’s \( \alpha = .78 \)). The biographical questionnaire provides a standardised and valid assessment of entrepreneurial potential and person-related success prediction.

Introduction

The prediction of the success of business foundations has always been an area of interest in the scientific and applied practice community. Credit institutes, investors and financial consultants have to decide whether applicants who plan business foundations can be granted loans or not. It is important to take personal factors of applicants as well as economic considerations in account in to predict business success. Valid decisions are required for the applicants as well as the investors and financial consultants. The financial risk for the investors depends directly on the quality of financial decisions i.e. whether the investment can be paid off or whether the consultation had been fruitful. Such decisions are also important for the entrepreneur. Suitable people require sponsorship. Unsuitable applicants, however, should be prevented from potential business failure. Hunter and Hunter (1984) describe the association between the validity of personnel decisions in businesses and the growths of a business. They report that appropriate aptitude assessments can increase or reduce sales of the business by up to 20%.

The prediction of business success requires the application of diagnostic principles in personality assessments. The prediction of success of entrepreneurs resembles the process to personnel selection. Both procedures require similar selection and assessment procedures (table 1).

Extensive research has in previous decades led to substantial knowledge in the area of classical personnel selection (Schuler 2006). About 15-20 different procedures including online variations (Hell, Schuler, Boramir, and Schaar 2006) have been used to date in Germany for the external personnel selection (Schuler, Frier, and Kaufmann 1993). Procedures which have been applied range from graphology to intelligence test and sophisticated assessment-centres.

The most commonly implemented procedures in the top 300 German businesses include interviews, work portfolios, analysis of application documents, performance-, intelligence- and aptitude tests, biographical questionnaires and assessment-centre outcomes (Schuler et al. 1993). The values of these procedures show substantial differences. Meta analyses report validity criteria ranging from .34 to .51 (Schmidt and Hunter 1998, p. 22). These allow initial conclusions for procedures to test the suitability for entrepreneurs. It can be hypothesised that effective measures for the prediction of career success can also be useful for the prediction of business success.
An Assessment Procedure to Predict Business Success

Standardisation and validity are key criteria for measures of individual potential of business success. These basic criteria for aptitude assessments are described in DIN 33430\(^1\) (Kersting and Hornke 2003; Kersting and Hornke 2006). The superiority of standardised and validated procedures over any other means of assessments in aptitude scenarios has been thoroughly researched and documented (Kersting and Hornke 2006; Schuler 2006). Despite of this it is surprising that non-standardised interviews, check lists, internal rating systems, thematic questionnaires or home-grown guidelines remain still to be the most commonly used procedures by banks, investors and financial consultants to assess entrepreneurs (Kissel and Muelenz 2010, in preparation). To achieve appropriate validity it is necessary to collect a number of evidence-based criteria with high prognostic value.

For example the human capital, in form of training or professional experience, has been shown to be a valid predictor of business success (Klandt 1984; Brüderl, Preisendörfer, and Ziegler, 1992). Additional criteria for aptitude procedures for entrepreneurs are procedural economy (second level validity criteria) and furthermore the opportunity to consider training and coaching needs. A biographical questionnaire appears to be a suitable measure to predict business success if existing knowledge about personnel selection procedures is taken into account. Biographical data have shown to be valid in the prediction of career success (Hunter and Hunter 1984; Schmidt and Hunter 1998; Schuler 2006) and are suitable for an objective diagnosis of business success (Gunter and Furnham 2001). Banks and financial consultants in Germany already use biographical data to assess the suitability of business starters (Kissel and Muelenz 2010, in preparation). Wins and Rosenstiel (2000) report that the success of biographical questionnaires is based firstly on the prediction of

---

\(^1\) DIN 33430 is a practice standard that provides norms for selection, planning, realization and analysis of professional aptitude assessments. It was developed by a German group of Psychologists in 2002. Central requirements are the quality criteria objectivity, reliability and validity.
future behaviour based on the evaluation of previous behaviour and secondly, on test theories for example the empirical and statistical test construction and validation.

The primary psychological assumption that future behaviour is best predicted from past behaviour also applies in the context of business foundations. The biography of a person is not determined by random influences (Bühler 1959), but also by self-determined elements which make her unique. Consequently, personal characteristics can be derivated from a biography and these can be investigated using a biographical questionnaire which has predictive factors.

The biographical questionnaire has essential advantages in comparison to other measures (e.g. personality assessments) because subjects in aptitude test situations naturally intend to present themselves in favourable positions. This however, may result in response bias towards social desirability, as subjects assessment performance is based on their assumptions about the theoretical concepts on which the assessments are based (Stehle 1990). The biographical questionnaire allows the collection of genuine, objective and testable data and therefore the risk of falsification is low. Therefore, it is unclear why biographical questionnaires are rarely used in Germany. Reasons for this may be the time- and cost intensive procedures involved in the test construction (Wins, and Rosenstiehl 2000) and that biographical data for personnel selection have only been used in recent history. Stehle (1983) was one of the first people in Germany who investigated biographical data in personnel selection using scientific principle. Also human resources managers in Germany frequently underestimate the validity and economy of biographical questionnaires (Schuler et al. 1993).

However, there are signs that biographical data for the prediction of business success are increasingly used. Biographical data provide robust outcomes following critical analysis based on their high validity criteria and authentic data. Modern employment environments encourage the use and prognostic value of biographical data. Gunter and Furnham (2001, p. 178) comment: “Changes to the world of work are probably going to increase the usefulness
of the biodata approach. [...] Indeed, we predict a renaissance of the biodata method to assess business potential.”

The “Biographical Questionnaire”

The biographical questionnaire is a standardised outcome measure which requires the subjects to give details about their biographical history. The development of the questionnaire is based firstly, on the principles of the classical test theory and secondly, is tailored to the particular purpose. The biographical questionnaire includes on one hand objective, testable data and on the other hand subjective information about a person’s earlier, current and future life scenarios. As such it includes demographical variables, experiences to date, professional activities and developments as well as attitudes and interests. The biographical questionnaire represents in the first instance a retrospective description of a life history based on experiences and interactional pattern of a person (Nickels 1994). The association with career progression and success is generally a focus point in a person’s life history.

The biographical questionnaire was already implemented at the beginning of the 20th century for the selection of personnel in insurance companies (Stehle 1990) and spread eventually into parts of the economy such as military, industry, research and development or areas like the prediction of leadership potential (Schuler 2006).

There are controversial opinions about the meaning of the term ‘biographical item’, but the orientation on a person’s history is a generally accepted criterion (Mael 1991). Instead of formulating items like ‘Are you interested in the topic YX?’ one would ask specifically ‘How many books about topic XY have you read in the last two years?’ Such questions are external, historical and testable. Such characteristics optimise the psychometric qualities (objectivity, reliability, validity) of outcome measures (Schuler 2006). Research results show that biographical questionnaires are accepted and have good predictive powers (Hunter and Hunter 1984; Schmidt and Hunter 2000).
The practical implementation of the biographical questionnaire is characterised by its ease of use and straightforward data analysis and is therefore particularly suitable for applied practitioners.

Most validity studies of biographical information date back to the 1970’s and early 1980’s. Despite of this, literature reviews frequently refer to these early findings in relation to modern hypotheses. One example is Schuler (2004), who presents the “actual state” of aptitude assessments validity criteria in his organizational psychology textbook. But for biographical data he refers to the well known study by Hunter and Hunter (1984). It proves very difficult to find more recent studies about the validity of biographical data. Life- and occupational histories have changed significantly in recent years (Gunter and Furnham 2001) resulting in consequences for the prediction of career success on the basis of biographical data. Therefore, further research in this area appears essential.

**Theoretical Model for the Prediction of Business Success**

Research about diagnostic and assessment procedures in the area of entrepreneurship is extremely rare. Especially in the field of women as business starters are very few evaluations of diagnostic and assessment procedures. The initiative of the Ministry for Research and Education: *Power for Female Entrepreneurs-Steps to improve women’s potential to found businesses* led to the project “Ladies First – the development of a gender fair diagnostic assessment measure for potential business starters”. This involved the development of the biographical questionnaire BEP check (Biographical Entrepreneur Potential check).

Sonnenfeld and Kotter’s model (1982) provides the theoretical base to explain the association between biographical data and professional success in general. They assume three main areas of biography (“working environment”, “individual sphere” and “family background”) to be relevant for professional success. An adopted model (see figure 1)
replaces professional success with business success. Also “macro influences” are added to the adapted model representing all influences relevant for business success, which are not part of biography (for example external factors like business plan and start-up capital) and therefore not assessed by the biographical questionnaire.

Figure 1
The Association between Biography and Business Success.

Method
Construction of the Biographical Questionnaire

There are four different approaches to develop a biographical questionnaire: the inductive approach, the deductive approach, the sub-grouping approach and the empirical approach. The main difference between them is the item generation and selection based on the theoretical model or empirical guidelines (Schuler 2006). The BEP check was developed using the empirical approach. Initially, item questions were collected and revised. Questions
underwent a selection process and were weighted using their calculated validity due to an external criterion. Therefore, a so called key sample (Schuler 1990) with a minimum of 100 subjects was used, which represents a wide range of characteristics of the criteria that has to be predicted. The items were summarized according to their weight resulting in the item key. Following that, cross-validation is undertaken in a second sample - the validity sample. Cross-validation provides evidence about the correlation between questionnaire score and the criteria which is intended to be predicted. Consequently, a reliable statement about the quality criteria validity has been achieved. The development and application of the BEP check followed the guidelines of DIN 33430 (Kersting and Hornke 2003; Kersting and Hornke 2006).

A literature review focussed firstly, on procedures for the selection of business starters and associated consultations. Secondly, results about predictive factors for successful business foundations were researched in order to generate an item pool.

The literature review was followed by an interview study with experts i.e. financial consultants and investors within the German entrepreneurship domains. A half-standardised interview guideline was used to investigate the opinions of the experts about: firstly, which personal aspects predict business success and secondly, how these are represented in female entrepreneurs. Additionally, the experts were asked which measures had been applied to assess business success and what the optimal measure should look like. These qualitative data were evaluated to contribute to the item generation (Kissel and Muelenz 2010, in preparation).

Forty female entrepreneurs were investigated using a biographical interview (Bortz and Döring 2006; Hopf 2007). This empirical data was generated using standardised and written curriculum vitae formats (Flick 2000) and a half-standardised interview guideline. The content analysis contributed to the generation of potential elements for the biographical questionnaire.
A further research was conducted to find out which online procedures for the selection and consultation of business starters were available. Forty-one online procedures were identified which were also included in the item generation (Kissel and Muelenz 2010, in preparation). According to practical and theoretical needs (classical test construction) an item pool of \( i = 990 \) items was generated on the basis of the interviews with experts and female entrepreneurs, literature and online research. The item pool was reduced by a number of steps to \( i = 191 \) using the criteria similarity, relevance, biographical orientation, ethic and ease of comprehension. A group of 15 people evaluated the pilot version of the questionnaire regarding ease of use and comprehensibility.

**Analysis of Item Weights in the Key Sample**

The first sample for the online survey was obtained through nationwide networks related with self employment. Participants were initially contacted by post, emails, leaflets, announcements about the projects and direct emails via business network “Xing”. The total initial sample consisted of 1562 subjects (key sample). 180 subjects (11.5 percent) fulfilled the criteria: self-employed women who where at least at the end of their second business year and had completed the questionnaire. Average age was 45.1 years with a range from 26 to 78 years. Table 2 shows the description of the key sample with percentage given for county, type of foundation, business branch, individual/team business foundations and full/part time business foundation (sorted by descending frequency).

</tbody>
</table>

Values are percentage in descending order.

The validation criteria and item weighting of the BEP check has to include objective/economic and subjective aspects. Sales of the second business year were used to indicate success. Sales are common criteria to measure success. Subjective success was measured by the satisfactory scale by Klandt (1984) which concerns different aspects of life and work related to self employment. The subjective success indicator (scale score, range 7-28) and the objective success indicator (sales in the second business year, range 1-8) were multiplied resulting in the integrated success indicator (range 7-224).

Using the integrated success indicator 180 subjects were sorted and 4 quartiles were generated. Q₁ represents the group with the percentile rank² 1-25, Q₂ the percentile rank 26-50, Q₃ the percentile rank 51-75 and Q₄ the percentile rank 76-100. Item weights were calculated by comparing the extreme groups Q₄ (very successful) vs. Q₁ (unsuccessful). A percentage frequency distribution was undertaken for the multiple choice responses of every question for the two extreme groups. Frequency differences for every multiple choice response were transformed into “netto and rough weights (0,1,2)” according to England (1971). Table 3 illustrates the process in relation to a fictional question. A question will be

---

² Percent ranks are related to the integrated success indicator score. Lowest score equals percent rank 1, highest score equals percent rank 100. Q₁ represent the 25 percent with the lowest scores.
eliminated if all multiple choice responses achieve the same weight. Following this procedure the number of items was reduced from 191 to 82. The remaining items were strong predictors of the integrated success indicator.

Results
Validity Criteria in the Validation Sample

The cross validity was calculated according to the methods used for biographical questionnaires. Therefore a second sample (validation sample) is required which has to be independent from the initial sample (key sample). This second sample was generated using the same methods as the key sample. 998 subjects participated in the survey. 110 subjects fulfilled the criteria and completed the questionnaire (11.0 percent). Average age was 44.0 years with a range from 29 to 63 years. Table 4 shows the description of the validation sample with percentages given for county, type of business foundation, business branch, individual/team foundation and full/part time foundation (sorted by descending frequency).

</tbody>
</table>

Values are percentage in descending order.

Single item weights of 82 items were summed up to obtain the total biographical score (BS). The internal consistency was Cronbach’s $\alpha = .78$ which was satisfactory. The rank correlation between BS and the integrated success indicator in the key sample was $r = .67$. The rank correlation was $r = .33$ in the validation sample, which was also satisfactory. Most important is the relationship with objective success. The correlation between BS and sales is significant for all assessed business years. The amount is highest for the third to the fifth business year: $r_1 = .24$, $r_2 = .35$, $r_3 = .43$, $r_4 = .42$, $r_5 = .41$. The average correlation of the BEP check is $r = .37$ which is equivalent to meta-analysis findings of Hunter and Hunter (1984) who reported an average correlation of $r = .37$ for biographical questionnaires and professional success.

Normative Data

The Kolmogorov-Smirnov-Adaption test confirmed a normal distribution in the validation sample with $Z = 0.684; p = .74$ (see figure 2). This distribution is the source for normative data. The BS ($M = 80.75; SD = 11.56$) is transformed to the standardized score by $z$-transformation ($M = 0, SD = 1$). The $z$-value is converted into a “Biographical Quotient”
BQ \( (M = 100; SD = 15) \) in a similar way as raw scores of intelligence tests are converted into an intelligence quotient. The BQ provides the possibility of obtaining percentile ranks (see table 5).

Biographical Score (BS), z-score (z), Biographical Quotient (BQ) and percentile rank (pr).
Furthermore six domain-specific results are provided for the examinee (1. relevant professional experiences, 2. attitudes and occupational behaviour, 3. foundation related experiences, 4. current foundation, 5. family and 6. other aspects). The domain-specific results are expressed as percentage of the achieved score in each area (see figure 3). This kind of presentation provides an objective evaluation of relevant skills and the possible need of training in certain areas.

**Figure 3**

**Domain-Specific Results of a Fictional Examinee.**

![Bar chart showing domain-specific results](image)

**Application for Different Age and Branch Groups**

Literature shows that biographical questionnaires are less suitable for adolescents, because their personal life history is too short. The BEP check can be applied equally for younger and older people. We recommend a minimum age of 25 to obtain a realistic and valid outcome. For example, an 18 year old entrepreneur has not yet had the opportunity to obtain a university degree. Age alone appeared not to be an advantage in general as one could expect. T-test results showed no significant differences between the BS of younger (age \( \leq 34 \)) and older (age \( > 34 \)) entrepreneurs \( t(102) = .10; p = \text{n.s.} \).
In general, more precise data can be obtained if a specific business branch is investigated rather than a whole group of entrepreneurs. This study includes entrepreneurs from all business branches, but a bias is not expected. The idea of BEP check is that there are biographical aspects which are relevant for a successful business foundation. Business branch specific aspects are relevant in a personal biography, but these were not assessed. ANOVA results showed no significant differences in the integrated success indicator for different business branches \([F(5,109) = 1.72, \ p = \text{n.s.}]\). Multinomial regression results showed that branch was no predicting factor for the BS [Nagelkerke’s \(R^2 < .20\)].

Discussion

The assessment of entrepreneurial aptitude in Germany still lacks standardized or validated assessment procedures in most cases. This is a critical point as the outcomes of these assessments lead to decisions about foundations. In general, assessment procedures which fulfil the quality criteria will improve the validity of predictions in contrast to subjective and non-standardized procedures.

This study describes the development of the biographical questionnaire BEP check which represents a high quality assessment procedure for entrepreneurs. The items were selected and weighted in a key sample \((n = 180 \text{ female entrepreneurs})\) and cross-validated in a second validation sample \((n = 110 \text{ female entrepreneurs})\) in line with the requirements for empirical approach.

Cronbach’s \(\alpha = .78\) proves that the variable “biographical potential” is suitable to predict business success using the BEP check and can be measured reliably and homogenously. The distribution analysis further confirms that the biographical potential can be measured like a personal characteristic with this questionnaire. Firstly, this is due to the large deviation of “Biographical Scores” \((SD = 11.75)\) which means that people can be well
differentiated. This is measurable and represented by low to high scores on a one-dimensional scale.

Secondly, the deviation is within normal distribution as it is typical for personal characteristics (for example intelligence). This distribution allows, furthermore, to convert raw data to standardised scores and to calculate percentile ranks. Percentile ranks are useful and practical to evaluate and compare person related potential.

Analysis of validity proved that BEP check is able to predict entrepreneurial success. Validity, defined as the correlation between biographical potential (BS) and business success (sales per year), was satisfactory with an average $r = .42$ for the third to the fifth business year. Two facts are important. Firstly, BEP check provides a good prediction of business success until the fifth business year. Secondly, the strength of prediction of business success increases from the first to the third business year and then stabilises. That means that personal impact increases while external impact decreases. In conclusion, external factors like business location are more important at first. But over the years the entrepreneur becomes the most important factor. There appears to be no mention of this fact in the literature to date.

The biographical potential measured as BS by the BEP check proved to be independent from branch or age and can be seen as a personal characteristic. Currently, there is limited evidence of long term outcomes measured by BEP check as the present study used retrospective data of success. Long term studies will have to be conducted to investigate effectiveness of BEP check to measure success prospectively.

The BEP check represents a standardised assessment procedure to measure entrepreneurial potential. It can provide a valid estimation of the individual entrepreneur as the questionnaire does satisfy the quality requirements for such measures. The ease of use and straightforward analysis makes it a useful tool for any assessment of entrepreneurial potential. The BEP check can be characterised as an economic assessment procedure which is recommended to researchers as well as to practitioners.
A large number of studies have been done to relate personal traits and entrepreneurial success. This study showed that prediction of entrepreneurial success on the basis of biographical data is possible with BEP check. The question about the strength of person’s impact to the business success remains open. Biographical data provide a relevant personal approach to investigate the relation of the entrepreneur and business success. This is certainly an area of emerging research interest which is worth investigating further.

Author’s biography

Cornelius Muelenz studied Psychology at the Johannes Gutenberg University in Mainz. Since 2008 he works as a research assistant at the chair for entrepreneurship at the European Business School in Oestrich-Winkel.

Dorothea Kissel studied Psychology at the Johann Wolfgang von Goethe University in Frankfurt. Since 2006 she works as a research assistant at the chair for entrepreneurship at the European Business School in Oestrich-Winkel.

Prof. Dr. Heinz Klandt studied business administration in Cologne. In 1984 he made his PhD. Since 1998 he is the chair holder of the first chair for entrepreneurship in Germany at the European Business School in Oestrich-Winkel. He initiated the first German entrepreneurship conference “G-Forum” and is director of the bifego institute.
Industrial clusters and networks as complementary sources of competitive advantages to small firms in developing countries: a theoretical essay

Principal Topic

Small and medium enterprises (SMEs) developed functions that create value for the productive system. In developing countries, SMEs play a relevant role for the social development, also. In Brazil, for example, small firms represent 99% of the number of the firms and they employ almost 60% of the national work force. However, 59.9% of them fail in the first four years of life (Sebrae, 2004).

Increasing evidence indicates that industrial cluster and networks can aid SME to overcome their constraints and reduce the rate of bankruptcy. The studies that focus on it can be classified in two main streams. The first one focuses on how agents (firms, universities and support institutions) shape the cluster and their evolution. Lazerson and Lorenzoni (1999), for example, stressed the function of large business in spread technology and in coordination in Italian clusters. Another stream stresses the externalities and collective efficiency. For example, Giuliani, Pietrobelli and Rabellotti (2005) indicated how clustering can contribute to small firms to overcome their constraints and compete in distant markets.

This work aims to bridge these streams focusing on how industrial clusters constrain the strategies of the firms. This theoretical paper explores how the characteristics of the industrial clusters influence the network strategy of the firms placed in clusters.

Key Proposition

Small firms can gain some benefits from firm agglomerations, generally called cluster (Porter, 1999) or industrial districts (Marshall, 1920, Schmitz, 1995), and by means overcome their constraints of resources without losing the flexibility through external economies.

However, clusters are different among themselves, even the ones in the developing countries. Pedersen (1997) has described four types of clusters and has stressed the specialization and the
efficiency collective sources as criteria for distinguishing clusters in developing countries. Van Dijk and Sverrisson (2003), based on previous empirical works, have proposed five different criteria according to the main theoretical characteristics of clusters: spatial proximity, local novelties, number of firms involved in similar activities, inter-firm linkages and specialization. The differences can emerge also from the predominant sector in the cluster. Beaudry and Swann (2009) study has indicated that cluster effects are positive for some industries, while it can be considered insignificant for others.

Networks are a second way for firms overcome their resources limits. Networks mean a linkage among firms (trade agreements, labor division, outsourcing, etc.) and among firms and institutions (technological services, consultants, etc.). Street and Cameron (2007) state that smaller firms are more likely to establish cooperative linkages than larger ones. Moreover, Al-Laham and Souitaris (2008) argue that firm size have a relevant influence on internationalization via research alliances. The firms can establish linkages with other firms to get access to resources that they do not have or are not strategically interested in maintaining internally.

Networks can be promoted by proximity, that is, by clustering, since nearness can reduce transactions costs and help the face to face interaction. In addition, according to Resource Based View firms are different among themselves (Peteraf, 1993, Barney, Hesterly, 2006). This approach fits well in studies about small firms (Rangone, 1999, Aragón-Correa el al, 2008), especially because it focuses on internal resources and allows emphasizing the characteristics of SME: scarcity of resources (capital and human) and dependence of the entrepreneur’s vision.

Based on the stated above, two hypothesis are proposed in this study. Studying the differences among clusters, Pedersen (1997) argue that the benefits raised from agglomerations depend on the structure of the cluster. So, our first hypothesis is that firms that are similar to each other, but placed in clusters that are different to each other, will establish links according to their resources and according to the structure of the cluster. For the studies of the differences among firms, our second hypothesis is
that firms that belong to the same cluster, but bestow with different resources, will have different network strategies.

The methodology applied aims to compare data from two different garment clusters in Minas Gerais State, Brazil. The firms placed in Divinopolis city have an agreement with other institutions, for example, with a technical school and with the Brazilian Service of Support for Micro and Small Enterprises (Sebrae). Moreover, there is an association of producers and there are many other firms of different industrial sector, for example, footwear. On the other hand, in Poços de Caldas, a smaller city than Divinopolis, the firms have no agreements with other institutions neither among the producers. However, it is relevant to notice the rate of importance of the sector to the city, measured by the rate of the employees from this sector in the city when compared to the same index in the state. In Poços de Caldas presents a bigger rate (1.04) than the one found in Divinopolis (0.25). In this study, the data will be collected through a questionnaire and further data will be obtained through official sites and associations. Other sources, such as reports and news about the sector and the industrial districts, will be considered to better understand the context of the study.

Contributions

Some questions arise to policymakers and practitioners. For policymakers, the heterogeneity within and among industrial clusters suggest that the public polices could be changed to consider the differences between industrial clusters. For practitioners, the heterogeneity between firms in the same cluster call attention to the complementary roles played by cluster and networks so small firms can overcome the size constraints.

Theory Morphing vs. Theory Testing: Human Capital in Entrepreneurship

Thomas P. Kenworthy

W. Edward McMullan

Abstract
A shift toward theory testing has occurred in A-rated journals across the various Management disciplines. This article examines the outcomes of Human Capital Theory (HCT) testing in the field of Entrepreneurship. Two conclusions are reached: one methodological and the other, substantive. The methodological conclusion is that scholars neglect the core assumptions and hypotheses of HCT. The substantive conclusion is that entrepreneurs may not benefit from formal post-secondary education, suggesting a major ad hoc adjustment to HCT.

Introduction
The initial purpose of this article was to explore the new, cumulative knowledge being generated around the application of Human Capital Theory within the field of entrepreneurship. Our frustrated attempts to unambiguously code the various human capital hypotheses according to level of theory-testing sophistication (c.f., Colquitt and Zapata-Phelan, 2007) led to an awareness that the predictions contained in the many hypotheses under review were morphing considerably across a set of hypotheses that were only nominally dedicated to the testing of Human Capital Theory. As such, this study should be viewed as a case study of theory testing amongst A-rated journals in an emerging social science discipline.

The idea of human capital is predicated upon an economic concept of capital. Capital, in this context, elicits the ideas of investments in longer-term assets and of any resulting returns on such investments. In an economic development context, the concept of human capital has, as a result of the theory, become an important alternative to that of
either financial or physical capital. The concept of human capital raises the question of whether or not investments in formal education in both developed and developing countries generate returns that justify expenditures from the perspectives of the private individual and of the public at large.

In the early 1990s, empirical research began on human capital in the top journals of the entrepreneurship discipline. Cooper, Gimeno-Gascon & Woo (1994) morphed the human capital concept in order to test whether formal education and experience contributed to entrepreneurial success. The typical human capital analysis of related costs, financial benefits and returns on investment was eschewed in the research from the very beginning, in effect negating the ‘capital’ in ‘human capital’.

From 1994 until the end of 2008, Entrepreneurship scholars generated fifty-two human capital-related articles in the top three journals in the field of Entrepreneurship. Four additional articles linking human capital to entrepreneurship were published in leading Management journals. From any perspective, the volume of articles represents a substantial investment in human capital research by the top journals. It is only fitting that after all this work a review of the empirical status of Human Capital Theory in the field of Entrepreneurship should be forthcoming.

**Human Capital Theory**

Human capital is an economic concept comparable to the factors of production associated with classical Economics. In the 1960s, a number of scholars developed a testable theory of human capital in order to examine the economic returns of, inter alia, education and
work experience. The work resulted in a Nobel Prize for one of the key scholars, Gary Becker, in 1992.

This section provides an overview of the history and development of Human Capital Theory, as well as the criticism levied against it. The following sections briefly explore the empirical treatment of Human Capital Theory in the field of Entrepreneurship with a focus on useful knowledge and insight.

**History and Overview**

The origins of thought with respect to the economic relevance of human knowledge and abilities can be traced back a couple of centuries. The most prominent economist to describe the relationship is Adam Smith (1776) who argued that wealth was driven by two components of human productivity: 1) acquired and useful abilities derived from skill, dexterity and judgment, and 2) abilities acquired from education, study and apprenticeship. Though other well-known economists made contributions to the notion of human capital, Human Capital Theory (HCT) is considered to have originated in the 1960s. In October of 1962, *The Journal of Political Economy* published articles that established the legitimacy of the following human capital factors: education, labor market experience, migration, healthcare, and job search.

At the very core of Human Capital Theory was an assumption that investment in human beings pays off in economic terms at both the micro (individual) and macro (societal) levels. Micro-level HCT assumes that an individual makes a rational investment decision based on expected annual return, the cost associated with an
investment, the labor force time required to recoup the investment and the discount rate, (that is the value of present versus future earnings). It also assumes that there exists a curvilinear relationship between age and amount of human capital and that individuals who expect to spend substantial time away from the labor force will invest less in human capital. The law of diminishing returns has also been found to apply (Schaffer, Deller & Marcouiller, 2004). Macro-level Human Capital Theory contends that governments take into account human capital development costs when making decisions with respect to the sustainability and growth of gross national and domestic products.

The two human capital investments that stand out as most relevant to the field of Entrepreneurship are experience and education. These two types of human capital investments have been investigated heavily in Economics. In the 1960s Jacob Mincer, considered the father of modern labor economics, began to examine private returns to on-the-job training (that is, work experience) and formal education. At the same time, Gary Becker examined key factors contributing to US economic growth beyond the explained variance attributed to physical capital and labor. Inspired by census data indicating a positive return to education, Becker argued that individuals and organizations purchase education, training and healthcare with a view to the future. He indicated that increases to human capital lead to individual payoffs in the form of higher wages and to macro-scale returns in the form of economic growth.

The vast amount of HCT research (Blaug, 1978) led to reviews by different scholars (Blaug, 1976; Maglen, 1990). The results, which challenge different aspects of HCT, are presented in the next section.
Criticism

In the 1970s, Economist Mark Blaug reviewed the empirical status of Human Capital Theory. He (1976) found that:

1. high-achievement-oriented students are less motivated by economic factors such as rates of return to education than cost-conscious, low-achievement-oriented students;
2. European students do not become informed about labor market earnings patterns in order to make decisions about post-compulsory education;
3. some Philippines students were willing to undertake college-level programming associated with negative rates of return; and,
4. the rates of return to individuals tend to decline monotonically with more schooling.

The review called into question some of the key beliefs about individual investment behavior towards, and the payoffs associated with, post-secondary education. Further, the review provided evidence in favor of the consumption hypotheses, a competitive framework, and it failed to defeat a third competitive perspective known as the screening hypothesis, which suggests that education is used by employers to filter job applicants. Blaug (p. 849) conjectured that the human capital research stream appeared to be in a crisis.

In the 1980s, a resurgence of interest in HCT occurred, driven mainly by a move toward quality and effectiveness of teaching resources and a market-oriented approach to education. According to Williams (1987, p. 153), the redirecting and re-energizing of the field yielded no better gains: “...the guardians of traditional theory have not allowed persistent empirical irregularities to dampen faith in the essential correctness of the human capital hypothesis...human capital theorists have countered the growing plethora
of potentially damaging data with modifications intended to generate hypotheses more compatible with extant evidence.”

In 1990, Leo Maglen systematically reviewed the empirical evidence related to individual rates of return. He found the micro-economic evidence to be fragmentary and inconclusive. It indicated some support for the attainment of lowers levels of education in developing countries, but not for the higher education of manufacturing and service-sector workers in developed countries. Maglen (1990, p. 291) also reviewed the evidence for the link between education and macro-economic growth and found it to be particularly weak: “Neither time-series nor cross-country studies lend much support to the contention that increased education promotes the growth of labor productivity.”

On Human Capital Theory, Blaug (1994, p. 19) ultimately concluded: “…not that human capital is wrong, but that it is thin and unproductive despite its early promise.” In spite of the critical reviews, many in the Economics of Education field have continued to carry the HCT torch. The behavior may stem, in part, from a deeply-held belief that investments in education must provide increasing rates of return.

**Research Method**

**Data and Sample**

In order to examine the empirical status of Human Capital Theory in the field of Entrepreneurship, the research here focuses on empirical research published in the top three Entrepreneurship journals and in three top Management journals. The journals are listed in Table 1 below. The Management journals are included because they are viewed as effective outlets for Entrepreneurship research.
For the Entrepreneurship journals, every article of every issue was examined. For the Management journals, a key word search via Business Source Premier was used to narrow the results to only those articles containing the terms ‘entrepreneur*’ and ‘human capital’. The term ‘human capital’ was used rather than ‘human capital theory’ in order to capture as many related articles as possible during the search process.

Procedure

The research process undertaken for this study represents a subset of a larger study on the use of theory in the top three Entrepreneurship journals. The larger study involved the grouping of articles into one of three categories: conceptual; theory-driven empirical; and, non-theory-driven empirical. In order to distinguish conceptual from empirical, an empirical article was defined as involving the collection, analysis and interpretation of data. Such articles typically included Method and Results sections. An electronic spreadsheet was used to track the number of conceptual and empirical articles; the number of theory-driven articles; the total number of theories used; and, the frequency of theory usage.

All of the articles were available in Adobe PDF format from Business Source Premier. Many PDF files were in a format that allowed the Find function (Ctrl+F key) to search for text in the body of articles. In such cases, the search process was quite
An article had to overcome two hurdles to be coded as theory-driven empirical. The first hurdle involved the identification of a theory. For an article to use a theory, the theory had to be described prior to its Research Methods section. Initially, the term ‘theor’ was sought via the find function in each PDF file. In PDF files that would not allow the Find function, a manual review was undertaken. The majority of theories were labeled quite clearly. All of the theory-driven empirical articles that used Human Capital Theory are analyzed in this article.

The process for the three Management journals followed the same protocol as above. The search for articles containing keys words yielded a very small number of results and hence, the process was extremely efficient.

The second hurdle represented explicit communication of at least one hypothesis. The term ‘hypothes’ was sought when the Find function was available. Otherwise, a manual review occurred. In many cases, hypotheses were clearly separated from paragraphs. In a very small number of cases, hypotheses were communicated within paragraphs. If any or all hypotheses were presented after a Research Methods section, the article was not deemed theory-driven empirical. The explicit and sequential style described here is considered to be consistent with scientific method and theory-driven research.

Once the database of Human Capital Theory-driven empirical articles was complete, a coding of the hypotheses contained in each article took place. The total
number of hypotheses, including sub-hypotheses, in the 56 articles is 439. The method of recording hypotheses partially accounts for the high average number of hypotheses per article. Researchers often bundled a number of separate propositions together into one hypothesis. For example, the hypothesis that level of education might be related to firm performance might include a number of measures of firm performance. Since the results of the testing might vary from measure to measure, it was decided to separate the original hypothesis into a number of sub-hypotheses – each one related to a separate measure. Thus, the hypotheses in each article were reviewed carefully in order to capture the results of all the separate relationships tested, rather than generally reporting on only the overall results.

Moreover, hypotheses were coded according to the implicit theory that they represented. If a hypothesis predicted a positive relationship between formal education and firm performance, it was so coded. If it predicted a negative relationship it was coded in a different category. Further, the hypotheses that predicted that a relationship between formal education and firm performance would be modified by a third variable were coded in another category. All together, 10 different categories or theory variants were identified in the dataset. It is important to note that in each category there is substantial implicit theoretical diversity owing, in part, to numerous moderating and mediating variables. The analysis, reported below, also revealed a wide variance in the number of hypotheses per theory variant. In addition, the analysis uncovered an article, categorized in the Team Models variant, containing 68 hypotheses.
Results

The analysis of each article in the dataset revealed how Human Capital Theory is being used in the top Entrepreneurship and Management journals. The research uncovered 10 variants of HCT. Each is described below. It should be noted that the first two variants are conventional variants from the field of Economics and that they were not found to exist in the current dataset.

Human Capital Theory: This theory predicts that both formal education and/or workplace education (called experience) will directly impact personal career performance to the extent that the related financial gains will exceed the related costs and yield a financial return on such investments in people over their careers. This theory is a general theory that has micro and macro implications, predicting positive rates of return across the entire spectrum of careers for individuals as well as a positive rate of return on a societal level of investments in education for society as a whole.

Human Capital Theory with Diminishing Returns: This theory is the same as HCT other than for predicting a reducing rate of return on increasing investments in education and experience.

Increasing Human Experience Model: This variant is our name for the model implicitly proposed by Cooper, Gimeno-Gascon and Woo in their 1994 (Cooper variations) article that appears to have inspired the program of nominally-named human capital research in the field of entrepreneurship. The human experience model predicts that more formal education and more work experience will yield higher levels of entrepreneurial performance. In this model no attempt is made to measure the related costs, the financial benefits or the rate of return either to the individual or to society. An example hypothesis, from Cooper et al. (1994, p. 376), is “Probabilities of marginal survival and growth increase with levels of education.” In most cases this theory might be viewed as a primitive form of Human Capital Theory that may be a precursor condition to finding a positive human capital relationship in an entrepreneurial context (depending on the performance measures chosen).

No Effect & Decreasing Human Experience Models: This model predicts the opposite direction of effect of the Cooper 1994 model, namely that increasing amounts of experience will have either no impact or a deteriorating impact upon entrepreneurial performance. An example hypothesis, from Lerner, Brush & Hisrich (1997, p. 325), is “The influence of previous start-up experience will have no association with business performance.” It is a clear departure from the Human Capital Theory proposed in the field of Economics. The following variations also represent departures.
Curvilinear Models: This model predicts curvilinear relationships between formal education and experience, and entrepreneurial performance. An example hypothesis, from Allen, Link & Rosenbaum (2007, p. 941), is “Older faculty are more likely to patent with industry than younger faculty, to a point and then the impact of age will decrease.”

Moderator Models: This is an umbrella concept for hypotheses that include formal education and experience in predictions about entrepreneurial performance but involve moderators and interaction effects in their predictions. An example hypothesis, from Wright, Liu, Buck & Filatotchev (2008, p. 137), is “The SMEs of returnee entrepreneurs possessing more patents perform more strongly in a nonuniversity park than in a university park.”

Gender Differences: These models predict differences in human capital or differences in entrepreneurial activity based on differences in human capital between women and men, and are as such, a special case of moderator variables. An example hypothesis, from Langowitz & Minniti (2007, p. 345), is “Across all countries in our sample, sociodemographic variables explain a significant portion of the differences in the propensity to start a business across genders.”

Mediator Effects Models: This umbrella concept encompasses models that predict outcomes that we view as intermediate to entrepreneurial performance. An example hypothesis, from Powers & McDougall (2005, p. 298), is “The quality of a university’s faculty will be positively related to the number of start-up companies formed.”

Moderator/Mediator Combination Effects Models: These models predict that moderators will impact intermediate-level outcomes. An example hypothesis, from Zhang, Souitaris, Soh, & Wong (2008, p. 598), is “The similarity of the industrial sectors between entrepreneurs’ prior employment and their new ventures is positively correlated with their propensity to use existing networks when approaching initial investors.”

Outsider Participation Effects Models: This umbrella concept encompasses a variety of predictions about the positive impact of a variety of outsiders (with their related human capital) upon entrepreneurial performance. An example hypothesis, from Jain and Tabak (2008, p. 28), is “Venture capital participation reduces the probability of founder CEO at IPO.”

Team Models: This is another umbrella concept for different models for combining the education and experience of entrepreneurial team members as the basis for predictions of entrepreneurial performance. An example hypothesis, from Westhead, Wright, & Ucbasaran (2001, p. 341), is “Ventures with two or more partners/shareholders are more likely to be exporters seven years later.”

Difficult to Classify: The hypotheses in this category were unusual. Authors generally claimed to be investigating human capital relationship variables and their proposed relationships made them difficult to classify in the above-listed categories. An example hypothesis, from Corbett (2007, p. 104), is “Increased levels of specific human
capital will moderate, in a positive manner, the relationship between the comprehension information acquisition and the number of opportunities identified.”

Table 2 below presents the 12 theory variants along with the number of hypotheses and articles associated with each variant. Somewhat surprisingly, articles often advance predictions pertaining to more than one of the theory variants, and as a result the total number of articles reported in this table is greater than the number of articles reviewed.

Two key observations can be drawn from Table 2. The first observation is that none of the hypotheses is categorized under Human Capital Theory or Human Capital Theory with Diminishing Returns. None of the articles in the data set is concerned with measuring the costs and benefits in financial terms or in calculating the rate of return on investments in formal education or experience over time despite the fact that many of the authors appear to recognize the economic origins of the theory. An analysis of reference sections reveals that twenty-six articles (46.4 percent) cite Gary S. Becker’s work (1964, 1971, 1975, 1980, 1993 and 1994). Further, seven articles (12.5 percent) and five articles (8.9 percent) cite works by Jacob Mincer (1974, 1986) and Theodore W. Schultz (1959, 1961, 1980), respectively.

The second observation is that seventy-eight (17.8 percent) of the hypotheses in fifteen articles (26.8 percent) fall into the Increasing Human Experience Model (IHEM), which suggests that more formal education and experience should increase entrepreneurial performance. The IHEM is considered to be the best proxy for Human
Capital Theory and accordingly, its key variables, formal education and experience, are investigated more thoroughly in the proceeding sections. They are followed by some additional observations about the chart above.

**Formal Education**

Does it pay for an entrepreneur to get a formal education? Since no studies address this question we can only approach it indirectly. Since the only studies that address the value of formal education within the human capital literature cited here focus on post secondary education, we can say nothing about the value of formal education at the primary and secondary level. The most direct question about education that this literature tackles is whether the amount of formal education that an entrepreneur possesses is related to higher levels of entrepreneurial performance. Some articles (that is, Cooper variations) address this issue indirectly and might be called indirect tests of a human capital surrogate measure. If entrepreneurs with higher levels of formal education have consistently and substantively higher levels of entrepreneurial performance then we might expect that there is a reasonable likelihood that formal education pays for entrepreneurs, although it would make sense to test the original human capital theory directly.

This section is broken down into two sub-headings: Indirect Tests and Other Tests of the theory variant that formal education contributes to entrepreneurial performance. The Indirect Test results include the results of all of the Cooper variation hypotheses. The Other Test results make the generalized assumption that all of these A-level
publications are testing something relevant to human capital despite their formulations. The results are the author’s conclusions as to whether or not their hypotheses were supported. Needless to say, the Other Test results are dubious in the extreme when it comes to making pronouncements about the impact of formal education upon entrepreneurs. However, it is important to be able to say something about the fecundity of research across these variant theories. What is presented is the overall result of the effectiveness of theory variant testing in the entrepreneurship field. Although formal education tends to be measured somewhat similarly across studies as the number of years of post-secondary education, the sample populations and the dependent measures vary dramatically. In the case of the Indirect Tests, a small number of studies could not be used because the independent variables were based on factors constructed of both education and experience variables (for example, Rauch, Frese & Utsch, 2005).

*Indirect Tests.* Table 3 below indicates that nineteen of the tested Cooper hypotheses (76 percent) did not find a relationship between formal education and any one of a number of different measures of entrepreneurial performance. Of the seven hypotheses that found a relationship (27 percent), only one reached a $p \leq .001$ level of significance. Of the two $p \leq .01$ level findings, one was negative, or the opposite of that predicted.

---

Table 4 presents the findings at each level of statistical significance. The strongest evidence for the efficacy of formal education is represented by a single finding
with business survival as the criterion variable. The second strongest evidence of a relationship provides mixed results (negative and positive) for the relationship between formal education and venture performance.

Other Tests. Table 5 below indicates that ninety-six hypotheses involved the testing of education as an independent variable. Twenty-six of the hypotheses (36.1 percent) were found to be supported. Forty hypotheses (55.6 percent) failed to find support and six hypotheses (8.3 percent) found a negative relationship, the opposite of that predicted.

A summary of the positive and statistically significant findings is presented in Table 6 below. It provides insight into the extent of statistical significance and the number of hypotheses at each level. The calculations do not include the six statistically significant negative findings reported in the table above. A question mark is used for cases in which authors verbally indicated a statistically significant relationship, but did not communicate the level. Only one finding reached a $p \leq 0.001$ level of significance.

The Other Tests include a wide variety of dependent variables such as the timing of a new product move, entry into self employment, firm absorptive capacity, perceptions of business success and growth expectancies.
Experience

Following the format of the Education section above, this section reviews results of the Indirect Tests and the Other Tests. Again since there were no real tests of Human Capital Theory amongst the hypotheses testing experience the Cooper variant was used as the best amongst a set of weak proxy theories.

*Indirect Tests.* Of forty-seven hypotheses that tested the relationship between some measure of experience and some measure of entrepreneurial performance, 62 percent failed to support the hypotheses. Of the eighteen hypotheses that found a relationship, four reached a $p \leq 0.01$ level of significance. Table 7 below reports the findings.

Table 8 presents the findings at each level of statistical significance. The four strongest findings suggest that 1) business failure is mitigated via prior work experience in a similar industry; 2) prior new venture experience positively influences revenues; 3) prior similar business experience positively influences the amount of money that an entrepreneurs draws from a business; and 4) prior similar business experience substantially reduces the odds of exiting a new venture. Additional findings at the $p \leq 0.01$ level suggest that work experience reduces the chance of failure and increases the probability of revenue growth and firm profitability. However, the types of work experience that influence success are not made clear from the findings. It is interesting to
note that there is evidence, albeit weak, that prior management experience hurts new venture survival probability.

Other Tests. Table 9 below indicates that two hundred and sixteen hypotheses involved the testing of experience as an independent variable. Eighty-six hypotheses (39.8 percent) were found to be supported. One hundred and twenty hypotheses (55.6 percent) failed to find support and ten hypotheses (4.6 percent) found a negative relationship.

A summary of the eighty-six positive and statistically significant findings is presented in Table 10 below. Fifteen findings reached a p ≤.001 level of significance.

The Other Tests include a wide variety of dependent variables such likelihood of patenting with industry, probability of engaging in portfolio entrepreneurship, propensity to use network ties, and likelihood of being an exporter seven years later.

Discussion

The research findings provide several discussion points. The first point is the vast diversity of implicit theories that are actually tested. The 10 new theory variants indicate that researchers imagine an incredible array of competing theories that involve education,
experience and entrepreneurship. Most of the theories are largely unrecognizable as Human Capital Theory. It is unclear why researchers choose not to test the theory in its original form. It is also unclear why so many variations exist. One possibility is that researchers believe that if they try enough different permutations and combinations of data they will eventually discover something. This behavior fits Paul Feyerabend’s ‘anything goes’ anarchist approach to science. It could even be called dust-bowl empiricism. It certainly is not theory-driven research demanded by top journals.

The second discussion point is the usefulness of Human Capital Theory in the field of Entrepreneurship. It is obvious that the theory is not being tested properly. The costs of formal education and work experience are not included in empirical research. However, if the indirect tests return extremely strong results for formal education and work experience, a stronger rationale exists for remaining buoyant about Human Capital Theory. The indirect test of formal education does not promote the efficacy of formal education. Entrepreneurship success is not indicated by increases in formal education.

The indirect test of experience is not quite as straightforward. Thirteen hypotheses support a positive relationship at or beyond the 0.01 level. However, twenty-nine of the hypothesis tests (62 percent) do not indicate a relationship. Five hypotheses (10 percent) at or below the 0.05 level indicate a weak relationship. Ultimately, the evidence is still far from strongly supportive.

The third discussion point is the possibility that the results here are not surprising to many who have observed both the academic and entrepreneurial milieus. On the academic side, some published review studies have found questionable support for popular theories such as Transaction Cost Economics (c.f., David and Han, 2004). On
the practical side, many observers would have already been doubtful of the applicability of the human capital thesis within an entrepreneurial context given the large number of famous entrepreneurs who have built business empires without the benefit of either much formal education or much prior business experience.

The fourth discussion point is that there may be a productive way forward from the human capital research results. An untapped area that may provide high explanatory power is auto-didacticism. There are accounts of self-educated entrepreneurs on the World Wide Web. Such auto-didactics purportedly learn what is needed just before, or at the time that, it is needed, rather than via learning models characteristic of the formal education system.

Conclusions

There are at least two important conclusions that can be drawn from this paper – one methodological and the other substantive.

The methodological conclusion: To the degree that this paper is illustrative of theory testing in different spheres of the social sciences, it raises concern about current practice. When Meehl (1990) referred to the tendency of psychologists to conflate theory testing with hypothesis testing he may have been characterizing a vast array of dubious practice in a number of social science fields.

The array of dubious practice that comes from a poor understanding of theory testing is of substantial concern. The researchers did not appear to appreciate that they were not actually testing Human Capital Theory despite allusions to it. That some would draw hypotheses in the opposite direction of the theory and still imply that it was a test of the theory illustrates how extreme the problem is.
Not one scholar seemed to appreciate the questionable or problematic aspects of the theory, and some acted as if it were already ‘proven’, and thus only required elaboration. No one article expressed skepticism based on the mass of contrary observations of famous entrepreneurs with limited formal education and limited experience, or on the large number of unsupportive findings to date. The narrative reviews of existing evidence in these articles was next to useless – apparent exercises in cherry-picking – as most were able to find a few studies that contained evidence generally supportive of human capital in an entrepreneurial context. Even the non-supportive and negative findings failed to alert them to the possibility that human capital theory might not be applicable within the field of entrepreneurship.

It would also appear that researchers not only conflate theory with hypotheses but also that they conflate novel ideas with creative ideas. The theory of human capital was morphed in so many different directions perhaps out of a need to be original when the real demand is that the research be creative. Many, many implicit theories were advanced in greatly varied hypotheses. The rationale for advancing the hypotheses was typically skimpy. In fact, viewed across all of the studies, the entire exercise appears to have been a massive fishing expedition under the guise of theory testing.

The substantive conclusion: It would appear that Human Capital Theory may need to be modified for the entrepreneur. Considering that Human Capital Theory is first and foremost a theory of economic development, it is of noteworthy significance that the entrepreneur – oftentimes regarded as the most important agent of economic development – doesn’t appear to be subject to Human Capital Theory, at least as far as formal education is concerned. This observation suggests a need for a major ad hoc adjustment.
in the theory. It also raises very important questions as to why entrepreneurs would tend to be an exception. It would appear that the field of Entrepreneurship is in a position to make a substantial contribution to the field of economic development if scholars are able to get a handle on this problem.

Thomas P. Kenworthy
Thomas completed his doctoral training in Entrepreneurship at the University of Calgary in 2008. He is currently an Assistant Professor of Entrepreneurship at Suffolk University in Boston, MA. His focus is on understanding the knowledge generated through extant entrepreneurship research.

W. Edward McMullan
Ed began his relevant career as a student entrepreneur in the 1960’s. He obtained his MBA and PhD from UBC and began teaching at the University of Calgary in 1973. Since then he has had around 80 different articles published in a variety of journals. His area of persistent scholarly interest has been entrepreneurship education and support, and entrepreneurship theory. In 1990, he wrote a book providing an integrated, mid-range theory of entrepreneurship. He has since conceived and designed a general scientific theory of entrepreneurship which is now in manuscript form.

### TABLE 12

**Additional Entrepreneurship Outcome Variables**

| Probability of academic patenting with industry | Number of university start-ups formed |
| Complexity of the loan granting decision process | Number of IPO firms that licensed technology from a university |
| Bank loan approval rate | Success at closure |
| Probability of being an entrepreneur versus an intrapreneur | Strategy of quality / customer service |
| Differences in propensity to start new ventures between men and women | Strategy of innovation |
| Probability of engaging in portfolio entrepreneurship | Acquisition capabilities |
| Probability of using an independent firm as the organizing mode for portfolio entrepreneurship | Assimilation capabilities |
| Propensity to use existing networks when approaching initial investors | Intended scale (by revenue) of venturing activity |
| Probability of network utilization | Motivation to continue and grow business operations |
| Probability of founder still with firm at IPO | Hotel occupancy and customer satisfaction |
| Order of a new product move | Tourism and business strength |
| Timing of a new product move | Probability of post-IPO profitability |
| Probability of being a first mover versus an imitator | Time to profitability |
| Relative importance of human capital in an entrepreneurial board | Amount of equity versus debt |
| Probability of being laid off during a recession | Self-employment intentions |
| Failed versus operational business owners | Firm debt level |
| Decision to franchise | Team member entry |
| Initial capital provided by founder | Team member exit |
| Export status in 7 years | Growth expectancies |
| Opportunity exploitation | Innovation radicalness |
| Opinion about venture success | Business strategies |
| Home runs in venture capital portfolio | Location decision (university science park or non-university park) |
| Strike outs in venture capital portfolio | Founder's threshold level of performance |
| New tie (that is, partnership) between two firms | Speed of strategic decision making |
Utilizing a resource-based theory (RBT) base, this study attempts to uncover resource conditions common across social entrepreneurial ventures. This study differs in that it builds on the RBT and the entrepreneurship literature by expanding an existing framework to evaluate competitive advantage in the social entrepreneurial context and propose two additional factors related to the concept of social rents in order to achieve a more suitable outcome. This is defined as sustainable contributive advantage. Social rent generation and conversion is a primary factor involved when applying the rationality of RBT towards social entrepreneurial ventures (SEVs). A model has been developed around the newly proposed sustainable contributive advantage and the social rent aspect of this model will be presented in detail in order to demonstrate how this expanded lens facilitates a better identification of performance differences in social entrepreneurial ventures.
Introduction

Unlike the reasonably clear financial and market performance measures available in most entrepreneurship research, a standard performance metric for cross-comparison in social entrepreneurship has not yet emerged. Evaluation and comparison methods such as the triple bottom line, statements of functional expenses, and social return on investment calculations are gaining wider acceptance as tools for comparison, yet they do not give explanatory insight on what is happening inside these organizations. Admittedly, this has made analysis of social ventures challenging for researchers. We propose a framework for analyzing social venture performance, which is based on core frameworks and conceptualizations in both strategy and entrepreneurship.

Understanding firm success or failure is central in strategy (Porter, 1991) with a clear focus on firm success. The field of strategic management conceptualizes success as having a competitive advantage over other firms (Barney, 1991), which is manifested in a competitive position or series of competitive positions that lead to superior and sustainable financial performance (Porter, 1991). As social ventures appear to have measures beyond just financial performance due to the very nature of the venture, how then, do we begin to apply the concept of competitive advantage? Can the field of strategic management be applied to the world of social entrepreneurship? Is competitive advantage it at all appropriate as a concept to study a social venture?

Using elements of resource-based theory (RBT) to attempt to explain why some social ventures seem to perform better than others may be fruitful, as RBT lends a firm’s success to a firm’s resources and capabilities, rather than to external forces such as competition and the economy. As competition and economic issues are transformed through social entrepreneurship practices and business models, analysis of external forces can be helpful in grasping the
environment in which these firms operate. However, it does not address why and how some social ventures attain success and others fail. This is why RBT may be suitable in the context of social entrepreneurship. Entrepreneurship and resource-based theory adopt precisely the same unit of analysis – the firm resource (Alvarez & Busenitz, 2001). It is the analysis of social entrepreneurship resources that becomes the avenue to greater insight into these social ventures.

The paper begins with a review of social entrepreneurship, RBT and competitive advantage followed by a detailed description of Peteraf’s (1993) four cornerstones of competitive advantage. We then utilize Peteraf’s model in order to present the additional conditions of social entrepreneurship ventures (SEVs) through the concepts of social rents and sustainable contributive advantage. We conclude with a discussion of future research possibilities created by this expanded view.

**Literature Review**

**Social Entrepreneurship**

In general, the development of the research in social entrepreneurship has taken the same developmental path the research field of entrepreneurship took decades ago (Carsrud, Olm & Eddy, 1986). The definition of entrepreneurship has been debated in the similar way that scholars debate over what social entrepreneurship is and how it is defined today. Numerous perspectives about what social entrepreneurship is (and what it is not) have been developed. While many will argue that the existing research is not yet rigorous in nature, researchers have published more than 200 scholarly articles on the subject, nearly all since 2000 (Hill, Kothari, & Shea, 2008). Due to the current stage of development, it is helpful to use adjacent or similar fields of research as comparables or beginning frameworks. However, one should exercise caution when translating findings from research on the creation of economic entrepreneurial ventures (EEVs) directly to
the process of creating social entrepreneurial ventures (SEVs). It is as yet unclear as to how similar or different those processes may be (Dorado, 2006).

Many of the initial entrepreneurship studies examined personal traits, motivations, or network relationships (Gartner, 1988; Carsrud, Olm & Thomas, 1989). Similar studies of have emerged for individual social entrepreneurs (Steinerowski, et al, 2008) applying, for example, identity theory (Simms, 2006). Studies have examined what social entrepreneurs do and achieve for the community (Thompson, 2002), how exclusive the category of social entrepreneurship should be (Light, 2005), how social entrepreneurs rise from social welfare challenges (Leadbetter, 1997), how social entrepreneurs act as social change agents (Dees, 1998), and opportunity is recognized by social entrepreneurs (Townsend & Hart, 2008). Similarly, as the entrepreneurship research field developed, researchers are now beginning to focus on the social ventures, rather than just on the social entrepreneurs. For purposes of this study, we specify below what constitutes a social entrepreneurial venture (SEV) and what differentiates it from an economic entrepreneurial venture (EEV).

**Properties of Social Entrepreneurial Ventures**

When beginning to define a social entrepreneurial venture, there are two aspects that should be addressed. The first of these is what separates a social venture from a social entrepreneurial venture. The second of these is what separates an entrepreneurial venture from a social entrepreneurial venture. Clearly stating the distinctive properties of each of these defining characteristics of ‘social entrepreneurship’ are key to providing a clear lens as to how these social entrepreneurial ventures can begin to be analyzed and observed.

The first of these distinctions is to clearly separate a social venture from a social *entrepreneurial* venture. This distinction is similar to the popular argument that separates a small business from an entrepreneurial venture. Although there are many overlaps between
entrepreneurial firms and small business firms, they are different types of entities (Carland, et.al., 1984). Here, we present the perspective of Carland and colleagues that combines the work of Vesper (1980) and Schumpeter (1934) presenting four criteria that if observed in a firm’s actions, they can be classified entrepreneurial: (1) introduction of new goods (services), (2) introduction of new methods of production, (3) opening of new markets, or (4) industrial reorganization. In Table 1 we present four types of ventures within the context of this study: economic venture, economic entrepreneurial venture, social venture, and social entrepreneurial venture. We present this table to highlight the distinction between entrepreneurial vs. non-entrepreneurial ventures. The distinction between social and economic ventures will be further extended and presented in Table 2.

The second of these distinctions is what separates an economic entrepreneurial venture (EEV) from a social entrepreneurial venture (SEV). This distinction has been one of the more popular topics of discussion among researchers in social entrepreneurship. Many scholars have claimed that social entrepreneurship is a subset of entrepreneurship. The word ‘social’ simply modifies entrepreneurship (Martin & Osberg, 2007). In fact, the prefix ‘social’ itself is vague enough to create a situation where just about any venture could be called ‘social entrepreneurship’ (Zahra, Gedajlovic, Neaubaum, & Shulman, 2009). Mair and Martí (2005) discuss the term ‘social’ as somewhat misunderstood. They present the simplistic view of profit motives vs. altruistic motives and caution against thinking in this dichotomous nature. These two motives have been discussed at detail often through interviews or surveys of the entrepreneurs themselves (Neck, Brush, Allen, 2007).

We suggest that the differences between EEVs and SEVs should not be placed solely on the personal motivations of the entrepreneur. While the personal motivations of the entrepreneur
may determine whether the venture they pursue is more social or economic in nature, the personal motivations alone are not sufficient evidence to determine what kind of venture eventually develops. Individual motivations and founder intentions often change as the business grows, ages, dies, or makes other changes. Therefore, it is naïve to propose that at any given time, the purpose of any organization can be matched to the founder’s original intention of creating the venture.

For example, the founders of Whole Foods, a United States nationwide organic food supermarket, were four local businesspeople that decided the natural foods industry was ready for a supermarket format (Whole Foods Market, 2010). The founders launched Whole Foods because they saw a business opportunity in the market, not because they wanted to help alleviate world poverty. However, through their affiliated private foundation, that is exactly what they are doing. Among many other campaigns, Whole Foods most recently raised over 2.26 million dollars from its customers that will translate into over 12,200 micro-loans for women in developing countries (Whole Planet Foundation, 2010). This example begins to demonstrate how founder intentions can provide little insight as to the subsequent nature of the business at any given moment.

The term ‘social value’ is an area of vagueness worth noting. Some researchers have pinned the distinction of an SEV as one that creates social value of some kind (Peredo & McLean, 2006). Beugre (2007) claims the primary purpose of social entrepreneurs is to create superior social value for their clients, whereas the primary purpose of economic entrepreneurs is to create economic value. However, what is social value? At what point does the value a firm creates become social in nature? We define social value as: the *contribution to the welfare or well being in a given community that fills a need not currently being served effectively by a market (government or private sector)*.

To refer to Beugre’s (2007) claim, one could argue that there are many cases where
economic entrepreneurs provide superior social value for their clients in order to achieve superior economic returns. Whole Foods could be touted as example of this as their primary mission is to provide ethical, organic, and eco-friendly products for their clients and as a result they enjoy superior economic returns. The question then becomes, does this make Whole Foods an SEV? Some would argue that it is, so would argue that it is not. The point is the concept of social value creation is not a sufficiently deep or rigorous approach for examining the phenomenon of social entrepreneurship.

There are several positions that deserve mention at this point. Dees (1998) proposes that in social entrepreneurship, the social mission is explicit and central. Others describe social entrepreneurship as an entrepreneurial activity with an embedded social purpose (Austin, et. al., 2003) or an event where persons aim either exclusively, or in some prominent way, to create social value of some kind (Peredo & McLean, 2006). Still others classify it as organizations that are not owned by shareholders and do not pursue profit as their main objective (Leadbetter, 1997). Others see it as an innovative, social value creating activity that can occur within or across the non-profit, business, or government sectors (Austin, Stevenson, & Wei-Skillern, 2006). There are others that see it simply as taking a strategic approach to limit dependency on donations and government subsidies in order to become self-sufficient (Dorado, 2006).

As can be seen from the definitions above, social entrepreneurship has been described as an activity, an event, an organization, and a strategic approach. For our purposes in this study, we limit social entrepreneurship to the phenomenon of venture creation by the label social entrepreneurial ventures (SEVs). The key point is what makes these ventures distinctly social rather than economic. In order to do this, we propose that the unit of analysis is not the individual/founder, nor the organization itself, but the resources, processes and decisions of the organization, in line with resource-based theory.
In summary, we present our definition of social entrepreneurial ventures for purposes of this study to be: *A social entrepreneurial venture purposefully designs decisions and processes in order to create social value, grow the firm, and produce monetary returns in order to maximize their social value creation while simultaneously engaging in at least one of Schumpeter's four categories of behavior characterized by innovative strategic practices.*

By breaking down ventures into their decisions, resources, and processes, a comparison across social ventures becomes a more manageable goal. Within our definition, we admit that there are degrees among SEVs with regard to the extent they design their resources around social value creation (see Peredo & McLean, 2006; Neck, Brush, & Allen, 2007). We go beyond a typology approach in this paper to explore a mechanism at play within the SEVs. We expect that the differences between their resource allocations will match some of the previously proposed typologies. Using the frameworks presented, this study takes a step in that direction.

**Competitive Advantage and Resource-Based Theory**

Resource-based theory (RBT) posits that sustained competitive advantage derives from the resources and capabilities that a given firm controls (Barney & Clark, 2007). In addition, RBT posits that unique combinations of these resources and capabilities held by the firm are then mobilized to produce products and services that enable the firm to achieve sustainable competitive advantage (Barney, 1991; Grant, 1991). The theory suggests that there can be firm-level differences and it is within those differences sustained competitive advantage can be found (Barney, 2007). Therefore, RBT emphasizes the strategic decisions that the firm’s management make in regard to identifying, developing and mobilizing key resources in order to maximize returns and the theory been used to better understand the processes and strategic orientations of entrepreneurial ventures (e.g. Borch, Huse & Senneseth, 1999; Ray, Barney, & Muhanna, 2004).
In RBT, resources are an all-encompassing term, which includes capabilities, competencies, knowledge and resources (Barney, 2007). An additional key concept in RBT is the assumption of Ricardian rents (or efficiency rents). Ricardian rents are defined as earnings above breakeven that do not induce more competition (Peteraf, 1993). For example, more efficient firms are able to enjoy higher rents (profits) than competing firms because their operating costs are lower due to their highly efficient processes. When the price for goods drops, the more efficient firm will be able to stay in the market and the non-efficient (non-rent-generating firm) will be forced out of the market because the price exceeds the cost for production (Alvarez & Barney, 2004).

Peteraf’s (1993) model of competitive advantage from an RBT perspective, presented in Figure 1, is based on four necessary conditions that underlie sustained competitive advantage. These four cornerstones are described as superior resources (heterogeneity within an industry), imperfect resource mobility, ex-post limits to competition, and ex-ante limits to competition. The model takes a firm-level approach that has practical applications so managers can then take a resource-level view approach to their decisions (Peteraf, 1993).

It is important to note that Barney presented an earlier, better-known set of conditions for sustained competitive advantage that works complimentary to that of Petaraf (Peteraf & Barney, 2003). To have the potential for sustained competitive advantage according to Barney, a firm resource must be “(a) valuable, in the sense that it exploits/opportunities and/or neutralizes threats in a firm’s environment, (b) it must be rare among a firm’s current and potential competition, (c) it must be imperfectly imitable, and (d) it must be able to be exploited by a firm’s operational processes” (Barney, 2007). Barney’s attributes are commonly known as VRIO (valuable, rare, imperfectly imitable, and organization).
The primary difference between the two models lies in the heterogeneity characteristics of resources across firms. In Barney, ‘resource heterogeneity’ is a basic assumption that precedes his well-known VRIO framework (Barney, 1991, 2007). In Peteraf’s (1993) framework, ‘resource heterogeneity’ serves as one of the four ‘cornerstones’ of sustainable competitive advantage. Although resource heterogeneity is the source of rents in Peteraf’s model, she employs this term to signify a great deal more than just input differentials across firms (Peteraf and Barney, 2003). Therefore, Peteraf’s model fits the current study’s purpose because it is a value-based approach to competitive advantage and thus aids in the demonstration of new concepts and how they conceptually fit within the overall firm structure. While these two models of competitive advantage differ slightly, they both support an efficiency-based explanation of performance differences. They share common definitions of sustained competitive advantage, ‘value,’ and ‘rent’ (Peteraf and Barney, 2003). A resource-level and enterprise-level of analysis and view of RBV is supported by both of these models (Peteraf and Barney, 2003).

**Competitive Advantage as it Applies to Social Entrepreneurship**

A recent set of exploratory studies used elements of resource-based theory (RBT) to attempt to explain why some social ventures seem to perform better than others (Meyskens & Post, 2008; Meyskens, Robb-Post, Stamp, Carsrud, & Reynolds, 2010). They found that increasing partnerships were correlated with funding sources, which could imply that the more partnerships an SEV creates, the more opportunities they have to monetize the social value they create. Additionally it has been shown that the firm factors explained about twice as much variance in profit rates as did economic factors (Hansen and Wernerfelt, 1989). Whether or not this translates directly to SEVs is as yet unclear. However, as the analysis of economic and social outcomes across SEVs is challenging, an extension of what the concept of competitive advantage
looks like from an RBT vantage point within the world of social entrepreneurship is a necessary developmental step in research.

As SEVs must wrestle with both social and economic value, the concept of competitive advantage becomes highly problematic in this context. Social value creation as a priority in an SEV presents an interesting challenge in the context of competition. It is important to note at this point what social value creation is and is not in the context of a firm and for the purposes of this study. Social value creation by a firm is when the firm has done some work to create social value through programs, tasks, etc. Donating money or other resources to another organization is not social value creation (some may call it philanthropy). This distinction becomes important as we develop the concept of a ‘social rent’, which will be discussed later.

As mentioned earlier, the term ‘competitive advantage’ is somewhat challenging to apply to social ventures. ‘Competitive advantage' is typically defined as superior financial performance (Winter, 1995). For social ventures, this may simply not the case. For example, if the social goal is to end world hunger, the presence of additional SEVs to help conquer world hunger is often a welcome addition. The idea of capturing market share from competitors does not quite seem to fit. SEVs are, in a sense, fighting a social problem, not each other and collaboration is often a strategy these groups employ to tackle this larger social problem. However, competition does take place among these organizations. For example, if the source of funding, as a resource, is finite and scarce then multiple SEVs in a local market must compete for those funding resources.

An SEV is not simply judged on the funding sources they retain, as an EEV might be judged on their customer base, market share, etc. SEVs are judged on their ability to contribute to the solution to a social problem. EEVs are required to remain competitive, but SEVs are, in a sense, required to remain contributive. EEVs try to out compete one another in the marketplace. It could be stated that SEVs try to out contribute one another in the marketplace. SEVs strive to
contribute more by creating social value and they also strive to consistently enhance their ability to contribute.

**Sustainable contributive advantage.** In applying the concepts of RBT to social ventures, we offer a social entrepreneurship orientated description for sustainable competitive advantage. Sustainable competitive advantage in a social entrepreneurial context includes *sustainable contributive advantage*. An enterprise has *sustainable competitive advantage* if it is able to create more economic value than the marginal competitor in its product market (Peteraf and Barney, 2003). An enterprise has *sustainable contributive advantage* if it is able to consistently create more social value than the marginal contributor in its social problem area. The result of sustainable competitive advantage (more economic value) is what Barney and Clark describe as an economic rent:

“Value is expressed in terms of the difference between perceived benefits, or customer willingness-to-pay, on the one hand, and the economic costs on the other. This is, in essence, the same as the concept of *total surplus*, which equals the sum of the economic rents (*producer surplus*) and customers’ ‘value for the money’ or *consumer surplus*. The definition supports the notion that the value that an enterprise creates has the potential to enhance the welfare of all of its stakeholders (Barney and Clark, 2007:25).”

In the case of SEVs, they have chosen to serve an additional set of consumers that do not have the ability to pay regardless of their willingness to pay for perceived benefits. Yet, they still must wrestle with the economic costs of providing for those consumers. This is where the case of the ‘social rent’ presents itself. In essence, a social rent is *a perceived benefit or excess residual value that can be converted at a later time into a realized monetized value*. Whereas, economic rents are the actual returns (profits) to a factor in excess of opportunity costs (Barney & Clark, 2007: 28), social rents are the *potential* returns to a factor in excess of opportunity costs. The
social rents must be converted in order for the venture to experience monetary gains from the social rents.

In the case of the EEV, the perceived benefit of a product or service is assessed, converted, and realized by the purchaser during the transaction. The ideal situation is that the perceived value is greater or equal to the price set by the company and that price exceeds the costs of production. For example, the perceived value of a Mercedes-Benz automobile is inflated due to the brand image of the company, thereby producing larger profit margins. The economic rents for Mercedes-Benz are realized when the consumer agrees that their perceived benefit meets the price set for the automobile. They purchase the automobile for the set price and Mercedes-Benz earns economic rents due to their brand image, i.e. customers prefer their brand to others and are willing to pay for their preference. The customer pays for and enjoys the perceived benefit directly.

However, in the case of the SEV, the perceived benefit becomes a distorted concept. For example, the perceived value of a hot meal is not converted or realized when the homeless person agrees to consume it, regardless of how valuable the homeless person perceives the value to be. Therefore, the SEV has an additional step in their value creating and capturing process. The perceived benefit must be converted and realized by a party not directly enjoying the benefit the SEV is creating. It is the SEV’s responsibility to initiate and follow through on the conversion process of the social value. The SEV could increase the convertibility of their social rent through a number of tactics such as publicizing the event, partnering with another organization, or perhaps collecting data from the population.

In the example of a hot meal being served to a homeless person, the SEV could enhance the social rent (or increase the likelihood of converting the perceived benefit into a future monetized value) by partnering with a group of students studying social welfare so that they could
conduct research on the area (which could result in research grants) or by engaging a local
government official in the event (generating press coverage which could result in a future
sponsor). These two tactics are enhancing the social rent (perceived value) so that a party _not enjoying the benefit directly_ will be more inclined to assess and convert that social rent into a
realized monetary value.

If an SEV is able to achieve sustainable contributive advantage, it is able to utilize value-
creating strategies that enable it to grow from within and through its economic and social
resources it is able to generate transactions of creating both economic and social rents and
capturing value by monetizing social rents into new economic equivalents. These value-creating
strategies stem from the organization’s ability to acquire, utilize, and manage resources. As
valuable resources underpin superior performance, the resource-based view of the firm allows for
analysis of these social ventures at both the resource and enterprise view (Peteraf & Barney,
2003).

**Towards a Sustainable Contributive Advantage**

Integrating all of these frameworks together leads to a proposed model for sustainable
contributive advantage based on the resource-based view of the firm. Here we attempt to draw
direct and specific connections to the model presented by Peteraf (1993). We additionally
propose two new factors in the model in order to demonstrate the role of social rent enhancement
and conversion. We discuss each factor in turn as described by Peteraf (1993) and as
alternatively presented in here Figure 2. These are discussed in detail.

-----------------INSERT FIGURE 2 HERE-----------------

**Heterogeneity** The first of the cornerstones, heterogeneity, is an assumption, widely
accepted in RBT, that allows for firms with superior resources to earn rents (Peteraf, 1993). The
goal of maintaining the heterogeneity of the resources for EEVs is to create Ricardian rents.
SEVs also work to create Ricardian rents (economic value) for their organizations. Whereas in the case of EEVs, those rents typically become profit back to stakeholders SEVs reinvest in their organization in order to achieve marginal sustainability.

**Imperfect Mobility.** The activities that a social venture partakes in to utilize resources should be organized in such a way as to create use-specific or firm-specific resources that are uniquely valuable to the organization. Some examples of Ricardian rent-generating resources with imperfect mobility that are: operational procedures, human resource practices, or customer/donor/member bases. Many social organizations depend greatly on their recurring membership dues and therefore prize their paid membership database. This base, while transferrable, is not as valuable to another organization due to the historical relationship of the member with the original organization.

**Ex post limits to competition.** The third cornerstone Peteraf (1993) calls ex post limits to competition, refers to the things firms do (also known as isolating mechanisms) to preserve the heterogeneity of their resources after they have entered a market or established a position in a market. Ex post limits to competition become most applicable to social ventures when there are limited resources available to similar groups. For instance, if a number of SEVs are submitting to a foundation for the same pool of funds, the isolating mechanisms of the SEVs are what will prove the case to the foundation that certain SEVs should be funded over others. Examples of isolating mechanisms might be an alliance or a record of success.

**Ex ante limits to competition.** The final condition Peteraf (1993) describes is ex ante limits to competition. These are the those resources that are in place prior to firms establishing themselves as leaders in the market that will help to ensure their position in the market remains intact. According to RBT, as a firm develops a strategy, it is important to keep in mind both the returns of the strategy as well as the costs of implementing it (Barney, 1986). Returns on
strategies higher than the cost of implementation results from timing, knowledge, or luck (Ahuja, Coff, & Lee, 2005). Ex ante limits to competition describe the firm’s ability to estimate the future value of a strategy in the hopes that the costs of implementing that strategy are much less than the future value. Unless there is a difference between the ex post value of a venture and the ex ante cost of acquiring the necessary resources, the entrepreneurial rents are zero (Rumelt, 1987; Peteraf, 1993). An example for an SEV may be large equipment or a physical location that they expect will allow it to perform more efficiently.

As previously mentioned, we offer a social entrepreneurship-orientated and expanded description for sustainable competitive advantage. Sustainable *competitive* advantage in a social entrepreneurial context includes sustainable *contributive* advantage. In order to include the additional transactional challenges involved in an SEV, we propose two additional conditions for SEVs.

**Ex post limits to scarcity.** We propose a fifth condition referred to as ex post limits to scarcity. Similar to ex post limits to competition, ex post limits to scarcity are those resources or capabilities enable social rents to be converted into Ricardian rents (i.e. monetize social value). In line with RBT, we propose those resources should be highly tacit in nature, socially complex and path dependent similarly related to ex post limits to competition. However, unlike ex post limits to competition, that focus on securing Ricardian rents, ex post limits to scarcity focus on converting social rents in order to secure Ricardian rents. A dedicated and familiar employee’s rapport with constituents may fall under this category, as that relationship is key in converting the social rents created into a monetized value for the SEV. Additionally, a socially complex and historical relationship with a press agent may also fall under this category. This helps to ensure sponsors will pay for visibility associated with the social rent creation process. This condition
refers specifically to those resources that create and support the social rent conversion process and ultimately create Ricardian rents for the organization.

**Ex ante ability to scale.** Our sixth proposed condition for sustainable contributive advantage is ex ante ability to scale. This condition relates to ex ante limits to competition in that it describes the conditions of what must be in place prior to attaining a strong position. However, in the case of social ventures this condition focuses on the infrastructure in place to allow for growth and enhancement of the social rent. Ex ante ability to scale refers to an organizations ability to respond to demand in an efficient way in relation to the social value they create. In other words, it is those resources that allow an organization to generate consistent social rents (if not growing social rents) in the face of a high demand for services or products. It is those resources that allow for SEVs to create social rents more efficiently or effectively. Examples may be technology, social networks, or in-kind contributions.

**Discussion**

It is with the generation and conversion of social rents that the true nature of the social entrepreneurship venture presents itself. To what length does an SEV dedicate its resources toward the social rent process? Additionally, to what extent does an SEV dedicate its resources and decision-making processes toward social rent enhancement vs. social rent conversion? Perhaps most importantly, are they able to consistently convert their social rents? It is within this entrepreneurial ability to find new business models that shorten the conversion of social rents to grants, revenues, memberships or other economic equivalents that determines whether social entrepreneurial firms can achieve sustainability. But perhaps more importantly, the consistent conversion of social rents also allows social entrepreneurial ventures to grow.

In order for any organization to reap the benefits of a sustainable competitive advantage and enable possible growth, they must master the continuing process of creating value (rent
creation and enhancement) and capturing value (rent conversion). The ability of a company to organically sustainably grow must mean that it has mastered the internal practices or activities necessary to capture some of the value (economic or social) that it creates. In the beginning stages of development, a start-up firm creates more value than they capture and for a time period, operates at a negative cash flow. In order to be sustainable, it must move toward capturing more value. It accomplishes this by building the foundation that will support the value transactions.

Therefore, the goal of the entrepreneur becomes the creation a new venture that has an ability to organically grow with the value that it has created and has enough ability to capture value such that organic sustainable growth is possible. At its essence, entrepreneurship relates to the process of organizing unique resources in order to accomplish a closed system of economic value creation and capture sufficient to achieve marginal sustainability. Many start-up social entrepreneurial ventures also operate in an early induction period whereby they create more value than they capture. Some SEVs are never able to turn their processes around to enable it match their value creation and capture ratio and end up operating in a nonprofit starvation cycle (Goggins & Howard, 2009). The goal of SEVs then should be to form an economic transaction engine by which operational processes are created that facilitates the creation of social and economic rents.

This new model for sustainable contributive advantage presents a research framework for analyzing SEVs from an external perspective that circumnavigates the financial performance analysis challenges stated previously. It is often possible to observe the resource utilization practices and strategies employed by SEVs and determine their probability for success based on those practices and strategies. While this approach does not rely on financial metrics for analysis, future research efforts should make connections between the model presented here and the financial stability and service growth of SEVs. It is important that future research studies remain
cautionary in their choices for analysis, as RBT suggests studies on firms located in a single
industry as it helps to establish the link between the resources and strategies in question (Barney,

Studying the presence (or lack of presence) of the resource conditions proposed in this
study required for SEV success provides a model as well as a lens of analysis that holds not only
predictive power, but managerial power as well. The model provides a practical framework to
guide leaders of SEVs toward best practices, better systems, and newly framed objectives that
ultimately lead the organization to sustained contributive growth. It can also represent a decision
framework that allows leaders of SEVs to look at the impact of their resource acquisition
strategies from a resource level as well as a firm level.

Similar to the framework for sustained competitive advantage, the framework for
sustained contributive advantage ultimately empowers the social entrepreneur to run more
efficient and powerful ventures. The responsibility of the social entrepreneur to ensure their
social rents are convertible is a shift in perspective for some non-profit organizations, but it is a
healthy and necessary shift. It is through a sustainable venture that an entrepreneur creates and
manages transactions in the marketplace that allow for the venture to create more value than they
capture from the market. This is the case whether the venture is socially oriented or not.
Examining powerful and struggling SEVs in the context of the model presented here will uncover
tools, strategies, and practices that can further enable the social entrepreneur.

FIGURE 1
The cornerstones of competitive advantage (Peteraf, 1993)

FIGURE 2
Model of Sustainable Contributive Advantage
The study is based on the analysis of a large number of publications on social norms using Harzing’s publish or perish. It aims to explain what is meant by the term social norms and to give an account of social norms as an important element within entrepreneurial behaviour. Its’ goal is to suggest a model that explains this connection by making a proposition that social norms affect attitudes toward success, failure and trying. If it is possible to affect these attitudes, it could stimulate entrepreneurial spirit and create new companies. The intention models are widely used and tested (e.g. Ajzen 1985, 1991; Krueger 1993; Krueger et al. 2000) but they still leave some questions about behaviour and the factors that influence it. Ajzen and Fishbein modified their model as recently as 2005. Their latest model presents background factors and normative and behavioural beliefs.

“While accepting the caveat that it is not easy to change attitudes…there are a number of areas where Finland needs to challenge what arguably are perceived as accepted norms of economic behaviour”

Evaluation of the Finnish national innovation system 2009 p. 186

Introduction

Entrepreneurship is about creating companies which contribute to regional development and thus serve, as sources of economic growth (Shane and Venkataraman 2000). To foster this
process it is important to understand: Why do certain people want to start their own company and others do not? Why and under what circumstances do these people start a company? How do entrepreneurial intentions emerge?

There can be little dispute that social norms are an area of importance in the field of entrepreneurship research, yet there have been no literature reviews on this topic. Examination of the articles quickly showed the lack of definitions among the articles that was studied. The current paper looks at both theory and empirical evidence from the entrepreneurship and social-psychological literatures in order to analyse why the content of social norms is important for entrepreneurial intentions. This conceptualisation will show that instead of using such socially defined variables as subjective norms, group norms or group identifications, we could use the variable social norms. It has been suggested that one reason why the subjective norm construct tends to have a lesser role in prediction to intentions (Krueger 1993, 1994; Krueger et al. 2000) is that the conceptualisation of subjective norms is limited (Conner and Armitage 1998; Hagger and Chatzisarantis 2005).

This study is of particular conceptual interest to entrepreneurial scholars, but it also provides a policy discussion serving regional and national policy-makers for understanding the role of social norms in economic development. While accepting the fact that it is not easy to change attitudes and norms, there are a number of areas where countries need to address what are perceived as currently accepted norms of economic behaviour, i.e. an entrepreneurial culture should be valued.

The basic proposition of this study is that a wider understanding of social norms is valuable because it helps us to reveal its impact to intentions. This paper is an attempt to develop a concept of social norms pulling from the broadest possible range of research studies and theories.
This paper is organised in six sections. The literature that was examined is described as well as how it was examined. The findings of the analysis will be discussed and finally a conceptual definition that has been constructed is composed. In conclusion, the research implications of the study will be discussed.

In the introduction chapter the problem setting of the paper will be introduced. Following this the purpose of the paper will be established. As a background for the research design of this paper, the perspectives and research approaches commonly adopted in research within social norms will be discussed. The terminology use in this paper will be motivated and central concepts will be defined.

2 The landscape of social norms

Most definitions of social norms focus on social relations in a group. The variety of definitions identified in the literature stem from the highly context specific nature of social norms and the complexity of its conceptualization and operationalisation.

Social norms do not have a clear, undisputed meaning. For this reason there is no set and commonly agreed upon definition of social norms and the particular definition adopted by a study will depend on the discipline and level of investigation. Not surprisingly considering the different theories for looking at social norms there is considerable disagreement and even contradiction in the definitions of social norms. From selected definitions it is possible to confirm that most definitions of social norms share at least one thing in common with each other.

Social norms have a long history and it has been used extensively in social psychology. Since the days of David Hume (1739, 1978) there has been a controversy of the explanatory and predictive value of social norms. One of the major problems is the lack of agreement in definition. While there are differences, there are also agreements on some points. The result is
that it is difficult to arrive to a precise definition and this implication of this lack of precision is discussed. Despite this problem, a working definition is emerging in an interdisciplinary literature and refers to norms, social capital and cooperation between individuals and groups. Social norms do not have a clear, undisputed meaning and thus no set and commonly agreed upon definition of social norms. The particular definition adopted by a study will depend on the discipline and level of analysis. This should not be surprising considering the different theories for looking at social norms and the considerable disagreement and even contradiction in the definitions of social norms (e.g. to Dohrenwend 1959; McKirnan 1980; Axelrod 1986; Cialdini et al. 1990; Hechter and Borland 2001; Bicchieri 2006). Another basic problem is the use of norms and social norms as synonyms. Some researchers, e.g. Bettenhausen-Murnighan (1985) and Feldman (1984) use the word norm and view it as “behaviour patterns that are relatively stable within a particular group” (Bettenhausen-Murnighan 1985, p. 350). The third problem is the flack of definition.

Social norms are the common and accepted behaviours for a specific situation. Norms can be formal or informal. Formal norms are those that have been publicly stated as some sort of law. Informal norms are often unconscious; they are implicitly understood rules of exchange that most members of a group have incorporated. This includes rules that are based on traditions as well as those which have a moral underpinning (North 1990). It is important that social norms are distinguished from moral and legal norms (Elster 1989).

Is it a central concept to a proper understanding of human social behaviour as have been proposed (e.g. Berkowitz 1972; Fishbein-Ajzen 1975; Ajzen-Fishbein 1980; Ajzen 1985)?

All studies must discuss social norms in relation to the particular discipline, study level and context and that a set definition for such is not required, only an identification of operationalisation or conceptualization. Therefore this study will not create a new definition of social norm and will not select an existing definition from the literature as doing so limits
the application and understanding of the concept. This study will identify an appropriate operationalisation and conceptualisation for social norms in following sections. The above discussion of definitions should provide a wide understanding of the social norm concept.

3 Methodology and analysis

This paper presents results of an investigation that analysed 690 articles from 7 peer review journals. This study systematically investigated the different conceptual and operational definitions of social norms found in the articles. These articles have been chosen with the help of Harzing’s publish or perish. Findings suggest that there are three different schools of defining social norms. Most definitions of social norms focus on social relations in a group. The variety of definitions identified in the literature stem from the highly context specific nature of social norms and the complexity of its conceptualization and operationalisation.

In addition to searching titles, abstracts and keywords the search included the full text of articles and their lists of references. This was done to ensure as many definitions as possible in order to give a variety of definitions.

As the focus of this paper is on social norms the review was thus limited to journals focused on social norms as well as entrepreneurship. The examined articles are published in the following highly-cited journals:

The result of the search was 63 articles and the final analysis included 47 articles
4 Orientations associated with social norms

After reading these articles it was possible to see three different orientations:

1. Social identity theory and social categorisation theory

2. Focus theory of normative conduct

and

3. A traditional way of looking at social norms: definitions and concepts found in different articles which are presented as a new concept in this paper

Social identity theory (SIT) was developed by Tajfel and Turner in 1979. The theory was originally developed to understand intergroup discrimination. Taifel et al. (1971) attempted to identify what individuals identify them with, why they do it and when they do it. With the aim to reach a positive social identity, individuals tend to overemphasize the advantages and the superiority of the in-group. Additionally, people try to belong to groups they evaluate as better than others. Evaluations are made in recurrent processes of social comparison between in-group and out-group.

The basic phenomenon observed is that people attempt to establish positive self-esteem by showing solidarity with their in-group and discrimination against out-groups. Tajfel’s (1978) definition of a group is rather broad. He specified that groups do not have to consist of people who personally know each other, but that even remote similarities like being a female member of a specific company might qualify as a relevant group membership.

In SIT a person has not one identity but several selves that correspond to group membership. Different social contexts may trigger an individual to think, feel and act on basis of his personal, family or national level of self (Turner et al. 1979). SIT suggests that people categorize themselves and others in different groups and that they evaluate these groups (Tajfel 1978, Tajfel-Turner 1979).
Turner and Tajfel (1986) showed that the mere act of *individuals categorising themselves as group members* was sufficient to lead them to display in-group favouritism. After being categorised of a group membership, individuals seek to achieve positive self-esteem by positively differentiating their in-group from a *comparison* out-group on some valued dimension. This means that people’s sense of who they are is defined in terms of ‘we rather than I’. An individual has both a self-identity and a social identity which belong to the group.

According to the **focus theory of normative conduct** (Cialdini et al. 1991), there are two types of norms: descriptive and injunctive. Whereas descriptive norms refer to perceptions of what is commonly done in a given situation and they characterise the perceptions about behaviours of group members. Injunctive norms refer to perceptions of what is commonly approved or disapproved within the culture (Reno et al. 1993). Focus theory predicts that if only one of the two types of norms is prominent in an individual’s consciousness, it will exert the stronger influence on behaviour (Cialdini and Goldstein 2004). Normative beliefs refer to the perception and not the reality. Normative beliefs are social in nature, referring to what other people think and do (Kallgren et al 2000).

### 5 A new concept of social norms

**The structure of social norms**

The content of a norm

The content of a norm is defined as normative and empirical expectations. Of interest is the fact that norms are different for members and non-members of a given group. An individual knows that a group of people follow a rule in a certain situation as well as believes that a group of people expects the individual to follow the rule in the situation (Bicchieri 2006). A group creates shared rules and values of both proper and improper ways of behaviour to its members (Sherif-Sherif 1969).
The normative structure and evaluate reactions

What is appropriate behaviour; what behaviour is disapproved? A norm is related to the evaluation of behaviour: positive evaluations for normative behaviour and negative for non-normative behaviour. Many of the studies emphasize the fact that unwanted behaviour meets disapproval. However, Sherif and Sherif (1969) describe norms as latitudes; an individual can behave without being controlled. An individual has knowledge of a rule that applies in certain situations and believes that a group of people expects the individual to follow the rule in a situation, knowing that sanctions may occur (Bicchieri 2006).

Some but not all norms are functional in the sense that they provide legitimate expectations of another's behaviour and they have also the ability to motivate people. People are thereby able to predict the actions of others and to feel confident of others' responses to their own actions. This predictability and confidence serve to facilitate exchange (Horne 2001). Norms and trust are related; norms guide people’s behaviour and there for they are trustworthiness that increases trust in other people. Another important norm is reciprocity (Knack and Keefer 1997).

The focus of a norm

Social context of norms

All norms have a specific social context and they govern much of our social and political life; an established norm can be very powerful. How do we learn to behave in an expected way in a given environment? We learn to behave in ways we believe others approve of. Social norms are rules shared by a group for contextually bounded behaviour i.e. they depend on the situation and the roles of the participants, but norms are attributes of a social system rather than of individuals (Bettenhausen-Murnighan 1985). The normative social influence is based on the need to be accepted by others (Cialdini et al. 1990; Kallgren et al. 2000; Hechter and
A norm is a property of a social system and expresses important values of a group (Feldman 1984; Sutton-Rafaeli 1988). Social norms are functional in regulating social life and they especially evolve when individual actions cause negative side-effects for others (Coleman 1990). Social norms, therefore, help establish "a stable but not necessarily efficient structure to human interaction" (North 1990, 6).

Heide and John (1992) look at norms as expectations about behaviour. They indicate the established and approved ways of doing things; these vary through time, age group, social classes and social groups. Norms apply at different levels: societies, particular industry, individual firms or groups of individuals (Heide and John 1992). Social norms can also be looked as unwritten rules or a social contract. Norms are often transmitted by non-verbal behaviour, for example with looks. They may also be transmitted through stories, rituals and role-model behaviour (Kaasa 2007).

The level of analysis of a norm

Norms are learned within and shared among a social group. For example taboos and cultural values can be analysed by looking at the entire culture and norms governing drug use must be studied among a special social group. The use of alcohol could be studied across different groups or in a group (McKirnan 1980). If social norms are learned, they can change over time which would mean change in behavioural patterns (Labovitz-Hegedorn 1973).

Definitions of norms are often based upon expectations, values and behaviour (Axelrod 1986). Values are relevant but they are individual or commonly shared. Norms are generally accepted and they have both a subject (those who set the prescription) and an object (those to whom it applies (Morris 1956). According to Axelrod (1986) "a norm exists in a given social setting to the extent that individuals usually act in a certain way and are often punished when seen not to be acting in this way” (p. 1097), i.e. norms uniform behaviour in a social group.
(Young 2008). Fishbein and Ajzen (1975) use the term subjective norms to describe this phenomenon. This can be compared to what Bandura (1989) refers to as role models and social persuasion.

Hechter and Borland (2001) use the same argumentation as Axelrod. According to them social norm are the rules that a group uses for appropriate and inappropriate values, beliefs, attitudes and behaviours. Social norms are rules shared by a group for contextually bounded behaviour i.e. they depend on the situation and the roles of the participants. Norms govern and unify behaviour and interaction in the group. These rules may be explicit or implicit. Failure to follow the rules can result in punishments, which can lead to exclusion from the group.

According to Dohrenwend (1959) and Gibbs (1965) a norm has three definitional attributes: collective evaluation, collective expectation and reactions to behaviour. Collective evaluation is perhaps the most commonly used characteristic, e.g. how a person ought or ought not to behave. Collective expectations refer to predictions of what persons will do. People believe that regulations, for example traffic regulations, should be obeyed although they know that these rules are sometimes violated.

An injunctive social norm describes the perceptions of what most people approve. Another social norm, the descriptive social norms refer to one’s perception of what others actually do. Although these two different kinds of norms are often related, they are conceptually and motivationally separate. Injunctive social norms stimulate a person to act by making a social evaluation. Whereas descriptive social norms make a person act using social information about a proper conduct in a given situation, for example, “If the majority of people do this, it’s the right thing to do” (Cialdini et al. 1990; Cialdini et al. 1991; Reno et al. 1993; Kallgren et al. 2000).

There is confusion between social norms and attitudes. This confusion stems from the fact that both attitudes and social norms are being learned and there exists a network of
expectations to respond in a consistent manner. As attitudes apply to everything; social norms apply specifically to behaviours (Ajzen and Fishbein 1980). Another major difference is that attitudes, although influenced by the group, are individually held. Social norms, however, are beliefs about generally approved behaviour, which most individuals share with the group even if they do not agree with them personally (Katz-Kahn 1978; Feldman 1984; Bettenhausen-Murnighan 1985). Fishbein and Ajzen (1975) incorporated the concept of social norms in behaviour models to optimise the prediction and explanation of human action.

The social component of Ajzen and Fishbein’s model, the subjective norm, is a person’s perception of whether most people think that he or she should perform the behaviour in question. Subjective norms look at the influence of people in one’s social environment on his/her behavioural intentions. The beliefs of people, weighted by the importance one attributes to each of their opinions, will influence one’s behavioural intention. Although the theory of planned behaviour suggests that normative influences may affect behaviour, that normative influences are those of significant others such as friends, family and co-workers and not a widespread norm (Fishbein-Ajzen 1975, Ajzen 1985). Could the social norm be a better predictor?

6 Conclusions and implications for the development of conceptualising social norms

One of the most significant findings from the article analysis has been the relative lack of the definitions. Any development would require more rigorous and structured research in the topic and conceptual development is critical to the establishment and development of studying entrepreneurial intentions.

It can be recognised that developments in understanding social norms require multidisciplinarily in order to address the contrasting antecedents.
This paper had a goal to provide a taxonomy of social norms as an aid to the classification of research in the field and as a means of providing a framework for the identification of the key contents of the concept. Of significance is the need for researchers to be aware of the complementary studies of the “normal” domains. Future research may require a more cosmopolitan approach, incorporating a combination of social psychology and entrepreneurship disciplines.

This research makes the following contributions:

First, this paper provides a wider understanding of social norms and how and when these affect entrepreneurial intentions. By providing a concise working definition of social norms, this paper analyses why it is important for developing entrepreneurial intentions to start a firm as well as to policy-makers and regional development to understand how societal norms can inhibit entrepreneurial activity. The intention models are widely used and tested (e.g. Ajzen 1985, 1991; Ajzen-Madden 1986, Krueger 1993, 1994, Krueger et al. 2000) but they still leave some unanswered questions about behaviour and the factors that influence it. Ajzen and Fishbein modified their model as recently as 2005. Their latest model presents background factors and normative and behavioural beliefs.

Second, the paper analyses why norms are important to entrepreneurial intentions. This paper also offers a discussion of how entrepreneurial intention models could be developed to better understand the role of social norms.

Third, studies typically discuss social norms in relation to the particular discipline, study level and context and that a set definition for such is not required, only an identification of operationalisation or conceptualization. Therefore this study does not create a new definition of social norm and does not select an existing definition from the literature as doing so limits the application and understanding of the concept specific to its use. This study identifies an appropriate operationalisation and conceptualization of social norms. This discussion of
definitions should provide a wide understanding of the social norm concept to the development of entrepreneurial behaviour.

Using customer relationship management as a vehicle to enhance the sustainability of small and medium tourism enterprises in the Eastern Cape, South Africa: Towards a conceptual framework

by Dinesh Vallabh and Laetitia Radder

Abstract
This paper reports on the initial stages towards the development of a conceptual framework that can determine the use of CRM as a vehicle to enhance the sustainability of small and medium tourism enterprises in the Eastern Cape South Africa.

Tourism is widely acknowledged as one of the economic drivers for South Africa. One of the challenges identified is the importance of supporting emerging tourism entrepreneurs and of maximizing opportunities for the SMME sector. The province of the Eastern Cape (EC) is characterized by high levels of unemployment, poverty and crime. The role of SMTEs is imperative in attempting to alleviate poverty and create jobs. The role of CRM in the success of SMTEs has been proven worldwide. The research highlights using CRM as a vehicle to enhance sustainability of SMTEs in the EC. A conceptual framework is proposed. The study will follow both a quantitative and a qualitative approach. The study is expected to add to the body of knowledge that attempts to make SMTEs sustainable in the South African context. This is part of a phased study.

Dinesh Vallabh is a senior lecturer in Marketing in the School of Tourism and Hospitality, Walter Sisulu University, South Africa. His research interests include consumer behaviour, strategic marketing and small business. He also serves as a city councillor. He represents Buffalo City Municipality of South Africa on tourism and local economic development as well as development planning.

Laetitia Radder is a professor in Marketing in the Department of Marketing, Nelson Mandela Metropolitan University, South Africa. Her research interests include consumer behaviour, and services and experience marketing in retailing and tourism.

JSBM Research Area: Small Business Technology and Innovation
Introduction

The South African tourism industry is one of the country’s leading economic growth sectors, not only because of its contribution to the gross domestic product, but also because of its creation of sustainable jobs, particularly in the small, medium and micro-enterprise sector (Focus on Buffalo City, 2005). Research conducted by the World Travel and Tourism Council highlighted that by 2010 more than 174,000 direct new jobs will be directly created and a total of 516,000 employment opportunities will be generated as a result of tourism activities. The majority of these new jobs are expected to be found within the SMME industry (Thomas, 2003).

Tourism is widely acknowledged as a strategic priority and potentially one of the economic drivers for South Africa in the 21st century. Since 1994, new policy frameworks have been put in place to guide the development of the country’s SMME economy and change the direction of the tourism industry. The White Paper on the Development and Promotion of Tourism is the core of South Africa’s new tourism policy. It identifies tourism as a priority for national economic development (Thomas, 2003). Creating an enabling environment in terms of national, regional and local policy frameworks for SMME development is an important priority. Furthermore, through the White paper, important initiatives were brought about in addressing historical industry imbalances resulting from a discriminatory political system. Important initiatives included tourism entrepreneurship, human resources development, equity and ownership among disadvantaged individuals and communities (South Africa, 1999).

Several key constraints are seen to limit the effectiveness of the tourism industry in playing a more meaningful role in the national economy. The major constraints include: inadequate resource-funding by government; lack of involvement of the private sector; limited integration of local communities and previously neglected groups into tourism; inadequate or absence of tourism training, education and awareness; inadequate protection of the environment through environmental management; poor level of service standards within the industry; lack of infrastructure in rural areas; lack of appropriate
institutional structures; and the problem of violence, crime and the security of tourists (South Africa 1996). The White Paper aims to chart a path towards changing the tourism industry in South Africa and offers proposals to unblock constraints within the context of objectives for reconstruction.

At the heart of national government’s SMME support programmes are the policy interventions introduced by new institutions and structures which were set up to implement the national SMME strategy. The key players were the Ntsika Enterprise Promotion Agency, which was responsible for non-financial or business development services, and Khula Enterprise Finance, which functions as a wholesale finance institution supporting a range of retail finance intermediaries which would deal directly with the SMME entrepreneurs themselves. Support focused on improved and decentralised access to information, training, markets, finance and technology, improvements in business infrastructure, the market environment, and the strengthening of networks between enterprises (Thomas, 2003). The institutional support network that was created through the White Paper was to nurture the sustainability of South Africa’s SMME economy. One of the key challenges identified by the Department of Tourism and Environmental Affairs (DEAT, 2000) is the importance of stimulating and supporting emerging tourism entrepreneurs and of maximizing opportunities for the SMME sector.

The Eastern Cape Province (EC), economically the poorest province in South Africa, is characterized by high levels of unemployment, poverty and crime. These factors impact negatively on the economy and become problematic to the sustainability of SMTEs. Poor service level standards were identified as one of the barriers that need to be addressed to facilitate tourism-related product development in the EC. Nelson Mandela Bay Tourism research indicates that service levels in restaurants were below par. Furthermore, in 2008, a skills shortage among tourism organisations, municipalities, communities and management implementation levels was reported (Porter, 2008).

Tourism in the EC has the potential to generate billions of revenue. Further development is a critical priority for future prosperity, while an aggressive strategy for
improving all aspects in the industry is important for attaining economic growth. The high levels of unemployment and poverty are central issues currently addressed by government. The EC as a whole suffers from high rates of unemployment and widespread poverty. With 71 percent of the population earning less than the household subsistence level, poverty alleviation and job creation are a high priority (Focus on Buffalo City, 2006).

The role of entrepreneurship and SMTEs cannot be over-emphasized in attempting to alleviate poverty and create jobs. Entrepreneurship and the development of small and medium enterprises (SMEs) has become a dominant theme of development economics in the developing and developed world (Tassiopoulos, 2008). Furthermore, SMEs are well recognized and acknowledged as significant contributors to economic development, employment, health and welfare of the economy. Ntsika (in Tassiopoulos, 2008) indicates that SMEs are being targeted as a means of stimulating economic growth, creating employment and raising the standards of living for many South Africans in rural and urban areas. Furthermore, SME development is seen as a low-cost means of addressing geographic inequalities and promoting entrepreneurial activity to build the economic strength of the country.

The benefits of a burgeoning small business sector are especially relevant to the current economic situation in South Africa. Given South Africa’s legacy of big business domination, constrained competition and unequal distribution of income and wealth, the small business sector is seen as an important force to generate employment and more equitable income distribution, to activate competition, exploit niche markets, and enhance productivity and technical change. In addition, the SMME sector provides a highly effective vehicle for black economic empowerment (Chabane, 2003)

The South African tourism industry is numerically dominated by Small and Medium Tourism Enterprises (SMTEs) which underpins the delivery of the tourism product. This is typical in most countries and is particularly important in destination development. However, SMTEs have to increasingly cope with political, economic,
environmental, social, technological and innovation challenges as well as those related to
distribution handicaps, and seasonality of supply and demand (Buhalis, 1994; Europe
Direct, 2003 in Tassiopoulos, 2008). In addition, Tassiopoulos (2008) suggests that
SMTEs fail due to lack of proper business support structures, communication, aftercare,
access to information, provision of infrastructure and service support, managerial
competence and experience.

In 2008, South Africa’s Department of Environmental Affairs and Tourism
(DEAT), highlighted service excellence as a strategy for increasing tourism to the
country. Furthermore, it was emphasized that customer service is one of the critical skills
lacking as there has been a lack of underlying service ethos which prevails across the
board in the country. These statements stem from a competitiveness rating in which
South Africa was rated number 62 out of the 124 countries assessed. Van Schalkwyk,
Minister of Environmental Affairs & Tourism (2008) reported that an audit into the skills
levels indicated that service excellence was one of the crucial ingredients in sustainable
tourism growth. The audit also highlighted the need to urgently develop a customer
service programme and transform South Africa into a globally competitive service
economy and destination of choice.

Given tourism’s role in economic growth and in addressing economic
development, poverty and unemployment in the EC, it becomes imperative to investigate
avenues for enhancing its sustainability, particularly of SMTEs in the EC. Tourism is a
growth sector in the EC economy and with its employment intensity, significant
unrealized potential and linkages to the rural economy has been identified as a priority
sector for the province. THETA (2009a) indicates that formal SMTEs in the EC
including franchisees amounts to 6.62% of all SMTEs in South Africa. Furthermore,
according to THETA (2009a), the largest number (74%) of SMTEs, employing less than
50 employees, operate within the Hospitality sub-sector. The Hospitality sub-sector,
similarly, has the largest number of SMMTEs that employ 150 and more employees.
The role of CRM in the success of SMTEs has been proven worldwide. For example, Massey, Montoya-Weiss and Holcom (2001) observe that CRM encourage companies to serve customers more effectively by bolstering business systems and thereby become truly customer-centric. Furthermore, Ozgener and Iraz (2005) in their study of SMTEs in Turkey found that business dynamics play a critical role in customer relations. They identified CRM as a key driver of SMTEs. As far as could be determined, the role of CRM in the success of SMTEs in South Africa has not been investigated in any depth.

The question, therefore, arises as to how SMTEs in the EC, a province in dire need of growth, can become sustainable? Given the proven importance of CRM, it needs to be determined if, and how, CRM can enhance the continued existence and growth of these enterprises.

The main problem can thus be stated as follows:

Can CRM be used as a vehicle to enhance sustainability of SMTEs in the EC and if so, how?

In addressing the problem statement it, however, has to be borne in mind that successful implementation of CRM, requires of organizations to first determine whether CRM fits into their overall business strategy, their current CRM capabilities, and whether they have a business reason for implementing CRM. Despite the prominence given to CRM, not all organizations are necessarily ready to implement such a strategy (Tie, 2003). Entrepreneurs must examine how critical CRM is to the survival of their business. They should consider whether increased competition, the growing cost of customer acquisition and high customer turnover are indeed major issues which they can address by means of CRM.
The meaning of CRM

CRM is a holistic approach to managing customer relationships to create shareholder value. It uses marketing strategies and IT to create profitable, long term relationships with customers and other key stakeholders (Payne & Frow, 2005). CRM is an active, participatory and interactive relationship between the business and customer. Ozgener and Iraz (2006) observe that the focus should be on customer needs rather than product features. This means moving from a product orientation to customer orientation.

The role of CRM

CRM is currently a popular topic in the fields of business strategy, marketing management and information technology. SMEs are embracing CRM as a vital aspect of business strategy because technological applications permit a precise segmentation, profiling and targeting of customers and because competitive pressures require a customer-centric culture (Ozgener & Iraz, 2006). Lindgreen (2004) asserts that if CRM is applied correctly, it can contribute exceptional economic value to the company as well as add to its competitive advantage. Implementing CRM systems can enhance an organisation’s ability to improve customer service, which can in turn generate revenue, which enhances sustainability.

However, not all organisations that implement CRM have been successful. Re-engineering a customer-centric business model requires cultural change and the participation of all employees within the organisation. Successful implementation of CRM means that some jobs will significantly change. Management must show its commitment to an ongoing company-wide education and training program. In addition to enhancing employee skills and knowledge, education boosts motivation and commitment of employees and reduces employee resistance (Morphito, 2008).

Challenges and barriers to CRM success

Payne (2006) stresses that many CRM failures can be avoided by paying more attention to the organisational issues involved in assessing the readiness for CRM; addressing the project management and change management requirements; understanding
the role of employees and planning; and carefully executing and evaluating the CRM programme. Successful CRM implementation is preceded by the development of a clear, relevant and well-communicated CRM strategy.

Light (2003) and Payne (2006) raise the question of organisational maturity and organisational information technology selection, implementation and usage capabilities. The stage of CRM development or readiness, is therefore also critical. Payne (2006) maintains that when reviewing CRM readiness it is useful to consider the barriers typically faced by other organizations in developing their CRM programs. A number of common barriers to CRM success have been identified: lack of skills; inadequate investment; poor data quality and quantity; failure to understand the business benefits; functional boundaries; lack of leadership.

These barriers can help explain why CRM has become a critical business issue. However, the problem faced by many companies, both in deciding whether to adopt CRM and in proceeding to implement it, stems from the fact that there is a great deal of confusion about exactly what CRM is. Payne (2006) suggests that this confusion may be explained by three factors as listed below.

- The lack of a widely accepted and clear definition of its role and operation within the company.
- An emphasis on information technology aspects rather than its benefits in terms of building relationships with customers.
- The wide variety of tools and services offered by information technology vendors, which are often sold as CRM.

CRM entails getting closer to customers and gaining an in-depth understanding of their situations, motivations and behaviours. While sophisticated technological tools and techniques have made this task easier, the secret of success lies in their specification, integration and careful implementation.
**CRM strategy**

Just as building a house first requires an architectural plan, successfully implementing CRM must be preceded by a sound CRM strategy. Kumar and Reinartz (2006) highlight that a CRM strategy requires the following four components.

- A customer-management orientation: customer-management orientation recognizes that customers are heterogeneous in needs and value to the company. Furthermore, customer orientation reflects a readiness to treat different customers differently.

- Integration and alignment of organizational processes: all departments and functions must be involved in a strategic initiative.

- Information capture and alignment of technology: information capture and alignment of technology can be used to make customer management processes more effective.

- CRM strategy implementation: the implementation of CRM pertains to the processes and activities required for a successful CRM strategy.

Kumar and Reinartz (2006) highlight that each component plays an essential role. Each component should interact and reinforce each other for CRM to succeed as shown in Figure 1.
Research Aim and Objectives

As the literature on SMTEs and CRM did not provide an answer to the research question, therefore, further research is deemed necessary. It is important to provide SMTE organizations in the Eastern Cape with a simplified diagnostic and development model that can assist them in their decisions on CRM. To this effect, the following steps would be required.

- Examine the role of SMTEs in the tourism industry of the EC.
- Establish a profile of SMTEs in the EC (e.g. number of employees, annual turnover and total gross asset size)
- Identifying the elements and requirements of CRM strategy (study

Source: Kumar & Reinartz (2006)
assumes that some form of CRM will result in a sustainable SMTE, however, the measurement of sustainability is not considered to be within the parameters of the study

- Identify environmental constraints (micro, market and macro) that impact SMTEs, particularly in the Eastern Cape
- Identify potential CRM strategies given the environmental constraints and opportunities and the stage of SMTE development
- Determine the current levels of implementation in SMTEs in the EC
- Integrate the knowledge resulting from the preceding objectives to serve as a foundation of the development of the proposed model

**Conceptual framework to service as basis for the model development**

Stefanou and Sarmaniotis (2003) alleges that CRM as an emerging discipline is in great need of theoretical assistance. According to them, internationally, guiding theories and models are lacking. A few seemingly useful models that could be serve as input into the development of the required model found are those by Stefanou and Sarmaniotis (2003); Chen and Popovich (2003); Nguyen (2007); Winer (2001); Park and Kim (2003); Payne and Frow (2005) and Tie (2003).

The framework shown in Figure 2 is modeled on that developed by Stefanou and Sarmaniotis, (2003) and Saayman and Snyman (in Tassiopoulos, 2008). The work by Stefanou and Sarmaniotis (2003) focused on exploratory research based on a mail survey addressed to the largest 1,000 organizations in Greece. They proposed a conceptual model of CRM development stages of CRM. On the other hand Saayman and Snyman,(in Tassiopoulos, 2008) identified various strategies that an entrepreneur can implement in order to grow or sustain growth of a business. They analyse key stages of growth with both barriers and challenges to growth.

Chen and Popovich (2003) proposed an integrated approach to managing relationships by focusing on customer retention and relationship development. They claim that CRM as a technology-only solution is likely to fail. Furthermore, managing a
successful CRM implementation requires an integrated and balanced approach to technology, process and people. In addition, Chen and Popovich’s model focuses on the implementation of CRM.

Nguyen (2007) suggested that CRM is an information system that tracks customers interactions with the firm. He puts forward strategies for successful implementation of CRM and discusses barriers to CRM in e-business. The model depicted focuses on customer segments and channel maps.

Winer (2001) indicated that there is a strong, positive relationship between customer satisfaction and profits. He expresses that managers must constantly measure satisfaction levels and develops programmes that help to deliver performance. He presents a comprehensive set of relationship programmes which includes customer service, loyalty programmes, customization, reward programmes and community building.

Park and Kim (2003) put forward a customer information system (CIS) which manages and distributes customer information. They identify a gap between marketing and information technology as a barrier in implementing a successful CIS. A framework of dynamic customer relationship management is developed which is supported by an information technology strategy.

Payne and Frow (2005) developed a conceptual framework for CRM that helps broaden the understanding of CRM and its role in enhancing customer value and shareholder value. They identify five key cross-functional, process orientated approaches that positions CRM at a strategic level. These approaches include: a strategy development process, a value creation process, a multichannel integration process, an information management process and a performance assessment process. The conceptual framework is based on these processes and explore the role and function of each element in the framework. Given the nature of their framework, it is expected that this structure could be useful in informing the current research
Tie (2003) observed that unlike large companies, SMEs do not possess sufficient technology know-how, resources and information technology personnel to implement a CRM programme. As a result, most SMEs cannot afford such expensive CRM products that are offered by traditional CRM vendors. Tie mentions that a typical in-house CRM system development approach widely employed by large firms is unlikely to be applicable to SMEs. Tie recommended using application service providers (ASP) which is an effective approach that SMEs can employ in order to benefit from CRM.

Based on the preceding discussions on the characteristics of SMTEs, the elements of CRM and CRM models, a proposed conceptual framework is shown in Figure 2. Since no model addressing the research question of the current research could be found, a conceptual framework expected to serve as a foundation for the development of a model addressing the needs and objectives of the study is proposed as shown in Figure 2 is put forward.
A conceptual framework of CRM for SMTEs

**MICRO & MARKET FACTORS**

- Business Strategy
- Customer Strategy
- Size of Company
- Information Technology
- Organisational Readiness
- Employee Motivation
- Change Management
- Customer Demographics
- Segmentation
- Customer Value
- Multi-channel Integration
- Performance Assessment

**GROWTH PHASES OF SMTEs**

- Survival
- Profitability
- Growth
- Maturity
- Rejuvenation

**MACRO ENVIRONMENT**

- Technological
- Economic
- Social
- Physical
- Government
- Intern

Source: adapted from Saayman in (Tassiopoulos (2008); Stefanou & Sarmaniotis (2003))
A number of market and micro variables form part of the conceptual framework shown in Figure 2. Careful analysis of each of these variables are required as these variables will have a profound impact on the customer experience (Chen & Popovich, 2003; Park & Kim, 2003; Payne, 2006; Tie, 2003).

The macro-environment includes more general forces that do not influence the activities of the SMTE directly, but that may have an impact on its decisions. Tassiopoulos (2008) identifies six distinct sub-environments within the macro-environment with an influence on the operations of SMTES. These are technological, economic, social, physical, governmental and international variables.

Apart from the environmental factors, the stage of development of the organization also has to be taken into account when deciding on CRM as each stage poses unique challenges associated with sustainability. For example:

- The first CRM development stage is characterized by an absence of advanced information technology. Survival of the organizations is of paramount importance.
- In the second stage, profitability of the organization becomes more important.
- The third stage is focused on growth of the SMTE. Generally, IT-automated CRM becomes more important.
- The fourth stage is the maturity phase. The organization might need to modify its operations to maintain profitability. Integrated CRM could be associated with customer personalization and high levels of service and customer satisfaction.
- The fifth stage can be characterized by rejuvenation.

As it is expected that the challenges, opportunities and implementation of CRM will differ according to the phase of development, organizations will have to be classified into the different stages. This would allow for the focus of the model to be aligned with the characteristics of the particular phase.
Research design and methodology associated with the model development

In order to develop a useful CRM model, qualitative as well as quantitative approaches will be required. The process should commence with detailed analysis of existing models and theories to provide a basis for a conceptual framework of an anticipated CRM model applicable to SMTEs in South Africa, taking cognizance of the unique challenges in the environment. This process should be integrated with focus groups conducted with managers of SMTEs from each stage as indicated in Figure 2. These processes should allow for the formulation of hypotheses underlying the fundamental elements of the model. Quantitative data collected from a sample of SMTEs should then be used to test the hypotheses to arrive at a final CRM model.

Conclusions and managerial implications

This paper reports on the initial stages towards the development of a conceptual framework that can determine the use of CRM as a vehicle to enhance the sustainability of small and medium tourism enterprises in the Eastern Cape South Africa.

As a business strategy, CRM establishes the need to make customer satisfaction the company’s ultimate objective. The overall goal of CRM in SMTEs is to help organizations deliver a higher level of customer satisfaction than their competitors which would ultimately result in their sustainability. In order to achieve this, organizations first have to:

- determine whether CRM is required and viable given their particular situation;
- decide in which stage of development they find themselves and determine which challenges this stage pose to the implementation of CRM;
- analyze environmental factors that influence their decision-making; and determine the role of CRM
- determine the optimal implementation of CRM.

The study is expected to add to the body of knowledge that attempts to make SMTEs sustainable in the South African context. If the challenging issue of CRM implementation
can be successfully addressed, the failure rate among SMTEs could be dramatically reduced, contributing to the social and economic wellbeing of the South African community.

Innovation as a pre-condition for export activities of SMEs?  
- Evidence from the European Union -  

Christian Hauser*  
Kerstin Wagner**

ABSTRACT. The growing internationalisation of business and globalisation of trade are changing the competitive industrial environment for European small and medium-sized enterprises (SMEs). Technological innovation such as the introduction of new products and the improvement of a firm’s existing product range is considered to play a key role for a firm in the maintenance or improvement of its market position, particularly in competitive and saturated industries. In recent years, the relationship between innovation and export performance has therefore received growing attention in economic literature. However, the existing empirical results for single countries tend to be inconclusive stating a clear link between the two variables. In our study, we examine the relationship between product innovation and export intensity using data covering 2,813 enterprises from the manufacturing sector from the 27 Member States of the European Union. The results of our regression analysis show that the level of innovation activity seems to have a significant impact on the export intensity of a firm.

Women Entrepreneurship in Mongolia: The Role of Culture

Majid Aramand, Hannam University, Linton Global College, School of Global Business

Todd Terhune, Hannam University, Linton Global College, School of Global Communication & Culture

“We could start our business because the society encourages women to go outside and have jobs like men.”
-Erika, MBA, co-founder of Golden Gobi

Abstract
Building on psychological theories of creativity and entrepreneurship, this study examines the role of culture on women entrepreneurship in Mongolia. Based on several exploratory field trips to Mongolia, two woman-founded, woman-owned, entrepreneurial firms were identified and researched. The findings of the research show that beside factors predicted in the theoretical model (entrepreneur’s knowledge, motivation, personality and environment), an entrepreneur’s culture plays a major role in the creation and success of new entrepreneurial firms as well. Specifically, the Mongolian nomadic culture of adventurism, secular culture of empowerment of women and Asian culture of collectivism play significant roles in the creation of new firms and the success of female entrepreneurs in Mongolia.

Introduction
According to the UN country statistics, Mongolia is considered a landlocked developing country¹. Its GDP per capita is $3,400, ranked 160 in the world. Mongolia is in central Asia with an area of 1.56 million square km (one-sixth the size of the United States) and a population of only 3 million. For centuries, breeding livestock and agriculture has been the Mongolian traditional way of life. The current Mongolian economy, however, depends only 18.8% on agriculture and husbandry. The rest of the economy depends, 38.5% on industry and 42.7% on service².

---
² Source: CIA World Fact Book.
Although it is a developing country, Mongolia enjoys a 98% literacy rate: one of the highest literacy rates in the world, especially, literacy among women. Besides a broadly-educated population, Mongolia is a vast country with abundant mineral resources of copper, coal, gold, molybdenum, fluorspar, uranium, tin and tungsten. Mongolia also has a diverse nature (covered by steppes, desert, snow-capped mountains and glaciers, fresh-water lakes) and diverse wildlife (such as wild horses, argali, ibex, deer, and gazelles). These combined with the Mongols’ unique nomadic way of life creates a potential for tourism development. Therefore, despite all the shortages (such as poor infrastructure), the country has a great potential for development and progress.

In our field trips to Mongolia and direct observation of Mongolian businesses and Mongolian way of life, we noticed that in both rural and urban areas, women are actively involved in all aspects of their society’s life. For instance, in rural areas women are not only actively involved in the day-to-day family business affairs, they also play a key role in making family business decisions such as buying equipment, selling or buying livestock or migrating to a different location. On the other hand, in urban areas such as the capital Ulaanbaatar, many women are particularly active entrepreneurs involved in all sorts of entrepreneurial activities including tourism, production, manufacturing and trade.

These observations motivated us to raise and research the question ‘what role does Mongolian culture play in women entrepreneurship in Mongolia?’ To answer this question, we chose two woman-founded and woman owned companies: Tseren Tours, one of the biggest tour companies in Ulaanbaatar and Golden Gobi, a well-known guest house and tour company in Ulaanbaatar,
founded and run by three sisters. First, in our trips to Mongolia in summer 2008 and 2009, we visited and discussed with co-founders of these firms. Then, back in our university we developed a theoretical model and we interviewed the co-founders of these companies again. The result of this study is reported in this paper in the following order: theoretical background, empirical research and findings, discussion, conclusion and need for further research. This paper contributes to three strands of literature: entrepreneurship in developing countries, women entrepreneurship and entrepreneurship and culture. Thus, we adopted a multidisciplinary and qualitative method of inquiry in this study.

**Theoretical Background**

**Entrepreneurship and economic development**

There is little disagreement in the literature that entrepreneurship contributes to the development and growth of national economies (e.g. see, Anokhin et al., 2008; Holcombe, 1998; Naude, 2009). For instance, Acs et al. (2008) argue that ‘entrepreneurship is considered to be an important mechanism for economic development through employment, innovation and welfare effects” (p. 219). Similarly, scholars have consensus that entrepreneurship plays a vital role in the economic development of developing countries. Bertaux and Crable (2007) for instance argue that ‘entrepreneurship is the foundation of a new model of development for developing countries’ (p. 467).

**Women entrepreneurship**

In developing countries, as Self and Grabowski (2009) argue, gender inequality and the lack of gender development are major problems. In developed countries, studies show that women entrepreneurship can provide jobs for more women and contribute to economic stability and
economic development. For example, the findings of an empirical research on 400 female owner-managers of businesses in Quebec City, Canada, show the significant role of women entrepreneurs in the stability of small businesses and sustainability of the local economy (Lee-Gosselin and Grisé, 1990). Another study done by Wells et al. (2003) on 561 women entrepreneurs in Russia shows the significance of women-owned businesses to the Russian economy. According to this study, more than two-thirds of these firms had 10 or more employees, mostly women, providing employment and social services no longer provided by the state to fellow-women (Wells et al. 2003: 70). Therefore, entrepreneurship, not only in developing countries but also in developed countries, can become an important mechanism to overcome gender inequality.

**Male and female entrepreneurs**

Studies show some dissimilarity in the motivations for business entry of male and female entrepreneurs. For instance, research conducted by Buttner and Moore (1997) on 129 executive women who left large organizations to become entrepreneurs shows most women in this study were motivated by the desire of avoiding gender discrimination in the workplace as a major obstruction to their self-determination and career advancement. Males becoming entrepreneurs share some of these motives, like desire for challenge and self-determination or desire for career achievement; however, since they face less gender discrimination in workplaces, avoiding discrimination is not a major motive for them to start a new business. Meanwhile, most studies show more similarities between male and female entrepreneurs in psychological characteristics and common operational problems perceived by business owners, like marketing, accounting and management problems (Stevenson, 1986).
Entrepreneurial firm

An entrepreneur is an individual who establishes and manages a business for the principal purposes of profit and growth (Carland et al., 1984: 358). Business here is referred to as an entrepreneurial firm. According to Covin and Slevin (1991: 19), “firms with entrepreneurial postures are risk taking, innovative, and proactive. An entrepreneurial firm’s economic performance is generally acknowledged to have two primary dimensions - growth and profitability. The financial criteria implied by these dimensions would include, for example, sales growth rate, return on assets, and the profit-to-sales ratio and the prospect of favorable ratings on such criteria must be regarded as a key reason why firms engage in entrepreneurial behavior.” Therefore, an entrepreneur’s success depends on two major factors: 1) creation of an entrepreneurial firm and 2) a firm’s growth and profitability.

Entrepreneurship and creativity

According to Schumpeter (1934), an entrepreneurial venture leads to the introduction of a new product; or the introduction of a new method of production of an existing product; or the creation of a new market for an existing product. Establishing a new venture that leads to one of these outcomes requires entrepreneurial creativity. An influential creativity theory that is applicable to entrepreneurial creativity is confluence theory. Confluence theory incorporates cognitive and environmental factors that influence individual creativity. This theory has gained increasing acceptance in recent years in entrepreneurship discipline (Baron and Shane, 2008). According to this theory, creativity requires a confluence of six distinct but interrelated resources (Sternberg, 2006; Sternberg and Lubart, 1991, 1995): intellectual abilities (the ability to think about new ideas and identify suitable ideas); knowledge (expert knowledge about new idea); styles of thinking (preference and decision to think in new ways); personality (personality attributes for
creativity such as willingness to overcome obstacles, willingness to take sensible risks, willingness to tolerate ambiguity and self-efficacy); \textit{motivation} (intrinsic, task-focused motivation essential to creativity such as focus on work rather than the potential rewards); and \textit{environment} (that is supportive and rewarding of creative ideas).

\textbf{Psychological theory of entrepreneurship}

Although creativity is important to the creation of a new venture, there are other individual factors that play a role in the creation and success of a new venture firm as well. Theories in entrepreneurship that pay particular attention to the attributes of individual entrepreneurs for the creation and success of new ventures are psychological theories. These theories assume that fundamental attributes of people determine who becomes an entrepreneur (Shane, 2000). According to these theories, major personal attributes that distinguish entrepreneurs from others include need for achievement, self-efficacy, locus of control, willingness to bear risk and tolerance for ambiguity (Begley and Boyd, 1987; Brockhaus, 1982; Brockhaus and Horwitz, 1986; Chen et al., 1998; McClelland, 1961; Shane, 2000).

Self-efficacy is an individual’s belief about his or her capability to begin and to perform a task successfully. For instance, an entrepreneur’s inner belief in him or herself that he or she can start a new venture company and can make it a successful business. Studies show that self-efficacy is positively related to the intention to set up a new business. For example, a study conducted by Chen et al. (1998) on students in management and organizational psychology shows that students who studied entrepreneurship and were business founders had higher self-efficacy in innovation and risk-taking than those who did not study entrepreneurship and were not business founders.
In a related vein of argument, Brockhaus and Horwitz (1986) argue that entrepreneurs who have a high belief in their abilities to influence the achievement of business goals (the outcomes), their perceived possibility of failure are relatively low. Consequently, their perceived level of risk is lower than that of non-entrepreneurial personalities as well. In other words, an entrepreneurs’ willingness to take risks is higher than those of non-entrepreneurs. A survey conducted by Jennings et al. (1994) on 19 independent entrepreneurs and 20 intrapreneurs (entrepreneurs working in large corporations) shows that 75 percent of independent entrepreneurs consider themselves risk-takers and having the ability to influence the outcome of their business goals. For example, one of the respondents to this survey, Peter de Savary, points out:

“I suppose I’m a risk-seeker. Business is like chess and you’ll find a lot of entrepreneurs play chess... It’s something that you are born with, it’s not something you can ever learn” Jennings et al. (1994: 116).

Another important characteristic of entrepreneurs is tolerance for ambiguity. At firm level, Alvarez and Busenitz (2001) argue that causal ambiguity – the uncertainty regarding the causes of efficiency differences among firms – may be the essence of entrepreneurship because it prevents other firms from imitating. At individual level, similarly, Begley and Boyd (1987) argue that opportunity exploitation involves ambiguity, and people who have a greater tolerance for ambiguity may be more likely to exploit opportunities.

The last characteristic of entrepreneurs that has been widely discussed in psychological theories for decades is motivation. McClelland (1961), for instance, argues that “high achievement
motive” is a driving force for entrepreneurs to gain economic achievement by seeking opportunities. Current research also shows that intrinsic need for achievement is a driving force for entrepreneurial success. For example, a longitudinal study conducted by Sibin Wu et al. (2007) on nascent entrepreneurs in a metropolitan area of a mid-western state in the US shows need for achievement is positively related to entrepreneurial persistence; meaning, entrepreneurs who have a higher level of need for achievement, stay in business longer and consequently, have a higher chance of success.

**Culture and entrepreneurship**

Culture is referred to as collectively held values that distinguish the members of one human group from those of another (Hofstede, 1980). The cultural orientation of a society reflects the complex interaction of values, attitudes, and behaviors displayed by its members (Adler, 2008; Hofstede, 1998). Therefore, as Rogers and Steinfatt (1999) argue, culture has very powerful effects on individual behavior including entrepreneurial behavior. As Anisya and Mueller (2000) argue that entrepreneurs, like their managerial counterparts, while they might share some universal traits [like attitudes toward achievement, affiliation, autonomy and dominance], they reflect the dominant values of their national culture. For instance, a study done by Redding (1980) shows Asian entrepreneurs rely on familial ties in developing their businesses. Or, another study conducted by Min and Bozorgmehr (2003) on Korean and Iranian immigrant entrepreneurs in Los Angeles, US, shows a significant difference between these two groups. For example, Korean immigrants rely on ethnic resources, whereas Iranians rely on class resources. Korean businesses are smaller, concentrated, and serve more co-ethnic low-income minority customers, while Iranian immigrants are larger, mores dispersed and largely serve white customers. With all other
factors being equal, we can assume that the Korean and Iranian cultures are the major factors influencing the behavior of Korean and Iranian entrepreneurs in Los Angeles.

**Theoretical model**

The role of culture on entrepreneurship has been studied by some scholars (e.g., see Hayton et al., 2002); however, it is still under-studied and under-researched. Therefore, based on cultural and psychological theories of entrepreneurship [discussed above] we developed the following model.

As shown in figure 1, creation of a new firm and subsequently the success of the entrepreneur are our dependent variables. Independent variables are entrepreneur’s knowledge about business, entrepreneur’s motivation, entrepreneur’s personality, entrepreneur’s environment (e.g., family environment, society and national economy). Entrepreneur’s culture is a control variable that influences entrepreneur’s knowledge (e.g., tacit knowledge about business), motivation (e.g., whether to become an entrepreneur or not), personality (e.g., the degree of taking risks) and environment (e.g., family supports for starting a business).

![Figure 1: Theoretical model: the role of culture on entrepreneur’s success](image-url)
**Empirical Research**

**Research methodology**

The method we used to examine the above model (Figure 1) is a combination of field research combined with case study method. A case study inquiry allows investigating a contemporary phenomenon within its real-life context, especially when the boundaries between phenomenon and context are not clearly evident (Yin, 2003: 13). If we consider entrepreneurial behavior [that leads to entrepreneur’s success] as a phenomenon and entrepreneur’s national culture as a context, we realized that the boundaries between these two are not clear. Mongolian culture, like other Asian collectivistic cultures, is a *high-context* culture (Rogers and Steinfatt, 1999). In high-context cultures, according to Edward T. Hall (1989, 1976), communication or message is one in which most of the information is either in the physical context or internalized in the person, while very little is in the coded, explicit, transmitted part of the message. The behavior of individuals in this context is influenced by explicit and uncoded cultural elements that cannot thoroughly be captured by quantitative methods such as a survey research. Thus, to study the interaction between culture and individual behavior of entrepreneurs we need to utilize research methods such as a field survey or a case study that allow us to have more in-depth observations.

**Research design**

According to theoretical model (Figure 1), we designed a semi-structured questionnaire. As shown in table 1, for examining entrepreneur’s knowledge background and level, we asked a couple of questions about whether she had relevant education and relevant work experience prior to beginning the business. To examine entrepreneur’s personality, we used the “Big Five” traits model. This model is supported by an impressive body of research and encompasses most of
significant variation in human personality (Barrick and Mount, 2005; Robbins and Judge, 2010). The Big Five model consists of five dimensions (Barrick and Mount, 1991): *Extraversion* (being ambitious, initiative, sociable, exhibitionist, gregarious, assertive, talkative and active); *Emotional Stability* (being anxious, depressed, angry, embarrassed, emotional, worried and insecure); *Agreeableness* (being courteous, flexible, trusting, good-natured, cooperative, forgiving, soft-hearted and tolerant); *Conscientiousness* (being dependable, careful, thorough, responsible, organized and planful); and *Openness to Experience* (being imaginative, cultured, curious, original, broad-minded, intelligent and artistically sensitive). Based on this model, as shown in Table 1, several questions were outlined to examine the personality of female entrepreneurs.

As discussed before, motivation is a driving force for entrepreneurial activities and personal achievement. Motivation is the processes for an individual’s intensity, direction, and persistence of effort toward attaining a goal (Robbins and Judge, 2010). Frederick Herzberg’s two-factor theory, also known as *motivation-hygiene* theory, is one of the well-known motivational theories, which was developed from a large pool of empirical data. According to this theory (Herzberg, 1959, 2003), people are motivated by a combination of *intrinsic factors* (motivation factors) such as achievement, recognition and responsibility—and *extrinsic factors* (hygiene factors) such as supervision, pay, company policies and work conditions. In most studies on personality of entrepreneurs, intrinsic factors have been emphasized as the main motivational factors for entrepreneurs versus non-entrepreneurs or managers. As shown in Table 1, based on a two-factor theory, several questions were outlined to examine whether female entrepreneurs have intrinsic or extrinsic motivations.
There are five environmental factors, frequently cited in the literature, that play a role in the development of entrepreneurial firms (Gnyawali and Fogel, 1994): *government policies and procedures* (such as restrictions on imports and exports, provision of bankruptcy law, entry barriers); *socioeconomic conditions* (such as public attitude toward entrepreneurship, existence of persons with entrepreneurial characteristics, diversity of economic activities and extent of economic growth); *entrepreneurial and business skills* (such as technical and vocational education, business education and availability of information); *financial support to businesses* (such as low-cost loans, venture capital, alternative sources of financing); and *non-financial support to businesses* (such as counseling and support services, entrepreneurial networks, government support programs, tax incentives and exemptions and entrepreneurial networks).

For culture, we did not use any theory. As Peterson (1988) argues, ‘the U.S. culture of individualism and achievement has dominated the world view of entrepreneurship’. To reduce this bias, we decided just to ask entrepreneurs what role they think Mongolian culture played in the creation and success of their businesses.

Case 1: Tseren Tours

In 1991, Rik Idema quits his job in The Netherlands to fulfill his lifetime dream: “bicycle touring around the world”. In 1992, while peddling in Mongolia, he meets Tseren Enebish, his future wife. Two years later, in 1994, they receive an offer from a Dutch company to organize cycling trips in Mongolia. They decide to take this opportunity and establish a company called Tseren Tours, named after the co-founder. For the first time, in 1994, by using the license of another tour agency, they organize a 3-week mountain bike tour through central Mongolia. The next year, they expand their business and start to bring groups of adventure seekers directly from Europe. In 1996, they expand their touring territories and go to the far western provinces to research hiking possibilities in the high Altai Mountains so that they could offer original itineraries. In 1997, by the request of ex-mountain climbers, they organize their first hiking tour in western Mongolia. In 2001, they organize their first “Horse Treks” for groups in the Hanggai Mountains and the Khentii Mountains. In 2002, for the first time, the company organizes a Fishing tour. In subsequent years, they add specialized activities such as canoeing and camel treks. They still continue expanding their services to the extent that in 2005, they organized two concerts in the Opera and Ballet Theatre for the famous Inner Mongolian singer, Urna, on her first visit to Mongolia (coming from China). Today, they offer a wide range of tour packages including Canoeing, Trekking, Horse Trekking, Special Interest Travel and Jeep Tours.

Interview with Tseren Enebish

Tseren was born in a small provincial capital, Bayanhongor. The co-author of this paper, Todd Terhune, had met Tseren on numerous occasions and knew her through trekking tours. Last summer, when both of us were in Mongolia, we did not have a chance to see and interview her
face to face (she was guiding a tour). Therefore, we decided to interview her via Skype video conferencing. This is what she said based on our semi-structured questions (Table 1):

"After I finished my basic education, in 1992, I entered fine art school and graduated. It was not an academic school but just a college. So, I don’t have any academic degree in fine art. Also, I haven’t done any formal business, tourism or English education either.

Before I started my business, I had no prior knowledge about the tourism business. About 17 years ago, not many people spoke in English in Mongolia. Hence, before starting my business, my huge interest in learning and speaking English helped me to go abroad—country to country, meeting other people and networking with other people. But when my husband and I started the business, we had a hard time because we not only didn’t have any work experience in Mongolia, but also, didn’t have any marketing strategy.

About motivation, my main motivation to start the business was curiosity. I’ve always wanted to travel new places around the world and wanted to know different kinds of people. In addition, in a closed country that I had grown up, communicating with other country was hardly imaginable thing to do at that time. So, I wanted to start to do something special like communicating with other people, with other language. And another big motivation was the desire to travel in my own country, Mongolia. At that time, I thought that I had never traveled in Mongolia before, although I lived in this country. So, this motivated me to start a tour business in Mongolia.

Besides, I cannot deny that one of my motivations was making money because I had to make a
living as well, at that time. I had no money when I started the business but money was never my first priority in starting the business.

Actually, I didn’t get any financial support from none of my family members for starting this business. But I’ve got emotional support from my mother specially. She still supports me emotionally. She helps me become emotionally stable when I am upset or stressed out. She does not judge me, always cheers me up by saying “everything will be fine, don’t worry”. Besides, I did not get any support from the Mongolian government for starting the business. Now they want to support me! And I can get support from the Mongolian government because my business is grown and is well-known. But at that time that I needed their supports, they did not give me any financial support to small and medium sized companies. Also, banks were same. They were not interested in lending any money to my small company. But after my company success and expansion, I could easily borrow money from the banks.

I consider myself as a very open-mined person. I am always open to new ideas and experiences so that I do not judge everything and everybody too fast. I am not authoritative person. I’ve never seen myself being a tough boss or stiff leader. To become an acquaintance with me, it’s easy, perhaps; but making friendship with me, is not so easy. I can talk with others easily but hard to make a close relationship with them. I wouldn’t say that I am very well organized and dependable person. But I am not sure that if I am a persistent person or not. (Interviewer: persistence means you do not give up easily. Once you start something, you continue until you finish it to achieve your goals.) In that case, I am a persistent person. And if I have troubles at work I wouldn’t keep it to myself. I have to speak about it. Lastly, about my self-confidence, I
would say “sometimes yes” and “sometimes no”. Sometimes, I think that I am very self-confident but sometimes I do not feel so confident.”

Case 2: Golden Gobi

Golden Gobi is tour and guesthouse company in Ulaanbaatar that offers a wide range of tour packages and affordable accommodations for independent and group travelers. It was founded in 2005 by N. Ulamtuya (known as Ogie) and her three sisters who originally came from countryside in south Gobi desert. To accommodate foreigners, in 1996, their uncle opened a company and named it after himself: Idre’s guesthouse. At that time, this kind of business was quite new in Mongolia. In the same year, Ogie and 16-year-old Erika started working for their uncle’s company. Ogie was working as an English translator and Erika as a Japanese translator. While working in Idre’s guesthouse, Ogie was volunteering for couple of charity organizations in the countryside. This gave her a chance to work with international volunteers as well.

In 2005, with over 10 years experience in tourism and hospitality and driven by the desire to support nomad families, Ogie opened “Golden Gobi” guesthouse. The name was chosen by their mother who always supported them emotionally and spiritually. In that year, they started their tour guide business with the help of siblings (a brother and three sisters) and few family drivers. Since Ogie knew all the shingles and pebbles in the country, they started organizing tours to every part of Mongolia. The first year, without any advertising or even having a website, they received several hundreds tourists from all over the world. In 2009 alone, they accommodated
more than 2000 tourists from all over the world and offered customized tours to more than 1000 tourists.

Now they are internationally recognized among tourists and travel agencies. They recently opened a second location Golden Gobi 2 in the capital. They have currently more than 30 drivers and 30 guides working for them who can speak English and Japanese well. Besides, they have several cleaning and laundry ladies and tour and office staffs. Most of their employees are their relatives coming from all over Mongolia (21 provinces), particularly, from their home country, south Gobi region. Like Tseren, we interviewed co-founder and younger sister Erika via Skype video conferencing. This is what she said based on our semi-structured questions (Table 1):

“I recently completed my MBA in international business management in Virginia International University, Virginia Fairfax city, USA. But before 2005, when we started this business, my sister and I didn’t have any degrees in business. Although my sister took some certificate course in business but it was not formal education. Instead, we were both English teacher before we started the business. I had a Bachelor degree in teaching English and my sister majored in teaching English.

Before my sister and I started this business, we worked in a tour company called: Edri Tour. It was my uncle’s company and probably was the first guest house in Mongolia. Although they were guest house, they also did works which were similar with what we are doing now: such as organizing trips, accommodating people, and managing tours not only backpackers but also VIPs. So, we had some prior knowledge about this business by working in our uncle’s company.
Before we started this business, we both were tour guide in my uncle’s company. And when we worked in that company, lots of people told to my sister that she could actually do this business on her own. People could easily notice her leadership and communication skills and her ability to make people to work together. So, she was motivated by other people’s encouragement. And another motivation was our willingness to provide the job and work to jobless people in Mongolia. At that time and even now, there are lots of jobless people, especially, in south Gobi area. So, as people who are originated from south Gobi region, we wanted to support nomads and people who live in the country side to earn extra money to sustain their livelihoods.

We got lots of support from our entire family member. As you know, Mongolian family culture is very united and very collectivistic culture. So, they easily support each other. Therefore, when we started this business, our whole family members supported us including my mother, father, brother, and sisters. Not only they supported us emotionally, but also they supported us financially and physically. But we didn’t get any financial or regulatory supports from the Mongolian government. Mongolian government might have some supporting programs for new venture entrepreneurs but we couldn’t get any supports from them.

Actually, lots of people emphasize that we are one of the kind and sociable people. And we both are very open minded and open to new ideas. We haven’t traveled much all over the world, yet. So, we try to travel a lot and often meet many people and experience other cultures. For that reason, we naturally have to be open minded and sociable people. And we easily trust our colleagues so we never force our workers to work for us. My sister, in fact, is very self-confident, in a way that, she always does her work confidently.
I cannot deny the fact that Mongolian culture helps us a lot to start and run our business. Mongolian culture is amazing, especially, the Mongolian hospitality culture helped us a lot and still it does. For example, when we travel to country side, Mongolian nomad families always welcome us and offer us their food and shelters (in many cases for free). But this offering is hard to imagine in Western individualistic culture, like the USA. And also nowadays, changing status of women helped us a lot to start and run our business. Actually, Mongolian culture is very similar in the other Asian culture when it comes to women’s social status. So, until the end of the communist era, Mongolian were clearly separated the role of men and women—so that, women could only do housework like cleaning the house, raising children and staying at home. But nowadays, things have changed a lot. Women are freer to express their self and freer to voice their opinion. Hence, we could easily start the business because the society encourages women to go outside and have jobs like men.”

Discussion

Entrepreneur’s knowledge

The findings of the interviews are summarized in Table 2. With Tseren Tours, the entrepreneur had little, if any, prior knowledge about tourism and hospitality before starting her business. With Golden Gobi, however, the original founder of the business (the elder sister, Ogie) had extensive relevant work experience (tacit knowledge) about this type of business. Given the achievement that Tseren Tours had in establishing themselves as a successful tour company in Mongolia, importantly, not changing their business model, we may argue that the prior knowledge of the entrepreneur played an insignificant to a moderate role in the creation of a new venture firm. At the same time, however, we may argue that it played a significant to major role
in the success and growth of a new firm. For instance, in our interview, Tseren emphasized that due to a lack of knowledge of marketing strategy, managing the firm was a very difficult task for them. Golden Gobi co-founder also emphasized that the main reason that she decided to go to a graduate school in the USA and obtain an MBA degree was the need for having relevant knowledge about managing and running their business. These findings are in accord with previous studies by Stevenson (1986) that even though women entrepreneurs tend to be well-educated, they often do not have an educational background in business.

**Entrepreneur’s motivation**

The Tseren Tours’s co-founder emphasized that she had high motivation for starting her business. Meanwhile, she wasn’t motivated by money or even by the desire of creating jobs for herself or for her community. She was motivated by the desire of adventure and curiosity about visiting and discovering different parts of her native country, Mongolia. The co-founder of Golden Gobi emphasized that they had high motivation for starting their own business as well; however, they were mainly motivated by the desire of creating jobs for themselves and for other people, especially, for the people in the south Gobi region where they originally come from. Therefore, based on the findings of these two cases, it not possible to make any assertion about the type of motivation and the creation of new venture firms. Nevertheless, both entrepreneurs emphasized that they had high Achievement motivation for the growth and success of their firms. This is in accord with the previous research and studies (most notably, McClelland studies and Sibin et al. research) that high Achievement motivation plays a major role in the success of entrepreneurial firms.
Entrepreneur’s personality

The co-founder of Tseren Tours emphasized that before starting her businesses she was open to experience, was a risk taker and, to some degree, a sociable person. The co-founder of Golden Gobi also emphasized that her elder sister was open to new experience, a risk taker, a confident and quite sociable person. In these two cases, openness to experience and risk taking were the common personality traits. Therefore, we can argue that these two personality traits play a more important role than other personality traits (like agreeableness or sociability) in the creation of new venture firms. Meanwhile, agreeableness and sociability personality traits played an important role in both firms’ success and growth. At the same time, however, sociability might play an important role in this type of business and might not play an important in other types of firms, like technology firms for instance.

Entrepreneur’s environment

In our interview, Tseren Tours’s co-founder emphasized that for starting, especially, for continuing her business, the main source of support was her mother’s emotional support. In spite of her difficulties, her mother inspired and encouraged her to start and continue her business. However, she did not receive any financial, physical or emotional support from other members of her family. The co-founder of Golden Gobi, on the other hand, emphasized that for starting and for continuing their business, they received enormous support from all the family members and even from friends. Therefore, based on the findings of these two cases, it is difficult to make any assertion about entrepreneur’s supportive environment and the creation and success of venture firms. At the same time, in both cases, the entrepreneurs emphasized that they did not receive any sort of financial or non-financial support from the Mongolian government. Again,
based on these two cases, it is difficult to make any assertion about the role of government in the creation and success of entrepreneurial firms.

**Entrepreneur’s culture**

The Mongolian traditional way of life is nomadic – i.e., breading livestock, living in tents called ‘Ger’ or ‘Yurt’ and moving from pasture to pasture in different seasons. Thus this way of life is very labor-intensive, which requires the help and involvement of not only all the adults but also all the children in a family. Also, communist governments (1924-1990) for secularizing the society encouraged active involvement and participation of women in all aspects of their social life. Therefore, Mongolia has a unique culture: on one hand, it is an Asian collectivistic culture (family- and long-oriented), on the other the hand, via Russia as a long-time big brother, it has been greatly influenced by Western secular culture. It is no surprise that according to Lonely Planet (Kohn, 2005), Mongolians consider themselves Asian by ethnicity and Western by culture.

In our interviews, Tseren and Golden Gobi both emphasized that Mongolian culture played an important role in the creation and success of their businesses. Tseren told us that for starting her business she was inspired by the Mongolian culture of adventurism. After finishing her high school and entering college, she started traveling to other countries to learn English and explore other cultures. And when she came back to Mongolia, she realized that she had traveled to many countries but hadn’t yet seen many parts of Mongolia. When she met her husband, Rik (originally from Holland), they thought the best way to travel in Mongolia was to start a tour company. She emphasized that for continuing and succeeding in her business her mother’s emotional support was very helpful. She always inspired her to continue without having worries.
Golden Gobi’s co-founder also emphasized that for starting and for the success of their business they received lots of support from their family members. She also told us that they benefited a lot from the Mongolian culture of hospitality. For instance, from our experience when traveling in Mongolia, we observed that tour companies leverage the Mongolian culture of hospitality to accommodate tourists. This way of accommodation is so reliable for tour companies that with no worries they take tourists to different parts of Mongolia. She emphasized that after the end of the communist era, the country went through lots of changes. One of the changes that had positive impact on women entrepreneurship was the freedom for women to express their views and voice their opinions. As a result, she told us that they could easily start their business because society nowadays encourages women to go outside and obtain jobs conventionally held by men—like entrepreneurship.

Table 2: Cross-case Analysis
Conclusion

Mongolian culture is an Asian collectivistic culture that nurtures collective values such as family, community and national long-term values. At the same time, due to the close link with Russia during the communist era, the Mongolian culture was influenced by the feminist culture of equal status for women. In addition, after the communist era, Mongolia has witnessed a resurgence of Mongolian nomadic culture, which inspires individual self-reliance, liberty and adventurism. From our field observations and our case studies, we can conclude that in our theoretical model (Figure 1), entrepreneur’s knowledge about business and entrepreneur’s motivation are influenced by the Mongolian nomadic and feminist culture, while entrepreneur’s personality and entrepreneur’s supportive environment are influenced by both the nomadic and Asian collectivistic cultures. Then, finally we can conclude that these three dimensions of Mongolian culture influence and manipulate entrepreneur’s behavior and entrepreneur’s supportive environment consequently influence the creation of a new firm and the success of women entrepreneurs.

Further Research

For a wider generalization about the role of culture on female entrepreneurship, there is a need for quantitative survey research and statistical data analysis, e.g., Structural Equation Modeling (SEM).

Acknowledgement

The authors wish to thank the financial research support provided by Hannam University. They also would like to thank Hannam University student and research assistant Kaeun Lee (Rachel) for her help conducting and transcribing the interviews.

HUMAN RESOURCE PRACTICES AND FRONTLINE MANAGER INVOLVEMENT IN SMALL AND EMERGING FIRMS: AN EXPLORATORY ANALYSIS

Jeffrey Hornsby, William Wales, Jake Messersmith, Jennifer Bott

Abstract

Small businesses which may or may not have a human resource professional on staff are likely to rely heavily on frontline managers to perform many of the basic human resource functions. However, little is known about the extent of this practice or how satisfied frontline managers tend to be with their involvement in HR processes. Survey results from 111 businesses of varying size were collected and analyzed. Results indicate that supervisor involvement in HR activities is predicted by employer size. Analysis of variance reveals significantly greater supervisor involvement in the areas of planning, wage increases, and safety administration. However, as frontline manager involvement increases, their satisfaction with the organizations hiring and performance appraisal processes tends to decrease. Overall, it appears that supervisors become more involved in HR practices as company size increases, but this greater involvement tends to come at the price of satisfaction with key aspects of the HR function.

Introduction

Given the prevalence of small and medium sized enterprises and their importance to the overall economy, (Gudmundson, Tower, and Hartman 2003; Headd and Kirchhoff 2009; Liberman-Yaconi, Hooper, and Hutchings 2010; Payne, Kennedy, and Davis 2009) the success factors within this segment remains a salient area of investigation. One element of small firm development and success that has seen many calls for increased research attention is the role that human resource management (HRM) policies and practices play in smaller organizations (Hornsby and Kuratko 2003; Heneman, Tansky, and Camp 2000). People management issues are likely even more important in small and medium sized enterprises, where stocks of physical capital and slack resources are less likely to be present (Cardon and Stevens 2004; Hornsby and
Kuratko 2003; Tocher and Rutherford 2009). In addition, human resource management issues are clearly on the minds of small business owners. For example, in a large sample of SME business owners, Tocher and Rutherford (2009) report that 21% of respondents indicated that a subject related to human resource management was the most critical issue they were facing. Furthermore, a recent study of firm failures reported that managerial incompetence was one of the most frequently cited reasons for the firm’s failure to become and remain a viable enterprise (Dun and Bradstreet 2001).

These findings suggest that additional research is needed into the role that managing human resources plays in the performance and survival of small firms. This study adds to the discussion of HRM in small businesses by examining the role of a critical stakeholder – frontline managers – in HR activities and decision-making within small firms. In smaller organizations frontline managers or supervisors frequently “where multiple hats,” including that of human resource manager (Hornsby and Kuratko 2005). This study examines the level of supervisor involvement in HR practices across different sizes of enterprises ranging from small to large, and within different industry segments. In addition, this paper addresses the level of satisfaction with various dimensions of HR practices across these varying contexts.

In investigating these two research questions, the paper builds on a small, but growing body of literature addressing HR sophistication in small business (i.e., Hornsby and Kuratko 1990; Kotey and Slade 2005) and also extends the discussion of HR practices beyond the HR department to a specific discussion of the role and importance of frontline manager involvement with HR activities (Hermans, Wright, Ulrich, Sioli 2009; Ulrich, Allen, Brockbank, Younger, and Nyman 2009). The remainder of the paper is organized as follows. First, the existing literature on HRM in small business is reviewed. Following this discussion we theoretically
highlight the important role that frontline managers play in the proper management of human resources in small businesses. This assessment is followed by an empirical test of the utilization of HR practices across businesses of varying size to compare small firms with medium to larger sized organizations, the level of frontline manager involvement with HR within these businesses, and frontline manager satisfaction with HR outcomes in these firms. We conclude with a discussion of the study findings as they apply to the role of frontline managers in HR decisions.

**Human Resource Management in Small Businesses**

While extant research is limited with respect to the role of HRM in small businesses, current work suggests that the practice of effective human resource management is integral to the success of small to medium sized businesses (Deshpande and Golhar 1994; Hayton 2003; Hornsby and Kuratko 1990; Messersmith and Guthrie 2010; Jones, Morris, and Rockmore 1995; Smith 1991; Wager 1998; Way 2002). In fact, Marlow and Patton (1993) argue that the effective management of human resources is a key to survival for smaller firms.

Theoretical discussions of the prospects for HR’s future strategic role in organizations (e.g., Becker and Gerhart 1996) have led researchers to examine the most effective configurations of HR practices and how these configurations can be leveraged to build an effective HR architecture (Lepak and Snell 1999). However, the weight of this scholarship has analyzed large and well established businesses, leaving investigations of HRM in small and growing businesses in a more embryonic state. Despite the fact that these businesses make up the majority of firms in the United States (U.S. Small Business Administration 2007), much less research exists to help us understand the dynamics of effective HR administration in these firms (Heneman et al., 2000), and the vital role that frontline managers are likely to play in these processes. Therefore we endeavor to investigate this key organizational resource. Below we
review the extant literature to date on the role of HR in small firms, followed by a review of the literature exploring the involvement of frontline managers in the organizational HR function.

**Recent Literature on the Human Resource Role in Small Firms**

Research on HRM practices within smaller, less established, firms has received multiple calls for investigation in order to provide a better assessment of the needs, concerns, challenges, and strategies of this important body of organizations (Heneman et al., 2000; Purcell 1993; Williamson 2000). Employees represent a critical resource that often makes the difference between success and failure in smaller firms (Tocher and Rutherford 2009). This is because smaller firms generally suffer from lower levels of slack resources, lesser degrees of efficiency when using their resources, as well as inferior legitimacy associated with the products their resources produce (Stinchcombe 1965; Thornhill and Amit 2003). This often remains the case even as the firm begins to grow. Until organizations reach substantial size they may still suffer from “liabilities of smallness” which hinder their efforts to procure and efficiently use critical organizational resources (Freeman, Carroll, and Hannan 1983). It is, perhaps, not surprising that Thornhill and Amit (2003) observe the failure of small firms to be generally attributable to a lack of resources and capabilities. Thus, in many cases, the owner or manager of a small business assumes responsibility for a bulk of the human resource functions, since he or she is usually unable to devote financial resources to employ HR professionals.

Early work on HR management in small businesses tends to suggest that HR issues are less prevalent in the minds of small business owners. For instance, an early study of HRM practices in smaller ventures found that the areas of accounting, finance, production, and
marketing all take precedence over developing the human resource management function (McEvoy 1984). Little (1986) observed that the owners of firms with less than 50 employees typically handled the HRM function themselves. In addition, Amba-Rao and Pendse (1985) surveyed the compensation and maintenance practices of 78 small firms and found that most firms lacked any systematic or rational approach in their compensation practices.

In a study of sixteen manufacturing firms, Duberley and Walley (1995) conclude that a wide variety of HR practices exists among firms, yet few had developed an integrated set of strategic HRM practices. Wager (1998) further studied the determinants of HRM functions in small Canadian firms and found that less than half of the companies surveyed utilized formal appraisal (50 percent), sexual harassment policies (35 percent), employee pensions (30 percent), total quality management (34 percent), employee assistance programs (21 percent), employee attitude surveys (27 percent), and employee relations (19 percent). The research also showed that firms which emphasized open communication and employee participation were much more likely to have formal HRM procedures. More recently, an assessment of small and medium sized enterprises in the UK revealed that 64% of the 100 firms surveyed had no formal HR strategy, despite the fact that most felt that HR practices were useful (Cassell et al., 2002).

While this body of work paints a grim picture of the perceived importance of the HR function in small business, there is evidence suggesting that some smaller firms are progressing in the development of HRM practices and policies. Hornsby and Kuratko (1990) studied 247 smaller firms and found that firms under 50 employees had very little in place regarding formal HRM practices; however, firms with 50 to 100 and 101 to 150 employees had more sophisticated HRM practices in place. Hornsby and Kuratko (1990) observed that as organizations grew, so did the formality of their HR systems, especially for job analysis, recruitment, compensation, benefits and incentive plans. However, in practice less than half the firms surveyed employed any formal HRM practices. Hornsby and Kuratko (2003) performed a ten year follow-up of their
initial 1990 study and found similar results in place, which suggests that advancements in practice have lagged behind the theoretical lessons advanced within the small, but growing, literature devoted to understanding the manifestation and consequences of HR practices in smaller firms.

A notable study by Kotey and Slade (2005) assessed human resource management practices in micro, small, and medium firms in Australia and further found that human resource practice utilization (specifically recruitment, training, and performance appraisal) begins early in the growth process and proceeds at a faster rate than during latter growth phases. They also found that the adoption of formal HRM practices at the managerial level lagged behind the operational level in smaller firms. It is also concluded that in micro and small businesses, an informal practice of HR may in fact be necessary to facilitate firm growth at those stages.

Taken together this literature seems to suggest that despite the important role that HRM can play in firm success a) small to medium sized businesses are often slow to adopt HR practices, and b) the adoption and implementation of such practices is generally not under the guidance of full time HR professionals. Who then is tasked with this important role? Certainly, the small business owner himself plays an important role in the smallest of firms, but in larger firms it is likely that frontline managers accept the responsibility of not only managing their lines and functions, but also of implementing many of the functional elements of HRM (i.e., selection, training, performance appraisal, promotion and compensation decisions, information sharing, discipline, etc.). Yet this important organizational resource is rarely analyzed in studies of human resource management. This begs the question – to what extent, and with what consequences, are frontline managers involved in the HR function as firms grow?

**Frontline Manager Involvement in HR Management**
Managers below the level of top executives and directors have been the focus of recent attention in entrepreneurship research (i.e., Floyd and Lane 2000; Kuratko, Ireland, Covin, and Hornsby 2005). These studies have theorized that middle managers and operational level managers play an important and often overlooked role in the execution of firm strategy, and ultimately in the performance of the firm. In the present research we focus on the operational level and the role of frontline managers. We define frontline managers as all functional leaders within the organization who may carry such titles as supervisor, team leader, or unit manager that have direct interaction with operational level employees. As discussed, since many small organizations do not have a designated human resource professional or a formal human resource structure, the responsibility of managing, identifying, and developing key personnel often is bestowed on the line managers (Hornsby and Kuratko 2005). Even once formal human resource representatives emerge within the firm, managers may continue to implement many HR functions while the HR representatives administer and coordinate these activities.

As stated by Ulrich et al. (2009) “line managers are ultimately accountable for ensuring that the organization has the right talent and right organization in place to deliver on expectations to customers, shareholders, and communities” (p. 129). In other words, many of the value-adding aspects of the HR function are often handled by line managers. Specifically, managers are usually responsible for interviewing, training, appraising, and disciplining their subordinates. In addition, managers play important roles in compensation, safety, job analysis, and planning. According to the U.S. Small Business Administration Office of Advocacy (2007) firms with fewer than 500 employees represent 99.9 percent and firms with less than 10 employees represent 78.6 percent of the 29.6 million businesses in the United States. This implies that supervising frontline managers are likely to play a critical role in the HR function for the bulk of
organizations in the United States. Therefore, although little research has been devoted to exploring the involvement of frontline managers in the organizational HR function, these organizational actors serve as the first-line human resource manager for their company and it is logical to expect that their role will be even greater in smaller firms, where the existence of a human resource department is less likely.

The Current Study. Given the recognized need to address HR issues in smaller firms (Heneman et al., 2000), and the vital role that frontline managers are likely to play in these processes we endeavor to investigate this key organizational resource. Specifically, as stated above the purpose of this paper is to examine the use and satisfaction of human resource practices by frontline managers in small and growing firms. Specifically, this study examines the extent to which firms recognize the practice of effective human resources, the extent to which their frontline managers practice effective human resources, company satisfaction with these activities, and the amount of human resources training that firms provide for frontline managers. As this was an exploratory study, no specific hypotheses are advanced; however, company size was expected to differentiate involvement in and satisfaction with the various aspects of human resource management (e.g., hiring, training, performance appraisal).

Method

Sample

Three hundred emerging companies located in the Midwest United States were sent a survey concerning their company’s practices regarding frontline HR management. Student research assistants were utilized for survey distribution and data collection. Using a surveying methodology similar to that employed by McEvoy (1984) and Hornsby and Kuratko (1990; 2003), research assistants utilized Chamber of Commerce directories to develop a target sampling pool. These directories were the same data source used in the Hornsby and Kuratko
(1990) study. Probable respondents were contacted and asked to participate. Surveys were then distributed and collected by the research assistants. The respondents were further divided into three size categories based on the theory that, in general, a company’s human resource practices will become more sophisticated as employment size increases. Specifically, three size categories were utilized. The first category included “smaller” firms with companies having 100 and under employees. The second category consisted of “medium-sized” small firms and included companies that employed between 101 and 500 employees. Finally, the third category consisted of “larger” small firms and included companies that employed between 501 and 1000 employees.

**Instrument**

The data were gathered by means of a 15-item questionnaire. The survey investigated each company’s demographic background (i.e., type of business, size, and revenues), frontline HRM practices in seven major areas (hiring/selection, HR planning, performance appraisal, training/coaching, wage administration, safety administration, and discipline/employee relations), and future concerns for the frontline manager’s role in HR. The respondents were asked to rate, using a five-point Likert scale, their frontline manager’s involvement with these functions and the extent to which these frontline managers are held accountable for these HR responsibilities. In addition, respondents were asked whether or not training is offered to frontline managers and the extent to which the training is offered. Finally, respondents were given a chance to list the most significant challenges facing managers and supervisors.

**Results**

A total of 111 surveys were returned, representing a 37% response rate. The majority of the sample reported working in the manufacturing industry (35.1%), followed by those in the public (21.6%) and service sectors (21.6%). A majority of respondents came from large companies (1001+; 24.5%) or moderate-sized companies (201-500; 23.6%). Revenue over 100 million was most frequently endorsed for the sample (29.5%), followed by revenue between one and five million (20.5%) and 10 to 50 million (19.3%). Most respondents identified themselves
as lower-level HR professionals (31.3%), followed by HR Directors (24.1%). The average experience of respondents was 12 years. Summary statistics for all variables, broken down by company size, can be found in Table 1.

We were primarily interested in determining whether organizational characteristics (i.e., employer size, revenue, industry) impacted frontline manager involvement and satisfaction with human resource practices in small and growing firms. As such, a series of regression analyses and analyses of variance were conducted to determine whether differences emerged as a result of organizational characteristics.

**Regression Analyses: Predicting Involvement and Satisfaction from Organizational Characteristics**

Of particular importance for small and growing firms is the importance placed on frontline supervisor and manager involvement in human resources. Organizational characteristics (i.e., employer size, revenue, and industry) were entered into a regression to predict importance of supervisor/manager role in human resources. Employer size emerged as the only significant predictor ($\beta = .42, p< .01$), accounting for 8% of the variance.

The prediction of satisfaction with various HR functions as a result of organizational characteristics was also examined. In terms of organizational characteristics, only employer size emerged as a significant predictor of satisfaction with hiring ($\beta = -.35, p< .05$) and performance appraisal processes ($\beta = -.39, p< .05$). For both of these predictors, the relationship with employer size was negative, indicating that satisfaction decreased within larger organizations.
Supplementary Analyses of Variance: Are There Differences across Firm Revenue and Industry?

In order to more fully understand the relationships between organizational characteristics and supervisor involvement in and satisfaction with various HR functions, a series of univariate analyses of variance across firm revenue and industry were conducted.

**Firm Revenue.** Supervisor involvement in planning activities significantly differed by company revenue ($F_{(5, 81)} = 2.41, p < .05$); Bonferroni post-hoc analyses indicated the difference was the result of those organizations reporting revenue between 50 and 100 million as compared to organizations with revenue below one million. An analysis of mean differences indicated more supervisor involvement in those organizations reporting between 50 and 100 million in revenue. Supervisor involvement in wage increases also significantly differed by company revenue ($F_{(5, 81)} = 1.40, p < .05$), with post-hoc analyses revealing no significant differences between categories of revenue. However, those organizations reporting revenues between 50 and 100 million appeared to be marginally significantly different from companies with one to five million in revenue ($p < .07$), with more involvement from companies with greater revenue. Lastly, company revenues differentially related to supervisor involvement in safety administration ($F_{(5, 82)} = 3.21, p < .01$), with differences occurring between companies reporting over 100 million in revenue as compared to those reporting between 10 and 50 million. Again, companies with higher revenue appeared to involve supervisors more in safety administration.

**Industry.** One analysis of variance was significant when examining industry differences in supervisor/manager involvement in and satisfaction with HR activities, as differences emerged on supervisor involvement in selection ($F_{(3, 103)} = 4.18, p < .01$). Post-hoc analyses indicated that supervisors in the public sector were more involved in selection than in manufacturing. In
addition, marginally significant differences were found across industries with respect to supervisor involvement in safety administration \( (F_{(3, 102)} = 2.64, p < .06) \); however, post-hoc analyses did not indicate a pattern of differences across the different industry classifications.

**Future HR Challenges Facing Frontline Managers**

Finally, the survey respondents were asked to list the future challenges that they perceive for frontline managers and their HR role. Responses were content analyzed and the results can be found in Table 2. The top five challenges cited include: Keeping up with and understanding laws and regulations; employee relations and discipline; consistency and fairness; finding quality employees; and training relating to safety, equality, and efficiency.

**Discussion**

We were primarily interested in examining the extent to which human resource management practices (e.g., activities in the areas of hiring, training, performance appraisal, etc.) occurred in small business and frontline manager involvement in these activities. We were also interested in understanding the relationship between frontline manager involvement in HR activities and overall satisfaction with HR practices in the company. Specifically, we were interested in the differences that emerged between small and medium to moderately large organizations (operationalized as companies with 100 employees and under, 101 to 500 employees, and firms with more than 500 employees). Building upon a key trend within prior research suggesting limited formal HR management in small firms (Hornsby and Kuratko 2003;
Little 1986; Wager 1998), the demographic information presented in Table 1 suggests that less than half of the companies had formally designated HR professionals. Moreover, less than half the small firms surveyed provided formal HR training to supervisors within performance appraisal, training, wage administration, safety, hiring, and discipline.

Unfortunately, this lack of formal training may be detrimental to the success of small firms. As mentioned in the introduction, managerial incompetence is frequently cited as one of the main reasons underlying firm failure (Dun and Bradstreet 2001). One specific area of managerial incompetence continually cited is dealing with employee problems that include recruiting, selection, ineffective or nonexistent training, compensation and benefits, and weak or nonexistent performance appraisal (Hornsby and Kuratko 1990; Hornsby and Kuratko 2003). These complaints are likely to be even more pronounced in smaller firms when business owner/managers are unwilling to spend time and effort developing the expertise necessary to manage what is arguably his or her firm’s greatest asset - human resources.

In addition to these descriptive differences regarding the manifestation of HR activities between small, medium, and larger size companies, regression analysis was used to further understand the impact of company size. Additionally, supplementary analyses of variance were conducted to examine the possibility of differences across revenue or industry. Taken together, these analyses generally reflect the descriptive differences, with employer size serving as a significant, positive predictor of supervisor involvement in HR practices (accounting for 8% of the regression variance). Employer size was also a significant negative predictor of satisfaction with hiring practices and performance appraisal. Therefore, in larger organizations, frontline supervisors were more likely to be involved in HR practices, but less likely to be satisfied with
their greater involvement in such organizational HR practices as hiring and performance appraisal.

The emergence of more sophisticated HR systems with firm growth was supported within the results of the supplementary analyses of variance. With respect to the analyses of variance, company revenue appeared to differentiate frontline manager involvement in planning activities, wage increases, and safety administration. Supporting the regression results with regards to employer size, post-hoc analyses indicate that frontline manager involvement increased as firm revenue increased. Industry category was not found to be a differentiating factor in terms of frontline manager involvement, with one exception that showed supervisors in the public sector to be more involved in selection than in the manufacturing sectors. These results suggest that industry may not be a significant differentiator concerning frontline manager involvement in HR activities as the present results tend to be robust across different industry contexts.

These findings represent an important contribution to advancing theory and practice for several reasons. First, the present research sheds light upon the involvement of frontline managers in small and growing firms. It appears that supervisors in smaller firms tend to have less involvement in the administration of HR practices than when the organization begins to experience growth. As Kotev and Slade (2005) suggest, smaller firms may indeed benefit from less formal HR practices. As firms grow and frontline manager involvement in HR practices increases, their satisfaction with these practices tends to decrease. Taken together, for the most part larger firms (and those with more revenue, which is often used as a proxy for size), exhibit higher supervisor involvement but, somewhat paradoxically, less satisfaction with HR practices.

This lack of satisfaction with HR practices is an important contribution to the literature as it suggests that frontline manager satisfaction with HR practices tends to decrease as firms grow.
Given the espoused importance of frontline managers to an organization's ability to effectively manage its human resources and achieve its strategic objectives (Floyd and Lane 2000; Hornsby and Kuratko 2005; Ulrich et al. 2009), understanding and devising means of maintaining frontline manager satisfaction with HR practices represents a key managerial imperative as firms grow. We speculate that the observation of higher levels of satisfaction in smaller firms is due, at least in part, to factors associated with “smallness” that serve to increase the informality of HR administration. Smaller firms tend to possess more “organic” structures characterized by greater flexibility, more fluid communication, and higher levels of informal relationship driven interaction when approaching problem solving (Burns and Stalker 1961). When companies become larger, and more established, the formality of HR practices tends to increase (Hornsby and Kuratko 1990; 2003). Frontline managers are likely to experience this in terms of less control, more hurdles, or some combination of the two, which serves to increase the complexity of routine HR activities. In turn, this greater complexity in the HR function is likely to be a key contributor to the observed decreases in satisfaction, particularly as frontline managers are charged with being more involved with a wider variety of HR responsibilities as the firm grows.

This supports the importance of developing a strong culture which allows the firm to maintain many of the advantages of “smallness” even as it experiences growth (Schein 1992). The present results suggest that as firms grow they increasingly decentralize the administration of their HR practices into the hands of frontline managers without necessarily paying sufficient attention to how such greater involvement in HR practices changes the day-to-day responsibilities and relational interactions of these important organizational actors. Regrettably, the consequence appears to often be a decrease in supervisor satisfaction with various HR
functions. As such, an implication of the present research is that the good things about being small need to be driven deeper into a company’s culture as it grows.

From a practical standpoint, these results indicate that small business owners should be careful about the ways in which HRM is implemented in the organization as it grows. Certainly, there is an important role to be played by HR generalists and specialists within the firm, but these roles should not be developed in a functional silo. Rather, HR staff needs to work closely with frontline supervisors to ensure that best practices for selecting, developing, and rewarding talent are seamlessly embedded within the functional activities of frontline managers. The more tightly linked HR professionals are to frontline managers the more likely the firm will be able to benefit from the strategic human resource management ideas discussed above. As firms grow, top managers should make it a point to oversee this process to ensure that HR staff effectively and efficiently interacts with frontline managers when planning and implementing key HR practices.

Limitations and Future Research

While this research adds to the literature by assessing the specific role of frontline managers in the HR practices of small businesses, conclusions should be considered in light of the study’s limitations. First, as this was an exploratory study, data on all HR practices, as well as satisfaction with these practices, was collected from the same individual at one time. This may have resulted in common method bias and future research is needed to examine the amount of involvement and satisfaction with these HR practices at various levels of the organizational hierarchy (where available). In addition, longitudinal data, tracking small companies that grow over time, would also illuminate the evolving role of HR in small businesses.

Future research is also needed to shed light on the apparent paradox revealed in this study. Namely, as firms develop an official HR presence the satisfaction with these practices
tends to decrease. The tradeoff between frontline manager involvement in and satisfaction with HR practices demands further investigation. The data collected for this particular study do not allow us to make firm conclusions as to why satisfaction seemed to drop in this sample of firms, so future work is necessary to investigate these linkages in more depth and to specifically examine the connection between frontline manager involvement with HR and satisfaction. In addition, this work needs to be extended to include firm performance metrics, to assess the bottom line impact of supervisor participation in HRM.

**Conclusion**

Frontline managers represent an important organizational resource. This resource is particularly important in designing and implementing effective human resource management strategies. The results of this study suggest that frontline supervisor involvement with HR tends to increase as firm size increases, but that this increase leads to a decrease in the level of satisfaction with various HR practices. Study implications suggest that seamlessly integrating the HR function within the role of frontline supervisors may be a key criterion for the success of smaller firms as they begin to experience growth.

Entrepreneurship, Growth and the High Impact Firm: Comparing Indigenous and Foreign Firms

Yazid A. Abubakar
and
Jay Mitra

Centre for Entrepreneurship Research
Essex Business School, University of Essex, Elmer Approach, Southend-on-Sea SS1 1LW

Aim of the paper

As the global economic crisis deepens with the consequent negative effect of increasing levels of unemployment and falling aggregate demand, it is important to understand how, where and why entrepreneurial firms are able to turn the tide by creating prospects of growth. This paper is concerned with entrepreneurial and ‘high-impact firms’ by which we mean firms that generate ‘both’ disproportionate levels of employment and sales growth, and have high levels of innovative activity (Acs et al., 2008). It investigates differences in factors influencing high-impact growth between indigenous and foreign firms.

The contribution to the literature

This study makes several original contributions by identifying differences in factors affecting high impact growth between indigenous and foreign firms. Specifically, the findings are: 1) First, regional knowledge resources – particularly local human capital and business R&D; lie at the heart of high impact growth for indigenous firms but to a lesser degree, foreign firms; 2) Secondly, however, because low-tech industries have less need for knowledge resources, we find that indigenous firms have less growth advantages over foreign firms in low-tech industries compared to high-tech industries; 3) Thirdly, because foreign firms appear to have less access to regional resources, their growth appears to be relatively more dependent on large size and internationalisation. On the other hand, for indigenous firms, small firms had significantly higher growth rates than large firms and were more reliant on. Thus, the hypothesis that small firms grow faster than large firms was only supported for indigenous firms; 4) Due to greater familiarity with local environment, growth rates of indigenous forms was not found to rely much on international markets but home markets, while that of foreign firms appears to be significantly associated with international markets.

The methodology

The study is based on an analysis of data drawn from United Kingdom (UK) Innovation Scoreboard on 753 firms in 12 UK regions. Based on 1992 Standard Industrial Codes (SIC), identified by CCC (2004), the firms were further classified into those belonging to high-tech industries and low-tech industries. These thus provide a unique data set that allows for critical analysis of firms generating both employment and sales growth. The data was for the most part analysed using multiple regressions, bivariate correlations and t-tests.
The results and implications

These insights have potential implications for local and national policies on job creation, firm growth and the concentration of firms in specific spaces, especially under circumstances where many firms are shedding their work force as they struggle for survival in recessionary times.

1. Introduction

Interest in firm growth theory now spans about 30 years. The initial excitement centred on the work of Birch, where job providers, were seen to be the smaller, younger firms (Birch, 1979, 1987). Once firms grow older, their ability to generate new jobs decline substantially. Birch’s work has influenced a whole generation of researchers and generated significant contributions to knowledge making an impact on both research and public policy promoting small and medium enterprises (SMEs) in many countries (Storey, 1994; Landstrom, 1996; Acs et al., 2008). In the United Kingdom (UK) from 1987–88 alone, public expenditure on promoting enterprise was almost £200 million, supporting more than 106,000 unemployed people to start new businesses (Storey, 1994). Further, in 2004, the UK government launched the ‘encouraging a dynamic start-up market’ one of the key pillars of small business policy reflecting the interest on small firms and growth (Stel and Storey, 2004).

Today, scholars of firm growth argue that most job creation by small-firm occurs within a relatively small number of firms – called Gazelles (Birch and Medoff, 1994; Acs et al., 2008). In this setting, gazelles are firms that “move between small and large (size) quickly…(characterised by) great innovation and rapid job growth” (Birch and Medoff, 1994: p.163). Acs et al. (2008) extended the work of Birch beyond firms with mainly employment growth, by adding the revenue growth variable to that of expanding employment. Firms showing both revenue and employment growths were referred to as “high-impact firms” in order to distinguish them from gazelles (Acs et al., 2008). The major conclusion of the work by Acs et al. (2008) is that high-impact firms are relatively old, rare and contribute to the majority of overall economic growth.

This perspective on high impact firms (Acs et al., 2008) is particularly important at a time of global economic crisis. However, a critical review of the literature (see below), reveals that there is hardly any systematic study investigating a combination of region, sector specific or firm specific factors influencing high impact growth, and especially between indigenous and foreign firms. We believe that information about these factors could help with the formation of empirically informed policies for promoting high impact growth of firms that take into account the distinguishing features of indigenous and foreign firms (Nanchum and Keeble, 2003). Policies on local firm formation and growth and foreign firm investment can,
therefore be supported on the basis of empirical evidence. Firm managers may also benefit from a more clear understanding of regional, sectoral and firm specific factors that could hinder or promote high impact growth of the firms. Managers of such firms can, therefore, design effective strategies for high impact growth.

The central research problem addressed by in this paper is that of the differences in region, sector and firm specific factors influencing high impact growth of indigenous and foreign firms. The paper claims several contributions to knowledge. We construct a High-Impact Growth Index (HIGI), which measures firms’ ability to generate both sales and employment growth over a long time period. A second contribution is the identification of differences in role of regional human capital, regional business R&D and regional university in the growth of indigenous and foreign owned firms. Thirdly, this study identifies the differences in the relative growth rates of indigenous and foreign firms in both high-tech and low tech sectors. Fourthly, this study examines the differences in the influence of firm size and internationalisation in the growth of indigenous and foreign firms. Taken together these contributions augment the literature on gazelles and high impact firms (Birch, 1979, 1987; Gallagher et al. 1990; Daly et al. 1991; Birch and Medoff, 1994; Acs et al., 2008) regional factor theorists (Jaffe, 19989; Acs, 2002; Krudsen, 2007) and firm ownership – indigenous and foreign firms (Buckley and Casson, 1976; Caves, 1996; Nanchum and Keeble, 2003).

The paper begins with a review of the literature on gazelles and high impact firms (Birch and Medoff, 1994; Acs et al., 2008). This is then followed by a presentation of theoretical arguments on whether high impact firms on differences on regional factors (Acs, 2002; Stuart and Sorenson, 2003; Krudsen et al., 2003), sectoral factors (Audretsch, 1998; Doloreux, 2003) and firm specific factors (Hall, 1987; Nerlinger, 1999; Nanchum and Keeble, 2003) influencing the high impact growth of indigenous or foreign owned firms.

2. The Evolution of the High Impact Firm Theory

In the 1970s and 90s, firm growth theories on job creation consisted mainly of the work of the prominent economist, David Birch (1979; 1987). Various other researchers confirmed one of Birch’s key conclusions, namely that small firms account for most new job creation in an economy (Birch, 1979, 1987; Gallagher et al. 1990; Daly et al. 1991). In Birch’s seminal work, titled The Job Generation Process (1979), he developed an ‘economic micro-scope’ (Landstrom, 1996) that went beyond aggregate employment statistics so as to explain how the behaviour of individual firms leads to employment changes. Employing Dun & Bradstreet database in the United States (US), Birch initiated the systematic study of small businesses. Prior to his research only a few economists had studied small businesses in spite of their contribution to a large fraction of employment (Brock and Evans, 1989). Accordingly, Birch found that:
• In the US, about 60 percent of all jobs were created by firms employing fewer than 20 people; and almost 50 percent of the jobs were generated small by independent entrepreneurs. In contrast, large firms (employing more than 500 people) had less than 15 percent of all net new jobs.

• It was not all the small firms that were job generators. Rather, it was the smaller, younger firms that created jobs – and job generation abilities of firms declined once they were up to four years old.

Birch concluded that “whatever they are doing, however, large firms are no longer the major providers of new jobs for Americans” (Birch, 1981, p. 8). These seminal contributions have since then triggered a large canon of research, public policy measures and debate on the role played by small firms in employment creation (Gallagher et al. 1990; Daly et al. 1991; Acs et al., 2008). Researchers in other countries have long replicated Birch’s findings, with results of the UK (based on Dun & Bradstreet) indicating that small firms make a disproportionately large contribution to net job creation, although the contribution is not as high as estimated by Birch (Gallagher et al. 1990; Daly et al. 1991).

Gazelles

Birch’s work has also been subject to some criticism especially from Brown, Hamilton and Madoff (1990). In a book titled Employers Large and Small, they argued that:

Perhaps the most widespread misconception about small businesses in the United States is that they generate the vast majority of jobs and are therefore the key to economic growth. … Small employers do not create a particularly impressive share of jobs in the economy, especially when we focus on jobs that are not short lived (Brown, Hamilton and Madoff, 1990: p.1-2).

Subsequently, in early 1990s attempts at finding common ground between David Birch and James Madoff were made culminating in the emergence of another conceptual category of firms called ‘Gazelle’ . Gazelles were defined as firms with significant revenue growth (Birch and Madoff, 2004). It was argued that the difference between the role of small and large firms in creating jobs is of less significance. The firms that create most jobs are gazelles, which are not necessarily small or large. “These gazelles move between small and large quickly—at various times in either direction—and to classify them by their size is to miss their unique characteristics: great innovation and rapid job growth (Birch and Medoff, 1994: p. 163).

Since then, this perspective on gazelle has attracted attention from prominent entrepreneurship scholars (Parker, Storey and Witteloostuijn, 2005; Acs and Mueller, 2007). In 2005, Parker, Storey and Witteloostuijn (2005) take the study on gazelles further by developing a theory of dynamic management strategies of high-growth firms: gazelles. Based
on a data set from Britain containing information on over 100 gazelles they advance a framework that emphasises dynamic, rather than static, management strategies as key high growth (Parker, Storey and Witteloostuijn, 2005). Another recent paper by paper by Acs and Mueller (2007) found that business start-ups with less than 500 employees have persistent employment effects over time and across large, diversified metropolitan regions. Therefore, Acs and Mueller (2007) conclude that gazelles and characteristics of the region are important for employment growth. Another important point is that gazelles account for almost all the job creation in the economy (Birch and Medoff, 1994; Acs and Mueller, 2007).

From Gazelles to High Impact Firms

Zoltan Acs, William Parsons and Spencer Tracey in a report entitled ‘The High Impact Firm: Gazelles Revisited’ (2008) for the US Small Business Administration (SBA) extended the scope of Birch and Medoff’s (1994) findings. They argue that although Birch’s research is important, very little is known about what high impact firms are before they become high impact firms. To distinguish their research from that of Birch, they went beyond Birch’s definition of gazelles to include firms with significant revenue growth and expanding employment, referring to such firms as ‘high impact firms’ (Acs, et al., 2008). Based on a critical analysis of data set drawn from American Corporate Statistical Library (ACSL), which covers data from both public and private sector sources over a 12-year period, they found that:

High-impact firms are relatively old, rare and contribute to the majority of overall economic growth. On average, they are 25 years old, they represent between 2 and 3 percent of all firms, and they account for almost all of the private sector employment and revenue growth in the economy (Acs, et al., 2008).

Acs, et al.’s (2008) conclusions support Birch’s observation that gazelles account for almost all the job creation in the economy, although their measures were not entirely comparable. They also found comparable findings with regard to firm size, but not firm age. High impact firm are not new firms and they are found in all firm-size classes. High-impact firms are rare and contribute to the majority of overall economic growth (Birch and Medoff, 1994; Acs et al., 2008).

3. Research Issues

We argue that the research on the subject still remains unsatisfactory at least for three key reasons. First, existing theories on gazelles and high impact firms are important in helping us to understand which firms create jobs, and how they impact on the economy (Birch and Medoff, 1994; Acs et al., 2008). But these theories do not take into consideration the importance of region specific factors’ affecting high impact growth of indigenous and foreign
firms. By region specific factors, reference is being made to local human capital, business R&D and university R&D (Jaffe, 1989; Acs, 2002; Krudsen et al., 2007). This is of crucial importance especially in a time when economic policies are developed at the regional level (DTI, 1998; ERP, 2007). Such information will allow regional policy makers to understand the different roles local resources play in the growth of indigenous and foreign firms, thereby helping to design more informed policies specifically for indigenous and foreign firms. Secondly, it is not clear whether sector-specific factors have any impact on the growth of indigenous and foreign firms. These factors often refer to the extent to which high and low tech sectors rely on research and development (Butchart, 1987; Doloreux, 2003; CCC, 2004). At a time when many regional policies prioritise high-tech over low-tech sectors, it is important to understand whether such prioritisation should also apply to both indigenous and foreign firms. Thirdly, we appear to lack an understanding of the differences in the influence of varying ‘firm specific factors’ (such as ownership, firm size and internationalisation) for the high impact growth of indigenous and foreign firms. Such information could help both policy makers and managers of indigenous and foreign firms to understand whether the size of the firms offer greater advantages for firm growth, and also the extent to which their growth depends on international markets.

**Hardly compare differences between indigenous and foreign firms in terms of region specific, sector specific and firm specific factors influencing their high impact growth.

We contend that differences in factors influencing high impact growth between indigenous and foreign owned firms remain by and large obscure (see table 1). Identification of these differences provides the basis for generating new propositions related to the research problem and the development of a conceptual framework.
4. CONCEPTUAL FRAMEWORK AND PROPOSITIONS

The literature on localised knowledge spillovers sheds light on regional differences in resources that may affect the growth of indigenous and foreign firms. A review of this literature enables us to compare indigenous and foreign owned firms in terms region specific factors (Jaffe, 1989; Acs, 2002; Stuart and Sorenson, 2003; Krudsen et al., 2007). The literature on high-tech and low-tech industries (Mahmood, 1992; Doloreux, 2003) allows us to find the theoretical basis for proposing that patterns of high impact growth by indigenous and foreign high impact firms may differ across sectors. Figure 1 below presents our conceptual framework for comparing indigenous and foreign firms in terms of differences in the three factors influencing their high impact growth. The region specific factors are local human capital, business R&D and university R&D (Jaffe, 1989; Acs, 2002; Stuart and Sorenson, 2003; Krudsen et al., 2007). The sector specific factors relate to the nature of technology developed by firms – high-tech and low tech sectors (Doloreux, 2003). Finally, the firm specific factors are: firm size (Birch, 1979, 1989; Evans, 1987a, b; Hall, 1987; Nerlinger, 1999) and internationalisation (ECLAC, 1985; Wilmore, 1986; Falvey et al., 2007).

This model integrates high impact firm literature (Acs et al., 2008), localised knowledge spillover theory (Acs, 2002; Stuart and Sorenson, 2003) and international business theory (Nanchum and Keeble, 2003). The aim is thus to empirically examine the effect of various factors on high impact growth (Acs, et al. 2008) by indigenous and foreign firms.
What follows is a discussion of each component of the model so as to develop specific propositions on differences in the effect of the three factors on the growth of indigenous and foreign firms.

4.1 Region Specific Factors

The knowledge spillover theory mainly highlights the significance of local linkages for a firm’s generation of its own knowledge (Jaffe, 1989; Acs, 2002; Stuart and Sorenson, 2003). Localised knowledge spillovers are defined as “knowledge externalities bounded in space”, which allow firms operating in proximity to key knowledge sources to introduce innovations at a faster rate than rival firms located elsewhere (Breschi and Lissoni, 2001). Knowledge takes the form of local human capital, business R&D and government R&D (Acs, 2002; Stuart and Sorenson, 2003; Krudsen et al., 2007). According to Breschi and Lissoni, 2001, localised knowledge spillovers can be broken down into three logical chains (Breschi and Lissoni, 2001: p.258):

a. knowledge generated within innovative firms and/or universities is somehow transmitted to other firms;

b. knowledge that spills over is a public good, i.e., available to those wishing to invest for searching it out, and may be exploited by more than a few users at the same time;

c. Despite b., knowledge that spills over is mainly “tacit”, i.e., highly contextual and difficult to codify, and therefore is more easily transmitted through face-to-face contacts and personal relationships, which require spatial proximity; in other words, it is a public good, but a local one.

The key question here is the extent to which local knowledge is significant for high impact growth of both indigenous firms and foreign firms assuming they are located in the same region. Following the argument of localised knowledge spillover theorists, local entrepreneurs and managers are likely to have greater connections to technologists, universities and other local sources of knowledge since they are more likely to have close social connections (Stuart and Sorenson, 2003). However, foreign firms are also attracted to regions with key knowledge inputs in order to gain access to its specialised resources (Dunning, 1993; Nanchum and Keeble, 2003). International business theory suggests that gaining access to immobile resources (such as technologies and organisational capabilities) available in foreign countries is an important rationale for firms to invest outside their home country (Dunning, 1993; Wesson, 1997; Kuemmerle, 1998). Foreign firms attracted by regions with resources can become insiders, and some of their needs can be met locally, in a manner similar to indigenous members of a local agglomeration or cluster (Nanchum and Keeble, 2003).
Paradoxically, foreign firms with their linkages with the rest of the transnational corporation (TNC) (Nanchum and Keeble, 2003) may have limited need for accessing local resources during the growth process. Greater cost disadvantages for foreign firms arising from unfamiliarity with the local environment (Buckley and Casson, 1976; Caves, 1996; Nanchum and Keeble, 2003) suggest that local (indigenous) firms will benefit more from local resources due to more established social connections (Stuart and Sorenson, 2003). These observations lead to the proposition that regional knowledge resources are critical for high impact growth, especially for local firms.

**P1:** Regional knowledge resources lie at the heart of high impact growth for indigenous firms but to a lesser degree, foreign firms.

### 4.2 Sector Specific Factors

Since indigenous firms have higher levels of access to regional knowledge resources compared to foreign firms, we argue that such growth advantages are more likely to be in high-technology sectors rather than low technology sectors. This is because although in high-technology sectors, firms have a high level of requirement for external knowledge resources (Jaffe, 1989; Acs, 2002; Stuart and Sorenson, 2003), firms in low-technology sectors have less need for knowledge resources (Dolororeux, 2003). Therefore, the advantage of accessing knowledge resources that indigenous firms have in high-technology industries compared to foreign firms may be less important for their low-technology counterparts. Moreover, indigenous and foreign firms in low technology industries are likely to have less reliance on local knowledge resources. By way of contrast since foreign firms are often established by large multinationals, which often supply them with key resources (Nanchum and Keeble, 2003), we cannot expect indigenous firms to have higher growth rates than foreign firms in low-tech sectors.

**P2:** Indigenous firms are less likely to have higher growth advantages over foreign firms in low-tech industries (which require less knowledge resources) compared to high-tech industries.

### 4.3 Firm Specific Factors

**Firm Size**

One key finding on firm growth is that of the negative correlation between the growth rate of firms and their size. This finding suggests that small firms grow faster than large firms (Evans, 1987a,b; Hall, 1987; Nerlinger, 1999). This finding appears to support Birch’s contention that small firms create the majority of jobs in an economy (Birch, 1979, 1989). However, the picture becomes less clear when firms are divided into indigenous and foreign firms.
We argue that smallness of size is less likely to be associated with the growth for foreign firms. Small foreign owned firms incur higher setting up and transaction costs in a host country compared to indigenous firms due to the unfamiliarity with the local environment (Buckley and Casson, 1976; Caves, 1996; Kinoshita, 1998; Nanchum and Keeble, 2003) and greater lack of local social connections (Stuart and Sorenson, 2003). These disadvantages can however often be offset by their firm-specific advantages (Kinoshita, 1998; Nanchum and Keeble, 2003). Foreign firms incur sunk costs at the initial stage; thus large firms are considered to have better access to capital in comparison to small firms to off-set such costs (Horst, 1972; Kinoshita, 1998). Many researchers have concluded that large foreign firms have more advantages investing abroad compared to small firms (Horst, 1972; Lall, 1986; Blomstrom and Lipsey, 1986). Horst’s (1972) seminal work on foreign direct investment (FDI) from U.S. to Canada suggests that size is the key explanatory attribute of the positive coefficient that explains investment. Firm size was also found to be significant for foreign investment in a study on Indian firms by Lall (1986). More recently, some researchers on Japanese firms have found that if destinations go beyond Asia, firm size plays a significant role in Japanese investments (Horaguchi, 1992; Trevino and Daniels, 1994). This discussion leads us to the third proposition:

**P3: While small, indigenous firms tend to grow faster than large firms, small foreign firms will not grow significantly faster than large firms.**

**Firm Internationalisation**

Another important reason for expecting differences in factors influencing high impact growth between indigenous and foreign firms is the role of internationalisation. Researchers of international business have compared indigenous and foreign firms on a range of international related activities (ECLAC, 1985; Wilmore, 1986; Falvey et al., 2007) although not in terms of high impact growth. The results appear to suggest that foreign firms have advantages in terms of internationalisation in comparison to indigenous firms. Findings from these studies have shown that the possibility of exporting for a foreign firm doubles or even triples that of an indigenous firm (ECLAC, 1985). Other studies suggest that the costs of exporting are much lower for foreign firms, because they have more access to information on markets and sales organizations abroad (Wilmore, 1986; Buckley, 2001). The extent of internationalisation has positive effects on foreign firms. Falvey et al. (2007) argue that larger market size leads to higher survival probability for foreign-owned firms, but reduces the survival probability of indigenous firms.

When it comes to home markets, indigenous firms have comparatively more advantage because of their knowledge of local markets (Mirza, 1986; Casson, 1997; Mariotti and Piscitello, 1995). Hence, although indigenous firms may be able to benefit more from home markets, they may not be able to participate in international activities to the same extent.
as their foreign counterparts. This implies greater advantages in international activities for foreign firms but more advantages for indigenous firms in home markets.

**P4:** Greater familiarity with local environment and greater access to local resources, restricts growth rates of indigenous firms to local markets, while foreign firms are more likely to be significantly associated with international markets.

These four propositions provide the basis for our investigation into high impact foreign and local firms.

5. Data and Methods

Data and Geographic Level of Analysis

The key database used in this study is the 2008 UK R&D Scoreboard, which is an international league table of the companies investing most in R&D. The report presents the latest data on investment in R&D and financial performance of the 850 most active UK owned and foreign companies operating in UK. With a focus on innovative high growth firms, the R&D Scoreboard provides reasonably rich data for testing some of the theoretical propositions developed above. The data has a geographic aggregation level of regional development authorities (RDAs) in UK, making regional analysis of such data more appropriate for economic policy, especially because the RDA level in the UK is where regional economic strategies are developed (Lambert, 2003; Adams and Smith, 2004). The data is analysed using bi-variate correlations, ordinary least square (OLS) regressions, as commonly employed in entrepreneurship and innovation studies (Jaffe, 1989; Acs, 2002; Abubakar and Mitra, 2007; Abubakar and Mitra, 2009; Abubakar, 2009).

Variables and Measurements

The R&D Scoreboard firms were thus sampled based on the following criteria: 1) firms must have 4 year employment growth data available; 2) firms with 4 year sales growth data available; 3) located with UK RDAs. This yielded a total of number of 753 firms. Below, we provide a definition of variables and their sources:

- **High Impact Growth** - The high impact firm definition was operationalised as firms with both sales and employment growth over a 4 year period (Acs et al., 2008). We develop a new index termed “High Impact Growth Index (HIGI)” which measures the extent to which a firm achieves both positive employment and sales growth over a 4 year period. The index has a Cronbach’s alpha score of 0.5, which indicates reasonable level of reliability as used in other entrepreneurship studies (Manimala, 1999);

- **Ownership** – the R&D Scoreboard data classifies firms as UK owned (referred to here as ‘indigenous’) and foreign owned, or ‘foreign firms’;
- **Firm Size**: this was measured in terms of number of employees employed by firms, as this is the measure commonly used in many growth studies (Birch, 1979, 1989; Wagner, 1995).

- **Internationalisation** – is used to describe the outward movement or increasing involvement of a firm or larger grouping’s international operations (Johanson and Vahlne, 1977; Welch and Luostarinen, 1988). We measure internationalisation as the percentage of sales outside home region (Hejazi and Santor, 2005).

- **Regional human capital**: human capital at the regional level is defined as percentage of population with up to National Vocational Qualification (NVQ) 4+ as commonly used in entrepreneurship studies (Mitra and Gleave, 2007; Abubakar and Mitra, 2007; Lee et al., 2004). This variable is employed as many studies have shown that educational attainment is associated with entrepreneurship and innovation (Mitra and Gleave, 2007; Abubakar and Mitra, 2007; Lee et al., 2004).

- **Regional R&D** – We measure R&D at the regional level using R&D expenditure as generally used in entrepreneurship and innovation studies (Jaffe, 1989; Acs, 2002; Abubakar and Mitra, 2007; Abubakar and Mitra, 2009).

- **Other variables** – Almost all the other variables are taken directly from the R&D Scoreboard data (see the 2008 UK R&D Scoreboard for more information).

Figure 2 below shows the correlation between the high impact growth index and R&D growth. For both indigenous and foreign firms, high impact growth appears to be significantly correlated with increased R&D activities suggesting that high impact growth appears to associated with R&D and entrepreneurial activities in terms of introducing new products and services (Abubakar, 2009; Abubakar and Mitra, 2009).

**Figure 2: Correlation between High Impact Growth Index (4 yrs) and R&D growth (4yrs)**

![Graph showing correlation between high impact growth index and R&D growth for indigenous and foreign firms](image-url)
Appendix 1 presents the descriptive statistics that show a comparison between indigenous and foreign firms on a range of variables related to firm growth, R&D, sales, employment and financial information. In general, the data suggests that indigenous firms have significant higher performance in comparison to foreign firms.

5. FINDINGS AND DISCUSSION

5.1. Regional Factors

In this section we examine the proposition developed earlier that region specific resources are relatively more important for generating indigenous high impact firms compared to foreign owned high impact firms, although they are significant for both groups. Figure 3 shows the geographic concentration of high impact firms per 10,000 population i.e. firms that have generated both positive growth in sales and employment. The map shows variations in high impact firms on a per-capita basis at the regional level. It ranges from 3.7 firms per capita (Yorkshire and Humber) to 30 (London). The highest number of indigenous high impact firms in London (25.1), South East (18.1) and Eastern region (15.8), which rank 1st, 2nd and 3rd respectively. Similarly, the regions with the highest numbers of foreign high impact firms per capita are the South East (9.9), Eastern (5.4) and London (4.9). These suggest that most high impact firms in the UK are geographically concentrated around London, South East and Eastern regions (an explanation of these regional variations in the geography of high impact firms is provided later).

Figure 3: Geographic distribution of high impact firms
1) East  (2) East Midlands  (3) London  
4) North East  (5) North West  (6) South East  
7) South West  (8) West Midlands  (9) Yorkshire and Humber

Note: This map depicts only firms that have generated ‘both’ positive growth in sales and employment over the 4 year research period. Firms with negative growth rates in sales and/or employment have thus been excluded.

Table 3 shows summary data on human capital and R&D for each of the UK regions. The table suggests a high level of disparity across regions in terms of human capital, business R&D, higher education institution (HEI) R&D and government R&D. Our primary interest here is thus the extent to which these regional resources are associated with indigenous and foreign high impact firms.

Sources: DTI (2001); Business Enterprise Research and Development Scotland (2007)

Next, we examine the relative impact of these regional resources on number of high impact firms per capita. Since in this analysis, we are only interested in high impact firms, only firms with both positive employment and sales growth over a four year period were selected. Accordingly, the analysis is conducted across the twelve UK regional development authority (RDA) regions. We use the regional population measure to control for varying sizes of regions (Lee et al., 2004). The number of high impact firms is reported on per capita basis.

Table 4 reports the results of the regression analysis. Consistent with our proposition, it appears that region specific resources are more associated with indigenous high impact firms (0.94) in comparison to foreign high impact firms (0.71), although both are highly significant at p≤0.01. Thus, indigenous firms appear to derive higher benefits from local knowledge resources in comparison to foreign firms. However, it appears that knowledge generated in another country can be accessed and has a significant impact on the growth of foreign firms, which is in contrast to arguments of some scholars who argue that spillovers are highly localised (Audretsch, 1998;
Stuart and Sorenson, 2003). It seems that foreign firms even in the UK are particularly attracted to regions with high levels of local resources. This finding is similar to that of Abubakar and Mitra (2009) who reported significant correlations between international knowledge sources and innovative activities of small firms.

N=12

Note: This analysis is conducted only on firms that have generated ‘both’ positive growth in sales and employment over the 4 year research period. Firms with negative growth rates in sales and/or employment have thus been excluded.

Another important finding emerging from the regression results is that while human capital and business R&D appear have positive effects on the number of high impact firms across the UK regions (both indigenous and foreign) once the effect of all other factors are controlled (business R&D and human capital) university R&D appears to be insignificant for both groups of firms. This finding implies without strong local business R&D and local human capital, university R&D plays an insignificant role for firm growth. Thus, it seems although university R&D is highly important for the creation of innovative start-ups (Saxenian, 1994; Abubakar and Mitra, 2007), it plays less significant role for firm growth, except where the region has a reasonably good pool of human capital and business R&D. When the effect of business R&D and human capital are not removed, we observe positive correlations for both indigenous (correlation=0.80) and foreign firm (correlation =0.47) between firm growth and university R&D across the regions. However, once effect of business R&D and human capital are controlled the partial correlations become negative and insignificant for both indigenous (correlation = -0.12) and foreign firms (correlation = -0.49). Hence, it seems that regional business R&D and human capital mediate the effect of university R&D on firm growth.

In brief, the results of the analysis appear to support our first proposition. The different results for indigenous and foreign firms clearly demonstrate the need to take into account varying effects of local resources for firm growth by the two groups of firms.

**5.2. Sectoral Factors**

Since foreign firms have lower levels of access to local knowledge resources compared to indigenous firms, such growth disadvantages are more likely to be found in high technology sectors. We test the proposition that while indigenous firms may have significantly higher growth advantages in high-tech sectors due to greater access to regional
knowledge resources, (which require less knowledge resources), no significant differences are likely to exist in the growth rates of indigenous and foreign firms in low technology industries.

We first classify sectors into high-tech and low-tech industries (Butchart, 1987; CCC, 2004). High-tech industry definition was originally developed by Butchart (1987) based on selected industries from 1980 Standard Industrial Classification (SIC). This provided a definition of high-tech industries based on the ratios of a) R&D expenses to sales and b) employees working in R&D to total employees. In 2004, Butchart’s (1987) original 1980 SIC code classification of high-tech sectors, was built upon by the authoritative Cambridgeshire County Council (CCC, 2004), which identified high-tech sectors through the modernised 1992 SIC codes. This definition has been employed in a number of entrepreneurship and innovation studies (Keeble *et al.*, 1999; Athreye, 2001; Abubakar, 2009). We also considered sectors in the R&D scoreboard data that relate closely to CCC (2004) high-tech sectors as high-tech industries; while all the other sectors were considered as low tech industries.

Table 5 below gives descriptive statistics on growth and R&D investment measures between the high-tech industries and low-tech industries identified. In general, in line with Butchart’s (1987) definition, the high-tech sectors appear to higher scores for various R&D indicators.

**High-tech sectors:**
- Pharmaceuticals & biotechnology, Health care equipment & services, Electronic & electrical equipment, Technology hardware & equipment, Software & computer services, Leisure goods, Automobiles & parts, Industrial engineering, Electricity, Chemicals, Aerospace & defence, Fixed line telecommunications, Oil equipment, Services & distribution, Mobile telecommunications, General industrials, Industrial transportation, Industrial metals, Oil & gas producers etc.

**Low-tech sectors:**
- Beverages, Media, Personal goods, Food producers, Support services, Construction & materials, Travel & leisure, Financial services, Household goods, General retailers, Forestry & paper, Nonlife insurance, Mining, Life insurance etc.

In order to test our second proposition, the high impact growth index (HIGI) discussed in the methodology section is used as the proxy for high impact growth. We use a t-test to examine whether growth rates of indigenous and foreign firms in high-tech industries but not low tech industries. Accordingly, figure 4 below depicts the t-test results. The results appear to support our contention that indigenous firms have less growth advantages than

---

2 See section on data methods for more details
foreign firms in low-tech industries. A relatively smaller difference in the mean figures was observed for low-tech industries compared to high-tech industries.

**Figure 4: Differences in High Impact Growth Index between indigenous and foreign firms in high-tech and low-tech industries**

Although a number of studies suggest that indigenous firms have more advantages compared to foreign firms due to greater familiarity with the local environment (Buckley and Casson, 1976; Caves, 1996; Kinoshita, 1998; Nanchum and Keeble, 2003), our finding suggest that it is important to acknowledge that such performance differences are more likely to exist in high-tech industries rather than low-tech industries. Low-tech industries have less need for knowledge resources compared to high-tech industries (Audretsch, 1998). Even if foreign firms are more likely to lack social connections to providers of knowledge resources, this disadvantage becomes less important in industries that require lower levels of technical know-how. Having found some differences in the importance of sector related factors for the growth of firms in the two groups, what roles do firm-specific factors such as firm size - play in the growth of indigenous and foreign firms.

**5.3. Firm Specific Factors: Size and Internationalisation**

We examine our third proposition, which states that: while for indigenous small firms tend to grow faster than large firms, small foreign firms will not grow significantly faster than their larger counterparts. In statistical terms, this suggests that while for indigenous firms, the High Impact Growth Index will be significantly higher for small firms compared to large firms; for foreign firms, no significant difference will be found between small and large firms.

We begin by classifying firms into small and medium enterprises (SMEs) and large firms. We use the American definition of firms having less than 500 employees so as to be in line with existing literature on gazelles and high impact firms (Birch, 1979, 1989; Birch and Madoff, 1994; Acs et al., 2008). First, we carry-out a simple bi-variate correlation between firm size and growth for indigenous firms separately and then foreign firms separately. For
indigenous firms, we find firm size to be negative and significantly correlated with high impact growth ($p \leq 0.1$). This appears to be in line with the argument that small firms grow faster than large firms (Evans, 1987a and b; Hall, 1987; Nerlinger, 1999). In contrast, however, we do not find any significant negative correlation between firm size and growth for foreign firms. It appears that small size may not be a significant factor in influencing the high impact growth of foreign firms.

Next, we conduct t-tests separately for indigenous and foreign firms in order to determine differences in the High Impact Growth Index of SMEs and large firms. Table 6 below displays the results of the t-test. Consistent with the results found earlier (see table 5); we find that for indigenous firms, SMEs are significantly more likely to experience high impact growth ($p \leq 0.05$) compared to large firms. As far as foreign firms are concerned we find no statistically significant difference between the growth of SMEs and large firms ($p \geq 0.1$).

Our findings suggest the need for a distinction between indigenous and foreign firms when observing that small firms grow faster than large firms (Evans, 1987a and b; Hall, 1987; Nerlinger, 1999). These findings confirm our proposition that small foreign firms are unlikely
to grow faster than large firms. This as mentioned earlier is due to disadvantages faced by foreign firms compared to indigenous firms because of costs arising from unfamiliarity with the environment. These disadvantages can be offset by their firm-specific advantages such as their large size (Horst, 1972; Kinoshita, 1998). Size plays different roles in the drama of high impact growth of foreign and indigenous firms.

We also expect more firm-specific differences in factors influencing the growth of indigenous and foreign firms, especially in terms of the internationalisation process. We proposed that due to greater familiarity with the local environment and greater access to local resources, the growth rates of indigenous forms is less likely to occur in international markets. This proposition contrasts with the view that foreign firms are more likely to be significantly associated with international markets. To test our fourth proposition, we adopt a measure of internationalisation, which is measured as the percentage of sales outside home region (Hejazi and Santor, 2005).

Figure 6 below shows the simple bi-variate correlation between the High Impact Index and proportion of sales outside home region for indigenous and foreign firms. The results suggest that while the growth rate of foreign firms is significantly correlated with proportion of sales outside home region (p<0.01), the growth rate of indigenous firms does not appear to be significantly correlated with proportion of sales out home region (p>0.1).

Figure 6: Correlation between High Impact Index and Proportion of sales outside home region

![Correlation plots](image-url)
It appears that although indigenous firms have higher growth rates, a large proportion of their sales occur within home markets. The role of home market for firm growth appears to be particularly important for indigenous firms. In contrast, the growth of foreign firms appears to be more dependent on the extent of sales beyond home markets. Therefore the role that internationalisation plays for firm growth may need to be distinguished, depending on whether firms are foreign and indigenous owned. This does not mean that internationalisation is not important for indigenous firms, rather, their growth relies less on international markets. This is likely because indigenous firms have less access to information on markets and sales organizations abroad (Wilmore, 1986; Buckley, 2001).

6. Conclusion

Recent theories of firm growth view small firms as the primary engine of employment generation and growth (Birch, 1979, 1989; Evans, 1987a, b; Hall, 1987; Nerlinger, 1999). While firm related characteristics such as small size are considered important for firm growth, it remains unclear whether differences exist in factors influencing the growth of indigenous and foreign firms – especially in both employment and revenue (high impact growth). This study examined differences in the influence of specific, sector and region specific factors influencing high impact growth. Using data on 753 firms, 35 sectors classified into high-tech and low tech industries and 12 regions of the UK, we made several original findings.

6.1. Original Findings

First, regional knowledge resources – particularly local human capital and business R&D; lie at the heart of high impact growth for indigenous firms but to a lesser degree for foreign firms; Regional resources play a more crucial role in the high impact growth of indigenous firms compared to local firms even when they are both located in the same region. Second, because low-tech industries have less need for knowledge resources, we find that indigenous firms have less growth advantages over foreign firms in low-tech industries in comparison to high-tech industries. Therefore, although foreign firms can be more unfamiliar with the local environment and have less social connections to providers of local knowledge resources (Nanchum and Keeble, 2003; Stuart and Sorenson, 2003), this disadvantage becomes less important for firm growth in industries that require less knowledge i.e. low tech industries.

Thirdly, also, because foreign firms appear to have less access to regional resources, their growth appears to be relatively more dependent on large firm size. In contrast, for indigenous firms, small firms have significantly higher growth rates than large firms. The finding that small firms grow faster than large firms (Birch, 1979, 1989; Evans, 1987a, b; Hall, 1987; Nerlinger, 1999) was only supported for indigenous firms. This carries an implication
for job generation by foreign firms; small foreign firm may not generate more jobs than their larger counterpart.

Fourthly, due to greater familiarity with local environment, growth rates of indigenous forms was not found to rely much on international markets but home markets, while that of foreign firms appears to be significantly associated with international markets. Therefore the significance of the home market for firm growth may have been underestimated by the excessive focus on firm internationalisation especially because indigenous firms were found to have faster growth rates. Thus, this study is likely the first attempt towards identifying differences in factors affecting high impact growth between indigenous and foreign firms. Below, we report some refutation findings.

6.2. Refutational Findings

In contrast to the expectations of researchers on university spillovers (Jaffe, 1989; Audretsch, 1998; Stuart and Sorenson, 2003), once regional business R&D and human capital are controlled, we find no evidence that firm growth rates across UK regions between 2004-2008 are positively impacted by university R&D. When the effects of regional business R&D and human capital are not controlled, university R&D becomes positively associated with firm growth for both indigenous and foreign firms. Even though university R&D plays crucial role in region’s ability to generate innovative start-ups (Abubakar and Mitra, 2007), it seems a region may only benefit from university R&D in terms of firm growth if the business R&D in the region is strong and there is sufficient human capital in the region to ‘absorb’ the research outputs. Regional human capital and business R&D mediate the effect of university research, and therefore without them, university R&D may not be significant for firm growth.

6.3. Implications for Policy

In encouraging high impact growth by indigenous and foreign firms policy makers should take into account specific differences in the regional, sectoral and firm specific factors influencing growth as indicated above. A blanket strategy may not be very effective in fostering the growth of indigenous and foreign firms. If regional policy makers wish to encourage the use of university R&D for firm growth, it is important for them to contextualise their value by ensuring that there are sufficient levels of business R&D and human capital complements and absorbs these assets. Fostering commercialisation of university R&D should be done in association with encouragement of both human capital and business R&D.

6.4. Limitations

Researchers are often criticised for not making clear the environments to which their theories apply. The present analysis is concerned only with firms that have significant R&D activities, especially since the sample was drawn from R&D Scoreboard data. Therefore, the
results of the analysis on indigenous firms are applicable only to indigenous firms that engage in R&D; while the findings on foreign firms are mainly applicable foreign firms that conduct R&D. Also, this study is limited to firm growth in employment and sales; it does not consider other growth and firm performance measures. Any attempt to apply the findings of this research in other regions must take into account the contexts within which the research was conducted.

Entrepreneurship, Growth and the High Impact Firm: Comparing Indigenous and Foreign Firms

Yazid A. Abubakar

and

Jay Mitra

Centre for Entrepreneurship Research
Essex Business School, University of Essex, Elmer Approach,
Southend-on-Sea SS1 1LW

Aim of the paper

As the global economic crisis deepens with the consequent negative effect of increasing levels of unemployment and falling aggregate demand, it is important to understand how, where and why entrepreneurial firms are able to turn the tide by creating prospects of growth. This paper is concerned with entrepreneurial and ‘high-impact firms’ by which we mean firms that generate ‘both’ disproportionate levels of employment and sales growth, and have high levels of innovative activity (Acs et al., 2008). It investigates differences in factors influencing high-impact growth between indigenous and foreign firms.

The contribution to the literature

This study makes several original contributions by identifying differences in factors affecting high impact growth between indigenous and foreign firms. Specifically, the findings are: 1) First, regional knowledge resources – particularly local human capital and business R&D: lie at the heart of high impact growth for indigenous firms but to a lesser degree, foreign firms; 2) Secondly, however, because low-tech industries have less need for knowledge resources, we find that indigenous firms have less growth advantages over foreign firms in low-tech industries compared to high-tech industries; 3) Thirdly, because foreign firms appear to have less access to regional resources, their growth appears to be relatively more dependent on large size and internationalisation. On the other hand, for indigenous firms, small firms had significantly higher growth rates than large firms and were more reliant on. Thus, the hypothesis that small firms grow faster than large firms was only supported for indigenous firms; 4) Due to greater familiarity with local environment, growth rates of indigenous forms was not found to rely much on international markets but home markets, while that of foreign firms appears to be significantly associated with international markets.

The methodology
The study is based on an analysis of data drawn from United Kingdom (UK) Innovation Scoreboard on 753 firms in 12 UK regions. Based on 1992 Standard Industrial Codes (SIC), identified by CCC (2004), the firms were further classified into those belonging to high-tech industries and low-tech industries. These thus provide a unique data set that allows for critical analysis of firms generating both employment and sales growth. The data was for the most part analysed using multiple regressions, bivariate correlations and t-tests.

The results and implications

These insights have potential implications for local and national policies on job creation, firm growth and the concentration of firms in specific spaces, especially under circumstances where many firms are shedding their work force as they struggle for survival in recessionary times.

1. Introduction

Interest in firm growth theory now spans about 30 years. The initial excitement centred on the work of Birch, where job providers, were seen to be the smaller, younger firms (Birch, 1979, 1987). Once firms grow older, their ability to generate new jobs decline substantially. Birch’s work has influenced a whole generation of researchers and generated significant contributions to knowledge making an impact on both research and public policy promoting small and medium enterprises (SMEs) in many countries (Storey, 1994; Landstrom, 1996; Acs et al., 2008). In the United Kingdom (UK) from 1987–88 alone, public expenditure on promoting enterprise was almost £200 million, supporting more than 106,000 unemployed people to start new businesses (Storey, 1994). Further, in 2004, the UK government launched the ‘encouraging a dynamic start-up market’ one of the key pillars of small business policy reflecting the interest on small firms and growth (Stel and Storey, 2004).

Today, scholars of firm growth argue that most job creation by small-firm occurs within a relatively small number of firms – called Gazelles (Birch and Medoff, 1994; Acs et al., 2008). In this setting, gazelles are firms that “move between small and large (size) quickly...(characterised by) great innovation and rapid job growth” (Birch and Medoff, 1994: p.163). Acs et al. (2008) extended the work of Birch beyond firms with mainly employment growth, by adding the revenue growth variable to that of expanding employment. Firms showing both revenue and employment growths were referred to as “high-impact firms” in order to distinguish them from gazelles (Acs et al., 2008). The major conclusion of the work by Acs et al. (2008) is that high-impact firms are relatively old, rare and contribute to the majority of overall economic growth.

This perspective on high impact firms (Acs et al., 2008) is particularly important at a time of global economic crisis. However, a critical review of the literature (see below),
reveals that there is hardly any systematic study investigating a combination of region, sector specific or firm specific factors influencing high impact growth, and especially between indigenous and foreign firms. We believe that information about these factors could help with the formation of empirically informed policies for promoting high impact growth of firms that take into account the distinguishing features of indigenous and foreign firms (Nanchum and Keeble, 2003). Policies on local firm formation and growth and foreign firm investment can, therefore be supported on the basis of empirical evidence. Firm managers may also benefit from a more clear understanding of regional, sectoral and firm specific factors that could hinder or promote high impact growth of the firms. Managers of such firms can, therefore, design effective strategies for high impact growth.

The central research problem addressed by in this paper is that of the differences in region, sector and firm specific factors influencing high impact growth of indigenous and foreign firms. The paper claims several contributions to knowledge. We construct a High-Impact Growth Index (HIGI), which measures firms’ ability to generate both sales and employment growth over a long time period. A second contribution is the identification of differences in role of regional human capital, regional business R&D and regional university in the growth of indigenous and foreign owned firms. Thirdly, this study identifies the differences in the relative growth rates of indigenous and foreign owned firms in both high-tech and low tech sectors. Fourthly, this study examines the differences in the influence of firm size and internationalisation in the growth of indigenous and foreign firms. Taken together these contributions augment the literature on gazelles and high impact firms (Birch, 1979, 1987; Gallagher et al. 1990; Daly et al. 1991; Birch and Medoff, 1994; Acs et al., 2008) regional factor theorists (Jaffe, 19989; Acs, 2002; Krudsen, 2007) and firm ownership – indigenous and foreign firms (Buckley and Casson, 1976; Caves, 1996; Nanchum and Keeble, 2003).

The paper begins with a review of the literature on gazelles and high impact firms (Birch and Medoff, 1994; Acs et al., 2008). This is then followed by a presentation of theoretical arguments on whether high impact firms on differences on regional factors (Acs, 2002; Stuart and Sorenson, 2003; Krudsen et al., 2003), sectoral factors (Audretsch, 1998; Doloreux, 2003) and firm specific factors (Hall, 1987; Nerlinger, 1999; Nanchum and Keeble, 2003) influencing the high impact growth of indigenous or foreign owned firms.

2. The Evolution of the High Impact Firm Theory

In the 1970s and 90s, firm growth theories on job creation consisted mainly of the work of the prominent economist, David Birch (1979; 1987). Various other researchers confirmed one of Birch’s key conclusions, namely that small firms account for most new job creation in an economy (Birch, 1979, 1987; Gallagher et al. 1990; Daly et al. 1991). In Birch’s seminal work, titled The Job Generation Process (1979), he developed an ‘economic
micro-scope’ (Landstrom, 1996) that went beyond aggregate employment statistics so as to explain how the behaviour of individual firms leads to employment changes. Employing Dun & Bradstreet database in the United States (US), Birch initiated the systematic study of small businesses. Prior to his research only a few economists had studied small businesses in spite of their contribution to a large fraction of employment (Brock and Evans, 1989). Accordingly, Birch found that:

- In the US, about 60 percent of all jobs were created by firms employing fewer than 20 people; and almost 50 percent of the jobs were generated small by independent entrepreneurs. In contrast, large firms (employing more than 500 people) had less than 15 percent of all net new jobs.
- It was not all the small firms that were job generators. Rather, it was the smaller, younger firms that created jobs – and job generation abilities of firms declined once they were up to four years old.

Birch concluded that “whatever they are doing, however, large firms are no longer the major providers of new jobs for Americans” (Birch, 1981, p. 8). These seminal contributions have since then triggered a large canon of research, public policy measures and debate on the role played by small firms in employment creation (Gallagher et al. 1990; Daly et al. 1991; Acs et al., 2008). Researchers in other countries have long replicated Birch’s findings, with results of the UK (based on Dun & Bradstreet) indicating that small firms make a disproportionately large contribution to net job creation, although the contribution is not as high as estimated by Birch (Gallagher et al. 1990; Daly et al. 1991).

Gazelles

Birch’s work has also been subject to some criticism especially from Brown, Hamilton and Madoff (1990). In a book titled Employers Large and Small, they argued that:

Perhaps the most widespread misconception about small businesses in the United States is that they generate the vast majority of jobs and are therefore the key to economic growth. … Small employers do not create a particularly impressive share of jobs in the economy, especially when we focus on jobs that are not short lived (Brown, Hamilton and Madoff, 1990: p.1-2).

Subsequently, in early 1990s attempts at finding common ground between David Birch and James Madoff were made culminating in the emergence of another conceptual category of firms called ‘Gazelle’. Gazelles were defined as firms with significant revenue growth (Birch and Madoff, 2004). It was argued that the difference between the role of small and large firms in creating jobs is of less significance. The firms that create most jobs are gazelles, which are not necessarily small or large. “These gazelles move between small and large quickly—at various times in either direction—and to classify them by their size is to
miss their unique characteristics: great innovation and rapid job growth (Birch and Medoff, 1994: p. 163).

Since then, this perspective on gazelle has attracted attention from prominent entrepreneurship scholars (Parker, Storey and Witteloostuijn, 2005; Acs and Mueller, 2007). In 2005, Parker, Storey and Witteloostuijn (2005) take the study on gazelles further by developing a theory of dynamic management strategies of high-growth firms: gazelles. Based on a data set from Britain containing information on over 100 gazelles they advance a framework that emphasises dynamic, rather than static, management strategies as key high growth (Parker, Storey and Witteloostuijn, 2005). Another recent paper by paper by Acs and Mueller (2007) found that business start-ups with less than 500 employees have persistent employment effects over time and across large, diversified metropolitan regions. Therefore, Acs and Mueller (2007) conclude that gazelles and characteristics of the region are important for employment growth. Another important point is that gazelles account for almost all the job creation in the economy (Birch and Medoff, 1994; Acs and Mueller, 2007).

From Gazelles to High Impact Firms

Zoltan Acs, William Parsons and Spencer Tracey in a report entitled ‘The High Impact Firm: Gazelles Revisited’ (2008) for the US Small Business Administration (SBA) extended the scope of Birch and Medoff’s (1994) findings. They argue that although Birch’s research is important, very little is known about what high impact firms are before they become high impact firms. To distinguish their research from that of Birch, they went beyond Birch’s definition of gazelles to include firms with significant revenue growth and expanding employment, referring to such firms as ‘high impact firms’ (Acs, et al., 2008). Based on a critical analysis of data set drawn from American Corporate Statistical Library (ACSL), which covers data from both public and private sector sources over a 12-year period, they found that:

High-impact firms are relatively old, rare and contribute to the majority of overall economic growth. On average, they are 25 years old, they represent between 2 and 3 percent of all firms, and they account for almost all of the private sector employment and revenue growth in the economy (Acs, et al., 2008).

Acs, et al’s. (2008) conclusions support Birch’s observation that gazelles account for almost all the job creation in the economy, although their measures were not entirely comparable. They also found comparable findings with regard to firm size, but not firm age. High impact firm are not new firms and they are found in all firm-size classes. High-impact firms are rare and contribute to the majority of overall economic growth (Birch and Medoff, 1994; Acs et al., 2008).
3. Research Issues

We argue that the research on the subject still remains unsatisfactory at least for three key reasons. First, existing theories on gazelles and high impact firms are important in helping us to understand which firms create jobs, and how they impact on the economy (Birch and Medoff, 1994; Acs et al., 2008). But these theories do not take into consideration the importance of region specific factors affecting high impact growth of indigenous and foreign firms. By region specific factors, reference is being made to local human capital, business R&D and university R&D (Jaffe, 1989; Acs, 2002; Krudsen et al., 2007). This is of crucial importance especially in a time when economic policies are developed at the regional level (DTI, 1998; ERP, 2007). Such information will allow regional policy makers to understand the different roles local resources play in the growth of indigenous and foreign firms, thereby helping to design more informed policies specifically for indigenous and foreign firms. Secondly, it is not clear whether sector-specific factors have any impact on the growth of indigenous and foreign firms. These factors often refer to the extent to which high and low tech sectors rely on research and development (Butchart, 1987; Doloreux, 2003; CCC, 2004). At a time when many regional policies prioritise high-tech over low-tech sectors, it is important to understand whether such prioritisation should also apply to both indigenous and foreign firms. Thirdly, we appear to lack an understanding of the differences in the influence of varying ‘firm specific factors’ (such as ownership, firm size and internationalisation) for the high impact growth of indigenous and foreign firms. Such information could help both policy makers and managers of indigenous and foreign firms to understand whether the size of the firms offer greater advantages for firm growth, and also the extent to which their growth depends on international markets.

**Hardly compare differences between indigenous and foreign firms in terms of region specific, sector specific and firm specific factors influencing their high impact growth.
We contend that differences in factors influencing high impact growth between indigenous and foreign owned firms remain by and large obscure (see table 1). Identification of these differences provides the basis for generating new propositions related to the research problem and the development of a conceptual framework.

4. Conceptual Framework and propositions

The literature on localised knowledge spillovers sheds light on regional differences in resources that may affect the growth of indigenous and foreign firms. A review of this literature enables us to compare indigenous and foreign owned firms in terms region specific factors (Jaffe, 1989; Acs, 2002; Stuart and Sorenson, 2003; Krudsen et al., 2007). The literature on high-tech and low-tech industries (Mahmood, 1992; Doloreux, 2003) allows us to find the theoretical basis for proposing that patterns of high impact growth by indigenous and foreign high impact firms may differ across sectors. Figure 1 below presents our conceptual framework for comparing indigenous and foreign firms in terms of differences in the three factors influencing their high impact growth. The region specific factors are local human capital, business R&D and university R&D (Jaffe, 1989; Acs, 2002; Stuart and Sorenson, 2003; Krudsen et al., 2007). The sector specific factors relate to the nature of technology developed by firms – high-tech and low tech sectors (Doloreux, 2003). Finally, the firm specific factors are: firm size (Birch, 1979, 1989; Evans, 1987a, b; Hall, 1987; Nerlinger, 1999) and internationalisation (ECLAC, 1985; Wilmore, 1986; Falvey et al., 2007).

High Impact Growth

[Employment + Sales Growth]
This model integrates high impact firm literature (Acs et al., 2008), localised knowledge spillover theory (Acs, 2002; Stuart and Sorenson, 2003) and international business theory (Nanchum and Keeble, 2003). The aim is thus to empirically examine the effect of various factors on high impact growth (Acs, et al. 2008) by indigenous and foreign firms. What follows is a discussion of each component of the model so as to develop specific propositions on differences in the effect of the three factors on the growth of indigenous and foreign firms.

4.1 Region Specific Factors

The knowledge spillover theory mainly highlights the significance of local linkages for a firm’s generation of its own knowledge (Jaffe, 1989; Acs, 2002; Stuart and Sorenson, 2003). Localised knowledge spillovers are defined as “knowledge externalities bounded in space”, which allow firms operating in proximity to key knowledge sources to introduce innovations at a faster rate than rival firms located elsewhere (Breschi and Lissoni, 2001). Knowledge takes the form of local human capital, business R&D and government R&D (Acs, 2002; Stuart and Sorenson, 2003; Krudsen et al., 2007). According to Breschi and Lissoni, 2001, localised knowledge spillovers can be broken down into three logical chains (Breschi and Lissoni, 2001: p.258):

a. knowledge generated within innovative firms and/or universities is somehow transmitted to other firms;

b. knowledge that spills over is a public good, i.e., available to those wishing to invest for searching it out, and may be exploited by more than a few users at the same time;

c. Despite b., knowledge that spills over is mainly “tacit”, i.e., highly contextual and difficult to codify, and therefore is more easily transmitted through face-to-face contacts and personal relationships, which require spatial proximity; in other words, it is a public good, but a local one.

The key question here is the extent to which local knowledge is significant for high impact growth of both indigenous firms and foreign firms assuming they are located in the same region. Following the argument of localised knowledge spillover theorists, local entrepreneurs and managers are likely to have greater connections to technologists, universities and other local sources of knowledge since they are more likely to have close social connections (Stuart and Sorenson, 2003). However, foreign firms are also attracted to regions with key knowledge inputs in order to gain access to its specialised resources (Dunning, 1993; Nanchum and Keeble, 2003). International business theory suggests that gaining access to immobile resources (such as technologies and organisational capabilities) available in foreign countries is an important rationale for firms to invest outside their home country (Dunning, 1993; Wesson, 1997; Kuemmerle, 1998). Foreign firms attracted by
regions with resources can become insiders, and some of their needs can be met locally, in a manner similar to indigenous members of a local agglomeration or cluster (Nanchum and Keeble, 2003).

Paradoxically, foreign firms with their linkages with the rest of the transnational corporation (TNC) (Nanchum and Keeble, 2003) may have limited need for accessing local resources during the growth process. Greater cost disadvantages for foreign firms arising from unfamiliarity with the local environment (Buckley and Casson, 1976; Caves, 1996; Nanchum and Keeble, 2003) suggest that local (indigenous) firms will benefit more from local resources due to more established social connections (Stuart and Sorenson, 2003). These observations lead to the proposition that regional knowledge resources are critical for high impact growth, especially for local firms.

**P1:** Regional knowledge resources lie at the heart of high impact growth for indigenous firms but to a lesser degree, foreign firms.

4.2 Sector Specific Factors

Since indigenous firms have higher levels of access to regional knowledge resources compared to foreign firms, we argue that such growth advantages are more likely to be in high-technology sectors rather than low technology sectors. This is because although in high-technology sectors, firms have a high level of requirement for external knowledge resources (Jaffe, 1989; Acs, 2002; Stuart and Sorenson, 2003), firms in low-technology sectors have less need for knowledge resources (Dolororeux, 2003). Therefore, the advantage of accessing knowledge resources that indigenous firms have in high-technology industries compared to foreign firms may be less important for their low-technology counterparts. Moreover, indigenous and foreign firms in low technology industries are likely to have less reliance on local knowledge resources. By way of contrast since foreign firms are often established by large multinationals, which often supply them with key resources (Nanchum and Keeble, 2003), we cannot expect indigenous firms to have higher growth rates than foreign firms in low-tech sectors.

**P2:** Indigenous firms are less likely to have higher growth advantages over foreign firms in low-tech industries (which require less knowledge resources) compared to high-tech industries.

4.3 Firm Specific Factors

**Firm Size**

One key finding on firm growth is that of the negative correlation between the growth rate of firms and their size. This finding suggests that small firms grow faster than large firms (Evans, 1987a,b; Hall, 1987; Nerlinger, 1999). This finding appears to support Birch’s contention that small firms create the majority of jobs in an economy (Birch, 1979,
However, the picture becomes less clear when firms are divided into indigenous and foreign firms.

We argue that smallness of size is less likely to be associated with the growth for foreign firms. Small foreign owned firms incur higher setting up and transaction costs in a host country compared to indigenous firms due to the unfamiliarity with the local environment (Buckley and Casson, 1976; Caves, 1996; Kinoshita, 1998; Nanchum and Keeble, 2003) and greater lack of local social connections (Stuart and Sorenson, 2003). These disadvantages can however often be offset by their firm-specific advantages (Kinoshita, 1998; Nanchum and Keeble, 2003). Foreign firms incur sunk costs at the initial stage; thus large firms are considered to have better access to capital in comparison to small firms to off-set such costs (Horst, 1972; Kinoshita, 1998). Many researchers have concluded that large foreign firms have more advantages investing abroad compared to small firms (Horst, 1972; Lall, 1986; Blomstrom and Lipsey, 1986). Horst’s (1972) seminal work on foreign direct investment (FDI) from U.S. to Canada suggests that size is the key explanatory attribute of the positive coefficient that explains investment. Firm size was also found to be significant for foreign investment in a study on Indian firms by Lall (1986). More recently, some researchers on Japanese firms have found that if destinations go beyond Asia, firm size plays a significant role in Japanese investments (Horaguchi, 1992; Trevino and Daniels, 1994). This discussion leads us to the third proposition:

**P3:** While small, indigenous firms tend to grow faster than large firms, small foreign firms will not grow significantly faster than large firms.

Another important reason for expecting differences in factors influencing high impact growth between indigenous and foreign firms is the role of internationalisation. Researchers of international business have compared indigenous and foreign firms on a range of international related activities (ECLAC, 1985; Wilmore, 1986; Falvey et al., 2007) although not in terms of high impact growth. The results appear to suggest that foreign firms have advantages in terms of internationalisation in comparison to indigenous firms. Findings from these studies have shown that the possibility of exporting for a foreign firm doubles or even triples that of an indigenous firm (ECLAC, 1985). Other studies suggest that the costs of exporting are much lower for foreign firms, because they have more access to information on markets and sales organizations abroad (Wilmore, 1986; Buckley, 2001). The extent of internationalisation has positive effects on foreign firms. Falvey et al. (2007) argue that larger market size leads to higher survival probability for foreign-owned firms, but reduces the survival probability of indigenous firms.

When it comes to home markets, indigenous firms have comparatively more advantage because of their knowledge of local markets (Mirza, 1986; Casson, 1997; Mariotti and Piscitello, 1995). Hence, although indigenous firms may be able to benefit more from
home markets, they may not be able to participate in international activities to the same extent as their foreign counterparts. This implies greater advantages in international activities for foreign firms but more advantages for indigenous firms in home markets.

**P4:** Greater familiarity with local environment and greater access to local resources, restricts growth rates of indigenous firms to local markets, while foreign firms are more likely to be significantly associated with international markets.

These four propositions provide the basis for our investigation into high impact foreign and local firms.

5. **Data and Methods**

**Data and Geographic Level of Analysis**

The key database used in this study is the 2008 UK R&D Scoreboard, which is an international league table of the companies investing most in R&D. The report presents the latest data on investment in R&D and financial performance of the 850 most active UK owned and foreign companies operating in UK. With a focus on innovative high growth firms, the R&D Scoreboard provides reasonably rich data for testing some of the theoretical propositions developed above. The data has a geographic aggregation level of regional development authorities (RDAs) in UK, making regional analysis of such data more appropriate for economic policy, especially because the RDA level in the UK is where regional economic strategies are developed (Lambert, 2003; Adams and Smith, 2004). The data is analysed using bi-variate correlations, ordinary least square (OLS) regressions, as commonly employed in entrepreneurship and innovation studies (Jaffe, 1989; Acs, 2002; Abubakar and Mitra, 2007; Abubakar and Mitra, 2009; Abubakar, 2009).

**Variables and Measurements**

The R&D Scoreboard firms were thus sampled based on the following criteria: 1) firms must have 4 year employment growth data available; 2) firms with 4 year sales growth data available; 3) located with UK RDAs. This yielded a total of number of 753 firms. Below, we provide a definition of variables and their sources:

- **High Impact Growth** - The high impact firm definition was operationalised as firms with both sales and employment growth over a 4 year period (Acs *et al.*, 2008). We develop a new index termed “High Impact Growth Index (HIGI)” which measures the extent to which a firm achieves both positive employment and sales growth over a 4 year period. The index has a Cronbach’s alpha score of 0.5, which indicates reasonable level of reliability as used in other entrepreneurship studies (Manimala, 1999);

- **Ownership** – the R&D Scoreboard data classifies firms as UK owned (referred to here as ‘indigenous’) and foreign owned, or ‘foreign firms’;
- **Firm Size**—this was measured in terms of number of employees employed by firms, as this is the measure commonly used in many growth studies (Birch, 1979, 1989; Wagner, 1995).

- **Internationalisation**—is used to describe the outward movement or increasing involvement of a firm or larger grouping’s international operations (Johanson and Vahlne, 1987; Welch and Luostarinen, 1988). We measure internationalisation as the percentage of sales outside home region (Hejazi and Santor, 2005).

- **Regional human capital**: human capital at the regional level is defined as percentage of population with up to National Vocational Qualification (NVQ) 4+ as commonly used in entrepreneurship studies (Mitra and Gleave, 2007; Abubakar and Mitra, 2007; Lee et al., 2004). This variable is employed as many studies have shown that educational attainment is associated with entrepreneurship and innovation (Mitra and Gleave, 2007; Abubakar and Mitra, 2007; Lee et al., 2004).

- **Regional R&D**—We measure R&D at the regional level using R&D expenditure as generally used in entrepreneurship and innovation studies (Jaffe, 1989; Acs, 2002; Abubakar and Mitra, 2007; Abubakar and Mitra, 2009).

- **Other variables**—Almost all the other variables are taken directly from the R&D Scoreboard data (see the 2008 UK R&D Scoreboard for more information).

Figure 2 below shows the correlation between the high impact growth index and R&D growth. For both indigenous and foreign firms, high impact growth appears to be significantly correlated with increased R&D activities suggesting that high impact growth appears to be associated with R&D and entrepreneurial activities in terms of introducing new products and services (Abubakar, 2009; Abubakar and Mitra, 2009).

![Figure 2: Correlation between High Impact Growth Index (4 yrs) and R&D growth (4yrs)](image-url)
Appendix 1 presents the descriptive statistics that show a comparison between indigenous and foreign firms on a range of variables related to firm growth, R&D, sales, employment and financial information. In general, the data suggests that indigenous firms have significant higher performance in comparison to foreign firms.

6. Findings and discussion
6.1. Regional Factors

In this section we examine the proposition developed earlier that region specific resources are relatively more important for generating indigenous high impact firms compared to foreign owned high impact firms, although they are significant for both groups. Figure 3 shows the geographic concentration of high impact firms per 10,000 population i.e. firms that have generated both positive growth in sales and employment. The map shows variations in high impact firms on a per-capita basis at the regional level. It ranges from 3.7 firms per capita (Yorkshire and Humber) to 30 (London). The highest number of indigenous high impact firms in London (25.1), South East (18.1) and Eastern region (15.8), which rank 1st, 2nd and 3rd respectively. Similarly, the regions with the highest numbers of foreign high impact firms per capita are the South East (9.9), Eastern (5.4) and London (4.9). These suggest that most high impact firms in the UK are geographically concentrated around London, South East and Eastern regions (an explanation of these regional variations in the geography of high impact firms is provided later).

Figure 3: Geographic distribution of high impact firms
Note: This map depicts only firms that have generated ‘both’ positive growth in sales and employment over the 4 year research period. Firms with negative growth rates in sales and/or employment have thus been excluded.

Table 3 shows summary data on human capital and R&D for each of the UK regions. The table suggests a high level of disparity across regions in terms of human capital, business R&D, higher education institution (HEI) R&D and government R&D. Our primary interest here is thus the extent to which these regional resources are associated with indigenous and foreign high impact firms.

Sources: DTI (2001); Business Enterprise Research and Development Scotland (2007)

Next, we examine the relative impact of these regional resources on number of high impact firms per capita. Since in this analysis, we are only interested in high impact firms, only firms with both positive employment and sales growth over a four year period were selected. Accordingly, the analysis is conducted across the twelve UK regional development authority (RDA) regions. We use the regional population measure to control for varying sizes of regions (Lee et al., 2004). The number of high impact firms is reported on per capita basis. Table 4 reports the results of the regression analysis. Consistent with our proposition, it appears that region specific resources are more associated with indigenous high impact firms (0.94) in comparison to foreign high impact firms (0.71), although both are highly significant at p ≤0.01. Thus, indigenous firms appear to derive higher benefits from local knowledge resources in comparison to foreign firms. However, it appears that knowledge generated in another country can be accessed and has a significant impact on the growth of foreign firms, which is in contrast to arguments of some scholars who argue that spillovers are highly localised (Audretsch, 1998;
Stuart and Sorenson, 2003). It seems that foreign firms even in the UK are particularly attracted to regions with high levels of local resources. This finding is similar to that of Abubakar and Mitra (2009) who reported significant correlations between international knowledge sources and innovative activities of small firms.

Note: This analysis is conducted only on firms that have generated ‘both’ positive growth in sales and employment over the 4 year research period. Firms with negative growth rates in sales and/or employment have thus been excluded.

Another important finding emerging from the regression results is that while human capital and business R&D appear have positive effects on the number of high impact firms across the UK regions (both indigenous and foreign) once the effect of all other factors are controlled (business R&D and human capital) university R&D appears to be insignificant for both groups of firms. This finding implies without strong local business R&D and local human capital, university R&D plays an insignificant role for firm growth. Thus, it seems although university R&D is highly important for the creation of innovative start-ups (Saxenian, 1994; Abubakar and Mitra, 2007), it plays less significant role for firm growth, except where the region has a reasonably good pool of human capital and business R&D. When the effect of business R&D and human capital are not removed, we observe positive correlations for both indigenous (correlation=0.80) and foreign firm (correlation =0.47) between firm growth and university R&D across the regions. However, once effect of business R&D and human capital are controlled the partial correlations become negative and insignificant for both indigenous (correlation = -0.12) and foreign firms (correlation = -0.49). Hence, it seems that regional business R&D and human capital mediate the effect of university R&D on firm growth.

In brief, the results of the analysis appear to support our first proposition. The different results for indigenous and foreign firms clearly demonstrate the need to take into account varying effects of local resources for firm growth by the two groups of firms.

6.2. Sectoral Factors

Since foreign firms have lower levels of access to local knowledge resources compared to indigenous firms, such growth disadvantages are more likely to be found in high technology sectors. We test the proposition that while indigenous firms may have significantly higher growth advantages in high-tech sectors due to greater access to regional
knowledge resources, (which require less knowledge resources), no significant differences are likely to exist in the growth rates of indigenous and foreign firms in low technology industries.

We first classify sectors into high-tech and low-tech industries (Butchart, 1987; CCC, 2004). High-tech industry definition was originally developed by Butchart (1987) based on selected industries from 1980 Standard Industrial Classification (SIC). This provided a definition of high-tech industries based on the ratios of a) R&D expenses to sales and b) employees working in R&D to total employees. In 2004, Butchart’s (1987) original 1980 SIC code classification of high-tech sectors, was built upon by the authoritative Cambridgeshire County Council (CCC, 2004), which identified high-tech sectors through the modernised 1992 SIC codes. This definition has been employed in a number of entrepreneurship and innovation studies (Keeble et al., 1999; Athreye, 2001; Abubakar, 2009). We also considered sectors in the R&D scoreboard data that relate closely to CCC (2004) high-tech sectors as high-tech industries; while all the other sectors were considered as low tech industries.

Table 5 below gives descriptive statistics on growth and R&D investment measures between the high-tech industries and low-tech industries identified. In general, in line with Butchart’s (1987) definition, the high-tech sectors appear to higher scores for various R&D indicators.

**High-tech sectors:**
Pharmaceuticals & biotechnology, Health care equipment & services, Electronic & electrical equipment, Technology hardware & equipment, Software & computer services, Leisure goods, Automobiles & parts, Industrial engineering, Electricity, Chemicals, Aerospace & defence, Fixed line telecommunications, Oil equipment, Services & distribution, Mobile telecommunications, General industrials, Industrial transportation, Industrial metals, Oil & gas producers etc.

**Low-tech sectors:**
Beverages, Media, Personal goods, Food producers, Support services, Construction & materials, Travel & leisure, Financial services, Household goods, General retailers, Forestry & paper, Nonlife insurance, Mining, Life insurance etc.

In order to test our second proposition, the high impact growth index (HIGI) discussed in the methodology section is used as the proxy for high impact growth.\(^2\) We use a t-test to examine whether growth rates of indigenous and foreign firms in high-tech industries but not low tech industries. Accordingly, figure 4 below depicts the t-test results. The results appear to support our contention that indigenous firms have less growth advantages than

---

\(^2\) See section on data methods for more details
foreign firms in low-tech industries. A relatively smaller difference in the mean figures was observed for low-tech industries compared to high-tech industries.

**Figure 4: Differences in High Impact Growth Index between indigenous and foreign firms in high-tech and low-tech industries**

a) High-tech industries

b) Low-tech industries

Although a number of studies suggest that indigenous firms have more advantages compared to foreign firms due to greater familiarity with the local environment (Buckley and Casson, 1976; Caves, 1996; Kinoshita, 1998; Nanchum and Keeble, 2003), our finding suggest that it is important to acknowledge that such performance differences are more likely to exist in high-tech industries rather than low-tech industries. Low-tech industries have less need for knowledge resources compared to high-tech industries (Audretsch, 1998). Even if foreign firms are more likely to lack social connections to providers of knowledge resources, this disadvantage becomes less important in industries that require lower levels of technical know-how. Having found some differences in the importance of sector related factors for the growth of firms in the two groups, what roles do firm-specific factors such as firm size play in the growth of indigenous and foreign firms.

6.3. Firm Specific Factors: Size and Internationalisation

We examine our third proposition, which states that while for indigenous small firms tend to grow faster than large firms, small foreign firms will not grow significantly faster than heir larger counterparts. In statistical terms, this suggests that while for indigenous firms, the High Impact Growth Index will be significantly higher for small firms compared to large firms; for foreign firms, no significant difference will be found between small and large firms.

We begin by classifying firms into small and medium enterprises (SMEs) and large firms. We use the American definition of firms having less than 500 employees so as to be in line with existing literature on gazelles and high impact firms (Birch, 1979, 1989; Birch and Madoff, 1994; Acs et al., 2008). First, we carry-out a simple bi-variate correlation between firm size and growth for indigenous firms separately and then foreign firms separately. For
indigenous firms, we find firm size to be negative and significantly correlated with high impact growth ($p \leq 0.1$). This appears to be in line with the argument that small firms grow faster than large firms (Evans, 1987a and b; Hall, 1987; Nerlinger, 1999). In contrast, however, we do not find any significant negative correlation between firm size and growth for foreign firms. It appears that small size may not be a significant factor in influencing the high impact growth of foreign firms.

Next, we conduct t-tests separately for indigenous and foreign firms in order to determine differences in the High Impact Growth Index of SMEs and large firms. Table 6 below displays the results of the t-test. Consistent with the results found earlier (see table 5); we find that for indigenous firms, SMEs are significantly more likely to experience high impact growth ($p \leq 0.05$) compared to large firms. As far as foreign firms are concerned we find no statistically significant difference between the growth of SMEs and large firms ($p \geq 0.1$).

Our findings suggest the need for a distinction between indigenous and foreign firms when observing that small firms grow faster than large firms (Evans, 1987a and b; Hall, 1987; Nerlinger, 1999). These findings confirm our proposition that small foreign firms are unlikely
to grow faster than large firms. This as mentioned earlier is due to disadvantages faced by foreign firms compared to indigenous firms because of costs arising from unfamiliarity with the environment. These disadvantages can be offset by their firm-specific advantages such as their large size (Horst, 1972; Kinoshita, 1998). Size plays different roles in the drama of high impact growth of foreign and indigenous firms.

We also expect more firm-specific differences in factors influencing the growth of indigenous and foreign firms, especially in terms of the internationalisation process. We proposed that due to greater familiarity with the local environment and greater access to local resources, the growth rates of indigenous forms is less likely to occur in international markets. This proposition contrasts with the view that foreign firms are more likely to be significantly associated with international markets. To test our fourth proposition, we adopt a measure of internationalisation, which is measured as the percentage of sales outside home region (Hejazi and Santor, 2005).

Figure 6 below shows the simple bi-variate correlation between the High Impact Index and proportion of sales outside home region for indigenous and foreign firms. The results suggest that while the growth rate of foreign firms is significantly correlated with proportion of sales outside home region (p<0.01), the growth rate of indigenous firms does not appear to be significantly correlated with proportion of sales out home region (p>0.1).

Figure 6: Correlation between High Impact Index and Proportion of sales outside home region

Correlation = 0.04; P>0.1
Note: *p<0.1; ** p<0.05; *** p<0.01

Correlation = 0.24; P<0.001***
Note: *p<0.1; ** p<0.05; *** p<0.01
It appears that although indigenous firms have higher growth rates, a large proportion of their sales occur within home markets. The role of home market for firm growth appears to be particularly important for indigenous firms. In contrast, the growth of foreign firms appears to be more dependent on the extent of sales beyond home markets. Therefore the role that internationalisation plays for firm growth may need to be distinguished, depending on whether firms are foreign and indigenous owned. This does not mean that internationalisation is not important for indigenous firms, rather, their growth relies less on international markets. This is likely because indigenous firms have less access to information on markets and sales organizations abroad (Wilmore, 1986; Buckley, 2001).

7. Conclusion

Recent theories of firm growth view small firms as the primary engine of employment generation and growth (Birch, 1979, 1989; Evans, 1987a, b; Hall, 1987; Nerlinger, 1999). While firm related characteristics such as small size are considered important for firm growth, it remains unclear whether differences exist in factors influencing the growth of indigenous and foreign firms – especially in both employment and revenue (high impact growth). This study examined differences in the influence of specific, sector and region specific factors influencing high impact growth. Using data on 753 firms, 35 sectors classified into high-tech and low tech industries and 12 regions of the UK, we made several original findings.

7.1. Original Findings

First, regional knowledge resources – particularly local human capital and business R&D; lie at the heart of high impact growth for indigenous firms but to a lesser degree for foreign firms; Regional resources play a more crucial role in the high impact growth of indigenous firms compared to local firms even when they are both located in the same region. Second, because low-tech industries have less need for knowledge resources, we find that indigenous firms have less growth advantages over foreign firms in low-tech industries in comparison to high-tech industries. Therefore, although foreign firms can be more unfamiliar with the local environment and have less social connections to providers of local knowledge resources (Nanchum and Keeble, 2003; Stuart and Sorenson, 2003), this disadvantage becomes less important for firm growth in industries that require less knowledge i.e. low tech industries.

Thirdly, also, because foreign firms appear to have less access to regional resources, their growth appears to be relatively more dependent on large firm size. In contrast, for indigenous firms, small firms have significantly higher growth rates than large firms. The finding that small firms grow faster than large firms (Birch, 1979, 1989; Evans, 1987a, b; Hall, 1987; Nerlinger, 1999) was only supported for indigenous firms. This carries an implication
for job generation by foreign firms; small foreign firm may not generate more jobs than their larger counterpart.

Fourthly, due to greater familiarity with local environment, growth rates of indigenous forms was not found to rely much on international markets but home markets, while that of foreign firms appears to be significantly associated with international markets. Therefore the significance of the home market for firm growth may have been underestimated by the excessive focus on firm internationalisation especially because indigenous firms were found to have faster growth rates. Thus, this study is likely the first attempt towards identifying differences in factors affecting high impact growth between indigenous and foreign firms. Below, we report some refutation findings.

7.2. Refutational Findings

In contrast to the expectations of researchers on university spillovers (Jaffe, 1989; Audretsch, 1998; Stuart and Sorenson, 2003), once regional business R&D and human capital are controlled, we find no evidence that firm growth rates across UK regions between 2004-2008 are positively impacted by university R&D. When the effects of regional business R&D and human capital are not controlled, university R&D becomes positively associated with firm growth for both indigenous and foreign firms. Even though university R&D plays crucial role in region’s ability to generate innovative start-ups (Abubakar and Mitra, 2007), it seems a region may only benefit from university R&D in terms of firm growth if the business R&D in the region is strong and there is sufficient human capital in the region to ‘absorb’ the research outputs. Regional human capital and business R&D mediate the effect of university research, and therefore without them, university R&D may not be significant for firm growth.

7.3. Implications for Policy

In encouraging high impact growth by indigenous and foreign firms policy makers should take into account specific differences in the regional, sectoral and firm specific factors influencing growth as indicated above. A blanket strategy may not be very effective in fostering the growth of indigenous and foreign firms. If regional policy makers wish to encourage the use of university R&D for firm growth, it is important for them to contextualise their value by ensuring that there are sufficient levels of business R&D and human capital complements and absorbs these assets. Fostering commercialisation of university R&D should be done in association with encouragement of both human capital and business R&D.

7.4. Limitations

Researchers are often criticised for not making clear the environments to which their theories apply. The present analysis is concerned only with firms that have significant R&D activities, especially since the sample was drawn from R&D Scoreboard data. Therefore, the results of the analysis on indigenous firms are applicable only to indigenous firms that engage
in R&D; while the findings on foreign firms are mainly applicable foreign firms that conduct R&D. Also, this study is limited to firm growth in employment and sales; it does not consider other growth and firm performance measures. Any attempt to apply the findings of this research in other regions must take into account the contexts within which the research was conducted.

The relevance of the region for new ICT ventures: Challengers or victims of geography?

Frank Lasch, GSCM-Montpellier Business School
Frédéric Le Roy, GSCM-Montpellier Business School & University of Montpellier
Frank Robert, GSCM-Montpellier Business School

Abstract
In this study, we formulate a set of hypotheses to measure the influence of ‘conventional’ Marshall-Arrow-Romer localization economies and ‘new economy’ localization factors concentrating on geographical proximity. To understand the principles of localization for a new industry, we examine the relationship between entrepreneurship and local environment for the emerging period of the ICT sector. What are the regional preconditions to foster and to attract this type of entrepreneurship? Which theoretical framework applies for the new venture creation in this sector (predominance of existing regional structure vs. economies of localization of a ‘new economy’)? These are the questions the present study deals with.

Keywords: France, high tech entrepreneurship, ICT sector, local environment, proximity effects

Author bios

Frank Lasch is an associate professor at GSCM-Montpellier Business School, France (Groupe Sup de Co Montpellier). He completed his bi-national Ph.D. in Economic Geography (2002: University of Regensburg, Germany & University of Montpellier III, France) and received his certificate for the supervision of doctoral research (Habilitation) in Management Science (University of Montpellier I) in 2007. His main topics of research are the relationship between entrepreneurship and the regional environment, start-up survival and growth, and entrepreneurship in the ICT sector. Contact: f.lasch@supco-montpellier.fr.

Frédéric Le Roy is Full Professor at Montpellier I University and Adjunct Professor at GSCM-Montpellier Business School, France (Groupe Sup de Co Montpellier). He is author of many articles in the field of strategy and high tech entrepreneurship. Frédéric Le Roy is also the director of the management research laboratory “Equipe de recherche sur la firme et l’industrie (ERFI)” hosted at Montpellier I University (http://www.erfi-management.net/). Contact: frederic.le_roy@univ-montp1.fr

Frank Robert is Assistant Professor at GSCM-Montpellier Business School, France (Groupe Sup de Co Montpellier). He holds a PhD in Economics (2005: University of Montpellier I) and his major research topic is the relationship between economy and strategic management. Contact: f.robert@supco-montpellier.fr.
In an “entrepreneurial economy” (Audretsch, 1995), innovation and knowledge-based entrepreneurship is a strategic topic for the economic development of regions. But to understand why innovation-based entrepreneurship happens, we must first understand where it happens. The geography of innovation and production has raised much research interest in the past and localization economies and their influence on economic growth have provided first frameworks for the understanding of this relationship (e.g., Marshall-Arrow-Romer theories). Exploring this key issue, we examine innovation and knowledge-based entrepreneurship in an industry which emerged in the early 1990s and has become today, after initial controversy discussions (“Solow paradox”), commonly agreed (Souter, 2004), an important growth sector in many countries across Europe: The information and communication technologies (ICT).

This specific industry bears a particular research interest, as the diffusion of information and communication technologies is naturally expected to challenge the relationship between geographical proximity and the accumulation of knowledge (Ceh, 2001; Lethiais et al., 2003). In this line, innovation and knowledge-based ICT entrepreneurs are often described as “footloose” (Huffmann & Quigley, 2002) and challengers of the dependence from geography (“death of distance”; Cairncross, 1997). Following this viewpoint the competitive advantage of location would tend to diminish or even disappear. In opposition to these approaches grounded in diffusion theory, different authors stress the persistence of regional structure principles and argue that new technologies like e-commerce are not about to dissolve the laws of regional organization (Coucelis, 2004). From a more technical viewpoint, Graham underlines that deployment of telecommunications networks remain driven by geographic imperatives which makes ‘information age’ or ‘network society’ not as immaterial and anti-geographical as assumed (2001: 405).

In reality, confirming the latter, we observe that ICT firms concentrate geographically. Today, three regions hold 10% of the UE-27 employment in the ICT sector (Meri, 2007): The Ile-de-France agglomeration (4.3%, France), the Lombardia region (2.5%, Italy), and the Communidad de Madrid (2.1%, Spain). Amongst those three countries, we shift our focus to France where, in opposition to the “death of distance” theory, ICT firms tend rather to concentrate and cluster than to diffuse spatially (Suire, 2003; Lasch, 2003). France reveals to be specifically dynamic in ICT entrepreneurship, but this process masks sharp regional disparities: whereas some areas are particularly “entrepreneurial” others seem not to be affected at all.
Understanding the main forces for this asymmetric process is important for entrepreneurship as a mechanism that converts innovation into new products, services and economic growth. Analyzing the newness of industries, we will explore in this paper a.) Why ICT entrepreneurs become concentrated in some regions leaving others relatively undeveloped, and we will b.) Identify and measure regional determinants that attract ICT entrepreneurship.

1. Literature review

1.1 Theoretical background

Entrepreneurship research exploring the relationship between the emergence of new ventures and space is an interdisciplinary effort in nature and draws much upon economic geography literature. Empirical findings in the past revolved mainly around three theories of localization economies: Marshall-Arrow-Romer (‘MAR’, Marshall, 1890; Arrow, 1962; Romer, 1986) privileged industrial specialization to foster innovation, Porter (1990) added competition and market structure to the MAR theory, and finally Jacobs (1969) formulated the principle of industrial diversity as engine for regional growth as opposed to the Marshallian localization economies. In the following, Glaeser, Kallal, Scheinkman & Shleifer (1992) distinguished between static (pecuniari) and dynamic externalities (knowledge spillovers).

In the same line, endogenous growth theories stressed the role of regional human capital and innovation for economic growth and provided useful insights to analyze the emergence of new ventures in one place (Romer, 1986; 1990; Arrow, 1962; Nijkamp & Poot, 1998). New economic geography focused on market forces to explain the geographical concentration of manufacturing activities (Krugman, 1991), putting forward circular logic\(^1\) as trigger for the formation of agglomerations (Krugman, 1998). Cluster theories describe emergence of geographic concentrations of interconnected firms (Porter, 1998) and use a variety of factors including market forces and local demand. Against this background, knowledge based economy approaches move interaction between firms in the center of discussion analyzing geographical

\(^1\) ‘\(\ldots\) firms want to concentrate production (because of scale economies) near markets and suppliers (because of transportation costs); but access to markets and suppliers is best where other firms locate (because of market-size effects). This circular logic can produce agglomerations’ (Krugman, 1998: 166).
proximity to external knowledge and innovation sources, formal and informal networks, and knowledge spill-overs (Audretsch & Keilbach, 2007). Loosely speaking, all these streams of literature revolve around the idea that industries and firms tend to concentrate in agglomerations in order to take advantage of spillovers to generate increasing returns at a spatial level.

1.2 Regional determinants of entrepreneurship

1.2.1 Local market demand: a key factor also relevant for high tech venturing?

There is agreement in literature that demand factors (measured through population growth or household incomes) are key determinants for entrepreneurship. Strong empirical evidence for the positive effect of market demand has been found in France, Germany, Sweden, the United Kingdom and the USA. Johnson & Parker (1996) measure a strong impact of market demand on entrepreneurship in the UK, Armington & Acs (2002) for the USA, Carree & Dejardin (forthcoming) for Belgium, Guesnier (1994) and INSEE (2000) for France. Also in Finland, Turkey and Japan, market demand has been measured positively (Kangasharju, 2000; Gaygısız & Köksal, 2003; Okamuro & Kobayashi, 2006). Garofoli (1994) obtains no significant influence of this variable for the case of Italy.

Hypothesis 1 (Local market): Local market opportunities are positively related to high tech entrepreneurship.

1.2.2 Agglomeration effects: economies through a high quality infrastructure?

There is agreement in literature that agglomeration economies are also key factors of entrepreneurship in a region. According to Audretsch & Fritsch (1994) entrepreneurs reduce their transaction costs by benefiting from positive, local externalities (a specialized job market, highly developed infrastructure, regional networks, knowledge spillovers, etc.). These spillovers are typical for regions with a high population density (Audretsch & Fritsch, 1994: 360). Reynolds et al. (1994) provide evidence for a positive influence of this factor in France, Sweden, and the UK. They explain variations of new firm birth rates between regions\(^2\) by positive externalities for start-ups in agglomerations. However, Lasch (2007) studying the impact of regional determinants in France between 1993 and 2001 at labour market level, measures no significant effect of agglomeration economies. In Italy, even if Garofoli finds no real impact of agglomeration effects, Capello (2002) presents empirical findings for the positive influence

\(^2\) Geographical level of analysis: the 100 French “departments”.)
of this determinant for high tech entrepreneurship. But some authors present opposite findings and suggest diseconomies in case of important market barriers or costs (Bade & Nerlinger, 2000; Nerlinger, 1998). Folta et al. (2006) present similar findings for diseconomies in agglomerations. While the findings for the UK appear to be consistent, the findings for the USA are contradictory. Armington & Acs (2002) explain regional differences in entrepreneurship mainly by agglomeration economies, but Bartik (2001) measures a negative impact of this variable in the USA. Gaygisiz & Köksal (2003) consider agglomeration economies as main explanatory factor for the case of Turkey, as do Okamuro & Kobayashi (2006) for the case of Japan.

**Hypothesis 2 (Agglomeration):** Agglomeration economies are positively related to high tech entrepreneurship.

### 1.2.3 Regional human capital: endogenous entrepreneurial potential and high qualified labor market

The analysis of human capital linked to the working population of a region is important insofar as most start-ups are founded in proximity of the entrepreneurs’ residence (Keeble et al., 1993: 17). New firms reflect in some way the regional “endogenous” potential and proximity effects (Schmude, 1994a: 173). The concept of human capital is one of the most privileged sources to explain the success and performance of high tech ventures (Brüderl et al., 1996), but is also considered as a main resource for the emergence of new firms. Harrison et al. (2004) study the Ottawa technology cluster and argue that entrepreneurs are exogenous, attracted to talent pools and stress the importance of the economic geography of talent and human capital to explain high tech entrepreneurship. Acs & Armington (2004a) explain differences in levels of entrepreneurial activity with the diversity among geographically proximate industries and the extent of human capital. Spatial differences are related with the share of high qualified working population, especially for industries that require entrepreneurs with a broad knowledge base (Acs & Armington, 2004b). While authors agree on the importance of this factor especially for knowledge intense entrepreneurship, results for entrepreneurship in general (all industries) are more confusing. Bartik (2001) finds a positive relationship between the high qualification level and small business start-ups in the USA. For Germany, results are contradictory. Fritsch (1991) first found no significant evidence, but measures in a later study a positive relationship (Audretsch & Fritsch, 1994). Bade & Nerlinger (2000), measure a positive correlation. Musyck (2003) highlights a process of long-term continuity in the accumulation of skills combined with a process of industrial renewal. For the case of the United King-
dom, no significant relationship was found by Reynolds et al. (1994) as opposed to the findings of Georgellis and Wall (2000). Human capital has been confirmed for Spain (Blasco & Fornielles, 2001), Japan (Okamuro & Kobayashi, 2006) and France (Guesnier, 1994; Lasch, 2007), but not for Turkey (Gaygisiz & Köskal, 2003).

Human capital proxied by a high qualified working population is stands also for networking opportunities (Aldrich & Zimmer, 1986; Greve & Salaff, 2003).

*Hypothesis 3 (Human capital): A highly educated and workforce is positively related to high tech entrepreneurship.*

### 1.2.4 Unemployment: accelerator or brake for entrepreneurship?

It has been claimed that high unemployment in a region favors entrepreneurship, as unemployed working population seeks self-employment as an escape out of unemployment (“unemployment push” theory). But empirical evidence for this regional determinant is considerably more ambiguous. Fritsch (1991), states that a high unemployment rate does not lead to high levels of entrepreneurship. Paradoxically, Audretsch & Fritsch (1994) measure a positive correlation between unemployment and firm birth in the same West Germany Länder. Hinz & Jungbauer-Gans (1999) argue that entrepreneurs starting out of a situation of unemployment have higher hurdles to pass if they want to raise capital. Studies for France tend rather to confirm the unemployment-push theory (Guesnier, 1994; Lasch, 2007). The above cited studies for Japan and Spain confirm this finding. Foti & Vivarelli (1994) measure a negative relationship for the case of Italy. Reynolds et al. (1995) have found negative correlations. Carree (2002) finds little evidence for unemployment push theory, but describes that differences appear between industries.

Applied to the specific type of high tech venturing, local unemployment rates may not primarily stimulate entrepreneurship in a region as entrepreneurs come rarely from lower qualified socio-professional categories with a typically higher probability of staying unemployed (Lasch, 1997).

*Hypothesis 4 (Unemployment): A high unemployment rate in a region is negatively related to high tech entrepreneurship.*

### 1.2.5 Industry structure: shadow of the past?

Authors do not agree on the impact of this variable, and present different and sometime contradictory findings. Johnson (2004) argues that structural characteristics of a region may influence start-up activity with growing industries attracting new firms and declining industries
shedding firms. Industry structure is considered in many studies and two proxies are mainly used: sector structure and firm size. Tödtling & Wanzenböck (2003) measure a higher start-up activity for tertiary centers in Austria, compared to substantially lower rates in old industrial or rural areas. Okamuro & Kobayashi (2006) measure a higher start-up rate for Japanese regions with a low share of manufacturing. Fritsch & Niese (2000) argue that the impact of a region’s industrial structure on the number of start-ups is rather low in Germany. Bade & Nerlinger (2000) measure no significant effect of regional sector structure on high tech entrepreneurship (services) in Germany. Reynolds et al. (1994) find no systematic empirical evidence in the UK. Blasco & Fornielles (2001) measure a negative effect in Spain. For France, the INSEE (2000) study measures a negative impact of sector specialization and a positive one for sector diversification, while Lasch (2007) finds no significant effect of sector diversification at the labour market level.

Hypothesis 5a (Industry structure 1): Concentration rather than diversification favors high tech entrepreneurship.

While the effect of industry structure is not unanimously approved, authors agree on the influence emanating from local firm size structures. Kangasharju (2000) presents strong evidence for the seedbed effect small firms produce for entrepreneurship in Finland. The firm size of the last employment of the entrepreneur can be relevant for the learning process of managerial skills which are crucial for most authors (Cooper et al. 1994; Pleschak, 1997). Employees in SMEs seem to have more opportunities to gain entrepreneurial and managerial knowledge compared to those in large firms with a higher division of labour (Greenan, 1994; Schmude, 1994a). Small firms can also use symbiotic, collaborative arrangements with larger firms to overcome size constraints and to improve their international competitiveness (Eternad et al., 2001).

Firms founded by entrepreneurs with experience in large firms seem to be less sustainable (Lasch et al., 2007; Pleschak, 1997). But as for most of the determinants of regional start-up activity, results differ across sectors. Keeble & Walker (1994) present findings for the positive impact of a labor market area dominated by small firms, while large firms rather seem to stimulate entrepreneurship in the service sector. Large firms play an important role as potent customers and initiators for outsourcing (Almus et al., 1999) as well as incubators (Nerlinger, 1998; Pleschak, 1997). Close to 90% of the ICT start-ups in France belong to the service sector, we consequently expect a high influence emanating from large firms embedded in the local economy.
Hypothesis 5b (Industry structure 2): Large firms rather than small firms are positively related to high tech entrepreneurship.

1.2.6 Knowledge and space: competitive advantage for entrepreneurs in clusters?

Acs et al. (2005) argue that knowledge is created endogenously, especially via R&D results in knowledge spillovers, and that such spillovers give rise to opportunities to be identified and exploited by entrepreneurs. Meusburger (2000) argues that innovations and new knowledge emerge in some places, in some contexts, and in interaction with the socio-economic environment. Forni & Paba (2002) analyze Italian manufacturing sectors and provide evidence for clustering of industries based upon dynamic externalities. Local research and development structures (universities, non-university institutes, private R&D firms, etc.) represent important knowledge externalities for high tech entrepreneurs (Engel & Fier, 2000; Meyer-Krahmer & Schmoch, 1998; Fritsch & Schwirten, 1998). Dahlstrand (1999) analyzes the Göteborg area in Sweden and shows that the major parts of new entrepreneurs were endogenous and former employees of large firms, students or local universities’ personnel. Audretsch et al. (2004) confirm that university spillovers have a strong influence in the strategic locational decisions of firms. Huffmann & Quigley (2002) confirm this finding for the Silicon Valley and underline the role of universities as a factor of attraction and stimulation of entrepreneurial talent. Greunz (2005) presents findings for intra-regional knowledge spillovers in European regions. Bade & Nerlinger (2000) present empirical findings for Germany that high tech entrepreneurship spreads in proximity to universities and other R&D facilities. Fischer & Varga (2003) confirm this for the case of Austria. Findings for France outline that entrepreneurs benefit mostly from research activities in their close neighborhood and less from research in more distant areas (Autant-Bernard, 2001). Public researchers becoming entrepreneurs are rarely observed (Mustar, 1995 & 1997; Emin, 2003).

To summarize, the level of availability of regional knowledge externalities fosters (or inhibit) the organizational emergence of high tech entrepreneurship (Audretsch, 1998; Collinson & Gregson, 2003; Nguyen & Vicente, 2003).

Hypothesis 6a (Knowledge): Regional knowledge externalities are positively related to high tech entrepreneurship.

Another facet of knowledge externalities is interaction between firms located in the same area. Spatial clustering has raised a strong research interest. Localization economies emanating from the neighborhood of firms of the same or similar activities are of particular impor-
tance for high tech entrepreneurs as they depend more on synergies, interaction and cooperation as low tech industries (Bade & Nerlinger, 2000; Van Oort & Atzema, 2004). Innovation and synergy play a crucial role in the regional development and competitiveness (Ritsilä, 1999) and stress the importance of proximity effects and interaction between firms in the local context.

Asleben (2005) argues that Industries with stronger competition appear to avoid more frequently agglomeration while those with weaker competition cluster. Proximity is often similar to good opportunities of integration in the local network (Pleschak, 1997; Koschatzky, 1997). Entrepreneurs of emerging knowledge-based firms dedicate significantly more time when compared to non-innovative firms to cooperation and networking (Johanisson, 1998; Nijkamp, 2003). Varamäki & Veslainen (2003) demonstrate that co-operation leads to cooperation once entered in the first co-operation agreement. The firms’ capacity to innovate improves if they co-operate with other firms over innovation in addition to or instead of investing in R&D (De Propris, 2002). Face-to-face contacts are essential, in particular concerning “implicit” knowledge and highly specialized information (Koschatzky, 1997; Saxenian, 1990 and 1994; Storper & Venables, 2004).

A high concentration of ICT firms in an area is also an indicator for future entrepreneurs of a well developed infrastructure for their business and inspires a favorable business “climate” for the realization of their entrepreneurial project (Simmie, 2002).

Hypothesis 6b (Proximity): Proximity effects are positively related to high tech entrepreneurship.

1.2.7 The attraction of a region: life quality and government incitation (taxes)

Attractive lifestyle environment, a rich natural environment, a clement climate (“sunbelt effect”) describe the general attraction of a region for entrepreneurs. These factors are considered by as especially important for the location choice of “footloose” firms (George, 1991; Rouzier, 1987). Incitements for entrepreneurs include macro or meso-level (taxation, regulation, etc.) and micro-level policies (advice, training, finance, technology transfer, etc.; Mcquaid, 2002). Grants, tax breaks or a low tax level, for example, are traditional measures aimed at encouraging entrepreneurial activity and localization of new firms. Bartik (2001) measures a negative relationship for regional attraction in the USA.

Hypothesis 7a (Life quality): Attraction of a region favors high tech entrepreneurship.

Hypothesis 7b (Tax level): A low income tax level in a region favors high tech entrepreneurship.
2. Methods

From a methodological viewpoint, the research design responds to the claim of more longitudinal studies analyzing one sector at a time. We analyze the relationship between high tech entrepreneurship (new firm formation) and the regional environment on the aggregate level of the labor market area (LMA). In our study, an empirical lead forward was made as the French national institute of statistics and economic studies (INSEE) granted us exceptional data access to explore an entire population of new ventures. The independent variables are crossed in a multiple regression model with the ICT firm birth rate (dependent variable) in each of the 348 French labour market areas.

2.1 Data

France is one of the few European Union member states that have developed a statistical and administrative register of all existing firms (entitled “SIRENE” database: the official French register of all existing and newly created firms; Picard, 1995: 4) and exceptionally rich sources of economic and population statistics can be exploited for regional studies on different aggregate levels. Our data include information of every new ICT firm founded between 1993 and 2001 (84,535 start-ups3) in the 348 labour market areas of metropolitan France. This data in combination with the long observation period and the fine grained geographic unit of analysis (LMA) permitted us to obtain highly significant and statistically solid results. Additionally, we use socio-economic data for the labour markets (census data, labour statistics, etc.) to cross the local firm birth rates with proxies describing the environment.

2.2 Observation period and aggregate level

The literature review outlines also the claim for more longitudinal research. Consequently, we focus on longitudinal analysis (annual firm birth rates between 1993 and 2001) in combination with a fine grained zoning (labor market areas). We use the labour market aggregate level for our analysis. These labor market areas (LMA) are aggregations of the 33,000 municipalities in France into 348 LMA4. Reflecting the economic area of influence of agglomerations

3 Overseas departments excluded.
4 Oversea departments (“DOM-TOM”) excluded.
and small and middle-sized towns (at the difference to the French “départements” or the “régions”) these travel-to-work areas are much more suitable for studying the local economic context in which the founder implants his business (Houdebine, 1999: 192; Hecquet & Laine, 1999: 11).

2.3 Defining the ICT sector

Appendix A details the four digits SIC code definition of the ICT sector. The definition is similar to most of the recent publications in France dealing with the ICT sector (Cases et al., 1999; Heitzmann & Rouquette, 1999; Rouquette, 1999). According to our definition, the ICT sector is composed by three subsectors: high tech industries; computer/software services and telecommunications; other knowledge intense services (non university R&D, technical studies, analysis, testing and inspections). According to our definition, the French ICT sector accounts for 87,200 firms and more than 710,000 employees in 2001. The firm size is in average 1,9 employees and nine firms out of ten belong to the service sector. The new firm formation (NFF) in this sector represents during the period of observation 4,6% of all economic activities (industry, trade and services, ICS) and 5,4% of all jobs generated by new firms at start-up.

2.4 Dependent variable

High tech venturing (dependent variable) is measured by the local firm birth rate (LMA) in the ICT sector. The firm birth rate is defined as the number of new ICT firms divided by the number of all existing firms in a labour market area (“ecological approach”: see Schmude, 1994b for an overview about different measures of new firm formation rates). As we focus on the comparison of firm birth intensity between areas, we calculate our rate in combination with the location quotient (Schmude, 1994b). Hereby firm birth rate in an area measured in using the ecological approach is divided by the national firm birth rate.

2.5 Independent variables

The 16 independent variables (Table 1) are defined as follows. Market demand (H1) is measured by two proxies. Population growth is supposed to trigger entrepreneurship, but (future) entrepreneurs need time to recognize opportunities and to react. Thus, to capture this time-lag, we use census data prior to the observation period (1982-1990). The second proxy for market demand indicates the average household income. Agglomeration economies (H2) are synonym to a high developed infrastructure typically found in areas with a high population densi-
ty per km². The regional qualification level is used as an indicator for human capital structure and measures the part of high qualified people at the working population (H3). Unemployment in opposition to the education level is used as proxy for regions with an insufficient labor market pool for high tech entrepreneurship (H4).

* Colinearity test has been applied to exclude conflict between variables: all the proxies are confirmed.
* Indicators provided by the French national institute of statistics and economic studies (INSEE).
** Indicators calculated by authors (SIRENE data base).

Table 1: Description of independent variables

The four proxies for industry structure describe the sectoral mix of the local economy and local firm size structures (H5a: specialization displays the balance of industry vs. service activities and diversification indicate to which degree economic activities are split over several sectors; H5b: SME as proxy for the number of regional employment held by small firms up to five employees and large firms describe employment in firms 200 employees). Five variables measure the impact of knowledge externalities (H6a) and proximity effects (H6b). University indicates the share at the residential population of students and researchers in public universities. R&D proxies the number of employees in private research and development firms or institutes. Proximity effects are described as employment in existing ICT firms split into the
three main subdivisions of this sector (high tech industry, ICT services, and knowledge intense services). Two indicators measure the attraction of a region for entrepreneurs. Life quality is proxies by the tourist attraction of a region (H7a). The local firm tax level is an indicator for pecuniary, in this case the fiscal attraction of a LMA for entrepreneurs (H7b).

3. Results
The regression obtains a solid overall result (R²=0.9629; Table 3) confirming the explanatory value of the model for regional determinants of high tech entrepreneurship. Colinearity test revealed no conflict between the variables. We explain this overall result of our model with the high quality of the data available for our study (longitudinal data for an entire population in combination with a fine grained geographical zoning). Table 2 presents the results obtained for each variable. Ten variables are highly significant at the 1% level, two variables are only confirmed at the 10% level (diversification, SMEs), four variables obtained no significant result at all (specialization, high tech industry, life quality, tax level). H1, H2, H3, and H4 statistically validated as all proxies are significant at the 1% level. H5b is testing the impact of local firm size structures on high tech entrepreneurship and finds a strong support for the large firms proxy. Our model fully supports the importance of knowledge externalities (H6a). Proximity effects (H6b) are entirely validated, but the insignificant result for high tech industry emphasizes notable difference between services and industry ICT subsectors. Our model finds no significant support for the influence of the local sector structure (H5a), as only one proxy passes the 10% significance threshold (diversification). H7 (attraction of the region) is fully rejected as no proxy obtains any significant result. Eliminating size or unit effects, the standardized regression coefficient enables us to compare directly the results for each variable.

4. Discussion

We identify two key factors for high tech entrepreneurship: positive knowledge externalities and interaction between firms indicated by the positive effect of geographical proximity (localization economies). These knowledge spill-overs and proximity effects are far more important than agglomeration effects. While some demand factors (large firms & local market demand) trigger entrepreneurship, certain weaknesses of institutional knowledge and innovation transfer appear in France (university, R&D). As the following discussion will show, the factors triggering ICT entrepreneurship are in some cases different from the results obtained by prior studies in various countries (industry structure, regional attraction, etc.; cf. Table 3).

We identify five topics that provide explanation how geography matters for high tech entrepreneurship: education and knowledge, local demand and firm size, the role of universities and R&D, critical thresholds linked to agglomeration economies, relative independence from industry structure and general regional attraction.

4.1 Education and knowledge: main triggers for entrepreneurship

Two main questions arise when we consider the regional factors human capital and knowledge: Does the spatial concentration of knowledge and qualification (education) concord with the intensity of high tech entrepreneurship as stressed by Meusburger (2000; H3)? Do high tech entrepreneurs take advantage in clusters (knowledge externalities, networking opportunities, localization economies due to proximity effects, etc.) as suggested by several authors (Armington & Acs, 2002; Bade & Nerlinger, 2000; Capello, 2002; H6)?

Hypothesis 3 examines the role of human capital, one of the most privileged regional factors for high tech entrepreneurship in literature. Our results confirm that entrepreneurs have competitive advantages in labor markets with a high education and knowledge potential. Regional governments should consider that mobilizing the human capital for entrepreneurship in a region depends also on the willingness, motivation, and cultural openness of highly educated people to become entrepreneurs. This is especially true for regions with a high qualified labor market but low levels of entrepreneurship.
Hypothesis 6 examines knowledge and space under a different angle and measures proximity effects between new firms that belong to the same sector. With two variables under the top five ranked (ICT services, knowledge intense services; Table 2), geographical proximity is the main result measured by our regression model. The concentration of innovative firms in a regional economy stimulates high tech entrepreneurship. Local innovation and knowledge networks are strategic factors able to embrace a cumulative process based on innovation. Intensiifying regional knowledge and high tech networks facilitates the integration, the survival and growth of new ICT firms in a region.

Finally, the negative result obtained for unemployment (H4) confirms the role of education and knowledge as main triggers for entrepreneurship. Nevertheless, regional governments must be aware of structural features to prevent fallacy: High tech entrepreneurship in a region can go hand in hand with high unemployment rates when the working population structure is heterogeneous (i.e. high shares of low qualified and high qualified working population).

In sum, geography of education and geographical proximity are to be considered as the main triggers for high tech entrepreneurship in a region.

4.2 Crucial demand factors: local market demand and large firms

Hypothesis 1 examines one of the most important factors for entrepreneurship as identified in prior studies (market demand). Conforming to the literature review, we expected a positive impact of this regional key factor for high tech entrepreneurship. Nevertheless, the high regression result obtained for this variable is a rather surprising result. Local market demand appears to have a quite stronger importance for ICT entrepreneurship as displayed by most studies. Bathelt (1992), Fritsch (1990) and Koschatzky (1997) for example argue that innovation- and technology-based firms concentrate firstly on national and international markets. They are considered to be rather “footloose” and little involved in the local context. But the positive influence of the local market is (at least in the crucial post-creation period), more important than pointed out by those authors.

Average household income, another indicator for H1, revealed to be of minor importance for ICT entrepreneurship. Reluctant entrepreneurial attitudes prevailing positive effects due to consumer behavior (purchasing power) may explain the negative result measured for this variable. In France, investing private venture capital into new firms, or becoming self-employed seems not be a principal career option for households with a high average income.

The main implication resulting from H1 is twofold: first, new ICT ventures are especially sensitive to the local market: a growing market potential and large firms trigger demand and
are a critical part of the entrepreneurial process. Second, local market demand is to be considered also as an indicator for migration and fostering the potential of new ventures is closely linked to integration and local networking opportunities, at least in the early development stage of the firm.

Local firm size is an important demand factor (H5), insofar as large firms embedded in the local area produce one of the best regression results (rank 3 out of 12; Table 2). Labor markets with a high share of small firms turn out to be less favorable environments for high tech entrepreneurship. Even if many authors identify a higher propensity of employees in small firms for spin-off entrepreneurship, explained by a more efficient transmission of managerial or entrepreneurial knowledge and skills, this seedbed effect does not prevail in the ICT sector. We explain our result with structural features of new ICT ventures. In majority services, entrepreneurs may be sensitive to demand-side advantages large firms represent as important potential customers, but large firms may also trigger local spin-offs offering opportunities for new client-customer relationships.

4.3 University and R&D: insufficient knowledge transfer?

As our results indicate, education and knowledge are main regional factors for entrepreneurship, but to our surprise universities and non-university R&D institutes (or firms) don’t confirm their role as important sources of external knowledge and incubators for future entrepreneurs. Even if the result is statistically significant, the regression coefficient is weak, comparing to other knowledge related determinants. The relationship between new ICT firms and universities, generally considered as crucial, appears weaker in France, which supports the findings of Emin (2003) and Guillaume (1998) and outline insufficient knowledge transfer. Mobilizing entirely this potential presents another point on which public authorities can concentrate their effort.

4.4 Agglomeration economies: a critical threshold?

Hypothesis 2 examines the role of agglomeration economies for high tech entrepreneurship suggesting positive externalities for new ICT ventures emerging in labour markets with a highly developed infrastructure. Agglomeration economies do not figure amongst the most important regional factors (rank 9 out of 12). So, positive agglomeration effects, typical for areas with a high population density and a well developed infrastructure, can turn into diseconomies. This finding confirms the results of Bade & Nerlinger (2000) for German high tech firms. Agglomeration economies turn into diseconomies when a certain size of urban and
economic concentration starts more to hamper than to foster entrepreneurship. Consequently, we have to reject H2 and to affine our knowledge about the geography for high tech venturing. This finding leads us to include the factor of critical thresholds also in the interpretation of localization effects (proximity).

4.5 High tech entrepreneurs: independent from industry structure and regional attraction?

In literature, the general attraction of a region (sunbelt effects, life quality, etc.) or structural heritage linked to the individual industrial growth path are often advanced to explain why certain areas are more entrepreneurial for emerging sectors than other. Our results present no empirical evidence for these regional factors. Neither the industry structure (H5a) of a region, nor the general attraction (H7) influence high tech venturing in a significant way. The professional tax level also belongs to this category of determinants where no significant impact is measured and probably no real lever for entrepreneurship exists for regional policy.

The same result is obtained for the sector specialization, insignificant in our regression model. Similar to specialization, no significant link with high tech entrepreneurship can be established in regions with a high sector diversification. Entrepreneurial activities in the ICT sector do not directly depend on sector structures in an area. This finding confirms the results of Fritsch & Niese (2000) and Schmude (1994b).

**Conclusion**

This study examined the role of the socio-economic environment on entrepreneurship and identified regional key factors for high tech ventureing. An empirical lead forward was made in studying one sector at a time and by including data of all new ICT firms created between 1993 and 2001 in the 348 French labor market areas (84,535 firms). Entrepreneurship constitutes a regionally differentiated process in the ICT sector we examined. The main determinants are knowledge externalities, localization economies, local embedded large firms and population growth. Contrary to most researches the influence of agglomeration effects is not clearly measured. The conclusion is at hand that the impact of knowledge externalities should reinforce the position of large and middle sized agglomerations, amplifying existing regional disparities. Nevertheless, our results relativize, to a certain extent, this tendency due to the greater flexibility of new ICT firms in terms of location than non-innovative firms.

Our study opens some directions for future research. Future research should consider more multiple level designs. In connecting with this point, we put particular focus on the need for transferring results obtained on an aggregate level to an individual level. So, a number of our findings could be detailed, for example the role played by universities, large firms, local market structures, spin-offs from existing firms, networking and co-operation, in the entrepreneurial process of ICT ventures. These are only a limited number of possible starting points for future research. In so doing, we see a great potential for further research, for a better understanding of the key determinants of new firm birth but also of those of the survival and growth.

Measuring the firm birth rate ($fr$)

Formation rates may be measured in different ways (see Schmude, 1994b: 95 for an overview). Two dimensions make the basically difference: the choice of the denominator and the choice of the observation period (“snapshot” vs. long time series). The use of the registration stock is called “ecological approach”. Another alternative is to use the population or work force as the denominator (“labor market approach”). We choose to analyze the NFF in the ICT sector over a long time period and calculate the firm birth rate using the ecological approach. Additionally, our interest is also in the comparison of firm birth intensity between areas, so we calculated our rate in combination with another method, the “location quotient”. Hereby firm birth rate in an area measured in using the ecological approach is divided by the national firm birth rate (figure C1). In so doing, the firm birth rate obtained permits easily to measure the local dynamics in terms of NFF of each labor market area. For example, a firm birth rate of 2.0 signifies a new firm birth intensity twice as important as the national average (which is 1.0).

INVESTIGATING STRATEGIC BEHAVIOUR IN SMALL, MICRO AND MEDIUM TOURISM ENTERPRISES IN SOUTH AFRICA

Dimitri Tassiopoulos¹, Tobie De Coning² and Eon Smit³

Abstract

The South African small, micro and medium tourism enterprises (SMMTE) sector faces numerous challenges. To ensure long-term sustainability the owners of SMMTEs need to make efficient and effective strategic business decisions about the internal and external threats and challenges their businesses face. The paper explores the potential dynamic interrelationships between profile attributes and preferred strategic behaviour of SMMTEs. The results provide important guidelines for interventions aimed at optimising the behaviour of these enterprises and, in so doing, to enhance the probability that they will be sustainable and successful. Important insights are gained on these enterprises and their owner operators, which account for a major part of South Africa's developing tourism sector. In an international context the paper also makes a contribution to the body of knowledge concerning this important economic sub-sector.

¹Dimitri Tassiopoulos is an Associate Director at the School of Tourism and Hospitality of Walter Sisulu University, South Africa. Since 1993, he has been involved in various national and international tourism research projects, of a multidisciplinary and multi-institutional nature, concerning entrepreneurship, agri-tourism, events, cultural and wine tourism, amongst others.

²Tobie De Coning is a Professor at the University of Stellenbosch, South Africa.

³Eon Smit is a Professor at the University of Stellenbosch Business School, South Africa.

JSBM Research Area: 3. Small Business Strategy and Organization

**Introduction**

In 1994, with the end of apartheid, the South African government undertook to make tourism one of the country’s leading industries in the creation of employment and the generation of foreign income (Tassiopoulos, 2008). Although the tourism industry has some large organisations, the sector is numerically dominated by SMMTEs, according to Szivas (2001), Kirsten and Rogerson (2002), and Cooper and Buhalis (1992), yet in the literature of tourism there is a relative dearth on the research into tourism and small business development. SMMTEs, state Cooper & Buhalis (1992), which underpin the delivery of the tourism product in most countries and are particularly important in destination development, not only providing tourists with direct contact with the character of the destination, but also facilitating the rapid infusion on tourist spending in the local economy.

The South African tourism industry, according to Rogerson (2005a), could be conceptualised as a three-tiered hierarchy of enterprises. At the top are the operations of larger, established groups of enterprises that are responsible for, amongst others, the country’s major travel and tourism retail and wholesale operations, transportation, hotels, casinos and event facilities. The largest proportion of SMMTEs, however, are found in the middle-tier of the hierarchy, which consists of SMMTEs owned by owners of predominantly European descent that operate a host of different establishments from travel and touring operations, restaurants, small hotels, self-catering and resorts, game farms, bed and breakfasts or backpacking hostels. The lowest-tier in the South African tourism economy is comprised of the emerging black-owned tourism economy, which constitutes a mix of formally registered micro-enterprises as well as a mass of informal tourism enterprises. It is, however, not clear, due to an absence of reliable statistics, what the actual shape and size of this hierarchy actually is (the number of established versus emerging SMMTEs is not
known). Recent research, as depicted in Table 1, (The DTI, 2003, and DEAT, 2007) concerning SMMTEs in South Africa has confirmed that established SMMTEs (owner-managed and employing less than 50 employees) overwhelmingly dominate the local tourism industry (Tassiopoulos, 2008):

</tbody>
</table>

In South Africa, according to the DTI (2003), lifestyle factors amongst SMMTEs are found predominantly amongst entrepreneurs of European descent who mostly own accommodation SMMTEs in the Western Cape, KwaZulu Natal (the Midlands area) and Free State provinces. In contrast, economic motives represent the basis of development of the (predominantly black-owned) emerging SMMTE economy which includes the rural areas, such as the Wild Coast in the Eastern Cape Province with many such tourism entrepreneurs operating at the barest levels of economic survival. The research findings of Szivas (2001) indicate that there are two aspects to SMMTE’s that need to be noted: the relative ease of entry into the tourism industry as many of the entrants into the tourism industry come from a wide range of industries, and, the “way of life” motives for entrepreneurial entry into tourism reveals that the industry is seen as offering a better lifestyle and a better standard of living while promising a pleasant work environment and high levels of human interaction. The study does not suggest that that experience is not required. It, however, underscores industry-specific experience as a prerequisite for success. The study
highlights the implications of this for the debate on the quality of the tourism product. SMMTEs, according to Cooper and Buhalis (1992), Buhalis and Main (1998) and Buhalis (1994), can be summarised as follows:

1. SMMTE’s are characterised by family run businesses, and are self-employed,
2. SMMTE’s have managers with few formal qualifications and limited previous experiences in tourism,
3. SMMTE’s have managers who enter the industry for a variety of reasons, not only for economic reasons,
4. Sources of capital for SMMTE’s are varied and SMMTE’s tend to have very low levels of capital investment - thus possibly impacting negatively on quality, and
5. SMMTE’s have no formalised management system.

Furthermore, according to Getz and Nilsson (2004), seasonal fluctuations in demand could be problematic for some people who rely on tourism for a living, whilst for others; seasonal closures can be a necessary component of living a traditional lifestyle or a benefit for lifestyle orientated SMMTE owners. Consequently, seasonality can adversely affect some SMMTEs, thus owners need to evaluate their goals and options carefully; the responses to seasonality should be based on the needs of the family and the SMMTE as well as the assessment of viable alternatives to off-peak-demand periods. Alternatives such as closing down the SMMTE during the off-peak period and pursuing alternative forms of income, treating the SMMTE as a secondary source of income, or accepting diminished revenue from the SMMTE could be considered.
The scope of attributes of the SMMTE owner

SMMTE owners play a central role in a venture in terms of strategic behaviour. Consequently, the SMMTE owner is an important element of this paper. SMMTE owners with a certain attribute profile (profiled in this paper in terms of knowledge, skills and attitude) have a direct bearing on the strategic behaviour that can potentially manifest within an SMMTE as a preferred strategic behaviour, and ultimately, will impact on the success or failure of an SMMTE. Timmons and Spinelli (2003), Morrison, Rimmington and Williams (1999) and Visser (2003) identify core attributes or characteristics of successful entrepreneurs. It is stated that there are “six themes” of entrepreneurial attributes as to what successful entrepreneurs “do and perform”. The six themes concerning the dominant entrepreneurial attributes are: a) commitment and determination; b) leadership; c) opportunity obsession; d) tolerance of risk, ambiguity and uncertainty; e) creativity, self-reliance and adaptability; and f) motivation to excel. It is, however, not the objective of this paper to empirically research the attributes of entrepreneurs as there are a number of studies (for example, De Coning, 1988, and Maas, 1996) that have already been completed in this regard. The central focus in this paper is to determine the possible linkages between the attributes of entrepreneurs and the preferred strategic behaviour that is manifested in SMMTEs. Consequently, the attributes of entrepreneurs, as empirically determined by De Coning (1988), as in Maas (1996), are accepted for this paper as they are congruent with the attributes that have been determined by other researchers in this field and because the De Coning study (1988) has a South African focus. It can thus be concluded from the above-mentioned discussion that there is a broad agreement amongst researchers concerning the attributes of entrepreneurs. The De Coning (1988) findings are set out in Table 2.
The various entrepreneurial attributes are briefly discussed hereunder:

i. Conceptualisation or holistic approach: this is described by De Coning (1988) as the management approach employed within an SMME by the owner. In some instances, certain owners find it adequate to only focus on effectiveness (internal environment), whilst in others instances, owners may focus on both efficiency and effectiveness (external and internal environments). Hereafter, for the purposes of this paper, this attribute is referred to as the holistic approach.

ii. Entrepreneurial growth perceptions, value systems and motivations: perceptions are noted by De Coning (1988) as referring to the various reference frameworks of owners and determine their behaviour in specific situations. Three main categories of business owner perceptions are indentified. These range from perceptions of owners who try to avoid venture bankruptcy to those owners who are characterised by a growth perception. In-
between these two continuum poles there are indications of perceptions that simultaneously include survivalist characteristics and bankruptcy avoidance characteristics. Value systems and motivations are considered synonymous concepts by De Coning (1988). The central question that needs to be answered is: what primarily motivates SMMTE owners to operate a business? There can be one or a combination of reasons, including the improvement of the financial position of the SMMTE owner; provision for the needs of the family lifestyle, need to be independent, need to excel, to actualise growth or to innovate.

iii. Locus of control: various empirical studies are noted by De Coning (1988) to have found that entrepreneurs are characterised as having an internal locus of control.

iv. Management knowledge or formal education: SMMEs are not large businesses of a small scale emphasises De Coning (1988). In large businesses, the management and operational levels are normally clearly demarcated, however this is not so in SMMEs. SMME owners are normally required to manage as well execute the operational tasks in the SMME. Thus, it is critical to determine the extent of formal management education and the various functional areas that are affected.

v. Risk propensity: risk reflects the degree of uncertainty and potential loss associated with outcomes which may follow from a given behaviour or set of behaviours (Forlani and Mullins, 2000). Basic elements of risk construction are identified: potential losses and the significance of those losses. The central issue is how entrepreneurs cope with the risks inherent in their decisions, what determines the way they perceive the riskiness of their decisions, whether they possess character traits which predispose them to engage in uncertain behaviour or whether they assess opportunities and threats differently from non-
entrepreneurs. Sitkin and Weingart (1995) and in contrast with previous researchers such as Derby and Keeney (1981) do not consider risk propensity as a stable personal attribute because risk is a cumulative tendency to take or avoid risks and can be changed as a result of experience. Successful entrepreneurs, indicate Timmons and Spinelli (2003) have a propensity to take calculated risks or avoid risk that they do not need to take.

vi. Prior work experience: De Coning (1988) indicates that two of the main reasons that SMMEs fail are due to inadequate business and management experience. The different roles that SMME owners have to fulfil also require comprehensive prior-work experience. Thus, it is critical to determine if the SMMTE owners have relevant experience related to various functional management areas of the business.

It is assumed that the entrepreneur has a direct bearing on the strategic behaviour of the SMMTE and, the consequences thereof could range in varying degrees from success to failure for the SMMTE. Furthermore, it is also assumed that preferred strategic behaviour of the SMMTE has a higher likelihood to translate into preferred final outcomes, which can manifest in different formats – depending on the attributes of the entrepreneurs. The extent to which SMMTE owners manifest strategic behaviour, is dependent on a multitude of variables. Some of these variables are controllable and others may be beyond the control and influence of the SMMTE owner. Controllable internal factors, according to Visser (2003), are those that are internal to the SMMTE owner, such as strategic thinking skills. This implies that SMMTE owners can learn the techniques and obtain qualities that they need for preferred strategic behaviour to manifest in their ventures. Alternatively, it can be said that SMMTE owners can become strategic leaders who inspire and stimulate their employees. Uncontrollable factors are fundamentally external variables over which the SMMTE owner has little, if any, direct influence. The state of the
economy and socio-political influences are examples of such external variables. Although proactive behaviour by SMMTE owners can result in a preferred advantage from external variables, it is proposed that the focus of the paper should rather be on the SMMTE owners themselves and the attributes that enable them to react strategically toward external variables. In regard to the internal variables, the presence of strategic behaviour is linked to co-producers of strategic behaviour within SMMTEs. The interrelationship in the form of a conceptual model is depicted in Figure 1.

![Figure 1: The a priori model for strategic behaviour of SMMTEs (Conceptual Model)](image)

*The elements of the conceptual model: a discussion*

The proposed conceptual model consists of integrating a minimum set of variables ($E_1 \ldots E_n$) characterised as the attributes of the SMMTE owners (and their businesses) and a second set of
intermediate variables (SB₁ …. SBₙ) characterised as the potential manifestations of strategic behaviour of the SMMTE owners. This relationship is depicted in Figure 1.

This paper is primarily focussed on the SMMTE owners and the potential manifestations of strategic behaviour, and, is not focussed on the attributes of the SMMTE employees. It is emphasised that SMMTE employees are not the main focus of this paper, however, this approach does not deny the possible strategic behavioural contributions of such employees. The focus is rather on the nature of SMMTE structures or processes and the behaviour of SMMTE owners who act as stimuli or agents for strategic behaviour. Consequently, the study determines the extent to which linkages can be established between the unique attributes of SMMTE owners and the manifestation of strategic behaviour. For instance, a link will have to empirically measure the individual (or set of) attributes, or characteristics, of the entrepreneurs to the characteristics that are both unique and / or typical to strategic behaviour of these SMMTE owners. The correlation of these relationships, or absence of any direct link, is based on the indicators from literature, logical conclusions and insight. The focus of the paper, thus, is primarily on the SMMTE owner and the manifestation of strategic behaviour within the SMMTE and is not focussed on the final outcomes of an SMMTE in terms of success. It is expected that the results from applying this approach will have a better probability of predicting business success.

**Strategic behaviour (IO)**

Strategic behaviour (illustrated as Intermediate Outcome in Figure 1), according to Johnson and Scholes (1997) is characterised as being highly complex in nature; involves a high degree of uncertainty in view of making decisions in a dynamic and uncertain future; demands an integrated approach to managing the venture as owners are required to be cross-functional and
have operational boundaries to deal with strategic challenges; and, strategic decisions may also involve major changes in the venture which may require decisions for planning, making the changes and the implementation thereof.

Strategic behaviour at individual and organisational level is depicted in Table 3. Strategic behaviour can, thus, be described as utilising the venture’s threats and opportunities to enhance its long-term prospects, and, a strategic decision can be defined as a set of critical actions and dynamic factors, at individual and organisational level, beginning with the identification of the stimuli and ending with the specific commitment for action. Strategic behaviour is, overall, described as unstructured, irregular and incomprehensive with SMME strategising considered as incremental, sporadic and reactive.

</tr>
<tr>
<td><strong>Organisational level:</strong> Foster on-going strategic dialogue among the internal and external stakeholders (power structure, past performance and strategies, the complexity and volatility of the SMMTE). Exploit the ingenuity and creativity of employees (venture size; past strategies; performance; structure; top management team attributes; beliefs; and, the use of organisational slack.).</td>
</tr>
</tbody>
</table>

Source: Rajagopalan, Rasheed and Datta (1993), Hynes (2003) and Bonn (2001)

The paper assumes that the preferred manifestations of strategic behaviour are the end-product of a dynamic interaction between various elements that involve the SMMTE owners’ attributes and the strategic business processes that are utilised. Consequently, an investigation of the relationship between certain SMMTE owner attributes and strategic behaviour will be the basis
of this paper. It is assumed that some of the preferred strategic behaviour manifestations have a higher likelihood to translate also into preferred final outcomes.

**Final outcomes (FO)**

There are varying interpretations as to what constitutes success (classified as a Final Outcome in the conceptual model, Figure 1). There are no generally accepted lists of variables that distinguish business success from failure, according to Lussier and Corman (1995), thus negating prior research which cites different variables as contributing to success or failure. For instance, in family ventures; success could be concerned with retaining ownership within the family, maintaining a certain lifestyle, or even growing the business (Timmons & Spinelli, 2003). Consequently, due to the conceptual ambiguity of measuring success, this paper will instead focus on the relationship between the attributes of the SMMTE owners that produce strategic behaviour and the manifestation of strategic behaviour within SMMTEs (Intermediate outcomes). It will, thus, assume that if the preferred strategic behaviour is applied, it can result in a successful final outcome for the SMMTEs, as after all, as underscored by Timmons and Spinelli (2003) it is the lead entrepreneur that must be seen to be “taking charge of the success equation”.

**Environmental variables**

This paper is primarily focussed on investigating the nature of possible relationships between profile elements of the SMMTE owner and intermediate outcomes in the form of the SMMTE preferred strategic behaviour that an SMMTE will have. SMMTEs, according to Bennett (2000), cannot be divorced from the fact that the external environment impacts on the host population, the tourists and the businesses that are in the tourism system. It could be assumed, however, that within a homogenous geographical area, such as South Africa, that such influence would be
generally the same for all SMMTEs. It is, however, further noted by De Coning (1988) that the extent to which external variables impact on an SMMTE are to some extent influenced by the ability of entrepreneurs to understand the external environment.

Against this background, the paper endeavours to establish the potential linkages or relationships between the characteristics or attributes of SMMTE owners and the manifestation of strategic behaviour. The investigation of the strategic behaviour in SMMTEs with particular emphasis on determining which variables co-produce preferred manifestations of strategic behaviour in such enterprises is because the preferred strategic behaviour of the SMMTE has a higher likelihood to translate into preferred final outcomes which is dependant on the attributes of the entrepreneurs.

**Methodology**

**Study design**

The research design for the proposed study involved is primarily descriptive and explanatory research.

**Sample**

The target population covered all nine provinces of South Africa. In order to incorporate SMMTE’s on a national basis, the services of a commercial database company were used to compile a database of SMMTEs, caused by a dearth of workable alternatives concerning comprehensive databases of SMMTE’s in South Africa. The decision-makers of formally registered businesses (informal businesses were not included) were selected by rank (most senior person: managing director, chairperson, manager etcetera). The businesses included could be described as head offices and stand-alones employing no more than 100 staff. The researcher selected the most appropriate business types and codes associated with the tourism industry (the
so-called unit of analysis) to extract a representative national list of 1965 SMMTE’s for the purpose of this research. In total 316 questionnaires were returned which represented a total response rate of 16.08 percent, of this 168, or 8.56 percent was deemed, conservatively, to be the useable response rate.

**Research instrument**

The research instrument used was a structured questionnaire consisting of five sections. Section A of the research instrument consists of question items related to determining the demographic profile of respondents. This section of the instrument determines the geographical location; the duration of business operation, the number of branches, if any; the type of businesses, the tourism sector the businesses consider to be their core business; the number of full and part-time employees, an estimation of the number of new full-time posts the business could create within five years; an estimation of the annual gross total turnover and total gross asset value; the gender and age profile of the respondents; the highest educational level; and an indication of the population group of the respondents. Most of the said items have been derived from other instruments that have been previously validated by other researchers such as Loubser (1999), Maas (1996: 249); and Orford, Herrington and Wood (2004).

Section B of the research instrument consists of question items that have been previously validated by other researchers such as Maas (1996). Various questions were posed to the SMMTE owners concerning their personal convictions (locus of control), incidence of formal education in the management fields, experience in the management fields, practical/technical experience relevant to the workplace, risk propensity, reasons provided as to why people started their own business, decisions that influence the business, common challenges and various approaches to address these factors.
Sections C and D of the research instrument consists of question items that are intended to measure the strategic behaviour dimensions at organisational and individual levels of the strategic behaviour construct.

**Demographic characteristics**

The typical demographic profile of the SMMTEs can be characterised as follows: the majority of respondents can be demographically characterised as originating from the Western Cape (28.7%) and Gauteng (26.2%); are most likely based in an urban/municipal area; are most likely (28.6%) 45 to 54 years of age; most likely (70.5%) of the male gender; the highest number have attained a Grade 12 (33.5%) qualification; and, the majority (85.9%) can be classified as being from the White population group. The profile of this study compares favourably with that of the South African SMMTE profile provided by THETA (2009a).
**Business characteristics**

The typical business characteristics of the SMMTEs included in the study are summarised in Table 4.

**The typical attributes of the SMMTEs**

The typical attributes of the SMMTE owners in the study suggest the following: the majority of owners have an internal locus of control; many have almost no formal management education in all the functional management areas and the largest proportion have received management functional education in only two functional areas; many have almost no prior-experience in all functional management areas and the largest proportion have some prior-experience in three of the functional management area; however, a large proportion indicated appropriate technical competence for the operations of their business and almost half of the respondents indicted three entrepreneurial reasons for starting a business but a small proportion did indicate no entrepreneurial reason for starting their businesses; the majority of owners indicated a tendency toward risk aversion and thus were deemed non-entrepreneurial for the purpose of this study; and lastly, the holistic capabilities of the respondents indicate an internal approach was dominant within these SMMTEs and were, thus, also deemed non-entrepreneurial for the purpose of this study.

The study then stated the main research hypothesis, along with its set of sub-hypotheses, and then proceeded to investigate a possible relationship between strategic behaviour (the dependent variable) and entrepreneurial attributes (independent variables) using inferential statistics. Although the research hypotheses of this study are implicitly stated through the *a priori* model, as depicted in Figure 1, to assist with data analysis objective of this paper, only the main research hypothesis is stated hereafter:
Null Hypothesis ($H_0$) = There is no association between the owner attributes of the SMMTEs (that are characterised by locus of control, reasons for starting a business, holistic capabilities, propensity to risk, formal management education and prior-experience) and preferred strategic behaviour.

Alternative Hypothesis ($H_1$) = There is an association between the owner attributes of the SMMTEs (that are characterised by locus of control, reasons for starting a business, holistic capabilities, propensity to risk, formal management education and prior-experience) and preferred strategic behaviour.

The relationships and constructs, as depicted in the a priori model, were empirically tested through the means of various statistical techniques:

- Reliability testing of the data set was conducted.
- Validity of the research instrument was determined.
- Reliability of the new constructs after exploratory factor analysis was determined.
- The relationships between the variables of the hypotheses were tested through Spearman’s rho and ANOVA.
- The relationships between the variables of the hypotheses were tested, further, through regression analysis.

A summary of the associations between the variables (ref. Table 5) revealed the overall significant associations concerning the selected attributes of venture owners and the potential manifestations of strategic behaviour within the SMMTEs. This was determined after the data had been subjected to the Spearman’s rank-order correlation coefficient (Spearman $\rho$), ANOVA and multiple regression analyses.

**Discussion of findings**

The study noted that a number of the sub-dimension elements of the strategic behaviour construct (ref. Table 5) were identified as having no (overall) statistically significant relationship with the
identified attributes of the venture owners. The study identified, as summarised in Table 5, the following significant end-results of the interaction that involves SMMTE owner attributes and the manifestations of strategic behaviour:

i. The **internal locus of control** owner attribute seemingly affects the strategic behaviour of SMMTE owners as to how they perceive the **vision** of their businesses, how they foster **strategic dialogue** within their ventures, and how they enact the **gathering and sharing of market intelligence** for their businesses.

ii. The **formal education** owner attribute seemingly fosters **strategic dialogue** with all their key stakeholders and contributes towards the improved **task environment awareness** within SMMTEs.

iii. The **prior-experience** owner attribute of SMMTE owners seemingly enables the strategic behaviour of SMMTE owners towards an improved **gathering and sharing market intelligence** that is used by SMMTEs.

iv. The **entrepreneurial reasons for starting a business** owner attribute seemingly motivates the strategic behaviour of SMMTE owners to **synergise business development** activities and contribute towards the improved **task environment awareness** of their businesses.

v. The **holistic profiles** owner attribute seemingly affects the strategic behaviour of SMMTE owners through enabling them to perceive the **holistic understanding** of their businesses; engendering the **vision** formulation of their businesses; **fostering strategic dialogue**; developing a **planning focus**, and encouraging **creativity** within SMMTEs.

vi. The **risk-seeking (propensity) profile** owner attribute seemingly **does not have an overall**
affect on the strategic behaviour of SMMTE owners in conducting the affairs of their businesses.

![Diagram](image)

**Figure 2: The populated *a priori* theoretical model and its statistically significant associations**

The study did, however, find statistically significant results of the Spearman’s ρ and regression analyses, as depicted in Table 5, between some of the attributes of the owners and certain elements of strategic behaviour. These results (ref. Table 5) were used to populate the *a priori*
theoretical model and are depicted in Figure 2 (ref. intermediate outcomes).

Although the research hypothesis of this study is implicitly stated through the a priori model, as depicted in Figure 2, the research findings provide support that there is an ultimately statistically significant association between the independent and dependent variables, and that the alternative hypothesis can be accepted, namely, there is an association between the specific attributes of the owners of the SMMTEs (which is characterised by locus of control, reasons for starting a business, holistic capabilities, formal management education and prior-experience) and the selected strategic behaviour variables. Furthermore, the research findings provide support that there is an overall statistically significant association between the various independent and dependent variables, as stated by the sub-hypotheses, and that the following alternative sub-hypotheses, can be accepted, namely:

i. There is a positive relationship between locus of control and strategic behaviour.

ii. There is a positive relationship between management education and strategic behaviour.

iii. There is a positive relationship between prior-management experience and strategic behaviour.

iv. There is a positive relationship between entrepreneurial reasons for starting a business and strategic behaviour.

v. There is a positive relationship between greater holistic capabilities and strategic behaviour.

However, the research findings do not provide support that there is an overall statistically significant association between the risk propensity independent variable and the strategic behaviour dependent variables and, consequently, the following null sub-hypothesis is accepted: the risk-seeking profile owner attribute seemingly does not have an overall effect on the strategic
behaviour of SMMTE owners in conducting the strategic affairs of their businesses. This may be indicative of SMMTE owners not aspiring to grow their businesses (namely, have capped growth motives), and, are often motivated by non-financial considerations, such as lifestyle (including familial) factors, when starting and managing their SMMTEs. This has a direct implication on the varying levels of strategic behaviour evidenced within the SMMTEs, and consequently, the study postulates that SMMTE owners employ a risk-avoidance profile when formulating strategic behaviour.

The populated conceptual (or, \textit{a priori}) model and its sub-components, depicted in Figure 2, focused primarily on the two main constructs: the attributes of an SMMTE owner and preferred strategic behaviour variables that is manifested within an SMMTE. The study focused on analysing the association between specific attributes of the SMMTE owners that produce preferred strategic behaviour and the manifestation of preferred strategic behaviour within SMMTEs (Intermediate outcomes). The study assumes that certain preferred strategic behaviour of the SMMTE has a higher likelihood to translate into preferred final outcomes, which can manifest in different formats – success or failure.

\textbf{Recommendations and conclusion}

This study examined the determinants of strategic behaviour through the use of a sample frame of SMMTEs owners in the formal tourism industry of South Africa. It is assumed that in cases where strategic behaviour manifests in SMMTEs, that there should be a higher likelihood of successful outcomes (and conversely, failure where strategic behaviour does not manifest in SMMTEs) for such SMMTEs. The importance of successful SMMTEs as a mechanism for job creation, innovation and long-term sustainable economic development, for a developing country economy such as South Africa can not be emphasised enough.
To ensure long-term sustainability, notes Whittle (2000), the owners of SMMTEs need to make efficient and effective business decisions about the internal and external threats and challenges their businesses face to ensure that they have enough strategic information to make decisions and maintain their competitive advantage in the tourism industry. Crijns and Ooghe (1996) indicate that, in general, it can be viewed that the development and growth of SMMEs can be attributed toward how quickly the entrepreneur, the business team and organisation can adapt and learn from their experiences in combination with the external and internal environments. This implies that the core elements of strategic behaviour are internal and external and, according to Hofer (1991), should include market-related, industry-related, competitor-related, supplier-related, resource- and capability related, and broader environmental-related strategic challenges.

The practical recommendations indicated in this section are derived from the summary of the relationships between specific SMMTE entrepreneurial attributes and selected strategic behaviour variables, as depicted in Figure 2. In terms of the said theoretical model, strategic behaviour can be developed at two main levels: the individual level and the organisational level.

**Individual level**

The study found that the independent variables were overall not good (statistically significant) predictors of strategic behaviour of SMMTE owners. The study, further, found however, that statistically significant associations between the owners’ attributes (independent variable) and a number of sub-dimensions of strategic behaviour (dependent) variables as depicted in Figure 2 exist.

The study noted the findings of the descriptive statistics which indicated that the majority of respondents in this study had mostly entrepreneurial reasons for starting their businesses.
Agencies involved with SMMTE development need to assess more the **entrepreneurial attributes** of aspiring tourism entrepreneurs who want to start an SMMTE, as this has a direct bearing on the strategic behaviour that such ventures will evidence, and which can ultimately impact on their growth orientation (capped-to growth-directed) and sustainability. This study proposes the provision of strategic behavioural skills to be included as part of the entrepreneurship programmes of schools and universities so as to enhance the entrepreneurial attributes of aspirant tourism entrepreneurs. It is suggested that the entrepreneurial reasons for starting an SMMTE can contribute towards the development of synergistic business developments through putting together business projects that contribute towards business sustainability; and, will contribute towards improved task environment awareness within the SMMTE in order to ensure that business projects are completed as profit-effectively as possible.

The study found that a good predictor of strategic behaviour is the **formal education** that SMMTE owners receive which in turn has a direct bearing on the strategic behaviour that such ventures will evidence; and ultimately their sustainability. The findings of this study, however, show that the descriptive statistics noted that the majority of respondents in this study had no formal management education with only a small minority having receiving formal education in all management functional areas. It is recommended that learning opportunities be provided for applied learning in all management functional areas and that such education should not only include the “hard science” of business plan writing but must also deal with the “soft science” of developing strategic thinking and behaviour competencies of SMMTE owners. Such learning opportunities should also be firmly grounded in the tourism discipline. It is suggested that improved (also implying appropriate) formal education can significantly contribute towards fostering and supporting strategic dialogue with the SMMTE stakeholders; and will contribute
towards improved task environment awareness within the SMMTEs. Fletcher and Harris (2002: 307) indicate that “entrepreneurship education should rather concentrate on the process rather than on the content, with how to aspects being more important than know how”. It is emphasised by Bolton and Thompson (2004) that entrepreneurs “learn by doing” and may need a coach to promote the learning process. Thus, education is needed to be “hands-on” rather than “talk about” but owners also need to accept that they need “mentoring”. It is further indicated by De Coning (1995: 8) that SMME owners should become “business literate” through upgrading their knowledge skills in respect of general management, finance, marketing and the management of people as these are considered to be necessary “entry level” abilities for entrepreneurs. The descriptive results of this study further indicated that the majority of SMMTE owners had received no formal education in strategic management and tourism business studies.

The **internal locus of control** attribute is a good predictor of strategic behaviour and it is suggested that SMMTE owners need to develop this attribute further so as not feel disempowered due to the various macro-environmental issues that may be impacting on the operation of their ventures and which may be beyond their control. It is suggested that an improved internal locus of control can contribute towards the formulation of more appropriate (even far-reaching) visions; will tend to foster strategic dialogue with stakeholders; and will contribute towards the improved gathering and sharing of market intelligence. It is, in addition, proposed that SMMTE owners be provided with strategic business support and education to the point where they can depend on their own skill (internal locus of control) and will, thus, be more likely to work harder and improve their strategic abilities to manage their businesses. The descriptive results of this study further indicated that the majority of SMMTE owners had an internal locus of control.

**Prior-experience** has also been identified as a good predictor of strategic behaviour. This is
indicative of the need for prospective SMMTE owners to first gain appropriate prior-experience through working in the tourism industry before establishing their own SMMTE. The results suggest that the experience gained in this way impacts on the type of strategic behaviour that is evidenced within SMMTEs. It is suggested that prior-experience can contribute towards the improved gathering and sharing of market intelligence supposedly because appropriately experienced SMMTE owners know how to operate in a networked tourism industry and have experience in dealing with its idiosyncrasies. It is noted, however, that the findings of the descriptive statistics bear evidence that the majority of respondents in this study had prior-management experience in at least three of the management functional areas with an almost equal number having no prior-experience in any of the management functional areas. It is suggested that because of the different (even non-tourism) management backgrounds from which many of the SMMTE owners have gained their prior-experience, there is need to acknowledge and address this through possibly teaming-up entrepreneurs with SMMTE entrepreneurs who have the relevant prior-experience (possibly, in the form of mentor-mentee networks).

The **holistic** attribute of successful SMMTE owners is a good predictor of strategic behaviour because it leads to the ability to take a holistic view of the SMMTE and its environment. This implies an understanding of the different problems and issues, and how they influence the SMMTE. It is suggested that the holistic attribute of SMMTE owners can contribute towards the formulation of more appropriate (even far-reaching) visions; exploiting ingenuity, encouraging a planning focus, engendering creativity, fostering strategic dialogue with stakeholders; and will contribute towards the improved gathering and sharing of market intelligence. It is noted, however, in the findings of the descriptive statistics that the majority of respondents in this study had an internal approach when conducting their business. Consequently, there is need to develop
the ability of SMMTE owners to have holistic ability that includes external factors when conducting their business behaviour because it leads to the ability to take a holistic view of the SMMTE including the environment in which it is situated.

The research findings indicated that the **risk-seeking behaviour** attribute of SMMTE owners is not a good predictor of strategic behaviour. The descriptive research findings of this study also indicate that most SMMTEs avoid risk when conducting their business. It would, thus, be prudent of agencies involved in SMMTE development to take cognisance of the risk avoidance strategies of most SMMTEs in the process of designing interventions to assist aspiring SMMTEs so as to ensure the sustainability of these ventures. This is indicative of SMMTE owners who seemingly are not motivated to grow their businesses (namely, have capped growth motives), and are often motivated by non-financial considerations, such as lifestyle (including familial) factors, when starting and managing their SMMTEs. As indicated, the predominance of middle-aged respondents in the study may further reflect a trend towards semi-retirement and subsequent self-employment, and thus the tendency to be more risk-averse.

Finally, the blending of strategic thinking and planning together is a learned practice. The whole purpose of strategy is to create business advantage, to maximise resources, decisions and core competencies. Strategic thinking seems to emphasise the formulation of strategy within the organisation and strategically plan the implementation of these strategies. In an SMMTE scenario, the synergistic effect of both elements operating together is what is required, and quite often strategies for the SMMTE require implementation and action at the same time. The extent to which SMMTE owners manifest strategic behaviour, however, is dependent on a multitude of variables. Some of these variables which are internal to the SMMTE owner, such as strategic thinking skills, are controllable but others may be beyond the control and influence of the
SMMTE owner. Uncontrollable factors were fundamentally external variables over which the SMMTE owner has little, if any, direct influence. The state of the economy and socio-political influences were examples of such external variables. However, the extent of the SMMTEs ability to understand the external environment could affect the influence of the external variables on the performance of the SMMTE.

Organisational level

SMMTEs owners should create a business climate whereby it is conducive towards supporting the creative strategic act within the entire enterprise. SMMTEs should also draw from the entire SMMTE talent pool because the most effective strategic entrepreneurial behaviour sometimes originates from individuals or teams whose input was not expected. It can be further emphasised that SMMTEs should promote divergent thinking, the generation of different views, within the enterprises which should result in creative and strategic behaviour.

Although macro environmental factors do impact on the strategic behaviour of SMMTEs, the plethora of SMMTEs operating within tourism destinations means that they have the potential to strategically influence the environmental, social and economic (triple bottom line) progress towards achieving sustainability within such destinations. The sustainable development of destinations places SMMTEs in the centre of sustainability debates as they have the potential to form strategic networks and spread the environmental, social and economic benefits within their destinations. This implies that measureable sustainability indicators need to be developed for SMMTEs and that further research that measures the interaction between sustainability, strategic behaviour and strategic networks needs to be conducted.

Strategic behaviour, recommends Grundy and Brown (2002), is a habit that SMMTE owners
should continually cultivate. Such behaviour should include devoting time regularly to engage with the strategic issues of the SMMTE; focussing on one strategic issue at a time; using ad hoc free time to work on strategic issues; gathering small, but rich, data from the key stakeholders (clients, competitors, staff, etc.); and to be confident of their ability to think strategically. This will assist with translating strategic behaviour imperatives into practice.

INVESTIGATING STRATEGIC BEHAVIOUR IN SMALL, MICRO AND MEDIUM TOURISM ENTERPRISES IN SOUTH AFRICA

Dimitri Tassiopoulos¹, Tobie De Coning² and Eon Smit³

Abstract

The South African small, micro and medium tourism enterprises (SMMTE) sector faces numerous challenges. To ensure long-term sustainability the owners of SMMTEs need to make efficient and effective strategic business decisions about the internal and external threats and challenges their businesses face. The paper explores the potential dynamic interrelationships between profile attributes and preferred strategic behaviour of SMMTEs. The results provide important guidelines for interventions aimed at optimising the behaviour of these enterprises and, in so doing, to enhance the probability that they will be sustainable and successful. Important insights are gained on these enterprises and their owner operators, which account for a major part of South Africa's developing tourism sector. In an international context the paper also makes a contribution to the body of knowledge concerning this important economic sub-sector.

¹Dimitri Tassiopoulos is an Associate Director at the School of Tourism and Hospitality of Walter Sisulu University, South Africa. Since 1993, he has been involved in various national and international tourism research projects, of a multidisciplinary and multi-institutional nature, concerning entrepreneurship, agri-tourism, events, cultural and wine tourism, amongst others.

JSBM Research Area: 3. Small Business Strategy and Organization

Introduction

In 1994, with the end of apartheid, the South African government undertook to make tourism one of the country’s leading industries in the creation of employment and the generation of foreign
income (Tassiopoulos, 2008). Although the tourism industry has some large organisations, the sector is numerically dominated by SMMTEs, according to Szivas (2001), Kirsten and Rogerson (2002), and Cooper and Buhalis (1992), yet in the literature of tourism there is a relative dearth on the research into tourism and small business development. SMMTEs, state Cooper & Buhalis (1992), which underpin the delivery of the tourism product in most countries and are particularly important in destination development, not only providing tourists with direct contact with the character of the destination, but also facilitating the rapid infusion on tourist spending in the local economy.

The South African tourism industry, according to Rogerson (2005a), could be conceptualised as a three-tiered hierarchy of enterprises. At the top are the operations of larger, established groups of enterprises that are responsible for, amongst others, the country’s major travel and tourism retail and wholesale operations, transportation, hotels, casinos and event facilities. The largest proportion of SMMTEs, however, are found in the middle-tier of the hierarchy, which consists of SMMTEs owned by owners of predominantly European descent that operate a host of different establishments from travel and touring operations, restaurants, small hotels, self-catering and resorts, game farms, bed and breakfasts or backpacking hostels. The lowest-tier in the South African tourism economy is comprised of the emerging black-owned tourism economy, which constitutes a mix of formally registered micro-enterprises as well as a mass of informal tourism enterprises. It is, however, not clear, due to an absence of reliable statistics, what the actual shape and size of this hierarchy actually is (the number of established versus emerging SMMTEs is not known). Recent research, as depicted in Table 1, (The DTI, 2003, and DEAT, 2007) concerning SMMTEs in South Africa has confirmed that established SMMTEs (owner-managed and
employing less than 50 employees) overwhelmingly dominate the local tourism industry (Tassiopoulos, 2008):

Table 1

</tbody>
</table>

In South Africa, according to the DTI (2003), lifestyle factors amongst SMMTEs are found predominantly amongst entrepreneurs of European descent who mostly own accommodation SMMTEs in the Western Cape, KwaZulu Natal (the Midlands area) and Free State provinces. In contrast, economic motives represent the basis of development of the (predominantly black-owned) emerging SMMTE economy which includes the rural areas, such as the Wild Coast in the Eastern Cape Province with many such tourism entrepreneurs operating at the barest levels of economic survival. The research findings of Szivas (2001) indicate that there are two aspects to SMMTE’s that need to be noted: the relative ease of entry into the tourism industry as many of the entrants into the tourism industry come from a wide range of industries, and, the “way of life” motives for entrepreneurial entry into tourism reveals that the industry is seen as offering a better lifestyle and a better standard of living while promising a pleasant work environment and high levels of human interaction. The study does not suggest that that experience is not required. It, however, underscores industry-specific experience as a prerequisite for success. The study highlights the implications of this for the debate on the quality of the tourism product. SMMTEs,
according to Cooper and Buhalis (1992), Buhalis and Main (1998) and Buhalis (1994), can be summarised as follows:

1. SMMTE’s are characterised by family run businesses, and are self-employed,
2. SMMTE’s have managers with few formal qualifications and limited previous experiences in tourism,
3. SMMTE’s have managers who enter the industry for a variety of reasons, not only for economic reasons,
4. Sources of capital for SMMTE’s are varied and SMMTE’s tend to have very low levels of capital investment - thus possibly impacting negatively on quality, and
5. SMMTE’s have no formalised management system.

Furthermore, according to Getz and Nilsson (2004), seasonal fluctuations in demand could be problematic for some people who rely on tourism for a living, whilst for others; seasonal closures can be a necessary component of living a traditional lifestyle or a benefit for lifestyle orientated SMMTE owners. Consequently, seasonality can adversely affect some SMMTEs, thus owners need to evaluate their goals and options carefully; the responses to seasonality should be based on the needs of the family and the SMMTE as well as the assessment of viable alternatives to off-peak-demand periods. Alternatives such as closing down the SMMTE during the off-peak period and pursuing alternative forms of income, treating the SMMTE as a secondary source of income, or accepting diminished revenue from the SMMTE could be considered.
**The scope of attributes of the SMMTE owner**

SMMTE owners play a central role in a venture in terms of strategic behaviour. Consequently, the SMMTE owner is an important element of this paper. SMMTE owners with a certain attribute profile (profiled in this paper in terms of knowledge, skills and attitude) have a direct bearing on the strategic behaviour that can potentially manifest within an SMMTE as a preferred strategic behaviour, and ultimately, will impact on the success or failure of an SMMTE. Timmons and Spinelli (2003), Morrison, Rimmington and Williams (1999) and Visser (2003) identify core attributes or characteristics of successful entrepreneurs. It is stated that there are “six themes” of entrepreneurial attributes as to what successful entrepreneurs “do and perform”. The six themes concerning the dominant entrepreneurial attributes are: a) commitment and determination; b) leadership; c) opportunity obsession; d) tolerance of risk, ambiguity and uncertainty; e) creativity, self-reliance and adaptability; and f) motivation to excel. **It is, however, not the objective of this paper to empirically research the attributes of entrepreneurs as there are a number of studies (for example, De Coning, 1988, and Maas, 1996) that have already been completed in this regard.** The central focus in this paper is to determine the possible linkages between the attributes of entrepreneurs and the preferred strategic behaviour that is manifested in SMMTEs. **Consequently, the attributes of entrepreneurs, as empirically determined by De Coning (1988), as in Maas (1996), are accepted for this paper as they are congruent with the attributes that have been determined by other researchers in this field and because the De Coning study (1988) has a South African focus.** It can thus be concluded from the above-mentioned discussion that there is a broad agreement amongst researchers concerning the attributes of entrepreneurs. The De Coning (1988) findings are set out in Table 2.

Source: adapted from Maas (1996)

The various entrepreneurial attributes are briefly discussed hereunder:

i. Conceptualisation or holistic approach: this is described by De Coning (1988) as the management approach employed within an SMME by the owner. In some instances, certain owners find it adequate to only focus on effectiveness (internal environment), whilst in others instances, owners may focus on both efficiency and effectiveness (external and internal environments). Hereafter, for the purposes of this paper, this attribute is referred to as the holistic approach.

ii. Entrepreneurial growth perceptions, value systems and motivations: perceptions are noted by De Coning (1988) as referring to the various reference frameworks of owners and determine their behaviour in specific situations. Three main categories of business owner perceptions are indentified. These range from perceptions of owners who try to avoid venture bankruptcy to those owners who are characterised by a growth perception. In-
between these two continuum poles there are indications of perceptions that simultaneously include survivalist characteristics and bankruptcy avoidance characteristics. Value systems and motivations are considered synonymous concepts by De Coning (1988). The central question that needs to be answered is: what primarily motivates SMMTE owners to operate a business? There can be one or a combination of reasons, including the improvement of the financial position of the SMMTE owner; provision for the needs of the family lifestyle, need to be independent, need to excel, to actualise growth or to innovate.

iii. Locus of control: various empirical studies are noted by De Coning (1988) to have found that entrepreneurs are characterised as having an internal locus of control.

iv. Management knowledge or formal education: SMMEs are not large businesses of a small scale emphasises De Coning (1988). In large businesses, the management and operational levels are normally clearly demarcated, however this is not so in SMMEs. SMME owners are normally required to manage as well execute the operational tasks in the SMME. Thus, it is critical to determine the extent of formal management education and the various functional areas that are affected.

v. Risk propensity: risk reflects the degree of uncertainty and potential loss associated with outcomes which may follow from a given behaviour or set of behaviours (Forlani and Mullins, 2000). Basic elements of risk construction are identified: potential losses and the significance of those losses. The central issue is how entrepreneurs cope with the risks inherent in their decisions, what determines the way they perceive the riskiness of their decisions, whether they possess character traits which predispose them to engage in uncertain behaviour or whether they assess opportunities and threats differently from non-
entrepreneurs. Sitkin and Weingart (1995) and in contrast with previous researchers such as Derby and Keeney (1981) do not consider risk propensity as a stable personal attribute because risk is a cumulative tendency to take or avoid risks and can be changed as a result of experience. Successful entrepreneurs, indicate Timmons and Spinelli (2003) have a propensity to take calculated risks or avoid risk that they do not need to take.

vi. Prior work experience: De Coning (1988) indicates that two of the main reasons that SMMEs fail are due to inadequate business and management experience. The different roles that SMME owners have to fulfil also require comprehensive prior-work experience. Thus, it is critical to determine if the SMMTE owners have relevant experience related to various functional management areas of the business.

It is assumed that the entrepreneur has a direct bearing on the strategic behaviour of the SMMTE and, the consequences thereof could range in varying degrees from success to failure for the SMMTE. Furthermore, it is also assumed that preferred strategic behaviour of the SMMTE has a higher likelihood to translate into preferred final outcomes, which can manifest in different formats – depending on the attributes of the entrepreneurs. The extent to which SMMTE owners manifest strategic behaviour, is dependent on a multitude of variables. Some of these variables are controllable and others may be beyond the control and influence of the SMMTE owner. Controllable internal factors, according to Visser (2003), are those that are internal to the SMMTE owner, such as strategic thinking skills. This implies that SMMTE owners can learn the techniques and obtain qualities that they need for preferred strategic behaviour to manifest in their ventures. Alternatively, it can be said that SMMTE owners can become strategic leaders who inspire and stimulate their employees. Uncontrollable factors are fundamentally external variables over which the SMMTE owner has little, if any, direct influence. The state of the
economy and socio-political influences are examples of such external variables. Although proactive behaviour by SMMTE owners can result in a preferred advantage from external variables, it is proposed that the focus of the paper should rather be on the SMMTE owners themselves and the attributes that enable them to react strategically toward external variables. In regard to the internal variables, the presence of strategic behaviour is linked to co-producers of strategic behaviour within SMMTEs. The interrelationship in the form of a conceptual model is depicted in Figure 1.

![Diagram of the conceptual model](image)

**Figure 1: The a priori model for strategic behaviour of SMMTEs (Conceptual Model)**

*The elements of the conceptual model: a discussion*

The proposed conceptual model consists of integrating a minimum set of variables (E₁ … Eₙ) characterised as the attributes of the SMMTE owners (and their businesses) and a second set of
intermediate variables (SB₁ …. SBₙ) characterised as the potential manifestations of strategic behaviour of the SMMTE owners. This relationship is depicted in Figure 1.

This paper is primarily focussed on the SMMTE owners and the potential manifestations of strategic behaviour, and, is not focussed on the attributes of the SMMTE employees. It is emphasised that SMMTE employees are not the main focus of this paper, however, this approach does not deny the possible strategic behavoural contributions of such employees. The focus is rather on the nature of SMMTE structures or processes and the behaviour of SMMTE owners who act as stimuli or agents for strategic behaviour. Consequently, the study determines the extent to which linkages can be established between the unique attributes of SMMTE owners and the manifestation of strategic behaviour. For instance, a link will have to empirically measure the individual (or set of) attributes, or characteristics, of the entrepreneurs to the characteristics that are both unique and / or typical to strategic behaviour of these SMMTE owners. The correlation of these relationships, or absence of any direct link, is based on the indicators from literature, logical conclusions and insight. The focus of the paper, thus, is primarily on the SMMTE owner and the manifestation of strategic behaviour within the SMMTE and is not focussed on the final outcomes of an SMMTE in terms of success. It is expected that the results from applying this approach will have a better probability of predicting business success.

**Strategic behaviour (IO)**

Strategic behaviour (illustrated as Intermediate Outcome in Figure 1), according to Johnson and Scholes (1997) is characterised as being highly complex in nature; involves a high degree of uncertainty in view of making decisions in a dynamic and uncertain future; demands an integrated approach to managing the venture as owners are required to be cross-functional and
have operational boundaries to deal with strategic challenges; and, strategic decisions may also involve major changes in the venture which may require decisions for planning, making the changes and the implementation thereof.

Strategic behaviour at individual and organisational level is depicted in Table 3. Strategic behaviour can, thus, be described as utilising the venture’s threats and opportunities to enhance its long-term prospects, and, a strategic decision can be defined as a set of critical actions and dynamic factors, at individual and organisational level, beginning with the identification of the stimuli and ending with the specific commitment for action. Strategic behaviour is, overall, described as unstructured, irregular and incomprehensive with SMME strategising considered as incremental, sporadic and reactive.

Source: Rajagopalan, Rasheed and Datta (1993), Hynes (2003) and Bonn (2001)

The paper assumes that the preferred manifestations of strategic behaviour are the end-product of a dynamic interaction between various elements that involve the SMMTE owners’ attributes and the strategic business processes that are utilised. Consequently, an investigation of the relationship between certain SMMTE owner attributes and strategic behaviour will be the basis of
this paper. It is assumed that some of the preferred strategic behaviour manifestations have a higher likelihood to translate also into preferred final outcomes.

**Final outcomes (FO)**

There are varying interpretations as to what constitutes success (classified as a Final Outcome in the conceptual model, Figure 1). There are no generally accepted lists of variables that distinguish business success from failure, according to Lussier and Corman (1995), thus negating prior research which cites different variables as contributing to success or failure. For instance, in family ventures; success could be concerned with retaining ownership within the family, maintaining a certain lifestyle, or even growing the business (Timmons & Spinelli, 2003). Consequently, due to the conceptual ambiguity of measuring success, this paper will instead focus on the relationship between the attributes of the SMMTE owners that produce strategic behaviour and the manifestation of strategic behaviour within SMMTEs (Intermediate outcomes). It will, thus, assume that if the preferred strategic behaviour is applied, it can result in a successful final outcome for the SMMTEs, as after all, as underscored by Timmons and Spinelli (2003) it is the lead entrepreneur that must be seen to be “taking charge of the success equation”.

**Environmental variables**

This paper is primarily focussed on investigating the nature of possible relationships between profile elements of the SMMTE owner and intermediate outcomes in the form of the SMMTE preferred strategic behaviour that an SMMTE will have. SMMTEs, according to Bennett (2000), cannot be divorced from the fact that the external environment impacts on the host population, the tourists and the businesses that are in the tourism system. It could be assumed, however, that within a homogenous geographical area, such as South Africa, that such influence would be
generally the same for all SMMTEs. It is, however, further noted by De Coning (1988) that the extent to which external variables impact on an SMMTE are to some extent influenced by the ability of entrepreneurs to understand the external environment.

Against this background, the paper endeavours to establish the potential linkages or relationships between the characteristics or attributes of SMMTE owners and the manifestation of strategic behaviour. The investigation of the strategic behaviour in SMMTEs with particular emphasis on determining which variables co-produce preferred manifestations of strategic behaviour in such enterprises is because the preferred strategic behaviour of the SMMTE has a higher likelihood to translate into preferred final outcomes which is dependant on the attributes of the entrepreneurs.

**Methodology**

**Study design**

The research design for the proposed study involved is primarily descriptive and explanatory research.

**Sample**

The target population covered all nine provinces of South Africa. In order to incorporate SMMTE’s on a national basis, the services of a commercial database company were used to compile a database of SMMTEs, caused by a dearth of workable alternatives concerning comprehensive databases of SMMTE’s in South Africa. The decision-makers of formally registered businesses (informal businesses were not included) were selected by rank (most senior person: managing director, chairperson, manager etcetera). The businesses included could be described as head offices and stand-alones employing no more than 100 staff. The researcher selected the most appropriate business types and codes associated with the tourism industry (the
so-called unit of analysis) to extract a representative national list of 1965 SMMTE’s for the purpose of this research. In total 316 questionnaires were returned which represented a total response rate of 16.08 percent, of this 168, or 8.56 percent was deemed, conservatively, to be the useable response rate.

**Research instrument**

The research instrument used was a structured questionnaire consisting of five sections. Section A of the research instrument consists of question items related to determining the demographic profile of respondents. This section of the instrument determines the geographical location; the duration of business operation, the number of branches, if any; the type of businesses, the tourism sector the businesses consider to be their core business; the number of full and part-time employees, an estimation of the number of new full-time posts the business could create within five years; an estimation of the annual gross total turnover and total gross asset value; the gender and age profile of the respondents; the highest educational level; and an indication of the population group of the respondents. Most of the said items have been derived from other instruments that have been previously validated by other researchers such as Loubser (1999), Maas (1996: 249); and Orford, Herrington and Wood (2004).

Section B of the research instrument consists of question items that have been previously validated by other researchers such as Maas (1996). Various questions were posed to the SMMTE owners concerning their personal convictions (locus of control), incidence of formal education in the management fields, experience in the management fields, practical/technical experience relevant to the workplace, risk propensity, reasons provided as to why people started their own business, decisions that influence the business, common challenges and various approaches to address these factors.
Sections C and D of the research instrument consists of question items that are intended to measure the strategic behaviour dimensions at organisational and individual levels of the strategic behaviour construct.

**Demographic characteristics**

The typical demographic profile of the SMMTEs can be characterised as follows: the majority of respondents can be demographically characterised as originating from the Western Cape (28.7%) and Gauteng (26.2%); are most likely based in an urban/metropolitan area; are most likely (28.6%) 45 to 54 years of age; most likely (70.5%) of the male gender; the highest number have attained a Grade 12 (33.5%) qualification; and, the majority (85.9%) can be classified as being from the White population group. The profile of this study compares favourably with that of the South African SMMTE profile provided by THETA (2009a).
**Business characteristics**

The typical business characteristics of the SMMTEs included in the study are summarised in Table 4.

**The typical attributes of the SMMTEs**

The typical attributes of the SMMTE owners in the study suggest the following: the majority of owners have an internal locus of control; many have almost no formal management education in all the functional management areas and the largest proportion have received management functional education in only two functional areas; many have almost no prior-experience in all functional management areas and the largest proportion have some prior-experience in three of the functional management area; however, a large proportion indicated appropriate technical competence for the operations of their business and almost half of the respondents indicted three entrepreneurial reasons for starting a business but a small proportion did indicate no entrepreneurial reason for starting their businesses; the majority of owners indicated a tendency toward risk aversion and thus were deemed non-entrepreneurial for the purpose of this study; and lastly, the holistic capabilities of the respondents indicate an internal approach was dominant within these SMMTEs and were, thus, also deemed non-entrepreneurial for the purpose of this study.

The study then stated the main research hypothesis, along with its set of sub-hypotheses, and then proceeded to investigate a possible relationship between strategic behaviour (the dependent variable) and entrepreneurial attributes (independent variables) using inferential statistics. Although the research hypotheses of this study are implicitly stated through the *a priori* model, as depicted in Figure 1, to assist with data analysis objective of this paper, only the main research hypothesis is stated hereafter:
Null Hypothesis (H₀) = There is no association between the owner attributes of the SMMTEs (that are characterised by locus of control, reasons for starting a business, holistic capabilities, propensity to risk, formal management education and prior-experience) and preferred strategic behaviour.

Alternative Hypothesis (H₁) = There is an association between the owner attributes of the SMMTEs (that are characterised by locus of control, reasons for starting a business, holistic capabilities, propensity to risk, formal management education and prior-experience) and preferred strategic behaviour.

The relationships and constructs, as depicted in the a priori model, were empirically tested through the means of various statistical techniques:

- Reliability testing of the data set was conducted.
- Validity of the research instrument was determined.
- Reliability of the new constructs after exploratory factor analysis was determined.
- The relationships between the variables of the hypotheses were tested through Spearman’s rho and ANOVA.
- The relationships between the variables of the hypotheses were tested, further, through regression analysis.

A summary of the associations between the variables (ref. Table 5) revealed the overall significant associations concerning the selected attributes of venture owners and the potential manifestations of strategic behaviour within the SMMTEs. This was determined after the data had been subjected to the Spearman’s rank-order correlation coefficient (Spearman ρ), ANOVA and multiple regression analyses.

**Discussion of findings**

The study noted that a number of the sub-dimension elements of the strategic behaviour construct (ref. Table 5) were identified as having no (overall) statistically significant relationship with the
identified attributes of the venture owners. The study identified, as summarised in Table 5, the following significant end-results of the interaction that involves SMMTE owner attributes and the manifestations of strategic behaviour:

i. The **internal locus of control** owner attribute seemingly affects the strategic behaviour of SMMTE owners as to how they perceive the **vision** of their businesses, how they foster **strategic dialogue** within their ventures, and how they enact the **gathering and sharing of market intelligence** for their businesses.

ii. The **formal education** owner attribute seemingly fosters **strategic dialogue** with all their key stakeholders and contributes towards the improved **task environment awareness** within SMMTEs.

iii. The **prior-experience** owner attribute of SMMTE owners seemingly enables the strategic behaviour of SMMTE owners towards an improved **gathering and sharing market intelligence** that is used by SMMTEs.

iv. The **entrepreneurial reasons for starting a business** owner attribute seemingly motivates the strategic behaviour of SMMTE owners to **synergise business development** activities and contribute towards the improved **task environment awareness** of their businesses.

v. The **holistic profiles** owner attribute seemingly affects the strategic behaviour of SMMTE owners through enabling them to perceive the **holistic understanding** of their businesses; engendering the **vision** formulation of their businesses; **fostering strategic dialogue**; developing a **planning focus**, and encouraging **creativity** within SMMTEs.

vi. The **risk-seeking (propensity) profile** owner attribute seemingly **does not have an overall**
affect on the strategic behaviour of SMMTE owners in conducting the affairs of their businesses.

Figure 2: The populated a priori theoretical model and its statistically significant associations

The study did, however, find statistically significant results of the Spearman’s ρ and regression analyses, as depicted in Table 5, between some of the attributes of the owners and certain elements of strategic behaviour. These results (ref. Table 5) were used to populate the a priori...
theoretical model and are depicted in Figure 2 (ref. intermediate outcomes).

Although the research hypothesis of this study is implicitly stated through the a priori model, as depicted in Figure 2, the research findings provide support that there is an ultimately statistically significant association between the independent and dependent variables, and that the alternative hypothesis can be accepted, namely, there is an association between the specific attributes of the owners of the SMMTEs (which is characterised by locus of control, reasons for starting a business, holistic capabilities, formal management education and prior-experience) and the selected strategic behaviour variables. Furthermore, the research findings provide support that there is an overall statistically significant association between the various independent and dependent variables, as stated by the sub-hypotheses, and that the following alternative sub-hypotheses, can be accepted, namely:

i. There is a positive relationship between locus of control and strategic behaviour.

ii. There is a positive relationship between management education and strategic behaviour.

iii. There is a positive relationship between prior-management experience and strategic behaviour.

iv. There is a positive relationship between entrepreneurial reasons for starting a business and strategic behaviour.

v. There is a positive relationship between greater holistic capabilities and strategic behaviour.

However, the research findings do not provide support that there is an overall statistically significant association between the risk propensity independent variable and the strategic behaviour dependent variables and, consequently, the following null sub-hypothesis is accepted: the risk-seeking profile owner attribute seemingly does not have an overall effect on the strategic
behaviour of SMMTE owners in conducting the strategic affairs of their businesses. This may be indicative of SMMTE owners not aspiring to grow their businesses (namely, have capped growth motives), and, are often motivated by non-financial considerations, such as lifestyle (including familial) factors, when starting and managing their SMMTEs. This has a direct implication on the varying levels of strategic behaviour evidenced within the SMMTEs, and consequently, the study postulates that SMMTE owners employ a risk-avoidance profile when formulating strategic behaviour.

The populated conceptual (or, a priori) model and its sub-components, depicted in Figure 2, focused primarily on the two main constructs: the attributes of an SMMTE owner and preferred strategic behaviour variables that is manifested within an SMMTE. The study focused on analysing the association between specific attributes of the SMMTE owners that produce preferred strategic behaviour and the manifestation of preferred strategic behaviour within SMMTEs (Intermediate outcomes). The study assumes that certain preferred strategic behaviour of the SMMTE has a higher likelihood to translate into preferred final outcomes, which can manifest in different formats – success or failure.

**Recommendations and conclusion**

This study examined the determinants of strategic behaviour through the use of a sample frame of SMMTEs owners in the formal tourism industry of South Africa. It is assumed that in cases where strategic behaviour manifests in SMMTEs, that there should be a higher likelihood of successful outcomes (and conversely, failure where strategic behaviour does not manifest in SMMTEs) for such SMMTEs. The importance of successful SMMTEs as a mechanism for job creation, innovation and long-term sustainable economic development, for a developing country economy such as South Africa can not be emphasised enough.
To ensure long-term sustainability, notes Whittle (2000), the owners of SMMTEs need to make efficient and effective business decisions about the internal and external threats and challenges their businesses face to ensure that they have enough strategic information to make decisions and maintain their competitive advantage in the tourism industry. Crijns and Ooghe (1996) indicate that, in general, it can be viewed that the development and growth of SMMEs can be attributed toward how quickly the entrepreneur, the business team and organisation can adapt and learn from their experiences in combination with the external and internal environments. This implies that the core elements of strategic behaviour are internal and external and, according to Hofer (1991), should include market-related, industry-related, competitor-related, supplier-related, resource- and capability related, and broader environmental-related strategic challenges.

The practical recommendations indicated in this section are derived from the summary of the relationships between specific SMMTE entrepreneurial attributes and selected strategic behaviour variables, as depicted in Figure 2. In terms of the said theoretical model, strategic behaviour can be developed at two main levels: the individual level and the organisational level.

**Individual level**

The study found that the independent variables were overall not good (statistically significant) predictors of strategic behaviour of SMMTE owners. The study, further, found however, that statistically significant associations between the owners’ attributes (independent variable) and a number of sub-dimensions of strategic behaviour (dependent) variables as depicted in Figure 2 exist.

The study noted the findings of the descriptive statistics which indicated that the majority of respondents in this study had mostly entrepreneurial reasons for starting their businesses.
Agencies involved with SMMTE development need to assess more the entrepreneurial attributes of aspiring tourism entrepreneurs who want to start an SMMTE, as this has a direct bearing on the strategic behaviour that such ventures will evidence, and which can ultimately impact on their growth orientation (capped- to growth-directed) and sustainability. This study proposes the provision of strategic behavioural skills to be included as part of the entrepreneurship programmes of schools and universities so as to enhance the entrepreneurial attributes of aspirant tourism entrepreneurs. It is suggested that the entrepreneurial reasons for starting an SMMTE can contribute towards the development of synergistic business developments through putting together business projects that contribute towards business sustainability; and, will contribute towards improved task environment awareness within the SMMTE in order to ensure that business projects are completed as profit-effectively as possible.

The study found that a good predictor of strategic behaviour is the formal education that SMMTE owners receive which in turn has a direct bearing on the strategic behaviour that such ventures will evidence; and ultimately their sustainability. The findings of this study, however, show that the descriptive statistics noted that the majority of respondents in this study had no formal management education with only a small minority having receiving formal education in all management functional areas. It is recommended that learning opportunities be provided for applied learning in all management functional areas and that such education should not only include the “hard science” of business plan writing but must also deal with the “soft science” of developing strategic thinking and behaviour competencies of SMMTE owners. Such learning opportunities should also be firmly grounded in the tourism discipline. It is suggested that improved (also implying appropriate) formal education can significantly contribute towards fostering and supporting strategic dialogue with the SMMTE stakeholders; and will contribute
towards improved task environment awareness within the SMMTEs. Fletcher and Harris (2002: 307) indicate that “entrepreneurship education should rather concentrate on the process rather than on the content, with how to aspects being more important than know how”. It is emphasised by Bolton and Thompson (2004) that entrepreneurs “learn by doing” and may need a coach to promote the learning process. Thus, education is needed to be “hands-on” rather than “talk about” but owners also need to accept that they need “mentoring”. It is further indicated by De Coning (1995: 8) that SMME owners should become “business literate” through upgrading their knowledge skills in respect of general management, finance, marketing and the management of people as these are considered to be necessary “entry level” abilities for entrepreneurs. The descriptive results of this study further indicated that the majority of SMMTE owners had received no formal education in strategic management and tourism business studies.

The **internal locus of control** attribute is a good predictor of strategic behaviour and it is suggested that SMMTE owners need to develop this attribute further so as not feel disempowered due to the various macro-environmental issues that may be impacting on the operation of their ventures and which may be beyond their control. It is suggested that an improved internal locus of control can contribute towards the formulation of more appropriate (even far-reaching) visions; will tend to foster strategic dialogue with stakeholders; and will contribute towards the improved gathering and sharing of market intelligence. It is, in addition, proposed that SMMTE owners be provided with strategic business support and education to the point where they can depend on their own skill (internal locus of control) and will, thus, be more likely to work harder and improve their strategic abilities to manage their businesses. The descriptive results of this study further indicated that the majority of SMMTE owners had an internal locus of control.

**Prior-experience** has also been identified as a good predicator of strategic behaviour. This is
indicative of the need for prospective SMMTE owners to first gain appropriate prior-experience through working in the tourism industry before establishing their own SMMTE. The results suggest that the experience gained in this way impacts on the type of strategic behaviour that is evidenced within SMMTEs. It is suggested that prior-experience can contribute towards the improved gathering and sharing of market intelligence supposedly because appropriately experienced SMMTE owners know how to operate in a networked tourism industry and have experience in dealing with its idiosyncrasies. It is noted, however, that the findings of the descriptive statistics bear evidence that the majority of respondents in this study had prior-management experience in at least three of the management functional areas with an almost equal number having no prior-experience in any of the management functional areas. It is suggested that because of the different (even non-tourism) management backgrounds from which many of the SMMTE owners have gained their prior-experience, there is need to acknowledge and address this through possibly teaming-up entrepreneurs with SMMTE entrepreneurs who have the relevant prior-experience (possibly, in the form of mentor-mentee networks).

The **holistic** attribute of successful SMMTE owners is a good predictor of strategic behaviour because it leads to the ability to take a holistic view of the SMMTE and its environment. This implies an understanding of the different problems and issues, and how they influence the SMMTE. It is suggested that the holistic attribute of SMMTE owners can contribute towards the formulation of more appropriate (even far-reaching) visions; exploiting ingenuity, encouraging a planning focus, engendering creativity, fostering strategic dialogue with stakeholders; and will contribute towards the improved gathering and sharing of market intelligence. It is noted, however, in the findings of the descriptive statistics that the majority of respondents in this study had an internal approach when conducting their business. Consequently, there is need to develop
the ability of SMMTE owners to have holistic ability that includes external factors when conducting their business behaviour because it leads to the ability to take a holistic view of the SMMTE including the environment in which it is situated.

The research findings indicated that the risk-seeking behaviour attribute of SMMTE owners is not a good predictor of strategic behaviour. The descriptive research findings of this study also indicate that most SMMTEs avoid risk when conducting their business. It would, thus, be prudent of agencies involved in SMMTE development to take cognisance of the risk avoidance strategies of most SMMTEs in the process of designing interventions to assist aspiring SMMTEs so as to ensure the sustainability of these ventures. This is indicative of SMMTE owners who seemingly are not motivated to grow their businesses (namely, have capped growth motives), and are often motivated by non-financial considerations, such as lifestyle (including familial) factors, when starting and managing their SMMTEs. As indicated, the predominance of middle-aged respondents in the study may further reflect a trend towards semi-retirement and subsequent self-employment, and thus the tendency to be more risk-averse.

Finally, the blending of strategic thinking and planning together is a learned practice. The whole purpose of strategy is to create business advantage, to maximise resources, decisions and core competencies. Strategic thinking seems to emphasise the formulation of strategy within the organisation and strategically plan the implementation of these strategies. In an SMMTE scenario, the synergistic effect of both elements operating together is what is required, and quite often strategies for the SMMTE require implementation and action at the same time. The extent to which SMMTE owners manifest strategic behaviour, however, is dependent on a multitude of variables. Some of these variables which are internal to the SMMTE owner, such as strategic thinking skills, are controllable but others may be beyond the control and influence of the
SMMTE owner. Uncontrollable factors were fundamentally external variables over which the SMMTE owner has little, if any, direct influence. The state of the economy and socio-political influences were examples of such external variables. However, the extent of the SMMTEs ability to understand the external environment could affect the influence of the external variables on the performance of the SMMTE.

Organisational level

SMMTEs owners should create a business climate whereby it is conducive towards supporting the creative strategic act within the entire enterprise. SMMTEs should also draw from the entire SMMTE talent pool because the most effective strategic entrepreneurial behaviour sometimes originates from individuals or teams whose input was not expected. It can be further emphasised that SMMTEs should promote divergent thinking, the generation of different views, within the enterprises which should result in creative and strategic behaviour.

Although macro environmental factors do impact on the strategic behaviour of SMMTEs, the plethora of SMMTEs operating within tourism destinations means that they have the potential to strategically influence the environmental, social and economic (triple bottom line) progress towards achieving sustainability within such destinations. The sustainable development of destinations places SMMTEs in the centre of sustainability debates as they have the potential to form strategic networks and spread the environmental, social and economic benefits within their destinations. This implies that measureable sustainability indicators need to be developed for SMMTEs and that further research that measures the interaction between sustainability, strategic behaviour and strategic networks needs to be conducted.

Strategic behaviour, recommends Grundy and Brown (2002), is a habit that SMMTE owners
should continually cultivate. Such behaviour should include devoting time regularly to engage with the strategic issues of the SMMTE; focussing on one strategic issue at a time; using *ad hoc* free time to work on strategic issues; gathering small, but rich, data from the key stakeholders (clients, competitors, staff, etc.); and to be confident of their ability to think strategically. This will assist with translating strategic behaviour imperatives into practice.

Knowledge, Perception, and Application of Strategic Marketing in MSMEs (Micro, Small, and Medium Enterprises) in Bogota*

By Ricardo Vega and Sandra Rojas

Abstract

The theory states the strategic marketing as one of the most important components of the management of any organization. In this work, some aspects regarding the use of this management tool in Bogota’s MSMEs were researched. Although the attitude about the utilization of strategic marketing management was positive and there is a clear perception of the benefits it gives, there are some barriers that impede its application. The main barriers detected were the low training in strategic marketing that their employees have and the lack of resources and time to implement this process. With these results in mind, it is pertinent to analyze the focus of the Colombian support programs, to this kind of companies, about the marketing management elements. Academics and practitioners should propose theoretical and practical concepts to apply this tool in a more extensive way in Colombian MSMEs.

Introduction

MSMEs are an important source of employment and Gross Domestic Product (GDP) in the countries. In the case of low income countries, they represent 31 percent of employment and 15 percent of the GDP; for countries of middle income, SMEs are around 55 percent of employment and 40 percent of the GDP. And in high income countries, they achieve levels of around 65 percent in employment generation and 50 percent in their GDP.

1 Ricardo Vega and Sandra Rojas are Marketing Teachers at Politécnico Grancolombiano, Bogota, Colombia (South America). Their teaching and research activities focuses on strategic marketing and small business management. Address correspondence to: Ricardo Vega, Marketing Department, Politecnico Grancolombiano, Calle 57 No. 3-00 Este, Bogotá, Colombia, South America. E-mail: rvegarod@poligran.edu.co.
For this article, MSMEs are defined based on the Colombian norms (Diario Oficial 2004) dividing them in Micro Companies, with a number of employees no more than 10 workers or total assets less than 500 legal monthly minimum wages (LMMW) (approximately US$132.581 in 2010). Small Companies are businesses with a number of employees between 11 and 50 workers or total assets between 501 and 5,000 LMMW (approximately between US$132.581 and US$1,325,809). Medium Companies are companies with a number of employees between 51 and 200 workers, or total assets between 5,001 and 30,000 LMMW (approximately between US$1,325,809 and US$7,954,856). And Large companies are enterprises with more than 200 employees or total assets greater than 30,000 LMMW (approximately US$7,954,856 or more).

**Strategic Marketing Management in MSMEs**

Strategy is defined as the process "to define the reach and purpose of the business, its objectives, the initiatives and the resources to achieve those objectives" (Cravens, and Pierce 2007). And the process to apply this management tool is the strategic planning whose essence is “in all levels of the company to identify possible risks to avoid them and identify opportunities” (Mullins, Walker, Boyd, and Larréché 2007).

Porter (1991) says that “the strategic success requires the choice of a relatively attractive position given industry structure, the firm’s circumstances and the position of
competitors. It also requires bringing all the firm’s activities into consistency with the chosen position.”

One of the most important elements of the strategy is the marketing strategy, and Mullins, Walker, Boyd, and Larréché (2007) establish that the main interest of this part of the strategy is “to assign and to coordinate effectively the marketing activities and resources in order to achieve the company’s goals in a specific market, specifying the target markets for a particular product or line of products.”

Furthermore, Uncles (2000) states that the marketing strategy “is concerned with the processes and activities associated with creating and satisfying customers by continually assessing their needs and wants, and doing so in a way that there is a demonstrable and measurable impact on business performance.” Palmer and Pels (2004) say that “Market orientation is therefore a component of the overall business strategy, which is seen to contribute positively to business performance.”

But, it has been found that strategic marketing is not broadly applied in the SMEs like it could be thought (Lancaster and Waddelow 1998), and it is affected primarily by three elements, interrelated to each other: the attitude that the company has in front of the importance that should play the marketing in the firm, the focus of the managers’ work in the SMEs, and the availability of resources to implement this process. About the first element, Murdoch, Blackey, and Blythe (2001) found that in Welsh SMEs the marketing is perceived more as a short term activity than as a strategic function and then there is a general indisposition to invest money in this activity seen as something 'expensive' and ineffective.
One of the main barriers is that the MSMEs consider the process too long (poor return on the invested effort) and it will be outdated when it is finished (a waste of resources) (Lancaster, and Waddelow 1998). It is not seen as a continuous process of adaptation to the environment, but as an element that provides useless information.

Their attitude in front of this process comes from the misunderstanding that the marketing is impossible to evaluate in terms of cost, and its results are intangible and of difficult measurement. It is considered more a cost than an investment. The marketing becomes a peripheral activity and it does not have a significant impact on the business performance (Carson, and McCartan-Quinn 1995).

Murdoch, Blackey, and Blythe (2001) say that in this kind of organizations, managers put more emphasis in ‘doing’ than in ‘thinking.’ They are more focused on the day by day activities than on the medium and long term thinking that demands the strategic planning, and in the case of Colombian SMEs, they do not write formal marketing plans (Zapata 2005). Lancaster and Waddelow (1998) affirm that the SMEs managers` focus is ‘the processes’ more than ‘the strategy.’

Lancaster and Waddelow (1998) add that few managers understand that ‘thinking’ is one of their most important activities. They jump from one task to another and are oriented towards the achievement of results in the short term. Their ‘work ethic’ and their culture are based on ‘getting things done’. They feel that it is better to make things than simply to think about them. This takes them to plan based on the firm’s tradition and on tactical things according to their day by day managerial reality. The positive part of this situation is that it takes them to generate action plans they consider can be implemented.
Their conclusion is that this situation has four consequences: a constant pressure with the work; failings in the prioritization process becoming problem solvers; it is rewarded more the loyalty that the effectiveness in their employees; and they enter in a vicious circle of the ‘here and now,’ believing that if they do not solve the urgent problems there won't be future for the company (Lancaster, and Waddelow 1998). As the proverb says, “urgent things do not permit to do the important ones”. This characteristic is intensified because many of these managers do not receive a formal education and training in business administration (Kirby 1990).

Regarding the available resources to do strategic planning in SMEs, Knight (2000) affirms that this kind of enterprises, because of their size, lack the capabilities, the market power, and other resources that large companies have. The mentioned situation is reflected in the little experience and training in marketing in this type of companies (Murdoch, Blackey, and Blythe 2001).

Lancaster and Waddelow (1998) found that SMEs cannot offer competitive salary packages that offer big companies and for this reason they hire personnel that provide more empathy and loyalty that attitudes and abilities in its work. Also, they do not have enough time to develop strategic planning.

As a consequence of this situation, a certain number of theories and formal models attempts have been proposed for the strategic planning in SMEs. Murdoch, Blackey, and Blythe (2001) say that none of these models and theories has been adopted by SMEs and those meaningful guides have not been created to this respect. The findings show that strategic marketing planning is discouraging in this type of organizations and generates
resistance against it (Murdoch, Blackey, and Blythe 2001). But these authors complement that this fact is more related to the way marketing concepts are implemented than to the possibility to transfer them to the SMEs.

Lancaster and Waddelow (1998) concluded that the process of marketing strategic planning is created for big companies and a simpler methodology is required in the case of SMEs. But they recognize that marketing strategic planning is like accounting. There are common principles that can be adapted depending on the specific necessities of each organization. The problem for them is to find a practical way to put in practice the principles of marketing strategic planning in such a way that it covers the organizational characteristics of SMEs.

There is an entire theoretical framework to develop marketing strategic planning independently of the firm`s size, but there are also many barriers that hinder the application in the case of SMEs. The necessity to propose theoretical solutions with pragmatic applications to resolve this situation in a given environment appears (Watkin 1986; Alpander, Carter, and Forsgren 1990). But this position will be more coherent if there is a previous characterization of the current state of the context in front of the application of the marketing strategic planning.

**Methodology**

This research was developed using a descriptive and transversal design with Bogota’s MSMEs.
Based on the Murdoch, Blackey and Blythe (2001) classifications, the following research areas were defined, related to the knowledge and attitude of the businesses about the strategic marketing:

- customer and customer focus
- competitive advantage
- market research
- marketing communications
- marketing plans formalization
- importance of the different time horizons (short, medium, and long term) in marketing planning
- benefits perception of marketing planning
- barriers to apply marketing planning

In the survey applied, the demographic data were collected first and then the areas researched and defined above. The questionnaire could be answered in a short time (between eight and 12 minutes) to improve the response level, including open and closed questions.

The invitation to participate was sent by e-mail to a database compiled by the researcher and where Bogotá’s MSMEs were covered. The mail included a link to the auto-applied survey that was filed in the Spanish website www.encuestafacil.com. When the application of the surveys finished, the data was exported to Excel to do the results analysis that are showed in the next section.
Results

The initial sample contained 1074 companies and was the number of mails sent. 74 surveys were recovered or 6.8 percent of gross response rate. 19 responses were eliminated giving 55 final valid surveys with a 5.1 percent of net response rate, similar to other response rates found in similar studies that fluctuated between 2.95 percent and 10.19 percent (Siu, Fan, and Lin 2004). The elimination reasons of the 19 questionnaires were: 14 surveys were no ended, one of the companies was not from Bogotá, one was a large firm, one business repeated the process, and in two cases the demographic data was inconsistent.

Classification of the Companies (Figure 1)

Businesses were classified on the basis of the number of employees according to Law 905/2004 of the Colombian Ministry of Industry, Trade, and Tourism and this norm defines the companies based on their number of employees or total assets. It was considered more conveniente to use the number of employees, because it was easier to obtain and more reliable data than the asset information.

The final sample had 62 percent of microcompanies, 33 percent of small enterprises, and five percent of medium companies that matched very well with the proportion of businesses created in the period 2003-2005 in Bogotá being 79 percent microcompanies, 16 percent small enterprises, four percent of medium companies, and one percent of big businesses. The sample reflected in a good way the relative composition of the enterprises in this city.
Industrial sectors of the companies (Table 1)

The companies were classified based on the ISIC (International Standard Industrial Classification). 15 firms were manufacturing companies and 40 enterprises were services businesses showing the importance of the service sector in this kind of companies in Bogotá.

Marketing Management Orientation (Lamb, Hair, and McDaniel 2006; Mullins, Walker, Boyd, and Larréché 2007)

31 of the 55 enterprises of the sample had a market orientation and eight had a sales orientation focused on the satisfaction and knowledge of their customers complemented with an adequate distribution system, and 15 companies were focused more on internal factors and were divided between a product orientation (9 of 55) and production orientation (6 of 55).

Competitive Advantage Conceptualization (Lamb, Hair, and McDaniel 2006; Porter, 1991)

It was a multiple choice question and 98 answers were obtained, but just seven firms covered the three defining characteristics of the competitive advantage: benefits of the product, perception of the value of the benefits by the client, and being sources of differentiation in front of the competitors. The results are presented in figure 2.

40 of the 98 answers pointed out the benefits of the product, 26 the attitude of the clients in front of those benefits, 26 the advantage created by the benefits vs. the competence, in 1 answer no alternative was chosen and in five cases other answers were
specified. In general, there was a partial conceptualization of the competitive advantage and more importance was assigned to the internal factor generated by the business, in terms of benefits of the product, than to the external factors as the client and the competitors.

**Customers’ Necessities Detection Process**

The results can be seen in figure 3. This question was of multiple choice and 92 answers were collected distributed this way: in 40 cases the knowledge was obtained by their own experience, 16 enterprises surveyed their customers, 29 detected the necessities in the sales process, just one firm used the outsourcing, and in five cases they used other elements including one company that accepted a great weakness in this point.

Based on these responses, it can be said that in most of the cases a structured market research processes did not exist, most of the businesses trusted in their knowledge of the industrial sector and in the information obtained in the sales processes (69 of 92 answers). In only 17 of the answers, interest in the formalization of this process through surveys applied by the business (16) or hiring a market research company (just one case) was detected.

**Communication Mix Elements (Lamb, Hair, and McDaniel 2006; Mullins, Walker, Boyd, and Larréché 2007)**

The results are in figure 4. It was a multiple choice question and for this reason 111 answers were collected or almost in average 2 responses by firm. Public relations was the element with the highest utilization (29 of 111), in similar proportions direct marketing (25 of 111) and sales forces (23 of 111) and in the lowest proportions advertising (19 of 111)
and sales promotions (10 of 111). But the final objective of this question was to induce to the next question where it was possible to know the conceptualization of the surveyed business people about the elements of the communication mix.

**Conceptualization of the Communication Mix Elements**

In this case the definition of the materials and actions developed to implement each of the communication mix elements answered in the previous question was asked. 20 answers were obtained for advertising, 22 for public relations, and 16 for direct marketing. In other words, in only 58 of the 111 answers the people gave a concrete answer. It is possible that the people surveyed were not sure about the correct response and for this reason they did not complete the answers. In part, this was confirmed because only 11 of the 20 responses about advertising were right, 13 of 22 in the case of public relations, and 10 of 16 of direct marketing (Lamb, Hair, and McDaniel 2006; Mullins, Walker, Boyd, and Larrêché 2007). It was evidenced a conceptual weakness in a significant proportion of the enterprises of the sample.

**Formalization of the Marketing Plans (Figure 5)**

29 of the 55 companies did not formalize their marketing plans using in a high proportion implicit strategies in this type of organizations.

**Planning Time Horizon (Figure 6)**

19 of 55 businesses planned in the short term horizon, almost half (25 of 55) in the medium term horizon, and only seven of the 55 companies planned in the long term horizon which is coherent with the answers of the formalization of the marketing plans. Four
responses were “Other” and three of these firms answered that they did not have any planning time element. These answers raise the short term horizon to 22 of the 55 surveyed organizations.

In other words, there were a low formalization and short horizon planning times to look the future of the companies in the sample.

**Perceived Benefits of the Marketing Planning (Figure 7)**

This was a multiple choice question and 178 answers were collected, in average three responses by company. Almost half of them (86 of 178) put the client as the central element of the marketing planning in the aspects of customers’ recruiting (48 of 178) and retention (38 of 178). Other important proportions (43 of 178) are related to the growing of the firm, in 25 of the 178 responses the definition of the products’ characteristics was considered and in 22 of the 178 answers it was done to analyze the competitors. The obvious question is if the benefits are so clear for business people, ¿why the strategic marketing planning is used in a significant low proportion? One part of the answer is contained in the barriers that they reported in the next question.

**Barriers to the Marketing Planning (Figure 8)**

It was a multiple choice question and had a total of 102 responses. Few barriers are related directly with the planning process by itself: in four of the 102 answers they said the process does not contribute to solve the company’s problems, in four responses it was expressed that this is a more theoretical than practical concept and in other four answers they thought that there is not a clear return on investment. But the main barriers are lack of
resources (33 of 102), low training in the subject (31 of 102), and lack of time to develop the planning process (19 of 102).

These barriers were consistent with the previous answers, like the low conceptualization of the basic marketing elements, low formalization of marketing plans, and the short term horizon in the planning process.

**Conclusions and Recommendations**

Business people in this context have a clear concept about what the role of marketing in the organizations should be, stating that the client has the central role in the marketing processes, but this conceptualization is not reflected on the day by day management of Bogotá’s MSMEs.

One of the main causes for this situation is the low level of knowledge they have about basic marketing concepts, like competitive advantage and communication mix, that are necessary in order to define strategic plans in the enterprises. For this reason, it is difficult that they apply those concepts in their business commercial management.

Another significant aspect is the function assigned to the market research process in Bogotá’s MSMEs. The attitude is to consider, in a high proportion, that they know sufficiently the customers because of their experience in the sector and for the knowledge they acquire in the sales interviews. They developed market research in a low proportion and the outsourcing of this function is a rare event, avoiding the utilization of one of the most powerful tools in order to gain competitiveness in their markets. This behavior is not
centered in the client and it is not congruent with the opinions given in the point about marketing management orientation.

This knowledge and attitude about strategic marketing planning is also reflected in two formal elements of the process, the low generation of written marketing plans and the short term planning horizon they apply in the marketing processes. They are managing marketing in an informal and short-time way and this situation is similar to the findings in other contexts.

Complementary to the aspects analyzed before about the application of strategic marketing management in this kind of enterprises, there are some barriers impeding the use of this management tool. The most frequent barrier is the low training in marketing planning that their employees have. The other significant barriers are the lack of resources and time to implement this process.

There is a clear perception about the benefits they could get of the strategic marketing management process, but it is not complemented with its practical application because of the lack of resources, attitudes, and barriers detected.

Although this research is descriptive, transversal and the sample is small, it would be pertinent to develop other qualitative and quantitative longitudinal researches to detect the structural elements that give the results found in this work. These works can be extended to other geographical areas of Colombia in order to analyze the situation all over the country.
Another implication is the revision of the Colombian entrepreneurship and MSME’s support programs about their marketing components and analyze if they include the concepts, practical tools, and long term follow-up elements to do an effective and useful marketing management or if they are more focused on the financial or other management aspects.

With the results of this work in mind, Colombian researchers have the challenge to structure conceptual and practical frameworks in order to improve the strategic marketing management in this type of companies in the country and to reduce their high mortality. A possible option is the research of specific industrial sectors to generate the recommendations adapted at each one of them.

Social Entrepreneurship Workshop: Combining experiential education and entrepreneurship to attack social issues - perspectives from America and Ireland

Thomas M. Cooney*, Gary Palin** and Christina Benson**

*Dublin Institute of Technology (Ireland) and **Elon University (USA)

thomas.cooney@dit.ie

The workshop is designed to assist entrepreneurship educators to identify and introduce different forms of experiential learning that will enable students to better understand how entrepreneurship can be employed to address social issues. The workshop will explore the advantages and disadvantages to this form of learning for the student, and the challenges that it might create for the educator. The workshop will highlight specifically how such a learning experience can be adopted with regard to social entrepreneurship and it will detail examples used by the authors that have generated positive results for all stakeholders.

Network Benefits: Linking use of social networking by SMEs to business success.

Ted Mallett, Marvin Cruz

Canadian Federation of Independent Business

Abstract

In recent years, social networking has exploded as a form of interactive communications. Aided by advances in communication technologies and pricing structures, social networking has been transforming the delivery and structure of information and putting the once capital-intensive role of broadcasting within reach of individuals. Its impact on personal communications and entertainment has been obvious, as has its effects on the businesses directly connected to these industries. Less is known, however, on how traditional SMEs have actively embraced these forms of networking and whether adoption has led to stronger business performance. This study is designed to find if there is a link between the intensity of business use of social networking tools by SMEs and how well these individual businesses are performing—and if so, how strong a link. The timing of this kind of study is right because the extreme swing of the business cycle in 2008-2009 coincides with the early- to mid-level adoption rates of social networking among SMEs.

Introduction

Small and medium enterprises (SMEs) function in a fiercely competitive and ever-changing world. To effectively compete in such an environment, SMEs must equip themselves appropriately to meet any challenges. One of the emerging challenges facing these enterprises is how to appropriately incorporate and harness the mass collaboration that social networks facilitate into their own business strategy.

In recent years, social networking as it is seen in the form of Facebook, Ebay, Twitter, YouTube and others has exploded as a form of interactive communication. Aided by advances in technology, social networking has changed the delivery, structure and availability of information,
putting the once capital-intensive role of broadcasting within the reach of individuals. This has empowered and transformed individuals around the world from passive recipients of information and products into active creators of content (information and ideas) who are able to collaborate with one another in social networks. For businesses, social networking is already becoming an essential tool for keeping in touch with their suppliers, customers and contacts, recruiting employees, and promoting their profile and brand. In this respect, and as it pertains to business strategies, social networking provides businesses with an opportunity to collaborate and share knowledge with their network, thus creating new adaptive more successful business strategies.

Examination of the manners in which companies can take advantage of emerging social networking technologies, as in the case of Li and Bernhoff (2008), suggest that entrepreneurs who make use of social networks are more likely to achieve greater success than those who do not.

Although the general assumption is that a positive correlation exists between the use of social networking tools in the business environment and business success, earlier studies on internet usage showed considerable lags in adoption by SMEs, which infer that the costs/benefits to adoption are connected to considerable economies of scale. The purpose of this paper is to determine whether there is indeed a link between the intensity of use of social networking tools by SMEs and their competitiveness and success. The analysis should be able to identify whether small businesses, individually or in groups, have been able to utilize social networks towards increased levels of growth.

**Literature review**

The argument that social networks are a factor that can beneficially influence entrepreneurial success has been given considerable attention in the literature. For instance,
Brudel and Preisendorfer (1998) suggest that large personal social networks stimulate the entrepreneurial success of its participants by providing access to more reliable and exclusive information. Further, a diverse network give access to a diversity of customers and suppliers as friends and acquaintances help to spread the information through their own personal networks. This argument is echoed by Dubini and Aldrich (1991), who propose that entrepreneurs can increase their span of action through diverse personal networks and acquire support and resources that would be otherwise unavailable.

Li and Bernhoff (2008) consider the importance of online social networks in their analysis. According to their argument, changes in online behaviour have created a social trend in which people are using technologies to get the things they need from each other, rather than from traditional institutions like corporations. They refer to this social trend as the ‘Groundswell’. In this respect the ‘Groundswell’ has changed the balance of power in such a way that individuals are now shaping the economy by increasingly relying on themselves to produce, market, and distribute products just like traditional corporations did in the past. Furthermore, this argument suggests that this ‘Groundswell’ is an unstoppable trend which threatens the success of those businesses which do not incorporate it as a part of their business strategy.

To better take advantage of the social networks, Li and Bernhoff (2008) created a social network profile (Techno graphics profile) which allows businesses to classify individuals based on the Groundswell activities in which they participate. This profile enables businesses to better understand how social technologies are being adopted by any group of people. With such information businesses can then examine and create targeted strategies based on the tendencies of individuals within the ‘Groundswell’. The profile classifies individuals in a hierarchical arrangement according to their involvement in social networks. This hierarchy begins with
creators at the top followed by critics, collectors, joiners, spectators, and inactives. Creators are individuals who at least once a month publish a blog or article online, maintain a webpage, or upload videos audio to sites. Critics react to online content by posting ratings, reviews and comments on blogs or online forums. Collectors are those who organize the content created by creators and critics by collecting and aggregating information. Joiners participate in or maintain profiles on social networking sites. Spectators consume what all other produce – blogs, online videos, podcasts, forums and reviews. Finally, inactives are simply nonparticipants.

Despite the aforementioned arguments, other studies indicate that there might not be a link between social networks and business success. A notable example is presented by a survey commissioned by Citibank and which was conducted by GfK Roper (Whitney, 2009). The findings, based on interview of 500 executives running businesses with fewer than 100 employees, show that 86 per cent of executives questioned have not used social-networking sites to pursue business advice or information. Further, 79 per cent of executives found social networking sites to be of little help in finding new business leads. These small businesses reported using tools other than social networking to promote and grow their business including reliance on their own website to generate leads, e-mail marketing, and online advertising. In their analysis Citibank executives argue that this survey suggests that small business owners are still feeling their way into social media as a means to grow their business, and that such businesses may also not have the necessary manpower or time required to take advantage of social media.

An important caveat to the arguments that social networks improve business success is that the beneficial effect that social networks may provide can only be gained by companies that have the sufficient flexibility and capacity to absorb the information into their own business constructs (Cohen and Levianthal, 1990). Therefore factors such as available resources,
education, entrepreneurial experience, and social competencies determine how much benefit an entrepreneur can derive from existing network ties. Further, the entrepreneurs’ opportunity for success is also dependent on the characteristics of their personal social network. In this respect, factors such as size, network density, strength of ties, and network redundancy determine the potential of a personal network to provide resources to entrepreneurs (Aldrich and Zimmer, 1986).

**Research question**

The analysis should be able to identify whether small businesses, in whole or in groups, have been able to lever social networks to increased chances of survival or higher levels of growth. Society seems to presume the positive connection, but earlier studies on internet usage showed considerable lags in adoption by SMEs, which inferred that the costs/benefits to adoption were connected to considerable economies of scale.

**Methodology/Key Proposition**

The analysis will be able to control for business sector, size of employment, years in business and region, while also controlling for owner age group, and gender.

\[
\text{Performance.} = f(SN\text{-tools, SN\text{-}behaviour, Owner\text{-}characteristics, Business\text{-}characteristics}) + e
\]

We are under no illusions that this model can perfectly predict business performance. There are simply too many immeasurable qualitative influences (and random ones) that drive these kinds of results. Variable and model specification errors are also highly likely because they are each necessarily too crudely defined to give accurate enough results. All we are hoping to show is through a simple OLS multiple regression, we can test whether social networking activity is positively correlated with business performance—accounting for basic owner and business
characteristics. If there are strong levels of correlation, we can infer that more intensive use of social networking can bring positive and lasting benefits to businesses. If the relationship is weak, however, while social networking may still be of value, there may be seriously unproductive aspects to it that can divert business owners’ attention from more important tasks of running a business. Business owners’ time is valuable and workweeks typically average 50 hours or more. Any activities that can productively allow business owners to save time would be a benefit. Conversely, any activities that take a lot of time, but don’t deliver tangible performance results should be put on the chopping block.

**Available Information**

The data come from two separate surveys of CFIB-member owners of SMEs in Canada. The social networking profile came from a broader marketing research survey conducted in July 2009. In total there were 6,840 respondents. The business performance responses come from CFIB’s monthly survey of business expectations. Although there are data that go back as far as September 2008, we chose to limit the results to the June 2009 to March 2010 period so that the massive business cycle disruption from the past recession did not swamp the analysis. An important point about these data is that each monthly group of respondents is typically unique and independent from the next. The overall sample set rotates every six months. Because the survey sample frame is longer than six months, there are some repeat respondents. In these cases, we removed the second (later) response. In total there were 8,928 unique respondents for this period. Both surveys are non-anonymous, in other words, we know the identities and business profiles of each respondent, who is keyed by a unique membership number. The demographic and business characteristics data came from CFIB’s database, where
membership records are checked and revised annually. The merged dataset resulted in 1,942 respondents who had responded to all relevant questions on both surveys.

**Business Performance:**

The question of how to measure business performance is by no means trivial. In the macroeconomics world, analysts focus on aggregate measures of profits, value added or employment levels to gauge business performance. In the micro sense, or from the perspectives of business owners themselves, the range of performance measures used is much wider. For example, individual business owners may consider survival a key measure of success—particularly at the start-up stage. Other objective measures can include sales levels, debt coverage, profits, net value, and market share. Performance can also be a subjective measure, covering an owner’s satisfaction with their general state of affairs. CFIB’s economic analyses recognize that no single performance measure is suitable, and employing a multiple of methods is too onerous to collect. Our traditional approach has simply been to ask business owners perspectives on past, present or future ‘performance’, implicitly leaving it up to them to define performance their own way. The approach has been quite successful. Since 2000, when CFIB started asking this form of question in a quarterly survey, aggregate results on expected performance 12 months into the future actually tracks very closely with the current rate of real GDP growth. The relationship actually got stronger once CFIB switched to a monthly survey format (see Figure 1). The focus has been on building a good relative indicator of the economy rather than an absolute measure. While it is well understood that a one-year horizon is appropriate for planning purposes, it is too distant to be a good forecast horizon for SMEs. Shorter term forecasts, however, we found to be too influenced by seasonal business influences, which reduce the correlations with macroeconomic measures. Twelve-month future performance
therefore can be considered a good proxy of *dynamic* performance, that is, a measure of the change in business health compared to current levels. The actual question construction is quite simple for survey respondents to deal with and analysts to evaluate:

**How do you expect your firm to be performing in 12 months compared to now?**

1. Much better
2. Somewhat better
3. About the same
4. Somewhat worse
5. Much worse

For the purposes of CFIB’s monthly Business Barometer series, the results are transformed into index form. The top two response percent distributions are each given a 100 percent weight, while the middle distribution is given a 50 percent weight. The range of possible index scores ranges from 0 to 100, with 50 as the balancing point.

**Figure 1: CFIB Business Barometer® Index and GDP Growth**

![Chart showing CFIB Business Barometer® Index and GDP Growth](image)

For the purposes of this analysis, however, we left the data in its original form, except for assigning response scores ranging from 1 (much worse) to 5 (much better). See Figure 2 for the distribution of responses.
CFIB’s economic analyses, however, did not want to simply rely on a single measure of performance. When we first started to build a monthly series for the first time, we did not know how closely this measure would track GDP. To hedge our bets, we also prospectively built a second measure, based on OECD and EU analyses of business cycle surveys, which is more of a static definition of performance. Quite simply it asks business owners to grade the current state of their business. Here, we simply use a three-point scale:

Currently, what is the general business situation of your company?
1. Good
2. Satisfactory
3. Bad

The series, while published since February 2009, is still too new to become part of the Barometer. But if it adds explanatory power and creates a better correlation with GDP growth, then it will be added once there is sufficient statistical justification. For now, we can use it for this study. Interestingly, to date, this series shows a high degree of stability in its first 14 months of life. It is not highly sensitive to monthly variations (see Figure 3). This will help in ensuring a relatively stable measure during a particularly volatile part of the business cycle. The downside, however, is that the series may prove to be insensitive to cross-sectional variables as well.
Among the merged sample set, almost 36 percent of respondents said their business was in ‘good’ shape, while just over 45 percent said it was ‘satisfactory’ (see Figure 4).

**Figure 4:** Endogenous variable 2, current state of business, June 2009 – March 2010 aggregate results (percent response)

**Use of Social Networking**

To construct a picture of Social networking use among SMEs, CFIB conducted a survey in July 2009. The data captured included business use of Internet, usage of social networking tools such as Facebook, Twitter, LinkedIn, etc, as well what type of business networking they engage in. The latter series of questions was built in line with, but not identical to, Forrester’s analysis of business social networking. The questions were worded as follows:
Q10: There is currently a great deal of interest in online social networking. If applicable, which ones do you use? (Select as many as apply)
   a. MySpace
   b. Facebook
   c. Twitter
   d. YouTube
   e. AgentSolo
   f. LinkedIn
   g. Product or industry-specific discussion boards
   h. Other___________
   i. None of the above, do not use (skip to Question 12)

Q12: Which of the following business-related activities do you participate in? (Select as many as apply)
   a. Attend association or networking meetings, conferences, tradeshows
   b. Read online blogs, forums, customer reviews
   c. Watch online videos and podcasts
   d. Participate in webinars, online courses
   e. Subscribe to automatic email notification tools (e.g. RSS)
   f. Make comments in forums, post ratings and reviews of products and services, or add ‘tags’ to interesting web pages
   g. Publish a blog or upload stories, videos, podcasts, etc.
   h. None of the above

We constructed a flag variable from Q10 above by subtracting the flag response to option 10i from 1. The flag variable therefore represents 1 for respondents who use any of the social networking tools listed from 10a to 10h, and 0 for respondents who use no online social networking tools. In the merged data set, 30.9 percent of respondents use one or more online social networking tools (see Figure 5).

From Q12 above, because it allows for multiple response, we constructed seven flag variables each corresponding to responses 12a through 12g. To eliminate the possibility of multicollinearity, the reference variable excluded from the model, therefore, becomes the non-networker respondents (Q12h). Here, the responses vary considerably, with lower frequencies as one gets higher up in the hierarchy of social networking sophistication. While 59.0 percent of respondents actively network in person at meetings, conferences, tradeshows, etc., only 7.6 percent add their own comments to existing sites and 3.2 percent are at the high level contributor
level by posting their own blogs and other online content (see Figure 6). Among the networking behaviors in between these extremes, roughly one respondent in four actively partake as a reader or viewer of networking content.

These eight variables therefore represent the heart of the analysis of whether social networking activity actually influences business performance—one variable for the tool(s) used and seven variables for the extent of their networking behavior. All the remaining variables in the model are meant to control for owner demographic and business profile influences (see Figures 7 through 11). These include:

- Business owner age
- Business owner gender
- Business owner response method (online or mail)
- Business size (employees)
- Business sector (based on 4-digit NAICS)
- Business age (years)
- Business setting (urban-rural)

We used a log function to construct the business size and age variables. Age is delineated by 6 groups, while all the remaining variables are flags. The survey response method is meant to capture an additional sense of a business owner’s comfort with online technologies. The communications survey was delivered to each sample member twice, once by email and once by mail—and respondents were free to choose how to respond. It should be noted that the business outlook survey is only conducted online, so the merged data set would somewhat tilted toward more active online participants—perhaps decreasing the potential explanatory power of this variable. The reference industry used in the analysis is deemed to be the retail sector—about 20 percent of the merged sample—so its flag variable is excluded from the model.
Figure 5: Exogenous variable, business owners’ use of online social networking tools, July 2009 (percent response)

- Facebook: 19.9%
- YouTube: 9.0%
- LinkedIn: 5.6%
- Twitter: 2.8%
- MySpace: 1.1%
- AgentSolo: 0.2%
- Industry, product discussion board: 7.0%
- Other: 2.2%
- Any of the above: 30.9%

Figure 6: Exogenous variables, business owners’ networking activities, July 2009 (percent response)

- Attend networking meetings: 59.0%
- Read online blogs, forums, cust. reviews: 23.9%
- Watch online videos and podcasts: 20.4%
- Participate in webinars, online courses: 26.5%
- Subscribe to auto. notification tools (RSS): 24.8%
- Add comments to forums, post ratings, tag: 7.6%
- Publish a blog or upload videos, podcasts: 3.2%

Figure 7: Exogenous variable, business owners’ age groups, July 2009 (percent response)

- Age 18-24: 0.3%
- Age 25-34: 4.5%
- Age 35-44: 17.5%
- Age 45-54: 37.2%
- Age 55-64: 31.3%
- Age 65+: 9.2%

Figure 8: Exogenous variable, business employment size, July 2009 (percent response)

- 0-4 empl: 35.6%
- 5-19 empl: 43.3%
- 20-49 empl: 14.0%
- 50-99 empl: 4.9%
- 100-499 empl: 2.1%
- 500+ empl: 0.2%
Regression results

The simple regressions were performed twice, one each for the dependent variable. Of these, the regression that used the 12-month expectations measure was a far superior model. As suspected, the lack of a meaningfully observable relationship between ‘state of business’ and other measures of the business cycle appeared to show a lack of relationship to other factors as well in Regression 2. The only significant drivers were found to be age group (younger), survey response method (web) and industry sector. The suspicion is that the scale measure ranging from ‘good’ to ‘poor’ varies over time and relative to businesses in different
situations. Therefore, although none of the social networking variables were strongly correlated, we believe the fault lies more with the dependent variable rather than any independent variables.

Because the dependent variable used in Regression 1 has been proven to be a good indicator of macroeconomic performance (GDP), we have higher confidence in the relationships it reveals. We are not surprised by the overall goodness of fit. The adjusted R-square of only 0.052 shows only 5 percent of the variation in business expectations is explained by the other 27 independent variables. As we had stated above, business performance is too complex a concept to predict with a small number of basic indicators. Overall, we find eight statistically significant correlates, of which five are not simply related to business sector.

In each case, the sign and strength of the coefficient reveals some meaningful results. On the demographic side, it is apparent that younger businesses and younger business owners have some effect on the results. Cross-tabbed results on business performance by demographic group have always revealed an inverse relationship with age and business expectations, and it is no real surprise to see in the results that people earlier in their business ownership lifespan are more positively oriented. The regression not only shows that this effect survives the inclusion of other demographic variables, but is also allows both measures to be statistically significant at the same time.

** Significant to 5 percent level
* Significant to 10 percent level
It is the social networking variables, however, that is the real subject of our attention, and Regression 1 reveals defensible results. Three measures stand out: In-person attendance at networking meetings, conferences, etc., participation in online courses, and blogging. These represent the extreme low, high and midpoint of the social networking ‘Groundswell’ hierarchy. At the basic level, the results show that networking, at its root, is important for business success—but that its online nature is less relevant. The results reinforce the value of networking in person. It is difficult to replace this kind of interaction online, except in specific circumstances. Of these, online learning is an ideal application for businesses in a direct sense, and that any time spent taking courses or participating in webinars can be seen as high-value activities. The Net has opened up education and accreditation options never available before to business owners—people who rarely have had the time or the flexibility to attend traditional classroom sessions, or are too small to command one-on-one meetings with industry experts, or too remote or tied to their business location to travel frequently. At the upper end of the social networking spectrum, we also see a small group of content contributors positively correlated with business success. Here, the causality may be reversed—successful business owners who develop an online following and who are in a position to raise their profile further.

What these results also tell us is the weak or non-existent relationship with the more generalized aspects of social networking. For example, use of Facebook, Twitter, YouTube and other tools has next to no generalized association with business growth expectations (in fact, the coefficient is negative). We see the same with notification tools, making comments to forums, and reading online blogs and reviews. Although some of the information passed this way can be of value, it has to compete with a far greater volume of information that has low relevance to the business. Time spent at these activities by business owners is much more likely to be
unproductive. This is not to say that social networking sites like Twitter, Facebook and others offer no value to small businesses. They offer marketing benefits that can potentially and significantly raise the profile and brand awareness of individual small companies. But achieving buzz is a hit and (mostly) miss affair. Not all small businesses have brands to lever effectively in the way that global brands can. And, most SMEs are too narrowly defined by sector, product or region to benefit from the global nature of online social networking as an outward business development strategy.

The results suggest that at this stage where relevant, social networking tools and activities are better at filtering and amplifying the inflow of information for small businesses. Nonetheless these findings are based on lumpy data and a simple model structure. A caveat to our analysis is that our data, which examined a six month time frame, did not allow for an investigation into the effects of social networking on the business survival. As always, there will be considerably more to learn in more targeted analyses.

**Conclusion**

Employing the appropriate form of social networking tools in business strategies is an important ingredient in the formula for business success. In particular, corporate social networking strategies offer solutions and knowledge transfer to business owners in a collaborative fashion. Whether through in-person collaboration as is the case with networking meetings, or online interactions in the form of online courses, social networking has opened up new sources of information that business owners can use to enhance their business. Results, however, indicate that a greater link between social networking and business success exists at the in-person level than the online level. As such, while online social networking has had great impact on personal communications, its effect on the businesses is less relevant. While the
emphasis of our analysis did not touch upon the effects of social networking on business survival, it is an aspect that needs to be further studied.

THE CONTRIBUTION OF SMALL BUSINESS RESEARCH TO ECONOMIC POLICY IN THE U.S.

Bruce A. Kirchhoff

Abstract

This paper provides a summary of the research on small business job creation and describes how it has affected U.S. government economic policy regarding job creation. The methods being discussed for implementing these policies are over simplistic and this paper proposes that another model of small business be adopted to guide government policy.

Introduction

On July 9, 2009, the Washington Post published an article beginning with the sentence, “One of the most enduring lies in American politics is the myth of small-business job creation.”\(^1\) This statement reflects a growing dissatisfaction of public policy makers with the hypothesis of small business creates the majority of net new jobs.

The purpose of this paper is to explore the academic research literature on small business and its influence on economic policy in the U.S. This academic literature has been at the forefront of the publicity of public policy regarding job creation and economic growth in the U.S. The importance of this research to public policy today is waning as noted in the Washington Post. And, it is not at the forefront of many other nations. Other nations have provided academic research that suggests the U.S. evidence of small business’s contribution to economic growth is not appropriate for them. The issue addressed herein is that entrepreneurial start up businesses are typically small, these are the major job creators because their successes become large very quickly but choice of which of the many small businesses can be expected to grow.

I begin this paper with a brief chronological review of the small business research that underlies the small business influence on public policy for economic growth. I offer no new data for analysis but only review the past research. By and large, the past research is very well done. I review the oldest research first as a mechanism for revealing the commonalities that allow the

formation of a small business definition. I then provide my definitions of small business in the U.S. derived from the early research. Next I review the academic research literature to expose its commonalities that fit my definition. I then review several research articles that are typical of those that contradict the U.S. beliefs about small businesses. I conclude with suggestions for recognizing the underlying assumptions that drive the U.S. focus on small businesses as a basis for economic growth and recognize how this greatly affects the direction of future public policy.

The Early Development of the Theory of Small Business as the Creator of Job Growth

In 1979, David Birch prepared a research paper in which he provided evidence that his analysis showed that small firms created the most net increases in U.S. jobs over the period of 1968 through 1976. His data was assembled from basic individual firm information from Dun and Bradstreet.²

It seems important to the evolution of this area of research to describe the data base used by each researcher. Until 1996, there was no data base in the U.S. that stored individual firm data that was linked longitudinally. The U.S. Bureau of the Census reported data every year on employment but it was classified by size groups and each year of data did not have a unique identifier attached to every firm. Thus, it was not possible to track a specific firm over time so as to measure its growth or decline. Birch recognized this and therefore went to Dun and Bradstreet and obtained their annual file on all the firms which were identified by a unique “Dun’s number.” Thus, by linking Dun’s numbers year after year, he was able to assemble the change in each individual firm’s status longitudinally from 1968 through 1976.³

However, few economists believed his results because (1) they did not believe Dun and Bradstreet had quality, reliable data, (2) that the data did not accurately represent the real world of businesses and (3) that his results contradicted the Bureau of Census published classified employment data where the largest class of firms reported the greatest number of net new jobs annually. However, in spite of the wide spread view that Birch’s work was not quality research, in 1980, the U.S. Small Business Administration through its Office of Advocacy began to de-

---

³ Ibid., Birch 1979
velop its own Dun and Bradstreet database to test Birch’s methods. The results for 1978 to 1984 were published first in 1989. Subsequently, a book detailing the finding of the data analysis for years 1978 through 1984 was published in 1995. This book explains SBA’s data analysis research, its meaning in terms of economic theory and its implications for economic policy. It also validated Birch’s way of using the D&B data by finding similar results as Birch found in his research. And SBA’s longitudinal analysis of 1978 through 1984 yielded the same radically different measures of net new job creation by size of business as that reported by Census’ analysis of its newly developed longitudinal data developed beginning in 1996.

In 1991, SBA had cancelled the D&B database assembly and research. Shortly thereafter, SBA’s Office of Advocacy, in response to the growing interest and controversy regarding small businesses and job growth agreed to finance the Bureau of the Census to create a longitudinal database. This database used the existing data drawn from surveys and Censuses of Business from 1986 and continuing this with the data as collected beyond 1986. This became a database now called the U.S. Census Bureau’s Business Information Tracking Series (BITS). It now consists of annual data from 1986 through 2008. Additional years are continuing to be added and individual firms are followed longitudinally using the employer identification numbers. This data base provides the primary data for job creation research since 1996. Among Washington economists, it was more comprehensive, reliable and respected than D&B data.

SBA’s additional financing resulted in Census hiring several research personnel that focused primarily on the creation and use of this data. Thus began a series of criticisms of the Birch and SBA’s earlier work and a rejection of the small business job creation hypothesis. The researchers initially changed the definition of business size used by Birch and SBA in their re-

---

4 The author of this paper was Chief Economist in charge of the data base development in 1980 and 1981.

7 It seems useful at this point to mention that data on businesses is reported in two different ways. An establishment is a place where work is performed. A firm is a business owner that may or may not have multiple establishments. For example, Walmart is a firm that has many, many establishments most of which are retail stores.
search. SBA assumed the existence or formation of a business that was small provided an appropriate definition of business size, and this size definition remained unchanged through the period of analysis. Employment in each business was report to the total using this definition of businesses size over the years used in research. Thus, if a business started with ten employees and grew to 800 employees in five or six years (think Cisco) it was identified as a small business with growth adding 790 employees to the work force.

The Bureau of Census researchers believed that this was wrong. Once the business grew past 100 employees, it became a large business that added 690 employees there by adding to the jobs created by large businesses. So this meant that the definition of size changed the designation of size based on the firm’s size in each year rather than at the beginning of a series of years. Moreover, the researchers claimed that “regressions to the mean” was probably a problem with the methodology used by Birch and SBA in earlier research. Using their methodology, they calculated that small firms did not create he majority of net new jobs and that large firms were the major contributors to job growth.8

**Research Literature Since 1996**

In response to the Census researchers’ arguments, Statistics Canada created a longitudinal data file of Canadian companies using the same rules regarding the definition of business size used by SBA and the methodology of analysis of longitudinal data as used by the U.S. Census researchers. The Canadian research showed results similar to those taken from SBA’s research and different from that produced by the Census researchers. And, Statistics Canada also tested for regression to the mean and found none.9 But, this activity created a burst of new interest in small business and job creation research.

Two arguments stood in the way of accepting small businesses as job creators. First, all researchers found that less that 50 percent of start up businesses survived more than four years so how could the remaining 50 percent create all the net new jobs? Second, most start up business

are small low innovation businesses that do not hire only a few employees to start and none after they have started. So how could the remaining few create all the net new jobs.

Brian Headd addressed the survival issue by using the U. S. Census Bureau’s Characteristics of Business Owners (CBO) survey in 1996. The survey asked owners of recent start up and now closed firms whether their business was successful at closure. Headd found that 29 percent of managers of closed businesses said the business was successful at time of closure. That is 29 percent of the 50 percent that closed or 15 percent of all businesses in the population of start ups. Adding this 15 percent to the 50 percent that report survival for four or more years yields 65 percent of successful businesses for four or more years. This is almost 2/3rds of the start up businesses are successful at four years. This is a substantially larger survival rate than considered in the past suggesting that the number of survivors might be adequate to create many new jobs.

Second, what is the proper way to measure the size of business over a period of time. If one examines this growth phenomena more carefully, it is clear that only a small percentage of start up businesses create the majority of the net new jobs. In fact a very thorough review of research literature clearly identifies this fact as a major issue to be explored. I examined this fact and created an analytical scheme to explore this is more detail and it shows that job creation by start up firms is spread among both highly innovative and lowly innovative start up businesses. This requires a major change in the public policies being discussed and implemented in the U.S. today. This is the topic of the next section.

**Dynamic Capitalism**

Dynamic capitalism is a term I created to describe the changing nature of the business community of the U. S. These changes are huge among the ranks of small businesses even though the domination of the economy by large firms largely obscures this vital section. Yet, the data consistently shows that most of the job increases come from the small business sector.

The research Bruce Phillips and I did in the 1980s and 1990s yielded a great deal of useful information. Since it was done on SBA’s Small Business Data Base (SBDB) derived from Dun and Bradstreet data this information has largely been ignored. However, recent analysis of the BITS data has shown that results from the SBDB data are very similar to results from the

---

BITS analysis. Most recently, the survival rates calculated on BITS are almost exactly the same as we calculated from the SBDB twenty years ago. This increases the likely hood that not only are SBDB research measures correct but the U.S. survival rates are relatively unchanged for twenty years. Since the two sets of research data do not overlap, it is not possible to conduct any additional tests.

Currently, it is clear that public policy is focused on highly innovative small start up small firms. However, it is essential that researchers recognize that all highly innovative small start up firms are not equal and that low innovative start up firms are not equal. This is best explained with two dimensions: rate of innovation and rate of growth. This can be displayed as a two by two matrix as shown in the figure below.

![Dynamic Capitalism Typology Diagram](Image)

The rate of growth can vary from low to high and the rate of innovation can vary from low to high. This creates four sectors within the population of small start up businesses

**Economic Core** Let us begin with the ECONOMIC CORE. This is the residence of the vast majority of small businesses. Typically, these are small retail stores, drycleaners, auto repair shops, restaurants, plumbers, etc. Most of us interact with these businesses on a daily basis.

---

11 This diagram is taken from Entrepreneurship and Dynamic Capitalism, published by Prager in 1969. All rights are held by Bruce A. Kirchhoff. This diagram may not be reproduced without the expressed consent of Bruce A. Kirchhoff.
These businesses perform services or supply products and are an important part of the American economy. They employ slightly over half of the U.S. workforce. While successful, that are not aggressively seeking new and different ideas that may risk their business security. These businesses create few and perhaps no innovations during their life. There are over 27 million such small businesses in the U.S. However, these are not great job creators since they seek little growth over time.

**Ambitious Businesses**  Ambitious businesses do not create many innovations but they do seek and achieve growth. These businesses have at least one major innovation that gives them the power to create growth. However, they do not have major research and development efforts and so they use their major innovation to achieve growth.

Walmart is such a business. Walmart began with an innovative approach to selling products at discount retail in rural county capitals in the midwest. However, in the early 1970s, Sam Walton decided that the way to increase his return on assets was to reduce his assets. Since WalMart’s biggest asset was inventory Sam looked for technology that would help reduce inventories. By 1974, Sam had acquired the largest installation of IBM computers of any business organization in all the U.S. And WalMart leased a transponder on a earth circling satellite to link all WalMart stores to the central office every night to control inventory on a daily basis. This was the innovation that rocketed WalMart to become the largest retailer in the world creating hundreds of thousands new jobs. WalMart also has created other smaller innovations since but none of these innovations had the impact of daily computerized inventory control. The other major retailers in the 1970s -- for example,K-Mart and Sears -- failed to follow WalMart until much later and suffered decline.

WalMart is not the only retail organization that developed a major innovation early and built a growing firm from the one or two major innovations. McDonalds, Pizza Hut, and other food service firms used their initial food service system innovations to grow rapidly. Dell’s innovation was to market computers via telephone and direct mail. It has built a major business based up the gradual improvements but it still uses telephone and internet access although internet access is faster than mail. This is essentially the same communication system for buying
Computers and others have copied it. But it has grown very large even though Dell has not developed any other major innovation (it looks to it manufacturing suppliers to innovate.)

Ambitious businesses create and grow on the basis of one or a few innovations. None have a record of major innovations after the first one. These are ambitious businesses.

**Glamorous Businesses** These businesses are well known as their continuous development of new innovations are the subject of regular press releases and stories in many publications. Cisco, Apple, Intel, Hewlet Packard, and many others have a continuous flow of inventions. These inventions have allowed them to emerge from small start up technology companies and serve as examples of how technology start ups can become major job creators. Such firms, the experts argue, should be assisted through their early days so as to stimulate the economy through job creation. Technological invention through research and development is the basis for their success and this success creates new jobs. Technologically innovative companies are seen as the major source of future job creation in the U.S. However, not all technologically innovative start-ups that have a major invention succeed. The steps from invention to commercialization can be a major barrier and a constraint on growth.

**Constrained Growth**

Constrained growth businesses are unquestionably the largest part of start-up technology firms. Such firms begin with a single attractive invention. However, they fail to achieve significant commercial success with the invention and fail to create a stream of other inventions but fail to achieve commercialization. Their success is constrained by some factor or factors regarding the development of new inventions. These constraints can be external or internal in origin.

External constraints typically are in the form of inability to find adequate financing; this is especially true during periods of recession such as the U. S. has had since early 2008. Also, it can be very difficult to find appropriate personnel. A marketing expert is needed to commercialize an invention but may be difficult to find. And, suppliers of required components or sub-assemblies may be unwilling to advance credit.
However, most constraints are internal. Inventors frequently are frequently unable to realize that they are not knowledgeable in marketing. And, they are unwilling to commit the available resource (i.e. stock or stock options) necessary to hire a competent marketing person. Although there may be friends, family or others who are interested in helping the company, the inventor may not be willing to sell stock for fear of losing control of “his” company. The inventor finds that commercial lenders are unwilling to lend to the struggling company usually for good reasons. So outside funding is nearly impossible to find. Growth slows to a crawl.

Simply stated, inventors are not good investments and the business fails for lack of resources. If the invention appears to be valuable, someone or some organization may buy the invention and eventually create a successful business. Constrained growth technology businesses are far more common than successful start up technology businesses.

CONCLUSIONS

The prevailing public policy clearly places emphasis on government financial support for start up small businesses. This is not completely wrong but dynamic capitalism clearly describes that reliance on all small businesses for job creation is not wise. The government support programs that now exist are probably adequate for the economic core. On the other hand, Dynamic Capitalism also shows that government programs that focus solely on high tech start up small business are not adequate for those low tech ambitious businesses that may have a major innovation that could create a high growth business and many new jobs. Government assistance should be allocated to these firms along with the glamorous high tech start ups.

Clearly, dynamic capitalism shows that government programs of assistance to glamorous technology based start ups are necessary for the future growth of the U.S. economy. However, existing government programs may be adequate but should be examined to see if they can be expanded. On the other hand, some constrained growth technology start-up firms may now be receiving government assistance that should be allocated to other technology start ups. It is very difficult to determine whether a start up technology firm will be constrained by internal factors. Thus it may take several years of government support to discover the irresolvable internal constraint problem. Providing continued external assistance to such firms is a loss of resources that other start ups could use. For example, an incubator has limited space for new firms. If one tenant is clearly internally constrained, it should be asked to leave and a new firm can enter.
ernment loan assistance programs should be very careful about lending to start-ups that appear to be internally constrained. The need in the U.S. is for ambitious high growth low innovation businesses along with high growth glamorous technology businesses. It is worth while to assess every start up business early in its struggle to determine if it may be a glamorous or ambitious business and direct government support programs to these firms.
Public Policy Measures to Revamp the Competitiveness of the Puerto Rican Economy:

A Benchmarking Approach

Edgar Soto-Rodriguez

Universidad Metropolitana, Puerto Rico

esoto@suagm.edu

According to the Global Competitiveness Report, the Puerto Rican economy occupies a distant 42nd place from its main trading partner – the U.S. - and behind its major counterparts Singapore, Ireland and Chile (WEF, 2008). A three-tier economic development program has been proposed by local policymakers to include a fiscal reform, an infrastructure development program and a knowledge-based economy with an export orientation. This study benchmarked the strategic measures taken by Puerto Rico’s close competitors as a validating mechanism of the proposed measures to restore the competitiveness of the Puerto Rican economy. The results suggest an aggressive realignment of Puerto Rico’s public policy to strengthen its institutional framework, the macroeconomic environment, and the quality of the infrastructure.

ENTREPRENEURIAL ATTITUDES OF ARTS AND BUSINESS STUDENTS

by Lloyd G. Gibson and Regina A. Gibson

Abstract

Research into the entrepreneurial attitudes of business and arts students can have important implications for the marketing and efficacy of entrepreneurship education and initiatives. However, few studies have considered arts students who are increasingly venturing into entrepreneurial enterprises or entering university-sponsored entrepreneurial programs. This study determined the significance of factors influencing the entrepreneurial attitudes of both arts and business undergraduate students at a small mid-Atlantic liberal arts university. The survey (N = 321) used attitudinal constructs from Robinson and Hunt’s 1991 entrepreneurial attitude orientation model. Results indicated that for both business and arts students, student characteristics and entrepreneurial experience were found to be significantly related to certain entrepreneurial attitudes, and in some cases, arts students scored higher than business students. In particular, arts students with their own businesses or who had taken at least one business course had significantly higher entrepreneurial attitudinal scores than business students.

Introduction

Interest in entrepreneurship education, especially for business students at the undergraduate level, has been rapidly growing, and consequently, the entrepreneurial attitudes or intentions of business students have been the subject of several studies (Harris, Gibson, and Taylor 2007; Harris, Gibson, Wang, Barber, and Orazov 2009; Kerrick 2008; Wilson, Kickul, and Marino 2007). However, few empirical studies have been performed relating to the factors affecting the entrepreneurial attitudes of non-business students, in particular, visual arts and performing arts students who are increasingly

venturing into entrepreneurial enterprises and who are entering university-sponsored entrepreneurial programs tailored to their needs (Beckman 2007).

As arts entrepreneurship programs are emerging in higher education, some of these programs are attempting to tailor entrepreneurship classes for the arts industries. These programs include the following: (a) the University of Arizona-Camarata Career Development Program, (b) the Eastman School of Music's Arts Leadership Program, (c) the Maryland Institute College of Art professional development curricula, (d) the University of Colorado at Boulder Entrepreneurship Center for Music, as described by Beckman (2007), (e) Montana State University artisan entrepreneurship program, (f) the Trinity College Crafts Program (Gose 1997), and (g) the numerous universities which incorporate business courses, such as FastTrac (Falon 2005), into the arts curriculum. This wide variety of arts entrepreneurship programs begs the question as to what factors would be most important in motivating visual and performing arts students to become entrepreneurs and what programs would be most effective.

Several factors have been suggested as predictors of entrepreneurial intention. Recent studies of business students (Harris, Gibson, and Taylor 2007) suggest that an entrepreneurial perspective can be developed in business students, and this perspective can be enhanced by the development of positive attitudes encouraged by entrepreneurship education. The Harris et al. studies utilized the Entrepreneurial Attitudes Orientation (EAO) model developed by Robinson, Stimpson, Huefner, and Hunt (1991). The EAO model, which is theoretically well-grounded, measures attitudes by four different subscales (achievement in business, innovation in business, perceived personal control of business outcomes, and perceived self-esteem in business). The results of the Harris et al. studies showed that scores on all four of the entrepreneurial attitudes increased as a result of the students’ completion of a semester-long Small Business Institute course.
This result suggests that if entrepreneurial education strengthened the entrepreneurial attitudes of business students, then perhaps the same result could be experienced by visual and performing arts students in an arts entrepreneurship program. It should be pointed out, however, that Harris and Gibson (2008) also determined that other factors, such as gender and family business experience, played an important role in predicting entrepreneurial attitudes.

To date, no studies using the EAO Model have been conducted with visual and performing arts students as a participant base. The purpose of this project was to identify and compare the demographic and other factors that relate to or influence entrepreneurial attitudes in undergraduate business students and visual and performing arts students. If the factors which influence entrepreneurial intention are known, then a college or university could utilize this information to develop and market entrepreneurial programs to both business and arts students.

Literature Review

The entrepreneurial attitudes or intentions of undergraduate students have been the subject of several cross-campus and business student studies. An examination of self-employment and a graduating class of 1993 (Moutray 2008) revealed that undergraduate business students are either less likely or not significantly different than students in other majors to have entrepreneurial intentions, and that entrepreneurs can emerge from wide variety of majors. A recent empirical study (Shinnar, Pruett, and Toney 2009) of both business students and non-business students also showed that interest among non-business students suggested a significant opportunity to offer entrepreneurship education to non-business students. However, although students in this study represented a variety of disciplines in and outside colleges of business, a comparison of the factors which would influence the aspiration to become an entrepreneur was done for business students and non-business students, with no focus on the individual majors of the non-business students.

Cross-campus studies also included a study by Harris, Gibson, and Taylor (2007) which surveyed students from six universities, with management majors comprising 54 percent of the sample
population. This study showed that the students’ completion of only one course in a Small Business Institute program had a major impact on the students' entrepreneurial attitudes. Other cross-campus studies also advocated entrepreneurial education. An empirical study of 106 students at the Technical University of Catalonia (UPC) in Spain (del-Palacio, Sole, and Batista-Foguet 2008) reviewed student evaluations of the university’s entrepreneurship center which had been developed to promote the entrepreneurial attitudes of students, educators, and professionals. Analysis of the evaluations showed that the UPC students perceived that both the center’s teaching and courses were of high quality.

Studies of the entrepreneurial attitudes of business students still continue to dominate the literature, since most university entrepreneurship courses appear to be developed for the interests and needs of business students as opposed to other students in other disciplines (Brkic 2000; Beckman 2007). These studies include a recent study by Wilson, Kickul, and Marino (2007) comparing the attitudes of students working toward a masters degree in business administration with the attitudes of adolescents. However, there are studies in the literature focusing on the entrepreneurial aspirations of students in non-business majors which have compared their aspirations with those of business students. As early as 1991, Robinson, Huefner, and Hunt had included both undergraduate psychology and business students in their study using the Entrepreneurial Attitude Orientation (EAO) model in order to measure factors affecting entrepreneurial attitudes. Souitaris, Zerbinati, and Al-Laham (2007) have also included science and engineering students in a more recent study, showing that entrepreneurship education also increases the intention of these students to start a business. In addition, Kerrick (2008) recently has compared the entrepreneurial intention of both education students and business students, showing that both education and business majors had intentions to become entrepreneurs.

**The Entrepreneurial Attitudes Orientation (EAO) Model**

The model that has been most recently related to the prediction of entrepreneurial intention or aspiration is the Entrepreneurial Attitudes Orientation (EAO) model which is based on prior research on personality, demographics, and entrepreneurship (Robinson, Stimpson, Huefner, and Hunt 1991).
According to Harris and Gibson (2008), this model, by using an attitudinal approach, increases the correlation with actual behavior and reduces unexplained variability.

As mentioned previously, the EAO model measures the entrepreneurial attitudes of individuals with a composite score based on measures from four attitude subscales. These subscales are used to measure the entrepreneurial attitudes across the following constructs: (1) achievement in business, as in creating a business, (2) innovation in business (by acting upon business incentives), (3) perceived personal control of business outcomes, and (4) perceived self-esteem in business (as an indication of self-evaluated confidence in business affairs). Robinson et al. (1991) found that these four subscales were able to predict entrepreneurial intention in 77 percent of cases.

The EAO has been extended by McCline, Bhat, and Baj (2000) in the context of the health care industry. In addition to the four subscales developed by Robinson et al., McCline et al. proposed subscales of two other constructs: (a) attitude toward risk and (b) an attitude of recognizing unmet needs in the health care environment.

**Hypotheses**

Several studies have supported the influence of demographic and other factors on entrepreneurial attitudes. Using the Robinson et al. EAO model (1991), Harris and Gibson (2008) showed that that previous exposure to a small business in one’s family was significantly related to achievement in business, innovation in business, and perceived personal control. Having owned one’s business was also significantly related to achievement in business and perceived personal control.

Other studies have supported that previous exposure to business is a significant factor in predicting entrepreneurial attitudes. A recent study (Frazier and Niehm 2008) based on social cognitive career theory (developed by Lent, Brown, and Hackett 1994) of family and consumer science students determined that self-efficacy beliefs related to self-employment were positively influenced by exposure to entrepreneurship through family, work, and educational experiences. In this study, self-efficacy was considered to be a measure of entrepreneurial intention.
Gender could also be a likely factor affecting entrepreneurial intention. Harris and Gibson (2008) also determined that there was a significant difference between male and female business students in their need for perceived personal control of business outcomes and their innovation in business, with males having higher scores on the entrepreneurial attitude scale than females. These results conflicted with a previous study (Wilson, Kickul, and Marlino 2007) which had also considered self-efficacy to be a better measure of entrepreneurial intention. Wilson et al. had showed that entrepreneurship education resulted in higher self-efficacy scores for women MBA students than for male MBA students. Based on their research, Wilson et al. concluded that women need the self-confidence and expectation of success in order to pursue entrepreneurial aspirations.

Entrepreneurial experience has also been suggested as a factor influencing entrepreneurial attitude, and educators have recognized this need in entrepreneurial education (Beckman 2007). McCline, Bhat, and Baj (2000) in their EAO-based study of self-employed (entrepreneurial) and employed (non-entrepreneurial) nurses found that the self-employed nurses had significantly higher perceived control and perceived self-esteem in business scores. This study supported two of the four constructs measured by the EAO model (Robinson et al., 1991) in assessing the entrepreneurial attitudes of entrepreneurs and non-entrepreneurs. The EAO model was also partially supported by van Wyk and Boschoff (2004) in their study of the entrepreneurial attitudes of accountants (entrepreneurs) and pharmacists (non-entrepreneurs). This study showed significant higher scores for the entrepreneurs relating to innovation and self-esteem.

Differences in entrepreneurial attitudes of business and non-business students have been studied (Shinnar, Pruett, and Toney 2009) using a survey instrument developed at the University of Alicante, Spain. The survey asked the students to rate their entrepreneurial disposition on a 7-point Likert scale. This study revealed that business majors were more likely to want to start their own businesses, although there was some interest in entrepreneurial careers among non-business majors.
This result suggested that there existed a significant opportunity to formally expand entrepreneurship-related education beyond the business school.

Based on these prior findings, the following hypotheses are offered for analysis:

H1. Business and accounting students will have stronger entrepreneurial attitudes than arts students.

H2. Male business and arts students will have stronger entrepreneurial attitudes than female arts and business students.

H3. Both business and arts students with exposure to business courses or entrepreneurship will have stronger entrepreneurial attitudes than students without any exposure to business or entrepreneurship.

In addition to these hypotheses, demographic factors based on the information collected from the participants are also suggested for analysis to determine any significant relationship between these factors and any of the four constructs measured by the EAO model.

Methodology

Research Approach and Participants

The quantitative approach has been successfully used in several previous studies. These studies include ones performed by Robinson, Huefner, and Hunt (1991), Robinson, Stimpson, Huefner, and Hunt (1991), McCline, Bhat, and Baj (2000), van Wyk and Boschoff (2004), Wilson, Kickul, and Marlino (2007), Harris, Gibson, and Taylor (2007), Harris and Gibson (2008), Frazier and Niehm (2008), Kerrick (2008), and Shinnar, Pruett, and Toney (2009). This study derives important precedents for its methodological procedures from these and other published studies. In addition, because the intent of this study was to generalize the results to the larger population of business, visual arts students, and performing arts students, a quantitative approach was deemed the best fit for the objectives of the study.
Little information, however, is known concerning the demographic characteristics of the U. S. population of business and arts undergraduate students. According to the Digest of Education Statistics (US Department of Education 2007) of the 1,485,242 bachelor’s degrees conferred by degree-granting institutions in the U.S. from 2005 to 2006, 318,042 (21 percent) were business degrees and 83,297 (6 percent) were visual and performing arts degrees. Approximately 50 percent of the undergraduate business students graduating in that time period were male, and 68 percent were Caucasian. In contrast, approximately 39 percent of the undergraduate performing and visual arts students graduating in that time period were male, and 77 percent were Caucasian.

The sample population in this study was similar to the general population in gender and race. Participants in this study were 146 undergraduate business students and 127 undergraduate arts students enrolled at a small mid-Atlantic liberal arts university between November, 2009 and February, 2010. Approximately 55 percent of the business students and 30 percent of the arts students were male. Like the general population, a large percentage of the participant population was Caucasian. Approximately 83 percent of the business students and 97 percent of the arts students were Caucasian. Accounting majors made up 10 percent of the business students, and performing arts majors made up 58 percent of the arts students. Demographic characteristics and other information concerning the sample population are summarized in Table 1.

Procedure

Faculty teaching undergraduate courses in business and arts were asked by the research team for their voluntary participation in this study. The stated purpose of the study was to investigate the entrepreneurial attitudes of business and arts students. The research team then visited the business and arts classes taught by the faculty participating in the study, and after explaining to the students the nature of the study, the research team asked the students to complete an anonymous survey during a break in the class. The research team stressed to the class that survey completion was entirely
voluntary, that no identifying information would be recorded, and that all individual information was confidential.

**Measures**

Entrepreneurial attitudes were measured with the EAO survey instrument developed by Robinson et al. (1991) with the four subscales across the following constructs. These constructs are the
dependent variables used in this study: (1) achievement in business, as in creating a business (Cronbach’s alpha = .84), (2) innovation in business by acting upon business incentives (Cronbach’s alpha = .70), (3) perceived personal control of business outcomes (Cronbach’s alpha = .90), and (4) perceived self-esteem in business, as an indication of self-evaluated confidence in business affairs (Cronbach’s alpha = .73).

Participants responded to the 75-statement EAO survey, using a 10-point Likert type scale to items in terms of how much they agree with the statement, where a “1” indicated “strongly disagree” and a “10” indicated “strongly agree.” In addition, participants provided demographic information including undergraduate major, gender, age, marital status, ethnicity, highest level of education, household income, and yes-no responses to eight statements relating to exposure to business courses or entrepreneurial initiatives. Statements relating to exposure to entrepreneurial initiatives were as follows:

1. I have close friends who have or had their own business.
2. I have worked in a small business.
3. My parents or other close relatives have or had their own business.
4. I was self-employed or had my own business.
5. I am currently self-employed or have my own business.

**Data Analysis**

All hypotheses were tested using independent *t*-tests with determinations of significance based on a *p* < 0.05 standard. When applicable, one-way ANOVA was used followed by the Bonferroni procedure.

**Results**

There were 321 surveys collected, and the participants identified their major as either business (only), accounting, performing arts, or visual arts on 273 of them. In this study, *business students* were comprised of students majoring in business (only) and students majoring in accounting, while *arts*
students were comprised of students majoring in performing arts and students majoring in visual arts. This breakdown is detailed in Table 1. This sample, while not random, was diverse and could be considered representative of the general student population majoring in these areas.

Overall results indicated that both business and arts students possessed entrepreneurial attitudes, and that both student characteristics and entrepreneurial experience were found to be significantly related to certain entrepreneurial attitudes. In addition, several demographic and other factors that influence entrepreneurial attitudes were identified through the analysis of this data.

\( H1 \) proposed that business and accounting students would have stronger entrepreneurial attitudes than arts students. This hypothesis was supported by an independent \( t \)-test analysis showing that business students had a significantly higher mean score (\( M = 7.83 \)) for achievement in business versus a mean score of 7.51 for arts students, \( t(271) = -2.59, p < .05 \), and a higher mean score of 7.08 for personal control versus a mean score of 6.78 for arts students, \( t(271) = -2.63, p < .05 \). However, the one-way ANOVA of the relationship between the individual specializations in the undergraduate major and the four constructs revealed significant differences in the mean scores relating to innovation in business attitude, \( F(4, 313) = 2.36, p = .05 \), with performing arts students having the highest mean score of 6.75, followed by visual arts students (\( M = 6.75 \)), business students (\( M = 6.67 \)), and accounting majors (\( M = 6.28 \)).

Only two demographic factors, age and education, were also found to be significantly related to any of the four constructs after all the demographic information collected from the respondents was analyzed. Gender was not found to be a significant factor; thus, \( H2 \), which proposed that male business and arts students would have stronger entrepreneurial attitudes than female arts and business students, was not supported. The independent \( t \)-test analysis did show that for business students, age was significantly related to innovation in business. The mean score for business students 21 years and
older \((M = 6.82)\) for innovation in business was significantly higher than the mean score of 6.47 for business students under 21 years, \(t(143) = -2.85, p < .01\).

The one-way ANOVA of the education level of the students also indicated a significant relationship to the innovation in business attitude. For arts students, mean scores decreased from 7.27 for first-year college students to 5.94 for students with over three years of college education, \(F(4, 122) = 5.90, p < .001\). For business students, mean scores increased from 6.48 for first-year college students to 7.37 for students with over three years of college education, \(F(4, 141) = 3.92, p < .01\).

H3 proposed that business and arts students who had taken at least one business course or who had exposure to entrepreneurship would have stronger entrepreneurial attitudes than students without any entrepreneurial experience or business training. This hypothesis was supported by positive responses to a majority of the questions relating to entrepreneurial exposure or business education. The employment of business students in small businesses particularly enhanced their innovative attitude scores. The mean innovation in business score \((M = 6.74)\) for business students who had worked in a small business was significantly higher, \(t(143) = -2.34, p < .05\), than for business students who had never worked in a small business \((M = 6.44)\).

The entrepreneurial attitudes of arts students especially benefited from exposure to business courses or entrepreneurship. The mean perceived self-esteem in business score \((M = 7.20)\) for arts students who had parents or close relatives with their own businesses was significantly higher, \(t(122) = -2.58, p < .05\), than for arts students without this exposure to entrepreneurship \((M = 6.80)\). The arts students who, at the time of the study, were self-employed or had their own businesses scored significantly higher in three entrepreneurial constructs than arts students who were not entrepreneurs. Arts student entrepreneurs had a significantly higher, \(t(122) = -2.47, p < .05\), mean score of 8.43 in achievement in business than the arts student non-entrepreneurs \((M = 7.48)\). The mean perceived personal control of business outcomes score \((M = 7.72)\) for arts student entrepreneurs was also significantly higher, \(t(122) = -2.62, p < .05\), than for arts student non-entrepreneurs \((M = 6.74)\). In
addition, art student entrepreneurs scored significantly higher, $t(122) = -2.10, p < .05$, with a mean score of 7.34 in *innovative attitude*, than art student non-entrepreneurs ($M = 6.72$).

Arts students who had taken at least one business course also scored significantly higher, $t(122) = -2.27, p < .05$, in *innovative attitude*. The mean score for arts students related to this construct was 6.97, versus a mean score of 6.65 for arts students who had not taken any business courses. Arts students who had taken at least one business course also scored significantly higher, $t(122) = -2.00, p < .05$, in *personal control of business outcomes*, with a mean score of 7.04 versus a mean score of 6.67 for arts students who had not taken at least one business course.

**Discussion**

Although mean attitudinal scores for *achievement in business* and *perceived personal control* were significantly higher for business students, both performing and visual arts students scored higher than business students in *innovation in business*. In particular, arts students with their own businesses had high scores in *business achievement*, *perceived personal control of business outcomes*, and *innovation in business*. The *perceived self-esteem* of arts students was also higher if they had parents or close relatives who were entrepreneurs. Furthermore, arts students who had taken at least one business course had significantly higher mean scores for *innovation in business* and *perceived personal control of business outcomes* than arts students who had not taken any business courses.

Analysis of the demographic factors showed that older business students with more education and arts students with less college education, for example, freshman arts students, tended to score high in *innovative attitude*. It could be that the creativity of business students is enhanced with more education and experience, whereas the creativity of arts students must be nurtured at a younger age or their creativity may be inhibited.

**Practical Implications**
In order for colleges and universities to attract and retain arts and business students and to develop business and entrepreneurship programs tailored to their needs and interests, it is important to understand what the predictors of entrepreneurial attitudes are for the arts and business segments of the student population. For any educational institution or small business initiative pursuing students interested in business, visual arts, or performing arts careers, these findings are important because the results of this study can be used to successfully design, implement, and market entrepreneurship programs and business curricula.

For example, this study reveals that the entrepreneurial attitudes of arts students could be enhanced by their taking at least one business course. Thus, it may be important for arts students to take a business course in their freshman year because the younger students could respond to new ideas at a younger age before they acquire any pre-conceived notions about business. In addition, for institutions pursuing arts students, a target market segment could be arts students with parents or close relatives who have their own businesses, because these people could serve as role models and sources of support for budding entrepreneurs in the visual arts- or performing arts-related businesses. The findings in this study confirm Beckman’s recommendations (2007) for the administration of entrepreneurship programs: (a) by emphasizing experiential education as a way to create an opportunity for students to use a taught skill set, such as basic business literacy, and to apply entrepreneurial techniques in a controlled environment and (b) by focusing on the intangible and less explored aspects of the typical entrepreneurial curriculum which involve innovation development and entrepreneurial behavior.

The attitudes of business students also could possibly benefit from their working in a small business setting, because they are already taking business courses. Older business students who are interested in entrepreneurship may benefit from more business education, particularly at the
graduate level. Graduate courses in business should thus offer some type of exposure to entrepreneurship and/or an entrepreneurship specialization.

This information on the entrepreneurial attitudes of the business student and arts student populations may also be of interest to other audiences for a variety of reasons. These audiences include the Small Business Administration, the U.S. Small Business Development Centers, small business institutes or initiatives, and the developers and managers of arts entrepreneurship programs.

Impact of Knowledge Resource as a Moderator of EO-Performance Relationship: Evidence from Japan

Yoshihiro Eshima

Abstract
By using 124 Japanese samples of small firms, this study investigated for the influence of the entrepreneurial strategic orientation (EO) to the performance as well as the moderating effect of the knowledge resource to their relationship. As most EO literature suggests, the result indicated that the EO was a strong predictor of a firm’s performance. Furthermore, when being moderated by the highly intensified knowledge resource, EO showed an even stronger performance. The theoretical and practical implications were discussed.

Introduction
Entrepreneurial strategic orientation (EO) has been highlighted in the strategic making literature over twenty years. It has been conceptualized as a firm level strategic engine through which entrepreneurial actions are encouraged for exploring and exploiting new opportunities. The choice of EO provides a firm with a strong management lens to monitor and evaluate opportunities and substantially leads a firm to achieve higher corporate performance. Most of empirical evidences support the positive effect of EO to a firm’s performance (Rauch, Wiklund, Lumpkin and Frese, 2009).

EO is a forward-looking, aggressive and innovative with risk-taking posture. Originated mainly from the study of Miller (1983) and Covin and Slevin (1989), EO researches frequently use their conceptual dimensions of EO construct: Proactiveness, innovativeness and risk-taking propensity. The conceptual domain of EO construct in the literature seems to be consistent. However, the process between such strategic posture or orientation and a firm performance are neither well understood nor clarified. Missing link between EO and a higher corporate performance still exists.

EO is regarded as a strategic engine. However, engine needs a fuel. In particular, appropriate fuel to fit EO engine to boost strong but efficient corporate performance are desired. By using resource-based view and knowledge-based perspective, investigations of contingent or moderating factors of EO-performance relationship were explored (Wiklund and Shepherd, 2003a, 2003b, 2005; Lee, Lee and Pennings, 2001). However, few empirical evidences are accumulated to conceptualize their appropriate relationship. Furthermore, their managerial implications are neither straightforward nor practical for small entrepreneurial business owners and policy makers to apply. Accordingly, exploring for contingent or moderating factors of EO-performance relationship has been continued. Questions still remains in the EO literature where and how the critical fuel can be acquired and developed in order to facilitate EO with a high corporate
To contribute to answering this question, this study explores the knowledge resource to improve EO-performance relationship by utilizing the emerging perspective of the guided preparation as an outsider knowledge resource (Chrisman and McMullan, 2000, 2004; Chrisman, McMullan and Hall, 2005) and empirically test the validity of this view. The guided preparation is conceptually defined as a business counseling activity which provides entrepreneurs or small business owners with value-added explicit and tacit knowledge. Counseling is provided through learning by doing approach and experimentally-based practice. Therefore, the guided knowledge is seen as a context-oriented and socially-complex and thus relatively difficult to duplicate and substitute by competitors (Barney, 1991). This intangible knowledge is subjected to produce a basis of sustainable competitive advantage and substantially enhance a corporate performance. Empirical evidences support this view (Chrisman and McMullan, 2000, 2004; Chrisman, McMullan and Hall, 2005). However, they use only one knowledge resource in the US Small Business Development Centers (SBDC). This study uses a conceptually similar but differently located knowledge resource, namely Small Business Support Centers in Japan (SBSC), to explore the effect of the guided preparation as a knowledge resource and test the validity of this view.
This study contributes to three areas of EO literature. First, new empirical evidence is found and added to the literature from Japan about the EO-performance relationship. To my knowledge, no Japanese empirical studies of EO were ever reported and published outside of Japan. The result may contribute to generalizing the conceptual domain of EO globally. Second, this study shows a new evidence of a moderating factor of EO-performance relationship which is one of the unclear and inconsistent areas of entrepreneurship study. It contributes to supporting a contingent approach of EO study. Third, this study tests the validity of the perspective of the guided preparation by using a different knowledge resource. The empirical result may further develop a wide range of applicability of this new perspective in entrepreneurship study.

In the following sections, literature reviews and hypotheses are discussed and developed. Following these, the unique data-set of SBSC and research methodology are explained. Then, empirical results and discussions including practical implications follow. Finally, limitations and future research are discussed.

**Literature Review and Hypotheses**

**Conceptualizations and Dimensions of EO**
Over the past twenty years, the conceptualizations and dimensions of EO have been frequently discussed and developed in the strategic making literature. Covin & Slevin (1991) conceptualized EO as an organizational strategic initiative which is based upon the realized patterns of entrepreneurial activity from the past strategic decision. McGrath and MacMillan (2000) conceive the EO as a frame of mindset or entrepreneurial thinking. Reviewing the literature, EO has been seen as a critical strategic posture or guidance in the strategic decision making process. It can help to monitor, discover and exploit new opportunities and lead a firm to a high corporate performance. From such entrepreneurial forward-looking behavior, firms are likely to acquire future wants and needs of the emerging market faster than competitors.

One of the dominant and classical dimensions of EO is originated from the study of Miller (1983) and it has been frequently referred in the EO literature. It consists of proactiveness, innovativeness and risk-taking propensity and they have to be exhibited simultaneously. Lumpkin and Dess (1996) added two more dimensions of EO: Competitive aggressiveness and a capacity for autonomous action. They argued that EO should be viewed as a multidimensional construct: All element of EO does not necessarily and simultaneously have to be high to capture entrepreneurial phenomenon.

Although there are some criticisms for the EO concepts and construct instruments
(Wiklund 1999; Churchill 1992; Shane and Venkataraman 2000), EO researchers are appeared to attempt to capture the mechanism of entrepreneurial process or behavior based upon their own analytical perspective by using a wide rage of conceptual domain of EO. Recognizing commonly used conceptualized domain of EO over the past twenty years (Zahra, Jennings and Kuratko, 1999; Rauch, Wiklund, Lumpkin and Frese, 2009), I conceptualize the EO as a firm level and a critical strategic engine through which entrepreneurial initiatives or actions are encouraged for discovering and exploiting new opportunities. In terms of the dimensions of EO, I followed the study of Miller (1983) and Covin & Selvin (1989, 1991) since this study views EO as a collective organizational engine to guide for a high corporate performance.

Accordingly, the following three dimensions of EO construct were used in this study: Proactiveness, innovativeness and risk-taking propensity. The proactive orientation is a very fast and aggressive market strategy or product development process. Typically, firms initiate actions before competitors move into the new market so that they dominate the new business opportunities. Proactiveness is seen as a strategic posture of exploring future wants and needs in the market. The second innovative action refers to the firm’s tendency toward experimentation of new ideas, creative processes and technological leadership which may produce new lines of unique products and services
in an emerging market. Firms with innovative mode tend not to stay in established
technologies, business model and practice. The risk-taking propensity involves a large
resource investment toward uncertain high-risk and high-return projects or businesses
which cost of failure may be high.

EO-Performance Relationship

EO is regarded as a strategic engine or lens to monitor how management may focus
on and discover new frontiers. From this strategic lens, firms benefit with a quick
penetration to new and niche market and selling their services better (Zahra & Covin,
1993). The firms with innovative, pro-active and risk-taking strategic initiative are
likely to move them forward in the technological or market frontiers and keep
competitors behind, which may lead firms to capture new opportunities and create
additional market values. Such aggressive and forward-looking strategic orientation
facilitates a firm to achieve higher performance.

EO literature consistently suggests that firms are likely to perform better when they
behave entrepreneurial (Covin & Slevin, 1989, 1991; Lumpkin & Dess, 1996; Key et al.,
2007; Zahra, 1991; Zahara & Covin, 1995; Wiklund, 1999; Madsen, 2007). However,
these empirical studies are mostly conducted in western context. Although empirical
evidences from non western context such as China or Korea (Tang, Tang, Marino, Zhang & Li, 2008; Lee, Lee and Pennings, 2001; Li et al., 2008) are increasing, they are still few. To my knowledge, no empirical studies of EO are reported from Japan.

Yet, reviewing and evaluating 51 EO studies across the country, Rauch, Wiklund, Lumpkin and Frese (2009) concluded that the correlation of EO with performance is moderately large. In line with their findings and many other empirical results in EO literature, I address the following general hypothesis.

**H1: EO is positively associated with a firm’s performance.**

Although firms receive greatest benefits from the entrepreneurial strategic initiative, there are missing links between EO and the performance. It is argued that there are some contingent factors to influence EO-performance relationship (Covin and Slevin, 1991; Lumpkin and Dess, 1996). Scholars point out that EO is a resource-consuming strategic initiative (Covin and Slevin, 1991; Romanellie, 1987) and EO-performance relationship may change better or worse depending upon the resource availability and utilization. The knowledge is a part of the firm resource. In particular, the knowledge related to discovery and exploitation of new opportunity can be a critical resource for
firms to achieve entrepreneurial outcomes.

Supporting this view, Wiklund and Shepherd (2003b) emphasized the necessity of knowledge development about the discovery and exploitation of opportunity to advance their performance. Since EO is a strategic aspect for decision making styles or methods or practices in nature (Lumpkin and Dess, 1996), it will not be directly related to the entrepreneurial action without the practical knowledge input. Specifically, the knowledge of how well and where to explore the niche or emerging market, interpretative capability of and the ability to utilize the new opportunity should be coincided with the aggressive and forward looking aspect to pursue entrepreneurship. Empirical evidence supports this effective role of knowledge in association with entrepreneurial initiative and performance (Wiklund and Shepherd, 2003b).

Entrepreneurial oriented firms are mostly growth-oriented since they seek aggressively for new opportunity. As such, they are willing to absorb and acquire any information and knowledge related to their business endeavors. They are quite enthusiastic for learning something new and something different to achieve their goals. Such strategic leaning posture or capability may be one of the features of the entrepreneurial oriented firms. Therefore, in order to acquire and develop managerial knowledge and then to grow faster, entrepreneurial oriented firms have advantages since
they are a good strategic learner. Such learning capability makes it possible that they actively search for the needed knowledge and attempt to understand it precisely and utilize it properly. It seems that EO is a strong magnet to combine the efficient but powerful knowledge fuel with a high performance. Accordingly, through the provision of the value-added knowledge, EO capability as a strategic engine may increase and then enhance a firm’s performance even faster.

In this respect, the emerging perspective of the guided preparation as the critical knowledge resource helps to improve the EO-performance relationship.

**Perspective of the Guided Preparation as a Knowledge Resource**

Developing the resource-based view and knowledge perspective, Chrisman and McMullan (2000, 2004) and Chrisman, McMullan and Hall (2005) conceptualized a role of guided preparation as a critical knowledge resource for entrepreneurs to be innovative, survive and grow. Through their extensive long term research of Small Business Development Centers\(^1\) (SBDC) in the US, they induced important value of outsider assistance which develop entrepreneurial knowledge and realize entrepreneurial

---

\(^1\) Information about SBDC in this study is mostly from the referred literature. However, it was confirmed and added by author’s interview research to the State Director of Pennsylvania Small Business Development Centers and the Director of Wharton Small Business Development Center. Both studies were conducted in August, 2003.
outcomes. It is suggested that business counseling, which is implied as a hands-on type of business mentoring activity, plays a key role of filing in the knowledge gap of nascent entrepreneurs or small business owners to achieve their goals. It is assumed that start-ups or small businesses who have the growth aspiration or desire have a gap between the knowledge possessed by them and the knowledge required for their growth.

More importantly, explicit and tacit knowledge from the guided preparation is posited as a critical role of facilitating entrepreneurial behavior and performance of small firms. The knowledge provided from business counselors is not only explicit knowledge such as business facts or theories but also tacit knowledge such as knowing-how or knowing-who. It is pointed out that knowing-how is associated with the business development process of learning by doing and knowing-who is involved in development of business network (Malecki, 1997). Although both explicit and tacit knowledge are needed for business launching or business extending process, the business counseling tends to focus more on developing the tacit knowledge. It is because such knowledge can make the firm to place on the highly competitive position. It can be quite difficult to duplicate and substitute by competitors since it is a context-oriented and socially-complex (Barney, 1991). Such intangible organizational knowledge can be seen as a source of sustainable competitive advantage (Hitt, Ireland
and Hoskisson, 1999; Wiklund and Shepherd, 2003b).

The way to conduct the SBDC counseling service is unique. Collaborative work between entrepreneurs or small business owners and professional business counselors is central. Counselors do not provide a direct assistance like a business consultant. Rather, they take a responsibility of guiding business owners for structuring and developing business plan, marketing plan or financial plan. Actual works and actions are taken by business owners under the thorough guidance of business counselors. Such a well structured guidance and intensified interactions develop the intangible asset necessary for improving and enhancing new or existence business.

The empirical evidence of the high survival and growth performance ratio of the nascent entrepreneurs or small business owners (Chrisman and McMullan, 2000, 2004; Chrisman, McMullan and Hall, 2005) explains the critical role of the managerial guidance or counseling activity from SBDC. The experimentally-based and learning by doing practice is the nature of the assistance. It builds the important managerial knowledge or ability (mixture of explicit and tacit knowledge) required for and fit to entrepreneurial oriented firms to explore and exploit new opportunity. Such a highly intensified business counseling was a key for success. In line with this perspective and its supporting empirical evidences, I address the following hypothesis.

Overview of SBSC\(^2\) as a Knowledge Resource

Small Business Support Centers (SBSC) in Japan provides small business owners or entrepreneurs with conceptually and practically similar business counseling services to SBDC in the US. The SBSCs are mainly supported or subsidized by regional governments since their inceptions. They were established in 2000 and have sixty regional centers throughout Japan. It is aimed at helping growth-oriented SMEs to start or extend their own businesses with success. Centers provide for professional managerial services to solve their critical managerial issues to achieve their goals. The assistance mainly covers the on-site professional management advice/counseling services, feasibility evaluation and advice of business plan, and the provision of a wide range of business information. The number of users of on-site professional services was

\(^2\) To understand the scheme and service of SBSCs, author conducted interview research frequently to the project manager of regional SBSC in Osaka between 2000 and 2005, and collected material information as well. Furthermore, author attended counseling sessions and workshops of two small business clients to fully understand specific implementation process of their services in spring and fall of 2007.
10,205 in 2000 and 21,789 in 2005. About the service users of feasibility evaluation and advice of business plan, each number was 126 in 2000 and 241 in 2005.

Services are provided as a request base by small business owners. Some assistance continues for a year or even longer as a series of project. On the other hands, specific advice or information finishes by one shot and no continuation. The way to provide business advice has some similarity with business mentoring or hands on type of business counseling activity especially when the service continues as a project base. This long-term based business counseling activity, in general, starts with the thorough discussions of management issues by business professionals and business owners. Following the clarification and specification of the problems, both are subjected to agree the scope of the managerial issues and the approach to solve. Then, the counseling project launches. When it starts, most of the actions and works are done by small firm clients except for some technical or professional research. The essential role of business counselors is to develop management capability of the client to solve their own management problems. For example, business counselors help to identify and evaluate internal resources, and determine which resources to invest or utilize. Their services focus not only on the direct problem-solving but also the guiding to the development of managerial capability from the learning by doing approach. It resembles with the
relationship of a teacher and student to achieve their educational goals.

Through the counseling process, the emphasis goes on building contextually and socially embedded managerial knowledge. Accordingly, business professionals frequently assign clients (SMEs) for a particular work to guide them from one phase to another. For example, when SWOT analysis was assigned to the client during the counseling period, the expertise professional opened in-house workshop for CEOs and managers including middle managers to explain the objectives and contents of the work. After a couple of weeks, their assignments are presented, discussed and commented. Occasionally, they are required to start over. But, mostly they go to the next phase under the thorough guidance of business professionals. Likewise, the counseling project continues step by step.

Business counseling from SBSCs assists small firms by providing the knowledge which is more associated with the market opportunity and its utilization. They focus more on monitoring internal and external resources, and guide small businesses to pay more attention to the marketing and strategic issues.

Business professionals in SBSCs are well qualified. Acknowledging general management principles and specific small business issues throughout the extensive business advising experiences (including business management or owner experiences),
they have additional areas of business expertise such as marketing, human resources, strategy, networking, operations management, information system, accounting or financing.

When the counseling is implemented, generally the project team from both sides (SBSCs and small business firms) is organized. The team is initiated by the project manager from SBSC and business owners or CEOs. Then, the project is implemented by the business counselor from SBSCs and staff including managers from client firms. They work together and commit to achieve their goals. Successful provisions of the services from SBSCs heavily depend on their aspirations, commitment and collaborative works.

SBSCs provide small firms with opportunity to improve their performance. Regarding the program assistance, McMullan et al. (2002) showed five areas of conditions of effective business assistance: (1) the process of the informed choice of the assistance, (2) availability of the qualified advisors or counselors, (3) just-in-time delivery of the appropriate fresh managerial knowledge, (4) client involvement into the counseling process to gain applied knowledge and (5) an attention of the strategic or managerial aspect. As explained above, these elements are contained in the SBSC service. Likewise, the SBSC business counseling provides small firms with knowledge.
development process or opportunity and substantially fills in the gap between the knowledge possessed by them and the knowledge required for their growth.

**Research Methodology**

**Data Collection**

To test hypotheses described above, service recipient firms from SBSCs were used. To collect their managerial data, the following procedure was taken. First, their mail addresses were searched in order to send a mail questionnaire to all service recipient firms. As a result, “the best practice list of SBSCs’ clients” was found in the web-site which is run by the small business agency. Firms in the list were chosen by each regional SBSCs. There were no clear-cut selection criteria for the list. However, it was assumed that the structure and the quality of the service provision to the listed firms was close to the scope or picture which SBSCs were willing to attain. Firms in the list were considered benefited or satisfied from the service provision. As such, I chose these firms

---

3 I requested to SBSCs for acquiring their addresses but they were not allowed to provide. It is because the service recipient information, although it is a mail address and for academic use, seem to be purely confidential.

4 Please check the following web site for more information (in Japanese).

5 Through the author's research interviews to the project manager of regional SBSC in Osaka between 2000 and 2005, the described meaning of the best practice list was confirmed.
for the following analysis; Its number was 879. Then, the mail questionnaire was sent to these firms in December 2007. During three months period, a total of 187 responses were received. The total response ratio was 21.3%. To make the precise data set for the business counseling users from SBSCs, the responded questionnaires were carefully reviewed and non-users of this service were eliminated. They were the client of the SBSCs but did not receive the business counseling assistance; Business information or over-the-counter consultation services may be provided for them. Accordingly, 124 usable data were chosen. I checked sample representative bias by their size (capital) and industry. The result indicated that the responses to the questionnaire were representing the original sample of the study.

The demography of the sample is as follows. About the industry, the most dominant industry was manufacturing (54%) followed by the service (10%) and the construction (10%). Average size of capital and sales turnover were about 28,603,000 yen (equivalent to 286,030 US dollars) and 444,722,000 yen (equivalent to 4,447,220 US dollars), respectively\(^6\). The average number of employees is about 24. The average year of the firm establishment was 1980 and the average age of the firm was about 27.

\(^6\) Calculated as one dollar is equal to one hundred of yen.
Measurements

In this study, a firm’s performance was used as a dependent variable, and EO and the knowledge resource (or the business counseling service) from SBSCs were used as an independent variable and a moderating variable, respectively. Firm age, size and a scope of market are used as control variables.

Performance. Adapting the view that the performance is multidimensional in nature (Cameron, 1978), this study integrates different dimensions of the small business performance and measures performance with competitors in the same industry (Birley and Westhead, 1990).

Four performance indicators are used in this study: Innovation, sales, market share and profitability. Each indicator was measured by respondents’ perceived measurements. The innovation was measured by average sales of new products/services divided by total sales for the last three years compared with competitors in their industries by using a 7-point likert-scale (1=very low, 3=industry average, 7=very high). Similarly, sales turnover was measured by average sales growth rate for the last three years compared with competitors in their industries by using a 7-point likert-scale (1=very low, 3=industry average, 7=very high). Market share was measure by average increase of
market share for the last three years compared with competitors in their industries by using a 7-point likert-scale (1=very low, 3=industry average, 7=very high). Profitability was measured by average operational profit divided by total sales for the last three years compared with competitors in their industries by using a 7-point likert-scale (1=very low, 3=industry average, 7=very high). These measures were standardized and then combined into single performance measure. The cronvach’s alpha is 0.870.

EO. Adopting the study of Covin and Slevin (1989), I measured EO by three main components: Innovation, proactive orientation and risk-taking propensity. Of each component, three specific questions from the survey of Covin and Slevin (1989) were used by a 7-point Likert scale. A scale assesses firms’ strategic reliance on the following question items. Respondents were asked in innovation items: (1) Top managers favor “a strong emphasis on marketing of tried and true products or services”=1 versus “a strong emphasis on R&D, technological leadership and innovation”=7 (4=neutral); (2) For the past 5 years, a firm has marketed “no new lines of products”=1 versus “many new lines of products”=7 (4=neutral); (3) For the past 5 years, “changes in product lines have been of a minor nature”=1 versus “changes in product lines have been dramatic”=7 (4=neutral). In proactive orientation items, respondents were asked: In dealing with its
competitors, my firm (1) “responds to actions which competitors initiate”=1 versus “initiates actions which competitors respond to”=7 (4=neutral); (2) “is seldom the first business to introduce new products, etc.”=1 versus “is the first business to introduce new products, etc.”=7 (4=neutral); (3) “seeks to avoid competitive clashes”=1 versus “adopts a very competitive posture”=7 (4=neutral). In risk-taking propensity items, respondents were asked: (1) Top managers have “a strong proclivity for low-risk projects”=1 versus “a strong proclivity for high-risk projects”=7 (4=neutral); (2) Top managers believe “it is best to explore the environment gradually via timid behavior”=1 versus “wide-ranging acts are necessary to achieve the firm’s objectives”=7 (4=neutral); (3) When confronted with decision-making situations involving uncertainty my firm “adopts a cautious, ‘wait-and-see’ posture to minimize the probability of making costly decisions”=1 versus “adopts a bold, aggressive posture to maximize the probability of exploiting potential opportunities”=7 (4=neutral). To capture the EO variable, measures were standardized and combined. The Cronbach’s alpha was 0.787.

The knowledge resource. As described already, the business counseling service from SBSCs involved in learning by doing practice. The service provides clients with value added managerial and practical knowledge through which firms are guided to align their
entrepreneurial aspirations with a higher corporate performance. To measure the intensity of such knowledge input (high intensity or low intensity of knowledge provision), two dimensions were used: (1) The series of structured business counseling activity and (2) the interactive process with thorough discussions. Series of business counseling with a long interactive process is hypothesized to enhance management capabilities and thus performance. One shot or unscheduled (unstructured) counseling without much interaction is considered less effective for developing management capabilities. To construct the knowledge resource variable, two questionnaire items were used from the survey. Respondents were asked: (1) Business counseling was provided as “a single base upon the request” =1 versus “a long term series or a project base”=2; (2) the guidance was provided by thorough discussions and interactions within the organization (no=1, yes=2). Each answer was coded 1 and 2 as low and high intensity of knowledge input. Then, they were standardized and summed to construct the knowledge resource variable. The Cronbach’s alpha was 0.422.

Control variables. Besides the main (EO) and the moderating variables (knowledge resource), characteristics of firms and targeting size of the market are stated as important variables to influence for a firm’s performance (Storey 1994; Lumpkin and
Dess 1996; Chrisman, McMullan, and Hall 2005). In this study, four control variables were used: The firm age, size, industry and a market scope. The firm age was indexed by calculating the number of years after a firm’s establishment. The firm size was measured by taking a logarithm of the capital of firms. Industry and the scope of market were measured by dummy variables: Industry (1=manufacturing, 0=non-manufacturing) and the scope of market (1=nationwide or global, 0=non-nationwide nor global).

The descriptive statistics and correlation matrix of dependent, independent, moderate and control variables are presented in table 1. No serious multicollinearity in this sample was found; Their correlations are all under 0.5 (Hair, Anderson, Tatham, & Black, 1998).

**Empirical Results**

To test hypotheses, the hierarchical regression analysis was used. It is expected to identify the main effect of EO as an independent variable and the knowledge resource as a moderating variable of EO to a firm’s performance.

Table 2 shows the result of the analysis. In model one (base model), all control
variables were entered into the regression model. As a result, only the size of capital was found as a positive and statistically significant relationship with the performance ($p<.05$). Besides, there were no statistically significant variables to explain variance of the performance dependent variable. In model two, the EO as an independent and main variable was added to the regression equation. It was found that the positive and significant relationship of EO with the performance was shown ($p<.05$). The positive sign of coefficients indicates that the performance was higher for firms with higher entrepreneurial strategic orientation. About the control variables, the size of capital is still significant but its relationship with performance is weak ($p<.10$). Adjusted $R^2$ (=.099) improved from the model one. Change in $R^2$ was statistically significant ($p<.05$).

It explains that this independent effect model (model two) contributes significantly above and over the model one (base model). By controlling firms’ characteristics, industries, the market scope, EO appeared as a positive and strong predictor of the firm performance. As previous EO literature indicates, the result confirmed that entrepreneurial strategic posture or initiative was effective for a corporate performance. Thus, hypothesis 1 was confirmed.

In model three, the knowledge resource as a moderating variable was entered into the regression analysis. The result showed no statistically significant relationship between
the knowledge resource and the performance. On the other hand, EO still showed the positive and significant relationship with performance \((p<.05)\). All control variables showed no significant relationship with performance. This model indicated that unlike the EO variable the knowledge resource variable independently did not explain for the performance dependent variable.

In model four, the interaction term between EO and the knowledge resource was allowed to enter into the regression equation. It showed a significantly positive relationship with performance \((p<.05)\). No control variables showed significant relationship with performance. The Adjusted \(R^2 (.205)\) in model four is the highest among other models. Change in \(R^2\) was also significant \((p<.05)\). Compared with the result of model two, three and four, it is suggested that the interaction term is present and is moderating the EO-performance relationship.

To capture the nature of the interaction term, two plots of the effect of EO (x-axis) on performance (y-axis) for values of outside knowledge resource (high and low level of intensity of the moderating term) were shown in figure 1. The value of high and low of
knowledge resource was set at plus and minus one standard deviation from the mean (Cohen and Cohen, 1983). Accordingly, these plots indicated that the higher performance with low level of EO could be achieved under the provision of low intensity of knowledge input. However, when the level of EO changed to be higher, the superior performance was attained under the condition of the high intensity of the knowledge provision. Firms with a high level of EO could not perform better or rather perform worse when the low intensity of knowledge was provided. As such, the result showed that a high intensity of knowledge input extensively improved the EO-performance relationship. Thus, hypothesis 2 was supported.

Discussions and Implications

Over the twenty years EO studies were conducted and developed mostly in western context. Few were observed from Asia. Symbolizing this, the comprehensive meta-analysis of EO studies selected and used the conceptual and empirical analysis of EO mostly from western nations such as the US or Europe (Rauch, Wiklund, Lumpkin and Frese, 2009). To my knowledge, no empirical studies of EO were reported from
Japan. This study contributed to filling in this research gap.

Four important findings or contributions were withdrawn from this study. First, this study confirmed that the entrepreneurial strategic orientation played an important role of enhancing the performance of small firms. The result was consistent to the previously developed EO studies and supported the view that firms with proactive, innovative and risk-taking propensity are likely to achieve entrepreneurial outcomes. As I adopted the conceptual domain of EO and its construct from the most dominant EO literature (Miller, 1983; Covin and Slevin, 1989), the finding from this study can be globally comparable. As such, the result of this study may contribute to generalizing the conceptual domain of EO globally.

Second, this study showed a new evidence of a moderating factor of EO-performance relationship which is one of the unclear areas of entrepreneurship study. The result indicated that the knowledge became the key factor which fit EO engine to boost the strong performance. The higher performance was achieved under the condition of a high intensity of the knowledge input when a firm’s level of EO changed higher. Two reasons can be considered for this finding. First, it is because the provided knowledge could be a valuable, rare and inimitable resource and fit to the needed knowledge for small firms to explore and exploit new opportunity. Stated differently, the value added knowledge
became a firm’s distinctive resource. As the study of Wiklund and Shepherd (2003b) implied, the knowledge played a key role of enhancing the EO to pursue entrepreneurial outcomes. As the resource based view suggests, firms with such knowledge resource are likely to achieve sustainable competitive advantage and substantially earns above normal returns (Barney, 1991). Second, it is because that the entrepreneurial oriented small firms are good strategic learners in nature. They are so eager, competitive and aggressive to acquire and understand new knowledge and to apply for their own business and experiment for new ideas or products. Such a forward-looking strategic posture is likely to fit to the intensified knowledge input and substantially to optimize the organizational performance.

Third, this study clarified or identified another knowledge resource in Japan, namely the SBSCs. They have many similarities to the SBDCs in the US. The business counseling service from SBSC emphasized on the knowledge development process through which the market opportunity and its utilization were highlighted. At the same time, the counseling process had unique characteristics and contained key elements of developing the organizational knowledge. The study suggested that the successful business counseling was not a one shot advice nor a short term guidance but a well structured series of service provision. Furthermore, the face-to-face interactions with
thorough guidance and the client involvement into the business counseling process were added. The value-added knowledge here was more or less a context-oriented and socially-complex and thus relatively difficult to duplicate and substitute by competitors. The nature of SBSC service was based upon the learning by doing approach and the highly interacted long-term based professional guidance. It was concluded that this highly intensified knowledge provision was the key for small firms to attain entrepreneurial outcomes.

Fourth, relating to the third finding, this study tested and confirmed the validity of the emerging perspective of the guided preparation by using a different knowledge resource. Through the extensive long term research of SBDC, Chrisman and McMullan (2000, 2004) and Chrisman, McMullan and Hall (2005) conceptualized a role of guided preparation as a critical knowledge resource for entrepreneurs to be innovative, survive and grow. Many empirical evidences supported their views. However, it has been tested by using one knowledge resource (SBDC). By setting the conceptually similar but differently located knowledge resource (SBSCs), this study investigated for the effectiveness of the provision of the another knowledge resource. As discussed already, the result confirmed the impact of the guided preparation (the business counseling service) from the new knowledge resource. The provision of the service developed
entrepreneurial knowledge and realized entrepreneurial outcomes. Likewise, the empirical result further developed a wide range of applicability of this new perspective in entrepreneurship study.

This study has some practical implications for both top managers of small firms and policy makers or public administrators to support small business. First, the result showed clearly that entrepreneurial strategic initiative was a strong engine for the firm’s high performance. Thus, such an orientation should be encouraged to be introduced into their firms. Top managers have to lead the firm to be innovative and proactive in the marketplace with the calculated risk-taking posture. Similarly, it can be worth considering that the public policy for supporting small business should focus more on the entrepreneurial strategic aspect of small firms rather than assisting for their financial assets such as the public loans to grow.

Second, this study suggested that the outsider knowledge was quite helpful for developing management capability to explore and exploit opportunity. In order for the entrepreneurial oriented small firms to enhance their corporate performance, the adoption of the intensified knowledge input became an important management choice. In this study, the government assistance program (the SBSCs’s service) played such a role. Accordingly, it is advisable for top managers of small firms to search for such
knowledge opportunity close by and use it properly. By the same token, policy makers should shed more light on this value of the intensified knowledge resource and spread this opportunity throughout the regions. By doing so, the growth oriented small firms will be able to reach out and benefit it for their growth and substantially will contribute to the regional economic development.

**Limitations and Future Research**

I conclude this paper with a discussion of the several limitations of the study as well as suggestions for future studies. First, although this study tested and validated the perspective of the guided preparation or the counseling services by using the new knowledge resource, more conceptual and empirical evidences across the regions and country are needed to develop and generalize this view. Researchers are encouraged to explore and investigate for other would-be-knowledge resources such as Business Links\(^7\) in UK by comparing with the SBDC in the US or SBSCs in Japan. Through such an endeavor, the effective small business assistance program may be developed and encouraged to launch and spread all over the country. Future research should

---

\(^7\) Business Links in UK provide for similar business advising services to SBDCs or SBSCs. It originally started its service provision in 1992. Many investigative and evaluation studies were reported (Eunst & Young, 1996, 1997; Public and Corporate Economic Consultants, 1998; Roper, S., Hart, M., Bramely, G., Dale, L and Anderson, C., 2001; Mole, Hart, Roper and Saal, 2008).
Second, although, this study contributed to the entrepreneurship literature by providing new evidence from Japan, the finding should be carefully interpreted since the study used the cross-sectional data. Accordingly, the long-term effect of EO to the performance and the moderating effect of the knowledge resource were not empirically clear. To confirm their long-term and causal relationship, a longitudinal data analysis is necessary for future study.

In principle, this is a preliminary and explorative study of the relationship of EO, knowledge resource and the performance of small firms in Japan. It was the very first research attempt from Japan. In spite of the research limitation, the value of this study is still high. As discussed already, the finding from this study contributed to the EO literature to a great extent by generalizing the conceptual domain of EO globally and by highlighting the critical role of knowledge resource.

The Effect of Triggering Events on Entrepreneur’s Decision Styles in Buying Small Business

Dr. Theresa Lau

Dr. K.F. Chan

Mr. Edwin Lee

Department of Management and Marketing
Hong Kong Polytechnic University

Abstract
An entrepreneur can start the business by buying an existing business rather than starting a new one from scratch. Past studies have argued that there are always benefits and costs in buying an existing business and the main issue would therefore be “how to choose the right business and make the right decision to buy”. In other words, we believe the decision process does matter in this particular buying situation. In brief, the aim of the paper is an attempt to examine the behavior of an entrepreneur’s decision to buy an existing small business. The following questions would be addressed. Why do entrepreneurs display different decision behavior patterns in buying a new business and how? What triggering events will affect their patterns and how? To achieve these aims, a conceptual framework is developed in the paper to explain the buying behavior with reference to the literature on strategic decision making process. They are generally labeled as rational mode, emotional mode, political mode and intuitive mode. Triggering events that have been reported in the studies of entrepreneurs’ venturing are assumed to be the drivers of initiating the buying decision. Based on literature review, triggering events are found to impact various types of decision process. In order to confirm whether or not there is any logical relationship between these two sets of variables: i.e. triggering events and types of decision process in the context of buying a new business, we propose to a) conduct exploratory in-depth case studies to identify what triggering events are prevailing and how they lead to different types of decision to buy a new business and b) confirm the relationship between triggering events and types of decision process by using survey data. At the start, in-depth case studies approach is a more preferable method as it could provide more practical insight and rich information on the decision process, which would enable the researchers to draw more meaningful explanations and to generate possible decision patterns. With reference to past studies, it is found that positive triggering factors, e.g. seeking autonomy and independence, grasping venture opportunity, striving for higher profit, and etc. are more related to rational, intuitive and political decision making style while negative triggering factors, e.g. layoff, family pressure, job dissatisfaction, and etc. will lead to more emotional decision making style. Interpretations are given in the paper with reference to psychological state of entrepreneurs when they make decisions to buy the new business under different triggering events. The implications of our proposed framework are: a) entrepreneurs who intend to start up new
ventures might consider the approach of buying the existing small business instead of starting the business from scratch but cautions must be made with regards to the decision process in the buying situation, i.e. the decision process that is appropriate to specific buying situation; b) the process of buying an SME across country and culture (e.g. local entrepreneur buying an overseas small business or foreign entrepreneur buying a local small business), would be more complicated but the general principle of decision style would be equally applied; c) potential entrepreneurs who are driven to start up the business by buying an existing business due to strong negative triggering events should be alerted as they would tend to behave emotionally in their buying decision process. In conclusion, the development of theoretical framework in this paper would form a basis for further research direction in entrepreneurs’ strategic decision making in the context of buying a small business as a form of startup and would also contribute to the practice of how an entrepreneur behaves in buying a small business.

Introduction

Entrepreneurs can start a business in three ways: starting a business from scratch, buying a franchise or buying an existing business (Steingold, 2005). Steingold (2005) and Melles (1996) suggest that there are many advantages of buying an existing business, compared to other two major forms of business start-up. For example, it can obtain an existing customer base, gain immediate cash inflow if the existing business has been running quite well and have lower risk of business failure given the proven record of successful operation. However, buying a business is not without problem. Taulli (2002) points out, for example, there is always a high hidden risk of failure if the entrepreneur who buys the business is not capable and cannot execute the operation properly. Furthermore, he/she must be able to cope with strain on personal life, deal with crisis and make tough decisions. Lack of flexibility is another drawback for an entrepreneur to start up business by buying an existing one as both the business model and the business operation have been preset by the former owner and as such, it is difficult, though not impossible, for the new entrepreneur to make changes according to his/her own wish. In addition, the costs of buying an existing business are usually higher than those of starting the business on their own (Feldman, et al 2003).
Given the pros and cons of buying a small business to start up, people who intend to undertake such kind of activity have to face a decision with future commitment and long term consequence. Decisions of this type are “strategic” as they require a careful analysis and evaluation before they are made. Literature on strategic decision making process has been comprehensively documented but studies are usually conducted in the context of corporate decisions such as merger and acquisition, consolidation, downsizing, restructuring, diversification, etc. Very few studies were conducted on the decision making process of buying a small business as a form of entrepreneurial start-up. In this paper, we intend to develop a conceptual framework with an attempt to throw some light on the issue of how decisions to buy an existing business by entrepreneurs are made and what factors would affect their various decision processes. Specifically, the following research questions would be addressed:

1. What factors would trigger entrepreneurs to start looking for buying a business?
2. What is the decision making process of entrepreneurs in buying a business? Can the different processes co-exist?
3. How do the triggering events affect the decision making process in buying a business?
4. What factors would moderate the relationship between the triggering events and the decision-making process?

In order to develop a theoretical model to explain how triggering events, decision making processes and decision outcome of “buy” or “not buy” of an existing business are related, we would review the past studies in the following sections.

Triggering Events of Business Start-up
A brief review of past studies reveals that there are two closely-related explanations of entrepreneurial motivation to start-up – pull and push factors (Shapero, 1975, Gray et al, 1996). First, “pull” factors are opportunities that draw individuals into self-employment. This may come from a potential partner, mentor, parent (or relative), investor, particular customer, or market opportunity. They usually provide positive support to making decision to start-up a business. Second, “push” influences are necessity-driven and refer to the negative aspects of a potential entrepreneur’s present economic/employment situation that cause him or her to look for something else, either another job or a start-up (Shapero, 1975). In this respect, one is either forced to pursue entrepreneurial activity, i.e. starting up a new business, or choose nowhere. Empirical studies characterize entrepreneurs as misfits, rejects from society or displaced individuals (Shapero and Sokal, 1982 and Gray et al., 1996). Especially in small-firm-intensive rural areas, entrepreneurship is often chosen over unemployment. In such a case an individual may be “forced” to become an entrepreneur in order to secure a living in changed circumstances (Storey, 1982). Furthermore, according to Gilad and Levine (1986), the “push” theory argues that individuals are pushed into entrepreneurship by negative external forces, such as layoffs, job dissatisfaction, difficulty of finding employment, insufficient salary, or inflexible work schedule. Gray et al (2006) categorize push factors as having no job prospect, not satisfied with work, cannot work for others, badly needs money, fail out of school.

The “pull” theory contends that individuals are attracted into entrepreneurial activities seeking independence, self-fulfillment, wealth, and other desirable outcomes. The existence of tempting and possibly profitable business opportunities pull talented entrepreneur-minded individuals into the business start-up (Storey, 1994). In particular, pull factors are typically those
attached to self-fulfillment, like independence and autonomy (Huuskonen, 1992). Some other examples include the categories of great market opportunity, family business inheritance, applying own field of study, previous work experience, observed success of others, approached by partner, friends’ suggestions and given opportunity to buy business (Gray et al 2006).

Since 2001, the Global Entrepreneurship Monitor (GEM) has discussed two different types of entrepreneurship: necessity entrepreneurship and opportunity entrepreneurship. The difference between the two types depends on the motivation of an entrepreneur to start his/her venture. Opportunity entrepreneurs are those who start their businesses in order to pursue an opportunity, while necessity entrepreneurship is more requirement-based (Reynolds et al. 2005). The GEM’s categorization of opportunity entrepreneurs versus necessity entrepreneurs is quite similar to the framework of pull factors versus push factors in the entrepreneurship process. Furthermore, Amit (1994) proposes that “pull” entrepreneurs may perform better than “push” entrepreneurs, and those that can be classified as both “push” and “pull” type may be the most motivated of all.

Despite the distinctly different factors involved in the pull and push effects, Gilad and Levine (1986) suggest that the "pull" and "push" factors are not necessarily competing or mutually exclusive. It suggests that push and pull factors might co-exists at the same time within individuals. Therefore, they have developed a formula to measure the overall intensity of all the factors combined. However, Gilad and Levine (1986) did not state which specific forces within the push and pull factors are stronger or weaker. In developing our conceptual framework for further empirical analysis, the above mentioned pull and push factors are categorically grouped while their intensity of influence on various decision making type are hypothesized with the support of theoretical arguments.
Strategic Decision Making Process in Buying Business

Many studies have been conducted on how entrepreneurs decide to start a business. Vroom’s (1964) expectancy model establishes a common thread connecting many process-oriented explanations of entrepreneurial motivation. Current process models are implicitly or explicitly grounded in this basic conception: an individual’s intentions to become an entrepreneur are predicted by two questions: (a) Is entrepreneurship desirable? and (b) Is entrepreneurship feasible? The Vroom model explains that an individual will choose among alternative behaviors by considering which behavior will lead to the most desirable outcome. This is typically called rational decision making approach. However, Simon’s theory of bounded rationality provides a more realistic depiction of individuals’ decision processes (Simon 1947, 1955, 1983). Limited information processing and computational abilities, imperfect knowledge about the world and restricted time are among the conditions (internal as well as external) people must face when making decisions. There is no exception when considering buying a business. Though the entrepreneurs will have the opportunity to visit and observe the operation, collect necessary business information and talk to existing business owner/managers in the buying process, imperfect knowledge and time pressure still inhibit entrepreneur from exercising rational analysis to its full strength.

The cognitive approach provides an important perspective why some entrepreneurs accept an inordinate amount of risk even though, on average, they do not apparently differ in their risk-taking propensity. For example, Palich and Bagby (1995) find that entrepreneurs tend to be predisposed to cognitively categorize business situations more positively. Baron (1998) also finds that entrepreneurs have greater reliance on certain cognitive techniques, such as heuristics
and biases, in searching for business opportunities. Busenitz (1999) proposes that entrepreneurial risk may be explained by recognizing that entrepreneurs use biases and heuristics more, which is likely to lead them to perceive less risk in a given decision situation. The empirical data by Busenitz (1999) indicates that entrepreneurs do use representativeness more and are more overconfident than managers in large organizations in making their decisions. Baron (2004) and Michell et al. (2007) have further supplemented that cognitive approaches are robust and effective means of accounting for the role of the individual in the entrepreneurial process. In fact, the term “entrepreneurial cognition” has emerged to highlight the distinctive way in which individuals identify, evaluate and exploit opportunities. On the other hand, Morrison (2000) adds that culture also account for large part of the entrepreneurial decision. Decision to become an entrepreneur is largely affected by culture at four levels: national, regional, business and individual. Input to culture includes religion, education, politics, family, history, role models, etc. Ireland et al (2003) supplement that there are four distinctive dimensions of entrepreneurship: entrepreneurship mindset, entrepreneurial culture, entrepreneurial leadership and entrepreneurial resources. As a result, cognitive biases in making decision to buy business might come from the differences in culture related factors.

In addition to rationality perspective, Cunha (2007) suggests two more different modes to explain how entrepreneurial opportunities come into existence. They are the intuitive and improvisational perspectives respectively. In the intuitive perspective, entrepreneurs imagine the opportunity before it exists. In the improvisational perspective, entrepreneurs act in order to construct the opportunity. The above perspectives are similar to the approaches suggested by Mintzberg and Westly (2001): (i) thinking first – featuring science and facts, (ii) seeing first –
featuring art and ideas, and (iii) doing first – featuring craft and experience. In fact, emotions arise when a person is confronted with a real or virtual situation relevant to her well-being. This relevance may be direct or in imagination (Smith, 2000). It is a well-established and documented fact that the mood of a person influences cognitive activity and behavior (Bagozzi et al, 1999; Cohen and Areni, 1991). Emotional states play a major role in how people think, learn, remember, take risks, and evaluate complex social information (Bless, 2000; Cohen and Andrade, 2004). In the situation of buying a business, the entrepreneurs are required to interact with the existing business owners so as to understand better the operational issues and make evaluation before buying decision is made. In such process, the mood of the entrepreneur will certainly play an important role in affecting his/her judgment. Similar to emotion, intuition is argued to be a common influence on human decision making (Sadler-Smith, 2008). Bird (1988) refers directly to the importance of intuition in entrepreneurial activity. She argues that rational, analytic, and cause and effect oriented processes underlie formal business plans, opportunity analysis, resource acquisition, and goal setting, whereas intuitive, holistic, and contextual thinking inspires vision, hunch, an expanded view of untapped resources, and a feeling of the potential of the enterprise. However, which decision making process is engaged is affected by some internal and external factors. People are more likely to use heuristics rather than engaging in a more systematic analysis when there is no time to engage in lengthy analytical processes; when there is information overload; when the issue is considered not to be very important; and when there is little information available for making a decision (Pratkanis, 1989). However, Pech and Cameron (2006) argue that entrepreneurs’ decision making framework is also affected by many emotive and attitudinal filters including enthusiasm, audacity, fun, determination, gut instinct and intuition, confidence of can-do and emotional intelligence. Jayasinghe et al. (2008) also argue
that entrepreneurship research has been characterized by an over-obsession with logical rationalism and methodological functionalism. It has ignored the emotional dimension of the relations between structure and people. Lerner & Kelner (2001) develops an Appraisal-Tendency Framework that dramatically changed the worldview of emotional decision by demonstrating, for instance, that two mood states such as fear and anger, although both negative, can yield very different judgmental effects on decision making. To describe entrepreneurial emotions, Russell (2003) proposed four primary elements: (i) individual core affective states of entrepreneurs, (ii) affective qualities of entrepreneurial ventures, (iii) their interaction with core affective states evidenced in attributed affect, and (iv) emotional meta-experiences that involve a conscious experience of felt emotional states and processes.

Political decision making process is found very common in many studies of large and complicated decision situations. In the case of making decision to buy an existing business, we believe politics might be involved in different stages. Pfeffer and Jeffrey (1992) suggests that for political decision making, the problem definition stage is more concerned with establishing constraints and preferences of those involved in and affected by the decision. The decision making process is more dependent on others. When going through the three stages of decision making, i.e. definition of constraints and preferences, alternative generation, and gathering of information about alternatives, all people involved in the debate and discussion will serve to reduce the number of and differences between possible alternatives. Guler (2007) indicates that a potential reason for the persistence of decision errors in organizations is that political and institutional influences may interact with individual decision errors and produce adverse results.
Individual processes may interact with influences from within and outside the organizations, such as group dynamics among employees and pressures from external parties.

In summary, the above review indicates that the decision making process of buying an existing business is found not much different from other contexts. Entrepreneurs usually adopt the following approaches or their mixture in making decision to buy business: i) rational, with variations in bounded rationality and cognitive biases, ii) emotional, and sometimes based on personal feeling and past experience, iii) intuitive with cognitive biases and heuristics from various sources and iii) political decision making, which largely involves interaction with outside parties and consideration of balance of power during decision process. On the other hand, different decision making systems do not seem to be mutually exclusive of one another. In other words, individuals could be rational and emotional, or intuitive and political (dependent) or whatever mix at the same time. They may co-exist in any decision making process to supplement the individuals decision outcome. Moreover, Scott and Bruce (1995) identified five decision making styles which are similar to our review as above. They are labeled as: (i) rational: logical and structured approaches to decision making; (ii) intuitive: reliance upon hunches, feelings and impressions; (iii) dependent: reliance upon the direction and support of others; (iv) avoidant: postponing or avoiding making decisions; (v) spontaneous: impulsive and prone to making “snap” or “spur of the moment” decisions.

Since we argue conceptually that different triggering events will have different impact on the entrepreneurial behavior in making decision to buy an existing business, we will integrate all variables that have been reviewed in the above section and develop a framework for further
empirical testing. Based on theoretical arguments, a number of hypotheses would also be proposed after presenting the framework. As already pointed out in the introduction section, the decision outcome of adopting various processes is “buy” or “not buy” the existing business. The decision of starting business from scratch or buying a franchise is not considered in our framework.

A Conceptual Framework of Decision Making in Buying an Existing Business

Building upon the past studies in the literature review on entrepreneurs decision making process and venture creation, the following framework (Figure 1) is to present the impact of entrepreneurial triggering events (i.e. push and pull factors) on the decision making process and the decision outcome of whether or not to buy an existing business.

Figure 1: Theoretical Framework on the Impact of Entrepreneurial Triggers on Decision Making Process of Buying a Small Business
As shown in Figure 1, the entrepreneurial triggering factors are assumed to affect a person’s decision process to buy or not to buy an existing business. The interesting question that we would like to address is in what ways the decision process is affected. Conceptually, we argue that entrepreneurs will display different decision behaviors if they are triggered by different factors, such as push or pull. Moreover, different strength of intensity of push or pull factors would also affect the adoption of different patterns of decision process in buying (or not buying) an existing business.

1) The Effect of Push and Pull Factors on Emotional Decision Making Process

Kornhauser (1965) claims that conditions on the job would affect the individual’s values and value fulfillment which affect his level of satisfaction or frustration, and in turn affects his self-concept and mental health. The mentally healthy individual has a more rational set of values to begin with, and is more rational in the ways he goes about seeking them. The mentally unhealthy person probably has fewer and less ambitious values, has structured them into a less logical hierarchy, and is less capable of understanding how to achieve them.

Job dissatisfaction is an emotional response to a value judgment by an individual worker. If his/her job values are perceived to be frustrated, he/she will experience the unpleasant emotion of dissatisfaction. The intensity of these emotional reactions will depend on the importance of the values whose fulfillment is being frustrated by the work experience (Locke 1976). Also, it was found that stress at work, job dissatisfaction and a desire for early retirement are highly correlated (Denton et al., 2002; Luce et al., 2002) and usually lead to negative emotional feelings.
Armstrong-Stassen (1994) also found that layoffs are experienced as highly stressful and anxiety provoking both by the victims and survivors of job loss. In addition, Dahlstrom (1991) states that upon layoff, many are engaged in blaming themselves, and have forgotten to explore hidden opportunities more rationally by adapting to new skills, looking at the occupation from different perspective or access the possibility of starting one’s own business.

Many empirical studies confirm that entrepreneurs are higher in the desire for autonomy and lower in preference for job security than other people (Caird, 1991; Cromie & O’Donaghue, 1992). Moreover, Reynolds and White (1997) found that people engaged in the start-up process were scored higher on measures of autonomy and independence than a control group representing the overall population. Vesalainen and Pihkala (1999) also supports that the desire for independence increases the odds that a person will engage in the business start-up process. For many entrepreneurs, money is not the only reward that matters. They gain utility from greater autonomy, from broader skill utilization, and from the possibility of pursuing their own ideas (Benz, 2005; Hundley, 2001). Hence, persons experiencing positive affect tend to perceive objects, other persons, ideas, and almost anything else more favorably than individuals experiencing neutral or negative affect (Bower, 1991; Garcia-Marques et al, 2004). Another study by West (1997) suggests that entrepreneurs consider buying / investing into a business because they want to do their own thing, control their own destiny and not work for someone else. They want to make better use of their skills and abilities and to make money.

Based on the above discussion, it seems that entrepreneurs who are driven by pull factors do have much more personal interests and pursuit of “dreams” involved in the decision making
process like buying an existing business to start up. Although there might not be very strong pull factors, it is more likely that emotion comes into play due to the presence of “dream” or “hope for change” elements. On the other hand, entrepreneurs who are “pushed” generally suffer from some negative emotional swing. Their decision making process may also be affected accordingly. In particular, those individuals who suffer from strong push factors, i.e. layoffs or financial stress, are more in negative emotional state. Previous literatures have shown that they often become very emotional or even violent as compared to those merely suffering from mild job dissatisfaction or facing poor prospect. With pull and push factors combined, we propose the following hypothesis:

\[ H_1: \text{Entrepreneurs mostly likely adopt a more emotional decision making approach of buying a business when they are driven by strong push and weak pull factors.} \]

2) The Effect of Push and Pull Factors on Rational Decision Making Process

According to Elsbach & Barr (1999) and Sinclair (1988), people in unpleasant affective states (as in the case of weak push factors) but not to the extent of critical negative events, e.g. layoff (as in the case of strong push factors) tend to engage in a more effortful, systematic, piecemeal information processing, which leads to effective decision making when decisions require accurate, unbiased, and realistic judgments or systematic execution of a structured decision protocol. Also, Schwarz and Clore (1996) found that individuals who are in a sad mood (in the case of weak push factors) are more likely to adopt a systematic processing strategy that is characterized by bottom-up processing, with little reliance on pre-existing knowledge structures and considerable attention to the details at hand.
Praag and Cramer (2001) found that people would become entrepreneurs if the expected rewards surpass the wages of employment. Because expected rewards depended on the assessments of individual ability and attitudes towards risk, perceptions of entrepreneurial feasibility are included in the calculation. Thus the model, like expectancy theory, finds entrepreneurial activity to be a function of feasibility and desirability. Levesque et al. (2002) further examined the choice between employment and self-employment in a utility-maximizing model that changes according to the individual’s age (i.e. stage of life).

Shane (2000) has shown that entrepreneurs discover opportunities that are related to their prior knowledge on markets, ways to serve the markets and customer problems. Choi and Shepherd (2004) further argues that entrepreneurs are more likely to exploit opportunities when they perceived more knowledge of customer demand for the product, more fully developed enabling technologies, greater managerial capability, and greater stakeholder support. Education is one of the most frequently examined components of human capital. Formal education is seen as providing the necessary cognitive skills to adapt to environmental changes of entrepreneurship (Hatch and Dyer, 2004). Highly educated entrepreneurs may be better able to deal with complex problems. They may also leverage their knowledge and the social capital generated through the education system to acquire resources and to identify and exploit business opportunities (Shane, 2003). On the other hand, formal education may inculcate attitudes that are antithetical to entrepreneurship (Casson, 2003). As a result, past studies did confirm a positive relationship between education levels and the likelihood of recognizing opportunities (Arenius and DeClercq 2005).
According to Evans and Bishop (2001), when entrepreneurs see a potential business purchase target, their analysis frequently begins by identifying and quantifying the synergies they could achieve through acquisition. They prepare a model that forecasts the target’s potential revenues if they own it, the adjusted expense levels under their management and the resulting income or cash flow that they anticipate.

Based on the above discussion, it seems that entrepreneurs tend to think through the process with cost-and-benefit analysis if they are triggered by weak pull factors. They perceive better prospect or fit their field of study if they possess higher market knowledge and are better educated. They would analyze the situation much more than others as they are relatively free from peer pressure or immediate needs. In addition to the weak pull factors, entrepreneurs who have weak or no push factors are less emotionally too. They do not have the urgency to leave a job due to strong dissatisfaction or layoffs and they tend to have more time to think through the process of entrepreneurship. Based on the above review and rationale, we hypothesize:

\[ H_2: \text{Entrepreneurs most likely adopt a more rational decision making approach of buying a business when they are driven by weak push and weak pull factors}. \]

3) The Effect of Push and Pull Factors on Intuitive Decision Making Process

Affect influences cognition involves the tendency to engage in heuristic processing, i.e. thinking that relies heavily on mental “shortcuts” (heuristics) and knowledge acquired through past experience. This has important implications for decision making and problem solving activities performed by entrepreneurs on a regular basis and that can strongly influence the success of new ventures (Mackie and Worth, 1989). People in pleasant affective states tend to
categorize stimuli in a broader, more inclusive, and more flexible fashion, which often enhance creativity and performance on complex tasks (Staw & Barsade, 1993, Isen et al, 1987). Furthermore, past studies have also shown that affect may assist or impede access to intuitive processing; for example, negative mood states may predispose an individual to engage in rational analyses to a greater extent (Elsbach & Barr, 1999; Sinclair et al., 2002).

Sun (2008) discovers that many people often take extra time to consider existing information. They do so possibly in order to acquire more information, or even to “wait” in the hope that new information may be forthcoming before they make a decision. However, when people are in a negative emotional state they prefer to take immediate action rather than wait to get out of their emotional state.

Research findings indicate that persons experiencing positive affect are more likely than persons experiencing negative affect to engage in heuristic thought (i.e., to rely on previously acquired “rules of thumb” and previously gathered information) in dealing with current problems or decisions (Park and Banaji, 2000). It supports the findings by Schwarz and Clore (1996) that individuals who are in a happy mood are more likely to adopt a heuristic processing strategy that is characterized by top-down processing, with high reliance on pre-existing knowledge structures and relatively little attention to the details at hand.

Based on the above brief review, we conclude that entrepreneurs who are strongly pulled by positive factors are generally in very good mood pursuing lifelong personal dreams or imminently better opportunities. On the other hand, as strong pushed entrepreneurs who are
strongly pushed by negative factors will not have much choice and may do anything quickly to get out of the negative mood state. Since the entrepreneurs are being strongly pushed and pulled at the same time, they may tend to think in a big picture without much consideration of the details in making a “buy or not buy” decision. In brief, we propose the following hypothesis:

\[ H_3: \text{Entrepreneurs most likely adopt a more intuitional decision making approach of buying a business when they are driven by strong pull and strong push factors.} \]

4) The Effect of Push and Pull Factors on Political Decision Making Process

Pfeffer and Jeffrey (1992) suggests that for political decision making, the problem definition stage is more concerned with establishing constraints and preferences of those involved in and affected by the decision. The family is one of the most important influences on major life decisions, such as the determination of a career path and the decision to start up a business. Individuals coming from families where there is entrepreneurial activity are much more likely to set up a business as well (Mancuso, 1974). According to Gray et al (2006), family background (finding a role model) is important to one’s decision to become an entrepreneur. The same principle can be inferred in the case of buying an existing business. The entrepreneurial environment as well as parental guidance and support appear to be conducive to fostering entrepreneurial traits such as risk-taking, independence, creativity and achievement. The self-employed parent becomes a role model and a mentor to the nascent entrepreneur and is usually inclined to encourage entrepreneurial behavior.

In the case of strong pull situation, entrepreneurs may be presented with an imminent business opportunity or invited by family members or close friends to start a business. It is more
about choosing one’s career path and assessing the risk-taking ability of becoming an entrepreneur. Previous research has shown that other parties, including family and friends, are often involved in the decision making process. The decision making process is therefore more “dependent” on others. At the same time, in the case of weak push, the entrepreneurs may not be suffering from any strong push factors like layoffs or major job dissatisfaction. The entrepreneurs may be under immense amount of family/peer pressure or influence for the decision they make about their career. In sum, the following hypothesis is established to reflect the above arguments:

\[ H_4: \text{Entrepreneurs most likely adopt a more political decision making approach of buying a business when they are driven by strong pull and weak push factors.} \]

5) The Effect of Moderators on Decision Making Process of Buying Existing Business

In addition to capturing the effect of triggering events (i.e. push and pull factors) on decision making process of buying existing business, it is obvious that many other internal and external factors will moderate the relationship between the above two determinants. Based on observations and knowledge of past studies, we can argue that there are mainly three moderating factors: i) economic environment, ii) relevant experience of the entrepreneur and iii) personal wealth of the entrepreneur. The rationale of incorporating these moderators in our conceptual framework is illustrated as follows.

According to the Global Entrepreneurship Monitor 2007 (GEM) reports, entrepreneurial activities are strongly related to the individuals’ economic outlook, i.e. the more positive the economic outlook is, the more people engaged in entrepreneurial activities. The report also found
that entrepreneurs are generally wealthier than non-entrepreneurs to start off with. With regards to the effect of individual wealth on entrepreneurship, the study of Holtz-Eakn et al. (1994) found that the probability of becoming an entrepreneur rises with the size of the wealth inheritance by the potential entrepreneurs (who are also the potential buyers of existing business). Also, according to Messner (1995), up to 48% of the 150 executives surveyed in his study would make the move to become entrepreneurs if they have enough capital. Similarly, Praag and Ophem (1995) find that wealth is a one of the necessary requirements for becoming entrepreneurs. They also find that a first start in entrepreneurship requires the support of assets or collateral.

In term of previous relevant experience, Cooper (1985) reports that in a broad cross section of industries, seventy percent of all founders pursued opportunities are closely related to their previous employment. Similarly, Bhide (1994) also finds that more than seventy percent of all founders had replicated or modified an idea encountered through previous employment. In sum, Gaddam (2007) states that economies, personal financial base and work experience are factors affecting entrepreneurial behavior. Hence, we propose the following hypothesis for further empirical analysis:

\[ H_5: \text{Economic environment, relevant experience and personal wealth will moderate the relationship between the \textquote{push and pull} factors and the decision making process of buying an existing business.} \]

\section*{Conclusion}
Entrepreneurs can start up the business by buying an existing business. Past studies suggest that there are advantages and disadvantages of using such approach as compared to other alternatives, e.g. starting from scratch or buying the franchising. Hence, making decision to buy a business is critical to entrepreneurs. Drawing from the literature on the areas of strategic decision making and entrepreneurial start up, this paper is intended to offer some preliminary explanations on how triggering events are related to the decision process to buy an existing business. It is expected that a theoretical framework could be developed and would contribute to both academics and practitioners in better understanding the under-explored knowledge gap on the entrepreneurs’ behavior of buying an existing business. The highlights of our review and conceptual development could be summarized as follows.

First, based on comprehensive review of past studies, we conceptually assert that precipitating events are prevailing in driving entrepreneurs’ intention to set up business by initiating their effort to consider buying an existing business. Second, triggering events could be generally categorized into “push” and “pull” factors, of which push factors produce negative impact while push factors induce positive driving force when entrepreneurs consider making the ‘buy’ or ‘not buy’ decision. Thirdly, similar to prior studies in strategic decision making process, the decision making patterns of buying an existing business could be typically grouped into five major types: rational decision making, emotional decision making, intuitive decision and political decision making. Fourthly, it is conceptually argued, with the support of theories drawn from the perspective of organization psychology that different types of triggering events will lead to different types of decision process in buying existing business. It is hypothesized in our analysis that the presence of both push and pull factors will affect the use of various types of decision
making process, depending on the intensity of the strength of the factors. The following table summarizes the possible combination matrix. Lastly, our framework also incorporates three moderators: economic environment, relevant experience and personal wealth, because it is evidenced from past studies that they might affect the relationship between the triggering factors (i.e. push and pull) and decision making process of buying business.

**Figure 2: Decision Making Matrix with Push and Pull Factors**

With regards to future research direction, we suggest to test our proposed hypotheses with empirical studies within the conceptual framework. By so doing, we can take one step further to confirm the consistency of all variables included in the framework. In brief, the development of this conceptual framework will act as a bridge covering the gap between the two separate and widely research knowledge bases: entrepreneurial venturing and strategic decision making process.

An Exploratory Study on the Development of Social Enterprises in China: Does Context Matter?

K.F. Chan Theresa Lau Carlos Lo Nina Ni
Department of Management and Marketing
Hong Kong Polytechnic University

Abstract
Social enterprises (SEs) are ventures established to meet both economic and social needs and their sustainability largely rests on sufficient funding either drawn from public donations, subsidies and sponsorship or from the ventures’ internally generated profits, which depends on the SEs’ efficiency and profitability performance. However, both the internal mission and public expectation would usually drive the social enterprises into a conflict of how the social contribution and economic performance could be balanced. It is obvious that the operations of SEs are usually small in scale, and their market scope is limited and mainly community based. The emergence of SE sector is relatively earlier and therefore more developed in the Western studies on this area, e.g. their conception, drivers for and the process of establishment, and operation mode, etc. might not be directly applicable in other contexts. The primary aim of the paper is to report our study on the general development of social enterprises in China with particular focus on whether or not their development is affected by macro and institutional context, and examine how it is affected. Specifically, the questions of how the context in China will shape a) the conception of SE entrepreneurs, b) their personal driving forces in setting up SEs and c) their strategies and modes of operations would be addressed in our study. To explore the above issues, a qualitative approach is adopted. The results of our analyses confirm that both the macro and institutional context is not conducive, sometimes very inhibitive to the early formation and continuing development of SE ventures in the future. In this connection, the paper presents specific examples and elaborations on cases of how the above conclusions are drawn. It is believed that our results on the conception, the drivers and the formation process that the social entrepreneurs experience and the issues they face are somewhat different from the western context. Therefore it will render a great opportunity for researchers, policy makers and practitioners to draw theoretical and practical implications.

Introduction
Social entrepreneurship (SE) is emerging as a new discipline of study in recent years. Drawing from the knowledge of private or commercial entrepreneurship and bearing in mind with a nonprofit focus on social value creation, SE ventures are established to meet both social and economic needs (Austin, Stevenson & Wei-Skillern, 2006). Although the definition and
fundamental conception of social entrepreneurship has been discussed and documented in recent literature (see Dees & Anderson, 2003; Austin, Leonard, Reficco, & Wei-Skillern, 2004; Thompson, 2002; Chell 2008), its theoretical underpinnings and applications in various contexts has not been adequately explored. The paper is intended to report on a preliminary study in the mainland China, where the economy is in a dynamic change and SE ventures are relatively underdeveloped compared with the West, The main objective is to investigate the rationale of why social entrepreneurs develop their interests in start-up SE ventures, the process of how SE ventures start up, and the problems they encounter during the founding and operation process. Furthermore, the study will also examine the effect of institutional context on SE ventures’ development in the mainland. We believe the results of our study would be of particular relevance and value to academic and SE practitioners for future reference.

**Method of study**

Owing to the reasons of lack of understanding on social entrepreneurship in the Mainland the exploratory study in nature and limited studies on the issues and development of SE ventures in the mainland context, we decide that a qualitative approach would be the most appropriate method at this stage. Throughout our study, an open-end survey method and a series of in-depth focus group interviews with potential social entrepreneurs and those who are undertaking and running SE ventures are used as research tools. Based on our contact with the British Council in China, we got access to a large group of participants in the Mainland who joined the skill training program for social entrepreneurs in October and November 2009. Participants are invited to fill in an open-ended questionnaire so that their background, conception and operating contexts on SE ventures could be explored. To collect more comprehensive information on the
operation and development of their SE ventures, we conducted in-depth focus group interviews with selected participants at two training sites, i.e. Chengdo and Shenzhen. Since we aim at gathering rich information at the exploratory stage, the sample frame is not supposed to be representative and systematic. At the end, there are 23 valid survey questionnaires collected and 12 in-depth focus groups, 6 groups on each site. The groups are formed on the basis of years of establishment so that participants’ interaction and discussion could be enhanced during focus group sessions. In the following sections, we shall present the analyses on the development of social entrepreneurship in the Mainland with reference to the data we collected.

**Conception of Social Entrepreneurship in China**

Social entrepreneurship can be defined in broad and narrow senses. For example, Dees & Anderson (2003) suggests that social entrepreneurship refers to innovative activity with a social objective in the for-profit sector or in social-purpose commercial ventures, or in corporate social entrepreneurship (Austin, etc., 2004), or across sectors (Dees, 1998). But in narrow perspective, it refers to the phenomenon of applying business expertise and market based skills in the nonprofit sector (Reis, 1999; Thompson, 2002). The common feature across all definitions is to create social value by innovation and to address social problem. Thus, social entrepreneurship is not just defined by its legal form as it can exist in the nonprofit, business, or governmental sectors. A broader conceptualization of social entrepreneurship is as follows: an innovative, social value creating activity that can occur within or across the nonprofit, business, or government sectors.

According to our survey data, it is found that there is a common understanding among social entrepreneurs in China that the main target recipients of SE ventures are the “poor”, the
“handicapped”, the “minority”, the “weak” in the society. Therefore, it is literally for the social entrepreneurs to pay pity to this particular group of people. As a result, social entrepreneurs do not care too much who the customers are but more concerned who the recipients are. For instance, one typical response from the in-depth interview is as follows:

“We should strive to fight for the benefits and survival on behalf of the minority group; they are unlucky and abandoned by the community and therefore, we, as social entrepreneur, should do something about the unfairness.”

Due to such underpinning conception, it is difficult for SE ventures in China to sustain economically.

In terms of objectives of SE ventures, it is revealed in our study that China’s social entrepreneurs places social value on top of economic benefits. Contrary to the tradition belief that SE ventures should achieve a balance of social objective and economic objective, priority is always given to social contribution in China. Social enterprises must bear social responsibilities at any costs. Their existence can only be justified when they contribute and help in solving social problems. Profit distribution is said to be the criteria to distinguish social enterprises from private enterprises. The respondents in our survey point out that profits derived from private enterprises should belong to the entrepreneurs, senior management and shareholders themselves while profits of the social enterprises should be ploughed back completely to the society and therefore, profits should be owned by the public. Our respondents did emphasize in our survey and interview results that making profit is the mean for social enterprises while the end is to provide social benefits to the public. The different perspectives of welfare orientation and profit orientation as a way of distinction between the two types of enterprises is mainly attributed to the
traditional upbringing of people in China whereby communist philosophy is the guiding principle in their ways of life.

However, the perception on the operation model used by SE ventures in China is somewhat very similar to other main stream of thought in the West. In general, the respondents in our study agree that the business model used in private enterprises should be equally applied in social enterprises so that the business viability and sustainability are to be maintained. Both SE ventures and private enterprises have to take care of the markets, customers, finance, purchase, people management, and etc. Like private entrepreneurs, social entrepreneurs should also be innovative in offering products and services to meet customers’ needs; they should be well trained in management skills so that the ventures can be run in a cost effective manner; they need to apply marketing techniques, e.g. branding, promotion, public relation (media communication) to generate revenue and profits. In addition to those personal characteristics found common among different types of entrepreneurs such as innovativeness, flexible responses to market, quality orientation, missionary leadership, high achievement need and high level of persistence, most respondents suggest that social entrepreneurs should possess “passion and love”, “social value orientation”, “high concern on social responsibility”, and “driven by social changes and reforms”.

**Entrepreneurial Development Process of SE ventures in China**

The majority of studies investigating venture creation in the entrepreneurial process have been conducted in the private sector. The description usually involves entrepreneurial behavior relating to functions, activities, and actions associated with perceiving marketing opportunities and the creation of organizations to pursue them (Bygrave and Hofer, 1991; Aldrich, 1995). Katz
and Gartner (1988) developed a useful pre-venture creation model consisting four major properties, namely, intentionality, resources, exchange, and boundaries. On the other hand, many models map the process of new venture creation into a series of stages, including the sequential stages of activities of opportunity recognition, resource acquisition and opportunity exploitation (Bhave, 1994; Hills, Lumpkin, & Singh, 1997; Shane & Venkataraman, 2000). Other models consider post-start up activities, which cover further development of the venture beyond creation stage (Chell, Haworth, & Brearley, 1991; Bolton, 1997; Flamholtz & Randle, 2000).

Due to the increasing recognition of nonprofit sector at policy level by governments in Europe and the U.S. and its potential to generate social and/or environmental benefits in addition to economic gains, social ventures receive increasingly more attention from policy makers, academics and practitioners. Since its funding model is different from private entrepreneurial ventures, which could be a combination of earned incomes, service delivery contracts, grants, sponsorship, and donations, its creation process and development path might be conceptually and practically different from the private entrepreneurial ventures as described above. Austin, Stevenson and Wei-Skillern (2006), for example, applied the PCDO (People-Context-Deal-Opportunity) model (Sahlman, 1996) in SE venture and proposed a new framework to explain social entrepreneurship. Four major components are identified to deliver on the core SVP (social value proposition): the opportunity, people, capital, and context.

Another model to describe the process of new social venture creation with specific reference to the local community environment is proposed by Haugh (2007). Six stages are identified in her qualitative case studies of social ventures: opportunity identification, idea articulation, idea ownership, stakeholder mobilization, opportunity exploitation, and stakeholder reflection. In addition, it is also found that a formal support network and a tailor-made support
network are also part of the model in contributing resources to the new social venture throughout the stages.

All the above discussed models of SE venture creation are developed in the scenario of western cultures while specific research in a contrasted institutional context is lacking. Aldrich (1995) pointed out the process of venture creation could be very different as a result of various evolutionary paths in different institutional environments. Mainland China offers a typical example of this kind. The following sections describe the path of development of SE ventures in China based on our analysis of the real case stories in the survey and in-depth interviews.

The ideas of initiating the set up of SE ventures in China largely come out of the mind of the social entrepreneurs from their personal experience and observation of unsolved but immediate social problems. For example, one social entrepreneur sees the need of poor women in the village farm to improve their livings and enhance their status in the male dominated families. She then initiates to establish an association for women development in a community and use her knowledge of micro finance to lend money to poor women in the village with favorable term so as to facilitate them to run some micro businesses. Many beneficiaries become more economically independent in the family and gain higher social status and earn public respect. Another social entrepreneur sees the need of helping the weak minority group (the handicapped, the AIDs, etc.) to increase incomes to maintain their basic living standard by selling the handmade arts and crafts. He finds that the price paid by shops is too low, which is considered as exploitation of inferior class in the society. Recognizing the fair trade concept, he sets up a company to negotiate with all buying organizations, e.g. retailing shops, wholesalers and other institutions, on behalf of the minority group members who are individual suppliers and producers of arts and crafts. There are many similar examples in our data analysis of how social
entrepreneurs recognize the social need of people who might be unemployed, or who might lose
the earning power due to social/policy/family/personal changes, and therefore they come up with
the idea of helping them out in some ways. Interestingly, creation of SE ventures in China is not
a systematic process of seeing the market need and filling the need by offering what the
customers want. Actually, the creation process is simply based on the premise of helping people
solve some difficult problem or improve the living standard. The idea of SE ventures is
spontaneous, community and regional based, always related to living standard, and totally not
market driven, nor opportunity oriented. There is no doubt that the core social value proposition
(SVP) is vital in all SE ventures but the consideration of fulfilling market opportunity is equally
important if they are to be sustainable in the later stage. By the standard of dual objectives of
social enterprises, many SE ventures in China cannot survive for long.

In making the idea work after identifying the social need in the first stage, SE
entrepreneurs in China have to face two major challenges. First, they have to spend time and
effort to develop relationship with people as networking is crucial in doing business in China.
Social capital is one of the major assets that many respondents claim to possess in our study and
they all have already built a strong lie with various parties concerned. In fact, the analysis of our
data suggests that stakeholders’ networking process has been started and continued at the same
time when the idea of forming the SE venture is generated. Second, social entrepreneurs in China
have to sort out the legitimacy problem as there is no clear guideline on how SE ventures are
formally registered. Legal status of NGOs and government agencies are clear and registration
process should be undertaken under the administration of Public Affairs Bureau. However, social
enterprise is a new product in China and there is no specific policy governing its registration and
operation. At the moment, some respondents indicate that their SE ventures can register under
Public Affairs Bureau and their incomes are not subject to taxation while others report that they register in the Commerce and Industry Bureau while their incomes are subject to corporate profit tax. Moreover, there are still some cases that are not formally registered in China despite the fact that they have been operating in the market.

Not like private enterprises, financing SE ventures is not a big problem in their development process. Raising fund through debt market or equity market for expansion of SE ventures is rare. It is found in our study that the major constrain for development of SE ventures in the Mainland is due to the lack of sustainable business model. As it has been pointed out in the previous sections, the idea of SE ventures is usually based on filling social need instead of grasping market opportunity, it is imperative that all effort would be directed towards maximizing social benefits for the community and thus ignoring the economic existence of SE operations. As revealed in many cases of our study, when initial capital is exhausted, the SE venture cannot be further developed without the support of revenue from its own operation. A few of them can sustain either because they are lucky to start with the idea of balancing market driven mission as well as social value mission, or because they start with a successful and profitable private enterprise, i.e. and branch out a social enterprise for the sake of fulfilling social responsibility. This is a typical model called quasi social enterprise, a parallel operation of both types. Alternatively, it is also found that a few social entrepreneurs start the SE ventures initially to fulfill the social objectives and then change parts of their operation into private enterprises so that the income drawn from this sourced is used to support the continuous operation of the SE ventures. In conclusion, a number of mixed models are found in our case analysis, which are unique and worth further examination.
Issues of Social Enterprises Development in China

Alongside with the development path of SE ventures in China, it is found that both the formal government support network and informal institutional network are important determinant, either facilitating or inhibiting the quality, magnitude and speed of their development. For examples, many respondents report that many government departments, government agencies, semi-government bodies (British Council is an example of this type), universities and research institutions, public welfare organizations, private/public foundations in support of social enterprises, etc. provide tremendous assistance in enhancing the awareness of social entrepreneurship and upgrading the skills of social entrepreneurs in planning and running SE ventures. However, the main issue raised by the respondents is that such positive effort is not coordinated and sometimes fragmented and overlapped due to the widespread geographical dispersion across regions in China. A strategy of using community local based approach or country wide based approach to SE venture development should be evaluated in terms of its costs, benefit, timing and priority of community need.

The pendulum principle of swinging from NGO to social enterprise and back to NGO is still applied in China. According to our analysis, many NGOs transform themselves to social enterprises and strive to earn incomes from their own operations. After sustaining for a few years, they suffer from insufficient incomes due to ineffective business model or poor management and therefore turn back to NGOs again, looking for financial support from sponsorship, donation and public funding. It is obvious that the fundamental reason for failing to maintain to be a SE venture is the absence of a sustainable business model. The problem of poor management skills in running SE ventures can be overcome by training and upgrading of people quality but the lack of a workable business model is a difficult condition to meet. The issue is related to the pre-
venture stage, in which social entrepreneurs is too much overwhelmed by seeing social needs in the process of idea generation. A check on demographic background of social entrepreneurs in China provides a cue that why their perspective is biased toward social value orientation. In fact, very few of them in our study have gained business related experience and/or received similar training or education, implying further that their marketing perspective is quite limited. It will therefore be not surprising to see that the SE ventures are set up without reference to market opportunity and business model of any kind.

The third major issue identified from our study is the recognition of the value of social enterprises in China by various stakeholders, including central and local government, NGOs, public/private foundations, media, academic institutions and the public. At present, government policy toward social enterprise with regards to its roles, functions, legal status, operational scope, methods of finance and tax issue are not clear and varied from one geographical region to others. Public receptiveness is another major concern as most people believe that social enterprises should be the same as NGOs and some even consider as government agencies. The contextual environment is not conducive to the development social entrepreneurship if all stakeholders hold the view that they are just another category of charity organizations or NGOs.

The conflict of meeting social need and maintaining economic sustainability is another issue that are more critical in the context of communist and socialist philosophy like mainland China. The respondents in our focus group interview express their deep concern on whether the primary role of social enterprises is to achieve social objectives. Debate on the conceptualization of social entrepreneurship is controversial as arguments for and against the importance of obtaining economic profit for SE ventures are not conclusive. It further implies that the social entrepreneurs who are now running the ventures in China are still struggling on whether or not
they should make profit by charging their stakeholders, e.g. suppliers, distributors, customers and the public, etc. who belong to the minority groups. Some debates are even raised to the ethical and moral level. The dilemma that exists in China is due to the ideology problem but it leads to the eventual development and operational problems.

**Conclusion**

This paper is the first attempt to explore the conceptualization, processed and issues of social entrepreneurship in China. First, based on our survey data and focus group interview, it is found that contextual environment do make a difference in the fundamental understanding of social entrepreneurship by those who are running SE ventures in China. Secondly, the perceptual differences contribute to various perspectives in defining the objectives of SE ventures. The mixed views on social and economic objectives are prevailing among social entrepreneurs due to the transition from traditional socialist ideology to socialist market economy. Thirdly, after examining the detailed development process of SE ventures in China, it is found that the stages of development are generally not much different from the literature. However, the idea generation process in China is initiated by seeing the social needs rather than the market needs. So the core social value exists at the pre-venture stage. In the formation stage, stakeholders networking and legitimacy are relatively more crucial than those in the Western context. Opportunistic behavior of social entrepreneurs is also found occasionally when things cannot get done through formal approach. Lastly, some peculiar issues are identified in such a unique context. They are as follows: i) no coordinated approach and/or model for the development of SE ventures, leading to waste and overlap of resources at the national level; ii) lack of sustainable business model for SE ventures throughout their development; iii) lack of macro and micro-level
policies governing the operation, role and functions, etc. of social enterprises, iv) the insufficient recognition on the value of social enterprises which inhibit their future development. In sum, it is strongly believed that social entrepreneurship in China would be flourished and developed more rapidly if the contextual environment as highlighted in the above sections can be improved and government can formulate more conducive policies to facilitate the formation and strategic development of SE ventures. The study reported in this paper contributes to better understanding on the issues that we should focus to resolve and, on the other hand, it also bring more reference to practitioners in social entrepreneurship when they consider to develop and operate their SE ventures more effectively.

How Legislative Requirements Impact the Entrepreneurial Orientation of Social Enterprises: An Empirical Study

Hanna Duvnäs, Pekka Stenholm, Malin Brännback, Alan L. Carsrud, and Colleen Robb Post

Abstract
This paper analyses 154 Finnish firms with respect to the potential constraints legislative requirements impose. The legal requirements create an environment where these firms cannot create a sustained competitive advantage - at best it can be described as an artificial advantage. Results also show that while the entrepreneurial orientation is associated with the firms' ability to create a competitive advantage, these firms score below average on all three dimensions of entrepreneurial orientation, which raises a justified question: are these firms entrepreneurial? These firms seem to have been created according to legal requirements and an artificial opportunity provided by the government in need of solving a social and political dilemma, not the entrepreneur's desire to create social value.

Introduction
Social entrepreneurship as a field of research within entrepreneurship has emerged over the past decade (Dees 1998; Tracey and Jarvis 2007; Seelos and Mair 2007; Peredo and Chrisman 2006; Zahra, Gedajlovic, Neubaum, and Shulman 2008; Austin, Stevenson, and Weerawardena and Mort 2006). Yet the phenomenon as such is not particularly new. A related topic such as social welfare can be considered rather established in disciplines like economics, sociology, and even anthropology. However these studies rarely consider the potential entrepreneurial opportunities associated with this issue.

Much of research on social entrepreneurship can be considered attempts to sort out a quite massive conceptual confusion. Therefore much of available research is rather descriptive and conceptual (Dees and Anderson 2006; Dorado 2006; Mair and Marti 2006; Weerawardena and Mort 2006). This confusion originates from the fact that the aim of entrepreneurial ventures is to create
economic value. Within social entrepreneurship some researchers argue that social ventures should only create social value and in its purest form not at all pursue economic value. Others argue social ventures have to create economic value as this is a prerequisite for firm survival (Meyskens, Carsrud, and Cardozo 2010).

Moreover, in debating social entrepreneurial opportunities, the principles of free markets are automatically assumed to exist, and it is also assumed that one key component differentiating a social venture from “ordinary” ventures is whether the aim is to create social or economic value. To our knowledge, few studies exist which are concerned with the possibilities of legislative regulations governing the activities of social ventures. That is, the option that creating a social venture is not merely a matter of mission statement or declaration of strategic intent on behalf of the creator – the entrepreneur. That there may be nations that regulate this behavior considerably or even that it is politically not quite acceptable that private firms may take care of services and functions, which are considered to be the business of governments and states, does not seem to cross many researchers minds at all. This blindness results in the disregard of certain fundamental research questions that may be both important and relevant. In fact, this may point at the fact that social entrepreneurship is not a homogeneous concept when applied into a global context (although the problems social entrepreneurship attempt to solve most likely are global) and therefore, social entrepreneurship may have to be considered context specific and a unified theoretical framework may not evolve.

While a unified theoretical framework is lacking (Mair and Martí 2006), researchers are forced to apply those theoretical frameworks that are available, for example from the field of strategic management. Hence there are similarities between commercial entrepreneurship and social entrepreneurship and differences (Austin et al. 2006). Dees (1998) has identified the primary characteristics of social entrepreneurship as innovativeness, risk-taking, resourcefulness, accountability, and social mission. Other researchers have found innovativeness (Alvord, Brown,
and Letts 2004; Bornstein 2004), business model (Dees and Anderson 2006), and legal structure (Dees and Anderson 2003; Dorado 2006) to be distinct features of social ventures. These distinctive characteristics suggest that the input and output resources may be very different.

The resource-based theory (RBT) of the firm serves as a basis for analyzing a social venture’s resource management (Wernerfelt 1984) acknowledging that firms are heterogeneous regarding the resources they control. RBT, as it applies to social enterprises, focuses on looking inside an enterprise to determine their ability to grow. In social enterprises, the process and resources employed in creating social value are the sources of their ability to survive and grow (Meyskens, Post, Stamp, Carsrud, and Reynolds 2009). Using RBT offers a systematic analysis of mobilization and leverage of resources and how restrictions placed on those resources may hinder the creation of competitive advantage and subsequent growth.

In Finland, social enterprises have unique legislative requirements related to human resources. They are obligated to offer employment to the disabled and long-term unemployed for at least 30% of the total workforce of the enterprise, and at least one of the employees must be disabled. In addition, they have to produce goods and services according to commercial principles (Heckl, Aaltonen, and Stenholm 2007). This employment requirement is compensated through subsidies provided by the government; such as support for employing disabled individuals and special aid for starting social enterprises and establishing operations (Heckl et al. 2007). The fact that these firms have to operate according to commercial principles means they have to generate profit. To ensure profitability requires the ability to create a competitive advantage (Porter 1980). Based on the social entrepreneurship literature these requirements are highly problematic as it is generally assumed that the goal of social entrepreneurs is primarily social not economic.

This situation presents an interesting case for investigation, as this is the essential nature of Finnish social enterprises, as outlined by law. RBT assumes that all resources among firms are heterogeneous and mobile. Here, two of the resources are forced to be homogeneous in
nature (30% human resources and the financial resources received through stipends). This distortion in the natural ebb and flow of entrepreneurial activities present Finnish social entrepreneurs with a unique challenge that has yet to be explored. Clearly, effective management of resources is important in social enterprises, but as these are forced sets of resources for each enterprise to manage, these ventures may become dependent on public funding due to their obligation to act as work-integration enterprises (Heckl et al. 2007). Accordingly, this may mean they lose their entrepreneurial characteristics conceptualized here as entrepreneurial orientation (Covin and Slevin 1991) and ability to create a competitive advantage.

Finnish social enterprises provide a unique group for study allowing for empirical analysis of the entrepreneurial processes and the creation of economic and social value within a regulating legal environment. This study extends existing literature on the social enterprises by examining the potential constraints the legislative requirements impose on Finnish social ventures. We also argue that the legal constraints impact the entrepreneurial orientation of the firm in a negative way, that is legal regulations decrease entrepreneurial orientation and thus the firm is unable to create a sustainable competitive advantage and thus sustained growth.

**Competitive Advantage and Entrepreneurial Orientation**

In commercial entrepreneurship a requirement for sustainable business activity is for a firm to create a competitive advantage. Competitive advantage ensures profitability and is based on a firm’s ability to sustain growth (Porter 1980). While the concept of competitive advantage is problematic within the context of social entrepreneurship as it assumes a primary economic goal, and we know many social ventures have a social mission, we find it appropriate to include the concept in this study. The reason is found in the requirement in the Finnish Law, which explicitly requires these firms to operate by economic principles despite their social mission. Moreover, previous studies also suggest the human and financial resources, as well as the context of the social
value, have to be aligned in social enterprises (Austin et al. 2006). Thus, if these enterprises own or are able to acquire the particular resources and capabilities, the more likely they are able to react to the recognized opportunities and create value. However, if resource allocation is partly directed by legal requirements, it may hinder their value creation. Moreover, it is unclear if these firms are created based on “genuine opportunity recognition” or if they are created because the entrepreneur sees a way, provided by the government, to create a venture, which is kept afloat through subsidies. Thus, it is unclear if a firm’s ability to create a competitive advantage is “genuine” or “artificial”.

Hypothesis 1: Special legislative requirements are associated with social enterprises’ ability to achieve competitive advantage.

The Schumpeterian rationale for entrepreneurship in turn rests on the notion of a firm’s ability to innovate. Moreover, the vast stream of entrepreneurial orientation (EO) literature posits that EO, which is a firm-level construct, is dependent on proactiveness, innovativeness, and risk-taking (Covin and Slevin 1991; Miller 1983). Proactiveness refers to seeking and identifying new opportunities, which may be related to present operations or the introduction of products ahead of competition (Venkatraman 1989). Proactiveness thus reflects the notion of an ability to create a competitive advantage through the generation of high entrepreneurial profits (Wiklund and Shepherd 2005), that is the firms possess sufficient resources for this. Innovativeness – in line with Schumpeter (1934) – reflects the firm’s ability to create and support the creation of new ideas, new products or processes (Lumpkin and Dess 1996). Finally risk-taking reflects the ability to pursue opportunities even when the costs of failure are high or the outcome highly uncertain (Wiklund and Shepherd 2005).

Two of three distinct elements in EO have also been found be distinct for social entrepreneurship; innovativeness and risk-taking (Dees 1998; Alvord et al. 2003; Bornstein 2004). As proactiveness, ability to innovate and risk-taking contribute to firm performance, EO should be associated to a firm’s ability to achieve a competitive advantage. Thus, we assume that the social
enterprises in question have to be entrepreneurially oriented, that is they have to take risks, innovate and act pro-actively. As business entities they have to pay attention to the prerequisites of their continuity. Without this, they lose their entrepreneurial characteristics.

Hypothesis 2: Entrepreneurial orientation is associated with social enterprises’ ability to achieve competitive advantage.

Method

Data and Variables

The total population of Finnish social enterprises; 154 firms were analyzed. The firms were sourced from the register by the Ministry of Employment and the Economy, which they are required to maintain, by The Finnish Act on Social Enterprises, enforced in 2004. The number of registered social enterprises has declined relatively fast during February–April 2010. The decline was from 208 to 154. This may be partly due to the expected changes in the subsidies provided for employing disabled individuals.

Data was collected through an Internet-based survey targeted at the 127 firms, whose e-mail addresses we were able to access. In all, six firms’ e-mail addresses were not functioning, two firms informed that they were no longer social enterprises and two firms replied that they had closed their business. In all, three reminders were sent to the potential respondents. The 41 firms with no known e-mail address from the start were contacted via telephone. The ones that we got in touch with and from which we got an e-mail address were sent a link to the Internet-based survey. One respondent did the survey over the telephone. The final sample was 69 social enterprises (45 percent response rate). The analyses of non-response bias show that participating firms were slightly larger than the non-responding firms. However, there were no statistically significant demographic differences found between the first-wave and second-wave respondents.
**Ability for Competitive Advantage (CA).** The ability to achieve sustainable competitive advantage was measured in terms of five separate items. We examined social enterprises’ competitive advantage based on their physical, human, and organizational resources. The respondents were asked to answer statements using the five-point Likert scale. The reliability of the factor items was also acceptable (Cronbach’s $\alpha=.896$, see Appendix 1, Table 3 for the items).

**Legislative Requirements.** The legislative requirements set for the Finnish social enterprises were measured in terms of five self-reported items. The items comprised the subjective perception of the possible effects of legislation on firms’ innovativeness, development of the know-how, ability to get finance, development of competitiveness, and success in the markets. The respondents were asked to answer statements using five-point Likert scale. The reliability of the final composite variable was acceptable (Cronbach’s $\alpha=.886$, see Appendix 1, Table 5 for the items).

**Entrepreneurial Orientation (EO).** Entrepreneurial orientation was measured in terms of a modification of Miller’s (1983) scale. The respondents were asked to respond to eight statements about risk-taking behavior, innovativeness, and proactiveness of the firm. Miller’s (1983) scale or its modifications have been used in several studies (Covin and Slevin 1989; Wiklund and Shepherd 2005) to measure entrepreneurial orientation. Instead of using original pairs of opposite statements, we asked the respondent to answer statements using the 5-point Likert scale. One item that is “In dealing with its competitors, my firm typically initiates actions which competitors then respond to” was dropped out of the analyses due to its low communality value. The reliability of the composite variable was acceptable (Cronbach’s $\alpha=.851$, see Appendix 1, Table 4 for the items).

**Control Variables.** In addition to age, profitability (profit/turnover) and industry of the firm, the analyses were controlled for the social value creation of the social enterprises. This was
based on the self-assessed variable on their social values. Similarly, we controlled for the relative share of disabled workers in the firm, which was also based on self-reported numbers.

All the relevant variables, their descriptive statistics and correlations are shown in Table 1. There is a correlation between items measuring EO, but VIF statistics indicated no multicollinearity. The studied firms were 11 years old on average and they have been officially registered as social enterprises 2.7 years on average. The age of the firm varied from one to 65 years and the time as official social enterprise varied from five months to 6.3 years. More than half, 54 percent of the firms were operating in services, and the rest were either in trade (21 percent) or in manufacturing (25 percent). Their emphasis on social value was less than 50 percent, which may come as a surprise but can be attributed to the legal requirement of operating by economic principles. Still, the relative share of disabled employees (disabled and people with long period of unemployment) was 67 percent.

**Results and Discussion**

Our explorative results show that the studied social enterprises perceive their abilities to achieve competitive advantage relatively adequate (see Appendix 1, tables 3–5). They perceive that they work more efficiently than their closest competitors and that their personnel’s know-how is good enough to match competitors’ actions. On the contrary, their engagement in entrepreneurial
orientation, especially in risk-taking and innovativeness is weak or at best average. Among the studied social enterprises the role of legislative requirements is perceived less negative than expected. Their status as registered social enterprises has opened up a special source of finance. Accordingly, these enterprises do not perceive that legislative requirements would hinder their ability to access finance. In addition, these enterprises see that their success in the markets is not hampered by the legislative requirements. These findings suggest that Finnish social enterprises have adjusted their goals and operations based on their capabilities. At the same time, however, their tendency to behave entrepreneurially is less prevalent given the low scores on innovativeness.

$DV$: Ability to achieve competitive advantage
All coefficients are standardised.

We tested our hypotheses with a hierarchical linear regression in which the self-assessed ability to achieve competitive advantage was regressed on EO and the legislative requirements. Our results show that entrepreneurial orientation is positively associated with the ability to achieve competitive advantage ($p<.001$). This supports our hypothesis H2 (Table 2). However, the assumed
association between the legislative requirements and the ability to achieve competitive advantage was not supported. Even if the descriptive statistics show that 2/3 of the personnel is disabled to some degree, it does not hamper the perceived ability to achieve competitive advantage. In addition, our results show that social value or the relative share of disabled employees is not associated with the perceived ability to achieve competitive advantage.

**Implications**

Our results indicate that Finnish social enterprises do not lack the unique bundles of resources necessary for sustainable competitive advantage. In addition, the studied social enterprises perceive that the legislative requirements to employ disabled individuals do not hinder their ability to achieve competitive advantage. This suggests that social enterprises may adjust their behavior, goals and market orientation according to their current capabilities. Thus, possible “below the average” productivity do not hinder their operations if the goals are adjusted accordingly.

However, the current trend of a declining number of Finnish social enterprises due to expected changes in financial support provided for employing disabled individuals suggests that these firms are relatively dependent on the external financial support, either through subsidies from government or some special foundations. This may indicate that the proposed adjustment is exogenous. This suggests that their value creation is mainly focused on fulfilling the legal employment requirements, and not on providing social value to a larger community as the primary mission. We do not claim that this value creation is incorrect nor should it be underestimated. However, results suggest that social enterprises under restrictive legislative requirements have highly demanding circumstances for securing their continuity and creating significant changes in the social, political, and economic contexts for marginalized groups (Alvord et al. 2004).

The engagement in entrepreneurial orientation is, however, positively associated with the ability to achieve competitive advantage in social enterprises. While this is a positive finding for
the future of social enterprises it is problematic as the respondents score below average or at best average on all three dimensions of EO. These firms seem to be created and exist out of legal requirements and an artificial opportunity constructed by government to deal with a social dilemma. For example, a firm registered as a social enterprise in Finland could be the result of an initiative taken by a foundation that sees this form of activity, including the subsidies it implies, as an opportunity to finance its activities (see The Law about Social Enterprises 1351/2003 4 § subsec. 1). Nevertheless, even if they are obligated to fulfill the legislative requirements, there seems to be some kind of seedbed for innovative and proactive behavior and thus a potential for competitive advantage. This may create a favorable basis for cultivating new innovations leading to wider social value creation. However, the steep decline in the number of social enterprises indicates their very strong dependency on external funding, which during economic recessions normally is tightened. This in turn indicates a clear weakness in their business model, which seems unable to sustain operations. Thus this would indicate that the competitive advantage at least in some cases is artificial rather than genuine. While EO is associated with competitive advantage the relatively low scores raises yet another question – especially with reference to Schumpeter’s notion of entrepreneurship containing the element of innovativeness; how entrepreneurial are these firms?

Obtaining Intangible Resources through Entrepreneurs’ Network Mix:  
A Multi-case Study of New Firms in an Emerging Economy 
by Zhaoping Liu, Cathy Hsu, and Songshan (Sam) Huang

Based on in-depth interviews of entrepreneurs in China’s economy hotel industry, the current study summarized the network mixes used by entrepreneurs to acquire intangible resources at different development stages of new firms. In the early start-up stage, entrepreneurs used many weak business ties. In the establishment stage, they relied on strong business ties, but they did not value personal network ties in the final growth stage. This research discovered that very few political ties were used to acquire human capital and knowledge, but some interviewees indicated that political ties were effective in other procedures such as obtaining funding and gaining legitimacy. Our analysis also suggested that network mixes used by entrepreneurs to acquire tangible and intangible resources are not identical.

Introduction

The resources-based view (RBV) suggests that heterogeneous and immobile firm resources are sources of sustained competitive advantage (Barney 1991; Wernerfelt 1984). Citing Daft’s (1983) definition, Barney (1991, p.101) indicated that “firm resources include all assets, capabilities, organizational processes, firm attributes, information, knowledge, etc. controlled by a firm that enable the firm to conceive of and implement strategies that improve its efficiency and effectiveness.” Resources are composed of physical capital resources, human capital resources, and organizational capital resources (Barney 1991).

Entrepreneurial firms face the liability of newness and often lack resources essential to their survival and long-term growth (Stinchcombe 1965). Many entrepreneurs have addressed
this liability by building networking capabilities and acquiring organizational resources through their personal network ties (Hoang and Antoncic 2003; Johannisson 2000; Slotte-Kock and Coviello 2010).

Previous studies have shown that entrepreneurs use different types of network ties at different development stages (Lechner and Dowling 2003; Lechner, Dowling, and Welpe 2006). Many researchers have explored the roles of strong ties versus weak ties during entrepreneurial processes (Bruderl and Preisendorfer 1998; Elfring and Hulsink 2003; Jack, Drakopoulou Dodd, and Anderson 2008). However, an important dimension of network ties has been neglected: political ties versus business ties. Furthermore, few researchers have distinguished network mixes used for acquiring intangible resources from those for acquiring tangible resources. No study seems to have compared the network mixes for acquiring explicit knowledge and obtaining tacit knowledge.

Using in-depth interviews with owners/top executives of 13 economy hotel chains, the current study has added political ties versus business ties as a new dimension in discussion of the network mix and explored how entrepreneurs in an emerging economy acquire intangible resources through different network mixes for new firms at the early start-up, establishment, and growth stages. Other objectives of this study included comparison of the network mixes used by entrepreneurs to acquire intangible versus tangible resources and those for acquiring explicit knowledge versus tacit knowledge.

In the next section, we develop our research questions from reviewing relevant literature. Section three covers the research methodology of this study. The results and discussions of this multi-case study are presented in section four and conclusions are drawn in section five.
Acquiring Intangible Resources through Network Ties

Network Mix at Different Development Stages

Studies have shown that entrepreneurs use different network ties during different stages of the entrepreneurial process (Adler and Kwon 2002; Lechner and Dowling 2003). The networking activities of entrepreneurs can be identified with multiple stages (Butler and Hansen 1991; Hite 2005; Larson and Starr 1993). Butler and Hansen (1991) showed that, during the opportunity identification process, entrepreneurs communicate opportunities through social networks; during the business formation process, the newly developed business-focused networks took the central stage; and during the ongoing business growth stage, entrepreneurs use inter-firm strategic networks to obtain more resources, especially intangible resources. Hite (2005) suggested that resource acquisition through a network depends on the type and evolution of relationally embedded ties. Drakopoulou Dodd, Jack, and Anderson (2006) found that entrepreneurs’ networks change over time according to the needs of entrepreneurs.

A typical typology of network ties distinguishes strong ties from weak ties. The roles of strong and weak ties in providing firm resources differ (Burt 1992; Coleman 1988; Hansen 1999; Granovetter 1973; Uzzi 1997). A number of previous studies have explored the roles of strong ties versus weak ties during entrepreneurial processes (Bruderl and Preisendorfer 1998; Elfring and Hulsink 2003; Jack et al. 2008). For example, Starr and Macmillan (1990) suggested that new ventures should focus on strong ties during the founding and early growth stages.

Jack, Drakopoulou Dodd, and Anderson (2004) proposed that ties are differentiated by dimensions other than intensity and called for a multiple perspective to substitute for the strong versus weak tie dichotomy. This study considers a new typology in discussion of network ties: political ties versus business ties. Network ties can be classified further as business ties (ties with
suppliers, buyers, and competitors) and political ties (ties with officials in government, industrial bureaus, and regulatory organizations). In emerging economies with powerful governments and uncertain institutional environments, political ties have played important roles in supporting entrepreneurial firms (Peng and Luo 2000). Network mix refers to the constitution of networks involving the four types of network ties derived from the two typologies, that is, strong political ties, weak political ties, strong business ties, and weak business ties.

**Acquiring Intangible versus Tangible Resources**

Significant differences exist between tangible and intangible resources (Hall 1992, 1993). Michalisin, Smith, and Kline (1997) proposed that imitability is a major factor that distinguishes intangible from tangible resources, and that a resource-based advantage is only driven by intangible resources. Another difference between the two types of resources is that the use of intangible resources will increase their value, while the use of material resources depreciates their value (Fernández, Montes, and Vázquez 2000). Hall (1992, 1993) proved from two of his empirical studies that intangible resources are more important to firm success than tangible ones, for the top five most important resources listed by CEOs in the United Kingdom were all intangible resources.

While many studies have discussed the process of securing resources in general, very few of them distinguished between acquiring tangible and intangible resources (Michalisin et al. 1997). The important role played by intangible resources and the many peculiar characteristics they have deserve tailored studies on how to obtain intangible resources during the entrepreneurial process.
Acquiring Explicit versus Tacit Knowledge

Knowledge is one important form of intangible resources of a new firm. Multiple dimensions of knowledge have been discussed in previous studies. For example, Koka and Prescott (2002) introduced the three dimensions of information as information volume, information diversity, and information richness. Zander and Kogut (1995) developed five central constructs to describe the multi dimensions of knowledge. These dimensions are codifiability, teachability, complexity, system dependence, and product observability.

However, the dominant dimension for a typology of knowledge is based on its communicability or transferability. Knowledge could be defined as explicit or tacit knowledge using this measurement (Polanyi, 1967). A similar typology (Grant, 1996; Nahapiet and Ghoshal 1998) distinguishes two categories of knowledge as information (or know-what, know-that, declarative knowledge) and know-how (or procedural knowledge). Information is “knowledge which can be transmitted without loss of integrity once the syntactical rules required for deciphering it are known” and know-how (defined by Von Hippel 1988) is “the accumulated practical skill or expertise that allows one to do something smoothly and efficiently” (Kogut and Zander 1992, p. 386).

Strong ties and weak ties are good at transferring different types of knowledge. Entrepreneurs can get innovative information through weak ties, while they mostly get fine-grained information through strong ties (Granovetter 1973; Uzzi 1997). Byosiere, Luethge, Vas, and Salmador (2010) have found that strong ties are essential to tacit knowledge transfer and weak ties are vital to explicit knowledge transfer. Nevertheless, the conclusion might be contingent upon the different stages of new firm development and not be universally applicable.
One objective of this study was to answer the question of how entrepreneurs in an emerging economy acquire intangible resources through different network mixes (for example, strong political ties or weak business ties) during different stages of entrepreneurial processes. It compared the network mixes of new firms at the early start-up, establishment, and growth stages.

The current study also aimed to investigate how entrepreneurs obtain intangible resources through network ties and compare the network mixes for acquiring intangible resources with those for obtaining tangible ones. More specifically, we focused on the acquisition of human capital and knowledge transfer using network mix. Some human resources are considered invisible assets and many “of the invisible assets of the firm are embodied in people” (Itami and Roehl 1987, p. 14). Knowledge transfer “is the process through which one network member is affected by the experience of another” (Inkpen and Tsang 2005, p. 149). This study compared the network mixes used by entrepreneurs to acquire explicit and tacit knowledge for new firms in different development stages.

Methodology

The major purpose of the study was to investigate how entrepreneurs acquire intangible resources through different network mixes. The exploratory character calls for a qualitative approach (Eisenhardt, 1989). To compare and contrast entrepreneurial firms in three development stages, a multiple case study is appropriate (Van de Ven and Poole 2005; Yin 2003).

Researchers have used different standards to define entrepreneurial or new firms (Brush 1995; Covin, Slevin, and Covin 1990; Yli-Renko, Autio, and Sapienza, 2001; Zahra, Ireland, and Hitt 2000). Many have agreed on the definition that a firm in the entrepreneurial process should be eight years old or younger (Li and Zhang 2007; McDougall 1989; Zara 1996; Zhang and Li 2010). Employing this definition, this study chose economy hotel chains that had been in
operation for no more than eight years. By this standard, most of the economy hotel chains in China could be included in the research population.

The stages of firm development have been defined by many studies. Wilken (1979) identified three phases in the establishment of enterprises: the motivation phase, the planning phase, and the establishment phase. Lechner and Dowling (2003) classified firms in the following five stages: fast-growing start-up firm, initial public offering (IPO)-preparation, IPO-due diligence, post-IPO, and established firms. Jack et al. (2008) summarized the three stages used by most life-cycle approach models: pre-start up, establishment, and growth.

Mainly considering the sizes of economy hotel chains combined with their founding time and current competitive strategies, we differentiated entrepreneurial firms in early start-up (with 10 or fewer hotels), establishment (with a double-digit number of hotels), and growth stages (with over 100 hotels). Glaser and Strauss (1967) defined theoretical sampling as “seeking samples of populations, events, and activities guided by the researcher’s emerging theory” (Peng, 1997, p. 392). We sampled five Chinese economy hotel chains in an early start-up stage, five in an establishment stage, and three in a growth stage. To avoid releasing informants’ private information, we identified the five executives of the economy hotel chains in the early start-up stage as S1 through S5, those in the establishment stage as E1-E5, and those in the growth stage as G1-G3.

The major method of data collection was hour long in-depth interviews with entrepreneurs (mostly founders, CEOs, GMs, and VPs who own company shares). The name generator method (Scott, 2000) was used to locate entrepreneurs’ friends and acquaintances who played important roles in the processes of acquiring human capital and knowledge. Information on network tie strength (strong vs. weak) and type (political vs. business) was also collected. The
interview guide was composed of questions on the development of network ties, the processes of acquiring human capital and knowledge, and the importance of each type of ties. All interviews were voice-recorded and transcribed. Two authors coded the transcripts independently and the cross-check showed inter-rater consistency.

**Results and Discussion**

**The Importance of Network Ties in Acquiring Intangible Resources**

A total of 38 network ties of various types were mentioned during the interview process, averaging about three ties per informant. Among the 13 informants, one could not recall any network ties through which to acquire intangible resources; others gave at least one example of using network ties to obtain intangible resources. E2 described the highest number of six network ties through which intangible resources were obtained.

Knowledge and human capital are two specific types of intangible resources discussed in this study. We found that network ties played an essential role in acquiring human capital. Among the 38 network ties mentioned by informants, 21 were used for acquiring human capital. For example, the director of human resources of S2’s hotel chain was hired through a referral. G1 contacted colleagues in his previous company to hire a former customer because he was moved by her sense of responsibility many years ago.

The major reason entrepreneurs hire friends and acquaintances or hire through referrals is that they know each other better. Knowing the ability, attitudes, and moral qualities of the potential employees and the managing style of the employers leads to high levels of trust between them. E1 suggested that resumes are not reliable sources of people’s capability and that hiring through referrals is more effective. About 80 percent of middle or high level managers hired through network ties were retained in the company, but only 20 percent of those employed
through the public recruitment process kept their positions after the probation period. S1, S5, and E4 hired previous subordinates as key assistants because entrepreneurs could instantly assign important jobs to them.

Although other studies showed that hiring through network ties is not uncommon in international hotel chains (Liu, Huang, and Hsu 2010), network tie-related hiring is more important to the population considered in this study. The major reason may be that the headhunter industry is not yet well-developed in China, and most economy hotel chains lack human capital support from their parent companies, which themselves possess only limited talent in hotel chain operation. Well-established databases on available human capital that companies can resort to in the market are yet to be built. Due to these reasons, network ties could be the primary channels for hiring middle and high level managers at this stage. This study also found the practice of combining public recruitment with network-related hiring. Both G2 and E3 verified that people referred by friends and acquaintances must pass all formal screening procedures before being employed.

**From Weak Ties to Strong Ties and No Ties**

A general pattern was found for using entrepreneurs’ network mixes to acquire intangible resources during entrepreneurial processes in this emerging economy. The majority of network ties used by entrepreneurs in the early start-up stage are weak business ties. For example, S3 hired three acquaintances and all of them played important roles in the firm: two are property level general managers and the other takes care of multiple properties in the city where the chain started. S5 hired a previous colleague as the general manager of a large hotel.

This finding is different from previous study results showing that strong ties are more willing to offer help to entrepreneurs at early stages when the risks of failure are high (Bruderl
and Priesendorf 1998). Uzzi (1997) suggested that in early stages, most entrepreneurs get resources through strong ties such as relatives or good friends. The reason for the difference could be that the current study only focused on intangible resources. The passing of information to others does not reduce the welfare of the actors (Fernandez et al. 2000), which makes people more willing to share intangible resources with those linked through weak ties.

In the establishment stage, almost all entrepreneurs relied on strong business ties to obtain intangible resources. Many of the strong ties used in this stage are developed from weak ties in the earlier stage. For example, E1 can discuss any topic on hotel administration in depth with a university researcher who conducted consulting work for his previous company. E1 also learned the whole process of on-line business booking through a supplier of IT technologies to his company. E2 developed a close relationship with the manager of a consulting firm during an earlier fundraising period. Even though the cooperation between them failed, E2 can still obtain answers for all questions on how to raise funds from financial organizations from this tie. Jack et al. (2008) explained that, with the growth of business and an increasing number of network ties, entrepreneurs delegated previous network ties to colleagues for maintenance and only dealt with strong tie-related issues.

In the final growth stage, none of the entrepreneurs took individual ties seriously. They concentrated on creating core competences through employee training, building corporate culture, and improving the efficiency of execution. G1 claimed that his network ties were not important in improving firm performance, and the competitive advantage of the firm was the unique corporate culture. When being charged with an offense against regulations, G2 paid government fines without trying to solve the problem under the table through political ties because he did not
want to lead employees to the wrong direction. G3 pointed out that network ties are irrelevant to the core competences of his company.

Institutional theory held that, in a transitional economy, network ties play a less important role as market regulations and institutions are established. This is consistent with our finding of how entrepreneurs weigh network ties differently in the growth stage versus in previous stages. Another possible reason is that organizational level strategic networks were substituted for the network ties between individuals. Inkpen and Tsang (2005) suggested that, with the development of new firms, the individual level and organizational level social capital are often interrelated. Without asking questions on organizational networks, we cannot judge whether organizational networks are important in the growth stage.

**Political Ties Not Key to Acquiring Human Capital and Knowledge**

Our analysis suggested that the network mixes for acquiring tangible and intangible resources are not identical. In our study, the only informant who did not use network ties to acquire intangible resources did use a strong tie to obtain funding critical to the start-up and survival of his firm. Some informants, such as E1, who used many network ties to obtain intangible resources, did not acquire tangible resources through network ties.

A clear pattern was found in the use of political ties versus business ties. We discovered that political ties are not popular for acquiring human capital and knowledge. Most network ties through which entrepreneurs obtain human capital and knowledge are business ties. Only one entrepreneur learned about the minimum area requirement for a hotel room through a strong political tie. He found that his hotel was in the grey area as regards breaking regulations. This entrepreneur obtained suggestions from the government official and fixed the problem at minimum cost. Tsang (1998) proposed that after receiving support from government officials,
managers often had to pay them back, in particular, by hiring unqualified people recommended by those officials. Nevertheless, no such case was found in our study.

Although using political ties is not common for acquiring these two types of intangible resources, some cases suggested that they are effective in other procedures, such as gaining legitimacy and settling disputes with other parties. For example, when an informant intended to break a lease to reduce losses and was sued by a property owner, she obtained help from a political tie and settled the lawsuit, paying only nominal penalties far lower than the amount required by the original contract.

A related study (Liu et al. 2010) found that political ties also function in the acquisition of tangible resources. In China, government officials control a large proportion of funding and can assign funds to state-owned companies based on rationales other than investment return. When government executes a tight monetary policy, support from strong political ties is very important to entrepreneurs for obtaining loans from state-owned commercial banks. Entrepreneurs have also leased properties of good location through both strong and weak political ties.

**Similar Network Mixes for Acquiring Explicit and Tacit Knowledge**

While previous studies have shown that weak ties are good for innovative information and strong ties for in-depth information, this study showed that the primary factor affecting entrepreneurs’ network mixes in acquiring knowledge was the development stages of the firm. In the early start-up stage, entrepreneurs either did not use network ties or used weak ties; in the establishment stage, they mostly used strong ties; and in the growth stage, they used weak ties (Table 1).

^a: S4 is an exception in this category. He reported all his network ties as strong ones.

None of the entrepreneurs in the early start-up stage used network ties to identify opportunities, because all of them had been working in the economy hotel sector and had found the business opportunities by themselves. These informants obtained tacit knowledge mostly through weak ties. For example, S3 learned about philosophy of product design and other tacit knowledge from two weak business ties.

Entrepreneurs in the establishment stage, such as E2 and E4, obtained both explicit and tacit knowledge through strong business ties. E2 obtained macro-level knowledge of the whole economy hotel industry through a scholar (listed as E2’s strong tie) who was invited to develop strategies for the parent company. The fine-grained knowledge of how entrepreneurial firms can obtain funding was discussed by E2 and her friend, a manager of a consulting firm. E4 identified the optimistic future of economy hotels and product positioning through a strong business tie. They shared knowledge such as general pricing strategy (explicit) and details of product design (tacit).

Weak ties help entrepreneurs in the growth stage to acquire knowledge. G1 entered into the economy hotel sector through an acquaintance who played the role of a broker between G1 and the primary investor. G2 first learned of the potential of economy hotels through a classmate...
working in a regional bank which received many loan applications from economy hotel developers.

The network mix found by this research is in contradiction to the commonly accepted pattern of strong ties being good for tacit knowledge and weak ties for explicit knowledge (Byosiere et al. 2010). The major reason could be that the differences between explicit knowledge and tacit knowledge are subtle; thus, the network mix was dominated by the firm’s development cycle. Another possible reason for firms in the establishment stage obtaining explicit knowledge through strong ties could be due to the bias incurred by the name generator method. Using this method, informants tended to recall more strong ties than weak ties. Entrepreneurs in the growth stage obtained tacit knowledge through weak ties instead of strong ties, possibly because they separated business relationships from personal relationships and used different standards to define the strengths of those two types of ties. For instance, G2 maintained frequent contacts with a supplier and was able to obtain in-depth knowledge and timely feedback from him, but he did not take the relationship as emotionally committed and defined it as a weak tie.

A by-product of analyzing explicit/tacit knowledge transfer is that entrepreneurs who combined other methods with networking in obtaining knowledge in different stages. In the early start-up stage, entrepreneurs learned through books, websites, and “shopping the competitors” to gain explicit knowledge that is publicly available. In the establishment stage, they participated in conferences or hired competitors’ employees to obtain both explicit and tacit knowledge. In the growth stage, entrepreneurs exchanged fine-grained knowledge by organizing structured face-to-face meetings with competitors. For instance, G1 and his VPs visited G3’s company and formed panel style discussions with top executives there. G1 also visited another well-known economy
hotel chain to learn from their operational experiences. G2 initiated an informal meeting with top executives of other large economy hotel chains.

**Conclusion**

Results of this study supported the application of social network theory to the entrepreneur field. Through network ties, entrepreneurs can gain intangible resources that are otherwise either unavailable or marked by higher prices in the market. Entrepreneurs use different network mixes during different stages of firm development. A wealth of empirical evidence was recorded to help improve our understanding of the roles of entrepreneurs’ network ties in the specific processes of acquiring human capital and knowledge. The distinction between network mixes used for acquiring tangible and intangible resources added to the enrichment.

In addition to the strong versus weak tie distinction, we added a new dimension for describing network ties: political versus business ties. The role of political ties has not been thoroughly discussed in the literature. In transitional economies like China, the role of political ties is particularly relevant and could be a good topic for future study. Furthermore, we realized that political and business ties do not form a complete typology because they do not exhaust all possible network ties. Entrepreneurs’ network ties with other parties, such as relatives, classmates, and hometown fellows, cannot be put into either category. Some informants in this study noted that they especially benefited from network ties with academic researchers, but a full discussion of such tie is unwarranted since we did not ask specific questions on this type of network tie. Exploring the roles of researchers as network actors in knowledge transfer in the hotel industry may also generate promising research findings.

Using retrospective design to probe process-related research questions is feasible but flawed. The different network mixes used by entrepreneurs in different stages could be due to the
characteristics of individuals, not the firm development process. Using a longitudinal design to follow up the same group of informants over time can remedy such a methodological defect and lead to more convincing results.

Abstract

This research paper aims to investigate how innovation emerges as a result of interactions among firms in a collaborative network of micro, small and medium enterprises (SME) in São Paulo’s furniture sector. Innovation in SMEs’ collaborative networks in emerging economies has been influenced by various entities, especially the government, and the complexity of this phenomenon cannot be sufficiently explained by the theoretical perspectives in the literature. In order to generate a substantive theory that explains it, a case study has been conducted using Grounded Theory. The analysis is based on about 1068 minutes of interview material together with secondary source material relating to the organizations interviewed. The findings contribute to our understanding of the impact of context on innovation, and shows how group’s experiences and the need for knowledge have influenced innovative relationships.

Keywords: collaborative network, small and medium enterprises, innovation, knowledge, qualitative research.

1 Introduction

Firms’ innovation capability has become a critical factor for productivity and competitiveness. Advances in information technology, communication and globalization have increased competition and simultaneously created opportunities for co-located businesses to work together to form innovative clusters for technological upgrading and diversification (Carayannis and Wang, 2006; Porter, 1985; OECD, 1999). Here, we focus on how an agglomeration of small and medium enterprises located in an emerging economy can collaborate effectively to increase their ability to innovate.

Research studies of small business have often been based on theoretical perspectives developed for larger companies, but this extrapolation should be treated with caution, as a small business is not a big company in reduced scale (Welsh and White, 1998, Gibb 2000). Indeed, the recent literature review by Tan, Fischer, Mitchell and Pan (2009) suggests that little research effort has been devoted to SME theory building from a small businesses setting, and that even less theory building has been done in the case SMEs’ external relationships in the network context (Street and Cameron 2007). Rather, studies have tended to focus on

individual, organizational and environmental characteristics which affect the formalization of relationships, and their subsequent performance, organizational development and competitive advantage rather than focus on the evolution of these relationships, and their impact on future relations. The contribution of our research is to generate a substantive theory\textsuperscript{2} to help us understand and explain how innovation emerges and to explore which factors contribute or inhibit this process in an SME collaborative network.

To focus our research, we sought a network that had an established record of acting collaboratively and which has been generating concrete results from this collaboration. With that in mind we approached the Forum for Innovation\textsuperscript{3} and the Brazilian Service of Support for Micro and Small Enterprises (SEBRAE)\textsuperscript{4}. The Movelaria Paulista was nominated by SEBRAE as an example of Local Productive Arrangement (LPA), whose behaviour; practice and work represent an example of good practice and provide a valuable reference to other associations. The Movelaria Paulista currently consists of 57 companies that are part of a complex of more than 3,000 furniture companies in the metropolitan region of São Paulo, accounting for more than 15 thousand formal jobs. During the period of 2004-2007, this group was able to raise their revenue by 31.4\% and increase their employment by 28.7\%.

Innovation in SME’s collaborative networks in emerging economies is influenced by its historical and cultural context, by different entities, especially the government, and becoming a complex phenomenon that cannot be sufficiently explained by one theoretical perspective in the literature. Therefore, in order to investigate the collaborative process at Movelaria Paulista as an intersubjective experience of social actors, without any pre-conceived theoretical approach, it was decided to use the Grounded Theory as research methodology. This leads to a substantive theory that explains how the practice of co-operation was established in Movelaria Paulista and how it has evolved in the group. At the same time, it highlights the positive impact on exploitative (marketing) innovations that had already carried out, and provide

\textsuperscript{2} Substantive theory is specific to a particular group or situation and it is not intended to generalize beyond their substantive area. It explains a “reality”, made real by the subjects, not an absolute truth, devoid of value. (Banderia-de-Mello, Cunha, 2006)

\textsuperscript{3} The Forum for Innovation was created on May/2000 from the interest of EAESP and private organizations to work jointly on the theme Innovation. Its mission is to stimulate and facilitate research, generation, dissemination and application of knowledge about innovative organizations.

\textsuperscript{4} SEBRAE was created in 1972 as a private non-profit organization to encourage entrepreneurship and sustainable development of Brazilian micro and small firms. SEBRAE has 27 offices, 788 service points, 4.5 thousand employees and 12 thousand consultants which allow the organisation to develop regionally specific interventions while at the same time gathering relevant knowledge and data across the country.
explanations to the difficulties have found in implementing exploratory innovations. From a practical standpoint, the theory helps entrepreneurs and other agents (support agencies and trade unions) to understand the how Movelaria Paulista actually works and to support their decision making process. For the entrepreneurs who are members of Movelaria Paulista, the theory can be used to forecast scenarios for Movelaria’s evolution, so actions can be taken to minimize risk and accelerate results. Support agencies, such as SEBRAE, can use the Movelaria’s collaborative dynamics as a base to expand their understanding of SME networks dynamics and evolution, providing resource to analyse their role in this context and with other networks, allowing mechanisms to improve their contribution.

The article begins with the presentation of the research design and its methodological aspects, then the field research and theoretical elements of the Movelaria Paulista’s collaboration dynamics are exposed. The propositions suggested are then evaluated through a comparison with the current theoretical mainstream. Finally, closing this article the concluding remarks of this study, future studies propositions and practical application in small business networks are explored.

2 Research Design and Methodology

To address the research question: “How do innovations arise from collaborative network relationships between organizations?”, and the desire to understand the answer within a social context we sought to develop an appropriate research project. To support this decision, Guba and Lincoln (1982) emphasize that it is essential to position the researchers in their ontological and epistemological beliefs, since these beliefs influence how the world is viewed and guide researchers’ actions. Burrel and Morgan (1979) classified these positions on two axes, and the nature of science (objective-subjective) and the nature of society (order-conflict), proposing four broad paradigms: functionalist, interpretive, radical humanist and radical structuralism. Lewis and Grimes (1999) explain the axes of the division of the paradigms of Burrel and Morgan:

[...] Objectivity presumes an external reality of deterministic and predictable relationships, whereas subjectivity presumes contextually bound and fluid social constructions. Regulation assumes harmonious and orderly social relations, whereas radical change assumes conflict and power (Lewis and Grimes, 1999).

Here we adopt the interpretativism lens, subjective as nature of science and a social context that seeks order. although we are more aligned to the Boeira and Vieira (2006) proposal that encourages researchers to
reflect on the proximity of the Complex Thought from Edgar Morin (2006), which recognizes that different paradigms can coexist and “we must regroup the knowledge to seek the understanding of the universe, returning a knowledge that is asleep, regrouping unity and diversity”. In Morin’s opinion researchers should include the specialized competencies in a natural context, as a whole, he proposes the knowledge hierarchy and organization in the contemporary thoughts: “We must contextualize each event, because things do not happen separately ...”. He points out the importance of historical context in the citizens training and the challenge of complexity is exactly the understanding of “our community destinies”.

The complex context and reality of this study suggest the need for a flexible approach which enables the evidence to shape our conceptualization of innovations in collaborative network of small enterprises. According to Goulding (2002), Grounded Theory is essentially a qualitative research method for collecting and analyzing data and it is independent of the underlying epistemology. This means that Grounded Theory is as Glaser describes a "paradigmatically neutral" (URQUHART, 2001), which makes possible an investigation using multiple paradigms (BRYANT, CHARMAZ, 2005), therefore suitable for the purpose of this research.

2.1 Methodology

The researchers ontological and epistemological positioning and the research question led to chose Grounded Theory approach to guide this research. There are several definitions of Grounded Theory, the first made by the creators, Glaser and Strauss (1967), defining it as “the discovery of theory from data – systematically obtained and analyzed in social research”. A more detailed definition is as follows:

The methodological thrust of grounded theory is toward the development of theory, without any particular commitment to specific kinds of data, lines of research, or theoretical interests ... Rather it is a style of doing qualitative analysis that includes a number of distinct features ... and the use of a coding paradigm to ensure conceptual development and density (STRAUSS, 1987).

The two key points related to Grounded Theory are: (a) it does not use a predefined theoretical framework; and, (b) analysis and conceptualization use the core process of joint data collection and constant comparison. The first point relates to the importance of the researcher not starting from a pre-defined theoretical framework. This is not, in fact, an accurate representation of the position of Glaser and Strauss
which is more subtle and deserves a clarification. The aim is to ensure that the researcher uses a more inductive than deductive approach, and “listens” to the data instead of imposing preconceived ideas. The other key point concerns the circularity of data comparison that is the center of Grounded Theory as a method, in simplified explanation is the process of comparing instances have already labeled to a particular category with other slices of data, whether these categories are adjustable and feasible. If they are, the slices overlap and we have what Strauss (1987) and Glaser (1992) called the “theoretical saturation”.

It is important to mention that Glaser and Strauss disagreed on two key issues. First, Strauss and Corbin (1998) suggested breaking the coding process into four prescriptive stages (open, axial, selective, and ‘coding for process’). Glaser uses only three: open, selective and theoretical coding with incremental levels of abstraction. Secondly, Glaser opposed the use of coding paradigms and the ‘conditional matrix’ that are designed to provide tools to facilitate the process of conceptualization. Glaser noted that it ‘forces’ the coding by using a model and/or establishing conditions which is not Grounded Theory, but a conceptual description, which ignores the emergent nature of this theory (GLASER, 1992). Moreover, the coding paradigm used by Corbin and Strauss (2008), suggests that the researcher examines the context, conditions, action/interactional strategies, intervening conditions and consequences for the purposes of creating categories and their relationships.

According to Urquhart (2001) it is also important to consider a couple of other issues: first, the paradigm of encryption provides only an overview of a particular phenomenon. In contrast, Glaser suggests 18 families of coding, covering the ideas and elements as size, purpose and mutual reciprocity, social control, recruitment and isolation, and many other ideas for categories and relationships. Secondly, there is the insistence of using the axial coding stage, where categories and relationships are considered simultaneously using the paradigm of coding may cause difficulty for some researchers. This work makes use of Corbin and Strauss (2008) approach to analyze data, believing that it provides clear guidance to allow more abstract theorizing and avoiding the potential pitfalls and complexities of Glaser’s axial coding.
2.2 Research Design

The research design for this study comprises two main elements: interacting with the study object and subsequent desk based research on the circularity of data comparison. ATLAS/ti will be used as a tool to support and facilitate the documentation of all research stages required by Grounded Theory (figure 2). Data were collected from February to August 2009 and involved: 11 interviews (2 SEBRAE’s managers; 2 trade unions’ representative; 1 manager from Agency for Economic Development of Greater ABC; and 6 entrepreneurs) total 1068 minutes recorded and transcribed; 2 factories visit and participation in 4 meetings as an observer. The research activities at the Movelaria’s network were designed to allow the use of a collaborative approach (Shani, et al, 2008) aiming to mitigate the impact of an external observer. The researchers used the Atlas/Ti as a tool to support the documentation and circularity of collection and analysis process required by the method.

The primary data were analysed using the procedures and techniques suggested by Corbin and Strauss (2008) for coding and increasing the theoretical awareness. For the first round of open coding 6 interviews were chosen, totalling 630 minutes: a manager SEBRAE (more time on the project), a union representative, four businessmen (the interviewer’s perception of being those more comprehensive and revealing). During open coding process highlighted 553 quotations, 164 memos and 74 codes. Data analysis is one of the key stages in Grounded Theory and is based on the method of constant comparison, which aims at the discovery of properties and dimensions that characterize the theoretical categories. The addition of dimensions to the categories allows new data to be compared to existing ones, which increases the validity and the empirical foundation of the theoretical elements (Bandeira-de-Mello and Cunha 2006). After identification of possible conceptual categories by open coding, axial coding was used to examine the relationships between categories and subcategories to explore causes and effects, intervening conditions and action strategies that were presented in propositions. This led to the identification of 20 abstract concepts. Finally, selective coding refined and integrated all the results, resulting in 8 theoretical constructs and the central category of substantive theory: the dynamics of collaboration in the Movelaria Paulista.
The remaining (5) interviews were used for the validation phase of the substantive theory. In order to assess the quality of the substantive theory, we present in table 1 criteria for Assessment Quality proposed by Hutchinson (1988) adapted from Glaser and Strauss (1967) where the theory should: Fit, Work, be Relevant, Modifiable, have Density and Integration.

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Description</th>
<th>Movelia´s Collaboration Dynamics</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Fit</strong></td>
<td>Data fall into place naturally; the researcher does not force them into codes. Readers of quality theories can see and understand this fit.</td>
<td>The theory was submitted to a peer review process and they named the central category.</td>
</tr>
<tr>
<td><strong>Work</strong></td>
<td>Theory explains major behavioral and interactional variations in the data. It can predict what will happen under certain conditions and with given variables.</td>
<td>It explains why Movelia is a reference for SEBRAE as a collaborative network and allows the forecast of some future scenarios.</td>
</tr>
<tr>
<td><strong>Relevance</strong></td>
<td>It is related to the core variable and its ability to explain the ongoing social process in the action scene.</td>
<td>The theory was submitted to the Movelia’s entrepreneurs and they see their reality reflected on it.</td>
</tr>
<tr>
<td><strong>Modifiable</strong></td>
<td>Must be flexible, allowing new cases enrich it by contributing with introduction of new properties and categories.</td>
<td>The next phase of this research is to conduct multiple case studies in order to increase this theory explicative power.</td>
</tr>
<tr>
<td><strong>Density</strong></td>
<td>Theory is dense when it possesses a few key theoretical constructs and substantial number of properties and categories.</td>
<td>During the process were identified: 553 quotations, 164 memos and 74 codes. Then 20 general concepts were abstracted and narrowed to 8 theoretical constructs. Getting the following relationship: 8/20/74/164/553.</td>
</tr>
<tr>
<td><strong>Integration</strong></td>
<td>Ensure that propositions are systematically related and fit into a tight theoretical framework</td>
<td>The propositions were integrated into the Movelia’s storyline and all related to the central proposition. Second set of interviews ratified the substantive theory.</td>
</tr>

Table 1 - Assessment Substantive Theory Quality at Movelia Paulista
Source: adapted by authors, based on Hutchinson (1988) and Glaser and Strauss (1967)

In next section we describe our case study and what we discover during our analysis process and the propositions are presented alongside Movelia´s storyline.

3 **Field Research – Movelia Paulista**

The Movelia’s formation process began in 2004, in a context of increasing market competitiveness in São Paulo’s furniture sector, which was facing strong competition from Southern industries. During interviews, the entrepreneurs explained that Movelia was constituted in an increasing competitive market context, outdated technology and lack of market information. These conditions increased their desire to constitute a differentiated group. The respondents addressed not only the time of this constitution, but also
rescued the story of their own businesses, enriching the interviews and contextualizing the Movelaria’s importance in their organizational lives.

To present the results of a study using Grounded Theory without going into technical details of how the substantive theory was constructed, which may seem at first glance like a complex puzzle, and at same time to be able to highlight the process, we follow the recommendation of Goulding (1999): “the paper or thesis should be written in a way that allows the reader to identify key stages in the research and highlight conceptual development ... they demonstrate the process of telling the story of building theory using this method.”. In the next section we present the synthesis of what the Movelaria Paulista’s case revealed, followed by the story of how its collaboration dynamics was built.

3.1 What was revealed

The research revealed a group of companies with a strong desire to make a difference for its members and the society around them. Three aspects dominated: the role of Movelaria Paulista (MP) in the respondents’ organization story; the existence of common values; and, demands for change, derived from the difficulties faced by some initiatives (projects).

The MP’s formation stage was marked by a desire to create a centre for information exchange and share best practices, leading to projects that brought tangible results for the group and reinforcing the importance of the association. However, over time more complex projects appeared, the market created new demands and the interviewees cited managerial or technical issues to explain their poor performance, below expectations, generating in the group the need to resolve them.

The concept of collaboration dynamics represents the inter-relationship that occurs among MP’s members, from the individual or collective’s goals a set of experiences are accessed and have promoted actions. The lack of experience in dealing with some subjects suggests that new knowledge must be acquired and what ways to address and forward the issues should be discussed in the group, in order to promote a common understanding and directing.

During the formation stage, Behavioural trainings were provided by SEBRAE, which were tailored to MP (focus on associativism and entrepreneurship). They worked as a knowledge source required aligning
the different experiences and values which enabled the MP constitution. In the consolidation period, the group have faced two challenges: to expand its knowledge and experiences base and to hold common values and directions, by creating mechanisms that encourage the issues’ discussion and addressing them as soon as they arise (see Figure 1).

![Diagram](image)

Figure 1 – General View of Substantive Theory

3.2 MP Storyline – A Dynamic of Collaboration Emerges

The creation of an LPA among furniture companies was originally proposed by SEBRAE and trade unions and the idea was well accepted. The entrepreneurs’ previous experiences of difficulties to access and lack of information, isolation, loss of market share and unsuccessful initiatives in forming associations strengthened their desire to work in collaboration. The first action was the Behavioural training provided by SEBRAE, which was considered by respondents as the landmark that has provided the knowledge needed to enable the group’s wish: build a differentiated LPA. It served as a catalyst that changed the attitude and the way of members’ behave, as in interviewee testimonial:

"First, we did the behavioural ... was the most important thing! The furniture business was not mentioned, it’s spoken only about behaviour ... I changed my vision, I do not see other factories as adversaries, much less as enemies, I see in them possible partners (E6:145)"

In this context, they had the desire and the experience; they knew what not wanted and what had gone wrong. The training provided the knowledge required to underpin the development of the MP. It helped entrepreneurs to start a set of initiatives, which were conducted in order to build a differentiated LPA. This suggests our initial proposition (P1):
**Prop 1: The interrelationship of experiences and knowledge associated with common values/desires led to the project’s realization.**

The MP’s story can be divided in two periods: the first covers its formation in 2004 until 2008 when the second round of investment was approved, and the second period from this approval until nowadays. The first period, I called the formation, where the group’s desire was to constitute a LPA. The initiatives or group’s projects were aimed at establishing sharing and knowledge exchange practices through members’ interaction (see P2 and P5 in table 2). The statements collected confirm the quality difference in learning process between participating in isolation and being in group, when insights and learning are shared and exchanged among them during the event. The group used the Internet to create a user group to exchange ideas, information and mutual support, sharing the difficulties and needs of raw materials, machinery, services and even in the execution of large orders. One interviewee said:

“... or appears someone telling you: I have a problem here I do not know how to manage this product can anyone help me? Soon someone says: you should do this and that ... so there is a constant exchange of information (E5:298)”

Thus, relationships were developed and solidified. As the mutual trust increased the greater the relationships’ relevance for the group, becoming a valuable asset. The isolation and lack of information now were no longer part of the MP’s daily business. This supports our second proposition and first hypothesis:

**Prop 2: MP strengthens its ties when it experiences the success of projects.**

**Hyp 1: Successful experiences increase mutual trust and the relationships’ value for the group, becoming a valuable asset**

The trade union’s role in this period was to mediate and introduce the entrepreneurs, SEBRAE acted as training and consulting provider, serving as the catalyst in this initial stage. The training was conducted during 2004-2006 in three different cycles, each group became known as G1, G2 and G3, respectively. During the training some initiatives emerged as families’ parties or group met to talk about their companies, this period strengthened the groups’ acquaintance, interaction and experiences exchange. After the G1 was trained, they had worked on MP’s mission, vision and values definitions, while G2 and G3 were being trained, as they completed the behavioural training these definitions were been validated and refined by all of them. In these definitions, the terms ‘sharing’ and ‘contribute to a better society’ are present, providing
evidences supporting the enthusiasm for the projects: LeoEduca and Residues (P14 and P4 in table 2). The institutions’ role is recognized when it adds value, such as the behavioural training provided by SEBRAE, in other situations their performance is questionable, as the trade unions management capability. See the following statement:

“SEBRAE has enormous merit ... brought money, brought the intention, and brought a lot of things right? But they do not manage by themselves; they need management and validation ok? The trade union has no such competence, they need us ... (E6:172)”

This suggests us to the following proposition:

**Prop 3: The institutions aggregate value when provide knowledge and gather experiences to accelerate the projects’ execution.**

The second period I called consolidation, since the group’s desire was to strengthen the LPA, with initiatives (see in table 2) for the creation and dissemination of an identity (P1), technical projects to improve competitiveness (P3, P9) or social actions aimed to improve São Paulo’s furniture sector (P6, P10, P12, P13). In a natural process of evolution, some projects are more complex, requiring new knowledge and generating situations where the past experiences do not contribute to address them efficiently. Moreover, the current macroeconomic context has required full attention of small businessman, who demonstrates a high dependence on market conditions. The story of these furniture companies is full of ups and downs, which had required entrepreneurs’ versatility and adaptability to deal with market volatilities. See what was said by one of entrepreneurs:

“... in last September (2008) the crisis hit me, I sent e-mail asking for help ... I do not know, I remember that I did with Jean, the “Livraria da Vila” bookshop, it gave me work for a month and then I work jointly in another big ...it saved me... (E6:178)’

If the market goes into recession, MP’s member focus is on its own business; its attention turns 100% to the company’s issues. Then there is a dilemma: focus on own business vs. MP, delegate management vs. Institutions’ lack of managerial skills. The entrepreneurs expressed their anxieties related to the delay of certain projects (marked with $ in table 2), clearly stated in the following passages:

“... we as a businessman, we have to bring results and promote and get members interested in participate in that. In the other hand, for you to participate you have to do this, this and this ... it is not that we will get you thing you have to train yourself and you, as interested one have to do this, this and that... (E2:251)”
“... you know things do not happen and so ... I realize that people is sick of this thing, so you know ... participating in the meeting and there are a lot of reunions ... actually, things are not happening! (E6:178)”

I named their concerns as **issues** which were grouped by nature into three categories: technical, managerial and institutional. The technical issues are associated with the need to increase product quality and production process’s efficiency, increasing the MP’s competitiveness as a whole. The issues of a managerial nature are linked to ways of maintaining group’s involvement and their cohesion. Concerning to the institution’s issues, they are related to set required skills, boundaries, roles and responsibilities.

The way issues are conducted by MP is directly related to the different entrepreneur profiles existing within the group. During the analysis of field material I could identify three types of entrepreneurs: the conservative, the visionary and the articulator, and some of them have a mix of these profiles. The conservative profile results from trauma that originates from past experiences of isolation and lack of information. These entrepreneurs tend to value more the results obtained so far, showing an accentuated concern with the lack of results and performance of ongoing projects. Their biggest fear is the group demobilization, due to the lack of results or institutions’ slowness. The visionary is one step ahead of everyone in the group, not always able to express adequately their ideas, which sometimes creates misunderstandings. The articulator profile comprises a group of entrepreneurs with clear concerns about political matters. This profile adds the defence of MP’s issues along class entities and simultaneously promotes their integration and besides has access to privileged information. However, they have the need to be close to power, creating difficulties in promoting greater participation and rotation in coordination roles and have difficulty to impose limits and charge the institutions responsibilities. Based on those we suggest more three propositions:

**Prop 4:** The ties among MP’s members are strengthened when the company’s issues (difficulties) are solved by the group.

**Prop 5:** The absence of previous experiences and relationships that provide knowledge to address issues generate project delays.

**Prop 6:** The communication among entrepreneurs to reach the single desire (value) as a way to address issues, is the key to leverage the projects.
The inclusion of new members is a recurring theme because it is a demand that frequently reaches SEBRAE and trade unions. The interviewed entrepreneurs are unanimous in stating that the preparation (provide behavioural training) and/or their capability enhancement are the trade unions’ responsibility. The conservatives are against the newcomers, because they may weaken the ties, as they would require a new cycle of trust building and would affect current relationships. The visionary group believes that MP must be open to newcomers by the establishment of parameters that allow MP to be dynamic, flexible and agile, being independent of any institution. The articulators try to prevent parties’ exaltation, recognizing the trade unions and SEBRAE’s limitations in preparing a new group, the G4, but at the same time they have not been able to come up with a solution.

Another incident example occurred in the Residues Project, which was approved by the municipalities and got the commitment of collectors’ association, educational institutions and research centres, demanding a manager from MP to carry it out. The group had decided in hiring a full-time professional and whom MP shall be responsible for supervising. The hiring process was delegated to SEBRAE and trade unions, which stopped in these institutions’ bureaucracy and delays. Deepening in this theme during the interviews, the conservatives do not make their points strongly in order to not expose the relationships, the visionaries had difficulty in articulating their ideas and get listeners buy-in and the articulators are too entangled with institutions to glimpse an alternative solution.

During the first period MP had a single and explicit wish, a set of acquired experiences and the knowledge supplied by SEBRAE were sufficient to achieve their goal: the LPA formation. The tripod knowledge, experience and values were present. The current period, consolidation, has demanded new knowledge, the required experiences do not exist in the group and some situations have led a lack of consensus. It allows developing the following hypothesis:

**Hyp 2: MP’s strengths is based on respecting its members’ experiences, searching new knowledge and maintaining common values, which are reflected in their projects and actions**

If this hypothesis proves to be valid, the MP needs to invest in its tripod to address its issues: expanding the sources of knowledge, trying new forms of management (broaden experiences) and keeping a single and cohesive group’s desire (values). In order to make it happen, it is essential to create a process to
discuss and address their issues. Indeed, a process that is conducive to learning, allows experimenting different alternatives and broader sources of knowledge; building new experiences and identifying those that fit better, which bring satisfaction and performance. For then, to reach a third period, I would call it organic growth, in which the group has learned to address their issues, incorporating experience, seek new knowledge and develop their capabilities, keeping common values and growing in a sustainable way.

Table 2 – List of Movelaria Paulista’s Projects
4 Substantive Theory and current Theoretical Mainstream

The analysis of MP’s collaboration dynamics theory, by promoting a reencounter with current theoretical mainstream, leads us to the studies of: innovation, resource-based view (RBV), collaborative networks and economic sociology. When the MP’s initiatives are analyzed taking the concept of innovation\(^5\) stated by OECD (2005) and have their nature assessed based on Benner and Tushman’s (2003) classification, exploratory (new) or exploited (improvement). We find that the ones in MP are mostly exploitation and little has been done in terms exploration (see table 2). This study contributes to this perspective, adding value through their formation history and how this network has addressed their issues to facilitate innovations (projects). This understanding enables MP to take action in order to increase its capability to establish new relationships, identify opportunities and take advantage of them, considered essential to foster innovation (Tidd, Bessant and Pavitt, 2005).

According to RBV, a superior performance to be sustainable requires that company has valuable resources, difficult to copy, rare and difficult to substitute (Barney, 1991). The MP has as valuable resource their relationships and experiences, which innovations can be seen as the product of relational view of dynamic capability. The dynamic capabilities include the abilities and competences of organization purposefully create, extend or modify its resource base. The MP has been using their social networks, searching for complementary capabilities to increase and expand its base of resources, by making use of the relational view to be more competitive and innovative (Teece, 2007; HELFAT et al, 2007; Teece, Pisano and Shuen, 1997).

The network theory explains the MP’s initial formation process where the interlacing of social initiatives was articulated around common purpose, enabling the MP. The collaborative networks are based on informal movements that are self-working towards a common goal (Cowan, Jonard and Zimmermann, 2007; Inpken and Tsang, 2005; Gulati, Nohria and Zaheer, 2000). It is relevant to remember that the networks are linked to social capital, which has as a central proposition that network relationships are a source of valuable resources for the individual and the organization. As confidence grows, it will also

---

\(^5\) “... the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations”
compose and improve social capital, one of its benefits is the access to the information and to the preferential flow of knowledge between them. Inpken and Tsang (2005) investigated how the knowledge transfer occurs in different types of network and observed that three dimensions of social capital directly affects this transfer among its members: Structural, reinforcing network links, configuration and stability; Cognitive, by establishing common goals and building a shared culture; and Relational, strengthening the commitment and trust among members. Some researchers argue that this continuous process of construction should be adjusted to the organization’s strategy, which is best conducted in an environment where there are diversities, is more organic and less formal (Hatchuel, Lemasson and Weil, 2006; Farjoun, 2002; Courtright, Fairhurst and Rogers, 1995; Weick, 1995). In the current market context, organizations are increasingly seeking for strategic partnerships, fostered by complex internal and external networks, in order to produce innovations and generate value for their members. Indeed, the goal is to have a social capital to produce knowledge and actions (Chesbrough, Vanhaverbeke and West, 2006; Singh and Mitchell, 2005; Gulati, Nohria and Zaheer, 2000; Nonaka and Takeuchi, 2004), which is exactly what MP have been searching for. In addition this substantive theory contributes to this field, providing an example of how a network of small businesses was formed and explaining how their relationships have been developing and the challenges that have arisen along its trajectory.

Jones, Herterly and Borgatti (1997) integrated Network Theory to Transaction Costs Theory; they explored the relevance of trust and cooperation in relationships, plus the three exchange conditions proposed by Williamson (1985), in Transaction Costs Economics: uncertainty, asset specificity and frequency. According to them the uncertain environment requires adjustments to what is considered the central problem of economic organization: market dependence, which is experienced by MP. The trust and cooperation promotes a more efficient exchange and sharing of assets, processes and knowledge, which are unique and developed by participants. The customization combined with uncertainty requires guarantees of safeguards that reduce the uncertainties of behavioural environment, which can range from honest disagreements to opportunistic attitudes. The frequency is considered important for three reasons: first, it facilitates the transfer of tacit knowledge; allows immersion relational and structural foundations; and, provides social
mechanisms of adaptation, coordination and safeguards work efficiently. This theoretical model, which probably explains MP’s fears of losing what they have conquered through their relationships, but it, provides no alternatives to understand the current discomforts and how to overcome them.

MP’s base of knowledge and experiences seem to have reached a plateau and thus begin a level of stagnation, at this point economic sociology theory can help us to combine and expand the substantive theory. According to Granovetter (2005), the basic principles that guide economic results for social networking are: network’s norms and density, which includes shared ideas about conduct and accepted behaviours; the strength of weak ties leads to knowledge expansion; relevance of structural holes, what matters is not the quality of ties but what kind of knowledge is connected; and, the social embeddedness, where economic and non-economic activities are inter-mixed, and economic activities will not affect costs and techniques available for their implementation. At the moment you accept to put management science within the economic thought, economic sociology is very close to the organizational action science as proposed by Hatchuel (2000). Hence it allows the reflection on collective action, contributing to the understanding of MP and suggesting new actions that increase the weak ties and ways to address the structural holes, as ways to broaden the base of knowledge and experience to address their issues internal.

Table 3 – Theoretical mainstream and MP’s Collaboration Dynamics
5 Final Considerations and Directions for Future Research

The substantive theory has not the intention to any statistical generalization of results. The target generalization of this type of research lies in theoretical terms, to the extent that the variability of the phenomenon is considered in its propositions. In the MP case the procedural studies cover only six years, so it can be argued that it does not allow a considerable variation in the external and internal network environment, suggesting that further case studies need to be conducted to increase its explanatory power. Even though the substantive theory is flexible and allows changes as new variations of the phenomenon are identified by new cases studies, they should not deny the previous theory; instead of they should improve the current categories and develop new theories.

Another point of concern is the nature of propositions. We do not have any pretension to isolate variables to discern cause-effect relations. The research design and ex post characteristics would not allow such procedure. In fact, the propositions must be understood as co-relationship between contexts and observed behaviours. For example, other variables could be acting on how the projects are conducted, such as the availability of financial resources and conflicts of interest, but the propositions presented here have the elements highlighted by the interviewees and in our view constitute a framework consistent with the MP’s collaboration dynamics.

These results were compared with the literature in the last section. After analysis, we have ratified that there is no single current theory that explains how the collaboration dynamics has affected the result of innovations in the MP. The substantive theory explains how the previous experiences and the common values favoured their innovation deployment, as well as lack of knowledge and experiences that enable solutions to internal issues are affecting negatively the results of innovations. With respect to convergent points, building trust and relationships are remarkable aspects in the MP’s history as well as the importance of increase weak ties and uncover structural holes to expand the base of knowledge and experiences.

One aspect not explored in this article was to look at the substantive theory under the lens of social entrepreneurship, as throughout the MP’s data analysis there is a concern with their role within the industry sector and society. There is evidence that this is glue between their members, but requires a deeper analysis.
The substantive theory contributes directly to the MP’s actions by providing subsidies to expand their understanding of how their collaboration dynamics works. The entrepreneurs can promote greater communication space, in order to define a common sense to address projects’ issues, ensuring the turnover in management roles and participation of all members. The institutions can review their roles, acting as agents that help expand the MP’s base of knowledge and experiences by bridging ties with different networks or integrating new members to the MP.

A practical contribution of this study to SEBRAE is to enhance their knowledge base to explore and assess the context of SMEs networks, before the services are started, exploring the network’s repository of previous experiences and shared values. In addition, the partnership with SEBRAE and research centres can enable monitoring and keeping abreast of SME’s networks, so that a longitudinal study can be designed in a broader scope and comprehensiveness.

**Bibliography**

The Perception of Entrepreneurial Orientation among the Organization – a Triangulation Approach

Markus Braun, Mario Geissler and Christoph Mueller

The concept of Entrepreneurial Orientation (EO) has not only become a dominant subject in entrepreneurship research, but has also shown practical relevance in both defining as well as exploring the strategy of the firm. We argue that there is reasonable doubt that the management team assesses the EO of the company the same way as other employees or business partners do. The subject of this analysis is a high tech company of 318 employees, started in 1995 in Saxony, Germany. By applying statistical methods, we find no significant difference in the perception of EO between managers, employees and business partners.

Principal Topic

During last years, the concept of Entrepreneurial Orientation (EO) has not only become a dominant subject in entrepreneurship research, but has also shown practical relevance in both defining as well as exploring the strategy of the firm. (Simsek et al., 2010; Naldi et al, 2007). The concept of EO has since then become a widely used tool in entrepreneurship research. According to a number of studies, Entrepreneurial Orientation has an influence on performance (see for example, Rauch, Wiklund, Lumpkin and Frese 2009 for a meta study of 51 studies). EO plays also an important role in prominent studies about long and fast growing companies like Collins (2001) and McFarland (2009).
Entrepreneurial Orientation

The concept of Entrepreneurial Orientation has first been developed by Miller (1983). In this paper, Miller shifts the focus of analysis from the entrepreneur as actor to the entrepreneurial activity of the firm and the entrepreneurial process. He defines the entrepreneurial firm as “one that engages in product-market innovation, undertakes somewhat risky ventures, and is first to come up with ‘proactive’ innovations, beating competitors to the punch” (compare further Toulouse 1980; Kets de Vries 1977). Entrepreneurship is presented as a multidimensional concept, an aggregate variable consisting of the “composite weighting of these three variables”, innovativeness, risk-taking and proactiveness. As Miller points out, firms that do reach high levels in two of the three dimensions may well be acting all but entrepreneurial, hence his focus on the composite dimension. The dimensions may vary independently, but to call a firm entrepreneurial, it must reach a certain level in each of these dimensions.

As in his earlier works (for example Miller and Friesen 1982, Miller and Friesen 1980), Miller (1983) examines the entrepreneurial character of the firm by taking questionnaires from top management executives. Miller and Friesen (1982), and subsequently Miller (1983), link the measures directly to the profiles of top management, “their goals and temperaments” (Miller and Friesen 1982). According to Basso, Fayolle and Bouchard (2009), they argue that “the choice of strategy, entrepreneurial or conservative, is thus determined more by the nature of top managers”.

The concept of entrepreneurial orientation is then clarified and expanded by Lumpkin & Dess (1996). They make the distinction between entrepreneurship as the act of new entry, and entrepreneurial orientation as “the methods, practices, and decision-making styles managers use to act entrepreneurially“. According to them, “new entry explains what entrepreneurship consists of, and entrepreneurial orientation describes how new entry is undertaken”. To account for this view, Lumpkin and Dess also introduce two additional dimensions to the construct:
Autonomy and Competitive Aggressiveness. According to them, Autonomy refers to “the independent action of an individual or a team in bringing forth an idea or a vision and carrying it through to completion”, while Competitive Aggressiveness refers to “a firm's propensity to directly and intensely challenge its competitors to achieve entry or improve position, that is, to outperform industry rivals in the marketplace”. In contrast to Miller, they position EO not as referring to the nature of the firm, but as referring to new entry. As Basso, Fayolle and Bouchard (2009) point out, this leads to a number of alteration compared to the original concept, including the ways of examination – while Miller targeted “top executives” to answer the questionnaires, Lumpkin and Dess expand the focus to “key players” in the area of new entry, while not explicitly defining them. Basso, Fayolle and Bouchard further point out that this “poses serious operationalization problems, which later articles will fail to solve”.

The Problem of Self-Reported Managerial Perceptions

The original studies of Miller (1983) and Covin and Slevin (1989) apply self-reported managerial perceptions to measure EO. Their measurement approach, sometimes adapted, was used in most subsequent studies. Lyon et al (2000) find that of a sample of 32 studies utilizing EO, 21 studies measure it by managerial perception, with six studies using direct behaviour measures and five studies employing resource allocation. These authors, in line with other researchers, argue that, besides the advantage for research design (sample size), “the views of the respondent may, in fact, reflect those of the firm”, especially in case of smaller firms. However, the same approach is used widely also on medium-sized and large companies – for example, Rauch, Wiklund, Lumpkin and Frese (2009) report that of 51 studies examined, 15 were mid-sized or large.

We argue that there is reasonable doubt that within a moderately grown venture, the top management team assesses the EO of the company the same way as other employees or business partners do. As organizational reasearch suggests an organization might have characteristics
that differs from characteristics of their members. Thus, measuring organizational characteristics may differ from methods employed for measuring individual characteristics (for example, Weiss, 1994). As a result, a distinction is made between informants and respondents regarding the participants in studies dealing with organizational level issues. While an informant gives specific information about organizational characteristics (for example, level of innovativeness, bureaucratic or flexible) the latter provides information about itself as an individual (for example, the personal view about organizational events or procedures). Furthermore, different studies empirically demonstrate the danger arising from the use of single informants for the analysis of organizational phenomena (for example, Ernst and Teichert, 1998; Phillips, 1981). In detail, they address lacking knowledge about the focused issue and the position held in the company as possible sources for the informant bias. In this respect, respondents need to be knowledgeable about the focused issue and need to provide consistent as well as unbiased answers (Ernst and Teichert, 1998).

**Research Question**

Taking this into account, our research addresses the question, “Does the perception of a company’s Entrepreneurial Orientation vary among different groups within and outside the company (for example, management team, the employees, business partners of the company)? If so, can these differences be explained by organizational aspects (for example, position held in company)?” Therefore, our study aims at validating the practice of using top-management self-reported perception as a proxy for the firm’s Entrepreneurial Orientation. We test the results of the top management team against the perception of the full sample of employees of the company, as well as against the perception of other business partners.

Since we assume that the assessment of a company’s Entrepreneurial Orientation differs among the organisation, we test the following hypotheses:
H1: There is a significant difference in the perception of a company’s Entrepreneurial Orientation between the top management team and other employees,

and

H2: There is a significant difference in the perception of a company’s Entrepreneurial Orientation between the employees of the company and the company’s business partners.

Sample

We are currently researching a number of small and medium sized companies in Germany. In this paper, we are able to report first results.

The first subject of our analysis is a high tech company, started in 1995 in Saxony, Germany. Based on university research, the venture provides casting molds for rapid prototyping and has grown up to 350 employees and € 35 million in revenues in 2009. The founder of the company still owns the majority and is serving as CEO.

The management team of the company is composed by three members of the executive board and two additional managers. On the next level, there are 17 team and shift supervisors. Currently, they have 318 employees in total.

The survey itself was carried out in paper form. 74 of the 318 employees answered the survey, including four of the five members of the management team, 17 team or shift leaders, 47 workers and 6 key account managers.

Unfortunately, we were not able to receive the results of the business partners in time. As a proxy for the outside view of the firm, we therefore decided to use the key account managers, since they work on the interface between customers and the company, should be well aware of the thoughts of their clients and may have adopted them.
Methodology

To measure Entrepreneurial Orientation, we follow the approach of Lumpkin, Cogliser and Schneider (2009) and employ the most commonly used EO items, that is Covin and Slevin (1989), Lumpkin and Dess (2001), Lumpkin (1998), and for the autonomy measure the results of Lumpkin, Cogliser and Schneider (2009) themselves. Since the focus of our research is the work force of a German company, we could not assume the necessary level of the English language to understand the questions as they were and chose to translate them to German. The translation was executed as close to the original as possible, but with regard to the different sources of the original questions, careful adaptations have been made. Covin and Slevin (1989) give in general not only a statement and ask the respondents to specify their level of agreement to it, but also specifies the alternative, which is in general the opposite. In the German translation, we chose to leave the alternative statements out. An overview of the original questions, their origin and their German translation can be found in Table 1.

To test for the validity of our translations, we test for reliability of the scale used to measure the four multi-factor dimensions (Autonomy, Innovativeness, Proactiveness, Risk Taking and Competitive Aggressiveness). The reliability test showed that of the four multi-factorial dimensions of Entrepreneurial Orientation, only two have at least a moderate reliability in the survey we used. Innovativeness and Proactiveness prove to be not reliable. This may be due to our translation, or indicate a general weakness in the scale. Due to these results, the significance of the results of the distribution of EO between employee groups may therefore be questionable for the two dimensions Innovativeness and Proactiveness. The detailed results can be found in table 3.

The different groups of employees (Management, Supervisors, Employee, Account Manager) show in some aspects quite different perception of the Entrepreneurial Orientation in their organisation. A first analysis based on the differences in means of the dimensions is shown in Figure 1.

Figure 1
Differences between Means over Groups
As can be seen, the differences between the groups is greatest in the dimensions Autonomy, Risk-Taking and Competitive Aggressiveness, while the two dimensions mentioned above for their questionable reliability do not differ that much. It seems that especially the key account manager, the employees who have most contact with the customers of the company, have a quite different view on the company than the management team. There seems to be a tendency by top management team to see the company as less risk-taking and competitive aggressive than the rest of the employees does. On the other hand, account managers seem to have a feeling that working autonomic is not part of the company’s posture.

To see if those differences are indeed a signal, we apply the Kruskal–Wallis rank test (h-test) to test for significant differences between the groups. Table 4 shows the results.

Table 4

<table>
<thead>

<td>0.533</td>
<td>0.9116</td>
</tr>
<tr>
<td>Proactiveness</td>
<td>5.269</td>
<td>0.1531</td>
</tr>
<tr>
<td>Risk-Taking</td>
<td>4.293</td>
<td>0.2315</td>
</tr>
<tr>
<td>Competitive Aggressiveness</td>
<td>1.253</td>
<td>0.7403</td>
</tr>
</tbody>
</table>

As can be seen, the differences found by inspection prove to be not significant. To answer the hypotheses stated above, we furthermore tested the groups of management vs. other employees (excluding as account managers who serve as a proxy for customers), as well as account managers (as proxy for customers) vs. other employees. The results are shown in tables 5 and 6.
Table 5  
Kruskal-Wallis test: Management vs. Employees

<table>
<thead>
<tr>
<th>Dimension</th>

<td>2.325</td>
<td>0.1264</td>
</tr>
<tr>
<td>Competitive Aggressiveness</td>
<td>0.696</td>
<td>0.4042</td>
</tr>
</tbody>
</table>

There are no significant differences in the perception of Entrepreneurial Orientation by the management compared to other employees, so we must reject hypothesis H1.

Table 6

<td>0.6196</td>
</tr>
<tr>
<td>Competitive Aggressiveness</td>
<td>0.421</td>
<td>0.5163</td>
</tr>
</tbody>
</table>

Regarding hypothesis H2, here too can no significant difference in the perception of the company between employees and business partners be found. H2 must also be rejected.

**Implications**

By applying statistical methods, we have shown there is no significant difference in the perception of Entrepreneurial Orientation between top managers, employees and business partners.

The results of the study seem to be a valuable hint into a direction that may prove valuable as implications not only for researchers, but also for practitioners. By clarifying that EO percep-
tion does not differ among the organisation itself as well as between the organisation and its
environment, we enable researchers to collect EO measures more efficiently by allowing to
not only ask the management team, but also other members of the business sphere instead.
Also, if Entrepreneurial Orientation is perceived equally all over the company, it may be used
as a tool to direct a company and implement strategic decisions.

Limitations and Future Research

This study has a number of limitations. All of these limitations should serve as starting point
for future research.

The first limitation regards our sample. It is limited to a single company, thus making it diffi-
cult to generalize the results we have found here. Also, the actual size of the groups is in some
cases very small – the top management team group consists of four replies, the account man-
ger group of six. While this does not invalidate the results we have, it gives reason to repeat
the analysis with a bigger sample.

Second, the group of external business partners was not taken into account directly, but via a
proxy that comes from within the company. We believe that this is a valid way if no contact
with business partners can be made – however, the results of this should be validated by using
external business partners themselves.

Third, the survey used proved not to be reliable in part. The development of a reliable and
verified German-language version of the test still needs to be done and would be proof valu-
able for entrepreneurship researchers, since it would allow to include the wide range of Ger-
man-speaking companies in the samples.

Stakeholder Patronage as Influencers of Micro-enterprise Growth at Kamukunji in Nairobi, Kenya

Huldah Oroko

Abstract

The paper provides knowledge on stakeholder patronage as determinates of growth. Literature review indicates that concepts, theories, and stakeholder patronage influencing growth are developed in Western countries yet their applicability in Kenyan context is contestable. A correlational survey research design meets the objective of the study. The sample includes 354 micro-enterprises selected by systematic sampling from Kamukunji Jua Kali Association membership register. Data were collected using structured questionnaire, observation guide, and field notes. Factor analysis determines seven stakeholder patronage namely: debtors, professional advisors, employees and partners, bank managers, friends, suppliers, and family. Key findings indicate that stakeholder patronage model (65.33 percent variance explained) remain conceptually valid. Kaiser-Meyer-Olkin measure of sampling adequacy is good (KMO = .87) and Bartlett’s test of Sphericity is significant (.001). Hypothesis testing of 13 hypotheses indicates 76.92 percent acceptance. The paper emanates from the thesis fulfilling the requirements for degree of Doctor of Philosophy of Kenyatta University.

Key Words— Stakeholder Patronage, Growth, Micro-enterprises, Manufacturing, Metallic Products, Kamukunji

Introduction

The last two decades have witnessed massive downsizing and restructuring of many large enterprises in the global economy (Audretsh, Carree, & Thurik, 2001). As a result, micro-enterprises have increased internationally. Due to this economic swing, the micro-enterprises have increased both in number and size worldwide (Grilo & Thurik, 2004). The increment leads to depiction of micro-enterprises as an avenue for economic development or engine for growth (Mambula & Sawyer, 2004; Jack & Anderson, 1999). The focus on micro-enterprises has been influenced by the transformation of micro- and macro-economic policies in developed and
developing countries. These changes in policies have brought a global economic turnaround with a paradigm shift which lays emphasis on the growth of micro-enterprises.

Literature review indicates that concepts, theories and factors influencing growth of micro-enterprises featured in the study are largely developed by studies from Western countries particularly United States of America and Europe (Greiner, 1979; Churchill & Lewis, 1983; Scott & Bruce, 1987; Perren, 1999). Few studies determine whether these concepts, theories, and empirical studies are applicable to micro-enterprises in Sub-Saharan Africa generally and specifically in Kenya (Namusonge, 1998; Karimi, 1998; Teal, 1998; Bisebroeck, 2005). This literature implies insufficient empirical studies to elaborate the development of factors influencing growth of micro-enterprises manufacturing metallic products in Kenya. The study intends to bridge this research gap. Specifically, the study seeks to validate and determine the extent to which stakeholder patronage influences growth of micro-enterprises. The hypotheses dwell on the premise that the relationship between stakeholder patronage and growth happens to be significantly moderated by the entrepreneur and enterprise profiles and; hence, expects positive influence. The study is on micro-enterprises manufacturing metallic products at Kamukunji in Nairobi. Kamukunji lies in the eastern side of the City of Nairobi, the capital city of Kenya. Nairobi is fondly described as "the green city in the sun" because it seems to be below the tropical sun (King, 1996).

**Stakeholder Patronage and Enterprise Growth**

Patronage means the support given by a person that has an interest or shares in an enterprise (Macmillan Education, 2002). Patronage allows monetary and non monetary resources to be availed by the stakeholders to the micro-enterprises. According to Perren (1999), four
components of stakeholder patronage influence micro-enterprise growth namely: family and friends, employees and partners, professional advisors, and debtors and creditors.

The family and friends include parents, brothers, sisters, non-parents, non-brothers, and non-sisters investing in an enterprise. Women consistently report family and friends as an overwhelming source of support (Fielden et al., 2003). Most (86.7 percent) women entrepreneurs get support from husbands (Oroko, 1992). Younger women become entrepreneurs to balance family and work responsibilities (McKay, 2001). Family and friends have influence on entrepreneur’s growth motivation, expertise in managing growth, and resource access. Difficulties in an entrepreneur’s family life decreases growth as when an entrepreneur goes through marriage difficulties. Family offering an entrepreneur with managerial and financial support increases enterprise growth. Involvement in the enterprise by a member of family with sales ability also increases growth.

The employees receive salaries from the enterprise while partners share in the profits and own the enterprise (Macmillan Education, 2002). Most (55 percent) entrepreneurs obtain assistance from employees while away from the micro-enterprise (Karimi, 1998). Employees and partners have influence on expertise in managing growth and resource access. Micro-enterprise employing and accessing individuals who offer an entrepreneur support with management increases growth. On the contrary, micro-enterprise employing unsuitable individuals to help with management decreases growth. Employees who provide lower cost services than normally available in the labour market increases growth. Also, problems with employees decrease growth. Employees and partners with sales ability increases growth. Employees supplying core technical knowledge increases growth.
Employees and partners greatly influence growth (Macpherson et al., 2005). They bring along immense human capital and relevant experiences gained while working for large companies (Mambula & Sawyer, 2004; Fielden et al., 2003). Employee satisfaction turns out to be an important ingredient in growth (McKay, 2001). As an enterprise matures, an entrepreneur gives up some control and relinquishes the job at the head of the enterprise to someone else.

Professional advisors are experts who give advice to enterprises. Professional advisors have influence on expertise useful in managing growth. Bianchi, Raimondi, and Fasone (Retrieved July 9, 2005) found that professional advice transforms micro-enterprises from dwarfism to fast track growth. An entrepreneur accessing a professional advisor who offers help with the management of the micro-enterprise gets increases growth. These professionals are actors such as universities, research institutions, consultants, banks, science parks, and others.

Women entrepreneurs report that banks offer poor and extremely costly services besides the frustrations from bank managers (Fielden et al., 2003). Excessive formalised management procedures practised by banks stand in the way of innovation and flexibility (Gibb, 2006). All these measures call for cross-national partnerships, training services, and universities support (Lloyd-Reason & Mughan, 2002). Professional advisors help micro-enterprises to preserve and increase capability of moving the economy up the value chain.

Debtors are persons who owe money to an enterprise while creditors are persons to whom money is owed by an enterprise. Perren (1999) found that debtors have influence on resource access. Creditors like a supplier offering special terms increases growth. A supportive bank that issues loans increases growth. Quick paying customers and good debtor management practices increases growth too while poor debtor control decreases growth. Cash-based micro-enterprises with low stocks increase growth. A major bad and doubtful debt decreases growth.
Debtors like banks have stringent lending measures unfavourable to micro-enterprises. Collateral still remains the banks popular requirement. Micro-enterprises lack collateral which leads to small loans and mostly none at all (International Conference on Innovation, 2004). Deficiencies of funds lead to delay of payments to the suppliers and other creditors (Bigsten et al., 2000). Payment terms from creditors become unfavourable, making debts unpaid by customers for 56 days on average after product delivery (Valsamakis & Sprague, 2001). These delays create cash flow problems that revolve into obstacles to growth.

**The Conceptual Model**

The Conceptual model consists of the independent, moderating, and dependent variables. Independent variables are numbered Factor 1 to 7. Entrepreneur and enterprise profiles are the moderating variables numbered moderator 1 to 13. The dependent variable consists of four variables numbered growth 1 to 4. Each straight single-headed arrow indicates a hypothesised fundamental relationship in the direction of the arrow. The variables happen to be identified from theoretical frameworks developed by previous studies (Greiner, 1979; Churchill and Lewis, 1983; Scott and Bruce, 1987; Penrose, 1995; Perren, 1999). These variables used by other studies which are not specifically reviewed for this study are also adapted by this study. The study expects results on factors influencing growth of micro-enterprises at Kamukunji. The findings will be used by entrepreneurs, consultants, researchers, and policy makers to mainstream growth. The conceptual model is summarised in Figure 1.
Methodology

The research design for the study was a correlational survey. The correlation design delineates the important variables associated with the problem (Sekaran, 2003). The study was largely quantitative with the support of qualitative data. Quantitative data were analysed through the use of tables and statistics while qualitative data were analysed through the use of conceptualisation and in-depth analysis (Saunders, Lewis & Thornhill, 2000). The combination
of multiple data sources overcame the intrinsic bias that came from single and data sources. The quantitative data were collected by a self-administered questionnaire while qualitative data were collected through key informant interviews.

The target population for the study was micro-enterprises manufacturing metallic products at Kamukunji in Nairobi. The micro-enterprises consisted of sheet metal, metalwork, painting, welding, and scrap metal categories which were started by entrepreneurs. The micro-enterprises were sole proprietorships and partnerships owned by Kenyans of various ethnicities. After the researcher requested for updating, there were 1,118 micro-enterprises in Kamukunji Jua Kali Association membership register for the year 2006. These micro-enterprises formed the universe of the study. The sampling methodology involved the selection of the sample from micro-enterprises that fell under the definition of a micro-enterprise and were registered by the Kamukunji Jua Kali Association (2006) as metallic product manufacturers. The study used systematic sampling to select 354 micro-enterprises who participated in the study.

The survey was confined to the local area of Kamukunji metallic products manufacturing zone. Surveys are often carried out in a limited area and at one point in time (Johnson & Duberley, 2000). Data were collected for six months, between July and December 2006. The researcher made field notes when important issues surfaced that were not in the questionnaire. Data were analysed largely using quantitative with the support of qualitative techniques. Quantitative data were analysed using descriptive statistics, factor analysis, and Spearman rhos. The results of data analysis were presented in two ways: the textual presentation and Statistical Packages for Social Sciences outputs in tabular presentation showing exact numerical values in columns and rows. The outputs were in form of tables for easier interpretation, drawing of conclusions, and making appropriate recommendations.
Three measures were applied when assessing factorability of the matrix. The first measure was the visual inspection where if there was no factor loading greater than 0.30, then the data were inappropriate for factor analysis. All the factor loadings used were between 0.50 and 0.86. The second measure was Bartlett’s Test of Sphericity where the determinant of the matrix of the sums of products and cross-products was converted to a chi-square statistic and tested for significance. A significant result at 0.05 levels indicated that sufficient relationship existed among variables. Third measure was the Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO) which varied between 0 and 1 and values closer to 1 were better, in fact, there was 0.87 for stakeholder patronage. A value of 0.60 was a suggested minimum (UCLA, 2007). The internal consistency of items was assessed by the Cronbach’s alpha coefficient (\( \alpha \)). The alpha values ranged from a minimum of 0.64 to a maximum of 0.78 where a threshold of 0.50 checked for internal consistency among items (Sekaran, 2003).

A principal component analysis transformed all the variables into a set of composite variables that are not correlated to one another (Kothari, 2003). For example, stakeholder patronage measured four concepts of family and friends, employees and partners, professional advisors, debtors and creditors with seven questions each for friends and family and employees and partners. The professional advisors had four questions while debtors and creditors had 19 questions. After factor analysis of the 37 items, seven items were found with the right loadings, confirming that the concepts were measured correctly. In the initial solution, each variable had a mean of 0 and a standard deviation of ± 1. The variance of each variable was = 1. A useful factor accounted for more than 1 unit of variance and had eigenvalues \( \lambda > 1 \) and a percentage of variance explained \( (R^2) \) at a minimum of 50 percent where results turned out to be 65.33 percent. The initial solution suggested the number of factors that were extracted by the
final solution. A rule of thumb happened to be that the number of components with eigenvalues \( \lambda > 1 \) lies between the number of variables divided by 3 and 5.

The factor interpretability or factor pattern was clarified by rotating the factors using the orthogonal Varimax rotation method with Kaiser Normalisation. Orthogonal rotation was done because the factors are independent (Kothari, 2003). The Varimax rotation achieved loadings of ones and zeros in the columns of the component matrix. After rotation, the effect on loading of the factor pattern was assessed for increased or decreased change (Friel, 2007). The conceptual model and nature of items loading on each factor guided the labelling of factors. The assumption of unidimensionality was observed by ensuring that a variable represented a single concept. Summated scales option was adopted by this study because it is a compromise between the surrogate variable scale and factor score option. The main advantage of summated scales is that it is straightforward where items with high factor loadings are summated.

To examine the multivariate relationship between the dependent, independent, and moderating variables, the Spearman \( r \) was used. The main idea was to determine whether moderating variables had significant positive or negative relationship with independent variables and micro-enterprise growth. The 13 hypotheses were tested by Spearman rank correlation. Spearman rhos measured linear relationship between the variables and ranged from -1 to 1. The level of statistical significance were reported depending on probability (\( p \)) as: significant ranging \(.05 > p < .01\) and highly significant: \(.01 > p < .001\). Probabilities were based on two-tailed tests as each comparison had two possible directions.
Data Analysis and Interpretations

The objective of this study is to establish the relationship between stakeholder patronage and growth of micro-enterprises. Questions explore stakeholder patronage and respondents' answers are summarised in this section. Thirty nine items measure stakeholder patronage such as family and friends, employees and partners, professional advisors, and debtors and creditors using a five-point Likert-type scale questions. The Likert scale options are strongly agree = 5, agree = 4, neutral = 3, disagree = 2, and strongly disagree = 1. The measures are above the threshold of 10 items necessary so as to avoid computational difficulties.

Factor Analysis Results

Using factor analysis, underlying variables are identified. The principal components analysis extracts an initial solution from an intercorrelation matrix where nine components are extracted out of the seven target variables. The Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO = 0.87) is meritorious almost at the marvellous threshold of 0.9 to 1. The Bartlett Test of Sphericity is very highly significant at 0.001 level ($\chi^2 = 6837.25$, $df = 741$, $p = .00$) showing that factor analysis using principal component is relevant for the data set. These results imply that the correlation matrix is an identity matrix.

The results of the initial eigenvalues of the first nine variables indicate total variance of >1. The cumulative percentage of variance explained ($R^2$) by the nine variables (65.33 percent) stays above the threshold of 50 percent. The results indicate that 65.33 percent of the common variance shared by the 39 variables is accounted for by the nine factors. The nine-component factor model measures a goodness of fit which accounts for substantial amount of variance. Further, the first variable has high eigenvalues ($\varphi = 9.87$). It becomes the most important variable
because of being greater than 1 and explaining more variance than a single variable, in fact 9.87. The first component explains percentage variance of 25.32 percent. The least component variance explained (2.95 percent) has a low eigenvalues of $\lambda = 1.15$. The practical implication of this finding is that the remaining factors 10 through 39 have eigenvalues less than 1, and therefore, explains less variance than a single variable.

Results indicate that the sum of the eigenvalues associated with each variable totals 39 which represent the number of variables factored. Rotation in F-dimensional space clarifies the factor pattern. To avoid ambiguous interpretation, Varimax with Kaiser Normalisation rotation method was performed. The orthogonal rotation preserves the independence of factors; geometrically at 90° apart. Varimax rotation method with Kaiser Normalisation reduces data and provides results by using factor loadings ($FL$) above 0.30. The rotation converged in 10 iterations. The Varimax attempts to achieve factor loadings of ones and zeros in the columns of the component matrix (1 & 0). Variables which load greater than 0.30 for each component combine to form six factors namely: debtors, professional advisors, employees and partners, bank managers, friends, suppliers, and family. The orthogonal rotation reduces the nine to seven components extracted by the principal component analysis method. Family and friends stakeholder patronage becomes two factors: 18 and 20 respectively.

The first component factor extracted is Debtors (Factor 1) which comprises of: keeping a watchful eye on people who owe me is difficult ($FL = 0.86$), the terms of trade are not favourable ($FL = 0.81$), it is likely that I will suffer a major bad debt ($FL = 0.78$), I do not know how to chase people who owe me money ($FL = 0.78$), my debtors do not settle their accounts quickly ($FL = 0.78$), and I know steps to take to reduce bad and doubtful debts ($FL = 0.71$). These six items are summated to form an interval scale ranging from a low of 6.00 ($n = 123$, 34.7 percent)
to a high of 30.00 ($n = 4, 1.1$ percent) scores with mean of 14.50 ($SD = 7.36$). A score closer to 6.00 indicates few bad and doubtful debts while a higher score of 30.00 specifies many bad and doubtful debts. The majority of the micro-enterprises score 6.00 ($n = 123, 34.7$ percent) seconded by 24.00 ($n = 19, 5.4$ percent) scores. Results imply that Factor 1 is less likely to influence growth as most micro-enterprises score 6. Lack of trust between micro-enterprises and debtors has a negative influence on growth. The Cronbach’s coefficient alpha of internal consistency of items is significant ($a = 0.78$).

The second component factor extracted is Professional advisors (Factor 2) consisting of stakeholder patronage that encompass: I put in a lot of effort in order to obtain professional advice ($FL = 0.77$), professional advisors ($FL = 0.76$), I have access to professional advisors who offer help with management of growth ($FL = 0.73$), professional advisors, like accountants, help with the setting up of support systems ($FL = 0.67$), and professional advisors, like bank managers, help with running of support systems ($FL = 0.61$). These five items are summated resulting in scores ranging from a minimum of 5.00 ($n = 102, 28.8$ percent) to a maximum of 25.00 ($n = 4, 1.1$ percent) with mean of 11.18 ($SD = 5.63$). A score closer to 5.00 indicate low linkage to professional advisors while a higher score of 25.00 specify high linkage to professional advisors. The majority of micro-enterprises score 5.00 ($n = 102, 28.8$ percent) seconded by 9.00 ($n = 32, 9$ percent) scores. Results indicate that Factor 2 is less likely to influence growth as most micro-enterprises score 5.00 ($n = 102, 28.8$ percent). The alpha shows high internal consistency of the items ($a = 0.70$).

The third component factor extracted is Employees and partners (Factor 3) involving items expressed as: I have employees and partners who have good sales abilities ($FL = 0.74$), loss of employees and partners will drastically reduce sales ($FL = 0.70$), employees have set up
stock control and customer records ($FL = 0.68$), employees work with minimum supervision ($FL = 0.67$), my employees are willing to work longer hours ($FL = 0.66$), and my partners help me with the running of support systems ($FL = 0.64$). These six items are summated to form an interval scale, for the factor F3, which has a low of 7.00 ($n = 60, 16.9$ percent) to a high of 35.00 ($n = 3, 0.8$ percent) scores. A score closer to 7.00 indicate low patronage from employees and partners while a higher score of 35.00 specify high patronage from employees and partners. The mean turns out to be 19.02 ($SD = 7.44$) with the majority of micro-enterprises scoring 7.00 ($n = 60, 16.9$ percent). Results have three implications. First, a large of number of micro-enterprises has neither employees nor partners. Second, the micro-enterprises are highly independent preferring to work singly than in teams. Third, the Factor 3 is less likely to influence growth as majority of micro-enterprises score 7.00. Reliability test with the alpha show internal consistency of the items ($a = 0.68$).

The fourth component factor extracted is Bank managers (Factor 4) load highly on items described as: my relationship with the bank managers is cordial ($FL = 0.82$), I am trying to make the bank more supportive ($FL = 0.80$), my bank is supportive ($FL = 0.71$), and I keep the bank informed on how the micro-enterprise is going on ($FL = 0.67$). These four items are summated resulting in an interval scale ranging from a low of 5.00 ($n = 101, 28.5$ percent) to a high of 25.00 ($n = 5, 1.4$ percent) scores. A score closer to 5.00 indicate low support from bank managers while a higher score of 25.00 denotes high support from bank managers. The majority of micro-enterprises score 5.00 ($n = 101, 28.5$ percent) seconded by 10.00 ($n = 35, 9.9$ percent) scores. The mean becomes 11.34 ($SD = 5.39$). Results have two practical implications. First, high proportion of micro-enterprises has low bank managers bond due to collateral and regular
income requirements coupled with high interest rates. Second, Factor 4 is less likely to influence growth. Reliability test with the alpha shows a high internal consistency of the items ($a = 0.75$).

The first component factor extracted is Friends (Factor 5) using items depicted as: my friends are willing to let me use their non monetary assets ($FL = 0.79$), my friends have money that I can use to maintain the micro-enterprise ($FL = 0.77$), my friends have worked in an office before and have helped me in bookkeeping skills ($FL = 0.63$), and my friends help with setting up and running of support system ($FL = 0.57$). These four items are summated to form an interval scale ranging from a low of 4.00 ($n = 67$, 18.9 percent) to a high of 39.00 (1, .3 percent) scores. A score closer to 4.00 indicate low support from friends while a higher score of 39.00 stipulates high support from friends. The majority of micro-enterprises score 4.00 ($n = 67$, 18.9 percent) seconded by 8.00 ($n = 43$, 12.1 percent) scores. The mean happens to be 9.85 ($SD = 4.75$). Results have two practical implications. First, the high number of micro-enterprises have a low proportion of F6 due to manual productivity that require a lot of time. Second, the micro-enterprises are not getting support from friends due to limited time for networking. Hence, factor 5 is less likely to influence growth. Reliability test with the alpha show an internal consistency of the items ($a = 0.69$).

Suppliers (F6) load highly on items that incorporate: I am able to negotiate even better terms from my suppliers ($FL = 0.80$), my suppliers give me first class service ($FL = 0.79$), I am currently receiving special terms from my suppliers ($FL = 0.73$), and I have many suppliers who offer favourable terms of trade ($FL = 0.64$). These four items are summated to form an interval scale ranging from a low of 4.00 ($n = 14$, 4 percent) to a high of 20.00 ($n = 11$, 3.1 percent) scores with a mean of 12.37 ($SD = 4.16$). The majority of micro-enterprises score 16.00 ($n = 54$, 15.3 percent) seconded by 8.00 ($n = 37$, 10.5 percent) scores. Results have two practical
implications. First, a large number of micro-enterprises have a high proportion of Factor 6. Second, the Factor 6 is highly likely to influence growth. Reliability test with the alpha shows a high level of internal consistency of the items ($a = 0.74$).

Family (F7) consists three items that comprises of: family problems affect my micro-enterprise drive ($FL = 0.67$), I take several steps to reduce family friction ($FL = 0.67$), and family and friends ($FL = 0.58$). The resulting interval scale range from a low of 3.00 ($n = 9$, 2.5 percent) to a high of 15.00 ($n = 9$, 2.5 percent) scores with a mean of 9.66 ($SD = 3.18$). The majority of micro-enterprises score 13.00 ($n = 46$, 13 percent) seconded by 9.00, 10.00, and 14.00 ($n = 36$, 10.2 percent) scores each. Results have two practical implications. First, a large number of micro-enterprises have a high proportion of family. Second, family highly influences growth. Reliability test with the alpha show internal consistency of items ($a = 0.64$).

**Hypotheses Testing**

The 13 hypotheses were tested using Spearman rank correlation coefficients resulting in partial acceptance of 76.92 percent. The Spearman rhos measure significance of the relationship between stakeholder patronage, growth, and moderating variables according to the conceptual model. Rank correlation happen to be used because data indicate a departure from normality.

H1: Stakeholder patronage has significant relationship with growth of micro-enterprises for entrepreneurs aged 26 ÷ 35 years than 36 ÷ 45 years. Entrepreneur’s age moderates the relationship between stakeholder patronage, employees, sales, departments, and divisions’ growth. The hypothesis is accepted.

H2: Stakeholder patronage has significant relationship with growth of micro-enterprises for male than female entrepreneurs. Gender of an entrepreneur moderates the relationship
between stakeholder patronage, employees, sales, departments, and divisions’ growth. The hypothesis is accepted.

H3: Stakeholder patronage has significant relationship with growth of micro-enterprises for entrepreneurs with primary than secondary education. Level of education of an entrepreneur moderates the relationship between stakeholder patronage, employees, sales, departments, and divisions’ growth. The hypothesis is accepted.

H4: Stakeholder patronage has significant relationship with growth of micro-enterprises for Luo than Kikuyu entrepreneurs. Ethnicity of an entrepreneur moderates the relationship between stakeholder patronage, employees, sales, departments, and divisions’ growth. The hypothesis is accepted.

H5: Stakeholder patronage has significant relationship with growth of micro-enterprises for Protestant than Catholic entrepreneurs. Religion of an entrepreneur does not moderate the relationship between stakeholder patronage and employees growth but moderates the relationship between stakeholder patronage, sales, departments, and divisions’ growth. The hypothesis is accepted.

H6: Stakeholder patronage has significant relationship with growth of micro-enterprises for married than unmarried entrepreneurs. Marital status of an entrepreneur moderates the relationship between stakeholder patronage, employees, sales, departments, and divisions’ growth. The hypothesis is accepted.

H7: Stakeholder patronage has significant relationship with growth of micro-enterprises for entrepreneurs with farming than enterprise managing fathers. Entrepreneur’s father’s
occupation moderates the relationship between stakeholder patronage, employees, sales, departments, and divisions' growth. The hypothesis is rejected.

H8: Stakeholder patronage has significant relationship with growth of micro-enterprises for entrepreneurs with farming than enterprise managing mothers. Entrepreneur's mother's occupation moderates the relationship between stakeholder patronage, employees, sales, departments, and divisions' growth. The hypothesis is rejected.

H9: Stakeholder patronage has significant relationship with growth of micro-enterprises categorised as sheet metal than metalwork. Enterprise's category moderates the relationship between stakeholder patronage, employees, sales, departments, and divisions' growth. The hypothesis is accepted.

H10: Stakeholder patronage has significant relationship with growth of micro-enterprises aged 1–10 years than 11–20 years. Enterprise's age moderates the relationship between stakeholder patronage, employees, sales, departments, and divisions' growth. The hypothesis is accepted.

H11: Stakeholder patronage has significant relationship with growth of micro-enterprises for sole proprietorships than partnerships. Type of business moderates the relationship between stakeholder patronage, employees, sales, departments, and divisions' growth. The hypothesis is accepted.

H12: Stakeholder patronage has significant relationship with growth of micro-enterprises sales than divisions' priority growth goal. Enterprise's priority growth goal moderates the relationship between stakeholder patronage employees, sales, and divisions growth but does not
moderate the relationship between stakeholder patronage and departments growth. The hypothesis is rejected.

H13: Stakeholder patronage has significant relationship with growth of micro-enterprises funded by personal than family savings. Enterprise's sources of funds moderate the relationship between stakeholder patronage, employees, sales, departments, and divisions' growth. The hypothesis is accepted.

**Discussion**

The discussion is on the level of agreement and disagreement between previous studies and this study. Correlation analysis indicates that as family increases, growth increases. Watson et al. (1998) indicate that micro-enterprises are likely to be supported by family. Perren (1999), however, disagrees and states that negative family patronage, especially when an entrepreneur goes through marriage difficulties, growth decreases. Entrepreneur's not allowing family problems to affect their drive increases growth. Entrepreneur's not taking several steps to reduce family friction decreases growth.

Correlation analysis reveals that as friends increase, growth increases. Studies show that friends' patronage increases growth (Perren, 1999; McKay, 2001; Fielden et al., 2003). Friends' willingness to let micro-enterprises use their monetary and non monetary assets increases growth. Friends not helping with the setting up and running of support systems decreases growth. Most entrepreneurs at Kamukunji come from poor backgrounds and are unlikely to have well-to-do friends.

Correlation analysis indicates that as employees and partners increases, growth increases. Perren (1999) suggests that having unsuitable individuals to help with the management of growth
can be a negative influence. Studies indicate that employees and partners have positive influence on growth (Mckay, 2001; McCarthy, 2003; Macpherson, 2004; Macpherson et al., 2005). Micro-enterprise having employees and partners who have good sales abilities increases growth while not having partners who help with the running of support systems decreases growth.

Correlation analysis indicates that as the professional advisors increase, growth increases too. Studies indicate that professional advisors offer help with management that facilitate the transformation of micro-enterprises from dwarfism to fast track growth (Perren, 1999; Lloyd-Reason and Mughan, 2002). Micro-enterprises putting in a lot of effort to obtain professional advice increases growth while not having professional advisors that help with the running of support systems decreases growth.

Correlation analysis indicates that as debtors increase, growth increases. Perren (1999) indicates that poor debt control management can be a negative influence. Other studies signify that debtors influence growth (Bigsten et al., 2000; Valsamakis and Sprague, 2001). Micro-enterprises being able to keep a watchful eye on debtors increases growth while not being able to reduce bad and doubtful debts decreases growth.

**Conclusion**

Growth is a complex and multi-dimensional element influenced by a myriad of interacting factors. Despite the innumerable factors influencing growth, the last two decades have witnessed massive downsizing and restructuring of many large enterprises in the global economy. Due to this swing, the micro-enterprises have increased both in number and size worldwide. The increment has led to depiction of micro-enterprises as engine for growth. The stakeholder patronage partially increases growth, ceteris paribus. Hypotheses testing results
reveal that professional advisors and employees and partners increase growth. As professional advisors and employees and partners increases, growth increases.

**Recommendations**

The technical institutes, polytechnics, and universities need to strengthen stakeholder patronage by training entrepreneurs on the control of family patronage. When delivering courses on entrepreneurship, it is possible to invite family to participate in the business clinics. Thus, family patronage increases. The family and suppliers have little influence on growth. However, the fact that these stakeholder patronages have little influence on growth needs further investigation.

Hypotheses can either be accepted or rejected. Most (76.92 percent) hypotheses for this study happen to be accepted. A study may be designed to identify factors that cause rejection of hypotheses (23.1 percent). The study was done way back in 2006, approximately five years ago, and since then, socio-politico-economic factors at Kamukunji have drastically changed. Results indicate that the concepts, theories, and factors influencing growth developed in Western countries particularly United States of America and Europe are partially applicable to Kamukunji. Micro- and macro-economic factors affecting micro-enterprises in various countries disagree leading to differences of results between countries. In conclusion, the concepts, theories and factors influencing growth of micro-enterprises at Kamukunji are not fully comparable to the ones in United States of America and Europe. Unique socio-politico-economic factors influence growth of micro-enterprises manufacturing metallic products at Kamukunji.

Workshop: Building the academic-business partnership in international education: Providing an experiential learning activity in a global setting for undergraduate students.

Donald Hoy

Benedictine College, United States

Keywords: experiential learning; partnerships; research

dhoy@benedictine.edu

This workshop demonstrates an experiential learning activity in a global setting for undergraduate students. We demonstrate a partnership between the international business community and academics by sharing our College – International Trade Council “Global Research Initiative”. Presenters discuss issues confronted, solutions devised, success achieved and support obtained. The value to cooperating businesses and the International Trade Council is also shared.

This workshop is for educators seeking experiential learning opportunities, SME owners and managers who utilize the research conducted and trade organizations seeking additional benefits for members.
The Growth Strategies of French Listed SMEs:  
Towards a Distortion of the SMEs Concept

Nazik FADIL

Abstract

The SME and the stock exchange market are a strange alchemy! This is all the more surprising when the SME adopts an aggressive strategy focused on external growth, international openness; investment in technological innovation ... The definition of SMEs seems disoriented in this context and with such strategic behavior. This article is focused on the impact of stock market listing on the growth strategies of French SMEs and explores the distortion of the SME concept so caused. It includes a review of literature on organizational theory and entrepreneurial finance. It is based on a longitudinal methodology over seven years, following a sample of 65 listed SMEs and a control sample. Overall, it appears a significant effect on growth indicators in the direction of our presumptions of distortion.

Introduction

In the context of the current financial market crisis, many researchers and practitioners are questioning the value of the IPO (Initial Public Offering) decision, especially for small business. Of course, the listing offers a number of advantages (fundraising, brand awareness, capital liquidity, management control ...). It is nevertheless true that it creates a particular consideration in terms of cost, energy, obligation of transparency and the need to comply with promises ... This is all the more compelling when it is question of a small organization with limited resources, a highly concentrated ownership, centralized control and often a strong family presence.

The impact of the IPO performance has been the subject of multiple investigations into the U.S. market (Jain and Kini, 1994, Mikkelson et al., 1997) Asian (Cai and Wei, 1997; Wang, 2005) and European market (Pagano et al. 1998; felt, 2001; Coakley et al., 2004, 2004, 2004).

1 Professor of Finance in Normandy Business School.
Serve, 2007). Little research interested in the impact in terms of strategic behavior and even less to the particular case of SMEs. However, the link between stock market listing and the performance is not direct but occurs through the strategic variables. Indeed, the value theory teaches us that the origin of changes in performance are the strategic levers; growth is a component (Hoareau and Teller, 2001; Hirigoyen and Caby, 2001). As such, the objective of this paper is to clarify the impact of the IPO on the growth strategies of French SMEs.

The phenomenon of the SMEs listing is rare, but existing. It is therefore important to address this situation atypical or denaturing of SMEs concept, to check if the growth strategy that will result is in a logical anti-SME. The interest is twofold: In a practical perspective, this article focuses attention on part of the constellation of SMEs that decide to go public and explores the consequences in terms of growth. This is to ensure that the resources generated by the listing and control resulting, effectively promote SMEs development and provide, therefore, some answers about the change in performance that would result. In a theoretical viewpoint, this research provides insight into the distortion (or denaturation) of SMEs concept after the IPO and questions the consistency of growth strategies conducted after being listed with the SMEs concept. No study has been conducted to this end.

This paper is divided into two parts: the first presents the theoretical deductions. The second describes the methodology and analysis results.

1. **Theoretical Approach: Stock Listing, Growth and Contingent Specificity of SMEs**

The objective of this section is to present theoretical approaches that allow us to assume that the Stock Exchange listing would affect the growth strategies of SMEs. A reading of organizational theory sheds light on two key issues: the achievement of growth requires financial resources and governance that directs to value creation. The financial market meets both requirements. Particular attention will be paid to the case of SMEs. The phenomenon of
stock market listing in SMEs is fairly atypical or denaturant. This deserves a critical reflection on the subject of our work.

1.1. The listing on the stock market and growth strategies: lessons from organizational theories

Edith Penrose (1959), a founder of the growth theory, sees potential growth of a company as unlimited, but subject to restrictions related to managerial skills, procurement of inputs and outputs, to uncertainty and risk. In extension of this theory, Hambrick and Crozier (1985) and Bruton and Prasad (1997) conclude that the first cause that limits the growth of companies is the lack of liquidity (cash deprivation). Indeed, without financial resources, a company can not invest and improve its production, turnover and market share nationally let alone internationally ... It can not recruit or train staff and therefore improve the management skills, she can not diversify its risk ... In short, without financial growth trajectory in the sense of Penrose (1959), is hampered. Welbourne et al. (1998) introduce the concept of entrepreneurial growth ceiling (CGE: Entrepreneurial Growth Ceiling). They see the IPO as a means to generate financial resources and to break, therefore, that limit growth through investment in human resources and R & D. This type of deployment of financial resources from the listing reassures shareholders and the authorities of financial markets are creating shareholder value in the short term and ultimately ensure the long-term performance.

The resource-based approach considers the firm as a combination of heterogeneous resources that determines the performance (Pateraf, 1993). According to Barney (1991), achieving a sustainable competitive advantage based on resource use evaluable, rare, inimitable and not substitutable. Hofer and Schendel (1978) identified five types of strategic resources: financial, human, organizational and technological. In the same vein, Castrogiovanni (1991) and Covin and Slevin (1991) have shown that financial resources are positively correlated with the growth of the firm. Blowers et al. (1995) identify the benefits of
the IPO and specifically cite the improved financial conditions, capital to support growth "capital to sustain growth" opportunities for future funding and a means to grow externally "mergers and acquisitions "... That being said, the financial resources are not sufficient alone to stimulate growth. We need a system of governance that would guide the strategic leaders in this direction.

The agency theory considers the financial market as a control mechanism that would induce managers to make strategic choices in the direction of maximizing shareholder value (Jensen, 1993). Indeed, the regulatory bodies of financial markets, including the AMF (Autorité des Marchés Financiers)² agree to protect shareholders and ensure the transparency of information. This is, inter alia, through the requirement to publish annual reports and to inform shareholders of the strategies implemented and their consequences in terms of value creation. Leaders must be vigilant in their mode of development, their management and expenditure incurred. They must also comply with the promises of growth displayed. Otherwise, the disgruntled shareholders sell their shares, thus lowering the value of the company, with all negative consequences for executives (in terms of pay, reputation, difficulty in issuing new securities and the threat of takeover ...) Anyway, in the context of the "glass house", the leaders are not entirely free in their choices. Any strategic decision would be a signal about future prospects and have a direct impact on shareholder value.

As such, the signal theory is instructive. It aims to explain variations in stock prices through signals from the strategic decisions of leaders. They must not only make fair decisions, but also convince the market by positive signals (Vernimmen, 2009). The examples most frequently cited concern the financial strategies, the politics of finance (Ross, 1977) and distribution (Charest, 1978). The investments in profitable projects are also a signal about future prospects of the company that would involve an assessment of the stock price (Leland

² The equivalent of the SEC (Stock Exchange Commission)
and Pyle, 1977). In the absence of profitable growth, shareholders prefer to sell their shares, to garner liquidity and diversify their investment portfolio in more projects that create value.

Among the strategic levers of **value creation**, we can cite the growth strategies (Hirigoyen and Caby, 2001). Regarding organic growth, many researchers have demonstrated a positive relationship between the market value of the company and its investment in capital assets (Mc Connel and Muscarella, 1985), research and development (Copeland et al., 1994), (Chan et al., 1992) and generally any type of investments which are of strategic long-term (Woodbridge and Snow, 1990). We are therefore tempted at this stage to speculate as follows:

**H1: The stock market listing incentive to invest in organic growth.**

That said, Pagano et al. (1998) show that companies bidding to carry out the exchange of heavy investment and results in a high growth and high performance accounting. After the successful introduction, the authors found a decrease in performance and a reduction in investment. This is consistent with the hypothesis that the timing leader deliberately introduced his company during periods of strong performance or in the context of stock market euphoria (Cai and Wai (1997); Pagano et al (1998) and Coakley al. (2004); Serve (2007)). Some authors (Rangan (1998), Pastor-Llorca and Proveda-Fuentes (2006), Roosenboom et al. (2003)) refer to results management in the sense of reflecting growth prospects and a healthy financial position that would ensure the success the IPO. Thereafter, growth is not necessarily to go.

The contribution of external growth strategies on creating shareholder value is mixed. Such a strategy would potentially create value if it can control and strengthen the bargaining power vis-à-vis a partner (customer, supplier, competitor ...), to conquer new market shares and harness synergies and economies of scale. Overall, existing studies indicate that this type of growth, although it is favored by exchange of securities on the stock market is not necessarily create value for shareholders of the acquiring firm. It especially allows an
assessment of the securities of the target company (Couret and Hirigoyen, 1992, Caby, 1994) and a transfer of wealth in their favor, because of the premium offered (Roll, 1986 and Sudarsanam et al., 1993). From the perspective of creating value, we therefore assumed the following:

**H2: The stock market listing handicapping strategies of external growth**

All these theories reflect the impact of stock market listing on growth strategies. However, their scope (including agency theory, and signal value) is more concerned with big business. What is the particular case of SMEs, characterized by a high concentration of capital, an owner and a family structure often?

Van Loye (1991) considers that SMEs in its path toward growth is expected to open on the outside looking for additional financial resources in line with its rationality. New shareholders and financial institutions will emerge, thus promoting agency relationships and the associated costs. In the same vein, Charreaux (1998) finds that SMEs are not always spared of agency problems. For some, the conflicts are reduced because of the confusion of functions ownership / decision / control. For others, especially those who have opened their capital stock, traditional relationships are modified. According to Denis (2004), the SME is facing the same organizational problems: conflicts of agency and asymmetric information. These problems are more important in SMEs and require, therefore, contractual safeguards.

That said, many researchers continue to regard the SMEs, especially family, like the one that generates the smallest agency costs and more efficient forms of governance (Daily and Dolinger (1992) and Kang (2000)). Jensen and Meckling (1976) go further by saying that it is not necessary to establish mechanisms of governance in family firms. The costs associated are not without reducing performance. Schulz et al. (2001), by undertaking a study on family businesses in 1376, demonstrate that the combination of the functions of ownership and decision-making in general and in particular the homestead is not the mode of governance
more efficient. The agency problems may well exist, but they present themselves differently. They are mainly related to inefficient markets, treasury, the opportunism of the owner (Perrow, 1986), the existence of non-monetary incentives (Jensen, 1998), altruism notably members of the family (Simon (1993); Eschel et al (1998)), etc., It is nevertheless true that they support the hypothesis of a positive impact of this type of structure on performance if the system of corporate governance is efficient. The financial market is a component.

1.2. The SME and the Stock Market: what a strange alchemy!

From 455 firms listed on Euronext (B & C) and Alternext, 127 are SMEs. These companies have a turnover growth rate and total assets greater than their unlisted counterparts. They are 50% more likely to get into the category of larger size. The most successful of them outperform unlisted in terms of profitability and growth rate ... (Bank of France, 2010). This report sheds light on two key points: the stock exchange listing of SMEs is quite rare, but generates a spiral of growth. It follows clearly significant interest to the political powers. In terms of research, there is little work in this area. Most studies have looked at alternative sources of financing, including venture capital. Others are looking to finance upstream of the entrepreneurial venture. It is the seed capital which involved incubators, business angels, family contributions, aid from the state ... (Pare et al., 2009)

Finally, the theory of pecking order or pattern of life cycle Company, the company's IPO on the stock market remains the last resort of SMEs, after the cash flow and bank debt. The reasons why an SME go public are mainly related to funding opportunities. Indeed, the listed company may appeal to the financial market to carry out capital increases. It may well improve its investment capacity and financial independence, while retaining the benefits of leverage (Deign and Joly, 1986; Pagano et al., 1998). Also, the Exchange allows - it finance external growth without disbursement of cash. These are mainly payment by securities (Levasseur and Quintart, 1998; Brau and Fawcett, 2005). The IPO contributes significantly to
strengthening the reputation of the company and its bargaining power vis-à-vis its partners, customers, employees, suppliers, creditors ... Chemmanur and Yan (2004) refer to the introduction of marketing offering. The financial market, as we noted earlier, is also a tool for monitoring management and evaluation of their performance. Finally, the listing provides the liquidity of securities (Sentis, 2005). "The founding shareholders may emerge and new shareholders interest in society without fear of being trapped (Saada, 1996). This is rarely the case managers of SMEs with maintaining power is at the heart of their concerns (Belletante et al., 2001).

Despite these advantages, few French SMEs are listed. The IPO is rampant in a culture very hostile to the transparency and sharing of property (Chertok et al., 2009). Belletante et al. (2001) highlight the difficulties and fears about the economy, the size, the obligation of result, the constraints of maintaining the stock price, the high cost, loss of autonomy, under-reporting, the refusal to disclose information ... There are also fears of failure and lack of preparedness for this kind of exercise. These apprehensions have been reduced during the creation of the New Market (1996-2005) and the development of small innovative companies, the emergence of introducers market makers and more recently the introduction of "experts mean values" on Eurolist by Euronext. "The coincidence of a flurry of introductions and a more efficient support the stock market authorities and intermediate results in learning a logic that approximates the behavior of SMEs than large listed companies (Belletante et al., 2001). The comments raised by Belletante et al., 2001, we suggest thinking about the definition of SMEs and its apparent contradiction with the phenomenon of listing. Indeed, by slipping stock market, the SME opens its capital, change its ownership structure, changing its mode of governance, organizational architecture and strategic behavior. It seems to distort its specific characteristics closer to large enterprises. The current distortion based on a contingent approach to the specificity of SMEs. It aims to critically examine the context of validity of the
classical concept of MSY. It is justified in the research themes that address the paradoxical relation to the standards generally accepted in the SME. The demonstration of the distortion based on the concept of anti-SME. Torres (2002) defines it as "a small company that has all the opposite characteristics of the classical conception of SMEs ... In some kinds of anti-SME represents a large company miniature. The author believes that the demonstration of the distortion of the SMEs can not afford a single case. It would take a denaturing context. That is to say a context in which small companies have different characteristics from what is commonly accepted for SMEs. Taking the example of stock exchange, the natural context associated with the concept of SME is defined by a sample of small businesses not listed, is financing from own resources (internal and / or specific inputs), and possibly bank debt (Desroches, GREPME, 1994). The model-SME is a model of financial independence. In this regard, some studies have shown implicitly that the specificities of SMEs are significantly altered due to their mode of financing, such as the use of venture capital (Stephany, 1993) or public savings (Belletante and Desroches, 1994; Belletante et al., 2001). It would be interesting to study how the IPO could distort the specificities of the SMEs. The listing would change the environment of the SMEs (more heightened transparency, a more diversified ownership, more diffuse and especially more demanding, etc.) Encourage and conduct a different policy from that which would be adopted in the absence of context (Perhaps more offensive thrust toward growth, internationalization of markets, investment in R & D, financial openness to foreign funds, etc.). The purpose of this article is precisely to shed light on these presumptions.

Some interesting studies have been conducted on Canadian firms (Desroches and Jog, 1991) and French (Belletante and Desroches, 1993). They have to understand, among other things, the implications of the decision to IPO for SMEs. Overall, it shows an impact on attitudes and behavior of the leader, its management and financing, its network of financial
partners ... In short, a positive impact on the strategic management and growth prospects, "Access to finance public also seems to be a first step toward growth and maturity of the SME [...] It is clear that the experience of public funding appears to be very positive." (Desroches and Jog, 1991). Serve More recently (2007) conducted a study of 115 French companies, introduced the New Market between 1996 and 2000, and a control sample. It showed a decline in performance and lower growth indicators, including investment spending. Author (2006), by making a comparison longitudinal and transverse finds a statistically significant performance indicators. This trend is contrary to the sample "witness" of unlisted SMEs. He considers that the financial market reduced the discretionary latitude leader, certainly, but in a destructive sense of value.

2. **Empirical Approach: the Growth Strategies of Listed SMEs**

It stems from different theoretical approaches mentioned effect of listing on the growth strategies of SMEs. In what follows, we will try to validate (or not) our hypotheses empirically. This is to ensure that the stock market presence that offers advantages in terms of finance and strategic development potentially can actually create value and consistent with the specificities of SMEs.

2.1 **Methodology and other assumptions**

To provide some answers, we opted for a longitudinal study over a period of seven years (three years prior to the listing, the year of listing and three years later). The study focused on 65 SME and listed on a control sample of similar unlisted SMEs. For the constitution of our sample, we set an upper limit of 50 million euros at the date of IPO. Such a test is inadequate given the variety of industries to which firms belong. Careful attention was paid to each company, given its turnover, its staff, its total assets and business. The information gathered has been gathered from the database Dianne, CD-pro Dafsaliens and supplemented by annual reports available at the Documentation Centre of the MFA. It took place in two stages
corresponding to the two procedures based on the study of Alexandre and Charreaux (2004). The first step is mainly used to test the "evolution static" growth indicators selected. Just follow the evolution of the indicators on average, before / after listing (longitudinal comparison) and SMEs listed / unlisted SMEs (cross comparison). Parametric tests of difference of average have to see if the change is statistically significant. To better understand the temporal dynamics, further tests were performed on the values of the same indicators in the years between successive extremes -3 / +3 and -3 / 0 (pre-listing period) and, finally, 0 / +3 (The post-listing). Still, the dynamic effect of the quotation is perceived very imperfectly.

To overcome this deficiency, like Alexandre and Charreaux (2004), we felt it necessary to use an econometric model that allows us to take into account the temporal dynamics and whether the listing is a significant explanatory variable growth, ceteris paribus. This is to measure the growth rate per firm. For this, the main indicators were regressed on three variables: 1) the time T (the values of 1 to 7 denotes the seven years), this variable can take into account the effect of the doubt time and see if the rate growth has improved over the years, and 2) a dummy variable reflecting the L listing (equal to 1 if the company is listed, 0 otherwise): With this variable, we know a priori if the listing variable is significantly Explanatory growth, and 3) a variable equal to the product of TL variable "time" and the dummy variable "listing". This variable would give us an idea about the evolution of the growth strategy over the years after listing. Indeed, the consequences of the IPO are not instantaneous but they are spread over a longer period. Finally, to improve the quality of the model, two control variables were introduced: the size and the business cycle. The creation of a panel can control the heterogeneity that is often a source of statistical bias and identify the determinants of differences in observable behaviors. Given the two dimensions of data, the regression has increased from 455 observations (65 firms 7 years).
\[ Gr_{it} = \alpha_i + \beta_{1i} T_{it} + \beta_{2i} L_{it} + \beta_{3i} TL_{it} + \beta_{4i} Size_{it} + \beta_{5i} Cycle_{it} + \epsilon_{it} \]

Gr: the growth of the firm i in year t  

T: time for firm i (value ranging from 1 to 7)  

L: dummy variable taking the value of listing for year t listing of firm i, and 0 otherwise  

TL: variable expressing the interaction of the two previous  

Size: the turnover of firm i in year t  

Cycle: the rate of growth of GDP in year t for firm i  

\[ \epsilon_{it} \]: Error term  

Regarding the indicators of growth, we used indicators of growth in the strict sense: the internal growth and external growth. The first is the business model in the sense of heritage-In Montmorillon (1989): The company grows by acquiring new productive assets, approximated by the ratio (Fixed assets / total assets). The second is for equity or partial shareholding in other companies, have already combined factors of production, for control purposes (Paturel, 1992). We approximate this growth mode, like Alexandre and Charreau (2004), the ratio (financial assets / total assets). These two models of development, we added in addition, other indicators of growth: the rate of overall investment (net fixed assets / Total assets Net) growth of sales (St-St- 1/St-1) in France and abroad (rate of foreign sales) and the rate of investment in R & D (R & D / total assets).

We hypothesize that all of these indicators are expected to grow further in the context of quotation. We suppose like Desroches and Jog (1991) that "public financing is a step toward growth." As noted above, the listing improves access to financial resources (equity and long-term debt), it often requires the creation of a financial service (Belletante, 1998) which deal in particular operations investment. Also, the constraint of transparency and
accountability for results they would encourage the leader to opt for these promising strategies for positive signals. To avoid penalty Financial Market, the leader should be careful and put growth in the center of his thoughts for the development expected by the shareholders.

2.2. **Statistical comparisons: presentation and analysis of results**

Table 1 presents the results of tests of the first procedure for listed and unlisted SMEs. For each indicator, are listed the averages of the 65 companies surveyed in the year -3 (that is to say, the third year before entry), 0 (the year of introduction), 3 (third years after introduction) and the average of three years before and after listing. Subsequent columns show the average difference tests. These tests check whether the difference is significant or not.

In light of all the ratios of growth, the listing seems to have a statistically significant effect on the strategic behavior of SMEs in our sample, in terms of growth. The variations are insignificant at best, if not otherwise in the case of SMEs "cookies". The change in turnover is positive, which means an increase in turnover from one year to another. It is nevertheless true that he is at a decreasing rate, so the variation of turnover has decreased compared to the situation before listing. This decrease was significant on average before / after listing and third year after listing. The level of activity of the company seems to grow with a frantic pace after the IPO. The trend is not significant in the case of unlisted sample. That said, sales abroad increased significantly after listing. This evolution is far from being confirmed in the control sample. Probably because the listed company has more financial resources enable it to increase its market share abroad or in an effort to improve its image vis-à-vis investors and reflect future flourishing. The IPO also has a reputation and an additional guarantee for customers abroad. Alain Manoukian and justified the introduction of his company stock: ‘*We decided to enter the second market of the Bourse de Lyon because we needed an international reputation, particularly in the United States. Since, we are more than satisfied with relapsed.*"
Not only the title climbs, but many people contact us for licensing agreements ... This introduction has made us save years of expansion.\footnote{Cited by Daigne et Joly (1986)}

Regarding the ratios of growth in the strict sense, the quotation seems to have a significant effect on the investment policy of the company. In fact, its ratio of capital / total assets increased from -3 to +3, from 0-3 and averaged before and after listing. This trend is quite contrary in unlisted SMEs. The bulk of investments concern the external growth. The ratio of financial assets / total assets has continued to grow. However, investments in tangible and intangible assets (including research and development) have decreased significantly. Leaders, it seems, favor, after their IPO, the external growth strategies at the expense of growth.

This step has mainly helped us to monitor indicators of growth, on average, in a static view. But, we are not able to apply the rule of, all things being equal. Indeed, the differences, even significant, can not be systematically attributed to the phenomenon of listing. For this reason, the empirical study has been extended by an analysis that explains the impact of the listing for each company while introducing the variable "time" in a more dynamic perspective.

### 2.3 The econometric models for a better understanding of the temporal dynamics

Introducing the time variable is justified by the fact that it is unlikely that the effect of listing on growth strategies is immediate. Indeed, businesses, even small ones, are relatively rigid systems, high inertia. It takes time for new policy directions from the IPO are apparent. Thus, to better reflect the effect of listing, it would be interesting to measure the gradual evolution of selected indicators of growth (organic growth, acquisitions, growth in foreign sales, and investment in R & D). The procedure we can apply precisely measured for each
firm, the growth momentum due to listing and to verify whether the listing is a significant explanatory variable in growth ceteris paribus.

Table 2 presents a summary of the results obtained for organic growth. This is a linear regression on panel data on 455 observations (65 firms in seven years). The method that we considered most appropriate is that of weighted least squares, applied to the software Eviews.

Table 2 provides a sample of results for the 65 SMEs listed in our sample. For each company, we have estimated coefficients of explanatory variables and their degree of significance (t test). Like Alexandre and Charreaux (2004), we assume that the two control variables which would condition the growth strategies (the size and the business cycle) are common to all firms. In other words, the impact of these variables on the growth strategies of SMEs is the same for all firms. Here in this case, the effect size is negative and significant: the more the company is large lower is its investment in organic growth. Conversely, economic cycle is more favorable, more companies are internal growth. Finally, for each company we have estimates of the time variables and quotation. To better understand the contents of the table, take the example of the company No. 17 (Icom Informatique), a company for which all coefficients are statistically different from zero. The coefficient on the variable T is positive reflecting, on average, an increase in growth over the seven years studied. The coefficient of the variable L, also positive, means an increase of static indicator in the listing. Finally, the negative coefficient of TL means that the growth tends to decline over the years after listing.

The coefficient of the variable L gives information whether static sufficiently close to the parametric tests of difference of averages have provided. However, in this case, information is given company by company. It appears that the effect of listing on growth is positive for 28 out of 65 SMEs, but it is positive and significant for only 8 SMEs. The negative effect is more significant in 13 cases and 37 non-significant. The coefficients of TL
give information of dynamic nature. They are positive in 31 SMEs but are positive and significant in 18 cases. However, they are negative for the remaining 34 SMEs and negative and significant for 27 SMEs. This is consistent with the results obtained in the framework of the statistical study. Contrary to our assumptions, the growth does not seem to be preferred in a context of quotation.

The same model was applied to the external growth strategy. This indicates that the listing had a positive effect on the external growth strategy in 40 cases. This effect is positive and significant in 16 cases. However, negative factors are present at 13 cases and 12 cases insignificant significant. This confirms the results of the statistical study: the listing had a positive effect on the external growth strategy if we compare a static evolution of this ratio compared to the situation pre-listing (risk of error 1%) and in relation to unlisted SMEs. However, the most interesting factor is that which reflects the evolution of strategy over time after scoring in a more dynamic perspective. This is the coefficient TL. It is positive in 28 SMEs and significant in 12 cases against 24 negative coefficients and significant and 13 insignificant. The results are different from the statistical test. Apparently, most SMEs in our sample, drawn by the possibilities of acquisition of securities by exchange, recourse to external growth from their IPO. Subsequently, over time this strategy assumes. This is especially true that the shareholders having the opportunity to diversify their portfolio, by far the focus on profitability growth. Thus, we are tempted to temper the confirmation of this hypothesis: The listing had a positive effect on the external growth strategy in a static perspective. The trend reversed over time.

As regards investment in R & D, listing has had a positive effect in 13 cases out of 65. This positive effect is significant only for three cases. The negative effects are more prevalent in 52 cases (but not significant). As regards the coefficients of TL, they are positive for 48 SMEs with two significant. They are, however, negative and significant in 6 cases. The listing
seems to have a negative effect on the growth of investment in R & D this is confirmed in our statistical results. That said, we remain skeptical about the rejection of this hypothesis on a more distant future, as we move from 13 positive coefficients for the variable L to 48 variable TL, which means that there is probably a change in trend. Since its introduction, the leader of the SME does not promote the realization of such an investment is costly and that the payback period is very long. This would impact negatively on the immediate results of the company and its stock offering. However, beyond three years of listing, management does not preclude the realization of such an investment often conducive to improved performance.

Finally, about the percentage of sales abroad, we found a positive effect of listing in 24 out of 65 SMEs. This effect is significant only in 5 cases. It is, however, negative for 43 SMEs with 13 significant cases. The static effect of listing on the percentage of exports seems rather negative. This is in contradiction with the statistical results that confirm a positive trend in this ratio on average. Certainly, because if we take each company in each case, we see more negative effects of listing on the percentage of internationalization. However, these effects have had a low weight as the average export rate has increased significantly. As for the dynamic effect of listing on this strategy, it is positive in 37 cases including 23 significant and negative in 28 cases including 13 significant. These results lead us to accept the hypothesis which states that the listing seems to have a positive effect on growth of sales abroad, especially in a dynamic perspective.

Discussion/Conclusion

Following this study, what can we conclude about the impact of the IPO on the growth strategies of SMEs and the distortion of the concept SMEs?

The general conclusion of statistical comparisons and econometric models summarized a significant impact on growth indicators. The listing has indeed had an impact on the strategic behavior, in terms of growth. This impact is not always positive. The listing
does not automatically mean growth for all selected indicators and for all SMEs in our sample. The general trend that emerges is an increase in investment for the bulk of which external growth at the expense of growth and investment in R & D. The growth in turnover is positive but it shows a decreasing rate. Its share abroad increases significantly, especially in a context of temporal dynamics.

These behavioral changes brought on strategic external growth and internationalization, coupled with financial openness from SMEs to public savings, are in line with our presumption of distortion. Indeed, the current stock market and growth strategies resulting dissolve the specificities of SMEs and switch the definition of SMEs in the extreme and beyond continuum proposed by Julien (1994) size increases, the market is open to international perspective, the structure is decentralized, financial independence is meaningless, growth is pushed toward more risk and technology tends to be developed ... As such, it is closer to the profile of SMEs GAS (growth / autonomy / sustainability) as SIG (sustainability / independence / growth) as defined by Julien and Marchesnay (1987), "risk" to distort and to shake up the boundaries that specify big business.

That said, the study is not without limits, we agree that the horizon is very short selected to evaluate the effect of listing on the strategic behavior of leaders, particularly in terms of growth. The apprehension of the temporal dynamics has been achieved through the econometric model. The latter along with the statistical approach is not free from criticism. Similarly, the accounting indicators of growth are only a rough approximation of the complex reality of the concept.

It seems, well, that to better understand the effects of listing on the growth of SMEs, it may be necessary in connection with the extension of this research, use of qualitative studies. Such studies would probably a better understanding of listing and its impact in organizational and strategic. This would also allow us to deepen the criteria for definition of anti-SME when
speaking of listed SMEs. Finally, it would have been interesting to study the impact of new strategic directions from the listing on the creation or (destruction) of value to SMEs. The purpose of this study is, rightly, a prerequisite to better understand and explain the evolution of the performance of listed SMEs. It is likely that the decline in performance often found after listing due to a growth strategy inconsistent with the logic of SMEs under pressure and "short-term approach" imposed by the financial market. The purpose of this study is also based on the reflection on the concept and its small distortion after the IPO. A small public company is not necessarily an SME if it adopts a strategic management, particularly in terms of growth, which removes the commonly accepted characteristics of SMEs. Should we push the limits of the definition of SMEs? Or look at the other extreme, the SMEs when it enters the stock market is no longer an SME?

**Fostering Trust Within Strategic Alliances Among SMEs:**
*A Study on the Role of Network Facilitator*

*Benedetto Cannatelli and Fabio Antoldi*

**Abstract**

The paper describes how the role of network facilitator played by a third party institution may substantially contribute to enhance trust-based ties among the entrepreneurs involved in a local business network, thus reinforcing a sound alliance strategy initially based only on calculativeness about a business opportunity. In our work, empirical evidence is presented by a longitudinal analysis of a case history. The case study focuses on eight international-oriented competitors located in the furniture industrial district of Brianza, a geographical region in Northern Italy, that built up a formal network called "I-Style Partners" to foster beneficial associations with one another. Two series of in-depth interviews were carried out with entrepreneurs and facilitator’s managers involved in the strategic alliance during a three-year period.

In this case analysis, a descriptive framework of the impact exerted in the network by the interaction of calculativeness and trust will be provided. Findings from this research show that interaction with an external actor has been crucial to promote the formation of linkages, to develop trust and to solve relational problems among competitors in an individualistic and masculine environment.

Keywords: Strategic alliance, SMEs, Trust, Calculativeness, Network facilitator

**Introduction: strategic alliances among SMEs as a form of network**

Strategic alliances among firms have been gaining increased attention among scholars as an innovative way to improve competitiveness (Ahuja, 2000). Indeed, by building inter-organizational relationships, firms achieve new competitive advantages that contribute to their ability to reach a better position in the market. This is especially true now that globalization has pushed businesses toward new strategies by reducing the distance between demand and supply abroad. Therefore, alliances have to be regarded as a critical pattern that firms may well be involved in, so as to better cope with new challenges coming from the external environment.

The strategic implications for single firms participating in such an alliance are mainly: lower transaction costs in the supply chain; easier creation of intellectual capital, especially in the form of...
tacit knowledge; as well as the facilitation of learning and knowledge transfer (Jarrillo 1988; Nahapiet, and Ghoshal 1998; Inkpen, and Tsang 2005).

Strategic alliances often involve several economic actors whom, cooperating long-term, may also generate stable networks of firms. “These strategic networks are composed of interorganizational ties that are enduring, are of strategic significance for the firms entering them, and include strategic alliances, joint ventures, long-term buyer-supplier partnership and host of similar ties” (Gulati, Nohria, and Zaheer 2000).

Firms may gain substantial advantages from belonging to one or more networks. Indeed, the special presence, evolution and interaction of social capital (and intellectual capital) inside the network generate an additional “organizational advantage” that is based both on the inter-firms relations and on the continuous transference of knowledge among its members. For these reasons, particularly in favourable contexts, network member firms are able to generate greater value as compared to those that operate according to other modes of organization, such as market or hierarchy (Adler, and Kwon 2002; Ghoshal, and Moran 1996).

All of these advantages are even more considerable for Small to Medium size Enterprises (SMEs), which often do not handle enough resources and capabilities to achieve their critical goals in large international markets. In fact, through strategic alliances, small firms can fill an often otherwise overwhelming gap by gaining access to such particular resources, thereby better developing economies of scale, sharing risks and costs, entering foreign markets and improving their speed of entry into the market (Rosenfield 1996; Doz, and Hamel 1998; Bierly III, and Gallagher 2007).

The role of trust in building strategic alliances

Even though joining a strategic alliance may well offer several advantages for SMEs, the process toward collaboration is not always smooth. Indeed, collaboration among small firms predominantly implies collaboration among entrepreneurs; such people are often individualistic (and sometimes masculine) profile. Due to the high probability of conflict among the people involved, managing strategic alliances among SMEs is a complex and risky venture (Medcof 1997).
According to the literature concerning networks of firms, the main constraints to the creation of a strategic alliance are related to: (a) the risk of opportunism among the entrepreneurs, (b) a low commitment from the counterpart and (c) the culture of the actors joining an alliance.

The risk of opportunism comes from the divergence of objectives and in the management style of the firms involved as well as from environmental volatility. Williamson defined it as “self-interest seeking with guile.” Opportunism improves the complexity of the alliance building process by increasing the transaction costs, reducing confidence levels among the participants, and by focusing on short-term rather than long-term interest, thus discouraging reciprocity and repeated commitment (Williamson 1975; Parkhe 1998; Luo 2002).

A high level of commitment is necessary for a successful strategy in a firm as well as in a strategic alliance. According to Salancik (1977) commitment is the binding of the individual to behavioural acts and Ghemawat (1991) defines it as the tendency toward the persistence of a firm’s strategy, underlining its relevance in order to produce a superior performance. On the contrary, alliances characterized by low commitment of its members - due to relevant differences in their self interests, business characteristics and market strategies – may end in divorce due to substantial differences in the amount of time and the number of resources devoted by each of them (Medcof 1997).

Lastly, the individual culture of the entrepreneurs joining the alliance plays an important role in determining their attitude to take part in the collective strategies. Hofstede defines culture as “the collective programming of the mind which distinguishes the members of one human group from another.” (Hofstede 2001; Doney, Cannon, and Mullen 1998). Accordingly, masculine and individualistic cultures tend to stand as a barrier to the consideration of a competitor as a potential partner, while feminine and collective cultures seem to be correlated to cooperation.

Notwithstanding the above mentioned constraints, strategic alliances may be supported and fostered by the development of trust among the partners (Ring, and Van de Ven 1992; Zaheer, and Harris 2006).

The topic of trust has been widely observed from several points of view, corresponding to as many disciplines as psychology, sociology and economics. With regard to the latter, in the last two
decades, a growing amount of attention has been paid to the subject of trust among actors within the same and among different organizations (Zaheer, and Harris 2006; Dirks, and Ferrin 2001; Saparito, Chen, and Sapienza 2004; Zaheer, McEvily, and Perrone 1998, Krishnan, Martin, and Noorderhaven 2006). Precious insights on trust have been offered to the fields of Strategic, Organizational and Inter-organizational Management.

In management literature, several issues concerning trust have been taken into account. A milestone paper by Zaheer, McEvily and Perrone (1998) defined trust as “the expectation that an actor can be relied on to fulfil obligations, will behave in a predictable manner, and will act and negotiate fairly when the possibility for opportunism is present.” Their research highlights the need to distinguish between interpersonal and interorganizational trust. The individual boundary spanner at a single firm establishes relationships with both individuals and groups of individuals that belong to the partner organization. Hence, if the origin of the relationship is always an individual, the counterpart may vary. This insight is very useful in order to avoid making the cross level fallacy (Russeau 1985), for one will then distinguish between these two levels of analysis. This insight has been of great value, especially in examining the relationships among SMEs, that, because of their entrepreneurial nature, are prone to an overlap of interpersonal and interorganizational ties.

According to this approach, trust among partners has a relevant impact on the respective firm’s performance by reducing transaction costs and conflicts. In fact, even other benefits, such as increased sales and an increased return on investment, are to be listed as direct outcomes of trust (Zaheer, and Harris 2006; Mohr, and Spekman 1994; Luo 2002).

Literature acknowledges trust to be a requirement of a strategic alliance. The main purpose of our work is to analyse how trust emerges over time, during the network building and developing process, as result of both network facilitator activities and interactions among entrepreneurs.

**Calculativeness and trust in the strategic alliance building process**

Before analysing the emergence of trust within the network, it is necessary to introduce the topic of rationality and its role in leading entrepreneurs to the decision whether to join an alliance or not.
To broaden this topic, it is useful to refer to the debate about the relationship between calculativeness (which usually focuses on the economical returns of a decision) and trust (which conversely focuses more on psychological and social dimensions of behaviour). Different statements have been made about the relationship that occurs between the two paradigms, especially when referring to the matters associated to having an alliance. On one side, some authors consider calculativeness as a component of the trust-building process among the economic actors, hence including the economic expediency of an alliance as an ingredient of trust (Doney, Cannon, and Mullen 1998; Zaheer, and Venkatraman 1995, Luo 2002).

Conversely, according to Williamson (1993), calculativeness is the only paradigm that is in a position to explain economic behaviour, asserting that trust “is reserved for very special relations between family, friends and lovers”. Hence, he goes on to state that “calculative trust is a contradiction in terms”. Such a position has been strongly objected to by Craswell (1993), who substantively disagrees with Williamson’s work by distinguishing between a possible explanation paradigm for the economic behavior (calculativeness) and the cognitive process that really leads to that behaviour (trust). In other words, Craswell introduces a “distinction between the internal psychology of the actors involved and the external or «as if» theories of an academic analyst,” by supporting an explanandum approach that cares about how the actors involved in the analysis view their actions. In so doing, he thus holds trust to be a key factor of economic behavior. Like Williamson, Craswell considers calculativeness and trust to be two separate concepts. However, he does diverge from the former in conceiving the two paradigms as complements rather than substitutes.

Such considerations lead to the first research question of this work:

Q1. What are the roles played over time by calculativeness and trust in the strategic alliance building process among SMEs?

Accordingly, the perspective assumed in this work considers trust and calculativeness to be different but complementary concepts. In so doing, this leaves the door open to a decision making process in which calculative, psychological and sociological elements coexist.
The role of network facilitators in fostering trust among members

The second purpose of this research is to deepen the body of knowledge about network facilitators, a concept introduced in work by McEvily and Zaheer (2004) to analyze the role of institutions (such as associations of firms) in fostering collaboration among actors involved in geographical industrial networks. In particular, with the acceptation of “Architects of Trust,” these authors focused on the dynamic through which trust is built among people belonging to geographically close organizations involved in the alliance. They proposed the performance of an exploratory in-depth case study on the activities led by an institution called Western Michigan Manufacturing Technology Center (WMMTC) so as to foster trust within a network called the Office Furniture Industry Council (OFIC). The main result of their study has been a better understanding of the importance of the presence of a third party that is trusted by each participant due to the presence of a pre-existing relationship.

Even if it has been observed that network facilitators play a relevant role in building trust among participants (Obstfeld 2005), the dynamic according to which this occurs is still unclear, especially from a longitudinal perspective. Thus, in regard to the invitation by Zaheer and Harris (2006) to better analyze the role of the network facilitator, the second research question of the paper is stated as follows:

Q2. How do network facilitators foster the development of trust among members of a strategic alliance over time?

Methodology of the research

The research performed here is a longitudinal case study with an exploratory purpose. The field case analysis carried out focuses on the I-Style Partners experience, a strategic alliance among eight firms belonging to the industrial furniture district of Brianza, a geographical area in Northern Italy. These firms are: Feg-Salvarani Group, Lema (through its business unit, called “Concept International Office”), Mobileffe, Misuraemme, Giellesse, Turri, Zanaboni and Coro. They are all SMEs: their number of employees ranges from 20 to a maximum of 200. It is important to note that they all
belong to the same local association of firms, Compagnia delle Opere (CdO), which acts as network facilitator in the case history.

To lead an in-depth case study fits the purpose to explore causal links that are too complex to be analysed, for example, through a survey. Indeed, the utilization of a longitudinal perspective is consistent with the research objective: explore the dynamics according to trust is created and maintained among a group of entrepreneurs, as well as the call for research to explain the evolution of such trust over time (Zaheer, McEvily, and Perrone 1998). Again, it is also a key-tool to detect the influence exerted by the network facilitator over the different stages of the alliance.

Narrative has been used as basic tool for analysis: this is consistent with both the need to re-enact main events of the case history and to describe motivations and actions carried out by different actors along the process.

The validity of the construct is enhanced by triangulation among multiple sources of evidence: a couple of in-depth interviews with each entrepreneur and manager of the CdO – registered and transcribed, backed up by a systematic review by the interviewee, then codified by the authors – over a period of two years (see Table 1); analysis of corporate documents; direct observations attained during the alliance meetings. Some extracts of the interviews are reported and commented on in the following paragraphs.

A clear statement of the variables considered in the analysis section gives both internal and external validity to the theoretical model proposed. Finally, research practices compliance is strengthened by the adoption of a case study protocol as well as the creation of a database that reports all documents and interviews that qualify as research data.

**I-Style Partners and the Brianza Furniture District**

The furniture district of Brianza is composed of 4,476 independent enterprises, all specializing in the production of furniture, co-located within an area of 258 Km² in the Lombardy Region. In reference to the number of employees, the average size of the firms is only 3.6 units. Indeed, this is the result of the co-existence of enterprises that differ among each other. In fact, three classes of
SMEs can be found in the region: the micro-firms, with no more than 9 employees (they work mainly as sub contractors for other manufacture in the district); the small enterprises, with 10-49 employees (they work both as sub contractor or directly for the wholesale dealers or retailers); medium enterprises, with 50-249 employees, with focus on the market, subcontract for several stages of the supply chain to smaller enterprises in the district. Only a small number of firms inside the district has more than 250 employees (fewer than 10) and none of them has more than 400.

The initial proposal of gathering the eight entrepreneurs was made in the spring of 2005 by the local office of Compagnia delle Opere (CdO) – an association of firms with branches all over Italy and in fourteen other countries. Two weeks before, CdO was involved in a large real estate redevelopment project in Ivory Coast. CdO asked for a collaboration to occur among the eight associated firms. In Table 2 the eight firms involved in the I-Style Partners alliance are depicted.

The process of forming the group has been a progressive effort. Only three firms were involved at the outset: Lema, Mobileffe and Giellesse. They mainly deal with modern, day, and night furnishings and, thanks to Concept (a Lema’s business unit) they could assure the coverage of all possible office furnishing needs. The fourth firm asked to collaborate was Turri, the only one with the expertise to produce furniture with a classic style, which is especially appreciated abroad. Then, production volume and the investment budget was estimated, and the need to call on additional firms within the district became evident. In order to avoid product overlap within the group, the selection process had to be accurate. That was when another business, Feg-Salvarani Group, was invited to join the alliance. In fact, with the aid of the Salvarani unit, the group also would have been able to satisfy the demand for kitchens. Finally, Zanaboni, Misuraemme and Coro were added to the strategic alliance so as to increase the productive capacity for classical, modern and garden furnishings.

The following step, in 2006, was to establish a temporary association of firms in order to create a single juridical institution to interact with the Ivory Coast purchaser.

After almost two years of slow but fruitful process of start-up, in early 2007 the original project suddenly seemed to fail because the furniture orders vanished for a series of financial and legal problems of the purchaser.
Notwithstanding the stop, CdO still had the willingness to hold on to everything that had been built in the previous months among the entrepreneurs. CdO’s idea was to push the “entrepreneurs’ table” (they used to call themselves this way) toward the sharing of a strategic solution, which would have led to a brand value increase in new markets such as the Far East and South America.

In addition to the need for a strategic repositioning in new markets, a structure targeting the contract segment of the furniture industry, which had not been present within the firms involved, was needed. With this structure, the relationships built over two years of collaboration would not be lost with the dissolution of the original project. Facing these arguments from the CdO, all members of the “entrepreneurs’ table” agreed to continue the path they were following a few weeks before; they agreed to a formal strategic alliance within the SMEs. All of the enterprises joined forces and presented themselves “under the same roof” at an international trade fair in 2008.

In May 2008, all eight of the entrepreneurs further committed themselves and employed a full time manager to lead the business of the alliance. The shared mission regarded the collaboration in the contract segment in foreign countries, with a particular focus on India, Russia, the US and the main tourist regions abroad.

Their first target was a deal with Ventaglio Real Estate for the furnishings of one hundred and twenty apartments and one hundred and twenty hotel rooms in Rosa de Bayahibe in the Dominican Republic, a thirty-five million Euro business deal.

A longitudinal analysis of the alliance evolution

The starting point: calculativeness for capturing a business opportunity – At the very beginning of the story, the arrival of a substantial international project could have been considered the first step toward the constitution of the I-Style Partners alliance. The project advanced by CdO was so vast, however, that no firm within the district could take it on alone. Thus, given the difficulty of sustaining such a project, it was not been considered a real opportunity by any of the district’s firms acting alone.
Instead, the opportunity became a realistic possibility once the hypothesis of collaboration was considered. By cooperating, all allied enterprises would share their production capacity in order to reach the volume needed to supply a furniture order for 5,000 country-houses in the Ivory Coast.

By filling the prior production capacity gap through this alliance, the Brianza furniture district enterprises would have a great advantage in competing for the contract due to its high product quality, Made in Italy design, the firms’ experience and the district’s reputation amongst industry operators.

Moreover, CdO was aware of the fact that a “yes” to their offer would not be easily attained due to an entrepreneurial culture that was quite masculine and individualistic, and that, in the past, has pushed such companies away from collaborations with their competitors. In fact, while from a “macro” point of view the Brianza territory must truly be considered a district (firms are strictly connected by both vertical and horizontal linkages), from a “micro” point of view (the entrepreneurs’ point of view) it cannot be said that collaboration is thought of as being part of the development pattern. Thus, these entrepreneurs describe themselves in the following manner:

«... we are in Brianza, where it is very hard to collaborate. The typical behavior among us is well described by the sentence “Your loss, my gain”. Collaboration among competitors is completely absent. On the contrary, we are very reluctant to seek it. The success of an enterprise is strictly related to the failure of its competitors. The saturation of the market and the consequent reduction of profits in the last years has contributed to the development of such a situation».

This paradox made it even more difficult to find a common point of contact among the entrepreneurs when faced with this sudden and unexpected business opportunity:

«The project was so huge that no one of us would have been able to cope with it on his own. This opportunity was almost incredible. It would have provided business for all of whole Brianza for the following five years...Indeed, when the numbers allow everybody to make their profit, it is much easier to find an agreement... while, in the usual market in which every one competes for a larger market share it is much harder».

In this first stage of the alliance lifecycle, the cohesive factor and the engine of such an entrepreneurial initiative are born from a decision making process characterized by a calculativeness that spawns its effect by evaluating the means available (the production capacity level) in order to
achieve economically quantifiable goals (profit). According to this perspective, and taking into account a culture that is not oriented toward inter-firm collaboration, this alliance is viewed exclusively as an essential step needed to achieve an otherwise unattainable goal. Once again, calculativeness prevails.

The selection of the enterprises was the next step. CdO provided the opportunity and, therefore, had the power to choose one enterprise rather than another. The main issue was that of identifying, amongst the associated firms, those that were best able to synthesize their features in regard to both product range and organization.

For this reason, the eight enterprises in this district were progressively asked to join the “entrepreneurs’ table” with the objective of grouping enough resources together so as to assure the coverage of the required production volumes according to a rational objective logic of “complementarity” with respect to the production needs.

The emergence of trust among the entrepreneurs – Consequently, it is clear that the selection process had to take place according to the criteria of the single enterprise’s operative features. At the same time, CdO – considered the alliance’s “playmaker” at the time - could not ignore the importance of building trust among the single actors involved. Indeed, it was found that trust is an essential factor within alliances, one that can assure cohesion within groups of people where different individual objectives (that possibly run against each other) are present.

Thus, CdO’s presence was fundamental because it played a two-fold role: firstly, due to its trusted relationship with the single entrepreneurs, all of the partners considered it to be the warrantor; secondly, because of its singular non-competitor position in the group, it was supposed to be the project playmaker. One entrepreneur explained this particular role of CdO quite well in saying:

«The presence of a playmaker not involved in the industry, and thus supposedly impartial, is clearly a benefit because of his “super partes” status. It demonstrated its fairness by supporting many of us for many years. Trusted relationships like this are tried in such circumstances. These are relationships that cannot be created in a few weeks. The role that the CdO is playing is fully reliable and is the result of years of collaboration».
Therefore, in the beginning, there were no direct, trusted relationships among the entrepreneurs. Rather, a sort of “mediated trust” supported by CdO developed. The presence of an established goal, as well as a sort of guarantee of the behaviour of the strategic partners, seemed to be, according to several entrepreneurs, the main difference compared to their previous experiences within local export consortia among SMEs. According to the entrepreneurs the experiences in such consortia were unsatisfactory:

«After ten meetings everybody is in agreement; then, when the moment of signature of the constitution arrives, everybody takes a step back» and «there is no familiarity... which is present in a smaller group, where the goals are concrete and clear, and everybody is committed to achieving “that goal”. In missions like the first, concrete goals are absent and the number of participants is too big to work well. Export consortia have never been very useful for us».

The need to share an established market goal, instead of a less defined collective strategy, is underlined by the entrepreneurs’ choice of setting up a temporary firms association, which ceases to exist once the goal has been achieved.

The passage toward relational trust – In the first months of 2007, however, all of the essential requirements of the alliance seemed to collapse along with the failure of the Ivory Coast deal. Indeed, along with this came the disappearance of “the cake,” the main goal behind the beginning of the collaboration. The opportunity for profit was the market goal around which a market logic had been developed, and was considered by each entrepreneur as the engine of the initiative.

However, the disappearance of a foundation of strict economic rationality did not keep the collaboration – originated only one year before – from continuing in a new dimension. This third stage of the case is well described by the image of the phoenix: the mythological bird that revives from its ashes. That is practically what happened to the I-Style Partners.

The idea that, notwithstanding the original goal’s failure, a path for a strategic alliance was still practical, was strongly brought forward by the CdO:

«... for us, who promoted and supported such a meeting in neutral territory – CdO headquarters – it seem a pity not to persist in the same direction with a broader perspective». 
Facilitating a meeting among competitors under the protection of a neutral environment allowed new evaluation criteria to enter the players’ decision processes. Such criteria, implicitly present in the district’s experience in vertical relationships, are trust, identification with the territory, and a special industrial atmosphere («the Brianza furniture ... has a quality that no other will ever attain. Our product breathes our air, which is different»). These features permitted a shift from means/goals-based relationships to those where logic coexists with ethical, relational and social premises. Indeed, from the first months of collaboration, the owners of the eight enterprises have had possibilities for confrontation on different issues, such as supply processes within the district, human resource formation, or the best trade fairs:

«...know-how began to flow, without any of the enterprises loosing its own identity or being robbed of its ideas. In this way, by discussing issues concerning our industry rather than regarding a single enterprise, it allowed the facing of these issues together. This is one of the benefits that we got just by sitting around the same table».

In this way, relationships among entrepreneurs started to develop beyond the single project - still the shared goal – thus strengthening the development of social capital within the alliance. In order to keep the latter alive, it was necessary to identify a new paradigm that would promote a new form of collaboration:

«By working with this group of firms, by letting a new way of doing business emerge – completely different from our traditional approach – by collaborating, we have introduced a new work conceptualisation in Brianza. To have the opportunity of entering a competitor’s firm was impossible until recently. Now we are tuned on a “your life, my life” philosophy. Thanks to the confrontation I see that, even though we naturally are still competitors, there is an exchange of information that is very important».

By extending the collaborative view to a longer time-frame and focusing on international markets («The only way to stay alive is to sell abroad. Enterprises that did not do so, are now closed»), significant quality and high flexibility can be achieved at the same time:

«It is like having a very flexible enterprise that can shift from classical to modern furniture assuring expertise and quality. It would be impossible for a single firm». 
The cultural impact of this collaborative experience enabled the CdO to change its role within the alliance. Indeed, since the unifying element among firms became a collective strategy, and since there are direct relationships of trust among entrepreneurs – instead of the aforementioned “mediated trust” – the CdO has partially and voluntarily kept a lower profile by shifting the handling of the alliance over to the firms. Yet the CdO remains present in its role of supporting the association.

The first official step in the direction of an alliance occurred with the participation in Matching 2006, a trade fair event that the eight firms attended as a single business group. This was an important sign in terms of how the entrepreneurs were increasingly conceiving their alliance in accordance with the logic of collective social action:

«The aim, here in Brianza, where there are incredible jealousies, is to manage this (the alliance): a very important challenge, beyond what any of us could have imagined.»

Greater group identification has opened the door to several economic benefits coming from this collaboration, such as a constitution of supply agreements («Collaboration gives us more power in purchasing raw materials by exploiting economies of scale»), cost and risk reduction through shared marketing investments, and the penetration of several markets as I-Style Partners. Indeed, such agreements allow firms to work together in international markets for contract orders, while still respecting the individuality of each firm in the Italian market:

«Every firm has to share its knowledge, while keeping its own features and identity, for something more.»

**Theoretical and managerial implications**

The case of I-Style Partners can be viewed as an interesting tool for understanding the development dynamics of trust and calculativeness within a strategic alliance among SMEs, especially in contexts in which the entrepreneurial culture is not prone to such inter-organizational collaboration. Accordingly to the scope of this study, culture has not be considered as a macro-feature of the whole context in which the I-Style Partners operate (i.e. the district of Brianza). Rather, by relying on interviews with each actor, Hofstede’s metrics of culture (individualism and
masculinity) are used here as a framework to assess entrepreneurs’ personal attitudes toward alliance building.

Consistent with the exploratory purpose of the case history, some implications may be formulated, both at theoretical and managerial level.

More specifically, with respect to the first research question (“What are the roles played over time by calculativeness and trust in the strategic alliance building process among SMEs?”), several issues emerge as fresh insights to be added to the literature.

Firstly, as hypothesized, calculativeness and trust result in becoming complementary categories of rationality, rather than simply alternatives. Notwithstanding, it appears that – in a scenario characterized by a small number of firms that are (a) potential competitors (although in different but very close segments), (b) geographically close and (c) of small–to-medium size, where a masculine and individualistic culture prevails – stages branded by just one category of rationality may occur, as seen in the first stage of the I-Style Partners case.

Figure 1 presents a three-stage model that summarizes what happens in the I-style case history and – more generally – describes the evolutionary pattern of such an alliance. It includes four elements of analysis: (a) the extension of the time perspective adopted by partners in building their alliance; (b) the main cohesive factor that links partners in different moments of their collaboration; (c) the strategic objective of the alliance; (d) the functions played by the network facilitator in different stages.

The starting point in the first stage of the model is the presence of a cohesive factor among partners which, in the I-Style Partners case study, consists of the initial market opportunity. The main feature of this factor is that it must be “catalysing.” Thanks to its extraordinary nature, it is therefore able to attract potential members to the alliance. According to the calculativeness paradigm cited above, such a decision (to start cooperation) is considered a product of the calculative process that measures the convenience of an action by comparing goals and resources. Hence, in the early stage, the objective of the cooperation is a business opportunity.
In the second stage, the activities required by the common project (such as meetings to assess the production capacity within the network) bridge relationships among members, and knowledge (i.e. information about suppliers) begin to flow, even if in an informal way. According to Anderson and Narus, who found cooperation to be an antecedent of trust, such relationship changes, overcoming the original ground of cooperation (the cohesive factor), move toward an embryonic form of trust that is still mediated by the network facilitator.

Finally, in the third stage, a personal assessment by each entrepreneur of the level of convenience (both economic and social) coming from the alliance emerges. This judgment is helpful in order to strengthen the relationships and to facilitate the development of trust among members, i.e., the need to feel as part of a group is proven by the signs of identification that start to develop. In the case of the I-Style Partners, the signs are about belonging to the same territory and, in particular, to the same industrial district. This is consistent with Morgan and Hunt (1994) and Young-Ybarra and Wieserma (1999), who found a positive relation between shared group values and trust. At this point, the path from a fully calculative to a relational trust approach (which, it is important to note, does not abstract from assessment of economic convenience), reaches its maturity. Here, evidence of the co-presence of both calculativeness and relational trust in the third stage support the hypothesis that these dimensions are not alternatives, as stated above.

Another finding of this work is the correlation that emerges among (a) the stage of the alliance, (b) the dimension of rationality and (c) the time perspective adopted by members. It appears that the early stages of the network creation are strictly connected to a calculative approach that is likely related to the awareness of each entrepreneur of the risk of opportunistic behaviour by the other members. The fear of opportunistic behaviour by potential partners emerged in literature as being an important obstacle in alliance formation, especially in the partner selection task (Holmberg, and Cummings 2009). Here, an important variable that influences this relation is the entrepreneurial culture, which, in the I-Style Partners case, is the same for all of the entrepreneurs. The need for a cohesive factor based on calculativeness seems to be more critical here than in a context – less masculine and individualistic – in which cooperation is seen as a viable and natural pattern to
develop entrepreneurial activities. Accordingly, the first stage of the case study is characterized by a short-term collaboration perspective. This is explainable if related to the time needed for the goal of the collaboration to be achieved.

This paradigm is also supported by the later stages when a switch in the rational approach to the network and entrepreneurs’ personal assessment of the convenience (not just economic, but even social) of the alliance leads the time perspective to evolve in the “long-run”. This finding is consistent with Rousseau et al. (1998), according to whom “repeated cycles of exchange, risk taking, and successful fulfilment of expectations strengthen the willingness of trusting parties to rely upon each other and expand the resources brought into the exchange… These expanded resources can, in turn, give rise to a psychological identity”.

Significant managerial implications emerge with regard to the second research question, which investigates the role played by the network facilitator in fostering trust among the alliance members. Consistent with the aim of this research, it is important to focus on two features related to the role of the network facilitator within a strategic alliance: (a) the position assumed and (b) the activities lead by such institution in each of the three stages of the network creation.

The most critical characteristic of the network facilitator that emerges in the first stage of the alliance is its pivotal position. This can be seen as a consequence of three facts:

1. The network facilitator is the actor that keeps control over the cohesive factor (market opportunity);
2. It is the only actor within the network that has a tie with each member;
3. The network facilitator is seen as trustworthy to each entrepreneur because of its neutrality and history of social contact, which confirms previous findings (Larson 1992; Poppo, Zhou, and Zenger 2003).

As illustrated in Figure 2, by virtue of the dyadic relationships that it holds with each entrepreneur and the contemporary absence of ties with other members, the position of the network facilitator in the first stage is pivotal. In this early stage the contribution of the network facilitator, in terms of activities, is to:
• identify the business opportunity;
• rationalize the business opportunity, making it accessible for the firms;
• design the framework for cooperation;
• coordinate activities (as the pivot of the alliance), and keep the cohesive factor achievable.

In the second stage, because of the trust relationships that exist between it and the members, the position of network facilitator remains central, even if they cease to be exclusive: i.e., loose ties between firms begin to take shape. However, as the warrantor of entrepreneurs’ behaviour with other members, the presence of the network facilitator is still critical, and its role could be defined as mediator. The activities led here are mainly oriented toward the facilitation of the germination of relationships among members, making the dialogue among them as smooth as possible:

• to summon meetings;
• to assure equilibrium in the workloads;
• to give input toward a new perspective of the alliance.

In the last stage trustworthiness among members reaches its maturity: ties are strengthened from the knowledge transfer and common experiences gained during the previous years. Hence, the need of a warrantor gradually decreases, as each entrepreneur freely decides to trust other members of the alliance. As such, the network will no longer need an internal facilitator. Rather, it will cast aside the mediator position on behalf of an internal leadership that assures that entrepreneurial guidance is in place for the alliance. Nevertheless, the activities carried out in this stage – in which the facilitator assumes the position of advisor – are:

• to hand over the coordination of the alliance to an internal leadership;
• to externally support the alliance by continuously looking for opportunities and watching over relationships.

The chief role of the network facilitator appears to be that fostering trust within the strategic alliance to the extent that he is able to consider the rational approach of the members and to leverage it: when calculativeness leads the interest, it offers a cohesive factor that makes it attractive for them
to cooperate in order to receive an economic benefit from the collaboration. Instead, when the cohesive factor ceases to be exclusively an economic opportunity, as the members begin to be more willing to cooperate (as result of trust), the facilitator has to begin to move away from the alliance while guaranteeing support when needed.

Again, the cultural context in which the alliance arises seems to influence the role of the network facilitator: in a context such as the one described in the I-Style Partners case study, its role has been highly significant especially in making members take the first step toward such a well-formed alliance. It is expected that - within a more feminine and collectivist culture, the need for a facilitator is reduced or, at least, it attends to other needs by developing common expectations or leveraging a critical mass of influence, as suggested by McEvily and Zaheer (2004).

**Conclusion**

Based on a longitudinal case study, an exploratory model of an alliance building process among SMEs has been developed. The I-Style Partnership is a successful experience of how a strategic alliance among local businesses – competing within the same industry in international markets – can be supported in the creation and early development stage.

In particular it has been found that the alliance building process has to be built on some cohesive factors responding to rationality criteria leading to the entrepreneurs’ choices. Within a highly masculine and individualistic environment, a need to conceive the opportunity for alliance under a calculative perspective, especially in the early stage, has been observed. Subsequently, when collaboration creeps in, a new criterion that is based on relational trust drives the alliance toward a long-term perspective in which a common strategy is shared.

In such a dynamic, a fundamental role is played by the network facilitator, an institution that acts as the playmaker of the alliance, especially by leveraging the interests of the entrepreneurs according to the different stages.

This work, because of its inductive approach, contributes to the literature in terms of theory generation. Further research is needed to empirically test our findings through quantitative surveys or
more extensive case studies. Several conditions have to be considered here in order to gauge these findings: the I-Style Partners’ alliance involves eight firms belonging to the same industrial district and sharing the same culture, even while being naturally adverse to such cooperation. Further research, studying the alliance building dynamics among firms with different cultural backgrounds could contribute significantly to the growth of the field. Other rare insights would be likely to come from further research focusing on the effect that joint performances have on the development of trust, something that was beyond the scope of this work due the present stage of the alliance. While the overall literature showed a positive relation between trust and performance (Zaheer, McEvily, and Perrone 1998; Sako 1998; Dyer, and Chou 2003; Hagen, and Simons 2003; Jap, and Anderson 2003), almost none of it focused on the inverse relation, leaving a gap that yet remains in this field.

Major limitations affecting the research are related to the presence of variables that are difficult to manage, such as those coming from the psychological arena. Whereas there are several models for the above considered economic and sociological behaviour, it is much more difficult to find uniformity regarding the psychological factors that support the model. Indeed, as stated above, the validity of the model proposed has to be tested further through both multiple case studies and statistical inference.

Several managerial implications stand out as a result of this study, especially with regard to the great potential of network facilitators – such as multi-firm associations and service centres acting within a local area – to foster alliance creation among SMEs. In particular, great importance has been given to the history of the interaction built through the years between the facilitator and the alliance members. This seems to be a basic feature that the network facilitator is required to have in order to be a credible warrantor of other members’ behaviour as acting as a safeguard from opportunism.

Passion as a Predictor of Entrepreneurial Goal Achievement:
An Opportunity Costs and Commitment Approach

Joseph Roberts and Harold Welsch

Abstract
Passion is an important concept in understanding how the entrepreneurship process works. It is often defined as the “fire in the belly” or entrepreneurial commitment which is necessary to overcome the long, twisted and difficult journey of starting and establishing a business. Roberts and Welsch (2008) found that the intensity of entrepreneurial commitment was significantly related to opportunity costs and strength of their motivations. This study extends this research by testing whether these measures of passion are related to entrepreneurial goals. The study captures passion in two dimensions and extends the research across six industries. A proposed model is tested and the results and implications to entrepreneurs are explained.

Key Words: Passion, Entrepreneurial Commitment, Entrepreneurial Goals, Opportunity Costs

Introduction
Passion leads to compelling action. Passion has been identified as an important conceptual variable in the entrepreneurship process. “Passion inspires us to work harder and with greater effect” (Chang, 2001). Academics and practitioners argue that entrepreneurs who exhibit passion are more successful than those who are not (Moses, 2001, Chang, 2001 Baum & Locke, 2004). Passion- word often reserved for romance and artistic work is more prevalent in the business world (Chen, Yao & Kotha, 2009). It is often described as the “fire in the belly” or entrepreneurial commitment, which is necessary to overcome the arduous, twisted and complicated journey of starting and growing a business venture. It is also seen as willingness to incur substantial opportunity costs and make considerable sacrifices in relation to motivations held by entrepreneurs. Some argue that passion is the grease that keeps the wheels of entrepreneurship turning (Roberts, 2009).
Roberts and Welsch (2008) found that the intensity of entrepreneurial commitment was significantly related to opportunity costs and strength of their motivations. The current study explores and extends this research by testing whether these measures of passion are related to achievement of entrepreneurial goals. It is also expected that the presence of passion makes entrepreneurs achieve higher level of success. It is recognized that not all entrepreneurs are the same (Welsch, 2010).

The general hypothesis states that passion (measured by opportunity costs incurred and entrepreneurial commitment) is positively related to goal attainment. It is possible that entrepreneurs think alike and thus miss personal life style opportunities or make sacrifices in order to achieve success as an entrepreneur. Various measures of entrepreneurial passion has been suggested (Getley, 1979; Filion, 1991; Shane, et al., 2003; Cardon, et al., 2009) but criticized as being of limited relevance when a generalized scale is applied to entrepreneurs and minimizes the importance of entrepreneurial activity by failing to capture key aspects of passion. The measures of opportunity costs and entrepreneurial commitment meet the criticisms head on. The highly committed passionate entrepreneur is characterized by single minded focus to start a business and work toward its survival and growth, often at the expense and high costs of other worthy and important goals. The scales were developed and tested in the United States and Central Europe and Mexico where individuals are hard workers, exhibiting sacrifice, work ethic, determination and diligence with a focused commitment to entrepreneurship (Liao and Welsch, 2004). The scales have been successfully validated across 10 different countries in numerous studies.

Perhaps Cardon, et al(2009) said it the best:” … researchers and practitioners alike have invoked passion to explain entrepreneurial behaviors that defy reason-based explanations, such
as unconventional risk taking, uncommon intensity of focus, and unavering belief in dream” (p. 511). The proposed study captures this passion in two dimensions and extends the research across six industries to test the model in different contexts.

**Entrepreneurship Passion**

Given the complexities of entrepreneurship involving uncertainties, risks, innovations, untried processes, new markets, ambiguity and unstable, unpredictable futures, it is vital that the entrepreneur possess a laser-focus and total dedication on the origin, growth and survival of his or her firm. Several authors have suggested that entrepreneurship passion, commitment and intensity are absolutely necessary to be successful. Baron (1998) stated “… their commitment to their ideas, businesses and products is frequently intense” (p. 281). Chen, et al. (2009) define entrepreneurial passion as “an intense affective state accompanied by cognitive and behavioral manifestations of high personal value” (p. 199), whereas Cardon, et al (2005) argue that the notion of “entrepreneurial passion is grounded in affective states recognized as emotional meta experiences associated with high intensity, and developed primarily through enduring bonds of identification and attachment between entrepreneurs and their ventures.” (p. G1)

In a later version of Cardon’s paper (2009) it is stated “when entrepreneurs are aroused by their passion for activities associated with a meaningful identity, they experience intense excitement that comes from pursuit of deeply internalized goals, such that they often ignore activities or people that may detract from it.” (p. 521) it suggests that entrepreneurs are willing to give up things in their passionate pursuit of entrepreneurial goals. Thus we operationalized the concept of “entrepreneurial sacrifice” or “entrepreneurial opportunity costs” that entrepreneurs are willing to pay to pursue their entrepreneurial endeavors. These 18 specific behavioral
measures are listed below. They represent a wide range of diverse engagements across which entrepreneurs participate and serve as a measure of passion.

*Entrepreneurship Opportunity Costs*

In the literature the focus of opportunity costs is usually financial. This paper presents the non-financial costs that entrepreneurs seem to care more than the financial costs. The following items were tested and a variable called opportunity cost was developed. A value of .75 for Cronbach alpha confirmed that the reliability for this variable is high. The following items make up this variable.

- Peaceful life
- Regular hours
- Sleep
- Health
- Leisure
- Hobbies
- Luxury
- Marital harmony
- My children’s education
- Time with my family
- Friends
- Social status
- Religious worship
- Ethical standards
- Financial opportunities
- Savings
- Retirement planning
- Other careers

The opportunity cost perspective emanates from Edwards and Rothard (2000) who suggests that work-family conflict arise because pressures arising from one role are incompatible with those from another role. As a result, obtaining rewards in one domain requires foregoing rewards in another. In fact, Gasser (2006) defines opportunity costs as “the foregone benefit of next available alternative as a consequence of making a choice”. His findings suggest that
opportunity costs are an important determinant of the scale of intended venturing activity. Shaw in his 1992 paper titled “Searching for the opportunity cost of an individuals’ time,” states that the cost of time, not the “value” which is often more important in the determination of surplus measures. The same argument can be made in the case of the entrepreneur who consciously incurs of not only time and money but also leisure and regular hours (such as in the case of an employee) time with family and so on. The opportunity costs have several dimensions to them. There are family costs, financial costs, educational costs, career costs, health costs, quality of life costs and ethical costs. This study examines how these costs influence the entrepreneurial process. Furthermore, the impact of these costs are measured by studying the family and business goals. Do these costs influence entrepreneurs to make permanent sacrifices such as children, education, and family, or temporary sacrifices, such as luxury items, vacation trips, and time off from work, and religious worship, or both?

A thorough review of the entrepreneurship and related economic literature search provides the following findings. There are numerous articles addressing the opportunity costs of being an entrepreneur. This is calculated primarily in terms of financial costs, particularly in dollars and cents. As an example, an entrepreneur investing $100,000 in a small business start-up and fails in a two-year period has lost not only the $100,000 but also the job earnings he could have earned working for someone else. Usually they also incur debt in addition to these above numbers.

One segment of economic literature looks at this type of entrepreneurial activity where entrepreneurs incur heavy losses and condemns it as inefficient use of capital and resources. (Jennings, 1980) However, there is no attention paid to the non-financial aspects of this process of losing start-up capital and other resources. One can argue that this is because it is not worth
exploring and studying. Nevertheless, common sense tells us that any study that looks at one aspect of a phenomenon and not the associated aspects can provide skewed results. When an entrepreneur incurs losses, he or she is put in a situation that can best be described as difficult.

Those that can overcome such difficulties and plough through to the next step are the ones that become successful. Even history teaches us that we have to learn how we as humans can look at our mistakes and overcome them. Thus, the human side of things deserves a closer look. The word cost can be substituted with price or fee. Some related terms are sacrifice, forfeiture, forego, waive, abandon, acquit, endure forsake, and sufferance. Thorough search of the literature, using these terms produced negligible results. The psych literature explains these terms from the psychological perspective in clinical terms. Sociology explains these terms from a relational perspective. In essence, the non-financial costs entrepreneurs have to incur have not been explained clearly in existing entrepreneurship and related sociology, psychology or economics literature.

When an individual is faced with an obstacle, he or she usually attempts to overcome it. Entrepreneurs behave similarly. In the process of overcoming obstacles, entrepreneurs incur costs unlike other individuals because the cost of not overcoming such obstacles can be catastrophic. The following segment explains the theoretical footing of the model. The significant amount of research conducted in the field of entrepreneurship allows a preliminary passion model using costs to be suggested. (Roberts, 1997)

**Entrepreneurial Commitment**

In a study involving members of the National Federation of Independent Business (NFIB), Cooper and Dunkelberg (1986) observed that there are several paths by which one might
become a small business owner, including founding the business, purchasing the business, inheriting the business, and being promoted or brought in by the other owners. They hypothesized that significant difference in the “degree of entrepreneurship” or “entrepreneurship intensity” could be expected. However, they never developed an empirical/operational measure of entrepreneurial intensity or commitment. They suggested that it may not be directly measureable or observable but may be inferred through its reflection in a set of characteristics that they indentified from the previous research (Keats & Bracker, 1988). These included background, attitudes, and “a complex set of factors associated with previous career, incubator organizations and process of starting”. According to Cooper and Dunkelberg, these characteristics collectively reflected the conceptual variable “degree of entrepreneurship”. Until now, no actual measures of have been developed. This conception of entrepreneurial intensity/commitment perhaps will alleviate this need. The concept is not focused on the paths of origins of entrepreneurial endeavors but the behaviors they engage in establishing and growing their businesses.

Entrepreneurial intensity and commitment has its foundation in the Protestant Work Ethic (Weber, 1905) and the achievement motive (McClelland, 1961). It has a secondary base in commitment, internal locus of control, diligence and determination. Despite religious pluralism in U.S. society, the strains of Protestantism have exerted a powerful influence on people’s thoughts and actions since the early history of the country. The main core of these beliefs asserts that spiritual salvation was to be attained through striving and making a commitment to achieve success. More recently this work ethic idea has evolved outside of its religious context to a point where spiritual values are set aside. In this context the focus on religion is replaced by hard work and individuals working for material benefits and personal recognition it affords. It has evolved
into a form of a Type A behavior in motivation theory that leads to understanding of this variable in this study. This behavior in its early characterization was identified by excessive and competitive drive and enhanced set of time and urgency. Later, additional components were identified, such as intense sustained drive to achieve, an eagerness to compete, persistent drive for recognition, a continuous involvement in deadline activities, a habitual propensity to accelerate mental and physical functions, and consistent alertness. Price (1982) had suggested that this behavior pattern is learned in open, competitive economies where upward mobility is possible. Success was thought to be a function of individual effort and that progress is best defined in terms of material or tangible achievements. (e.g., Liao and Welsch 2004).

The visualization of a successful enterprise combined with parental and spousal support, in addition to the right circumstances, such as life stage, education and a nutrient-rich environment can cause an individual to generate a great “fire in the belly”, termed “high entrepreneurial intensity”. This level of commitment to the entrepreneurial endeavor can be characterized as passion. Passion is required for entrepreneurial success (Selz, 1992). It is further characterized by a single-minded focus to start and grow a business. The intensity/commitment variable is operationalized by the following items:

My business is the most important activity in my life.
I’ll do whatever it takes to succeed.
There’s no limit to how long I’ll give everything to my business.
I am willing to make great sacrifices to stay in business.
I would even work elsewhere to restart my business.
My philosophy is to do “whatever it takes” to succeed.
I want my business to make a positive impact on my community.
I would rather own my own business than earn more elsewhere.
Eventually I may sell my business but, if I do, I’ll start again.
**Goal Conflict**

Entrepreneurs must often cope with competing and conflicting goals. Some goal conflicts clearly pose direct challenges for entrepreneurs in that achieving one or more of one’s objective inevitably involves some version of a trade-off or sacrifice – that seeking more of one output inevitably comes at a cost to the others. Conflict is manifested by the simultaneous occurrence of competing pressures from an entrepreneur’s multiple roles that make enacting those roles somehow more difficult. Dierdorf and Ellington (2008) suggest that roles are enacted in separate environments entailing distinct norms and requirements. These disparities often necessitate the sacrifice of meeting expectations for one role to enact the other role. Role conflict occurs when expected behaviors or tasks are at odds with each other. Since the entrepreneur is expected to wear many hats, it is easy to see how they may interfere with each other. Adding to the potential strain of balancing multiple roles is the fact that entrepreneurs have finite resources to transfer from one role to another. Thus, enacting multiple roles can drain these resources, negatively impacting performance and creating stress. To reduce this stress, entrepreneurs are often forced to make concessions in performing one role over another. These concessions are viewed as opportunity costs, or price that must be paid in order to perform one of the conflicting roles. Viewed another way, these are factors (sacrifices) the entrepreneur is willing to give up in order to pursue his or hers entrepreneurial role.

**Work-Family Conflict and Entrepreneurial Goals**

Work-family conflict is a form of inter-role conflict in which the demands of functioning in two domains of work and family are incompatible in some respect. Work-family conflict is within a person across domains transmission of demands from one area of activity to another.
Research has focused how reactions experienced in the work domain are transferred to and interferes with the non-work domain for the same individual. Work-family conflict has led to a variety of outcomes including health issues, including depression and somatic complaints, absenteeism, turnover intentions, job dissatisfaction and job burnout. The concept has been grouped theoretically into three broad categories including time-based, strain-based and behavior-based sources. Given the complex and immediate demands placed upon entrepreneurial behavior, it is highly likely that he or she is subject to these conditions. Furthermore, it is proposed that these conditions interfere with other goals which the entrepreneur has, including:

- To enjoy life
- To be free
- To fulfill my goals
- To express myself
- To reduce stress
- To improve my standard of living
- To promote security for my family
- To give my family work

**Research Model**

Given the intense passions that are required for entrepreneurs to succeed, it is proposed that we discover a best fit model. When the variable – selection procedures are aimed at selecting a model of independent variables these variables should yield the best fit to the model. The criterion for selection is usually the F-statistic:
\[
F(x_1,\ldots,x_p; x_{p+1}) = \frac{\text{SSE}(x_1,\ldots,x_p) - \text{SSE}(x_1,\ldots,x_p, x_{p+1})}{\text{SSE}(x_1,\ldots,x_p)}(n-p-1),
\]

Where \( n \) is the total number of data points, \( \text{SSE} \) is the sum squares due to error - that is, the sum of squares minimized by the least squares method. If adding the variable \( x_{p+1} \) to variables \( x_1,\ldots,x_p \) does not improve (or deletion of the variable \( x_{p+1} \) does not worsen) the fit significantly, this statistic follows an F- distribution; otherwise, the statistic tends to take on larger values. Statistics.com

The above model is tested using the stepwise regression method which at each step determines whether any of the variables can be removed. If none of the variables can be removed, we determine whether another variable can be added. A variable can be added to the model at a step and removed at the following steps and so on, thus the name the stepwise method. The end goal is to determine the best model with the least noise possible.

If the significance value of the F statistic is less than 0.05, which means that the variation explained by the model is not due to chance. The ANOVA table reports a significant F statistic, indicating that using the model is better than guessing the mean.

Based on the above the following is tested:
Entrepreneurial passion as expressed by the composite variables commitment and opportunity costs can predict goal achievement.

**Hypotheses**

It is expected that entrepreneurs will exhibit behavior that compels them to act on their business ideas. The following examine the behaviors of entrepreneurs across six different industries.

**Hypothesis #1**

It is expected that the best fit model with “enjoy life” and the predictor variables commitment and opportunity costs will be positively related and yield significant R and F values.

**Hypothesis #2**

It is expected that the best fit model with “to be free” and the predictor variables commitment and opportunity costs will be positively related and yield significant R and F values.

**Hypothesis #3**

It is expected that the best fit model with “to fulfill my goals” and the predictor variables commitment and opportunity costs will be positively related and yield significant R and F values.

**Hypothesis #4**

It is expected that the best fit model with “to express myself” and the predictor variables commitment and opportunity costs will be positively related and yield significant R and F values.

**Hypothesis #5**

It is expected that the best fit model with “to reduce stress” and the predictor variables commitment and opportunity costs will be positively related and yield significant R and F values.

**Hypothesis #6**
It is expected that the best fit model with “to improve my standard of living” and the predictor variables commitment and opportunity costs will be positively related and yield significant R and F values.

**Hypothesis #7**

It is expected that the best fit model with “to promote security for my family” and the predictor variables commitment and opportunity costs will be positively related and yield significant R and F values.

**Hypothesis #8**

It is expected that the best fit model with “to give my family work” and the predictor variables commitment and opportunity costs will be positively related and yield significant R and F values.

Discussion

The empirical results demonstrate that each of our hypotheses was proven. The items in the composite variables commitment and opportunity costs are positively related to the dependent variables. The impact of predictor variables on the dependent variable are explained in each of the categories. Whatever it takes behavior to make the business a success along with the commitment to own business even if it means giving up higher earnings elsewhere at another job point to an entrepreneur who thinks of the working in the business as a higher calling or more than just a job. It is this attitude that can create a state of mind that can lead to enjoying life as a business owner. In the same way; the not giving up mindset and philosophy adds to the level of importance that the business enterprise is the most important thing in the life of an entrepreneur. This leads to the freedom one can enjoy as an entrepreneur. This theme seems to be the common thread that explains achievement of the entrepreneurial goals for entrepreneurs. Entrepreneurs seem to approach these goals as expectations that can be achieved over time. The idea that entrepreneurs have to give up something to achieve success is similar to anyone who is seeking to establish a career; however the major difference is that some of the costs that entrepreneurs have to sacrifice are not common in the general populations. Costs such as peaceful life, to be free and enjoy life are such costs. Entrepreneurs are risking marital harmony, leisure and even ethical standards to achieve a level of enjoyment. This sample includes restaurant owners, financial service providers and usually these businesses demand constant attention to customers and logistics. This is perhaps why these predictors are behaving in the manner explained by empirical analysis.
Peaceful life, Friends, Time with family and Leisure are related to quality of life of an entrepreneur. The results suggest that entrepreneurs are willing to incur these costs and willing to sacrifice quality of life in order to achieve their goals. It is not unusual to make sacrifices in order to achieve success but entrepreneurs seem to behave differently than the general population when it comes to the level of sacrifice they are willing to make. The very quality of life that they seek has to be sacrificed in order to achieve it. From psychometric analysis this behavior is captured by the independent variables and their predictors. The predictors of passion are significant at p<.05 and further more the F statistic is significant at .000.

As entrepreneurs prepare to start a business or expand their operations they should be willing to give up religious worship, compromise their children’s education, Leisure, Luxury, Other Careers and even Marital Harmony. The general idea perhaps is to incur these costs for a period of time and catch up as the businesses become more successful. The reality however is somewhat different, once incurred these costs are usually permanent. This should give pause to entrepreneurs and entrepreneur educators. The opportunity for capturing these costs once incurred is forever gone.

**Conclusion**

This study demonstrates how entrepreneurial passion can be measured empirically and successfully predicted by utilizing the opportunity costs incurred by entrepreneurs and the high level of commitment they display to starting and establishing their businesses. However passion sometimes is negatively interpreted and conjures up images of emotional and perhaps even unprofessional behavior. This paper suggests that passion is a skill that entrepreneurs have to master much like any other competency or skill necessary to succeed in the ever changing
landscape of entrepreneurship. However, a comprehensive study of this proposition needs to be conducted that goes beyond the opportunity costs and commitment concepts.

Empirically we should define passion in terms of several additional predictors and weight some of these variables. Based on the weighting of each of these variables we can increase or decrease the influence of predictors resulting in more precise regression estimates. The search for more reliable predictors must continue to determine how passion works as the ingredient that keeps all the wheels of entrepreneurship turning.

Joseph S. Roberts, Ph.D. is the Coleman Foundation Professor at Columbia College Chicago. His research interest includes creating theory that can explain why entrepreneurs exhibit behaviors that are not found in the general population.

Harold P. Welsch, Ph.D. is the director of the entrepreneurship program at DePaul University in Chicago and holds the Coleman Foundation Chair in Entrepreneurship. His research interest includes angel investors, technology communication, motivations of entrepreneurs, privatizing economies and economic development.

Critical factors for SMEs from emerging economies competing in developed markets

Juan Arriaga-Múzquiz, René Díaz-Pichardo, and Elisa Cobas-Flores
Business Accelerator Center, EGADE Business School, Tecnológico de Monterrey, Mexico
juan.arriaga@itesm.mx

Internationalization is more and more a key issue in the increasingly global economy. This workshop introduces participants to key issues in the process of internationalization of SMEs from emerging economies competing in developed markets. The new institutional economics (NIE) and the resource based view (RBV) theories complement each other and offer a suitable framework to explore the critical factors in that process. From the NIE theory, firms structure themselves in response to institutional changes. Globalization makes boundaries less restrictive and facilitates a global competition, giving a boost to processes of internationalization. From the RBV theory, firms must develop competitive advantages in the international arena that allow them not only going abroad successfully, but also being capable of defending their positions in their domestic markets.

Keywords: Internationalization, SMEs, emerging economies.
abstract

The focus of this workshop is the real meaning of the terms interdisciplinary and cross-campus in the context of collegiate entrepreneurship programs. Traditionally these programs are designed and taught by the school of business for non business students. This workshop presents another model directly involving faculty from another school (college of arts and sciences) and school of business in designing, implementing, teaching, and administrating an interdisciplinary entrepreneurship minor. Each speaker will present an aspect of the program and discuss implications and lessons learned.. Participants will receive handouts with our view of best practice in constructing such cross-campus, interdisciplinary programs.
Abstract

For over three decades, the Iraqi economy has been adversely impacted by war, costly militarization, and international sanctions. In these turbulent times, Iraqi entrepreneurs face numerous challenges, including an ineffective legal environment, no access to certain markets or finance, the inability to acquire new skills, and the general lack of government support.

This paper examines efforts by the Iraqi government together with the United States and the international community to create a business climate conducive to establishing an entrepreneurial class. Identifying the practices utilized in addressing these challenges should aid future entrepreneurial development efforts in emerging economies or war-torn areas.

Introduction

For the past three decades, the Iraqi economy has been adversely impacted by three wars, costly militarization, and international sanctions. These events have severely shaken Iraq’s population, damaged its political and economic institutions, and negated many of the previous economic and social gains (Gorrill 2007). In these turbulent times, Iraqi entrepreneurs and small business owners have faced numerous challenges. The inability to acquire new skills and managerial expertise, a lack of access to markets, technologies, and finance, the general absence of government support, and the nonexistence of a legal and regulatory environment conducive to business establishment and growth, have constrained the growth of a sizeable entrepreneurial class (USAID Tijara Program 2009).
Iraqi small business owners and entrepreneurs, not unlike others, suffer from the same constraints, the liabilities of newness and smallness. They often lack the physical capital, financial capital, human capital, social capital, and reputational capital to successfully operate their businesses and new ventures. This paper will examine how the US government, especially through the efforts of the US Agency for International Development (USAID), has partnered with the Iraqi government, non-governmental organizations (NGOs), community-based organizations, and the private sector to create a business climate which reduces the challenges faced by Iraqi entrepreneurs and which is conducive to entrepreneurial development. Information for the paper was garnered from secondary sources, especially the WebPages of the USAID-Tijara project and from first hand observations of one of the authors who worked in Iraq for 17 months as a civilian contractor for one of the many civilian contracting companies operating in Iraq under contracts with the U. S. Department of Defense.

***Liabilities of Newness and Smallness***

Entrepreneurial research has identified two problems that challenge entrepreneurs and small business owners: the liabilities of newness and smallness (Stinchcombe 1965; Singh and Lumsden 1990).

**Liability of Newness**

Liability of newness is the propensity of new organizations to be less successful or be required to expend greater resources. New organizations have to learn new roles and spend significant amounts of time, money, and effort in doing so (Singh and Lumsden 1990). New businesses must establish external legitimacy with customers, locate sources of capital, and create external networks (Singh and Lumsden 1990). Older organizations have a distinct
advantage in having already established relationships with their stakeholders, especially their customers. Newer organizations lack these stable relationships because the trust needed to establish relationships among the parties is not present. Further, lack of stable relationships and the absence of trust affects the ability of new businesses to attract and retain human capital (Swaminathan 1996). The absence of networks with professional advisors, especially accountants, is also often lacking (O’Neill and Duker 1986). The liability of newness argument associates the problems faced by individual organizations, such as lack of social capital and the difficulties of running their businesses, with the increased likelihood of organizational mortality (Bradley and Rubach 1999).

New business owners often lack specific business skills, including general management skills, capabilities in finance, operations, or strategy, and the capacity to plan (Shonesy and Gulbro 1998). New organizations and the individuals who run them often fail because the owners simply lack the knowledge and experience to operate the businesses (Dyke, Fischer, and Reuber 1992). Business experience can take many forms, including previous management experience, industry specific experience, and observational experience gained from observing others, especially family members who have started or managed a company (Dyke, Fischer, and Reuber 1992; Duchesneau and Gartner 1990). Managerial inadequacy, incompetence, inefficiency and inexperience are common themes in explaining small business failures (Haswell and Holmes 1988). Bad management skills include uneven knowledge which exists when the business operators lack experience in one or more functional areas which are critical to the success of the business, especially human resource skills (Castrogiovanni 1996). Especially, a lack of expertise in financial-related matters is often cited as a cause of failure (Peterson, Kozmetsky, and Ridgway 1983).
One way to ameliorate the effects of the liability of newness is to purchase an existing business (Duchesneau and Gartner 1990). A small business owner can buy legitimacy by acquiring an existing business, rather than starting a business from scratch. The networks necessary for success are already established. However, the absence of an entrepreneurial class does not provide the critical mass of businesses needed to take advantage of this alternative strategy.

**Liability of Smallness**

Related to the liability of newness is the liability of smallness, which assumes that organizational size influences organizational success. Firm size has been considered to have an effect on the availability of resources. Lack of resources put small businesses at a distinct disadvantage.

Smaller firms often suffer from inadequate financial resources, relying upon limited sources of capital, including the savings of the owners. Smaller firms are often highly leveraged, carrying a high debt load (O’Neill and Duker 1986). Smaller firms lack the necessary resources, both staff and time, to engage in strategic planning (Robinson and Pearce 1984). Further, compliance with governmental regulation weighs more heavily on smaller organizations (Aldrich and Auster 1986). Smaller businesses also have a more difficult time competing for skilled and knowledgeable personnel. Small firms often do not have an internal labor market upon which to draw. Additionally, coupled with limited financial and staff resources, small firms often cannot afford the expenses of needed reward systems and training and recruitment programs for their workforces. Smallness can also affect the creation of networks with external stakeholders, especially suppliers and customers (Aldrich and Auster 1986).
Challenges in Iraq

While entrepreneurs generally possess the experience and skills gained from a craft or trade, they are often poorly trained in business management and lack formal training or business education. In addition to absence of managerial expertise, entrepreneurs and small business owners located in developing economies or war-torn economies face multiple obstacles, including the absence of an entrepreneurial class. There are usually few institutions that provide education and training opportunities or facilities, and those that do have limited capacities. There are often inadequate seed capital, microfinance, and specialized financial institutions to provide needed capital. Often the governments in such areas are unable to provide support or they create roadblocks to business development through bureaucratic red tape or their acquiescence to corruption. In war-torn areas, infrastructures are often inadequate, especially transportation and logistics networks, which impede importing and exporting. The deterioration of law and order and a weak legal and regulatory system create a business climate that is not conducive to entrepreneurial development (USAID Tijara Program 2009). Iraqi entrepreneurs face each of these challenges. The responses to these challenges by the US government, especially through the efforts of USAID, and its partnerships with the Iraqi government, non-governmental organizations (NGOs), community-based organizations, and the private sector will be examined next.

Responses to the Challenges

Absence of an Entrepreneurial Class.

Max Weber in *The Protestant Ethic and the Spirit of Capitalism* (1958) theorized that the emergence of entrepreneurship in a country may depend upon the emergence of an
entrepreneurial class (Xu 2008). There are some commentators, who when interpreting Weber, have argued that predominantly Muslim societies do not possess "the spirit of capitalism" or work ethic characteristics necessary for the development of an entrepreneurial class. (Benzing, Chu, and Kara 2009; Xu 2008). This is highly disputed and others contend that individual initiative is sufficient for the development of an entrepreneurial class. The presence of organizations to promote and support entrepreneurial development and the creation of family-owned small and medium-scale companies will guarantee the creation of a strong entrepreneurial class. (Benzing, Chu, and Kara 2009).

Supporting organizations are present in contemporary Iraq. At the international level, Iraq is progressing toward World Trade Organization (WTO) membership, having achieved observer status (U.S. Commercial Service 2009). The International Monetary Fund (IMF) has recognized the government of Iraq and granted an assistance package of over $400 million (U.S. Commercial Service 2009). The IMF under its programs of policy advice and financial support has assisted in the successful achievement of macroeconomic stability: improved public financial management, a new currency accepted by the populace, an efficient banking system, and an improved economy (International Monetary Fund 2009; U.S. Commercial Service 2009). Additionally, the World Bank, through the International Finance Corporation, has provided over $170 million to establish the Iraq Small Business Finance Facility to assist Iraqi banks in their efforts to provide loans to small businesses (U.S. Commercial Service 2009).

On a national level, the U.S. government through the USAID has played a significant role in economic development. Initially the USAID’s mission was to restore Iraq’s infrastructure, support healthcare and education, expand economic opportunities, and improve the efficiency of the Iraqi government (U.S. Commercial Service 2009). The USAID Izdihar project, begun in
2005, attempted to create a sustainable microfinance industry, bank lending for small and medium size enterprises, business development services and training, investment promotion, and trade reform (USAID-Tijara 2009). In 2008, the USAID Tijara project became the successor to the Izdihar project. *Tijara* means trade in Arabic. The Tijara project is a three to five year program to promote private enterprise growth and employment in Iraq. The project focuses on Iraqi communities and provides services that will stimulate businesses and provide greater access to loans and financial services (USAID-Tijara 2009). The mission of the Tijara project is:

“to promote economic growth and employment in Iraq by increasing private sector access to finance, in particular for micro, small and medium enterprises. This objective is fulfilled by stimulating microfinance institutions and private banks to increase loan volume and diversify their services and clients; by creating and supporting indigenous providers of business development services; and by working with the Government of Iraq to develop an improved enabling environment for increased trade and investment in the private sector.” (USAID-Tijara 2009).

Other organizations created to support small business development and entrepreneurship include Business Centers in Baghdad, Basra, Kirkuk, and Mosul that provide business services and information (U.S. Commercial Service 2009). Additionally, there are numerous Iraqi business associations created to link businesses: Union of Iraqi Chambers of Commerce, Iraqi Industries Union, Iraqi Businessmen’s Association, and Iraqi Contractor’s Federation (Coalition Provisional Authority n.d.)

At the local level, the creation of Small Business Development Centers has been a critical element in business expansion. The critical services that SBDCs perform will be discussed next.
Educational Opportunities

Providing educational and training opportunities or facilities are critical to ameliorating the liabilities of newness and smallness. The USAID, especially through the Tijara project, and the Iraqi government fully recognize this and created SBDCs to fill these needs. The SBDC services range from offering microloans to develop new businesses to offering basic business training courses to help educate the Iraqi citizenry about how to manage a business (see Figure 1). The SBDCs have created a voucher system to provide individuals with the financial resources to pay for the business education programs. The SBDCs also offer assistance for creating business plans and help entrepreneurs develop businesses from the ground up in areas that vary from taxi drivers to new hospitals. Further, SBDCs sponsor business conferences, host trade fairs, and provide business and consulting services.

A critical service that SBDCs perform is linking aspiring and struggling entrepreneurs with microfinance institutions and banks that have capital to invest in the local business economy. In its attempts to link businesses with financiers, it is interesting to note that in the Frequently Asked Questions section of SBDC’s website, the agency was asked if there was an age limit on receiving assistance from the SBDC. The response was intriguing: “We would expect that a person who wants to create a business or has an idea should be 15 years of age or older.” (Small Business Development Centers in Iraq n.d.).

Inadequate Access to Finances

Iraq’s financial sector is still developing. Iraq’s six state-owned banks make up over 90% of the banking sector of the country. The two largest banks, the Rafidian and Rashid, account for over 85% of the sector’s assets (U.S. Commercial Service 2009). However, Iraq remains seriously “under banked.” (U.S. Department of State, 2008: 3). Most banking
operations concern basic consumer transactions, which has left credit transactions for small businesses and entrepreneurs to private transactions and the microfinance industry (U.S. State Department 2008).

Microfinance and microlending are relatively new to Iraq (USAID-Tijara 2009). Before 2003, there was no microfinance industry in Iraq. While loans were made to state-run enterprises and some small businesses during the Saddam Hussein regime, financial capital was often available only to those loyal to the regime. Entrepreneurs without political connections had no sources of capital except loan sharks (Iraq Microfinance Industry (IMFI) 2010).

Between 2003 and 2006, there were only three Microfinance Institutions (MFIs) in Iraq and those were operated by international NGOs (USAID-Tijara 2009). Currently, there are ten microfinance institutions operating in Iraq’s 18 governorates. Loans to micro and small business enterprises range from $500 to $25,000 in size with an average duration of 12 months. Interest rates vary depending on loan size and the business’s location (Iraq Microfinance Industry (IMFI) 2009).

The USAID began the Izdihar project in 2005 (it was terminated in March 2008). The Izdihar project began the USAID efforts to create a sustainable microfinance industry and provide for bank lending to small and medium sized enterprises. In 2006, the Izdihar project, in conjunction with the US military, created and funded the first indigenous Iraqi MFIs: Al Bashaer in Baghdad and Al Aman in Kirkuk. By the time the Izdihar project was terminated in 2008, six additional MFIs had been established (see Figure 1) (USAID-Tijara 2009).

Since July 2003, when the first MFI working with the USAID began operation, some 200,000 loans worth more than $370.7 million have been made (Iraq Microfinance Industry (IMFI) 2009). Over 75% of the microloans were made to start or improve businesses in
production, services, agribusiness, and trade. The remaining loans were for home improvements which supported home-based and cottage industries. Private residences are often the locales for many neighborhood businesses, such as barbers, cosmetologists and seamstresses (USAID-Tijara 2009).

As of February 2010, there are 58,852 outstanding microfinance loans in Iraq with a total value of $82,855,717 (US) (USAID-Tijara 2009). The primary goal of the Iraqi microfinance industry is to provide quality financial services, mostly through loans, that will stimulate economic growth and create new and higher-paying jobs. The Tijara program assists in these endeavors by providing business development services and creating a sustainable microfinance industry (USAID-Tijara 2009).

Government Support

The Iraqi government has recognized the need to grow a strong private sector. The government understands that a modern free market economy and a favorable legal environment are necessary for Iraq to join the global economy. As discussed herein, there has been substantial progress in the government’s efforts to establish a business climate conducive to economic growth (USAID-Tijara 2009).

Iraq’s currency has been successfully transitioned to the New Iraqi Dinar and a new central bank has been created (U.S. Commercial Service 2009).

While much work remains to be done, Iraq is on the way to establishing an investor-friendly business environment (U.S. Department of State 2008). Although land ownership by foreigners continues to be restricted in most of Iraq, the government is very open to foreign investment. Iraq’s constitution affords protection from expropriation. Arbitration is well developed and supported. Despite problems associated with persistent crime and lawlessness,
the protection of intellectual property rights (IPR) is well recognized; Iraq is a signatory to a number of international IPR treaties (U. S. Department of State 2008).

Under the Hussein regime, commercial laws existed, however, the laws were not up to international standards. Trade was severely restricted and subject to extensive licensing requirements and inspections (U.S. Commercial Services 2009). While there are still areas of the law that are weak (labor, competition, and consumer protection laws) the Iraqi government has moved forward on a number of fronts to enact laws conducive to business development.

Corruption remains a major problem in Iraq. Under the Hussein regime, corruption was a way of life touching all economic transactions (U.S. Department of State 2008). The legacy of the prior regime still affects the business climate, especially government procurement. While the government has created agencies to lead anti-corruption and anti-bribery efforts, their success so far has been somewhat mixed and their operations somewhat ineffective (U.S State Department 2008).

**Adequate Infrastructure**

Iraq’s infrastructure is being restored. The airports in Baghdad, Basra, and Irbil are all now fully functional with civilian flights nearly doubling since Spring, 2004. The ports of Uum Qasr and Khwar Az Zubair are now reopened, allowing for increases in both import and export trade (U.S. Commercial Service 2009). Travel by automobile to and from neighboring countries (Kuwait, Jordan and Turkey) is manageable. There are still major security issues associated with car travel. However, highways are modern with fuel and food available along most major routes. While not without some connection and interruption of service issues, mobile and satellite phone service is available (Coalition Provisional Authority n.d.). In 2003, US Congress appropriated
over $18 billion to fund the Iraqi Project and Contracting office to support the reconstruction of
Iraq’s infrastructure (US Commercial Service 2009).

**Presence of Legal and Regulatory System**

Security continues to be the number one deterrent to business development. Theft and
violent crime persist. Security issues are still a paramount concern for business and the Iraqi
government (U.S. Department of State 2008).

Saddam Hussein came to power in 1979 and was said to rule with a true “iron fist.” He used fear as a regular tactic to keep the Iraqi citizens under his control. Examples of the harsh
tactics used under Saddam Hussein are many. Iraqi citizens were not allowed to assemble legally unless it was to express support for the government. The Iraqi government controlled the establishment of political parties, regulated the parties’ internal affairs and monitored the activities of their members. Police checkpoints on Iraq's roads and highways prevented ordinary citizens from traveling. Travel abroad was nearly impossible; government permission and expensive exit visas were needed. Before traveling abroad, an Iraqi citizen had to post collateral. Iraqi women could not travel outside of the country without the escort of a male relative. The activities of citizens living inside Iraq who received money from relatives abroad were closely monitored.

Even with the liberation of the country, Iraq is not without its problems. The primary religion in Iraq is Muslim. The Iraqis are a deeply religious people and hold to their beliefs throughout their personal and business lives. The Muslim religion generally comprises two conflicting sects, Sunni and Shia. This division has led to sectarian conflicts. While the actual religious differences between the two factions are few (both groups believe in the five fundamental Pillars of Islam and each group recognizes the other group as part of the Muslim
faith), the differences and contentions between the two groups go beyond who is the rightful successor to Muhammad and extend to the political realm where the issue of inclusion in the political process is contested.

The threat of attacks against the citizenry and their facilities remains high (U.S. Commercial Service 2009). The following anecdote is descriptive of the effects of security breakdowns. One of the authors was contracted to the Department of State to oversee operations of the embassy in the southern Iraq town of Basra. During the last 7 months of his deployment, he was a manager of a group of Iraqis. Every morning the group of Iraqi men who were hired to work for the embassy would be picked up at the front gate of the base in a fully armored bus for transportation to U.S.-run facilities. While the State Department took every precautionary step to ensure the safety of embassy workers, much attention was drawn to the Iraqi workers being picked up at the gate in the armored bus. This apparently spread back into the town and insurgents took notice. One day after finishing his day job at the embassy, an Iraqi man went home to find that his son had been kidnapped and was being held for ransom. This incident caused a noticeable change in the demeanor and work behavior of the supervised workers. The workers began to disappear for weeks at a time and when they did show up for work they were very distant and reluctant to help. The workers had equated the author with the State Department, and lost trust in their supervisor because of the kidnapping. The workers became reluctant to do any business with the embassy and only did so out of necessity for money.

**Conclusion**

This paper examined the efforts by the Iraqi government to create a business climate that ameliorates the challenges and obstacles faced by Iraqi entrepreneurs. The Iraqi government
acknowledges that the real engine of sustainable economic growth is in the private sector and understands that institutions must be put in place to support entrepreneurial development and the creation of an entrepreneurial class.

A dynamic private sector is the driving force behind inward investment, technological change, and economic growth. It is a major driver of a strong market economy. Iraq is no exception to this rule. In order to transform itself, Iraq has focused on entrepreneurs and small businesses, with the support of the international community, especially the United States. This study addressed the challenges faced by Iraqi entrepreneurs and small business owners. These challenges are not dissimilar from those faced by entrepreneurs in other war-torn regions, such as the Middle-East, Africa and Sri Lanka. What seems to be different is the presence of significant support programs, especially those funded by the US government to foster entrepreneurial development and to support the entrepreneurial spirit of the Iraqi people.

Despite operating under the challenges of an insecure political environment, including continued sectarian violence, inadequate sources of human capital, and an underdeveloped legal and regulatory schema, the Iraqi entrepreneurial class has displayed significant growth – it is succeeding and winning. The potential for Iraq is described by the Coalition Provisional Authority:

“Iraq is a uniquely attractive place for business in the Middle East. Iraq’s blend of hardworking, resourceful people; rich agricultural potential; abundant natural resources, including oil, phosphate, and sulfur; and a central Middle East location make it ideally suited for investment opportunities. Despite decades of under-investment and an ensuing war for the liberation of its people, Iraq is recovering and on the road to a booming
future. The potential of Iraq and its abundant resources is being unleashed in the country’s new free market economy.

Iraq has close to 25 million people along with a long-suppressed demand for modern goods and services which were denied to them for years. Since the summer of 2003, consumption has increased as a result of an increase in wages and the opening of international trade. A surge in recent foreign-donor investment will result in up to a million new jobs, provide significant economic stimulus, and accelerate consumption. The recent establishment of a new, single currency, a transparent legal environment, and an open business environment will help ensure strong, sustained growth in the years ahead” (Coalition Provisional Authority (CPA) n.d.).

The USAID Tijara Project, together with its predecessor, the Izdihar program, has provided both financial capital and services to nascent Iraqi businesses. The programs have created a successful microfinance industry. More than 132,000 microloans, worth a combined value of $300 million, have already been made to Iraqi businesses (U.S. Federal News Service 2009). Small Business Development Centers (SBDCs) have been created throughout Iraq to provide services and educational opportunities. The USAID also provides support to the Iraqi government in its efforts to overcome its shortcomings concerning security, legal system and international trade.

A better understanding of the challenges faced by new and small businesses should enable policy makers and business advisors to better serve small business owners in Iraq and other areas of the world that are subject to disruptions caused by war, corruption or violence. Identifying the practices utilized in addressing these challenges should aid future entrepreneurial development efforts in emerging economies or war-torn areas.

The Role of Environment in Fostering Conductive Entrepreneurial Learning: Is Entrepreneurship Boot Camp an Effective Tool in Teaching the “Art” Form of Entrepreneurship?

Caleb Kwong
Jay Mitra

Introduction

Gibb’s (2002) notion of conductive entrepreneurial environment points to the importance of providing an all-rounded student entrepreneurship learning experience that meets the rigors of academia, while keeping an experientially-based approach that enhance creativity and innovation (Gibb, 2002; Porter and McKibbin, 1988). Since then many components that may enhance this conductive entrepreneurial environment has been identified, including work experience schemes (Timmon et al., 1987) and campus-based extracurricular activities. This exploratory study examines the value of entrepreneurship summer camp at the end of an academic year aiming to allow students to participate in multidimensional entrepreneurship activities and discussions in a less formal environment. It is expected that an informal environment away from campus would produce added-value to classroom-based entrepreneurship learning, whilst its multidimensional nature would produce different outcomes to those of other experiential-learning approaches, thus providing another piece of jigsaw to the conductive entrepreneurial environment puzzle.

The Role of Environment in the Entrepreneurial Learning Process

Learning models such as Brigg (1989) have long proposed that environment and learning are closely related. It is found that students who are embedded in a learning environment have higher motivation, self-efficacy, inter-personal self-esteem, and are more satisfied with their learning experience (Astin, 1975; 1999). Traditional
content theory that places students in a passive role of information has therefore been widely challenged, particularly in the context of entrepreneurship learning (Gibb, 2002). As entrepreneurship development often follows a chaotic and ill-defined process of trial and error (Boussouara and Deakins, 1998; Soloman, 2007), many have argued that the formalistic and theoretical nature of classroom-based learning neglects the development of judgement, patience, responsibility and other practical skills that are essential in dealing with uncertainties and ambiguities (Boussouara and Deakins, 1998; McCabe, 1998; Soloman, 2007; Hynes, 1996). Classroom-based entrepreneurship learning has also been criticised for its inability to enhance participant’s creativity, innovation, and problem solving skills – skills that are referred to as the “art” form by Jack and Anderson (1998) and Shepard and Douglas (1996). In addition, it has also been criticised that some important traits of entrepreneurs, such as self-confidence, persistence and high energy level cannot wholly be acquired from classroom (Miller, 1987; Ryle, 1963; Garavan and O’Cinneide, 1994). Kantor (1988) study of 400 students in Canada, for example, found that it is easier to teach skills rather than traits in classroom. This has led some researchers to conclude that classroom-based entrepreneurship learning is better at producing managers than entrepreneurs.

Having said that, there is no doubt that classroom-based entrepreneurship learning is an effective tool in increasing perceived feasibility of entrepreneurship for a number of reasons. First, classroom-based entrepreneurship learning teaches participants functional disciplines that are essential for starting and running a small business, including accounting, finance, marketing, management information systems and manufacturing skills (Deakin, 1996; Henry et al., 2005a). Second, classroom-based entrepreneurship learning is also found to be effective in providing skill
building courses, including negotiation and leadership (Soloman, 2007). These, according to Mitra and Matley (2002) and Jones (2007), are broad-based, transferable, and lifelong learning skills that also increases ones perceived feasibility. Third, classroom-based entrepreneurship learning provide participants an understanding of the rigorous analytical techniques required to set up a new business and an appreciation of the limitations of those techniques (Miller, 1987). It has been suggested that the cognitive approach of classroom-based entrepreneurship learning increases decision-making ability (Fiet, 2000b), as well as to help participants to acquire analytical thinking ability (Henry et al., 2005a), both of which are important for business start-up.

The above discussion points to the importance to create a more rounded environment for students that is favourable to their entrepreneurial learning. Contemporary learning theories, such as the theory of involvement, emphasise the active participation of the students in the learning process (Astin, 1999), which many argued is more suitable for learning entrepreneurship related subjects (Soloman, 2007).

*The Role of Entrepreneurship Summer School in Fostering Entrepreneurial Behaviour*

Entrepreneurship summer school is becoming increasingly popular in recent years. However, despite its increasing popularity, there appears to be very few studies discussing the scope of such training beyond technical and business skills acquisitions. Robertson and Collins (2003) study has discussed a number of skill-based advantages of entrepreneurship training camp, including the provision of broad frames of references, environmental knowledge and personal networks, as well as the development of analytical, interpersonal and structuring skills. However, the study did
not discuss in depth its additional value in relations to classroom-based entrepreneurship training and work experience programmes, particularly the role of environment in fostering innovation and creativity.

One apparent gap of classroom-based enterprise training that has not been filled by work experience programme is the use of what Gibb (2002) referred to as the conductive learning approach to encourage students to find and explore the wider concepts relating to a problem. This allows students to think independently of ways to overcome business and sector specific constraints, by seeking external sources of information and expert advices. Although such gap can partly be filled by participatory classroom-based training such as business plan development and off-curriculum activities such as student enterprise club, both have their limitations in terms of scope (see Table 1). Business plan allows students to identify potential opportunities and barriers, as well as to be aware of the issues that need to be resolved when starting up a business (Russell et al., 2008). However, as a traditional tool for venture capitalists and bankers to assess business proposals (Gibb, 1997; Wan, 1989), it does not reflect one’s true capability to start and run a business (Wan, 1989), and inhibit entrepreneurial response to subsequent changes in the environment (Gibb, 1997). Expert validation through work experience programmes can increase experimental knowledge of students (Walmsley et al., 2006, King, 1994), and provide a career laboratory to deliberately test the prospective occupation (Ducat, 1980), but the effectiveness of this type of programme in raising entrepreneurial intention and participation has always been questioned (Kwong et al., 2009; Thompson et al., 2008). For students who entered work experience programmes, the ‘entry shock’ can be so dramatic that it often produces out-of-proportion negative perceived desirability (Walmsley et al., 2006; Feldman, 1988), especially when they are only exposed to one
entrepreneur and are therefore more exposed to personality, behavioural, and sectoral differences.

Incorporating extra-curricular activities into the academic curriculum is getting increasing popular, with activities such as student enterprise club becoming increasingly widespread (Gartner and Vesper, 1994). Studies have shown that these activities are very important in increasing student’s intention in starting a business. They also foster creativity as well as to provide students with valuable experiences in trying out their business ideas. Such approach is consistent with previous research which suggests that the emphasis of enterprise education should be less about assessment but more about support (Colins and Robertson, 2003). Yet, due to work pressure, the lack of academic legitimacy (Levie, 1999) means that many students are reluctant to get involved in non-accredited after-school activities. On the other hand, to incorporate such activities into a formal academic curriculum is extremely difficult, due to resource and structural pressures. Although there have been calls for the use of less rigorous assessment process, for example, through the use of milestones (Ames et al., 2002), this is not always possible (for example in the UK) due to the fact that courses cannot divert from other academic programmes too much (Colins and Robertson, 2003), especially when it comes to the validation process.

The shortcomings of current entrepreneurial mediums in universities point to the need of a new type of programme that enhances behaviour orientated entrepreneurship learning through new learning environment, and entrepreneurship summer school appears to be the ideal solution for this. Entrepreneurship summer school provides a new environment that is dedicated to a particular learning objective allows students to spend considerable time and energy on activities that enhances their overall learning experience (Astin, 1999). As people are whole entities and domestic

                       | • School environment discourages participation  |

Concerns inevitably influence work performance and vice versa (Heap, 1996), a new environment physically and symbolically removes people from their daily routine, and liberates them from burdens and limitations of everyday life (West, 2004). With the aid of some highly respected facilitators, consultants or business schools, such an environment generates a pleasant and comfortable atmosphere, in turns allowing participants to step back from the on-going day-to-day processes, examining and reflecting upon the appropriateness of existing ways of doing things, challenging the way they usually behave and introducing new ways of thinking (Johnson, 2008; West, 2004). In addition, a new environment also provides a platform for participants to challenge each others’ ideas, and allows differences to surface for constructive debate.
(Dunne, 2007). Furthermore, new environment provide a platform for individual to review their strengths, skills, weaknesses, problem areas, and future functioning being improved (West, 2004). Many companies and organisations strongly believed that events such as away-days ensure a team’s continuing effectiveness (West, 2004). In the UK, 1,700 listed companies spent an average of two days a year on away-days, amounting to 30 million working days in total (Dunne, 2007).

However, to create an environment specifically for learning is not without its problems. Johnson (2008) argues that learning that is detached from everyday life is likely to fail, due to the unchallenged nature of many of the ideas developed from such environment. The “pressure of the immediate”, such as everyday routines, often reverses participants to the old way of doing things. It has also been criticised that a short duration of environmental change is not adequate in changing behaviour permanently (West, 2004). Therefore whilst changing environment may provide a moment of inspiration for some, to maintain this inspiration and to carry it forward proves to be more difficult. There is a need for organisations to encourage participants to put what they learnt into practice (Heap, 1996), for example, by providing such training at a time where work disruption can be kept to minimum (West, 2004). One way of overcoming this problem is to have very limited aims and objectives that can be achievable in the short and medium terms (West, 2004). However, cost effectiveness remained a major issue with such programmes (Dunne, 2007).

The aim of this exploratory study is to examine whether entrepreneurship summer can provide an added-value to other entrepreneurship programmes that are already in existence, through providing a creative environment that allows students to develop their own business ideas, and, if so, how does this affects students’ perceived
feasibility and desirability of entrepreneurship, as well as their intention to start a business in the future.

Research Methodology

Whilst a quantitative approach provides valuable information, given the small number of participants, a qualitative approach that facilitates an understanding of the processes, rationale, subjective realities, complexities and context behind the students’ decision-making is adopted for this study. In-depth face-to-face interviews as well as focus group discussions were carried out with all camp participants who came from the UK (n=8). All participants were business students (two undergraduates and six postgraduates) who expressed interest in entrepreneurship by submitting a business proposal. All students received training on writing and developing business plan prior to the departure, and regularly attended extracurricular entrepreneurship events organised by the university, including student enterprise club, departmental seminars by academics, practitioners, policy makers, and motivational speakers.
