Results of the CHAID analysis (Figure 1) indicated that population group proved to be the first critical and significant success predictor to split performance into distinct and significantly different subsets with respect to the pass/fail ratio attached to each population group. Segregation into three population subsets was significant, as indicated by a probability of less than 0.0001, associated with the chi-square statistic of 197.49. The pass/fail ratios for the African, white and coloured/other subsets were 1.05, 4.07, and 2.01 respectively, which indicates significantly different pass/fail ratios. The ratios imply that, for white respondents, four students passed for every one student who failed, while one African student passed for every student who failed in the African population group. The most critical, statistically significant contributor in explaining variation in pass/failure performance was thus population group. Based on pass/fail ratios, level one data segregation therefore indicated the white population group as probably the most successful student and the African student as probably the least successful student.

In the second step of the CHAID analysis, the type of matriculation certificate obtained acted as the next most critical splitting agent to split African and coloured population subsets into the most distinct and significantly different sub-subsets with respect to the pass/fail ratios of the performance variable. No splitting agent was identified for the white population subset. Probabilities of 0.001 and less than 0.001 were associated with the chi-square statistics of 48.40 and 18.12 respectively, for the African and coloured/other population groups. The analysis herewith identified type of matriculation certificate as the second most critical and statistically
significant success predictor (in conjunction with race group). For the matriculation categories of the African population groups, a pass/fail ratio of 1.11 was reported for category 2 and 3 matriculation certificates, and 0.71 for category 1 matriculation certificates. For the coloured/other population group, ratios of 1.54 and 3.72 were reported for categories 1 & 3 and for category 2 matriculation certificates respectively. Based on the pass/fail ratio, level two data segregation illustrated the interactive effect of predictors on performance, and (apart from the white population subset, with $r=4.07$) indicated coloured students with category 2 matriculation certificates as the most likely to attain success ($r=2.01$), while African students with a category 1 matriculation certificate are probably more at risk ($r=0.7$).

Satellite class attendance was identified in the third level as the most influential and statistically significant splitting agent. This made satellite class attendance a contributor in jointly explaining and predicting the performance of students. The pass/fail ratios for the attendance and non-attendance categories of the satellite class-splitting agent of the level three subsets are:

- 1.9 and 1.1 for the African population group in possession of a category 2 or 3 matriculation certificate
- 1.1 and 0.7 for the African population group in possession of a category 1 matriculation certificate
- 7.5 and 1.5 for the coloured population group in possession of a category 1 or 3 matriculation certificate.

The chi-square probabilities associated with the level three subsets were equal to 0.0001 (chi-square=29.93), 0.01 (chi-square=8.97), and 0.05 (chi-square=5.66) respectively, which indicate significance on the 0.1 percent, 1 percent and 5 percent levels of significance, respectively. Level
three data partitioning identified African students who wrote category 1 examinations and did not attend satellite classes as an at-risk student group ($r=0.65$). In addition, data partitioning suggests that African students who wrote the category 2 matriculation examination and did not attend satellite classes, to be at risk too. Age level should be ignored, as the significance attached to this small proportion is negligible. Conclusions regarding the latter subset are based on more observations and would represent a more conservative prediction. Level three data partitioning thus indicated that satellite class attendance contributed jointly and significantly to predicting student performance. This result confirmed the findings of the initial research.

The risk estimate, which estimates the accuracy of the model, was calculated as 0.41, with a standard error of 0.0065. The standard error is very small, which indicates that the risk of misclassification is stable, but the chances of misclassification are about 41 percent.
Profiling of the successful and at-risk student should thus follow the pass/fail ratio path relating to high and low ratios throughout the decision tree. The relative sample size of subsets
should also be considered when making deductions. Results can be summarised to describe the success profile of a first-year Business Management or Management student as follow:

- either a white student \((r=4.07)\), or
- a coloured student \((r=2.01)\) in possession of a category 2 matriculation certificate \((r=3.72)\).

The profile describes the at-risk diploma student as:

- an African student \((r=1.05)\) who is
- in possession of a category 2 matriculation certificate \((r=1.11)\)
- who did not attend satellite classes \((r=1.08)\) and
- is younger than 35 \((r=0.83)\).

**Summary and Conclusions**

The significance of the effect of satellite class attendance on performance, established in the initial research (Swanepoel *et al.*, 2009), was validated by this study. Satellite class attendance, as a significant third-level success predictor in the CHAID model, attests to this. The current study furthermore added new and relevant applied knowledge to the field of ODL and blended learning in that the interactive nature of success predictors (incorporating satellite classes) in first-year Business Management and Management modules, was identified and verified with the CHAID analysis strategy. The strategy allowed the effect of interaction between success predictors to be acknowledged and described in success and at-risk profiles for students.

Success profiles suggested that population group, the type of matriculation certificate and satellite class attendance impacted on students’ academic performance. In research, attributes such as ethnicity are a given and appreciated as such. However, if influential forces such as varying matriculation standards can be phased out (all SA students have been writing the same matriculation examinations since 2008) with a more uniform student corps entering into first-
year Business Management and Management modules, the impact of satellite classes as a blended learning intervention might be found to be even more beneficial. Nkomo, Weber and Amsterdam (2009) maintain that the exclusion from quality education for all has a paralytic effect on the individual and on society. A longitudinal evaluation study on the effectiveness of satellite classes will have to be conducted to monitor whether the gradual phasing in of a uniform entry level in the first year will indeed cancel out the identified current differences in entry-level effect. However, the non-uniform entry level of first-year students will probably take more time to peter out at Unisa, as an ODL institution, than at residential tertiary institutions. The average age of students at ODL institutions is typically higher and Unisa is no exception (with 50.6% of Unisa students in the ‘over 29’ age category, according to Subozky, 2009). Students with ‘old’ matriculation certificates will therefore be in the system over a longer period of time than at residential South African universities, which attract larger numbers of school-leaving matriculants who study full-time.

The risk estimate of the current CHAID analysis was reported as 0.41, which is still relatively high and indicates that other success predictors, currently unknown, could possibly explain an additional component of the variation present in the data. Further research should also consider new potential success predictors, such as psychographic factors, to the success profile.

The CHAID analysis methodology followed in this study proved to be truly applicable to the particular research context. The applicability of the research methodology and ease of interpretation suggest that the technique in itself could add value to the broader base of research strategies available and applied under similar profiling conditions.

An honest desire to fathom the success profile structure of first-year Business Management and Management students to enhance student learning in an ODL context, should remain the
driving force of the research, in the hope that measures might evolve to contribute to improved
student throughput and more effective blended learning interventions.

SUCCESS PROFILING OF STUDENTS IN SMALL BUSINESS MANAGEMENT: A METHODOLOGICAL PERSPECTIVE ON THE INTERACTIVE NATURE OF SUCCESS PREDICTORS ON STUDENT PERFORMANCE AT AN OPEN AND DISTANCE LEARNING INSTITUTION

ABSTRACT

Aim of the study
The drive to improve the dismal academic performance of approximately 22 000 first-year students in the field of entrepreneurship and small business management at an open and distance learning (ODL) institution in a developing country, has resulted in the incorporation of a blended learning component, namely satellite classes, in the learning strategy to enhance the academic performance of these students in the subjects Business Management (covers business plans) and Management (covers management functions for small and medium-sized enterprises). Satellite classes mimic physical face-to-face student–lecturer tutoring and interaction by means of a series of networked, virtual real-time verbal communication and tutoring sessions. The task of monitoring the effectiveness of this intervention in relation to student performance to justify high implementation costs (Mathur & Olivier, 2007: 3) is essential. However, an in-depth analysis strategy should recognize the fact that no single intervention or attribute influences an outcome (such as performance) in isolation; a combination of interacting forces usually affects an outcome (Sadler and Erasmus, 2005:32). Whereas an initial study confirmed a statistically significant relationship between satellite class attendance and academic performance (Swanepoel, de Beer & Müller, 2009), this study evaluated the interaction effect of satellite classes and additional potential success predictors, namely population group, type of matriculation and age on academic performance from a methodological perspective. External indicators and biographical characteristics (and combinations of these factors) that enhance academic performance translate into profiles of successful and at-risk students (Wojciechowski & Palmer, 2005:1).

The research objectives is to create an exploratory prediction model for the success rate of students where the model takes cognisance of the interactive nature of predictor variables and evaluates the contribution of satellite class attendance in conjunction with other possible biographic predictors in the model and present the model as a provisional profile for successful and unsuccessful first-year Business Management and Management students at the University of South Africa.
Methodology and approach

Information on 2007 first-year student performance (in the Business Management I modules [BSM1M1P and BSM1M2P] and in the Management I modules [MNG1M14 and MNG1M25]) regarding satellite class attendance and potentially influential biographical indicators were collected from two separate databases. The non-parametric and categorical analysis technique that was applied as part of the analysis methodology, namely a decision tree data partitioning analysis approach, aligned with the data type and structure and also satisfied the underlying analysis assumptions set by the statistical analysis technique.

As a first step in the analysis strategy, frequency distributions on all variables were calculated. This was followed by a decision tree data partitioning analysis methodology which is referred to as the Chi-square Automatic Interaction Detection (CHAID) technique. This decision tree methodology described the interactive driving forces that impacted on student success. Satellite class intervention and biographical student attributes constituted the driving forces.

Results and conclusions

The CHAID analysis enabled the profiling of successful and at-risk students. The interactive nature underpinned by the analysis technique made the methodology perspective applicable to the situation which exists in many departments at ODL institutions. The decision tree algorithm mimics true life situations where various effects interactively and jointly influence and predict an outcome.

The results of the CHAID analysis (figure 1) indicated that the segregation of the data entered population group (Blacks, Whites and Coloureds) as the most critical and significant success predictor to split performance into the most distinct and significantly different subsets with respect
to the pass/fail ratio of each population group category. In the second step of the CHAID analysis, the type of matriculation certificate obtained acted as the next most critical splitting agent to split the African and Coloured population subsets into the most distinct and significantly different sub-subsets with respect to the pass/fail ratios of the performance variable. Satellite class attendance was identified in the third level as the most influential and statistically significant splitting agent. This made satellite class attendance a contributor in jointly explaining and predicting the performance of students. The risk estimate, which estimates the accuracy of the model, was calculated as 0.41 with a standard error of 0.0065. The standard error is very small, which indicates that the risk of misclassification is stable but the chances of misclassification is about 41%.

Implications

Student failure is costly to both the institution (in terms of the eventual throughput rate and associated subsidy quotas from central government) and to the students (in terms of time and accumulated study expenses). The findings are relevant to education policy makers with regard to the type of school leaving certificate programmes at secondary education level that would result in greater performance at tertiary education level. For educators it is evident that to enhance distance learning education, satellite classes could be added; in addition they would be able to develop appropriate bridging courses for high-risk profile students. From a university counselling perspective, it is possible to identify the type of students with the highest risk profile and the type of counselling they would need.
The risk estimate of the current CHAID analysis was reported as 0.41, which is still relatively high and indicates that other success predictors (currently unknown) could possibly explain an additional component of the variation in the data. Further research is required to identify new potential success predictors, such as psychographic factors which should also be considered in the success profile.

Abstract

The aim of this research is to analyse the emergence of the concepts of sustainable development and social responsibility in companies in time and space. A spatio-temporal reading will indicate the most important socio-political and environmental events that have emerged with these two concepts. In order to complete the odyssey, a spatio-temporal analysis has retraced the epistemological evolution of these latter, whilst at the same time
remarking the appropriation that has been made by the different institutional and organisational actors.

The historical and epistemological reviews tell us that these two concepts, which came into existence almost 80 years, have indefinite outlines; one can be substituted for the other. However, thanks to this odyssey, we have reduced the boundaries even further between sustainable development and social responsibility and shown their theoretic and historical association. The perspective adopted shows that the concept of corporate social responsibility is closely connected to that of sustainable development. This connection means that researchers in management science are faced with more new problem issues reaching further than the simple lack of conceptual consensuses.

**Key words:** spatio-temporal analysis; American and European approaches; sustainable development; eco-development; corporate social responsibility.
A spatio-temporal odyssey around the concepts of sustainable development and corporate social responsibility: boundaries to be determined?

Abstract
The aim of this research is to analyse the emergence of the concepts of sustainable development and social responsibility in companies in time and space. A spatio-temporal reading will indicate the most important socio-political and environmental events that have emerged with these two concepts. In order to complete the odyssey, a spatio-temporal analysis has retraced the epistemological evolution of these latter, whilst at the same time remarking the appropriation that has been made by the different institutional and organisational actors.

The historical and epistemological reviews tell us that these two concepts, which came into existence almost 80 years, have indefinite outlines; one can be substituted for the other. However, thanks to this odyssey, we have reduced the boundaries even further between sustainable development and social responsibility and shown their theoretic and historical association. The perspective adopted shows that the concept of corporate social responsibility is closely connected to that of sustainable development. This connection means that researchers in management science are faced with more new problem issues reaching further than the simple lack of conceptual consensuses.

Key words: spatio-temporal analysis; American and European approaches; sustainable development; eco-development; corporate social responsibility.

Introduction
The policies in industrialized and developing countries show an increasing awareness of the ecological, economic and social risks run by man and ecosystems. Companies are increasingly committed to the process of sustainable development. The fact that this latter, as well as corporate social responsibility, is being taught, denotes the increasing interest on the part of the academic community in these emerging pedagogical fields.

The aim of this article is to provide an odyssey in time and space of the concepts of sustainable development and corporate social responsibility. This spatio-temporal analysis highlights the major social, political and environmental events that have marked the emergence of these two concepts. This odyssey also retraces the epistemological evolution of these two concepts by indicating the appropriation which has been made of them by
governments, diverse institutions and companies. The historical and epistemological perspectives have caused links to be built up between sustainable development and corporate social responsibility. These two concepts that have existed for nearly a century have instable boundaries, as one can be substituted for the other in particular contexts.

This research has been structured in three parts. The first considers the socio-political and academic emergence of sustainable development through institutional commitment (1.1) and the conceptual metamorphosis (1.2). In the second part, we have discussed the change in the paradigm of company responsibility by inviting the reader to look at the origins of this concept (2.1) whilst highlighting the differences and the similarities between the American and European approaches (2.2). This historic and epistemological path led us to summarise the emergence and the transformation of these two concepts in connection with the principal socio-political and environmental events which have marked them. (3). This summary is one of the main contributions to this research. As a conclusion and going beyond the debates concerning the preservation of resources and the equity within and between generations, company performance is achieved by resolving the profitability/responsibility equation. We have given information on the theoretical contexts that are likely to explain why companies are committed to sustainable development. The stakeholder theory appears to be the most appropriate.

1. The socio-political and academic emergence of sustainable development

In the middle of the 1960s, a new awareness of the ecological challenges brought numerous social, economic and environmental questions to the forefront. Different organizations and governments took action to clarify and enrich the debates on sustainable development.
1.1. Institutional commitment

The negative effects of the industrial revolution on the environment and on man have been accumulating since the last century. This observation meant that the development question had to be reconsidered by examining the models that guarantee long-term economic, social and environmental progress. This is what is called sustainable development which we will denote in the following text by the abbreviation SD.

In 1962\(^1\), the book *Silent Spring*, published by Carson, had an important impact on American civil society. The author indicated that the residue of agricultural pesticide was reaching catastrophic levels; considerable damage was being caused to animal species and man. Strategy for a sustainable world,

Apart from these ecological threats, demographic concerns were also emerging. The President of the French Academy of Sciences, Heim (1963), was questioned on the impact of demographic growth on SD (term not yet used at the time). In the same way, Ehrlich (1968), in his work *Population Bomb* predicted a rarefying of resources and mass deaths due to pollution. The doubling of the world population in twenty five years, he confirmed, would mean that that the increased needs that would be difficult to fulfil for developed countries and impossible to satisfy for those that were poor (communication structure, raw materials, agricultural products, health care needs etc). The overpopulation would exhaust the supply of mineral resources and water and lead to famine, epidemics, destruction of the fauna in the oceans and air pollution etc.

The 70s was a period of international protest movements in favour of environmental protection. The United States organised *The Earth Day* on 22\(^{nd}\) April 1970, a project initiated by Senator Gaylord Nelson; the ecological and environmental issues brought together a crowd

\(^1\) In the 19th century, the works of John Muir strongly influenced the emergence of the modern environmental movement. His activism contributed to saving the Yosemite in the USA.
of almost 20 million people. This demonstration shaped the emergence of a modern ecological movement in the West.

Conscious of the ecological and demographical risks that threaten the environmental, socio-political and economic balance, various programmes and measures were implemented by international organisations, governments and companies\(^2\). Table 1 shows the most significant.

The chronological analysis of this summary indicates that the concept of SD has progressively moved further away from its initial strictly ecological acceptance. In many forms and dimensions, it can be defined in numerous ways.

1.2. The emergence of the concept: the triple elements “development-eco-development-sustainable development”.

Following the socio-political events which marked the 1970s, the two antagonistic approaches, that of human development and the environment, needed to be reconciled. This reconciliatory metamorphosis was recorded over two important periods, the first being situated in the 1970s. A team of researchers mainly made up of economists, led by Maurice Strong met together in 1972, in order to examine the connections between the environment and development. This team concluded that it was necessary and possible to implement equitable socio-economic development strategies that respected the environment, called eco-development strategies.

In France and from 1973 onwards, the Sachs team continued the American research on the concept of eco-development. In order for environmental constraints to become part of entrepreneurial strategies, five factors have to be taken into consideration, that is to say: the combination of social relevance and the equity of the solutions proposed, ecological prudence, economic effectiveness, cultural aspects and territoriality. This transition of the concept of
development in its traditional approach, to that of eco-development, called into question the development models used up to then by the economists.

The second important step was the continuation of this evolution at the end of the 1970s and during the 1980s. In fact, the expansion of the conception of eco-development led to problem issues which were much more than just ecological preoccupations. In fact, in November 1976, the "Primer simposio sobre ecodesarrollo", organised by the ‘Mexican Association of Epistemology’, affirmed that the more and more pronounced conflicts between the economic models in place and the natural degradations could be resolved by a choice of society which was a matter for the institutional and political powers. The development should not only be guided by economic considerations, but also by social and ecological requirements.

Therefore the concept of eco-development, reappropriated by the Anglo-Saxons, disappeared and was referred to as ‘Sustainable development’, initially translated as tenable, then sustainable development. This expression was cited for the first time in 1980 by the International Union for Nature Conservancy in its work ‘World Strategies for Conservation’ It was then introduced in 1987 in the report ordered by the United Nations for the Brundtland Commission and was accepted by the Rio conference on the environment and development in 1992.

Recently, in 2001, the European Communities Commission noted that “sustainable development is more than a purely environmental concept; it is a question of making a dynamic economy exist in a society that would give everyone their chance, at the same time improving the productivity of resources by disassociating growth and the degradation of the environment”. 
These different approaches refer to a macro-economy; however it is at a micro-economic level that SD is subject to contingencies; (Reynaud 2004). These approaches did not generally provide the means of integrating this concept into company management. It was only at the end of the last century that this concept spread to the micro-economic level.

2. Responsibility going beyond the traditional paradigm: from leaders to companies

In the 1970s, the considerable increase in industrial accidents, pollution and environmental or health scandals… provoked the indignation of public opinion. Social actions questioned companies on the level of ecological responsibility in their activities, their commitment in political life, and the equality of the sexes at work or even racial discrimination (Smith 2003). The fundamental question was how to apply a systematic managerial approach to dynamic and new objectives, that is to say, the social questions which companies found themselves confronted with. Faced with pressure from the different stakeholders, the management teams have become more and more committed to the SD process (Grégoire, and Mercier 2003).

The Rocky Mountain Institute (RMI) in the United States has the aim of encouraging companies to make an efficient use of natural resources that is compatible with SD and the global security of human beings. The World Business Council for Sustainable Development (WBCSD) had been militating so that company management developed a sense of responsibility with regard to respecting natural resources. In one of the programmes dating from 1992, the UNO incited industrials to work on a declaration of commitment to SD. In Europe, and since 1987, industrial companies have increasingly integrated the problem issues connected with SD In 2002, the European Commission set up a multilateral forum to enable companies to exchange views on responsible social practices.
Including SD in company preoccupations shows a significant move from a paradigm centred on management responsibility to another focused on companies and their managers. According to Stuart (1997) a company is a unique organisation which has the financial, technological and motivational resources necessary to reach sustainability. It can act internally on each of its resources to propose ‘sustainable’ goods and services. The challenge is to overcome pollution, climatic changes, the drain on resources, poverty and inequalities.

This paradigmatic transition has led to numerous debates on corporate social responsibility that we have denoted with the abbreviation CSR. The academic and managerial community is becoming more and more implicated. (Capron, and Quairel-Lanoizelée 2004; Déjean, and Gond 2004; Igalens 2004; Allouche 2005). However the definition of CSR has not by any means led to a consensus. In this part, we have returned to the origins of this concept (2.1) and then analyzed the American and European approaches.

2.1. The origins of the concept

A voyage to the historic origins of CSR ineluctably implies a detour to consider religious facts. These have played an important role in the theoretic construction process of social responsibility. The Protestant religion occupied a preponderant place in the formation and the spread of the notion of CSR in the USA. (Bowen 1953). According to Acquier, Gond, and Igalens (2006), the Protestant and Catholic religions were the more or less explicit sources of inspiration for the first conceptualisations of the notion of CSR.

During the first half of the 20th century, the Protestant concepts of "public service" and "stewardship" characterized the relationship between companies and society. Property was not an absolute and unconditional right. Private property management had to contribute to collective well-being. Each property owner had to satisfy the needs of society and answer for his acts before God and society. The Catholic Church condemns the exploitation of the human
race and more recently that of the environment. "The doctrine of the church has also inspired numerous practices, by creating a model of paternalist management that can be considered retrospectively as socially responsible" (Acquier, Gond, and Igalens 2006).

For Frederik (1994), the origin of the concept was to be found in the work of Berle and Means (1932). They questioned the consequences of power transfer following the separation of capital holdings and the exercise of managerial power. Carroll (1979) attributed the paternity of the CSR concept to Bowen in his work Social Responsibilities of the businessman. Along the lines of the works of Bowen (1953), the CSR concept has progressively emerged as a managerial problem issue. Thus appeared the trend of companies’ social performance "CSR: Corporate Social Responsiveness". The works of Ackermann (1975) and Ackermann, and Bauer (1976) were precursors of this trend; they apprehended companies as organisations that were not closed in. This conception based on a processual vision, studied the capacity of a company to respond to social pressures. They were no longer interested in the contents of the CSR, but a process more orientated towards the means than the ends.

There was a certain lull in the intellectual and social debate on CSR in the 1980s and the beginning of the 1990s. It was in the middle of this period that they resurfaced (Acquier, and Gond 2005). The consequences of numerous scandals and economic crises awakened the interest of the media, governments and various social actors. The observation was that economic performance does not necessarily lead to the well-being of society or social progress: a few illustrations of this were the destruction of the environment, job insecurity or even discrimination towards certain social groups.
Important works re-orientated and reunified approaches which seemed in the past, to be far from one another. Those relating to companies’ societal performance contributed summaries of approaches which had, up until then, been disparate in this field of research. The investigations were structured around precise managerial problem issues such as the operationalization of CSR and the relationship between performance and this latter (Drucker 1984; Gond 2003).

The view according to which CSR participates in a company’s financial performance shows that it has a preponderant role. The only performance objective being to maximize the share value was called into question; the shareholders were no longer considered as the only beneficiaries of the profit, actors carrying out true entrepreneurial functions were also associated with it. This view highlighted the interest in a ‘partner’ approach which took the interests of all the company stakeholders into account (Berles, and Means 1932). The assessment of company performance was apprehended from three angles ‘Triple Bottom Line’: social, the social consequences of the company activity were analysed for all the stakeholders (People); environmental, to ensure there was a compatibility between the company activity and maintaining the ecosystems (planet) and economic; a company has to ensure that it is viable.

Because of its managerial dimension and its conceptual scope, the use of the stakeholder theory in the field of CSR constituted the second marked advance in the 1990s period. According to Déjean, and Gond (2004) "companies therefore seemed to rediscover the necessity of better managing their societal responsibility which could be defined, when first analysed, as more explicitly taking the stakeholders into account in the strategy".

Despite the efforts to summarise this in the 1980s and 1990s, there was still no normative definition that was capable of really defining the CSR concept. A geographic approach
highlighted the fundamental differences between the American and European conceptions. Whereas the first is built on ethical and religious values, the second took its sources from political debates.

### 2.2. American and European approaches: philanthropism versus mercantilism

Like SD, CSR is a large and not very stabilized concept. The numerous theses have been disparate, unclear and even contradictory (Wood 1991; Allouche, Huault, and Schmidt 2004). We made the choice to make comparisons that were likely to show common or differentiating dimensions. Globally two currents of thought emerged from this; the American and the European. Capron and Quairel (2004) concluded that the first consider CSR as a group of philanthropic actions. Bowen (1953), Carroll (1979), Wartick and Cochran (1985), Wood (1991) and Clarkson (1995) are authors who are representative of the American school. In the following summary table, we have highlighted the principal American approaches to CSR with the corresponding definitions.

Contrary to the American positions, the European models recommend that, apart from making profits which is the first responsibility of companies, they can together contribute to achieving social and environmental objectives; this objectives need to be included in the strategic investments (Igalens, and Vicens 2004).

Associating CSR with voluntary participation and with the internal and external stakeholders is one of the discordant points which have been identified by the school that criticizes CSR. According to Gendron (2000), this association gives a great deal of latitude to companies which are unaware of the role of public authority; but it is the State which formalizes arbitration between social actors and see that there is social equity.

In a comparative study carried out in Europe and the United States, Maignan and Ralston (2002) highlight the different significant geographic approaches. Contrary to the United States, French and Dutch companies do not really put forward an image of citizenship in their communication operations. This comes back to the conceptions of the role and the place that
the company has in society in general. In Western Europe, CSR is often reduced to working conditions (The State being responsible for social ‘well-being), whereas in the United States, companies have a moral responsibility towards the community in which they operate (Allouche, Huault, and Schmidt 2004).

As this concerns the implication of American entrepreneurs in CSR, these authors conclude that this implication is strong, long-standing and is clearly founded on the values of shareholders; this is consequently infused in their organisational culture. In France and in Holland, the implication is based on performance criteria.

Therefore the way in which CSR is in the two continents indicates that in the United States it is essentially based on philanthropic programs and voluntary participation; through questions of quality of life, integration and education, the community is the centre of interest. On the other hand, in France and in Holland, actions favouring CSR are certainly orientated towards programs of voluntary participation, but they are also closely linked to productive activities and marketing; these programs concern the stakeholders engaged in productive cycles (quality of products and services in France, health and security of employees in the Netherlands).

According to Gond (2005), in Europe, unlike the USA, CSR is largely assimilated with SD. This semantic and conceptual conciliation attempts to remove a recurrent difficulty which consists in finding a consensual foundation that is likely to provide companies with stable situations for exercising CSR. It is however still the case that despite the fundamental differences in American and European paradigms, the connection presented previously still dominates, that of the *Triple Bottom Line*. This concerns the transposition of the concept of SD to companies.
Human beings, finding themselves at the centre of problem issues concerned with management, ecological preoccupations and globalization are calling for managerial processes to be renewed. The challenges of sustainability require social responsibility that goes beyond legal obligations; this indicates more investment in human capital, respect for the environment and relations with the "stakeholders" (CCE 2001). Whatever the CSR approach, the debate is no longer concerned with its relevance and its importance; it concerns the operating strategies and the role of companies to succeed with it.

In the light of the spatio-temporal analyses of SD and CSR, we have proposed a framework for analysing their emergence; this combines the missing dates, the corresponding socio-political events and the institutional and organisational commitments which resulted from them. This framework is one of the major contributions of this research.

3. A synthetic putting into perspective delimiting the links between the two concepts

The diverse economic crises, the decade of development in the 1960s, the reports of the Brundtland commission, the Rio and Johannesburg summits were some of the major events that marked the emergence of the SD and CSR concepts (table 3). The implication of diverse organizations and governments and more and more in depth works from the scientific communities have marked our conceptual odyssey. From development to sustainable development, it is today necessary to improve human conditions without destroying the ecosystems. From the moral dimension in entrepreneurial decisions to societal performance; CSR is the perfect application for SD in companies.

*The World Business Council for Sustainable Development (WBCSD)* includes CSR in a SD context. This is *the continuous commitment of companies to act correctly from an ethical viewpoint and contribute to economic development, at the same time improving the quality of*
life of its employees and their families, the local community and all of society" (Lavorata, and Pontier 2005). The European Commission on SD agreed with this observation in a paper of July 2002. “In fact CSR is intrinsically connected with the concept of sustainable development”; it is considered as an essential element in SD strategy; for this, the authorities must encourage and ensure that companies include environmental and social preoccupations into their ways of management.

For Dreveton and Krupika (2005), CRS is the means of transferring sustainable development to companies Igalens (2004) totally agrees with this sense. The concept of CSR seems to be simply the application of SD in companies. This implicates the responsibility of a large number of actors; According to Capron and Quairel-Lanoizélée (2004), CSR is an appropriation on the part of the companies of SD logics. Therefore this appropriation, as an expression of SD applied to organisations, is a process of development which implicates combined changes so that this new means of management is totally effective.

Conclusion

SD and CSR are themes which have mobilised many political, economic, social and academic communities. The difficulty of finding a universal definition and delimiting the scope of each of the two concepts often causes the definition of these connections to be unclear and ambiguous. However, thanks to our odyssey, we have been able to further reduce the boundaries between them and show their theoretic and historic association.

CSR is intrinsically connected with the concept of SD. This interaction is one of the keys factors in the capacity of companies to adapt to the challenges of SD. The central hypothesis is that the respect of certain moral and ethical values is indispensible for companies’ sustainable economic development.

The general idea is that this latter integrates social and environmental objectives into its managerial choices. This means that the expectations of all the stakeholders are taken into consideration in the strategic decisions. This necessitates adopting new management models and making a change in the systems of values of organisations. To achieve performance, the two factors, profitability/social responsibility, must be interconnected.

It remains that in order to explain companies’ strategic choices to favour sustainable energy, it is necessary to adopt integrating approaches based on the entrepreneurial theory (Spence, Ben Boubaker-Gherib, and Biwolé 2007); the stakeholder theory (Dontenwille 2005) or the resources approach (Borchani 2004). The stakeholder theory seems to be the most relevant; the influence of diverse actors (internal or external) when adopting responsible and sustainable behaviour, would better explain these strategic choices. Included in an enlarged system thanks to the systematic approach of SD, companies are social organisations whose interactions with neighbouring social groups are intensifying.

Does the history matter?
The role of past links in the emergence of SMEs networks

Abstract
This paper aims at exploring if and under which conditions the need for knowledge exchange within a small firms’ cluster is able to generate a more or less stable structure of links among them. We focus on a specific kind of small firms’ clusters called Industrial Districts (IDs); in particular, we analyze IDs with flexible specialization, in which knowledge exchange is driven by the search for the complementary knowledge assets. Previous works of the authors proposed an agent-based model of IDs to explore which are the properties of networks emerging from firms interaction prompted by the search and exchange of complementary specialized knowledge. This model brought to the conclusion that limited relational capability due to the small size and an exchange mechanism solely based on the barter of complementary knowledge are structural conditions that limit individual firms growth in IDs with flexible specialization. This paper presents a new version of the model to analyze the role of embeddedness of relationships among IDs firms in shaping emergent network structures. The aim of the paper is to answer to the following research questions:
Can knowledge complementariness explain the emergence of a stable network of firms within a SMEs cluster? Which are the structural properties of these networks? Which role the embeddedness of relationships among firms play in shaping the structure of emergent networks?

Key Words: small firms clusters, networks, agent-based simulation, embeddedness

Background
The notion of Industrial District (ID) was introduced by Alfred Marshall in 1919; he identified in the availability of network externalities a crucial factor for the competitiveness of local systems of specialized small and medium enterprises (SMEs). Traditional approaches to the theory of the firm like transaction costs theory (Coase, 1937) have been used to explain IDs functioning and performances (Dei Ottati, 1994), but such economic explanations have been considered unable to provide a full account of the complex nature of the embedded nature of inter-organizational links and processes characterizing small firms clusters (Uzzi, 1996).
By adopting a theoretical perspective influenced by social network theory and complexity science, another stream of literature mostly developed in the ‘80s and ‘90s attributed IDs’ effectiveness to the richness of IDs’ underlying relational systems (Aydalot, 1986; Becattini, 2000; Brusco, 1982; Camagni, 1989; Rullani, 1992).
According to the network approach, ID’s structure is based on a dense and strong network of relationships among autonomous and heterogeneous agents (firms, families, local institutions). The network perspective (Granovetter, 1985; Powell, 1990), though acknowledging the relevance of transaction economics, emphasizes the social and cultural determinants of inter-firms relationships, like the role of informal transactions (Uzzi, 1997), the sharing of norms and culture, reciprocity and trust (Jones et al., 1997). A key characteristic of social networks is that they allow efficient access to knowledge resources for members in the network (Podolny, Page, 1998) as well as the creation of idiosyncratic and valuable knowledge resources thanks to sharing and integration of individual knowledge. In particular, knowledge flows inside district boundaries are recognized as one of major drivers of dynamism of IDs (Basant, 2002). Furthermore, thanks to geographic proximity and the availability of social capital, IDs are privileged loci for tacit knowledge diffusion (Inkpen, Tsang, 2005).

While the network approach has greatly contributed to the understanding of the complexity of knowledge exchange in IDs and its influence on IDs performances, research on small firms networks has mostly assumed the network as a given.

Cowan and Jonard (2004) developed a model to analyze how network topology influences knowledge sharing performances. In this paper we start from Cowan and Jonard’s model but follow the opposite perspective taking also into account the role played by the embeddedness of relationships among firms in the emergence of specific network structures.

Methodology and Main Results

To answer to the above questions we adopted the agent-based simulation (ABS) approach. We present an agent-based model of a vertical ID. In this kind of IDs firms are specialized in one or two small phases of the production process (Piore and Sabel, 1984) and need to establish vertical links in order to build productive chains able to assemble and deliver final products to
the market. In our model, firms population is made up by subgroups of firms with complementary competencies; during each simulation cycle each firm tries to establish a link with partners having complementary competencies with a probability depending on some control parameters including: the number of allowed outgoing links (measuring the relational capability of the agents), the knowledge gap among agents, and the number of past links between two agents (measuring the level of embeddedness). The aim of each firm is to increase the level of its competencies by mutual knowledge transfer with linked partners. During the simulation, competencies levels are decreased at each cycle by a certain percentage determined by an obsolescence rate. Firms can die if they are not able to react to obsolescence by recovering competencies level through partnerships. Different simulative experiments were made in order to analyze the influence on emerging network structures of different levels of embeddedness. In particular we performed three kind of experiments: in the first one the creation of a link between two agents is mainly influenced by the number of past link between them (the past experience); in the second one the creation of a link is mainly influenced by the competencies gap between the agents; finally, in the third one the probability of a link creation is determined at the same time by the past experience and by the level of competencies gap. The first result of simulations is about network stability: for any value of simulation parameters a stable network emerged. With respect to the structure of this network we observed that the network topology obtained in the first and in the second experiment is a quasi-random network. In the third experiment, the structure of emerged network is like an “hubs and spoke” structure. In the final version of the paper we will present more in depth experimental sets and results. We will also discuss additional results concerning the performances of different networks in knowledge accumulation process and the implications of results from the theoretical and also from the policy making point of view.

The Role of Ecopreneurship in the Evolution of Environmental Management

Hien Nguyen* and Kevin Boberg1

Abstract

This paper presents an institutional framework for the existence of ecopreneurs and the institutional change in human behaviors toward protecting the environment. In the evolution of environmental management, within Colby’s five paradigms of environmental management in development, the world economy has passed the frontier economic phase and is most likely in the next phase, the environmental protection paradigm. With the support of advancement in technology and the growth of knowledge fund, ecopreneurs are found to be principally responsible for moving forward to a third stage of the environmental paradigm, Resource Management. Accompanying this will be the formation of new form and evolution of existing institutions.

Keywords: ecopreneur, institutions, institutional approach, ceremonial, instrumental, environmental management, paradigm, technological innovation, knowledge fund, sustainable economic development.

Introduction

Entrepreneurs are key agents and prime movers in economic development. Innovations introduced by entrepreneurs bring new combinations to the economy, such as new products, new methods, new markets, new resources and new organizational forms (Schumpeter 1950 and 1961). As entrepreneurship pervades almost every corner of development (High 2004), entrepreneurs play a critical role in any development process.

Entrepreneurship is driven by individualism with both economic and non-economic motivations. The motivations are greatly influenced by political and social institutions that govern the market process and formulate human behaviors (Glavan 2007). The institutions are formed in a process of natural selection within the limits of the natural environment, technology, and social and cultural values.

Kevin Boberg is Professor of Marketing and Director of NMSU’s Arrowhead Center, College of Business, New Mexico State University. Tel 575-646-1434; email: kboberg@nmsu.edu
(Adkisson 2009; Matutinovic 2007). As asserted by Veblen (1934), the development of institutions represents the development of society and institutions will change with the changing circumstances.

The global economy has evolved through different stages of development. After a long history of ignoring the impact of economic activities on the environment, environmental protection and sustainable economic development are beginning to attract a significant amount of attention from governments, organizations and individuals in every country. Institutions to manage the environment likewise have been created and evolved over time.

Both formal and informal institutions toward environmental protections have been formed and strengthened over years. Formal institutions can count on the formation of environmental agencies with regulations governing environmentally harmful activities. Informal institutions are individuals’ attitudes and increasing awareness toward protecting the environment. Together with technology and biology, these institutions influence the behaviors of entrepreneurs, creating a new form of more responsible entrepreneur: ecopreneurs.

Changes in the behaviors of individuals and entrepreneurs together with the existence of ecopreneurs in the society are analyzed under the framework of institutional change. Different typologies of ecopreneurs identified by Issac (2005) (green and green-green businesses) and Walley and Taylor (2005) (innovative opportunists, visionary champions, ethical mavericks, and ad-hoc enviropreneurs) closely fit the conventional institutional dichotomy, ceremonial and instrumental values. The expansion and promotion of ecopreneurship together with new institutions are formed from the cultural lag between ceremonial and instrumental behaviors in the progress of social changes (Veblen 1934; Bush 1987).

The formation of institutions concerned with environmental protection and the institutional changes in entrepreneurial behaviors greatly influence the progression of environmental management. Identifying levels of environmental concern and protection, Colby (1989) introduces the evolution of five paradigms of environmental management, namely Frontier Economics, Environmental Protection, Resource Management, Eco-Development and Deep Ecology. These paradigms go from extreme ignorance to extreme protection of the environment and can be seen shaping and being shaped by institutions devoted to environmental management in different levels of development.

The world economy has evolved through the first paradigm of Frontier Economics and is most likely in the second level, the Environmental Protection paradigm. Efforts to move to the next level,
Resource Management, have been promoted by governments, organizations and individuals in many countries in the world, especially the industrial countries. At this point in economic development and environmental stewardship, it is hypothesized that the individual – the ecopreneur – will be principally responsible for moving forward to the next stage of the environmental paradigm, Resource Management. Accompanying this will be the formation of new and evolution of existing institutions.

The remainder of the paper will address the issue of ecopreneurship in the following fashion. The first section examines the role of entrepreneurship in economic development. Next, the relationship between entrepreneurship, individualism and institutions is analyzed in the second section. Institutional change framework and the creation of ecopreneurs are discussed afterward. In next section, Colby's paradigms of environmental management with the existence of ecopreneurs are evaluated. Finally, a summary of findings will suggest opportunities for future research.

The Role of Entrepreneurship in Economic Development

The role of entrepreneurs has been studied since the work of Schumpeter (1950 and 1961) who emphasized the importance of innovations and innovators in economic development processes. According to Schumpeter, an entrepreneur is the central innovator and a prime mover in promoting economic development in a society. Innovations of entrepreneurs can be any forms of new combinations, such as new consumer goods, new methods of production or transportation, new markets, new sources of supply, or new forms of industrial organization. From anticipating what consumers need and/or reducing operating and production costs, entrepreneurs produce new consumer goods, and innovate to create and use the available resources and technology most efficiently. Innovational activities of entrepreneurs are the driving force behind economic development of any society.

Entrepreneurship pervades almost every corner of a society, creating incremental innovations that generate substantial cumulative effects over time (High 2004). Entrepreneurial activities permeate the social fabric and can be found practically everywhere, in religion, the military, politics, the arts, economic performance, and “wherever human activity attempts to alter its environment and influence the future” (High p.52). Entrepreneurial ventures are not necessarily small. Indeed, large corporations can be and often are entrepreneurial because of their willingness and capability to innovate (Drucker 1985). However, small entrepreneurial businesses with fewer than 100 employees innovate at a higher per-employee rate than their larger counterparts, especially in higher-technology industries (Malizia and
In addition to the evolutionary innovation, the sum of small innovations exerts long term cumulative effects and is a critical source of economic development.

Entrepreneurship has been perceived as the engine of economic and social development throughout the world (Audretsch et al 2006). The essential role of entrepreneurship in economic development has been increasingly acknowledged since the 1990s. The changing role of entrepreneurs reflects the increasing importance of innovations, especially in technological change and knowledge-based economic activity. Technological improvements and knowledge-based innovations become comparative advantages for developed countries. With the support of information technology and knowledge spillovers, knowledge created in one organization can become commercialized in a new venture locally and globally. Therefore, the cumulative effects of innovations in one country can spill over to other countries, making entrepreneurship a driving force of economic development in both developed and developing nations.

Entrepreneurial activities are most likely associated with improvements in technology. There is no historical record of sustained economic growth without technical change, that is, with no new combination and incremental innovation. New sectors, such as biotechnology, software, bioinformatics, nanotechnology and molecular electronics depend on the innovations of entrepreneurs for their development and survival (Suarez-Villa 2004). So do green technologies. In its dedication to clean technology innovation, Intel has released a plan to invest in eight new solar installations in four states of the US. This project involves in three newly formed sectors, namely biotechnology, molecular electronics and green technology. Entrepreneurs hasten the rate of diffusion of technological and scientific knowledge in the modern world. In return, the rapid diffusion of technological and scientific knowledge will promote innovations and entrepreneurial activities.

**Relationship between Individualism, Entrepreneurship and Institutions**

Individuality is established as societal value in the modern society (Matutinovic 2007). The prominence of individualism has promoted entrepreneurial activities and economic development in almost every developed and developing country. Entrepreneurship is driven by individualism that allows individuals to pursue their goals and derive pride from their own accomplishments. Entrepreneurs are individuals who have innovations and are motivated by self-interest and achievement of personal goals. Entrepreneurs could be inspired by economic and/or non-economic goals.
The majority of entrepreneurs are motivated by economic incentives. The most popular economic motivations that promote entrepreneurship are profits and market powers. In addition to economic motivations, non-economic motivations increasingly influence entrepreneurial activities, illustrated by the increasing number of social entrepreneurs in the society. These entrepreneurs are nonprofit and operate to solve social issues. Such motivations as desire for creativities, solving social issues or protecting environment becomes more and more popular in line with the economic motivations. Increasing number of entrepreneurial businesses is formed from both economic and non-economic incentives of entrepreneurs. These businesses can be formed from the desire of entrepreneurs to overcome poverty and create jobs for their families’ members and/or relatives or to protect the environment. Entrepreneurs with the motivations of protecting the environment are called ecopreneurs and number of ecopreneurs has been growing over years.

Motivations of individuals, whether entrepreneurs or not, are greatly influenced by social and political institutions of society. As suggested by Neale (1988) and adopted by Adkisson (2009), institutions can be identified by the patterns of human activity, the rules that give order to the activities, and the social beliefs or norms that explain both the activities and the rules. Institutions govern socioeconomic systems and regulate interactions between humans in society. Institutions are formed from the combination of different components, such as physical environment, worldview, belief, value, culture, technology and so on. The processes for the formation of institutions are complex and institutions are changing as any of the components change and the society move forward.

Institutions can be formal or informal constraints to human activities (Veciana and Urbano 2008). The formal constraints are governmental or organizational rules and regulations, such as constitutions, laws, economic rules, property rights, and so on. The informal constraints may include values, beliefs, norms, sanctions, taboos, customs, traditions, codes of conducts, habits, and such such. The informal constraints are important in themselves and not simply as appendices to formal institutions (North 1990). These formal and informal institutions regulate and influence activities as well as motivations of individuals, and hence entrepreneurs. The expansion and enhancement of institutions supporting environmental protection have led to the increasing number of ecopreneurs over the world.

Formal institutions to protect the environment are rules and regulations from governmental and organizational agencies concerned with environmental issues. Every country in the world has its own set of rules and regulations to eliminate the impacts of economic activities on the environment, some more numerous and impactful than others. A typical example of the formal institutions is the cap and trade
system with policies that regulate the limit on pollution and depletion of economic activities. In the U.S., the Environmental Protection Agency (EPA) enforces environmental laws and regulations through different acts and guidance, such as Resource Conservation and Recovery Act (RCRA), Toxic Substance Control Act (TSCA), Clean Air Act (CAA), or Code of Federal Regulation (CFR) on Protection of Environment, and so on (www.epa.gov). According to the Global Competitiveness Report 2007-2008, German has the highest rank on overall stringency of environmental regulations, followed by New Zealand, Japan, Singapore and United Kingdom.

Together with green rules and regulations from governmental and organizational agencies, informal institutions whose purpose is protecting the environment have been formed and promoted. Efforts to communicate and educate people on environmental issues by the government, other societal organizations and individuals have led to the increasing awareness of individuals on impacts of human activities on the environment. As a result, other informal institutions, such as individuals’ attitudes, behaviors and habits toward protecting environment and consumers’ preference and expectation toward environmentally-friendly products, become more and more popular. Formal and informal institutions on protecting the environment give rise to the green movement in almost every country in the world.

Individuals, especially entrepreneurs, are actively and intensely engaged in the green movement. To date, ecopreneurs primarily originated in Australia and Europe and have begun to emerge if not flourish in the US in recent years (Allen and Malin 2008). Ecopreneurship in academic discussions has tended to focus on developed countries, such as Australia, New Zealand, EU and US (Issac 2005; de Bruin and Lewis 2005; O’Rourke 2005). Activities of ecopreneurs with the focus on eco-friendly solutions are also promoted in developing countries, such as India, Nepal, Brazil and Mexico (Issac 2005; Pastakia 1998 and 2005; O’Rourke 2005; Kruks-Wisner 2005), a trend which is reflected in academic discussion as well.

Ecopreneurs often take the form of counter-culture or social entrepreneurs. Similar to other “regular” entrepreneurs, ecopreneurs are risk-takers and face the possibility of failure. The differences of these ecopreneurs are their intention to protect environment, their desire to move to more sustainable future path and the overall positive effects of their commercial activities on the environment (Schaper 2005). Although facing higher possibility of failure as the environmental-protection products are relatively more expensive, the green movement on consumer behaviors make ecoprenuerial businesses profitable and number of ecopreneurs increasing over years.

**Institutional Change Framework for the Promotion of Ecopreneurship**

The existence of ecopreneurs results from changes in behavioral patterns and social institutions concerned with and protecting the environment. The current social and individual attitudes and awareness for the environment are the outcomes of the institutional change process that involve interactions and correlation among ceremonially behavioral patterns and instrumentally behavioral patterns. The correlation of these behavioral patterns is the unique function of ceremonial and instrumental values in society. These values link individual’s behaviors and determine the characteristics of the behavior patterns. The process of combining these values and behavior patterns forms institutions in society.

According to Bush (1987), ceremonial values correlate behavior within the institution by “providing the standards of judgment for invidious distinctions, which prescribe status, differential privileges, and master-servant relationships, and warrant the exercise of power by one social class over another”. Instrumental values correlate behavior by “providing the standards of judgment by which tools and skills are employed in the application of evidentially warranted knowledge to the problem-solving processes of the community” (p.1079-1080). A behavior of individual may have either ceremonial or instrumental values. Some ceremonially behavioral patterns may incorporate instrumental behavior and some instrumentally behavioral patterns may incorporate ceremonial behavior.

As other individuals, ecopreneurs incorporate ceremonial and/or instrumental values in their economic activities. Their behavioral patterns and types of business are determined from ceremonial and instrumental values of their motivations. Different typologies of ecopreneurs defined by Issak (2005) and Walley and Taylor (2005) could be used to explain ceremonial and/or instrumental behavioral patterns of the ecopreneurs.

Issak (2005) categorizes ecopreneurs into “green businesses” and “green-green businesses.” A typical “green business” does not have ecological concerns from inception, but instead made a green move as the managers realized the advantages of being green in the marketing strategy. According to Issak, the ideal type of ecopreneur will create “green-green business” with the green intention formed from the start-up. The green businesses, by this definition, are likely to have more ceremonial behaviors in the first place. In the early stage of green movement, the ceremonial behaviors could be prominent as producers want to maximize their profits adding green components to their marketing strategy.
However, this is not the sustainable way of doing businesses, especially in a democratic environment with developed media system. The institutional change in business management toward sustainable development results in more instrumental behaviors from green businesses. The green-green businesses, by definition of Issak, are more likely to have instrumental behaviors and expected to be growing in terms of both quantity and quality.

Walley and Taylor (2005) present four types of ecopreneurs, namely innovative opportunists, visionary champions, ethical mavericks, and ad-hoc enviropreneurs. The first two types are influenced by hard structural drivers, such as government regulation and economic incentives, together with other market-driven and value-driven signals from green consumers. The reactions to government regulations of these ecopreneurs are more likely reflect their ceremonial behaviors. The latter two types are influenced by soft structural drivers, like family and friends, past experiences, personal networks and education. With the objectives of protecting the environment, and the influences of social institutions, these ecopreneurs could have the instrumental behaviors in their business activities. While the innovative opportunists and ad-hoc enviropreneurs are financially oriented, the visionary champions and ethical mavericks focus on sustainability orientation.

Ceremonial values emanate from human nature and ceremonial behavioral patterns are believed to be dominant in every culture (Bush 1987). The dominance of ceremonial behaviors represents the cultural lags of new institutions. The culture lag of individual behavior involves the pass-binding characteristics and the time lag for the adaption of new institutions. The behaviors of ecopreneurs in the early stage of environmental protection may incorporate more ceremonial values than instrumental values. “Green businesses” or “innovative opportunists” and “visionary champions” may be seen more often than “green-green businesses” or “ethical mavericks” and “ad-hoc enviropreneurs” as a result of the cultural lag in individuals’ behaviors.

New patterns of behaviors often start with ceremonial dominance and the level of dominance will increase or decrease in the institutional change process. Institutional change results from a change in the value structure of institutions. The value structure reflects the combination of ceremonial and instrumental values and the change in the value structure of an institution is measured by the index of ceremonial dominance. According to Bush (1987), the index of ceremonial dominance indicates the dominance of ceremonial warranted values over instrumentally warranted values. An increase or decrease in the index of ceremonial dominance represents regressive or progressive institutional change. Progressive institutional change is characterized by the displacement of ceremonial patterns of
behavior by instrumental patterns of behavior. Institutional change does not happen if the index of ceremonial dominance remains unchanged. In other words, institutional behaviors of individual in society will not change if ceremonially warranted patterns of behavior increase at the same rate as instrumentally warranted patterns of behavior.

Changes in value structures in society, therefore, influence ecopreneurs’ behavior. The progressive institutional change on human behaviors toward environmental protection will result in the increasing number of ecopreneurs with instrumentally warranted patterns of behavior. The result will be inverted if a society experiences a regressive institutional change or unchanged institutional behaviors on environmental protection. The current green movement and initiatives in almost every country reflect the decrease in the index of ceremonial dominance or the progressive institutional change on environmental issues. Accordingly, the “green-green businesses” or “ethical mavericks” and “ad-hoc enviropreneurs” will or are gradually beginning to exceed the number of “green businesses” or “innovative opportunists” and “visionary champions”.

Institutional change process combines the interactions of different components having formed institutions. Technological innovations and knowledge fund, the pool of knowledge of and available for individuals in society, are crucial factors in the process of institution change. New patterns of behavior are required to accommodate the diffusion of new technology and the broadening of human knowledge fund (Bush 1987). The current green movement is the outcome of interactions among different factors that promote the recognition on harmful impact of economic activities on the environment, the advancement of technology and the development of knowledge fund.

Technological innovations have always contributed to the scope and intensity of human impacts on the environment (Matutinovic 2007). Technological innovation can originate from any area of social and economic activities and appear more frequently in a culture with high degree of permissiveness in ceremonial practices (Bush 1987). Technological innovations are developed on existing technologies and adapted to the new institutional arrangement. Changes in the trend of technological innovations reflect the change in individual habits of thought and the progressive institutional change. The current trend of technological innovations, once again, indicates the progressive institutional change of social and individual behaviors on the environment.

The advancement of technology enhances the accumulation and expansion of the knowledge fund, a dynamic force for institutional change. The fund of knowledge in embedded in ceremonial and instrumental patterns of behaviors, hence is incorporated in the value structure of society. Incremental
contributions to the knowledge fund come from every corner of human life, eventually influencing institutional value structure and the process of institutional change in society. The high rate of technological innovations and extensive fund of knowledge give rise to the displacement of ceremonial behaviors by instrumental behaviors and advantageous for progressive institutional change. This is the interrelated process. High rate of technology innovations and the growth of the knowledge fund are forces and also outcome of progressive institutional change. Institutional change process, therefore, is happening faster in the modern society.

Technological advancement, as most recently evidenced by and especially the development of the Internet, reinforces the breadth and depth of the knowledge fund in every society. Green movement spreads out almost everywhere, breaking down the barriers of ceremonial values on environmental protection. The existence of ecopreneurs and the development of ecopreneurship toward more instrumental warranted patterns of behaviors reflect the progressive institutional change in value structure of environmental protection. This progressive change happens at all levels (individual, organizational, governmental…) of environmental management. As “institutions are a creation of human beings” (North 1990 p.5) and individual behaviors are central to institutional change, ecopreneurs have been and will be active actors to promote technological innovations and progressive institutional change on environmental management practice.

Colby’s Paradigms of Environmental Management

Environmental management becomes a growing concern of governments and non-governmental organizations as the problems of environmental degradation are more and more obvious. Identifying the level of concern and sense of urgency of the environment management, Colby (1989) introduced the evolution of five paradigms of environmental management in development, namely Frontier Economics, Environmental Protection, Resource Management, Eco-Development and Deep Ecology. The level of environmental protection goes from extremely ignore to extremely protect environment. The five paradigms presented by Colby could be seen as guidelines for environment management in different level of development.

Frontier Economics

The prominent feature of the institutions in the society under the Frontier Economic management paradigm is the social belief in infinite growth and economic prosperity. The Frontier Economics treats nature as an infinite supply of physical resources to be used for human benefits in any
forms that cause pollution and ecological degradation. Natural environment was generally perceived as an inexhaustible source of material inputs to the economic machinery. Economic models, such as the production model, most likely consider only labor, capital, and, in some cases, technology. Natural resources are exploited to maximize the material quality of human life but environmental issues and impact of polluted activities on human standard of living, such as human health and natural amenities, is largely ignored in the paradigm.

**Environmental Protection**

In this Environmental Protection paradigm, the extensive exploration of natural resources has been corrected by different institutionalized regulation implemented most likely in industrial countries. Environmental degradation is largely concerned as the impacts of pollution on human health and endangered species. Environmental Protection Agencies were created to regulate activities that have impacts on environment. Environmental impact statements are required to measure costs and benefits to environment before any development activities begin. Environmental protection in this period involves repairing, setting limits to harmful activity and cleaning up if limits are exceeded. In Colby words, this paradigm is only a modest variation that shows up as added costs on the frontier economics paradigm. Concerns on environment are somehow considered as anti-development.

**Resource Management**

The Resource Management paradigm emphasized the need to increase the efficiency of resource allocation. It is in higher level of environmental protection and conservation compared to Environmental Protection paradigm. In the Resource Management paradigm, sustainable development is promoted with the increasing concerns for the environment. Resource management could be performed through conservation, wise management, technology advancement and policies that integrated economic and ecological principles. In this paradigm, sustainability, especially long-term sustainability of resource use, is seen as necessary constraint for economic development.

**Eco-Development**

The Eco-Development paradigm includes and expands the Resource Management toward the environmental conservation. The dominant imperative in this paradigm is the “green growth” that is based on the information intensiveness, community consciousness and experiential quality of economic activity. The eco-development emphasizes on the ecological relationships among people and nature in communities, among communities sharing same eco-regions, and among eco-regions cooperating to sustain the shared ecosphere of the planet. It makes explicit social, ecological, and economic criteria for
the development and the use of technology, and incorporates many social equity and cultural concerns to the development.

**Deep Ecology**

Frontier Economics and Deep Ecology are two extreme paradigms in the five paradigms of environmental management in development. While Frontier Economics extremely ignores the environment to promote economic growth, Deep Ecology is extremely conservative toward environment with the dominant imperative of anti-growth and constrained harmony with nature. Deep Ecology puts man under nature, and is in favor of “do with enough”. Deep ecologists perceive the idea that technology fixes usually leads to larger, more costly and intractable problems to environment and expect the world to return to pre-industrial, rural lifestyles and standards of living. This paradigm is proposed in paper as a polar opposite of frontier economics but is impossible in practice at the current population levels and rural land degradation.

During the course of socio-economic development, world economy has passed through some of the paradigms mentioned above. Frontier economics was dominant in economic theory and practice before 1960s. Many schools of economic thought had developed during that period to explain economic activities and economic development. The importance of entrepreneurs to economic development has been emphasized and the number of entrepreneurs and entrepreneurial innovations has increased over years. However, the importance of environmental pollution from economic activities was largely ignored in any explanation of economic activities and development in this period. Institutional economists have treated non-economic variables as endogenous factors to explain economic phenomena, but non-economic factors are complicated and hard to measure.

Frontier economics began to weaken in the 1960s. With the additional impacts of population growth, by the end of 1960s, economic development under frontier economics had resulted in serious environmental problems, such as ozone layer depletion, loss of biodiversity and desertification, and global warming, drawing special attentions from government of every countries. The urgency of environmental issues has moved environmental management practice to the next paradigm in development, Environmental Protection. Individual behaviors toward environmental protection in this period mostly incorporate ceremonial characteristics. Entrepreneurs were mostly motivated by profit and their environmental concerns are subject to the institutionalized regulations from governments and governmental agencies.
Toward the last decade of the 20th century, environmental issues drew much greater attention from governments, organizations and individuals in both developing and developed countries. The growth of knowledge fund on environmental issues has led to the change in value structure of society. In addition to the regulations from governmental organizations, informal institutions in favor of environmental protection were largely formed. These institutions have affected social and individual behaviors on environmental issues. Ceremonially warranted patterns of individual and entrepreneurial behaviors start to be displaced by instrumentally warranted patterns of behaviors. Green movement, since then, has been featured by consumers’ behaviors and ecopreneurial innovations toward safe and environmentally benign products and services. However, the progressive institutional change is not large enough to move environmental management to the next level, the Resource Management paradigm.

A prominent feature of the Resource Management paradigm is the emphasis on the efficiency of resource allocation that could be enhance by innovational activities. Similar to the role of entrepreneurs in economic development, ecopreneurs, a primary source of green innovations, will be a leading force for the movement toward Resource Management paradigm of Colby’s environmental management. Technological innovations to energy saving and environmental protection have been promoted by ecopreneurs over the last decade. Technological innovations and the growth of knowledge funds on environmental issues have increased the awareness of individuals on protecting environment and the number of ecopreneurs over years. Ecopreneurs, therefore, are outcomes and also forces of the expansion in knowledge funds and technological innovations, which give rise to the progressive institutional change on environmental protection.

The progressive institutional change as a result of ecopreneurial activities do not limit within a boundary of a country or continent. Technological innovations and the growth of knowledge fund have been spread out to every country in the world. Number of ecopreneurs with instrumental behaviors will continue to increase in every society. The incremental importance of ecopreneurs on environmental protection will be strengthened over years with the progressive change of institutions.

**Conclusion**

The increasing number of ecopreneurs over the past decade is a result of the progressive institutional change of individual behaviors on environmental issues. Ecopreneurs have promoted the growth of fund of knowledge about and contributed to the further progressive change of the institutions.
on environmental protection. As a force for green innovations, ecopreneurs will be principally responsible for moving forward to the next stage of Colby’s environmental paradigm, the Resource Management. The importance of ecopreneurs on environmental protection and therefore sustainable economic development requires more attention from governments and economic development organizations.

This paper focused on the institutional change process and the role of ecopreneurs in the evolution of environmental management. Many other aspects of ecopreneurial and entrepreneurial issues, such as translating creativity into innovation and its diffusion, institutional factors facilitating and inhibiting ecopreneurs, demographic and psychographic influences on ecopreneurship and so on are still uncovered. Further study on ecopreneurship is needed to promote the development of ecopreneurs and the sustainable economic development of society.

Reference

The emergence and growth experienced by many developing countries is associated with the development of some key sectors with strong potential to lead the technological catching-up processes and economic improvement (Malerba 2002). Information and Communication Technology (ICT), especially the software industry, brings to the forefront the enormous potential for catching-up, based mainly upon cost advantages and economic transparency (Soete 2005). The software industry is positively impacting different economic areas around the world by enhancing innovation, facilitating the development of new business models or shifting global capabilities. Over 4 percent of total worldwide employment are related to ICT-specialist occupations (e.g. engineers, software developers, etc.); over 20 percent of worldwide jobs are occupations that use ICT (OECD 2008).

Many developing countries have instituted policies to cater to specialized software sectors and incentivized Multinational Corporations (MNCs) to invest. These policies, for example, income taxes holidays, import duty exceptions, or infrastructure subsidies, are designed to maximize the foreign investment externality technology transfer pay-off (Aitken and Harrison 1999).

Scholars focus on elucidating those externalities and the other positive spillover effects of MNCs flowing to SMEs in emerging sectors. Altenburg (2000) discusses the different types of linkages and spillovers in developing countries and gives some policies to develop and upgrade local SMEs. Alfaro and Rodriguez Clerk (2003) explore the horizontal and vertical integration externalities from MNCs in developing countries. Aitken, Hanson et al. (1997) and
Fosfuri, Motta et al. (2001) found evidence of technological spillovers due to worker’s mobility from Multinationals to local firms. Altenburg also suggests some other spillover-effects not entirely related to technology transfer, such as: Opening or gaining access to new export markets; preparing the field for followers; introducing new management techniques; or developing new ways of inter-firm division of labor. Previous literature reviews highlight the positive effects of an MNC’s investment in emerging and developing countries but there is a lack of evidence about negative effects.

The present discussion paper shows how the multinational software corporations negatively impact the innovation processes of small and medium software development firms in an emerging technological sector.

Between 2000 and 2002 the government of Córdoba, Argentina – spatial location of the research – began a host of new policies designed to attract multinational software development companies, which demanded a number of technical skilled employees that largely exceeded the normal wage, creating negative consequences in the development and operation of the local companies.

The research is composed of 62 local SMEs involved in the IT industry out of a total 170 that were strongly related with software development. The interviews were conducted in the place of business with the owner or a key manager. Data were gathered on the basis of a questionnaire made up of 40 queries (110 questions counting the sub-questions).

The results showed an accelerated rising wage and a massive turnover of the technical skilled employees in the region immediately after the settlement of the first MNCs. This effect is largely justified on the power of the multinationals at the time to attract qualified employees paying wages almost impossible to match by small local companies. Innovation performance meant comparing the SMEs settled before and after the massive entrance of the MNC. Local
SMEs which started their activities before the settlement of the large corporations show an acceptable innovation performance, despite the fact they struggled to afford the accelerated rising wages and massive technical skilled employee turnover. Most young companies, which started after the settlement of the multinationals, could never develop their innovation capabilities and showed a very poor performance in innovation issues.

The results shed light on a number of issues to be considered by local governments when they develop policies aiming at attracting foreign investment, especially when the investment requires qualified or skilled employees. These employees are, on a global scale, considered to be a scarce resource, especially in the case of the software industry. Policies must focus on local SMEs, promoting linkages and cooperation between SMEs and MNCs in order to achieve positive technological spillovers into the region.

The impact of relevance marketing on credit collections within an emerging market micro finance institution (MFI)

Marc Joubert

Abstract

The development and implementation of a marketing campaign aimed at reducing the number of drop off accounts purported to prove that customers incentivised to remain current are less likely to default on their loan repayments than customers not incentivised to remain current. The results of the six month initiative show positive, albeit inconsistent results in reducing the number of drop off accounts.

Introduction

In 2006, Mohammed Yunus was awarded the Nobel Peace Prize, the same year saw MFI’s reach around one hundred and thirty million customers worldwide (Daley-Harris 2007). Lending to the poor has become such big business that it now occupies entire sectors in most, if not all, economies. This alternative financial sector, also called ‘fringe banking’ (Caskey 1994), ‘bootstrap capital’ (Servon 1999) or microcredit has relegated the poor and near-poor ‘to expensive and, in many cases, poorly regulated alternatives' (Drysdale & Keest 2000). For the most part, microcredit operations in many emerging markets are conducted through non-banking institutions or MFI’s. Standard and Poor’s defines an MFI as an organisation ‘providing small loans and financial services to low income and/or financially underserved clients’, and conventional wisdom has held that for many years, MFI’s have had a significant impact on poverty alleviation around the
world (Toye 1993; Yunus 1994; McPherson 1996; Mead & Liedholm 1998; Murdoch 1999; Weber 2002; Zohir and Matin 2004; Bakhtiari 2006; Hietalahti & Linden 2006; Cuong 2007; Mondal 2009). As such, and in particular reference to Africa, Mwenda & Muuka (2004) view MFI’s as becoming more and more ‘critical to Africa’s quest for solutions to the continent’s development challenge’. African MFI’s find themselves in a precarious position where the market is becoming more competitive due to the increased competition from commercial banks like Standard Bank through its Stanbic Bank operation, Deutsche Bank, and Citi Bank and global networks such as ACCION, FINCA, BRAC, ASA, Advans, and MicroCred. This along with the fact that, globally, MFI’s have started moving from predominantly non-profit models to for-profit models (Navajas, Conning, and Gonzalez-Vega 2003; Schreiner 2004), means that MFI’s must find ways of becoming more competitive and relevant if they are to remain sustainable. For the purposes of this paper, sustainability is broadly defined as ‘the ability to cover costs and to continue operations without resorting to gifts, subsidies and debt relief or without keeping depositors savings illiquid’ (De Crombrugghe, Tenikue, and Sureda 2008). The impact of these large financial institutions showing interest in microfinance means an increase in access to credit for the poor and lower income individuals which in turn compounds the challenges faced by MFI’s, such as; access to funding or subsidisation (Pollinger, Outhwaite, and Cordero-Guzman 2007), cost reduction (Caudill, Gropper, and Hartarska 2009), interest rates, regulation, outreach (Johnston, Yeargin, Brundige, and Payne 2006 and Karlan & Zinman 2008), and increased relevance through product diversification (Turvey & Kong 2009).
**Purpose**

Sustainability impacts on and could threaten the very existence of an MFI and in the case of a growing South African MFI concerning itself with the business of micro-lending, the level of non-paying loans is a serious cause for concern that is impacting on the future sustainability of the organisation. The objective of this paper is to analyse the impact of marketing related incentives on customer loan repayment behaviour. The aim is to show that customers incentivised to remain current are less likely to default on their loan repayments than customers not incentivised to remain current in the belief that improved loan repayment will improve the long-term sustainability outlook of the organisation.

**Background and Theory**

Microfinance, specifically micro-credit, operates on two basic levels; either a joint liability level or individual liability level.

Joint liability or group liability is the traditional association when referring to microfinance and ‘is often cited as a key innovation responsible for the expansion of access to credit for the poor in developing countries’ (Giné & Karlan 2008). The original model of collateral free micro-credit began as a group-based initiative through Kaligram Krishi Bank in Bangladesh at the beginning of the twentieth century (Mondal 2002) and has undergone numerous modifications. The original model as conceived by Rabindranath Tagore required the borrower to belong to a group of five individuals, who would guarantee repayment of each loan before being offered a new loan. Subsequent models
have modified the level of group involvement resulting in the formation of villages, associations or centre structures comprising between twenty to forty individuals. These models operate on the premise that the entire group within a specific community are responsible for the loans given to individuals within the group. Based on homogenous matching, this model; where group members ‘have an incentive to screen other clients so that only trustworthy individuals are allowed into the program’ (Giné & Karlan 2009), has proven to work well not only with the poorest of lenders (Vigenina & Kritikos 2004) through its reliance on peer pressure and group monitoring to ensure that individuals repay their loans. The reluctance to default on loan repayment is based either on the principle of ‘shame’ (Karim 2008) or that of ‘lender of last resort’ – from the perspective that defaulters will have no alternative finance options available to them. The group model, as popularised by Grameen Bank, is currently used in developing countries around the world (Dalglieh & Matthews 2009), and shows varying degrees of success; from the sixty three percent repayment rate as highlighted in an Indian study conducted by Deininger and Liu (2009) to the success’ of a ninety five percent repayment in a Bolivian study (Schreiner 2004) to that of Grameen Bank as ‘demonstrated through its 98 percent rate of recovery.’ (Karim 2008)

Individual lending, traditionally the domain of banks and non-banking institutions, has started gaining more favour among MFI’s (Lehner 2008; Giné & Karlan 2009). The major difference in individual lending lies in the need for and use of traditional credit screening methodologies and technologies, the requirement of collateral in some cases and the reliance on some form of individual monitoring by the MFI, with much of the theory in this regard pointing to the critical nature of individual monitoring (Zeitinger 1996; Armendáriz de Aghion & Murdoch 2000; Dellien, Burnett, Gincherman, and Lynch
2005; Gangopadhyay & Lensink 2007; Champagne, Tjossem, Ohman, Pikholz, and Cracknell 2007). Individual lending, where the individual is solely responsible for the repayment of the loan via a loan officer, or by depositing directly into the bank account of the MFI, works on a similar premise to group lending; that of incentivisation and/or fear. Repayment of loans, in most cases, results in ongoing access to additional funds while failure to repay loans results in the sale of any collateral, repossessions or even legal action.

The literature on the analysis between group and individual lending is substantially weighted in favour of group lending, however, that which exists on a comparative basis shows that there is no statistically significant difference in loan repayment when comparing group lending to individual lending (Greif 1994; Giné & Karlan 2009) suggesting that the monitoring differences in group versus individual lending may be unimportant. In fact in a study conducted in Georgia (Vigenina & Kritikos 2004), not only were the findings consistent with the above statement in so far as it found that a combination of individual and group loans should be offered by MFI’s as ‘there is no better design’, the study suggested that individual and group liability offerings should be offered as a product suite as they ‘dovetail the micro-finance movement’. According to the World Bank, the average return on assets (ROA) for group-based models, this includes village banks and solidarity groups, is negative while individual lending shows a positive, albeit small, ROA. Irrespective of the level of operation, customers defaulting on loan repayments, impacts on the sustainability and could potentially result in the eventual closure of an MFI whose core business is credit extension. The literature on loan repayment performance, particularly with regards to payment arrangements and incentives for contractual repayment behaviour, is limited and that which does exist -
showing factors affecting repayment performance - varies greatly in its results (Ahlin & Towsend 2007; Cull, Demirgüç-Kunt, and Murdoch 2006). Non payment is a business risk, with repayment performance relying on the existence of an efficient credit management policy; commencing with a reliable scoring model, to agreements clearly stating the terms of the loan and its repayment through to ongoing regular contact with the individual, irrespective of the level of liability.

The recent global credit crisis resulted in South Africa, a developing country and an emerging market, experiencing its first recession in seventeen years. Commencing in the first quarter, 2009 was characterised by rising unemployment, low imports and exports, and contracting economic activity (Financial Mail, 18 December 2009). This led to an increase in default rates due to the fact that a growing number of customers could not keep up payments on their financial obligations. This despite the fact that, financial trend surveys conducted by the Bureau of Market Research (CFVI Fourth Quarter), a South African research institute involved in socioeconomic research since 1960, showed that customers’ ability to service their debt had improved more than 10 percent during the past twelve months.

The organisation under review is a South African MFI concerning itself with the business of short-term and long-term unsecured micro-lending, a category of financial services to low income customers. The modus operandi of the organisation is to offer individual loans to customers on the basis that they comply with the following minimum criteria:

- Potential customers are required to be South African citizens,
- have a bank account, and
- earn at least R2,000 ($270) per month
In order to validate the above requirements, customers are required to furnish proof of the above criteria by supplying copies of the following documentation, namely;

- Copy of their South African identity document,
- Three consecutive months’ bank statements, and
- Their latest payslip

The above information, along with certain demographic and financial information – as mandated by the National Credit Act, No. 34 of 2005 (NCA) and as regulated by the National Credit Regulator (in terms of NCA Chapter 2, Part A) - allows the MFI to assess affordability and determine whether either a short-term or longer term unsecured loan will be approved and ultimately disbursed to the individual.

Up until October 2009, the organisation had experienced contractual arrears of 26.6 percent of the capital at risk (CAR) averaged over the preceding six months. Given that a credit collections strategy was in place – utilising traditional approaches such as self collection, use of external debt collectors and ultimately the legal system, the business required an intervention that would mitigate the business risk of lower than expected loan repayment rates.

There have been many suggestions on the use of risk reducing initiatives to ensure loan repayments and in so doing ensure the sustainability of MFI’s. Baumann (2004) points to the improved overall organisational cost-efficiency and productivity, Schreiner (2004) suggests the use of predictive scoring models to ‘cut the cost of judging the credit risk of the self-employed poor’, a case study by Hartungi (2007) of BRI village units in South Sulawesi, Indonesia, showed how the use of innovative collateral choices not only made credit an interesting proposition but also served as compensation in the event of any repayment issues. Another suggestion emanates from China where Turvey and Kong (2009) point to the potential of using insurance in the form of crop, weather
and pricing insurance as financial leverage. As a result, the marketing department was approached to develop a marketing initiative that would assist in the drive towards ensuring the ongoing repayment of loans by current customers - current customers being defined as not having defaulted on loan repayments.

If according to the Boone and Kurtz (1998) definition, ‘marketing is the process of planning and executing the conception, pricing, promotion, and distribution of ideas, goods, services, organizations, and events to create and maintain relationships that will satisfy individual and organizational objectives’, then the problem required the marketing department to entice ongoing commitment from current customers toward loan repayment ultimately benefiting all of the MFI’s six groups of stakeholders as highlighted by Schreiner (1998). Figure 1 shows how, according to Pollinger, Outhwaite, and Cordero-Guzman (2007), marketing drives the business model in terms of the volume of potential borrowers that an MFI is able to access and the pool of loans it can develop.

**FIGURE 1:**

**Relationship-Based Financing Schematic for Microfinance Institutions**

From a literature review, there has been much written on the correlation between marketing activities and various aspects of business performance, namely; sales (Jagpal 1981; Tellis & Weiss 1995; Kapil & Shoemaker 2004; Mumel, Hocevar, and
Snoj 2007); profitability (Srinivasan & Anderson 1998; Reid 2003); customer retention (Lewis 2004; Mumel, Hocevar, and Snoj 2007).

In line with the recommendations as outlined in the collaborative global report “From Exclusion to Inclusion through Microfinance”, MFI’s need to recognises that, as an organisation which offer access to financial services, we serve a unique target market requiring innovation in reaching and serving this audience with relevant products and services as suggested by Turvey and Kong (2009) following their study of 400 farm households in Shaanxi Province, China. With this notion in mind and given the lower cost of better retention in comparison to better acquisition (McDonald & Wilson 2002) and in conjunction with the four C’s: Cost, Convenience, Communications and Consumer wants and needs as outlined by Schultz, Tannenbaum, and Lauterborn (1993), the over-arching business strategy of creating a compelling market customer value proposition was applied to improving the quality of life of our customers by offering a relevant and targeted incentive plan as a reward for ongoing contractual repayment behaviour.

**The Analysis**

In order to commence with our investigation, few key issues needed to be answered; firstly, what would constitute a relevant customer offer and secondly, would it be compelling enough to be a value proposition good enough to induce ongoing loan repayment?

An analysis of the customer and their situation, more specifically, an analysis of the customer’s bank statements revealed that a high proportion of existing customers had
at least one insurance policy reflecting on their monthly bank statements. The specifics of the particular insurance policy in each case are unknown; however, information from the Johannesburg Poverty and Livelihood Study (JPLS) showed that ‘the most frequent life changing event was the death of a member of the household or of someone closely related to the household’.

Source: Adapted from the Johannesburg Poverty and Livelihood Study (2008)

As a result and in conjunction with insight from our insurance partner, we developed the idea of offering all contractual customers a microinsurance product in the form of a free R5,000 funeral plan, which in the event of the loan account holder passing away, the remaining family members would receive a benefit a R5,000 towards the funeral of the departed. The offer and its benefits would exist for the entire duration of the loan but would be suspended should the customer fail to make their required monthly loan payment; the benefit would however be reinstated once the loan account was up-to-date. Cohen and McCord (2003) describe microinsurance as ‘a system of protecting poor people against specific shocks using risk pooling in return for regular affordable premium payments proportionate too the likelihood and cost of the risk involved.'
Appropriate delivery mechanisms, procedures, premiums, and the coverage, define microinsurance policies that respond to the limited and variable cash flow of low-income households, and the often unstable economic environment in which they live’. Because financial resources available to the poor are so limited, Roth, McCord, and Liber (2007) comment that ‘poor people can experience great financial disruption when unexpected events befall on them. Even small sums insured can ensure some protection and peace of mind (and dignity) for a poor person’.

In order to validate the hypothesis of customers incentivised to remain current are less likely to default than customers not incentivised to remain current, the following data was collected:

- The total number of current accounts per month, and

- The total number of drop off accounts per month - drop off accounts are defined as current accounts that have defaulted on repayments in the last month.

The data was sourced from account repayment information six months prior to implementation of the marketing initiative. The time period analysed is April 2009 to September 2009, and six months after implementation of the marketing initiative, October 2009 to March 2010. The first analysis looks at identifying the rate of change of drop off accounts before the implementation of the incentive plan while the second analysis identifies the rate of change of drop off accounts after the implementation of the incentive plan. The determination of success or failure of the hypothesis was the outcome of a test of the statistical significance of the difference between the rates of change of drop off accounts pre-implementation and post-implementation.
Analysis of the number of drop off accounts post-implementation versus pre-implementation reveal the following statistics:

- **Month One** – a nine percent *reduction* in drop off accounts against a total base growth of seventeen percent,

- **Month Two** - a thirty-nine percent *increase* in drop off accounts against a total base growth of fourteen percent,

- **Month Three** - a twelve percent *increase* in drop off accounts against a total base growth of seventeen percent,

- **Month Four** - a sixty percent *increase* in drop off accounts against a total base growth of nineteen percent,

- **Month Five** - a two percent *reduction* in drop off accounts against a total base growth of fourteen percent, and

- **Month Six** - a nine percent *increase* in drop off accounts against a total base growth of twelve percent.

The average drop off rate for the six months prior to implementation of the marketing initiative is seven hundred and sixty two accounts while in the six months after the implementation of the marketing initiative, the average drop off rate is one thousand and twenty six accounts – growth of thirty five percent on a total base growth of sixteen percent.

Interestingly, table 2 shows that in a six month comparison reflecting post-implementation versus pre-implementation versus previous year;
• comparing post-implementation to pre-implementation, four of the six months post-implementation show slightly reduced drop off percentages, and

• comparing post-implementation this year (TY) to same period last year (LY), two of the six months post-implementation show reduced drop off percentages.

### TABLE 2:

</tr>
</tbody>
</table>

Analysing the drop off accounts before the implementation of the marketing initiative the results show a 0.0086 change in slope with an average of 0.0375 that has a standard deviation of 0.0077.

The analysis of the drop off accounts after the implementation of the marketing initiative, show a change in slope of 0.0186 with an average of 0.0434 and standard deviation of 0.0167. The difference in the rates of change of drop off accounts pre-implementation and post-implementation are negligible, amounting to a slope of 0.0391 and a mean of 0.3575 which are not statistically significant.
Findings

Following on from the analysis of the performance of the marketing initiative and its impact on the drop off accounts, the findings are inconclusive for the following reasons:

- Insufficient data – six months of data is insufficient in order to prove conclusively whether customers incentivised to remain current are less likely to default than customers not incentivised to remain current, especially when one considers the erratic results of the first four months, in the post-implementation versus pre-implementation comparison, and the relatively consistent positive results of the last two months, namely February and March 2010.

- Timing of the initiative may have been a contributing factor in not being able to prove the hypothesis. The months of December and January are historically bad months for loan repayments, considering that December and January are the Holiday and Back-to-School seasons for most, if not all, of the customers concerned. This period seriously impacts on the ability of individuals to honour their financial commitments which has been further compounded by the recent recession. However, this fact was considered at the inception of the initiative with the view that its implementation would have a positive impact on loan repayments during these notoriously bad repayment months. The significant reduction in December drop offs (TY versus LY) suggests that the customer value proposition is relevant and that the initiative needs more time to prove itself.
**Conclusion**

The paper goes some way towards showing that, despite evidence to suggest that the customers’ outlook is improving post-recession, along with all the measures that this MFI was implementing; there is still huge reluctance on the part of customers to deliver on their financial commitments and that marketing has not yet proven itself as being a significant contributor in the role of inducing commitment to ongoing loan repayments. In terms of the future on issues around arrears and the repayment of loans to MFI’s, there is some literature on how scorecard data could have ‘some predictive power….can flag high-risk cases’ (Schreiner 2004), this information is critical in ensuring that the risks of non-payment are reduced upfront. Ongoing monitoring of loan performance has also been highlighted as an important driver for loan repayment. Further literature exists regarding the performance measures and mechanisms that could be adopted to assist in payment performance; however, most focuses on the “stick approach” with very little emphasis being given to the possibilities of the “carrot approach”.

The impact of offering relevant incentives for the ongoing repayment of loans has not, as yet, been proven at an individual lending level and poses a rather interesting question, as to whether the impacts of targeted and relevant incentivisation would be greater, not just in regard to loan repayments but also in the area of social upliftment, if applied at a group lending level. As with all researched initiatives, many questions persist as to whether these findings will hold in other environments, in other cultures and with other lenders. The implications for practitioner’s intent on using relevant incentive marketing initiatives to encourage ongoing customer loan repayment may yet prove to be significant and as such requires further investigation.

ENTREPRENEURIAL INTENTIONS AT UNIVERSIDAD ICESI

Rodrigo Varela V., Ph.D.¹

Ana Carolina Martinez²

Alba Tatiana Peña³

ABSTRACT

In this article, the Colombian’s results of a cross cultural research in Entrepreneurial Intentions oriented by Gasse and Tremblay, which did cover Canada, France, Tunisia and Colombia are presented and analyzed. A set at perceptions, values, attitudes, were evaluated in the undergraduate student that were taken Entrepreneurship related courses at the Universidad ICESI.

The results are used to evaluate their behavior and performances in relation to the entrepreneurial process and from there some very important ideas are derivate about the educational process that the Universidad ICESI has been implementing.

¹ Rodrigo Varela Villegas, Director, Center for Entrepreneurship Development, Universidad Icesi.Calle 18#122-135.Cali/Colombia. Phone: 57-2-3212002. E- mail: rvarela@icesi.edu.co
² Ana Carolina Martinez, Director for Educational Resources, Center for Entrepreneurship Development Universidad Icesi. acmarti@icesi.edu.co, Phone: (57 2) 3212002
³ Alba Tatiana Peña, Young Researcher, Center for Entrepreneurship Development, Universidad Icesi. atpena@icesi.edu.co, Phone (57 2) 3212002.
1. Introduction

Since 1985 the Center for Entrepreneurship Development of the University Icesi has been implementing entrepreneurial education in different programs: for students at the undergraduate and graduate level; for university professors, secondary teachers, primary teachers; for professionals with several years of experience; for communities with different levels of education; for students from other universities for high school students; for ethnic groups and for groups of women entrepreneurs, among others.

Throughout these years, the Center has been reforming the educational model and has structured an entrepreneurial education model based on entrepreneurship competences developed from: global knowledge, its own experience and research about the entrepreneurial alumni of the Universidad Icesi and of many other Colombian entrepreneurs.

However, in order to increase the understanding of the Colombian population in general and of the student population at the University Icesi in particular, more research is needed to give basis on the one hand, to improve educational processes and on the other to have specific measurements on certain variables that will allow to compare the Colombian results with the results of other countries. That is why the CDEE-ICESI is actively involved in Global Entrepreneurship Monitor research that in 2009 did cover 54 countries under a unified methodology, and also is participating in the research "Entrepreneurial Intention: a cross-cultural study of University Students in four countries", oriented at Laval university by Gasse and Tremblay.
This article presents the results obtained with students of the University Icesi and in a subsequent article we will present the comparison with students in Canada, Tunisia and France. The basic idea of this research is to extend it to other groups: graduate students at Icesi, other groups of Colombian university and other university groups in Latin America, so that we can make better comparisons between our countries and universities and also generate new educational activities to improve entrepreneurial education in Latin America.

2. Basic ideas

The GEM model (GERA, 2009) stratifies the entrepreneurial process in four very distinct sections as shown in Figure No. 1

![Figure No. 1 - MODELO GEM](image)

Potential entrepreneur is someone who has not yet started his/her company, but is willing to do it. At this stage it is important to review their attitudes, particularly its intention to start the company, which is very much defined by: their perceptions about the existence of business opportunities, their personal ability to carry out it, their motivation to undertake the business process, their personal and professional aspirations, their fear of failure, the acceptance that the society gives to the entrepreneurial activity.
Varela (2008), complementing the ideas proposed by Albert Shapiro, considered that the entrepreneurial process that has to happen to transform a non-entrepreneur in an entrepreneur has six stages which are presented in Table No. 1.

**Table No. 1 - Entrepreneurial Process Stages**

<table>

</tr>
</tbody>
</table>

Obviously one of the big questions that come up, especially for the population receiving entrepreneurial education is what the level of attrition at the various stages is. It is known empirically that "many people" want to have their own company and “several” did not get to have it at all.

It is not possible to have an enterprise, and therefore be an entrepreneur, if he (she) does not ever had the desire to be one, so the "Taste" or "Intent" or "Planned behavior and reasoned action" are necessary but not sufficient conditions to achieve the dream and the entrepreneurial vision proposed by Filion (1991).

Gasse and Tremblay made a detailed research about studies that have been focused on the "Entrepreneurial Intention" of college students (Audet, 2004; Boissin, Emin 2006; Kolvereid, 1996; Tkach, Kolvereid 1999, Filion, L'Heureux, Kadji - Youleua, Bellavence, 2002). Also reviewed the theory of reasoned action and planned behavior of Ajzen (1991)
and studies based on it (Shapero, Sokol, 1982; Davidsson, 1995b, Krueger 1993, Krueger and Carsrud, 1994, Krueger, Reilly and Carsrud, 2000; Reitan, 1996)....

Shapiro and Sokol (1982) clearly showed that becoming an entrepreneur requires a change in life style and there are two basic perceptions to define the change on life style: the perception of desirability and the perception of feasibility. Both are affected by the culture that has the potential entrepreneur, or in other term their values, beliefs, attitudes, skills, abilities, knowledge, ways of acting, etc. (We call them in the Icesi’s entrepreneurial educational model, the Entrepreneurial Competences).

With all these basic elements, Gasse and Tremblay, developed a conceptual model, which enrich Shapiro’s is one, keeping the idea that the business process is a multivariable process affected by "Desirability" and "Feasibility", but adding a third element that they called "Creation", which relates to the accumulation of resources that allow the entrepreneur to transform a dream in a real and operating enterprise. Table No. 2 integrates Tremblay and Gasse conceptual model with Varela’s model.

Figure No. 2 presents Gasse Tremblay’s Model (2009), which indicates the complexity of the interactions between the variables and the difficulty that exists in a formal educational process to meet for each student and for each situation all these variables. Tremblay and Gasse clearly indicate that this model is designed to facilitate the understanding of the problem and not to predict entrepreneurial actions.

Figure No. 2 Gasse-Tremblay Model
Varela, (2008), presents 21 elements or component of the Entrepreneurial Spirit, which largely coincide with those Gasse Tremblay proposed as elements; and on the other side the 13 entrepreneurial competences of Varela and Bedoya (2006), also agree with many of the elements of Gasse – Tremblay.

Gibbs Dyer. (1994) developed an interesting model on entrepreneurial careers, and identifying four basic categories: career selection, career socialization, career orientation and career advancement. Varela and Bedoya (2006), adjusted Dyer Gibbs model and formulated a set of specific variables, within that model, in which there are several variables that indicate the role of the cultural development experiences, in the personal entrepreneurial process, that the potential entrepreneur has to follow.

3. Research Design

Gasse and Tremblay, based on their model and all the bibliographical research, described in the previous section, developed a questionnaire to measure in university students basic ideas on: Entrepreneurship and on perceptions about the desirability and the feasibility of the entrepreneurial event, with the idea that through them it is possible to measure the intention of students to behave entrepreneurial.

The questionnaire was translated into Spanish in the CDEE-Icesi, making some adjustments that were considered necessary to the application environment and also to
measure some special aspects which were considered important for the Universidad Icesi’s educational process.

The questionnaire was applied to students who were taking any one of the following courses: Entrepreneurship, Business Opportunity, Business Plan, Business Plan for Technology Based Enterprises, in the first semester 2009. These students are generally between the sixth and the ninth semester in their various academic programs, and all of them, with the exception of Business Administration students, were taking their first required course in Entrepreneurship. In the case of Business Administration, and Business Opportunity is the fourth course in the sequence Business Plan is the fifth course in the entrepreneurship sequence. The vast majority of students are day students, whose main function is the university life, whereas students in the Business Administration night program are full time employees.

The answer to the questionnaire was voluntary. From a total of 212 students enrolled in these courses (108 women and 104 men) a total of 121 students (64 women and 57 men) filled the questionnaire completely. The questionnaire contains questions specifically aimed at:

• Demographic aspects: age, gender, program, level of progress in the curriculum, professional experience, business background and existence of entrepreneur in the family.

• Entrepreneurship: in terms of how they understand and measure it; where they consider it could be developed; the support the University gives them; the social stimuli, etc.

• Enterprise features: in terms of characteristics, attitudes, motivations, values, beliefs.
• Intentions to create new enterprises in the short, medium and long term. In the Colombian survey it was included the option "Never", because it was considered very important to measure the number of students that does not consider the option of creating an enterprise as part of their professional action
• Entrepreneurial Experience: To identify actions related to the creation of enterprises at any stage during their life.
• Desirability in terms of their careers development: type of work, risk orientations, desired social and professional status.
• Feasibility in terms of the factors making feasible to go ahead with the business.

4. Results

4.1 Demographic aspects

Table No. 3 presents the demographic aspects. The data on age, gender, program, semester and year of graduation are data that simply characterize the sample. The gender distribution is fairly representative of the overall composition in these programs at these levels of development.

It’s important to observe that 81.6% of students have had work experience, mostly part-time. There should also be noted that 59.5% of the students mentioned that in their immediate family there are entrepreneurs, and this should reinforce the commitment of the University ICESI to support entrepreneurial education and in providing training in management of family businesses, because all these young people will end up attached to those family enterprises.
4.2 Beliefs and perceptions

One of the basic aspects of the research was to learn how students perceive certain concepts and phrases used in the academic world. Table # 4 presents the students' understanding about the concept of Entrepreneurship. This was a multiple response question and hence the sum of the percentages exceeds 100%.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
These results indicate that in the development of the concepts of Entrepreneurship / Intrapreneurship the university has been able to seed the ideas quite well, but that additional efforts are needed in the area of enterprise development and social entrepreneurs.

</table>

As shown by table No. 5 it is clear that the goal of eliminating some myths about the entrepreneurial process has been reached.

In relation to the perception of social support and the encouragement that society provides to the person involved in the creation of new business 19.9% of students believe that the support is in the high and very high levels, 58.7% in the average levels and 21.5% at low and very low levels. This perception is a very positive factor that, undoubtedly, will encourage them to undertake their entrepreneurial careers.
The theme of acceptance of entrepreneur failure by the Colombian society, indicates that only 8.4% believe that society tolerates very high and high failure levels, 37.5% tolerates failure at medium level and 54.2% tolerate failure at low and very low levels. It is necessary to think of ways to alleviate this perception of the Colombian society which is not prepared to accept entrepreneurial failure, which everybody knows that it is a normal part of the entrepreneurial process. This perception is very unfavorable for the entrepreneurial actions.

In relation to the place where they could apply entrepreneurship 89.3% considered the private sector, 77.7% the public sector and 87.6% the non-profit organizations. From these results it’s clear that entrepreneurship in the social sector has been well seeded in the students. It is important to note the high value the students gave to the application of Entrepreneurship in the public sector, which should be required to think of specialized courses in this subject and deeper orientation to the development of civic entrepreneur.

### 4.3 Personal characteristics

Table No. 6 present some attitudinal characteristics and values of the students. The fact that most of the students' responses are positive, clearly indicates that the educational
process (family, social, and civic) has been able to get to them the attitudes and values that are necessary for business creation.

Table No. 7 shows on a Likaert scale ranging from totally agree (Position 1) to strongly disagree (Position 7) the results of self-assessments of students on various aspects of entrepreneurial attitudes.

Table No. 6 - Attitudes and values

</tr>
</tbody>
</table>

Again, in all the behaviors that encourage the processes of new business creation there is a strong tendency for students to show their agreement with this behavior, which means that to the system (family, society, academia) intention to develop an entrepreneurial culture would seem to be fulfilling its positive role in this regard.

4.4 Feasibility Conditions For The Creation Of New Business Enterprises
Table No. 8 shows the importance that students assign to the main barriers to the creation of new enterprise. Again, the results show that a positive perception has been created through the training process. None of the traditional barriers is described as real to most people. It is very important to observe the effect that the educational process for developing the ability to generate business opportunities has produced because it has the lowest rating. It is necessary to make additional efforts to provide more financing options to achieve a reduction in the negative perception of this variable.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Complex procedures</td>
<td>20.7%</td>
</tr>
<tr>
<td>Economic conditions</td>
<td>28.9%</td>
</tr>
</tbody>
</table>

Again one feels that there is good understanding on the fundamental factors for entrepreneurship development: innovation, access to resources, motivation, education system, personal characteristics, and support system.

Interestingly, to the notion of feasibility, is the fact that 78.4% of students believe that if they need resources to start their new business, their family would be supporting them in the entrepreneurial process. In summary it seems that the notion of feasibility is well grounded in the students.

4.5 Desirability conditions for the creation of new enterprises
In the analysis of the desirability is necessary to associate this concept with the entrepreneurial career plans of the students. It is important to note that 68.6% of students would like to develop their career in a large company, 41.3% in a small business, 6.6% in the public sector and 5% in the non for profit sector. This result shows a strong orientation to the private sector, but also indicates that the effort that has been done in the courses to show the importance and opportunities of the SME sector, have begun to show its positive effect. The low interest of the students with both the public and the social sector is something that worries.

Table No. 10 presents the motivations of students when creating their own enterprise to become self-employed.

<table>
<thead>
<tr>
<th>Motivation</th>

<td>76.0%</td>
</tr>
<tr>
<td>Becoming my own boss</td>
<td>42.1%</td>
</tr>
<tr>
<td>Making money</td>
<td>35.5%</td>
</tr>
</tbody>
</table>

The results are quite interesting as it clearly shows the possibility that many of the companies that they will create over their life will be more "opportunity oriented" than other styles (Necessity, hobby, rejection of the system, etc.). These results indicates also that they are looking for personal fulfillment. These results maybe the effect of the emphasis that has been done in the Business Career Plan and in the Vision of an Entrepreneurial Career along the courses.
Table No. 11 shows the effect of work experience in the intention to pursue an entrepreneurial career. It is perceived again that the work experiences have helped them to shape their entrepreneurship career plans, and this should lead to strengthening the educational process designed to find positive and negative factors of employment and entrepreneurial careers.

It can be concluded that the perception of desirability is well grounded in the goals of the Icesi’s students.

4.6 Intention to create a new business

One of the main objectives of this research was to measure the time span in which the students plan to create a new enterprise. Table No. 12 presents the basic results.

It is interesting to note that only 2.8% of students considered that they will never be involved in the creation of a new business and a very high number of them plan to start their new business relatively quickly. It is expected that with the support of the Start-Upcafe, these intentions will increase and that many students actually create their company during university and / or a few years after their will get their undergraduate degree.

As shown in Table 13, each program has its own specific situation. For example the Business Administration Program (Night), where the people is already full time employee or independent, consider that 64.3% will start new enterprises as they are doing their studies, the highest value in all groups, maybe because they had more experience, more age, more business knowledge. However is the second group in terms of the percentage of students that will never create its own business.

The intentions by gender are presented in Table 14. It reconfirms the data from GEM Colombia (2009) that the propensity towards entrepreneurship of men is higher than women. It is interesting that in the range "during my study" the proportion of men is almost twice as women. This result proves again that it is necessary to investigate deeply what is happening with the woman and what is needed to motivate women toward entrepreneurship.

It is important to note that 60.8% of the students have been involved in the process of creating new organization, either within or outside the university during their studies. These processes may have come from their own initiative, or from group projects, or from university organizational activities. The "Competencia Empresarial" which takes place at various levels, is an element that will help all students to live a real business experience while they are students. This process also indicates that the students are living entrepreneurship along it’s the academic process.

4.7 Educational Aspects
Another interesting aspect of this research is to analyze the extent to which learning activities used in the University have influenced the intent and the vision of their entrepreneurial career. Table No. 15 presents the results.

Interestingly, most of the elements of the courses are quite well assessed, in the sense of considering that they had very positive effects. Virtually all elements receive more than 60% of highly favorable reviews except for "opinions of “classmates”, "just exercise", "readings and workshops". The only one who receives more than 10% in the range negative / very negative is "just exercise." These results invite to revise our teaching practices and to devote more effort to those that are actually producing positive effects to the students.

5. **Conclusions and Recommendations**

This approach to the perceptions of students on various phases of the business process has allowed deriving some conclusions and recommendations:

1. The possibility of integrating various models that explain the multivariate entrepreneurship process and the entrepreneurial training, not only to better understand the variables and factors, but also to study results of academic processes conducted with university students.

2. The research being conducted in various countries can allow the research to identify differences among various groups, cultural, educational processes, economic and political situations.

3. The questionnaire developed by Gasse and Tremblay, and adjusted by the CDEE, requires improvements in order to clarify certain variables such as: measuring intentionality periods of Entrepreneurship, business and labor history of the student, the training received on the business and entrepreneurship academic areas.

4. It is necessary to continue doing this research with various promotions, so that the effect of adjustments to the curricular and extracurricular activities can be measure.

5. This research should be expanded to more Latin American universities to enrich the knowledge of our students and to better align the programs.

6. One highlight in this study is the high percentage of students whose families have business and this should encourage research into the training processes for the development of entrepreneurial family and the strengthening of programs for Family Business Management.
7. It was very satisfactory to know, that many of the ideas, beliefs, perceptions and values that the University Icesi has sought to build in their students have been accepted by them and that some negative myths about the entrepreneurial process have been reduced.

8. The great paradox of the research was to identify the contradiction in our society, which on one hand stimulates the process of new enterprise creation, but on the other is unwilling to accept entrepreneurial failure.

9. A significant change was found because many students show acceptance of the SME sector not only to implement entrepreneurship, but also to work on it. This learning process should be fortified with curricular and extracurricular activities.

10. Self-evaluation of performance made by the students indicates that the system to develop an entrepreneurial culture, made: by the family, society and academia, is fulfilling the role of strengthening the performance processes that favor entrepreneurship.

11. Perceptions of feasibility and desirability are been achieved with our students.

12. The intention towards the creation of companies is high and only 2.8% think that they will never undertakes the process. This is a great achievement of entrepreneurial education.

13. There are significant differences between men and women in terms of their propensity to start new business. This difference needs to be studied in detail and requires actions aimed to achieving equity.
14. There are teaching practices that are recognized by students as useful for the definition of their entrepreneurial careers. That must be taken into account to improve educational processes.

The process of successional transmission in family business revisited through Nonaka and Takeuchi. The case of French SME

Principal Topic and Research Question

Succession is a dynamic stage of firms’ organizational change. Beyond the mere event materialized by the break induced by the departure of a former leader and the arrival of a new one, succession can also be analyzed as a change process. Several researchers attempted to understand and model this process. The first research studies in this field adopted an approach based on the life-cycle concept (Barnes and Hershon, 1976; Holland and Boulton, 1984; Holland and Olivier, 1992; Gersick et al., 1997) in order to build models representing actors’ role playing (Handler, 1989). Their major contribution is the identification of the two main components of the succession process: family and entrepreneurship. They also contributed to shed the light on the double character of succession: management transfer and property transfer (Handler, 1990; Hugron and Dumas, 1993). There seems to be a consensus on the fact that succession is a dynamic process during which the roles of both major actors (the assignor and the acquirer) evolve in an intertwined way (Handler, 1990; Hugron and Dumas, 1993). This process has two main centers of gravity: power (Churchill and Hatten, 1987; Handler, 1990; Hugron, 1993) and property (Ambrose, 1983; Churchill and Hatten, 1987; Dunn, 1999; Morris et al., 1997).
The first research studies about the succession process date from the fifties (Christensen, 1953). Since then, it’s only in 1975 that the first attempts to model this phenomenon was carried out, with Hershon’s works. This author contributed to the existing theory by emphasizing the problems related to each kind of transmission: psychological problems (power transfer), organizational ones (leadership). Today, research studies rather focus on the factors affecting succession (Cadieux, 2007; Venter et al., 2005; Jess et al, 2008), the impact of harmony and continuity (Lambrecht and Lievens, 2008), family orientation (Lumpkin et al, 2008), family emotions (Astrachant and Jaskiewicz, 2008), the role of evolutionary psychology (Nicholson (2008), as well as trust (Miller and Miller, 2006).

Four key stages characterize the succession process (Barnes and Hershon, 1976; Longenecker and Schoen, 1978; Churchill and Hatten, 1987; Handler, 1990; Hugron and Dumas, 1993): initiation, integration, conjoint reign, and withdrawal. The success of this process requires a knowledge transfer from the predecessor to the successor. In this perspective, some works have been pointed out: Distlberg and Sorenson (2009) dealing with the impact of resources and the succession system dynamics, Salvato and Melin (2008) with value creation and social capital in family businesses, Denoble et al. (2007) about the Ressource based view approach of the family business, those of Chirico and Salavato on knowledge integration, and of course Bierly and Daly (2008), Julien (2009), Sutter and Stongh (2009).

This research study is an attempt to redefine the succession transmission process and its different stages from the perspective of Nonaka and Takeuchi (1995) by identifying the resources and notably knowledge as a key variable of the analysis.
Methodology

Twenty semi-directive interviews have been carried out within French familial SMEs whose first transfer has been successful. These interviews mainly dealt with the social, cultural, and economic factors affecting the transmission process. We focused on the exchanges between the predecessor and the successor during the transmission. The content of the interviews has been coded and analyzed with Nvivo 8.

Contributions

This research study lays emphasis on a new definition of the different stages of the succession process in family businesses. Three main stages have been highlighted: pre-transmission, transmission and post-transmission. Revisiting Nonaka and Takeuchi’s model helped understand the specificities of each stage: the first one depends clearly on socialization, the second stage is an iterative process between externalization and combination and the last stage deals mainly with internalization. Two levels of analysis are taken into account during the analysis: the individual level, and the system level of the group. Succession time is also a central variable to this analysis. A process integrating three stages and two levels of analysis is presented as a conclusion.
Innovation Capacity and Developed Innovation Types in Small Enterprises
by Helena Forsman and Hannu Rantanen

This paper focuses on innovation development in small enterprises. It explores what are the factors of innovation capacity that predict the development of radical and incremental innovations in small enterprises. The empirical evidence is based on data gathered through an email questionnaire, which yielded 708 qualified responses from the representatives of Finnish small enterprises with fewer than 50 employees. The findings of this study provide two contributions to academic literature. First, the importance of innovation capacity as predictive factor of innovation development in small enterprises is reported in relation to different innovation types. Second, the results establish that the model consisting of innovation capacity and contextual variables explains reasonably well the variability regarding developed radical innovation types but it does not explain the variability regarding developed incremental innovation types.

Introduction
It has been recognized in many countries that small business is an important contributor to gross domestic product (GDP) and employment. It is therefore logical that serious efforts have to be directed towards improving the competitiveness of small enterprises, innovations acting as one driver of it. Therefore, it is needed to enhance our knowledge on the relationship between innovation capacity and innovation development in the context of small business. This paper aims to contribute to the above challenge by exploring the factors of innovation capacity that have influence on the development of certain types of innovations in small enterprises.

Innovation types developed by small enterprises have been examined in current literature resting on two main typologies. Maybe the most studied typology is the distinction between incremental and radical innovations. Enterprises developing incremental innovations often pursue to enhance processes, make operations more effective, improve the quality and decrease costs (Dewar and Dutton, 1986). Correspondingly, radical innovations are completely new offerings characterized by discontinuity in technology and the market (Garcia and Calantone, 2002). Another common typology is the distinction between product and process innovations (Damanpour and Gopalakrishnan, 2001). Product innovation represents changes in end products while process innovation represents changes in methods and procedures how enterprises are producing products and services (Dibrell et al., 2008). Instead, the distinction between product and service innovations is not clear. Service innovations developed by the enterprises of the service sector are considered to be similar to the product innovations developed by the enterprises of the manufacturing sector. On the other hand, the dividing line between manufacturing and services may be blurry. Today’s customers are increasingly seeking solutions to which manufactured products are accompanied by services and vice versa (cf. McAdam et al. 2004; Miles 2000).

In order to accelerate the development of innovations in enterprises, two interconnected terms emerge from existing literature: innovation capacity and innovation capabilities. Szeto (2000) defines innovation capacity as a continuous improvement of capabilities and resources that an
enterprise possesses to explore and exploit opportunities for developing new innovations. Amit and Schoemaker (1993) distinguish capabilities from resources by defining that resources are the stocks of available factors that are owned by an organization while capabilities refer to the ability of an organization to combine efficiently its resources for achieving its objectives. Thus, capabilities are an intermediate transforming ability between resources and objectives (cf. Dutta et al., 2005).

There are a number of studies in literature that examine developed innovation types and innovation capacity in the context of small business (e.g. Avermaete et al. 2003; de Jong and Marsili, 2006; Forsman, 2009; Hernández-Espallardo and Delgado-Ballester, 2009). However, relatively little work has been published on the relationship between innovation capacity and developed innovation types in the smallest enterprises. The purpose of this paper is to identify the sources of influence that have impact on developed innovation types in small enterprises. This will be done by examining the relationship between innovation capacity and the developed product, service and process/method innovations, divided further into radical and incremental innovations. In addition, the relationship between contextual factors and the types of developed innovations will be examined. The empirical evidence is based on an email questionnaire which yielded 708 qualified responses from the representatives of small enterprises with fewer than 50 employees.

The rest of the paper is structured in the following manner. In the next section the theoretical assumptions and hypotheses are introduced. Subsequently, the methodology is presented followed by the findings. In the final section the findings are discussed and the implications for future research are provided.

**Theoretical Assumptions**

**Contextual factors and innovation development**

In literature some contextual factors have been identified as having an influence on innovation development in enterprises. One common contextual factor is the size of an enterprise. When comparing innovation development between small and large enterprises, small enterprises have been found to be more innovative due to their flexibility, higher ability to adapt and improve, and because they are quick movers in implementing change (e.g. Cohen and Klepper, 1996; White et al., 1988). Correspondingly, poor opportunity identification practices, limited capabilities, difficulties to measure the business impact of development work and difficulties in networking are seen as challenges for small enterprises. (e.g. Forsman, 2009; Hannula and Rantanen, 2000; Scozzi et al., 2005). Despite the above characteristics of small enterprises as innovators, researchers have introduced conflicting results about common innovation types developed by small enterprises. Damanpour and Wischnievsky (2006) found that the generation of radical innovations will be nearest to young and small enterprises while the adoption of innovations and the development of incremental innovations will be the most prevalent in large, established enterprises. de Jong and Marsili (2006) examined innovations in small enterprises with fewer than 100 employees and found that process innovation is more widespread in small enterprises than product innovation. Contrary to this, Avermaete et al. (2003) did not find differences between product and process innovations among the micro and small enterprises of the food industry.

Along with enterprise size, Hernández-Espallardo and Delgado-Ballester (2009) pay attention to the influence of the industrial sector on innovation development. They suggest that the high pressure of competition (cf. Porter 1980) on small enterprises would be a motivator for developing
product innovations. Also Pavitt (1984) highlights that the industrial sector affects innovation development in enterprises. He distinguishes three sectoral patterns based on the sources of technology, the requirements and price sensitivity of users and the possibilities for appropriation. Pavitt (1984) argues that the enterprises of low and medium-technology sectors commonly adapt externally acquired technology and make it function in a new environment while innovation generation is more common to the enterprises of the high-technology sector. This is somehow supported by Kirner et al. (2009) who found that low-technology enterprises perform more weakly as regards product innovations and product-related services, but they are able to innovate their production processes at least as efficiently as medium and high-technology enterprises.

Innovation in the service sector is a younger research field than innovation in the manufacturing sector. Pavitt (1984) classifies service enterprises as a whole into supplier dominated sectors characterized by low-technology intensity. This is in line with Miles (2000) who explains that innovations in the service sector are incremental in nature due to the fact that they are consumed in the point of production. Contrary to this, Miozzo and Soete (2001) suggest to service enterprises a similar taxonomy with the one introduced by Pavitt (1984) to manufacturing enterprises. They identified three main service sectors based on the degree of in-house R&D, capabilities and the utilization of technology. This is supported by de Jong and Marsili (2006) who highlight that common diversity patterns in service enterprises are as broad as in manufacturing enterprises. Finally, Cohen and Klepper (1996) remind us about the commonly observed evolution: when industries mature, enterprises tend to emphasize more incremental and process innovations.

On the premise of the above it is hypothesized regarding contextual variables that:

\[ H1a: \text{ The size of enterprise will be related to innovation development in small enterprises.} \]
\[ H1b: \text{ Industrial sector will be related to innovation development in small enterprises.} \]
\[ H1c: \text{ Knowledge-technology intensity will be related to innovation development in small enterprises.} \]

**Capacity for developing innovations**

Innovation capacity has often been equated with the formal R&D activities of enterprises (Kirner et al., 2009) suggesting that higher inputs into R&D reflect more active innovation development in enterprises. Literature on small business management introduces conflicting results about the relationship between innovation development and formal R&D. It points out that innovations are not necessarily results of formal R&D, but rather results of daily business development, customer collaboration or optimization of processes (Hirsch-Kreinsen, 2008). This view is supported by de Jong and Marsili (2006) who identified that only around one third of small enterprises write down a formal plan for innovation and half of the enterprises reserve a budget for innovation. According to Santamaria et al. (2009), innovation often involves informal R&D activities such as experimentation, learning, evaluation and adaptation of technologies. This could result in difficulties in distinguishing innovation development from other business activities, especially in small enterprises in which the development work is integrated into their daily business (Forsman, 2009). On the contrary, Turner et al. (2009) argue that there are no differences between the percentages of revenues spent on projects reflecting the innovation activities of enterprises. According to them, smaller enterprises seem to undertake smaller projects.
Capabilities have been introduced as the transforming ability between R&D investments and innovation objectives (Amit and Schoemaker, 1993; Dutta et al., 2005). The question, ‘What are the capabilities that predict innovation success?’ has been widely studied in literature resulting in a variety of findings. It is a well-established empirical fact that the accumulation of existing knowledge plays an important role in innovation. With a low level of existing knowledge, an enterprise is not able to internalize and exploit the external knowledge. Absorptive capacity is a commonly used concept to describe the ability of an enterprise to recognize the value of new external knowledge, to assimilate it and to apply it to commercial ends (Cohen and Levinthal, 1990; Zahra and George, 2002). Resting on the concept of absorptive capacity, Branzei and Vertinsky (2006) have described it as a basis of dynamic capabilities for product innovations in small and medium size enterprises. This is supported by Teece et al. (2007), who define that the dynamic capabilities of enterprise consist of sensing and shaping new opportunities, seizing opportunities, and orchestrating and reconfiguring the intangible and tangible assets of the enterprise for maintaining its competitiveness.

In addition to dynamic capabilities, literature provides a number of research results about the capabilities or mixes of them that are needed to develop some particular innovation type. Capabilities needed to generate radical innovations have been studied by several researchers while the capabilities needed for developing incremental innovations have received less attention. Market and customer knowledge has been found to be in a key role for developing radical innovations (e.g. Danneels, 2002). Herrmann et al. (2007) add that transformation capabilities, risk-propensity and customer orientation are essential for the development of innovations which are radical in nature. Generally, researchers have found that the development of radical innovations demands the disruption of existing capabilities or the creation of new capabilities while incremental innovation development requires enhancements of existing capabilities (e.g. Ellonen et al., 2009; Forsman and Annala, 2010). Finally, inter-organizational collaboration and networking have been introduced as important innovation catalysts. Thus, Gruenberg-Bochard and Kreis-Hoyer (2009) stress interaction-oriented capabilities for ensuring success in innovation development. To be able to take advantage of networking, enterprises need to be relationship-oriented. Relationship orientation refers to the proactive creation, development and maintenance of relationships with customers, suppliers and other parties of business (Harker, 1999).

It has been suggested that enterprises should engage in collaborative networks to increase their opportunities for innovation development, resource acquisition and capability creation (Caniëls and Romijn, 2005; Powell et al., 1996). Szeto (2000) argues that innovation capacity can be incrementally or radically increased through participation in activities which trigger the supply of innovation resources in an interactive environment. On the other hand, it has been argued that especially small enterprises which are commonly at the periphery of production chains, have encountered difficulties to gain advantage through networking (Forsman, 2009; Tödtling et al., 2009). What are the benefits of networking for innovation development? Various arguments have been introduced, e.g. opportunities to improve knowledge, access to new markets, lower costs of production and R&D (e.g. Glaister and Buckley, 1996; Karaev et al., 2007). Simonin (1997) classifies the benefits of collaborative business relationships into two categories: tangible and intangible. He mentions additional profits, improved market share and sustained competitive advantage as examples of tangible benefits and the creation of specific skills and competencies as intangible benefits. Developing core competencies reduces the dependence of an enterprise on its
partners, and enables it to leverage knowledge and develop new innovations (e.g. Caniëls and Romijn, 2003; Hamel, 1991; Palakshappa and Gordon, 2007). Smedlund (2006) has studied networking benefits from the perspective of small business. He classifies the networks of small enterprises on the basis of three forms of collaboration: knowledge creation for developing new innovations, knowledge transfer for learning best practices and knowledge implementation needed for producing products as efficiently as possible.

On the basis of the above it can be hypothesized that variables of innovation capacity would influence on the development of innovations, all types of them. Hence:

\[ H2a: \text{ Innovation capabilities will be related to the developed innovations in small enterprises} \]
\[ H2b: \text{ Networking benefits will be related to the developed innovations in small enterprises} \]
\[ H2c: \text{ RD investments will be related to the developed innovations in small enterprises} \]

Finally, it is assumed that contextual factors, variables of innovation capacity and their interactions as a whole model predict the developed innovation types in small enterprises. This assumption leads to the fifth hypothesis:

\[ H3. \text{ The model consisting of the contextual factors, the factors of innovation capacity and their interactions explains the variability regarding the developed innovation types in small enterprises.} \]

**Methodology**

**Research data**

In order to examine innovation capacity and innovation development in small enterprises, an email questionnaire was developed. It yielded 762 responses from the representatives of Finnish small enterprises with fewer than 50 employees. The accuracy was checked and the responses with missing values (22 respondents), the responses with inconsistencies (7 respondents) and the responses with inaccuracies (25 respondents) were removed from the data. The final response rate was 13.0 percent. As Table 1 demonstrates, 43.5 percent of the respondents are representatives of the manufacturing enterprises and 56.5 percent of them are from the services enterprises. This ratio is similar to the actual figures of the Finnish economy (Business Register of Statistics Finland, 2008). It has been earlier explored that innovation patterns in service and manufacturing enterprises are similar (e.g. de Jong and Marsili 2006) while there are differences within these sectors (Pavitt, 1984). For this reason, the industrial sub-sector characterizing the knowledge and technology intensity of an enterprise is a contextual variable.

As regards the distribution by the size of enterprise, the data is skewed towards the larger size categories compared with the actual figures of the economy. According to the Business Register of Statistics Finland (2008), the share of the enterprises with fewer than ten employees is almost 90 percent of all the enterprises having fewer than 50 employees, and the size distributions are similar in the service and manufacturing industries. In this data, the share of the smallest enterprises is 43.8 percent. For this reason, also the influence of the size of the enterprise will be examined as a
contextual variable. Nevertheless, the departure from the real size distribution should be noted when interpreting the results.

**Measures**

*Contextual variables.* As suggested in the literature review, the size of the enterprise, the industrial sector and the degree of knowledge and technology intensity of the industrial sector are used as contextual variables. The size of the enterprise is identified based on the number of people working for it. The two size categories used in the analyses are: 0= micro enterprises with fewer than 10 employees and 1= small enterprises having 10 to 49 employees. Also the sector of the enterprise is based on dichotomy variable: 0= manufacturing enterprise and 1= service enterprise. The knowledge-technology intensity of the industrial sector has been identified following the taxonomy introduced by Pavitt (1984). The manufacturing enterprises have been grouped into three categories: 1= supplier dominated sectors (SD) characterized by relatively low knowledge-tech intensity, 2= scale intensive sectors (SI) representing medium knowledge-tech intensity and 3= specialized suppliers (SS) and science based sectors (SB) characterized by high knowledge-tech intensity.

Miozzo and Soete (2001) have modified an application from the Pavitt’s (1984) taxonomy to the service industries which is used in this study as a basis for grouping service enterprises into three categories: 1= supplier dominated sectors (SDS) characterized by low knowledge-tech intensity, 2= the sectors of scale intensive physical networks (PN) representing medium knowledge-tech intensity and 3= the sectors of scale intensive information networks (IN) and specialized supplier sectors (SSS) characterized by high knowledge-tech intensity. The coding principles follow the classification used by Castaldi (2009). Due to the small number of responses from the enterprises of the sectors of SB (12 responses) and IN (20 responses), these enterprises have been combined with SS in the manufacturing sectors and with SSS in the service sectors.

Table 1 introduces the respondents grouped into manufacturing and service enterprises and further into six sub-sectors characterized by low, medium or high knowledge-technology intensity.

Note: " Size by the number of people working for the enterprise, b Knowledge-technology intensity of the sector

**Perceived innovation capabilities.** The perceived degree of innovation capabilities is examined based on 16 questions from which factor analyses using principal component approach with varimax rotation identified five capability factors: entrepreneurial capabilities, knowledge exploitation, networking capabilities, risk management, and finally, customer and market knowledge. These factors account for 59.4 percent of the total variance. The Kaiser-Meyer-Olkin measure of sampling adequacy is .849, exceeding the recommended value of .60 (Jokivuori and
Hietala, 2007). The internal consistency was measured with Cronbach’s Alpha giving results ranging from .64 to .73 being above the critical limit of 0.6 (Jokivuori and Hietala, 2007).

Benefits through networking. External input into innovation development through networking is studied based on eight questions. The respondents assessed what impact networking has had on their business. The responses are graded by one (1) indicating benefits from networking and by zero (0) indicating no benefits related to the item in question. The factor analysis using principal component approach with varimax rotation reveals the presence of three factors: benefits through collaboration for innovation development, benefits through collaboration for improving customer performance and benefits through effectiveness and improved supply chain management. These factors account for 67.8 percent of the total variance. The Kaiser-Meyer-Olkin measure of sampling adequacy is .832 exceeding the recommended value of .60 (Jokivuori and Hietala, 2007). The internal consistency was measured with Cronbach’s Alpha giving results ranging from .71 to .72. The values for all three factors are above the critical limit of 0.6 (Jokivuori and Hietala, 2007).

RD Investments. The rate of R&D investments was reported by respondents in terms of the percentage of sales invested in development activities. The distribution of the percentages of R&D investments supports the findings that innovations are not necessarily results of formal R&D (Hirsch-Kreinsen, 2008; Forsman 2008). The preliminary review of the data indicated that 19.5 percent of the service enterprises and 12.0 percent of the manufacturing enterprises could not determine the rate of R&D investments in their enterprises. The responses were coded to a dummy variable with two categories: low investors and high investors. The first category (0) consists of those who could not estimate the rate of R&D investments and those who had estimated that their enterprises had invested less than three percent of sales in R&D activities. Correspondingly, the second category (1) consists of respondents whose enterprises had invested at least three percent of their sales in R&D.

Dependent variables. The dependent variables of this study are developed innovation types in enterprises. The items are generated from the question asking to separate what types of innovations have been developed in the respondents’ enterprises during the past four years. In this study, the dependent variables consist of six innovation types: radical products, radical services, radical processes/methods, incremental products, incremental services and incremental processes/methods. It was emphasized that innovation development had had to become so advanced that innovation output had been exploited in business. The definitions were provided in the questionnaire. A radical innovation was defined as a product, service or process/method which differs dramatically from the competitors’ ones while an incremental innovation was defined as an improvement to an existing product or service.

Those responding “yes” to a particular innovation type are coded as one (1) and those responding “no” are coded as zero (0). The logistic regression analyses have been carried out by comparing innovators to non-innovators. Non-innovators are enterprises which have not developed any innovation types during the past four years.
Analysis

The correlation analysis was conducted to determine the degree of multicollinearity among the independent variables. The results in Table 2 show relatively low correlation coefficients between capability dimensions. All of them are less than .70 which is a limit suggested by Tabachnic and Fidell (2001, p. 84) and therefore the variables do not give an indication of a multicollinearity problem.

The potential for non-response bias could be assessed by comparing the means of the responses in the last quartile to those responses in the first three (Armstrong and Overton, 1977). It is assumed that the responses of the last quartile are the most similar to those of the non-respondents. The comparisons of the means of all the variables used in this study revealed no significant differences.

Since the research model of this study makes use of six dependent dichotomy variables and 12 independent categorial or interval variables, logistic regression analysis, which is less stringent in terms of normality assumptions, was considered to be a suitable statistical technique for analyzing such mixed data sets (Tansey et al., 1996). In each logistic regression analysis the focus is on: a) the goodness of fit indicating how well the model with its predictors performs, b) the parameter estimates to explore the relationship between independent and dependent variables, and c) the classification table indicating how well the model predicts the correct categories, i.e. innovators and non-innovators. The data has been analyzed in six categories according to the developed innovation types: 1) Innovators of radical products versus non-innovators, 2) innovators of radical

services versus non-innovators, 3) innovators of radical processes/methods versus non-innovators, 
4) Innovators of incremental products versus non-innovators, 5) innovators of incremental services 
versus non-innovators, and finally 6) innovators of incremental processes/methods versus non- 
innovators. The number of innovators varies between 136 and 394 depending on the innovation 
type while the number of non-innovators, i.e. enterprises that have not developed any types of 
innovations, is 87. Table 5 exhibits the results for the categories of 1 – 3 (radical innovators versus 
non-innovators) and Table 6 introduces the results for the categories of 4 – 6 (incremental 
innovators versus non-innovators). The hypotheses of this study are rejected if the significance 
value is above .05 (p>0.05).

Results

Hypotheses H1 predicted that contextual variables would influence the development of 
innovations in small enterprises. This was tested using Logistic regression Model 1, which 
contains three contextual variables: size of enterprise (H1a), industry divided to manufacturing and 
service sectors (H1b) and the knowledge-technology intensity of sector (H1c).

Overall, the model was rejected (p>.05) for predicting the development of incremental 
innovation types. For predicting the development of radical innovation types, the model was 
significant (p<.05) but its usefulness is low. Nagelkerke R² indicates that only 5.0 - 7.3 percent 
of the variability is explained by this set of variables. However, there are some contextual variables 
that contribute significantly to the predictive ability of the model. The coefficients for the size of 
enterprise were significant (p<.05) with incremental product and process/methods innovations and 
with radical service innovations. It seems that radical service innovations and incremental product 
and process/method innovations are more common to small enterprises than to micro enterprises. 
Instead, the results suggest that the industrial sector is not a predictor for developed innovation 
types. Finally, the coefficients for the knowledge-technology intensity were significant with radical 
product and process/method innovations and with incremental service innovations. This indicates 
that the enterprises characterized by high or medium knowledge-technology intensity will more 
likely to create radical product and process/method innovations than the enterprises characterized 
by low knowledge-technology intensity (Table 3). Further, the enterprises characterized by 
medium knowledge-technology intensity seem to create more often service innovations than the 
enterprises characterized by low knowledge-technology intensity (Table 4).

Hypothesis H2a asserted that innovation capabilities would have influence on developed 
innovation types in small enterprises. This was examined by Model 2 which consists of five 
capability variables. Regarding radical innovation types, the explanatory power of this model is 
much higher than it was in Model 1. Nagelkerke R² indicates that capability variables explain 31.3 
- 35.5 percent of the variability regarding radical innovation types. Correspondingly, with 
incremental innovation types only 6.6 - 10.1 percent of the variability is explained by the 
capability factors. The results suggest that entrepreneurial capabilities, risk management 
capabilities, and market and customer knowledge are important as predictor variables. As Tables 
3 and 4 indicate, the coefficients for entrepreneurial capabilities and for market and customer 
knowledge are significant regarding all innovation types while the coefficients for risk 
management capabilities are significant regarding all radical innovation types. In addition, the 
coefficient for knowledge exploitation is significant with radical process/method innovations and 
the coefficients for networking capabilities are significant with radical product innovations.

Finally, the classification tables show that Model 2 consisting of five capability variables classifies reasonably well the radical innovators (71.6% - 81.0%) and non-innovators (64.4% - 74.7%) while the accuracy regarding the incremental innovation types is low. The model cannot classify correctly non-innovators (0.0 %) from incremental innovators (100.0%).

Hypothesis H2b predicted that the benefits acquired through networking would have influence on the development of innovations. This was tested by Model 3 consisting of the three variables of networking benefits. The model explains 14.7 - 21.3 percent of the variability regarding the radical innovation types (Table 3) while it explains 8.9 - 10.0 percent of the variability regarding the incremental types (Table 4). The coefficients for development collaboration are statistically significant with all innovation types and the coefficients for effectiveness are significant with all incremental innovation types. Instead, the coefficients for customer performance are insignificant regarding all innovation types. This indicates that networking benefits acquired through collaborative development increase the probability that the enterprise reports on developed innovations, all types of them while the benefits acquired through improved effectiveness increase the probability that an enterprise reports on developed incremental innovations. The classification tables indicate that Model 3 classifies quite well the radical innovators (75.0% - 81.6%) and non-innovators (47.1% - 60.9%) while it cannot classify correctly non-innovators (0.0 %) from incremental innovators (100.0%).

The last item indicating innovation capacity is R&D investments. It was hypothesized in H2c that R&D investments would have influence on the development of all innovation types. As Tables 3 and 4 demonstrate, Model 4 explains 29.0 - 38.5 percent of the variability regarding radical innovation types and 11.6 - 13.2 percent regarding incremental innovation types. The coefficients for R&D investments are statistically significant related to all innovation types. The enterprises which invest more than 3 percent of their sales in R&D activities will more likely to report on develop innovations, all types of them. This relationship is stronger with radical innovation types than with incremental innovation types. Again, the classification tables indicate that Model 4 predicts reasonably well the radical innovators (67.4% - 75.7%) and non-innovators (81.6%) but it cannot classify correctly non-innovators (0.0 %) from incremental innovators (100.0%).

The last Model 5 consists of contextual variables, all innovation capacity variables, and of the interactions between the different innovation capacity variables. It was hypothesized in H3 that this model explains the variability regarding the developed innovation types in small enterprises. As Table 3 shows, the overall accuracy regarding radical innovation types falls between 80.5% and 83.4%. The results suggest that Model 5 has a good capability for predicting both radical innovators (84.4% - 87.7%) and non-innovators (65.5% - 81.6%). Correspondingly, the overall accuracy of Model 5 is very high regarding incremental innovations (Table 4) but it could predict correctly only incremental innovators (94.6% - 96.1%) but not non-innovators (14.9% - 17.2%). Nagelkerke R² indicates that Model 5 explains 52.0 - 60.8 percent of the variability regarding radical innovation types while it explains only 23.5 - 27.9 percent of the variability regarding incremental innovation types.

When examining the capability variables in Model 5, it can be noticed that entrepreneurial capabilities emerge as a significant variable for developing all types of innovations, both radical and incremental. Risk management capabilities are significant for developing all radical innovation types and market and customer knowledge emerges as significant for developing radical product and service innovations as well as for developing incremental process/method innovations. Finally,
knowledge exploitation is a significant variable for developing radical process/method innovations. On the contrary, the coefficients for networking capabilities are insignificant regarding all types of innovations. Nevertheless, the benefits acquired through networking influence innovation development. The coefficients for development collaboration are significant for developing radical product innovations and radical and incremental process/method innovations. In this model, the coefficients for customer performance are significant with radical service innovations and incremental product and process/method innovations. The third variable of networking benefits is effectiveness. The coefficients of it are significant with incremental service innovations.

As was hypothesized, coefficients for R&D investments were significant related to all innovation types. Finally, Model 5 also consists of variables for interactions. As Tables 3 and 4 indicate, there is an agglomeration of significant coefficients for interaction suggesting that interaction effects predict the development of radical service innovations. The coefficients for interactions are not significant regarding other innovation types.

Discussion

The aim of this study was to identify general sources that have influence on innovation development in small enterprises. It explored the relationship between the developed innovation types and innovation capacity in terms of capabilities, benefits acquired through networking and investments in R&D. In addition, it examined the relationship between the types of developed innovations and contextual factors comprising three variables: the size of enterprise, industrial sector and the knowledge-technology intensity of industrial sector.

In general, the results confirm that there are several variables that predict the development of certain types of innovations in small enterprises. As regards the contextual variables, the size of enterprise was found to have influence on the development of radical service innovations and incremental product and process/method innovations. Small enterprises with 10 to 49 employees will be more likely to report on the development of these types of innovations compared with micro enterprises with fewer than 10 employees. Instead, the size does not contribute significantly regarding other types of innovations. These findings give only partial support to Avermaete et al. (2003) who found that there exist no differences between product and process innovations among the micro and small enterprises. Also in this study, the size of enterprise is not a statistically significant predictive variable regarding radical product and process innovations. Instead, it is statistically significant regarding incremental product and process innovations.

Another significant coefficient among the contextual variables was found for knowledge-technology intensity. In line with Pavitt (1984) as well as Miozzo and Soete (2001), the enterprises of the sectors characterized by medium and high knowledge-technology intensity would more likely to introduce radical product and process/method innovations than enterprises characterized by low knowledge-technology intensity. Within incremental innovations, knowledge-technology intensity was significant regarding service innovations. The results suggest that the probability that an enterprise reports about the developed incremental service innovations is higher with the enterprises characterized by medium knowledge-technology intensity than with enterprises characterized by low knowledge-technology intensity.

The major variables of innovation capacity predicting whether an enterprise reports about developed innovations are: investments in R&D, entrepreneurial capabilities, market and customer knowledge and networking benefits through collaborative development activities. The coefficients
of these variables are statistically significant regarding all innovation types. The entrepreneurial capabilities are similar to dynamic capabilities (cf. Branzei and Vertinsky, 2006; Teece et al., 2007), and thus this study supports the arguments which emphasize the importance of dynamic capabilities for maintaining the competitiveness through innovations. Risk management and market and customer knowledge have been considered as important capabilities especially for developing radical innovations (cf. Danneels, 2002; Herrmann et al., 2007). The results of this study confirm that the higher values of risk management capabilities increase the probability that an enterprise reports about developed radical innovation types while the higher values of customer and market knowledge increase the probability that an enterprise reports about both, developed radical and incremental innovations.

Several researchers have emphasized that formal R&D investments not necessarily reflect the innovation activities in small enterprises (e.g. de Jong and Marsili, 2006; Hirsch-Kreinsen, 2008). The results of this study are somehow conflicting with the above arguments. Based on the preliminary results, less than 20 percent of respondents could not point out the percentage of sales that had been invested in R&D. On the other hand, the probability that these enterprises report about innovations is lower regarding all radical and incremental innovation types compared to the high-investors.

It has been recommended to enterprises that they should engage in collaborative networks to increase their opportunities for innovation development and resource acquisition (e.g. Caniëls and Romijn, 2005; Szeto, 2000). These recommendations are in accordance with the findings of this study. The benefits acquired through development collaboration increase the probability that an enterprise reports about the developed innovations, all types of them. The existing literature introduces also cost effectiveness and improved customer performance as advantages of networking (e.g. Glaister and Buckley, 1996; Karaev et al., 2007; Smedlund, 2006). The results of this study suggest that the networking benefits acquired through improved effectiveness increase the probability that an enterprise reports about the development of incremental innovation types while the networking benefits acquired through customer performance is a statistically significant predictive variable for incremental product and process/method innovations.

Finally, the interaction effects regarding different combinations of innovation capacity variables are significant only with radical service innovations. The coefficients are statistically significant for interaction consisting of all five capability dimensions, interaction between R&D investments and capabilities and interaction between capabilities and networking benefits. Table 5 summarizes the variables that contribute significantly (p<.05) to the predictive ability of Models 1 – 5.

In terms of model fit, the omnibus tests of model coefficients are significant related to all Models from 1 to 5, with one exception: Model 1 consisting of contextual factors is not significant regarding incremental innovation types. Nagelkerke $R^2$ values indicate that Model 2 consisting of five capability variables and Model 4 consisting of R&D investments explain between 29.0 – 38.5 percent of the variability regarding developed radical innovation types while these models explain only 6.6 – 13.2 percent of the variability regarding developed incremental innovation types. Model 5 consisting of all potential variables explains 52.0 – 60.8 percent of the variability regarding radical innovation types while it explains only 23.5 – 27.9 percent of the variability with incremental innovation types. These findings are supported by classification tables. Model 5 has a good capability for predicting both radical innovators and non-innovators but it could not correctly predict non-innovators from incremental innovators. These results are in line with studies...
suggesting that radical innovation development demands disruption of new capabilities and in-house R&D (cf. Ellonen et al., 2009; Forsman and Annala, 2010; Pavitt, 1984). Regarding incremental innovation types, the results suggest that significant variables and interactions are missing from the analysis.

Conclusions
In summary, this study provides two contributions to academic literature. First, the importance of innovation capacity and contextual variables as the predictive factors of innovation development in small enterprises are reported related to six different innovation types. The results mainly support the existing literature but also deepen it by more detailed analysis indicating, what are the factors that have influence on the development of certain types of innovations. Second, the results establish that the model consisting of innovation capacity and contextual variables explains reasonably well the variability regarding radical innovation types developed by small enterprises but it does not explain the variability regarding the developed incremental innovation types.

This study also has some managerial implications. It recommends that small and micro enterprises might consider directing their resources for improving innovation capacity relating to the factors that influence positively those particular innovation types that an enterprise aims to develop. Based on the results of this study, it can be recommended to pay attention to adequate resources invested in R&D, entrepreneurial capabilities and market and customer knowledge and in potential networking opportunities leading to collaborative development activities. These are
statistically significant factors which have influence on the development of all types of innovations in small enterprises.

There are limitations with the current study that provide direction for future research. First, the literature on innovation management and small business development was used to determine the factors that influence innovation development. Nevertheless, it should be acknowledged that innovation development in the context of small business is a multidimensional challenge and there might be other sources of influence which are not captured in this study. Especially, regarding the incremental innovation types, a question emerges from the results: What significant variables and interactions are missing from the analysis? Second, the research data has been provided by single informants from Finland. The reliance on small business owner-managers is consistent with the prior evidence that they possess the most complete and up-to-date information about the innovation development of their enterprises. Further studies may attempt to gather information from multiple respondents and to extend the analysis to other countries.

**Biographical Notes**

Dr Helena Forsman is working as a Senior Researcher at Lappeenranta University of Technology, Lahti School of Innovation. Her research interest focuses on business development and innovation management in the context of small business. Dr Hannu Rantanen is Professor of Industrial Management and Vice Rector at Lappeenranta University of Technology. His current research deals with performance analysis, both in the private and public sector and cost management in industrial enterprises.

Banking on Better Service:
Canadian SMEs Rank the Performance of their Bank

For Canadian small and medium-sized businesses (SMEs), obtaining financing and other banking services at affordable rates has never been easy. It has been well documented that the smaller the business, the bigger the challenge (Bruce, 2000). Last year, this challenge was exacerbated with the most severe global financial and economic crisis in decades. While the impacts on the Canadian economy were not as severe as other economies, SMEs in Canada were pushed to their limits in weathering the economic storm that caused banks and other lenders to tighten credit availability.

The purpose of this study is to produce a comprehensive ranking of the Canadian banks and other institutional lenders (hereafter referred to as “banks”) based on a set of performance-based factors. In other words, the study answers the question: how good or bad a job are banks doing in serving the financing and banking needs of their small and mid-sized business clients? The main source of data is a survey conducted in 2009 that received responses from 12,124 SME owners in Canada.

Given the large survey data set, the analysis goes one step farther. It ranks the banks according to the size of the business client according to nine factors. Three categories of businesses were chosen: micro businesses with 0-4 employees; small businesses are those with 5-49 employees; and mid-size defined as 50-499 employees. The main rationale for distinguishing business clients by their size is based on the premise that businesses generally receive different levels of treatment
and service from their bank compared to larger firms (Bruce, 2003). Another reason to focus on the size of the business client is to address the fact that certain banks cater to different clients.

Nine performance-based factors are used to measure the performance of each bank. The factors are grouped into three sub-indicators: Financing, Fees, and Service. The “Financing” indicator assesses how banks are performing in terms of willingness to lend, lending terms, and information requirements for financing. The “Fees” indicator covers factors including credit card merchant fees and service charges while the “Service” indicator shows how each bank is performing with regards to understanding small business, treatment given by the account manager to the business owner, access to full-service branches, and on-line banking.

The results show that some banks do a better job in catering to businesses in the micro or small size category, while other banks’ strongsuit rests in serving larger businesses. The ultimate goal of the study is to provide clear and objective information on how well the banks are serving the Canadian SME sector. The information can be useful for business owners to help determine which bank is the most appropriate for their banking and financial needs. It also sheds light on the issue of credit availability for SMEs. Conversely, it is also an independent source of competitive intelligence for the banks to consider in developing their approach to better serving the SME market. Those banks that embrace these findings will gain a competitive edge; those that do not will miss an opportunity.
Process of Validation of Complex Conceptual Models after Soft Systems
by Joao Vilas-Boas*

A theoretically validated model to position a discussion about Production Planning and Control (PPC) within a rich organisational context was found as the main outcome of the process. Then, ten rival frameworks were described, as representing other systems thinking, to compare the conceptual model, by following the Soft Systems Methodology (SSM). Analysed dimensions concerned the gap, purpose, scope and expected results, research method, validation of results, models and outcomes and, conclusions. An appreciation of other researchers’ work was provided, promoting the improvement of PPC decision-making. In addition, guidance to operationalise stage 4b of SSM was presented. To sum up, science methods might help entrepreneurs to learn more robust processes to deal with complex corporate structuring, and so, to address some determinants of both organizational behaviour and effective management. In this way, corporations may be offered more credible vehicles for both intra- and entrepreneurship, providing safer bridges to jump over boundaries.

Introduction

From Validity to Better Decision-Making across Boundaries

Validity is a research demand that is difficult to assure, especially in messy and complex unstructured situations. In addition, its level of difficulty increases, when qualitative research is added. This paper aims at reporting the specific validation of a conceptual model previously deducted by the author (Silva 2002: 4, 137, 174). This framework positioned the discussion concerning the relevance of Production Planning and Control (PPC) procedures within a rich organisational context after several different worldviews – the Weltanschauungen (Checkland and Poulter 2006: 6).

*Joao Vilas-Boas is an assistant professor of technology and operations management at the ISCTE – Lisbon University Institute. His research interests include: structure and design of manufacturing systems; organisational structuring and business processes redesign; business and manufacturing strategies; intervention, innovation and change programmes; Soft Systems Methodology; strategic planning and structured design of information systems.

Address correspondence to: Joao Vilas-Boas, ISCTE – Lisbon University Institute, Departamento de Ciencias de Gestao, 1649-026 Lisbon, Portugal. Tel: +351 217 903 403. E-mail: jmvbs@iscte.pt
The objective was to show that the methods of science could and should help to validate a construct and so, getting a more robust contribution to the knowledge. Therefore, the concept of validity is understood twofold, as follows: i) what findings appear to be about, is what they ‘really’ are about? And, ii) the relationships in findings should also be verified for truth (Robson 1995: 68).

The practical contribution of construct validity under the guidance of stage 4 of the Soft Systems Methodology (SSM) is about getting models that are more defensible than others, with regard to inconsistency, inadequacies, inclusion of the critical components whose absence or inefficiency is crucial to the existence of the perceived problem and, completeness (Checkland 1994: 176). In this case, the development of a credible audit tool was targeted, later on.

To sum up, this paper presented an instance of the use of the validation concept in order to promote the discussion around the subject – development of a model to find relevant PPC procedures – under the umbrella of stage 4b of SSM. It is argued for that the validated model might point out significant and better-defined ways to sort out practitioners problems, improving the quality of decision-making in the studied domain. Consequently, entrepreneurs may learn more robust processes to deal with corporate structuring, and so, to address some determinants of both organizational behaviour and effective management. In this way, corporations may be offered more credible vehicles for both intra- and entrepreneurship, providing safer bridges to jump over boundaries.

**Model Validation against Other Systems Thinking**

*Stage 4b* of Soft Systems Methodology establishes that the developed conceptual model should also be examined for validity in terms of other systems thinking that the researcher finds significant. Thus, ten relevant approaches to the ‘assessment of the PPC systems (PPCS) success’ were purposefully selected for the main test. Moreover, other
authors might be included in the testing process that follows, whenever their remarks were found as relevant contributors.

Later on, these rival models were summarised with regard to the following dimensions: research gap, purpose of the investigation, expected results, research method, results validation, developed model and research outcomes and, main research conclusion. These meaningful categories were found and derived from cross-analysing the chosen approaches as depicted in Table 3 to Table 6 – labelled A… to …J.

Then, the categorised data were cross-checked with the conceptual model developed in previous research (*vide* Silva 2002, for details) and further discussed, in order to promote its validation. The summary of the findings is also depicted in Appendix Table 1 and Table 2.

This paper presents the validation exercise in two sections: research definition and research design. Each section addressed the previously mentioned categories starting by summarising the main findings of the rival frameworks. Then, the conceptual model validation is attempted by discussing its similarities, contrasts and completeness with regard to the rival approaches.

**Summary and Discussion of Research Definition Dimensions**

**Summary of the Gaps (Table 3 to Table 6)**

*Lack of Satisfaction*. The expenditure of a large amount of money (B in Table 3), put together with not truly effective computer-based implementation and operation of Manufacturing Control Systems (MCS) (B) has resulted into increasing dissatisfaction of users with their Computer-Aided Production Management (CAPM) (F). Some have blamed the deficiencies of the commercially available CAPM for the lack of success
(F). To sum up, vendor’s predictions of improvement are rarely achieved in practice (C).

Common Approaches to PPC Assessment. Few efforts of evaluating and selecting PPC packages have been done (H). Absence, informal or wrong measurements of the performance of most of the Manufacturing Planning and Control Systems (MPCS) modules is still usual (J). Most of the methodologies to assess CAPM focus on a comparison with respect to best practice and require data that the company is unlikely to have (C). Thus, there is a requirement for detailed understanding of the relationships between performance measures, contributing variables and associated best practices (J).

Moreover, criticism about insufficiently validated models to conduct the manufacturing strategy process effectively has also been carried out. These models should assure consistency among the decision categories and between manufacturing strategy and environment. Most of the frameworks make explicit a structural, consistency requirement but miss both functional consistency and empirical testing (E). In addition, many MPCS are based on a single philosophy executed by static methods of planning and control that restrict flexibility and responsiveness. Finally, single view modelling techniques were considered inadequate (G).

Holistic and Strategic Needs. There is a need of debate about the CAPM contribution to the overall performance of the company (C) rather than only considering problems associated with traditional financial performance measures (J). Many times, the development of IT, production organisation, production control, production technology and market has been unbalanced (A). Indeed, failure to consider all related factors is common (B). Moreover, the effort with regard to the measurement of effectiveness and efficiency of MPCS is still little, particularly, in relation to the strategic objectives (J).
Contingency and Situational Needs. Some production control systems have not been related to production situations (A). For instance, factors linked to the industrial sector have been ignored (H). In addition, most of the methodologies to assess CAPM ignore different company types and their individual requirements (C). In fact, there is no best PPCS for all instances. The best system for a firm is contingent upon a number of factors particular to that organisation (D). Finally, it is difficult to make the right choice of PPC software that should be applied to a specific manufacturing firm (H). Thus, some researchers have argued that more standardisation of the PPC software would make the choice process easier (H).

Discussion of the Gap (Appendix)

Table 1 and Table 2)

This research agrees with the trend that was found in the surveyed rival views concerning the lack satisfaction with PPC performance as consequence of the approaches undertaken which (i) are not independent from established interests, (ii) promote the comparison with best practice (vide also Hill and Brook 1994) and, (iii) which are missing relationships between performance results and the related causes. However, it is the most committed approach (I) that looks more complete with regard to the selected research design aspects (vide Table 2), despite most of the rival approaches showing relevant evidence of being independent from software vendors.

On the other hand, the research disagrees with the type of relationships – that is cause-effect – that is sometimes addressed either explicitly or implicitly by the other researchers (for example J, H). It also disagrees with the allocation of failure responsibilities to the commercially available computer-aided ‘solutions’ (F), despite, many times, their operational performance not being the best, as studies from important
researchers have argued for, for example, Porter et al. (1996). Little et al. (2000) advanced some causes to explain PPCS failure, which are found more plausible and that are taken into consideration by the developed model in this research. These causes, which are also explored by some of the rival models, concern the need for holistic, strategic, contingent and situational approaches. In addition, the suggested increase of the standardisation of the CAPM systems seems a positive move, in order to get a better match with the needs of the related industrial vertical sub-sectors (H), despite the needed customisation due to the individual PPC requirements both at the company and SBU levels.

Finally, the research highlights the gap concerning integration. This gap was not identified by some of the rival approaches, either explicitly or implicitly. By integration it is meant the relationships of PPC with the other control procedures within the scope of the business (I) and also, with the other design parameters (B, E). Moreover, consistency has to be more than conceptual or structural (E, J). It should address the functional aspects, that is implementation and operation as the proposed research considered.

**Summary of the Objectives and Purpose (Table 3 to Table 6)**

*Auditing Purpose.* There is the need of a checklist to focus on what is required to become more competitive and achieve world class performance (I). Thus, an audit methodology to evaluate an installed CAPM should be designed, developed and tested (C). It should provide a consistent means of assessing progress periodically (I) with regard to both effectiveness and efficiency (C). This methodology should also provide guidance to establish how existing structured techniques and tools can be used in an integrated manner to analyse and design a manufacturing planning and control system (G).
**Conceptual Guidance.** A methodology that helps user companies to specify and select a CAPM system that fits the company present and future needs should be produced (F). It should help to choose or develop PPCS for different production situations (A, B). Thus, a contingency model should be designed to explain differences in the specifications for PPCS across firms (D). This methodology might be involved with the formulation and implementation of manufacturing strategy, *viz.* description, analysis and design of production systems, in light of present and anticipated market demands (E). If PPC software packages are required, the final stage should be the definition of a way for selecting them. Some authors suggest expert system techniques to support this process (H).

**Effective Implementation and Operation.** The methodology should also provide a set of guiding principles to implement appropriate CAPM (F), in order to assist the effective implementation and operation of MPCS (B). It should also improve the MPCS operational performance by linking performance measures, practices and strategic objectives (J).

**Discussion of the Objectives and Purpose (Appendix Table 1 and Table 2)**

This research is also in line with some of the rival views with regard to the need of consistently and systematically developing and testing an audit tool to assess the potential PPC performance (*for example* C, I, J). Thus, the developed model should provide a set of guiding principles (F) to address the current and future conceptual effectiveness of the PPC procedures, within the scope of the structured analysis and design of the manufacturing system. In fact, the developed methodology should be able to provide conceptual guidance for the specification of the PPC needs and also for the
eventual selection of a CAPM commercial application. However, it is not expected to become a checklist for business success (I). In addition, operational efficiency is not directly targeted despite being the legitimate object of other studies (for example I, J). Finally, the effective implementation is linked to other issues than conceptual design as above argued, for example the interdepartmental co-ordination or the objective assessment of the need for individual MCS (B).

Moreover, this research disagrees from the views arguing for expert systems (H) or another form of automated support to decision-making concerning the choice of a software package, especially in the advanced stages of the selection process. However, this could be acceptable for checking basic compatibilities between the production system characteristics and the PPC features in the early stages (vide MacCarthy and Fernandes 2000, for details).

Appendix

Table 1 shows that there is a great research concern with the conceptual effectiveness of PPC and with its related specification of requirements. However, there still is a significant PPC performance mismatch. This might mean that this concern with the research design has not covered all the relevant issues or that it did not cover some issues sufficiently well. A further point is that there might be other significant contributors to the PPC performance.

Summary of the Scope (Table 3 to Table 6)

Even, typical approaches close to best practice – for example the 4th edition of the ABCD checklist – address a broader scope than only MRPII and DRP. This may also include strategic and organisational issues, as follows: strategic planning processes, people/team processes, total quality and continuous improvement processes and, other planning and control processes (I).
Situational and Strategic Scope. Different manufacturing environments using different types of control systems (B) stated in terms of investment in information processing systems and organisational integrativeness are related to firm’s competitive strategy and environment (D). In fact, there is a need to formulate and implement consistent strategy-driven decisions on manufacturing, in order to achieve success in marketplace, *that is* rapidly and reliably design, produce and deliver a wide range of low cost, high quality products (E). Thus, dynamic environment, great pressure, a changing business environment, continuously increasing global competition, growing product customisation and time-based competition markets (G) should also be part of the scope concerns. Thus, the overall assessment of the situation in the company (I) should be considered part of the scope.

Organisational Scope. The functional characteristics of the physical production system – *for example* layout and process flow – do not seem enough to determine production management requirements (H). MPC are made up of factors and their related interactions in the physical, decisional and informational domains (G) that are part of the organisational structuring. Indeed, the critical importance of the infrastructure, of policies, procedures and technology supporting practices has showed up as relevant. In addition, the integration of humans and computers in the production management system also includes social issues in the scope (F).

Functional Scope. Many times, generic MPCS models free from any framework, applicable to a wide range of manufacturing systems are followed (C, J), for the purpose of developing these methodologies. They are not constrained to any specific computer architecture and the studied system does not even need to be computerised (C). These models define generic processes, known as modules most of which applicable to all manufacturing companies, although the way in which they are organised may not match
the functional organisation of the company (J). Some authors believe that any methodology must include a software specification (F).

**Discussion of the Scope (Appendix)**

**Table 1 and Table 2**

The developed conceptual model agrees with several rival views (*for example* B, E, J), with regard to the support to the implementation stage, due to its broad business orientation and strong relationship with the design of the organisational structure. As a consequence, the organisational and inter-personal processes at play during the implementation of the PPC procedures (Newell *et al.* 1991) are also considered relevant to the scope.

In addition, PPC is an integrant part of the overall company performance. In fact, even some traditional views, which used to be predominantly functionalist and so, considerably reductionist (*for example* Dougherty 1981), have broaden the scope to include strategic alignment (*for example* F, G, I). Thus, the choice to position PPC within the organisational and business scopes changes the ‘problem’ nature because it includes the need to deal with people, the integration of humans with computers, a social dimension, policy definition, decision-making, contribution to the competitive advantage, in addition to the strict specification of the system functionality and to the IS/IT issues.

To sum up, some of the rival views, despite implicitly recognising a different problem nature, have carried on sticking to typical hard systems concepts (*for example* I, J) such as the cause-effect relationships, (*for example* J). Some significant differences are that the conceptual model developed and presented in this research is strongly supported on a methodology from a social sciences background, *that is* on the soft
systems methodology. Thus, it takes into consideration most of the richness coming from the scope broadness, assumes relationships but not causal and, relies on a qualitative approach and on a strong theoretical feed-forward mechanism. However, the pursued methodology also accepts the usefulness of a detailed functional specification to complete the developed conceptual model (I, F).

**Summary of the Expected Results (Table 3 to Table 6)**

Expected results are as follows:

- Comparing PPCS performance against established benchmarks (I); the improvement of the MPCS can be critical to the whole organisation performance and a source of competitive advantage (J); it should even motivate people to work in a more effective manner (I);
- Determining parameters affecting MCS choice, implementation and operation (B);
- Discussing which control concepts fit a given production situation; some existing production control concepts are roughly allocated/related to production situations (A);
- Designing a flexible method to set CAPM contribution to company overall performance (C); successful PPCS must consistently reflect a firm’s competitive strategy (D);
- Developing a generic validated model covering the prerequisites of completeness, relevance and operationalisation for manufacturing strategy (E) may simplify the manufacturing system and ease CAPM implementation (F);
- Expanding the role of a checklist as an industry standard for operational performance measurement (I);
- Constructing a[n] [expert] system that gives as results the required PPC software
functions and the structure of the whole software package that these functions belong to (H); develop the methodology to analyse and design an integrated hybrid system of support tools capable of operating in a dynamic environment supported by existing resources (G).

Discussion of the Expected Results (Appendix

Table 1 and Table 2)

The outcomes expected from the designed conceptual model should be consistent with the manufacturing strategy developed for the business, reflect the firm’s competitive strategy, contribute to the overall performance of the company matching a given production situation and so, fitting the determinants of the manufacturing system (for example A, C, D). Thus, the parameters affecting not only PPC design, but also its implementation and operation (Appendix Table 1) are discussed within the scope of organisational structuring (E), as well as the findings concerning the relevance of the PPC procedures. This is expected to be a significant innovative contribution of this research approach, if compared with the rival views (Appendix Table 1).

Neither performance assessment against established benchmarks, nor setting industry standards for operational measurement are expected results (I) from this investigation. Expert systems development to select CAPM packages (H) is also outside the research scope.
Summary and Discussion of Research Design Dimensions

Summary of Research Methods and Validation Actions (Table 3 to Table 6)

Most of the research methods employed in the surveyed investigations – that is seven out of ten – were found based on prescriptive conceptual models mainly based on literature (A, D, E, F, G, H and I). Two of the models were being predominantly developed by exploratory approaches based on case studies (B and J). Finally, the last of the investigated models presented a prescriptive basis smoothed by the inspection of a wide variety of vendor systems (C).

The validation of the research is a more sensitive issue. Six out of the ten investigations did mention case studies as the validation tool (A, B, D, E, G, I). One of the models was validated through verbal presentations given in the four original case studies. Thus, detailed reports from the field studies were analysed and, an overall assessment of the findings was carried out (J). Eighteen valid replies to a questionnaire from a survey were returned with opinions about other of the investigated models (C). Other of the models does not mention any validation action at all (H). Finally, it is expected that the practical use and application of the CAPM workbooks mentioned as outcomes (F) will result into some form of framework validation.

Discussion of Research Methods and Validation Actions (Appendix Table 1 and Table 2)

The structuring of the problem situation approached by this research is based on an exploratory investigation – carried out outside the scope of this work – on both the researcher’s background and interest and, on a literature review. Thus, the conceptual model was established on a predominantly prescriptive basis smoothed by a previous exploratory view. In fact, most of the rival models are of a prescriptive nature (A, C, D,
E, F, G, H, I). So far, in a natural sciences paradigm, this would be the equivalent to a hypothetico-deductive approach. However, a Popperian attempt to disprove the hypotheses based on prediction fed by fresh data is not possible due to both complexity and problem nature. Nevertheless, it is possible to find some misleading semantics (for example Parnaby 1979; Westbrook 1995), such as: ‘to predict the production systems performance unambiguously’ (Draaijer and Boer 1995).

The differentiating option to the majority of the rival models was to strictly follow up a well-established methodology, that is the soft systems methodology. This resulted into the discussion of the initial research question – that is ‘how can successful PPC procedures be chosen?’ – within the scope of the manufacturing systems design taking into consideration all the structure determinants (D), as well as, in choosing business as the research unit of analysis.

In addition, the validation of the rival models was also found an opportunity for significant improvement, especially with regard to the theoretical validation (vide Table 2). In fact, none of the rival models directly mentioned any type of specific theoretical validation. Some of them even missed any kind of empirical validation (for example H, F). The developed model in this research is theoretically and empirically validated by addressing this gap, as follows: (i) by comparison with generic theories and models of management (SSM ‘stage 4a’) (vide Vilas-Boas 2009a) and, now, by comparison with other significant systems thinking (SSM ‘stage 4b’); and, (ii) by running a confirmatory case study to apply and appreciate the usefulness of the developed enquiring tool as sources of debate about change and of learning (Vilas-Boas 2009b).

Finally, it is explicitly assumed that the analyst has carried out an interpretive, subjectivist and political exercise, during both the case study and the theoretical validation. Moreover, the research pursues naturalistic views, assuming both non-
deterministic and non-programmable variables that do not relate by linear cause-effect relationships.

**Broad Outline of the Conclusions of the Investigations (Table 3 to Table 6)**

In general, the developed models were judged positively by their designers, as follows: (i) with some potential that ‘stylised typifications’ should test (A); (ii) useful for objective assessment of the need for individual MCS (B); (iii) satisfactory, because useful results relating to the appropriate behaviour of the installed CAPM could be obtained (C); (iv) positively discriminatory between the system needs of firms within the same industry, facing the same general environment and employing the same process technology (D); (v) useful to pursue the implementation of consistent manufacturing strategies both internal and externally (E); (vi) helpful, once it resulted in a workbook to specify and select the appropriate software, which was supported by a SERC grant (F); (vii) successfully including the features to be employed as a design tool of systems operating in a dynamic environment, because of its positive testing in different environments (G); (viii) valuable to those who plan to buy/develop and implement a PPC package (H); (ix) successfully pointing out the way to the achievement of world class (I); and, (x) successfully resulting into MPCS that are designed to co-ordinate the execution of manufacturing activities to support customer requirements and strategic objectives (J).

**Discussion of the Conclusions of the Investigations (Appendix Table 1 and Table 2)**

The positive evaluation that most of the researchers make of their own models appear, at first sight, to be a matter of opinion not explicitly supported. In fact, even when questionnaires were issued the results were not appreciated after the statistics
rules (C). Moreover, the addressing and explanation of the confirmatory case studies was very humble. It should be mentioned that there might be more information available about the rival approaches but not externally reported or even gathered by this research. Nevertheless, research validation, as such an important issue, should have been detailed mentioned in the papers analysed, some of them reporting seminal work. Thus, the evaluation of the approaches is mostly left to deficient political arguing due to the nature of problem and to a fragile methodological basis.

Moreover, the self-assessment exercises of the rival researches are usually related to their initial purpose. However, some initial claims (vide Appendix Table 1) were mostly forgotten, for example the implementation and the operational aspects concerning the strategic process, in addition to the structural issues; the relationship between PPC and the other control procedures within a holistic and integrated scope; or, the discussion of the role of the IS/IT strategy within the strategic approach. In addition, other initial intentions were softly or incompletely addressed, for example the contingency factors (determinants of organisational structure); or, the validation of the research results.

**Conclusions**

A previously deducted conceptual model (Silva 2002: 4, 137, 174) was purposefully compared with other systems thinking, in order to complete a theoretical validation exercise (Vilas-Boas 2009a). Thus, ten significant rival frameworks were chosen, described and analysed. These approaches were recognised as important as the soft systems one, but they also were found contrastively different.

It is argued that this validation process after the stage 4b of SSM contributed to add sufficiency to the necessary condition for finding relevant PPC procedures, which had
been previously checked in stage 4a (Vilas-Boas 2009a) – finding ‘true’ relationships. As further research, the model usefulness should also be set against real-world activities in other different contexts.

Finally, this exercise was expected to provide a contribution to the practitioner because it appeared to have helped in structuring a complex situation by providing credibility and trustworthiness to the conceptual model through its validation process. The choice of the soft systems thinking methodological paradigm and its operationalisation were relevant, updated and unusual contributions to the design of enquiries concerning situations with significant social and political dimensions (Vilas-Boas 2009c). In fact, there is a growing safety feeling that the proposed model is, now, much closer to what it appeared to be than before this exercise.

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- 29% found it helpful to set CAPM contribution</td>
</tr>
<tr>
<td><strong>Models and outcomes</strong></td>
<td></td>
<td></td>
<td>- Four stage audit tool</td>
</tr>
<tr>
<td></td>
<td>- Typification of production control concepts</td>
<td>- MCS depend very much on the following issues</td>
<td>(i) Product mix, manufacturing &amp; product characteristics</td>
</tr>
<tr>
<td></td>
<td>(i) Market: product specificity, demand regularity &amp; uncertainty, product life cycle</td>
<td>- Internal considerations: products, manufacturing processes, workforce and systems</td>
<td>(ii) Database, decision support &amp; transaction processing characteristics</td>
</tr>
<tr>
<td></td>
<td>(ii) Technology: product complicity, number of processes per product</td>
<td>- External considerations: market demand</td>
<td>(iii) Competitive measures</td>
</tr>
<tr>
<td></td>
<td>(iii) Production org.: internal co-ordination, diversity, unit convergence, volume, price, added value</td>
<td>- Manufacturing, systems complexity, which requires a MCS need and can be used to assess the MCS requirements</td>
<td>(iv) Establish source of CAPM problems/adequacy</td>
</tr>
<tr>
<td></td>
<td>(iv) Control of a chain of production centres: integration, supplier characteristics</td>
<td>- Uncertainty parameters, which create a MCS need and they may inhibit the effective implementation of MCS</td>
<td></td>
</tr>
<tr>
<td></td>
<td>(v) Order generation for both customers &amp; factory: on stock/on order</td>
<td>- Flexibility characteristics, which help to overcome problems introduced by complexity and uncertainty</td>
<td></td>
</tr>
<tr>
<td></td>
<td>(vi) Capacity allocation and sequence determination: fixed/variable</td>
<td>- Essential prerequisites for success, which are top mgmt. commitment, education and training, discipline, data accuracy and attitude to change</td>
<td></td>
</tr>
<tr>
<td></td>
<td>(vii) Requirements planning: statistical/deterministic</td>
<td>- Appropriate to effective implementation to follow a MRPII structure to assess the MCS requirements</td>
<td></td>
</tr>
<tr>
<td></td>
<td>(viii) 3-D matrix to make an overall allocation of production control concepts to different production situations</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Conclusion</strong></td>
<td>- The characteristics above identified can be used to create a structured framework for objective assessment of the need for individual MCS</td>
<td></td>
<td>- The proposed framework was found satisfactory</td>
</tr>
<tr>
<td></td>
<td>- For general consideration, stylised typifications give rough indications for practice &amp; illustrate the method</td>
<td></td>
<td>- Useful results relating to the appropriate behaviour of the installed CAPM could be obtained</td>
</tr>

Notes:
1. **G** Banerjee et al. (1993)
2. **I** Tatsiopoulos and Mekras (1999)
3. **I** Souza (1993)
Table 6
Rival approaches to find relevant PPC procedures (Part IV/IV)

(J) Davies et al. (1996); Kochhar et al. (1997)

| Gap | Requirement for detailed understanding of the relationships between performance measures, contributing variables and associated best practices
| Problems associated with traditional financial performance measures
| Little measurement of effectiveness & efficiency of MPCS, particularly, in relation to the strategic objectives
| Absence, informal or wrong measurements of the performance of most of the MPCS modules

| Objective/ purpose | To improve operational performance through the MPCS by linking measures of performance, practices and strategic objectives

| Scope | A generic MPCS model is followed. It defines generic processes, known as modules most of which applicable to all manufacturing companies although the way in which they are organised may not match the functional organisation of the company

| Expected results | Improvement of the MPCS. They can be critical to the performance of the whole organisation and a source of competitive advantage

| Research method | Exploratory field studies: identify measures, priorities, actual values, critical issues, causal relationships, data collection difficulties/cost, effect on performance indicators, improvement action assessment, confirm best practices
| Expert knowledge

| Validation of results | Verbal presentations given in the four original case studies
| Analysis of each of the detailed reports from the field studies and, overall assessment of the findings

| Models and outcomes | Indication of the appropriate measures and practices and the full effects, both desirable and undesirable aspects, of taking action on a specific area of performance
| From the organisation’s top level strategic objectives, objectives for each model of the MPCS system is defined, with measures of performance implemented to support these objectives
| Variables and practices affecting these measures are identified, as well as the effects of implementing the practices and manipulating the variables on the desired, and other, measures of performance.
| The relationships between the identified measures of performance, variables and practices provide information on the full effects of taking action intended to improve a specific area of performance

| Conclusion | Strategic objectives can be developed throughout the organisation and focused on the areas that can satisfy them. This has particular importance within MPCS as they are designed to co-ordinate the execution of manufacturing activities to support customer requirements and strategic objectives
| Many MPCS are simply no more than transaction processing systems
| There is little understanding of cause and effect relationships. Further research is required to contribute to the integration of overall and sustainable performance
PROCESS OF VALIDATION OF COMPLEX CONCEPTUAL MODELS AFTER SOFT SYSTEMS

Purpose

This paper concerns a dimension of Corporate Entrepreneurship related to the strategic development of the organisational structure.

Theoretical background

The author has been working in a framework that positions organisational development by considering knowledge from two core schools of thought: the strategists and the structuralists. An extension to this framework was recently proposed by introducing an innovative definition for structure adequateness, as follows:

- «an organisational structure is found adequate if relevant choices for all its design parameters can be met or, at least, argued for.»

This definition also considered that two types of theoretical validation exercises were required, in order to assure the necessary and sufficient conditions for setting the relevance of the design parameters. These two validation exercises, which were performed for one design parameter, followed stages 4a and 4b of a methodology recognised by the scientific community – the Soft Systems Methodology (SSM) (Checkland, 1994). In fact, a credible scientific methodology is a requirement to go away from the doxa domain and to build up knowledge that targets the scientific label.

Paper aim

This paper detailed the process to theoretical validate a conceptual model concerning relevant Production Planning and Control (PPC) procedures, as regards stage 4b of SSM.
**Objectives and research question**

The conceptual model should provide a base for ordered questioning (Checkland, 1994: 178) that will be redefined and presented as a credible audit tool. Then, a research question arose, as follows:

- **How to operationalise** this model, in order to argue for relevant PPC procedures?

**Design/methodology/approach**

Ten rival working frameworks were purposefully selected and described, as representing the other systems thinking, that the researcher outstanding admired. Then, the proposed conceptual model was compared with those ones, according to stage 4b of Soft Systems Methodology.

The dimensions that were analysed were classified into two categories, as follows:

i) The first one concerned the research definition, i.e. gap, purpose, scope and expected outcomes;

ii) The second one concerned the research design, i.e. conceptual model, research methodology and validation of results (both empirical and theoretical).

The validation of the conceptual model should not concern an accept/reject decision making but, instead, it should identify models that are more defensible than others (Checkland, 1994: 173). In fact, after the validation exercise, one could only argue for a conceptual model that should be more defensible than others with regard to inconsistency, inadequacies and completeness. Thus, the conceptual model validation was attempted by discussing its similarities, contrasts and completeness with regard to the rival approaches. Other authors were also included in the testing process that followed, whenever their remarks were found as significant contributors.
Findings

The positive evaluation that most of the researchers made of their own models appeared, to be a matter of opinion not explicitly supported. In fact, even when questionnaires were issued the results were not appreciated after the statistics rules. Moreover, the addressing and explanation of the confirmatory case studies was very humble. Thus, the evaluation of the approaches was mostly left to deficient political arguing due to the nature of problem and to a fragile methodological basis.

Moreover, some initial claims were mostly forgotten, *e.g.* the implementation and the operational aspects concerning the strategic process, while other initial intentions were soften or incompletely addressed, *e.g.* the contingency factors or, the validation of the research results. Research validation, as such an important issue, should have been detailed mentioned in the papers analysed, some of them reporting seminal work.

Relevance/contribution

This exercise was expected to provide a contribution to the practitioner because it appeared to have helped in structuring complex situations by providing credibility to the conceptual model. Thus, it was shown that the methods of science could help to improve the trustworthiness of research findings and so, getting a more robust contribution to the knowledge. In addition, guidance to address the operationalisation of stage 4b of the Soft Systems Methodology (SSM) was provided.

In the future, the model should also be empirically testing for the same design parameter, in order to check the robustness of the proposed mid range theory, as regards its usefulness.
Finally, it was recommended that both theoretical and empirical tests were extended to all design parameters of the organisational structure, in order to set the scopes for their individual relevance and also, to establish their usefulness. This would enable a more trustful overall discussion about the adequateness of organisational structures to pursue strategic business development.

Entrepreneurial opportunities identification processes, an exploratory study of French entrepreneurs from difficult districts

Amine CHELLY

Abstract

Opportunity identification is one of the most important issues in entrepreneurship. Indeed, one can’t speak about entrepreneurship without speaking about opportunities (Shane and Venkataraman, 2000). However, the question of what is an entrepreneurial opportunity and if it is discovered, researched, created, emergent, identified ... is still unresolved. Based on the work of Sarasvathy and al. (2003) on opportunity identification processes, we propose in this paper to analyze the process of identifying entrepreneurial opportunities within three entrepreneurs from deprived areas in the Paris region in France. Our goal is to understand and identify some trends from these entrepreneurs on their way to identify business opportunities and to understand, therefore, the specificity of business opportunities identifying processes

Introduction

Many studies in entrepreneurship (for example: Low, and MacMillan 1988; Stuart, and Abetti 1990) showed that the idea about the existence of differences between entrepreneurs and managers or other economic actors is not verified. Although researchers have not completely agreed on a definition of the term "entrepreneur" and "entrepreneurship" (for example: Bruyat 1993; Verstraete 1999; Gartner 1988), a large majority of them grants to give a prominent place in the field of entrepreneurship to the concept of "opportunity identification" (Ardichvili and al. 2003; Bygrave, and Hofer 1991; Kirzner 1979; Venkataraman 1997; Shane, and Venkataraman 2000). Ardichvili, and al. (2003) argue that opportunity identification is one of the most important skills that successful entrepreneurs must have. According to Gaglio and Katz (2001), "understanding opportunity identification process represents one of the most central questions in the field of entrepreneurship" (p. 95). Shane and Venkataraman (2000) believe that one of the fundamental issues in entrepreneurship research is "why, when and how some individuals and not others discover and exploit opportunities." The question of
“where” and “how” entrepreneurs identify entrepreneurial opportunities remains elusive and continues to be relatively ignored. Despite its theoretical and practical importance while it is the first step in the entrepreneurial process (Baron, and Shane 2005), research regarding opportunity identification remains under developed which is very surprising because without opportunity identification, we can’t talk about entrepreneurship (Shane, and Venkataraman 2000).

After presenting the specificity of the opportunity based-view in entrepreneurship (1), we focus in this paper on entrepreneurial opportunity identification processes within a group of entrepreneurs from some “difficult” districts in the suburbs of Paris, France (2). The goal is to understand and identify some trends from these entrepreneurs on their way to identify entrepreneurial opportunities.

1. The Opportunity Based-View in Entrepreneurship

1.1. Entrepreneurial Opportunity: an Ambiguous Concept

In the past, researchers have become interested in entrepreneurship as a process (for example: Bygrave, and Hofer 1991; Covin, and Slevin 1991; Gartner 1988; Lumpkin, and Dess 1996) and opportunity identification appears to be the most critical step (the first) of this process (Hills 1995; Timmons, and al. 1987).

Although definitions of entrepreneurship vary (for example: Kirzner 1973; Schumpeter 1974; Stevenson, and al. 1989), the fundamental activity of entrepreneurship stays, according to Gartner (1985, 1990), "the creation of a new organization." Thus, a major component of any firm should be the identification of entrepreneurial opportunities (for example: Bhave 1994;
Hills 1995; Timmons, and al., 1987). Kirzner (1973, 1979) supports the idea that the central role of the entrepreneur is to recognize an economic disequilibrium and turn the opportunities that arise into an advantage. Bygrave (1989a, 1989b) called the creation of an organization to pursue an opportunity, the "entrepreneurial event". Some define entrepreneurship as the process of creating value by combining resources to exploit an opportunity (Stevenson, and Jarillo-Mossi 1989), in some cases, ignoring the resources available.

Timmons (1994) developed a model representing the three driving forces of entrepreneurship which include: (1) entrepreneurs (2) opportunity identification and (3) the resources necessary to create an organization. All around the process, there are factors such as risk, chaos, information asymmetries, resource scarcity, uncertainty, paradox and confusion that make it more complicated. Successful entrepreneurship could take place only when all these three elements fit each other. The challenge for the entrepreneur is to manipulate and influence the factors that are around, in real time, to increase his chances of success of the organization. As noted by Timmons (1994), time to move forward and not stop the process of identification and seizure of an opportunity is often based on timing.

A comprehensive study on past research related to the concept of opportunity shows that there are several definitions of this concept, a "situation" (Stevenson, and al. 1989), an "economic disequilibrium" (Kirzner 1973), or "an idea that leads to a business concept" (Bhave 1994) or a new "production function" (Schumpeter 1934). Timmons (1994) argues that an opportunity "has the qualities of being attractive, sustainable and timely. It is also rooted in a product or service that creates and brings value to the person who buys or whoever uses the last "(p. 87). The term "opportunity" is very similar to "love" everyone knows what it is, but it is difficult to define because it means different things to different people.

Table 1 – Some definitions of the concept of opportunity

It appears from the above definitions that the concept of opportunity is unclear. Indeed, according to the scientific and intellectual sensitivity of the researcher, we have an attempt to define the opportunity. It must be noted that all attempts bring any light on this concept, but the first problem to define is that it is a concept that is considered *a posteriori*. One of the attempts to synthesize the visions of opportunity identification that we find in the literature in entrepreneurship is the one proposed by Sarasvathy and al. (2003).

1.2. Entrepreneurial Opportunities Identification Processes

The conclusion that we made in the preceding paragraph allows us to further analyze the entrepreneurial opportunities identification processes. To do this, we will rely on the work of Sarasvathy et al. (2003). Sarasvathy et al. (2003) have indeed proposed a new typology of
entrepreneurial visions of opportunity into three categories based on three different ways of seeing the market that offers the economics literature. The first view sees the market as "a process of resource allocation", second as a "discovery process" and the third as a "creative process".

From these three visions, which are based respectively on the work of Hayek (1945), Knight (1921) and Buchanan, and Vanberg (1991, cited by Sarasvathy, and al. 2003), Sarasvathy, and al. (2003) have modeled entrepreneurial opportunity as a function, a process or a set of decisions. They have built a typology of processes of identification of entrepreneurial opportunities in three categories

1. Opportunity Recognition: If both sources of supply and demand exist rather obviously, the opportunity for bringing them together has to be "recognized" and then the match-up between supply and demand has to be implemented either through an existing firm or new firm. Franchises are an example.

2. Opportunity Discovery: If only one side exists, demand or supply, the other side has to be "discovered" before the much-up can be implemented. Examples include drugs for certain conditions (the application already exists, but the offer has to be found) and applications for new technologies such as personal computers (supply and demand there is to discover).

3. Opportunity Creation: If neither supply nor demand exists in an obvious manner, one or both have to be created, and multiple economic inventions in marketing, finance, etc… are made to make the opportunity come into existence.

According to Sarasvathy, and al. (2003), an opportunity is the possibility for economic agents to allocate resources to good use to achieve specific goals if we view the market as a place of
resource allocation (opportunity recognition). The opportunities are recognized in this case through a process of deduction. Following the vision of the discovery, an opportunity appears as the possibility of correcting errors in the system and creates new ways to achieve those purposes. Opportunities are discovered through the process of induction. For the creative perspective, an opportunity is defined as an opportunity to create new ways and new purposes. It is created through the process of abduction.

We find in opportunity discovery and recognition, the vision of the Austrian school and its followers, who see entrepreneurial opportunity as an objective reality, pre-existing entrepreneurs and identifiable as such (Kirzner 1997; Shane, and Venkataraman 2000; etc.). The main theoretical trends in this vision of opportunity support the idea that opportunities are objectively identifiable (Shane 2003), but the problem with these approaches is that they are not testable in the field since the unique opportunity with which we work is one that has become visible. Opportunities which are not perceived as such do not exist. An opportunity is there when someone sees it (Holmquist 2004). This vision of opportunity is near to the SWOT model (Strengths, Weaknesses, Opportunities, and Threats) in strategic management. In fact, opportunities in this model are objective realities in the environment and completely independent from organizations actions.

Opportunity creation corresponds therefore to the new vision of opportunity as a social construction emerging from interactions and confrontations between the wearer and the various stakeholders in the draft. We find this way of looking at opportunities in strategic management as well. Indeed, to survive in an environment where competition is increasingly difficult, an organization should no longer be limited to identifying opportunities within the environment but must act on its environment (Ansoff, 1975) and by being prospective
economic intelligence. The idea of crossing entrepreneurship and business intelligence appears naturally in this case (Chelly 2003).

To summarize, we believe that entrepreneurial opportunities do not exist independently of the individual entrepreneur and describe them well (objective realities independent contractor) does omitting a part of their nature. Meanwhile, entrepreneurs do not exist separately from their structural context and their social environment, and try to analyze them outside this context will not fully understand (Sarason and al. 2006). If we want to better understand the relationship entrepreneur / opportunity, we must necessarily follow a theoretical perspective that considers the interconnection between the entrepreneur and the opportunity.

As part of this paper, we conducted an exploratory study within entrepreneurs from difficult districts in France. Semi-structured interviews were conducted with them to have all the information on the identification phase of business opportunity.

2. Opportunity identification Processes within French Entrepreneurs from Difficult Districts

We have conducted three in-depth interviews with entrepreneurs from districts known as "difficult". The three contractors were from the Paris region. The social environment of the four contractors is very difficult. Indeed, the lack of infrastructure of all types, the presence of unemployment, violence and crime at rates higher than other places are that people in "difficult" neighborhoods live in a real ghetto. The entrepreneurs interviewed are from immigrant families and many are second generation through our interviews, we could identify points of convergence between the three firms regarding their process of identifying
entrepreneurial opportunities. Indeed, we found that all these entrepreneurs have identified business opportunities in direct connection with their environment in which they lived. Their thorough knowledge of the difficulties encountered by people living in these neighborhoods has enabled them to identify these business opportunities. Exhibits 1 and 2 below support our thoughts.

*How did you identify your market?*
*I conducted a market study. I was accompanied by local store management. This step allowed me to identify the market, check what the local demand. And to my surprise, the request is actually much greater than what we anticipated in our study. Indeed, we are in an area where unemployment is very high. With rates reaching 30% in that city, one in two households had no car and the price of a taxi fare for travel from one city to another in the suburbs is too high for people. These clients use the services of our company* (Interview 1 AS)

Exhibit 1 - The role of prior knowledge in identifying business opportunity

*How did you identify your market?*
*Our company meets a real need expressed by a population overlooked by traditional Internet access providers, to avoid social isolation. Our goal is to enable clients to computerize tough neighborhoods and enjoy the Internet. Do you know that 60% of households in this neighborhood do not have landline? The explanation is very simple: for this population, the subscription contracts "long life" are generally traditional source of litigation. Just a problem of unemployment, a situation of "no activity", or uncontrolled consumption for everything degenerates. To overcome this problem, we propose to STF (No Phone) offer comprehensive services enabling them to access the Internet "through the air, without being forced to take a fixed telephone subscription to obtain the ADSL" (Interview 3 AM)

Exhibit 2 - The role of prior knowledge in identifying business opportunity

Opportunities identification can be explained by the extensive prior knowledge of difficult areas that entrepreneurs have, but also and above all their knowledge of the needs of the population that lives in these difficult areas. All contractors we interviewed identified business opportunities to address problems facing the population of these neighborhoods hard. Indeed, having information literacy more important than other people do not live in these neighborhoods, they manage to identify business opportunities faster than the latter. The role of asymmetric information which spoke Hayek (1945) and is the origin of entrepreneurship is
evident in this case. The sample 2 also shows that knowledge of consumer expectations is critical to the identification of business opportunities for the entrepreneur AM. As he says, the offer fits very well in public that he was very familiar namely tough neighborhoods.

These conclusions are in the same direction statements Von Hippel (1994). In fact, according to the author, people tend to locate the information that is related to what they already know. For example, if an individual has knowledge about a particular technical field, it will be, according to Von Hippel (1994), more sensitive to information regarding this and pay no attention to information about other areas they do not know.

In the same vein and also based on the vision of the Austrian school, Shane (2000: 448) argues that "entrepreneurs are discovering the opportunities associated with the information they already hold," is to that the opportunities associated with their prior knowledge. According to Shane (2000), is having prior knowledge that triggers the identification of the value of new information. He then distinguishes three major dimensions of prior knowledge as may be important for the identification of entrepreneurial opportunities: those that relate to the market, those on different ways to serve those markets and related consumer issues.

In his qualitative study of eight different companies that have been created on the basis of eight different opportunities from a single technological innovation, Shane (2000) tested and confirmed a number of assumptions which may be summarized as follows:

- No business opportunity is evident to any aspiring entrepreneur (the reasoning is based on the idea that all people do not hold the same information at the same time, Kirzner (1997));
- Idiosyncratic prior knowledge creates an individual "knowledge corridor" that helps to identify some opportunities and not others (Hayek 1945; Ronstadt 1988; Venkataraman
The previous information that comes from past experiences, education or other means influence the capacity of the contractor to understand, extrapolate, interpret and apply the new data so that those who do not hold this information earlier can’t do (Shane, 2003).

As for the identification process of entrepreneurial opportunities, we found that contractors had completed more than a process of discovery that opportunity recognition or creation of opportunity. Indeed, we found for example that the contractor ME intended to create an upstream firm to identify the business opportunity. His approach is totally in the context of a discovery opportunity. Despite the fact that the contractor ME had no idea to start a business input, he has sought to identify against a business opportunity from the time he rented the room. The exhibit 3 gives our words.

---

*How the idea to create such a company came to your mind?*

"I will surprise you, but this decision was completely thoughtless, and, to be totally honest, I reached the milestone on a” whim ". I found a well-placed and I hired without accurate picture of activity to perform. I just had more time to find this brilliant idea…

*This is not common but how the idea of restoration in the pasta comes?*

Indeed, this approach may not be common but that is what I was then given desire to create. I found myself with this room, and my savings. These two elements were decisive in my choice: I had to find an activity that required a local and a low intake. I immediately thought of the restoration. However, in a booming market, I do not want to do yet another "kebab, pizza or fast food" and I end up with competitors already established. I absolutely had to distinguish myself from others. I thought about selling pasta" (Interview 2 ME)

---

**Exhibit 3 – The intention to create a company before identifying the business opportunity**

We find in the Contractor AM, another approach that is more intentional but it is always the discovery of a business opportunity. Indeed, as we noted above, with prior knowledge of the needs of people in her neighborhood, the contractor has correctly identified am a business opportunity, first, to avoid as he says " to move to illegal employment, and secondly, to provide a solution to the problems of these areas.
* How the idea of creating such a company came to your mind?

"At the time, I had a job as adviser to the insertion. This activity led me to consider what role I could play in this neighborhood to help people to reintegrate socially and to become aware of the priorities I wanted to give my life. You know, in those places, we are evolving rapidly to the illegal employment, job insecurity. The problems become our lives! To my partners and me, the creation of business was our way out and the urban zone a boon that France proposed to us! Our idea was hatched six years ago, turning a chance meeting. Beyond the technical, commercial, financial, it has become for us a real adventure. Our company was born from our desire to create our own affairs, to combine our positive energies and suggest to this audience, we know well, offer personalized service that exists nowhere. It's a market opportunity which, in time, should absolutely continue and grow" (Interview 3 AM)

Exhibit 4 – Discovery of business opportunities

The process of opportunity discovery seems to be predominant in our results. This is suggests that we can find these results to a larger scale due to quantitative research. We believe that the special districts and the social environment in which entrepreneurs saw the push toward the discovery of opportunity rather than other process for identifying entrepreneurial opportunities. The social environment plays a role much greater among entrepreneurs from deprived areas than in other geographical areas.

Conclusion

The characteristic of entrepreneurs from "difficult" districts about their process of identifying entrepreneurial opportunities lies in the fact that they usually look for business opportunities to meet especially the difficulties faced by their neighbors. Creating an organization is for them a way to get out of precarious situations and especially not to divert the illegal work which is found very often in this type of neighborhood. Their intention to create a business, therefore precede any action by their part. So they pursue a process of opportunity discovery rather than another. This finding deserves further exploration and generalized to a larger sample of entrepreneurs.
We have attempted in this paper include some process for identifying entrepreneurial opportunities in a group of entrepreneurs from districts called "difficult". We are aware that our sample is too small but the aim of this exploratory study was to map out the ground for more work and a quantitative questionnaire methodology to validate assumptions.

This work has also helped to ask other questions about the process of identifying entrepreneurial opportunities. Indeed, the question of what role could be played by prior knowledge or intent of starting a business in identifying business opportunities is not yet addressed in a comprehensive manner. Similarly, the question of whether entrepreneurs from the city called "difficult" identify real business opportunities in direct link with their country of origin since there is that they generally come from immigration.

Abstract
This study presents a theoretical model on entrepreneurial potential and its operationalization through an Entrepreneurial Potential Assessment Inventory (EPAI). The model is composed of eleven first-order skills that were previously evidenced as characteristic of entrepreneurial potential, and four second-order dimensions. The instrument of assessment is composed of 33 items and was tested on samples of university students (N=580) and young employees (N = 552). Multi-group confirmatory factor analyses were conducted and results evidenced good fit indexes. Also presented is the Entrepreneurial Potential Index (EPI) algorithm and the distribution in categories. Results evidence that young employees present a greater EPI mean value. The Inventory and the Index are presented, tested and validated methodologically. Regarding the practical implications, the Inventory and the Index can be established as a tool of high value to the community to help identify competencies requiring development, and to help design or adjust training courses in entrepreneurship.

Key-Words - Entrepreneurial Potential; Entrepreneurial Potential Assessment Inventory; Entrepreneurial Potential Index

Introduction

Multidisciplinary research on the entrepreneurship process has emphasized the importance of entrepreneurship promotion as a critical factor in economic development.
(Estrin, Meyer, and Bytchkova, 2006), social development (Licht and Siegel, 2006), self-employment (Parker, 2006), and technological and innovation development (for example, Berchicci and Tucci, 2006).

More than seventy years after the first contributions of Joseph Schumpeter (1934), entrepreneurship research is becoming a more stable field with his own theoretical, empirical and methodological debates (for example, Connelly, Ireland, Reutzel, and Coombs, 2010). However, there are still some theoretical, empirical and practical aspects that require deeper research, especially with regard to explaining the processes that contribute to enhancing the success of entrepreneurship programs.

The frameworks of these programs assume that it is essential to encourage the young, university students and young employees in particular, to develop entrepreneurship and a spirit of innovation. However, despite extensive entrepreneurial programs and the emphasis on academic entrepreneurship (for example, van Praag, 2009), knowledge about the operationalization and measurement of the entrepreneurial potential is still scarce and poorly systematized.

The present study aims to contribute to the development of the theoretical and empirical entrepreneurship field, through the proposal of an entrepreneurial potential assessment instrument and index. Thus, the present paper (a) presents a theoretical model for the operationalization of entrepreneurial potential; (b) empirically tests the theoretical model on two samples: one composed of university students and the other composed of young employees; (c) contributes to the empirical validity of the Entrepreneurial Potential Assessment Inventory (EPAI); and (d) presents the Entrepreneurial Potential Index (EPI).

Literature has evidenced that including entrepreneurship on graduation courses contributes to the intention to create new ventures (for example, Sanz-Velasco, 2007;
Shinnar, Pruett, and Toney, 2009). Up to the previous decade, the trend to teach entrepreneurship on the graduate courses was mainly focused on the management and business fields (for example, Volkman, 2004). Nowadays, there is dissemination to the main fields, such as the arts, geography, environmental science and nursing (for example, Gose, 1997; Maguire and Guyer, 2004; Dickerson and Nash, 1999).

Today it is largely assumed that academic entrepreneurship is one of the fundamental motors of economic growth and wealth creation (Shane, 2004b).

As a result, and in accordance with the emergence of academic entrepreneurship, universities have pursued policies that promote the creation of academic entrepreneurship centers and encouraged students, researchers and academics to patent their discoveries, spin-offs, and technological licenses, thus effectively expanding the universities’ activities (for example, Wood, 2009). Another strategy designed to foster academic entrepreneurship focuses on creating entrepreneurial opportunities and training students in the main skills, competencies and entrepreneurial activity (van Praag, 2009). One example of this is the initial financial funds for business opportunities to motivate academics and university students to become entrepreneurs and to launch new ventures (Shane, 2004a; Wright, Clarysse, Mustar, and Lockett, 2007). Another is the European Commission’s Entrepreneurship Action Plan to promote an agenda on entrepreneurship policy (Commission of the European Communities, 2006). Thus, it is clearly evident that the importance of promoting entrepreneurship is a widespread issue, and one that has the attention of academic, governmental and organizational agents.

It is becoming more and more important to focus on the academic agents and on the universities’ role in promoting entrepreneurial potential. As far as the university students and young employees are concerned, and with regard to the current economic
situation, entrepreneurship emerges as a strategy to tackle unemployment (for example, Santarelli, Carree, and Verheul, 2009; Remeikiene and Startiene, 2009). There is a clear need for research on academic entrepreneurship and university technology transference regarding entrepreneurial projects (Link and Siegel, 2007).

University students’ aspirations to become entrepreneurs have been studied in several cultural contexts, using different methodologies. For example, a recent study conducted in South Africa evidenced that the planned behavior theory (for example, Fishbein and Ajzen, 1977) explains 27 percent of the entrepreneurial intention variance among students (Gird and Bagraim, 2009). Another study on aspiring to become entrepreneur conducted in Japan evidenced that, for example, the unemployment rate, market growth, and market size all have a positive effect on the potential for entrepreneurship (Harada, 2005). However, the focus of that study is on venture level analysis and assessing the potential of the business idea, and as such refers to a different level of analysis from the present study.

Yet another study assesses the entrepreneurial potential of U.S. and German students and the results evidence that the German students score significantly lower than the U.S. respondents (Raab, Stedham, and Neuner, 2005). However, their entrepreneurial potential was assessed with an instrument developed by Müller (2002), which assesses personality dimensions and does not reflect the integrative literature overview.

Despite the aforementioned research on intention to launch a venture and on entrepreneurial potential, there are evident theoretical gaps and there is a clear need to develop an acceptable assessment instrument. More specifically, it has been shown that researchers apply different assessment methodologies on the intention to launch a new venture or on entrepreneurial potential, presenting different operationalizations among
the different theoretical constructs and thus weaken validation indicators (for example, Gird and Bagraim, 2009; Raposo, Paço and Ferreira, 2008; Teixeira, 2008; Couto and Tiago, 2009). Intending to get past these difficulties, the present research aims to clarify entrepreneurial potential and to empirically validate its operationalization.

**Entrepreneurial potential: Construct Theoretical Model**

The entrepreneurship process is deeply associated to the individuals’ characteristics (Baum, Frese, Baron, and Katz, 2007) given that he/she is the main agent in the decision making process to implement entrepreneurial initiatives and to assume the recurrent consequences. Thus, research has focused on the identification and description of the psychological characteristics, traits or personality characteristics that differentiate the entrepreneur (for example, Baron and Locke, 2004; Brandstätter, 1997). In several decades of research on the question “Who is an entrepreneur?” (Carland, Hoy, and Carland, 1988; Gartner, 1989) empirical evidence is disperse and fragmentized in the literature, which makes it difficult to develop a broad theoretical body of evidence.

Frequently, assessment instruments refer to the operationalization of specific psychological constructs such as entrepreneurial self-efficacy (for example, McGee, Peterson, Mueller, and Sequeira, 2009). These scales are not sufficient to assess a pattern or a typical entrepreneurial competencies profile (for example, Lumpkin, Cogliser, and Schneider, 2009) because: (a) theoretically, there are different conceptualizations on the same construct and there is no integration of the several psychological traits in the comprehensive model, which would comprise all of the most distinctive psychological traits or individual dimensions; (b) methodologically, there are different scales developed to assess the same construct and most of them inadequately
fulfill the validation and psychometric requirements; (c) in a reality based perspective, the existing assessment scales are not sufficient to be applied to the entrepreneurial activity, because they are time expensive, and the coding system is difficult and not comparable and intuitive for the entrepreneurship agents.

Thus, there is a clear need to develop an integrative theoretical model for entrepreneurial potential: one that will bring together the most outstanding aspects of previous empirical research, and theoretical suggestions. It is important, also, to develop an assessment instrument based on this integrative theoretical model, which would allow the entrepreneurial potential construct to be assessed in one single instrument.

Departing from the evidence in the literature, it is possible to explain the entrepreneurial potential construct on four dimensions: (a) entrepreneurial motivations; (b) psychological competencies; (c) social competencies; and (d) management competencies.

**Entrepreneurial motivation** has been identified in the literature as one of the greatest predictors of a new venture’s success (Baum, Locke, and Smith, 2001). It expresses focused and directed effort on the entrepreneurial activity (for example, Locke and Baum, 2007). The *psychological competencies* refer to the broad group of skills and attributes which characterize entrepreneurial individuals (for example, Chell, 2008). The *social competencies* denote an individual’s ability to interact effectively with others (for example, Baron, 2000). The *management competencies* are defined by the basic and transversal competencies in business management (for example, Baum, Locke, and Smith, 2001).

Given that there are various studies and that the empirical evidence available is diverse, there is an urgent need for systematization of the characteristics that make identifying entrepreneurial potential possible. Table 1 presents a summary of the typical
entrepreneur’s main characteristics, organized according to entrepreneurial motivations, psychological competencies, social competencies and management competencies.

| **Vision** | Ability to preview and visualize the goals, objectives and future realizations | Vision capacity has been shown to be a predictor of entrepreneurial venture development; it has been identified as a crucial motivational element in charismatic leadership. | Chell, 2008; Baum, Locke and Smith, 2001; Baum, Locke, and Kirkpatrick, 1998; Bass, 1990 |

| **Resources Mobilization capacity** | Ability to gather the resources to manage the venture (financial and material) | Identified as an important predictor of entrepreneurial success, given that resources are an essential feature of new venture development and make it easier for new ventures to adjust to complex environments. | Ramachandran and Ray, 2006; Romanelli, 1987; Tan and Peng, 2003 |

| **Leadership Capacity** | Capacity to mobilize and manage others allied to the business growth vision | Entrepreneurs share some characteristics with leaders. | Chell, 2008; Vecchio, 2003; Eyal and Kark, 2004 |
Rather than producing an exhaustive description of evidence and putting forward theoretical entrepreneurial traits, it is more important to highlight the main aspects that really allow us to identify and differentiate the different dimensions to entrepreneurial potential. Thus, and in accordance with the literature review, figure 1 presents a conceptual model that integrates the four central dimensions that definitively contribute to the emergence of entrepreneurial potential.

Based on this conceptual model, we operationalized each dimension through a set of indicators previously tested in empirical research and others specifically created for this study. This operationalization aimed to create a measurement instrument of entrepreneurial potential with psychometric rigorousness. The procedures to create new assessment instruments suggested by the specific literature (for example, Kline, 1993; Devellis, 1991) were followed. Thus, the present study reports the development of a structured survey with 42 items that operationalizes the main theoretical and empirical
constructs that evidence a significant link with entrepreneurial potential. The final version of the Entrepreneurial Potential Assessment Inventory (EPAI) includes thirty-three items. The Inventory was tested in a sample of 580 university students and in a sample of 552 young employees.

Method

Sample

This study includes a sample of 580 university students and another sample of 552 young workers, involved in the labor market for 3 years. Of the university students, all aged between 17 and 30, 62.3 percent are female with a mean age of 22.7 (SD = 4.2). The great majority of the students are undergraduates (92.2 percent) and 7.8 percent are doing a masters degree. With regard to the young employees (N = 552), their ages range from 18 to 30, they are all involved in the labor market and 56.6 percent are male. The mean age is 25.1 (SD = 2.3). The great majority are graduates (73.3 percent), 23.3 percent have a masters degree and 3.3 percent have a PhD. Table 2 presents the demographic description of the samples.

**EPAI Inventory Development Procedure and Measures**

To develop the Entrepreneurial Potential Assessment Inventory (EPAI), semi-structured interviews of entrepreneurs were first conducted to assess the dimensions identified in the relevant literature, and their applicability. Twelve interviews were conducted and a first inventory version of 84 items was compiled, based on evidence from empirical studies, literature review and information from the interviews. The first inventory version was discussed with the twelve entrepreneurs with the aim of assessing how adaptable the items contained in it would be to the entrepreneurial context.

After data content analysis from the entrepreneurs’ interviews, and based on the evidence from a previous literature review (for example, Brice and Nelson, 2008; Mueller and Thomas, 2000; Cross and Travaglione, 2003; Markman, Baron, and Balkin, 2005; Baron and Markman, 2000; Chen, Greene, and Crick, 1998), we compiled an inventory form with 42 items using the 5 points concordance scale (1 = completely disagree; 5 = completely agree). These items resulted from adapting some items used in previous studies (for example, Chen, Greene, and Crick, 1998; Baron and Markman, 2000), and another created specifically for EPAI.

**Measures**

*The desire to be independent* was measured by four items as, for example, “One of the most important things to me is having a job were I’m my own boss” or “One of my life motto’s is to have an independent life”.

*Economic motivation* was measured by four items (for example, “I will do my best to make as much money as possible” or “One of my mottos is to have the most money”).
Innovation capacity was measured by four items, as for example, “People often ask me for help with creative activities” or “I often surprise people with my new ideas”.

Emotional intelligence was measured by four items, among them there were “I easily recognize my emotions as I experience them” or “I have control over my emotions”.

Resilience was measured by four items, as for example, “In difficult times I tend to focus on what helps me to overcome them” or “When something negative happens to me I am unwilling to respond” (inverted).

Communication and persuasion capacity was measured by four items (for example, “In most situations I can make other people to do what I want” or “Normally, I am able to persuade others of many things”).

Network development capacity was measured by four items, as for example, “I know people from a variety of different places” or “Last month I did not add anyone to my network of contacts on my phone” (inverted).

Entrepreneurial self-efficacy was measured by four items, among them were: “When I decide to start any business project, I know I will see it through” or “I know that in one way or another, I usually get what I want”.

Vision was measured by four items (for example, “I can see clearly how to implement unlikely initiatives” or “Usually I define effective strategies to achieve the goals I want”).

Resources mobilization capacity was measured by five items as for example “Normally, I can find the resources to implement the initiatives I have” or “Generally I know how to get the resources I need to move forward with the initiatives that are important”.

13
Leadership capacity was measured with five items, as for example “Usually I can mobilize people for the initiatives I propose” or “I can easily lead people who have differing ideas on initiatives that I seek to achieve”.

Results

Factorial Confirmatory Factor Analysis on the Entrepreneurial Potential Model

A confirmatory factor analysis using the AMOS 7 software (Arbuckle, 2006) was performed to assess adjustment of the entrepreneurial potential theoretical model to the data collected from the university students and the young employees.

In accordance with the classic model of survey development conducted by factor analysis (Kline, 1993), preliminary factor analyses were performed\(^1\). The results evidenced that the loadings of some items were not appropriate and consequently, they were deleted from the model. Thus, the best confirmatory model for the operationalization of entrepreneurial potential that we arrived at comprised 33 items.

Figure 2 presents the confirmatory model of the Entrepreneurial Potential Assessment Instrument (EPAI) with the first order and second order dimensions.

\(^1\) We do not present the detailed description of this analysis for reasons of parsimony.
The confirmatory factor analysis of the entrepreneurial potential construct (EPAI) was developed in two distinct stages. Firstly, the second order confirmatory model constructs were tested (i.e. entrepreneurial motivations, psychological competencies, social competencies and management competencies). Table 3 presents the fit indexes of the second order confirmatory factor analysis. The results evidence good fit indexes for the four models tested separately.

</tbody>
</table>

Next, the Entrepreneurial Potential Assessment Inventory (EPAI) model, including the 33 items, was developed as shown in figure 2. The model was first tested on each sample separately. The fit indexes for the university students’ sample ($\chi^2 =$
and for the young employees’ sample ($\chi^2 = 1090.38; df = 454; p < 0.01; \chi^2/df = 2.40; CFI = 0.90; RMSEA = 0.04; SRMR = 0.04$) evidence an adequate fit of the data to the model. The standardized regression coefficients analysis shows that the relationship between the first order and second order is statistically significant ($p < 0.05$). The second order standardized regression coefficients of the university students are: 

$B_{\text{entrepreneurial motivation}} = 0.34^{**}; B_{\text{psychological competencies}} = 0.85^{**}; B_{\text{social competencies}} = 0.62^{**}; B_{\text{management competencies}} = 0.97^{**}, \quad {^{**}p < 0.01}$.

In the young employees’ sample, the second order standardized regression coefficients are: $B_{\text{entrepreneurial motivation}} = 0.44^{**}; B_{\text{psychological competencies}} = 0.90^{**}; B_{\text{social competencies}} = 0.67^{**}; B_{\text{management competencies}} = 0.96^{**}, \quad {^{**}p < 0.05}$. The one factor confirmatory factor analysis evidenced poor adjustment to the data.

The multi-groups confirmatory factor analysis, including both the university students and the young employees, evidenced good fit indexes ($\chi^2 = 1594.32; gl = 908; p < 0.01; \chi^2/df = 1.76; CFI = 0.89; RMSEA = 0.03$) suggesting that there is structural invariance in the entrepreneurial potential construct. In other words, the structure of the entrepreneurial potential construct is both suitable for university students and young employees.

This result supports the validation of the theoretical model proposed for the operationalization of the entrepreneurial potential construct (Byrne, 1989). Thus, there are theoretical and empirical arguments to support the development of the eleven first order dimensions: desire to be independent, economic motivation, innovation capacity, emotional intelligence, resilience, communication and persuasion capacity, network development capacity, entrepreneurial self-efficacy, vision, resources mobilization capacity, and leadership capacity. Analogously, there are theoretical and empirical arguments to support the development of the four second order dimensions:
entrepreneurial motivations, psychological competencies, social competencies, and management competencies.

The construct reliability assessment was computed in accordance with Hair, Black, Babin, Anderson, and Tatham (2006). The entrepreneurial potential construct evidences a reliability of 0.88 suggesting that there is internal consistency among the items used in operationalization. Table 5 shows the reliability of the second order constructs (Hair, Black, Babin, Anderson, and Tatham, 2006). The first order reliability indexes are not presented for reasons of parsimony.

**Descriptive Analysis of the EPAI Dimensions and Comparative Analysis among University Students and Young Employees**

The descriptive statistics of the first-order variables on the university students and young employees are presented in table 6. The network development capacity presents the lowest mean value (M = 2.9) and the entrepreneurial self-efficacy presents the highest mean value (M = 4.1). There are significant statistical differences among the university students and the young employees with regard to the mean values of desire for independence ($F(1;1130) = 19.99, p < 0.01$), innovation capacity ($F(1;1130) = 3.48, p < 0.01$), emotional intelligence ($F(1;1130) = 14.12, p < 0.01$), communication and persuasion capacity ($F(1;1130) = 55.20, p < 0.01$), network development capacity
\( F(1;1130) = 77.67, p < 0.01 \), vision \( F(1;1130) = 30.01, p < 0.01 \), resources mobilization capacity \( F(1;1130) = 16.69, p < 0.01 \), leadership capacity \( F(1;1130) = 33.53, p < 0.01 \), and entrepreneurial self-efficacy \( F(1;1130) = 47.53, p < 0.01 \).

* significant differences, \( p < 0.05 \)

Based on the previous evidence of the validity of the second-order variables of the entrepreneurial potential construct, the dimensions of entrepreneurial motivation, psychological competencies, social competencies and management competencies were computed. The descriptive analysis of the second-order dimensions allows a holistic overview of the entrepreneurial potential differences among the university students and the young employees (Table 7).

| 1. entrepreneurial motivation* | 3.3* | 3.4* |
| 2. psychological competencies* | 3.3* | 3.4* |
| 3. social competencies*        | 3.1* | 3.4* |
| 4. management competencies*    | 3.6* | 3.8* |

* significant differences, \( p < 0.05 \)
There are significant differences between university students and young employees with regard to entrepreneurial motivation \((F(1;1130) = 6.22, p < 0.01)\), psychological competencies \((F(1;1130) = 32.20, p < 0.05)\), social competencies \((F(1;1131) = 23.28, p < 0.01)\) and management competencies \((F(1;1130) = 110.13, p < 0.01)\). Compared to the university students, young employees evidence greater mean values in all second-order dimensions.

**Entrepreneurial Potential Index - EPI**

After validating the entrepreneurial potential construct through the EPAI Inventory, we proceeded with development of the Entrepreneurial Potential Index (EPI).

This index is composed of the four entrepreneurial potential operationalization variables: psychological competencies (PC), social competencies (SC), management competencies (MC) and entrepreneurial motivation (EM).

In accordance with what the literature suggests, entrepreneurial motivation (EM) has a direct effect on venture launch development (Baum, Locke, and Smith, 2001) and is suggested as the main catalyst of the entrepreneurial process (for example, Shane, Locke, and Collins, 2003; Wainer and Rubin, 1969; Correia Santos, Curral, and Caetano, 2010). In this line of reasoning, entrepreneurial motivations are conceptualized as the greatest weight component. Thus, entrepreneurial motivation emerges on Index IPE as a squared component \((EM^2)\).

Management competencies (MC) were also identified in a previous literature review as crucial to venture launch, especially as these include vision and leadership competencies (for example, Baum, Locke, and Kirkpatrick, 1998). In the present study, management competencies also include entrepreneurial self-efficacy, which has been successively evidenced as an important predictor of successful entrepreneurial
initiatives (for example, Bandura, 1982, 1997; McGee, Peterson, Mueller and Sequeira, 2009). So, management competencies are a relevant contribution to the entrepreneurial potential construct. Consequently, management competencies also have a higher weight, although smaller than that of entrepreneurial motivation. This weight of the management competencies is mathematically translated by the simple multiplication of management competencies with the other variables.

The psychological competencies (PC) and social competencies (SC) are two essential and complementary pillars of entrepreneurial initiatives (for example, Baum and Locke, 2004). Research has evidenced entrepreneurs’ individual traits, including both psychological and social characteristics, stressing the importance of both competencies (for example, Chell, 2008). Consequently, the Index EPI includes both the psychological and social competencies, attributing to both the same weight, translated by the arithmetic sum of both.

Based on these theoretical and empirical evidences and the rationale presented, the Index EPI was computed using the following mathematical formula:

\[(1) \quad EPI = (PC + SC) \times MC \times EM^2\]

Where, EPI = Entrepreneurial Potential Index; 
PC = Psychological Competencies; 
SC = Social Competencies; 
MC = Management Competencies; 
EM = Entrepreneurial Motivation.

As previously highlighted, due to theoretical and empirical reasons, management competencies and entrepreneurial motivation have different weights on the Index EPI computation. This index proves to be an important tool for the quantification and measurement of entrepreneurial potential. According to the psychometric suggestions,
the gross results of the measurement sample should be changed into standardized results for ease of comprehension (for example, Laveault and Grégoire, 2002; Kline, 1993).

The gross results of the measurement sample were transformed into standardized results with mean 50 and standard deviation 10 (Cronbach, 1976). Thus, the EPI transformed was computed with mean 50 and standard deviation 10. This transformation allowed the creation of five categories for the distribution of the EPI values. The transformed values and category identification of the EPI distribution are presented in table 8.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The results show that the young employees present a higher mean EPI (M = 51.6) than the university students (M = 48.5). The results also show that a higher
percentage of participants are in the average category. At the same time, there is a lower percentage of young employees with a low average EPI (8.2 percent), and there is a higher percentage in the above average and far above average categories (19.0 percent and 1.3 percent respectively).

**Discussion**

The present paper presents a theoretical model validated empirically on the operationalization of the entrepreneurial potential construct. More specifically, a theoretical model integrating the differentiating characteristics of entrepreneurs in the main literature and an assessment instrument, were developed. The assessment instrument - the Entrepreneurial Potential Assessment Inventory - was applied to a sample of university students and to a sample of young employees. The Entrepreneurial Potential Index (EPI), an important tool for the quantification and comparison of different individuals’ entrepreneurial potential, was also developed.

The entrepreneurial potential theoretical model suggests that the construct comprises eleven first-order dimensions: desire for independence, economic motivation, innovation capacity, emotional intelligence, resilience, communication and persuasion capacity, development network capacity, vision, mobilization resources capacity, leadership capacity and entrepreneurial self-efficacy. These eleven first order variables express four second-order dimensions: entrepreneurial motivation, psychological competencies, social competencies, and management competencies. This theoretical model was successfully tested by multi-group confirmatory factor analysis, using university student and young employee samples.

The results show that the network development capacity presents the lowest mean value and the entrepreneurial self-efficacy presents the highest mean value.
Moreover, this research shows that there are significant statistical differences among the university students and the young employees with regard to the mean values of desire for independence, innovation capacity, emotional intelligence, communication and persuasion capacity, network development capacity, vision, resources mobilization capacity, leadership capacity and entrepreneurial self-efficacy.

Generally, young employees evidence a higher mean value in all dimensions (except for economic motivation and resilience) than university students. There are also significant differences among the second order dimensions: entrepreneurial motivation, psychological competencies, social competencies and management competencies. Thus, there are evident differences in the pattern of the first and second order dimensions of the entrepreneurial potential of the university students and young employees.

The superior results for the young employees could be due to nature of the dimensions assessed in the EPAI. More specifically, the EPAI assesses competencies, and previous research (for example, Caetano, and Tavares, 2000; Cascio, 1991) evidences that these are changeable dimensions depending on previous experience, knowledge acquisition, and necessity.

This study also presented the development of the Entrepreneurial Potential Index (EPI). This Index makes it possible to position individuals on a measurable continuum of entrepreneurial potential, and thus allows the comparison among them. The results evidence that young employees show a greater mean value of EPI than university students. Moreover, there are a greater percentage of young employees with a far above average EPI.

Again, this suggested superiority in the young employees’ sample can be explained by the nature of the dimensions assessed in the inventory (EPAI). Competencies development is dependent on knowledge acquisition, experience and
necessity development, thus making it more likely that young employees have higher scores.

Theoretical and Methodological Contributions

The present study presents some contributions to the theoretical development of the literature on entrepreneurs’ characteristics. More specifically, it proposes a theoretical entrepreneurial potential model, which was tested on one university student sample and one young employee sample. The main theoretical contribution refers to the suggestion of a model which results from the convergence of the distinctive psychological dimensions evidenced in the literature.

The research into the entrepreneurial personality (Chell, 2008) has progressively changed the focus from a simple description of personality or psychological characteristics to predicting entrepreneurial behavior and potential assessment. In this sense, this article also provides a contribution to the operationalization of the entrepreneurial potential construct, with the validation of an instrument for assessment. Moreover, previous studies on entrepreneurial potential do not present a theoretical model of convergence, but only a description of the various psychological and social dimensions (for example, Raab, Stedham, and Neuner, 2005). The model of entrepreneurial potential developed by Krueger and Brazeal (1994) focuses on the antecedents of the venture development process and therefore presents itself at a level different from that presented here.

This study confirms the importance of individual characteristics and skills included in the entrepreneurial potential model, contributing to the strengthening of prior empirical results and comparisons with theoretical propositions. For example, Baron and Markman (2000) argue that social skills are highly important in the
effectiveness of the behavior of the entrepreneur, and the present data support that proposition. The previous results on entrepreneurial self-efficacy corroborate the empirical studies by Chen, Greene and Crick (1998) and McGee, Peterson, Mueller and Sequeira (2009). However, this study goes beyond describing the importance of each characteristic of a singular way, since it presents a theoretical model integrating the various features.

For the methodological contributions, this study tested an assessment instrument for the entrepreneurial potential whose results appear to be important for future empirical research. The need to develop assessment tools with cultural validation has been highlighted in research on entrepreneurship (for example, Davidson, 2000). This paper also presents the Entrepreneurial Potential Index (EPI) which allows each individual position to be assessed within a scale that measures the potential to be an entrepreneur, according to a consistent theoretical model. The construction of indices of measurement has also been evidenced in the literature as a requirement for the development of the theoretical framework on entrepreneurship (Rumelt, 2005).

Limitations and Practical Implications

Despite the contributions made by this article, it also presents some limitations. More specifically, in the university student sample only four areas of science were assessed, which means that many other training areas, such as the artistic fields still need to be addressed. It will be interesting in future research to include samples from other areas, thus enabling the mapping of the entrepreneurial potential of students by field of training. Concerning the employee sample, only a sample of young people was measured, leaving the patterns of entrepreneurial potential for workers with greater experience still to be explored. It is further crucial to analyze the results of
entrepreneurs. This would be a baseline benchmark for other groups. In addition, tests should be developed that focus on incremental and differential validity, which is particularly critical in the selection procedures (Kline, 1993).

Regarding practical implications, the Inventory (EPAI) can establish itself as a tool of high value to the community, since it allows students, teachers, academics and financial funders of projects to assess the level of entrepreneurial potential as well as the dimensions that need to be developed. Since entrepreneurial potential is mostly composed of skills and competencies, it appears that there is the possibility of designing specific training to develop these competencies. In this sense, the EPAI helps to identify skills and competencies requiring development and training in a group of students. This is crucial to the universities, and allows training courses in entrepreneurship to be designed to fit to the needs of students. Thus, the EPAI becomes of vital importance to the design of or adjustment to the curriculum, for diagnosing the dimensions in which students have the greatest difficulty, and in signaling the need for skills development.

The Entrepreneurial Potential Index is presented as a tool that also has important practical implications. The direct measurement of entrepreneurial potential allows us to place an individual on a scale of intuitive understanding, thus enabling the comparison between different potential entrepreneurs and help in the investment decision making and / or the formation of entrepreneurial teams.

Against a background of economic and social crisis, entrepreneurship presents itself increasingly as a solution for self-employment (for example, Ashcroft, Holden, and Low, 2009; De Nardi and Villamil, 2009). In this sense, Entrepreneurial Potential Assessment Inventory (EPAI) and the Entrepreneurial Potential Index (EPI) can play a critical role in the early stages of the entrepreneurial process: the individual's motivation
and the assessment of skills critical to the development of entrepreneurial business success.

How to assess the entrepreneurial potential?

Introduction and Purpose

More than fifty years after the first contributions of Joseph Schumpeter (1934), the entrepreneurship research is becoming a more stable field, with his own theoretical, empirical and methodological debates (e.g. Connelly, Ireland, Reutzel, & Coombs, 2010). However, there are still some theoretical, empirical and practical aspects that require deeper research, mainly having in mind the explanation of the processes that contribute to the success of entrepreneurship programs and the entrepreneurial potential assessment. Nevertheless, the broad empirical and theoretical attempts and the entrepreneurial programs, the knowledge about the operationalization and measurement of the entrepreneurial potential is still scarce and poorly systematized.

The present study presents a tested proposal of an entrepreneurial potential index and its assessment. Thus, this paper (a) presents a theoretical model regarding entrepreneurial potential index; (b) empirically tests the theoretical model on two samples: one composed by university students and the other composed by postgraduate trainees; (c) validates the Entrepreneurial Potential Assessment Inventory (EPAI); and (d) presents the Entrepreneurial Potential Index (EPI) results.

There are many studies on the intention to launch a venture and on the entrepreneurial potential. However, there are evident theoretical gaps and a clear necessity to develop an assessment instrument. More specifically, it is evidenced that researchers apply different assessment methodologies on the intention to launch a new venture or on entrepreneurial potential, presenting different operationalizations and weak consistent validation of the theoretical constructs. (e.g. Gird, & Bagraim, 2009).
Departing from the literature evidence (Baum, Frese, Baron & Katz, 2007; Baron & Locke, 2004; McGee, Peterson, Mueller & Sequeira, 2009; Lumpkin, Cogliser, & Schneider, 2009) it is possible to clarify the entrepreneurial potential construct on four dimensions: (a) entrepreneurial motivations; (b) psychological competencies; (c) social competencies; and (d) management competencies.

The entrepreneurial motivations have been identified on literature as one of the main predictor of new ventures success (Baum, Locke & Smith, 2001) and express the focused and directed strength towards the entrepreneurial activity (e.g. Locke & Baum, 2007). The psychological competencies refer to the broad group of skills and attributes which characterize the individuals (e.g., Chell, 2008). The social competencies show refer to the individual capacity to interact efficiently with the others (e.g., Baron, 2000). The management competencies are defined by the basic and transversal competencies on business management (e.g., Baum, Locke & Smith, 2001).

**Methodology and Main Results**

Departing from the entrepreneurial potential theoretical model we built an assessment questionnaire with 33 items accordingly to the psychometric literature recommendations (e.g., Kline, 1993) - the Entrepreneurial Potential Assessment Inventory (EPAI). We tested the questionnaire on two samples: one sample of 580 university students and another on 552 postgraduate trainees.

The confirmatory factor analysis conducted with AMOS 17.0 evidenced good fit indexes on the university students samples ($\chi^2 = 785.60; gl = 454; p < 0.01; \chi^2/df = 1.73; CFI = 0.90; RMSEA = 0.04; SRMR = 0.05$) and on the postgraduate trainees sample ($\chi^2 = 1090.38; gl = 454; p < 0.01; \chi^2/df = 2.40; CFI = 0.90; RMSEA = 0.04; SRMR = 0.04$). Moreover, the multi-group confirmatory factor analysis evidence also good fit indexes ($\chi^2 = 1594.32; gl =$
908; p < 0,01; \chi^2/df = 1,76; CFI = 0,89; RMSEA = 0,03), evidencing that the entrepreneurial potential construct is operationalized by the EPAI.

The results evidence that there are significant statistically differences among the university students and the postgraduate trainees on the entrepreneurial motivation \( (F(4;1127) = 18,59, \ p < 0,01) \), psychological competencies \( (F(4;1127)=10,55, \ p < 0,05) \), social competencies \( (F(4;1127)=33,55, \ p < 0,01) \) and management competencies \( (F(4;1127) = 17,22, \ p < 0,01) \).

The validation of the entrepreneurial potential construct through the Entrepreneurial Potential Inventory (EPAI) opens new insights on the development of the Entrepreneurial Potential Index (EPI). Thus, the EPI is composed by the four second-order dimensions on the potential entrepreneurial construct: the entrepreneurial motivation (EM); the psychological competencies (PC); the social competencies (SC); and the management competencies (MC). Accordingly to the literature review and the present empirical evidences, the EPAI is operationalized through the following expression:

(1) \[ \text{EPAI} = (PC + SC) \times MC \times EM^2 \]

The EPAI emerges as an entrepreneurial potential quantification tool. Accordingly to the psychometric literature suggestions, standardized results with mean 50 and standard deviation 10 were computed (e.g., Laveault & Grégoire, 2002; Kline, 1993). Thus, 5 categories were developed: a very low entrepreneurial potential, a low entrepreneurial potential, a medium entrepreneurial potential, a high entrepreneurial potential and a very high entrepreneurial potential. The results on the two samples were analyzed and evidence that the postgraduate trainees have a significant greater EPAI than the university students \( (M_{\text{trainees}} = 50,9; \text{DP}_{\text{trainees}} = 10,30; M_{\text{students}} = 48,5; \text{DP}_{\text{students}} = 9,9) \).
Theoretical, methodological and practical implications

Theoretically, this paper presents important contributions on the entrepreneurs’ characteristic field, proposing an operationalization of the entrepreneurial potential, converging the previous literature evidences on an integrated model. Methodologically, this paper presents an empirical validation on an entrepreneurial potential assessment tool. Moreover, it presents an index which allows to identify the relative positioning of an individual regarding his/her entrepreneurial potential. Considering the practical implications, the present paper presents two important outputs: the EPAI and the EPI. These tools are important to include on training and entrepreneurship promotion programs.
Transitioning from Entrepreneurial to Professionally Managed Firms in Sub-Saharan Africa: Lessons from South Africa’s Economy

johnoirya@hotmail.com

Abstract Summary:
Small businesses are incontestably important in generating economic growth, employment and new ideas. In South Africa, 73% of workers are employed by firms with less than 50 employees, and 45% of all employees work in firms with less than 10 employees. Nonetheless, many small firms in Sub-Saharan Africa (SSA) remain in the informal sector - unable to transition from entrepreneurial to professional management. By utilizing research on 300 small businesses in South Africa and research on 12 other mid-income economies in SSA, this paper recommends strategies and policy initiatives that could be adopted to ease this transition in the region.

Presented at:
55th World Conference of the International Council for Small Business (ICSB)
Cincinnati, Ohio, USA, June 24-27, 2010
Transitioning from Entrepreneurial to Professionally Managed Firms in Sub-Saharan Africa:

Lessons from South Africa’s Economy

A. BACKGROUND:
The World Bank defines Small and Medium Enterprises (SMEs) by the number of employees. While micro-enterprises are those with fewer than 10 employees, small enterprises are those with 10–50 employees and medium-sized businesses are those with 50–100 employees (Turner, 2008). Some authorities simply classify micro-enterprises as small enterprises. Small businesses are undeniably important in helping drive economic growth, creating employment, and being sources of innovation and new ideas both in developed and developing economies. In fact, the small business sector is the heart and lifeblood of many economies around the world (SBP, 2009). For example, nearly 80% of firms in Congo have fewer than five workers. The country has 2,100 firms in the formal and 10,000 in the informal sector. Nigeria’s SMEs account for some 95% of formal manufacturing activity and 70% of industrial jobs in the country. In 2003, small businesses in South Africa provided more than 55% of total employment and 22% of GDP (Kauffmann, 2005). Overall, in South Africa, about 73% of workers are employed by firms with less than 50 employees, and 45% of all employed people in the country work in firms with less than 10 employees. In Zambia, around 80% of all economic activities occur in the informal sector (Stern, 2005). Even in developed economies, the small business sector is regarded as the driving force of economic growth. For example, in Canada, over the past 35 years, the SME sector has experienced significant growth and accounts for almost 50% of Canada’s economy (Kerimova, 2007).

Despite their significant contribution to the economy, the transformation of entrepreneurial small firms and micro-enterprises into large professionally managed firms is still necessary in order for
these firms to upgrade their products, processes, quality levels, productivity and innovation. This growth is aimed at enabling these firms to integrate into local, national, and international value chains – to become profitable, productive and performance-driven enterprises. Many small firms continue to experience barriers to this transformation. The estimated failure rate of small, medium and micro enterprises in average economies around the world remains between 70% and 80%. Less than 50% of newly established businesses throughout the world survive beyond five years (Brink, 2003). Barriers encountered by these small businesses can be described amongst others as being environmental, financial or managerial in nature.

Sub-Saharan Africa (SSA)'s economy thrives on SMEs. Only a few countries on the continent have adopted sound economic policies and initiatives to foster an environment for its SMEs to easily transition from formal/entrepreneurial to formal/professional management. As a result, some of these countries have developed to become Middle-Income Countries (MICs) in SSA. Around 2007, there were 13 MICs in SSA, which although they hosted only 13% of the total SSA’s population, accounted for 66% of all incomes earned in the region. Seven of these MICs were in the lower middle income country group (per capita incomes between $826 and $3255). They included Angola, Cameroon, Cape Verde, Congo Republic, Lesotho, Namibia and Swaziland. The other six were in the upper middle income countries group. These included Botswana, Equatorial Guinea, Gabon, Mauritius, Seychelles and South Africa. With the exception of South Africa and Mauritius, none these countries were in the MIC category in 1960. Out of the 13 countries, seven have acquired their current status largely on account of their mineral wealth, including oil. The rest of the countries (35), which host 87% of all Sub-Saharan Africans fall in the low income country category and account for one third of all income generated in the region (Ndulu, et al., 2007, p. 3).
The disparity between most of the 13 MICs and the 35 countries in SSA can be partly explained by the divergent strategies pursued and the policy disposition adopted by countries with very similar opportunities. Different growth experiences yielded different outcomes. For example, both Botswana and Zambia are landlocked resource rich countries. On the other hand, both Mauritius and Côte d’Ivoire are coastal resource poor countries and initially both primary commodity dependent. However, by adopting sound long term strategies and economic policies to exploit their similar opportunities, Botswana and Mauritius ended up in the upper MICs. Zambia’s and Côte d’Ivoire’s per capita income hardly progressed relative to their levels in 1960 due to their poor economic strategies and policies (Ndulu, et al., 2007, p. 6). As a result, all poor countries in SSA need to emulate the economic paths adopted by most of the MICs in SSA.

B. OBJECTIVES:

The objective of this paper is to establish key environmental, financial, managerial and other factors that inhibit the transformation of entrepreneurially managed firms to professionally managed firms in South Africa. Findings in South Africa are incorporated with research findings in the other 12 MICs in SSA to recommend policies and strategies that would help small firms in SSA to easily transition from informal/entrepreneurial management sector to formal/professional management sector. South Africa forms an ideal setting for this study due to its unique economic characteristics that exist in all countries of SSA. While South Africa is one of the wealthiest countries in Africa (with some highly developed sectors analogous to those in G-8 countries), it is also a classic “dual economy,” with a sophisticated urban economy alongside many poorer, lower-capacity rural areas that have many informal firms. South Africa’s informal sector is characterized by undercapitalized and overly-labor intensive firms (Coolidge, 2008). SSA’s underdeveloped economies exhibit conditions that are typical in South Africa. For example, Zambia has an economy that is typical of
SSA, characterized by low productivity, little diversification outside of traditional activities (i.e. highly agricultural, small manufacturing base, etc.) and also with high levels of informality. Rwanda, on the other hand, is a post-conflict country with much of the economic base in the process of recovery and a high level of informality (Stern, 2005). With South Africa having transitioned from a state of economic inequalities and conflicts associated with apartheid to a state of relative equal opportunities and rapid economic development, many post-conflict countries can emulate South Africa’s economic growth path.

C. METHODOLOGY:

Survey Design:

This study on small businesses in South Africa was conducted by a team of researchers that included Annekie Brink, Michael Cant and Andre Ligthelm, with the objective of establishing to what extent owners/managers of small businesses in a typical South African setting experienced constraints that negatively influenced the success of their small businesses. A questionnaire was administered to 300 small businesses to solicit responses, using judgment sampling (Brink, 2003). Small businesses were selected for the study since most countries in SSA tend to have more small businesses than medium-sized businesses in their often large informal sectors. Thus, research findings in South Africa would be fairly compared to findings in other SSA countries while making policy proposal and recommendations.

To ensure the reliability of the data, only entrepreneurs with a reasonable level of sophistication and understanding of concepts such as interest rates, exchange rates and inflation were selected to participate in the survey. To ensure that only bona fide business participated in the survey, other requirements for participation included the small business: having compiled an annual budget,
operating from a demarcated business area, and occupying a permanent structure. Micro-businesses operating in the informal economy were excluded from the survey, mostly due to possible lack of accurately recorded data. Also, to ensure that only small businesses were surveyed, businesses with more than 50 full-time employees were excluded from the survey.

A structured and pre-tested questionnaire was administered to participants by 12 well-trained interviewers who lived in the survey areas, knew the areas well, and knew the locations of businesses well. The questionnaire included a socio-demographic information section that gathered information such as business ownership, period of ownership, management qualifications, number of full-time employees and annual turnover. The actually survey section consisted of 51 items, divided into seven categories, five representing problem areas faced by the small business according to various management functions (marketing, finance etc). Several statements relating to the various areas were phrased with a possible response continuum linked to a Likert-style five-point scale (1 = strongly disagree to 5 = strongly agree). In the absence of a sample frame, a judgmental sample was conducted among small business owners/managers. The survey was conducted in six identified areas, namely Soweto, Tembisa, Mamelodi, Soshanguve/Mabopade, Johannesburg’s Central Business District (CBD) and the Pretoria’s CBD. To ensure equal representation, 50 respondents were selected from each area, thus a totaling 300 respondents.

Interviewers were instructed to complete the 50 questionnaires in each area according to the following sectorial distribution: retailers (18); services (personal, social and community,18); manufacturing/repairs (6); other (wholesalers, construction, transport etc) (8). Substitution was only allowed after consultation with the researchers. As a result, limited divergence occurred from the initial 50 questionnaires planned in each area, with numbers ranging from 59 in Tembisa to 51
in Soshanguve/ Mabopabne and Johannesburg CBD. The processing of data, ranging from checking to coding, data capturing and analysis was undertaken by the Bureau of Market Research of the University of South Africa.

**Profiling Survey Population:**

The survey population portrayed the following characteristics:

- Businesses with a reasonable level of sophistication were included in the sample. Only businesses operating from demarcated business premises, occupying a permanent structure and compiling an annual budget were selected.
- Only business owners or managers were selected as respondents. Almost two thirds (64.5 %) of the respondents acted as managers or had owned their businesses for more than three years.
- One in every four (24.6 %) respondents had a formal management qualification or certificate.
- Exactly half (50.8 %) the businesses operated as sole ownership enterprises while the rest were partnerships (12.8 %), private companies (16.2 %) and close corporations (19.9 %).
- The average employment of respondent businesses amounted to 3.8 full-time employees in 2001.
- Almost four in every five businesses (79.1 %) reported a turnover of less than South Africa Rand (R) R500,000 for 2001. Only 7.1 % generated a turnover in excess of R1 million.
- Seven in every ten businesses (70.3 %) were owned or managed by Africans, 14.3 % by Asians, 4.0 % by coloreds and 11.3 % by whites.
- Two thirds of the questionnaires were completed in township areas and one third in the CBD areas of Pretoria and Johannesburg.

**D. SURVEY FINDINGS:**
The findings of the research are discussed under the factors that inhibit the transformation of entrepreneurially managed firms to professionally managed firms, which include macro environmental variables, marketing-related issues, management skills, management actions, human resource challenges and financial challenges.

**Macro Environmental Variables:**

The macro environmental variables which exerted the most marked influence on business success were crime, inflation, unemployment, interest rates and exchange rates. The percentages of businesses that agreed or strongly agreed in this regard are as follows:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Strongly disagree</th>
<th>Disagree</th>
<th>Neutral Agree</th>
<th>Agree</th>
<th>Strongly agree</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>

However, HIV/AIDS (28.2%), new government legislation (38.9%) and rapidly changing techniques (39.6%) were perceived as having the least influence on business success.

**Marketing-Related Issues:**

Increased competition was the major marketing-related issue faced by the respondent businesses as having a negative influence on the success of the businesses, as 68.4% agreed or strongly agreed with this finding. Increased competition was also the single factors with the highest percentage of ‘strongly agree’ responses. With regard to the low demand for products or services, 43.5% regarded it as a major problem. This finding corroborates the literature that new competitors and insufficient
demand hinder small business growth and expansion. Respondents with management qualifications tended to be more in agreement with the negative impact of increased competition, lack of knowledge of competitors and ineffective marketing on the success of their businesses, than those without qualifications. This observation may suggest that better insight into marketing-related issues is an important factor for business success.

*Management Skills:*

The majority of the respondents did not see management training as lacking and thus negatively influencing their businesses. This reaction might be explained as a form of response bias where respondents seek social approval in the eyes of the interviewer. Nonetheless, a larger percentage of those without management qualifications agreed that the lack of management training and skills impacted negatively on the success of their businesses.

*Management Actions:*

The lack of management skills did not present a serious problem to the success of businesses. Management actions generally refer to the tasks of planning, organizing, leading, coordinating and controlling the business. The majority of business actions identified in the questionnaire were perceived by respondents as important for ensuring business success. The percentage of businesses in agreement (“agree” and “strongly agree”) with the various management actions were as follows:

| Change is an integral part of running a business | 81.3 |
| Failure is a valuable learning experience | 72.7 |
| Time is spent more effectively if I plan better | 71.9 |
| Involve employees in planning and decision making | 68.4 |
| Set time apart to plan and prioritise | 68.0 |
| Prefer to do most of the work to be in control of business | 60.9 |
Respondents in possession of management qualifications constantly attached greater priority to the execution of management actions such as effective planning, organizing, leading and controlling of the business. Thus, management training not only transfers management skills to learners but also reinforces the lateral perception that the application of skills contributes to business success.

**Human Resource Challenges:**

The two most serious human resource challenges mentioned by approximately one in every three respondents (i.e. those who ‘agree’ and ‘strongly agree’ with the statements) were the introduction of the new labor laws (35.6 %) and the inability to attract and find suitable staff (32.6 %). The least important of the human resource issues were poor labor relations (19.8 %), poor staff planning (20.6 %), high labor turnover (22.8 %), poorly trained employees (25.4 %) and low labor productivity (26.7 %).

**Financial Challenges:**

Financial problems having the most widespread impact on businesses were difficulty in obtaining finance/credit (53.9 % of the respondents ‘agree’ or ‘strongly agree’) followed by high operating expenses (51.8 %). Interestingly, owners/managers with a management qualification experienced fewer financial problems than those without management qualifications.

**E. CONCLUSION:**

Overall, key findings of the study revealed that majority of the small firms in South Africa fail to transition to large professionally-managed firms, mostly due to a combination of environmental (e.g. security, governmental policies, etc.), financial (e.g. access to capital, infrastructural resources, etc.) and managerial factors (e.g. skills and training talent team). These factors confine firms to a
state of those characterized by informal management, centralized decision-making, over-dependence on one or two key personnel, and a paternalistic atmosphere; rather than have them transition to a state of those characterized by a functional structure, delegation of authority to subordinate managers, formal information analysis, formal communication systems, stable short and long-term strategies, and flexibility and interchangeability among organizational components. These findings generally explain why South Africa’s economy continues to heavily dominated by small and usually informal businesses, despite the country having highly developed structures to transition these businesses into large professionally-managed enterprises. Policies and interventions aimed at addressing challenges faced by small businesses in South Africa can be adapted to other economies in SSA to rapidly stimulate the region’s economic growth.

F. IMPLICATIONS:

These research findings on small businesses in South Africa compared to existing research on MICs and other poor economies in SSA reveal that the development of the private sector varies greatly throughout Africa. SMEs are flourishing in South Africa, Mauritius and North Africa, mostly due to fairly modern financial systems and clear government policies that favor the private enterprise. Elsewhere the rise of a small-business class has been hindered by political instability and strong dependence on a few raw materials. In the Democratic Republic of Congo, for example, most SMEs went bankrupt in the 1990s – as a result of looting in 1993 and 1996, during the civil war. In Congo, Equatorial Guinea, Gabon and Chad, the dominance of oil has slowed the emergence of non-oil businesses. In Nigeria, while SMEs account for about 95% of the formal manufacturing activity, insecurity, corruption and poor infrastructure prevent them from becoming key motors of Nigeria’s economic growth (Kauffmann, 2005).
Nonetheless, small businesses can undertake internal strategic policies and initiatives, while countries can undertake external strategic policies and initiatives to grow from informal to formal sectors of their respective economies. Along the process, these firms will most likely transition from entrepreneurial to professional management. These policies and initiatives are vital if SSA expects to reduce its abject poverty and transition all its countries into MICs or developed economies. Although the region currently accounts for only 10% of the world’s population, it accommodates 30% of the world’s poor. One in two Africans (or 300 million people) is poor, spending less than $1 a day on basic necessities of life (Ndulu, et al., 2007, p. 4). Nonetheless, it should be noted that each country’s situation is unique and requires specific analysis of constraints and opportunities, in order to devise viable economic growth strategies and policy interventions that are unique to each country’s economy. Thus, some of the policy and initiative recommendations discussed below may need to be modified and adapted to each country’s situation.

INTERNAL STRATEGIC POLICIES & INITIATIVES:

Internal strategic policies and initiatives are measures that are adopted internally by businesses to expand their enterprises from informal/entrepreneurially-managed firms to formal/professionally-managed enterprises. Businesses usually have strong control over devising and implementing these measures.

Entrepreneurial vs. Professional Management Styles:

The informal/entrepreneurial management style is usually an informal one-person show that is driven by the entrepreneur/owner’s vision, intuition, creativity and risk-taking. It is highly-centralized in decision-making. On the other hand, the formal/professional management style is
more systematic, and is characterized by planning and delegation of power to employees. All employees feel like team players. This later style is more conformist and drives the business with caution rather than risk-taking. A firm can prepare for professional management if it trains or hires employees with managerial skills and talents that are key to its success.

Detection of the Need to Transition to Professional Management:

Initial growth of small businesses often plateaus because of a lack of corresponding growth in basic management skills. In order to grow their businesses to large professionally-managed enterprises, entrepreneurs must shift their thinking from tactical and operational management, to strategic and supervisory management. They must ensure that growth in sales and employees is accompanied by corresponding growth in management skills (Normand, 2010). An entrepreneurial firm can detect the need to transform to professional management if it feels overwhelmed with management activities; it feels unqualified to handle the many issues surrounding its growth strategy such as marketing, finance and human resource management; it experiences financial strain caused by growth; communication in the firm and co-ordination of operations become increasingly difficult; motivation of employees become increasingly difficult; it experiences problems with customers or suppliers due to backlog of work orders; it experiences mistakes and it experiences a decline in its performance (Giampa, 2005).

Managing Successful Transition to Professional Management:

The life-cycle of a business is generally characterized by four stages of growth that transitions it from the SME category to a large corporation. These stages are: start-up, growth, maturity and decline. In order to successfully manage transition from entrepreneurial to professional management while avoiding the decline stage, the entrepreneur needs to set organizational policies
and procedures in place to guide the actions of the organization. Such guidelines might include production procedures, and marketing and sales tactics that are driven by sound research and development. At this stage, the focus of the management team becomes centered on coordination of business activities, rather than on managing every aspect of business operation. Also, decision-making becomes decentralized through creation of job descriptions and departments to handle specific tasks, and creation of organizational charts with clear reporting for all employees. Employees will usually need to adapt to the organizational structure and culture. Providing adequate training to employees, communicating openly about company changes, and involving employees in the change process will usually enhance this adaptation and minimize employee resistance to the transition. As the firm grows, it may choose to go public through raising equity capital. After it goes public, it may mature by increasing its net worth especially when its stock value appreciates. At this stage, many firms are usually highly productive, performance-driven, and integrated into local, national, and international economic value chains.

**EXTERNAL OPERATIONAL STRATEGIES & POLICY INITIATIVES:**

External strategies and policy initiatives are measures undertaken by countries and the wider business communities to create an environment that fosters the growth and expansion of SMEs from informal/entrepreneurial operations to formal/professionally-managed enterprises. Individual businesses usually have less control over these initiatives. Governments, business communities and other influential stakeholders usually have major control over these measures, and usually succeed if they work in a joint and concerted effort. Some of these measures that are unique to SSA include the following:

1. **Minimize Geographical Disadvantages:**
The transition of firms from informal/entrepreneurial firms to large formal professionally-managed firms in Africa is usually constrained by the continent’s geographical disadvantages. Economic isolation is more acute in Sub-Saharan Africa, where 31% of the countries are landlocked, compared to only 12% of all the other developing countries. Nearly 40% of the SSA population lives in these landlocked countries, with high transportation costs and poor trade facilitation (Ndulu, et al., 2007, p. 89). Long distances and being landlocked limit a country’s access to international markets, hinder its ability to exploit economies of scale, lower its production efficiency, and ultimately reduce its economic growth. Besides facing significant economic isolation, SSA is a highly fragmented region. For a given geographic area, the region has the highest number of countries, with each country sharing borders with four neighbors on average, often with different trade and macroeconomic policy regimes. This fragmentation got worse after independence for most countries, with the break-up of federations, customs unions, and currency zones – as countries established their own trade regimes, central banks, and immigration policies and systems. This process fragmented policy frameworks, fractured transportation networks, and led to more transshipments and longer transit times, thus making transacting business across the region’s most borders more cumbersome (Ndulu, et al., 2007, p. 90).

Thus, Africa needs to invest heavily in infrastructure to support the growth of its SMEs. It is estimated that Sub-Saharan African countries need $18 billion a year in infrastructure financing in order to achieve the much higher 7% economic growth target needed to halve extreme poverty in the region in about 10 years. Region-wide infrastructure development is needed to link up the isolated and fragmented countries of Africa and their remotely dispersed entrepreneurs. For landlocked countries, investment in transport links to ports is critical. This initiative involves not only roads and railroads, but dedicated port facilities and improvement in facilitation at cross-
border checkpoints (Ndulu, et al., 2007, p. 145-8). Also, the continent needs to devise cohesive economic policies to integrate its fragmented markets.

2. Initiate Business-Friendly Tax Policies:

Most small firms in Africa choose to stay in the informal sector if they can because the perceived benefits outweigh the perceived costs. First, these firms rarely see their tax contributions at work in the form of government services. Second, many African entrepreneurs fear that once they formalize their businesses their governments will over-regulate their business. Third, business owners complain that tax compliance costs (i.e. cost and enormous amount of time involved in preparing, handling and submitting required tax forms to tax authorities) add a serious burden to their operations (Coolidge, 2008). For example, Cameroonian businesses pay a hefty 52% of profits in tax, make an average of 41 different payments to the authorities and spend about 1,400 hours on tax preparation, filing and payments (Ellis, 2010). Thus, if compliance costs (both financial and time) are added into a firm’s cost-benefit analysis of paying taxes, the disincentive to comply with tax requirements becomes even stronger. As a result, many entrepreneurs with promising business ideas deliberately choose to remain small and operate off the books in the informal sector.

Nonetheless, there are compelling reasons for the small entrepreneur and the government to join the tax net. On the SMEs’ side, participating in a tax regime brings a firm into the formal sector, and allows it access to formal credit markets, government procurement and export markets. On the government’s side, by supporting firms to fully enter the formal sector through registering for and paying taxes, government promotes a culture of compliance and sets the stage for the firm to grow and become a bigger taxpayer. Also, firms in the formal sector are more likely to comply with all other regulations and official obligations than those in the informal sector (Stern, 2005).
Additionally, informal businesses do not contribute to the tax revenue of the state, which forces governments to raise taxes, thus overburdening legitimate formal businesses. The lost tax revenues from the informal sector are not available for the many critical infrastructure improvements needed to further the economic development of these nations (IBM, 2010, p. 32). As a result, governments in SSA need to make their taxation systems more appealing to SMEs by making the taxation system less costly and cumbersome, and utilizing the recouped tax dollars to offer services that support the growth of SMEs.

3. Increase Access to Credit:

While access to credit is critical to the sustainability and growth of any business, many African entrepreneurs lack access to this key financial resource. The lending environment across Africa is generally characterized by poor credit culture, poor contract enforcement and lack of protection of creditor rights. Coupled with a lack of collateral and inability for Africa’s entrepreneurs to prove creditworthiness, creditors usually have higher perception of risk and raise finance premiums for borrowers, a situation that further inhibits access to credit by many poor entrepreneurs (Ndulu, et al., 2007, p. 120). Consequently, many SMEs fail to secure finances to grow and become large professionally-managed enterprises. In order to increase access to credit for SMEs, countries need to create or support credit bureaus that collect trade/credit payment data from the informal sector and fairly share this information with the lending financial sector. Data from SMEs in the informal sector (data not traditionally reported) can increase lending by large creditors to these SMEs. In the sophisticated and well-capitalized financial sectors like that for South Africa, such additional data can enable financial institutions to reach the country’s traditionally underfinanced enterprises. In the underdeveloped financial sectors of other countries in SSA, such information can create opportunities for informal sectors to easily become formal.
4. Resolve Conflicts and Political Instability Peacefully:

Since the 1960’s Africa has experienced a debilitating descent of states into persistent internal conflicts. In fact, conflicts are now arguably the single most important contributor to poverty in Africa. For example, in 1999 Africa hosted more than 50% of the world’s conflicts. Instability not only escalated within countries but spilled over into neighboring states, resulting in catastrophic wars within and among countries. Africa’s conflicts are usually instigated by growing nationalism, ethnicity, abject poverty, lack of opportunities and corruption (Ndulu, et al., 2007, p. 110). Conflicts reduce economic growth by inhibiting investment in both physical and human capital, destroying existing business assets and infrastructure, and bringing economic activities to a halt. Political instability, on the other hand, even if it doesn’t lead to conflict creates uncertainty for investors, raises the riskiness of investment, and discourages overall investment. As a result, SSA needs to settle its disputes through alternative peaceful means such as arbitration, negotiation, diplomacy and dialogue rather than through violent conflicts in order to create an investor-friendly environment for its SMEs to easily transition into large professionally managed firms.

5. Support Women Entrepreneurs:

The role of women in the economic development of Africa continues to be increasingly well documented. In Africa, women account for more than 60% of the rural labor force, and contribute up to 80% of food production. Also, more than 80% of these women in the rural labor force are working, unregistered and unrecognized by the government, in the informal sector (IBM, 2010, p. 38). Despite their obvious contribution to Africa’s development, women continue to face cultural barriers to economic empowerment and progress. For instance, many leadership roles in African societies remain male-dominated. Consequently, women’s creativity, leadership skills, talents and
capabilities, and full participation in economic growth remain suppressed. In addition, since many women don’t have property ownership rights, female entrepreneurs usually lack collateral to secure financing to expand their SMEs into large professionally-managed firms.

In order to fully benefit from the dynamism that the feminine aspect brings to the economy and stimulate its fast economic growth, SSA needs to employ the full participation of women at all stages of its economic growth. The good news is that significant progress is being made to empower African women in the business world. More than ever, African women are seeking the experience, tools, technology, and role models to make their business visions a reality. Also, 85% of African microfinance clients are women (IBM, 2010, p. 41).

6. Improve Access to Tertiary Education:

Research data shows that for African entrepreneurs, education is very important in determining the size at which they entrepreneurs start their entrepreneurial ventures. African entrepreneurs with a university education generally start much larger enterprises compared to those that do not have a university degree. The completion of a university degree generally reflects a higher ability and accumulation of managerial skills that are responsible for entrepreneurial success. Also, the university degree enables access to a network of other business professionals that is useful for the expansion and success of the businesses (Ndulu, et al., 2007, p. 68). On the other hand, many of Africa’s SMEs owners lack formal education, a condition that usually condemns them to informal entrepreneurial managers. Thus, if Africa expects increase managers for its professionally-managed firms, it needs to invest in tertiary education and encourage the pursuit of entrepreneurship in academia.
In the overall analysis, many countries in SSA need to emulate the economic growth strategies of mid-income economies if they expect to become economically prosperous. For example, since its independence in 1966, Botswana has achieved a remarkable growth in economy, sociopolitical stability, and education. Its current political administration, which is one of the leading democratic systems in the world, is based on equity in the distribution of resource and services. In addition, the government of Botswana has designed various diversification programs and policies for its economic activities, and has prioritized its focus on the promotion of the development of SMEs (Temtime, 2004). These strategic and policy measures have enabled Botswana to easily position itself as a mid-income economy in SSA. These countries also need to combat their unique constraints to economic growth – most of which are largely historical, institutional and policy-related. These constraints increase investment risks, raise transaction costs, and limit business growth and productivity.

MAKING IT HAPPEN – ENTREPRENEURSHIP ACROSS THE CAMPUS.
PERSPECTIVES FROM ONE UNIVERSITY ON DELIVERING
ENTREPRENEURSHIP EDUCATION TO BUSINESS AND NON-BUSINESS
STUDENTS.

Barrett Baehler, D.MGT, Assistant Professor of Management
Webster University, St. Louis, MO, USA
baehlerb@webster.edu

Abstract

Entrepreneurship across the campus…Interdisciplinary Entrepreneurship… What do these mean? How do you design a program? How do you develop curriculum? How do you find faculty to teach? So many questions. What about answer?

This workshop will articulate the process of conceiving and developing an entrepreneurship curriculum across Webster University. Participants will learn about the interworking of one university’s efforts to bring entrepreneurship education to its students. This presentation will focus on Webster University’s undergraduate Certificate in Entrepreneurship curriculum – and how the process has been extended to numerous academic disciplines. Time will be provided for dialog between the panel and audience members.

Key Words
Entrepreneurship in the Arts; Entrepreneurship; Curriculum design and delivery; Music Business; Music Entrepreneurship; Cross-campus entrepreneurship; Partnership between Business School and non-business programs; What to do and not to do; Professional Development; Career development;
INNOVATION: STRATEGY THAT CONTRIBUTES TO ASSURE GROWTH AND DEVELOPMENT IN MICRO, SMALL AND MEDIUM FAMILY BUSINESS IN COLOMBIA.

Principal topic and Research Question (s)

Diverse authors have evaluated the impact of the innovation in the competitive development of the micro, small and medium companies, such RICARDIS (Reporting Intellectual Capital to Augment Research, Development and Innovation in SMEs) developed by the Commission of European Nations (2006), Beltran (2008), Gil (2002), Menkveld and Thurik (1999), Santarelli (1990), Damanpour (1991), COTEC Foundation for technology innovation (2004), Bueno (1986), Pujol (2005), Calabrese And Rolfo (1995) among others, who have found that innovation constitutes a basic factor for the companies’ growth, taking their investigations in the economic, social or technical dimension.

This research presents a characterization of the innovation and its economical impact in the micro, small and medium family companies in Colombia in a work with 396 organizations.

The results obtained present:

1. The impact of the innovation in the competitive performance of the SME´s family companies in Colombia.
2. The relation between innovation and the generation in charge of the family company.
3. The impact of the Regional Innovation Systems in the organizations
4. The main reasons that organizations have to carry on innovation activities.

5. The different types of innovation implemented at the companies.

6. The levels of investment that companies assign to the innovation activity.

7. The economical impact on sales and profits derived of innovation activity.

8. The stakeholders that participate on innovation activities.

9. The main obstacles that family companies have when develop innovation activities.

10. The knowledge level of companies about Colombian State credit lines for innovation activities.

This research try to contribute to business competitive development, by means of political formulation and promotion of the innovation, as Maloney and Perry suggest (2005).

Methodology / Key Preposition

With the purpose of determining the impact of Innovation and to know if this is a factor that contributes to the economic growth of the family SME’s in Colombia, the authors carry out a descriptive research with a statistical sample of 396 companies applying them an structured instrument (personal interview).

With the interest that this research had a representative statistically result of family business in Colombia, the authors worked with 5% confidence interval and 95% of confidence level to determine the sample size. To validate the hypothesis and the objectives of this research, they carried out statistical test of independence through contingency tables and factor analysis.
Contributions

This research contributes to:

In accordance with different research of Beltrán (2008), Pujol (2006), Rogers (1983), Well (1986), Santarelli (1990), Kleinschmidt and Cooper (1991), Damanpour (1991), Calabrese and Rolfo (1995), Menkveld and Thurik (1999), Gil (2002) the present research allowed to establish that the innovation constitutes a basic factor for the growth of the micro, small and medium family companies in Colombia. Of 396 analyzed companies, 57% have undertaken activities of innovation.

In accordance with Oslo Manual (2005), “Innovation is the implementation of a product (product or service) or new process or with a high degree of improvement, or a method of commercialization or new organization applied to the practices of business, to the place of work or to the external relations”, As an illustration they present four types of innovation: Innovation of product, of process, Innovation of “Marketing and Organizationl Innovation. At this research, the author could establish that in accordance with company size and specific characteristics they undertook different type of innovation, that contributed to his economic growth. In all cases the innovation types advanced in the same way of different categories contemplated in the Oslo Manual (2005).
Inside the companies the innovation process emerged by organization initiative and it comes reality with their own resources and they don’t know about Government politics to support business innovation.

In the same way the author established that companies that undertook innovations, increases its sales and profits at the periods of time analyzed, constituting the innovation a strategy that contributes to assure its growth and development.
Professional CEO, independent directors, innovation and family controlled firms’ performance

Dr. Mary Han

Dr. Nikhil Celly

Abstract

Our research addresses the importance of innovation to family controlled firms and proposes this can be achieved by outsiders in family controlled firms. We draw from the resource based view and dynamic capability literature to propose that professional CEOs directly impact the innovation and performance of family controlled firms. Further, we argue that their impact may be moderated by independent directors on the board. The higher the number of independent directors, the more positive the effect. Our study is among the first attempts to link the resource based view and corporate governance to family controlled firms innovation and continuity. Our testable propositions form a baseline for future research. Implications for theory and practice are discussed.

Worldwide family controlled firms generate and contribute to more than half of the world’s GDP. In 2001, Family Businesses magazine listed 116 family businesses in the world with over one billion revenue each. Such important economic engines as family controlled firms are facing extreme challenges as research shows that only 30% of US family firms survive into the second generation (Birley, 1986). In examining reasons for failure, research on family controlled firms and their survivability has focused on succession planning (Lee, Lim and Lim, 2003); family governance issues (Miller and Miller, 2006) and threat of imitation and strategic
responses of family influence (Sirmon, Arregle, Hitt and Webb, 2008) amongst others. However, little attention has been paid to an equally important factor, innovation or the lack of it to family controlled firms’ survival. More importantly, even less attention has been paid to linking how outsiders such as professional CEO and independent board members, play an important role in generating innovation and ultimately improving performance and continuity of family controlled firms.

Drawing from the resource based view and dynamic capability literature, our research aims to develop a theoretical model to explain how professional CEO is a specific resource of the family controlled firm and may positively influence innovation and continuity in the family controlled firm. We further explain the moderating effect of independent board members in the family controlled firms’ innovation and continuity. Our developed propositions contribute a baseline for future empirical studies in this important area of research. Positive impact of professional CEOs can be seen from many examples such as Ford Motor. The firm overcame a major shortcoming by hiring an outsider, a professional CEO, Allan Mulally after successive generations of family CEOs. Another example is IKEA’s founder, Ingvar Kamprad, who retired in 1986 after developing a Swedish firm into a worldwide phenomenon operating in 44 countries. Since 1982, the IKEA Group has
been owned by a foundation arranged by Kamprad. He set up a 7 member board, with only one person carrying his last name. The CEO and President, Anders Dahlvig, of the IKEA group is a professional CEO, not a family member (IKEA, 2009). IKEA has expanded new product lines and new markets ever since Dahlvig took over.

Family firms, we argue can suffer from a lack of innovation (or less innovation) than non-family firms. A monarch style founder, in Poza’s (2007) term means the founder who controls decision making, and never wants to release his crown. Boards dominated by family members, and overshadowing effects of the founder even after his/her exit are some of the other factors that contribute to the family controlled firms’ inertia and trap it in its past success, resulting in lack of innovation and risk discontinuity (Poza, 2007). This can directly lead to lower survival rates. Therefore, we develop a theoretical model to propose and depict a positive relationship between professional CEO and firms’ innovation, and hence its performance and continuity. The model also depicts an inverse relationship between too many ‘old time’ family board members and firms’ innovation and performance. We propose a positive moderator relationship between higher number of independent directors and innovation and performance of the family controlled firm (See Figure 1 for our theoretical model).
The contextualization of our model is that we characterize the family has at least 10 percent voting shares (Morck et al., 2005), is in its second generation, and is a publicly traded firm. In addition, we characterize the family controlled firm as being under the founder’s dominance (decision making). Further, we also characterize the family controlled firm has a few, if not too many close ties of the founder still on the board of directors. Further, we characterize professional CEOs by their 1) professional experience prior to managing the family controlled firm, 2) not being a family member. We characterize independent directors by their 1) not being a family member, 2) not a member of management, and 3) not having any ownership in the firm. We depict innovation in terms of new products and markets and performance as ROA and ROS necessary for sustainability and continuity of the family controlled firm (Morck and Yeung, 2004).

We argue that the professionalism of an outsider CEO and non family independent board members can bring in 1) professional emotion which is not attached unlike family members; 2) knowledge and experience that fill structural holes (Burt, 1992) and produce weak ties effect (Granovetter, 1973); 3) dynamical relationship with employees, family and shareholders; and 4) fresh perspective that is not stale based on the family’s historical view. Professional CEO’s years of
idiosyncratic knowledge, information and experience is very different from the family controlled firms’. The uniqueness of family knowledge and network ties coupled with the CEO’s idiosyncratic knowledge and network ties develops into a new set of network, knowledge base, and information pool. The professional CEO is hired based on his/her unique and specific resources that he can bring into the firm. We adopt the similar premise for independent director, except we contend that the number of these independent directors must be greater than old time family members on the board to have a positive moderating effect.

Our theoretical reasoning contributes to family business, resource based view, dynamic capability, entrepreneurship and corporate governance in several ways. First, our research is among the first attempt at linking outsiders (CEO and independent directors) to family controlled firms’ innovation and continuity. Second, our testable propositions provide a baseline for future empirical research which will bring fruitful and robust understanding for theory and practice. Finally, our theory helps research in family controlled firms to open up a new line of thinking in the area which is critical to survivability of family firms and economic development of society in general. In fact, our research is particularly important to entrepreneurship research as many entrepreneurs have neglected the importance of external knowledge,
information and experience for the firm’s innovation development, and thus the new venture’s continuity. Our research illustrates significant theoretical and practical implications to family controlled firms.

**Literature Review**

In this section we briefly review the two strategic management theories that have been most used to examine family firms, agency theory and resource based view (Chrisman, Chua and Sharma, 2005). Given the context of this study, our review focuses on agency theory effects on board composition and resource effects of CEOs on family firm resources and their management and deployment. We draw on the considerable literature on corporate governance and less work on family firms for this purpose.

**Professional CEO and Founder CEO**

Succession literature has examined the efficacy of an outsider CEO vs. an insider CEO although with conflicting results (Kesner and Sebora, 1994). Outsider CEOs can contribute to positive firm performance since they bring in fresh perspectives and have an ability to initiate strategic change (Shen and Cannella, 2002; Kesner and Dalton, 1994). Further, professional outsider CEOs have been considered to be more
objective in decision making than founder (in our case family) owners since their personal stakes in the business are not that strong (Schein, 1986).

However, outsider CEOs were also found to have detrimental effects on firm performance. They lack firm specific knowledge, and this can impact their ability to make strategic decisions which require idiosyncratic firm knowledge. They may also find it difficult to find support from the top management team, since it is likely the TMT was appointed by the previous CEO, or in the case of a family firm by the founder CEO or family members (the insiders). This top management team has close connections with the family and may resent an outsider being appointed as the CEO, and may in fact even be hostile to the new CEO, and resist new changes while remaining committed to previous firm strategies (Shen and Cannella, 2002; Wiersema, 1995). Founder CEOs are more able to move swiftly and act quickly due to autonomous decision making (Dyer, 1986).

**Composition of the Board**

Board composition has mainly been studied as the choice between inside, outside, affiliated or independent/interdependent directors (Daily, Johnson and Dalton, 1997). Dalton, Daily, Ellstrand and Johnson (1998) identify three main yet distinctly different functions of the board. These are control, resource dependence and
counseling/expertise. The control function of the board stems from agency theories’ (Jensen and Meckling, 1976) view that separation of ownership and control in corporations leads to potentially self serving actions by managers. The board of directors is one mechanism that serves to monitor the actions of the managers to protect shareholders from their self serving behavior (Fama and Jensen, 1983). Thus based on this view, outside directors are preferred to inside directors as they are independent of the firm. However an alternative view is suggested by stewardship theory which maintains that managers are trustworthy and good stewards of the corporation. ‘They diligently work to attain high levels of corporate profit and shareholder wealth’ (Dalton et al., 1998: 271).

In terms of resource dependence, there is general consensus regarding the superiority of outside/ independent directors versus inside/affiliated directors. Pfeffer and Salancik (1978) used resource dependence theory to argue that external board members provide access to valuable resources, information and networks that can protect the firm from adversity. Similarly, Wagner et al (1998) suggested that outside directors have greater breadth of knowledge and experience from external sources than insiders.
The advice and counseling function of boards however has mixed views. Some researchers have argued that outside directors are beneficial since they can bring in experience and knowledge not possessed by others (e.g. insiders) in the firm, and thus provide quality of advice to the CEO distinct from other others (Zahra and Pearce, 1989). However others have argued that insiders can provide superior advice on strategic issues since they have specialized knowledge and expertise about their organizations which only comes from personal experiences. Thus they can provide boards with higher quality and richer information than outsiders (Baysinger and Hoskisson, 1990). This may also help them to be better at monitoring top managers due to familiarity with and understanding of the organization (Esienhardt, 1989). Not surprisingly, empirical work on insiders vs. outsiders’ effects on firm performance also has equivocal results with positive negative and non-significant findings (Daly, Dalton and Cannella, 2003; Wagner et al 1998).

Family Firms’ Corporate Governance

We found less work on boards and family firms, in particular on the performance impact of board composition and outside CEOs in family firms-the focus of this study. One study by Voordekkers, Gils and Van den Heuvel (2007) however examined the determinants of board composition in small and medium sized family
firms. According to Voordeckers et al (2007) board composition is even more important in smaller family firms than in large firms. This is due to several reasons. First, CEOs are more powerful in such firms than boards (Fiegener et al, 2000). Second, contrary to popular belief of agency problems being less important in family firms, these authors state that families face different kinds of agency problems. They face power struggles between family members, opposite opinions and differing objectives and sibling rivalry. Due to this unique family context, the roles of the board in these firms include control, advice and counsel and resource dependence roles (as in large firms) but also additional responsibilities such as ‘arbitration among family members, networking and disciplining of management’ (Voordeckers et al, 2007: 138).

**Overview of Arguments and Propositions**

Family controlled firms’ longevity is important for economic growth. Further, innovation is a key factor contributing to firm success (Tushman and O’ Reilly, 1996). Thus we seek to examine factors affecting innovation that leads to firm sustainability in family controlled firms. We draw from the resource based view and dynamic capability literature to propose that professional CEO as an outsider to the family controlled firm plays an important role in generating innovation in the family
controlled firm, thereby positively influencing firm performance, in this case continuity. We also propose a positive moderating effect of independent directors as board members on innovation and performance of family controlled firms.

Contextualization of Our Research

Our assumption and contextualization for our theoretical model rest on the following premises. Miller and Miller (2006) follow the definition of La Porta, Lopez-de-Silanes, and Shleifer (1999) and treat a family controlled firm as one that is partly owned by one or more family members and that family members’ total control as a minimum of twenty percent (20%) of the outstanding vote. However, since many family controlled firms possess family influence without substantial voting share, we follow Morck, Percy, Tian and Yeung (2005) and define family controlled firms as having at least ten percent (10%) voting shares. The family controlled firms of interest in our study are those in their second generation that are publicly traded. Even the firm is in its second generation but is still under the dominant influence of the founder CEO.
Many family controlled firms, like non-family firms, are very successful, and achieve success generation after generation. One of the reasons differentiating these firms and explaining their superior performance and continuity is innovation in the firm (Tushman and O’Reilly, 1996). As the main goal of family controlled firm is to achieve continuity through many successions of generations (Miller and Miller, 2006) it follows then that innovation in the family controlled firm becomes paramount, and may be the main objective of its performance. However, the innovative ideas and business processes that helped the firm at its early stage, maybe a hindrance for the next generation, especially if the founder prolongs his/her status as family CEO without continuous commitment to careful stewardship, long term investment in R&D, training, infrastructure and capability building (Miller and Miller, 2006, Han 2004, Birkinshaw, 1999). This may result in poor performance as inertia leads to lack of innovation (Gersick, 1991). Therefore, we focus our study on family controlled firms that enjoyed superior performance in their first generation; meaning the founder of the firm has achieved entrepreneurial success. We further focus our study on those firms that have family members or old time family friends on the management team and board of directors.
**Theory and Proposition Development**

The resource based view informs us that performance differences across firms are due to the diversity in each firms’ specific resources that are rare, valuable, costly to imitate, and non-substitutable (Barney, 1991). As these core resources become cornerstones of competitive advantage of the firm (Peteraf, 1993), it makes sense to further investigate how family controlled firms can develop competitive advantages that are lasting and specific, only to the family controlled firms. Tushman and O’Reilly (1997) suggest that innovation can be achieved by building a balanced portfolio of incremental and radical change for the firm. We extend this logic to suggest that family controlled firms may embrace the newness from a professional CEO joining the family entity (DeMott, 2008), and the professional CEO may adapt to the relevant practices in the family controlled firms and the two together form the specific family resource that is unique. When both the firm and the new professional CEO become harmonized, the union becomes a rare and valuable asset, thus a specific, rare, valuable, costly to imitate, and non-substitutable resource for the family controlled firm. This combination helps the family firm to not only take advantage of its unique resources (i.e. familiness) while effectively managing the disadvantages, but also helps the family controlled firm to integrate and deploy these resources to
attain sustainable competitive advantage (Sirmon and Hitt, 2003). Further, the positive effects of the professional CEO directly and indirectly generate innovation in the family controlled firms leading to superior performance and continuity.

Professional CEOs possess expertise, experience, knowledge and social capital (Adler and Kwon, 2002; Miller and Miller, 2006; Han, 2006; Han and McKelvey, 2008) that can serve as a valuable resource to the firm. Family controlled firms have unique market knowledge, business practices and social capital (Arregle, Hitt, Sirmon and Very, 2007) that contribute to the firm’s success. We argue that the combination of the professional CEO and the family’s knowledge, experience and social capital work together towards the goal of achieving longevity of the family controlled firm: this combination is the cornerstone of the family controlled firms’ dynamic capability and competitive advantage (Peteraf, 1993; Teece, Pisano and Shuen, 1997). It serves to integrate and deploy the unique resources (familiness) of the firm (Sirmon and Hitt, 2003) creating value, and thus can lead the firm to achieve superior performance. There are three reasons for this.
Internal and External Conflicts Remover

As an outsider of the family, the professional CEO serves as the harmonizer, enhancer and actor for many internal and external conflicts, making timely and strategic decisions without emotion. Professional CEOs can be particularly useful since their expertise provides the family controlled firms with access to external financing (Sirmon and Hitt, 2003), networking (Han, 2006), access to new information (Burt, 1992), strategy development (Miller and Miller, 2006), advice and counsel (Poza, 2007). In addition, as the professional CEO may have less investment compared to the family, he may act more as a diversified investor with less emotion (Voordeckers et al, 2007). Professional CEOs may also focus more on traditional business objectives such as profit maximization, growth (Han and Celly, 2008) and innovation (Sharma, Chrisman and Chua, 1997; Voordeckers et al, 2007). On the other hand, family CEOs may also have other family objectives such as maintaining family control, financial independence of the family, family harmony and family employment (Voordeckers et al, 2007, p 144) that may impede or conflict at times with the business of the firm (Poza, 2007). Finally, a professional CEO can provide family controlled firms with arbitration and conflict resolution (Voordeckers et al,
2007; Whisler, 1998) since they bring objective views free of family biases or long
term family rivalry.

**Shared Social Capital**

The logic of structural holes (Burt, 1992) and weak ties (Granovetter, 1987) views the professional CEO as the weak tie to the family controlled firm, who can bring in new knowledge and information. Moreover, the professional CEO may also bridge across boundaries of structural holes between the social network of the family, the firm, the investors’ and his own (Han, 2006). Effectively, the new social network formed may become a new dynamic capability and firm specific resource for the family controlled firm. This newly formed network led by the professional CEO allows the family controlled firm to attract and retain highly qualified talent, be included in elite networks, and receive access to critical, professional and timely information.

**Shedding Resources**

Although family controlled firms have unique resources (familiness), ironically these resources may become a source of competitive disadvantage. The opportunity costs of maintaining and leveraging inferior resources can reduce or even destroy
economic rent instead of creating it (Sirmon and Hitt, 2003). This is even more serious in family firms that are usually resource constrained. Removing excess or underutilized resources, in particular human capital, can allow the family controlled firm to be leaner by reducing excess costs, release financial capital, become more flexible and diligent. It can also lead to a break from path dependencies and break old routines and norms. By doing so, this may allow the firm to hire new human capital that can generate new ideas for innovation. In sum, all these actions can result in increased innovation for the firm by breaking inertia brought on by years of old timers and old routines and norms. Family controlled firms however find it difficult to shed resources, in particular human resources, since these comprise family members and family CEOs suffer from liability of emotional attachment. However, a professional CEO can execute shedding based on his or her executive and strategic decision that is objective and professional. Sirmon and Hitt (2003) similarly argue that removing family members who may be underperforming or simply less qualified is extremely difficult in family controlled firms due to generational outlooks, family ties and emotional links. Thus bringing in a professional CEO who does not have these attachments to the family can assist the firm to make such decisions, implement resource shedding, and focus on growing the firm efficiently and effectively.
managing all resources and capabilities possessed by the firm. When wasteful resources are shed by the professional CEO, the family controlled firm can allocate resources to build future growth via innovation. Based on this logic, we infer the following proposition.

**Proposition 1**: Professional CEOs are positively related to family controlled firms’ innovation and performance.

**Moderating Effect of Independent Directors**

Innovation is often delayed or prohibited in family controlled firms due to three reasons. First, the fabric of family controlled firms consists of management, ownership (investors and shareholders), and the family (Poza, 2007). The management executives in the family controlled firms may seek to build their empire (Morcel and Yeung, 2003; Miller, 2003) and focus on short term gain in order to take benefits when possible, if they feel that advancement in the firm are due to family desire rather than competence (Miller, Miller and Steier, 2004). Managerial distrust can drive family controlled firms into chaos, as the strategic choices of the family and the management are not aligned, and resources allocation becomes an issue and hotbed of conflict (Poza, 2007). Clearly, internal conflicts and chaos can directly and indirectly hinder possibility of innovation in the firm. Second, investors and
especially investors who have larger investment in the family controlled firms may have a very short term horizon for their investment. Innovation often requires long term commitment in time and cost. But investors may perceive innovation as too costly and risky, therefore, may not be directly benefiting to their investment portfolio and objective (Sirmon and Hitt, 2003). As a result, these investors may block innovation and vote for safe bets in the interest of their ownership. Finally, family’s internal conflicts may emerge as the family firm grows, siblings rivalry increases as succession decision approaches, monarch style exit of the founder where the founder may become a shadow controlling the decision making process, exploitation of minority shareholders and spouse shareholders who may not have the same interest and passion in the family controlled firms. All these factors may contribute to the family controlled firms’ lack of time and interest to focus on innovation efforts (Miller, 2003; Poza, 2007; Han, 2004).

Independent directors are supposed to bring ‘arbitration among family members, networking and disciplining of management’ (Voordeckers et al, 2007, p 144). Thus, we propose, that independent directors of the board may serve as a force to align the family, management and investors, ease conflicts, resolve differences and
more importantly, help the firm to focus, develop and build consensus of morale to sustain the family controlled firms with innovation and superior performance. Further, we argue that independent directors moderate the effect of the professional CEO on innovation and performance in several ways. First, we argue that independent directors may achieve the alignment of the three distinctive stakeholders in the family controlled firm and drive innovation to continuity of the firm by virtue of their title. The mere existence of independent directors bestows the family controlled firm with a sense of fairness, transparency in reward and promotion, and intention of longevity and competitiveness. The fact that the founder CEO and the board, often consist of family members, but are willing to invite independent directors, who are experienced, respected by the industry, and knowledgeable, signal to its management team, investors and all family constituents that the family controlled form is striving to achieve alignment and willing to resolve differences. Therefore, independent directors may conduct their duty to rid the firm of barriers and constraints to innovation buried in managerial and family conflicts in reward and promotion, family and investors’ conflicts investment timeframes, and family and management’s conflict in succession. Second, independent directors may act as a supporting voice when the professional CEO attempts radical innovation that may perceived as risky and
uncertain. Their industry knowledge and experience earn them respect on the board, and their voice on the board can help the professional CEO to strengthen the case for innovation, if such innovation is required and relevant to the firm’s continuity. Finally, family controlled firms may have old timers or family members on the board since the inception of the firm. Their traditional view coupled with group think from the family over the years, may lead the firm towards conservative strategic choices that trap the firm due to its past success (Tushman and O’Reilly, 1996). Therefore, we further argue that the number of independent directors must be larger than the old timers and family members to become effective members in family controlled firms. As independent directors serve as a critical member and positive moderators to the family controlled firms’ innovation and performance, we argue that they are the specific resources and dynamic capability to the family controlled firms and we propose the following:

**Proposition 2a**: Independent board members positively moderate the effect of professional CEO on innovation and performance in the family controlled firms.

**Proposition 2b**: Higher number of independent board members will have greater moderating effect on innovation and performance in the family controlled firms.
Discussion

Family firms are now recognized as being fairly distinct to non-family firms and have consequently attracted research attention from both entrepreneurship and strategy scholars. Most of the research has focused on what differentiates family from non-family firms, unique characteristics or familiness of family firms, founder effects and family firm performance. However, little attention has been paid to an equally important factor, innovation or the lack of it to family controlled firms’ survival. Furthermore even less attention has been paid to corporate governance in family firm and how outsider (non-family) executives such as professional CEO and independent board members can create innovation leading to improved performance and continuity of family controlled firms. In this paper, we drew on the resource based view and dynamic capability literature to demonstrate the positive effects of using non-family members as part of the corporate governance body in family controlled firms. Specifically, we developed a theoretical model and propositions to explain how a professional CEO combined with unique family resources can positively influence innovation and continuity in the family controlled firm. We also proposed a positive moderating effect of independent board members in the family controlled firms’ innovation and continuity.
Our propositions and model extend Sirmon and Hitt (2003) by demonstrating how family controlled firms can leverage their familiness (unique resources) by hiring professional CEOs and independent board members to achieve sustainable competitive advantage. Thus we contribute to resource based theory of the family firm by isolating how one specific resource—the professional CEO can bundle with other firm resources (in this case familiness) to produce a unique new bundle of resources that are a source of sustainable competitive advantage. Although a professional CEO by himself/herself may not be a source of sustainable competitive advantage for the family controlled firm and the unique family resources themselves may also not be sufficient to create value, the two combined can be.

Our model also advances current thinking on the uniqueness and basis for competitive advantage of family firms by illustrating how family firms can build on their advantages (vs. non-family firms) while managing their disadvantages (such as rivalry, disputes, non-business objectives). We also extend corporate governance research by focusing on an under-explored but extremely important organizational form—the family controlled firm. Our final contribution to family firm research is that our developed propositions form a baseline for future empirical studies in this important area of research.
This research also suggests important implications for managers and owners in family controlled firms. First, our study suggests that family members need to think carefully about hiring a professional CEO and independent directors as board members. While family controlled firms have traditionally been dominated (ie. controlled and managed) by family members it may be time for them to consider letting go and actively seeking to add outsiders as top management and board members. Doing so can facilitate rather than negate the unique advantages of family firms and even increase harmony and decrease conflict within the firm.

Secondly, professional CEOs and top managers should not shy away from joining family controlled firms and sitting on their boards, but instead should actively seek positions in family controlled firms. Their unique skills and experience can combine with the family characteristics to create a highly successful and innovative firm. Finally, policy makers and governments interested in growing their economy may consider advising family controlled firms – a large engine of their growth to seek professional CEOs and outsiders as board members instead of confining themselves only to family members. Doing so would enable them to not only achieve greater innovation and continuity but may also increase profitability and other business performance metrics such as growth and market share. This advice may be even more
salient for policy makers in emerging countries with much larger share of family
controlled and family owned firms.

Conclusion

In our research, we addressed the importance of innovation to family controlled
firms. More importantly, we drew upon the resource based view to articulate the
critical role of professional CEO, and the moderating effect of independent directors
to the family controlled firms’ innovation and performance. Extant literature in
corporate governance, resource based theory and entrepreneurship have well
documented the role of external CEO and independent directors to firm performance,
but our study is among the first attempt to link the resource based view and extend it
argue that the combination effect of family firm and outsiders can build specific
resources for the firm, and become a dynamical capability that leads the family
controlled firm towards innovation and continuity. Our testable propositions may
form the baseline for future research in this important subject area in family business,
corporate governance, strategy and entrepreneurship.

The Role of Entrepreneurial Organizational Structure in Opportunity Identification and Exploitation: Resolving the Paradoxes of Uncertainty & Inertia

Krishna Poudel and Sherry Thatcher

Abstract

The void in theorizing at the interface of organizational structure (OS) and opportunity identification and opportunity exploitation motivated the present research. We contend the applicability of ‘organic vis-à-vis mechanistic’ organizational structure and ‘too-much-too-little’ organizational structure frameworks in the entrepreneurship context. Alternatively, we proposed a new framework of entrepreneurially-optimal organizational structure, defined as the differential development of various OS dimensions. To that end, we revealed and resolved two paradoxes, the paradox of uncertainty and the paradox of inertia, which are inevitably embedded in entrepreneurial processes.

Introduction

The debates of organic vis-à-vis mechanistic organizational structure (OS) and too-much vis-à-vis too-little organizational structure in the context of firm performance, environmental dynamism are perennial and polemic in organization literature (Burns & Stalker, 1961; Davis, Eisenhardt & Bingham, 2009; Mintzberg, 1979; Sine, Mitsuhashi & Kirsch, 2006; Weber, 1947). In these debates, the evidence is inconclusive as to which approaches are best (cf. Davies et al., 2009; Sine et al., 2006).

Some studies in the past (c.f. Covin & Slevin, 1989; Davis et al., 2009; Naman & Slevin, 1993; Sine et al., 2006) have discussed the relationship of structure and performance in the entrepreneurship context. Although these studies have immensely broadened our understanding of the relationship, a paucity of comprehensive theorizing in the intersection of organizational structure and entrepreneurship still exists. Many empirical studies merely took new venture performance simply as a new context of investigation (e.g., Sine et al., 2006) while others mentioned the relationship to the entrepreneurship context in passing (e.g., Alvarez & Barney, 2004; Covin & Slevin,
Even when organizational structure in an entrepreneurship context was part of theory building or testing, it was not the focus of these studies. For instance, Naman & Slevin’s (1993) focal argument was on the fit of entrepreneurship and the environment. And, Davis et al.’s (2009) investigation centered on the dynamism of environment and the too-much vis-à-vis too-little framework of optimality of organizational structure. To our knowledge, no study has theorized about organizational structure in the entrepreneurship context by incorporating two entrepreneurial processes, opportunity identification (recognition or creation or discovery) and opportunity exploitation (Shane & Venkataraman, 2000; Sarasvathy, 2001). This is the motivation behind the present research. A more comprehensive understanding of organizational structure in entrepreneurship contexts is necessary for the following reasons.

First, as we mentioned in the opening paragraph, given the inconclusive evidence and juxtaposed theoretical logic, the relationship between organizational structure and firm performance is intriguing and needs additional subtle, finely textured insights. Investigation of the impact of OS on entrepreneurial opportunity identification and exploitation has the possibility of generating new insights in both the entrepreneurship and organizational structure literatures.

Second, as scholars argue, the performance in entrepreneurial organizations, or entrepreneurial performance, is distinct from the usually connoted firm performance in strategy or organization literature (Shane & Venkataraman, 2000). Hence, the insights of OS developed in the context of firm performance might not be completely applicable in the entrepreneurship contexts of general entrepreneurship or corporate entrepreneurship.
Third, as Davidsson (2004) puts it: “The relationship between organizational characteristics and change on one hand, and discovery and exploitation of new venture ideas on the other, are important questions for entrepreneurship research”.

Finally, scholars deem two components of entrepreneurship process - opportunity identification (OI) and opportunity exploitation (OE) - as overlapping processes (e.g., Bhave, 1994; Davidsson, 2004; Sarasvathy, 2001). We argue that the two overlapping processes give rise to two paradoxes – the paradox of uncertainty and the paradox of inertia - and resolving these two paradoxes requires an entrepreneurially optimal organizational structure. Whereas reducing uncertainty is a desirable condition for opportunity exploitation, without the existence of uncertainty, opportunity identification would not be possible (Shane & Venkataraman, 2000; Williamson, 1981; Jensen & Meckling, 1976). Similarly, whereas structural inertia facilitates acquisition, efficacious recombination and marshaling of resources needed for opportunity exploitation (Shane, 2003), inertia obstructs and retards the adaptation or modifications needed in exploitation processes (Miller and Chen, 1994). Both of the paradoxes are explained extensively in the text of the paper.

In this paper, we build a new strand of organizational structure optimality, entrepreneurially-optimal organizational structure. In doing so, we borrow from both organic-mechanistic and too-much-too-little structural logic while simultaneously departing in major ways. For instance, while we build our theoretical framework on three widely accepted dimensions of organizational structure - complexity, formalization and centralization (Collins, Hage & Hull, 1988; Hage & Dewar, 1973) – we identify an additional dimension of organizational structure, richness of communication channels.
Deriving contingencies based on these dimensions of organizational structure, we develop and advocate an entrepreneurially-optimal organizational structure. The entrepreneurially-optimal structure we advocate resolves the two paradoxes mentioned above. In other words, it provides an optimality framework by identifying when inertia would be functional (or dysfunctional for that matter) and when uncertainty could be reduced (or can not be reduced for that matter) during OI and OE processes.

The rest of the paper proceeds as follows. In the next section, the definition and assumptions of entrepreneurship are stated. Then we review the debates and evidence surrounding organizational structure as they relate to firm performance. In the third section, we make the case that entrepreneurial performance is distinct from general firm performance, and as such, the conventional optimality arguments have limited applicability in the entrepreneurship context. Next, the criticality of OS in entrepreneurship context is explained. The following section covers entrepreneurially-optimal organizational structures. In this section, we explain the dimensions of organizational structure, including the new dimension we identify, as well as how entrepreneurial process gives rise to the two paradoxes. In section six, we extend our insights for resolving the paradoxes along with matrices derived from the dimensions of organizational structure. Finally, in the discussion section, we provide a summary conclusion, contributions of the paper, methodological implications, and potential limitations.

**Entrepreneurship: Definition & Assumptions**

There are many interpretations of entrepreneurship; self employment, small business, business ownership (mostly in economics, cf. Parker, 2009), creation of a new
organization (Katz & Gartner, 1988), competitive behaviors that drive market process (Davidsson, 2004; Kirzner, 1979) and the like. There is no convergence on what an entrepreneurship is (Parker, 2009). In this manuscript, in conformity with many authors (e.g., Sarasvathy, 2001; Shane & Venkataraman, 2000; Drucker, 2007), we follow a Schumpeterian conceptualization of entrepreneurship with a broad connotation. That is to say, we define entrepreneurship as the identification (recognition, or discovery, or creation) and exploitation of new opportunities. Entrepreneurial opportunity identification and exploitation is conceived here as one or more of the following: successful production of new goods, introduction of new methods of production, opening of new markets, finding new sources of supply, and industrial reorganization (Schumpeter, 1934). Note that we recognize the process of evaluation (Shane & Venkataraman, 2000), but consider it as subsumed within identification process for the same logic other entrepreneurship scholars have done so (e.g., Davidsson, 2004). We subscribe to the viewpoint that an entrepreneurial opportunity exists not only in product markets or service markets but also in factor markets (Shane & Venkataraman, 2000; Schumpeter, 1934).

There is a debate in the entrepreneurship literature about whether opportunities are recognized with higher cognitive ability (e.g., Kirzner, 1979, Gaglio & Katz, 2001), discovered capitalizing on asymmetric information about the objectively existing opportunity (Shane, 2003; Hayek, 1945, Fiet; 1996), created by the ones who have higher level of creativity, or created through abductive processes (Schumpeter, 1934; Sarasvathy, 2001). However, we regard recognition, discovery, and creation as simply
three methods of opportunity identification depending upon the nature of the opportunity concurring with Sarasvathy et al. (2003).

Although it can be assumed that majority of entrepreneurial opportunities will be exploited with the formation of new organizations, a \textit{de novo} organization is not a necessary condition for identification and exploitation of an entrepreneurial opportunity (Shane & Venkataraman, 2000). Identification and exploitation of entrepreneurial opportunities can be equally accomplished within an existing organization, which is often referred as corporate entrepreneurship (Barringer & Bluedorn, 1999; Stevenson & Jarillo, 1990) or intrapreneurship (Antoncic & Hisrich, 2001). We recognize that an entrepreneurial opportunity can be identified and exploited in the absence of a hierarchical organizing mechanism (an organization), in the market of opportunities (Shane & Venkataraman, 2000); however, these are rare events and do not fall within the boundary of entrepreneurship we defined here. Hence, the mode of exploitation, for the relationship we are theorizing, has to be within a hierarchical governance mechanism.

\textbf{Organizational Structure & Firm Performance: Debates & Evidence}

The influence of organizational structure (OS) on various aspects of an organization - such as on competitive interaction among firms (e.g., Vroom, 2006), strategic directions (Stieglitz & Heine, 2007), motivation (e.g., Sherman & Smith, 1984), political behavior of firms (e.g., Shaffer & Hillman, 2000), organizational learning (e.g., Lane & Lubatkin, 1998), and information systems (e.g., Kumar, Ow & Prietula, 1993) has been investigated. The relationship between organizational structure and firm performance, especially in the context of dynamic environments, has sustained a perennial and intriguing debate among organization scholars. From seminal works (e.g.,
Burns & Stalker, 1961; Mintzberg, 1979; Weber, 1947) to contemporary theorizing (e.g.,
Davis et al., 2009; Sine, Mitsuhashi & Kirsch, 2006), numerous insights and extensive
evidence have been offered that analyze various aspects of the relationship. More
specifically, two sets of related debates dominate the OS-performance relationship in the
literature – (1) organic structure vis-à-vis mechanistic structure and (2) too-much vis-à-
vis too-little organizational structure.

Usually, lateral coordination, networks of authority, and lack of task formalization
are referred to as the characteristics of an organic structure whereas vertical coordination,
hierarchy of authority, and formalization of documentation (rules, procedures and
instructions) are associated with a mechanistic structure (Collins, Hage & Hull, 1988;
Sine et al., 2006). The evidence of whether an organic or mechanistic organizational
structure is more conducive for the performance/survival in a dynamic environment is
inconclusive. Following the seminal evidence presented by Burns and Stalker (1961),
several other studies have replicated the finding that organic structure is better in
dynamic environments (cf. Collins et al., 1998). On the other hand, in line with the
classic Weberian argument, Sine et al. (2006) contend and provide evidence that a
mechanistic organizational structure is better for new ventures.

Organizational structure optimality, in other words, a balance between too-much
and too-little organizational structure for maximum performance, is equally preponderant
in the literature. This is based on efficiency-flexibility logic. Whereas organizations with
too much structure lack the flexibility needed for adaptation in a dynamic environment,
organizations with too little structure lack the efficiency (Martin & Eisenhardt, 2010;
Davis et al., 2009). In this framework, multiple literatures have suggested for an inverted
U-shaped relationship between organizational structure and performance (e.g., Hargadon and Sutton, 1997; Rothaermel, Hitt, and Jobe, 2006).

The argument linked to the too-much-too-little and to the mechanistic-organic structure debates is that of organizational change and organizational inertia\(^1\) (Hannan & Freeman, 1984). Organizational inertia is often referred to as a hyper-stability in structures and processes in an organization (Miller & Chen, 1994). In other words, inertia is regarded as a propensity to regularly repeat past actions and activity patterns (Jansen, 2004). Scholars in the evolutionary & population ecology tradition, especially in their early writings, strongly advocated that organizational inertia is advantageous for firm survival (cf. Hannan & Freeman, 1984; Nelson and Winter, 1982). Other theorists have considered organizational inertia deleterious for the adaptation and organizational changes necessary for surviving in a dynamic environment (cf. Hedberg 1981; Miller & Chen, 1994).

**Conventional Optimality Arguments: Constraints in the Entrepreneurship Context**

We set the stage for our narrative by succinctly reviewing the debates ongoing in organizational structure and organizational inertia and by clarifying the boundary conditions and assumptions of entrepreneurship for this manuscript. We contend that the conventional optimality of structures logic is constrained in the entrepreneurship context, and as such should be revisited.

The survival and growth of new ventures is fundamentally dependent on the successful identification and exploitation of entrepreneurial opportunities explained earlier (Sarasvathy et al., 2003; Bruderl, Preisendorfer, & Ziegler, 1992). With

---

\(^1\) Organizational inertia and structural inertia are often used synonymously. But some studies (e.g., Miller & Friesen, 1980) refer structural inertia and process inertia as two forms of organizational inertia. In this manuscript we use organizational inertia and structural inertia interchangeably.
globalization and swiftly changing environments, the survival and growth of even established firms have increasingly been dependent on the degree to which they possess entrepreneurial characteristics (Covin & Slevin, 1991; Antoncic & Hisrich, 2001; Stevenson & Jarillo, 1990; Tetenbaum, 1998). To be more precise, changing competitive dynamics have forced even established companies to identify and exploit entrepreneurial opportunities. The conventional logic of organizational structures, even when applied in the context of entrepreneurship, does not distinguish between its impact on opportunity identification and exploitation (e.g., Davis et al., 2009). This omission has serious implications for the impact of organizational structure in the entrepreneurship context for the following two reasons.

First, the dimensions of organizational structure might have a differential impact on each of the processes. For instance, centralization of authority and decision making might hinder the opportunity identification process whereas a moderate standardization of procedures might facilitate OI. In a strictly centralized system, employees in the lower strata will have less likelihood of identifying an entrepreneurial opportunity, and sharing it with employees in the upper strata if they do identify an opportunity. *Ceteris paribus*, in such a system, those in the lower strata will have less motivation and incentive to begin with. When someone does not wield any decision making authority, she/he is less likely to proactively pursue or push any idea that requires such decision making.

The simplest type of opportunity identification method, opportunity recognition (Sarasvathy, 2003), requires that a person be consciously alert to the opportunities available in environment (Kirzner, 1979). In the absence of motivation or incentives, a lower level employee will be less likely to be alert to entrepreneurial opportunities, and
thereby, less likely to recognize such opportunities when they are present. If we consider identification as a process of connecting dots, it is not hard to see that the discovery and creation of ideas will require better skills than being alert to opportunities - as in the case of recognition. The point of this explanation is that the centralization of authority would hinder the OI process.

On the other hand, the impact of standardization of processes and procedures can be both positive and negative depending upon the magnitude, as far as OI process is concerned. For instance, when processes, procedures are standardized too much it might impede employees to be consciously alert to opportunities or to think creatively. On the other hand, moderate levels of standardized processes and procedures might actually help the recognition process. While moderately standardized processes and procedures will not create any disincentives for the alertness to entrepreneurial opportunity, it might help employees concentrate their attention on the right type of opportunities present in the environment. From attention-based theories of organizational action (e.g., Ocasio, 1997; Hoffman & Ocasio, 2001), we know that attention is crucial in identifying and processing relevant information from a wide range of environmental stimuli because of the constrained cognitive ability of the agents/individuals (March & Simon, 1958). Hence, from this discussion, it is plausible to assert that different dimensions of OS will have a differential impact on OI. A Similar case can be easily made for OE.

Second, the same dimension of OS might have differential impacts on OI and EO. The impact of centralization on OE, contrary to its impact on OI, is that increasing levels of centralization would likely facilitate the exploitation process. Since exploitation
requires efficiency on the part of rank and file employees and authority on the part of supervisors, a centralized system would be more conducive than a decentralized system.

Earlier we argued that entrepreneurial performance must be distinguished from the usual standards of company performance. Unfortunately, almost all of the studies which made arguments about the organizational structure-performance relationship in an entrepreneurial context conceptualized and measured performance exactly the way they would in a general performance context, that is in terms of revenue, profit, and other similar indicators (e.g., Sine et al., 2006).

Note that our contention is not about the use of these common proxies but in the fashion they are represented and operationalized. When operationalized in the same manner as usual performance measures, they constrain the content validity and construct validity of entrepreneurial performance. However, we can use the same proxies to measure entrepreneurial performance more appropriately. For instance, determining how much revenue growth in a company occurred as a result of a new product introduction, or a new production technology, would be a good measure of entrepreneurial performance. It would represent and measure the successful identification and exploitation of an entrepreneurial opportunity.

Simply analyzing some dimension of organizational structure using general company performance measures (e.g., revenue) does not capture the rich texture of the relationship between OS and entrepreneurial performance. We believe that this tendency is partially due to the absence of a theoretical framework to guide researchers interested in OS and entrepreneurial performance.

*The Significance of Organizational Structure in Entrepreneurial Process*
According to the estimates of Timmons (1994) over 20% of the businesses fail within one year of start up and more than 66% of them fail within six years. Literature suggests various theoretical explanations for this high level of failure of emerging organizations, such as liability of newness (Stinchcombe 1965), liability of smallness (Bruderl et al., 1992), prior founding and disbanding rates (Carroll & Hannan, 1989), and initial resource endowment (Cooper et al., 1994; Dahlqvist, Davidsson & Wiklund, 2001). Another major reason for failure is the inability of entrepreneurs to design an effective organizational structure (Aldrich, 1999; Shane, 2003). We explain this point further.

Research has suggested two broad categories of factors that influence the probability that certain people will identify particular opportunities: (1) the possession of prior information, and arguably asymmetric information, necessary to identify an opportunity (information corridors) and (2) the cognitive properties necessary to value it (cognitive processes and characteristics of recognizers)(Gaglio & Katz, 2001; Shane & Venkataraman, 2000; Shane, 2004). These two corridors (information and cognition) make an implicit but constraining assumption. That is, opportunity identification may occur in the absence of organizational structures. Note, however, that without a structural context, both of the corridors face an ontological vacuum. Without a structure neither the systematic pursuit of investment on information nor the facilitating cognitive processes can possibly be imagined.

The role of organizational structure discussed above is applicable in both new ventures and established organizations. In the case of a new venture, upon the transition from a nascent entrepreneur to a newly established firm (Reynolds, 1994), the
entrepreneurial process is more of an organizational phenomenon rather than an individual act. Founder-owner(s) might still be the most important decision makers but they will be constrained, or facilitated for that matter, by the routines, boundaries and activities that the organization requires during the entrepreneurial processes.

Organic-mechanistic and too-much-too-little frameworks of OS are not appropriate in studying the impact of various dimensions of OS on OI and OE. For instance, it would not be possible to have an organic structure in OI and a mechanistic structure in OE, as existence of the two structures simultaneously is not possible. We discussed earlier the implications of failing to investigate the impact of various dimensions of OS on OI and OE. For these reasons, we take a different approach in identifying optimal organizational structures in the entrepreneurship context. Our approach is to show the impact of various dimensions of OS on OI and OE individually, and then analyze them in concert. Doing so will allow us to see the minute details of the relationships as well as the gestalt of the relationships.

**Entrepreneurially-Optimal Organizational Structure**

Entrepreneurship scholars largely converge on the idea that the processes of identification and exploitation of opportunity go hand in hand, as overlapping processes (e.g., Davidsson, 2004; Bhave, 1994; Sarasvathy, 2001). These overlapping processes give rise to two paradoxes, the paradox of organizational inertia and the paradox of uncertainty – as we explain subsequently. The contingencies of relationship between various dimensions of OS and OI and OE that resolve the paradoxes would be an optimal organizational structure with respect to entrepreneurial performance. Because the
dimensions of organizational structure are crucial in our theory building and we introduce a new dimension of OS, we briefly review the literature in this area.

**Dimensions of Organizational Structure**

Earlier works considered either six dimensions (e.g., Kerlinger, 1964; Sherman & Smith, 1984) or five dimensions (e.g., Pugh, Hickson, Hinings, & Turner, 1968; Pugh, Hickson & Hinings, 1969) of organizational structure. The five dimensions Pugh et al. (1969) used and tested are: (1) specialization of functions, the division of labor in the organization; (2) standardization of procedures, the existence of rules purporting to cover all circumstances and applying invariably; (3) formalization of documentation, the extent to which rules, procedures, instructions, and communications are written; (4) centralization of authority, the locus of decision making; and (5) configuration of positions, the shape of the role structure. Later studies focused more on three dimensions of organizational structure - complexity, formalization and centralization (e.g., Hage & Dewar, 1973; Hage, 1980; Collins, Hage & Hull, 1988).²

Studies which used complexity (e.g., Hage & Dewar, 1973; Collins et al., 1988) as a structural dimension have mostly conceptualized complexity as the degree of functional specialization and professional activity/professionalization. For our purposes, we consider functional specialization, standardization of procedures, and configuration of the positions as three manifestations of complexity of processes an organization must develop in order to grow as a thriving organization. More specifically, we term this structural dimension as the complexity of processes and we consider this as the first dimension of organizational structure.

² Readers are also encouraged to review two classic studies, Pugh et al. (1968) and Grinyer & Yasai-Ardekani (1980), for an extensive discussion of the dimensions of organizational structure – from two different perspectives, macro and micro.
Almost all of the studies in organizational structure include formalization and centralization as two dimensions of organizational structure. Although conceptually distinct, collectively, the two dimensions can be thought of as instruments of control. Researchers have noted that formalization leads to both structural and communicational rigidities and serves as a control mechanism (cf. Collins et al., 1988). In previous studies, centralization has been conceptualized and operationalized in many ways – such as a locus of decision making authority, a degree of decision making autonomy of an organizational unit (Pugh et al., 1968), participation in decision making (Hage & Dewar, 1973), and compact or singular leadership structure as opposed to wider representative leadership structure (Sherman & Smith, 1984). All these various conceptualizations and operationalizations suggest a degree of control, or more precisely, the rigidity of control, in an organization. Hence, given this shared property of the two structural variables, we build our theory considering the rigidity of control as the second dimension of organizational structure.

We are not confounding or mixing the two variables here. We suggest that the rigidity of control is a second order construct, with formalization and centralization as first order latent factors. Similarly, the complexity dimension is viewed as a second order structural variable. Since the measurement of organizational structure would still be in terms of the five structure variables as the first order constructs, it would not create any dissonance within current literature - so far as empirical implications are concerned. On the other hand, by regarding complexity and control as second order factors of OS, we provide some conceptual clarity for the thesis we build.
Although formalization of documentation construct involves “communication” as one of the elements, we contend that this downplays the role of an extremely significant construct in organizational structure theorizing. A communication perspective of firms deems organizations as communication systems with various network nodes (individuals, teams, divisions etc.) connected internally and to external environment (cf. Zmud, Lind & Young, 1990). In addition, organizational communication takes center stage in another popular perspective of organizations, the knowledge based perspective of firms (cf. Grant, 1996; Nonaka 1994).

“Communication is at the center of everything” – T. Michael Glenn, president and CEO of FedEx.

“Communications are an essential part of what you have to offer to customers and shareholders. It has to be in the center to be optimally effective.” – Dell’s founder, Michael Dell.

(Quotes courtesy: Argenti et al. 2005)

The two quotes could not be more correct in reflecting a general perception among entrepreneurs and top managers regarding the role of organizational communication in today’s competitive environment. Communication with external constituents - like customers, government institutions - as well as internal constituents - like employees, investors – is significant for organizational performance (Argenti et al., 2005). Richness of communication in an organization manifests itself in two reflective dimensions - how systematically the communication channels are built and how many communication functions are included. From a strategic perspective, Argenti et al. (2005) mention six distinct communication functions – employee communication, marketing communication, financial communication, government relations, community relations,
and media relations. Haphazard and ad-hoc developed communication channels within an organization can be expected to be less effective compared to communication channels that are systematic and prescient. Organizational literature, more precisely beginning in the 1990s, has started to recognize and investigate the significance of organizational communication (e.g., Yates & Orlikowski, 1992; Jehiel, 1999; Dessein, 2002; Argenti, Howell & Beck, 2005). However, to our knowledge, organizational communication has not been conceptualized as a primary dimension of organizational structure. Note that formalization of documentation, although it involves communication, does not represent the full spectrum and richness of organizational communication.

We will discuss the significance of organizational communication as a third dimension of OS for entrepreneurship contexts later in this paper. Our argument here is to emphasize that the relative omission of organizational communication in organizational structure theory building is a shortcoming in OS theorizing. Hence, the third dimension of OS we conjecture about in this manuscript is the “richness of communication channels” – reflected in the quality of communication channels and the range of communication functions.

**Inertia Paradox**

As an organization emerges, the organizational structure will develop on the three dimensions mentioned above, more specifically, the complexity of process, rigidity of control, and richness of communication channels. When growing, an organization’s structure will develop some inertial forces endogenously. In addition, as the established literatures suggest, institutional forces and ecological forces, which can be collectively
termed as environmental forces, would cause the development of structural inertia exogenously (DiMaggio & Powell, 1983; Hannan & Freeman, 1984).

Successful exploitation of an entrepreneurial opportunity needs acquisition, efficacious recombination, and marshaling of resources (Shane, 2003). To acquire, recombine, and marshal necessary resources for opportunity exploitation, a firm will require a certain degree of complexity of the processes, some rigidity of control as well as adequately enriched communication channels. For instance, when acquiring a resource, a good communication channel with investors is necessary. Similarly, if procedures are not standardized (one factor of the complexity of the processes), there may be efficiency losses during resource recombination. For the successful exploitation of an opportunity, it is not only necessary for there to be OS development on the three dimensions of OS, but it is also necessary that a certain level of stability be required. For instance, liquidity constraints (capital constraints) are a well known phenomenon in entrepreneurship (cf. Parker, 2009). A new entrepreneurial firm would find it difficult to receive any outside funding unless it has formed a stable organizational structure. As such, structural inertia would be helpful for the exploitation of an identified opportunity.

Given that the processes of opportunity identification and exploitation are overlapping, opportunity identification might need re-identification or modification. If so, it would necessitate corresponding changes in the exploitation process - either adaptation in existing process or inception of an entirely new exploitation process. In that event, structural inertia would obstruct adaptation processes (Hackman, 1990), retard adaptation processes (Miller and Chen, 1994) and limit the organization’s ability to enter new markets or exploit new market opportunities (Nelson & Winter, 1982). Therefore, the
overlapping nature of the opportunity identification process and the exploitation process gives rise to an inertia paradox (see figure 1). In fact, firms are unlikely to be successful without going through the cycle of identification – exploitation – re-identification - changed/new exploitation. Hence,

Conjecture 1: The overlapping nature of the entrepreneurial opportunity identification process and exploitation process gives rise to an inertia paradox, that is, a situation where a firm would require an inert organizational structure at the beginning of an entrepreneurial process but the inertia might potentially be deleterious for future entrepreneurial processes.

Our argument here is not about maximal organizational structure. Nor is it about the optimal OS as visualized in the too-much-too-little type of OS. Our thesis, instead, deals with the functionality of inertia. It is couched in the idea that organizational inertia can be functional (or advantageous) dysfunctional (or disadvantageous) depending upon the differential degree of development on each of the three dimensions. The functionality of organizational inertia is a condition which facilitates both identification and exploitation processes. For parsimony and conceptual clarity, inertial functionality is grouped into three heuristic categories – functional, moderately functional and dysfunctional.
The rigidity of control (the centralization of decision making authority and the formalization of documentation) is the dimension which is simultaneously conducive and constraining to entrepreneurial process. On one hand, the rigidity of control is conducive for opportunity exploitation. Since exploitation would require resource marshalling and recombination (Shane & Venkataraman, 2000), it often needs a tighter command structure and the ability to take swift actions. In the absence of such a command structure and quick decision-making ability, exploitation may not occur even when an identified opportunity has great potential. On the other hand, a moderate or low rigidity of control will facilitate an opportunity identification process. Hence, since the rigidity of control cancels out its impact on overall entrepreneurial process because of the opposing impacts on OI and OE, it would not have any impact on determining the functionality of inertia.

We make the following conjecture:

**Conjecture 2**: Assuming that opportunity identification and exploitation are overlapping processes, there is no influence of the degree of rigidity of control on the functionality of inertia.

As an organization grows, the rigidity of control and the complexity of processes are likely to grow more systematically relative to the growth of communication channels. In fact, the experiences expressed by entrepreneurs corroborate this observation. For example, companies which now wield state-of-the-art communication channels, such as CEDANT and DELL, built their organizational communication system either out of crisis or necessity in difficult times (cf. Argenti et al., 2005). When organizational communication systems are developed in a haphazard or ad hoc way, they are likely to lack richness. Deliberate attempts, incurring substantial resources, are needed to alter a
defective communication system. Argenti et al. (2005) rightly observe that a tactical and short term approach to communication with its constituents puts a company in a competitively disadvantageous position. Since the richness of communication channels ensures a smooth flow of ideas from various constituents, it will facilitate the opportunity identification sourced in these constituents.

Take an illustrative example of a junior sales manager working in a hygiene product manufacturing company called A-1. It is possible that this employee, by the virtue of being in direct contact with the end users of the product, knows the limitations of the company’s products. In other words, the junior employee might identify a high potential entrepreneurial opportunity. When communication channels lack richness, it is less likely that the identified opportunity would ever reach the individuals in the top echelon who are responsible for evaluation and exploitation of the opportunity.

On the other hand, the richness of communication channels is equally crucial when evaluating and exploiting an identified entrepreneurial opportunity. Exploitation of opportunities requires learning, integration, transfer and creation of knowledge. The literature in organizational learning and knowledge has sufficiently established the role of communication (Rico, Sánchez-Manzanares, Gil, & Gibson, 2008). Hence, it can be safely asserted that the richness of communication channels is conducive for both OI and OE.

The complexity of processes – functional specialization, the standardization of procedures, and role configuration – will be negatively associated with both the OI and OE processes. We argue that only low or moderate levels of complexity of processes would be beneficial for both OI and OE.
Earlier we argued that a moderate standardization of procedure will facilitate the OI process. The same can be argued for a low standardization of procedure. Research has shown that successful entrepreneurs are often “jacks-of-all-trades” and “masters-of-none” (cf. Lazear, 2005). Too much specialization obstructs the ability to get out of one’s realm of expertise and connect dots. Since opportunity identification - no matter recognition, discovery or creation - is essentially connecting dots, high levels of functional specialization in an organization would mean a deficiency of generalists who can actually connect dots. Note that the same reasoning would apply to role configuration. Overall, low or moderate levels of the complexity of processes would be favorable for OI.

We now focus on the reason high complexity of processes is detrimental for the entrepreneurial process. Imagine two companies with the same richness in communication channels and the same rigidity of control but with different levels of complexity of processes. In this situation, the company with higher complexity of processes will be ill-equipped to respond to changing task demands and to demonstrate necessary coordination relative to the company with lower complexity of processes. To illuminate this point, we evoke the concept of shared mental models and teams (Mathieu, Heffner, Goodwin, Salas, & Cannon-Bowers, 2000). First, in both de novo and established organizations, marshalling and recombination of resources would inevitably involve team work within and across different levels of hierarchy. In addition, as suggested in entrepreneurship literature, the entrepreneurial activities are commonly carried out by founding teams or top management teams (Amason, Shrader & Tompson, 2006). Second, the overlapping of identification and exploitation processes necessitates recurring changes in task demands during the exploitation process. Thus, team work is an
indispensable, integral part of the entrepreneurial process. A shared mental model permits team members to draw on their own knowledge as a basis for the actions that need to be coordinated with that of others and allows for better handling of recurring changes in task demands (Mathieu et al., 2000; Cannon-Bowers et al., 1993). High complexity of the processes, that is, too much functional specialization, role configuration, and standardization, will impair the development and the use of shared mental models – so critical for team functioning.

On the basis of the discussion above, it can be asserted that low/moderate levels of the complexity of processes and rich communication channels will be highly desirable conditions for entrepreneurial performance. Therefore, if an organization demonstrates inertia with the above mentioned development pattern, in the dimensions of its OS, it can be considered as functional inertia. If one of the desirables is present, it can be considered as moderately functional inertia. And if none of the desirables is present, it can be considered as dysfunctional inertia.

Note that in table 1 we develop the contingency with all 8 possible combinations of high and low/moderate degree on the three dimensions of OS. The rigidity of control, in the first column is only for the purpose of demonstrating possible combinations. As derived in conjecture 1, since the net effect of the rigidity of control on entrepreneurship would be null and void, table 2 more succinctly exhibits the contingencies reflected in table 1.

Conjecture 3: Low/moderate levels of the complexity of processes and high levels of communication channels will give rise to functional inertia; high levels of the complexity of processes and low levels of communication channels will give rise to
dysfunctional inertia; and low/moderate levels of the complexity of processes and low levels of communication channels or high levels of the complexity of processes and high levels of communication channels will give rise to moderately functional inertia.

Uncertainty Paradox

Many existing theories across disciplines view establishing a new organization as a governance mechanism designed to handle uncertainty in the course of generating an entrepreneurial rent. Agency theory suggests that a new organization exists to minimize an agency risk (Jensen & Meckling, 1976). The view of transaction cost economics is that it would be improbable for a firm to emerge without the existence of uncertainty (Coase, 1937; Williamson, 1981). Entrepreneurial attempts are for designing the products and services of future (Sarasvathy, 2001; Sarasvathy et al., 2003; Schumpeter, 1934). Since no future is knowable and since entrepreneurial opportunity (as we defined earlier) inherently has the element of novelty, no matter the theoretical tradition (e.g., Knight, 1921; Schumpeter, 1934; Kirzner, 1979) we use, uncertainty is inherent in entrepreneurship (McMullen & Shepherd, 2006). That said, as we explain below, the overlapping of the opportunity identification process and the exploitation process means a paradoxical implication of uncertainty reduction.

On one hand, opportunity identification presupposes uncertainty. Entrepreneurial opportunity identification occurs when someone makes a conjecture that a set of resources is not put to its “best use” (Shane & Venkataraman, 2000). This condition would hold irrespective of the type of identification mode - recognition, discovery or creation. Sarasvathy et al. (2003) theorize that when both supply and demand are known, the identification mode is recognition (putting resources to good use to achieve a given
end); when either supply or demand is unknown the identification mode is discovery (discovery of a new means for a given end); and when both supply and demand are unknown, the mode of identification is creation. Logically and perceptively it can be seen that in the case of creation, the conjecture would highly differ across potential identifiers. But in the case of recognition, the conjecture differential among potential identifiers about how to put a set of resources to best use would be narrower/less – the differential conjecture in discovery falling in between the two. In all three modes, it is just the matter of degree of uncertainty, hence, it has to be present so that people make differential conjectures (Schumpeter, 1934). Also, note that no matter if it is an entrepreneur acting on behalf of his/her new firm or a top management team acting on behalf of a corporate organization, opportunity identification always involves making differential conjecture on how to put a set of resources to best use.

For illustration, consider that the top management team (TMT) at A-1 Hygiene Product Company learned that regular toothbrushes available in the market for children are not appropriate for children under the age of 7. As such, A-1 sees the potential for a specially designed toothbrush for this group of children. The TMT at A-1 has to make a conjecture that the firm resources available - the technology, capital, professionals, scientists and the like – will be put to better use in producing this new toothbrush than in manufacturing the original toothbrushes. This conjecture is made amidst a wide range of uncertainties – such as the comfort of the new toothbrush vis-à-vis the original toothbrush, the probability of consumers liking the product, the uncertainty associated with legal permission for selling such a product, and the possibility of someone making a more user-friendly substitute of the toothbrush. If these uncertainties did not exist, other
hygiene product companies would be equally likely to identify and exploit the opportunity.

On the other hand, when it comes to exploiting an opportunity by acquiring, combining, and marshalling resources, the very uncertainty which made a particular opportunity possible becomes an impediment. As mentioned earlier, exploitation of the opportunity, or successfully acting upon the identified opportunity, means reducing the uncertainty. There is a substantial and long-standing debate emanating from multiple traditions, like neoclassical economics (e.g., Knight, 1921), Austrian economics (e.g., Schumpeter, 1934), and psychology (e.g., Atkinson, 1957) in entrepreneurship about whether an entrepreneur (or a team of entrepreneurs for that matter) bears the uncertainty associated with entrepreneurship. However, these traditions converge to suggest that successful entrepreneurial performance entails reduction or management of uncertainty (Sarasvathy et al., 2003). Hence, the uncertainty paradox, an indispensable phenomenon of entrepreneurship, is that OI requires uncertainty and OE requires the reduction of uncertainty.

However, in this theorizing there is a valid counterargument. What if identification and exploitation are sequential or stand alone processes? If so, initially, the uncertainty benefits the identifier, and then she/he engages in organizing activity to reduce the uncertainty and to appropriate entrepreneurial rent. In this scenario, our thesis will be contestable. However, this is unlikely. First, as stated earlier, entrepreneurship literature considers OI and OE as overlapping processes (e.g., Bhave, 1994; Davidsson,
Second, we argue that the notion of sequential process would need to make two assumptions: (1) once an opportunity is identified, there would be no more conjectures regarding that opportunity and (2) it would not need modification or re-identification. These assumptions are rather distant from reality. In reality, there would be conjectures on the part of different actors that come in contact with the focal conjecturer during the organizing process. At the very least, the competing conjectures of various potential identifiers would be valid unless the identified opportunity has been turned to ‘an exclusive right’ – for instance, a “patent” in the name of primary conjecturer. In our illustrative example, another hygiene product company, or the supplier of A-1, or any other related constituent is in a position to make that conjecture. Thus, the first assumption is easily challenged. In the case of the second assumption, hardly would there be any opportunity hundred percent identified \emph{ab initio}. Hence, the processes of identification and exploitation have to overlap, resulting in an uncertainty paradox, as explained above.

\textit{Conjecture 4: The overlapping of entrepreneurial opportunity identification and exploitation presupposes an uncertainty paradox: that is, a situation where uncertainty is needed to have differential conjectures about the best uses of resources among potential opportunity identifiers, but the actions for the actualization of the conjecture need to reduce uncertainty.}

A further question revolves around how this paradox is related to organizational structure and how it can be resolved. As we explain below, the resolution requires identifying a contingency based on the dimensions of organizational structure and the sources of uncertainty. However, unlike in the solution of inertia paradox, because
uncertainty is a necessary condition in identification, solving the uncertainty paradox is possible only during opportunity exploitation phase.

For organizational performance in general, and for entrepreneurial performance in particular, sources of uncertainty can be broadly grouped as – the uncertainty inherent in environment (Milliken, 1987; Waldman, Ramirez, House, & Puranam, 2001) and the uncertainty inherent in the novelty of the opportunity (Schumpeter, 1934; McMullen & Shepherd, 2006).

If the uncertainty that yielded differential conjectures among potential identifiers originated from the new information hidden in the opportunity itself (for example say the technology required by the opportunity), it would need low rigidity of control, high complexity of processes and high communication channels to tackle uncertainty in the exploitation phase. The low rigidity of control would mean less hierarchy in decision making, and less formalized procedures, rules, and instructions which would ensure the richness of contribution from the employees in every level of hierarchy. Managing the uncertainty inherent in the new information of the opportunity would also require a high degree of functional differentiation and standardization of processes and procedures (higher level of complexity) for ensuring effectiveness of the actions directed to cope with multiple uncertainties. Similarly, high level of communication channels is likely to permit better coordination and development of shared mental models required to grapple multiple uncertainties as explained earlier.

Consider A-1 company and the new toothbrush again. If uncertainty is inherent in the shape, chemicals, fabrics, and accessories, a junior sales manager would probably be in a good position to identify what should work and what should not work in the
toothbrush. His/her insights and expertise might be extremely valuable in reducing the uncertainties listed above. However, with a highly rigid control structure, she/he might not be able to and willing to contribute in the uncertainty reduction effort (we discussed the motivation and control relationship in earlier section therefore it would be redundant here). Plus, higher complexity of processes would be desirable as that would allow for handling a greater number of uncertainties. For instance, a sales manager might help in designing accessories, an engineer can contribute to the fabric and chemical concerns, and a graphic designer can help in creating the shape of the toothbrush. Obviously, for all these experts to contribute in uncertainty reduction multiple communication functions (mentioned earlier) and their systematic development would be needed.

On the other hand, if uncertainty lies in the environment, for example say a policy change that impacts the identified opportunity, then it would require high rigidity of control, low complexity of processes, and high communication channels. Say the toothbrush needs a specific kind of fiber that has not been used in such products before. Whether the government will approve this particular type of fiber in child-related products can be considered as a source of environmental uncertainty. If the communication channels of A-1 company include a well-developed government relations function, it can to some extent reduce that uncertainty. The point here is the necessity of richer communication channels. Since uncertainty does not reside in the novelty of the product, the higher rigidity of control is more important as it would ensure effective, swift action on the part of employees. Say, after incurring good amount of sunk costs in marketing and product development, A-1 finds that the government has passed a ban on some material used in the toothbrush. To cope with this environmental uncertainty, A-1
would need to make swift adaptations. High complexity of processes in this situation would prove counterproductive because the employees would have difficulty breaking away from their standardized procedures, to make quick adaptive actions.

In nutshell, the richness of communication channels is always desirable regardless of whether the source of uncertainty resides in the environment or in the novelty of the opportunity. When uncertainty stems from the environment, low rigidity of control and high complexity of processes are needed. When uncertainty results from the novelty of the opportunity, low complexity of processes and high rigidity of control are desirable. (See table 3)

Conjecture 5: Resolving the uncertainty paradox is only relevant for opportunity exploitation. The contingency based on two sources of uncertainty, the environment and novelty in the opportunity, and two organizational dimensions, the rigidity of control and the complexity of processes, would resolve the paradox. The richness of communication channels is an obligatory condition.

Conjecture 6: If uncertainty stems from the novelty of the opportunity itself, a high level of complexity of processes and low level of rigidity of control would reduce uncertainty. On the other hand, if uncertainty results from the environment, a low level of complexity of processes and high level of rigidity of control would reduce uncertainty.

Discussion

Motivated by the void in theorizing at the interface of organizational structure and opportunity identification and opportunity exploitation, we began our inquiry by
reviewing the debates and evidence in organizational structure and performance relationship. Juxtaposed logic and contradicting evidence in three major conversations in organizational structure – performance relationship (organic vis-à-vis mechanistic organizational structure, too-much-too-little organizational structure, and organizational inertia) provided the foundation necessary for our thesis in this paper. We extensively argued that entrepreneurial performance is different from usually connoted organizational performance and showed that existing frameworks of OS-performance would not be appropriate in the entrepreneurship context. Alternatively, we proposed a new framework of entrepreneurially-optimal organizational structure, defined as the differential development of various OS dimensions. We provided a coherent, finely textured relationship between OS and entrepreneurial performance. To that end, we revealed two paradoxes, the paradox of uncertainty and the paradox of inertia, which are inevitably embedded in entrepreneurial processes. Our major thesis stated that an entrepreneurially-optimal organizational structure would resolve these two paradoxes, and as such, facilitate entrepreneurial opportunity identification and exploitation. While we built our entrepreneurially-optimal structure off the widely used and tested structural variables, we made a serious endeavor to justify the addition of organizational communication as a major dimension of organizational structure.

Were the paradoxes resolved? Yes, but in a tricky way. We found some common roots of both of the paradoxes. Standing alone, we resolved both of the paradoxes effectively. Interestingly, some solutions of the two paradoxes converged. Readers might note that resolving the inertia paradox needed low complexity of processes and high communication channels which were also true to resolve the uncertainty paradox when
uncertainty stemmed from the environment. It would suggest that an entrepreneurially-optimal organizational structure is possible. In other situations/contingencies, when uncertainty stemmed from the novelty of the opportunity, the solutions of the two paradoxes have considerable overlap but are different. That is, they need different combinations of three dimensions of OS. It would imply that, in this scenario, while deciding on the role of organizational structure in opportunity identification and exploitation, the agents of organizations (e.g., TMT, founding members) will have to consciously judge whether their organization is more vulnerable to the inertia paradox or to uncertainty paradox.

In summary, we made four distinct contributions. First, we initiated a conversation on the centrality of organizational structure in entrepreneurship theorizing and research. Second, we identified two obvious but not yet theorized paradoxes embedded in entrepreneurial processes. We connected various dots - uncertainty, inertia, organizational structure, opportunity identification and opportunity exploitation – to provide a coherent picture of entrepreneurial process solving the two paradoxes. Third, we introduced one of the most visible concepts in current organizational literature, organizational communication, as a dimension of organizational structure which is surprisingly downplayed in organizational structure literature. Finally, by exploring the conditions when structural inertia could be functional and when uncertainty could be reduced in the entrepreneurship context, we have extended the organizational theory literature.

Methodological Implications & Limitations
The focal level in the conceptual model we presented is organizational, as we are referring to opportunity identification and exploitation by an organization and the role of organization structure to that end. However, other variables discussed in the paper, either as the consequences, antecedents, or moderators of the relationship make the overall thesis a multi-level enterprise. For instance, the exogenous force that determines the level of organizational structure, the external environment, is certainly not an organizational level construct. On the other hand, the outcomes of a successful identification and exploitation of an entrepreneurial opportunity can be conceptualized at individual level (e.g., founder’s achievement need satisfaction), organizational level (organizational revenue growth), industry level (e.g., market creation), and even at societal level (creation of a social surplus).

The richness of communication channels identified in this paper, unlike the other two dimensions, would need operationalization. We made the concept clear with two reflective latent factors, the degree of systematic development of communication channels and the range of communication functions. However, because of the scope of the paper, we did not discuss its operationalization aspects comprehensively. Operationalizations of other constructs, like the rigidity of control and the complexity of processes, are straightforward as they can be derived from the existing, tested variables in the literature. Similarly, we have not discussed the operationalization aspects of constructs like opportunity identification and uncertainty as they could vary widely depending upon the context of empirical investigation.

Our study theorized the impact of inertia on opportunity identification and exploitation but not the other way round. The impact of performance on organizational
inertia of a firm has been also widely hypothesized (cf. Miller & Chen, 1994). Hence, it is possible that entrepreneurial performance also impacts organizational inertia.

Organizational inertia literature has listed many endogenous and exogenous factors - like sunk costs, dynamics of political coalitions, standardized activities, entry barriers, and past failure and success - as contributors in the generation of structural inertia (Rungtusnatham & Salvador, 2008; Hannan & Freeman, 1984). It is very possible that the functionality of inertia might also be dependent on the sources or determinants of inertia. Since our focus was elsewhere, on the relative development of various dimensions of OS, we did not touch upon that issue. A contingency of inertial functionality based on the sources of inertia would be another interesting study in this stream of literature.

Youth Entrepreneurship and Workforce Development:  
The Crossroads of Ideation and Job Creation

ABSTRACT

A number of empirical and theoretical research studies have demonstrated links between entrepreneurship and unemployment (e.g. Audretsch, Carree, & Thurik, 2001) suggesting that higher levels of unemployment will lead to an increase in start-up activity based on decreased opportunity costs in launching a business enterprise. The authors of this paper present a unique partnership initiative designed to link entrepreneurship education with socio-economic distressed youth experiencing chronic unemployment. Through the U.S. American Recovery and Reinvestment Act (ARRA) and the Workforce Investment Act, a new “E3” (Employ, Enrich, Engage) Youth Employment and Training Program provided summer employment opportunities for economically and academically “at-risk” youth in Racine County, Wisconsin during the summer of 2009. There were a total of 240 youth that participated in this Racine County Workforce Development Center led program with a “commencement celebration” at the end of summer. The program received local, regional and national acclaim as a result of the unique private/nonprofit/public partnerships arranged, and because of the significant leveraging of federal funds to stimulate local social and economic capital.

A primary “E3” objective was to develop a cohort group to receive entrepreneurial training in fall 2009 as both an exercise to launch two new “green” businesses, as well as to create an entrepreneurial mindset as an enhancement to future employability. In partnership with the University of Wisconsin-Parkside Small Business Development Center and members of the entrepreneurship faculty, the youth participant group, comprised of 20 students ranging in ages 18-24 and varying levels of educational attainment, was provided assistance in developing and
launching a Green Car Care business along with a new venture for Green Lawn Care. In addition, the E3 entrepreneurship cohort was provided with a 13 week course, specifically geared towards youth entrepreneurship. The course, designed by NxLevel, allowed for students to explore their own entrepreneurial ideas, learning key components such as finance, marketing, ideation, opportunity analysis, legal structures, and management team formation. Concurrently students were being challenged to think creatively and examine ways to add value to current constructs. This further enhanced their entrepreneurship education experience as a mindset for approaching employment and future careers.

This paper will address the following three primary questions: First, how do entrepreneurial educational attainment and achievement outcomes for students contribute to workforce development goals regarding unemployment? Second, what correlations can be made between developing an entrepreneurial mindset and stimulating further educational attainment goals for economically and/or behaviorally “at-risk” students? Third, how can entrepreneurial teaching efforts contribute to the growing community development focus regarding transforming social capital into economic capital?

Data for this project is derived in part from a Web-based peer created survey of the youth participating in the “E3” Program. The survey was created by students enrolled in a university continuing education course focused on the impacts of the ARRA. Data is also utilized from an instructor administered post-assessment survey, valid nationally norm based work skills assessments (e.g. Work Keys and Learning Resources), and qualitative data from program delivery partners. Additional contextual information is derived from media stories generated by the students’ entrepreneurial activities. This paper will also present qualitative findings from the
entrepreneurship training and education program to examine student impacts, and to offer insight into future research and education enhancements within this area.

In an effort to have useful applications to U.S. lawmakers and the ARRA, as well as to university and workforce development professionals’ policy and programmatic decision making, this research also reviews and evaluates documented course and entrepreneurial work product outcomes and impacts. Students, educators and staff explored principles regarding sustainable management and “triple bottom line” principles, and their conclusions are addressed through the lens of the researchers and existing literature (e.g. Bansal & Roth, 2000; Bilgin; 2009; Bridges & Wilhelm, 2009; Burger, Daub, & Scherrer, 2009; Dixon & Clifford, 2007; Stark & Marcus, 2000). In order to have further practical utility, research regarding the links between social and economic capital (e.g. Hutcheson and Morrison, 200x) are examined through entrepreneurial scholarship theory and practice.

As the United States wrestles with developing meaningful strategies to stimulate workforce and economic development, this research informs scholars and policy makers about how entrepreneurial scholarship can enhance and/or detract from broader community development goals.

Exploring gender differences in the innovation activity of entrepreneurs: A multi-dimensional analysis

Principal Topic & Research Questions

Creating innovation is of immense interest (Baumol, 2002) as it is the primary instrument of competition for many firms. A number of research studies examining academic and industrial scientists have shown that gender plays an important role in innovation activity, with men producing a higher degree of patents compared to women (Whittington & Smith-Doerr, 2005). Considering the bulk of innovations are created by new firms it is surprising that little research has examined gender differences in the innovation activity of entrepreneurs. Although most scholars agree that entrepreneurship is a gender-based process, little research has explored the gender—innovation relationship in new firms, representing a gap in the literature. We address this gap, and explore three potential mediating factors between entrepreneur gender and innovation activity.

To increase our understanding of gender and innovation activity, we draw from recent research that suggests a number of multi-level factors (i.e., individual, inter-firm, and spatial location) facilitate innovation. First, formal education has been shown to bear on entrepreneurial outcomes with more advanced degrees being associated with higher degrees of innovation (Marvel & Lumpkin, 2007). In addition, Hagedoorn (2002) demonstrated that network collaboration expose individuals to a broader range of R&D partnership opportunities. These inter-firm partnerships allow for the ability to acquire and apply knowledge in useful ways as well as the acquisition of resources (Tsai and Ghoshal, 1998). In addition to individual educational background, and inter-firm partnerships, there has been increasing interest in the notion that geographic location impacts the competitive position of firms (Porter, 1998). One view is that firms are motivated to locate next to one another because of economies of agglomeration. That is, the net benefit to being in
more clustered geographic areas increases with the concentration in that particular location (Arthur, 1990). This rationale suggests the innovation activity of geographically clustered firms improves as cluster size increases.

Deepening our understanding of the relationship among entrepreneur gender and innovation activity has rich theoretical and practical implication for entrepreneurship. We contribute to the literature by developing and testing a model using educational background, inter-firm partnerships, and the regional location of the new firm as mediators between the gender and innovation activity relationship.

**Methodology/Key Proposition**

To test our model, we draw on data recently collected by the Korean Small and Medium Business Administration (KSMBA). The KSMBA is a branch institution of the Korean government with a mission of formulating and implementing public policy to promote the development of new firms. The sample includes 4,538 founders of new firms that are no more than six years old (Brush, 1995; Shrader, 1996). The sample includes a number of industry sectors including low-tech manufacturing, high-tech manufacturing, general service, and information technology.

To measure gender, we created a dummy variable that indicates whether the founder is male or female. To assess founder education background we used the academic major of their highest degree. Engineering and natural sciences was coded as a 1 and all other responses as 0. To measure inter-firm partnerships we used the level of technology cooperation that new firms maintain with universities, public R&D institutes, and other private companies. To assess regional location, we used the total number of employees in the county in which the firm is located (Carlton, 1983; Holmes, 1998). This includes all 234 counties of Korea. We categorized all 234
counties of Korea into five groups (i.e., 1-5) based on the number of employees clustering in the representative county. Consequently, the 20% of counties with the least employees were coded as a 1, and the 20% of counties with the most employees were coded as a 5. To assess innovation activity we use two measures: patent activity and R&D intensity.

**Contributions**

This research makes a number of contributions to emerging research on gender and entrepreneurship. First, it develops and tests a more comprehensive, multi-level model of gender and innovation activity than previously available. Little research has examined differences in innovation activity among male and female entrepreneurs. We advance the body of knowledge by demonstrating how combinations of individual background, inter-firm partnerships, and venture location affect the relationship among gender and innovation activity. Our preliminary results suggest that men and women founders have systematic differences in education, inter-firm relations, as well as location strategies. In turn, these bear on the innovation activity in terms of patents applied for as well as R&D intensity. Despite the increasing attention on gender and female entrepreneurship in particular, the notion of how these entrepreneurs can improve the rate of innovation creation has not been adequately explored. Traditionally, gender differences in entrepreneurial outcomes have been attributed to human or social capital (Greene, 2000), risk tolerance (Cliff, 1998), and that women tend to be more sensitive than men to a variety of non-monetary factors (Burke, 2002). Our study offers a potential new direction in deepening our understanding of how male and female entrepreneurs can increase the capacity to innovate.
Entrepreneurship: A Term of Art

Abstract

This conceptual paper introduces a three-dimensional perspective to explain the entrepreneurship phenomenon. The three-dimensional perspective is named the “Definitional Sphere of Entrepreneurship” and is intended to shift the discussion of entrepreneurship away from the battle-of-the-definition or the definition-of-convenience approaches to a more reflective and inclusive approach that searches for the underlying dimensions to explain the phenomenon of entrepreneurship. This approach will facilitate more explanations of the phenomenon rather than fewer and competing explanations of entrepreneurship.

Introduction

Entrepreneurship is a term of art, and as a term of art, entrepreneurship represents a phenomenon of importance for those who practice it, study it, as well as for the communities that support and depend upon it. Yet, entrepreneurship is in danger of losing its meaning and usefulness in the grammar of business, economics, and public policy, because entrepreneurship is being used to simplify the explanation of nearly everything that is good about business. Matlay notes that “In practice, . . . , entrepreneurship has entered everyday parlance and, as a generic term, is used in a variety of contexts and it encompasses a broad range of interchangeable meanings and situations” (Matlay, 2005, p666). If an activity involves risk and uncertainty along with some kind of reward, entrepreneurship is the term
used to name that activity. In fact, the word entrepreneurship is being used to name a strategy that firms can use to succeed. Several scholars have developed a model to explain how a firm can use entrepreneurship as a strategy (Meyer and Heppard, 2000) while others clearly state that “Entrepreneurship does not exclusively focus on the isolated individual creating a company” (Rispal, Boucler, and Verstaraete, ___, p2), even though we all recognize that “entrepreneurship is fundamentally personal” (Baum, et al, 2007, p1). In addition entrepreneurship is seen from different perspectives: The general public views entrepreneurship as the path to independence, ownership, and great wealth; academics view entrepreneurship in terms of behavior, process, attributes, cognition, innovation, and from micro- and macro-economics perspectives; while policymakers focus on the outcomes of entrepreneurship such as job and wealth creation, community development, and quality of life created by the social entrepreneur. Each perspective offers a different definition of entrepreneurship; a different outcome. Are these perspectives opposing or complementary? Are we seeing different faces of the same phenomenon or does each perspective represent a distinctly different phenomenon that we happen to name entrepreneurship for convenience? Is there commonality among the perspectives?

Approximately 25 years ago, the word entrepreneurship was used by scholars and professionals who believed in the uniqueness and value of entrepreneurship when the field had little respect in academia. This belief in entrepreneurship reversed the opposing beliefs commonly held approximately fifty years ago. The interest in entrepreneurship has come a long way from the days of the Organization Man in 1956 during which time Whyte “… challenged and refuted claims of entrepreneurial vigor and daring in business by describing an ongoing bureaucratization of white-collar environments -- board rooms, offices, laboratories. . . that the entrepreneurial scramble to success has been largely replaced by the organizational crawl" (Kaufman, 1999). However, Whyte (1957) did not end his derogatory
comments about entrepreneurship with the above quote, but continued to drive home his point with the following statements:

“They (college seniors) want to work for someone else. Paradoxically, the old dream of independence though a business of one’s own is held almost exclusively by factory workers – the one group, as a number of sociologists have reported – least able to fulfill it.” (Whyte, 1957, p75)

“. . . less than 5 percent (of college seniors) express any desire to be an entrepreneur. . . . Of the rest, most have one simple goal: the big corporation.” (Whyte, 1957, p75)

“The entrepreneur, as many see him, is a selfish type motivated by greed, and he is, furthermore, unhappy. The big-time operator as sketched in fiction eventually so loses stomach for enterprise that he finds happiness only when he stops being an entrepreneur.” (Whyte, 1957, p76)

“Small business is small because of nepotism and the roll-top desk outlook, . . . “ (Whyte, 1957, p76)

Today being called an entrepreneur is considered good in today’s business, and entrepreneurship awards are given to a wide array of individuals. Is every business person an entrepreneur? If so, this paper posits that entrepreneurship will become a meaningless word, because it fails to identify or stand for a unique phenomenon. Similarly, an underlying premise of this paper is that entrepreneurship is not ubiquitous. Instead, entrepreneurship is a “minority phenomenon” (Baum, et al, 2007, p300) and practiced by only a small percent of the population at any moment in time.

“What is entrepreneurship?” has been asked and answered by scholars since Cantillon first used the word in 1755. Definitions vary greatly and serve different purposes. Many definitions compete and conflict with each other while other definitions are ignored. Little effort is exerted to reconcile that variance. “Indeed, even the OECD\(^1\) itself contributed to the confusion since virtually every study that has focused on entrepreneurship has presented a different definition of the term” (Ahmad and Seymour, 2008, p5). How can so

---

\(^1\) Organisation for Economic Co-operation and Development (“OECD”), 2, rue André Pascal F-75775 Paris Cedex 16 France. Website: http://www.oecd.org
many well-intended definitions of entrepreneurship exist if we are all observing the same phenomenon?

What is the phenomenon represented by the word entrepreneurship? The challenges of finding the best definition of entrepreneurship are daunting. A common approach to seeking the best definition is to engage in lengthy and reflective discussions in order to identify a set of attributes that best fit the scholar’s observations of entrepreneurship. This approach can be called the “battle of the definitions,” i.e., whoever presents the most compelling definition “wins” the battle. Or, many scholars create a “definition of convenience” by stating the definition of entrepreneurship used for their particular study and leave it to the reader to determine the appropriateness of the definition, or simply “bypass the discussion of entrepreneurship definitions altogether, and simply equate entrepreneurship to a specific empirical measure . . .” (Ahmad and Seymour, 2008, p5). This paper documents thirty-seven distinctly different definitions of entrepreneurship spanning nearly 250 years of scholarship. A key question at this point is to ask ourselves whether we are seeking the best definition of the word entrepreneurship or searching for the best explanation of the phenomenon.

This paper forsakes the search for a single, best fit, definition of entrepreneurship. Instead, this paper posits that the multiple perspectives will provide a more in-depth understanding of entrepreneurship by making the presumption that many present definitions represent valid perspectives of the entrepreneurship phenomenon. An in-depth explanation of the multiple perspectives is presented in a book written by Daniel F. Jennings, Multiple Perspectives of Entrepreneurship published in 1994 and a recent publication in 2007 that emphasizes the need for an “inclusive framework” (Baum, et al, 2007, p36). This paper will identify several dimensions or components, within a common framework in order to explain entrepreneurship. Instead of rejecting some concepts in order to craft the most cogent
definition, this paper will attempt to include divergent and apparently different perspectives into a common framework to help explain entrepreneurship. The underlying rationale for seeking a three-dimensional explanation of entrepreneurship is based on the belief that entrepreneurship is a multi-faceted phenomenon resulting from the interplay among person, task, and environment (Shane 2003, p4) (Baum, et al, 2007, p315). However, by focusing on the “narrow aspects of what the phenomenon of entrepreneurship is, . . . , seems to be driving out a more complicated and comprehensive understanding of (the) phenomenon of entrepreneurship” (Baum, et al, 2007, p326) at a time when complexity or “differentiated traditions” as Ahmad and Seymour stated in their 2008 article may partly explain the difficulty of crafting a single definition:

Definitions of Entrepreneurship

What does the array of entrepreneurship definitions look like? To answer this question a fundamental analysis of thirty-seven definitions of entrepreneurship was performed in order to identify the principal components attributed to entrepreneurship by each author. Definitions start with Cantillan’s definition in 1755 and include Schumpeter’s 1934 definition along with McClelland’s 1961 definition and end with Shane and Vankataraman’s 2000 definition and Ireland, Hitt and Sirmon’s 2003 definition. The list of definitions spanning nearly 250 years is certainly not exhaustive, but the list is representative of the array of different perspectives of entrepreneurship that have been entertained during that time period.
The results reported in Table 2 reveal that the thirty-seven definitions included some combination of twenty-six different principal components described in Table 2, but no author included more than four principal components in their definition. Are some of these definitions wrong? Should we engage in a long and arduous process to assess all definitions with the intention of reducing them to one compelling definition? Or, should we accept each definition as representing a valid but different perspective of entrepreneurship and search for a framework by which to give meaning to these definitions? The challenge of choosing the best definition is aptly stated by Baum who identifies six distinctly different types of definitions:

“. . . we explain the challenge caused by the unresolved definition of entrepreneur and entrepreneurship. [There are multiple definitions of “entrepreneur” in terms of (a) business stage (Shane, 2003), (b) types of businesses (Timmons, 2000), (c) business goals (Smith & Smith, 2000), (d) levels of innovation (Shane 2001), (e) degrees of independence (Bird, 1989), and (f) management (Bird, 1989)]” (Baum, et al, 2007, p4)

This paper has chosen an approach based on the perspective that any effort to reduce entrepreneurship to a single definition suitable for publication in Webster’s Dictionary does a disservice to the phenomenon the word represents. In order to capture the vibrant and dynamic nature of entrepreneurship, this paper develops a three-dimensional perspective of entrepreneurship, and the perspective is be named: “Definitional Sphere of Entrepreneurship.”

**Entrepreneurship as a Source of Change**

Where do we begin to explain the entrepreneurship phenomenon from a three-dimensional perspective? The answer is to begin from its most common element. What is

---

entrepreneurship’s most common element? Change is the most common element. Change is an implicit or explicit aspect of our collective understanding of entrepreneurship. The notion of change is inseparable from the phenomenon of entrepreneurship, i.e., to have entrepreneurship without change is simply impossible. In fact, scholars discuss entrepreneurship within the context of the need for change. In fact, we seek an entrepreneur when a change is needed due to the failings of the status quo. The central role of change in entrepreneurship is succinctly stated by Baum: “The central theme of the process model (of entrepreneurship) presented . . . can be stated in a single word: change. The model assumes that entrepreneurship unfolds over time and that during different phases of the process, entrepreneurs are engaging in somewhat different activities” (Baum, et al, 2007, p27).

Scholars also agree that the entrepreneurs effect change in the world, because entrepreneurs perceive the world differently; believe in their ability to effect change; and have the skills to act on those two perceptions. Additionally scholars also agree that the notable achievements of these actions result from the inclination and ability to challenge conventional thinking, behave differently than those maintaining the status quo, and exhibit considerable confidence when effecting the change. Consequently, this paper places change at the epicenter of the “Definitional Sphere of Entrepreneurship” as an essential component for an understanding of the phenomenon, because entrepreneurship is viewed as a source of new ventures that create new methods of production or new markets. Following are eighteen words and concepts scholars have used to discuss and explain entrepreneurship and the entrepreneur’s capability to effect change.

**Outlier:** “In other words, Entrepreneurs seem to thrive as outliers, so it is true that the differences between a culture and its entrepreneurs matters more than the culture itself” (Baum, et al, 2007, p xxii).

**Disturb:** “A few entrepreneurs such as Bill Gates, Michael Dell, . . . have created companies that disturb, shape, and improve important business domains” (Baum, et al, 2007, p5).
Disruptive change: “As conceived by Schumpeter, entrepreneurs face extreme situations because their work involves disruptive change. They create new markets, disturb established markets, introduce new processes, and form new organizations (Schumpeter, 1911 and later editions) (Baum, et al, 2007, p8).

Markedly change: “Schumpeter, Taussig, and Knight proposed that entrepreneurs had the power to identify, operationalize, and market technological innovations that could markedly change the directions of societies” (Baum, et al, 2007, p10).

Marginalized: “... Hagen (1962) identified the more widely distributed potential for entrepreneurship in the population among people who see themselves as marginalized ... “ (Baum, et al, 2007, p11).

Driven outsider: “Works such as Zalenik and Kets deVries (1975) . . . considered the entrepreneur through a highly distinctive lens – that of the driven outsider, the individual who succeeded, despite strong psychological drives and conflicts” (Baum, et al, 2007, p13).

Rage hypothesis: “This approach (of driven outsider) paralleled the theme of marginality theorists in sociology, such as Bonjean (1966) and Hagen (1962), who even coined the term “rage hypothesis” to explain the motivation behind entrepreneurship” (Baum, et al, 2007, p13). ?Need source for Bonjean and Hagen?

Chance: “Chance events transform, in an unexpected way, either the context or some important dimension of the new venture itself, resulting in dramatic consequences: a casual meeting by the entrepreneur with an individual who then plays a decisive role in the fate of the venture; a natural catastrophe; a sudden war; a key individual’s premature death . . . Integrating chance into the entrepreneurial process reinforces the lack of predictability in its outcome” (Bouchikhi, 1993, p559).

Sabotage: “... [T]he entrepreneur often makes no productive contribution at all, and in some cases plays a destructive role, engaging in what Veblen described as ‘systematic sabotage’ of production” (Montanye, 2006, p554).

Fuzzy knowledge: “Individuals become entrepreneurs through their comparative advantage at systematically using knowledge to eliminate and reduce some uncertainty outright and to transform other bits into manageable risk. The entrepreneur’s diverse stock of fuzzy knowledge never becomes public or depleted, so it is a source of ongoing profits” (Montanye, 2006, p564).

Bullshit and deceit: “The art of persuasion – a combination of honest rhetoric, ‘bullshit,’ and abject deceit – emerges as one of the entrepreneurs’ most valuable talents. It is the means by which individuals operating in a complex world pitch themselves . . . “ (Montanye, 2006, p566).

Cyclothymic: “In the entrepreneurial theater of need for control, a sense of distrust, a desire for applause, and resorting to primitive defensive mechanisms . . . ‘the manic defenses’ appear to be common. The behaviors of

---

a number of entrepreneurs also seems to have a cyclothymic quality” (deVries, 1996, p853).

**Feeling different:** “The experience of feeling different seems to have an important influence on entrepreneurs. If the family of the entrepreneur does not seem to fit into the established order of things, their offspring may have little choice but to create a new niche for themselves in society” (deVries, 1996, p856).

**Allergic to authority:** “Many entrepreneurial individuals counteract feelings of low self-esteem, inferiority, and helplessness through excessive control and activity. It also seem that many of these people cannot function in structured situations. They appear to be allergic to authority” (deVries, 1996, p857).

**Rebel:** “the enterprise also symbolized his abilities to rebel. Setting up an enterprise somehow becomes a personalized statement of separation” (deVries, 1996, p871).

**Tails of distribution:** “Being innovators and idiosyncratic, entrepreneurs tend to defy aggregation. They tend to reside at the tails of population distributions, and though they may be expected to differ from the mean, that nature of these differences are not predictable” (Bull and Willard, 1993, p186-7).

**Disjointed:** “But that model does not describe entrepreneurship’s disjointed events that disrupt stability” (Bull and Willard, 1993, p187).

**Chaotic behavior:** “. . . a fundamental equation for population-ecology theory exhibits chaotic behavior that resembles entrepreneurship” (Bull and Willard, 1993, p187).

These words used to describe the entrepreneur’s capability to effect change by being different and challenging the status quo can also succinctly be stated as deviant behavior.

Deviant behavior is an analytical framework that provides an explanation for change-effecting behavior. Some may object to the use of the word “deviant,” and their objection is understandable. No business school would advertise that it is are educating students to be deviants? Unfortunately, eliminating the word, “deviant,” from the discussion of entrepreneurship also eliminates a concept from the discourse about entrepreneurship that may be central to our understanding of entrepreneurship causing scholars to use other words like: outlier, marginalized, driven outsider, rebel, cyclothymiacs, and chaotic behavior. In order to avoid a Type I error of rejecting a concept that might represent entrepreneurship, this paper will put aside the negative feelings and attitudes towards the word deviant in order to focus on the underlying concepts and principles of deviant behavior that can help to
expand the discussion and examination of entrepreneurship. Likewise, this paper rejects the notion that socially unacceptable behaviors are the only outcomes of deviance. Instead, this paper accepts the belief that deviant behavior can result in either a benefit or a cost to society and views deviant behavior as a potential explanatory variable.

**Entrepreneurship and Deviant Behavior**

What commonalities do entrepreneurship and deviant behavior share? Both deal with the concerns of varying from the status quo by doing things differently. In fact, many of the most admired entrepreneurs were considered outcasts during the early stages of their careers. Interestingly, once these outcasts succeed, many of their ventures establish a new operating normal for their respective industry, and their venture established a new status quo. Fred Smith, i.e., Fed-X is one of a long list of entrepreneurs that created a new status quo.

Is deviant behavior an appropriate word to use to explain the entrepreneurship phenomenon? Except for the public’s negative connotation attached to the word deviant, scholars in the field do not presume only a negative perspective of deviance. Instead they ask what it means to be different or to deviate from the status quo and place deviance within a social context. In fact, several scholars profess the need for deviant behavior in order to have a vibrant society.

Deviant enterprise, and the persons who engage them, are almost by definition troublesome and disruptive. . . . We do not for a moment wish that we could rid ourselves of deviant phenomena. We are intrigued by them. They are an intrinsic, ineradicable, and vital part of human society (Matza, 1969, p17).

Adler and Adler (2007) provide four insights regarding deviant behavior that are relevant to our understanding of entrepreneurship: an entrepreneur that effects change by challenging the status quo while accepting the role as an outsider, outlier, or rebel. In particular, Adler and Adler discuss the status quo, feeling different, risk, and overachieving from the perspective of deviant behavior:
Challenge versus conformity to the status quo:

“Perhaps we can conclude, then, that two separate yet often competing currents are found in any society: those forces which promote a high degree of conformity among the people of the community so that they know what to expect from one another, and those forces which encourage a certain degree of diversity so that people can be deployed across the range of group space to survey its potential, measure its capacity, and, in the case of those we call deviant, patrol its boundaries. In such scheme, the deviant would appear as a natural product of group differentiation.” (Adler and Adler, 2006, p22)

Feeling Different

“The problem lies in the social structure in society, where even if people follow the approved means, there are ‘roadblocks’ prohibiting them from rising though the stratification system. Deviant behavior occurs when socially sanctioned means are not available for the realization for highly desirable goals.” (Adler and Adler, 2006, p48)

Risk

“The idea, then, is that the person invest time, energy, himself, in a certain line of activity – say, getting an education, building up a business, acquiring a reputation for virtue. When or whenever he considers deviant behavior, he must consider the costs of this deviant behavior, the risk he runs of losing the investment he has made in conventional behavior.” (Adler and Adler, 2006, p79)

Overachieving (Over-conforming, Positive Deviance)

“Deviance has traditionally been regarded negatively, as failure to confirm to the norm of acceptability. Heckert and Hecker build on previous conception of ‘positive deviance’ which earlier suggested that people can be regarding as deviant through an excessive pro-social behavior, such that they come to be regarded as excessively altruistic, charismatic, innovative, conformist, or innately gifted.” (Adler and Adler, 2006, p32)

“Mother Theresa was almost universally proclaimed as a positive deviant, a person who overconformed on norms of altruism and charity and was almost unanimously appraised in a positive manner, as a saintly woman.” (Adler and Adler, 2006, p39)

Interestingly, scholars outside the field of entrepreneurship present Mother Theresa as a positive deviant when the field of social entrepreneurship considers Mother Theresa to be a social entrepreneur: “Mother Teresa was undoubtedly one of the foremost social
entrepreneurs of our times.” (Web #1) John Hope Bryant stated it more succinctly when he
spoke at Berea College in 2006: “He (John Hope Bryant) left the audience with a reminder
of ‘all the crazy people who have changed the world,’ giving such examples as Martin
Luther King Jr., Nelson Mandela, Mother Theresa and Jesus Christ” (Web #2).

Certainly, not all entrepreneurs are “troublesome and disruptive,” but rather vary in
intensity along some dimension, such as, entrepreneurial orientation. In a similar manner, so
does deviant behavior. Conceptually, Figure 1 expresses deviant behavior on a continuum.

![Figure 1 – Deviant Behavior Dimension](image)

In addition, literature shows a linkage between deviant behavior and
entrepreneurship, e.g., the connection between juvenile delinquency and entrepreneurial
behavior that resulted in new products or services. The following two sources illustrate that
linkage:

(1) Belmont University’s Center for Entrepreneurship reports how entrepreneurship was
used as a path out of gang life:

Reality TV, Guatemala Style, February 10, 2006: Community leaders
in Guatemala City are looking to entrepreneurship as a path out of gang
life for their young citizens, and hope that a new reality TV show may
create inspiration for this path.
From an AP story at Yahoo News: This gang-plagued Central American nation has found a new twist on reality television, putting wayward youths in a house and filming as community leaders turn them into small business owners. (Web #4)

(2) Off the Books: *The Underground Economy of the Urban Poor* by Sudhir Alladi Venkatesh reports how a poor community survives via an underground entrepreneurship to create a “ghetto economy:”

In this revelatory book, Sudhir Venkatesh takes us into Maquis Park, a poor black neighborhood on Chicago's Southside, to explore the desperate, dangerous, and remarkable ways in which a community survives. We find there an entire world of unregulated, unreported, and untaxed work, a system of living off the books that is daily life in the ghetto. From women who clean houses and prepare lunches for the local hospital to small-scale entrepreneurs like the mechanic who works in an alley; from the preacher who provides mediation services to the salon owner who rents her store out for gambling parties; and from street vendors hawking socks and incense to the drug dealing and extortion of the local gang, we come to see how these activities form the backbone of the ghetto economy.

The above sources illustrate the linkage between negative deviant behavior and entrepreneurship. At one extreme, entrepreneurship channels the negative deviance of gangs to a positive impact. In the latter case, the unregulated, unreported, and untaxed work is accepted as entrepreneurial behavior.

Another example of the connection between entrepreneurship and deviant behavior is presented by Robert K. Metron in his Deviance Typology (Web #6):
Metron explicitly makes reference to an entrepreneur in his explanation of his typology of deviant behavior: An example of conformity is the soldier who protects the status quo; an example of ritualism is the bureaucrat who maintains the status quo; an example of retreatism is the vagrant who is a hobo, tramp or bum; an example of innovation is the entrepreneur introducing change that falls short of a paradigm shift; an example of rebellion is an entrepreneur introducing change that causes a paradigm shift via creative destruction.

**Definitional Sphere of Entrepreneurship**

This paper posits that entrepreneurship is a complex phenomenon and that a three-dimensional perspective of entrepreneurship is better suited to explain the phenomenon for the following three reasons:

1. A sphere has an unlimited number of diameters, i.e., dimensions by which to capture the complexities of entrepreneurship found under different circumstances unlike the limited capacity of the thirty-seven definitions listed in Table 2, each of which only include a few attributes of entrepreneurship with no definition including more than four attributes. In addition, many two dimensional models, such as a flowchart or diagram, suggest a linear, left-to-right, directional flow with a few occasional feedback loops. Models of this type do provide some excellent insights into the entrepreneurship phenomenon, but the factors included in the models are either intended to explain specific activities of an entrepreneur, such as, opportunity recognition, or provide a broad and general overall model that include meta-factors like environment, markets, and firm.

2. A sphere has a core, an underground, with unseen attributes, and a surface that is a function of what lies beneath yet defines the surface, i.e., what is seen. This relationship provides a method for explaining the relationship among many factors,
both obvious factors and not-so-obvious factors that shape particular visible forms of entrepreneurship. The sphere provides an explanation as to why we can’t fully explain, rationally explain, many instances of entrepreneurship.

(3) Finally, a sphere cannot be viewed in its entirety from any one perspective. Its surface, or terrain, can look significantly different depending upon a person’s perspective. The essence of the phenomenon is the same except it is exhibited within a different context or market, under different circumstances with different resources, and for a different purpose or intended outcome. When seen from this perspective, the definitions or understanding of essentially the same phenomenon would result in different explanations.

(Insert “Definitional Sphere of Entrepreneurship”)

The remainder of this paper will explain the following three possible dimensions of entrepreneurship to illustrate the Definitional Sphere of Entrepreneurship: markets, benefits, and impact; and three sphere attributes: The core, two hemispheres, and the terrain.

**Three Sphere Dimensions**

**Market:** The nature of markets directly impact the entrepreneur’s attempt to create a venture within that market and will cause entrepreneurship to be defined differently. If the market is competitive with low barriers to entry and readily available resources, then the start-up effort and risk is low and the entrepreneur is simply using under-utilized resources. Starting another bakery is a good example of a low-barrier business in a relatively open and competitive market. If the right location is selected and quality products are provided, the business should both survive and succeed. Conversely, if the market is closed with only one or two dominate firms who have created high barriers to entry due to scale and propriety rights, then the entrepreneur would need an innovative business model backed by considerable financing and an exceptional person to tilt the scales in his or her favor.
Netflix is a good example of a start-up firm that changed the prevailing business model and almost pushed the incumbent giant into bankruptcy. Words from Schumpeter’s definition, creative destruction, would certainly apply to Netflix strategy. The question is whether the above two scenarios describe essentially the same entrepreneur or two different types of entrepreneurs. Upon reflection, it appears that the above describes two distinctly different types of entrepreneurs since it would be hard to imagine Reed Hastings, the founder of Netflix, to start-up a single retail outlet and vice versa. However, both are entrepreneurs.

**Benefit:** A second dimension of the entrepreneurship phenomenon is benefit. Who benefits from entrepreneurship? Who is the intended beneficiary: the individual or society? One could argue that society benefits from every successful venture, but the key question for this dimension is the intended beneficiary. Social entrepreneurship and a life-style business are good examples of the two extremes of this dimension. The field of social entrepreneurship is filled with many excellent examples of entrepreneurs creating non-profit enterprises to help solve social problems that markets and governments fail to solve. Conversely, the professional industries, such as accounting and consulting, have many new firms founded by experienced people who tired of working for a major firm in their industry. Many lifestyle businesses are examples of individuals seeking a better alternative to life within the confines of a large organization. As above, this dimension can be used to create different definitions of entrepreneurship as a function of the intended beneficiary of the entrepreneurial intentions.

**Impact:** The third dimension is impact. What is the result sought by the entrepreneur who is pursing a benefit within a market? Is the intended impact personal: an increase in value? Is the intended impact business: economic growth? At one extreme the impact is subjective while at the other extreme the impact is objective. Examples of these two extremes would include entrepreneurs who seize an opportunity and pursue it “regardless of
the resources currently controlled” (Timmons, 1994, p7) at one extreme versus the fact that start-ups will continue to occur in significant numbers regardless of the likelihood of success, i.e., population ecology. In some cases, the impact will be intentional because the entrepreneur is pursuing a specific opportunity. In other cases, entrepreneurship will have an impact because a lot of people are always eager to start a business; some will succeed while many will fail. However, it is believed that economic growth will occur as a function of the churning of entrepreneurial activity. Certainly the perception of entrepreneurship differs at the two extremes.

Three Sphere Attributes

In addition to the above three dimensions, the sphere has three other important attributes that help explain entrepreneurship phenomenon. The sphere attributes are: the core, the two hemispheres, and the sphere’s surface.

The Core: Deviant behavior provides an explanation of the source of change for all dimensions. Deviant behavior literature provides evidence of the alignment between the phenomena of deviant behavior and entrepreneurship through the discussion of change. Leading scholars in the field have reflected upon the nature and phenomenon of deviant behavior, and their explanations of deviant behavior are similar to the description of a status-quo breaking entrepreneur:

Change is a reality. Reality is structured out of our definitions and interpretations. Definitions of deviance come from a variety of sources. The study of deviance entails developing an understanding of the processes of change and developing an awareness of how definitions of reality are negotiated in everyday life situations” (Web #8).

“Deviance is a negotiated order. Deviance violates some group’s assumptions about reality (social order). It violates expectations. The definition of deviance defines the threat and allows for containment and control of that threat. The definition of deviance preserves, protects, and defines group interests and in doing so maintains a sense of normalcy. Deviance is a product of social interaction” (Web#9).
The dynamics of this change provides an explanation of the different instances of entrepreneurship seen on the sphere’s surface, i.e., the terrain of entrepreneurship. For example, the intensity of an entrepreneur’s desire to vary from the status quo can explain the difference between a life-style business versus social enterprise, between the start-up of a “Netflix” versus a new corner bakery, between the personal desire to pursue an opportunity versus the collective desire to pursue opportunities. Deviant behavior provides an explanation of the movement between the extremes of each dimension. In some cases entrepreneurs revolutionize markets. In other cases, entrepreneurs revitalize old businesses in established markets.

Two Hemispheres: A sphere has two hemispheres and both hemispheres can help to explain the entrepreneurship phenomenon. The northern hemisphere is called “transformational” and identifies an arena where ventures successfully challenge the status quo to transform the prevailing business model or market. Examples of these firms are found along the market and benefits dimensions and include non-profit ventures started by social entrepreneurs as well as private-sector firms such as Netflix and Fed-X. The southern hemisphere is named “transactional” and identifies an arena where ventures are created to improve the efficiency or effectiveness of the existing business models to make incremental improvements in the market structure. Examples of these firms are also found along the market and benefits dimensions and include the new corner bakery or small accounting firm. The impact dimension intentionally lies at the mid-point between the two hemispheres because ventures created as a function of this dimension can be a combination of either hemisphere.

Sphere’s Surface: Terrain of Entrepreneurship: The Terrain of Entrepreneurship is the most exciting aspect of the Definitional Sphere of Entrepreneurship, because the
sphere’s surface is a function of both the underlying and unseen dimensions of entrepreneurship as well as the forces of market, competition, and economic acting upon it during venture formation and growth. As with the global terrain, the Terrain of Entrepreneurship will appear differently as a function of its sources, the context in which it is occurring, and parochial forces acting upon it. Thinking about the entrepreneurship phenomenon in this way provides a more inclusive framework within which to understand the phenomenon and to discuss the numerous definitions of entrepreneurship.

**Conclusion**

How we think about a phenomenon directly impacts our investigative techniques and our findings. Thinking about a phenomenon from a one- or two-dimensional perspective may be appropriate in some cases. However, this paper posits that entrepreneurship is a dynamic process as well as a unique event of creation and requires a three-dimensional perspective to understand the phenomenon. The primary purpose of this conceptual paper is to introduce the concept of a three-dimensional perspective when thinking about the entrepreneurship phenomenon. The secondary purpose of this paper is to shift our search for a definition away from the “battle of the definitions” or the “definition of convenience” approaches to a more reflective approach that searches for the underlying dimensions, i.e., constructs, that might explain the phenomenon of entrepreneurship.

The study of entrepreneurship must move beyond the confines of any one discipline, because entrepreneurship is a phenomenon created at the nexus of markets, people, and process (use earlier quote) and should not be considered as the exclusive domain of any particular discipline.

</table>
The field of entrepreneurship involves the study of sources of opportunities; the processes of discovery, evaluation, and exploitation of opportunities; and the set of individuals who discover, evaluate, and exploit them.

Entrepreneurship is a context dependent social process through which individuals and teams create wealth by bringing together unique packages of resources to exploit marketplace opportunities.

Entrepreneurship is the mindset and process to create and develop economic activity by blending risk-taking, creativity, and/or innovation with sound management within a new or an existing organization.

**Principal Component** | **Words or Statement in Definition.**
--- | ---
**Uncertainty** | Deals with uncertainty; bearer of uncertainty; product function not well known; future goods and services.
**Coordinator** | Unites all production means; combining factors of production; undertake to initiate, maintain, or aggrandize . . . unit for production to create an enterprise. (?)
**Change** | Change: predict and act upon.
**New combinations** | New combination of production factors; carries out new combinations; create unique package of resources.
**Immunity from control** | Immunity from control of rational knowledge.
**Speculator** | Speculator.
**Arbitrageur** | Arbitrageur; trader; acts upon profit opportunities.

Entrepreneurship: A Term of Art

Principal Topic and Research Questions

The paper introduces a three-dimensional perspective for thinking about the entrepreneurship phenomenon and posits that entrepreneurship is both a dynamic process and unique event occurring under significantly different circumstances resulting in different but valid explanations of the phenomenon. Consequently the use of a three-dimensional perspective is more likely to capture the multiple dimensions and the inter-relationships causing the phenomenon. Another purpose of this paper is to shift our search for an understanding of entrepreneurship away from the battle-of-the-definitions or the definition-of-convenience approaches to an approach that provides a more inclusive framework.

Matlay notes that “In practice, . . . , entrepreneurship has entered everyday parlance and, as a generic term, is used in a variety of contexts and it encompasses a broad range of interchangeable meanings and situations” (Matlay, 2005, p666). If an activity involves risk and uncertainty along with some kind of reward, entrepreneurship is the term used to name that activity. In fact, the word entrepreneurship is being used to name a strategy that firms can use to succeed. Several scholars have developed a model to explain how a firm can use entrepreneurship as a strategy (Meyer and Heppard, 2000) while others clearly state that “Entrepreneurship does not exclusively focus on the isolated individual creating a company” (Rispal, Boucler, and Verstaraete, 2007, p2), even though we all recognize that “entrepreneurship is fundamentally personal” (Baum, et al, 2007, p1). In addition entrepreneurship is seen from different perspectives: The general public views
entrepreneurship as the path to independence, ownership, and great wealth; academics view entrepreneurship in terms of behavior, process, attributes, cognition, innovation, and from micro- and macro-economics perspectives; while policymakers focus on the outcomes of entrepreneurship such as job and wealth creation, community development, and quality of life created by the social entrepreneur. Each perspective offers a different definition of entrepreneurship; a different outcome. Are these perspectives opposing or complementary? Are we seeing different faces of the same phenomenon or does each perspective represent a distinctly different phenomenon that we happen to name entrepreneurship for convenience?

Methodology/Key Proposition

“What is entrepreneurship?” has been asked and answered by scholars since Cantillon first used the word in 1755. Many definitions compete and conflict with each other while other definitions are ignored. Little effort is exerted to reconcile that variance. “Indeed, even the OECD itself contributed to the confusion since virtually every study that has focused on entrepreneurship has presented a different definition of the term” (Ahmad and Seymour, 2008, p5). How can so many well-intended definitions of entrepreneurship exist if we are all observing the same phenomenon?

What is the phenomenon represented by the word entrepreneurship? The challenges of finding the best definition of entrepreneurship are daunting. A common approach to seeking the best definition is to engage in lengthy and reflective discussions in order to identify a set of attributes that best fit the scholar’s observations of entrepreneurship. This approach can be called the battle-of-the-definitions, i.e., whoever presents the most compelling definition
“wins” the battle. Or, many scholars create a definition-of-convenience by stating the definition of entrepreneurship used for their particular study and leave it to the reader to determine the appropriateness of the definition, or simply “bypass the discussion of entrepreneurship definitions altogether, and simply equate entrepreneurship to a specific empirical measure . . .” (Ahmad and Seymour, 2008, p5). This paper documents thirty-seven distinctly different definitions of entrepreneurship spanning nearly 250 years of scholarship. A key question at this point is to ask ourselves whether we are seeking the best definition of the word entrepreneurship or searching for the best explanation of the phenomenon.

This paper forsakes the search for a single, best fit, definition of entrepreneurship. Instead, this paper posits that the multiple perspectives will provide a more in-depth understanding of entrepreneurship by making the presumption that many present definitions represent valid perspectives of the entrepreneurship phenomenon.

Instead of rejecting some concepts in order to craft the most cogent definition, this paper will attempt to include divergent and apparently different perspectives into a common framework to help explain entrepreneurship. The underlying rationale for seeking a three-dimensional explanation of entrepreneurship is based on the belief that entrepreneurship is a multi-faceted phenomenon resulting from the interplay among person, task, and environment (Shane 2003, p4) (Baum, et al, 2007, p315). However, by focusing on the “narrow aspects of what the phenomenon of entrepreneurship is, . . . , seems to be driving out a more complicated and comprehensive understanding of (the) phenomenon of entrepreneurship” (Baum, et al, 2007, p326) at a time when complexity or “differentiated traditions” as Ahmad and Seymour stated in their 2008 article may partly explain the difficulty of crafting a single definition.
Contributions

So why should we care whether there is any commonality among the prevailing definitions? Why should we search for a more inclusive framework? The answer, simply stated, is that entrepreneurship is the term of art for all who study and teach it, and like every
other discipline, a field’s terms of arts are the specialized vocabulary that have specific meaning within the field and upon which new knowledge is built. This paper posits that the field of entrepreneurship is in danger of losing its most important term of art as it slips into use as common business jargon.
Factors Influencing the Success of Graduate Enterprises: Evidence from the Malaysian Graduate Entrepreneur Program

Saridan Abu Bakar

Abstract
This study was conducted to understand the underlying factors that contribute to the success of graduate entrepreneurs who participate in the government sponsored Graduate Entrepreneurship Scheme (GES) and receive financial support from the Graduate Entrepreneur Fund (GEF). Adopting the grounded theory approach, this study found the dynamics of customer satisfaction, product quality, networking, business image, location, diversification and committed workforce as particularly dominant in impacting graduate enterprise success. To these findings, the various factors that constrain accomplishment can be added. Foremost among these, the study found adaptation to technological changes and the availability and lack thereof of capital, employees and space as pertinent. This qualitative endeavor also managed to develop a conceptual framework of useful information on the factors investigated.

Keyword(s): Business Constraints, Graduate Entrepreneurs, Grounded theory, Malaysia, Qualitative Study, Success

INTRODUCTION

The Graduate Entrepreneurship Scheme (GES) is an entrepreneurship training program aimed at creating a new echelon of entrepreneurs among the graduates in Malaysia. This program, which was conceived in 1998, is conducted by the Malaysian Entrepreneurship Development Centre (MEDEC) of Universiti Teknologi MARA (UiTM) and funded by the Ministry of Entrepreneur and Co-operative Development (MECD) through the National Institute of Entrepreneurship (INSKEN). Up till 2008, GES has trained close to 6,000 graduates from various local and international institutions of higher learning recognized by the government (Utusan Malaysia, 2008). The main aim of GES is to develop and heighten the knowledge and skill of graduate entrepreneurs. Its 6-day training program primarily focuses on the honing of business planning skills of participants and the dissemination of useful information on the availability of business support and opportunities in the country. The participants are also given a basic grounding in entrepreneurial theories and motivation.
The comprehensive modules of the program provide not only a familiarization of the more important aspects of entrepreneurship but also an opportunity for budding entrepreneurs to network with their peers as well as governmental support institutions that outfit various infrastructure and amenities for the development of entrepreneurship in the country. The training is made available to all graduates aged 35 years and below who have graduated not more than 10 years before.

After the successful completion of the course, the participants may avail themselves of loans that are specifically set aside for graduate entrepreneurs. The government funded Graduate Entrepreneur Fund (GEF) under the MECD provides the successful participant with the required capital to start a new business or to enlarge an existing one. The government had made an initial allocation of RM5 million to this fund in 1998 and up till 2008 the allocated total had reached RM100 million. The actual money itself is being disbursed by Small and Medium Enterprise Bank (SME Bank). GEF offers loans amounting from RM20,000 to RM250,000 for the purchase of fixed assets and as operating capital up to a maximum of 80 percent of the total project cost. The loans come with a lenient payback period of maximum 7 years and at a flat rate of 5 percent yearly interest.

**Problem Statement**

This research was carried out in the context of the ongoing emphasis by the government to develop graduate entrepreneurs particularly through the MECD. It has been shown by a study conducted by Mohamad (2008) that the GES training program under the auspices of the MECD has not lived up to its expectation. Among the indicators cited for the dreary performance is the failure of many training participants to obtain loans from GEF since its inception in 1998 (Utusan Malaysia, 2008). After nine years, only 10 percent of the 6,000 odd trainees had been able to obtain financial aid from GEF. Hence, the espoused objective of GES in generating a class of graduate entrepreneurs is shown to be less than satisfactory. In a recent study by Universiti
Teknologi Malaysia (UTM) on 348 GES past participants, it was found that only 49 percent have become entrepreneurs (UTM, 2009).

Research Question and Objective

This research is an attempt at answering the question of what enterprise factors are instrumental in influencing the success of graduate entrepreneurs in Malaysia, thereby injecting new information on a relatively unexplored topic to the existing corpus of materials on entrepreneurship.

Methodology

The approach taken by this research is tailored to respond to the main research question: “What enterprise factors contribute to the success of graduate enterprises in Malaysia?” It utilizes a qualitative method of data collection, analysis and interpretation. Due to the relatively uncharted nature of the research subject, this study yields itself to the postulation made by Merriam and Simpson (2000) who referred to grounded theory as particularly suited to examine a phenomenon about which little is known. Moreover, grounded theory is also capable of generating new and exciting ideas from an otherwise already exhaustively investigated subject (Strauss and Corbin, 1994). By choosing grounded theory, this research therefore stands to gain not only from its exploratory character but also the new insights that it makes available as well.

Data Collection

Data were collected in the form of transcripts of eight in-depth interviews with graduate entrepreneurs and supplemented by field notes. These materials represent the respondents’ opinions, ideas and perceptions of the enterprise factors that contribute to their success.

Sampling
Random samples are of little use in a qualitative research such as this. Rather, the emphasis
in on purposeful, or theoretical sampling, in which the researcher seeks out the informants that can
provide the richest and most detailed data on the subject in question (Patton, 2002; Seidman, 1991).
Since the focus is on collecting detailed and in-depth information, the number of respondents was
kept small. The main criterion for judging sample size is that of saturation of information. When
the researcher begins to hear the same theme being reported over and over again and no longer
learns anything new from participants, it is evident that a category is saturated (Glaser and Strauss,
1967), and thus data collection is complete.

**Respondents Selection and Process**

The sampled graduate entrepreneurs were approached directly and invited by the researcher
to participate in in-depth face-to-face interviews. These respondents were referred to by SME Bank
and had been categorized as successful and good paymasters. They were first contacted by SME
Bank to seek their consent to participate in the study. In total, eight semi-structured in-depth
interviews were successfully conducted. A code name was established for each respondent, as
shown in Table 1.

Validity and Trustworthiness of the Study

In this study, a whole gamut of procedures was utilized to ensure that the information provided by respondents is true and accurate and that the analysis of data was systematic, intensive and valid. Member checking was carried out to validate interview transcriptions; triangulation to synthesize data and strengthen interpretation; thick description to ensure that every theme that emerges from the study convey similar meaning to both respondents and researcher; and firsthand reporting as suggested by Miles and Huberman (1994) and field notes to ensure the integrity of information gathered. In addition to all these, a participatory method of research, as suggested by Merriam (1998) was used in both the semi-structured interviews and the informal interactions between the participants and the researcher. To further strengthen the whole process, peer review and identification of researcher bias were also carried out.

Results of Cross Case Analysis

Drawing from the in-depth interviews with eight graduate entrepreneurs, 121 themes emerged. These themes can be segregated into three main classifications: Enterprise Success, Enterprise Factors and Constraints.

Enterprise Success

Since the fundamental research question deals with the factors that contribute to the success of Malaysian graduate entrepreneurs, it is only to be expected that a lot of discussion during the in-depth interviews would revolve around the definition of success. Reacting to open ended questions on this matter, the respondents gave many and diverse answers as to what constituted success from their respective viewpoints. As a whole, this study noticed that both quantitative and qualitative methods have been used by the graduate entrepreneurs to measure their success. Quantitative
measures quoted by the respondents are growth in sales, growth in assets, growth in the number of employees and business profitability. Survivability and personal satisfaction are two qualitative measures mentioned by them as well. In general, these findings echo previous studies on objective measures (Sexton, Upton, Wacholtz, and McDougall, 1997) and subjective measures (Ibrahim and Goodwin, 1986; Cooper and Artz, 1995). Personal satisfaction as a business success measure was discussed by Clarkson (1995).

Growth in sales appears to be the common denominator of success among entrepreneurs. Respondent 3, a tuition centre operator, remarked, “This year’s growth has been steady…There has been a marked increase [in students] as compared to last year and the two years before that.” (Personal communication, 2nd September, 2008). To respondent 7, owner of a hair saloon, “[It has been] one year and seven months [of operations] and the graph is showing an upward trend. As we progress, more [customers] are coming in.” (Personal communication, 16th September, 2008). Growth in sales, according to Respondent 4, a printing outlet operator, is contributed by new and large corporate customers on top of existing regulars. Respondent 6 resorts to providing monetary incentives to employees as a way of inducing higher sales. “In fact [the staff] now has sales target to meet. With this target the staff is spurred to perform better and be rewarded. This is a healthy form of competition among the employees to boost sales.” (Personal communication, 15th September, 2008).

The success of a business is also measured in terms of increase in business assets. In this regard, Respondent 4 had this to say: “We feel that we have been successful; from the very start we did not anticipate owning such a big machine as this. This is the first asset!” (Personal communication, 4th September, 2008). Past studies mostly equate increase in staff level to higher cost of operation and hence, lower business profitability. This view, however, is not shared by the graduate entrepreneurs. Conversely, these entrepreneurs are of the conviction that an increase in people level is a clear testimony of the success of the business. “Success is when you are able to provide job opportunities to people. This is visible success,” said Respondent 4.
Financial profitability emerged as another popular measure of success for the graduate entrepreneurs. To them, profitability contributes to the income of shareholders as well as to the fund that will be used for future growth. According to Respondent 6, “Profit is the investor’s return on investment. It is the all encompassing index that incorporates sales and other factors.” (Personal communication, 15th September, 2008). The ability to survive in the market place is yet another measure of success used by them. This is hardly surprising given the relatively short spell of time that these entrepreneurs have been in business. Since the respondents, on average, have been in business for just over three years, they are unanimous in regarding survivability as of utmost priority during the formative period. “In these two years, it is sufficient that we survive.” (Respondent 1, personal communication, 16th August, 2008). A business that survives, according to Respondent 3, is one that can cover all of its cost of operation that includes wages and rent. Additionally, a survivor business must also be able to fend off competitors. The entrepreneurs realized that they also need to strive and be more attentive to their business in order to survive. Self satisfaction plays a major role in spurring the entrepreneurs and is an important indicator of their success as well. Nash (1983), stressed that a business needs to succeed in order to survive. Like any other businesses, the success of small and medium sized ventures (SMEs) therefore depends on measurable gains such as growth in sales, workforce, capital and profit. Specific to this study, measurement indices in the form of sales growth, increase in workforce, increase in assets, levels of profitability, business survivability and entrepreneur satisfaction have been found to be the dominant measures used by the graduate entrepreneurs.

**Enterprise Factors**

Certain aspects relating to the business have been identified by the respondents as vital in determining the success of their ventures. These factors are customer satisfaction, product differentiation, niche products, networking with other businesses, business image, strategic location, diversification and worker dedication.
Customer Satisfaction

A majority of the respondents (7 out of 8) vouched that their businesses become successful because of the superior service that they provide to customers. Respondent 4, for example, said, “First customer that we tried to engage, for example, was UIA[M] where I proved my worth until the [vice] chancellor was happy with us.” (Personal communication, 4th September, 2008). Additionally, the respondents were convinced that a happy customer who is satisfied with the product or service offering will continue to support the business. On this, Respondent 7 said, “I hate to push [the] customer to sell my service. I also told my staff not to. If they [our customers] wish to do so, then it is up to them to [advertise] to other [customers]…” (Personal communication, 16th September, 2008). Repeat customers are important to entrepreneurs because they tend to spend more money, generate larger transactions, refer more customers, and buy a broader range of products than one-time shoppers. Hence, entrepreneurs are desirous to retain them as much as possible. This fundamental truth was hinted at by Respondent 5, “…with customers being aware of how both of us work…they use us and they will repeat.” (Personal communication, 12th September, 2008).

An effective strategy to retain customers adopted by the entrepreneurs is through continuous improvement to the quality of the product or service. Under this strategy, the entrepreneur continuously monitors customer satisfaction levels, follows strict quality maintenance standards and ensures that customers get the best. Commenting on this, Respondent 4 said, “When a customer is happy with a person, all his [or] her subordinates will follow suit. [These subordinates] do not look at the company. Suffice that they rely on their leader’s assessment, whether he or she is happy with a particular person.” (Personal communication, 4th September, 2008).

Product Quality
There are four aspects relating to product quality that contribute to the entrepreneurs’ success: product differentiation, niche products, product improvement and constant offering of new products. Product differentiation alludes to the practice of distinguishing the differences inherent in a product or service in order to make them more attractive to a particular target market. By doing this, the entrepreneur hopes to effectively thwart competition and gain a bigger share of the market. “We distinguish ourselves, we bring [distinguished products] to the market, we still do business…I always belief that it is [in] differentiating yourself.” (Respondent 8, personal communication, 25th September, 2008). By highlighting the unique aspects of a product, differentiation also creates a sense of value. According to Respondent 2 (personal communication, 27th August, 2008), “Others don’t have a swimming pool, we put up one. [We created] a new playground based on the latest model. Others’ are obsolete and dilapidated. The premise color is a striking purple!”

A niche product is a specialized offering that meets the need of a particular, if not small, market. As a strategy, creating a niche product is a means of getting ahead of the pack by identifying specialized demands in the marketplace that are under-supplied. According to Respondent 6, “There are many expatriates…many Koreans and Iran[ians]. And the Malays of the middle to high class too..” (Personal communication, 15th September, 2008). In satisfying the needs of customers, the graduate entrepreneurs do product improvements, often without regards to pricing change. By making improvements, products and services can become more pleasing, more versatile and more efficient, thus increasing their appeal to a larger market of consumers. “I don’t compete in pricing. I just place my own price,” said Respondent 2. In addition, “The customer, if he is satisfied, he won’t mind at all. What is more important is that we maintain a standard price but offer extra service to the customers.” (Personal communication, 27th August, 2008). Respondent 8 was more candid when she spoke on the improvement strategy implemented at her training center. “Rather than [a] stand alone project… we do series, we do follow-up, we do coaching, and we measure results.” (Personal communication, 25th September, 2008).
The entrepreneurs also found that constant offering of new products or services to clients leads to increase in their earnings and profitability. “We need to come out with better programs...Programs that will help people make more money...” (Respondent 8, personal communication, 25th September, 2008). Putting herself in the shoes of her customers, Respondent 8 could appreciate the necessity of constantly generating new products or services in order to survive and flourish. “I don’t think we want the same service all the time, right? We want to sell something new...we want to grow.” According to Storey (1994), a business that wishes to prosper must offer products or services that are new and different from those existing in the market place.

**Networking**

For business rookies like the graduate entrepreneurs, one of the greatest challenges is to secure the trust of the customers. This was best voiced out by Respondent 8. “We’re nobody in the market. People asked you how many companies have you trained? Who have you trained? Just starting. People would think that why would I use my people as experiment for you?” (Personal communication, 25th September, 2008). Hence, it is imperative that the entrepreneurs network with other more reputable businesses. Respondent 8 added, “It [is] just [the] two of us. But we work with other companies as well. Other training providers. So we compliment [each other].” Through this network, her business was able to run despite the limited resource. This finding is in line with earlier studies that showed networking with more renowned organizations as having the impact of heightening the chances of success of a business (e.g. Abu Bakar, 2007; Meeus, Oerlemans, and Hage, 2004; Mian, 1997). In respect to the present study, the researcher found that networking with other businesses or individuals by the graduate entrepreneurs is a strategy undertaken to obtain knowledge which otherwise would not be available to them. In conducting strategic collaborations with other businesses or individuals, the entrepreneurs were also successful in expanding their businesses to new markets.
**Business Image**

Image plays a significant role in ensuring the success of the graduate entrepreneurs’ business efforts. Having a reputable image means that the business would be easily accepted by the market. Furthermore, an image of good standing will attract new customers, who would, in turn, disseminate information on the products and services offered to other potential customers, thereby helping to expand the existing clientele. Previous studies have shown a direct relationship between business image and success (e.g. Abu Bakar, 2007; Olins, 1991; van Riel and Balmer, 1997). These studies also claimed that image is a resource that clearly distinguishes a business entity from another as well as providing better competitive advantage. A reputable business image has also been associated by past studies with increased confidence of customers in the products and services offered (Zeithaml, 1988); the attraction and subsequent retention of adept employees (Caminiti, 1992; Dowling, 1986; Preece, Fleisher, and Toccarcelli, 1995); reduction in the cost of operations (Kotha, Rajgopal, and Rindova, 2001); the ease in obtaining financial aid (Beatty and Ritter, 1986); and the reduction in the cost of purchases (Kotha et al.)

Brand or product reputation can also enhance the image of the businesses utilizing it, thus bolstering their chances for success. In this case, Respondent 6 elaborated, “For retail skincare…we do use a lot the product Dermalogica. That’s the reason why we lay them out at the main [entrance] area. In addition, other renowned products are also being offered.” Similarly, a business that has an established name or locality is bound to do well. In this study, Respondent 4 associated the popularity of his company’s name with success. “Before, we did not have large clients. We had mostly private limited companies that engaged us to make name cards and brochures. But today we print books, manuals and the like. This says that our reputation has spread.” (Personal communication, 4th September, 2008). A business that has long been established in a particular locale would have the upper hand against competitors who have just set up in that place. “The kindergarten has been long established. [Already] 12 years…” (Respondent 2, personal communication, 27th August, 2008).
The act of continuously promoting one’s business will eventually bear fruit in a heightened image of the business in the eyes of customers. “We still must be doing marketing, I don’t think we want the same service all the time, right?” (Respondent 7, personal communication, 16th September, 2008). Varied use of different types of media has also been found to be effective in promoting the activities of the business. In this respect, Respondent 7 said, “We used the magazine a lot…to promote.” (Personal communication, 16th September, 2008). Through sheer effective promotion an entrepreneur can attract customers to his or her premise despite being located in a less than ideal location. Nothing is more important to a business’ success than a proven track record in meeting the expectations of customers and business partners. In line with this, Respondent 4 endeavored to make good all his obligations towards his Financiers. “Because they are happy with us…as for example, when we give a check, the check will never once bounce… [And] when we commit to a week’s time and they come, the check would be ready.” (Personal communication, 4th September, 2008). A study by Zeithaml (1988) showed that business image can instill customer trust in the products and services and influence customer decision to buy. In addition, it has the effect of influencing customer retention, encouraging repeat buys and allowing the business to place a high price on its products (Chaminiti, 1992; Preece et al., 1995).

**Location**

Location plays a prominent role in determining whether a business flourishes or fails. According to Respondent 3, a tuition centre operator, being located in a housing estate and in close proximity to places of public interest gives the centre an added advantage in attracting more clients. “Being just in front of the market, it’s easy for people to see. Moreover, there is no other tuition centre. The one nearest is over there…and quite a distance from here.” (Personal communication, 2nd September, 2008). To Respondent 4, a strategic location provides all interested parties the ease of dealing with him. “We can’t locate the shop far away…customer[s] would have a problem coming to the shop.” (Personal communication, 4th September, 2008). Locating the business close
to the market, as was done by Respondent 3, is a strategy that pays handsome dividends. In her case, Respondent 3 chose to be near her targeted clients - primary school students. “There are five primary schools around here…they can come here for tuition.” She further added, “[The residents] here are packed…down here [the residents] are packed. The housing estate near the flats has many people.” (Personal communication, 2nd September, 2008).

**Diversification Activities**

Product or service diversification is a growth strategy aimed at creating a new customer base, which by definition expands the market potential of the original product or service; or creates a new market for a new product or service. As far as the GEF entrepreneurs are concerned, three strategies were evidently employed: that which requires market diversification of existing product or service; that which involves diversification into other product or service, and forward integration. The growth of institutions of higher learning at Chendering, Terengganu, had prompted Respondent 4 to open up a new branch in that locality. “At that location, we concentrate on the new universities like UiTM and KUSZA” (Personal communication, 4th September 2008).

Diversification to different products refers to the actions taken by entrepreneurs to offer a variety of different products as a way of exploiting all opportunities available in a given field. This action too contributed to the success of the graduate entrepreneurs. According to Respondent 4, “We established one more company called Agro and Medical. That’s because we have a lot of projects in the agro field. Medical, for example, medical lab. Here too, we have a number of scientific projects being offered to us.” (Personal communication, 4th September, 2008). The merits of diversification are well recognized by the respondents. For Respondent 1, diversification is a sure means of improving on her success, although at this point it is something that her business is not ready for. “We don’t want to concentrate on services [only], we now want to supply…[do] trading. That’s our current intention…” (Personal communication, 26th August, 2008).
Forward integration refers to a business strategy of conducting the distribution of the product by the business entity itself as opposed to middle men as was done previously. Respondent 5 said, “My father has five buses…so I have acquired one myself. Actually we have plans to get one more this year…” (Personal communication, 12th September, 2008). The respondent further associated forward integration with success of his travel agency, “The bus has many benefits…The bus provides free advertisement. With our company logo on the bus, many people can see…sometimes even government authorities contact us.” (Personal communication, 12th September, 2008). Forward integration strategy was also employed by Respondent 8.

Worker Dedication

As confirmed by Respondents 7 and 4, the type of employees that they have can exert a big influence on the performance of their businesses. “Of course! Staff too, is very important,” said Respondent 7. (Personal communication, 16th September, 2008). “Now, thank God, our staff has so far chosen to remain with us. We have been taking in people one at a time since 2004.” (Respondent 4, personal communication, 4th September, 2008). This contention is proven by the fact that the employees of Respondent 4 are willing to put the interest of the business above their own. In the words of Respondent 4, “If they are asked to do overtime, they will do. That’s where we want to create commitment.” (Personal communication, 4th September, 2008). The entrepreneurs also linked the way they handle employee welfare to enhanced productivity and loyalty on the part of the employees. “From the day we were established till today, we have only once delayed the payment of salary for two days. And that is only because I was outstation…The rest were on time.” (Respondent 4, personal communication, 4th September 2008). The same sentiment was voiced by Respondent 6. “Hands on commission is a normal practice, we do give. If they sell products, we will give [the commissions].” (Personal communication, 15th September, 2008). Ultimately, according to Respondent 6, “They are very happy. When we offer incentive like that, they like it.” (Personal communication, 15th September, 2008).
To cultivate employee commitment to the business, it is necessary for the entrepreneur to encourage the personal growth of the employees themselves. By so doing, the employees will sense that they have a better future ahead and will strive to give their best to achieve it. Directly or indirectly, this will positively impact the entrepreneurs’ businesses. One avenue of growth for the employees would be their promotion to the status of a partner in the business. “I have educated them from the very beginning; I will make them share partners. So, they will see that in the end they too can own a spa. So, in this way they become more committed.” (Respondent 6, personal communication, 15th September, 2008). As a testimony of this truth, a former employee of the respondent has now managed to open a business of her own.

**Constraints**

Earlier studies have identified many factors that obstruct the progress of SMEs (e.g. Abu Bakar, 2007; Mohd. Osman, 2002). In this study, the entrepreneurs identified four constraints that prevent them from achieving even greater success: capital, technology, employee and space. According to Respondent 1, “When we want to extend the business [or] do enhancement [or] need some more capital. That’s the part that we are most unhappy.” (Personal communication, 26th August, 2008). In concert with this, Respondent 4 admitted that insufficient funds have disrupted his business. “The most obvious difficulty is when we are short [of] capital. That’s the most obvious…[especially] when an order comes in.” (Personal communication, 4th September, 2008). Capital constraint was also felt by yet another respondent, who admitted to lost income as a result of insufficient funds. Due to capital constraint, the same respondent intimated how he had to delay servicing his loan to SME Bank. (Respondent 5, personal communication, 12th September, 2005). In the case of Respondent 4, a lack of funds prevents him from securing more lucrative markets and bigger clients. “If we were to expand further, we will need at least a capital of two million [Ringgit]. That would put us in a very secure position [and] we can approach bigger clients like National Printer.” (Personal communication, 4th September, 2008).
For a business that is susceptible to changes in technology, such as the printing business, technological constraint can exert a significant impact on its success. Respondent 4 quoted the lack of cutting edge machinery as a constraint that he had to endure. On this matter, the respondent said, “As far as constraints are concerned, we in the printing business are not up to par yet. There are other machines that we need.” (Personal communication, 4th September, 2008). Employee constraint is yet another factor that prevents the graduate entrepreneurs from achieving even greater success. “As far as employee requirement goes, we do sometimes face a shortage of manpower and this prevents us from expanding. When the orders keep coming in there will be a lot of jobs…printing and they are always urgent!” (Respondent 4, personal communication, 4th September, 2008).

Last but not least, this study found that the success of the graduate entrepreneurs is also hampered by inadequacy of premise space. Due to this constraint, Respondent 4 was not able to outfit his business with the required machinery and tools, thus affecting the business’ productivity. “And if we were to procure all the machinery, the existing space simply cannot accommodate it…the space is plainly not enough.” (Personal communication, 4th September, 2008). The discussion on constraints above suggests that the GEF entrepreneurs would have achieved even greater heights if it has not been for the existence of capital, technological, machine, employee and space constraints.

Analysis

The NVivo7 Qualitative Data Analysis Software was used to aid in the identification, condensation and analysis of the interview data in order to address the research question. The transcribed data from the interviews were divided into eight separate documents according to the number of respondents. Each document was opened separately and coded. Grounded theory uses three level of coding. The first level, involving open coding, is the stage where the transcripts are examined and coded via a process which breaks the interview into discreet threads of datum. The
data is then collated and amassed to form categories of similar phenomena. During the entire process of open coding, the data is examined without any limitations in its scope and without the application of any filters. Thus all data are accepted. As the categories begin to fill, those that are most dense become known as core categories (Glaser, 2001). As core categories become apparent, the researcher moves on to the second level of coding, that of selective coding. During selective coding, the researcher is allowed to filter and code the data which are determined to be more relevant to the emerging concepts. Hence, only the most relevant parts of a transcript are used and coded. To facilitate this process, interview questions are continuously reformulated to include new and more focused direction of the research.

The final stage of coding is known as theoretical coding. Theoretical coding occurs when core categories have become saturated. Saturation is both a peculiarity and strength of grounded theory. Unlike other methods of qualitative analysis which acquire rigor through multiple levels of confirmation or triangulation (Mertens, 1998), grounded theory builds on the analytical case by constantly seeking new categories of evidence. Eventually, after a period of data collection, a point is reached when no new data are forthcoming. This is the point of saturation. According to Selden (2005 p.124), “One keeps on collecting data until one receives only already known statements.” Theoretical coding examines these saturated categories for conceptual relationships between categories and their relevance to literature (Glaser 2001).

After the data has gone through the three stages of coding and when the full list of themes has emerged, the process of integration and screening is undertaken. In this process, any doubtful theme is initially left to stand alone rather than eliminated or integrated. For this study, 43 themes finally emerged after going through the coding and integration steps mentioned above. Eventually, the total list of 43 themes was segregated into 6 Parents, 23 Children and 12 Grandchildren nodes.

The final Tree Nodes are shown in Table 2.

**Conceptual Framework**

As a result of the qualitative study, a new conceptual framework of factors influencing the success of Malaysian graduate entrepreneurs is constructed as shown in Figure 1.
Figure 1. Conceptual framework of factors influencing the success of graduate entrepreneurs in Malaysia.

Summary

This qualitative study serves to explore the factors that contribute to the success of Malaysian graduate entrepreneurs. Using the grounded theory methodologies found in the works of Glaser and Strauss (1967) and Strauss and Corbin (1994), the study found that enterprise factors that contribute to the success of the graduates are customer satisfaction, product quality, networking, business image, strategic location, diversification and committed workforce. Enterprise success is measured by the graduate entrepreneurs in both subjective and objective terms. Technological, capital, employee and space constraints are found to hamper their progress. A conceptual framework encapsulating all plausible explanations of enterprise competitive advantage through its exploitation of internal resources and capabilities was crafted at the end of the study.

Science marketing within the biotechnology marketing culture

Päivi Eriksson, Heidi Rajamäki
University of Eastern Finland, Finland
heidi.rajamaki@uef.fi

Several scholars have written about a ‘marketing culture’ of business organizations. Our paper adds a new layer to this literature by looking at culture as a root metaphor. Adopting the culture as root metaphor perspective we analyse how commercial biotechnology marketing is understood from the inside, i.e. from the point of view of biotechnology business people. The analysis opens up two modes of marketing relevant within the biotechnology marketing culture: generic marketing and science marketing. The content and process of these will be discussed further in our paper.

Keywords: marketing culture, science marketing, biotechnology
This workshop will outline how three institutions - Webster University, Columbia College-Chicago and the University of South Carolina - approach entrepreneurship education for arts students. Facilitators will provide an in-depth description of their efforts including: degree plan outlines, curriculum and pedagogy.
Assessing the Business-Enabling Environment for Women’s Entrepreneurship: Lessons Learned

Annette St-Onge, Solutions for Women Business Owners Inc.
Anne Simmons-Benton, Booz Allen Hamilton
Lois Stevenson, Industry Canada
Julie R. Weeks, Womenable, jweeks@womenable.com

Entrepreneurial success is influenced by internal and external factors. An entrepreneur’s past experience and level of knowledge, his/her connections and relationships with others, and the level of financial investment made at start-up all impact business success. In addition, the environment in which firms operate can also either help or hinder business growth and development. Recent assessments of business-enabling environments (BEE) done from a gender perspective have shown that gender-blind environmental assessments can miss key structural and societal barriers that may be limiting the growth of women-owned enterprises. This panel discussion will focus on the exogenous factors influencing business success – laws and regulations, public and private sector support structures, and the social environment – taken from the perspective of women’s enterprise development.

The Triple Bottom Line:

Performance Measures in Social Entrepreneurship Research

Michelle D. Lane

Social entrepreneurship research is quickly evolving as a significant area of inquiry for academics. Because economies are weak there is a rise in social entrepreneurial ventures (SEV’s) that arise to fix the societal problems. The measurement of the social impact of these ventures is proving to be difficult as they have to deal with not only staying financially viable, they also need to demonstrate that they are making a difference. This research presents a review of the current academic literature on SEVs and performance measurement. A comprehensive framework for developing measures of SEV performance is then proposed.

Introduction

The rising stature of social entrepreneurship as a means to address social needs in a cost-effective, or even profitable manner has been accompanied by increasing interest in social entrepreneurship as a field of academic study. One great challenge in studying social entrepreneurship ventures (SEV’s) is that it is difficult to measure results. There are the standard measures of performance (e.g. profitability, productivity or cost effectiveness), as well as the measures of social impact, (addressing a social concern, minimizing carbon footprint), which are equally important in the minds of critical constituents.

Like for-profit firms, SEV’s have multiple constituencies to satisfy, but their triple bottom line measurement practices are complicated. First, the SEV’s must address sustainability as they generate human capital and financial capital to sustain operations. Second, they measure the outcomes of their processes in terms of Social Entrepreneurial Activities (SEA’s) in terms of
tracking how much they are doing, growth, scale, and the direct outcomes of their processes. The third area, one that is not addressed in regular business enterprises, is the measurement of social impact. Since SEV’s are founded for the purpose of filling a void in the social and environmental domains that is not met by existing governmental or business processes, determining their ultimate impact on the problem is a crucial and often evasive measurement.

This research will examine the research question:

*Is there consistency in way SEV’s measure performance or is it context specific?*

The purpose of this research is to summarize current literature on social entrepreneurship performance measures. Since this field is relatively new and there were fewer than a dozen articles on social entrepreneurship and performance I will also reference the work from two other sources. Two major university Social Entrepreneurship research centers have provided publications on this topic, Columbia University (RISE) and Duke University (CASE). The result is a framework for understanding performance measures for social entrepreneurs as well as proposal for future research on performance pertaining to the triple bottom line.

**Theoretical Background**

The examination of SEV performance needs to be placed in the domain under which social entrepreneurship is defined. Therefore a brief review of definitions will be presented in order to clarify the one that will be used in this research. The literature addressing the performance measurement of SEV’s will then be reviewed. Theoretically proposed measures and performance measures addressed in empirical studies will be summarized. This will provide the foundation for the framework to be presented in the subsequent section.

**Defining social entrepreneurial ventures**
As in any new field of research, there have been a few significant articles examining the
definition of social entrepreneurship (Thompson et al. 2000; Austin et al. 2006 and Weerawardena and
Mort 2006). The essence of the definition requires the ‘social’ part that is a business dedicated to
remediating a weakness in the social system, impacting people or the planet. Social ventures step up to
meet this need that is not met by the government or businesses. For example, illiteracy in adults is an
ongoing problem where the education system and government falls short. A social enterprise may
emerge that provides literacy education, but it is a traditional teaching model and is there, really to take
the opportunity to make money in filling this social need. In contrast, a Social Entrepreneurial Venture
may emerge that is driven by an individual who is focused on helping those who cannot read, as well as
attempting to fix the system that created the problem in the first place, and does so with unique practices
and initiatives. The focus of this organization is on the mission to solve the illiteracy problem, not make
money off of it, whether it is a non-for-profit or for-profit venture. The social enterprise is focused on
profitability, and will not be interested in endeavors that would eliminate the need for their services, in
other words, not wanting to have a social impact on the problem. This example demonstrates the contrast
between an SEV and a social enterprise. SEV’s are there to meet a social need unmet by current
infrastructure, in a unique or entrepreneurial way.

The previous example brings up the other consideration in defining an SEV: Does being a ‘for-
profit’ organization preclude them from being considered an SEV? There are arguments on both sides
regarding the profitability issue. The RISE report (2006) was a study specifically of for-profit social
ventures. Their findings indicated that 60% of the 190 firms studied where primarily socially oriented or
equally balanced between social and profit generation. The remaining 40% put financial goals first.
Philosophical differences between the two groups were clear. The social emphasis group viewed profit
generation as a necessary requirement to generate the financial resources needed to support their mission.
The financially oriented firms, while being just as focused on firm mission, viewed profit generation and
proliferation of their social value product or service as a means of enhancing social value. As one CEO
stated “We are social when it makes business sense: The generation of profits is our company’s major goal, but we do create social value when it enhances profitability and makes good business sense to do so” (Pg. 9). Social and economic goals are present in an increasing number of business ventures (Shaw and Carter 2007; Zahra et al., 2009) as well as in Corporations under the term ‘Corporate Social Responsibility’ (Matten and Moon 2008). As pointed out by Austin, Stevenson and Wei-Skillern (2006), the need for SEV’s is much greater than the ability of non-for-profits to meet those needs. Therefore the contributions by for-profit firms and corporations in pursuing social entrepreneurial missions are important. This research will use the broader, all encompassing definition presented by Paul Light (2008) as “efforts to solve intractable social problems through pattern-breaking change” (p.12) where non-for-profit and for-profit ventures can both be included. The creation of a general framework for summarizing learning should be more inclusive, rather than exclusive.

**Articles Presenting Theories Including Performance**

Upon reviewing an extensive amount of literature on SEV’s, there is little to report on theoretical propositions addressing measurement of SEV performance. There is considerable coverage that entails defining social entrepreneurship, looking at the business models for developing a successful SEV, classifications of social entrepreneurs and leadership traits of social entrepreneurs (Alvord et al. 2002; Prabhu 1999; Paredo and Mclean 2006; Zahra 2009). The articles summarized in Table 1 are a collection of research that address the theoretical underpinning of the measurement of SEV performance, either directly or indirectly. The prevailing common theme in this literature is the focus on the social impact performance of the SEV. The formation of a social entrepreneurial venture at its founding is a deliberate and unwavering focus the mission to cure a social or environmental ill. As such it is always a deficiency that is a result of some political, governmental or cultural activity (or lack thereof). In the earlier research by Prahbu (1999) and Wallace (1999), both researchers discuss the need for
performance measures that reflect long term changes in socio-political structures and the economic impact to the community. A comprehensive model presented by Austin, Stevenson and Wei-Skillern (2006) captures the essence of SEV’s success, the securing of human and financial capital, and points out the political, economic and government forces can seriously impact venture success.

Empirical SEV Research That Includes Performance

The empirical research that addresses performance measurement of SEV’s is also reflective of the early stages of this field in the research arena. Out of a dozen studies, seven were case studies from examining from one to six case examples, four were interviews where three of those were large scale studies sponsored by SEV centers and funds (CASE 2008; Clark and Ucak 2006; Light 2008) and one was a survey of churches (Pearse II et al. 2009). A summary of this research is shown in Table 2. The scope of the SEV domain includes a majority of studies that include both for-profit and non-for-profits, with only 3 studying strictly non-profits. The RISE study (Clark and Ucak 2006) is the only study specifically focusing on for-profit firms with a social mission, either explicitly or implicitly declared.

</table>
There are three major SEV studies included in this list, CASE, RISE and Paul Light’s research. The SEV research by Paul Light from New York University from 2001 through 2006, supported by the Ewing Marion Kauffman Foundation and the Jeffrey Skoll Foundation, is shown. The focus of his data collected on for his 2008 book was on the activities of SEVs that were classified as highly, moderately and not too socially oriented firms. He examined founder characteristics and involvement, level of risk, and organization management. Although the focus of his research was not on performance, he did collect information on firm budget growth and program demand. The findings showed that the highly socially entrepreneurial firms had much higher growth in demand and budget than the other two categories. It was also discovered that sources for interventions in improving performance including foundations, providers of technical assistance and to a lesser extent government were important.

**Summary of the CASE Research on SEV Performance**

The Center for Advancement of Social Entrepreneurship (CASE) sponsored by the Duke University Fuqua School of Business with funding from the Skoll Foundation published a report on “The Developing Field of Social Entrepreneurship” in 2008. This report summarizes a two year study to explore social entrepreneurship, including defining the field, exploring techniques used by social entrepreneurs, financial markets, human capital needs, and defining effective business models. Experts including practitioners, academics, funders, authors and consultants were used in this study. The focus was not on performance measures, with the exception of recognizing the need for effective measures that may vary with context. The comment was made in the report “If you add up all of the social entrepreneurs
and have no idea of impact—what have they done—the field cannot advance. You really need numbers to support the idea of impact” p. 17. The framework for the report provides the capital infrastructure needed for an SEV including financial, human, intellectual and social/political capital. They also note that the context setting factors such as politics, media, economic conditions can impact outcomes. Both of these categorizations shed some light on impact measures to be considered.

**Summary of the RISE Research on SEV Performance**

RISE is the Research Initiative on Social Entrepreneurship project being supported by the Columbia Business School. The following information is taken from the RISE For-Profit Social Entrepreneur Report (Clark and Ucak 2006) that summarized the findings from CEO’s of 211 for-profit SEV’s. These COE’s were classified according to their viewpoints on explicitness of their Social Value creation plans to their stakeholders, and their emphasis on financial orientation versus a more balanced or socially oriented focus. Four CEO classifications were proposed:

1. Activists (A) – Explicit with customers and socially oriented
2. Change Agents (CA) – Not always explicit with customers and socially oriented
3. Market Pioneers (MP) – Always explicit with customers but financially oriented

These classifications showed differences in the practice of evaluating the social impact. For instance Market Pioneers more frequently evaluate social impact than Change Agents, perhaps to justify claims they made to financial stakeholders. The industry context did reveal some differences in the type of social impact methods that are preferred and the percentage of firms in the industry that measured impact. Refer to Table 3. Overall, 59% of these respondents reported using measures of social impact performance. Consumer products and retail is the only industry group that far exceeds the average use at 83%. Agricultural, health and Food uses social impact
performance measures the least at only 39%. So it does appear that some contexts are more conducive measurement. The types of measurement also varied significantly. Stories and testimonials of success were the most common across all segments with 76% reporting their use. Comparative measures, cost/benefit analysis and surveys were the next most common methods across all groups, falling in the 41 to 54% range. Unfortunately this information does not spell out specifically what is being measured. The reasons for measurement seem to vary as well as often firms mentioned using the information to help them promote themselves and sell product or services, rather than to show what kind of long term impact they were making for the sake of the cause alone. The research does show that there is a lot of experimentation with different more rigorous evaluation tools, some provided by external consultants and academics. The desire is to find that simple method that can reflect their impact.

RISE has also developed a social venture rubric that assesses five financial factors and five social factors as part of their ‘double bottom line’ taken from the Double Bottom Line Project Report. These performance measured are summarized in Table 4. This instrument, while not designed to be an evaluative tool for the long term impact a firm has over time, is designed to help social entrepreneurs sort out the complex tasks of financing a venture and determining if it is staying on target with its mission. Some of these areas are important to impact measure creation and are useful in the framework developed subsequently.

There are several common themes that are present in the empirical research on SEV’s. Firm sustainability and process measures have many common factors. Growth, budgets, donations, funding are all indicators of firm survival. Process measures are also always an important indicator of the activities that firms undertake including clients served, educations provided, endeavors undertaken etc. The social impact measures seem to fall into three major categories: government and political impact, economic impact, and socio-cultural impact. If a SEV is successful in changing the way things are done in these areas, they are making an impact that dramatically changes the environment. Success would indicate that the SEV has worked itself out of business.
Framework for Measuring Performance

As shown by the review of the literature, performance measurement for social entrepreneurs is fraught with complexity. The measurements need to address survival, process outputs and ultimately reaching the social mission. Achievement of the social mission, however, depends on making a significant changes, often times to multiple constituencies including government, cultural attitudes, as well and the processes that are currently in place. In observation of the research presented, and in answer to the research question posed: “Is there consistency in way SEV’s measure performance or is it context specific?” Yes, there is consistency across context in measuring SEV performance. As such, I am proposing a two dimensional framework representing three levels of performance measurement over three dimensions of change.

Three Levels of Performance Measurement

Traditional businesses seeking profitability goals use the traditional Input-Process – Output model, where the measurements focus on process outcomes measurement, such as number of customers served, sales increases, growth, etc. plus profitability including all of the traditional measures including Return on Investment, Asset Turnover, Net profit, Earnings, etc. Process outputs lead to net profits (or losses). A SEV also has inputs leading to process outputs but the profitability measurement may or may not be there. But the ultimate goal is the social impact the firm makes, in achievement of its mission. Without profitability, how does the firm
know if they are achieving their mission. Sustainability alone may not mean they are accomplishing the social impact effectively, or at all. These measurement are therefore more of a recursive relationship as show in Figure 1.

**Figure 1**

SEV Performance Relationships

The common theme in the research points to measurement in these three categories. First, performance can be measured by *firm sustainability*. Are they making enough money to sustain their venture? Some operational measures typically used for regular business ventures, such as cash flow and operating income are appropriate, while profitability and return on investment may not be (depending on if they are a for-profit or non-for-profit organization). Second, they may measure their *social actions* that have a direct impact on their constituencies. This is a measurement of process outcomes. For example, the number of children tutored, the number of homeless served or the amount of media coverage might be measures of the outcomes of the processes used in the SEV. These direct measures deal with the day-to-day actions that take place. The third, and most difficult level of measurement, is the *social impact* they provide. Social entrepreneurs attempt to use creative means to meet the needs of social problems that regular means do not address. Ultimately the social impact is the key ‘triple bottom line’
measurement that is needed, but yet is the most elusive. As pointed out by Austin, Stevenson and Wei-Skillern (2006), measurement challenges are complex due to “nonquantifiability, multicausality, temporal dimensions and perceptual differences in the social value created” (page 3). These three areas that are used to assess performance; firm sustainability, social action and social impact, will be discussed in the following rhetoric. As a point of clarification, the ‘Triple Bottom Line’ designation used herein is different from the triple bottom line referred to in corporate social responsibility literature where the three ‘P’s refer to measuring corporate response in terms of Profitability, People and Planet (Cokins 2009; Stephenson et al. 2008). Since the social entrepreneurship literature makes reference to double and triple bottom line measures, this designation was used here.

Firm Sustainability, as far as a SEV is concerned, is about paying the bills. SE ventures are usually in a position where closing up shop when finances are scarce is not an option, unlike other entrepreneurial firms. Therefore, social entrepreneurs exhibit an insatiable optimism about their firm success, even when things are dire (Light 2008). Acquiring both human and financial resources are key components to firm survival. The literature shows creative means of financing and continually changing stakeholders as they seek new funding options. New sources of grants, retail operations, fees and new donors are all methods used. Their organizations are often flat, with a lot of autonomy so that organization members can act independently and pursue options as they occur.

Social Action measures address what are the direct, trackable process outcomes that the venture accomplishes. These are operation measures that include number of clients served, programs offered, illnesses treated, number of outreach actions and growth. These measures parallel general operating outcomes of any organization and in those organizations they represent
the success in achieving their goals. Unfortunately, for social entrepreneurs, these measures, while indicating their direct impact on the environment, are often misleading as to whether there is a sustainable ‘social impact’. For instance, a social entrepreneur may have developed a way to secure low income housing for the homeless. The local people benefit from this, and soon, there are an increasing number of people who need the housing in the area. This is due to the fact that word gets out that housing is available, so more people enter the region in hopes of getting housing. Therefore the direct impact measurement shows growth in finding homes but the percentage placed out of the total in need decreases. This leads to the third level of measurement, social impact.

*Social impact* is the measurement of outcomes in terms of changes to the social compared to how things would have been had nothing been done (Clark et al. 2003). Herein lies the complexity in measuring social impact. Perhaps social impact may be better measured by direct impact and achievement of goals. But the constituencies that support the cause want to know if they are making a difference. Is there social impact? Therefore, this research is important in sorting out the triple bottom line issues, in particular with respect to social impact. It research is highly relevant to those in policy-making positions who need to know if their funds achieve social impact. Researchers need an organized foundation in order to build their research, and practitioners want to know if they are making a difference.

**Three Dimensions of Social Change**

Unfortunately, the identification of these three levels of performance do not provide any detail on what to measure. The studies often refer to social return on investment but what will yield a lasting social impact? Since social entrepreneurs are agents of change, it seems appropriate to refer to a field of change research that is already well established, the field of
organizational change. Changing a business will not be exactly the same and changing an entire societal environment, but the influence factors and levers for change will be the same. In Kanter, Stein and Jick’s popular book *The Challenge of Organizational Change* (1992), there are three kinds of movement needed in order for organizational change to occur: Motion of the organization or industry at a macro level with respect to its environment, micro-evolutionary change within the organizational processes and change to the political dimensions. These three kinds of motions are similar to Noel Tichy’s three dimensions of organizational change that include Political, Cultural (macro-level) and Technical (micro-level) (Tichy 1983). He refers to a strategic ‘rope’ in which all three areas need to be addressed for the rope to be complete and the change to be effective and permanent. The technical problem entails the fact that the organization, or society needs to rearrange the way things are done in order for change to occur. For instance, if the illiteracy problem for school age children is to be eliminated, the means of teaching them to read needs to change, not just increasing reading time, but the methods used need to differ. The political dimension is also very important and was mentioned in several of the SEV studies (Alvord 2002; Austin et al. 2006; Weerwardena and Mort 2006). For instance, if political structures are protected by the long-standing government officials who put the current systems in place, they will be resistant to adopting a new approach. The cultural dimension points to the long standing values, beliefs and viewpoints that society has adopted over time. In a culture where homelessness is an accepted part of life, it will be difficult to create programs to remove homelessness as no one will want to dedicate their time or money for a problem they do not recognize. These three dimensions for change provide the foundation for creating a holistic set of measurements of SEV performance. Development of measures to track sustainability, social action and social impact across the technical, cultural and political dimensions would
apply across contexts. The scale of the SEV would place more or less emphasis on differing dimensions depending on if their impact is at a local, national or international level. Figure 2 provides examples of the relationships within this two dimensional framework, taken from the research presented above. The illiteracy problem was used for this example.

**Figure 2**

**Framework for SEV Performance Measurement**

- **Technical**
  - Sustainability-Growth, Income
  - Action-Process to improve literacy
  - Impact-ILLiteracy rates drop

- **Political**
  - Sustainability-funding for lobbyists
  - Action-Apperances before Committees
  - Impact-Laws changed to create new opportunities

- **Cultural**
  - Sustainability-Advertising funding to educate the public
  - Action-Forums, school activities, projects
  - Impact-New organizations created as a voice for the cause.

**Conclusions**

This research provides a starting point for organizing SEV performance measurement. The current research on SEV performance has been thoroughly studied and summarized. A comprehensive model for developing SEV performance measures has been proposed. Whether a firm uses anecdotal evidence, break even analysis or social return on investment, the framework is appropriate. In order for social entrepreneurs to develop programs to cure intractable social problems, they must measure their performance in all three categories. They cannot be
successful if they aren’t financially viable. They cannot be effective if they do not measure impact. Impact needs to be assessed in terms of process change (Technical dimension). But the cultural change and political motivations must also be addressed (Cultural and Political dimensions).

**Future Research Directions**

At this point the framework needs to be applied to several different social entrepreneurial ventures. Case studies can be used to fit the performance measures into the model. The comprehensiveness of the measures relative to the success of the venture will help validate the model. This framework provides social entrepreneurs with a means of developing comprehensive measures. It also provides researchers a foundation on which to build theory. It is also useful to educators as they help their students understand the complexities of measuring social venture outcomes. The weakness of the model is the need for case applications to validate the structure and dimension. This is a recommended next step for research in this area.

ABSTRACT

This article fills a need in the entrepreneurship literature by investigating the finances of entrepreneurship centers throughout the world. Three hundred entrepreneurship center directors were surveyed about the various facets of their center’s finances including budgets, fund-raising, contracts, salaries, and seminars/workshops. We received 174 responses for a 59% response rate. The findings go into depth on the specific areas in which centers raise funds for the programs. The results of this research project may be invaluable to entrepreneurship center directors to increase funding for the centers. The study can also serve as a benchmark for financing and fund-raising activities for centers throughout the world.

INTRODUCTION: THE RESURGENCE OF ENTREPRENEURSHIP

The nature of business has been transformed in this fast-paced, highly threatening, and increasingly global environment. With the U.S. suffering from its worst economic downturn since the Great Depression of the 1930’s, companies are realizing that sustainable competitive advantage is fleeting. And yet, in the midst of this economic turmoil, successful companies have made the fundamental discovery that the ability to continually innovate (to engage in an ongoing process of entrepreneurial actions) has become the newest source of competitive advantage (Morris, Kuratko, & Covin, 2008; Kuratko, 2010).

For entrepreneurship educators the revolution has become a reality in universities. Centers of Entrepreneurship are being sought out as the solution to enabling the students to gain greater understanding of entrepreneurship. In addition many centers suffer from
the high expectations of administrators who envision the center having numerous constituencies while providing little or no resource support. This is the state that university-based centers have to deal with all over the world. Faculty and center directors are simply expected to accomplish more with fewer resources. In an atmosphere like this it is imperative that center directors know how to utilize their resources most effectively.

In one of the most comprehensive studies of entrepreneurship centers, Finkle, Kuratko, and Goldsby (2006) stated, “One way that universities can enhance their budgets is through the development of a new entrepreneurship center or expansion of their existing entrepreneurship center. Entrepreneurship centers can be an excellent source of revenue for a university through donations, endowments, external programming, grants, academic programming, and commercialization of technology (pp. 184-185). In this time of reduced budgets and distressed economic times would this idea still hold true? If so what is the makeup of the financial structure of entrepreneurship centers?

With this in mind we undertook a study of entrepreneurship centers throughout the world. The study examines U.S. and international entrepreneurship centers focusing primarily on financial activities. The critical research purpose for the study is to examine what specific financial factors have impacted entrepreneurship centers and to what extent those factors are deemed most important by directors.

**IMPORTANCE OF ENTREPRENEURSHIP CENTERS**

The popularity of entrepreneurship education has been related to the potential for enhancing economic growth through equipping students for venturing or corporate entrepreneurial activities, either on graduation or at a subsequent time in their career (e.g.
Upton, Sexton and Moore, 1995; McMullan and Gillin, 1998; Kolvereid & Moen, 1997; Charney and Lidecap, 2000; Menzies 2004, 2009; Menzies & Paradi, 2002; Kuratko, 2010). University-based entrepreneurship centers have become an important vehicle by which universities provide a range of programs and services that advance entrepreneurship and economic development. Much of the growth of entrepreneurship education and research at universities can be related to the existence of a university-based Entrepreneurship Center (Menzies & Paradi, 2002; Finkle, et. al., 2006).

The foundation of many Entrepreneurship Centers is the offering of entrepreneurship ‘for credit’ and non-credit courses, programs and training in entrepreneurship for students on campus and often for the wider community. Indeed, Mason (2000) in a study of six, mostly Scottish, universities concluded that entrepreneurship courses were best taught if they were associated with a ‘center’ that had a group of professors, support services, and input from local entrepreneurs. The second major activity of many Entrepreneurship Centers located at a university is research. Sandberg and Gatewood (1991) found that most of the centers in their survey were actively engaged in research. Menzies (2009) attributes the existence of the Entrepreneurship Center, to one or more of the following, in relation to university entrepreneurship education and research, for example: initiation, nurturing, operations, championing, marketing, financing. Furthermore an Entrepreneurship Center is often engaged in a variety of additional entrepreneurship-related activities across the university and in the wider community.

Katz (1991), from the US perspective, sees universities and communities being linked by an ‘intermediary’, an entrepreneurship center that will ‘organize, facilitate,
support and direct faculty involvement with small and emerging businesses’ (p.92). The US has an extensive national network of universities (regional catalysts) that have created entrepreneurship centers and embraced entrepreneurship development within their mandate. However, Thierstein and Wilhelm (2001) note in the Swiss context, that there is ‘very little awareness and very little knowledge of these centers’ (p.317), which are aimed at various forms of economic development.

Awareness-raising and assistance at the pre-conceptual and conceptual stage of new venture creation are important ways to promote economic development. These are programs and activities which can be offered by a university Entrepreneurship Center, either for students, faculty and staff, or for people in the wider community. Networking has been shown as a key factor in entrepreneurial success (Donckels & Lambrecht, 1997; Huggins, 2000; Evans & Volery, 2001; Vanhaverbeke, 2001; Adler & Kwon, 2002; Blundel, 2002) and an Entrepreneurship Center can be a primary facilitator of this for a range of constituents. Mentoring programs, often associated with networking, can be a feature of some Entrepreneurship Centers and empirically it has been shown to be a factor in business success (Ragins, Cotton & Miller, 2000).

Activities provided by an Entrepreneurship Center are valuable for nascent entrepreneurs as well as established entrepreneurs (Chrisman & Carsrud, 1991). For example, university-based training and consulting for family business owners is a common and valued part of a center’s entrepreneurship development efforts (Kaplan, George and Rimler, 2000). Incubators, hatcheries, award programs, business plan competitions, training, consulting, facilitating access to funding and assisting with
business plan preparation are just a few examples of how a university-based entrepreneurship center can play a central role in economic development.

Notwithstanding the importance of a university-based Entrepreneurship Center, there are few studies that have taken a strategic focus on the financial structure and challenges associated with carrying out their mission. Given the large number of universities worldwide that are involved in entrepreneurship development, it is surprising that we only have a piecemeal view of what form entrepreneurship centers take and the financial activities in which they engage. It is timely that we learn more about these centers, given the large number that exist and new ones that are continuously being launched.

**STUDIES ON ENTREPRENEURSHIP CENTERS**

There have been numerous studies throughout the years that have focused on various aspects of entrepreneurship education including articles by Solomon, Duffy, and Tarabishy (2002), Brush, Duhaime, Gartner, Stewart, Katz, Hitt, Alvarez, Meyer, and Venkataraman (2003), Katz (2003; 2004), and Menzies and Tatroff (2006). Only a few studies have focused specifically on aspects relating to entrepreneurship centers.

An early study of US entrepreneurship centers, conducted by Sandberg and Gatewood (1991), looked at the focus of the center, the activities they were engaged in and the resources they had accumulated. Their study examined research orientation, budgets size, and constituents for entrepreneurship centers. They found that entrepreneurship centers are diverse and eclectic, however, it is generally accepted that entrepreneurship centers focus on one or more of the following: student teaching, applied
and academic research, training and assistance regarding venturing to on campus constituents and outreach to their local community.

A more comprehensive study of entrepreneurship centers was conducted by Upton (1997) where she performed an in-depth case analysis on entrepreneurship centers. She developed a best practices list for starting, directing, funding, managing, and marketing a center; however, she analyzed only nine centers.

Menzies (2002) studied the strategies and best practices of 19 Canadian entrepreneurship centers and attempted to move from a descriptive approach to a more analytical examination of entrepreneurship centers. Unfortunately, the study does not adopt a theoretical basis but presents a categorization based on the various activities of the 19 centers. For example, centers that focused on nurturing entrepreneurship on campus, or in the outside community (mostly Small Business Development Centers), or on a combination of both missions. In addition, she included case studies of various Canadian entrepreneurship centers, written by the director of each center. The categorization does advance us in terms of recognizing the variations in activities that lead to the various “types” of entrepreneurship center according to their activities. A 2009 study of 26 Canadian Centers by Menzies (2009) replicates the 2002 study but has the similar shortcoming of using only one case study.

Finkle, et. al., (2006) provided the most comprehensive study to date with 146 entrepreneurship centers located in the US and reported results on 94. They surveyed center directors and categorized centers into “nationally ranked” and “unranked centers”. To be nationally ranked it had to have been identified as such in the national media. To be included in the study of entrepreneurship centers by Finkle et al., (2006) it was
necessary that there exist four attributes, as follows: (1) recognition as a center, (2) entrepreneurship curriculum, (3) outreach activities, and (4) entrepreneurship research conducted by faculty, as follows: “a Center for Entrepreneurship (which may use titles such as Free Enterprise, Family Business, or Innovation Center), academic curriculum in entrepreneurship (having three or more for-credit courses aimed at an undergraduate or a graduate degree), external outreach activities, and faculty that perform research in the field of entrepreneurship” (Finkle et al., 2006, p. 186). The results of the study are largely descriptive in nature, however, the study is rigorous, interesting and provides a useful historical benchmarking tool regarding the emergence of these very important organizational units that nurture entrepreneurship on university campuses. Findings include information on the following: characteristics of entrepreneurship centers, number of faculty, including endowed chairs and staff, the type and number of undergraduate and graduate course offerings, including the numbers of students taking the classes, the problems encountered in running the center, detailed information on the directors’ background and demographics, the range of internal and external entrepreneurship development programming, and how the various stakeholders view and measure the overall success of the entrepreneurship center. A noticeable weakness in the study was the lack of information regarding the financial activities of the centers. Other than very general budget figures (many centers had not reported all of their budget figures in this area), there was little information reported in this area.

Other than these few studies there is little knowledge to be gained from the literature regarding entrepreneurship centers. Given the lack of research in this area and the importance of entrepreneurship centers play to a university, we surveyed the entire
sample of entrepreneurship centers in the world. To date this is the largest sample of centers ever examined in the literature.

**THE CURRENT STUDY**

*Methodology*

A list of the centers was formulated through an in-depth search of schools through the Internet, a list of the centers from the Global Consortium of Entrepreneurship Centers, and the Babson College research lists. The sample consists of all entrepreneurship centers (300) located all over the world. We received responses from 174 program directors for a response rate of 58%.

The survey in this study consisted of 50 items and took respondents, on average, about 30 minutes to complete. The survey was developed through the authors and was pre-tested with seven entrepreneurship center directors. Appropriate changes were made based on the comments from the pre-test group.

For this study, we define an entrepreneurship program as having a Center for Entrepreneurship (which may include a Free Enterprise or Family Business Center), if it has academic curriculum in entrepreneurship (having three or more for-credit courses aimed at an undergraduate degree or graduate degree), external outreach activities, and faculty that perform research in the field of entrepreneurship (Finkle, et. al., 2006).

In this study, we break down our sample into three categories: (1) mean for the entire sample, (2) mean for U.S. centers and (3) mean for international centers. We then examined the descriptive statistics for the samples.

**RESULTS/DISCUSSION**

*Table 1: Background & Demographics of Entrepreneurship Directors*
Results of Table 1 indicate that the average center director in the sample was 52 years old and 70% were male. The highest level of education achieved by the directors varied: Ph.D. (62.4%); MBA (24.8%); JD (2.6%); MS (3.2%); MD (.6%); and BS/BA (6.4%). Twenty-three percent of the directors were endowed chairs. Seventy-four percent of the directors were former entrepreneurs with an average of 9.1 years of experience as an entrepreneur.

-----------------------------
Insert Table 1 about here
-----------------------------

Table 2: Characteristics of Centers

The second table shows the characteristics of the entrepreneurship centers in the study. U.S. Centers comprise 70% of our sample. The average age for all of the centers was 10.4 years old. U.S. centers were older (11.4 years) versus international centers (7.9 years).

Eighty seven percent of the centers were located on campus and there were no significant differences between U.S. and international schools. Forty-five percent of the founders were still working at their centers. The average tenure of a founder was 4.8 years. Fifty-one percent of the centers had an associate director. The average size of the college was 3,049 and the average size of the university was 17,869. Out of the entire sample, 68.4% of the schools were public. Forty-three percent of the centers had endowed positions with an average endowment of $2.537 million U.S. Each school had an average of 2.2 endowed positions.
**Table 3: Financial Operations within Centers for Entrepreneurship**

As illustrated in Table 3, the average size of a center’s endowment for the full sample was $3,000,000. The results show that U.S. centers, on average, had $3,519,000 in endowment money versus $1,543,500 from international centers. The average percentage of the centers’ endowment used for operational expenses was 35.8%. The average size of a center’s annual budget was $536,198.

The percentage composition of the budget in order of importance was: (1) University Line items, 26.4%; (2) Grants and Contracts, 21.9%; (3) Endowment, 20.2%; (4) Donations, 14.9%; (5) Outreach Programs, 9.5%, and (6) Other, 7.1%.

The annual operating budget from the University (excluding the Director’s salary and benefits) was $327,190. The annual salary of a director (including summer pay and stipends) was $152,465. There was a significant difference between the average U.S. Director’s salary ($145,948) versus international ($170,957).

The final item in this table examined the percentage of the Director’s annual salary from the University (excluding the Center’s budget). Eighty-seven percent of a Director’s salary comes from the university.

**Table 4: Types of Internal and External Fund-raising Activities at Centers**
Table 4 outlines the various internal and external activities that Centers participate in to raise funds. Overall, the following internal activities are utilized to raise funds (in order of popularity): (1) business plan competitions, (2) student clubs, (3) internships, (4) high tech park/incubator, (5) technology transfer, (6) venture capital fund, (7) distance learning, and (8) journals.

The following external activities are utilized to raise funds (in order of popularity): (1) seminars/workshops, (2) Grants, (3) guest speakers, (4) executive education, (5) entrepreneur of the year program, (6) venture capital fund, (7) incubator, (8) family business program, and (9) FastTrac.

Table 5: Seminar Topics Taught to Raise Funds for Centers (Excluding regular teaching load)

Table 5 outlines the top 10 seminar topics taught by centers to raise funds. Overall, the following seminars topics were taught (in order of popularity): (1) startups, (2) business planning, (3) management, (4) strategic planning, (5) marketing, (6) finance, (7) family business, (8) corporate entrepreneurship, (9) valuations and/or acquisitions, (10) technology transfer.

Table 6: Length and Cost of Each Seminar/Workshop per Participant
Table 6 contains some of the most valuable information from the study. It examines the average length, hourly cost, and overall cost of a seminar. For example, the most profitable seminar for the entire sample focused on international dimensions of entrepreneurship with an average length of 7.68 hours and an average cost of $1,069 or $139 per hour.

When examining the entire sample from an overall cost per seminar basis the following seminars and their respective costs were: corporate entrepreneurship ($1,434), international ($1,069), family business ($866), startups ($624), franchising ($493), management ($488), technology transfer ($465), valuations and/or acquisitions ($444), business planning ($254), strategic planning ($230), accounting ($169), non profits ($168), finance ($167), marketing ($149), and information technology ($47).

When looking at the entire sample from an hourly cost basis the following seminars and their respective costs per hour were: international ($139), corporate entrepreneurship ($130), family business ($85), technology transfer ($80), startups ($67), management ($64), valuations and/or acquisitions ($63), franchising ($62), strategic planning ($32), finance ($23), business planning ($22), marketing ($21), non profits ($21), accounting ($18), and information technology ($6).

When looking at the entire sample based on the average length of time of each seminar topic in hours: startups (13.6), business planning (11.6), corporate entrepreneurship (11), family business (10.1), accounting (9.5), non profits (8.1), franchising (7.9), international (7.7), management (7.6), finance (7.4), information technology (7.3), strategic planning (7.3), marketing (7.2), valuations and/or acquisitions (7.1), technology transfer (5.8).
Table 7: Profitability of Seminars/Workshops

Table 7 outlines the top 15 most profitable seminar topics taught by centers to raise funds. Overall, the most profitable seminar topics were (in order of profitability): (1) corporate entrepreneurship, (2) startups, (3) marketing, (4) valuations and/or acquisitions, (5) finance, (6) business planning, (7) franchising, (8) management, (9) strategic planning, (10) information technology, (11) accounting, (12) technology transfer, (13) family business, (14) international, and (15) non-profits.

Table 8: Factors that Contributed to the Center’s Success in Raising Funds

Table 8 asked directors about what factors contributed to the Center’s success in raising funds. For all of the centers, the top factors that contributed to a Center’s success in raising funds are (in order of importance): (1) programs, (2) students, (3) community entrepreneurs, (4) faculty/staff, (5) alumni, (6) faculty quality, (7) advisory board, (8) administration, (9) marketing, (10) development, (11) conferences, and (12) government.

For U.S. centers, the top five factors that contributed to a Center’s success in raising funds are: (1) students, (2) community entrepreneurs, (3) programs, (4) alumni, and (5) faculty/staff.
For international centers, the top five factors that contributed to a Center’s success in raising funds are: (1) faculty/staff, (2) programs, (3) faculty quality, (4) development, and (5) students.

Table 9: Influx of Substantial Funding to Center

Table 9 asks the directors what they would do if they were to receive an influx of substantial funding to their respective centers.

For all of the centers in the study the top variables that directors would invest in if given a substantial amount of money are (in order of importance): (1) hire staff and/or faculty, (2) programs, (3) operations/capital for center, (4) research support, (5) scholarships for students, (6) outreach, (7) facilities, (8) faculty development, (9) competitions and/or venture capital fund, (10) marketing/growth, and (11) incubator.

For U.S. centers, the top variables that directors would invest in if given a substantial amount of money are: (1) hire staff and/or faculty, (2) programs, (3) operations/capital for center, (4) scholarships for students, and (5) outreach.

For International centers, the top variables that directors would invest in if given a substantial amount of money are: (1) research support, (2) hire staff and/or faculty, (3 tied) outreach and programs, and (5) operations/capital for center.
CONCLUSION & IMPLICATIONS

This purpose of the study was to learn about the finances related to entrepreneurship centers throughout the world. Given the current global economic crisis, this study provides important information for center directors. We collected in-depth data about the finances of these centers and broke down the sample into three categories: the entire sample of entrepreneurship centers, U.S. centers and international centers.

Table 1 examined the background and demographics of entrepreneurship directors (e.g., age, sex, educational background, endowed chair, former entrepreneur, years as an entrepreneur, etc.). The average director had these characteristics: 52 years old and male (79%). The educational characteristics of the directors varied: Ph.D. (62.4%); MBA (24.8%); JD (2.6%); MS (3.2%); MD (.6%); and BS/BA (6.4%). Twenty three percent of the directors were endowed chairs and 74% were former entrepreneurs with an average of 9.1 years of experience as an entrepreneur.

Table 2 shows that the average age of the sample was 10.4 years. There was a significant difference between the age of U.S. (11.4 years) versus international centers (7.9 years). We then examined the location of the centers and found the majority of centers were located on campus (87%). The rest of the centers were located either in an incubator, off campus, or some other location. Forty-five percent of the founders were still working at their centers.

The average tenure of a founder was 4.8 years. Fifty-one percent of the centers had an associate director. The average size of the college and university were 3,049 and 17,869 respectively. Sixty-eight percent of the entire sample was a public school. Forty-
three percent of the centers had endowed positions with an average endowment per position of $2.537 million. Finally, each school had an average of 2.2 endowed positions.

The results of Table 3 show some of the more useful findings of the study. Overall, the average size of a center’s endowment was $3,000,000. U.S. centers, on average, had $3,519,000 in endowment money versus $1,543,500 at international centers. The average percentage of the centers’ endowment used for operational expenses was 35.8%.

The average size of a center’s annual budget was $536,198 (this included the center director’s salary and benefits). The percentage composition of the budget was: University Line Items (26.4%); Grants and Contracts (21.9%); Endowment (20.2%); Donations (14.9%); Outreach Programs (9.5%), and Other (7.1%).

The annual operating budget from the University (excluding the Director’s salary and benefits) was $327,190. The annual salary of a director (including summer pay and stipends) was $152,465. International directors ($170,957) made a significantly larger amount of money than U.S. directors ($145,948). This is an interesting finding and one we cannot justify based on the data of the study. It must also be noted that overall, 87% of a director’s salary came from the University (excluding the Center’s budget).

Table 4 examined the various internal and external activities that Centers participate in to raise funds. The top four internal activities that were utilized to raise funds were: business plan competitions (51%), student clubs (40%), and internships (31%), and high tech park/incubator (25%).

Institutional theory argues that organizations operating in institutionalized environments demonstrate that they are acting in a legitimate manner adopting the
structures and activities that are perceived to be legitimate by their critical external resource providers (Finkle & Deeds, 2001). In essence by adopting the appropriate structures (institutions) the organization increases its legitimacy and is able to use this legitimacy to increase its support and ensure its survival (Dowling & Pfeffer, 1975; Finkle & Deeds, 2001; Meyer & Rowan, 1977). Accordingly, through the various internal activities, centers become more institutionalized, which assists with the legitimacy of the center. As a result centers get more stakeholder buy in and want to become part of the organization.

For example, business plan competitions have gained significant traction over the past decade. From their initial beginnings at schools like the University of Texas’ Moot Corp, they are being used to educate students through experiential learning. They also can be used to generate revenue for a center through donations, grants, and sponsorships from a variety of organizations. These competitions usually generate interest from a variety of students, faculty, administrators, government, and industry. They also help to increase the legitimacy of entrepreneurship centers. Placements at regional, national, and international competitions can assist in the legitimacy of centers. The same can be said about student organizations like Students in Free Enterprise (SIFE) and Collegiate Entrepreneurs’ (CEO), internships, and high tech park/incubator.

In our study we see that centers garnered resources outside their organizations through the top four external (outreach) activities: seminars/workshops (56%), grants (55%), guest speakers (44%), and executive education (41%). The next few tables will evaluate the types of seminars/workshops that centers participate in for funding.
Tables 5-7 are interrelated. Table 5 examines the most popular seminar topics taught by centers. Table 6 looks at the length and cost of each seminar per participant and Table 7 looks at the overall profitability of the different types of seminars.

According to Table 5 the top 10 seminar topics taught by centers to raise funds were (in order of popularity): (1) startups, (2) business planning, (3) management, (4) strategic planning, (5) marketing, (6) finance, (7) family business, (8) corporate entrepreneurship, (9) valuations and/or acquisitions, (10) technology transfer.

Table 6 indicates that the most profitable seminar for the entire sample focused on international with an average length of 7.68 hours and an average cost of $1,069 or $139 per hour. Other seminars, their respective costs, and average hours per seminar were: corporate entrepreneurship ($1434/11 hours), international ($1069/7.7 hours), family business ($866/10.1 hours), startups ($624/13.6 hours), franchising ($493/7.9 hours), management ($488/7.6 hours), technology transfer ($465/5.8 hours), valuations and/or acquisitions ($444/7.1 hours), business planning ($254/11.6 hours), strategic planning ($230/7.3 hours), accounting ($169/9.5 hours), non profits ($168/8 hours), finance ($167/7.4 hours), marketing ($149/7.2 hours), and information technology ($47/7.3 hours).

When looking at the entire sample from an hourly cost basis the following seminars and their respective costs per hour were: international ($139), corporate entrepreneurship ($130), family business ($85), technology transfer ($80), startups ($67), management ($64), valuations and/or acquisitions ($63), franchising ($62), strategic planning ($32), finance ($23), business planning ($22), marketing ($21), non profits ($21), accounting ($18), and information technology ($6).
Table 7 outlines the top 15 most profitable seminar topics taught by centers to raise funds. Overall, the most profitable seminar topics were (in order of profitability): (1) corporate entrepreneurship, (2) startups, (3) marketing, (4) valuations and/or acquisitions, (5) finance, (6) business planning, (7) franchising, (8) management, (9) strategic planning, (10) information technology, (11) accounting, (12) technology transfer, (13) family business, (14) international, and (15) non-profits. It is not surprising that corporate entrepreneurship is the most profitable seminar as we would assume that companies have the resources to pay for this.

Table 8 asked directors about what factors contributed to the Center’s success in raising funds. The top five factors that contributed to a Center’s success in raising funds were (in order of importance): programs, students, community entrepreneurs, faculty/staff, and alumni. For U.S. centers, the top five factors that contributed to a Center’s success in raising funds were: (1) students, (2) community entrepreneurs, (3) programs, (4) alumni, and (5) faculty/staff. For international centers, the top five factors that contributed to a Center’s success in raising funds are: (1) faculty/staff, (2) programs, (3) faculty quality, (4) development, and (5) students.

Table 9 shows the areas in which the directors would direct new funds if they were given an influx of substantial funding to their centers. Overall, the area that the centers would put their new funds towards was the hiring of faculty and/or staff. This is consistent with our previous studies (Finkle & Deeds, 2001; Finkle, et. al., 2006) which found that one of the biggest problems facing centers was finding qualified faculty. Other top areas that directors would devote funds to were: operations/capital for center, research support, and scholarships for students. Given the nature of today’s economic
environment and the decrease in school’s budgets, it is not surprising to learn that funds would be directed towards operations/capital for centers.

The paper gives an overview of the finances of entrepreneurship centers. This study supports the notion of resource dependency theory where firms scan the environment to extract resources to enhance the firm's legitimacy in society and to help it achieve its goals of efficiency and improved performance (Finkle, 1998; Pfeffer 1972, 1973; Price, 1963; Provan, 1980; Zald, 1967). Resource dependence theory proposes that an organization’s survival is contingent on its ability to gain control over critical environmental resources (Finkle, 1998).

**FUTURE RESEARCH**

A stream of potential research in this area should focus on the development of a best practices model based on the finances of entrepreneurship centers. The ideal model related to the finances of an entrepreneurship center is needed. Regression models can be run to determine centers that are able to raise more funds than others. Qualitative studies could be done to determine what actions are done by center directors to raise funds from various stakeholder entities.

**ASSESSING THE FINANCES OF CENTERS FOR ENTREPRENEURSHIP**

The purpose of this survey is to enhance entrepreneurship education throughout the world. From this and other surveys, a data bank will be established enabling Directors of Centers for Entrepreneurship to compare their financial practices with other Centers and to see the impact of their practices on success.

**NOTE: All of your responses are strictly confidential;** individual responses will not be seen by anyone within your organization, other schools, or entities. We will strictly prohibit the access of this data by unauthorized individuals or organizations. If you have any questions, please call Dr. Todd A. Finkle at finklet@uakron.edu, Dr. Donald F. Kuratko dkuratko@indiana.edu, Dr. Michael Goldsby mgoldsby@bsu.edu or Dr. Teresa V. Menzies tmenzies@brocku.ca.

WE APPRECIATE YOUR PARTICIPATION!!

- $600,001-700,000
- $700,001-800,000

Other (Please specify) _________________________________________

33. What is your annual salary (including summer pay and stipends)?

- $0-$24,999
- $25,000-50,000
- $50,001-75,000
- $75,001-100,000
- $100,001-125,000
- $125,001-150,000
- $150,001-175,000
- $175,001-200,000
- $200,001-250,000
- $250,001-300,000

Other (Please specify) _________________________________________

34. What percentage of your annual salary comes from the University (excluding the Center’s budget)?

- 0-10%
- 11-20%
- 21-30%
- 31-40%
- 41-50%
- 51-60%
- 61-70%
- 71-80%
- 81-90%
- 91-100%

Other (Please specify) _________________________________________

35. What percentage of your salary comes from the Center’s budget?

- 0-10%
- 11-20%
- 21-30%
- 31-40%
- 41-50%
- 51-60%
- 61-70%
- 71-80%
- 81-90%
- 91-100%

Other (Please specify) _________________________________________

36. What perks (e.g., expense account, travel allowances, etc.) do you receive for being the Director of your Center? (Please specify)

37. What is your teaching load during a nine month academic year (if your school is on a trimester system, please insert the number of courses you teach per session into the Other box; e.g., in Canada they typically teach three terms; Fall, Winter, and Spring/Summer so insert 2/2/1)?

- 0/1
- 2/1
- 3/1
- 4/1

I don’t teach

Other_____________________________________________________

38. Do you teach over the summer? If so, how many courses do you teach?

39. What are the 2007 rankings of your program? (Leave blank if you are not ranked)

- U.S. News and World Report
- Business Week
- Entrepreneur

40. What honors has your program received?
41. Have you ever been an entrepreneur of a startup? YES __ NO__

42. If so, how many businesses and for how many years did you operate each business?

43. What is your rank and title?

44. Is your position an endowed chair? YES __ NO__

45. What is your educational background (Highest level achieved)?
   Ph.D. __ MBA __ EdD __ JD __ MD __ BS __ BA __ High School __ Other ____

46. What is your age? ____

47. Male or Female (Circle One)

SME Performance: The Role of Learning Orientation and Its Relationship to Market Orientation and Entrepreneurial Orientation

ABSTRACT: This paper examines the role that a learning orientation plays with respect to entrepreneurial orientation, market orientation, and, ultimately, the performance of SMEs. The theoretical underpinnings for each of these constructs is discussed and integrated to form hypotheses about the relationships to be found in small firms. The hypotheses are tested on a sample of SME manufacturing firms. Results confirm many of the hypothesized relationships.

Keywords: SME Performance, Entrepreneurial Orientation, Market Orientation, Learning Orientation.
TOPIC AND RESEARCH QUESTION

Organization learning has long been an important topic of interest to organizational researchers (Hedberg 1981; Nonaka 1994; Cohen & Levinthal 1990). The premise underlying an organization learning capability is that it facilitates flexibility, opportunities for growth, and overall better performance in those firms that possess such a capability. Simply stated, a learning capability is thought to facilitate organizational adaptation in the face of negative and positive exogenous forces. This paper reasons that the ability to learn may be particularly important to small and medium-sized enterprises (SMEs) in their quest for survival and growth in the face of an environment that can be particularly hostile to smaller firms. From this overarching logic is derived the central research question for the paper: What internal dynamic is at work in the SME learning process that can lead to growth and higher levels of performance?

To address the research question the paper builds on the work of previous research that examined the market orientation (MO) construct (Jaworski, Kohli & Kumar 1993), the entrepreneurial orientation (EO) construct (Covin & Slevin 1986), and the relationship between MO, EO and SME performance (e.g., Baker & Sinkula 2009). These underlying constructs, MO and EO, can be viewed as action oriented dimensions of SME behavior each of which embody important manifestations of learning. Market Orientation is comprised of the actions that firms take with respect to understanding their customers; customer’s needs; and taking the appropriate actions in response. Entrepreneurial orientation is comprised of risk taking, innovativeness, and pro-activeness of the firm. Each of the constructs (MO and EO) in their operationalization demonstrates a proclivity for action. Action in an organizational setting is argued to be the result of an internal organizational dynamic that drives action as a result of information gathering, processing and knowledge creation regarding the actions to be taken. Thus, an antecedent
construct or constructs are likely present that ‘sets the stage’ for the requisite efforts, decisions, and actions implied by the notion of MO and EO.

The paper proposes that the notion of a learning orientation (LO) (Sinkula, Baker & Noordewier 1997) is an antecedent construct important in the organizational learning process and creates the necessary internal organizational environment for MO and EO to be effective influencers of SME performance. As proposed by Sinkula, et al. (1997) LO is a set of values exhibited by the organization that demonstrates whether or not the organization is likely to develop a learning culture. Absent a learning culture it is axiomatic that organization learning will likely be dramatically reduced if not missing entirely.

The purpose of the paper is to explore and empirically test the general notion that firm values when coupled with appropriate behaviors can lead to enhanced performance. Specifically we examine in the following sections the relationship between LO, MO, EO and the growth of small firms. A contribution that this research makes is to link theoretically and to test empirically the relationship between three constructs discussed above that have yet to be linked. In so doing we shed light on one mechanism for how organization values (i.e. learning) coupled with entrepreneurial behaviors and customer directed behaviors may contribute to organizational growth performance.

A second important contribution our research makes is to argue for clarity at the meta-construct level to more accurately specify theoretical relationships that model important organizational processes. We argue that significant confusion exists in the literature with respect to the term ‘orientation.’ As we show, some ‘orientations’ in the literature are philosophical and values-based constructs and some ‘orientations’ are behavioral and action-based constructs. We
present a general model that illustrates the intervening role of the behavioral meta-construct between organizational values and organizational performance.

The paper is organized as follows. We begin with a presentation of the values-behavior-performance arguments and explication of the confusion with respect to the term ‘orientation’. Next we discuss the theory underlying the constructs used in this paper. From the theoretical underpinning we present arguments for the hypothesized relationships between the constructs of interest. Following the hypotheses we present a discussion of our empirical methodology, the operational measures of the constructs, and the statistical analysis used to test the hypothesized relationships. We then provide the results of our analysis, a discussion of our interpretation of the results, and a discussion of the limitations of the research. Last we provide concluding remarks that address the implications and the directions for future research.

BACKGROUND

The term ‘orientation’ as it is employed in the organizational research literature is a common descriptor with an imprecise connotation. The American Heritage Dictionary (2007) defines orientation as “the act of orienting or the state of being oriented” (emphasis added). To ‘act’ is the process of doing while ‘state’ is condition with respect to attributes. In organizational research numerous constructs are articulated as orientation. Examples are ‘market’ orientation (Kohli & Jaworski, 1990), ‘role’ orientation (Parker, 2007), ‘motivation’ orientation (Schei & Rognes, 2005), ‘external’ orientation (Zhang, MacPherson, & Jones, 2006) and the constructs we examine in this study ‘learning’ orientation (Sinkula, et al., 1997) and ‘entrepreneurial’ orientation (Miller, 1983; Covin & Slevin, 1986). From each orientation label one cannot determine whether it is an action or a state construct. Absent a careful, clear, and consistent
articulation of a construct based on its original conceptualization, empirical tests and analyses can yield spurious or confusing results which muddy rather than clarify our understanding.

Two situations illustrate the issues that arise when logical inconsistencies occur in research. The first situation develops when researchers operationalize and measure theoretical constructs with dimensions that confuse or mix the action or state notion of an orientation construct. As it was originally conceptualized by Sinkula, et al. (1997) learning orientation (LO) is a set of values:

“Central to the organization’s learning orientation is the fundamental value it holds toward learning. This value influences whether an organization is likely to develop a learning culture.” (p. 309)

As such, values and culture represent a condition of being, therefore LO is a state construct as originally conceptualized.

In a recent study that examined the relationship between LO, firm innovation and performance Calantone, Cavusgil and Zhao (2002) operationalized LO as commitment to learning, shared vision, and open-mindedness as originally conceived by Sinkula, et al. (1997). However, also included in the operationalization of LO was ‘intra-organizational knowledge sharing’ defined as “. . . behavioral routines related to the spread of learning among different units within an organization” (Calantone, et al., 2002: 517). Clearly the added measure is a behavioral action dimension that is inconsistent with the original state LO construct, thus empirically derived results may be questioned based on logical inconsistency.
The second situation (more fully developed in the sections that follow) is where the relationship between ‘orientations’ are examined with respect to a dependent variable. Though researchers have examined the LO → Performance relationship (e.g. Baker & Sinkula 1999; Farrel & Oczkowski, 2002), this examination is akin to attitude → consequence research without examining the intermediate behavioral action variable. In other words attitudes do not by themselves lead to consequences. It is only when attitudes lead to behavior that consequences result. Similarly, an organizational state does not lead to performance in the absence of organizational action shaped by organizational state. We propose the generalized conceptual model that is illustrated in Figure 1. In this model we argue for the logic that organizational values influence organizational actions which, in turn, yield organizational outcomes.

**THEORY AND HYPOTHESIS DEVELOPMENT**

**Learning Orientation**

Organizational scholars have devoted significant attention to the topic of learning at the organization level during the last three decades. Since the seminal work of Argyris and Shön (1978) research into organizational learning has grown exponentially with many significant contributions occurring in the latter half of this period. One of the key beliefs driving this interest is the importance that learning has to a firm’s adaptability in dynamic environmental or competitive conditions (Moingeon & Edmundson, 1996). “Organizational learning occurs when members of the organization act as learning agents for the organization, responding to changes in the internal and external environments of the organization by detecting and correcting errors in organizational theory in use, and embedding the results of their inquiry in private images and shared maps of the organization” (Argyris & Shön 1978: 23). A central issue in studies of
organization learning is the achievement of different understandings, interpretations and insights with respect to the organization or its environment (Daft & Weick 1984).

The ability of a firm to interpret situations differently, recognize counter-intuitive patterns, and arrive at non-obvious conclusions is recognized as double-loop organizational learning (Lei, Hitt & Bettis, 1996). Alvarez and Busenitz (2001) argue that, in the context of resource-based theory, double-loop heuristic-based learning is much more likely to allow a firm to create or recognize valuable, rare, difficult to imitate and exploitable ideas faster and more effectively which may yield superior performance. Therefore the notion that organization learning—as a broadly construed construct—can yield performance improvements is logically appealing and is an important element with respect to understanding organizational function.

Conceptually, organizational learning is a meta-construct that is comprised of three constituent elements: a pre-disposition to learn; learning facilitation; and exploitation of learning through organizational adaptation (Sinkula et al., 1997). A pre-disposition to learn at the organization level is expressed by the philosophy-in-use and culture regarding learning. Sinkula et al. (1997) articulated this predisposition as a values-based cultural construct and termed it a ‘learning orientation’ (LO). The second element, learning facilitation, is captured by the ability of an organization to recognize, assimilate, and apply new information and knowledge. Cohen and Levinthal (1990) coined the phrase ‘absorptive capacity’ to represent this organizational ability. The third element of organization learning captures the notion that learning results in some changed perception or an insight not previously identified that yields a changed pattern of action by a part or the whole of an organization. The issue of exploitation cannot be captured by one construct due to myriad actions that may be undertaken under the auspices of learning.
We deconstruct the notion of organizational learning to distinguish LO as a focal construct in our research. Organization-level learning begins with the commonly held firm values of open-mindedness and commitment to learning that Sinkula, et al. (1997) articulated as the elements of LO. Open-mindedness is a precondition to the learning process because firms must be willing to question routines and assumptions that comprise the mental models (Senge, 1990) which drive thought and action. The willingness to question deeply held assumptions and beliefs may facilitate heuristics and non-routine mechanisms to divine insights and counter-intuitive patterns that solve ambiguous challenges, i.e., double-loop learning (Lei, Hitt, & Bettis, 1996).

Concomitant with open-mindedness is the value that the collective of individuals comprising a firm places on learning, in other words a commitment to learning (Sinkula, et al., 1997). Just as firms are not homogeneous with respect to structural organization they are likely to have very different views with respect to learning. Morgan (1986) conceptualized the culture dimension as a continuum anchored by hierarchical mechanistic organizations on one end and heterarchical network organizations at the other. The cultural values with respect to learning in a machine organization are likely much weaker than in the more organic network organization. Absent the values that reflect a commitment to learning, learning and adaptation is not likely. Hence, LO, at minimum, requires the elements of open-mindedness and a commitment to learning as a precursor for organizational learning and ultimately successful adaptation.

**Entrepreneurial Orientation**

The fundamental proposition that underpins entrepreneurial orientation (EO) as a significant theoretical construct is that entrepreneurial firms behave in ways different from other
types of firms. Within the field of entrepreneurship and, to a somewhat lesser extent, strategic management research entrepreneurial orientation (EO) has come to be an important construct in the study of entrepreneurial firms or corporate entrepreneurship. Miller’s (1983) conceptualization of EO was operationalized (Covin & Slevin, 1989), refined and developed (Lumpkin & Dess, 1996) and has a substantial literature taking shape around the construct (e.g., Covin & Slevin, 1991; Covin, Green, & Slevin, 2006; Lumpkin & Dess, 1996; Richard, Barnett, Dwyer & Chadwick, 2004). The dimensions most closely associated with the EO construct—those at the heart of Miller’s (1983) original conceptualization of the notion of entrepreneurial firms—are risk taking, innovativeness, and being proactive.

**Risk Taking.** Entrepreneurs are generally regarded as risk takers in terms of their decision-making and business activities. Brockhaus (1980) described entrepreneurs as willing to take calculated business risks that non-entrepreneurs viewed as higher risk. Later research on risk taking proposes that entrepreneurs view certain business situations more optimistically and with more confidence than do non-entrepreneurs (Palich & Bagby, 1995; Busenitz, 1999) leading to the contention that entrepreneurs may view risk differently than non-entrepreneurs. However, consistent with Miller (1983) and Covin and Slevin (1989), firm-level entrepreneurial characteristics are exhibited by a pioneering pattern of decision making under uncertainty reflective of risk at a level greater than that exhibited by a conservative, follower pattern.

**Innovativeness.** A fundamental element of entrepreneurship is innovation which is captured in the form of creating new products or processes (Covin & Miles, 1999; Schumpeter, 1934). Lumpkin and Dess (2001) define entrepreneurial innovation as “... creativity and experimentation in introducing new products/services, and novelty, technological leadership and
R&D in developing new processes” (p.431). With respect to corporate entrepreneurship, Covin and Miles (1999) argue that innovation is central without which the notion does not exist. Hence, to be entrepreneurial or exhibit an EO firms must exhibit behavioral actions that are exemplars of innovation irrespective the presence of other dimensions of entrepreneurial behavior.

**Proactiveness.** Being proactive implies behaviors that can be interpreted as taking the lead vis-a-vis competitors and perceived business opportunities. Covin and Slevin (1989) related proactiveness to aggressive action toward competitors when trying to gain or maintain competitive advantage. They compared this stance to that of a passive and reactive approach that might be taken by a more conservative firm. In a similar way Lumpkin and Dess (2001) articulated that proactiveness exhibits characteristics of leadership in the market place working to influence the task environment. Venkatraman (1989) defined proactiveness as opportunity seeking related or not to existing business activity, new product or brand introductions before competitors, and strategic discontinuance of operations in the face of declining markets. Entrepreneurs act ahead of non-entrepreneurs and entrepreneurial firms are similarly proactive.

Though there is significant agreement in the literature about the dimensions of EO—innovativeness, risk-taking, and proactiveness—there is some confusion about the nature of EO. From the descriptive and definitional work drawn upon since Miller’s (1983) seminal work in the area, the EO construct seems to be firmly rooted in behavioral action. However, Lumpkin and Dess (2001) introduce equivocation with respect to state or action in language used to articulate the dimensions of EO. Specifically, “Innovativeness refers to a willingness . . . Risk-Taking means a tendency . . . [and] Proactiveness is . . . perspective” (Lumpkin & Dess, 2001: 431). The
terms used in the descriptive cited above indicate a state of being reflective of the values of the organization. Yet “An EO refers to the processes, practices, and decision-making activities that lead to new entry” (Lumpkin & Dess, 1996: 136) seems to clearly articulate an action construct.

We adopt the notion that EO is a behavioral action construct in this paper. Miller’s (1983) seminal work on EO proposed that specific firm-level behaviors captured the essence of entrepreneurship within established firms. Extending and building on Miller’s work, Jeff Covin and Dennis Slevin (Covin & Slevin 1986; 1989; 1991) developed and refined a survey scale with which to measure a firm’s EO. The Covin and Slevin scale has been used by researchers to examine EO in the context of a varied set of firm-level objectives. A recurring theme is EO’s relationship to various dimensions of firm performance (Lee, Lee & Pennings 2001; Wiklund 1999; Zahra & Covin 1995). The expectation of a positive link between EO and performance derives primarily from the recognition that globalization, technological change, shortened product life-cycles and competitive dynamics have driven firms to be more creative and entrepreneurial in their approach to markets (Ireland & Hitt, 1999). Therefore, firms that undertake the actions represented by EO may be able to negotiate environmental dynamics more successfully which should yield higher levels of firm performance.

**Market Orientation**

Narver and Slater (1990) specify that MO is the ability of an organization to produce “the behaviors for the creation of superior value for buyers and, thus, superior performance for the business” (p.21). Further they articulate three behavioral elements with respect to MO: 1) customer orientation; 2) competitor orientation; and 3) inter-functional coordination.
**Customer Orientation.** The underlying premise to this dimension is that firms demonstrating MO have a depth of knowledge and understanding for their customers such that the firm can generate superior value for customers. As Narver and Slater state, “A seller must understand not only the cost and revenue dynamics of its immediate target buyer firms, but also the cost and revenue dynamics facing the buyers' buyers, from whose demand the demand in the immediate market is derived” (1990; p.21). Such knowledge and understanding down the value chain derives from organizational practices and behaviors that are deeply ingrained with the purpose of gathering and processing information continuously.

**Competitor Orientation.** Similar to the customer orientation dimension, competitor orientation is comprised of the behaviors related to gaining and acting on a complete understanding of current and future competitor’s long-term capabilities and strategic direction. Included is an understanding about how current and future competitors will or might be capable of satisfying their customer’s needs. Implied in this dimension is the need for actions designed and executed to create significant insight within the firm.

**Inter-functional Coordination.** This element is defined by Narver and Slater as “the coordinated utilization of company resources in creating superior value for target customers” (1990: p. 21). Perhaps the most complex element of the three behavioral elements of MO, coordination occurs at the level of the business organization and is a function of how well the functional areas of the business work together to create value for the firm’s downstream customers. Firms, large and small, are bundles of human, intellectual, and financial capital resources. How much value the firm creates is dependent upon the repertoire of skills and
knowhow with respect to how well the firm is able to coordinate its activities efficiently and effectively across the internal value chain of activities.

**Growth**

A fundamental dependent variable in strategic management research is some dimension of firm performance. Of particular importance to businesses may be the firm-growth dimension. Management often articulates the desirability of growth as an important organizational goal. Firm growth has been associated with the ability to better withstand environmental shocks (Hannan & Freeman, 1984) and is a core element underlying the resource-based view of the firm (Barney, 1991) where theorists propose that resource endowments are the crux of a firm’s ability to grow (Penrose, 1959). Thus, firm growth is an important dependent variable in the study of organizations.

Growth may be particularly desirable for small firms. What Stinchcombe (1965) termed a “liability of newness” Freeman, Carroll, and Hannan (1983) concluded was also comprised of a “liability of smallness.” Bruderl and Schussler (1990) propose and test the notion that it is not newness that is the liability but that it is a liability of adolescence supported by the logic that new business organizations possess a stock of resources that will sustain them through the startup phase and into the adolescent phase where the stock of resources may begin to run out. This notion is essentially an expansion of the liability of smallness notion in that the ability of a firm to sustain itself will cease if it cannot successfully generate the resource flows necessary. Hence small firms may need growth simply as a mechanism for survival.
Hypotheses

Given the globalization of markets, the pace of technological change (Ireland & Hitt 1999) and other exogenous environmental changes that inevitably challenge small firms, a coping mechanism is to gather information, analyze information and learn what decision avenues or opportunities may be open to them. The process of information gathering, analysis and gaining insight into dynamic conditions is organization learning (Fiol & Lyles, 1985). Therefore a key process in the successful strategic management for any firm may be its ability to learn. Learning may provide the means by which small firms successfully negotiate difficult environments and overcome liabilities of newness (Stinchcombe 1965), smallness (Freeman, et al. 1983), or adolescence (Bruderl & Schussler 1990).

Implicit in Narver and Slater’s (1990) content specification of MO is the notion of learning. In their discussion of customer orientation and competitor orientation is the idea of understanding. To understand complex and dynamic entities such as customers and competitors with respect to current and future needs and actions requires the firm to have a proclivity for information gathering, processing and interpretation—essentially a culture for learning. Firms that value learning are much more likely to enact the behaviors that comprise MO.

Similarly, entrepreneurship researchers propose that learning in various manifestations is an important element in the opportunity recognition process (e.g., Dutta & Crossan 2005; Lumpkin & Lichtenstein 2005) by entrepreneurs and entrepreneurial firms. Recognized opportunities provide options for strategic renewal or new product/new venture efforts (Lumpkin & Lichtenstein 2005), both of which may provide a firm the path to enhanced performance. The parallel between strategic management and entrepreneurship is the idea that opportunity provides
the avenue for a firm to grow and prosper. Firms with an orientation or the values present to
learn may be better able to successfully establish performance enhancement mechanisms (Baker
& Sinkula, 1999).

**Hypothesis 1:**  *Learning orientation is positively related to SME performance.*

To the extent that an EO allows SME firms to be more efficient in their activities, cater to
customer needs in superior ways, or be faster to market than competitors, firms may be able to
create competitive advantage and hence superior performance (Covin, et al., 2006). Given the
relative consistency in empirical support from other research studies that examine the
EO/performance relationship (e.g., Covin & Slevin, 1989; Wiklund & Shepard, 2003) we
anticipate a direct effects relationship between the EO construct and small firm growth.

**Hypothesis 2A:**  *Entrepreneurial Orientation is positively related to SME performance.*

The relationship between MO and performance has been the subject of much empirical
research in larger firms (Narver & Slater 1990), SMEs (Kara, Spillan, & DeShields 2005) and
Chinese SMEs (Li, Zhao, Tan & Liu 2008). The idea that firms with higher reported levels of
the MO construct demonstrate greater levels of performance is generally supported in the
literature. This outcome should not be surprising given that MO effectively measures how well
firm understands its customers, its competitors, and how well it coordinates its value creating
activities throughout the firm to (more effectively than competitors) meet its customers’ needs.

**Hypothesis 2B:**  *Market Orientation is positively related to SME performance.*

While there is logical and empirical support for the presence of a positive main-effects
relationship between both MO and EO with firm performance, there is also logical and empirical
support for a significant positive interaction effect between MO and EO on SME performance. As shown by Li, et al. (2008) in their study of transition economy SMEs there was a significant positive interaction effect between MO and two of the three dimensions of the EO construct (proactiveness and innovativeness). Interestingly the risk-taking dimension was positive but not significant. This outcome may be an artifact of the stage of development in the Chinese economy from which the sample was drawn (Li, et al. 2008). Irrespective of the outcomes reported by Li, et al., the notion that MO and EO may be complementary constructs that have a multiplier effect with respect to SME performance has logical and intuitive appeal and, thus, should be examined across a spectrum of SME conditions.

The complementary nature of MO and EO can be illustrated by the following discussion. The component dimensions of MO combine create within a firm the necessary knowledge to understand deeply customers, competitors, and how to effectively combine the internal organization to maximize value creation (Narver & Slater 1990). As previous research points out (Bhuian, Menguc & Bell 2005; Li, et al. 2009) this is a necessary condition for higher performance levels in firms but it may be insufficient for the highest levels of performance. Absent behaviors that provide a firm the capability to recognize opportunities and act on perceived opportunities performance improvement may be limited.

Conversely, past research has shown that the presence of EO in firms is positively related to performance (Covin & Slevin, 1989). However, while EO may signify that a firm has the knowledge base to recognize opportunities and the willingness to act on perceived opportunities, in the absence of a deep customer understanding, knowledge of their current and future needs and how to marshal organizational resources to satisfy needs, the full performance benefits from
EO may be attenuated. Hence, there is likely to be a mutually reinforcing positive relationship between MO and EO with respect to SME performance.

**Hypothesis 3:** Market Orientation and Entrepreneurial Orientation interact (moderate each other) such that higher levels of each yield a significantly positive relationship to SME performance.

To this point we have discussed the main effects relationship of LO, EO, and MO with performance and the interaction effects between EO and MO. In addition to these relationships there is a logical link that exists between the cultural values present in a firm, the actions taken by the firm and the resultant organizational outcomes realized by the firm. Specifically there is a relationship between LO (values), EO and MO (actions), and the performance (outcomes) of SMEs.

Learning is a process (Crossan, Lane and White, 1999). Knowledge, the desired result of the learning process, is that which facilitates innovation or the solution to problems (Nonaka, 1994). Crossan, Lane and White (1999) propose the 4I framework for organization learning—intuiting, interpreting, integrating and institutionalizing. The last two of these activity components can be argued to comprise the conversion of learning to knowledge. Integrating and institutionalization (the third and fourth I respectively) represent the transition from learning to organizational knowledge. Given these arguments we propose that the presence of a LO within the firm will yield more usable knowledge with which the firm can innovate or generate marketplace solutions to problems. However, LO represents a set of specific values that may guide the firm in what it does (Sinkula, et al., 1997).
Lumpkin and Dess (1996) state that “EO refers to the processes, practices and decision-making activities” exhibited by a firm (p. 136). Consistent with this reasoning is the argument that EO represents the actions that may be shaped by the values of the firm. An EO is an organization-wide predisposition to act in a way that reflects innovation, risk-taking, and pro-actions regarding how a firm operates (Lumpkin & Dess, 1996). A firm with an EO must learn to be able to innovate and act ahead of competitors. Therefore a firm’s LO is antecedent to an EO and may shape the actions that firms take. In other words there are indirect effects of the LO/performance relationship such that EO will mediate the effects of LO on the performance of the firm.

With respect to MO “[c]ustomer orientation and competitor orientation include all of the activities involved in acquiring information about the buyers and competitors in the target market and disseminating it throughout the business(es)” (Narver & Slater 1990: p. 21). Similar to the EO discussion above MO requires an organization-wide predisposition to act in a manner consistent with the elements that comprise the MO construct. Hence there is likely to be present in a firm that exhibits a strong MO the values that shape the culture or climate to acquire information, disseminate information, process information into knowledge, and use that knowledge to coordinate an organization-wide response to create value for customers. LO is antecedent to MO and shapes the actions taken by the firm to yield outcomes (performance) realized by the firm. Reinforcing these arguments is the premise that organizational values work through other factors (attitudes, climate, and task organization) to impact organizational performance (Marcouilides & Heck 1993).
**Hypothesis 4:** High levels of Market Orientation and high levels of Entrepreneurial Orientation will mediate the effects of Learning Orientation on SME performance.

Lastly we examine the differences between low and high performing SMEs. The constructs examined here and in previous research (e.g, Baker & Sinkula 1999; Covin & Slevin 1989; Narver & Slater 1990) are purported to be significant contributors to firm performance in many different contexts. According to Barney (1991) valuable, rare, hard to imitate, and non-substitutable resources are likely the source of competitive advantage. Each of the constructs examined in this research can be viewed as resources that meet the criteria for being the source of superior performance. Hence lower performing SMEs should exhibit lower levels of each of these resources than will high performing SMEs.

**Hypothesis 5:** There will be significant lower values for Learning Orientation, Entrepreneurial Orientation, and Market Orientation for low performing SMEs than are present in High Performing SMEs.

The hypotheses stated above are a specification of the relationships among the constructs we examine in this study. Figure 1 illustrates the proposed hypotheses that we have formulated in a path diagram that shows the dimensions of each construct and the various paths of influence the hypotheses represent.

------------------------------------
METHODOLOGY

The study uses a survey method approach for data gathering to test the above proposed relationships. A sample of 700 randomly selected small- and medium-sized firms were identified from a mid-western state. The sample represented a broad cross-section of SMEs from a wide array of industries. A cover letter soliciting a response to an enclosed questionnaire was addressed to the owner, CEO or president from each firm in the sample. A total of 138 key-informants responded to the survey, while 117 provided complete information for a 17% response rate. The approach and response rate is consistent with similar studies that survey top management (Hambrick, Geletkanyecz, and Fredrickson, 1993).

Measurement

Performance. Small- and medium-sized private firms are often reluctant to provide specific information regarding performance. Because of the sensitive nature of the performance construct and following prior research (e.g. Chandler and Hanks 1994) in this area, we employed a categorical approach to assess firm performance. We asked respondents to answer three questions concerning their firm’s performance when compared to similar firms in their industry. Each item used a five-point Likert scale format ranging from 1 ‘lowest 20 percent’ to a 5 representing the ‘highest 20 percent’ which was used as a measure of relative performance levels. The questions asked respondents to compare their firm to the industry for growth in sales during the past three years, growth in assets over the last three years, and growth in number of employees during the last three years. This construct was labeled “growth” and deemed it a
valid measure because of the single factor loading from a confirmatory factor analysis and because of the high coefficient alpha ($\alpha = .82$).

**Entrepreneurial Orientation.** Entrepreneurial orientation was measured using a modified version from Covin and Slevin (1991) and based on prior works of Miller (1983) and Covin and Slevin (1989). The construct was measured by asking respondents twelve (12) questions relating to each dimension - proactiveness, innovativeness and risk-taking. Each dimension included four items. For example in the case of the innovativeness dimension, we asked respondents ‘compared to others in the industry our company emphasizes’: ‘being first to the market with innovative new products/services’; ‘developing new processes’; ‘recognizing and developing new markets’; and ‘being at the leading edge of technology.’ Each of the twelve items used a seven-point Lickert scale with 1 representing ‘strongly disagree’ to 7 representing ‘strongly agree’. A confirmatory factor analysis was utilized to establish the presence of the multidimensionality of the construct. As expected and similar to past research (e.g. Covin and Slevin 1991) three dimensions emerged from the analysis with an overall scale reliability of $\alpha = 0.86$. This construct was labeled EO “entrepreneurial orientation.”

**Learning Orientation.** Following previous research such as the work of Baker and Sinkula (1999), we measured learning orientation construct, we also examined the multidimensional of the constructs two dimensions, commitment to learning and open-mindedness. The respondents were asked the degree in which they either agreed or disagreed with eight questions relating to learning. For example ‘commitment to learning’ was composed of the following: ‘the ability to learn is the key to our competitive advantage’; ‘learning is a basic value throughout our organization’; ‘employee learning is viewed as investment, not an expense’; and ‘learning is seen as a necessity to guarantee the firm’s survival.’ A seven-point
Licker scale ranging from 1 – ‘strongly disagree’ to a 7 ‘strongly agree’ was used. As expected the results of a confirmatory factor analysis yielded two dimensions with an overall reliability of $\alpha = 0.93$. We labeled this construct LO “learning orientation.”

*Market Orientation.* Consistent with previous research, we selected the MARKOR scale developed by Kohli, Jaworski and Kumar (1993) to assess market orientation. Respondents indicated the extent of their disagreement or agreement, on a seven-point scale (“1 = strongly disagree” to “7 = strongly agree”), with each item reflecting market orientation. These items are consistent with previous research measuring a firm’s market orientation (Jaworski and Kohli 1993). The overall scale reliability was $\alpha = 0.87$, we labeled the construct “market orientation” or MO.

We measured firm size with an open-ended question asking the number of employees currently employed by the firm, the log of employees was used as a control variable in the study.

**RESULTS**

The means, standard deviations and correlations are reported in Table 1. Analysis of the data with respect to skewness and kurtosis in the dependent variables fall within the boundaries of normality (Shapiro & Wilk, 1965) and thus allow for parametric tests of significance. The hypotheses presented above were analyzed using both hierarchical regressions and ANOVA analyses.

-----------------------------------
Insert Table 1 about here
-----------------------------------
The results of the regression analyses are displayed in Tables 2. The table provides the results concerning the proposed positive relationships between LO, EO and MO to SME performance. The first regression model found strong support for LO and performance, supporting hypothesis 1. Hypothesis 2A suggested a significant relationship exists between EO and performance, while hypothesis 2B suggests that MO would explain performance. The result of the second regression (Model 2) supports 2A, however no support was found for hypothesis 2B. Finally, Model 3 examined if there is a positive interaction between EO and MO on performance. The direct effects for the relationship between EO are positive and significant in the previous model but once the interaction effect is entered into the analysis the direct effects of EO disappears, confirming hypothesis 3. The results support hypothesis 3.

Hypothesis four proposed that EO and MO may mediate the effects of LO on performance. The results of the regressions indicate that the strength of the LO to performance relationship were attenuated, though not eliminated, when EO and MO were included in the regression models. We interpret this result as support for hypothesis 4.

The final hypothesis suggested that there would be significant differences between low- and high-performing firms in relation to LO, EO and MO. The ANOVA results are reported in Table 3. The performance measure was split at the mean (3.63) resulting in 51 low performing and 68 high performing classified firms. ANOVA analysis was then completed on both performance groups and the independent constructs. The findings found significant differences
for each independent measure (LO, EO, and MO) and performance; we also found a significant
difference for the interaction term (EOxMO). Overall the findings support hypothesis 5.

------------------------------------

DISCUSSION AND CONCLUSION

The primary rationale for this research was to examine the relationship between an
organization’s learning orientation with the concept of market orientation and entrepreneurial
orientation in the context of high performing SMEs. Overall, the preliminary results of data
analysis for this study support the proposed relationships illustrated above. In addition, it is
argued that this study adds to the evidence that organization learning in SMEs is comprised of
significant cultural dimensions, embodied by learning orientation, and decision/action
dimensions embodied by market orientation and entrepreneurial orientation. Further, it is
demonstrated in this work and in other research (i.e., Baker & Sinkula 2009) that the dimensions
examined have a positive relationship to higher levels of performance in SMEs. The paper
begins to build the arguments that the complex notion of organizational learning in SMEs is
multidimensional in nature comprised of culture, organizational processes, and decision/action
predispositions. The findings of this study suggest that understanding the nature of learning
organizations may provide an understanding of high performing firms.

This session introduces delegates to various profiles of the Caribbean entrepreneur and/or small business owner. The first GEM results for Puerto Rico will be presented. A general population profile will be explored, based on the GEM results. Recent research on women entrepreneurs/small business owners and how they conduct business and work within networks to gain footing in business will be presented. We will feature profiles of groups of women and how they use different strategies to conduct business. One of the activities in which SME’s have a competitive advantage in the Caribbean is the added value operations. SME's supply services and goods to industries that operate around seaports and airports in the various transshipment ports in the Caribbean. The opportunities and impact of SME's in this field will be discussed.

Keywords: GEM Study; Women Entrepreneurs in Puerto Rico; SME’s supply chain; Transshipment ports and SME’s
The Effects of Figure’s Symbolic Meanings of Product and Consumption Values on Corporate Awareness and Brand Association _

The Taiwan market perspective

Shu-Luan Kao
Hwa Hsia Institute of Technology, Taiwan

slkaojr@cc.hwh.edu.tw

As the degree of product differentiation is becoming less and less, many Asian SMB enterprises start with developing figure strategy to link to brand and extend competitive strategy outside of product itself. This study is to explore the effects of figure’s symbolic meanings and consumption values on corporate awareness and brand association in Taiwan. We use experimental design method and questionnaire to collect data and verify four hypotheses. We found that the figure's different symbolic meanings and consumption values has significant effect on the corporate awareness and brand association. Taiwan enterprises from OEM toward the brand, the researcher believe that the figure manipulation would be an effective strategy to strengthen brand management.

Keywords: symbolic meaning, consumption value, brand association
WORKSHOP: Building Successful Earned-Income Initiatives for Non-Profit Organizations

FORMAT: Discussion Leader, three (3) panelists, and active audience participation

ABSTRACT: Non-profit organizations have historically used earned-income initiatives to support their missions. These include a hugely broad array of strategies from licensing to retail sales to strategic partnerships. The discussion leader for this proposed workshop is the author of a new book, *Bankable Business Plans for Non-Profits*, which reviews the options and details the process of creating and building such earned-income initiatives. The workshop panel will include Executive Directors of non-profits from the Cincinnati area who will discuss their own experiences in creating and managing such business ventures within their non-profits. In addition, active audience participation will be part of sharing ideas, experiences, and issues related to this process.

WORKSHOP ORGANIZATION: The discussion leader will provide a 15 minute overview of the issue. Each panelist will review his or her experience related to this topic in 10 minutes. A 30 minute discussion will follow.

INTENDED AUDIENCE: Faculty who teach Management of Non-Profit Organizations, Entrepreneurship courses that includes sections on non-profits, Social Entrepreneurship, managers of non-profit organizations, policy makers, and researchers whose areas include Non-Profit Management and Social Entrepreneurship.

PRESENTERS:

**Discussion Leader:** Edward G. Rogoff is the Lawrence N. Field Professor of Entrepreneurship in the Department of Management of the Zicklin School of Business at Baruch College, The City University of New York. He is also Chair of the Department of Management. He also teaches at the Columbia Business School and received a B.A., M.B.A., M.A. and Ph.D. from Columbia University where he wrote his thesis under the supervision of Nobel Laureate William Vickrey. Dr. Rogoff has served as the Academic Director of the Lawrence N. Field Center for Entrepreneurship at Baruch College, teaches, and conducts research in entrepreneurship, particularly relative to minority and later-life issues. Dr. Rogoff has been named the 2010 Outstanding Entrepreneurship Educator of the Year by the United States Association of Small Business and Entrepreneurship. He is the author of *Bankable Business Plans* and co-author of *The Entrepreneurial Conversation*. His most recent book is *The Second Chance Revolution: Working for Yourself after 50*, co-authored with David Carroll. He has published in such journals as *The Journal of Business and Entrepreneurship, The Journal of Developmental Entrepreneurship, Family Business Review, and Journal of Small Business Management*. Dr. Rogoff was a 2003 Guest Co-Editor of the *Journal of Business Venturing*. In 2007, he is Guest Co-Editor of the *Journal of Developmental Entrepreneurship*. He has written articles for the *New York Times, Forbes, and Newsday*, as well as having been a guest on CNN. He has trained and worked with hundreds of entrepreneurs in many industries.

**Panelists:** Executive Directors of Non-Profit organizations from the Cincinnati area.
WORKSHOP: Building Successful Earned-Income Initiatives for Non-Profit Organizations

FORMAT: Discussion Leader, three (3) panelists, and active audience participation

ABSTRACT: Non-profit organizations have historically used earned-income initiatives to support their missions. These include a hugely broad array of strategies from licensing to retail sales to strategic partnerships. The discussion leader for this proposed workshop is the author of a new book, *Bankable Business Plans for Non-Profits*, which reviews the options and details the process of creating and building such earned-income initiatives. The workshop panel will include Executive Directors of non-profits from the Cincinnati area who will discuss their own experiences in creating and managing such business ventures within their non-profits. In addition, active audience participation will be part of sharing ideas, experiences, and issues related to this process.

WORKSHOP ORGANIZATION: The discussion leader will provide a 15 minute overview of the issue. Each panelist will review his or her experience related to this topic in 10 minutes. A 30 minute discussion will follow.

INTENDED AUDIENCE: Faculty who teach Management of Non-Profit Organizations, Entrepreneurship courses that includes sections on non-profits, Social Entrepreneurship, managers of non-profit organizations, policy makers, and researchers whose areas include Non-Profit Management and Social Entrepreneurship.

Designing an Entrepreneurship Education Program within a Four-Phase Venture Creation Process Framework

Abstract

Introduction

For years, entrepreneurship educators have been asked: Can you really “teach” entrepreneurship? If so, what exactly do you teach? This is a challenging question. A search for the answer has spawned entrepreneurship research that attempts to define the “work” of the entrepreneur (i.e. entrepreneurial activities) and then identify the skills needed to be successful at undertaking these entrepreneurial activities. The assumption is that once these skills are identified, they can be developed through participation in properly designed entrepreneurship training and education programs.

Entrepreneurial Self Efficacy (ESE)

Entrepreneurial self-efficacy (ESE) has long been studied as an important antecedent to entrepreneurial intentions (Barbosa, Gerhardt, Kickul, 2007; Boyd & Vozikis, 1994; Zhao, Seibert, & Hills, 2005). ESE is a construct that measures a person’s belief in their ability to undertake entrepreneurial activities and successfully launch a venture and is considered a strong predictor of entrepreneurial intentions and ultimately action (Bird, 1988; Boyd & Vozikis, 1994). In fact, some researchers have argued that an individual’s ESE may be elevated through training and education; thus potentially improving the rate of entrepreneurial activities (Florin, Karri, & Rossiter, 2007; Mueller & Goic, 2003; Zhao, Seibert & Hills, 2005).

Entrepreneurial Tasks and the Venture Creation Process

The process of starting a business involves very distinct activities unique to the new venture creation process. These activities, although somewhat management-related, should not be confused with general management tasks. A useful model for describing entrepreneurial tasks is a
process model first proposed by Stevenson (in Stevenson, Roberts, and Grousbeck, 1985) and adapted by Mueller and Goic (2003). Entrepreneurial activities are separated into four discrete steps or phases referred to as (1) searching, (2) planning, (3) marshaling, and (4) implementing.

The first step *searching* involves the development by the entrepreneur of a unique idea and/or identification of a special opportunity. The second step *planning* consists of activities by which the entrepreneur converts the idea into a feasible business plan. The third step *marshaling* involves assembling resources to bring the venture into existence. The final step is *implementing*. During this phase, the entrepreneur engages in strategic planning and manages a variety of business relationships with suppliers, customers, employees, and providers of capital.

Mueller and Goic (2003) found significant variation in the level of ESE from individual to individual and across the four phases of the venture creation processes supporting the argument that ESE is multi-dimensional. Some individuals, for example, exhibited high ESE for performing tasks associated with the searching phase while exhibiting low ESE for performing tasks associated with the marshaling phase.

**The Education Intervention**

Because self-efficacy is malleable, a number of entrepreneurship researchers and scholars have proposed and tested the use of an education (or training) “intervention” to raise an individual’s level of ESE (Cox, Mueller, & Moss, 2002; Florin, Karri, & Rossiter, 2007; Wilson, Kickul, & Marlino, 2007). For example, Cox, Mueller, and Moss (2002) measured change in ESE before and after the completion of an undergraduate course in entrepreneurship to determine course effectiveness. Wilson, Kickul, and Marlino (2007) noted that a well designed entrepreneurship [education] program should give the student a realistic sense of what it takes to start a business as well as raising the student’s self-confidence level (ESE).
Program Design

Designing an entrepreneurship education program based on a four-phase venture creation model has certain advantages. Matching each phase to a specific course in sequence provides a overarching structure for the curriculum and a logical flow in topics from business conception to launch. A sample design is presented.

References

The objectives of the study are to investigate barriers encountered by Thai small and medium-sized enterprises (SMEs) and to examine the perception on the supporting role of government towards SME sector in Thailand. A sample of 174 SMEs in Thailand was used to empirically examine the objectives of the study. The key barriers identified in the research included factors linked to institutional, internal organization, external, financial and other barriers. Empirical data were collected through survey questionnaires, and semi-structured interview. The findings reveal that external barriers were reported to be of major importance to SMEs performances. In contrast, in this study institutional barriers were seen as less serious than the other types of barriers. Thai SMEs found that government support programs are useful but inadequate. The findings suggest that Thai government should take into account difference in individual firm characteristics when offering those supports and should provide opportunity to SMEs to express their views regarding SME policy and development.

Introduction

It is widely accepted that the SME sector plays a key role in economic development. The main areas in which the sector contributes are in job creation, innovation and the creation of competition (Storey, 1994; Carter and Jones-Evans, 2006). For developing countries in particular, SMEs play an increasing role in industrial structures. The SME sector accounts for more than 90 percent of all firms outside the agricultural sector of East and South-East Asia and contributed between 40 to 85 per cent of the total employment in regional economies (Wattanapruttipaisan, 2002).

For Thailand, SMEs are vital to the Thai economy. Formal and informal SMEs together employ around two third of total enterprises’ employment. In addition, they account for a large proportion of the total establishments and engage across a broad range of economic
activities. Within the Thai economy, SMEs also have important roles in increasing in value added, supporting industrial development, utilizing indigenous raw materials, and linking large and small industries. SMEs therefore represent a particularly attractive candidate for future national economic growth. With the great contributions of SME sector to the Thai economy, appropriate government policies, strategies, and assistance programs are important for the sustainable development of SME sector in Thailand.

Despite their importance in the Thai economy, Thai SMEs still encounter with several obstacles in their operations. When considered about the barriers facing SMEs, a number of managerial aspects such as finance, marketing, and human resource were stated by SMEs. Training, technology, infrastructure, government policy and regulations were also seen as the main problems facing them. Recent study involving SME sector in Thailand (OSMEP, 2008) highlighted various common limitations of SME operations: lack of management capabilities, limited access to market information and promotional services by government agencies, shortage of capital, inadequate skilled labor, and uncertainties in support programs. To remove those barriers faced by SMEs, Thai government introduced a range of information, grants, training and assistance through various government agencies.

However, it is likely that many SMEs fail to take advantage on the assistance mentioned above. Only formal and larger enterprises could take advantage of the policy and supports, hence the smaller enterprises still cannot satisfactorily access these supports (White, 1999). In addition, it appears that little is known about the effectiveness of SME support programs.

This research therefore responds to the need for empirical analysis of the barriers facing SMEs and the perception on the role of government on supporting SMEs development. This study aims to provide policymakers with in depth information needed for designing effective policies and support programs in favor of the SME sector. Based on the findings and results of the study, conclusions and policy implications are drawn.
**Barriers Encountered Small Firms**

A crucial question for, economists, policy makers, and business owners and managers alike is why businesses do well or fail. Numerous studies have focused on measures of success and failure of small businesses (Ali et al., 2001; Gardenne, 1998; Lin, 1998). Several of these studies have attempted to indicate the factors responsible for business success, while others have addressed the issue from the point of view of business failure. One way of explaining why so many businesses are not successful is through the notion of barriers.

The importance of the barriers encountered by small firms has been highlighted in a previous report by the Federation of Small businesses (FSB, 2000). Barriers have been used to account for why so few businesses grow and why the SME sector does not survive. However, SMEs in different sectors may encounter different environment, problems, and therefore barriers. Attempts to support the development of SME sector by eliminating barriers should be based on knowledge, and understanding of these barriers facing SMEs. Barriers encountered by SMEs include both internal and external environments (Barber et al., 1989; Mullins, 1993; Smallbone et al., 1993; Jones-Evans, 1996; Fielde et.al, 2000). It has been found, for example, that economic fluctuations strongly affect the growth probability of small firms (Kangasharju, 2000). Institutional factors such as government policy, bureaucracy, limited infrastructure and entrepreneurial activities can have a profound influence on firms’ economic performance (O’Neill and Duker, 1986). Complicated laws, rules and regulations concerning businesses can be tough on small firms. This suggests that the promotional role of government assumes special significance for SME development (Khader and Gupta, 2002). The most common barriers relating to factors on difficulties in
obtaining finance and the level of and decrease in demand are also mentioned in a number of previous studies (McMahon and Holmes, 1991, Storey and Westhead, 1997; Gorton, 1999; Perren, 2000). Other barriers were caused by problems in obtaining a skilled workforce, access to raw materials, difficulties in exporting, and inability of owners and managers to control business functions (Storey, 1994; Bartlett and Bukvic, 2001). The internal factors include weak managerial or marketing skills, poor business planning, resource shortages and capacity limitations, human resource management are also encountered by small firms (Weinrauch et al., 1991; Bartlett and Bukvic, 2001; Kraus et al., 2006).

For Thailand, the overall views of problems facing Thai SMEs are not different from those of other developing countries. According to the report of Department of Industrial Promotion of Thailand (DIP) (1994), what small firms complained the most were the problem of insufficient capital or lack of financial sources, labor shortages, and limited access to market. Similarly, the National Statistic Office (NSO) (1999) survey also revealed that the marketing and financial problems were top of the list of problem and barriers faced by Thai SMEs. The study carried out by the Office of Small and Medium Enterprises Promotion (OSMEP) in year 2002 also reported that the main obstacles of SMEs were related to lack of access to skill development and training of employees, managerial capabilities of owners and managers, and administration system of the government.

**Public Policies toward SMEs in Thailand**

Owing to the growing importance of SMEs as an economic and political force, appropriate policy formulation is needed. In Thailand, “dual track” policy has been used to recover and at the same time promote growth and development of the Thai economy. This policy has been seen as bringing about some promising changes in the development of the Thai SME sector.
Several SME development-related measures have been introduced along with financial support schemes. Some of the popular supportive financial measures included the village funds “the People’s Bank” and “One Tambon One Product” (OTOP). The OTOP project aims to support grassroots communities to use their local knowledge to develop their own products with some technical support from government agencies. At the same time, OSMEP was set up as a coordinating body among government agencies for SME development. The OSMEP takes responsibilities to formulate SME promotional policies and strategies as well as serves as a central organization in coordinating with both government and private agencies to promote Thai SMEs. Following are the main responsibilities of the OSMEP (OSMEP, 2001):

- Formulating a SME promotion master plan and promotional policies.
- Preparing an action plan for the promotion of regional/sectoral SMEs as well as micro and community enterprises.
- Serving as the country’s SME information center and the central organization for the conduct of research and studies on SME-related issues.
- Developing information systems and networks to support the operation of SMEs.
- Administering the Venture Capital (VC) Fund for SMEs.

For, the first promotion plan (2002-2006), the emphasis was put on public support design to remove both internal and external barriers to the firm. The supports thus include programs to help SMEs develop internal capabilities as well as financial and marketing assistance. They also provide counseling on various areas of managerial practices. The ideology behind the plan is based upon the hypothesis that SME development can be promoted by the activities of local institutions and development coalitions among SME related development agencies- OSMEP, ISMED, SME bank, local governments, chambers of commerce, business associations, local commercial banks, colleges and universities, and
networks of firms. Practically, the first SME promotion policy has three main streams that are investment promotion, financial assistance, and technical and management consultancy. The SME Promotion Act and SME Development Bank of Thailand were also established with the role of assisting SMEs in securing sources of funds, preparing business plans and providing advice on business operations.

With the moderate success of the first plan, the second SME promotion plan (2007-2011) was established in 2006. The plan aims to enable SMEs to grow with continuity, strength, and sustainability in terms of knowledge and skills. Of the numerous measures employed in this plan, those related to various sectors include product quality improvement, establishing business incubator centers in regional and local areas, trade fairs, setting up of exhibition centers for SME products throughout the country, and creation of industrial networks.

Methodology

Questionnaire and Sample

This study employs both qualitative and quantitative approaches. The reason for using both approaches is simply that qualitative research paradigm may improve the understanding of firm barriers where the quantitative survey method might failed to explain “how” and “why” questions. Data for the study were collected from various sources in Thailand in 2008. Primary data were collected through fieldwork includes questionnaires, and semi-structured interviews. Two questionnaires were constructed in accordance to the objectives of the study. The items used to measure the variables in the present research were identified and selected from literature. Two sets of questionnaires were constructed: one for SME respondents and
the other for related agencies. The first set of questionnaires was mailed to SMEs and delivered in person to owner/manager respondents during the actual interview.

In this research, barriers encountered by SMEs that were included in the first set of questionnaires were separated into five groups that are institutional, internal organizational, external, financial, and other barriers. Institutional barriers include government bureaucracy, lack of support services, and poor government policies and regulations. Internal organizational barriers include business planning, managerial capacity and capability, skilled labors shortage, high labor cost, lack of technology for better production, and performing human resource management (HRM) techniques. Barriers due to the external constraints consist of high tax, access raw materials, lack of market demand, power supply and infrastructures, and changes in customer behavior. Financial barriers include availability and cost of loans, high collateral requirements, and high overall operating expenses. Finally, economic fluctuations, crime, population trends, and globalization are categorized in other barriers.

The second set of questionnaires was designed to assess issues related to the role of government in SME development. This set of questionnaires was used to interview those who work with the agencies directly involved in SME development such as commercial banks, university, and city council. A pre-test and pilot study of the survey instrument was conducted before the full-scale study was dispatched. The questionnaires were in Thai. Follow-up letters were sent after three weeks. Then, the empirical data was consolidated in a database for statistical analysis and coded and analyzed by using statistical software programs, SPSS. Interviews with SME owners/managers were conducted after the completion of questionnaire survey.

The first set of questionnaires was sent to 1,000 SMEs that registered with the Institute for SME Development (ISMED) in Thailand. A total 174 usable questionnaire were
returned, providing the response rate of 17.4 percent. All responding firms were still in operation. The second set of questionnaires was completed by 32 respondents of both public and private agencies.

**Results**

The data were processed and analyzed using descriptive and univariate statistics (means and frequencies) to provide a better understanding of the respondents and characteristics of the data. Characteristics of the firms in the sample are shown in Table 1. The respondent firms strongly support the information provided by the Office of Small and Medium-sized Enterprises Promotion (OSMEP) in year 2008 that the majority of SMEs in Thailand are in trade sector.

A great proportion of firms or 82.2 percent were small sizes whereas much smaller proportion or 17.8 percent of the firms in this sample were medium sizes. Moreover, the result of this study shows nearly half or 48.9 percent of the firms have been established in business for 6-10 years. About one third or 29.3 percent of the firms have been in business for 11-20 years, while 17.2 percent and only 4.6 percent have been in business more than 20 years and between 1-5 years, respectively. The majority of the firms base in urban centers (66.7 percent) while 33.3 percent of sampled firms base in rural area. Approximately 62.1 percent of firms in the sample were local market-based whereas only 12.1 percent were international market-based and 25.9 percent were both local and international markets-based. As expected, the sampled firms were dominated by sole proprietorship (65.5 percent), followed by limited liability company (17.8 percent), partnership (12.1 percent), and co-operative (4.6 percent).
An understanding of the barriers encountered by SMEs is of practical importance for those involved in SME development. For SMEs owners/managers, the perception of a situation as those barriers can influence their business performances (Walsh, 1988). For policymakers, understanding SMEs’ situations will help in formulating appropriate policies and developing SMEs assistance programs (Huang and Brown, 1999). List of common barriers faced by SMEs were included in the questionnaire. The barriers were placed in five groups covering institutional, internal organization, barriers external to the firm, finance, and other barriers. Altogether, 22 potential barriers were identified and included in the questionnaire. The respondents were asked to indicate the severity of a number of barriers to their firm performance from 1 to 5. Table 2 presents key findings of the survey on the five groups of barriers which the sample firms faced. To supplement the questionnaire

Scale: 1 = not important to 5 = very important

Among the institutional barriers, the general problem of poor government policies and regulations was ranked as the most important obstacle to business performance, with mean score of 3.02. Among internal barriers, the problem of high labor costs was clearly seen as the most important barrier with mean score of 2.85. Among external barriers, lack of market demand was ranked the most important with mean score of 3.65. Among financial barriers, lack of access to capital was ranked the most serious barriers, with mean score of 3.24.
Finally, among other barriers, an economic fluctuation was seen as the most serious, with score mean of 3.42. Clearly, overall institutional barriers are seen as less serious than the other types of barriers. This is consistent with Liedholm and Mead’s (1999) survey of entrepreneurs in five African countries which found that government regulations were reported to be of minor importance to firm performances. However, the results of this study may reflect success on the part of the Thai government efforts to reduce barriers by setting up a number of agencies dealing with SMEs and programs to support the SME sector.

Scale: 1 = not important to 5 = very important

Table 3 presents the top five perceived problematic barriers to firm performances among SMEs covered in the sample, ranked by the incidence of very high barriers. Of these, two were from the group of external barriers, one, from the group of other barriers, and two were financial barriers. It is interesting to find that an economic fluctuation which falls in the other category was regarded the second most important barrier to firm performance among the firms in the sample. This finding is consistent with Thee (2000). Thee (2000)’s study showed that economic crisis did have an adverse impact on small firms. This can also be noticed from interviews with SME owners/managers “I reckon that the fluctuation of national economy is the main factor that affects my business performances. This is because the profits and sales volumes dropped due to decrease in purchasing power of consumers, particularly as my business supplies to the domestic market.”
With regard to financial problems, small firms generally report more on financial problems. It is not surprising to find that the results of this study are consistent with those of previous studies (Wattanapruttipaisan, 2003; Tambunan, 2008) which found that financial constraints like lack of access to capital, and high collateral requirements are encountered by SMEs. This suggests that the attempts of government to alleviate SMEs’ financial problems by setting up several specialized financial institutions to help SMEs may not be effective enough.

As among the institutional barriers, poor government policies and regulations were ranked as the most important barriers to business performance. This may be interpreted that most SMEs believe that government’s role in supporting SME sector is crucial. This finding is consistent with the study of OSMEP (2002) which earlier found that lack of appropriate, systematical, clear, and coordinated planning and management in government in SMEs promotion is one of the barriers to SME development.

For the past 20 years, various kinds of assistance programs have been offered to SMEs by the Thai government. To investigate what are the assistances that SMEs actually needed, three areas of activities were listed and proposed in the questionnaire. Table 4 shows the results of assistance needed by Thai SMEs.

As shown in Table 4, Thai SMEs need greater assistance on various managerial areas in comparison to consultancy and information services. Among the support needs, assistance on marketing was needed the most. This is consistent with the results presented in Table 3 that the most needed assistance and support from government was in marketing area. In
addition, firms in the sample identified marketing barrier as the most important factor affecting their performances as can be seen from the list of problematic barriers to firm performances. This area of support is particularly important for smaller firms that cannot find their niche in the domestic or export markets.

As may be expected, the need to improve financial opportunities for SMEs is one of the priorities identified in the SME policy document. As can be seen from Table 5, financial consultancy was reported as high priority for Thai SMEs. This is to believe that advice or assistance from government in financial area appears to be crucial for SMEs in order to operate business efficiently.

With regard to information services, the results of the study reveal that they were least needed. This may be explained by the fact that it has been realized among SMEs that the Thai government has established a number of information services for SMEs under ISMED. These information services cover various aspects concerning SME development and promotion. For instance, ISMED offers “Buyer-Seller Business Matching” service which aims to help SMEs to get access to market by advertising their products and services in the ISMED’s website.

SME owners/managers were also asked to identify the various types of business assistance they had used. The following Table 5 shows types of assistance which have been used by SME owners/managers. Not surprising, the results of the study also show that marketing and financial assistances were used most frequently by SMEs.

When respondents were asked about the type of assistance they used to overcome difficulties and supported their business, marketing and financial assistances were reported with high level of use than technology and operations, development of personnel and HR, and information services. A possible reason why financial and marketing assistances were the most used was given by one of SMEs respondent during the interview that “I am
using both financial and marketing supports from government agencies. I apply for a loan from SME bank to start up my business, and use it for operation expenses. I also a member of local SMEs organization which helps me gain access to market for my products”.

An understanding of the usefulness of government support will also help policymakers to find suitable measures to support or assist SMEs. Hence, there is a need to identify whether those government supports work well as far as small firms are concerned. To obtain as complete a picture as possible, and to acquire comprehensive results on the usefulness of government assistance, the respondents were asked to rate the perceived usefulness of assistances that are provided by government or related public agencies. The results are shown in Table 6.

- **P9**: The assistance from government should be targeted to specific needs of SMEs
- **P10**: The needs of the business was analyzed before it receive the assistance
- **P11**: The SME support agencies in Thailand are very familiar with the problem facing SMEs

The results from Table 6 reveal that as much as 51.4 percent of SME respondents believe that the government supports are useful for their business and 56.9 percent believe that obtaining assistance from government helps improve their business performance outcomes. Conversely, a total of 55.6 percent of SME respondents disagreed that various assistances offered by government are adequate for SMEs. This is consistent with a report by White (1999). He asserted that even when assistance instruments themselves are supportive of small business operations, their implementation may be inadequate or inefficient. Similarly, Treerapongpichit (2002) found that most small and medium businesses that successfully recovered over the past few years were in Bangkok when access to
government assistance is higher. Those in the provinces made a slow recovery because of their small-scale operations, outdated technology and limited access to government assistance.

It is noticeable, that a total of 56.9 percent of SME owners/managers agreed that the assistance from government should be targeted to specific needs of SMEs (Mean= 3.48). This is consistent with Hull (1987) as he asserted that support programs from the perspective of the owner/manager have failed to take into account differences in the individual attitudinal and behavioral characteristics of firms, and difference in business characteristics of individual firms, which imply that the specific and unique nature of the support provision is often needed as individual firms encounter different sets and degrees of problems. Finnegan (1999) also suggested that providing direct support services in such areas as training, consultancy, easier access to credit, marketing, advice on industrial relations and promoting linkages with larger enterprises are crucial especially for small firms. Therefore, a further problem is always possible if SMEs are treated as a single entity. Similarly, a research study conducted by Chulalongkorn University in the early nineties found that training programs provided by government organizations were appropriate but should be more specific in terms of qualification of participants and assistance needed (Leopairote, 1997).

With regards to the role of government on SMEs development, it is considered to be important especially after the economic and financial crisis based on spreading recognition that SMEs play an important role in the national economy. A country like Thailand, the role of Thai government is clear to be crucial as it determines its policies, plans, and programs for SME sector. However, there is much debate on the role of government in stimulating enterprise and SME development. Some researchers believe that this process is market distorting and should not be intervened. On the other hand, some agree that policies and regulations can improve the climate and lead to favorable
situation for SMEs. Hence, government should at all times be careful not to overburden business with an excessive amount of regulation which may lead to the possible suppression of business and spirit of entrepreneurship (Frederick, 2005).

where:
G1: Government trusts the private sector to support its economic policies
G2: Local authorities do play a lead role in SME development
G3: Government delegates power to the local level in order to support local entrepreneurs
G4: Government has developed appropriate SME services to meet the needs of SME segments
G5: Government has facilitated the creation of markets for services
G6: Government has strengthened the role of stakeholders via stakeholder partnerships and the provision of services through business associations
G7: Government focuses on effectiveness of promotion activities rather than just outputs
G8: Government takes a long term strategic view and encourages a long term view in the business community
G9: Government consults regularly and openly with small business representative groups on SME policy issues
G10: Government has developed programs to support SME in specific target group
G11: Government has decentralized support organizations and services to SMEs
G12: Government does not impose excessive standardization of public accountability
G13: Government does not impose excessive control on local SME organization through funding
G14: Government usually delivers information and knowledge to businesses in appropriate forms

Table 7 compares the perception on the role of government on supporting SME of the two groups’ respondent in the sample. It is interesting to find that the perceptions of both groups of respondents appear to be quite different in terms of long term strategic view, and support
services for specific target group. SME respondents were not convinced that government has developed programs to support SME in specific target group (Mean score = 2.71) as compared with respondents from public and private organization (Mean score = 3.09). This suggests that government still needs to provide more information about existing assistance programs for specific target groups of SMEs.

Both groups of respondents agreed that government has developed appropriate SME services to meet the needs of SME segments (Mean = 2.90 for SME respondents and Mean = 3.00 for institution respondents). This is clear that government has attempted to provide a wide range of support to meet the needs for SMEs. It offers support to existing SMEs and also to prospective SMEs in different areas of assistance across different sectors. For instance, government provides training courses which focuses on facilitating and matching the requirements of SMEs. One respondent from institution involving SME promotion and development mentioned that “I have been working in the public sector for about fifteen years. I think at present, the government has attempted to support and at the same time promote SME sector as much as it can. A number of promotion organizations, and assistance programs have been established which there had never been before. SMEs now have more options on getting help from the government”.

However, SME owners/managers did not believe that government consults regularly and openly on SME policy issues with small business representative groups. Both groups of respondents rated this statement quite low (Mean score = 2.58 and 2.69) compare to other statements. This implies that SMEs would like to express their view regarding SME policy and development which is directly related to their businesses. One respondent of the institution group mentioned that “The government needs to contact a broader base of small companies, and listen to them more closely”. One SME respondent also stated that “Government should consult SMEs more widely. I still believe that the government needs to
put more effort on supporting SMEs and needs to let us participate more on supporting and promoting policy towards SMEs”.

Discussion

This study examined the critical barriers facing Thai SMEs and the perception of the respondents on the role of government on supporting SME sector. Respondents in this study can be generalized as being in trade sectors, forming as sole proprietorship, operating for over 5 years, and serving local markets. The majority of firms are located in urban area. These characteristics are similar to the results of the study by OSMEP (2008). The findings reveal that institutional barriers are seen as less serious than the other types of barriers for Thai SMEs. This may reflect the success of the Thai government efforts to reduce barriers by creating a favorable environment for business and setting up a number of agencies and programs to support SME sector. Conversely, external barriers to firms such as lack of market demand and changes in customer behavior seem to be more concerned by Thai SMEs. This suggests that government should place more attention on financial and marketing area in order to assist and support SME sector. Nevertheless, it is suggested that some barriers to firm performances can be prevented. SMEs themselves should realize their own problems and recognize the need for better understanding of those barriers and then seek for help from outside organizations.

It is hoped that the results of this study are especially useful to policymakers who may involve in SME development in Thailand. Clearly, the infrastructure and entrepreneurial activities in Thailand are still limited. The promotional and supporting role of government then assumes special meaning to Thai SMEs, as they were found to still need assistances from the government in order to overcome both internal and external barriers. As mentioned earlier, the Thai government has offered various types of assistance to SMEs such as
marketing, financial, training, technological, and information supports but the questions are raised whether those programs of assistance are really useful and fit for SMEs needs. In this study, the results appear to confirm the usefulness of government assistance programs for SMEs in Thailand. The findings reveal that from respondents’ point of view the government supports are useful for business and help improve business performance outcomes.

This research would suggest to SME owners and managers that receiving the assistance from government might well lead to better performances and to policymakers that there is a need for raising awareness of internal barriers and enabling SMEs to adapt to the sudden change of environment and challenges facing them. At the same time, the Thai government itself must take a proactive role in supporting SMEs to help SMEs overcome those firm’s barriers. Priority must be given to the development of effective business support, since the competitiveness of SMEs depends on them being able to apply their base of internal management resources and knowledge to overcome barriers to firm. In addition, a better understanding of barriers facing SMEs would also improve effectiveness of assistance.

It is not surprising to find that Thai SMEs would like to express their view regards to SME policy and development. For public policy makers, this study serves as evidence that the government should provide opportunities for SMEs and consult more regularly and openly with small business representative groups in order to achieve sustainable development of SME sector in Thailand.

**Conclusion**

The current research provides a great contribution to the existing research relating barriers encounter by SMEs. However, it should be noted that this study has its limitations. The most notable one is the fact that these results were derived from a sample of Thai SMEs and hence the concern that the findings might be country-specific. In addition, because of the
chosen sampling method, the results may be generalized only with regard to firms that are similar to those in this study’s sample. Future studies could use samples of firms from other countries to test and extend the generalizability of this findings. This study identified barriers facing SMEs as institutional, internal, external, financial, and other barriers. These groups of barriers might not have captured all areas of barriers that involved in SME operations. Future study could also examine the relationship between barriers and several dimensions of firm performance outcome.

Agency Costs and Ownership Structure
in New Zealand Unlisted Small Businesses

Nirosha Hewa Wellalage
Stuart Locke
Department of Finance
University of Waikato Management School
New Zealand

Introduction

This paper discusses a small business based investigation of principal-agent (PA) and principal-principal (PP) dimensions of agency cost. Panel data for 11 years to 2008, covering a sample of small businesses not listed on a stock exchange, are examined using multivariate statistical techniques. The sample of businesses includes sole proprietorships, partnerships and private companies and differs from previous studies in terms of selection bias and breadth of coverage. Several variables, including financial and operating structure, size, industry, performance and ownership concentration are found to be related to the level of agency costs. Consideration is given to how these variables, combined with the information opaqueness often associated with small businesses, might promote a broad range of policy issues and options for small business growth and sustainable profitability.

Aspects of agency cost have been researched for small and large listed companies but unlisted small businesses, many of which are unincorporated trading as sole proprietorships and partnerships, have not previously been the subject of robust empirical research. This paper makes a number of contributions to the agency cost debate, using a New Zealand data set for unlisted small businesses. Small businesses are important in most economies,
contributing significantly to gross domestic product (GDP), employment and government taxation revenue. In New Zealand, the number of small and medium enterprises (SMEs) increased by 2% between February 2006 and February 2007; the total number of people employed by SMEs increased by 18% between 2001 and 2007, and a 2008 report shows SMEs accounting for 31% of all employees in New Zealand (Cosgrove, 2008).

Few prior studies have attempted to measure directly agency costs for small businesses. Ang, Cole and Lin (2000) analysed small unlisted US companies and Fleming Heaney and McCosker et al. (2004) analysed unlisted Australian small companies. The PP agency cost analysis of Faccio, Lang and Young (2000) is also extended to this data set of smaller businesses. The panel data provides an opportunity to consider both cross-section and time-series effects and it is important that the econometric modelling distinguishes between fixed and random effects.

**Literature Review**

Costs associated with a lack of goal congruence between two parties were brought to the fore by Ross (1973) and were further explored by Jensen & Meckling (1976). These costs are often referred to as agency costs and can occur between a principal and agent and also between principal and principal. The majority of prior research has concentrated on the PA aspects of agency costs. An awareness of the PP component is relatively more recent.

To describe the costs of the resources used in the alignment of the interests of managers to the interests of owners, Jensen and Meckling (1976) created the idea of agency costs. With little accord surrounding the relationship between organisational performance and the ownership and control of a firm, it is widely accepted that separating ownership and management creates costs that would not exist had this separation been avoided (James, 1999). It is suggested that agency costs are inversely related to the proportion of ownership held by the primary owner (Ang, Cole & Lin, 2000). This argument is inline with Jensen’s
(1993) convergence of interests’ hypothesis, which states that managerial shareholdings create the alignment of the interests of the owners and managers, and as the proportion of managerial equity ownership increases firm performance also increases. Ang, et al (2000) claim that the incentive to consume perquisites or perks declines as the managers’ ownership share increases. They propose that because the managers’ share of the firm's profits rises with ownership managers will have less incentive to engage in non-value adding activities.

It is suggested by Bruce and Waldman (1990) and Schulze, Lubatkin, Dino & Buchholtz (2001) that parents who own a firm will employ and continue to employ their own children even when their offspring free ride or do not have the ability or skills needed to be a value creating member of the firm. Schulze, Lubatkin, Dino & Buchholtz (2003) posit that the effectiveness of a CEO in a family-owned firm may be reduced due to the effects of altruism, influencing the CEO’s perceptions of family members’ performance. Altruism may make it more difficult to punish poor performance because the effects spill over from the workplace to the home. (Schulze, Lubatkin, Dino & Buchholtz 2003). These factors contribute to agency costs.

It appears that agency costs are likely to be evident in small firms and that even closely held family businesses are not immune from this effect. The literature concerned with home-based, micro businesses and smaller businesses has not investigated empirically the magnitude of these potential agency costs.

**Principal Agent Problem**

A principal agent problem arises when agents pursue their own goals rather than the goals of the principal. It is the result of conflicting interests between managers and owners and asymmetric information (Chrisman, Chua & Litz, 2004). In many instances, agents will possess more or better information than the principals about strategic and operational
decisions and the results of those decisions (Ross, 1973). As a consequence of this
divergence of knowledge about the firm, agency problems are typically classified as
embodying adverse selection and moral hazard forms of market failure.

Adverse selection may occur in a firm when the manager knows more about his
managerial ability than the owner of the firm (Mankiw, 2007). In a situation such as this, the
owner runs the risk of employing a manager of low quality. The selection of a manager may
be adverse from the standpoint of the uninformed owner (Mankiw, 2007). As many
principals of smaller businesses are not trained in recruitment and interviewing and do not
employ experts to assist with recruitment, there is a significant possibility of poor hiring.

Moral hazard refers to the risk or hazard of inappropriate or immoral behaviour by the
agent (Mankiw, 2007). Moral hazard is a problem that arises when the principal cannot
perfectly monitor the agent’s behaviour. Because of this, the agent tends to expend less effort
than the principal considers desirable (Mankiw, 2007). According to Chrisman, Chua and
Litz, (2004), to mitigate the effects of adverse selection, owners (principals) have to incur
higher search and verification costs to ensure the right manager (agent) is selected. Likewise,
they suggest that to control for the moral hazard problem, rational principals will use an
optimal combination of incentives, punishments and monitoring to align the agents’ interests
to their own (Chrisman et al, 2004).

In order for principals to mitigate the PA problem they must incur costs, and these
costs are referred to as agency costs, a term coined by Jensen and Meckling (1976). Agency
costs, therefore, refer to the costs of the processes, systems and structures set up for the
purpose of monitoring, and aligning the interests of agents to those of the principals
(Chrisman, et al., 2004).

Principal Principal Problem
The PP cost has been articulated in the context of listed public companies in mature capital markets and has recently been tested in emerging markets. The extent to which PP is applicable for small business is developed in this paper. The PP problem is best described in a firm with one large shareholder and a fringe of small shareholders (Villalonga & Amit, 2004). In such a firm, the traditional agency cost or PA conflict is alleviated due to the large shareholder’s greater incentives to monitor the manager. But, a second type of conflict emerges as large shareholders exercise their substantial control and influence over firm matters and, as agency theory suggests, they have incentives to consume the firm's resources at the expense of the minority shareholders (Anderson & Reeb, 2004). It is important to note that the PP problem is more likely to overshadow the PA problem when the large shareholder is an individual or a family, as opposed to an institution. This is because an individual or a family will have incentives for both expropriation and monitoring, with a potentially greater incentive for expropriation.

Families and individuals are capable of expropriating wealth from the firm through excessive compensation, related-party transactions, or special dividends (Anderson & Reeb, 2003). While families/individuals may pursue actions that satisfy their own personal goals and happiness, such actions lead to poor firm performance relative to dispersedly owned firms and impact negatively on the firm’s other owners, creating PP costs (Anderson & Reeb, 2003).

A firm’s majority shareholder does not have to ‘loot’ directly from the company to impose costs on other owners. Accordingly, a diversified shareholder will evaluate investments using rules that maximise the value of the firms' residual cash flows (Anderson & Reeb, 2003). But large individual shareholders may evaluate investments based on their needs, such as firm growth, technological innovation or firm survival, rather than attempting to maximise shareholder value (Anderson & Reeb, 2003). Also, concentrated owners will
have a greater say in who runs and manages the firm, selecting people who will pursue their own goals rather than those of all owners.

Empirical research demonstrates the prevalence of PP costs and several studies confirm the role of family ownership and the subsequent performance of the firm. Burkart, Panunzi and Shleifer (2003) argue that family management, particularly by the founder’s descendent, is strongly related with poor decision making, and consequently, negative performance. Burkart, Gromb and Panunzi (1997) suggest that families expropriating wealth from a firm can adversely affect employees' productivity as they tend to redistribute wages from employees to the family. Morck, Strangeland and Yeung (2000) conclude, for a sample of U firms, that family shareholders generate excessive costs for the firm, which leads to lower returns in family firms relative to non-family firms.

Anderson and Reeb, (2003) investigate the relationship between founding-family ownership and firm performance. They find that this subset of family firms perform better than non-family firms. Moreover, they find that when family members serve as CEO, performance is better than with outside CEOs. Overall, their results suggest that minority shareholders are not adversely affected by family ownership. In a follow-up study Anderson and Reeb (2004) examine a sample of Standard and Poor 500 firms with founding-family ownership. Consistent with agency theory, they find that the most profitable firms are those where boards have either the same number or more independent directors as family board members. Consequently, they note that in firms with relatively few independent directors, the firm performance is significantly worse than in non-family firms. Their results highlight the importance of independent directors in mitigating conflicts between shareholder groups.

Using data on all Fortune 500 firms during 1994-2000, Villalonga and Amit, (2004) also find that family ownership creates value but only when the founder serves as the CEO of the family firm or as its chairman with a hired CEO. When descendants serve as CEOs,
however, firm value is destroyed. These final two results provide evidence to support stewardship theory. Specifically, the theory purports that founding-family members may identify closely with the firm and more-or-less treat the company as their own (Gomez-Mejia, Larraza-Kintana, & Makri, (2003); Davis, Schoorman, & Donaldson, (1997). Hence, the owner will act as a steward of the company, nurturing it and ensuring its success. Using parametric and non parametric tests on a sample of Canadian listed firms, Gadhoum, (2008) provides support for the PP cost theory. The family-owned firms and group-affiliated firms exhibit evidence of expropriation of minority shareholders.

**Data**

The sample consists of New Zealand unlisted small businesses, covering the period 1998-2008 inclusive, and was made available by the Management Research Centre of the University of Waikato. The data are collected annually in conjunction with the New Zealand Institute of Chartered Accountants as part of a financial benchmarking reporting programme, and the total time series reaches back to 1982. The random sample is drawn from accounting practices that prepare end of year financial returns for small businesses. This avoids the selection bias of using bank related data or those businesses that submit survey responses to government agencies. There is a maximum of 11 years of data for each business and given the high attrition rate for SMEs, this leads to an unbalanced panel dataset. Firms included in the study represent a range of industries. After adjustments, the dataset provides 1100 observations from a total of 100 businesses appearing each year. Data relating to listed companies, used for comparative purposes, are drawn from an online data base run by NZX (the NZ Stock Exchange) called NZX Deep Archive. Variables used in the study are presented in Table 1. The descriptive statistics for the full sample of 100 small companies for 1998-2008 are presented in the Appendix.

**Method**

The movement of PA and PP costs is based on financial data supplied by individual businesses and differs from previous studies of small businesses that drew on government
surveys or bank related data. Ang, Cole and Lin (2000) suggest principal agency costs are reflected in the ratio of operating expense to annual sales, and the ratio of annual sales to total assets. Faccio, Roug and Young (2001) propose measuring principal–principal costs using dividend payout. In the case of small businesses, dividends may not necessarily be appropriate, e.g. for a non-company structured firm, and an alternative profit distribution metric is necessary.

An ANOVA is used to investigate whether the PA and PP variables are the same between businesses and whether for individual businesses they remain the same over time. Prior expectations are that neither of these two tests is likely to suggest constancy because industry and size effects in first instance, and market effects in the second instance, are likely to be confounding issues.

**ANOVA test**

The testable hypotheses for the proposed ANOVA are:

**Hypothesis 1:**

H₀: There is no difference in the mean agency costs of the different firms in the same year.

Hₐ: There is difference in the mean agency costs of the different firms in the same year.

**Hypothesis 2:**

H₀: There is no difference in the mean agency costs of the same business in different years.

Hₐ: There is difference in the mean agency costs of the same business in different years.

<td>296032.6</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Both hypotheses require a two tail test and are relatively straightforward. In Table 2 the ANOVA test results are reported for each company in Panel A and each year in Panel B. The total sum of squares, which measures the variation around the mean for each company (Panel A) and in each year (Panel B) differ in each instance and therefore the null hypotheses are not accepted. The ANOVA formally tests the hypothesis that they are all the same and neither hypothesis 1 nor hypothesis 2 can be accepted.

An advantage of panel data methods includes the use of data for which the span of time-series data is insufficient and would thus preclude the study of many hypotheses of interest. Other benefits include more powerful properties in the testing procedures compared to standard time-series methods. However, panel data can give rise to statistical problems in regression analysis. In particular, it is important to determine whether there are fixed effects present in the variables. Hausman's specification test or \( m \)-statistic differentiates between random and fixed effects models by testing for correlation between the variables (x) and the individual random effects (\( \varepsilon_i \)).

Table 3

Hausman test results

<table>
<thead>
<tr>
<th>Ratio</th>
<th>Prob&gt;chi2</th>
</tr>

</tr>
<tr>
<td>Assets to sales ratio</td>
<td>0.3189</td>
</tr>
<tr>
<td>Income ratio</td>
<td>0.5943</td>
</tr>
</tbody>
</table>

The results for the Hausman test are presented in Table 3. The general random effects model may be written:
Where \( i = 1, \ldots, N \) firms, \( t = 1, \ldots, T \) time period with \( k \) regressors in \( X_{it} \) and \( u_{it} \) there is a normal error term and \( Y_{it} \) is agency cost. The test statistic has a \( p > 0.05 \) for all three ratios so the null hypothesis of no correlation cannot be rejected and the random-effects model is appropriate for the PA and PP agency costs measures.

**PA and PP regressions**

PA and PP costs have been associated with various factors in previous studies. As noted above, it has been suggested that increases in block ownership decrease PA as the large shareholder monitors management more closely than dispersed shareholders do and consequently there is a higher level of goal congruence.

Regressions using the two PA metrics suggested by Ang, Cole and Lin (2000), viz. the ratio of operating expense to annual sales, and the ratio of annual sales to total assets as dependent variables, are estimated. The independent variables, which are either continuous or binary, fall into one of three categories relating to corporate structure, external monitoring and control variables.

**Panel regression analysis**

**PA agency costs**

The regression analysis is undertaken in three steps involving the analysis of panel data. The first step is to regress the ratio of operating expenses to annual sales on each of the variables while controlling for external monitoring. Step two is to regress the ratio of operating expenses to annual sales on each of the variables while controlling for ownership. Step three is to regress the ratio of operating expenses to annual sales with each of the variables described above. Table 4 presents the results for the operating expenses to sales.
measure of agency costs. The second group of regression analysis follows a similar three stage process using the ratio of sales to assets as the dependent variable. Table 5 presents the results for the sales to assets measure of agency costs and these are discussed below under findings.

**PP agency costs**

To examine the explanatory power of various variables relating to PP cost, a proxy for the proposed dividend payout metric of Faccio, Lang and Young (2001) is necessary as many small businesses do not use dividends as a method of distributing profit. The PP proxy, net income/number of working owners divided by total sales, is regressed against ownership structure, industry, and control variables.

The regression analysis follows a three step process similar to that used in the PA analysis above. Step one is to regress the profit per owner ratio with each of the variables while controlling for external monitoring. Step two involves regressing the profit per owner ratio on each of the variables while controlling for ownership. The last regression considers the profit per owner ratio relationship to the variables described above. Table 6 presents the results for the profit per owner ratio measure of PP costs, and these are discussed below under findings.

The sign-on debt in the above regressions indicates an increase in debt is associated with an increase in agency costs. This differs from the results of Ang et al. (2000). The extent to which debt holders will monitor the performance of small business remains an open question. Quasi-equity, i.e. loans from the owner(s), can represent a significant portion of debt (Cosh and Hughes, 1994). There is evidence to suggest that banks, as major external
financial providers for firms, use mechanical credit scoring and arbitrary covenants (Berger and Udell 2002, 2006). With larger businesses, and larger loans, relationship building is more pervasive but there is no clear evidence of close monitoring. Nevertheless, bank guidelines working on security and cash flow ratios are likely to have impact and this is reflected in the results.

The debt to assets ratio is highly significant, as shown in Tables 4 and 5, but the sign differs from the finding of Ang et al. (2000). Singh and Davidson (2001) find a significant positive relationship for leverage in their study of large companies while a study of small firms by Fleming et al. (2004) found a non-statistically significant positive relationship with operating expense ratio, and significant positive relationship with asset utilisation ratio. In order to investigate this further, the variable is subjected to testing of its stationarity. The convergence of a variable is analysed with a unit root test. Debt-to-asset ratio (D/A) differentiates between each business and the industry average D/A are analysed determining the level of convergence between each company’s D/A and the industry average.

The Levin, Lin and Chu (LLC) Test is appropriate for a common autocorrelation coefficient, i.e. a homogenous $\alpha$, and the null hypothesis is that each individual time-series contains a unit root against an alternative that each time-series is stationary:

$$\Delta p_{ij,t} = c_{ij} + \alpha_p p_{ij,t-1} + \sum_{h=1}^{K(j)} \beta_{hj} \Delta p_{ij,t-h} + \epsilon_{ij,t}$$

Table 7 presents the results for the LLC test. The test statistics indicate a high level of significance with P value $= 0.0000$. Therefore, the null hypothesis is not accepted indicating that each individual time series does not contain a unit root.
Table 7
Levin-Lin –Chu test results

<table>
<thead>
<tr>
<th>Coefficient</th>
<th>t-value</th>
<th>t-star</th>
<th>p&gt;t</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1.28059</td>
<td>-32.181</td>
<td>-18.24280</td>
<td>0.0000</td>
</tr>
</tbody>
</table>

An extension of the LLC testing, known as Im, Pesaran and Shin test (IPS), which handles heterogeneous value of $\alpha$, i.e. for different companies and different years, is also considered. The IPS unit root test allows for individual effects, time trends, and common time effects. The test considers whether all series are non-stationary and the null hypothesis is:

$H_0$: $\alpha_t = 0$ for $i = N_1, 1, ..., N$

$H_1$: $\alpha_t < 0$ for $i = 1, 2, ..., N$

The test allows for individual fixed effects and allows $\alpha_t$ to vary over the cross-section under the alternative hypothesis. Table 8 presents the results for the IPS test.

$$
\Delta p_{ij,t} = c_{ij} + \alpha_{ij} p_{ij,t-1} + \sum_{h=1}^{k} \beta_{ijh} \Delta p_{ij,t-h} + \epsilon_{ij}
$$

Table 8
Im, Pesaran and Shin test results

<table>
<thead>
<tr>
<th>t-bar test, N,T=(50,11)</th>
<th>Obs=450</th>
</tr>
</thead>
<tbody>
<tr>
<td>Augmented by 1 lags(average)</td>
<td></td>
</tr>
<tr>
<td>t-bar</td>
<td>cv10</td>
</tr>
<tr>
<td>-2.491</td>
<td>-1.640</td>
</tr>
</tbody>
</table>
The test statistics P value is 0.0000 indicating that the null hypothesis cannot be accepted and each individual time-series does not have a unit root. Therefore, no convergence of debt to asset ratio for the small unlisted companies to the industry average debt to asset ratio is supported.

**Findings**

The analysis confirms that PA cost is correlated with several variables that have been noted in previous studies. It is noted that in some instances, prior studies have presented confounding results typically reflected by a sign reversal. The sign is important in terms of whether the explanatory variables make a positive or negative contribution to PA cost. The finding in terms of ownership structure, shown in Tables 4 and 5, are consistent with Ang et al (2000), indicating that ownership structure is inversely correlated with the expense ratio and positively correlated with the asset utilisation ratio. Further, it can be seen from Tables 4 and 5 that PA is related to industry type. This is similar to the observation of Chrisman (2004) who notes that firm size is negatively correlated with the expense ratio and positively correlated with asset utilisation ratio. These observations align with Ang et al (2000) but they differ from those of Ward and Filatotchev (2009). Firm performance is positively related to the assets utilisation ratio reported in Table 5. This finding is consistent with Fleming et al (2004).

Also reported in Tables 4 and 5, is the relationship between PA and the maturity of the firm. It is found to be statistically significant, indicating that agency cost increases with the age of the firm, as reflected in a positive expense ratio and negative correlation with the asset utilisation ratio. This has the same sign as Ang et al who find a non-significant positive
relationship between firm age and expense ratio, and a non-significant negative relationship with assets utilisation ratio.

PA is significantly positively related to firm debt-to-assets ratio, with the statistics presented in Tables 4 and 5. This finding is consistent with Fleming et al (2004) but opposed Ang et al (2000) who propose that with more debt there is an increased external monitoring from banks or restriction on the free cash flow to management, thus lowering agency costs. In part, the accounting conventions result in measurement problems for debt and assets in small businesses. The adoption of international financial reporting standards (IFRS) in most countries, except the US, will assist in ensuring both debt and asset measures are market based. The difficulty caused by historical cost assets having low written down values and debt being at market value distorts the numbers and introduces an aging bias.

Table 9 presents a comparative summary of the findings relating to PA with those of some key prior studies.

PP agency cost is found to be correlated with variables noted in previous studies. The size of the business is positively correlated with PP as shown Table 6, indicating that as firms grow so too does the potential for PP costs. Jensen, Solberg, and Zorn (1992) noted this for publicly listed companies. Intuitively, it seems likely that as firm size grows more power will be vested with a managing owner who is able to expropriate profit to their own advantage. Next it is noted that industry factors play an important role, with some being more prone to PP costs than others, which is similar to the observation of Chrisman et al. (2004). As profitability declines and the surplus diminishes the opportunity to divert relatively more resources to the major owners decreases.
Table 9

</tr>
<tr>
<td></td>
<td>Year of operation in the industry</td>
<td>Positive relationship with expense ratio(10% significant) negative relationship with expense ratio (1% significant)</td>
<td></td>
</tr>
</tbody>
</table>
As shown in Table 6, the maturity of the business is negatively correlated with PP cost. This suggests that longer life businesses are not only profitable in a sustainability sense but also, exploitation by senior owner(s) does not occur. PP cost has a significant negative correlation with leverage. As the proportion of debt in the capital structure increases so too does the interest expense with associated demand on cash flow, and it appears this situation curtails the likelihood of a major owner diverting additional resources their own direction.

A summary statement is shown in Table 10.

Conclusion

The analysis provides the first robust empirical analysis of small businesses that are not stock exchange listed companies. Data availability is a significant issue and this impedes the research process in terms of exploring independent variables that might reasonably be expected to be available for listed public companies. The research indicates that both PA and PP agency costs are present in small business and in many instances these findings are consistent with prior research for listed businesses. However, one significant confounding factor is the differential tax rate applying to businesses versus individuals. Sole proprietorships and partnerships are taxed at the same rate as individuals while incorporated businesses in the sample have a lower rate than the top individual marginal taxation rate. The rational owner will endeavour to use the business to make as many payments of a personal nature as possible to lower the tax incidence and consequently push up the PA and PP cost measures. Prior studies have correctly noted that regulatory frameworks, with associated compliance costs and taxation incidence, impact upon the form of business structure.

The paper makes an important contribution to the understanding of agency cost in smaller businesses. It is apparent that institutional factors, such as differences in marginal taxation rates between individuals and various business forms, make it rational to structure small businesses in a tax efficient manner. Similarly, the extent to which personal emolument can be extracted through the firm as a tax deductible expense will tend to load the proportion of operating expenses to revenue. While these ideas have been previously articulated there has been no prior detailed analysis to establish the veracity of such contentions.

The analysis indicates there is considerable variability in the burden of agency cost and this raises the potential for regulatory and policy reforms that may enhance the productivity and growth in the sector. The PP cost has received no prior consideration and, based on the results, this is of considerable importance. The well- meaning parents who
encourage the second generation children to participate and then run the business are subject to both PA and PP cost burdens.

**Implications**

Agency cost has two components, typically referred to as PA and PP, and these require separate consideration. First, it is important to remove any taxation incentivisation for financial engineering in the small business sector. The distortion between equity returns and debt returns gives rise to a preference for quasi-equity and distorts the productive base and effective pricing of risk. The common requirement for personal guarantees for business financing similarly distorts the operational efficiency as personal risk is not limited, and in the absence of a gambling mentality risk, taking is reduced. The results tend to be found in unnecessary overhead loadings with very high bankruptcy costs impounded into the cost of capital.

Second, as the number of owners changes the potential for one managing owner or family group to expropriate the profit of other owners becomes more pronounced. The requirement for greater disclosure in financial reporting by all businesses the ensuing reduction in opacity will potentially reduce this distortion concerning the effective distribution of scarce capital resources. Similarly, the distortion between corporate and non-corporate structures in terms of taxation minimisation and agency costs will flow through to any computerised credit scoring application for small business banking and is likely to work against those with higher administration to revenue and lower revenue to asset ratios. The adverse selection risk is not apparent to proprietors and consequentially is distorting the flow of funding through a mispricing of risk due to poor signalling by small business.

The Role of Knowledge Management in SME Networks

Pietro Evangelista\textsuperscript{1,2}, Mario Raffa\textsuperscript{1,3} and Emilio Esposito\textsuperscript{1}

\textsuperscript{3} Naples Municipality, Development Department, Naples, Italy

Abstract
Knowledge Management (KM) is a critical area for small business managers in the today competitive environment. However, there is a general consensus in relation to the fact that the benefits of KM have not been fully exploited by small and medium sized enterprises and this is reflected in the literature gap in this field. Indeed, empirical studies have been rarely conducted on this topic. The main aim of this paper is to shed light on the KM practices in small firms. To this purpose, the paper presents the results of a questionnaire survey carried out in a SME network consisting of 25 companies operating in high-technology sectors and located in the eastern area of Naples City (Italy). Survey findings highlight the following points: a) the surveyed companies show significant KM needs; b) knowledge exchanged is mainly tacit; c) firms express the need for both internal and external KM systems enabling inter-firm collaboration for developing common projects; d) there are some relevant factors motivating the adoption of internal and external KM systems but also significant barriers.

1. Introduction

One of the most significant evolutions in the business environment over the past decade is the dawn of the new economy. The velocity and dynamic nature of markets has created a competitive incentive among many companies to leverage their knowledge assets as a means of creating value and achieving a competitive edge. The focus on knowledge management (KM) is a critical area also for small and medium sized enterprises (SMEs). In particular, the management of knowledge assets may provide small firms new tools for survival, growth and maintaining a sustainable competitive advantage (Omerzel and Antoncic, 2008).

There is a general consensus in business practices and academia on the fact that SMEs are falling behind large companies in developing KM practices and benefits of KM has not fully exploited by these firms. This is reflected in a literature gap where little research efforts have been carried out on this topic. Indeed, to date, there is an abundance of literature describing how various large companies are successfully practising KM, but the reasons why small firms
show poor usage of KM tools are still unclear. In fact, little empirical studies have been conducted to identify the factors influencing KM adoption in SMEs (Finkl and Ploder, 2009). In addition, there is a growing need for qualitative analysis of the effects of knowledge management practices of networked SMEs (Valkokari and Helander, 2007).

The main aim of this paper is to shed light on the KM practices in small firms. The paper presents the preliminary results of an empirical investigation carried out in a cluster of 25 firms located in the eastern area of Naples city (Italy). The most part of this cluster comprises small firms located in the same area but operating in different high-technology sectors. The methodology adopted has been organised into two main stages. Firstly, a literature review on KM and its usage in small business has been carried out. Secondly, the outcome of the literature review allowed to set-up a semi-structured questionnaire that has been validated in a number of focus group discussions involving SMEs’ managers, academics and consultants.

The paper is organised into seven sections. Following this introduction, a literature review on KM (section 2) and KM in small businesses (section 3) is provided. Section 4 describes the context of investigation, while the methodology used is detailed in section 5. The main findings emerging from the empirical survey are presented in section 6. Conclusions and recommendations are outlined in section 7.

2. Knowledge and Knowledge Management

Research on knowledge and knowledge management spans the disciplines of economics, information systems, organizational behaviour and theory, psychology, strategic management, and sociology. This diversity has contributed to the rapid advance of research in specialised areas of inquiry that investigate different aspects of organizational learning and knowledge management.

Knowledge management, like knowledge itself, is difficult to define as concepts and practices evolved quickly through the 1990s. Two main issues are evident in this evolving
path: i) knowledge is a critical resource, rather than land, machines, or capital (Drucker, 1993), and ii) organizations generally poorly managed it. If more attention were paid to creating, providing, sharing, using, and protecting knowledge, the promise was that organizational performance would improve (Earle, 2001).

Current definitions of knowledge reflect a range of standpoints. The following definition contains a comparatively broad approach because it includes a range of phenomena such as values, insight, and information: “Knowledge is a fluid mix of framed experience, values, contextual information, and expert insight that provides a framework for evaluating and incorporating new experiences and information. It originates and is applied in the minds of knowers. In organisations, it often becomes embedded not only in documents or repositories but also in organisational routines, processes, practices, and norms” (Davenport and Prusak, 1998).

An understanding of the concept of knowledge and knowledge taxonomies is important because theoretical developments in the knowledge management area are influenced by the distinction among the different types of knowledge. The literature offers a number of different knowledge taxonomies. Drawing on the work of Polanyi (1962, 1967), Nonaka (1994) explicated the most cited classification of knowledge distinguishing tacit and explicit knowledge dimensions. The author also views knowledge as existing in the individual or the collective. Other classifications (Alavi and Leidner, 2001) refer to knowledge as declarative (know-about or knowledge by acquaintance (Nolan Norton 1998), procedural (know-how), causal (know-why), conditional (know-when), and relational (know-with) (Zack 1998). Likewise, research in the domain of knowledge management seems fragmented.

According to Sveiby (1997) the expression “managing knowledge” appears for the first time in a context of artificial intelligence at the end of 1980s. Early research in the field of KM was interested on the possibility of using information technology to support the process
of individual learning. Again, in the artificial intelligence community, Wiig (1993) was one of the first scholars to recognise the limits of a primarily technological approach and he defined KM in term of creation, learning, sharing (transferring), and using or leveraging knowledge as a set of social and dynamic processes that needed to be managed (Iandoli and Zollo, 2007). Almost at the same time, Nonaka and his research group conducted a number of studies on the management of innovation processes in large Japanese companies. These studies together with the total quality management movement and the concept of continuous improvement, re-evaluate the overall role that human resources play at all levels in organisations discovering what was not yet obvious in organisational practice: the centrality of the individual in the knowledge creation process and the consequent need to recognise the person’s necessary level of competence and autonomy (Nonaka and Takeuchi, 1995). Most of the contributions in the vast literature on KM can be summarised to one of these two approaches or attempts to integrate the two perspectives (Iandoli and Zollo, 2007).

According to Davenport and Prusak (1998), most knowledge management projects have one of the following three aims:

a) to make knowledge visible and show the role of knowledge in an organization, mainly through maps, yellow pages, and hypertext tools;

b) to develop a knowledge-intensive culture by encouraging and aggregating behaviours such as knowledge sharing (as opposed to hoarding) and proactively seeking and offering knowledge;

c) to build a knowledge infrastructure—not only a technical system, but a web of connections among people given space, time, tools, and encouragement to interact and collaborate.

Bhatt, (2001) defined KM identifying the different phases in which a KM project may be organised. In fact, the author defined KM as a process of knowledge creation, validation, presentation, distribution, and application. These five phases in knowledge management
allow an organization to learn, reflect, and unlearn and relearn, usually considered essential for building, maintaining, and replenishing of core-competencies.

In a broad sense, Quintas et al. (1997) define knowledge management as the process of continually managing knowledge of all kinds to meet existing and emerging needs, to identify and exploit existing and acquired knowledge assets and to develop new opportunities. Interestingly, the author pointed out that KM refers to the management of all kind of knowledge, but only for developing new opportunities.

However, the KM definition suggested by Iandoli and Zollo (2007) has been considered the working definition for this paper as it simultaneously refers to objectives, knowledge involved, tools and phases of KM. According to this definition: “KM is the process of creating, capturing, and using knowledge to enhance organisational performance. It refers to a range of practices and techniques used by organisations to identify, represent, and distribute knowledge, know-how, expertise, intellectual capital, and other forms of knowledge for leverage, reuse and transfer of knowledge and learning across the organisation”.

As illustrated above, KM initiatives involve not only an implementation of ICT but also social and cultural facets. However, while ICT does not apply to all of the issues of knowledge management, it can support KM in different ways. In this sense, according to Alavi and Leidner, (2001), knowledge management systems (KMS) refer to a class of information systems applied to managing organizational knowledge. That is, they are IT-based systems developed to support and enhance the organizational processes of knowledge creation, storage/retrieval, transfer, and application.

3. Knowledge Management in SMEs

Although introducing knowledge management systems into SME is a particular challenge because of the limited resources of these kinds of companies (Herrmann et al, 2007), the
literature review on KM reveals that the most part of research in this field is focused on large companies. In fact, the understanding of the organizational theory and practice considerations of KM has mainly been derived from large company experiences. Consequently, the potential of KM seems not fully exploited by small firms and this is reflected in a literature void where little research contributions on this topic have been published. In addition, research on KM in SMEs highlights some relevant different features (Pillania, 2006 and 2008).

According to the review carried out by Thorpe et al (2005), research on KM in the SMEs context may be broken down into three distinct fields:

1. the knowledgeable SME manager or entrepreneur;
2. the knowledge systems and routines embedded within the context of the firm and their immediate networks;
3. the institutional and policy framework that is intended to support knowledge production within SMEs.

As asserted by Frey (2001), although major corporations have led the way in introducing and implementing KM, it is increasingly important for small businesses to manage their collective intellectual assets. In KM practices, issues that small businesses will face will not be simply a scaled-down replica of large-company experiences (Sparrow, 2001). Desouza and Awazu (2006) discuss five key peculiarities that differentiate knowledge management practices in SMEs and larger companies:

1. in SMEs there is lack of explicit knowledge repositories. Instead, each manager/owner acts as the knowledge repository.
2. Common knowledge possessed by members of the SMEs is deep and broad. This common knowledge helps in the organization of work by easing issues of knowledge transfer, sense-making, and application.
3. SMEs by their nature and due to deliberate mechanisms are skilled at avoiding pitfalls of knowledge loss. The close social ties between members of the SME act as a deterrence against employees leaving the business. In cases where employees do leave the business, there are plenty of available knowledge resources that can be mobilized to quickly fill the void.

4. SMEs have a knack for exploiting foreign sources of knowledge. Since they are resource constrained, and cannot spend efforts to create knowledge, they look outside the organization for knowledge.

5. SMEs knowingly or unknowingly, manage knowledge the right way – the humanistic way. Technology is never made part of the knowledge management equation. The use of technology in an SME is mostly limited to acts of automation (such as the use of cash registers) and at times for informative purposes (storing of employee contact information in databases).

Similarly, McAdam and Reid (2001) firstly describe the key dimensions of KM (knowledge construction, knowledge embodiment, knowledge dissemination and knowledge use/benefit) and then, for each dimension, conduct a comparison between large firms and SMEs.

Sparrow (2001) indicates four components that figure strongly in small firm knowledge projects:

- the appreciation of personal and shared understanding;
- knowledge bases and knowledge systems;
- the integrated and contextualized action needed for knowledge projects in SMEs, and
- the knowledge and organizational learning processes in SMEs.

The author also suggests an emergent model of approaches towards developing knowledge management practices in SMEs. The model has as its most central tenet, the
assertion that KM development in SMEs needs to be supported through a process that recognizes and incorporates the current thinking and priorities in the knowledge project.

Egbu et al. (2005) highlight that knowledge generated in SMEs is tacit in nature due to various reasons. In the context of SMEs some elements of KM are practiced but in an ‘ad hoc’ fashion. Indeed any technological infrastructure that is put in place to support KM must be adapted to the organisation’s needs and not the other way round.

Another stream of KM research regards factors that can influence the success of KM implementation. Also in this area, most of research efforts are heavily focused on large companies as early adopters and superior performers of KM were large and multinational corporations. As such, existing factors are mainly large companies oriented, thereby reflecting their situations and needs. Directly applying these factors into the SMEs environment may not be sufficient without an understanding of their very own and specific conditions (Wong, 2005). By integrating the common factors and introducing some new ones, Wong (2005) and Wong and Aspinwall (2005), propose a more comprehensive model for implementing KM in SMEs based on the following 11 factors:

• management leadership and support;
• culture;
• IT;
• strategy and purpose;
• measurement;
• organisational infrastructure;
• processes and activities;
• motivational aids;
• resources;
• training and education; and
• human resources management.

The above set of critical success factors is important because of it can act as a list of items for SMEs to address and deal with when accomplishing KM. This helps to ensure that essential issues and factors are covered when small firms are planning and developing a KM strategy. It can also provide a basis for them to evaluate their KM practices (Wong, 2005).

4. The Context of Investigation

The empirical investigation on which this paper is based has been conducted in the East Naples high-tech enterprise system (ENS). This network of firms has been established in March 2007 and it comprises 25 companies. The total number of ENS employees is about 3,000 and the total turnover is about 400 million Euros in 2008. The ENS mainly consists of SMEs as shown in table 1. In the table, the latest EU definition of SMEs proposed by the EU Commission has been used (European Commission, 2005).

Table 2 shows that ENS the most part of firms operates in the aerospace and ICT sectors. It is worth to outline the working mechanisms of ENS. On the basis of a specific market opportunity, a firm proposes a project and it launches a call for adhesion. The firms that joint the project create a network inside ENS. They select a coordinator and develop the project. In this way, ENS is characterised by a set of peer temporary relationships orientated to specific projects. It is a dynamic network in which project collaboration relationships are continuously formed and reformed.

5. **Methodology**

After the literature review, a questionnaire survey has been conducted. The main aim of the survey is to shed light on the most relevant features characterising the usage of KM in ENS firms. The survey methodology has been organised into the following five steps:

*a) Definition of basic survey objectives and preparation of the draft questionnaire.* In this phase a draft version of the questionnaire has been prepared together with the basic survey objectives.
b) Establishment of focus groups. In order to test the suitability of the basic survey objectives and comprehensibility of the draft questionnaire a focus group involving 8 experts with different competence and professional background was established. The focus group has been developed in three different phases. Firstly, the topic investigated has been presented in order to make focus group participants familiar with it. Secondly, the draft questionnaire has been submitted to the panellists in order to get their useful feedback and comments. Finally, panellists’ remarks have been discussed in a plenary session.

c) Re-focussing of survey objectives and questionnaire. On the basis of feedback received during the focus group discussion, the questionnaire has been finalised. Most of the questions included in the questionnaire are based on a Likert scale ranging from 1 to 9. Some other questions allow more qualitative answer in order to allow respondents to express their own personal opinion.

d) Test of the questionnaire. In this step, the final version of the questionnaire has been tested through 3 pilot interviews carried out in ENS firms.

e) Survey implementation. The survey has been conducted in spring 2008. The total number of respondents is 18 out of 25 companies with a response rate of 72%. The questionnaire has been submitted during face-to-face interviews involving at least two managers with different skills and role (e.g. a manager involved in the strategic firm decisions making process and a manager involved in the operation management). This allowed obtaining both strategic and operational perspectives.

In order to have a more comprehensive picture of the East Naples high-tech enterprise system, information from complementary sources (e.g. company websites, company reports and industry magazines) have been collected and analysed.

6. Findings
Firstly, according to the definition of KMS provided by Alavi and Leidner (2001), the survey indicated that the vast majority of the sample firms (83%) have a KMS in place (see figure 1).

![KMS adoption](image)

73% of these companies adopt an internal KMS aimed at supporting knowledge management inside the firm. KMSs supporting the internal and external management of knowledge flows are implemented only in 4 firms (27% of 15 firms). This result is consistent with the tools used by ENS firms for KMS implementation (see figure 2). The most widespread forms of KMS implementation are through the Internet website and work teams. In fact these are relatively simple tools that fit the needs of managing knowledge inside small firms. The high importance attached to work teams also suggests that, in high technology sectors, in addition to ICT, interactions and interpersonal relationships are a fundamental tool for exchanging and sharing knowledge, as suggested by the literature.

![Tools for KMS implementation](image)
Nevertheless, advanced and structured KMS equipped with a document management system, data mining, and decision support systems are rarely used. These tools are more suitable for the implementation of external and internal KMSs as they support knowledge management both inside and outside the firms.

Although only 4 firms use internal and external KMS, almost all firm investigated claimed for wider KMSs to support project collaboration relationships. These systems enable KM practices not only inside a single firm, but also among firms involved in a common project that continuously need to exchange and share critical knowledge. For this reason, the benefits of a KMS enabling project collaboration relationships have been analysed (see figure 3). In the figure the average value of importance for each expected benefit is reported.

The figure interestingly shows that internal and external KMSs may have a positive impact not only on the innovation and the operational management, but also on the identification of the market opportunities. These features further clarify the potential support that internal and external KMSs can provide to support project collaboration relationships. In fact, the exploitation of market and innovation opportunities are the main aim of the common projects carried out by ENS firms. In this context, operational management is a fundamental tool that allows projects to be implemented effectively.
However, a number of barriers to KMSs implementation have been indicated (see figure 4). Interestingly, technological barriers and tacit nature of knowledge exchanged are the less relevant barriers. This may be explained considering that in the SMEs context, work teams allow sharing informal knowledge. Nevertheless, the unavailability of partners to share knowledge and the need to protect critical information are the most relevant barriers. This suggests that SMEs investigated seem oriented to preserve their own intellectual assets from the possible opportunist behaviour of potential partners.

Another aspect investigated relates to information that companies are willing to share through the adoption of a KM platform as shown in figure 5. This platform may assume the structure of a complex knowledge base in which ENS firms involved in different projects may share critical information.
The most important information that firms are willing to share are related to linkages with institutions and funding opportunities. This answer has been motivated by the lack of resources in SMEs that traditionally prevent these firms to manage effectively relationships with local authorities. Other important information are related to market. Firms attach significant importance to information about market features and opportunities because of they have to be able to recognise and exploit opportunities faster and more effectively in current dynamic business context. Indeed, as knowledge assumes a critical importance in new product/service development, information of this kind are critical to be shared. Another interesting issue concerns the human resources management. In fact, as shown in the above figure, a KM platform can provide useful tools both in recruiting and training employees and new staff. Finally, ENS firms show a low interest in sharing information about management control systems, administrative issues and quality management. This may be explained
considering that these information are generally firm specific and they don’t need to be shared for the effectively development of common projects.

7. Conclusions and Recommendations

This paper attempts to explore KM practices in small firms through an empirical investigation carried out in a set of 18 SMEs located in the eastern area of Naples. The main preliminary findings of the survey indicate significant KM needs of the surveyed companies. In addition, it has been found that ENS firms adopt predominantly internal KMSs using simple ICT tools. The surveyed firms also show the need for wider (external) KMSs enabling inter-firm collaboration in developing collaborative projects.

On the basis of the above findings, it is possible to outline some recommendations for SME managers. The survey indicates the following three areas for developing KM practices.

i) Management of market knowledge. KMS may support relationships with customers in order to facilitate both the exchange of relevant information and improving communication with them. Furthermore, a KMS should support the retrieval of information about market opportunities.

ii) Management of technology knowledge. This is a critical area for firms operating in high technology sectors. KM tools should support the circulation of critical information about know-how and technology. In the ENS context this appears particularly important as firms participate in collaborative projects aimed at developing new products and services. Practical examples may be the virtual sharing of design tools (e.g. CAD, CAE e CAM) and management and control systems (e.g. MRP and ERP) related to the same project.

iii) Management of relational knowledge. In developing and managing collaborative projects it is important to have in place tools facilitating the collaboration among participants. Nevertheless, the adoption of these tools may be inhibited by the
need to protect intellectual assets and cultural barriers. The ultimate goal of KMS in SME networks context should be to achieve an appropriate balance between individual needs and project partnership.

Abstract
Governance is now a major area of study in the finance, accounting, and management disciplines that draws on a number of research frameworks and is attracting an increasing level of attention within the small business and entrepreneurship domains. This paper uses research frameworks from those disciplines to identify and analyse difficulties in making simplistic assertions based on large firm considerations about the benefits and prescriptions for good governance activities in small firms.

These difficulties exist primarily because governance in small firms is driven by a different set of structures and process than those that apply to large firms. In the large firm governance literature there is recognition that governance can be approached from a control perspective or from a collaboration perspective. While these theoretical perspectives may hold in small firms, the prescriptions (around the Board of Directors primary role, board structures, executive stock ownership and the market for corporate control) need to be viewed with a different outcome in mind. Small firms may be able to achieve governance outcomes without strict internal and external structures and processes.

This paper takes a normative perspective as a precursor to establishing empirical approaches to evaluation. While the limited analysis identifies contextual variations, this does not mean small firms have an excuse to ignore good governance characteristics or that regulators can totally ignore governance requirements for small firms. However, the analysis indicates that these must be considered in an appropriate contextual framework and not merely be transferred from the large firm context. An important consequence of the research is the need for researchers and policy makers to develop a clearer understanding of the what, why, when and how of governance in privately owned firms.

Introduction
As suggested by Gibson (2009), “governance is now a major area of study in the finance, accounting, and management disciplines that draws on a number of research frameworks and is attracting an increasing level of attention within the small business and entrepreneurship domains”. This paper uses research frameworks from those disciplines to
identify and analyse developments in the field and to identify difficulties in making simplistic assertions based on large firm considerations about the benefits and prescriptions for good corporate governance activities in small firms.

This paper takes a normative perspective as a precursor to establishing empirical approaches to evaluation. It relies initially on the governance literature to identify assumptions and consequent good governance practices in the large firm environment. Entrepreneurship and small business literature that identifies the different contexts existing in small firms are then presented. Finally an analysis of the consequences of relying on the assumptions and processes from a large firm perspective in a small firm context is used to identify the variations that might be appropriate.

The Nature of Governance

Governance has a macroeconomic and country wide public policy dimension wherein policy makers within countries and regions seek to develop a framework where good governance practices are implemented in order to enhance the economic performance of the country or region (see, for example, Iskander and Chamlou, 2000). In part, such policy development is informed by an understanding of governance from a microeconomic focus at the firm level, and it is at that level that this paper focuses its arguments. The conclusions are of course expected to have influence at the broader policy level.

(Note that firm is used throughout this paper because while it is probably true that the vast majority of large firms are corporations that may not be true in smaller firms, many of which choose to operate as sole traders or in partnerships. The expression corporate governance implies a restriction to firms that have a corporate structure, yet many of the principles and processes discussed under the governance rubric also have potential application to firms structured in other ways.)
At the firm level, the most widespread definition (Mason and OMahony; 2008) is that of the Organisation for Economic Cooperation and Development (OECD) which, after replacing company and/or corporation with firm, describes governance as:

… a set of relationships between a firm’s management, its board, its shareholders and other stakeholders [that] provides the structure through which the objectives of the firm are set, and the means of attaining those objectives and monitoring performance are determined (modified from OECD, 2004, p.13)

Such definitions are used to determine best practice and, according to Ramaswamy, Ueng and Carl (2008) the core values of an efficient system of firm level governance include:

- Fairness: Protecting shareholder rights and ensuring the equitable treatment of all shareholders including minority and foreign shareholders.
- Responsibility: Recognizing the rights of all stakeholders as established by law, and encouraging active co-operation between the corporation and stakeholders in creating wealth, jobs and sustainable enterprises.
- Transparency: Ensuring adequate and timely disclosures of all material matters regarding the company, including its financial situation, performance, ownership and governance structure.
- Accountability: Providing for the strategic guidance of the company, effective monitoring of management and its accountability to the stakeholders.

Other aspects of governance that are also often included as determinants of best practice (see King, 2002) are:

- Discipline: commitment by senior management to adhere to behavior that is universally recognized and accepted to be correct and proper.
- Independence: mechanisms to avoid conflicts of interest.
- Social responsibility: responsive to social issues placing a high priority on ethical standards.
This OECD (2004) definition and the associated indicators of good practice have evolved from a number of theoretical and practical outcomes primarily developed in the context of large firms and discussed in the next section.

**Theoretical Approaches to Governance**

As suggested by Sundaramurthy and Lewis (2003) “… governance is an increasingly provocative topic” (p.397). To highlight this, they focus on a paradox framework that highlights underlying tensions between proponents of control approaches (exemplified by agency theory) and proponents of collaborative approaches (exemplified by stewardship theory). Figure 1 provides a schematic representation of the Sundaramurthy and Lewis (2003) framework. It highlights the extremes of approaches to governance. These extremes range, in respect of underlying assumptions, from a focus on individualistic opportunism engendered in an environment of mistrust to a trust based environment focusing on collectivist cooperation. In respect of prescriptions for practice the focus shifts from the exercise of discipline to control self serving behavior to the provision of service based on commitment to the organization.

These dichotomous extremes are also endorsed by Letza, Kirkbride, Sun, and Smallman (2008) who present an “orthodox view” (with a focus on adding value for stockholders / shareholders) and an “alternative view” (where the focus is on adding value for the benefit of all firm stakeholders). Elaborations around these extremes have manifested in a number of theories that, in respect of control, include agency theory, the market myopia view and to some extent the abuse of executive power view. In respect of the collaboration dimension, approaches have moved to incorporate elaborations that include the extension of the executive power view into a resource dependence perception of stewardship theory and a resources provision focused stakeholder theory.
While figure 1 provides a useful characterisation of the extremities of this continuum of approaches, it still hides that more expansive range of approaches. Following Letza et al. (2008), Abor and Biekpe (2007), and Mason and O’Mahony (2008), the following discussion focuses on an expanded agglomeration of other approaches including: as agency / control approaches - agency theory and a myopic markets perspective; and as stewardship / collaboration approaches – an executive power view, a resource dependence view and stakeholder (resource provision) theory.

At the core of the agency/control approaches are, as Abor and Biekpe (2007) acknowledge, the theoretical underpinnings that come from the classic thesis, “The Modern Corporation and Private Property” by Berle and Means (1932). Central to that thesis is the

(Source: Sundaramurthy and Lewis, 2003, p.398)
fundamental agency problem associated with the separation of ownership and control in a firm.

The agency theory approach regards the central problem of corporate governance as the control of self interested managerial behaviour in a principal-agent relationship (Letza et al., 2008). Agency theory is centred on agency costs (monitoring expenditures, bonding expenditures and residual losses) associated with the self interest of agents (managers). Share prices reflect these agency costs and they need to be reduced to increase firm value. Governance is consequently focused on reducing agency costs by determining the most efficient contracts governing the principal-agent relationship and the optimal incentive scheme to align the behaviour of the managers with the interest of owners (Letza et al., 2008).

The myopic market perspective is a variant of the principal-agent model that questions its pre-occupation with short-term gains in returns, profit, share prices and other performance measures induced by market pressures (Letza et al., 2008) that often force managers to behave in a way divergent from the maximisation of long-term wealth for shareholders (Blair, 1995). The governance focus from the myopic market perspective is on the development of an environment in which shareholders and managers are encouraged to share long-term performance horizons rather than focus on short term gains.

Stewardship/collaboration approaches are not predicated on opportunistic behaviour but expect managers ‘‘to do a good job [and] to be a good steward of corporate assets’’ (Donaldson and Davis, 1991). Governance is focused on ensuring structures and processes that facilitate performance, because it is performance that defines the success and achievements of management that improve value.

Overlapping the control/collaboration distinction is the abuse of executive power approach. The underlying premise of this view is that current institutional restraints on
managerial behaviour, rather than preventing managerial abuse of power are means through which managers can legitimise their abnormal overpayment. Consequently the supporters of this model propose statutory changes in corporate governance that allow executive management the power to develop the longer term business, while holding them rigorously responsible to all stakeholders involved in the business. The basic objective of corporate governance in this guise is managerial freedom with accountability (Letza et al., 2008).

The focus on managerial freedom that is central to the avoidance of the abuse of executive power is also central in the resource dependence approach (Pfeffer, 1973). Here however the focus is on non-executive directors (through the board) enhancing the ability of a firm to protect itself against the external environment, reduce uncertainty, or co-opt resources that increase the firm’s ability to raise funds or increase its status and recognition (Letza et al., 2008). There are four primary types of broadly defined resources provided by boards of directors. These are: advice, counsel, and know-how; legitimacy and reputation; channels for communicating information between external organizations and the firm; and, preferential access to commitments or support from important actors outside the firm (Pfeffer and Salancik, 1978). This resource facilitation role is achieved by board of directors mainly through their social and professional networks (Abor and Biepke, 2007).

The approach to governance that is most widely divergent from the control approaches is stakeholder theory. At its core is the proposition that a wider objective function of the firm (incorporating all stakeholders) is more equitable and more socially efficient than one confined to shareholder wealth (Keasey, Thompson and Wright, 1997). The well-being of other groups such as employees, suppliers, customers and managers, who have a long-term association with the firm and therefore a “stake” in its long-term success, is recognised. The goal of corporate governance is to maximise the wealth creation of the corporation as a whole (Letza et al., 2008). As Abor and Biepke (2007) point out “the stakeholder approach also
considers the provision of resources as a central role of board members” (p.289-90). The board of directors is seen as a place where conflicting interests of stakeholders are mediated.

Clearly these approaches to the underlying assumptions, and therefore required actions, in understanding and facilitating appropriate governance show a wide range of perspectives from a tight control of managerial activity in the interests of shareholders to a broader understanding of management pursuing interests of the firm that consider all stakeholders. Although, even though stakeholder theory embraces a wider set of interested economic actors, it is still regarded by some as too narrow because it lacks the analytical capacity to account for social embeddedness and legitimacy of governance (Mason and O’Mahony, 2008).

This brief review of theoretical approaches indicates that there are still a number of unresolved issues that in many respects hinge on the underlying perception of the firm as either a structure to facilitate the absentee management of shareholder interests in an environment of managerial self interest, or as a structure to facilitate management for the benefit of all stakeholders in an environment of responsible stewardship. The following section considers the manifestation of these theories in our understanding of the large firm environment.

**Governance in the Large Firm Environment**

Brunninge, Nordqvist, and Wiklund (2007) indicate that there is a broad coverage of many issues in contemporary corporate governance literature. The focus however appears to be primarily on control approaches, covering issues such as the relationship between owners, boards of directors, top management teams and executive officers, as well as the remuneration of executives at different levels. According to Brunninge *et al.* (2007) a problem with much of this governance research is a primary focus on one type of governance
mechanism, most commonly the board, while excluding others. This focus is reflected in Abor and Adjasi’s (2007) identification of the three main corporate governance themes, two of which focus on boards: the adequate separation of management from the board; and, ensuring that the board has an effective mix of independent and non-independent directors. (The third main theme is establishing the independence of the auditor and therefore the integrity of financial reporting, including establishing an audit committee of the board.)

What is also recognised as an important structural difference is the variation in board structures across cultures, “ranging from two-tiered supervisory and management boards in Germany, to insider-dominated boards in Japan, to mixed boards in the United States” (Li and Harrison, 2008, p.607). Not surprisingly these different cultural environments are also associated with different underlying theoretical perspectives. Letza et al. (2008) argue that the efficiency of the stakeholder approach draws on Japan and Germany as examples of successful industrial societies in which extensive stakeholder involvement with the firm is pervasive, and typically, corporate goals are defined more widely than shareholders’ profits.

Finally there are a number of governance practices that are reflected in broader research dimensions such as that of contingency theory. Sundaramurthy and Lewis (2003) indicate for example: the nature of resources and information demanded may influence the appropriate mix of insider-outsider directors (Daily and Schwenk, 1996); and, the financial institutions represented on a firm’s board may affect the amount and type of financing obtained (Stearns and Mizruchi, 1993; Claessens, Djankor, Fan, and Lang, 2002). Also identified is the importance of the data collection and reporting system (including the financial reporting system) that informs stakeholders (including debt providers, non-working owners, family members etc. as well as shareholders) about the outcomes of governance processes (Uhlaner, Floren and Geerlings, 2007).
These brief insights indicate that, while there is some recognition of the existence and use of collaborative stakeholder approaches in practice, most large firm research into governance structures and processes are still focused on control approaches such as agency theory with a focus on board structures and practices.

**Governance in the Smaller Firm Environment**

There has in recent years been an extension of governance research into the small firm area (Brunninge et al., 2007). As is often the case the focus of such research has been influenced by large firm findings and has also been primarily aligned with the control approaches. This is a particularly serious shortcoming in studies of small firms where firms are closely held and governance issues more entwined. This means that in small firms ownership, board membership (if they exist), and top management often overlap. Recognition of these shortcomings has seen emerging research that draws on and integrates an array of theoretical perspectives from both economics and other social science disciplines (Uhlaner, Wright and Huse, 2007) including those alternate governance approaches identified earlier.

As elaborated by Gibson (2009), Uhlaner, Floren, and Geerlings (2007) identify the following as organisational contexts that are issues to be considered in researching governance in privately held firms.

*Institutional contexts* - capturing cross-cultural and country differences

*Sector characteristics* – including variations across different industry sectors because of different technologies, patterns of ownership, the nature of resources, and differing competitive environments

*Ownership structure* - understanding variations that might exist in the proportion of ownership of privately held firms (for example, by individuals, employees and/or
family members) and how those proportions influence and are influenced by the structure and scope of governance.

Life-cycle – understanding the influence on governance structures and scope

Firm size – recognizing that governance structures and processes are likely to be less diverse and less complex and less formalized in very small firms but increase in complexity as firm size increases.

Gibson brings together these suggestions by Uhlaner, Floren, and Geerlings (2007) and others in the research framework presented in Figure 2. Within the figure there is identification of principal structures, processes and outcomes as well as allowance for influencing contingencies. Prepared with a small firm focus it proposes recognition of broader outcomes than owner wealth maximization and the different contextual influences on structures but still acknowledges a role for governance processes in small firms.
Notwithstanding these expectations, much of the research in small firm governance still reflects that in the large firm arena. As Uhlaner, Floren, and Geerlings (2007) indicate a lot of attention to corporate governance in privately held firms has focused on the role of boards.
Interestingly, much of the empirical evidence from studies of the selection and composition of board members in small companies seems to support the view that boards – on average – are, unlike boards in large firms, largely passive entities (Gabrielsson, 2007). For example, surveys of board practices have reported that small companies have relatively few directors on their board, ranging between three and seven members, and with the possibility that there may be one or two family members on the board (Corbetta and Tomaselli, 1996; Cromie, Stephenson, and Monteith, 1995). Where there is an outside director, this is often a person who has a close connection to the business, such as the family attorney, a banker, or a close friend of the owner (Corbetta and Tomaselli, 1996; Rosenstein, 1990). The board is therefore a formal but primarily passive entity (Gabrielsson, 2007). This is not surprising when the context is considered because “[i]n most [small firms] … owners … have direct and detailed insights into internal processes of the firm. As a result, there is less need for the control function of the board” (Brunninge et al., 2007, p.297). Hence, while boards may be an important governance structure in large publicly traded firms they may not be so important in small privately owned firms (Gibson, 2009) and our understanding of governance in small firms needs to reflect this contextual difference.

There is however a growing body of research that considers the benefits of boards beyond simple control concepts and supports the existence of boards in small firms from a collaboration perspective. Central in this research is the existence of external board members who can assist in making better decisions, attracting better resources (Abor and Adjasi, 2007), and enhancing strategic change. This approach is supported by research results. For example Brunninge et al. (2007) support the proposition that “governance variables related to ownership, the board of directors and the top management team all affect strategic change and that it is important to examine the interaction effects of these governance mechanisms” (p.295). More specifically their results indicate that it is possible to facilitate strategic change
by introducing governance mechanisms that increase the strategic capacity and competence of the firm (p.304). Gabrielsson (2007) supports the influence of this growing stream of research which has shown that active and empowered boards in small firms can provide assurance to critical strategic issues facing their operations while protecting their assets.

There are other structural mechanisms that have attracted some research interest is the data collection and reporting system that informs stakeholders (including debt providers, non-working owners, family members etc. as well as shareholders) about the outcomes of governance processes (Uhlaner, Floren, and Geerlings, 2007). The nature of the small firm is that reliance is often on informal mechanisms in which, if they exist at all, financial systems are extremely rudimentary (Gibson and Cassar, 2002). However, there is also acknowledgement that good corporate governance practices (such as enhanced financial systems) assist small firms in improving their prospects of obtaining funding from investors and financial institutions (Abor and Adjasi, 2007).

Again, while brief and selective, this overview indicates that research involving governance in small firms is supporting the existence of contextual differences that indicate different structures and processes are required to those of large firms although there are still clear benefits to be achieved by following some of the lessons learnt in larger firms. There still appears, however, to be too great a consideration of practices that comply with control approaches as discussed in the following section.

Consequences of Applying Large Firm Approaches in the Small Firm Environment

As indicted in the previous discussion, while the theoretical perspectives may hold, the prescriptions for governance in small firms need to be viewed with a different outcome in mind. Small firms may be able to achieve governance outcomes without strict internal and external structures and processes. Similarly the more detailed prescriptions for good
governance practice of discipline, transparency, independence, accountability, responsibility, fairness, and social responsibility (King, 2002) are likely to be influenced by different contextual settings in small firms.

As Abor and Biepke (2007) suggest, it is tempting to believe that corporate governance would not apply to small firms since the agency problems are less likely to exist. Certainly from a control perspective, small firms tend to have a less pronounced separation of ownership and management than larger firms. However, as discussed earlier, there are broader approaches than that focused on control. The collaboration approach with a focus on stewardship, resource management and stakeholders does appear to offer benefits to small firms that are not evident in the control approach.

In spite of such suggestions, there continue to be calls for the application of large firm corporate governance practices and policies in small firms. As Corbetta and Salvato (2004) suggest, the ongoing tendency toward improving board functions within publicly listed firms will extend to small firms by mimicry and institutional pressures. Clarke (2007) expresses the same concerns when arguing “it is assumed that the rules, norms and best practice [related to a contemporary Australian corporate governance project] will automatically filter down to [small firms]” (p.7). The difficulty for small firms is that neither resources nor practical guidance are offered to their multi-tasking managers and directors charged with corporate governance compliance. Policy reforms affected small firms disproportionately, as their key personnel are stretched to providing compliance and monitoring, in addition to maintaining the ongoing management of firms. Such circumstances are both politically unfair and economically inefficient (Clarke, 2007).

In addition to the issues above, it is also useful to remember that the competitive edge of small entrepreneurial firms lies in their creativity and innovation and it would be disastrous
should corporate governance dictates undermine value creation efforts (Abor and Adjasi, 2007).

Conclusions

While the theoretical perspectives of governance may hold, the prescriptions for small firms (around the Board of Directors primary role, board structures, executive stock ownership and the market for corporate control) need to be viewed from a collaborative approach and with a different outcome in mind. Small firms may be able to achieve governance outcomes without strict internal and external structures and processes. Similarly the more detailed prescriptions for good governance practice of discipline, transparency, independence, accountability, responsibility, fairness, and social responsibility (King; 2002) are likely to be influenced by different contextual settings in SMEs.

This paper has taken a normative perspective as a precursor to continuing the empirical evaluation of appropriate practices in small firms. It has relied on the governance literature to identify assumptions and consequent good governance practices in the large firm environment. Entrepreneurship and small business literature that identified some of the different contexts existing in small firms have then been presented. Finally an analysis of the consequences of relying on the assumptions and processes from a large firm perspective in a small firm context has identified variations that might be appropriate.

While the results identify contextual variations that show small firms to be different to large firms in respect of governance, this does not mean small firms have an excuse to ignore good governance characteristics or that regulators and policy makers can totally ignore governance requirements for SMEs. However, the analysis indicates that these must be considered in an appropriate contextual framework and not merely be transferred from the large firm context. An important consequence of the research is the need for researchers and
policy makers to develop a clearer understanding of the what, why, when and how of governance in privately owned firms.

I. INTRODUCTION

Recently, Korean government formulated and executed many policies for vitalizing SMEs by promoting their cooperation with large firms (mainly vertical buyer-supplier cooperation). These policies, however, focused mainly on economic performance of individual firms and also the lack of strategic and network approach. To overcome this limitation, this study tries to explain performance of individual firm from the perspective of business ecosystem. Business ecosystem is defined as "loose networks of suppliers, distributors, outsourcing firms, makers of related
products or services, technology providers, and a host of other organizations, which affect, and are affected by, the creation and delivery of a company's own offerings" (Iansiti and Levien 2004b). Loose networks imply that we must consider loose-tie networks (e.g., third-tier networks, potential suppliers from same or different industries) as well as strong-tie networks (e.g., first-tier suppliers) (Song, Kim, and Rhee 2009).

A company is not only a member of a single industry but also a part of a business ecosystem that crosses a variety of industries. For example, Apple Computer is the leader of an ecosystem that crosses at least four major industries: personal computers, consumer electronics, information, and communications. In a business ecosystem, companies co-evolve capabilities around a new innovation: they work cooperatively and competitively to support new products, satisfy customer needs, and eventually incorporate the next round of innovations (Moore 1993). Therefore, the performance of a firm is derived from something that is much larger than the companies themselves: the success of their respective business ecosystems.

The leader in a business ecosystem can increase ecosystem productivity by simplifying the complex task of connecting network participants to one another or by making the creation of new products by third parties more efficient. It enhances the robustness of an ecosystem by consistently incorporating technological innovations and by providing a reliable point of reference that helps participants respond to new and uncertain conditions, and encourage ecosystem expansibility (niche creation) by offering innovative technologies to a variety of third-party organizations (Iansiti and
Levien 2004b). The leader can realize these ecosystem goals by providing so-called platforms for ecosystem members. A platform is a set of solutions to problems that is made available to the members of the ecosystem through a set of access points and interfaces (Iansiti and Levien 2004a). Ecosystem participants use this platform to build its own offerings. Therefore a platform is a "package of resources" wherein a leader company shares values with its ecosystems and/or other members (Kim & Song, 2008). Apple's iPod is creating a myth of the 21st Century through the externality of a network created based on platform leadership (Kim 2009).

This study extends the findings of Iansiti and Levien (2004a, b). First, the success of SMEs' cooperation with large firms might be dependent partly on whether their business ecosystem is healthy or not. Thus, we tested whether the healthiness of a business ecosystem affect the performance of SMEs through collecting data from Korean suppliers. Second, this study explores whether and how each of the ecosystem indexes contributes to business performances differently over the developmental stages of a firm. This study built a model that explains the process in which the operating profit of SMEs is determined by the healthiness of a business ecosystem: productivity, robustness (stability), and niche creation (expansibility).

II. BUSINESS ECOSYSTEM

Kim (2009) used "flower-honeybees" metaphor to explain how a business ecosystem works. There are two types of interaction between a flower-the platform-and honeybees-ecosystem members. The first type of interaction is when
honeybees focus on making their own honey using the flower. This is similar to the ‘standalone’ business model where honeybees fly around and use flowers to create their own honey and sell the honey to earn money. The second type is where the honeybees focus on supplying moisture so that the honeybees and flowers come together for the flowers to produce fruits. This becomes the source of strength that enables fruits to create flowers and evolve into an ecosystem of the next generation. The platform model can evolve and develop in the long term only when it becomes a model that produces fruits (Kim 2009).

Platform is the core of the business ecosystem approach in expanding and developing mutually beneficial cooperation between small-to medium-sized companies and large corporations. The strength of a platform grows in the market in tandem with an increase in the number of business partners of the platform. This is the same as the relationship between flowers and honeybees. If honeybees suddenly disappear in earth, the ecosystem of the earth will be placed in danger. If the number of honeybees, which help to provide moisture, decreases, in ey dct, the plants will not be able to bear fruit. In cooperative relationship between small-to medium-sized companies and large corporations, large company must play as a platform leader, which is also called the keystone company. Keystone companies lure honeybees through a fragrant flower, while there are others that are not able to attract honeybees due to unavailability of fragrant flowers. Thus, fragrance plays an
important role in attracting the honeybees and enhancing the interfaces of the ecosystem.

The healthiness of a business ecosystem can be judged on various sub-dimensions. For a business ecosystem to continuously evolve and develop, the productivity of an ecosystem needs to be increased. In addition, members of the business ecosystem need to stably maintain a certain number of objects, despite environmental changes; thereby, increasing robustness of the ecosystem. Other required factor is ecosystem expansibility (niche creation), where innovative members grab new business opportunities and achieve expansion (Iansiti & Levien 2004; Kim 2009).

Ecosystem healthiness, which is comprised of ecosystem productivity, robustness, and expansibility, could be calculated by summing values of healthiness indexes across all of the business ecosystem members. That is, without overall healthiness of ecosystem members or ecosystem in general, sustainable growth of the leading company would be very unlikely. Ecosystem productivity requires enhancing value-adding activity of each individual. To improve this productivity, leading company or business ecosystem itself should simplify tasks that link ecosystem members from one another or enhance efficiency of the new product creation process of each member.
Ecosystem productivity comprises market responsiveness of new products, operational efficiency of member companies, and connection efficiencies. Market responsiveness is the degree to which customers show positive responses to buy a platform product and its related products. Operational efficiency refers to the ability to reduce costs through continuous improvement and constant cost innovations. Connection efficiency is the degree to which value-adding R&D activities and derivative NPDs are conducted due to efficient linkages between a platform and ecosystem members.

Ecosystem robustness indicates the degree to which the ecosystem keep and increase members despite environmental changes. The leader in a business ecosystem can enhance ecosystem robustness by consistently incorporating technological innovations and by providing a reliable point of reference that helps participants respond to new and uncertain conditions. Ecosystem robustness can be evaluated by comparing number of entrants with number of death or exits. Entrants into a business ecosystem strengthen robustness. On the other hand, increasing number of exit companies weakens the stability of the business ecosystem.

Ecosystem expansibility is the ability of an ecosystem to identify and extend new business opportunities. Large leading company must be able to extend the boundary of its business ecosystem by pioneering new areas through new combinations and securing resultant niches. It also has to be open-minded for open
innovation that can absorb even mutant resources. Ecosystem expansibility can be determined by calculating number of niche creating products and niche creators. The more the number of derivative products and/or new products are, the more partners enter the system to cultivate niche markets; thus, the higher is the level of ecosystem robustness.

III. ECOSYSTEM INEQUALITY

Indexes of ecosystem healthiness, that is productivity, robustness, and expansibility, can be classified into a necessary condition and sufficient conditions for the healthiness of business ecosystem. Among ecosystem indices, productivity is a necessary condition. Robustness is a (short-term) sufficient condition, and expansibility is a long-term sufficient condition for the ecosystem healthiness.

First, productivity represents the healthiness of each individual. Each firm must continuously show satisfactory advancements in operational efficiency (ability to improve continuously and reduce costs), output efficiency (ability to transform inputs into outputs), and connection efficiency (joint R&D, order-to-make, etc.)

Second, robustness is a sufficient condition because it is the ability to cope with environmental changes by continuously introducing state-of-the-art products. This robustness is a continuous improvement in the existing business domain. But for
a business ecosystem to grow continuously for a long time, it has to be able to extend into a new area.

Therefore, we can see the expansibility condition for the ecosystem existence as a long-term sufficient condition. Through innovation, that is a new combination, ecosystem members create new areas and; therefore, extended boundaries of ecosystem. For this, continuous inter-sectoral interaction and openness are necessary.

Generally, three indicators of ecosystem healthiness are equally important but the importance of each dimension will change dependent on the growth stage of SMEs or levels of cooperation between SMEs and large corporations. When there is nearly no cooperative relationship, productivity is most important in the evaluation of business-to-business trade relationship. On the other hand, when the relationship continues for a long time, the focus moves from price and/or cost to stable supply chain and innovative idea creation, for which technology and R&D capability and therefore robustness and expansibility become important.

If we divide the developmental stages of a business ecosystem into three stages of 'low', 'medium', and 'high', in the first stage, the business ecosystem needs just productivity to survive. As the ecosystem progresses to the second stage, it will need robustness as well as productivity. In the third stage, all sub-dimensions of business ecosystem healthiness will be necessary. Therefore, relative importance of
each sub-dimension changes as business ecosystem moves through each stage so that at the 'high' stage, the relationship will be expansibility > robustness > productivity, which we call 'ecosystem inequality'. As for growing and evolving business ecosystem, ecosystem inequality suggests that robustness should be higher than productivity and expansibility must be higher than robustness. While productivity is a necessary condition, robustness is a sufficient condition, which comes from external competition or externality drive. This condition helps ecosystem to maintain profitability for survival. Finally, expansibility is a long-term necessary condition for ecosystem to gain profit for continuous growth.

IV. EMPIRICAL STUDY

In order to draw an ecosystem inequality formula, we examined through an empirical study how indexes of ecosystem healthiness influence performance of member firms. We surveyed (non-equity) 143 vertical buyer-seller relationships in the automobile, electronics, steel, and telecommunication industries. Most responses were from first-tier suppliers.

We developed measurement scales to operationalize ecosystem healthiness based on the work of Iansiti and Levien (2004). Table 1 illustrates the measurement items and the result of ANOVA analysis.
To test the relative importance of each index, this study classified respondent firms into three groups according to the level of operating profit: (1) group with profit < 4.0%, (2) group with profit ranging from 4.0% to 8.0%, (3) group with profit > 8.0%. As implied in the theoretical explanation and hypotheses building, we assume non-linear relationship between ecosystem indexes and firm performance. Therefore, we tested differences between groups using ANOVA instead of regression analysis.

</table>
First, there was no significant difference in productivity among three levels of operating profit. From this result, we can infer that ecosystem productivity does not necessarily improve profitability of a firm. If productivity is low, a company cannot
survive, which indicates that productivity is a necessary condition for healthy business ecosystem.

Figure 2. Robustness and Performance

Second, robustness seems to be different among groups; although, only a degree of entry was statistically significant. As ecosystem robustness becomes higher, competition grows and bankruptcy ratio rises. From Figure 2, we can find kinked point in which robustness contributes to profitability to a certain level, but beyond that level, robustness does not contribute to performance anymore.
Therefore, robustness plays a role as short-term sufficient condition for the survival of an ecosystem.

Figure 3. Expansibility and Performance

Finally, expansibility seems to contribute to the performance. Expansibility values were different among groups although post-hoc tests were not significant. We also found a kinked point in the relationship between expansibility and operating profit. This kinked point suggests that expansibility contributes to performance only after operating income arrives at medium level.

V. DISCUSSION
Empirical study found that ecosystem productivity was not related with the operating profit of an individual firm but robustness and niche creation significantly influenced the operating profit. However, in the case of robustness, different effects were found depending on its sub-dimensions.

From Figures 1, 2, and 3, we drew overall patterns like figure 4. The Figure supports ecosystem inequality. First, productivity slightly varies across levels of operating profits. Second, robustness differs between low and medium groups. These two findings suggest that, in terms of relative importance, productivity becomes less significant than robustness. Third, between medium and high groups, robustness only slightly increases but expansibility changes upwards. Therefore, in terms of relative importance, robustness is less than expansibility. Thus, we confirmed the ecosystem inequality.

Figure 4. Ecosystem Inequality
Based on the model and its empirical validation, this paper provides managerial implications for policy makers, SMEs, and the supply chain management of large firms.

Empirical findings suggest that for its healthiness, business ecosystem needs more than just productivity and/or profitability. When it comes to issues about cooperation between SMEs and large corporations, there are much talks on low and ever decreasing profitability of SMEs. If we judge the healthiness of a business ecosystem just based on productivity and profitability, it is very likely that we might see cooperation between large and small businesses as conflicting relationship, which is a short-term perspective.

To maintain long-term view, we also have to check if robustness is increasing in the ecosystem. If a vertical business ecosystem is healthy, suppliers must have resistance to environmental turbulence and should be willing to maintain business against all odds. High robustness means that the firm is armed with high level of entrepreneurial willingness and expert knowhow. A business ecosystem must revitalize its entrepreneurship to recover its healthy condition. For this, SMEs must make a specialized expert company. Also if an ecosystem want to maintain its healthiness, it must have convergence-based competitive power, which raises ecosystem expansibility.
As for declining business ecosystem, robustness is higher than expansibility and productivity is greater than robustness. By contrast, as for growing business ecosystem, expansibility is greater than robustness and robustness is greater than productivity. Thus, robustness and expansibility are critical to the healthy business ecosystem.

This study failed to detail an empirical evidence concerning 'ecosystem inequality.' But we could catch an overall pattern, which must be a basis for future researches. More elaboration is needed for the measurement model. Finally, using company reports will be very helpful for measuring the healthiness of an ecosystem.

This paper study SMEs' cooperation with large firms from business ecosystem's perspective. A company is a part of a business ecosystem that crosses a variety of industries. The healthiness of this ecosystem is critical to the success of the company.

This study extends Iansiti and Levien's (2004) study and proposes 'ecosystem inequality'. Among ecosystem indices, productivity is a necessary condition, robustness is a short-term sufficient condition, and expansibility is a long-term sufficient condition for the ecosystem healthiness. Ecosystem inequality suggests that in the healthy and superior ecosystem robustness should be higher than productivity and expansibility must be higher than robustness.

Keywords: Business ecosystem, Large and small business cooperation, Healthiness, Productivity, Robustness, Expansibility

I. INTRODUCTION

Recently, Korean government formulated and executed many policies for vitalizing SMEs by promoting their cooperation with large firms (mainly vertical buyer-supplier cooperation). These policies, however, focused mainly on economic performance of individual firms and also the lack of strategic and network approach. To overcome this limitation, this study tries to explain performance of individual firm from the perspective of business ecosystem. Business ecosystem is defined as "loose networks of suppliers, distributors, outsourcing firms, makers of related products or services, technology providers, and a host of other organizations, which affect, and are affected by, the creation and delivery of a
company's own offerings" (Iansiti and Levien 2004b). Loose networks imply that we must consider loose-tie networks (e.g., third-tier networks, potential suppliers from same or different industries) as well as strong-tie networks (e.g., first-tier suppliers) (Song, Kim, and Rhee 2009).

A company is not only a member of a single industry but also a part of a business ecosystem that crosses a variety of industries. For example, Apple Computer is the leader of an ecosystem that crosses at least four major industries: personal computers, consumer electronics, information, and communications. In a business ecosystem, companies co-evolve capabilities around a new innovation: they work cooperatively and competitively to support new products, satisfy customer needs, and eventually incorporate the next round of innovations (Moore 1993). Therefore, the performance of a firm is derived from something that is much larger than the companies themselves: the success of their respective business ecosystems.

The leader in a business ecosystem can increase ecosystem productivity by simplifying the complex task of connecting network participants to one another or by making the creation of new products by third parties more efficient. It enhances the robustness of an ecosystem by consistently incorporating technological innovations and by providing a reliable point of reference that helps participants respond to new and uncertain conditions, and encourage ecosystem expansibility (niche creation) by offering innovative technologies to a variety of third-party organizations (Iansiti and Levien 2004b). The leader can realize these ecosystem goals by providing so-called platforms for ecosystem members. A platform is a set of solutions to problems that is made available to the members of the ecosystem through a set of access points and interfaces (Iansiti and Levien 2004a). Ecosystem participants use this
platform to build its own offerings. Therefore a platform is a "package of resources" wherein a leader company shares values with its ecosystems and/or other members (Kim & Song, 2008). Apple's iPod is creating a myth of the 21st Century through the externality of a network created based on platform leadership (Kim 2009).

This study extends the findings of Iansiti and Levien (2004a, b). First, the success of SMEs' cooperation with large firms might be dependent partly on whether their business ecosystem is healthy or not. Thus, we tested whether the healthiness of a business ecosystem affect the performance of SMEs through collecting data from Korean suppliers. Second, this study explores whether and how each of the ecosystem indexes contributes to business performances differently over the developmental stages of a firm. This study built a model that explains the process in which the operating profit of SMEs is determined by the healthiness of a business ecosystem: productivity, robustness (stability), and niche creation (expansibility).

II. BUSINESS ECOSYSTEM

Kim (2009) used "flower-honeybees" metaphor to explain how a business ecosystem works. There are two types of interaction between a flower-the platform-and honeybees-ecosystem members. The first type of interaction is when honeybees focus on making their own honey using the flower. This is similar to the 'standalone' business model where honeybees fly around and use flowers to create their own honey and sell the honey to earn money. The second type is where the honeybees focus on supplying moisture so that the honeybees and flowers come together for the flowers to produce fruits. This becomes the source of strength that enables fruits to create flowers and evolve into an ecosystem of the
next generation. The platform model can evolve and develop in the long term only when it becomes a model that produces fruits (Kim 2009).

Platform is the core of the business ecosystem approach in expanding and developing mutually beneficial cooperation between small-to medium-sized companies and large corporations. The strength of a platform grows in the market in tandem with an increase in the number of business partners of the platform. This is the same as the relationship between flowers and honeybees. If honeybees suddenly disappear in earth, the ecosystem of the earth will be placed in danger. If the number of honeybees, which help to provide moisture, decreases, in ey dct, the plants will not be able to bear fruit. In cooperative relationship between small-to medium-sized companies and large corporations, large company must play as a platform leader, which is also called the keystone company. Keystone companies lure honeybees through a fragrant flower, while there are others that are not able to attract honeybees due to unavailability of fragrant flowers. Thus, fragrance plays an important role in attracting the honeybees and enhancing the interfaces of the ecosystem.

The healthiness of a business ecosystem can be judged on various sub-dimensions. For a business ecosystem to continuously evolve and develop, the productivity of an ecosystem needs to be increased. In addition, members of the business ecosystem need to stably maintain a certain number of objects, despite environmental changes; thereby, increasing robustness of the ecosystem. Other required factor is ecosystem expansibility (niche creation), where innovative members grab new business opportunities and achieve expansion (Iansiti & Levien 2004; Kim 2009).

Ecosystem healthiness, which is comprised of ecosystem productivity, robustness, and expansibility, could be calculated by summing values of healthiness indexes across all of
the business ecosystem members. That is, without overall healthiness of ecosystem members or ecosystem in general, sustainable growth of the leading company would be very unlikely. Ecosystem productivity requires enhancing value-adding activity of each individual. To improve this productivity, leading company or business ecosystem itself should simplify tasks that link ecosystem members from one another or enhance efficiency of the new product creation process of each member.

Ecosystem productivity comprises market responsiveness of new products, operational efficiency of member companies, and connection efficiencies. Market responsiveness is the degree to which customers show positive responses to buy a platform product and its related products. Operational efficiency refers to the ability to reduce costs through continuous improvement and constant cost innovations. Connection efficiency is the degree to which value-adding R&D activities and derivative NPDs are conducted due to efficient linkages between a platform and ecosystem members.

Ecosystem robustness indicates the degree to which the ecosystem keep and increase members despite environmental changes. The leader in a business ecosystem can enhance ecosystem robustness by consistently incorporating technological innovations and by providing a reliable point of reference that helps participants respond to new and uncertain conditions. Ecosystem robustness can be evaluated by comparing number of entrants with number of death or exits. Entrants into a business ecosystem strengthen robustness. On the other hand, increasing number of exit companies weakens the stability of the business ecosystem.

Ecosystem expansibility is the ability of an ecosystem to identify and extend new business opportunities. Large leading company must be able to extend the boundary of its
business ecosystem by pioneering new areas through new combinations and securing resultant niches. It also has to be open-minded for open innovation that can absorb even mutant resources. Ecosystem expansibility can be determined by calculating number of niche creating products and niche creators. The more the number of derivative products and/or new products are, the more partners enter the system to cultivate niche markets; thus, the higher is the level of ecosystem robustness.

III. ECOSYSTEM INEQUALITY

Indexes of ecosystem healthiness, that is productivity, robustness, and expansibility, can be classified into a necessary condition and sufficient conditions for the healthiness of business ecosystem. Among ecosystem indices, productivity is a necessary condition. Robustness is a (short-term) sufficient condition, and expansibility is a long-term sufficient condition for the ecosystem healthiness.

First, productivity represents the healthiness of each individual. Each firm must continuously show satisfactory advancements in operational efficiency (ability to improve continuously and reduce costs), output efficiency (ability to transform inputs into outputs), and connection efficiency (joint R&D, order-to-make, etc.)

Second, robustness is a sufficient condition because it is the ability to cope with environmental changes by continuously introducing state-of-the-art products. This robustness is a continuous improvement in the existing business domain. But for a business ecosystem to grow continuously for a long time, it has to be able to extend into a new area.

Therefore, we can see the expansibility condition for the ecosystem existence as a long-term sufficient condition. Through innovation, that is a new combination, ecosystem
members create new areas and; therefore, extended boundaries of ecosystem. For this, continuous inter-sectoral interaction and openness are necessary.

Generally, three indicators of ecosystem healthiness are equally important but the importance of each dimension will change dependent on the growth stage of SMEs or levels of cooperation between SMEs and large corporations. When there is nearly no cooperative relationship, productivity is most important in the evaluation of business-to-business trade relationship. On the other hand, when the relationship continues for a long time, the focus moves from price and/or cost to stable supply chain and innovative idea creation, for which technology and R&D capability and therefore robustness and expansibility become important.

If we divide the developmental stages of a business ecosystem into three stages of 'low', 'medium', and 'high', in the first stage, the business ecosystem needs just productivity to survive. As the ecosystem progresses to the second stage, it will need robustness as well as productivity. In the third stage, all sub-dimensions of business ecosystem healthiness will be necessary. Therefore, relative importance of each sub-dimension changes as business ecosystem moves through each stage so that at the 'high' stage, the relationship will be expansibility > robustness > productivity, which we call 'ecosystem inequality'. As for growing and evolving business ecosystem, ecosystem inequality suggests that robustness should be higher than productivity and expansibility must be higher than robustness. While productivity is a necessary condition, robustness is a sufficient condition, which comes from external competition or externality drive. This condition helps ecosystem to maintain profitability for survival. Finally, expansibility is a long-term necessary condition for ecosystem to gain profit for continuous growth.
IV. EMPIRICAL STUDY

In order to draw an ecosystem inequality formula, we examined through an empirical study how indexes of ecosystem healthiness influence performance of member firms. We surveyed (non-equity) 143 vertical buyer-seller relationships in the automobile, electronics, steel, and telecommunication industries. Most responses were from first-tier suppliers.

We developed measurement scales to operationalize ecosystem healthiness based on the work of Iansiti and Levien (2004). Table 1 illustrates the measurement items and the result of ANOVA analysis.

To test the relative importance of each index, this study classified respondent firms into three groups according to the level of operating profit: (1) group with profit < 4.0%, (2) group with profit ranging from 4.0% to 8.0%, (3) group with profit > 8.0%. As implied in the theoretical explanation and hypotheses building, we assume non-linear relationship between ecosystem indexes and firm performance. Therefore, we tested differences between groups using ANOVA instead of regression analysis.

Technical Efficiency of Manufacturing SMEs in a Transitional Economy: Evidence from Vietnam

by Viet Le and Charles Harvie

This paper examines the performance of domestic non-state manufacturing small and medium enterprises (SMEs) in Vietnam. Specifically, it evaluates firm level technical efficiency and identifies the determinants of technical efficiency of these SMEs. The paper uses an econometric approach based on a stochastic frontier production function to analyse 5,204 observations of SMEs from three surveys conducted in 2002, 2005 and 2007. The results from the estimations reveal that manufacturing SMEs in Vietnam have relatively high average technical efficiency ranging from 84.2 percent to 92.5 percent. The paper further examines the factors influencing efficiency. It finds that firm age, size, location, ownership, cooperation with a foreign partner, subcontracting, product innovation, competition, and government assistance are significantly related to technical efficiency, albeit with varying degrees and directions. Exporting does not appear to influence technical efficiency. The paper offers some evidence-based policy recommendations to improve the technical efficiency and competitiveness of manufacturing SMEs.

Viet Le is a PhD student at the School of Economics, University of Wollongong, Australia. He is completing his PhD thesis which examines Vietnamese SMEs performance. Email: clvl970@uow.edu.au

Charles Harvie (PhD) is Associate Professor at the School of Economics, University of Wollongong, Australia. He is also Director of the Centre for Small Business and Regional Research, Faculty of Commerce, University of Wollongong. Email: charvie@uow.edu.au

Keywords: manufacturing small and medium enterprises, firm performance, technical efficiency, stochastic frontier production function, Vietnam.
Introduction

With the official recognition of the private sector since Đổi Mới, the domestic non-state sector, which is largely made up of small and medium enterprises (SMEs), has experienced considerable growth. Following Đổi Mới, early regulations governing the private sector were adopted since the late 1980s and early 1990s which paved the way for the growth of the sector. The private domestic sector emerged and grew steadily throughout the 1990s. However, from the start of the new century, business registrations in Vietnam really made a jump after the introduction of an innovative and breakthrough Enterprise Law in 2000.

Although the growth in number of enterprise registrations has been strong since 2000, there is little evidence about the quality of that growth in terms of enterprise performance. This paper will evaluate the performance of Vietnamese non-state manufacturing SMEs by estimating their technical efficiency. The paper uses a parametric
approach based on a stochastic frontier production function to analyse data collected from three surveys of manufacturing SMEs in 2002, 2005 and 2007. The paper is structured as follows. The next section presents an overview of the domestic non-state sector with a focus on manufacturing SMEs. Then the data, together with the methodology and econometric models for the estimation of technical efficiency and explanatory variables will be discussed. After that results from the analysis will be presented and discussed in the fourth section. The last section of the paper provides some concluding remarks and identifies several policy recommendations to improve the technical efficiency of manufacturing SMEs in Vietnam.

**Domestic Non-State Manufacturing Sector and SMEs in Vietnam**

Analysts have observed that private sector development and enterprise reform have played a crucial role in the reform of the Vietnamese economy (Harvie, 2004; Hakkala and Kokko, 2007). A dynamic non-state sector with an emphasis on SMEs in Vietnam will be a precondition for attaining the objectives of (1) restructuring and slimming state enterprises (2) job creation and income growth through expanding non-farm employment and income opportunities (3) attaining sustainable economic development (4) improving resource allocation efficiency and productivity growth (5) expanding exports (6) attracting FDI (7) achieving a more equal distribution of income (7) and assisting in rural and regional development (Harvie, 2007).

Vietnamese enterprises consist primarily of small and medium enterprises (SMEs). In Vietnam, an SME was first officially defined in 2001 as an enterprise with fewer than 300 workers or a registered capital of less than 10 billion VND (about US$630,000 at the time). Recently, a new definition for SMEs was introduced to replace the definition in 2001. The new SME definition, which became effective from 20 August 2009, provides a definition for each economic sector. It changes the capital clause from registered capital in the earlier definition to total capital of up to 100 billion VND (about US$ 5.6 million). It
also separates SMEs into micro, small and medium enterprises with different limits for the number of employees and capital (Table 1).

Figure 1 shows the number of new enterprise registrations from 1992 to 2009. After the Company Law and Private Enterprise Law were passed in 1990 and 1991 respectively, registrations of domestic private enterprises increased steadily. Registration increased rapidly in the first few years from a low base in response to the policy changes. However, the annual registration number declined from the mid 1990s. By the end of 1999, a total of 45,000 enterprises had been established. This is a modest number given the size of the population and in comparison to other countries in the region. Between 1992-1999 the private sector grew 24 percent per annum (Steer, 2001:4). Although this growth rate was high, it could be deceptive as it grew from a small starting base.

The gradual transformation of the regulatory and legal framework for private enterprises, the fact that SOEs are politically favoured for generating employment, the import substituting nature of the development strategy and the weak capacity of private management and capital generation all had their influence on the growth of the private sector in the 1990s (Webster, 1999; Webster and Taussig, 1999). The newly emerged non-state SMEs faced several major obstacles in the 1990s including institutional weakness, capital shortage, limited access to markets, technical and management limitations, and unfavourable public attitudes (Le Cong Luyen Viet, 2001).

However, Figure 1 also shows that the growth in registration of new enterprises since 2000 has been strong. This comes as the result of the new Enterprise Law (EL) which became effective in 2000. This important law combined the earlier Company Law and Private Enterprise Law into one law. Thus, it provided the legal framework for all types of domestic private enterprises. The EL contains an important innovation with a principle often referred to as “to register first, then to check” by the business community (World
Bank, 2005). This represents a fundamental shift in the approach and tools with which the government manages enterprises. The EL has also revitalized entrepreneurship and strengthened the trust of investors and entrepreneurs in the reforms and policies initiated by the Government (Vo Tri Thanh and Nguyen Tu Anh, 2006).

Since the introduction of the EL the number of new registrations has increased rapidly. The rapid growth in registrations has been sustained since 2000 (Figure 1). According to statistics from the National Business Information Centre, more than 414,000 enterprises have been established from 2000 to 2009. New business registration during this period has increased by more than nine times the number of registrations for the 1991 - 1999 period.

By any measure SMEs account for a significant share of Vietnamese enterprises. Of the 155,771 formally registered enterprises in operation in 2007, SMEs accounted for 97.4 percent of the total enterprises according to the employee criterion or 84.7 percent according to the registered capital criterion in the definition in 2001 (Table 2).

The manufacturing sector is an important sector as it contributes the most in Vietnam’s GDP. In 2008, the sector accounted for 21.10 percent of total GDP. Table 3 focuses on manufacturing SMEs and shows that they accounted for 91 percent of all manufacturing firms in operation in 2006. Their share increased gradually from 88 percent in 2000. This sector is notable for its ability to create stable jobs and produce for exports.

**Methodology, Econometric Models and Data**

Productivity and efficiency represents the economic aspect of firm performance. Growth in efficiency and productivity is the most important aspect of growth as it focuses on the quality of growth. For this reason theoretical and empirical works on firm performance focus on measuring enterprise productivity and efficiency (Storey, 1990).
Average labour productivity had been used as a measure of efficiency until Farrell (1957) introduced a method to measure efficiency in his seminal paper. Farrell’s efficiency measure contains an efficient production frontier which is the output that a perfectly efficient firm could obtain from any given combination of inputs. The performance of a productive unit will be measured against that efficient frontier (Farrell, 1957:254).

Figure 2 explains Farell’s efficiency measure. With constant returns to scale the isoquant $YY'$ is the efficient production frontier. The isoquant represents the minimum set of inputs per unit of output needed to produce a unit of output. Every package of inputs along the isoquant is considered as technically efficient while any point above it and to the right, such as point $P$, is defined as technically inefficient. The technical efficiency level is represented by $OR/OP$ in Figure 2. Meanwhile allocative efficiency of the producer at point $P$ is given as the ratio of $OS/OR$. In this case the isocost-line $CC'$ reflects the objective of cost minimisation. Thus, $R'$ is the technically and allocatively efficient point. The overall efficiency (which is also called economic efficiency) is equal to $OR/OP \times OS/OR = OS/OP$ (Murillio-Zamorano, 2004).

According to Kalirajan and Shand (1999:152) a measure of technical efficiency in the $i$th firm can be defined as:

$$TE = \frac{Y_i}{Y^*_i}$$

where:

- $Y_i$: Actual output
- $Y^*_i$: Maximum possible output

The above equation is the basic model used for measuring technical efficiency. The actual output is observable in this equation. However, maximum possible output is not
observable and must be estimated. A ratio of one in the above equation would mean that
the firm is technically efficient and operates on the production frontier.

A number of techniques have been developed to estimate this frontier. Several
authors broadly classified them into two main groups: parametric and non-parametric
(Kalirajan and Shand, 1999; Kumbhakar and Lovell, 2003; Murillo-Zamorano, 2004;
Coelli et al., 2005). The parametric method uses an econometric technique by specifying a
stochastic production function which assumes that the error term is composed of two
elements. One is the typical statistical noise which represents randomness. The other
represents technical efficiency which is commonly assumed in the literature to follow a
one-sided distribution (Alvarez and Crespi, 2003; Murillo-Zamorano, 2004).

One the other hand, the non-parametric approach does not distinguish between
technical efficiency and statistical noise. It is, therefore, considered as a non-statistical
technique as the inefficiency scores and the envelopment surface are ‘calculated’ rather
than estimated. The non-parametric approach is often associated with Data Envelopment
Analysis (DEA) which is based on a mathematical programming model to estimate the
optimal level of output conditional on the amount and mix of inputs (Murillo-Zamorano,
2004).

In the context of this study the stochastic frontier approach is most relevant. The
first reason is the ability of the stochastic frontier approach to consider both factors beyond
the control of the firm and firm-specific factors, and hence it is closer to reality. The
second reason is the separation of the random variation of the frontier across firms, the
effects of measurement error and other random shocks from the effect of inefficiency. The
third reason is the ability of the model to analyse the determinants for inefficiency
simultaneously with the estimation of technical efficiency which helps to derive policy
implications.
The stochastic frontier production model was developed independently and simultaneously by Aigner, Lovell and Schmidt (ALS) (1977), Meeusen and Van den Broeck (MB) (1977), and Battese and Corra (1977). In this model there is a composed error term which captures the effects of exogenous shocks beyond the control of the analysed units in addition to incorporating technical inefficiency. Errors in measurement of outputs and observations are also taken into consideration in this model (Kumbhakar and Lovell, 2003; Murillo-Zamorano, 2004).

The generalised functional form in the Cobb-Douglas case of the stochastic production function can be specified as:

\[ Y_i = x_i \beta + (V_i + U_i), \quad i = 1, \ldots, N, \]  

where

- \( Y_i \) is the production (or the logarithm of production) of the \( i \)-th firm;
- \( x_i \) is a \( k \times 1 \) vector of (or transformation of) the input quantities of the \( i \)-th firm;
- \( \beta \) is a vector of unknown parameters;
- \( V_i \) are random variables which are assumed to be independently and identically distributed (\textit{iid}) as \( N(0, \sigma_v^2) \), \(^1\)
- \( U_i \) which are non-negative random variables that are assumed to account for technical inefficiency in production and are often assumed to be \textit{iid}. \([N(0,\sigma_u^2)]\). It is assumed to be half-normal, exponential and truncated from below at zero. \(^2\)

\(^1\) This means that the errors are independently and identically distributed normal random variables with zero means and variances \( \sigma^2 \).
\(^2\) \( U_i \) reflects one-sided deviations of actual output from the maximum level of production due to technical inefficiency. If a firm is fully technically efficient, \( U_i = 0 \), otherwise it will be greater than zero. Thus, it is also called a one-sided error component.
Apart from the input variables, exogenous variables characterizing the environment in which a firm operates and firm-specific characteristics also influence their performance. In an attempt to identify determinants of inefficiency, many empirical studies often involve the estimation of stochastic frontiers, prediction of firm level efficiencies and identification of reasons for the differences in predicted efficiencies between firms in an industry (Kalirajan, 1981; Pitt and Lee, 1981; Hill and Kalirajan, 1993; Burki, 1996; Brada et al., 1997; Chow and Fung, 1997; Burki and Terrell, 1998; Jones et al., 1998; Zheng et al., 1998; Tong, 1999; Lundvall and Battese, 2000; Piesse and Thirtle, 2000; Aw et al., 2001; Aw, 2002; Alvarez and Crespi, 2003; Batra and Tan, 2003; Söderbom and Teal, 2004; Chapelle and Plane, 2005; Fernandes, 2006; Margono and Sharma, 2006; Roudaut, 2006; Yang, 2006; Yang and Chen, 2009).

A single-stage production model was proposed by several authors in 1991 (Kumbhakar et al., 1991; Reifschneider and Stevenson, 1991). In this model the parameters for the inefficiency effects model are jointly estimated with the stochastic frontier model. Battese and Coelli (1995) proposed a model that captures inefficiency effects for panel data based on earlier work by Kumbhakar et al. (1991). For cross-sectional data their model specification is expressed as:

\[ Y_i = x_i \beta + (V_i - U_i) \]  \hspace{1cm} (3)

or, in logarithmic form:

\[ \ln(Y_i) = \beta \ln x_i + U_i - V_i \] \hspace{1cm} (4)

where:

\( \ln(Y_i) \) is the logarithm of the scalar output for the \( i \)-th firm,

\( \beta \) is the vector of unknown parameters to be estimated,
$x_i$ is the vector of value of known functions of input and other explanatory variables associated with the $i$-th firm,

$V_i$ are random errors which are assumed to be iid $N(0, \sigma^2_v)$ and independent of $v_i$.

$U_i$ is non-negative random variables which are assumed to account for technical inefficiency in production and are assumed to be independently distributed as truncations at zero of the $N(\mu, \sigma^2_v)$ distribution;

With the assumption of a linear functional relationship, the mean distribution of $u_i$ is a function of the explanatory variables and can be specified as:

$$\mu_i = z_i \delta$$

where

$z_i$ is a $p \times 1$ vector of variables which may influence the efficiency of a firm;

$\delta$ is an $1 \times p$ vector of unknown parameters to be estimated.

Individual firm technical efficiencies from estimated stochastic frontiers are defined as:

$$TE_i = \frac{Exp(\ln Y_i / u_i, x_i)}{Exp(\ln Y_i / u_i = 0, x_i)} = e^{-u_i}$$

where

$Y_i$ is the production of the $i$-th firm,

$TE_i$ will take a value between zero and one in the stochastic production frontier. It measures the output of the $i$-th firm relative to the output that could be produced by a fully efficient firm using the same vector.

For both the stochastic frontier model and the inefficiency effects model, the maximum likelihood method can be used to estimate the coefficients of the two functions.
simultaneously. This will give consistent estimates of the parameters of the production frontier and the inefficiency effects model. The likelihood function is expressed in terms of the variance parameters of the frontier function:

\[ \sigma^2 = \sigma_v^2 + \sigma_u^2 \quad \text{and} \quad \gamma = \frac{\sigma_u^2}{\sigma^2} \quad (7) \]

where

\[ \sigma_v^2 \] is variance of noise and
\[ \sigma_u^2 \] is variance of inefficiency effects.

If the value of \( \sigma^2 \) is equal to zero, then \( u_i \) is also zero which means the firms are fully efficient. \( \gamma \) has a value between one to zero. If the value of \( \gamma \) is one, the deviations from the frontier are attributed to random error. If it has the value of one, the deviations are due to technical inefficiency.

A software package which is most commonly used in the estimation of stochastic production frontiers in the literature is FRONTIER 4.1 developed by Coelli (1996). The software program carries out three steps of estimation. The first step is Ordinary Least Square (OLS) estimates of the production function. It provides unbiased estimators for all the \( \beta \) except the intercept. The OLS estimates are then used as starting values to estimate the final maximum likelihood model. The second step carries out a two-phase grid search of the value of the likelihood function which is estimated for different values of \( \gamma \) with the \( \beta \) parameters derived in the OLS. The third and final step calculates the final maximum likelihood estimates (MLE) with an iterative Davidon-Fletcher-Powell algorithm. This step uses the values of the \( \beta \)'s from the OLS and the value of \( \gamma \) from the intermediate step as starting values (Coelli, 1996).
There are several choices of functional form for the production frontier. The most common functional forms for the stochastic frontier production function are the Cobb-Douglas production function and the Transcendental-logarithm (Translog) production function. A hypothesis test is conducted to choose the functional form for the stochastic frontier production function:

\[ H^1_0: \beta_3 = \beta_5 = \beta_7 = \beta_8 = b_9 = 0 \]  

(8)

The results of this test as presented in Table 6 reveals that the Translog specification is most appropriate for this study. The Translog stochastic production function can be expressed as follows:

\[
\ln Y_i = \beta_0 + \beta_1 \ln K_i + \beta_2 \ln L_i + \beta_3 \ln ME_i + \beta_4 (\ln K_i)^2 + \beta_5 (\ln L_i)^2 + \beta_6 (\ln ME_i)^2 \\
+ \beta_7 \ln K_i \ln L_i + \beta_8 \ln K_i \ln ME_i + \beta_9 \ln L_i \ln ME_i + V_i + U_i
\]  

(9)

where:

\[ Y_i = \text{Output of firm } i \]
\[ K_i = \text{Value of Capital of firm } i \]
\[ L_i = \text{Labour input of firm } i \]
\[ ME_i = \text{Value of Materials and Energy for firm } i \]
\[ V_i = \text{Random error in which } v_i \sim N(0, \sigma_v^2) \]
\[ U_i = \text{Technical Inefficiency in which } u_i \sim N(\mu_u, \sigma_u^2) \]

The second line of Equation (9) includes the squared terms of the input factors, while the third line expresses the interaction terms among the inputs.

We also model the factors influencing technical inefficiency including the firm-specific and external environment variables as follows:
\[
\begin{align*}
\mu_i &= \delta_0 + \delta_{1}age_i + \delta_{2}size_i + \delta_{3}comp_i \\
&+ \delta_{4}urban_i + \delta_{5}hh_i + \delta_{6}coop \\
&+ \delta_{7}ltd_i + \delta_{8}direx_i + \delta_{9}foreign_i \\
&+ \delta_{10}sub_i + \delta_{11}credit1_i + \delta_{12}land_i \\
&+ \delta_{13}credit2_i + \delta_{14}new_i + \delta_{15}improve_i + \omega_i
\end{align*}
\] (10)

The variables in Equations (9) and (10) and their description are summarised in Table 4.

Two more hypothesis tests need to be conducted for the technical inefficiency effects model as presented in Equation (10). The first hypothesis test is about the absence of technical inefficiency effects. Thus, there is no inefficiency function and no deviation from technical inefficiency. This is equivalent to imposing the restriction specified in the null hypothesis as:

\[
H^2_0: \gamma = \delta_0 = \delta_1 = \delta_2 = \delta_3 = \ldots = \delta_{15} = 0
\] (11)

The second hypothesis tests whether exogenous variables included in Equation (10) have a significant influence upon the degree of technical inefficiency. A test of the null hypothesis for this is:

\[
H^3_0: \delta_1 = \delta_2 = \delta_3 = \ldots = \delta_{15} = 0
\] (12)

This study uses recent firm-level data from three comprehensive and large-scale surveys of Vietnamese small and medium enterprises in 2002, 2005 and 2007. The surveys were carried out by the Vietnamese Institute for Labour Studies and Social Affairs (ILSSA) in Hanoi with the assistance of international counterparts from Sweden and Denmark. The first round of the survey was supported by the Swedish International Development Authority (SIDA) and the remaining ones were assisted by the Danish International Development Agency (DANIDA).

The surveys provide a valuable set of data about private sector SMEs in Vietnam. The surveys were implemented after the important Enterprise Law of 2000 was introduced.
The surveys contain the most comprehensive data about SMEs in Vietnam. Although other surveys have a larger coverage, they do not focus on SMEs\(^3\). In addition, the focus on domestic non-state and manufacturing SMEs in the survey make it the only dataset available about this most important sector for SMEs in Vietnam. The surveys also had coverage in different regions of Vietnam, including urban and rural areas. The sample was stratified to ensure that different types of ownership were represented based on the overall distribution of ownership in the population of domestic non-state enterprises. In total, 6,619 enterprises from different sub-sectors in manufacturing industries were interviewed in the three survey rounds.

From the raw data obtained in the surveys described above, data for analysis is constructed for the small and medium sized domestic non-state manufacturing sector. Enterprises reporting in the survey that they were not in the manufacturing sector are removed from the dataset. Similarly, enterprises with missing values are also removed. After this process has been carried out, the eligible observations for analysis have been reduced to 5,204 with 926 firms in 2002, 2,228 firms in 2005 and 2,050 firms in 2007. A summary of statistics for key variables for each survey year are given in Table 5.

**Results and Discussions**

This section presents results from our analysis using the FRONTIER 4.1 program developed by Coelli (1996). Several hypothesis tests were conducted to identify the appropriate functional form for the stochastic production function in Equations (8) and (9), to test for the presence of technical inefficiency and to test whether the inefficiency effects are a linear function of the explanatory variables according to the hypotheses in Equations (12) and (13).

\(^3\) They include the Industrial Censuses and Business Censuses carried out by the General Statistics Office and Business Environment and Enterprise Productivity Surveys conducted by the World Bank.
Table 6 reports the results of the three hypothesis tests. The first hypothesis test for functional form indicates that the null hypothesis $H_{10}^{'}$ is rejected at the 1 percent level. This means that the Cobb-Douglas production function is not an adequate specification and that the Translog production function should be used. The second hypothesis test confirms that technical inefficiency is present as the null hypothesis ($H_{20}^{''}$ assuming that there is no technical inefficiency) is rejected at the 1 percent significance level. The third hypothesis test indicates that firm-specific and external environment factors jointly have an influence on technical inefficiency as the null hypothesis ($H_{30}^{'''}$ that the explanatory variables do not have any influence on technical inefficiency) is rejected at the 1 percent significance level. This means that the joint effect of the explanatory variables in the technical inefficiency effects model is significant, although the individual effect of some variables could be statistically insignificant.

Table 7 provides a summary of the results from the estimation of the frontier production function with cross-sectional data from three surveys in 2002, 2005 and 2007, under the Translog functional form. The MLE also provides estimates of the variance parameters sigma-squared ($\sigma^2$) and gamma ($\gamma$). The first variance parameter, $\sigma^2$, determines whether there is technical inefficiency or not. If $\sigma^2$ is equal to zero, all firms are fully efficient. If $\sigma^2$ is larger than zero, then all firms are not fully efficient. Table 7 shows that the value of $\sigma^2$ ranges from 0.257 in 2005 to 1.35 in 2002, indicating that all firms in the sample are not fully efficient. In addition, the estimated variance $\sigma^2$ for the three periods are statistically significant at 1 percent, indicating goodness of fit and correctness of the specified distribution assumptions of the composite error term. The second variance parameter, $\gamma$, determines whether all deviations from the frontier are due to random error or technical inefficiency. If $\gamma$ is equal to zero then all deviations from the frontier are caused by random error. If $\gamma$ is equal to one, then all deviations from the frontier are caused by technical inefficiency. Gamma ($\gamma$) is estimated at 0.977, 0.934 and 0.943 for 2002, 2005
and 2007 respectively, and is statistically significant at 1 percent indicating that over 90 percent of the total variation from the frontier is due to technical inefficiency.

The mean technical efficiency for manufacturing SMEs are estimated at 84.3 percent, 92.5 percent, and 92.3 percent in 2002, 2005 and 2007 respectively. These results indicate that manufacturing SMEs in Vietnam can increase the current level of output by 15.7 percent in 2002, by about 7.5 percent in 2005, and by 7.7 percent in 2007 with the same level of inputs. Compared to the mean technical efficiency at around 60 percent to 70 percent of the best practice frontier in developing countries, as reported by Tybout (2000), Vietnamese manufacturing SMEs are quite efficient. Nevertheless, as the technical efficiency of Vietnamese SMEs is estimated with regards to their best practice frontier, it is not possible to conclude that Vietnamese manufacturing SMEs are more efficient than their counterparts in other developing countries.

Estimation of the technical inefficiency effects model is carried out simultaneously with the stochastic production frontier in FRONTIER 4.1. Table 8 provides a summary of the technical inefficiency effects. The discussion that follows is focussed on the sources of inefficiency.

Both firm age and firm size have a significant relationship with technical inefficiency in 2002 and 2007, but for 2005 firm age is found to be insignificant. As these two explanatory variables have a positive sign in the technical inefficiency effects model, they have a negative relationship with technical efficiency. Thus, there is no evidence of learning-by-doing for Vietnamese manufacturing SMEs. There could be some explanation for the results found here. Younger firms can be more efficient due to their new technology and equipment. Young firms can also enter the market with innovative ideas and hence are more efficient. Firm size is found to have a negative relationship with technical efficiency. This is surprising as large firms can benefit from economies of scale and their ability to
access information and technology. In addition, there is the virtuous cycle built-in where more efficient firms will survive and expand. Yet, small firms could benefit from flexibility which allows them to quickly diversify and adjust their activities to become efficient. Hence, evidence from Vietnamese manufacturing SMEs supports the “small is beautiful” view, and the need for policy to encourage the development of SMEs.

Competition is found to have no significant impact upon technical efficiency in both the 2002 and 2005 surveys, although it is significant and has a negative relationship to the technical inefficiency of manufacturing SMEs in the 2007 survey. This is supported in the literature as competition is generally believed to have a positive impact on efficiency, as it induces a disciplined performance and exit for loss-making firms. A study by Ito (2006) found that market competition is a significant factor in promoting efficiency in rural firms in China.

Results summarised in Table 8 indicate that manufacturing SMEs in urban centres had lower technical efficiency in 2005 compared to their counterparts in rural areas. The most notable issue for urban enterprises is higher costs for land and labour and space constraints for expansion, which have the potential to negatively affect their efficiency performance. However, the location of firms was found to be insignificant for both the 2002 and 2007 surveys.

In term of ownership structure and efficiency, household enterprises and collectively-owned firms are found to be more efficient than other types of ownership among the non-state domestic sector. However, this is only the case in 2007 and in 2005 for collectively-owned enterprises. There is no difference in efficiency among different types of enterprises in the 2002 survey. This suggests that the owner-manager nature of household business could ensure that they responsibly carry out business activities and have different cost-cutting measures including the use of family labour resulting in higher
efficiency. At the same time, household enterprises benefit directly from efficiency gains. For the case of collectively owned firms it is not clear why they are more efficient than firms with other types of ownership. The surprising result is that the more modern types of enterprises, including limited liability companies and joint-stock companies, despite having a better structure of corporate governance, have lower technical efficiency.

A portion of Vietnamese manufacturing firms have sub-contracting and co-operation arrangements with foreign partners. These two explanatory variables are examined in the technical inefficiency effects model. When they are statistically significant, except 2002 for co-operation and 2005 for sub-contracting, they are found to have a positive relationship with technical inefficiency, as shown in Table 8. By entering into a sub-contracting or co-operation arrangement, SMEs have to follow the terms and conditions of the arrangement and it will limit flexibility and innovation and hence their efficiency performance. There is no evidence of technology transfer from the sub-contracting and co-operation arrangements that benefits the efficiency performance of Vietnamese manufacturing SMEs.

Result from the analysis indicates that direct exporting does not exert a significant impact on the technical efficiency of Vietnamese manufacturing SMEs. Thus, there is no evidence for both self-selection of more efficient firms into exporting and learning-from-exporting hypotheses. The insignificant relationship between exporting and technical efficiency has also been found in previous studies (Brada et. al., 1997; Jones et. al., 1998; Commander and Svejnar, 2007).

Government assistance to firms for land and premises when they start their business and credit during their operations are found to have a significant negative relationship with the technical efficiency of Vietnamese manufacturing SMEs. This is consistent for all the three surveys with the exception of government credit in the 2005 survey. This finding
casts doubt on the effectiveness of government support in providing easy access to land and credit to SMEs. Businesses can take advantage of government support to secure land and credit and use them for other purposes, but not for productive activities. Only government credit for businesses at the time of establishment is found to have a positive impact on efficiency. However, this is the case for the 2002 survey only, and it is only statistically significant at the 10 percent level.

Results also show that manufacturing SMEs with major product improvements tend to have higher technical efficiency than those without product improvement. This is evidenced by a negative and significant relationship between product improvement and technical inefficiency for all three surveys as summarised in Table 8. The same is true for product innovation through the introduction of new products for manufacturing SMEs in the 2002 survey, which shows a positive relationship between new product innovation and technical efficiency. Innovation is found to benefit efficiency, productivity and growth in small firms in some studies (Heunks, 1998; Hall et al., 2009). Yet, the relationship between new product innovation and technical efficiency is negative in 2005 and is insignificant in the 2007 survey. There are two possible explanations for this. First, there could be a lagged effect as it may take time before the innovation results in gains in efficiency. The costs involved in innovation could make firms appear less efficient at the beginning. Second, introducing new products could suggest that the firm is already experiencing difficulties and has to make some changes to improve its situation.

**Conclusion and Policy Implications**

This paper addressed the lack of research about the performance of Vietnamese SMEs, as most studies have only focussed on the growth in number of enterprise registrations. In this paper we focussed on examining the technical efficiency performance of domestic non-state manufacturing SMEs in Vietnam, using comprehensive data from large surveys of domestic non-state manufacturing SMEs in 2002, 2005 and 2007. This
study is the first to use this comprehensive dataset to analyse the technical efficiency performance of Vietnamese SMEs. This research also revealed the impact of different firm characteristics and business environments on the technical efficiency performance of Vietnam manufacturing firms in the non-state sector. The research also aimed at providing empirically founded policy recommendations to enhance efficiency and competitiveness of private sector SMEs in Vietnam’s rapidly developing market economy. The findings from this study are useful for both policy-makers and entrepreneurs to promote the extensive and intensive growth of Vietnamese SMEs. At the same time the study may have policy implications for other transitional economies as well as developing countries in the promotion of SMEs.

In this research we used a stochastic frontier production function to estimate their efficiency level and identify sources of efficiency for this important group of SMEs. The results from this analysis show that domestic non-state manufacturing SMEs in Vietnam have mean technical efficiencies of 84.25 percent, 92.55 percent, and 92.34 percent of the best practice frontier in 2002, 2005 and 2007, respectively. Our results indicate that these firms increase their current level of output by almost 15.7 percent in 2002, by about 7.5 percent in 2005 and by 7.7 percent in 2007 with the same level of inputs. Vietnamese non-state manufacturing SMEs have higher mean technical efficiency than manufacturing enterprises in developing countries.

This paper also identified explanatory factors for the inefficiency of Vietnamese SME manufacturing enterprises. These are useful for policy recommendations to improve the technical efficiency and competitiveness of domestic non-state SMEs in Vietnam. Specifically, older and larger manufacturing SMEs are likely to be technically inefficient. This indicates the importance of the Enterprise Law for Vietnam, with its aim of encouraging the establishment of new and technically more efficient private SMEs. Expanded marketisation and competition in domestic markets also appears to have had a
desired impact on efficiency. Although not important in the 2002 and 2005 surveys, competition in the 2007 survey exerted a positive impact on SME manufacturing efficiency and this appeared to be the case irrespective of ownership form. The implementation of an effective and transparent competition policy that establishes a level playing field for all ownership types, therefore, remains a high priority for the country. Manufacturing SME weaknesses remain in terms of their cooperating with foreign partners and their participation in subcontracting. Too many SMEs are involved in simple assembly, low skill, low value adding activities that do not improve their technical efficiency. They need to upgrade their skills and technology so that their future growth, employment generation, competitiveness and efficiency will be improved. Government policies, in general, appear to be ineffective in increasing SME efficiency, particularly those focusing upon the provision of credit and access to land. The provision of finance should be based on solid commercial principles, otherwise it is unlikely to be effective and not produce substantive and sustainable efficiency outcomes. Our results suggest a re-appraisal of government financial assistance policies, including that of start-up assistance, with the aim of identifying how these could be more effectively utilised. Access to land is a major issue for many SMEs, and it is clear that current policies in this regard are adversely impacting upon SME efficiency. Finally, innovation, particularly in the form of improving existing products, is a vital ingredient in improving manufacturing SME technical efficiency. Innovation can add value to SME activities and enhance the benefits from collaboration with foreign partners and subcontracting, and can be improved through more effective targeting of government financial assistance. Consequently, many of the factors impacting SME efficiency, as identified previously, are inter-related, requiring a holistic policy response by government.

Note: (a) The test statistics have a $\chi^2$ distribution with degrees of freedom equal to the difference between the parameters involved in the null and alternative hypothesis
(b) As $\gamma$ takes values between 0 and 1, in $H_0^2$: $\gamma = \delta_0 = \delta_1 = \delta_2 = \delta_3 = ... = \delta_{15} = 0$ the statistic is distributed according to a mixed $\chi^2$ whose critical value is obtained from Kodde and Palm (1986).

Determinants of Cost Reductions in Vertical Pricing Relationship: Korean Case

Jong Ook Rhee
Seoul Women's University, South Korea
cgrh@swu.ac.kr

Chang Seok Song
Soongsil University, South Korea

Ki-Chan Kim
The Catholic University of Korea, South Korea

This paper analyzes the determinants of suppliers’ price and tests the hypothesis that market structure plays an essential role in suppliers’ determining their price. To test this hypothesis, the paper uses survey data of more than 1200 Korean firms (over 900 firms in the year 2008 and more than 300 firms in the year 2009). The empirical results show the importance of SME strategy and how it can prevent the cost reduction forced by the big assembler. The paper also discusses whether the government has to interfere to implement the fair pricing between SME’s supplier and big assembler. In the last section, the empirical results will be compared with those from other countries. We will look for common factors or country-specific factors in determining supplier price.

Keywords: SMEs’ supplier pricing, market structure, SMEs’ supplier strategy, determinants of cost reduction

1. Introduction

Products such as airplane, electronics, car, ship, etc. are made by assembling many parts. For example, it is a well known fact that car is made up of 20,000 parts. Most of these parts are supplied by small and medium enterprises (SMEs).

From the cost accounting perspective, the only determinant of suppliers’ price is the cost. However, from broader perspective, there are other determinants of suppliers’ cost such as: market structure, the level of technology, price of materials, patent, wage, the length of long-term relationship, asymmetric bargaining power etc. Under vertical pricing relationship, the most important determinant of price is buyer’s purchasing power. Economic Theory shows that the market structure can also play an important in determining the price. However, this hypothesis has to be tested empirically.

This paper consists of three parts except the introduction. The second section introduce the theory on the supplier price determination based on the market structure of both suppliers and assembly firms

The third section analyzes the determinants of suppliers’ price and tests the hypothesis
that market structure plays an essential role in suppliers’ determining their price. To test this hypothesis, the paper uses survey data of more than 1200 Korean firms (over 900 firms in the year 2008 and more than 300 firms in the year 2009). The empirical results show the importance of SME strategy and how it can prevent the cost reduction forced by the big assembler. The paper also discusses whether the government has to interfere to implement the fair pricing between SME’s supplier and big assembler.

The last section is the conclusion to summarize the results found in the previous section. And the future task will be discussed shortly.

2. **Vertical Pricing Theory**

Supplier’s price based on cost accounting is determined by the same principle. But the supplier price in economics has been analyzed by the buyer power with the vertical pricing relationship.\(^1\) Considering the market structure, vertical pricing determinants depend on the market structure that assembly firms and suppliers compete respectively.

The combination of the market structure of assembly firms with that of suppliers can be classified like Table 1. When the number of assembly firms is combined with that of supplier, it is shown that the situation of market structure consists of at least 7 cases. The imperfect competition theory except perfect competition can be applied to 6 cases. Unlike perfect competition, the supplier pricing in the imperfect competition is indeterminate. If vertical integration between assembly and supplier is not made, the joint profit-maximizing is not held. The parties try to maximize their individual profits, and then the price is indeterminate over a potential broad range.\(^2\)

</tbody>
</table>

From the perspective of economics, suppliers have to understand how pricing of suppliers’ parts can be determined with both the market structure of supplier and that of assembly firms. Hence suppliers’ price can’t be the sum of costs.

The economic principle which is widely accepted shows in the Figure 1 that suppliers’ price can be located according to the market structure of both supplier and assembly firms. Figure 1 provide the explanation on 5 cases among 7 cases in the Table 1.
The horizontal line and the vertical in Figure 1 are the quantity and the price, respectively. It is assumed that the curve MC, or Sc denotes the marginal cost of monopoly supplier and the supply curve of perfect competition market.

**Figure 1. Vertical Pricing and Market Structure**

Monopsony of consumers rarely occurs, so the demand curve in the above diagram should be seen perfectly competitive market’s demand curve (Dc); it is a derived demand that represent demand for delivery. This kind of derived demand represents the average net value of the product (AVP) of assemblers.

First, when suppliers and assemblers are in a perfectly competitive market, the quantity of the parts (Xc) bought f...

Second scenario is where suppliers monopolize the demand and there are competitive assemblers in the market. In this case, in order to maximize the profit, assemblers will decide to buy quantity Xbm at Pbm. When the demand for the product increases the price increases and MMC, the limiting curve of MC, Sc will set the marginal cost.
Also, since suppliers monopolize the demand, they will also monopolize the market; if the number of production factors increases the number of output increases and this leads to decline in the price. The lower cost from this increase in production is the average price that you can get from the purchase of production factors. Thus, buyers decide their profits based on the AVP curve and MRP. The buyers who maximize the profit will decide on the point where MMC equals MRP and thus, will purchase Xbm at Pbm.

If assemblers monopolize the demand and the market is perfectly competitive, then the purchase will occur at (Xs, Ps). The suppliers (who are monopolists) will set the price for assemblers so that the price equals the marginal output; this is the profit maximization point. Thus, MRP is the demand curve that monopolist assembler faces. Monopolist assembler’s marginal revenue function is MMRP, which is limiting curve of MRP. Thus, monopolist assemblers produce at a point where marginal cost equals MMRP, i.e. at (Xs, Ps).

Fourth, if assembler and suppliers are both monopolists, then price will be determined by the price leadership and price can be anywhere along HL. The price leadership cannot lead to the joint profit maximization; mathematical derivation shows that joint profit maximization occurs at a point where MR=MC. Realistically, only way to accomplish the joint profit maximization is for the two parties to reach an agreement between assemblers and suppliers on X*. However, there isn’t a clear way to mathematically derive P*, so the agreement can be very difficult.

Price shouldn’t go above H; at that point the assemblers won’t be able to generate any profit from the transaction. The price shouldn’t go below L, which is equal to the suppliers AC . Theoretically, the price will be somewhere between H and L, but the exact number cannot be derived. The agreement will have to be reached by two parties on the price and the price will be a point along the HL. In reaching the agreement various tools can be used. Some possible tools can include legal system, win-win management, joint venture, and long-term investment.

The X* is greater than Xsm or Xbm where the assembler or the supplier act as a price leader. Unlike the case of duopoly, consumers can benefit from the cooperation between suppliers and assemblers.

When two monopolists negotiate, the average price of the suppliers and assemblers should be given. However, in reality, this can be very difficult. It can be wiser for assembler to calculate the supplier’s average cost and try to negotiate price around that range.

The four cases are summarized in Table 2, and this specifies the conditions for assemblers to get higher price. The lowest price occurs when assemblers are monopolist and when suppliers are competitors. The second lowest price occurs in a perfectly competitive market or in a joint monopoly.
If suppliers have a stronger negotiation point than the assemblers, then they can get higher price for the good.

3. Empirical Analysis

(1) Survey Review

In the year 2008, the price of raw materials has been drastically increased in the international market, as shown in the figure 2. The price has been increased 2 or 3 times over several years.

SMEs’ suppliers which get the shock of big price increase in the raw materials can’t absorb the shock without supplier price increase. But suppliers don’t have the bargaining power with big firms to increase the part price. For example, SMES in the casting industry which don’t balance the cost and the benefit, demonstrate the strike to reject the supply of parts and stop producing cast-iron parts. SMES can increase the assembly part price through the strike. This event attracts scholars and policy-makers on studying how the price between supplier and assembly firm is determined.

Table 3 from the survey which has been done by Korea Small Business Institute shows what the fundamental reason of demand for suppliers’ price decrease is. The first factor is the Korean economic structure led by big firms. The second pressing factor is the assembly firms’ demand for cost reduction, which regularly force the supplier to cost down through the efficiency, the economy of size, and learning-by-doing. Thirdly, assembly firms have the dominant position to seek profit. Fourth,
the intense competition among firms in the global market decreases the supplier price. The fifth is the excessive demand for wage increase by big firms’ labor union. Lastly, SMEs are weak in the competency of technology and new product.

The dominant position of big firms in the price bargaining or the economic structure led by big firms has been resolved not only by SMES’ own efforts, but also by the fair trade commission or by the self-recognition on the competitiveness of their firm-related business ecosystem by big firms.

Table 4 gives the information to analyze the relation between supplier competition and supplier price decrease. The level of competition among suppliers has a great influence on the decrease of supplier price.

Source: Sung Il Kim(2008), p.27

To avoid the pressure of cost reduction caused by the competition among suppliers, suppliers have to attempt to reduce the unfair cut-throat competition among them and short-run profit-seeking, and to increase the competency in technology and in the development and differentiation of new product in the long run by their own efforts.

(2) Statistical Analysis

This paper tries to analyze what factors are statistically important in determining the reduction of suppliers’ price. Sun Il Kim(2008) provides the interesting survey results to explain what factors have influence on the supplier price determination, but not the statistical analysis. Our paper surveyed suppliers to collect the data necessary to analyze suppliers’ price determination in the year 2009. The
survey has been sponsored by the Center of Large-Small firms’ cooperation in the Federation of Korean Large Firms.

Data were collected by on-line survey of suppliers in automobile, electronics, telecommunications, and steel industries. Online survey of SME suppliers was conducted for 2 weeks. The lists were provided by large firms in each industry. Each respondent was asked to answer about the relationships with its biggest buyer.

143 SME suppliers responded and those covered metal and machinery (67 companies, 47.5%), electric/electronic and telecommunications (32 companies, 22.7%). Buyer companies belong to metal and machinery (68 companies, 50.7%), electric/electronic and telecommunications (37 companies, 27.6%).

Average number of employees was 164 people (median=83 people). During 2008 fiscal year, average sales was 43.5 billion won (median=14.3 billion won, $1=1,107 won). Companies averaged 15 years and 6 months in the length of relationship with buyer A (median: 12 years 11 months) and 58.2 percent in the sales portion attributable to buyer A. (median: 61 percent)

Forty seven percent of suppliers surveyed experienced price decrease and 19.4 percent earned price raise. 33.6 percent answered that price did not change for a year.

Table 5 shows the correlation of independent variables with the increment of supplier price ($\triangle SP$).

Table 6 shows that supplier's business type and buyer's industry affect degree of price raise significantly. Buyers metal and machinery industry experienced price raise in average compared with other industries and suppliers in electrics, electronics, and telecommunication industries experienced relative price reduction.

Among other variables, supplier's dependence on a buyer (sales portion), competitive intensity, and degree of technical change contributed significantly to the reduction of selling price.

4. Conclusion

Social network of entrepreneurs and its impact of Small Business Growth

Wasanthi Madurapperuma

Abstract

This paper explore the differences and similarities in the composition and structure of entrepreneurial social network at various stages of venture development and explore the impact of entrepreneurs social capital on business performance. Structural embeddedness (i.e. Configuration) of an entrepreneurs’ social network and the relational embeddedness (i.e.-strength) of those relations are considered. Based on 101 entrepreneurs in small retail businesses, this paper presents evidence indicating that different network configuration are associated with the mobilisation of different types of resources and also show different evolutions. Hierarchical regression results shows that after controlling for the most economic factors Strong diversified regular ties play a key role in explaining the business performance. This research contributes a deeper knowledge and understanding of network characteristics of small retail businesses for accessing resources which in turn influence on business performance.

Keywords: Entrepreneurship; Social Networks; Entrepreneurial process; Business performance; Small retail industry

INTRODUCTION

The importance of entrepreneurship to firm health and national economic growth has been widely acknowledged. Concerned government agencies and other supporting institutions have tried to encourage entrepreneurship. Academics have spent endless effort looking into the variables associated with entrepreneurship. Literature on entrepreneurship focuses on the importance of social network as key explanatory factor in the small business growth (Andersson 2000), and several empirical studies suggest that networks facilitate and accelerate new venture development (Holmlund and Kock, 1998). This study enables us to understand how entrepreneurs in similar stages of business development process use their contacts to acquire resources. Wellman (1999) find that social networks have similar properties in different
countries. Recent studies (Hogan, Eggebeen & Cloggs 1993; Silverstein & Waite 1993) studies didn’t describe in any detail the nature of the respondents social networks from which this support emanates (Mutran 1985). This study attempts to explore the social network model of small retail business and explore differences and similarities in the composition of entrepreneurial social networks at various stages of venture development. This paper employs data from two countries, the UK and Sri Lanka, to explore the network model and to study the factors that influence business performance. Despite the high participation by small retail businesses in entrepreneurial activities around the world and awareness of their role in economic development, there is limited academic attention. The rest of the paper is organised as follows; section two reviews the literature of entrepreneurship and social networks; section three gives the methodology of empirical study, section four discusses results and section five concludes.

LITERATURE REVIEW OF ENTREPRENEURSHIP AND SOCIAL NETWORK

Recent entrepreneurship literature has changed from viewing entrepreneur as autonomous and rational decision makers toward viewing entrepreneurs as embedded in social networks (Aldrich & Zimmer 1986; Hoang & Antoncic 2003; O’Donnell 2001). As a reaction to the former atomistic and under- socialized view of the entrepreneur often taken in the psychological perspective (e.g. Brockhaus 1980; Brockhaus 1982; Brockhaus and Horwitz 1986), an increased recognition of the importance of social networks has developed since the mid-eighties. From then, network analysis has been powerful framework for entrepreneurship researchers. Social network have been defined as the set of nodes or actors connected by a social relationship of a specified types (Castilla et al 2000). It is usual to distinguish
between direct ties and indirect ties and to characterise ties using type of interaction such as formal and informal, the intensity of the ties or the content of the relation i.e., types of resources that circulate through it. Literature agrees on the fact that social networks, in diverse ways, provide entrepreneurs with a wide range of valuable resources and help them to achieve their goals (e.g. Hansen 1995; Singh 2000). In the case of small retail entrepreneurship, we advance that the key resources are: information; access to finance; access to skills, knowledge and advice and social legitimacy. It is argued that different network configurations will be associated with the access and mobilization of different types of resources. Differences in network configuration can be introduced by the nature of resources or by stage of firm in the entrepreneurial process (Casson & Giusta 2007; Hite & Hesterly 2001; Larson & Star 1993).

Much attention in entrepreneurship oriented network research has been focussed on Granovetter (1973) strength of weak tie hypotheses. There is an intense debate about more beneficial configuration of social networks for resources mobilisation process. Granovetter (1973) argues that weak ties are more efficient than strong ties in spreading information and that it hence is important to nurture weak ties (Aldrich & Zimmer 1986; Johannison 1987; Burt 1992; Nohira 1992; Aldrich 1999). According to the other authors strong ties are more beneficial, as they generate trust and cooperation between the actors (Ahuja, 2000), facilitating the exchange of high quality information (Gulati, 1998; Van Gennhvizhen, 2008) and of complex (Hansen, 1999) and tacit knowledge (Lundvall, 1993). These network configurations may be particularly advantageous to access scarce resources (Lovas and Sorenson, 2008). Accordingly there may be difference in relative importance of strong and weak ties dependent on the stages of entrepreneurial development process (Greve 1995). However these differences are not tested for in
most studies. This means that it is important to carry out studies with focus on different stages of business development in order to find possible differences in the impact of strong and weak ties have.

The literature also suggests that both in terms of actor composition and in terms of the nature of the relationships (regular Vs non-regular; formal vs. informal; weak vs. strong, networks evolve over time, this evolution obviously influences the access to external resources in terms business development process. According to this context, some authors argue that the stage of the entrepreneurial process influences the network configuration, (Greve and Salaff, 2003; Hite and Hesterly, 2001; Larson and Starr, 1993). However, some authors advocate that network evolution is influenced by some characteristics of actors.

Most studies consider network evolution at sectoral or cluster level (Orsenigo et al, 2001; Owen Smith and Powell, 2004; Powell et al, 2005; Rosenkopf and Padula, 2008; Aldrich and Kim, 2007; Baum et al, 2000; Powell et al., 1999; Sorenson and Stuart, 2001). In this research we are interested in network evolution at firm level and we propose that:

- Different network configurations are associated with the mobilisation of different types of resources;
- Network composition and structure evolve through time (associated to different stages of development).
- Network structure help to sustain business performance.
METHODOLOGY

Method of investigation

This study uses the egocentric network approach to collect information on the respondents’ social contacts. It has already been shown that most studies of small firm networks have employed ego-centered method. Several tasks have to be performed in measuring ego-centred social networks. First the respondents (focal ego) list the name of existing ties via so-called name generator. When all ties (alters) have been identified, the characteristics of the listed alters and the characteristics ties linking egos to alters (such as strength, reciprocity or multiplexity) have been evaluated. The ego is the source that provided all these information. Owing to the complexity of the response tasks-compiling and editing the list of alters, recalling and writing facts about alters, recalling and evaluating characteristics of contacts with each of these alters etc.- data about ego-centred networks is usually collected by face-to-face surveys (Carraasco et al; 2005)

The data for this thesis were collected during the years 2007–8, titled ‘Social Network of Entrepreneurs and its impact on Business growth in the UK and Sri Lanka. The researcher conducted 101 owner-managers of 101 small firms. Descriptive, comparative and Hierarchical regression analysis techniques appropriate for examining the research questions are employed.

Variables and Measures

Independent variable

Business Growth- The measure of business growth (Krauss et al., 2005) asked participants to report their business growth on profit and sales during the past three
years on a 3-point scale. Therefore, we used the following 3 response possibilities: ‘declined’ ‘the same’, ‘increased’. A year-by-year comparison was made for the past three years (2005, 2006, and 2007), resulting in 3 items that were averaged to produce a measure of business growth. This measure is an aggregated index or causal indicator model (Bollen and Lennox 1991; MacCallum and Browne 1993).

Dependent Variable

Social-Demographic variables

Age: A dummy variable taking the value zero if the interviewee is less than 34 years

Gender: A dummy variable taking the value zero if the interviewee is male

Country: A dummy variable taking the value zero if the interviewee is SL

Ethnic status: A dummy variable taking the value zero if the interviewee is belong to the minority ethnic group

Educational level: A dummy variable taking the value zero if the interviewee has higher school qualification

Parents self-employed: a dummy variable taking the value zero if the interviewee’s parent self-employed

Size of the business: a dummy variable taking the value one if the business has more than five employees; zero if the business has less than five employees.

Firms life-time: measured in years

Business expectation: a dummy variable taking the value zero if the interviewee plan to expand the business
**Social network variables**

**Social network size:** We use multiple name-generators to measure the network size of entrepreneurs. We asked open ended questions of the number of people they talked with advisor, financier, business acquaintance and employees during the each venture stages: “with how many people would you estimate you have discussed aspects of pre-start up, start-up and running your own business?” The questions limits the number of people in the network to those with whom they discussed aspects of each venture stages and in this way restrict the reported network size.

**Network diversity:** We calculated the diversity of the firm’s business ties assessing whether interviewee carried, simultaneously, multiple types of ties to external actors. This measure was inspired by Aldrich H et al (1986). We defined network heterogeneity as the probability of randomly choosing people with two different attributes from the possible five attributes. We calculated it as follows

\[
1 - \left\{ \left[ \frac{\text{Family}}{\text{Total}} \right]^2 + \left[ \frac{\text{Friends}}{\text{Total}} \right]^2 + \left[ \frac{\text{Business}}{\text{Total}} \right]^2 + \left[ \frac{\text{Professional}}{\text{Total}} \right]^2 + \left[ \frac{\text{Supporting institutions}}{\text{Total}} \right]^2 \right\}
\]

A heterogeneity score equal to zero indicates a perfectly homogeneous network whereas heterogeneity score approaching one indicating a more heterogeneity network.

**Proportion of Kin:** We measured the proportion of kin members as the number of family members divided by the number of people in each of their network.

**Closeness:** To measure the strength of relations of each type of network, respondents were asked how close they felt with this person. In this study, Responses could be made from four categories: ‘especially close’ (1) ‘close’ (2), ‘less close’ (3), and ‘distant’ (4). Closeness of contacts was the mean closeness of contact with all network members.
Relational Trust: Trust is an important element in defining the strength of relationships, and is essential to sustaining long-term relationships (Rocha 1993). We focus on the concept of relational trust. Five Likert-type items comprise the scale for relational trust. The questions of relational trust was inspired by Moran P (2005); Cook and Wall (1980); Butler (1991). Items are answered on a 5-point scale (anchors: 1 = strongly disagree; 5 = strongly agree).

RESULTS
The characteristics of respondents in terms of entrepreneur and enterprise are exhibited in Table-1 in Appendix. The entrepreneurial characteristic includes the age distribution of the entrepreneurs, male-female distinction, ethnic status, parents self-employed, experience and the educational level of them. These characteristics help to understand the nature of the people who turn themselves into business entrepreneurs. With regard to the age distribution, most entrepreneurs start their entrepreneurial careers between the ages of 25 and 44. In the sample it was found that more than 70 percent of the owners of the enterprises started their business careers between these ages. In terms of entrepreneur’s male-female distinction, it is evident that still the majority of the business owners are male even though there has been significant growth in female enterprises owned by women. We found that 87.1% of the small retailers are males. Almost 80% business owners belong to ethnic minority group. However, nearly half of them immigrated to the UK more than 30 years ago. Survey data reflects that the fact that the entrepreneurs have a good formal education background in these two samples. It is amounted to 57.4%. In addition to these characteristics, previous industry experience is also an important factor of entrepreneurship. It is clear that the majority of the existing business owners have
had some or work experience before they started or inherited their existing business
tventure in the sample.

The enterprise characteristics include size of the business, firm’s life time and their
market expectation. These characteristics help to understand the nature of the retail
business run by the entrepreneur. Majority of small businesses in the sample are small
It is amounted 63.4%. The desire to be ones’ own boss is the primary reason for
starting a business for almost half of all small retail business owners. Another 42% stated
they started their own business to realise a better financial position. 9% started
their own business because they could not find a suitable paid job. Small retail
business owners are focus on the local community market. 87% of market
concentrated in the local community. With regard to expectation, 64.4% business
owners believe that their market percentage in the local market will either increase or
remain in the same while 35.6 of owners don’t foresee a growth in the market share.

Table-2 in Appendix shows the mean and standard deviation of the continuous
variables. The respondents have a mean advisor network size is 2.62, 2.74 and 3.54
ties in pre-start up stage, start up stage and ongoing stage respectively. Correlations
between Network variables are presented in Tables: 13, 14, 15 and 16 in Appendix.
No variables have correlation higher than 0.7 which indicates that there is no problem
of multicollinearity

**Network composition**

In network composition analysis, we are interested in nature, origin and functions of the
network actors as well as in their dynamic through business stages. We try to answer
questions like who are the key actors selected for each entrepreneurial networks. Did network composition change substantially over the business stages? We start the analysis of network composition with general characteristics of the regular contacts (Zone B) and non-regular contacts (Zone C) contacts. Results about those network size and composition are presented in Table 3, 4 and 5. In these tables we present zone-B and zone-C networks mean, max, min and SD values for total number of actor. Table -3 refer to discovery stage, Table 4 start-up and table 5 ongoing business stage.

</table>
When we compare zone B and Zone C networks it becomes clear that in firm development process they establish relation with new actor to access resources. We also notice a change in an actor composition of the Zone B, over the business stages. In this stage, family and friends is the key network member. There is an increase in the relative importance of non-family ties. This is related with the alteration of the nature of resources needed at start up and at later development stages. Facilities, financial capital were more pertinent at start up. During this stage, network extended to professionals and formal support institutions followed by business acquaintance. However, their non-regular contacts became more important than the more regular contacts. Apart from that they lacked knowledge about business environments and government requirements, the help of professional service, and up-to-date information concerning the trade. All these were unavoidable if the entrepreneurs were to start and maintain their business. Then the network composition consist more non-regular ties with business acquaintance, professionals and formal institutions. At later stages, the knowledge of local regulations regarding, health and safety and hiring employee was crucial to the success of the business. As well, Firm need to gain access to complementary resources and competence. Thus they need to reinforce relations with Zone C contacts. They also need to gain access to complement assets that support market exploitation thus they will tend to establish relations with zones-C contact. If the entrepreneurs could maintain non-regular ties with professional services, professional bodies and government agencies, the chance of improving the business was greatly enhanced, which is similar to the findings of the study of Granovetter, (1973). These contacts generated more business and obtained services or knowledge to improve the operation, building the company image and goodwill. In order to get a deeper understanding of this evolution, we now turn our attention to selection, looking at each entrepreneurial network.
Selection

Gulati (1995) defined that selection is to the choice of actors and to tie formation between them. Our objective is to get a deeper understanding of entrepreneurs’ selection regarding the network actors. To explore this we analyse each type of network and key actor types. Table 6, 7, 8 and 8 results in values for discovery stage, start up and ongoing stage respectively. It can be concluded, from the observations of those tables, that different entrepreneurial networks have different structure and different evolutions in terms of actor type composition. It reflects different strategies for different types of resources for different stages. It was very common for entrepreneurs to follow such an evolutionary network model to meet the different needs of different stages of entrepreneurship. Entrepreneurial success was secured by using the network adequately. The entrepreneurs had the tendency to spend more time cultivate and developing relationship with the new group of network members of that particular stage rather than maintaining the relationship with the existing group.

Network structure

The analysis of network structure focuses in the type of ties (relationships) and on their resource contents, as well as in their dynamics through each venture stages. We raise questions like: Do different network types present different configuration in terms of size, density and tie strength? Did network configurations change substantially through business stages? Was such change more manifest in some type of networks than in others?

In Tables 9, 10 and 11 we show some measures for networks structure characterisation, for each entrepreneurial network relevant to pre-start up, start-up and present stage. There we can see data about the number of actors and ties, the mean degree and the network density. From the observation of those tables, we can conclude that different networks have distinct configurations, both at prestart up, start-up and at present moment, and that those configurations show different evolutions.

Networks and Firm performance

So far we have analyse entrepreneurial networks, assuming that they are valuable for firm performance. Can this be confirmed with our empirical evidence, or do they perverse effects on performance? We have analysed this by using sales growth as an indicator of firm performance. Table 12 reports the impact of social capital variable on sales performance.

Model 1 presents the baseline model. There were no statistically significant effects for age, gender, ethnic-status, work experience, parents self-employed, size of the business and Business expectation. However, education level tended to perform better in financial performance (p<0.05). This was consistent across all models except the Model 6 and 7. Model 2, 3 and 4 examine the impact of the structural elements of social capital on sales performance. Model 2 indicates that neither the relationship between regular ties and sales performance nor the one between non-regular ties and sales performance is supported. Although the direction of both effects are supported – more regular ties and non-regular ties contribute to financial performance- neither is significant.

I tested whether network size impact on financial performance. Network size is among the most investigated structural network variables. It is argued that network size increases entrepreneurs’ performance. Test results shows that all network size variables are positively related to sales performance. However, only Business network size exhibit significant effects on sales performance (p<0.05).
The other authors have suggested that the diversity of network might also be important for business performance. The diversity of entrepreneurial networks is indeed positively related with performance. Business network diversity and employee network diversity has significant positive (p<0.05) influence on sales performance while advisor network diversity and financial network diversity is insignificant although the direction of effect is positive. Moreover, once network diversity variables are accounted for, regular ties exhibit significant effect on sales performance. In sum, entrepreneurs with many regular contacts contribute more than their counterparts to sales performance and lose this advantage as their business and employee network diversity where entrepreneurs receive a boost to their sales performance.

Turning to the relational measures of social capital, the Model 5 test the impact of kin-composition on sales performance and shows a negative relationship. If employee network consists of more kin ties, it negatively and significantly lowers the growth of the firm (p<0.05). However, if financial network consist of more kin ties, it boost the business performance (p<0.05).

The Model 6 reveals that the impact of closeness on sales performance. It shows that the coefficient for the closeness of social network with advisor and employees was significant and positively related to the sales growth of the firm (p<0.05). Closeness with advisors and employee will benefit. However, this relationship is negative for finance and business network and effect is not significant.

The relational trust, on the other hand, displays a marked impact on sales performance. There is a significant impact on relational trust with actors of business
network and employee network on sales performance of the business (p<0.05). The relationship between Relational Trust with actors of advisor and financier network and sales performance is positive, but not significant. The effect remains for both of these measures of relational quality in the full Model (Model 7). Where entrepreneurs have established familiar/close and high trust personal relations with employees, customers and suppliers, they are more likely to be successful entrepreneurs.

Model 6 shows the full Model – again all network diversity variables (except advisor network diversity) and regular contacts are supported. It shows that entrepreneurs who have more diversified regular ties with customer, suppliers, financiers and employees will benefit (p<0.05). This results support the network brokerage argument (Burt (1992).

Likewise, Entrepreneurs, who are very close-familiar and trusted relations with employees, will also benefit. However, entrepreneurs who have many strong kin ties in his/her employee network will lose. On the other hand, entrepreneurs who have trusted relationship with customers, suppliers and other business acquaintances will also benefit. However, they need not to be in very close relationship with these contacts to boost sales performance. Entrepreneurs who are close to and more familiar with their advisors will also benefit. But, they need not be in high trust relationship with these contacts to boost sales performance. This results support the network closure argument (Coleman 1990; Krackhardt 1999).

DISCUSSION

Do network matter for growth? The aim of this paper has been to provide insight into the effect of entrepreneurial network on access and mobilisation of resources and ultimately, also on the performance of small retail enterprises. The data allowed us to construct and characterise ego-centred networks for each firm. Given the rich set of information obtained, we managed to construct different networks, which gives us precious information about the way the entrepreneur use their social capital to access and mobilise different kinds of resources which are critical to firm performance and allowing to accessing a better understanding of the network compositions and configurations that are more effective to access to key resources in the retail industry. This contribution is important since previous research has rarely addressed, simultaneously, a variety of resources and relationships.

Social networks are predominantly important for the entrepreneurial managers since they can play a vital role in collecting and synthesizing information (Casson 1997). In this study, we have examined four types of networks that are effectively used by the firms in their search for resources: advisor network, finance network, business network and employee network. We have compared those networks characteristics relevant to each venture stages. The results also point to the fact that different entrepreneurial networks have different compositions and structures. This means that, as we proposed access to different types of resources entail different types of actors and different types of relations. It is also interesting to notice that, regular ties show a tendency to diversify their actor composition as firms evolve.
It can be concluded that this research provides evidence that contributes to on-going debates in the area of social network and entrepreneurship, both at the methodological and empirical levels. At this stage the main contribution regards the development of a methodology that was found offer important insights into the behaviour of small retail entrepreneurs in their search for key resources for firm performance.

This research has a potential limitation. This study was a cross-sectional examination of one economic sector. As such the reported results may be limited in their applicability to other industry sectors. The results obtained in this study contribute to a more in-depth understanding of the ways how small retail entrepreneurs mobilise their personal networks for accessing resources at different stages of firm development and hence for business performance. Further works is needed in order to better explore the results and also to confront them with the extant literature.

Wasanthi Madurapperuma: Wasanthi Madurapperuma is a Senior lecturer in Economics at University of Kelaniya, Sri Lanka. She holds a PhD placement with Overseas Research scholarship at the School of Economics, University of Reading, UK. Her research interests include Entrepreneurship, Networking in small business organizations and International business.

1. Introduction

Alfred P Sloan, CEO of General Motors in the early part of the 20th Century, recorded his experiences in his now famous book, “My Years with General Motors”(1). He introduced the topic of corporate entrepreneurship as follows:

“My aim was to create an organization in which executives would be no more disadvantaged than if they were operating their own companies”. (paraphrased, p406)

For at least the past 30 years, corporations have attempted to take up Sloan’s challenge by introducing programs to encourage and foster entrepreneurial behaviour while at the same time maintaining successful and profitable businesses using existing products, services and processes. Some companies have done it well such as 3M, Procter and Gamble and a range of High-Tech companies. Some tried and gave up when they faced economic hurdles or changes in corporate direction. Some created a flexible and creative corporate culture and waited for entrepreneurship to occur. Others introduced processes for developing corporate entrepreneurs.

This paper reflects on the work of five entities who explored corporate entrepreneurship development over 30 years. Each of these had a profound influence on the author of this paper as he attempted to develop entrepreneurial behaviour in both large Australian organisations and a small selection of international companies.
The paper commences with a brief comment on the author’s understanding of terms such as innovation, corporate entrepreneurship and corporate venturing. This is followed by an overview of the philosophies and practices of Gifford Pinchot III(2), Rosabeth Moss Kanter(3), The Foresight Group(4), Gary Hamel(5), and Doblin Inc(6). Each of these entities researched, published, lectured and practiced in the arena of corporate entrepreneurship and each has provided significant input to the beliefs and practices of the author of this paper.

The paper provides a listing of some tools and techniques used by the author having learned and adapted from the five entities listed above. It concludes with a selection of short case studies which demonstrate the types of outcomes that might be expected from the application of the tools and techniques identified.

2. Definitional Issues: Innovation and Corporate Entrepreneurship

This author adopts a simplistic view of innovation because complex definitions tend to confuse and obfuscate what is fundamentally a very basic process. During the 1980s, ArthurYoung, a member of the then “big 8” chartered accounting fraternity, used the following definition of innovation in a survey of Chief Executive Officers. They suggested that innovation is “Ideas Implemented Profitably(successfully)”

This author has expanded the ArthurYoung definition as follows:
• **Ideas** are the inventions or creative contributions of scientists, inventors and designers. Ideas exist in great numbers and most business leaders will readily admit that the generation of new ideas is not a problem in most organizations.

• **Implementation** is a human process, not a mechanized system that can be easily defined and replicated. Implementation of new ideas is fraught with ambiguity and uncertainty and thus it requires human effort in experimentation, testing and sharing with other humans. Implementation then requires entrepreneurial behavior in bringing the idea to fruition.

• **Profitability** (or success) with a new innovative idea comes not because the idea is world-shattering or exceptionally unique. Rather, success comes when the innovative entrepreneur or entrepreneurial team exhibits sufficient energy and creative effort to overcome all of the internal and external impediments that are put in the way of any new idea that threatens the status quo.

Innovation and corporate entrepreneurship are two sides of the same coin and each requires the other for successful corporate venturing. The development of corporate entrepreneurs thus, becomes an important ingredient in the process of generating innovative climates in organizations.

3. Philosophies and Practices of Five Developers of Corporate Entrepreneurs

(1) Gifford Pinchot III
Gifford Pinchot, coined the term “Intrapreneur” in the early 1980s to describe intra-corporate entrepreneurs or internal entrepreneurs. Around that time he conducted schools for entrepreneurs and intrapreneurs in the USA.

Pinchot’s philosophies are contained in the following statement:

“The primary secret of the venture capitalists success is revealed in the way they select ventures for investment. They say: “I would rather have a class A entrepreneur with a class B idea than a class A idea with a B class entrepreneur.” They put their faith in choosing the right people and then sticking with them, while many corporate managers would feel uncomfortable with a strategy dependent on trusting the talent, experience and commitment of those implementing it. I believe the primary cause for the lower returns of corporate managers of innovation is their failure to understand the importance of backing the right people – this is their failure to identify, support, and exploit the “intrapreneurs” who drive innovation to successful conclusions.

……..Intrapreneurs, are “the dreamers who do.” In most organizations people are thought to be either dreamers or doers. Both talents are not generally required in the one job. But the trouble with telling the doers not to bother about their dreams is that they dream anyway. When they are blocked from implementing dreams of how to help your company they’re dreaming dreams of revenge. A mind is meant to imagine and then act. It is a terrible thing to split apart the dreamer and the doer.” (7)

The Intrapreneurs 10 Commandments, highlight Pinchots’s views on what intrapreneurs need to do to succeed.

1. Come to work each day willing to be fired
2. Circumvent any orders aimed at stopping your dream
3. Do any job needed to make your project work regardless of your job description
4. Find people to help you
5. Follow your intuition about the people choose and work only with the best
6. Work underground as long as you can – publicity triggers the corporate immune mechanism
7. Never bet on a race unless you are running in it
8. Remember it is easier to ask for forgiveness than for permission
9. Be true to your goals but be realistic about the ways to achieve them
10. Honour your sponsors (8)

Pinchot has firm views on the training of intrapreneurs.

“Training your people in acquiring intrapreneuring skills is as important as knowing whom to hire. Though most people imagine that intrapreneurs are born and not made, we have had good results training intrapreneurs. In our Intrapreneur Schools we ask for volunteers. This way we are training a select group of people who are courageous enough to volunteer for an intrapreneurial role. Training succeeds partly because it gives people permission to use a part of themselves that their supervisors have been trying to beat out of them for quite some time.

…….In addition, most intrapreneurs are missing skills for which training can help. They have some functional abilities which are often technical, and they have been convinced that they really cannot understand some things like accounting or marketing. They
believe that those blind spots keep them from being the general manager of a new idea. They do not have to become excellent at all functions; they just have to understand enough to work easily with others in those fields. In fact, if the idea good, success does not require great sophistication in many disciplines, just a journeyman job that doesn’t overlook the obvious. Training should be structured to build teams and so the whole team should work together while training.”(9)

Pinchot’s, “Intrapreneurs 10 Commandments” highlight his views on what intrapreneurs need to do to succeed.

1. Come to work each day willing to be fired
2. Circumvent any orders aimed at stopping your dream
3. Do any job needed to make your project work regardless of your job description
4. Find people to help you
5. Follow your intuition about the people you choose and work only with the best
6. Work underground as long as you can – publicity triggers the corporate immune mechanism
7. Never bet on a race unless you are running in it
8. Remember it is easier to ask for forgiveness than for permission
9. Be true to your goals but be realistic about the ways to achieve them
10. Honour your sponsors(10)

Pinchot has firm views on the training of intrapreneurs.
“Training your people in acquiring intrapreneuring skills is as important as knowing whom to hire. Though most people imagine that intrapreneurs are born and not made, we have had good results in training intrapreneurs. In our intrapreneur schools we ask for volunteers. This way we are training a select group of people who are courageous enough to volunteer for an intrapreneurial role. Training succeeds partly because it gives people permission to use a part of themselves that their supervisors have been trying to beat out of them for quite some time.

……In addition, most intrapreneurs are missing skills for which training can help. They have some functional abilities which are often technical, and they have been convinced that they really can’t understand some things like accounting or marketing. They believe that those blind spots keep them from being the general manager of a new idea. They do not have to become excellent at all functions; they just have to understand enough to work easily with others in those fields. In fact, if the idea is good, success does not require great sophistication in many disciplines, just a journeyman job that doesn’t overlook the obvious. Training should be structured to build teams and so the whole team should work together while training.”(11)

Pinchot wrote of his processes and practices in 1999 in a new book entitled Intrapreneuring in Action.(12) The contents to that book provide a useful checklist for intrapreneur developers on what needs to be considered.

1. Make your mistakes faster and cheaper
2. Honouring the five people of innovation
3. Create the climate for innovation
4. Training for intrapreneurs
5. Choosing innovations that fit who you are
6. Getting started
7. Avoiding the classic new product mistakes
8. Intrapreneuring within a structured development process
9. Advice for hands-on innovators
10. What managers can do
11. What senior leaders can do
12. The future of the intrapreneurial organization
13. How to succeed as an intrapreneur

Chapter two of this latest book by Pinchot discusses the **five people of innovation**. Developers of corporate entrepreneurs need to take all of these people into account in their development activities. The five people are;

1. Idea people
2. Intrapreneurs
3. The intrapreneurial team
4. The sponsor (protecting intrapreneurs from the “corporate immune system”)
5. The climate maker (working to create an organizational pattern and culture empowering intrapreneurial teams.)
(2) Rosabeth Moss Kanter

Professor Moss Kanter entered the innovation literature and lecture circuit in 1982 following publication in the Harvard Business Review of an article entitled “The Middle Manager as Innovator.”

In 1983 she published a book entitled “The Change Masters” in which she outlines the importance of corporate entrepreneurs in championing change.

Moss Kanter visited Australia in 1983 and in one conference presentation she outlined her philosophies concerning innovation in bringing about corporate change. Her model for change included:

1. A shared vision
2. A mechanism and a process for managing change
3. Tools for change –
   - Participation in culture change teams
   - Training
   - Information
   - Support
4. Encouragement of localized innovation; widespread micro level change
5. Ensuring 2-way communication within the change process to facilitate the learning and the development of commitment
6. Ensuring signals, rewards and symbols are compatible with the changes sought
7. Realign policies, systems and structures to support the aims of the change processes

The research that Moss Kanter conducted for her book “The Change Masters” identified the following rules for stifling innovation in large organizations:

1. Be suspicious of any new idea from below
2. Insist that ideas go through many levels before reaching the final decision maker
3. Express criticism, withhold praise and instill job insecurity
4. Change policies and reorganize unexpectedly
5. Count everything that can be counted – frequently
6. Never forget that you at the top know everything there is to know that is important about this business(15)

Moss Kanter’s research in large US organizations highlighted 8 characteristics of innovative middle managers which she shared in her Australian visit in 1983:

1. Desire for change and a tolerance for uncertainty (The entrepreneurs disease)
2. Foresight, vision and clarity of direction
3. Thoroughness and complete preparation
4. Political astuteness
5. Participative management style
6. Persuasive
7. Pushes to the limits of his/her discretion
Her research also identified the following characteristics of winning innovations:

1. Trial-able
2. Reversible
3. Divisible
4. consistent with sunk costs
5. Concrete
6. Familiar
7. Congruent with image, goals and values
8. Potentially visible

As a last resort, an innovation may be:

9. Marginal
10. Idiosyncratic

Innovative middle managers have mastered a process of innovating and the following checklist from Moss Kanter provides developers of corporate entrepreneurs with a useful template for training and development programs

1. Definition
   - Sensing and seizing a need
- Broadening perspectives
- Gathering intelligence and planting seeds
- Shape the vision

2. Coalition Building
- Pre Selling
- Horse trading
- Secure blessings
- Form a team

2. Getting Results
- Managing the rest of the organization
- Secondary redesign
- Handling interference and opposition
- Maintain momentum and continuity
- External communication
- Deliver on promises (to team)(16)

(3) The Foresight Group (Sweden)

Gordon McCrae wrote in the Economist magazine in 1982 about the Swedish Foresight Group who had established a School for Intrapreneurs in Europe (4)
The Foresight Group consisted of three well known innovation consultants (Sven Atterhed, Gustaf Delin and Lennart Boksjo) who had been heavily influenced by Gifford Pinchot III. Their philosophies concerning innovation in large corporations are explained as follows:

“Think about the traditional approach to innovation. Management analyses and reviews ten ideas for new projects and chooses one. Money is then poured into the selected project to try and make it work. Everyone becomes blind to the possibility of failure. If the idea falls flat on its face, how much time and money will have been wasted? And even if it succeeds, how many good ideas are left on the shelf unexplored? How many other ideas are lost to the organization?

With intrapreneurship, the same ten projects are given to ten individuals, each of whom is burning to develop new ideas. They are given corporate support, but on a limited scale. Some projects will fail before they reach the finish line, but at minimal cost to the organization. Those that stay the course are by definition winners, since every step from concept to market testing have been carried out –typically in a fraction of the time and cost of traditional projects.”(17)

According to the Foresight Group, the role model intrapreneur is “a self selected employee who has been given the space tools and support needed to act as a fully responsible “free market entrepreneur” using the company’s name, know how and network to turn his/her vision or mission or idea into a profitable and growing business for the corporation.”(18)

The characteristics of the innovation process require entrepreneurs not controllers. These characteristics include:
1. High degree of ambiguity
2. High flexibility needed
3. Quick decisions
4. Many decisions
5. Many mistakes
6. Must learn fast
7. Hostility and suspicion from others
8. Little support
9. Must find sponsors
10. Must prove quickly that it works.(19)

It is clear to see that the Foresight consultants and Gifford Pinchot were of similar minds as far as innovation in corporations is concerned.

The Foresight Group School for Intrapreneur Development is seen as a “Five-Part Process”

1. Direction and commitment declared by senior decision makers to develop innovation and intrapreneurs in the organization
2. Intrapreneurial management and culture development whereby those who will manage intrapreneurs will exhibit encouraging and supportive behaviours
3. Intrapreneur identification and selection takes place through processes of self selection where individuals and teams are invited to hear about the school for
intrapreneurs and then decide for themselves if they wish to put in the effort required.

4. Intrapreneur training over a period of months with 2 and 3 day workshops in which potential intrapreneurs are confronted with the attitudes and skills needed for entrepreneurial behaviour while they test and develop plans for their chosen innovative ventures.

5. Support structures and systems developed to both capture and support the efforts of intrapreneurs but also to ensure that lessons learned are promulgated throughout the culture of the organization to ensure ongoing growth and progress.(20)

**Intrapreneurial skill training** in Foresight Schools include the following:

1. Trend identification
2. Creative idea generation
3. Goal formation - visioning
4. Business idea formulation
5. Business plan creation
6. Articulating and testing critical assumptions
7. Milestone budgeting
8. Seeking sources of funds
9. Presentation skills
10. Telephone skills(21)
The Foresight Group took their School for Intrapreneurs into the world between 1985 and 2005 by creating the Foresight Network, members of which developed many intrapreneurs and intrapreneurial ventures in corporations in Scandinavia, Europe, USA, Australia and New Zealand.

(4) Professor Gary Hamel

Gary Hamel became well known in the early 1990’s following publication of a book entitled “Competing for the Future”, co-authored with CK Prahalad. The authors at that time were arguing that successful companies in the future would not simply need to develop innovative products and services, but that they would need to recreate the industries in which they operated.

By the year 2000, Hamel was convinced that “strategic innovation” was the key to success for the world’s largest companies if they were to continue to operate and to prosper in a period of massive, unprecedented change.

Hamel published a paper in the Harvard Business Review in 1999 entitled “Bringing Silicon Valley Inside.” His introduction to the paper expressed his thinking about innovation as follows:

“Stewardship versus entrepreneurship: that’s the fundamental distinction between the mediocre mass and the revolutionary wealth creators. Stewards polish grandma’s silver –they buff up the assets and capabilities they inherited from entrepreneurs long retired or long dead. Devoid of passion and imagination, they spend their time trying to
unlock wealth by hammering down costs, outsourcing inefficient processes, buying back shares, selling off bad businesses and spinning out good ones. But in the new economy, investors don’t want stewards. They want entrepreneurial heroes-innovators who are obsessed with creating new wealth. Stewards conserve. Entrepreneurs create.

If you want your company to join the pantheon of wealth-creating superstars, you have to shift the balance of effort from stewardship to entrepreneurship in your organization. There’s nothing wrong with stewardship-someone has to safeguard all those brands, skills, assets, and customers that underpin today’s success. But in a world where strategy life cycles are increasingly measured in months, not decades, even the most skilled stewardship won’t enable you to capture tomorrow’s riches. It may not even enable you to survive.”(23)

Hamel published a new book in 2000 entitled “Leading the Revolution.”(5). He conducted an Innovation Academy in USA and Europe to encourage companies to take up the themes developed in that book. During one of these Academies he shared the following:

“Building a deep capacity for strategy innovation requires a company to imbue its employees with new passions, as well as new skills. It requires a never-ending effort to engage and capture the imagination of every single individual. It requires a relentless quest to bring profoundly new benefits to customers. It requires allegiance to new financial measures that focus attention on the challenge of creating new wealth. It requires a relentless search for new business concepts. It requires the total absence of nostalgia for old business concepts.”(24)
Professor Gary Hamel has held academic positions at London and Harvard Business Schools. He also established a consulting company called “Strategos Inc” (25), which assists large international corporations to develop innovative strategies for facing a rapidly changing world. His processes for assisting organizations to develop innovative thinking include:

1. Top level commitment to opportunity oriented thinking
2. Developing mindsets throughout the organization that welcome innovative ideas
3. Executives, managers and team leaders skilled in facilitating teams of idea generators
4. Employees trained in opportunity identification and evaluation (26)

In his book “Leading the Revolution” he lists 10 rules for re-inventing the company which he uses in his processes for developing innovative strategies. These are:

1. Set unreasonable expectations
2. Stretch your business definition
3. Create a cause, not a business
4. Listen to new voices
5. Design an open market for ideas
6. Offer an open market for capital
7. Open up the market for talent
8. Lower the risks of experimentation
9. Make like a cell - divide and divide

10. Pay the innovators well-really well

The above list of rules can be used both for building innovation into corporations, and for creating enduring cultures that recreate the whole corporation. Hamel argues that the culture change exercise needs to precede any thoughts of using the rules for building innovation. However, the rules can be employed independently of each other and have been proven to change the way innovative activity occurs in different parts of an company. One small example is the application of “listening to new voices” in management teams. If a team is prepared to invite people with different backgrounds and experiences to address its members and then to openly discuss the alternative new voices without judgment, the team can often discover new innovative opportunities that would never have occurred to them without the stimulus of the new voices.

Strategos Inc, under Hamel’s leadership introduced an innovation process into a number of international corporations with great effect. This has been known as the “Game Changer Program” and has the following characteristics:

1. Funnel concept. The heart of innovation is the revolutionary idea. Experience shows that a large volume of ideas is needed to generate a few breakthrough opportunities. The Game Changer process promotes proposals to be submitted at any time, from anywhere and from anyone.

2. Speed. Promising ideas should be pursued as quickly as possible. The process is based on speed: once an idea is submitted, a panel of peers rapidly assesses it and
responds. Larger promising ideas are progressed to an Extended Panel for further commerciality screening and potential acceptance for further funding.

3. Fast response. Quick follow-up on good new ideas encourages generation of additional ideas.

4. Funding until proof of concept. Game Changer aims to fund idea development until either proof of concept is reached or it is clear an idea is not (yet) feasible. Emphasis is on demonstrating the potential business impact if the idea had been successfully developed.

5. Hit and run. Small scale or immature, but promising, ideas may immediately receive controlled funding to mature the idea.

6. Review by peers. The funding of an idea as a Game changer and the continuance of a Game Changer project is determined by peer review, and not via traditional line management hierarchies with their inherent obstacles.

7. Opportunity to allocate time to ideas. Staff should have freedom during business hours to allocate time for idea generation.

8. Team orientation. The organization’s culture should encourage fleshing out of ideas by teams if necessary, rather than by individuals. The experiences and networks of team members can be advantageous to the project.

9. Interdisciplinary ideas actively encouraged. Traditional discipline and departmental areas should not be permitted to inhibit idea generation and development. A specific Game Changer team should be established to catch ideas that fall between the cracks of traditional business areas.
10. Ease of submission. Submission forms and the submission process must be simple and fast to use by occasional users.

11. Absence of organizational filters. No approvals (from line managers etc) should be necessary to submit an idea.

12. Rewards and recognition: no penalties. Generation of ideas should be recognized and rewarded appropriately. There must be no penalty for generating ideas not accepted by the viewing process: all contributions should be recognized.

13. Awareness of rewards. Rewards should appropriately compensate time and effort with an eye to potential benefit and all employees should be made aware of available rewards.

14. External awareness. An outward looking culture is necessary via participation in conferences, industry consortia, academia, personal networking, etc. Some global corporations include third parties in their review process to provide an independent perspective.

15. Active promotion of idea generation. Periodic focused workshops are needed for ongoing rejuvenation and stimulation of ideas to constantly fill the “funnel” of submitted ideas. Full-time process champions are essential to success not only in rapidly administering the process but also in visibly signaling organizational commitment to innovation and the future.

16. Database of ideas accessible to all. A database of ideas and their progression should be accessible to all and easy to use. This encourages sharing of new ideas and helps build upon already known submissions.
Doblin Inc, located in Chicago USA, began their operations 30 years ago as “Strategic Design Consultants” believing that corporations should spend their time when developing corporate strategy on “Design Strategy” much more than they spent time on market, production and finance strategies. Unfortunately, corporate strategists who were largely trained in business schools did not perceive design to be a significant issue. When “Innovation” became the catch cry of corporate strategists in the late 1990s and early 2000s, Doblin Inc realized that its approach to strategic design was ideally suited to companies who sought to be innovators in industry strategy and product and service strategies.

They applied the disciplines that they had traditionally used in product design to the innovation projects that they undertook in large corporations.

Doblin philosophies on corporate innovation questioned many of the conventional wisdoms on innovation. For example, they do not accept that innovation comes from a set of excited individuals who are encouraged to think up ideas, find market opportunities for those ideas and then attempt to convince a bureaucratic organization to say yes to their implementation.

Rather, Doblin has adopted a concept of “disciplined innovation” in which outcomes required from the innovation efforts are designed in advance, new discoveries are planned systematically, ethnographic data is collected on potential buyers or users, carefully designed solutions are developed, prototypes are experimented with, and
corporate executives are presented with innovations which match the requirements that they established earlier.

Doblin has also questioned the conventional wisdom that most profitable innovation comes from unique products and services. Their research has uncovered four categories of innovation encompassing 10 types. These are as follows:

Finance:

1. Business model. (How you make money)
2. Networks and alliances. (How you join forces with other companies for mutual benefit)

Processes:

3. Enabling processes. (How you support the company’s core processes and workers)
4. Core process. (How you create and add value to your offerings)

Offerings:

5. Product performance. (How you design your core offerings)
6. Product system. (How you create product systems and platforms)
7. Service. (How you provide value to customers and consumers beyond and around your products)

Delivery:

8. Channel. (How you get your offerings to market)
9. Brand. (How you communicate your offerings)
10. Customer experience. (How your customers feel when they interact with your company and offerings)

Doblin has researched large publicly listed companies in USA over the past 10 years to determine both resource allocation to innovation and where value has been created from innovation. They have discovered that the bulk of resources have been allocated to the “offering” category of innovation whereas the value has been created in the “finance” and “delivery” categories of innovation. Their research has indicated that 2% of projects produce more than 90% of value.

The above research has led Doblin to develop methodologies for mapping the areas where companies might identify the most profitable areas for innovation effort to be applied. They have created innovation landscapes for particular industries using the 10 types of innovation listed above and these landscapes pinpoint where innovation efforts might be profitably employed for a particular industry. (28)

Doblin consultants who enter into innovation projects with their client companies have developed specific tools that are based largely on the types of processes that designers would use when asked to identify new product or service designs. The Doblin processes are useful tools for developers of corporate entrepreneurs to build into their innovation projects. They may include the following:

1. Diagnosis of current commercial realities
   
   Client interviews
   
   Anthropological/ethnographic studies
Landscape analysis to identify industry history in innovation
Comparison with industry trends

3. Innovation Intent Workshop
Executives and researchers determine their innovation intent
Focused innovation is sought to improve innovation hit rates
Alignment between corporate strategy and strategic intent developed

4. Discovery Workshop
New discoveries are sought to satisfy innovation intent
Discoveries sought from external research and internal capabilities

5. Working teams produce business cases for new revenue streams
Doblin consultants and internal teams produce prototypes
Business cases presented to executives for support
Decisions made to proceed

6. Implementation of new innovative opportunities
Teams established and commissioned to implement
Detailed plans prepared and projects launched
Progress reports provided (29)

4. A Selection of Tools Used by the Author in Developing Corporate Entrepreneurs

The 5 entities described above have provided the author of this paper with philosophies and techniques and tools which he has attempted to employ over the past 25
years in assisting corporations to build innovation through the development of corporate entrepreneurs.

The range of useful tools fall into four categories: 1 Preparing for Innovation, 2 Recruiting and Selecting Corporate Entrepreneurs, 3 Innovation Laboratories and Workshops, 4 Institutionalizing Innovation.

1. Preparing for Innovation

- Working with senior executive team to ensure that commitment to the innovation process exists
- Establishing innovation intent and developing the design criteria for innovations with executive team, i.e. what are their expectations?
- One day workshops with middle level managers to ensure that they understand the likely outcomes and effects on their own activities: creating an innovative culture
- Choice of innovation managers or facilitators to oversee the process: ensuring that people with facilitation skills rather than directors or controllers are chosen

2. Recruitment and Selection of Corporate Entrepreneurs

- Creating processes for self selection by corporate entrepreneurs; advertising the process and inviting interested people to attend a seminar
- Conduct of after hours seminars to explain the innovation program; people who attend after hours are more likely to be committed
- Interviews with seminar participants who express interest in self selecting into the innovation program; the interviews are designed to ascertain whether genuine commitment exists

3. Innovation Laboratories and Workshops

- A series of two or three day sessions spread over 6 to 12 months are provided to explore entrepreneurial behavior and to build business cases
- Laboratory sessions may incorporate the following topics;
  - Examining the Executive Team’s innovation intent
  - Identifying opportunities in new discoveries

New discoveries might be made in:

- Un-voiced needs of customers or users
- Un-examined dogmas or orthodoxies of company or market
- Un-exploited trends in society or markets
- Un-seen assets in the company including intellectual capital
  (The 4 “Uns” are a tool developed by Gary Hamel)

- Understanding entrepreneurial approaches to ambiguity and uncertainty
- Establishing personal and team visions and goals
- Exploring the Venture Capitalist’s approach to risk
- Evaluating new innovative opportunities
Building business cases

Conducting low cost market research for new learning

Sharing business concepts with “new voices”

Identifying and fostering mentor and sponsor support inside the company

Building prototypes

Discovering sources of funds either inside or outside (including personal)

Exploring remuneration and reward systems

Developing presentation and internal selling skills

Presentations to sponsors, mentors and executive teams for support

4. Institutionalising Innovation

- Creation of an in-company centre which houses innovation facilitators

- Publication of regular news-letters sharing results with all employees

- Establishment of data bases for easy access to all innovative employees

- Ongoing assistance to entrepreneurial teams and intrapreneurs who are charged with the task of launching new ventures

- Remuneration and reward systems

- Working with universities, research institutes and other innovative organizations to ensure that all emerging developments are accessible to the company’s corporate entrepreneurs
5. Some Selected Outcomes from Corporate Entrepreneur Development Processes

The author of this paper has spent the past 25 years attempting to demonstrate how the development of corporate entrepreneurs can lead to increased levels of corporate innovation. Not all attempts have been successful but almost all attempts have led to the implementation of some innovative initiatives. Some of the author’s work was reported to the Babson College Frontiers of Entrepreneurship Research Conference in 1992.(30) Other writers identified above, have reported from time to time on the outcomes of their efforts.(31),(32),(33)

The following five brief stories attempt to give a flavour of the types of outcomes that have been achieved.

1. The CEO of a large national bank implemented an innovation program to bring the bank’s performance ratings up to those of competitors. Twenty five workshops were provided across the nation. Each workshop consisted of 20 to 25 self selected participants who identified and evaluated opportunities for changed business strategies, product ranges and customer support systems. A steering committee oversaw the whole program providing ongoing mentoring to participants. An external facilitator conducted the workshops over a nine month period. Regular reporting to the whole corporation on progress took place for a two years and at a meeting held 30 months after the commencement of the innovation program, the CEO reported that the bank’s performance indicators now put them at the top of the league table. The CEO reported that it was his
belief that the innovation program had provided the catalyst for the fundamental changes in culture and performance that had occurred.

2. A State office of a national telecommunications company discovered that some “natural entrepreneurial employees” had sold some unique services to a large Government agency in their State and had generated some millions of dollars of net profit from the exercise. The State management team decided that this type of behaviour should be fostered through the provision of a School for Intrapreneurs. Groups of middle level managers were invited to join innovation workshops and over a period of six months these managers identified, evaluated and launched a range of new ventures which generated some tens of millions of dollars of new revenues.

One of the intrapreneurial teams created a “Marketing Consulting Group” using in-house skills to offer an external consultancy. They produced a business case to show that the in-house performance of the marketing department would not be adversely affected by the new venture. They presented their case to a group of senior executives who were impressed with the revenue and profit projections. The team of intrapreneurs suggested that they would like to have a share of the ownership in the consultancy and thus they placed a cheque on the table for $30,000 and asked that they be given a 25% shareholding in the venture. The executives deliberated for 20 minutes and then returned to indicate that the corporate policies would not allow employee ownership. The intrapreneurs had expected that may be the response and so they removed their financial ownership
offer and proceeded to negotiate a share of the profits to be paid as a bonus to them if the plan proved realistic. The executive group found this to be acceptable and thus, the Marketing Consultancy was launched soon after.

3. The specialty chemicals division of a large conglomerate decided to develop its innovative efforts by encouraging self selected, corporate entrepreneurs to engage in a series of monthly innovation laboratories. Participants emerged from various parts of the organization and technical people found themselves working in entrepreneurial teams with lawyers, marketers, accountants and administrators. One team developed a rust retardant product which was later successfully launched and it produced significant new revenues for the corporation. In fact, one executive reported five years later that the rust product that emerged from this program was the biggest selling product for the division over that period. One participant in the innovation program was an administrative assistant to the division’s General Manager. She had observed previously that when administrative assistants in the whole corporation were absent on leave, the Human Resources Department hired replacements from a “temporary services” company. The program participant had also observed that many of her contemporaries over recent years had resigned to raise families. She realized that these people were an untapped asset who could be invited to provide short term, temporary services to the company when others were on leave. They knew all the company’s policies and practices and could become productive with very little briefing. Her interviews with past employees and her negotiations with the HR
Department during the innovation laboratory sessions, proved positive and a very successful process was initiated which both saved the firm substantial sums in hiring of external “temps” and kept a previously untapped human resource in the company’s employ.

4. The Development Director of a technology company decided to impress the Board of Directors by developing two $50 million revenue streams in three months. He offered the company’s employees a reward of three months leave on full pay and two first class, round the world airfares, if they could develop for him a $50 million revenue stream. Nothing happened and the Development Director was frustrated and annoyed with the employees.

A developer of corporate entrepreneurs was asked for advice and he suggested that maybe the employees needed to be shown how to identify and evaluate innovative opportunities for new revenue streams. It was suggested that bright, intelligent, university educated employees may not necessarily have the skills or attitudes necessary to engage in uncertain, risky evaluations of new initiatives. The Development Director accepted the advice and self selected corporate entrepreneurs were invited to engage in a series of innovation workshops. Over a six month period, two $50 million revenue streams plus a number of smaller ventures were identified and evaluated. Implementation took a further year but the firm became convinced that the processes employed were very effective and potentially profitable.
One interesting outcome of this project was the effectiveness that was observed in bringing “a new voice” into the innovation workshops. A successful technology-based entrepreneur was invited to sit with entrepreneurial teams and help them to make new discoveries and grow the opportunities that they identified. His experiences were in different technological fields but he was able to bring new ideas, connections and networks to the corporate entrepreneurs. In fact he identified one of the $50 million revenue streams which was eventually launched.

5. A semi-government agency had built an innovation theme into its strategic plan but the Senior Executive Group (SEG) realized that they were lacking in internal expertise to establish an innovative culture. An external developer of corporate entrepreneurs was commissioned to institute a process to bring innovative behaviour into the organisation. The consultant worked with the SEG to determine the direction that the innovation process should take and middle level managers were provided with seminars to demonstrate the likely outcomes from the process. When the consultant suggested to the CEO that staff should be offered the opportunity to self select into the process the CEO suggested that this would not be appropriate. He felt that no-one would volunteer because radical downsizing in recent years meant that no employees had excess time to work on innovative projects. The consultant had a different perspective and advertised throughout the organization, two after-hours seminars to outline the way in which the innovation program would operate. One hundred employees attended these
seminars in their own time and 25 attendees signed up for a series of two-day innovation laboratories. They were warned that apart from the two-day laboratory sessions, they were unlikely to be provided with time away from normal duties to work on their entrepreneurial ventures. They were not deterred and gave the impression that they were delighted to be given an opportunity to contribute to the organization even if it meant investing their own after-hours time.

The twenty-five laboratory participants identified and evaluated 10 innovative ventures within six months and presented these to the SEG for approval and funding support. Ventures were varied but all proved to be acceptable to the executive group. One venture developed a new service for clients which with some sponsorship that was arranged during the laboratories, forecast an annual new revenue stream within three years of $35 million. Another venture developed a plan to create new uses for a piece of expensive equipment that had been purchased some years earlier. The new uses included leasing the equipment to other Government agencies and charging hiring fees. The business case forecast annual savings coupled with new leasing revenues of $750,000 for the organization. Other ventures approved for implementation by the SEG generated new revenues, cost savings and some provided new innovative services to the clients of the Agency. The SEG came to the realization that their organization contained a large untapped entrepreneurial talent that with appropriate support and encouragement, could be employed to change the corporate climate.
6. Discussion

The above issues are a comment on 25 years of practice as an entrepreneur and intrapreneur developer in which the author attempted to acquire and apply best practices in assisting client organizations. At least four significant lessons have been learned over those years which may be useful to other professionals who engage in similar activities.

1. Twenty five years of unprecedented change have confronted corporations with the need to find methodologies for entrepreneurial thinking and for finding new and innovative ways of coping. The author has found that large companies who tackle the new challenges head-on can develop its corporate entrepreneurs and develop cultures in which many employees are searching for and implementing innovative opportunities for the corporation.

2. Many CEOs in recent years have expressed the need for innovative action to address the emerging challenges. However, it is the experience of this author that too few CEOs have taken the time to examine the various methodologies that may be employed to satisfy their needs. Perhaps the above overview of some available processes may be of use to CEOs seeking answers.

3. There appears to be an enormous untapped talent within organizations which is capable of being used to build innovative activity. Of course, not all employees either have the talent or have the desire to engage in entrepreneurial activity. However, experience has demonstrated that all organizations have underutilized
corporate entrepreneurs and with the appropriate processes, the skills of these people can be harnessed.

4. Conventional wisdom in the general community suggests that entrepreneurs are “born, not made” and thus, training and development processes are likely to be ineffective. However, all of the people and entities described above, have shown that entrepreneurial people who exist in large organizations can be assisted to improve their effectiveness as corporate entrepreneurs if they are confronted with the range of opportunity identification and opportunity evaluation skills that are often used to assist independent entrepreneurs.

7. Opportunities for the Profession of Corporate Entrepreneur Development

Research papers, if they are to be useful, ought to make a contribution to the profession in which they are located. The following are five opportunities that might be worth exploring by readers of this paper.

1. Read a selection of the books papers and websites shown in the bibliography to obtain a feel for the methodologies that have been employed to date.

2. Interview a few innovation managers in large corporations and seek their comments on the methodologies described in this paper.

3. Meet with a CEO and seek his/her comment on the innovation processes described in this paper and describe some of the outcomes that could be obtained from their application.
4. Identify an organization that is facing an urgent need to change to cope with emerging market and community pressures. Offer the CEO a corporate entrepreneurship program. To support your offer, suggest that he/she and their executive team should read some of the materials contained in the bibliography to this paper.

5. Bring a group of corporate innovation managers together and share the contents of this paper with them. Seek their reactions to the concepts described and facilitate with them a dialogue around how they could work collaboratively to ensure that some of the concepts are introduced into their own organizations. Of course, if all of the innovation managers are already using all of the methodologies described, then interview them all individually, and prepare and publish a set of case studies on their activities.

The Strategic Renewal of Family SME’s: A Case Study

Lucie Bégin, Didier Chabaud, Mariem Hannachi

Abstract:
The aim of this paper is to bring conceptual and operational clarity to the phenomenon of strategic renewal and, based on a multigenerational family SME case study, to apply it to family firms, an area in which it has received very little attention.

Introduction

How do family firms (FF) behave when it comes to strategic renewal (SR)? This question is of interest in that it links two separate streams of research, and addresses the underlying question of what a family firm can do to thrive on the long run.

Strategic renewal – which may be defined, on first analysis, as “corporate entrepreneurial efforts that result in significant changes to an organization's business or corporate level strategy or structure” (Sharma and Chrisman, 1999: 19) – has recently been the subject of renewed interest. Although Agarwal and Helfat (2009: 281) emphasized that the topic had “received relatively little attention", the special issue of Organization Science published in 2009 bears witness to the actuality of this question. Alongside the research done over the past twenty years in the area of strategic renewal and in parallel of it, a research field focusing on family firms has emerged, and already has its own associations, specific journals and congresses tackling the subject (Bird, Astrachan, and Pistrui 2002; Sharma, Hoy, Astrachan, and Kairanen 2007). What is more, FF’s research has now found a legitimate place in major management...
journals, and special issues are now regularly dedicated to it. (Craig, Moores, and Howorth 2009).

Until now, the question of the SR of FF’s has barely been touched upon at all, Sardeshmukh and Corbett (2008) being the most notable exception, to our knowledge. Nonetheless, the issue is important as it touches to the survival of one of the most common form of organization in the world, the family-owned business (herein referred to as FF). So the question invites us to scrutinize the way by which the FF may transform itself and its activity in order to cope with the changes that occur in the environment. When it comes to small or medium-sized family firms, the issue of strategic renewal is even more sensitive because, in most cases, these organizations do not benefit of the large amount of resources often available to large corporations. The aim of this paper is to explore this question by offering an analysis of the SR of a medium-sized FF. In doing so, we hope to show that the strategic renewal approach introduces a new angle from which to examine the longevity of FF’s and makes it easier to grasp the organisational processes underlying this.

To begin with, we offer a conceptual and operational clarification of SR, in general, and then in the context of family SME’s. Thereafter, we present the case study of a family SME that was founded in 1826 and is now in the hands of the 6th generation of the family. This family SME appears to be particularly well suited to deal with the research question given that its trading business has allowed the firm to gain a footing in a dozen or so different business areas and markets, over the course of its 184-year existence. Afterward, using the case study as our point of reference, we discuss the mechanisms of SR in order to shed light on the peculiarities of the choices opened to a family SME. Finally, we consider the scope and limitations of this approach.
The SR of FF’s: Reference Points from Literature

In papers written almost 20 years apart, Stopford and Baden Fuller (1990) and Agarwal and Helfat (2009) underline the lack of consensus when it comes to the definition and meaning of SR. So, we will try to clarify the concept and definition of SR, and to provide an operationalization, before seeking to define how the FF context may potentially affect its content and effects.

Strategic Renewal: Conceptual Overview and Operationalization

In the medical field that spawned the term, “renewal” refers to the repair phenomena whereby an individual regains integrity, as the organism replaces a part that has been lost or damaged spontaneously, accidentally or experimentally.

In management science, the concept of SR refers to a deliberate action. Over the past twenty years, authors have unanimously considered that SR is an answer to the changing and turbulent business conditions (Huff, Huff and Thomas 1992; Simons 1994; Whitney 1996; Floyd and Lane 2000; Pappas and Wooldridge 2002; Volberda 2005), echoing the assertion of Huff, Huff and Thomas (1992) whom consider the term “strategic regeneration” to be a substitute for the term “strategic change”. From this perspective, SR appears to be a kind of entrepreneurial activity implemented by established or mature companies in order to combat the dangers arising from maturity or decline (Baden Fuller and Stopford 1996; Verbeke, Chrisman, and Yuan 2007), or from internal and external changes (Capron and Mitchell, 2009), or in order to face up to the threats posed by dynamic and complex business conditions (Pappas and Wooldridge, 2002; Volberda, 2005). So, the diverse studies acknowledge that SR may be view as an answer to the challenges issued from external or internal factors, an answer that tries to keep the company afloat, even if it is not its only aim (Baden Fuller and Stopford, 1996).
But, if Germain (2007) sees in these works a “strategic school of thought” around Baden Fuller, we must nevertheless notice that these studies are not yet integrated in the core of the strategic literature considering that, for instance, in the special issue of Organization Science focused on SR, no author referred to Charles Baden Fuller's work. If we try to provide such integration, relying on the various definitions found in literature (See Table 1), it emerges that all authors agree that the dimensions of change and temporality are central to RS, in addition to other factors like inertia, maturity, dynamics, competition, entrepreneurial ability, opportunities, skills and abilities, etc. In fact, the literature may be separated in two parts, according of the level of analysis privileged by the author. At the micro level of analysis, the SR operates throughout the changes in activities and products, while at the meso level, it functions at company level, in terms of attempts to regenerate by implementing changes in strategy and business structure.

**Insert Table 1**

Going further, it will be necessary to identify the process and content of SR (Agarwal and Helfat 2009), and to look at how companies manage to renew themselves. To do so, we have to be aware of the fact that SR is not an easy task, that it is only one possible option in front of changes, and that several mechanisms can be used to renew the firm or activities.

Not all firms are equal in front of changes: the younger the company, the more likely it is to undergo considerable organisational change (Amburgey, Kelly, and Barnett 1993). More generally, the company has to face with its routines and the resulting inertia. So, the forceful willingness of managers and company members to safeguard the longevity and success of the company is a necessary condition, if not sufficient in itself, to make possible the strategic renewal of the firm. This leads Baden Fuller and Volberda (1997) to consider that the company can react in three ways to changing business conditions:
(1) It can avoid change, in other words adopt a strategy of inertia.

(2) It can accept change, processing it externally through an “outsourcing” strategy, for example by signing contracts, alliances and partnerships allowing it to capture new technologies or new ideas.

(3) It can implement an internal adaptation, and renew itself. Here lies the SR, and we have to notice that it will imply an entrepreneurial behaviour, as the manager will have to redefine some aspects of the structure of the firm, or to grasp new market opportunities – and/or to innovate.

One can consider that these ways constitute a first level of options for the managers: SR is only one of the possible behaviours in front of changes (See Germain (2007), for an overview of the factors of choice between these options).

When the manager decide to engage in SR, he may envisage four mechanisms (See table 1), by superimposing two methods of managing change (spatial separation and temporal separation) on two types of change consequences (“revitalisation” and “reordering”) (See table 2 for the definition of these terms).

**Insert Table 2 and Table 3**

Summing up what precedes, Figure 1 allows us to identify the conceptual framework that governs the SR approach, and the different paths available in face of changes.

**Insert Figure 1**

**The Particularities of Strategic Renewal in Family SME’s: Some Suggestions**

Although the area of FF’s research is undergoing rapid growth, the initial question of how to define them in theory has long directed the focus of debates (Allouche and Amann 2000). Here, we will consider that FF are characterised by the more or less extensive involvement of the family in the ownership and management of the company, as well as by the desire to hand it
down to subsequent generations (Chua, Chrisman, and Sharma 1999). This is the standpoint from which we will consider the SR of FF’s.

Indeed, the emphasis that most FF place on the aim of continuity (Miller and Le-Breton Miller) and their commitment to multigenerational transmission lead us to think that they might prefer the option of SR to inertia or outsourcing. Indeed, at one moment or the other over their life, FF’s will necessarily come up against changing business conditions. Thus, considering their desire to keep the company in business and to hand it down to subsequent generations, faced with changes in the market and/or technology, the heads of FF’s will have to emphasise the role of SR in the company, rather than accept the inevitability of a closure (choosing inertia) or consider transferring some of their interests and/or business to external companies (choosing outsourcing).

While the different levels of generic choice (inertia/transfer/SR) can be viewed as such, it is also worth looking at the forms SR can take. From each of these points of view, the family nature of the company can result in influences different to those generally described in literature.

**The SR of FF’s: Empirical Study**

To better understand the phenomenon of strategic renewal in family SME’s and to illustrate the mechanisms of renewal, we have opted for a single case study of a family SME that was founded in 1826 and is now in the hands of the 6th generation of the family: “Edmond Raoul Duval et Cie” (ERDC). As the case analysis will show, over its life, this company has had to face up to many events that could have caused it to go out of business.

Performing a case study is often the favoured method of investigation, given its contribution in terms of detailed analysis of the processes and theoretical models (De la Ville Indeed, this study has made it possible to reconstruct chronologically the events, assess local causality and draw up explanations that has been submitted to and validated by the actors (Wacheux 1996). From a methodological point of view, studying a single case is a relatively
common approach when looking at family firms (Chrisman, Sharma, and Taggar 2007), and
more generally management (Hlady-Rispal 2002). This approach has the advantage of allowing
an in-depth analysis of the company being studied and makes it possible to consider the context
in which the company has developed (Yin 2003). However, case studies are often criticised
because they limit the extent to which the results can be generalised, and are sometimes
considered anecdotal; seen from this angle, the single case study does not meet the criteria of
accuracy, economy and robustness (Giordano 2003). What is more, one of the major ongoing
debates surrounding the use of case studies in social science research is how many cases are
necessary and sufficient (Eisenhardt 1991).

To carry out this case study in depth, we conducted around twenty interviews between
2007 and 2009 with members of ERDC management, including the current company head, a
previous head who joined the company in 1946 and, finally, a long-term employee of the
company. In addition to this first-hand data, we used research from the company archives, which
consisted mainly of minutes from general meetings and meetings of the board of directors of
ERDC and its colonial subsidiaries from 1932 to the present day, registers of transactions made
by the Foerster business between 1878 and 1932, books of accounts, the stock transfer register,
confidential notes and internal reports. The study was supplemented by obtaining the complete
text from a conference held at the university of Le Havre by a former director, and by reading the
work of historians including Claude Malon on colonial Le Havre (a work published in 2006 and a
thesis including an interview with a former director), Hubert Bonin (2008) on the history of
overseas trade from 1887 to 2007, a note on the history of the ERDC family group, written by
Mathieu Goguel in 2005 (an unpublished internal document), and Nathalie Aubourg’s thesis
The SR of FF’s: Points of Reference of History

We will now take up the story of the family SME in episodic format, and will try to identify the points marking renewal in the company when it had to face up to certain events.

The Foerster business was founded by Frédéric Guillaume (FG) Foerster in 1826, in Le Havre (France). The company's line of business was tropical products from the West Indies and French colonies. It became a family business when his son, Frédéric, wearing the same name as his father as it was usual at this time, joined in 1835, and later, in 1863, he took over the family business. In the footprints of its predecessors, few years later, Edmond Raoul Duval (RD), grandson of the founder and nephew of Frédéric, the second, joined the business in continuity of the family tradition. Later, when he inherited the reins of the family business and became director in 1890, the company changed its business name to “Maison Raoul-Duval”. Finally, when at their turn Edmond’s sons joined the FF, the business became a joint-stock company, ERDC. For more than 180 years, the company has managed to continue operating in its main line of activity, trade, despite the hazards and changes that have affected the business. In this respect, the desire of successive directors to preserve the family heritage has allowed this company to survive while many other companies operating in the same business have folded over time (Aubourg 2000). Figure 2 illustrates the succession of family and non-family directors of ERDC from the year it was founded up to now.

Insert Figure 2

Trading activities in tropical products and shipping

FG Foerster based his business on the tropical products trade, which was supplemented by sail shipping. As this period of history was characterised by geographical expansion and the growth in maritime trade with the United States, the West Indies and the French colonies, FG
Foerster, the founder, and his son Fréderic, focused their business activities on trading with these destinations, importing products little known in France at the time and exporting national specialities like salted butter (Goguel, 2005). Thus, by 1868, the Foerster's business possessed no fewer than nine sailing boats plying the waters between its foreign trading posts, which allowed the company not only to transport its own goods but also to earn additional profits by offering freight services to other trading companies. At that time, they traded on many tropical commodities (coffee, cocoa, rubber, spices, tropical woods, snakeskin, ostrich feathers, etc.).

When he took the reins in 1890, Edmond RD kept up the existing activities of the Foerster’s business while also trying to diversify the range of traded products. In 1907 this enabled him to buy a participation into one of the largest sugar/rum companies in Guadeloupe (the Société Industrielle Agricole de Pointe à Pitre, or “SIAPP”), which was in a state of bankruptcy at the time. The company thus gained the monopoly of representation of SIAPP in France, a lucrative business even if it was a minor one.

The arrival of steam boats at the start of the 20th Century sounded the knell of sail shipping. As the company’s main line of business was trade/import, faced with this major technological innovation that greatly reduced transport times, the directors decided not to renew the merchant fleet and to gradually abandon the shipping business in order to focus on trade and to develop the company in this area by creating a subsidiary in Indochina. This company, which was named the Société Havraise Indochinoise (SHIC), was created in 1926 in Saigon (an old French colony) and consolidated the policy of expansion and diversification.

**Indochina and the transition towards coffee/cocoa**

The purpose of the SHIC was to supply the parent company, thus taking local intermediaries out of the equation. It was a natural move for the company “… insofar as it
specialises in tropical and exotic products, to establish itself in this new territory, in order for the world to gain from its new products: skins, peppers, coffee, rubber and its derivatives, kapok, peanuts..." (Goguel, 2005: 9). After the growth of its business in Indochina, the parent company, which changed its name to ERDC in 1933, soon opened an office in Marseille and subsidiaries in Saigon (Vietnam) and Phnom Penh (Cambodia). However, the political and economic instability in Indochina and the outbreak of the Second World War slowed down trade and affected profits: “basically, this year all our efforts will be concentrated in settling up the numbers from the past year and organising for the future, while continuing, as far as possible, to keep the business running as usual... The office we opened in Marseille in February 1941 is fulfilling our expectations" (minutes from the Shareholders’ General Meeting (SGM) on 12th May 1942). Imports were brought to a halt in 1942 as a result of the war, in order to prevent major risks such activities now involved: “the imports business, which was ticking over until the start of November 1942, has been brought to a complete halt, for reasons you already know, and we have not lost all hope that, until further notice, we will be able to regain our market share in imports as a result of goods we have imported to France previously” (SGM, 19th April 1943). The group’s responsiveness in terms of anticipating change after facing the setbacks of the changing business conditions allowed it to create new offices in Phnom Penh, Paris and Bordeaux in order to carry on trading and also to look for new opportunities, for example starting to trade with Côte d'Ivoire (one of the leading coffee and cocoa producers) at the start of the 1940’s.

The dangers of the war in Indochina ultimately caused the group to close its subsidiary there, although it did not altogether cease to trade with this part of the world. With the fall of Dien Bien Phu in 1954 forcing the subsidiary to be moved to Le Havre, the closure of the Saigon agency in 1960, the closure of the Marseille office in 1962 after the independence of Madagascar
and the ending of trade with this territory and subsequent reduction in trade with Indochina, the parent company was forced to close the Phnom Penh office in 1965.

While this series of closures was taking place, culminating in the loss of the SHIC subsidiary, the company was simultaneously developing its business in the coffee and cocoa trade with Côte d’Ivoire, which provided the group’s business with a new burst of momentum.

**Specialising in coffee**

Although the group had been trading coffee from its beginnings, with coffee from the West Indies, Indochina and America, it was not until the middle of the 1940’s that it decided to pay this commodity more attention, partly as a result of the political problems dogging Indochina at the time. An African subsidiary was opened in Abidjan in Côte d’Ivoire in 1952: the “Société Havraise Africaine de Commerce (SHAC)”. The main reason SHAC was opened was to sell Robusta coffee and cocoa, as well as to provide Africa with a platform from which to send international exports. The Côte d’Ivoire subsidiary did not enjoy an easy start to life, and registered losses during its first year in business, as illustrated with this business report: “the cocoa and coffee campaign has experienced difficult conditions... the quality of the cocoa fell far short of the level required... there was less coffee than after the previous harvest, and active competition... we have made a loss of 5,647,846 CFA Francs as a result of one of the contractors failing” (SHAC’s SGM on 28th January 1954). However, in spite of these losses, the directors recognised it as an opportunity for the group to make its name known on the local market and to prepare for the future, and as such they decided to pursue it. From the 1960’s onwards, the subsidiary began to make a profit and extend its structure: “We are happy to be able to report to you that we have, over the past financial year, been able to expand our operations appreciably and obtain results that finally correspond to the level of investment we have made up to now and
the unflagging work of our staff over course of the past campaign” (SGM on 4th March 1961). The positive development of the coffee/cocoa business continued until the start of the 1970’s, when the group decided to open other SHAC subsidiaries in Côte d’Ivoire to sustain the thriving coffee/cocoa industry. It thus opened a second factory in the town of San Pedro in 1970. Starting in 1973, it founded companies in partnership with other firms operating in the same sector and also created a subsidiary of its own to process the coffee/cocoa beans in 1978: the “Société Havraise Africaine de Décorticage” (SHAD) (Goguel, 2005: 10).

However, with the upheavals brought about by decolonisation in Africa, this success was not to last indefinitely. When Côte d’Ivoire gained independence, the company's assets in the country were gradually confiscated, and SHAC finally shut up shop there in 1987. With this sad ending in sight, but continuing to believe in the future of coffee, the group successively bought Inter-Océanique, a coffee-trading business belonging to Rufenacht, in 1980, followed in 1988 by Jobin & Cie, which specialised in trading and distributing coffee to wholesalers. At the same time, it set up the Société Commerciale Raoul-Duval (SCRD) to look after all of the group’s coffee business.

**Searching for diversity**

Alongside the coffee business, which constituted the group’s major source of income, and in view of the fact that a significant proportion of the trading activities relating to other exotic products had been abandoned, the group began to make a series of takeovers from 1965 onwards (external growth). Managed in tandem by Gilbert et Hubert RD (two 5th-generation first cousins), the purpose of these takeovers was to diversity group activities and to reduce the group's dependence on a single source of provisions: “the President wishes to inform the Council

---

2 This included a stake in a transit company (Prodexport), a company that maintained, repaired, purchased and sold all kinds of weighing equipment (SBCI), a storage company (SCSP), a property company (SCI), a factory processing agricultural products (UTPA) and STLCI (line of business unspecified).
that the income from our two subsidiaries (SHAC and SHIC) represents more than 75% of our total income, and that from our overseas activities (SHAC, SHIC, Sté Pointe à Pitre and Optorg) more than 82% of the total. Looking to the future, this is a dangerous situation and must be modified. Although the 1965 financial year produced favourable results, it is essential we introduce new sources of business in 1966. Of course, we must continue to develop our traditional areas of business (coffee trading, insurance) but it is also necessary for our company to start acting in one or more completely different economic sectors. As part of this search for new business, the president welcomes any suggestions the Administrators can draw up” (218th meeting of the Board of Directors, 15/03/1965).

As Goguel noted, “just like any good family group, the directors were always looking to diversify the business in order to minimise the risks” (2005:4). After assessing several businesses, this diversification drive began with the takeover of a business put forward by the legal auditor in 1970: a company specialising in the import and export of industrial equipment, based in Strasbourg, called “Société Nouvelle de Réorganisation et de Modernisation de l’Industrie Alimentaire”, (SNRMIA). The opportunity to invest in a shipping company specialising in maritime and river transport presented itself in 1971, and was followed by the takeover of a company manufacturing snail shelling equipment in 1975. Next came the takeover of a company specialising in fibres, honey and broomsticks in 1982 (later to become Société Havraidex), and the purchase in 1983 of shares in the “Compagnie Française des Extraits” (CFE), a company specialising in vegetable extracts for use in the tanning, cosmetics and animal food industries. Although these takeovers contributed to the group’s growth, most of them have since been resold or closed.
Restructuring the group around extracts and wood

Globalisation and increasing transparency in the coffee trade, along with the growing risks in the middle of the 1990’s, forced margins down considerably. The group decided to focus on greatly developing the extracts business (CFE) - which has been managed since 1999 by a member of the 6th generation, François RD - and the wood business, with the company Havraidex. Although the continued decline in prospects for the coffee business ultimately convinced the directors to dispose of this business in 2006, the past decade has been characterised by the desire to develop other activities to safeguard the group’s long-term future.

The work of CFE, which is based on the ability to develop and formulate products using vegetable extracts, requires the company to expand into new territories that are currently little developed or difficult to access. Therefore, a site was purchased in Nicaragua in 2004 to allow a change in dimension, both because it opened up the possibility of cultivating the plants required to provision the group, and because this made it possible to set up an on-site processing plant.

As far as the wood trade was concerned, the company had always adopted the approach of exporting French wood and importing exotic wood. When the decision was taken to bring to a halt its activity in the coffee trade, the director had to consider how this until then marginal part of the business could be developed. While the operations of many actors whose businesses make use of timber are still based on the large-scale exploitation of resources, the directors of the family group are keen to favour an environmentally friendly - or sustainable - exploitation of such resources. When the leaders of Gabon realised how important it was that the country's forests be protected through legislation that prevented both deforestation and the indiscriminate exploitation of the area, conditions were put in place at ERDC to subsequently invest there. The company embarked on this project in 2006, buying a concession and setting up a sawmill that
made it possible to make better use of the resource on the site, and to ensure exploitation was kept to an acceptable scale. Today, this local operation has some thirty employees and is in its first year of production.

Therefore, the past 184 years have seen the family group transform from an international trading concern involved in transport and shipping to a group specialised in vegetable extracts and wood. This transition has been made possible by several episodes in the group’s history that characterised its growth first in Indochina, then in Africa (SHAC). Even though the group appeared to have coffee and cocoa as its central activities, it was always looking to maintain a certain degree of diversity in its business. At the same time, it can be seen how, over the course of the various episodes the group has been through, the directors have tried to revitalise the business.

Results and Discussion

In spite of the changing business conditions, which were not always conducive to the growth and prosperity of ERDC, the company has always tried to safeguard the long-term survival of the family heritage for future generations. This desire to protect the company over the long term has been backed up by the firm’s entrepreneurial ability and its ability to seize opportunities that came its way.

The five episodes set out above illustrate the group's strategic choices and the actions implemented to combat the uncertainties and changes in the business conditions. Faced with pressures from the business conditions, political events, competition and new technologies, the group found itself in a position where it ended up either disposing of or selling parts of its business, a strategy Baden Fuller and Volberda (1997) refer to as “outsourcing”. However, as this is a family firm, one of the group’s major priorities was to keep the business up and running (Miller and Le Breton-miller 2005) in order to pass it on to the next generation. ERDC has
always tried to establish itself in new business areas and set up new sources of provisions before disposing of or selling a business, with the aim of keeping the continuity of the business and ensuring the group’s survival. Therefore, the desire to safeguard the long-term survival of the group, backed up by the entrepreneurial spirit of successive directors at the company, which enabled them to seize opportunities, has also played a decisive role in the choice of strategy adopted in the face of changing business conditions. The choice of renewal mechanism has therefore not been a systematic one and, depending on the situation the company has found itself in, such a mechanism has either been put in place by bringing skills and abilities already existing within the company into play, or by exploring new avenues of growth.

In the case of sail shipping, which was by no means an insignificant aspect of the group's business, the arrival of steamboats, seen as a major technological innovation, triggered the SR process. The director decided not to renew the fleet\(^3\), even though it continued to hold the shipping business for some time. This decision had imposed to redefine what the mission of the firm was and in which kind of activities they were. The diversification began with the opportunity to acquire a participation in the SIAPP distillery, which ensured to the company an exclusive trade in the goods in question, at the same time creating a subsidiary in Indochina that boosted its business in the tropical products trade. It only abandoned the shipping industry when it had set up its business in Indochina and consolidated its trading activities. In this area, the company looked into other possibilities, buying the SIAPP and selling Guadeloupian rum (regeneration), and making the most of its maritime trade and business skills by creating the SHIC subsidiary in Indochina (Venturing).

\(^{3}\) One of the reasons why they abandoned the shipping business is the importance of the investment that would have been necessary to renew the fleet, largely exceeding the resources of the small-sized family business.
Next, as business slowed in Indochina as a result of the war and the political and economic upheavals in Saigon and Cambodia, the group began to look into new destinations where it could continue to do business trading tropical products. This led to the start of its business in Côte d’Ivoire, which was one of the leading coffee producers, and gradually the group set up its subsidiary SHAC there in 1952 (Venturing). At the beginning, as the business in Côte d’Ivoire was not profitable, ERD also kept up its operations in Indochina, albeit while also gradually reducing these operations before finally bringing them to a complete halt in the 1970's, when SHAC’s business was flourishing at its height. The group also developed within the SHAC subsidiary a specialisation in the coffee industry by implementing a vertical integration of activities, as well as creating new subsidiaries and getting involved in activities outside trade, for example processing coffee/cocoa beans, maintenance, construction, etc. (Regeneration). Finally, foreseeing that it was going to lose its Côte d’Ivoire subsidiary, the group grasped all the opportunities that became available, diversifying its sources of coffee provisions by taking over Maison Jobin and Interocéanique (rejuvenation), entering new areas of business with SNRMIA and Havraidex company, etc. (Reordering).

The Figure 3 summarized the different episodes of strategic renewal that have dotted the life of ERDC and led to its transformation through time. This figure highlights the overlapping nature of the various SR initiatives, showing how the group has always tried to establish itself in a new area of business when an existing area is under threat. The case study of this family company illustrates the strategic renewal approach taken when faced with pressures from the business conditions. As a first step, we have tried to clarify the concept of strategic renewal that is often tackled in literature dealing with companies in decline or those operating in a mature sector (Baden Fuller and Stopford 1996) but have managed or attempted to survive by renewing themselves and opting for strategic choices that have allowed them to face up to inertia and
change (Agarwal and Helfat 2009). These choices find expression in “intrapreneurship”, “corporate entrepreneurship” and “renewal actions” (Sharma and Chrisman 1999), which are still largely unexplored in the context of family firms.

**Conclusion**

The company’s entrepreneurial spirit and its ability to seize opportunities have allowed it to overcome the paradox of change and stability and to confront the changing business conditions to achieve its aim of long-term organisational survival, in spite of all the setbacks and challenges it has come up against along the way.

This work has made it possible, to start with, to offer a conceptual and operational clarification of strategic renewal. What is more, we have put forward an analysis of a family SME in an attempt to contribute to the understanding of what characterises SR in a specific context. Of course, this study is only a first attempt at looking at SR in a family firm context. As we have focused on a single case, we cannot hope to provide a general observation applicable to all family firms, neither to delineate the behaviour of FF from non family ones. However, we have been able to demonstrate how the family dimension - and the desire to pass the company on to the next generation – helps explain the spirit of SR at work.

This study puts some light on an interesting process of overlapping between, on one side, the mature or declining activities and, on the other side, the start and growth of new ventures. From this, we can derive the following lecture for the practice: to guarantee its strategic renewal over the long run, a firm must continually be on the look-out for opportunities; therefore one must nurture its entrepreneurial orientations. Moreover, the manager must be committed to keep its firm on business. But, in the case of a FF, this dedication to the future maybe is facilitated by the presence of new generations that want to pursue the family tradition and business. Finally, it means also that the FF must not fear to fail. Sometimes the efforts might not
bring the success desired but, to be sure to have a heritage to pass to the next generation, the family firm's managers must go on by innovating and investing in the future, no matter whether it takes the form of new products, new lines, new ventures or new partnerships.

It would be helpful to further the study of SR in the field of FF, which is growing exponentially. To this end, it would be sensible to study other cases of family and non-family firms that have come up against similar challenges, in order to define as accurately as possible the specificities of SR in the FF context. Finally, future work can make it possible to establish this strategic current as a means of growth and a factor of long-term organisational survival in family firms.

The Impact of Corporate Entrepreneurship upon Internationalization
Strategy, Speed and Performance

Abstract

Corporate entrepreneurship encourages practices that spur innovation and renewal within established organizations. Prior studies have shown that corporate entrepreneurship (CE) promotes firm expansion and enhances firm performance. However, prior studies have not examined CE’s influence upon the speed or success of a firm’s international expansion. Furthermore, no current studies have mapped out the influence of each domain of CE upon firm strategy and performance. This paper fills this gap in the literature by extending the theoretical understanding of CE to the previously untreated context of international expansion, and also adds explanatory power to the CE construct by explaining its relationship to internationalization strategy—an important but previously undefined relationship. By answering these questions this paper answers several specific calls for research and also responds to a broadly recognized need for the inclusion of firmly-established theory from the field of entrepreneurship to the nascent field of International Entrepreneurship.

Introduction

Corporate Entrepreneurship enables organizations to gain competitive advantage through the combination of sustained innovation and a commitment to revitalizing the competitive landscape (Covin & Miles, 1999). Defined as the process in which individuals or groups within an existing organization instigate revitalization or create new ventures (Sharma & Chrisman, 1999), corporate entrepreneurship (CE) has been shown to positively influence financial performance (Zahra and Covin, 1995; Zahra, Neubaum & Huse, 2000), and corporate competitiveness (Lumpkin and Dess, 1996). In short, “corporate entrepreneurship revitalizes, reinvigorates, and reinvents” an organization. (Covin & Miles, 1999).

Given the recognized benefits of CE, the phenomenon has received significant academic attention. The underlying processes that constitute this phenomenon have been well-established conceptually and validated empirically. However, despite the considerable attention devoted to
this concept, almost no attention has been given to CE’s influence upon a firm’s international
growth (for the sole exception, see Zahra & Garvis, 2000). This lack of attention is significant
because the technological advances in communication, travel, and commerce have made
international expansion an increasingly viable option for businesses. Growth oriented firms
increasingly face the choice of whether to internationalize their business, and thereafter must
choose among myriad strategic choices in order to implement their international growth. These
choices are especially salient in firms that have adopted one or more forms of CE.

This paper examines the relationship between corporate entrepreneurship and
internationalization strategy (IS), and then analyzes the effect that both CE and IS have upon the
speed of internationalization and international performance. This theoretical analysis culminates
in a model (Figure 1) of internationalization that connects the four domains of CE with different
modes of internationalization, and offer insight into the effects that these connections may have
upon the speed and success of international expansion. In doing so this paper explains a
previously unexplained relationship between the various forms of CE and internationalization
strategies, and connects them to international performance.

Figure 1

This paper answers several recent calls for research and provides a deeply needed
contribution to the international entrepreneurship literature. In their recent assessment of the
state of corporate entrepreneurship, Dess, et al. (2003) stress the need to explore CE’s
relationship to international growth, specifically calling for research that examines whether firms
that employ different types of CE pursue specific types of internationalization strategies (Dess, Ireland, Zahra, Floyd, Janney & Lane, 2003).

A recent theoretical assessment of the field of international entrepreneurship not only echoed this specific call for research, but also noted a distinct need for a more fundamental development in the field (Keupp & Gassmann, 2009). According to Keupp & Gassman, international entrepreneurship suffers from an imbalance of theoretical contributions that weigh more heavily from the international business field than from the field of entrepreneurship (Keupp & Gassmann). While this imbalance is likely due to the relative stage of development in the respective fields, the authors suggest that the field would benefit from the application of well-established theories and constructs from entrepreneurship to international entrepreneurship (Keupp & Gassman). This paper answers that call by examining the well-established phenomenon of Corporate Entrepreneurship in the context of international growth.

Finally, this paper provides much needed support for the contention that CE positively impacts not only domestic, but also international growth and performance. Only one prior study has examined the impact of CE upon international performance (Zahra and Garvis, 2000), and the relationship established in that study left several explanatory variables out of their analysis. This paper will build upon their findings by adding a theoretical argument for several explanatory variables that may enhance the understanding of that relationship.

This paper will begin with an explanation of the various forms of corporate entrepreneurship and discuss several modes of international expansion. In the course of this discussion I will propose several theoretical propositions between CE, IS and internationalization speed and performance. Finally, this paper will conclude with a discussion of the results and some suggestions for future research.
Theoretical Foundation

Corporate Entrepreneurship

Corporate entrepreneurship attracts continued attention due to its noteworthy influence upon performance in existing firms (Dess, et al, 2003). Within established businesses, CE stimulates both the expansion of existing endeavors and the creation of new initiatives (Ireland, Kuratko & Covin, 2002). This intra-business stimulus is achieved through the implementation of one or more processes that, when combined, evidence a firm-wide commitment to constant innovation with the goal of continually achieving and sustaining competitive advantage (Covin & Miles, 1999).

The processes underlying CE have been conceptualized into four well-established forms: sustained regeneration, organizational rejuvenation, strategic renewal, and domain redefinition (Dess, et al., drawing upon Covin & Miles, 1999). While by no means mutually exclusive, each of these processes contributes to the enhancement of firm-wide innovation and competition.

Sustained regeneration refers to a firm-wide commitment to “regularly and continuously introducing new products, or introducing products to new markets” (Covin & Miles). Firms exhibiting sustained regeneration typically possess firm cultures and systems that engender innovation and adaptability to frequent changes in the competitive environment (Dess, et al.; Covin & Miles). Acts of sustained regeneration would typically take the form of introducing new products to the market, or introducing products to new markets (previously untapped by the firm).

Organizational rejuvenation refers to a firm’s commitment to enhancing its internal processes and capabilities in order to compete. Here the CE activities are focused upon the firm
itself, and the goal is to innovate internal processes in a way that leverages a firm’s competitive advantage (Covin & Miles). Acts of organizational rejuvenation often entail making changes to a firm’s value chain or renewing aspects of a firm’s operations (Dess, et al., 2003).

In contrast to organizational rejuvenation, strategic renewal describes firms that focus upon its external environment in an effort to change how it competes with its competitors (Covin & Miles). Strategic renewal entails the adoption of a new strategic direction, one that enables a firm to better exploit its current strategic advantages and/or exploit new product/market opportunities (Ireland, Hitt & Vaidyanath, 2002). Acts of strategic renewal may take the form of altering a growth strategy from acquisition-based to strategic partnering or joint-ventures.

Finally, domain redefinition describes firms who seek first-mover advantages by identifying new domains that have been unexplored or underexploited (Dess, et al; Covin & Miles). Acts of domain redefinition may entail the introduction of a new genre of product rather than a new product in a currently existing market (for example, the introduction of the Sony Walkman, or more recently, the introduction of the introduction of MP3 players and iPod).

Each of the four forms of CE highlighted above share a firm-wide dedication to sustained innovation, both internally and with respect to their external environment. I next turn to the relationship between CE and International Growth.

**CE and International Growth**

As stated previously, these forms of CE are not mutually exclusive, and they may combine in any number of ways to engender innovation. Prior studies have shown that CE positively impacts firm growth and performance (Kazanjian, Drazin & Glynn, 2001; Zahra & Nielsen, 2002). However, only one known prior study has analyzed the effects of CE upon the international performance (Zahra and Garvis, 2000). Beyond this single study no research has
connected CE to international performance, and no prior studies have examined the connection between CE and the speed of internationalization.

The impact of CE upon the speed of internationalization may at first appear intuitive given that the locus of entrepreneurship generally encourage a consistent commitment to innovation and entrance into new markets. However, within large established firms, there has been some reliance upon a stage-like model of firm internationalization (Caves 1982). The stage theory of multinational development typically is described as an evolutionary process, wherein internationalization proceeds in an incremental, risk-averse series of stages (Oviatt and McDougall, citing Johanson and Vahlne 1990).

In contrast to this graduated model of international development, the model proposed herein describes internationalization being spurred by consistent commitment to innovation. Firms with high levels of CE seek out unexplored domains for firm product development and firm expansion, and this organizational aptitude may spur international growth at a greater rate than that predicted by traditional stage theories of large firm expansion.

In addition, several studies suggest that the speed of international growth may be a significant indicator of overall performance in a firm. For instance, the speed of international growth may lead to higher performance in expanding firms (Autio, Sapienza & Almeida, 2000). Oviatt and McDougall note that the faster a firm internationalizes, the faster it grows overall (both domestically and internationally) (Oviatt & McDougall, 2005). Given these findings this paper seeks to expand the CE literature by examining its effect upon the speed and success of internationalization. With this in mind I propose the following propositions:

P1: CE will positively correlate the with internationalization speed

P2: CE will positively correlate with international performance
P3: Internationalization speed will moderate the relationship between CE and international performance

**CE and Internationalization Strategy**

In addition to examining CE’s relationship to the speed and success of international expansion, this paper will add a further level of explanatory power the CE construct by describing how it influences internationalization strategy. An essential element of internationalization strategy is the mode of internationalization. This paper will develop a map connecting each form of CE with a particular mode of International expansion.

For firms contemplating expansion, the choice to pursue international expansion has never been easier. Technological advances in travel, communications and commerce have decreased the psychic distance of locations that previously may have appeared out of reach. Furthermore, firms that do choose to expand internationally have an increasing amount of choices at their disposal. The modalities of international expansion are vast, but for the purposes of this study a limited set of modes of international expansion have been selected. In particular, among the many modes of international expansion, this paper will focus upon exportation strategies, franchising, alliances, joint-ventures, and the establishment of self-sufficient subsidiaries. These modes have been chosen for their salience to this paper and their generalizability to other aspects of internationalization that will be touched upon in subsequent sections. International expansion strategies range in their level of convenience, their level of required commitment and their level of control (Yip, Biscarri, and Monti, 2000; Benito, and Welch, 1997).

For the purposes of this paper, the modes of internationalization have been categorized according to the degree of control maintained by the host firm over the foreign expansion (Yip,
et al. 2000). Low-control modes of internationalization will include exportation and licensing strategies, Intermediate-control modes will consist of franchising, joint-ventures and cooperative agreements. These approaches delegate relatively high levels of authority outside of the hands of the expanding firm. In contrast, firms may retain some of the control over their international expansion by engaging in high-control modes, such as initiating wholly-owned subsidiaries or foreign direct investments.

In choosing between the available modes of internationalization, a firm may base their decision upon many factors, such as firm resources, networks, industry and risk tolerance. The potential impact of CE upon mode of internationalization has not yet been considered. This lack of attention is significant because there is reason to believe that the different forms of CE may influence a firm’s choice of mode of internationalization. For instance, Firms that employ sustained regeneration processes may be more likely to choose low-control modes of internationalization due to their low capital and commitment requirements. This form of CE results in the rapid development of new and innovative products, and firms may only need to strategically export their goods in order to reap the maximum gains.

In contrast, firms focusing organizational rejuvenation upon their own internal operations, their CE efforts may have no influence upon their internationalization strategy given that the attention is focused purely on the internal processes of the established firm. Firms scoring high in domain redefinition or strategic renewal, on the other hand, may choose more the more permanent and capital-intensive modes of internationalization belonging to the medium- and high-control categories. These forms of CE typically take longer periods of time to manifest themselves in the firm (Covin and Miles 1999), and the corresponding level of commitment and
capital may be better reflected in these higher control categories of international expansion.

With this in mind I propose the following propositions:

P4(a): Firms scoring high in sustained regeneration will positively correlate with low-control modes of internationalization

P4(b): Firms scoring high in organizational rejuvenation will have an insignificant relationship with all modes of internationalization

P4(c): Firms scoring high in strategic renewal will positively correlate with medium- and high-control modes of internationalization

P4(d): Firms scoring high in strategic renewal will positively correlate with medium- and high-control modes of internationalization.

Mode of International Expansion and Internationalization Speed

The mode of international expansion may influence the speed with which a firm expands internationally. Low-control internationalization methods such as exportation strategies may take less time to arrange than high-control methods such as establishing international subsidiaries. This differentiation is important because it may imply that congruence between a firm’s CE profile and mode of international expansion plays a significant role in the speed with which it can achieve international presence. Given a firm’s goals, industry and competitive environment, this speed may be a high priority. With this in mind I propose that Internationalization strategy moderates the relationship between CE and Internationalization Speed:

P5: Internationalization Strategy moderates the relationship between CE and Internationalization Speed
Discussion and Implications for Future Research

This model provides several significant implications. To begin with, corporate entrepreneurship may be looked to as an alternative to the traditional stage theory explanation for international expansion of large established firms. Rather than engaging in international expansion as a result of a methodical, linear growth model, international expansion may instead be driven by the entrepreneurial approach of a given firm. The behaviors underlying the CE construct belie an orientation to international growth that may be contrary to evolutionary stage-like development, and thus may be looked to for explanations in certain circumstances.

Secondly, the distinct domains of CE may suggest different paths to internationalization. At its heart, entrepreneurship is a concept heavily reliant upon strategic concerns. The success of the strategic choices made by corporate entrepreneurs within large organizations may depend heavily upon their congruence with the modality they choose to employ. With respect to international expansion, the choice of the method in which they cross borders may be more or less successful given its comportment with the domain of CE being engaged. It bears noting that this model is, by its very nature, oversimplified. Further, it is highly likely that firms engage in not only a mixture of CE practices, but also of modes of international expansion. However, despite the oversimplified nature of the model, the inherent connections remain important guideposts, which if adhered to, may promote greater success in internationalization.

Thirdly, the connection between CE and not only international expansion, but also the speed of internationalization provides a unique vantage point in which to view entrepreneurial behavior within established firms. While the literature has established clear links between CE and new product development and firm expansion in general, the addition of international
expansion to the discussion injects a new set of strategic variables that warrant attention by both practitioners and the literature. While exploring new domains and expanding new products domestically may naturally present a set of strategic questions, the expansion across borders raises a great deal more questions—including a central question of the level of retention of control of the mode of international expansion that has been touched upon in this paper.

The above implications suggest a theoretical model that is ripe for empirical validation. Examining the propositions set forth within this paper through empirical study would potentially validate the claims that lie herein, and provide support for further theoretical development. In particular, the connection between CE and mode of international expansion appears most salient and most in need of empirical investigation. In this vein, it may be prudent to expand the modes of internationalization to include other strategies. Likewise it may be fruitful to categorize the methods of international expansion by variables other than the degree of control retained by the host firm. These alternative interpretations may add force to the model established herein, or change the variables included in the model significantly.

Figure 1.
Economic Analysis of the Impact of the Public-private Matching Fund Programs using Firm-level Data

by Jeong-Dong Lee, Youngkyu Kim and Inha Oh

In the intermediate goods industry, which is comprised largely of small- and medium enterprises, the government can use a matching fund to execute policies such as providing supporting funds to promote firms’ innovative activities. The objective of this study is to perform an empirical analysis of the additional effects of government support for innovation activities using a matching fund in the intermediate goods industry. Specifically, the growth of firms is analyzed. Methodologically, to deal with the selectivity issue, we adopt a propensity score matching estimator. We also investigate the performance of the matching fund according to private share. As a result, the supported firms invested larger amounts in R&D expenditures and were observed to procure external financing through an overall improvement of their level of reliability. However, the results showed that it was not further connected to improvements in business performance. Moreover, although the results showed the positive impact of private investment in the matching fund on assets and R&D expenditures, there was no significant relationship between sales and fixed assets.
**Introduction**

Innovation activities are one of the major elements in the growth of firms. Firms become more competitive through innovative activities such as developing the performance of products or services, and these activities ultimately create added value and increase a firm’s market share (Giuliani, et al., 2005). However, external financing, which can be financing provided to a firm for innovation activities, has a higher tendency of under-investment within the loan market due to asymmetric information and spillover effects. In particular, it is hard to expect long term and large scale investments for small and medium enterprises (SMEs) or the intermediate goods industry, which has relatively poor condition for the innovation activity (Carpenter and Petersen, 2002; Lerner, 2002). Therefore, the government has made an effort to reduce the under-investment of innovation activities by implementing diverse support policies (Bendick Jr and Egan, 1986).

However, indiscriminate intervention of the government can also cause asymmetric information problems between government and supported corporations, including adverse selection, moral hazard, and the crowding-out effect (Cowling, 1998; Cressy and Toivanen, 2001). As a means to combat these problems, the government creates a matching fund with private investment corporations such as venture capital (VC) firms. In this matching fund, the VC’s role is to scout out select firms that are expected to yield high investment profits and, at the same
time, to coach that investment to be connected with the growth of the firms (Baum and Silverman, 2004).

The main purpose of this study is to analyze the additional effects of this government support. First, this study analyzes whether the support policies of the government aimed at intermediate goods corporations have the additional effect of improving the performances of participating corporations compared to those that did not receive support. Second, this study examines the effect of VC investment on the matching fund. In order to do so, we classified the ratio of government support and VC investment within the matching fund. Additionally, we observed the difference in performance according to the changes in private share.

In the case of Korea, the “Components and Materials R&D Program” is a typical example. The Korean government has conducted this R&D support program for SMEs in the intermediate goods industry since 2000. Around 45 to 80 SMEs have been selected for the program every year, and the firms have received financial support from public-private matching fund.

As is well known, the central issue of empirical research that estimates the performance of government policy is how to control the selection bias. Methodologically, reliable policy evaluation should solve the selection bias problem, which implies that public funding may be allocated to proposals judged in advance with a high probability of success. To deal with the selectivity issue, we adopt a propensity score matching (PSM) estimator. PSM methodology has been used to evaluate the government R&D support program in recent empirical studies to control for selection bias (Almus and Czarnitzki, 2003; Duguet, 2004;
Loof and Heshmati, 2005; Czarnitzki and Licht, 2006; Gorg and Strobl, 2007). Additionally, five-year performance, which includes three years of program participation and two years after the program, is estimated with consideration for the time-lag between innovation activity support and the firm’s performance.

The remainder of the paper is organized in the following manner. In chapter 2, an overview of the effects of government innovation policies and a brief introduction of the Korean Components and Materials R&D Program are presented. In chapter 3, we look at PSM methodology to control for selection bias, and in chapter 4, the definition of the data and the variables are explained. In chapter 5, we describe the additional performance of the program as a result of the empirical analysis and the additional contribution of the private sector. Finally, chapter 6 contains concluding remarks and a summary of the discussion and main implications of this paper.

**Background**

**Government support for innovation activities**

Firms carry out innovation activities by utilizing internal and external financing. Firms decide to invest money in innovative activities only if the marginal rate of return is larger than the marginal cost of capital (David, et al., 2000). However, due to asymmetric information problems in the loan market, the marginal cost of capital is higher for external investors, hence resulting in a lower possibility of inducing external investors to fund firms’ innovation activities.
Himmelberg and Petersen (1994) showed that the innovation activities of high technology SMEs with high expectations of asymmetric information are funded by internal financing rather than external financing. Moreover, the new knowledge as a result of these innovation activities tends to have elements of non-excludability and non-rivalry, resulting in spillover effects and a natural linkage to reduced external financial investment.

Therefore, the government intervenes in the market and establishes policies to reduce asymmetric information and uncertainty and alleviate the under-investment of firms’ innovation activities. Tax support, technology development finance support, and credit guarantees are some examples of intervention policies. However, since firms do not provide all of the necessary information, it is exposed asymmetric information, which results in adverse selection by the government or the occurrence of moral hazard in corporations (Arrow, 1962; Van der Meulen, 1998). In particular, the issues of adverse selection and moral hazard can be more prevalent in high tech industries, and government support may not be effective as a result (Stiglitz and Weiss, 1981; Myers and Majluf, 1984).

This is essentially a problem of poor choice due to lack of information and poor monitoring of the support program. One of the solutions to this problem is to create a matching fund along with a VC firm that has distinguished information processing and monitoring abilities. In this system, the VC makes appropriate decisions regarding the selection of firms with superior innovation ability, monitoring, determining whether performances are on the right track, and providing business consulting services on behalf of the government if necessary.
The role of the VC is based on providing the abilities that the government lacks. VC can create a leverage effect since the government investment is added to their own investment, accordingly investing in a firm’s innovation activities that were difficult to invest in the past. Therefore this form of support lures private investment and minimizes the crowding out effect that is induced by government support (David, et al., 2000; Hwang and Kim, 2000).

This discussion also applies to the intermediate goods industry, which is the subject of this study. First, the intermediate goods industry is generally based on high technology, and in terms of innovation activities, there is high uncertainty in both technology and markets. Consequently, in many cases, the functionality of the technology financing market is impeded and requires government support. Second, the intermediate goods industry does not have a significant ability to procure internal financing since the proportion of start-ups or SMEs is higher than that of other sectors. Although the necessity of utilizing external financing for innovation is more imminent than in any other sector, loan capital funding is difficult due to small scale collateral, and the possibility of inducing investment is lower due to the high uncertainty. Therefore, the intermediate goods industry is an area that requires government support. Third, the intermediate goods industry is located in the middle of the value chain, which means that it can create a large ripple effect on up- and/or down-stream industries, universities, and public research institutions when innovation is performed successfully. In terms of innovation policies, the intermediate goods industry is an area that can provide maximum social welfare benefits. In this regard, Lee and Park (2006) discussed the
characteristics of the intermediate goods industry, which requires government support from the perspective of its innovation system.

This characteristic of the intermediate goods industry clearly shows that it requires government support for innovation activities. As pointed out earlier, the method government support should be determined with caution due to the problem of adverse selection and moral hazard resulting from the asymmetric information. The Korean government has created innovation support programs using matching funds that invest in cooperation with VC to minimize this potential problem. The Components and Materials R&D Program is an example of such a support program. The characteristics of this program are discussed in the next section.

The Components and Materials R&D Program of Korea

The Components and Materials R&D Program of Korea is a program that supports R&D financing for the innovation of technology in the pre-competition phase by corporations in the intermediate goods industry. The evaluation structure of the support program is as follows.

![Program Evaluation Structure](image)

*Source: Edited from information excerpted from Korea Ministry of Knowledge Economy*

As seen in **Figure 1**, a panel of experts evaluates whether a submitted
proposal is technologically valid in the phase 1. Additionally, the focus of this phase is the request of government support, whether the proposed technology is at the pre-competition phase or there is a clear indication of market or innovation system failure. In phase 2, the investors, including the VC, evaluate the commercial value of the proposed technology. When the VC states its investment intentions toward technology that has passed phase 1, financial support is provided by the program. The fund for proposed technology development items is composed of VC investment financing, government technology development subsidies, and internal corporate expenditure.

The above business structure has the following features. First, the technological and political validity evaluation in phase 1 is conducted from the public perspective. The commercial potential evaluation in phase 2 is conducted from the investor’s perspective. By separating the host and the content of the evaluation, the VC is relieved of its burden of technological reviews, and the government can utilize the commercial judgment abilities of the private sector to minimize the problem of information asymmetry. Second, VC investment and corporate expenditure by the supported firm is a precondition for this program. This precondition is meant to diminish the crowding out effect of government support. Moreover, corporate expenditure by the supported company is intended to prevent moral hazard.

Table 1 displays the structure of support finances from this program until 2006, which is the analysis period of this study. The proportion of VC’s investment increases with time, which shows that this program is recognized as a good investment target.

Considering the structural characteristics of this program—both the government and the private sector support the fund in together—it is similar to the “Yozma program” in Israel (Avnimelech and Teubal, 2003). However, in the “Yozma program,” all funds are injected in the form of investment, whereas in this program, government support takes the form of subsidies rather than investment.

**Methodology**

This study intends to analyze any additional performance gained from participating in government programs. In this regard, Oh et al. (2008) defined the
additional program effect as “what would have happened to those who, in fact, did receive treatment, if they had not received treatment.” As it is impossible to predict the effect of those untreated by the program is impossible, it is counterfactual. Therefore, the business effect can be defined as the “factual performance” versus “counterfactual performance.” This is referred to as ATT (Average effect of Treatment on the Treated), and it can be expressed as the following equation.

$$\text{ATT} = E$$
High-Tech Start-ups in “traditional” industries – founding opportunities for women in and nearby the chemical industry in Germany

Melanie Birgit Roski
Institute for Entrepreneurship and Innovations Research
Schumpeter School of Business and Economics
University of Wuppertal
Germany
roski@wiwi.uni-wuppertal.de

The chemical industry in Germany is a traditional industry characterized by well established, large companies which faced fundamental changes during the last two decades. It is not only an important innovation provider for numerous other industry sectors, it is also essential for new emerging industries like biotechnology or nanotechnology. There is a high and growing number of small and medium-sized businesses developing and offering knowledge intensive services and products to the chemical industry and at the interface to other high-technology sectors.

Besides a detailed and recombinig analysis of statistical data retracing to different sources, a qualitative study was conducted to gain new findings about prospects and barriers for (women) entrepreneurs in the chemical industry and related high-technology sectors. The results of the twofold analysis show a high but often unused potential for start-ups. Diversification, alteration of traditional structures and the emergence of next generation technology sectors offer founders new perspectives and opportunities. On the other side the results of the non-standardized interviews with experts demonstrate a high number of barriers and disadvantages for founders, especially for female chemists.

Measuring the Entrepreneurial Attitude of the University Students Studying in Turkey and Cyprus

Mustafa TÜMER – Himmet KARADAL

Eastern Mediterranean University, Cyprus – University of Aksaray, Turkey
mustafa.tumer@emu.edu.tr

Keywords: Entrepreneurial attitude, Cyprus, Turkey

The major aim of this study is to find out the factors which may influence the entrepreneurial attitude of the third and the fourth year university students studying in Turkey and Cyprus. Although similar studies mainly in Europe and US were carried, our study will be the first in two different cultural contexts.

Explaining human behavior in all its complexity is a difficult task. Social and personality psychologists have tended to focus on an intermediate level, the fully functioning individual whose processing of available information mediates the effects of biological and environmental factors on behavior (Ajzen, 1991). However, majority of the researches related to measuring entrepreneurial attitude focused on personal and demographic characteristics, or attitudinal approaches (Krueger and Carsrud, 1993).

Taking more risk can be one of the personal characteristics (Gürol and Atsan, 2006), focusing on control (Brockhaus, 1982; Brockhaus and Horwitz, 1986), desire to be successful (Chell, 2001), desire to be independent (Shane et. Al, 1991), recognition (Shane et. al). A model of entrepreneurial attitude will be proposed, if the findings will be satisfactory.

Authors will look for differences and similarities between these two environments and also between two major disciplines (Faculty of Business and Economics – Faculty of Engineering).

Sampling frame of the study will be the third and fourth year students in the Faculty of Business and Economics and the Faculty of Engineering of the Universities established in Turkey and Cyprus.
The effects of limited staff capacity and capability of small firms on their access to official foreign trade promotion

Christian Hauser*
Arndt Werner**

Abstract
Small businesses face size-specific barriers with regard to the development of foreign markets. To counteract these structural disadvantages, governments worldwide have created a large number of different institutions and instruments to support the internationalisation of small firms. Grounded in the theoretical framework of the resource-based view, our study analyses the participation patterns of enterprises in foreign trade promotion schemes with respect to firm size. Our study is based on regression analysis using data obtained by an original survey covering 615 German enterprises from all sectors. Our findings provide strong evidence that (1) small businesses use foreign trade promotion programmes to a lesser extent than their larger counterparts and that (2) the limited staff capacity and capability of small firms, which in fact should be counter-balanced by the public promotion schemes, is the main reason why the support measures are not being accessed by small enterprises efficiently.

1. Introduction

The small business literature has identified resource and management limitations as one of the main weaknesses of small firms. From the perspective of the resource-based view, the lack of resources and skills needed for the entry into and development of foreign markets might also explain the weaker orientation towards international markets of small enterprises (Preece et al. 1999, Verwaal and Donkers 2001, Knight 2001, Haahti et al. 2005). According to official data only 10.7 % of all German small firms but 72.8 % of all German larger enterprises are involved in exports (Federal Statistical Office 2009). Furthermore, larger enterprises are also much more likely to use other forms of internationalisation than small businesses, such as international co-operation, international licensing or foreign direct investments (Haunschild et al. 2007; Lo et al. 2007; European Commission 2007).

Acknowledging the size-specific disadvantages of small businesses, it is the purpose of governments worldwide to remove the barriers which these firms experience so that they can achieve their full growth potential in international markets (OECD 2008). While larger enterprises are seen to possess the required resources to enter and develop foreign markets on their own, many small enterprises are believed to be able to realize their international market potential only with the help of such public support. Thus, it is the explicit objective of the official foreign trade promotion to foster the internationalisation of small enterprises by counterbalancing their typical lack of resources (Deutscher Bundestag 2003; Deutscher Bundestag 2005).

Previous fundamentally descriptive studies indicate that small businesses are making less use of the public foreign trade promotion programmes than larger enterprises do (Moini 1998; Lau et al. 2005, Haunschild et al. 2007). Surprisingly, the circumstances and the reasons for this – from the government’s point of view – unintended and unwanted results have not been analysed by academic research in depth. Moreover, these findings are especially alarming
because a recent study by Hauser and Werner (2009) provide evidence that the use of foreign trade promotion has a positive impact on the international performance of small businesses, while in the case of larger companies it has no significant effect. Thus, our paper extends the existing literature by investigating (1) if small firms do participate in foreign trade promotion schemes to a lesser extent and if so, (2) what causes the lower participation rate of small enterprises.

To summarise the results, our empirical analysis finds strong evidence that (1) small firms use foreign trade promotion programmes to a lesser extent and that (2) the lack of specialised in-house resources of small businesses, which in fact should be counter-balanced by the public promotion schemes, is the main reason why the support measures are not being accessed by small enterprises in the first place.

The rest of the paper is organised as follows: The next section discusses briefly the relevant literature on foreign trade promotion and outlines the political objectives of the public support scheme. Based on the existing literature and the theoretical framework of the resource-based view, hypotheses are proposed with regard to the use of foreign trade promotion by small businesses. The subsequent section deals with the empirical study, discussing the data, variables, data analysis method and the results. Finally, some concluding remarks and recommendations including concrete policy options and practical measures are formulated which could feasibly contribute to an improvement of the foreign trade promotion for small firms.

2. Theoretical Background and Hypotheses

A relatively large body of research exists, which has analysed the effectiveness of promotion measures for the internationalisation of firms (Wilkinson and Broughers 2006). One line of research has attempted to verify a causal relationship between official foreign trade promotion activities and the export performance of a jurisdiction (Coughlin and Cartwright 1987; Wilkinson and Broughers 2000). Recent findings on macro-level indicate that the promotion ac-
tivities can positively stimulate national exports (Lederman et al. 2009). But, up to the present
time, the effects of the promotion schemes on macro-level remain inconclusive. Additionally,
as a consequence of the fact that the promotion services are provided on a company specific
basis, in recent years academic research focused also on examining the effects of the pro-
grammes on firm-level (Lages and Montgomery 2001; Gillespie and Riddle 2004; Hauser and
Werner 2009).

Another line of studies has examined the firms’ awareness, usage and perceptions of the use-
fulness of foreign trade promotion instruments as an indication of their outcome (Vanderleest
1996; Haunschild et al. 2007). Although these tests give no evidence of the impact of the in-
struments themselves, they can be seen as a helpful tools for programme planning, assessment
and decision-making (Francis and Collins-Dodd 2004), since they can be used to evaluate the
transparency and accessibility of the promotion scheme.

Foreign trade promotion measures are provided to help small businesses to overcome real or
perceived barriers to internationalisation. In Germany, various types of instruments have been
developed during the last few decades that are provided free or for a modest fee through pub-
lic, semi-public or private organisations. As mentioned above, the government assumes that
larger enterprises possess the required resources to enter and develop foreign markets on their
own. Small firms, on the other hand, are defined as the principal target group of the support
efforts because they are believed to be able to overcome barriers to internationalisation only
with the help of public support. Hence, it is the explicit goal of the promotion schemes to
counter-balance size-specific disadvantages of small firms by providing them with external
areas of competency, capabilities and resources, such as information, networking, training or
finance, to deal with the special requirements of foreign trade activities (Gençtürk and Kotabe
2001).
Challenging this explicit governmental objective the results of several, basically descriptive studies indicate that small firms are making less use of the support programmes than larger enterprises do (Moini 1998; Lau et al. 2005; Haunschild et al. 2007). Faix et al. (2003) conclude (1) that the larger the enterprise, the more likely it is to apply for subsidies, and (2) that the available financial support is mainly absorbed by larger enterprises. Surprisingly, the circumstances and the reasons for these – from the government’s point of view – unintended and unwanted results have not been analysed by academic research in depth. Thus, up to this point in time, it remains unclear if small businesses actually do make less use of the support measures and if so, why they participate in foreign trade promotion schemes to a lesser extent. Hence, based on the descriptive results of the existing literature we hypothesize:

**H1: Small businesses obtain less frequently support from foreign trade promotion than larger enterprises do.**

Foreign trade promotion is available only on application. Thus, it is necessary to take screening efforts and costs into account. Hence, a firm that wants to use public support needs certain in-house resources and capabilities to identify relevant promotion measures and to apply for them. Now, the theoretical framework of the resource-based view considers that every enterprise is unique with regard to the human and physical resources it controls. It assumes that the specific internal characteristics and competencies of firms determine why enterprises make distinct strategic and operative choices that lead to different performances. These include, among other things, the firm’s management skills, its organisational processes and routines, and the information and knowledge it possesses. Thus, the resource approach can help to explain how the existence of specific in-house capabilities and resources influences a firm’s ability to adapt successfully to its economic environment (Barney et al. 2001, Knight 2001,
Esteve-Pérez and Mañez-Castillejo 2008, Wolf 2009). As often emphasized in the literature, small enterprises are typically managed by their owners or their family members (Coviello and McAuley 1999, Ritchie and Brindley 2005, Werner and Kay 2006). The dominating position of the entrepreneur is the reason that the decision-making power is typically concentrated in his hands and that the management structure remains in general quite informal (Fernández and Nieto 2006, Leonidou et al. 2007). The strong centralisation of all entrepreneurial decisions often leads to an overload of management resources which therefore frequently leads to neglecting of long-term planning (Kayser and Wallau 2003, Li et al. 2004). Moreover, usually all employees are strongly relied upon to run the day-to-day operations. Thus, small enterprises often have difficulties in investigating on additional topics such as public support measures, without neglecting the day-to-day business (Gankema et al. 2000, Leonidou 2004, Li et al. 2004). In the opinion of many scholars, the limited staff capacity and capability of small firms inevitably leads to a fundamental lack of available information, as the time, knowledge and experience are missing which is necessary to search and analyse the relevant data purposefully (Korhonen et al. 1996, Knight 2001). Thus, grounded in the theoretical framework of the resource-based view we hypothesize:

\[ H2: \text{The existence of a person or department specialised in foreign trade affairs has a significant positive impact on the usage of foreign trade promotion measures of small businesses.} \]

As mentioned above, from the resource-based view, it can be argued that the ability of an enterprise to apply for official foreign trade promotion programmes depends on its capacities, competencies and resources (Westhead et al. 2001). Hence, the characteristic organisational structure and managerial style of small firms indicate that they might not possess enough in-
house capabilities and resources needed to efficiently screen the promotion scheme. The existing small businesses literature indicates that small firms are characterized by a general lack of personnel resources compared to larger firms (Knight 2001, Hollenstein 2005). For instance, frequently small enterprises do not employ specialists with formal economic or legal education and relatively few of them have at their disposal a middle management level or specialised administrative departments (Nummela et al. 2004, Fernández and Nieto 2005, Fernández and Nieto 2006). So, based on the findings of the existing literature we expect that:

\( H3: \) Small businesses have less frequently a person or department specialised in foreign trade affairs than larger enterprises do.

3. Data Analysis

3.1 Survey sample and descriptive results

To examine the question whether or not small firms possess the resources necessary to access foreign trade promotion, a quantitative-empirical survey was conducted with 615 German enterprises participating in the study in 2005.

First, we developed a 17-item measure consisting of foreign trade promotion programmes that represent the core set of widely available foreign trade promotion measures. The programmes considered in this study are (1) business seminars, (2) company pools, (3) cooperation symposia abroad, (4) export and FDI finance credits, (5) foreign trade consultancy programme, (6) German Centres, (7) Hermes export credit guarantees, (8) how-to-do-business-abroad publications and information offers, (9) investment guarantees, (10) joint participations in trade fairs abroad, (11) marketing assistance programme, (12) matchmaking events abroad, (13) political support for projects abroad, (14) promotion of joint ventures, FDI and cooperation, (15) trade missions and entrepreneur trips, (16) training of foreign executives and staff, (17) services
provided by Federal Government embassies and/or by representative offices of the State Governments abroad. To test the effect of firm size and limited in-house resources on the usage of a foreign trade promotion schemes, we include as our dependent variable a dummy variable taking the value one if the firm has participated in one of these programmes and zero if otherwise.

Second, we use number of employees as our first major explanatory variable. We define small businesses as firms that have less than 50 employees. This threshold reflects the fact that enterprises employing over 50 persons tend to possess a more formal organisational and managerial structure and a more decentralised decision-making process. The inferior restrictions in staff capacity and capability allow those firms to have more time and skills to deal with specific topic such as official promotion schemes, without neglecting the day-to-day operations (Obermann 1996).

Third, we use the existence of a person or department specialised in foreign trade affairs as a proxy for in-house resources and capabilities as our major explanatory variable. In the literature several approaches have been proposed to measure the resources necessary to deal with the different issues regarding the internationalisation of a firm. Some have used number of employees or size of sales as a proxy for resources (Calof 1994) others focused on more specific resource issues, such as available management time, financial means or R&D-spending (Abdel-Malek 1978, Kirpalani and Macintosh 1980, Preece et al. 1999). By using the existence of a person or department specialised in foreign trade affairs as a proxy for in-house resources and capabilities we follow a more specific approach. The existence of such specific personnel indicates that the enterprise uses considerable resources to deal with questions concerning its international activities and that staff members possess the necessary expertise and time to identify relevant promotion measures and to apply for them.
Fourth, to check whether common method bias according to Podsakoff and Organ (1986) is of concern, a Harman’s one-factor test was performed. Common method bias is assumed to exist if a single factor emerges from unrotated factor solutions, or if a first factor explains the majority of the variance in the variables (Podsakoff and Organ 1986). The results of the unrotated factor analysis show 14 factors with eigenvalue more than one, where the maximum variance explained by one single factor is 8.5%. Thus, the results of Harman’s single-factor test gives evidence that this type of bias is not of concern in our study.

Number of cases N=615
Table 1 presents the definitions, means and standard deviations of variables included in our analysis. In total, 47% of the surveyed enterprises have used foreign trade promotion measures. 62% of the surveyed enterprises are small firms according to our definition and 74% of the enterprises are either in the manufacturing or in the services sector. 26% are in other branches, predominantly in the trade sector. 88% of the enterprises do business abroad and roughly one fifth of the enterprises state that the geographic concentration of industry at regional level in their region is very high. Nearly one quarter of the enterprises indicated that their degree of internationalisation is significant above the sector-specific average. A rise in the development of employment in the last two years prior to our survey was confirmed by 35% of the firms and 37% of them indicated that they retain a specific person or department to manage their international operations.

\(^*\), \(^**\), \(^***\) denote statistical significance at an error level of 10, 5, and 1 percent.

\(^1\) Note: Number of cases for "Scheme if (no) Foreign Department": \( N_s = 89 \) (294), \( N_l = 137 \) (95).

Table 2 compares small and larger firms. The analyses yield a number of significant differences. First, small firms make less use of support programmes than larger enterprises. While merely 40% of the surveyed enterprises with less than 50 employees obtained some kind of
public support, nearly 59% of the larger enterprises made use of foreign trade promotion programmes. In addition, the descriptive analysis shows that larger enterprises are much more likely to possess a person or department specialised in foreign trade affairs than small businesses are. Nearly three-fifth of the larger enterprises possess specific personnel but only less than one quarter of the surveyed small firms do.

With the exception of ‘development of employment’, ‘geographic concentration of industry at regional level’ and ‘other industry’, small firms differ significantly from larger ones. More larger enterprises are doing business abroad (small firms 83%, larger firms 97%) and are in the manufacturing sector (small firms 30%, larger firms 69%). Furthermore they are much more likely to have a significantly higher degree of internationalisation in comparison to the sector-specific average than small firms are (small firms 21%, larger firms 29%). On the other hand, more small enterprises are doing business in the trade sector (small firms 15%, larger firms 3%), the service sector (small firms 38%, larger firms 15%) and craft sector (small firms: 8%, larger firms 3%).

Two observations are noteworthy: the descriptive analyses reveals that the enterprises with personnel specialised in foreign trade affairs use foreign trade promotion schemes to the same extent, irrespective of firm size (small firms: 67%, larger firms 68%, the test of difference in proportions is not significant). On the other hand, if the enterprises have no department specialised in foreign trade affairs, small firms seem to use foreign trade promotion schemes to a much lesser extent: Average promotion usage of small firms without specialised personnel is 31% compared to 45% of larger firms.

The results of the descriptive analysis are somewhat alarming. They indicate that small firms – the supposed principal target group of the public support efforts – generally make less use of the promotion programmes than larger enterprises. These results are in line with the findings of the existing descriptive studies mentioned above. Taken together with the observation
that the percentage of small enterprises that have used any support measures is a lot higher with small businesses with personnel specialised in foreign trade affairs (67%) than with small firms without such specific capacities and capabilities (31%), can be taken as a first hint that limited in-house resources of small businesses may negatively influence their access to official foreign trade promotion schemes.

Yet, the descriptive evidence presented does not reveal the extent to which the variables discussed might be interrelated. Rather the descriptive findings may be – at least in parts – the result of other internal and external intervening variables. For example sector-specific differences or the orientation of an enterprise towards internationalisation or growth might affect its firm size, the in-house resources it possesses as well as its behaviour regarding the usage of promotion services. Thus, multivariate analyses have to be applied to reveal the ceteris paribus effects of firm size and internal resources on the foreign trade promotion usage of an enterprise.

3.2 Estimation strategy

In the following section we will investigate the ceteris paribus effects of limited in-house resources of small businesses on their access to official foreign trade promotion while other internal and external intervening characteristics and factors of the firm are controlled. Altogether we estimate four econometric models using regression analysis.

The dependent variable in all models is the usage of any foreign trade promotion scheme in the past (“scheme”). As described above, the dependent variable is a binary variable taking the value one if the firm participated in foreign trade promotion schemes and zero otherwise. Since the variable “scheme” is an indicator variable, we estimate binary probit models (using robust variance estimators). Beside our two major explanatory variables (small firm size and the existence of a person or department specialised in foreign trade affairs as a proxy for in-house capabilities and resources), we include a set of control variables that are known to af-
fect the usage of foreign trade promotion - but which are not included in our hypotheses. The literature has identified various factors that could stimulate or impede the participation in promotion schemes.

First, Foreign trade promotion is provided by public institutions to foster the internationalisation of small businesses. So, a firm’s orientation towards internationalisation might affect its behaviour regarding the awareness and usage of such promotion services. Research into export promotion has identified that enterprises having different degrees of international involvement also have different needs (Czinkota 1996; Diamantopoulos et al. 1993; Naidu and Rao 1993; Moini 1998) and face different obstacles (Kotabe and Czinkota 1992) that have to be addressed by the public programmes. To account for these possible differences we control for the factors such as if a company is doing business abroad and for its degree of internationalisation in comparison to the sector-specific average. Furthermore, the orientation of an enterprise towards growth might also affect its propensity to internationalise its business activities and therefore increases its need for public promotion services. The development of the number of employees in the last two years was chosen as a proxy for the orientation of an enterprise towards growth.

Beside these organisational factors the literature identified that also industry factors could stimulate or impede the internationalisation of an enterprise and subsequently the perceived importance or need for foreign trade promotion schemes (Al-Laham and Souitaris 2008). Academic research has documented that the internationalisation of enterprises from the service sector may differ in comparison with firms of the manufacturing sector (Buckley et al. 1992; Lehmann 2008) and that enterprises from crafts are generally mainly domestic market oriented (Müller 2004; Haunschild et al. 2007). Furthermore, with regard to the foreign trade promotion schemes it can be noted that they focus mainly on the needs of the manufacturing
sector while the specific requirements of the service sector are often disregarded (Lehmann 2008). Thus, to account for possible differences between the sectors we control for sector-specific differences. Research on the correlation between the geographic concentration of industry at a regional level and internationalisation is still limited. Yet, the existing literature indicates that enterprises embedded in regional clusters can benefit from the characteristics of clusters. E.g. knowledge spillovers or signaling effects can help small enterprises to master their internal resource restriction (Dunning 1998; Zain and Imm Ng 2006; Al-Laham and Souitaris 2008).

Furthermore, we focus only on German enterprises in order to control for institutional differences between countries which might affect the usage of foreign trade promotion schemes (Acs et al. 1997). Germany is conducive to the study because it has a strong export sector and a sophisticated foreign trade promotion system. In addition, we defined 16 dummy variables for each federal state of Germany to control for institutional aspects on the regional level. As base group we have chosen North Rhine-Westphalia which is in terms of population, economic output and exports the largest Land of Germany (Haunschild et al. 2007).

Table 5 (see appendix) presents zero order correlations. The bivariate relationships indicate that most of the independent variables are significantly related to participation in foreign trade promotion schemes. In addition, all the independent variables were not highly correlated with each other indicating no major risk for multicollinearity with regard to our estimation results.

To test our hypotheses we estimate four econometric models using hierarchical regression analysis:
\[ p(\text{scheme}) = \beta_0 + \beta_1 \text{firm}_\text{size} + u \]  
(1)

\[ p(\text{scheme}) = \beta_0 + \beta_1 \text{firm}_\text{size} + \delta \text{control} + u \]  
(2)

\[ p(\text{scheme}) = \beta_0 + \beta_1 \text{firm}_\text{size} + \beta_2 \text{foreign}_\text{dep} + \delta \text{control} + u \]  
(3)

\[ p(\text{scheme}) = \beta_0 + \beta_1 \text{small}_\text{dep} + \beta_2 l \text{arg e}_\text{nodep} + \beta_3 l \text{arg e}_\text{dep} + \delta \text{control} + u \]  
(4)

In model 1, the coefficient of "Firm_Size" reflects the discrete change in probability in scheme participation between small businesses and larger enterprises. Model 2 gives the same effect, while holding past development of employment, geographic concentration, degree of internationalisation, doing business abroad, industries and federal states fixed. In the third model we additionally control for in-house resources by adding "foreign_dep" to the equation. Finally, we relax the assumption that the “department premium” is assumed to be the same within small firms and larger ones in model 4 (see Wooldridge 2003). Put differently, here we estimate a model that allows for differences among four groups: Enterprises with (1) less than 50 employees (small firms) with a person or department specialised in foreign trade affairs and (2) companies with 50 employees and more (larger firms) also with such specific in-house resources as well as (3) small businesses which have no such person or department and (4) larger firms also without such specialised capacities and capabilities. The corresponding dummy variables are Small_Dep, Large_Dep, Small_NoDep and Large_NoDep, respectively. As our base group we choose Small_NoDep in model 4. Thus, the estimates on Small_Dep, Large_Dep, and Large_NoDep measure the proportionate difference in the probability of promotion usage relative to small enterprises with no foreign trade department.

3.3 Univariate probit estimates

Table 3 displays the results of our probit estimations. As can be seen, our hypotheses are borne out by the data. Estimation results of model 1, for example, provide evidence that small firm size is negatively linked to the probability of using promotion. The coefficient is significant and negative which implies that, on average, the probability of applying for a promotion programme is lower for small firms ($\beta_{dF/dx} = -.1893; p < .01$). In the second model we keep the size variable and include a set of control variables. As we assumed, the negative correlation between firm size and application probability does not disappear if we include these controls ($\beta_{dF/dx} = -.1621; p < .01$). Yet, the effect of the size variable becomes smaller if we include these controls. The discrete effects imply that small firms have an 18.9 percentage points lower probability of support scheme usage if we do not include the control variables in our analysis. On the other hand, if we include the controls, the magnitude of the size-effect is decreased to 16.2 percentage points. This means that only a part of the size-effect is explained by the controls in our second model. Therefore, H1 is supported by the data.

So obviously, there must be some other intervening mechanism that explains why small firms use the public support measure to a lesser extent compared to larger enterprises. To analyse such mechanism, we first include the department variable to control for the effect of restricted management capabilities and limited resources in model 3. As mentioned above, if our assumptions about the impact of the restricted internal resources of small companies are correct, we should observe that the effect of the size variable disappears if we control for such in-house capabilities. And, as can be seen, the size effect disappears as expected. That is, as soon as small businesses have built up enough in-house capabilities they do not have a significantly lower probability of using foreign trade support measures. Thus, we can conclude, that a large part of the support scheme application probability is actually explained by the availability of in-house resources. Hence, H2 seems to be supported by the data.
Yet, as stated above, a limitation of model 3 is that the estimated “department premium” is assumed to be the same for small enterprises and larger firms. This is not the case in model 4 were we control for differences among the following three groups: Small_Dep, Large_Dep, Small_NoDep and Large_NoDep. The base group is Small_NoDep (i.e. small firms with less than 50 employees with no foreign department). The estimates on the three dummy variables Small_Dep, Large_Dep, and Large_NoDep measure the proportionate difference in foreign trade promotion usage relative to Small_NoDep.

The results of model 4 confirm that H2 is supported by our data: Holding all other factors fixed, we find that small firms which have no foreign sales department are estimated to have a lower probability of using such foreign trade promotion programmes than (a) larger firms with a department (β_{df/dx} = .3259; p < .01), (b) small firms with a department (β_{df/dx} = .3359; p < .01) and (c) larger firms with no department (β_{df/dx} = .1371; p < .05). Moreover, further analysis also shows that small firms with a department do not achieve a statistically different level of promotion usage probability than larger firms with a department (χ² (1) = 0.04). On the other hand, larger firms without a department do diverge significantly from small firms with a department (χ² (1) = 6.90) and larger firms with a department (χ² (1) = 8.12).

3.4 Bivariate probit estimates

Our analysis is based on the idea that small firms use promotion schemes to a lesser extent because of the limited availability of in-house resources. Yet, it is also arguable that such an approach might not be appropriate because the decision to establish a foreign trade department and the decision to apply for foreign trade promotion might not be independent. In other words, it can be argued that the probability of applying for a promotion scheme is a conditional probability which in turn depends on the firm’s prior decision to implement the skills of a person or department specialised in foreign trade affairs. That means, the correlation of errors between both equations may be likely because the existence of promotion schemes may
have prompted specific firms to build up new in-house capacities and capabilities. In such cases, estimating the scheme usage probability as a univariate probit may provide incorrect estimates (Baum 2006; Cameron and Trivedi 2009). Fortunately, estimating a seemingly unrelated bivariate probit model can mitigate the problem described above. The bivariate probit model is based on the principle that both decisions are not separate but perhaps interrelated. Hence, in order to strengthen our findings and to test hypothesis H3 we use a bivariate probit model.

Table 5 shows the results of the bivariate probit estimations. In the first-stage equation, we use the controls described above. It can be argued that sector-specific differences, the orientation of a firm towards internationalisation or growth might also affect its decision to establish a source consisting of a department specialised in foreign trade affairs. The second equation, which is observed conditional on the outcome of the first, describes the probability of foreign trade promotion usage. Here, we include the same set of control variables as in Table 4, which we argued are important to this decision. In our estimated model, the potential correlation \( p \) is negative but not significant (ROH), meaning that estimates of the second equation are not biased if we do not account for the potential selection described above. Even though, in both models (univariate and bivariate) the effects of our major explanatory variables are similar, meaning that small firms which have no foreign department are estimated to have a lower probability of using such foreign trade promotion programmes than their counterparts that do have such resources at their disposal.

Furthermore the results of the first-stage equation show that small firm size has also a negative effect on the probability of having a person or department specialised in foreign trade affairs. Holding all other factors fixed, small firms are estimated to have a lower probability of having such internal staff capacities and capabilities at their disposal by around 32 percentage points (\( \beta_{df/dx} = .3197; p < .01 \)). Thus, H3 is also confirmed by the data.
In other words, it can be concluded in view of the fact that larger enterprises significantly more frequently have at their disposal specific in-house resources they are also at an advantage in the use of the foreign trade promotion system compared to small businesses.

4. Conclusions, Recommendations and some Limitations

The results of our empirical analysis provide strong evidence that small businesses use foreign trade promotion programmes to a lesser extent compared to larger firms. Based on the theoretical framework of the resource-based view we examine what causes the lower participation rate of small enterprises. For this purpose, our paper focuses on staff capacity and capability as explaining factors for the ability of small businesses to use official foreign trade promotion programmes. Our findings confirm the predictions of the resource-based view. They clearly illustrate that – although it is the explicit aim and the economic justification of the foreign trade promotion to reduce the size-specific lack of in-house resources of small firms – it is exactly due to these structural problems, which it tries to counter-balance, that the support measures are only, with difficulty accessible for small businesses. That indicates that the promotion scheme implicitly requires the existence of internal capabilities and resources which small firms typically do not possess. As a consequence, governments have to focus their promotion activities better than currently on small enterprises.

A recent study has shown that small businesses seem to profit from the foreign trade promotion while larger enterprises may incorporate windfall gains when benefiting from such programmes (Hauser and Werner 2009). The combination of these findings is alarming because it shows that although small firms seem to benefit from the promotion programmes, the current promotion system puts them systematically at a disadvantage. This, of course, could lead to a waste of public funds. Thus, policymakers at all levels of government have to pay particular attention to the implementation of policies and strategies which facilitate the access of small businesses to public promotion programmes.

Thus, policy measures should aim at reducing the existing shortcomings of the promotion scheme. To attend to enterprises which only possess limited in-house resources in an improved way, the promotion system should be simplified. In order to achieve this, policy mak-
ers have to take the structural problems and specific limitations of small firms more specifically into account. These efforts could initially target e.g. at the improvement of co-operation and co-ordination of the various institutions engaged in the foreign trade promotion. In this context, it is necessary that each institution views and presents itself as part of a comprehensive promotion scheme. For this purpose, the creation of a coherent corporate design could develop an integrating effect and play a significant role in the way the promotion scheme presents itself to both internal and external stakeholders. Hence, it is advisable to develop a common logotype and logogram as well as a uniform nomenclature for all promotion instruments and measures. This would take into account that small businesses require a high transparency and easy accessibility to the promotion system.

It should be noted however, that our study also has some limitations, which should be taken into consideration when examining our results. On the one hand, we rely on self-reported and single-item measures. Yet, we see this issue as less problematic for our study because the nature of our constructs are concrete practices (manifest variables) which are likely to be perceived similarly by all respondents and not perceived judgements or psychometric properties where multi-item measures are recommended (Fuchs and Diamantopoulos 2009). Second, we control only for in-house capabilities and management resources and not for all kinds of possible resource shortages (e.g. lack of financial resources etc.) because we do not have the information on this. Thus, similar studies in the future using a more comprehensive data source would be valuable. Yet, even when keeping these limitations in mind, in summary we are confident that our results indicate that small businesses participate in foreign trade promotion schemes to a lesser extent and that the lack of internal resources explains why they do so.

The Santa Fe Case: Using Art to Redevelop Ghost Towns

Cross Disciplinary Learning in Action Cases Summary Reports

The Learning in Action process has or/ is currently running in 10 different Universities. This is a brief summary of products from the Santa Fe case. This case along with the Phoenix case and the Music City Blues case have been used to develop redevelopment entrepreneurship plans for the following cities: Athens, TN; Florence, SC; Maryville, TN; Bowling Green, KY and Franklin, KY. This is a draft of ideas for discussion.

Executive Summary

All across America, small towns are facing a similar plight – the gradual decline of their downtown area. Early on, small town planners were concerned with traffic problems brought about by industrial growth. Many towns elected to build industrial parks to accommodate new businesses, and then to create newer highways to meet the transportation requirements of those companies. As areas outside of town began to be developed and supplied with city services, retail businesses began to relocate to new buildings as well. Today, businesses are moving out of central areas as more and more people elect to go “where the shoppers are,” generally to the larger highways that bypass the congestion of small town streets. In addition, large stores, the so-called “big box” retail operations, tend to locate in these outlying areas to take advantage of the increased flow of customers. The Interstate highway system has added to the problem by providing a constant flow of traffic just outside the periphery of most small towns. This traffic encourages the growth of specialty retail stores, as well as hospitality and industrial development.

Where do these trends leave the small town? Once the cycle has begun, it seems difficult to arrest. Usually, older buildings are left to crumble and decay, with the only holdouts often being the city offices, some professional buildings, and the law enforcement offices. Development dollars are spent elsewhere, while the downtown area sits as a sentimental reminder of the past, at best. Plans developed by different students will be discussed and the role of the arts students will be clearly shown. These are some of the cases developed by Wil Clouse and team while he was the director of the Entrepreneurship Forum for Education at Vanderbilt University and used in several different university sites across the country. These cases are now available at the Center for Entrepreneurship and Innovation at Western Kentucky University- www.wku.edu/cei.

So What Issues

Several cases will be discussed that show how students from several different disciplines work together to develop business ventures to revitalized small town areas that have become ghost town. It will show how business, arts and science and human and organizational development students work together to learn multiple concepts
simultaneously and shows the importance of applying knowledge across disciplines. It makes learning real and alive for several different types of students.

**Presenters**

This case will be presented by two faculty members from two different Universities. One member of the development team personally invested his own money in a ghost town to show students and the local business people that ghost towns can live again. This presentation will tell the story of how students in the Arts working with other students helped redevelop small down areas in several different cities. Personal experiences by the presenters will also be included.

**Case Name:** Santa Fe  
**School:** Vanderbilt University  
**Title:** Dore to Door Consulting

**Case summary:**

The students of Dore to Door Consulting, proposed to revitalize and redevelop downtown Athens by implementing a plan that focused on bringing in a major retailers and chain restaurants in addition to revitalizing existing landmarks. The plain includes placing a Wal-Mart Supercenter in the heart of downtown and targeting restaurants and shops that appeal to various demographic segments of the population, i.e. families, college students, etc. The consultants took into account the age, socio-economic background, and educational level of the community and targeted businesses that would appeal to the greatest percentage of the population. The focus of their proposal is to bring
individuals back to downtown Athens. They plan to accomplish this by creating a shopping strip, restaurant and bar district, renovating the historic Robert E. Lee hotel, establishing a Civil War Heritage museum, creating parks, and bringing in a movie theatre. The major element of their proposal is to use a Wal-Mart Supercenter as a draw to bring people into the downtown area. They hope that by having a popular low cost retailer in the midst of downtown it will expose people to the other attractions in the area. Dore to Door consulting created a marketing plan that focuses on hosting a series of community events to promote the revitalized downtown. The events range from an initial grand opening celebration to weekly parties held in the town square. The group also proposes creating a slogan and logo for the new downtown. The students operational plan begins with recruiting major retailers to establish a presence in the area, their next step is to begin renovating existing structures, and finally to create a park in the town square. The Consultants are seeking a loan of $50,000 to be repaid over 5 years; they predict their risk to be moderate.

Case Name: Phoenix
Title: Phoenix Cyber Cafe
School: Vanderbilt University

Case summary:
The entrepreneurs of the Phoenix Cyber Cafe aim to fill a niche in the city of Athens by providing not only a coffee shop with vast technological resources but an environment that fosters educational and social interaction. The cafe will be housed in a former print shop near Tennessee Wesleyan College and will feature specialty coffees and drinks, wireless and hard line internet access, a variety of technological resources, and baked goods. The cafe will provide the opportunity for social and educational interaction through open mike nights, guest speakers, and designated study space. The developers of the Phoenix Cyber Cafe sight the organizations uniqueness in the community as a major contributor to the success of their organization. The cafe’s target market is members of the Athens community and those affiliated with Tennessee Wesleyan College which average approximately 14,000 people. The cafe will operate at a
price point that reflects the demographics of the community it serves, which has an average income of about $20,762. The organization’s marketing plan is based on the size of the community they serve and focuses initially on direct mail and community flyers. The creators of the Phoenix Cyber Café predict moderate risk and request $150,000 and predict a net profit of $137,807 in the first year.

Case Name: Phoenix Case (2nd project)
Title: Ground Up, Inc.
School: Vanderbilt University

Case summary:
The Nashville based coffee shop *Ground Up* seeks to combine entrepreneurship and artistic development in the heart of Music City. The group of entrepreneurs responsible for the project, propose to address the challenges facing music industry songwriters by providing them with flexible jobs in a creative and artistic environment. The coffee shop will feature an artist showcase, live recordings of performances, a variety of coffee and refreshments, and artist workshops. The organization’s mission is to encourage “a holistic, creative, and interactive environment where the employees experience professional interaction, educational balance, and artistic development (EIA case).” Ground Up’s products include coffee, tea, frozen drinks, and baked goods. The group plans to market through securing a location with high visibility and word of mouth close to their target audience of students, songwriters, and others in the music industry. The entrepreneurs are seeking $100,000 for start up with total personal investments of $150,000. They expect to see an income of $187,200 on the low end to $343,200 on the high end.

Case summary:
The idea is to create a coffee shop/internet café in Athens, TN in order to capitalize on its location near Tennessee Wesleyan University. There is no immediate competition in the area which leaves an open niche for the café. Strategic planning has gone into the basic café design, the atmosphere, entertainment, and food provided. This café would be the first step in revitalizing this small downtown area.

Reason for using the cases

1. Introduction to entrepreneurship +
2. Critical thinking about entrepreneurship +
SRW Inc. Consultants (Santa Fe Effect Case)

This group proposed a comprehensive revitalization and development plan for downtown Florence. Their plan was very attractively written and proposed a series of actions that would revitalize the downtown area through the development of entertainment. The revitalization plan was designed to attract a multitude of residents and commuters to the downtown area. The group proposed several projects to make it more attractive to the general public and to make the area more than a place of convenience. They proposed a portfolio of an Italian dining and shopping activities. Some examples include an opera house, arcade, park, comedy theatre house, a French bakery, wine and cheese shop, pastry and coffee shop for stimulating thinking and boutiques for shoes, clothing and accessories and a bistro for multicultural cuisine. The group realized this would need major sources of startup funds from several different areas. In addition to state and local funding to stimulate creativity and innovation, the group also would seek venture capital to help build and revitalize the downtown area. This group had excellent pictures of the downtown area as related to how the revitalization would take place. The group emphasized imagination and ambition to bring people downtown.

ACR (Santa Fe Case)

This project emphasizes the revitalization of downtown Florence by embracing its traditions and historical value. The assumption behind this report was that people want a simple and safe way of life in a friendly and productive neighborhood. The group first of all indicated it would be necessary to clean up the downtown area before businesses would be willing and eager to open and or relocate to the area. The group felt that this was a necessary prerequisite to attracting businesses to the downtown area. They indicated if this could be done, venture capitalists maybe willing to invest in new apartment and condo living in the downtown area. The group wanted to create a more sophisticated cultural area that would incorporate the historical value of Florence. The group further indicated that there would be some attempt to clean up, revitalize, renovate and beautify the area before building new buildings. Vacant property would be sold to infuse new ideas and new businesses in the area. This group also indicated that it would take a substantial sum of money to revitalize the downtown area. They estimated it would take between 50 and 70 million dollars to begin the renovation.

Main Street—New Downtown Florence (Santa Fe Case)

Main Event is a restaurant/bar proposed to be located in downtown Florence. The group developing this business plan indicated that this new venture would provide quality food and services in a relaxing vibe, dance club venue. The group indicated that the Main
Street restaurant would be the initial investment in the developing the downtown area. The group proposes a high-energy concert theme venue for the restaurant. Of special interest, the restaurant will offer an assortment of fine beverages including beers and wines from around the world. The group intends to draw primarily from the Florence market but will also try to encourage guests from surrounding towns and cities. The plan also shows the forecast for the next year and provides startup costs.

**Aquarium Pee Dee (Santa Fe Case)**

This group also recognizes the need to revitalize the downtown area. They decided there was a need to change the area by renovating buildings and developing attractive landscaping. This group proposed a downtown Aquarium. Through this project the group aspired to create an area that encompasses a community of enlightened minds and high morale. The Aquarium will offer recreational activities for students to enjoy as well as an educational approach that would increase the community’s awareness of Florence life. The group estimated it would take approximately $5 million to start this venture. This would be South Carolina’s only inland aquarium. This project is well thought out and provides many details for implementation.

**GCP Downtown (Santa Fe Case)**

This group proposes to improve the downtown area of Florence by building and developing the biggest bar in Florence, South Carolina for people of all ages. The restaurant will feature steak, chicken, hamburgers, seafood and many side orders. They propose to sell the finest of beers and wines. They also proposed to have a video arcade within the restaurants. This group also wants to have a place where kids can come and get off the streets. They want this to be attractive place for both adults and young adults to attend. They have already identified a location in downtown Florence. They have developed a very, comprehensive startup costs and have identified liabilities statement.

**Florence downtown revitalization plan (Santa Fe Case)**

This group proposes a place of entertainment for mature audiences. This plan proposed to attract college students, commuters who are going to the beach and working class people. The plan is to design the city for several groups of people. The group would like to make downtown Florence a cultural hotspot. The group has identified several other locations around Florence that would be sources of competition. The group proposes expanded and redesign sidewalks, convenient parking and improved public transportation as a starting point to rejuvenate the downtown area. The group also identifies several sources of revenue for their plan. The plan calls for support funding from National Trust grants and loans for historical preservation trust grants and loans for historical preservation, and HUD grants. This proposal is more of a social entrepreneurship venture than a capitalist idea.
Lottery --Downtown Florence (Santa Fe Case)

This group has taken a unique approach to revitalizing downtown Florence. The group proposes the development of the lottery. The group states that the lottery has been proven to be a way to revitalize downtown areas. The goal for the project is to change Florence from a rundown city to a vibrant historical city. In order to get more businesses to come downtown, the group proposed to get the customers more interactive with business in Florence. The group believes that the lottery would provide the income to revitalize the downtown area. They would like to make the downtown area a place where natives and tourists could come together for an exciting experience in a joyous atmosphere and new social environment. They estimate it would take $4 Million to generate the lottery. However, they believe the lottery would generate $500,000,000 over the next ten years. The study also has developed a marketing strategy that would support their arguments. Breakeven analysis and support documents are presented to support their plans.

Providence-Consulting Agency Incorporated (Case Report 1) Athens, TN

This group has proposed a consulting firm to study and redevelop small downtown areas. The agency will be located in Knoxville, Tennessee with other offices in Athens Tennessee. The culture of this organization is built around an equity, fairness, stability, and commitment to honesty. This company will provide consulting services to small downtown areas for redevelopment. The first assignment for this company will be the renovation and development of the Robert E. Lee Hotel located at north Jackson Street in downtown Athens, Tennessee. The plan has identified a number of organizations that may have an interest in the revitalization of this downtown facility. The old rundown Robert E. Lee Hotel is a historical landmark in Athens, Tennessee. This is a very good approach to the Santa Fe affect case.

ABC Consulting Firm (Downtown Maryville, Tennessee revitalization proposal) (Santa Fe Effect Case)

This group’s proposal developed a consulting firm to investigate and propose strategies for revitalizing small downtown areas isolated by major interstates. The group chose the town of Maryville, Tennessee, which is located in the foothills of the Smokey Mountains. The project does a good job of identifying the characteristics of downtown Maryville and identifying the strengths of the city. The plan identifies a process to increase a sense of community, to generate local revenue and increased employment, the development of an in-depth action plan for project development and a method to infuse art and culture focuses into the downtown area. The plan would be a 501(c)3 non-profit organization. The plan identifies a number of strategies to revitalize the downtown area, develops a comprehensive cost analysis to do so and provides a milestone schedule for downtown revitalization. The plan provides limited resources to carry out the proposed activities.
Ground-Up (Music City Blues Case)

This group chose to call their business venture “Ground-Up,” and their title page shows coffee beans. This proposal was written in response to our Music City Blues case. The group proposed a coffee shop atmosphere that would provide part-time jobs that would give songwriters the opportunity and stability of an income and also provide them a creative environment to create and distribute their music. The Ground-Up Coffee Shop would provide songwriters the opportunity to have musicians come in and play their music onstage and to experience a live performance atmosphere. The Ground-Up Atmosphere encourages a holistic, creative and interactive environment where the employees experience professional interaction, educational balance and artistic development. The café provides the songwriters the flexibility to make money and practice and strengthen their talents. This was a well thought out, well developed approach to the Music City Blues case. The proposal provides support documentation for their approach, as well as estimated financial budgets.

The Phoenix Cyber-Café (The Phoenix Case)

This proposal was written in response to the Phoenix Case, which was originally written for Tennessee Wesleyan College in Athens, Tennessee. This group did an excellent job identifying the strengths and weaknesses of Athens, Tennessee, and developed a strong target market for the Phoenix Café. The project developed a reasonable assumption for a revenue stream and start-up expenses. The Phoenix Cyber-Cafe venture is directly targeted to a need in the community for advanced Internet access and for a creative social learning environment. The café is targeted for Tennessee Wesleyan College students (but also would be open to the community at large). This could be the forerunner of the development of the historical downtown Athens area that would be totally “wireless.” In addition to being a coffee shop to encourage creativity and entrepreneurship, the Phoenix Café would also feature live entertainment and performance for local artists as well as an avenue for Tennessee Wesleyan students. This project is very feasible for downtown Athens, the city in which we held our first Entrepreneurs in Action! Summer Institute in the summer of 2004.

Phoenix case (TWC)

The primary focus of the Honors class was to respond to the Phoenix case. The students were instructed to develop an Internet Cyber Café that would draw students from Tennessee Wesleyan College and the community at large. The primary focus of the Cyber Café was to develop a creative environment where new ideas could germinate and new business ventures could develop. Some previous thought had been given to the Cyber Café by professors and students at Tennessee Wesleyan and a former print shop had been secured as a facility for the Cyber Café. The students conducting the project decided to call the Cyber Café the “Warehouse.” This was a fitting name, since the building resembled a warehouse environment. The “Warehouse” was designated a limited liability company and the six-member team decided to invest $3,000 each as operating capital.

Before starting the “Warehouse”, the students did a comprehensive research analysis on current competition. They identified ER Video as an attempt to start a Cyber
The group also tested out some coffees at Starbucks and investigated other similar business ventures in and around the Chattanooga and Cleveland, Tennessee areas.

The “Warehouse” was designed to be a place for live entertainment, Internet and TV access, board and card games, video games, and well as food and coffee. The “Warehouse” programming was designed to encourage people to enter the doorway of new knowledge and to use the current facility to stimulate interesting and live conversation. The group also recognized that there would be certain risk factors related to this business venture. The group also developed a comprehensive pro forma that took into consideration cost analysis, break even, and revenue stream. Overall, this group seemed to learn and practice the skills necessary for an entrepreneur.

**Prelude Music Promotions (Music City Blues Case)**

The group that selected Music City Blues developed an LLC called “Prelude Music Promotions.” They developed a very attractive logo and slogan called “Big Dreams, Big Possibilities with Prelude Music Productions: Promoting Songwriters Across the Nation.” This group had a very interesting introduction to their business, playing off the early life of Gretchen Wilson, who had the award winning song “Redneck Woman.” Their scenario describes a mentor relationship between Gretchen Wilson and John Rich. It was out of this mentor idea that the Prelude Music Promotions group developed their business venture. They decided to provide the same kind of mentoring services to young developing stars as would be provided by a role model or mentor. The group recognizes that there are many creative, talented people in the world, but many never find their way to stardom. The group developed a very synergistic marketing approach using the 80/20 Rule.-- That 80% of the revenue is generated by 20 % of songwriters and record companies. The group plans to have its home office in Nashville, but to have sessions, in New York, Atlanta, Miami, Chicago, Dallas and Los Angeles. The plan presents a realistic growth potential and identifies talented management group. The plan also has an excellent pro forma and balance sheet. The plan is very attractive, including pictures and calling card designs. It is obvious that this group has spent a lot of time thinking about this business venture. They also have agreed to self-fund the project with investments from each of the four entrepreneurs of $250,000 each and with another $650,000 from two investors. (I think this is a hypothetical budget.)

**Livewire (Santa Fe Effect Case)**

Livewire, LLC, is a business venture derived from the Santa Fe Effect case. This group proposed a restaurant-entertainment business venture that would be placed downtown in Athens, Tennessee in an old CBS building. The group discusses the movement of businesses closer to the Interstate and the dying of the downtown area. So, they have proposed a restaurant club type of entertainment business. A comprehensive discussion centers on the operational characteristics of the restaurant, including employees and salary arrangements. The four owners plan to invest $28,000 from their own funds and borrow $300,000 from a local bank and secure another $200,000 from prominent business people in the community.
The group conducted a competitive analysis, including similar restaurant/club enterprises located in larger cities such as Knoxville and Chattanooga. Furthermore, they recognize the risk involved in this type of business venture. The group uses the 4 P of marketing in order to establish a marketing strategy. The plan provides a menu, a balance sheet and a pro forma.

**Western Kentucky University**  
Professor: Dr. Wilma R. King

Course title and Number: J453 Public Relations Research  
Number of students: 29  
Undergraduate  
What part did the case play in the course? 25%  
Case outputs: Class presentations & research papers

Reason for using the cases

1. Introduction to entrepreneurship +  
2. Critical thinking about entrepreneurship +  
3. To help develop the "e" spirit +  
4. Building organizations for the future +  
5. Addressing social issues+  
6. Others —International

**Case Name: The Phoenix**  
Western Kentucky University

**Case Summary:**  
Bowling Green, Kentucky is the ideal test market for Latte Login, the city’s first Internet café, because it is a city with a need, and none of the services in the marketplace today meet that need and offers an atmosphere, conducive to gathering over a bite to eat and stimulating conversation. Kentucky lags behind other states in technology, making Latte Login a beneficial partner in this community and a business suited for expansion into university communities such as Lexington, Owensboro and Murray. Similar services can be found in cities with populations far exceeding Bowling Green’s population of 50,000.

Our building’s design, unique in itself as it breaks the typical box-like mold, is a main attraction to the business. The light brown brick exterior, shaped as a “to-go cup of coffee including the lid,” shoots machine-produced steam sent through ducts, and then released out the top of the building, creating a retro look. This will be a visual display people will not overlook. Especially on cold mornings, this will make Latte Login a landmark.

What medium did the students use to present the project: PowerPoint presentations
Number of students involved in the case: 5

Case Name: Music City Blues

Case Summary:
With the motto, “Raw Talent, Real Results,” Raw Talent Consulting strives to give hopeful musical artists all of the tools, information, and know-how that they will need to break into the music industry and most importantly be successful in the industry. The partners feel that there is a general lack of information offered to prospective artists about the music industry as a whole. Many artists don’t know what steps they need to take to make their presence known, and also don’t understand the business and legal aspects of it.

What we do . . .
- The firm offers services such as legal consulting, media communications training, making contacts for artist within the music industry, showcase/booking opportunities, promotional and album cover photography, and publicity to local and national media.
- Raw Talent Consulting teaches prospective artists professional skills such as how to conduct themselves in a professional manner when giving interviews or anytime they are in the public eye as well as in important meetings. They act as a “middle man” by supplying artists with possible contacts that could possibly help them in the future if a good relationship is built.
- Raw Talent Consulting organizes lessons and workshops on songwriting, guitar lessons, drum lessons, dancing, and singing. The firm hosts an annual Showcase in Nashville, TN where all of their clients have the chance to perform their music and talk to executives and talent scouts from the top record labels in the area as well as other smaller labels.
- Provide all the information and resources that an artist needs in order to establish themselves as an artist and a professional while also maintaining a positive image.

What medium did the students use to present the project: PowerPoint presentations

Number of students involved in the case: 6

Case Name: The Santa Fe Effect

Case Summary:
Our mission is to bridge the community through artwork and freedom of expression. We aim to provide an outlet for local artists to display and sell their work. We want to educate people on the history of our community through pictures, music, video, displays, and any other means accessible. Also, our mission is to do all this while entertaining either as a rented space or serving others through the soda fountain.

The idea for our soda fountain gallery spawned from the lack of nostalgia that small town Americas possess. The town we chose to locate in, Franklin, Kentucky, is rich in beauty and history, but the downtown has needs. We feel our business can positive
contribute to the down town growth by drawing crowds to the old-time soda fountain for refreshments and showing community history through art, photos, music, videos and memorabilia. We want to be a positive, contributing member of the community by providing a space to showcase local artists, including school children, and have a community museum open to the public. We will contract with a local framer to have our artwork framed for a discounted price in exchange for advertising in our business. A small admission fee of $3 will be charged to enter the museum. Also, we will host field trips and educational tours on appointment.

Another aspect of our business, apart from the museum is the soda fountain. Patrons will be welcomed by a blast from the 1950s when entering our front door. We will employ a soda jerk, who can make all the fountain favorites, like milkshakes and malts to banana splits. We will only offer a limited menu of soda fountain treats, limited only to drinks and ice cream, but not food items to keep down costs. This is an area of opportunity for our business.

The third aspect to our un-named business is the space for rent. We have found through our market research that many citizens of small towns feel their towns lack a nice area that can be rented. We will offer our space rent, by reservations, for events such as holiday parties, wedding receptions, luncheons, etc. We will offer the services of providing our space, tables, chairs and certain decorations to go along with the charm of our business. Also, we can help renters contact and find catering services. We fill this will fill a valuable need in the community.

**The Phoenix -- Latte Login**  
School: Western Kentucky University

**Case summary:**  
Latte Login is an internet café introduced into the Bowling Green area that offers internet connection in a coffee shop type setting. This is a new idea to introduce to the area, but careful research and planning should lead to its successful implementation. It will be marketed to the students of Western Kentucky due to its location near the university.

**Case Name: Music City Blues Raw Talent Consulting**  
School: Western Kentucky University

**Case summary:**  
There are two major issues facing the music industry today: the legalities within the business and big executives who take advantage of and overwork artists only to drop them after their first album. The mission of this business is to help artists achieve their ultimate goal—a record deal. Every client is guaranteed to receive all the tools needed to polish themselves as an artist and as a professional, but the implementation of those skills is left up to the artist.

Case Name: Santa Fe LiveWire LLC
School: TWC

Case summary:
The mission is to provide citizens of Athens, TN and the surrounding area with a place to eat good food and enjoy a variety of entertainment. This is to be done in an ethical, safe, and friendly environment for both customers and employees. The hope is also to expand the downtown area and promote community unity in reaction to the “Wal-mart effect” which has hurt local businesses. They will create a theme-based club, which will change based on the evening—including comedy, open mic, senior’s night, country western dancing, etc. The intention is to be family oriented and alcohol will not be served.

Conclusion
The Learning in Action program is a holistic approach to teaching and/or encouraging the entrepreneurial spirit to several different groups including business, human development, education, public relations, marketing, nursing and other disciplines. The Universities and/or Schools involved are located in Tennessee, Texas, South Carolina, New York, Oklahoma, Louisiana, New York and Kentucky. This presentation is only about 3 cases which are used to rejuvenate small down towns that have been by passed by the current economic trends such as the ‘big box’ companies and super high way such as Interstates across the United States.

///Entrepreneurs in Action!

Description

*Entrepreneurs in Action!* is a curriculum designed to teach entrepreneurship, creativity and innovation by using online cases. The curriculum is a vehicle for creating learning environments that foster entrepreneurial activities and develop a mindset for thinking outside of structured settings. The curriculum takes the position that every person has the potential to think creatively and entrepreneurially.

Project Goals

The *Entrepreneurs in Action!* program is designed to accomplish the following:

- Encourage the development of a cross-disciplinary learning environment
- Connect learning with the framework of the learner
- Provide for just-in-time learning
- Utilize whole-part-whole teaching strategies
- Connect learning with local communities
- Use live cases
- Require the use of a variety of resources
- Provide online experts from the local community for content analysis

Featured Cases

- Blackout in America! – Electrical Energy
- A Question of Power – Oil Shortage
- Chasing the Dragon – Illegal Drugs
- Not in My Backyard! – Recycling
- Music City Blues – Music Business
- Talking to the Air – Wireless Technology
- The Santa Fe Effect – City Planning
- The Phoenix – Creating a Cyber Café
Increasing the rate of mid-sized companies in the economy: lessons from the French most dynamic regions

Frédéric NLEMVO
Reims Management School, France
frederic.nlemvo@reims-ms.fr

Groupe ESC Troyes, France
biga@groupe-esc-troyes.com

Mathieu CABROL
Groupe Sup de Co Montpellier, France
m.cabrol@supco-montpellier.fr

Entrepreneurial activity has been studied extensively at country level, but poorly at regional level. Answering to the concern of policy makers requesting locally-designed tools for the regional development, this paper explains why some regions are better than others at developing mid-sized companies by analysing a panel of the 22 French metropolitan regions over the period 2000-2005. The main finding is that (i) the French most dynamic regions are neither the largest regions of the country nor the most populated; (ii) these countries differ on various economic characteristics (e.g. R&D/GDP) but have a relative higher level of churn rate.

New Organizational Legal Forms for Global Social Ventures

Robert S. D’Intino  
Rowan University  
Glassboro, New Jersey USA  
Dintino@rowan.edu

ABSTRACT

Social entrepreneurship comprises organizations create social value. The broad array of global social ventures includes numerous organization forms utilized to change the world and improve human life and the planet. Existing organization legal forms include: government agencies, non-government organizations (NGO), non-profit organizations, established business firms, start-up and growing entrepreneurial firms, and various hybrid-form or blended-form organizations. Additional specific type social ventures include: village or farmer or fishing cooperatives, religious social benefit organizations, and local startup organizations designed to directly benefit communities. Numerous combinations and hybrid social benefit organizations are created involving different combinations of for-profit, non-profit, joint-venture, and other alliances. Currently there is a world-wide movement to design new legal organization forms through national legislation to benefit social entrepreneurship ventures. These new legal forms move beyond the old tired discussions and choices of entrepreneurs selecting either for-profit or non-profit organization forms to achieve creation of social value. Current examples from numerous national and state governments are presented with recommendations for future research.

Keywords: Social entrepreneurship; New organizational laws and forms; Institutional theory
Social entrepreneurship describes people and organizations dreaming, designing, and creating positive social change. Three informative definitions which together describe the term social entrepreneurship include “large-scale systemic social change” (Drayton, 2002); creating social value (Dees, 1998; 2001); and “pattern-breaking change” (Light, 2008). The one crucial action word that perhaps best specifies social entrepreneurship is change—change that plans, designs, and actively constructs socially beneficial outcomes for individuals and families and their larger society. A broad perspective on societal change ranges from small rural villages or ignored urban neighborhoods to specific target populations (Yunus, 2003; 2007), geographic regions, nation states or our entire global social, political, economic and ecological system (Offenheiser, 2009; Sacks, 2005; Sen, 1999; Stiglitz, 2003).

Observations and reporting from the social entrepreneurship field suggest that one commonality that distinguishes social entrepreneurs from others is that they tend to think broad brush creative thoughts and expect that their plans, new organization designs, and action will positively address and solve huge social problems. Drayton (2007a; 2007b) states that social entrepreneurs use systematic change ideas and create organizations designed and built to move forward beneficial social change.

This paper commences with the empirical reality that social entrepreneurs exist and are currently changing the world for the better (Bornstein, 2004; Dees, Emerson & Economy, 2001; Harding, 2004). Numerous recent studies have documented the thoughts and actions of active social entrepreneurs (Alvord, Brown & Letts, 2004; Kerlin, 2009; Light, 2008; Nicholls, 2007; Peredo & Chrisman, 2006; Pearce, 2005; Wei-Skillern, Austin, Leonard & Stevenson, 2007) and environmental entrepreneurs (Dean & McMullen, 2005).
Entrepreneurial individuals demonstrate their creativity, innovation, passion and tenacity in their thoughts and actions at both the individual and organization levels of analysis. The entire management design and process of creating and building new organizations or growing existing organizations is similar (if not identical) for individual business or corporate entrepreneurship or social enterprise ventures and organizations. Social entrepreneurs are different in that their motivations involving desires to improve the world and live out a mission-driven life and the various methods for accurately measuring social value outcomes (Brooks, 2009).

Most global social enterprises work within the expansive context of the United Nations Millennium Development Goal framework and progress reports. The eight objectives of the UN Millennium Development Goals (MDG) agreed upon by all member nations in September 2005 provide a social entrepreneurship course framework for a rigorous understanding of how to eliminate extreme global poverty.

The eight specific UN Millennium Development Goals are:

1. Eradicate extreme poverty and hunger
2. Achieve universal primary education.
3. Promote gender equality in empower women
4. Reduce child mortality.
5. Improve maternal health.
6. Combat HIV/AIDS, malaria and other diseases
7. Ensure environmental sustainability
8. Develop a global partnership for development

From the perspective of goal setting theory, MDG goals are written with the specific target completion date of 2015, a date that the member countries of the UN and the world's development organizations all agreed in 2000 was both a worthy and attainable goal. The Millennium Development Goals serves as an excellent frame for describing and understanding social benefit ventures these are well-know international goals, specific and measurable, and
annual progress reports will be U.N. published every July until 2015. United States Secretary-General Kofi A. Annan (2006) expressed the MDG goals in the following words:

“We will have time to reach the Millennium Development Goals - worldwide and in most, or even all, individual countries - but only if we break with business as usual. We cannot win overnight. Success will require a sustained action across the entire decade between now and the deadline. It takes time to train the teachers, nurses and engineers; to build the roads, schools and hospitals; to grow the small and large businesses able to create the jobs and income needed. So we must start now.”

Social Venture Organizational Analysis

Given the above broad global framework, this paper moves to focus beyond the individual social entrepreneur and attend to the creation of new social ventures and the legal and organizational form questions and answers that will foster more effective achievement of a social enterprise mission. This includes new legislation creating new social purpose organizational forms and structures and an examination of the interesting and innovative ways various nations and U.S. states have approached and addressed the clear and present needs of social entrepreneurs for more effective organizations.

Social entrepreneurship comprises organizations that create social value. The broad array of global social ventures includes numerous organization forms utilized to change the world and improve human life and the planet. Existing organization legal forms include: government agencies, non-government organizations (NGO), non-profit organizations, established business firms, start-up and growing entrepreneurial firms, and various hybrid-form or blended-form organizations.

Additional specific type social ventures include: cooperative enterprises, village or farmer or fishing cooperatives, religious social benefit organizations, government or private aid organization supervised ventures. Numerous combinations and hybrids are created involving different combinations of for-profit, non-profit, joint-venture, and other alliances. Currently there
is a world-wide movement to design new legal organization forms through national legislation in order to benefit social entrepreneurship ventures. These new legal forms move beyond the old tired discussions and choices of entrepreneurs selecting either for-profit or non-profit organization forms to achieve creation of social value.

A primary purpose of this paper is to provide a global conceptual framework to provide “…ways to improve the odds that social entrepreneurship might succeed by helping entrepreneurs. . . creating organizations that provide the kind of high performance needed for sustainable change” (Light, 2008: xi). The paper’s focus is on increasing a social entrepreneur’s choices in designing or choosing a legal structure and organizational form that will maximize their social ventures performance and ability to create social value and positive social change.

Contribution of Organizational Institutional Theory to Understanding New Forms

Organizational theory is important for a clearer understanding of how social enterprises operate (Mair & Martin, 2006) and to better understand specific contributions organizational scholars (DiMaggio & Powell, 1983) can provide in the way of theory and practical advice (Kilduff, 2006). Advice to begin a research project with field experience problems, formulate an initial theory, and then read and engage the ideas of previous scholars with the goal to design and conduct original research (Hambrick, 2005) is used here in developing the reasoning for employing organizational institutional theory to conduct social enterprise research.

Scott’s Three Pillars of Institutions

This paper closely follows the path of Scott’s organizational institutional theory perspective (Scott, 2008: 48) within which he states institutions: “…provide stability and meaning to social life”. Scott’s conceptual framework consists of his three pillars of institutions which are defined with the following system components.
Regulative systems
- Follow rules and laws
- Sanctions exist
- Coercive enforcement
- Practical logic
- Indicators – Rules, laws, sanctions
- Legitimacy based on legal sanctions

Normative systems
- Social obligation compliance
- Social expectations limit behavior
- Normative enforcement
- Indicators – certification, accreditation
- Legitimacy based on morality and expectations

Cultural-Cognitive systems
- Cultural understanding based on taken-for-granted behaviors
- Schema shapes actions
- Mimetic influences structures
- Indicators – shared beliefs and logics, isomorphism
- Legitimacy based on culture with shared beliefs and comprehensible behaviors

All three of these pillars of institutions construct organizational legitimacy in their own unique way. The reason for an emphasis on legitimacy is because this is crucial for understanding social enterprise performance. Social entrepreneurs who construct new social ventures that conform to socially accepted rules and legal norms are more likely to succeed because they are better able to access volunteer human resources and financial resources. This paper examines the multiple problems that social venture entrepreneurs face as they navigate the unknown spaces between normative non profit organizations and traditional business for profit organizations.

Regulative Pillar of Organizational Institutional Theory

This paper will focus on the regulative pillar of organizational institutional theory to explore how and why social entrepreneurs around the world are experimenting with cobbling together different legal organizational forms attempting to create organizations to provide
legitimacy to help more directly address the needs of mission-focused social value creating enterprises.

It is common for social entrepreneurs to establish two or three or four distinct legal organizations to support their social value creation plans. Selection of a legal form helps frame questions of ownership, capital structure, governing and control, and executive and operational management of an organization. Business for profit structures allow for freedom and flexibility, while a non profit organization is tax-exempt, has the ability to receive tax-deductible contributions or foundation funding, and benefits from perceptions of non profit trustworthiness. Social enterprise examples include a for-profit organization with a non profit complimentary organization, or a non profit with an earned income for-profit complimentary organization, or multiple combinations of these variations.

One example (2009 author interview) involves two medical doctors (MDs) from Cleveland who teach basic medical skills to village doctors in Central America. They have their non profit organization along with their for profit organization with four different websites about different educational and business aspects of their medical practice, training, and medical equipment. They might be more effective with one comprehensive organization that meets all of their diverse needs to provide medical care to poor people in rural villages.

When practical problems are examined with an organization theoretical lens focusing on the underlying resource and legitimacy needs of a social venture, it becomes more straightforward to discover what components of for-profit or non profit organizations are most needed. The country examples presented next show various solutions to the organizational form problem faced by numerous social entrepreneurs and their new ventures.

*Country Examples of Social Venture Legislative Innovations*
England, Wales, and Scotland – Social enterprises defined by the UK government consist of “businesses with primarily social objectives whose surpluses are principally reinvested for that purpose in the business or in the community…” The new organization form Community Interest Company (CIC) become law on July 1, 2005. Registering as a CIC requires a two-step process: (1) register under the Companies Act (1985) limited by guarantee or limited by shares and (2) apply for CIC status to the Regulator of Community Interest Companies. A CIC legal form must meet a community interest test, operate for public benefit, and does not have charitable status. The main innovation of the CIC form is that this organization form is asset locked exclusively for community benefits and thus assures that profits are reserved for social purposes and benefits.

Northern Ireland – The CIC form has been legal since April 6, 2007 following extension of the Companies (Audit, Investigations and Community Enterprise) Act (2004) and follows UK legal formats.

Ireland – NGOs are not required to benefit the public to be established, but NGOs must have a public benefit to become an established charity. The Designated Activity Company (DAC) will be the new legal form for the Republic of Ireland under the 2009 Charities Act. Charitable purpose is defined as including poverty prevention or relief, advancing education or religion, or any other community benefit. A DAC form is different from other types of limited companies because they will be able to designate a specific cause (not shareholders) as beneficiary of profits. Similar to the UK regulations, DACs are private companies limited by either (1) shares or (2) guarantees and also possessing capital shares.

Canada – Social venture proponents are working to create new legislation to create new hybrid organizational forms similar to the UK CIC. The Muttart Foundation reported in a 2006
survey that 85% of Canadians thought charities should be allowed earned income, as long as the charity goals were supported. Former Canadian Prime Minister Paul Martin is a strong supporter of new organizational forms that fit within Canada Revenue Agency (CRA) charitable giving regulations.

United States – The new low-profit limited liability company (L3C) legislation is designed to bridge the existing gap between for-profit and non-profit organizational legal forms (Reiser, 2009). L3C is clearly a hybrid-form combining the business limited liability company (LLC) with a stated focus on achieving social value and benefit. L3C is legally a for-profit legal form that must “significantly further the accomplishment of one or more charitable or educational purposes” and follows IRS regulations in order to receive program-related investments (PRIs) that qualify for charitable purpose tax treatment. As of October 2009, an L3C can be formed in Michigan, Vermont, Wyoming, Utah, Maine, Crow Indian Nation, Oglala Sioux Tribe, and effective January 1, 2010 in the state of Illinois.

Argentina – Civil society organizations have traditionally been based on cooperatives and other mutual benefit organization forms handed down from European immigrants who settled in Argentina (Janelle A. Kerlin, In Press). Political action is important and has an effect on recommendations for future legislation for new social venture organization forms. Argentine social enterprise organizations called regained companies are being created on the ruins of failed company organizational shells and reconstructed as worker social cooperative organizations.

Philippines – The many failures of government poverty solutions over the years have led citizens to create numerous organizational form solutions combining community initiatives and market-based legal forms. Current law requires that a NGO or NPO to be government accredited no part of income or assets may benefit any members or officers. Cooperative and religious
organizations are currently seeking new legal organization form legislation that will create laws that better reflect the ground reality of the social activities that they perform.

*Japan* – Social enterprise is a new concept in Japan that provides a business model for non profit organization earned income. Japanese discuss this topic with the name Non Profit and Co-operative Sector (Ishizuka, 2002). Social enterprise advocates have proposed legislation that may include variations of both the UK public-benefit test and the USA public support-test. Field experiments are currently underway comparing non-profit vs. privately owned long-term medical care hospitals and patient outcomes. In 2008 new laws were enacted for government committees (one national and 50 for prefectures) to determine if “Associations and Foundations of Public Interest” were planning on operating for the public interest.

**Conclusion and Recommendations for Future Research**

The paper concludes with research recommendations for future studies comparing different types of new global social venture organizational forms and their resulting outcomes of social venture human and financial resource acquisition, social legitimacy, and the creation of social value for individuals, communities, nations, and the planet. The country and state new legislative examples presented in this paper are quite recent and many other nations are in the process of writing, discussing, passing, and implementing new social benefit organization laws.

The concepts and research findings presented in this paper are preliminary and represent the beginning of a much larger global research project on new legislation around the globe.

Drayton, W. 2007b. The Monday Interview: William Drayton 'Social Entrepreneurship was an Oxymoron, Today it is Different', The Financial Express.

The effectiveness of entrepreneurship education:

a study on an intentions-based model towards behavior

Willem Hulsink & Andreas Rauch

Rotterdam School of Management Erasmus University, The Netherlands

Keywords: entrepreneurship, attitudes, subjective norm, perceived behavioral control, intentions, behavior, theory of planned behavior

Abstract

The growing attention for entrepreneurship education has resulted in a wide variety of articles about this topic and an ongoing debate about whether or not entrepreneurship can be learned, and if so how this can or should be done. We use a quasi experimental design to test the effectiveness of an entrepreneurship program, relying on theory of planned behavior. The findings suggest that students participating in the entrepreneurship course with an (auto)biography assignment, compared to students who followed a different non-entrepreneurship course, show an increase in the antecedents of intentions (attitude, perceived behavioral control, self-efficacy). Furthermore they have higher entrepreneurial intentions at the end of the program. Finally, these students do also pursue these intentions in their actual start-up behavior.

1 We thank Ernst-Jan Ottenhoff and Sarah Weber for their research help
Introduction

But whereas much of today’s discussion treats entrepreneurship as something slightly mysterious, whether gift, talent, inspiration, or ‘flash of genius,’ this book represents innovation and entrepreneurship as purposeful tasks that can be organized – are in need of being organized – and as systematic work (Drucker 1985: vii).

Entrepreneurship education has become a serious matter for university administrators, course developers, and researchers. The growing focus on entrepreneurial education has resulted in a wide variety of articles about this topic and an ongoing debate about whether or not entrepreneurship can be learned (Henry et al., 2005). However, there is ongoing debate in the entrepreneurship academy about whether or not entrepreneurship can be taught (Fiet, 2000). Additionally, while some studies indicated that entrepreneurship behavior can be taught (DeTienne & Chandler, 2004; Peterman & Kennedy, 2003), other studies found even negative effects of entrepreneurship education (Oosterbeek et al., 2010). Therefore, this study investigates the impact of entrepreneurship education on entrepreneurial behavior.

Our approach relies on theory of planned behavior (Ajzen, 1988, 1991) to explain how entrepreneurship education affects entrepreneurship behavior. Intention models focus on attitudes and their antecedents and have been proposed to better explain the entrepreneurial processes. As new organizations emerge over time, pre-organizational phenomena such as deciding to initiate an entrepreneurial career are both important and interesting (Bird, 1988). We may conclude that intentionality is typical of emerging organizations. Some researchers consider the intent to start a business venture as the result of an entrepreneurial intention (Bird, 1988; Krueger, 2000) while other researchers defined entrepreneurial intention as an objective to own a business (Kolvereid, 1996). Davidsson (1995) has developed an economic-psychological model of factors that
influence individuals’ entrepreneurial intentions. This model argued that the primary
determinant of entrepreneurial intentions is a person’s conviction that starting an own
business is a suitable career alternative for him or her. While background factors such as
education and vicarious experience have been recognized as influencing people’s
intentions regarding entrepreneurial activity, little is known how an entrepreneurial
teaching program, apart from general education, influences the attitudes and perceptions
of entrepreneurship (Davidsson, 1995). The student who starts with an entrepreneurial
teaching program have already passed this stage, but most of them are in the beginning of
opening themselves to entrepreneurial knowledge. So it would be plausible to assume
that the short-term objective of an entrepreneurial teaching program is to create a positive
attitude towards entrepreneurship. Instilling the belief that becoming an entrepreneur is a
realistic possibility is also a key objective. This perception of the difficulty of becoming
an entrepreneur, also known as perceived behavioral control, is something that can be
influenced by a teaching program. Intentions are assumed to be a motivation to certain
behavior and, moreover, intentions can be influenced. A central element in the process of
becoming an entrepreneur is each individual’s perception of himself (self-efficacy) and
his motivational structure.

Most studies in the research domain of entrepreneurial intentions actually did not
take into consideration what happens after entrepreneurial intentions are formed and the
longer-term impact of intentions on behavior. This study takes a deeper look at this
relationship between intentions and their effects, intending to gain novel insights of
whether these intentions identified previously actually lead to entrepreneurial behavior.
While theory of planned behavior has been used to explain the effectiveness of
entrepreneurship education, to our knowledge, only one study included entrepreneurial behavior into their design (Souitaris et al., 2007). However, this study did not find a significant relationship with entrepreneurial behavior. We think that this is partly due to a limited time frame used in this study, because the effect of intentions on behavior may evolve over time. Therefore, our approach uses a two years time lag to test the effectiveness of entrepreneurship education.

Finally, most studies evaluating the effectiveness of entrepreneurship education did not use a pre-test and post-test design, and also missed including a control group which means they suffer from several methodological limitations. This brings us to the focus of this paper: overcoming the methodological limitations of earlier entrepreneurship research and look at the relationship between an entrepreneurial teaching program, the intentions of students participating in it and their subsequent entrepreneurial behavior. Thus, our main research question reads: Do entrepreneurial intentions translate into entrepreneurial behavior? The significance of this study is whether these intentions actually lead to entrepreneurial behavior of the respondents, making it possible to more reliably determine the chance of ambitious would-be entrepreneurs actually starting their own business. It is important to know what drives a student’s decision to become self-employed and start for him/herself.

Theories and hypotheses

Entrepreneurial intentions are said to be the source of entrepreneurial behavior (Krueger et al., 2000). Intentions are said to stem from different sources. According to
Ajzen (1988), who established the theory of planned behavior, intentions consist of three elements. These are attitude toward entrepreneurship, social norms and perceived behavioral control and they lead as a whole to entrepreneurial intentions because each one of them focuses on a different important aspect of an intention. It is commonly argued that intentions help stimulate entrepreneurial behavior (i.e. Ajzen, 1991; Krueger et al., 2000. The model of Ajzen (1988) forms the basis of this research and assists in explicating the theory of planned behavior. Ajzen (1988) attempts to clarify the relationship among intentions and behavior. He argues that, in general, the stronger an individual’s intention to perform a specific behavior, the higher the likelihood of doing so in the future. According to Ajzen (1991), entrepreneurial intentions are shaped by three different factors which are attitudes, subjective norms and perceived behavioral control. In detail, Ajzen (1991, pp. 188) refers to attitudes as: ‘The degree to which a person has a favorable or unfavorable evaluation or appraisal of the behavior in question.’ Linking this to entrepreneurship, one of the independent variables is named ‘attitude toward behavior, in particular entrepreneurship’. This refers to the degree to which a person has a favorable or unfavorable evaluation or appraisal of the behavior in question (i.e. the opinion of an individual as to how he or she assesses key entrepreneurial acts such as seizing opportunities and considering new venture creation). The second factor, subjective norm, represents the perceived social pressures of others to perform or not to perform certain actions. This independent variable measures the extent to which an individual places an emphasis on the opinions of people close to him or her. As such it is a multiplication of perceived beliefs of important members in their reference group
(friends, family and others) and the degree to which someone feels (s)he will comply with them.

Lastly, perceived behavioral control reflects perceptions regarding behavior as personally controllable as well as notions relating to the ease or difficulty of initiating something (i.e. becoming an entrepreneur), including the influence of possible past experiences and expected difficulties that may arise. For example, perceived behavioral control could be an individual’s belief about the availability of resources and how well resources and opportunities can be exploited. Krueger et alia (2000) find strong support for Ajzen’s (1991) construct with regards to statistical outcomes. Also, Krueger and his associates (2000) argue that this intentions model is a very valuable predictor for entrepreneurial behavior, as especially attitudes, intentions and behavior are closely interrelated. Research on entrepreneurial intentions has often used students as a sample (e.g. Autio et al., 2001; Crant, 1996; Lüthje & Franke, 2003). Krueger et alia (2000) tested the TPB model and found that the model gave significant prediction of intentions. From a database of 185 independent studies published up to the end of 1997, TPB accounted for 27% and 39% of the variance in behavior and intentions, respectively (Armitage & Conner, 2001). At this point, we hypothesize that:

\[ H1: \text{It is expected that an individual's attitude towards the concept of entrepreneurship partly leads to forming entrepreneurial intentions.} \]

\[ H2: \text{It is expected that subjective norms partly lead to forming entrepreneurial intentions.} \]

\[ H3: \text{It is expected that perceived behavioral control partly leads to forming entrepreneurial intentions.} \]
Intention models are a good framework for looking at the influence of entrepreneurship education on entrepreneurial intentions. TPB is well tested and robust theoretical model for researching intentions. Davidsson (1995) argued that the TPB is a model with which the all pervading question within the entrepreneurship field of ‘how does a person become an entrepreneur’ can be answered. Therefore TPB is the theory of choice for most scholars researching entrepreneurial intentions. TPB states that actual behavior is a direct consequence from the intentions towards that behavior and argues that the more favorable the attitude and subjective norm with respect to behavior and the greater the perceived behavioral control, the stronger an individual’s intention to perform the behavior under consideration should be. Intentions, and more specifically, entrepreneurial intentions, are said to have different origins, according to today’s body of literature. However, with the help of Ajzen’s (1991) model of planned behavior it is possible to not only make the antecedents of entrepreneurial intentions clear, but also, that these antecedents can be modified and, thereby, affect the decision of starting up a business venture. Attitudes can be changed by changing the beliefs about the favorability of entrepreneurial behavior.

Entrepreneurship education, therefore, often stresses how rewarding entrepreneurial behavior is, explaining the merits of innovation and opportunity exploitations and decreases spurious beliefs about the downside of business venturing and failure. Perceived control can be changed by modifying beliefs about the availability of resources. This can be accomplished by providing knowledge about how to access resources, by increasing perceptions of self-efficacy, providing mastery experiences, and
dispelling spurious experiences of infeasibility. And that this is certainly affected by teaching e-ship. Therefore, we hypothesize that:

\[ H4: \text{Participation in the entrepreneurial teaching program will positively influence the student’s attitude towards an entrepreneurial career.} \]

\[ H5: \text{Participation in the entrepreneurial teaching program will positively influence the student’s perceived behavioral control.} \]

Not only are intentions expected to lead to behavior, but also the three variables from Ajzen’s (1991) model might have an influence on entrepreneurial behavior, possibly mediated by intentions. Since hypotheses 1, 2, 3 and subsequently 4 are all anticipated to hold causal relationships, a mediation by entrepreneurial intentions is not unlikely and therefore we will examine this as well. The above literature review makes identifying what actions are required in the start-up process relatively straightforward. Despite different scholars suggesting diverse levels of entrepreneurial behavior, some common ground is found among which is business planning, creating a legal entity, and providing and acquiring funding. With the help of the identified conditions, it is easier to draw the line between serious attempts to start a venture as opposed to individuals that simply consider starting a business. After depicting that intentions are a reliable predictor of behavior and explaining the steps that make entrepreneurial behavior, hypothesis 6 reads:

\[ H6: \text{It is expected that entrepreneurial intentions lead to entrepreneurial behavior.} \]
Consequently, hypotheses 7, 8 and 9 concerning a possible mediating relationship of intentions translate into:

\textit{H7: It is expected that attitude toward entrepreneurship leads to entrepreneurial behavior, with entrepreneurial intentions mediating.}

\textit{H8: It is expected that subjective norms lead to entrepreneurial behavior, with entrepreneurial intentions mediating.}

\textit{H9: It is expected that perceived behavioral control leads to entrepreneurial behavior, with entrepreneurial intentions mediating.}

\textit{Intermezzo: the subprogramme Fundamentals of entrepreneurship}

The two courses discussed here, Foundations of Entrepreneurship and Titans of venturing, make up the full-time Fundamentals subprogram taking two months of the one-year MSc BA/Entrepreneurship program at Rotterdam School of Management, Erasmus University (The Netherlands). In a two month block students become familiar with classic and contemporary debates in the field of entrepreneurship as an academic discipline. At the end of this core course they realize that it is a multidisciplinary field of study, which has been examined over time by various disciplines and which can be researched at various levels. The Foundations course addresses three main questions: (1) who becomes an entrepreneur, (2) how do entrepreneurs create new ventures, and (3) what contributes to and explains their entrepreneurial success. The approach taken in this course draws on the
contributions to the field by scholars in economics, psychology, and sociology (e.g. Schumpeter, Frese, Aldrich) and how these three disciplines have provided similar or different answers to the questions mentioned above. By confronting the different issues and items in the field of entrepreneurship from a range of disciplines and perspectives, students will be able to judge advances in theory development, analytical tools and relevance.

Alongside to this theoretical Foundations course, there is the ‘Titans in venturing’ course in which the students read a biography of an entrepreneur, analyze it and finally write a biography assignment. The objective of the Titans is to apply theory and concepts from the Foundations course to the life course of a selected more or less famous entrepreneur and learning from his motivations, networking skills and best practices. These theories and concepts originate from psychology, economics and sociology and entrepreneurs that have been chosen for the biography paper include Walt Disney, Donald Trump, Ralph Lauren, Jamie Oliver, Calvin Klein, and John de Mol. In order to allow the biography assignment as a learning project to be carried out successfully, a well-documented and balanced biography on a thriving entrepreneur and/or a dynamic firm is required (hence the title of this course: titans of venturing). After having checked its availability, students can effectively claim the (auto)biography of their ‘titan entrepreneur’ on the basis of first to come first to serve. In order to apply and integrate the insights from the disciplines and the field of multidisciplinary field of entrepreneurship, students are asked to write a paper on the life history of a thriving entrepreneur and/or a dynamic firm, as documented in their (auto)biographies. By doing the literature/biography paper students are actively encouraged to apply the concepts,
theories and tools from the three mother disciplines as discussed in the Foundations course, and link them to the particular evolution of the careers and life courses of entrepreneurs and the emergence and growth of new firms and industries. The Biography assignment will be concluded by a joint session of poster presentations by the various teams and a plenary information exchange where everyone provides the key information on their ‘Titan in venturing’ on posters hanging against the wall. This concluding event is also the deadline for submitting the final version of the Titans of Venturing paper.

In the September-October term of 2007, a total group of 101 students and 52 teams selected 52 titans of venturing, with their lifes and times covered in and by (auto)bigraphies. The evaluations of the course were reasonable positive, not clearly outstanding but just about average with scores between 3.6 and 4.0 on a five point scale. Some of the written comments observations and learning experiences: ‘It is a really interesting and funny way to integrate important learning points from for example the articles of Foundations and actually learn through someone else’s experiences’, and ‘An entertaining and creative way of learning about a successful entrepreneur and applying the taught literature to his life career. The course is open and gives you freedom, allows you to be creative.’

**Methodology**

*Design.* Our quasi experimental design consisted of two groups of Master students from the Erasmus University Rotterdam. The treatment group consisted of students of the Master program Entrepreneurship and New Business Venturing, the control group of
Supply Chain Management. Both groups participated in a pre-test at the beginning of the course and a post-test, which was administered at the end of the course. Finally, we measured start-up behavior one year after the course was completed. All independent variables were measured at the pre-test, pros-test and one year after the course was completed.

*Sample.* 96 Entrepreneurship students and 57 Supply Chain Management students participated in the pre-test of the study. The post – test was completed by 88 entrepreneurship students and 54 students from Supply Chain Management (experimental mortality 8,3 percent and 5,3 percent, respectively). Finally, the assessment of start up behavior was collected form 62 Entrepreneurship students and 12 students from the Supply Chain Management Master; the response rate was 69.3 percent and 22.2 percent, respectively.

*Measures*

*Intentions.* Entrepreneurial intentions were measured by the extent to which an individual seriously considers becoming an entrepreneur as a possibility to pursue. We used six items from Linan and Chen (2006). The scale was internally consistent (Cronbach’s α of .947).

*Attitude.* The attitude toward entrepreneurship is an independent variable and represents the notion of how an individual evaluates a possible behavior in terms of consequences (Ajzen, 1991). We measured attitude by five items from Kolvereid (1996). Cronbach’s α was .933.
**Subjective norm.** Subjective norms was measured by whether individuals intention to start a business are influenced by external social pressures, in this case friends, family members or people important to them. We used a six item scale from Kolvereid (1996); the Cronbach’s α was .809.

**Perceived behavioral control.** We assessed perceived behavioral control by the extent to which an individual rates a business opportunity as feasible and to what extent he or she can influence the resulting outcome. Specifically, we created questions with the help of examples made by Ajzen (2002) in his research, as no precise measurement scale for this item was available. The Cronbach’s α was .726.

**Entrepreneurial behavior.** Entrepreneurial behavior is the dependent variable in the conceptual model and questions from four different sources were combined. A list of 18 items has been established from (Carter, Gartner, & Reynolds, 1996; Gartner & Carter, 2003) and the Chamber of Commerce, of which Table 1 provides an overview. The items in Table 1 were asked as an entire set of questions to the respondents. They are dichotomous in nature and are therefore dummy variables. In the last column the alphas of the types of behavior are shown in the table as α if item deleted. In addition, we used 5 items from the Global Entrepreneurship Monitor (Reynolds et al., 2005). In order to obtain a single measure for entrepreneurial behavior, all items corresponding to this variable were z-standardized. After eliminating six items, Cronbach’s α amounted to .927. As a result, the remaining 17 items were added together and divided by 17.

Table 1: Questionnaire Items Entrepreneurial Behavior
Results

Notably, one year after the course, 39 respondents were involved in setting up a business. Table 2 displays the Pearson Correlation statistics for all variables.

Table 2: Intercorrelations of study variables

Hypotheses Testing

In order to test hypotheses 1, 2 and 3 stating that attitudes, perceived behavioral control and subjective norms are positively related to the intention to start a business, we looked at the lagged effects where we could hold prior intentions constant. The results are displayed in Table 3.

Table 3 shows that attitudes measured in the pre-test positively affected intentions in the post-test. However, attitudes did not predicted intentions one year after the course. Therefore, we found partial support for Hypothesis 1. Hypotheses 2 and 3 had to be rejected at all times in the longitudinal analysis. Concluding, perceived behavioral control showed no significance with intentions on either level of analysis. On the longitudinal level of research, only attitude appeared to be having a significant relationship with intentions. In other words, subjective norms and perceived behavioral control previously held do not influence later entrepreneurial intentions. An overall reason for this outcome
could be that this model in fact only holds for the same point of measurement and does not have any long-term effects. As for the insignificance in subjective norms, a cause could be that this is due to a cultural matter. The Dutch might not place a lot of importance on family’s and friend’s opinions. Concerning the other variables, further personal development or experience gained in the mean time might have caused the respondents to revise their answers. However, not only the independent variables could be the reason for the insignificant relationship, but also a change in entrepreneurial intentions over time could have occurred.

Hypotheses 4, and 5 stated that attitudes and perceived behavioral control were significantly increased by participating in entrepreneurship education. In order to test this hypothesis, we compared the means of the pre-test with the means of the post test separately for the experimental group (entrepreneurship students) and control group (supply chain management). The results are displayed in Table 4.

Table 4: Mean results pre- and post test.
Our results confirmed Hypothesis 4. The entrepreneurship students significantly increased their attitude towards entrepreneurship, while the supply change management students did not increase their attitude towards entrepreneurship. Moreover, this set of analyses supported Hypothesis 5. Perceived behavioral control was significantly increased for entrepreneurship students, while it was not increased for supply change management students.

Hypothesis 6 was concerned with the relationship among entrepreneurial intentions and behavior. A regression analysis was conducted in this case, measuring the influence from the results of the second measurement (t2) on the results of the third measurement (t3). By doing so, we could analyze a time lag in the effect on behavior at t3. Table 5 depicts the results of this analysis.

Table 5: Results The effect of intentions on behavior
Concerning the relationship between intentions (t2) and behavior (t3), while controlling for age and gender, the beta of .443 showed significance at \( p < .01 \), indicating that earlier intentions held by the respondents influenced their later entrepreneurial behavior positively. Thus, hypothesis 6 was supported.

Hypotheses 7, 8 and 9 stated that the relation of attitudes, subjective norms, and perceived behavioral control on behavior was mediated by intentions. For these three hypotheses, the mediator test by Baron and Kenny (Baron & Kenny, 1986) was employed. Table 6 displays the results for the test of Hypothesis 7.

Table 6: Intentions mediating the relationship between attitudes and performance.
From the results in Table 6 it showed that the first three steps of Baron and Kenny’s (1986) model are met. The effect of attitudes on behavior became insignificant when controlling for intentions (Step 3/4 of the regression analysis). Thus, in support for Hypothesis 7, the effect of attitudes in behavior was fully mediated by intentions. However, we had to reject Hypothesis 8 and Hypothesis 9, because both subjective norms and perceived behavioral support were not significantly related to entrepreneurial behavior (see Table 7 and Table 8).

Conclusion and discussion
The aim of this study was to test the effectiveness of entrepreneurship education relying on the theory of planned behavior. We were motivated to conduct this study because previous research did not successfully establish whether or not entrepreneurship education affects subsequent venturing activities. Using a quasi experimental design, our results indicated that entrepreneurship education increased attitudes and perceived behavioral control. Attitudes affect intentions and, thereby start-up behavior one year later. Thus, we conclude that. Ajzen’s (1991) theory of planned behavior appears to be a valid framework for predicting entrepreneurial behavior. There are several limitations to this research. To start with, the response rate at the third point of measurement is relatively small and not all data could be used for the longitudinal analysis. Although the sample size was acceptable, the results are less robust with a smaller number of respondents. Moreover, the analysis is only based on students, which all attend the same university. An effect of this could be biased responses because they possibly would like to give socially-desirable answers after having participated in an entrepreneurial teaching program. Due to that it is legitimate to question the generalizability of the measurement. Furthermore, by manipulating intentions for the second point of measurement, a possible bias in the respondents’ answers could exist. Despite the fact that the sample was somewhat selective because all targeted individuals received entrepreneurial training, this does not pose a problem because the analysis was also performed on a longitudinal basis. This balances out the effects of a possible bias.

The finding that would-be entrepreneurs are actually taking action within one year is remarkable. Most previous studies did either not address the link between intentions and behavior (e.g. Krueger et al., 2000) of found a non significant association between
intentions and behavior (Soitaris, et al., 2007). However, our study used a longer time lag because we assumed that the effect of intentions on behavior evolves over time. Using a larger time lag, our study indicate support to the assertion that entrepreneurship education affect entrepreneurial behavior. As Drucker (1985) years ago commented, entrepreneurship is something of a discipline, capable of being learned and being practiced effectively, and including the systematic actions and behavior of entrepreneurs: ‘Indeed, the events that explain why entrepreneurship becomes effective are probably not in themselves economic events. The causes are likely to lie in changes in values, perception, and attitude, changes perhaps in demographics, in institutions, perhaps changes in education as well (Drucker, 1985: 13).’

The effect of entrepreneurship education is mainly driven by attitudes. This means that entrepreneurship education needs to appeal to the emotion and passion of the entrepreneurial life course and subsequently increase the desire of students to perform venturing activities by themselves (Souitaris et al., 2007). For example, as experienced by the students investigating and learning from the career and best practices of entrepreneurs (as documented in the (auto)biography assignment), successful role models may inspire the new generation and increase the perception that enterprising is a rewarding activity. However, we did not find the expected effects of subjective norms and perceived behavioral control. These findings are not in line with Autio’s et al. (2001) research who found that perceived behavioral control has the strongest relationship with intentions. Possibly, individuals might not care about their friends’ and families’ opinions when it comes to behavior. Also, perceived behavioral control appears to be no predictor of behavior as mentioned earlier, which could be due to the fact that individuals do not base
their behavior on a self-assessment. Consequently, intentions are unable to mediate this non-existent association. Consequently, this part of Ajzen’s (1991) model is partially confirmed in its ability to reliably forecast entrepreneurial behavior, with especially attitude being the strongest predictor and to a certain extent subjective norms when attempting to forecast intentions and behavior.

Given our results, we believe that the antecedents of intentions relating to Ajzen’s (1991) theory of planned behavior have been validated sufficiently. However, attitudes and perceived behavioral control do not always predict intentions and, moreover, intentions do not always translated into behavior. Future research should focus on other sources of intentions and behavior. It is for example likely that moderators are present. For example, high opportunity costs may prevent some students high in perceived behavioral control to develop intentions to become an entrepreneur. The availability of resources and institutional forces may affect the relationship between intentions and entrepreneurial behavior. Thus, it is time to evaluate moderator factors that influence the entrepreneurial behavior. Another point to be considered for future research is that the internal relation between the three independent variables (attitude, subjective norm, perceived behavioral control) has not been empirically established. By doing so, one could possibly provide insights that help understand the journey of becoming an entrepreneur in more detail.

Entrepreneurial Integration of the Caribbean: A Comparative Study

Saidi Porta, MBA, PhD.c

The objective of this study is to research and compare the latest trends of the Entrepreneurial Climate on six Caribbean islands and analyze if Caribbean Entrepreneurial Integration could become a competitive advantage for entrepreneurs in the Caribbean Region. This research will be conducted using a Business Venture Approach and studied under two different views: from the perspective of economic theories on integration and from the perspective of entrepreneurship theories that explain how external environmental factors and culture impact the development of entrepreneurs. Results will contribute to expand the existing body knowledge in the development of opportunities and threats Caribbean entrepreneurs.
Toward the Scholarship of Teaching and Learning for Entrepreneurship (SoTLE)*

By Alex Bruton

The “learning perspective of entrepreneurship”, the “concept of entrepreneurial learning” and “models of how entrepreneurs learn” have received increasing attention in recent years because they are purported to provide a useful lens for studying entrepreneurial activity and the nature of entrepreneurship. This paper reports on initial work being carried out with the aim of advancing a theoretical framework that contributes to the conceptualization of scholarship in the entrepreneurial academy and provides a lens through which entrepreneurship scholars, curriculum designers, teachers and learners can view their work. Emerging theories of entrepreneurial learning are extended and complemented by concepts drawn from the fields of epistemology (theory of knowledge), the scholarship of teaching and learning (SoTL), entrepreneurial psychology, and entrepreneurship education. The overall result, a framework for the Scholarship of Teaching and Learning for Entrepreneurship (SoTLE), is advanced together with a detailed map of the SoTLE landscape in order to make clear the implications for educators, researchers and practitioners.

Introduction

Background

In his article debating the maturity and legitimacy of entrepreneurship education, Katz (2008) argues that in recent years there has been a convergence about what should be taught in a course in entrepreneurship or small business, that there has been a convergence in the

* The author acknowledges the support of the Mount Royal Teaching and Learning Scholars program and the Bissett School of Business.

Alex Bruton (PhD) is an Assistant Professor and Teaching and Learning Scholar at the Bissett School of Business at Mount Royal University. He has academic, industrial and entrepreneurial experience, including roles in engineering, in product management, as an inventor, as co-founder of an Innovation Department, as a business consultant and most recently as VP Business Development for a technology start-up. He is a passionate teacher, has spoken to audiences up to 500 in size on over 40 occasions in six countries, and has led the development of a renewed entrepreneurship curriculum for delivery to students across Mount Royal. His research interests include innovation and the scholarship of teaching and learning for entrepreneurship.

Alex Bruton, ICSB 2010
corresponding pedagogies, and that a significant level of standardization has taken place in entrepreneurship education. We agree with this. Using the convergence and standardization argument as evidence, he then concludes that the need for new product design in entrepreneurship education is low. We respectfully and quite strongly disagree with this. Rather, the work reported in this article is motivated by calls to action such as those made by Solomon et al. (2002), who said that “for entrepreneurship education to embrace the 21st century, professors must … expand their pedagogies to include new and innovative approaches to the teaching of entrepreneurship,” by Kuratko (2004) who argued that entrepreneurship “should begin to move into a leadership role” within the business school, and by Vesper (1999) who went even further by asking “…what might be different if we had started first with a school of entrepreneurship and then added a few courses for a concentration or major in middle management?”

While we have not had occasion (nor is there a desire) to create a school of entrepreneurship at Mount Royal University, we have just come through the process of completely re-designing our entrepreneurship curriculum. Our core offering has been made-over from a four-year applied degree with a fairly traditional small business focus to a cross-campus minor that delivers a creativity, innovation and entrepreneurship-based learning experience in an integrated fashion by phase of the new venture life cycle, and the intention is to offer a major to business students based on an augmented version of the same curriculum. While we kept our 14-year old award-winning curriculum on hand throughout the renewal process for reference and as a source of tried and true topic-level teaching innovations, we were fortunate to have the freedom to approach it as a completely greenfield project. This meant we were free not only to create new topics within existing courses, but to design entirely new courses and the program structure from scratch. We asked ourselves: what would the ideal undergraduate university program look like?
In doing this, we went back to first principles on many occasions in the fields of entrepreneurial learning, epistemology (theory of knowledge), the scholarship of teaching and learning (SoTL), entrepreneurial psychology, and entrepreneurship education. We believe the resulting curriculum has moved us into a leadership position within our business school and, based on the response from our students and members of our regional entrepreneurial ecosystem, we suggest that there is a strong need and opportunity for product design in entrepreneurship education today. And perhaps as importantly, we feel that our return-to-fundamentals approach has given us the tools and a perspective that can contribute to our ongoing renewal and the broader conversations taking place about the future of entrepreneurship education.

**Aims and Method**

This paper provides an introduction to and quick tour of the theoretically-informed work we are carrying out with the aims of:

1. Advancing a theoretical framework for the *Scholarship of Teaching and Learning for Entrepreneurship (SoTLE)* that we propose contributes to the conceptualization of scholarship in the entrepreneurial academy today and provides a lens through which entrepreneurship and innovation scholars, curriculum designers, teachers and learners can view their work; and

2. Providing a detailed *map of the SoTLE landscape* that we suggest contains the essential elements required to shape the design and intention of new entrepreneurship and innovation curricula – at the activity, topic and or program levels, and highlights the various domains of scholarly inquiry important to the SoTLE today.
Overall, we hope that this work-in-progress receives constructive feedback, influences dialogue about the process and roles of teaching and learning for entrepreneurship and innovation, and provides guidance for educators, researchers and practitioners. As described in the body of the paper, our approach is to extend and complement emerging theories of entrepreneurial learning using theoretical concepts drawn from the fields of epistemology (theory of knowledge), entrepreneurial psychology, the scholarship of teaching and learning (SoTL), and entrepreneurship education.

**Background**

This section sets the stage for the work that follows by introducing the state of play in higher education, entrepreneurship education and entrepreneurial learning. We do not intend to provide a complete review of the literature in each case but, rather, we use recent literature to describe the essential motivations for and elements upon which the paper builds.

**Higher Education**

Calls are being made around the world for new approaches to education (Owen et al. 2006; Guntram 2007) on the premise that we are part of an information society characterized by: technology-savvy students who learn more by absorption and experience than by reading a training manual or attending a course (Brown 1999); a shift in the focus of creativity from generating original content to the timely rip-mix-burn reshaping of existing content (Ito 2007); increasing requirements for interdisciplinary work carried out by teams across functional and institutional boundaries (Guntram 2007); new ways of perceiving and organizing knowledge in society (Weinberger 2005) and in the educational sector (Cunningham and Duffy 2000); and new forms of teacher and learner interaction enabled by innovative technologies and approaches to copyright (Dillon and Bacon 2006). And it is frequently argued that Web 2.0 technologies are
causing a disruption in higher education much like those that took place or are taking place in the music, newspaper, book and television industries (Christensen, Johnson and Horn 2008; Tapscott and Williams 2010). In order to survive in the networked, global economy of the future, universities are being told to embrace collaborative learning and collaborative knowledge production (Tapscott and Williams 2010) and teachers are being encouraged to shift their practices from the traditional teacher-centered transfer of subject-area-focused knowledge to the development of resources and practices that teach students the skills required to learn, collaborate and build knowledge on their own (Owen et al. 2006; Guntram 2007).

**Entrepreneurship Education**

We have already mentioned that the field of entrepreneurship is debating its maturity and seeking its own legitimacy (Katz 2008) and trying to chart its path forward (Vesper 1999; Solomon et al. 2002; Kuratko 2004). Meanwhile, many researchers, such as Kuratko (2004), Alberti, Sciascia and Poli (2004) and Pittaway and Cope (2007), are seeking to better understand and advance the roles of entrepreneurship education. We suggest that there is no discipline in which the shifts described above are more relevant at this point in time than in entrepreneurship education. And, as the calls for change are being made, debate about and research into how to best teach entrepreneurship continue to be wide-reaching and extensive (Alberti, Sciascia and Poli 2004; Pittaway and Cope 2007). There are questions about whether the business school is the best place to teach entrepreneurship (Gibb 2002; Kirby 2004) and about the appropriateness of traditional approaches to learning how to conceive of and start successful new ventures. An example of the latter point is that despite the ubiquity of the business planning process in entrepreneurship education (Honig 2004) and typically high levels of excitement about its use as a teaching method (Roldan et al. 2005), little evidence exists that the business planning process
helps student entrepreneurs learn (Honig 2004) (even if it might have other benefits in a new venture setting as suggested by Delmar and Shane (2003) and others). We also note the recent push being made to better understand how to measure the outcomes of entrepreneurship education. See Fayolle, Gailly and Lassas-Clerc (2006), Morris (2010), DeNoble and Singh (2010) for examples.

**The Roles of Entrepreneurship Education and Research**

A lot has been said about how entrepreneurship drives economic growth and creates value in society (Brock and Evans 1989; Acs 1992; Carree and Thurik 2002), and about the role of entrepreneurship education in encouraging and fostering entrepreneurship and innovation (Solomon et al. 2002; Kuratko 2004; Alberti, Sciascia and Poli 2004). Alberti, Sciascia and Poli (2004) present the causal diagram shown in Figure 1 that illustrates the generally accepted causal relationship between entrepreneurship education, entrepreneurial activity and benefits to individuals, firms, economy and society. It also shows the mediating role that entrepreneurship research is understood to play in the relationship between entrepreneurship education and entrepreneurial activity.

![Figure 1: The Relationship between Entrepreneurship Education, Entrepreneurial Activity and Entrepreneurship Research (Alberti, Sciascia and Poli 2004)](image)

**Entrepreneurial Learning as a Lens for Studying Entrepreneurial Activity**

The *learning perspective of entrepreneurship*, the *concept of entrepreneurial learning* and *models of how entrepreneurs learn* have been receiving increasing attention in recent years.
because they are purported to provide a useful a lens for studying entrepreneurial activity and the nature of entrepreneurship (e.g. Cope 2005; Harrison and Leitch 2005; Holcomb et al. 2009). This is perspective in contrast to other dominant theoretical perspectives of entrepreneurship, including the so-called functional, personality, and behavioural perspectives reviewed in Cope (2005). Existing definitions of the concept of entrepreneurial learning tell us that it involves acquiring, assimilating and organizing newly formed knowledge (e.g. Gartner 1988; Minniti and Bygrave 2001; Cope 2005; Holcomb et al. 2009) in relation to existing stocks of knowledge, skills and experience (Reuber and Fischer 1999; Harvey and Evans 1995) in a process that is cumulative (Minniti and Bygrave 2001) and recursive (Alberti, Sciascia and Poli 2004; Holcomb et al. 2009), and which involves both experiential and vicarious modes of learning (Holcomb et al. 2009). We have found the learning perspective to be very useful in understanding and interpreting entrepreneurial activity in the context of our curriculum renewal work. As a starting point for this paper, we share to the Holcomb et al. (2009) architecture shown in Figure 2. As shown, this model presents experiential learning (through direct experience) and vicarious learning (through modeling others’ behaviours and actions) as two different learning contexts, and highlights the effects of heuristics within those contexts and across the learning process. This model and their definition of entrepreneurial learning implies a process by which people acquire, assimilate and organize new knowledge for the discovery and exploitation of opportunities.
**Results: Toward the Scholarship of Teaching and Learning for Entrepreneurship**

The results of our work are reported here in four steps that build on what we have just reviewed and on each other. The first result adds to the entrepreneurship literature a broader perspective on the concept of knowledge as it applies to entrepreneurial learning (by borrowing from the field of epistemology to consider explicitly the types of knowledge that can be gained and the ways in which knowledge comes about through the learning process). The second proposes a model for thinking about entrepreneurial learning and its outcomes from the perspective of the individual entrepreneur (by drawing from theories in entrepreneurial psychology and educational research). The third briefly introduces to the entrepreneurship literature the concept of the scholarship of teaching and learning (SoTL). And the fourth uses the SoTL concept together with the earlier contributions to advance a modified version of the Holcomb et al. (2009) architecture of entrepreneurial learning and, in turn, advance the notion of the SoTL for entrepreneurship (SoTLE).
The Knowledge Creation Metaphor and Types of Knowledge for Entrepreneurial Learning

Our review of the entrepreneurship literature (not reported here) seems to indicate that almost all previous treatments of entrepreneurial learning are based on a knowledge-acquisition metaphor of learning (or they are not explicit in how they might be based on something other than the acquisition metaphor). In other words, knowledge is assumed to be acquired or accumulated through the learning process. Given the nature of entrepreneurship and its importance in today’s knowledge-based economy and society, we propose that models of entrepreneurial learning should be extended to also view it as a process of participation in shared learning activities and, importantly, as a process of knowledge creation for innovation. The first contribution of this paper comes about by introducing to the entrepreneurship literature a multiple-metaphors approach to how the process of entrepreneurial learning is understood. The emerging epistemological approach in Figure 3 (Paavola and Hakkarainen 2005) presents three different ways in which knowledge comes about and can be understood within human learning and cognition, an important one of which for entrepreneurship is the so-called knowledge-creation metaphor. Through the knowledge-creation metaphor, learners are understood to learn by developing collaborative shared objects and artifacts, and the learning process can be examined in terms of creating social structures and collaborative processes that support knowledge advancement and innovation (Paavola and Hakkarainen 2005). As we will discuss later, it is important to be aware of which metaphor(s) of learning apply when considering an entrepreneurial learning context and to be deliberate about them when designing entrepreneurship curricula.
Next we consider the different kinds of knowledge that can result from a learning process, as described by Biggs (2003). These are shown in Figure 4 and include declarative knowledge (learning about something), procedural knowledge (the skills and steps for how to do something), conditional knowledge (learning when, where and why to apply the previous categories of knowledge) and functioning knowledge (the ready-to-apply knowledge gained through experience).

![Diagram of relationships between different kinds of knowledge](image_url)

**Figure 4: Relationships between the Different Kinds of Knowledge (after Biggs 2003)**
Earlier, in the context of Figure 1, we referred to the role that entrepreneurship education is often understood to have in creating value in our economy and society: education should generate more and better entrepreneurs (Ronstadt 1985) and this should increase the chances of entrepreneurial success (Kirby 2004). However, as Alberti, Sciascia and Poli (2004) and others point out (McMullen, Chrisman and Vesper 2001; Storey 1994), very few studies have actually proven that these commonly held beliefs hold true. And we are not aware of any work done yet to formally establish the impact of the broader entrepreneurial learning construct (as distinct from formal entrepreneurship education) on these outcomes. In order to understand why such evidence may not exist and to provide insight into our own entrepreneurship curriculum renewal process, we drew from the field of entrepreneurial psychology to develop what we call a 10-Arrow Model of the Individual’s Entrepreneurial Learning Context in Figure 5. Directly analogous to the model developed in Rosenthal (1981) and described in Rosenthal (1994), the intention of the 10-Arrow Model is to provide clarity for the study of a mediating variable. In our case the mediating variable of interest is entrepreneurial learning (although we also wish to clarify the role of formal entrepreneurship education). In a way exactly analogous to the work of Rosenthal (1981), we posit that 10 links exist between five groups of variables: A) distal independent variables that represent the stable attributes of the entrepreneur, including his or her educational background; B) proximal independent variables that represent his or her situationally and domain-specific attributes; C) mediating variables, including entrepreneurial learning and many person and nonperson variables; D) proximal dependent outcomes, including proximal learning outcomes; and E) distal outcomes, including distal learning outcomes. In postulating this model we considered a spectrum of the literature on predictors, determinants and outcomes of entrepreneurial success, including for example Robinson et al. (1991), Baum and Locke.
(2004), Baum et al. (2007), Mitchell et al. (2007), and Ahmad and Hoffman (2008). Recognizing that this model has not yet been validated, we propose that it is useful for several reasons:

1. It appears to more completely represent the relationship between entrepreneurial activity, entrepreneurship education, and entrepreneurial learning than does Figure 1;

2. It makes a clearer case than Figure 1 for why it is so difficult to establish and quantify the role of entrepreneurial learning (it is only one of many mediating variables in a complex system of relationships between many independent and dependent variables) – designing an experiment to isolate just the mediating effect of entrepreneurial learning is difficult;

3. It underscores that there is a difference between proximal and distal outcomes, and between learning outcomes and other types of outcomes for entrepreneurial success, as discussed in Noel and Latham (2006);

4. It shows that, nominally, the learner’s formal education is a distal independent variable to entrepreneurial success;

5. As described in Rosenthal (1994), the 10 arrows represent the types of relationships that can be examined in research about the mediating variable – of most interest to the curriculum designer might be the B-C and C-D relationships, that is the inputs and outputs closest in time to the learning process; and

6. It puts the spotlight on the relationship between entrepreneurial learning, proximal learning outcomes and distal outcomes, as discussed next.
Figure 5: A 10-Arrow Model of the Individual’s Entrepreneurial Learning Context

In the context of our renewal project, the last point above gave rise to the causal relationship shown in Figure 6 which is intended to represent the domain of the entrepreneurship teacher and curriculum designer. It includes the teaching process and shows its relationship to entrepreneurial learning and to the corresponding proximal learning outcomes. Comparing Figure 6 to the fuller context of Figure 5, we found it somewhat daunting that as teachers the only control we have is over the teaching inputs and we can typically only measure the teaching outcomes and the proximal learning outcomes. We do not control any of the other dependent variables shown in A and B in Figure 5, and we have to make considerable efforts to measure the
other independent variables shown in D and E, if they can be measured at all. On the other hand, we were encouraged by the discourse taking place in the literature on the importance of the learning perspective of entrepreneurship and by the important role the learning outcomes play among the other types of outcomes (Noel and Latham 2006). Together, the 10-Arrow Model of the Individual’s Entrepreneurial Learning Context in Figure 5 and the teaching and learning relationship in Figure 6 constitute the third contribution of this paper.

![Diagram of the 10-Arrow Model](image)

**Figure 6: Relationships in the Teacher’s Domain**

**The Scholarship of Teaching and Learning**

While we feel that the 10-Arrow Model of the Individual’s Entrepreneurial Learning Context in Figure 5 represents the relationship between entrepreneurial learning, education and activity more realistically than Figure 1, Figure 5 does not define the relationship of these constructs with entrepreneurship research. Doing this is the fourth contribution of this paper. Based on the seminal work of Boyer (1990) and interpreted here for entrepreneurship in much the same way as Atkinson (2001) interpreted it for sociology (see Figure 7 for example), we bring into the spotlight a concept known as the scholarship of teaching and learning (SoTL).

In his well known report entitled *Scholarship Reconsidered: Priorities of the Professoriate*, Boyer (1990) introduced the notion of four conceptualizations of scholarship: discovery,
application, integration and teaching. The scholarship of discovery is what we usually think of when we talk about research and reflects the excitement of a new idea, the exhilaration of a new insight, and the search for knowledge for the joy of knowing (Boyer 1990). The scholarship of integration is work that compiles, interprets and can generate new insights from original research and offers an analytical and integrating perspective on other work (Boyer 1990). The scholarship of application is applied research that is also “engaged” through a dynamic process through which theory and practice interact, and it implies applying what we know in a process that leads to discovering new knowledge and contributing to our existing knowledge base (Boyer 1990). And as Atkinson (2001) proposes, we choose to view the scholarship of teaching and learning as the application of the other scholarships to the discipline of entrepreneurship. Discussion of the four domains is not without precedent in entrepreneurship. For example, Ireland (2009) presented Boyer’s four concepts of scholarship as being relevant to research in business. He also suggested that the Academy of Management’s four pillar publications fit the framework as follows: The Academy of Management Journal publishes scholarly work in the discovery category, The Academy of Management Review publishes work in the integration category, The Academy of Management Perspectives publishes work in the application category, and The Academy of Management Learning and Education publishes work in the scholarship of teaching category.
It is our intention to present the SoTL as an invitation to entrepreneurship educators to revisit their perspectives on teaching and research, and as an opportunity for the broader re-conceptualization of scholarship within the entrepreneurial academy. Specifically, for example, SoTL has the following characteristics:

- **On the domain of our work as scholars:** The SoTL practitioner is at once a scholar of his or her own discipline and a scholar of learning and teaching within that discipline (O’Brien 2008);
- **On the focus of our work:** “Basic to understanding of the scholarship of teaching is that the focus is always on the student – not the professor, not even the discipline…. The professor … is [only] the vehicle to student understanding.” (Atkinson 2001);
- **On the goal of our work:** “The ‘northern star’ of SoTL inquiry is the enablement of learning. This should not be seen as a narrow prescription, but rather an overarching intention that guides thinking and practice.” (O’Brien 2008); and

![Figure 7: Domains of Scholarship](image-url)
• *On the teaching-research tension:* Rather than let teaching and research compete for our attention, a SoTL perspective brings into view the close and mutually informative nature of the teaching-research relationship (Barnett 2005).

**A Framework for the Scholarship of Teaching and Learning for Entrepreneurship**

At this point, we have all the tools in place to propose the framework for the Scholarship of Teaching and Learning for Entrepreneurship (SoTLE). To do this we modify the Holcomb et al. (2009) architecture of entrepreneurial learning (Figure 2) by incorporating the results presented so far in this paper. As others have argued for the importance of applying learning and knowledge concepts to entrepreneurship (Harrison and Leitch 2005), we are encouraging adoption of an entrepreneurial learning perspective together with a multiple metaphors approach to learning (knowledge acquisition, knowledge participation and or knowledge creation), separation of outcomes along the proximal-distal continuum, and, where appropriate, a shift away from the research vs. scholarly teaching tension in favour of the scholarship of teaching and learning. The result is shown in Figure 8.

Specifically, we have borrowed from the Holcomb et al. (2009) model the treatment of experiential learning and vicarious learning as two different entrepreneurial learning contexts, and we continue to highlight the effects of heuristics across the learning process. To their concept of entrepreneurial learning as the acquisition, assimilation and organization of new knowledge, we suggest addition of a multiple metaphors viewpoint, thereby suggesting that entrepreneurial learning be seen as a process made up (differently in every instance) by some combination of *acquiring* new knowledge, *participating* in shared learning activities and, importantly, collaboratively *creating* mediating conceptual artifacts, for conscious knowledge advancement, discovery and innovation. Assimilation of that knowledge using heuristics and its
organization through linking to pre-existing structures are still assumed to occur as described in Holcomb et al. (2009). We have also added to the model the relationship between scholarly teaching and the learning processes (as discussed in the context of Figure 6) and the notion of articulating outcomes of the learning process along a proximal-distal continuum (as discussed in the context of Figure 5 and Figure 6). Importantly, we also suggest that the scholarship of teaching and learning (as discussed in the last section) has a place in the learner’s environmental context such that it mediates the relationship between outcomes of the process and scholarly teaching. In the next section will discuss the nature of the role of the entrepreneurial scholar given this relationship.

We propose that the framework for the SoTLE in Figure 8 provides an alternative to Figure 1 for how entrepreneurial scholars, teachers and curriculum designers view their work and roles within the entrepreneurial process. And we close this section by offering the following definition of the SoTLE: a rigorous inquiry-driven lens through which students, experienced entrepreneurs and scholars work together to understand, improve and enable learning for entrepreneurship so that our students – whether they are young or old, nascent or experienced – are best equipped to innovate in today's economy and society.

**Discussion and Implications**

It is one thing to talk about a shift in thinking, as we have done above, and it is another to understand what it means and how to act on it. In this section we try to bridge this gap by sharing an understanding of the SoTL and by introducing a map of the SoTLE landscape that is intended as a guide to the implications for scholars, teachers and curriculum developers.
Understanding the SoTL: The Teaching Hospital Analogy

Lee Shulman is Past-President of the Carnegie Foundation for the Advancement of Teaching, a pioneering institution in the SoTL field. In an article called “Inventing the Future” (Shulman 2000), he drew analogy between the SoTL concept and the work he saw being carried out in teaching hospitals. We share it briefly here in order to impart insight into how the SoTLE can be perceived as different from teaching, research on entrepreneurship education and research on entrepreneurship. Shulman’s analogy was based on his observation that medical faculty members not only engaged in scholarly healing in their day-to-day work, but also contributed...
wherever they could to what he called a scholarship of healing, for example, by reading the literature voraciously as needed to help their patients, carefully documenting their patients’ diagnoses and treatment plans, conducting clinical research and sharing the results for peer review and feedback. In his observation, they did not seek to publish as a first priority or as much as was possible; rather, Shulman spoke of the “moral and pragmatic responsibility” medical faculty had to “monitoring their clinical work and doing whatever could be done to improve its impact.”

It is our vision that rather than just being teachers informed by the entrepreneurship-related scholarship we do (even if that scholarship is focused in the area traditionally referred to as entrepreneurship education), we need to move deliberately to become a more integral part of our regional entrepreneurial ecosystems. At the 2009 Experiential Classroom X in Tulsa Oklahoma – seen by many to be one of the gatherings of leading entrepreneurship teachers worldwide – it was said by one of the pioneers of entrepreneurship education research quoted earlier in this paper that an overwhelming majority of the literature in the field of entrepreneurship is not even read by practicing entrepreneurs. Especially if this is true, then entrepreneurship scholars should aspire to their version of a teaching hospital. This would mean being engaged not only in the processes of scholarly teaching and entrepreneurial learning in our own day-to-day work, but also contributing wherever we can to a scholarship of teaching and learning for entrepreneurship in order to improve the impact of entrepreneurial learning for individual practicing entrepreneurs. It is likely that most of us would agree to the important role of teaching hospitals both for enabling the life-long learning of residents and doctors, and for keeping the scholarship that takes place extremely focused on healing patients. In the same way, teachers of entrepreneurship would benefit from this sort of on the ground experience and we propose that
our scholarship would benefit being focused on doing whatever can be done to improve entrepreneurial learning. Another way to put all of this is that, like medical faculty, we need to make sure we are an indispensible mediating variable among all of those listed in part C of Figure 5.

Before moving on, we wish to be clear that we do not mean to suggest that today’s entrepreneurship faculty seek only to publish as much as possible, that they do not already do some of these things, or that their research is not relevant to individuals, firms, economies or society; despite the comment referred to above, we have no data-driven evidence that supports these kinds of conclusions. Rather, we seek to bring forward the SoTL concept at a time when, as we have already said, the field of entrepreneurship is debating and seeking its own legitimacy and path forward, and when it is being suggested that there is little need for product design in entrepreneurship education. It is our hope that this adds to the conversation by sharing a perspective and encouraging entrepreneurship faculty to serve entrepreneurial learners first and foremost by enabling their learning experience, just as medical faculty serve their patients first by enabling their healing. And then by contributing wherever possible to a collective scholarship of teaching and learning for entrepreneurship based on what takes place in our classrooms and at their interface with our communities and regional ecosystems.

**A Map of the SoTLE Landscape**

Gale (2008) tells us that SoTL inquiries primarily seek “to understand and improve student learning in specific curricular contexts.” Because this speaks to the importance of getting the curricular context right and because designing the curriculum is where the rubber hits the road for entrepreneurship scholars, the final contribution of this paper is the map of the SoTLE landscape shown in Figure 9. The notion of such a map for orienting those new to the SoTL is
borrowed from O’Brien (2008), and parts of the structure were presented in Alberti, Sciascia and Poli (2004) as outstanding issues in entrepreneurship education. We have combined the work of those authors and added to it the elements required for undertaking SoTL activities in an entrepreneurial context. As such, Figure 9 contains the essential elements that shape the design and intention of an entrepreneurial curriculum, and highlights the domains of research and scholarly inquiry important to the SoTLE today. It can also be used as a general tool for analyzing, designing or describing curricula at the program, course and topic levels.

In the following we share selected implications for curriculum design, and teaching and learning. We do not describe every section of the map in detail. Rather, we use it to highlight selected implications of the SoTLE concept for the scholar, curriculum designer, teacher and learner that we have found to be most important throughout our own renewal process to date. More detailed examples can be found of its application at the course level in Bruton (2010) and its application at the program level in Bruton, Kenny and Jensen (2010).

The Learning Objectives Need to be Right, Right Up Front. The question of defining the desired learning outcomes is shown in the map in Figure 9c. In the context of Figure 5 and Figure 6 we discussed the important notion of a proximal-distal continuum of outcomes and the relationship between teaching, entrepreneurial learning, proximal learning outcomes and distal outcomes. We think of proximal outcomes as those that the teacher and learner have some direct control over and ability to measure, such as measures of student performance, measures of student learning and measures of program performance. And we think of distal outcomes as being more difficult to control and measure because they are typically so distant in time and only partially controllable through the intermediary of the proximal variables. It is important that the learning objectives (desired outcomes) be identified, articulated and agreed-upon early, and
revised often throughout the design process. For us this usually means first looking at Figure 5 and deciding which of the proximal outcomes we would target; that is, which of the C-D relationships we would focus on. This includes trying to identify which proximal outcomes mediated the distal outcomes we thought were most important. Otherwise we rarely put more than a little effort into directly targeting the distal outcomes.

Figure 9: Map of the SoTLE Landscape (adapted from O’Brien 2008 and Alberti et al. 2004)
What Will Be Learned is Not Just About Content. The question of what will be learned is shown in the map in Figure 9d. As discussed in O’Brien (2008), it is important that one’s answer to this is not just limited to defining content, and we suggest that it is better if content is defined last in favour of first considering the core constructs at hand, the fundamental elements being imparted and the types of knowledge to be gained by to the students.

Examples of core constructs include the strategic entrepreneurship construct defined by Ireland, Hitt and Sirmon (2003), the entrepreneurial business model framework in Morris, Schindehutte and Allen (2005), the definition of value innovation in Chan and Mauborgne (2005), the network construct reviewed in O’Donnell et al. (2001) and the entrepreneurial orientation construct clarified in Lumpkin and Dess (1996). There are many other examples, some of which have been well validated and others which have been proposed based on theory and await validation. (In fact, many of the variables in Figure 5 are common entrepreneurial constructs in their own right.) For any curricular context, there is almost always at least one underlying construct that defines the context and parameters of the learning, and the implication of a SoTLE approach to curriculum design is that the construct(s) should be defined and articulated as soon as possible in the process. Of course teachers should clearly understand these, and we have found success in also making them transparent to our students.

Fundamental elements is a term used to refer to the three broad ways of answering the “what will be learned?” question proposed by O’Brien (2008). Speaking first about ways of thinking and practice, she points out that it is generally accepted “across the academy that knowledge is itself a construction of particular social and cultural communities (Berger and Luckmann 1967) and that all such communities orient to the specific and shared aims, activities and ways of achieving them that comprise and make distinctive that community (Wenger 1998).” The
community of entrepreneurs that our students join before and after graduation is most certainly no exception to this. The implication is that one should try to articulate and build into the curriculum the relevant ways of thinking and practice common to successful entrepreneurs. Examples might include: thinking about challenges as opportunities to create value; seeing oneself as an agent of change; accepting and even yearning for criticism; tolerating ambiguity; and being open to taking risk. Next, according to O’Brien (2008), threshold concepts are concepts that: represent fundamental ways of thinking and knowledge within the field; are transformative, in that learning about them changes the way students think about the phenomena or area of application; and once understood open up a deeper level of thinking that in turn affords access to other important concepts within the field. Examples of threshold concepts in entrepreneurial learning might include: that a group is different from a team; that having “skin in the game” is usually a condition for greater success; that bootstrapping is an option; and that in the eyes of an investor one’s experience and passion can be more valuable than one’s venture idea. Also according to O’Brien (2008), troublesome knowledge is a kind of transformative knowledge that “brings into view aspects of troublesomeness that are less about difficult concepts and more to do with the challenges inherent within a change to one’s inner landscape, perspective and worldview (O’Brien 2008; Perkins 2006).” In entrepreneurial learning, threshold concepts and troublesome knowledge seem to have been addressed in the context of learning from ‘critical events’ that cause one to question previously taken-for-granted beliefs and assumptions (Deakins and Freel 1998; Cope and Watts 2000; Cope 2003), and to reframe one’s understanding to create a shift in mindset (Applebaum and Goransson 1997). Occasions where students might gain troublesome knowledge include: the breakup of an entrepreneurial team; seeing a good idea receive support because it was pitched more convincingly than a great idea;
recognizing and being tempted by the perceived gains that would come from misrepresenting their work; and receiving conflicting advice from two equally accomplished and well-respected entrepreneurs. Because of its importance, the implication for a SoTLE initiative is that room be made for this type of learning in at least two ways. First is through the nature of the curriculum design itself. Second, as Cope (2003) suggests, is through building opportunities for critical self-reflection into the learning process in order to encourage this sort of higher level of learning and capture it when it occurs. This implies making it transparent to the teacher and the learner.

We discussed the types of knowledge in detail in the context of Figure 4 and will not say much more here other than to suggest that it helps in the design process to recognize the highest level of knowledge required by your learning objectives, constructs and fundamental elements. As we will describe shortly, the types of knowledge need to align with the rest of the design.

Finally, because teachers are often quick to jump to content definition, we reiterate that the SoTLE approach requires leaving content definition until after the constructs, fundamental elements and types of knowledge have been addressed. One way to think about answering the “What will be learned?” question is that of deciding which of the B-C relationships in Figure 5 will be learned, and which of the other mediating variables in C will be targeted. Clearly, it is guesswork to select content without having made those decisions first.

Constructive Alignment is Critical. As described in Biggs (2003), constructive alignment means that the learning activities, the assessment methods, and the learning objectives in your curricular design are all consistent with and supportive of each other. Constructive alignment is often a challenge in entrepreneurship education where it is not at all unheard of to find complete misalignment. For example: a teacher might be found lecturing on business planning (the learning activity) and requiring the students to deliver a business plan (to be assessed), all with
the hope that the students will be able to start their own businesses (the actual learning objective). In our experience, the type of authentic curricular design required for a SoTLE approach implies the need for a broader concept of constructive alignment between the shaded elements of the map. In other words, what will be learned (Figure 9d) needs to align with how you choose to enable the learning (Figure 9e), with your desired outcomes (Figure 9c), and with how you plan to assess (Figure 9f). See our work on the Venture Design Studio (Bruton 2010) for an in-depth example of this kind of broad alignment in a non-traditional design.

As a brief example of the importance of constructive alignment between the elements in Figure 9d and Figure 9e, we have found that curricular designs based on the knowledge creation metaphor for how entrepreneurs learn (recall the metaphors of learning in Figure 3) seem better suited for meeting their requirements for gaining conditional knowledge (recall Figure 4) and especially functioning knowledge (the ready-to-apply knowledge gained through experience). Similarly, it is not surprising that designs based on a knowledge acquisition and participation metaphors seem better suited for gaining declarative knowledge (learning about something) and procedural knowledge (the skills and steps for how to do something).

**Summary and Concluding Thoughts**

We have introduced a framework for the Scholarship of Teaching and Learning for Entrepreneurship (SoTLE) that extends existing models of entrepreneurial learning with the aim of contributing to the conceptualization of scholarship in the entrepreneurial academy and providing a new lens through which entrepreneurship scholars, curriculum designers, teachers and learners can view their work. We propose that this perspective can help entrepreneurship programs lead the way at their universities in embracing collaborative learning and collaborative knowledge production, and help entrepreneurship scholars shift their practices even further away.
from the traditional teacher-centered transfer of subject-area-focused knowledge toward the development of resources and practices that teach students the skills required to learn, collaborate and build knowledge on their own.

We have also provided a detailed map of the SoTLE landscape that contains the essential elements required to shape the design and intention of new entrepreneurship and innovation curricula, and highlights the various domains of scholarly inquiry important to the SoTLE today. Based on our experience renewing our curriculum to date, we propose that this is an attractive way to approach the design and ongoing improvement of curricula that aim to provide students with authentic entrepreneurial learning experiences and the opportunity to reach into and catalyze innovation within their local ecosystems.

Finally, we close by acknowledging that the research described here necessarily favours breadth over depth in order to get across all of the main concepts. We look forward to future work, the plans for which include: documenting our reviews of the literature referred to herein; elaborating on the 10-Arrow Model shown in Figure 5; refining and further describing the SoTLE framework shown in Figure 8; using this perspective to contribute to ongoing discussions in the field about how to assess the outcomes of entrepreneurship programs; and articulating the various domains of research and scholarly activity that follow from this work.

**ABSTRACT**

The reduction of unemployment is a major challenge for many economies across the world. As youth graduate from tertiary school or even higher education, the opportunity for work is limited. One solution towards this struggle is to increase employment through entrepreneurial activities where individuals create their own opportunity. The Know About Business curriculum was developed by the International Labour Organization to meet the demands of individuals in developing economies who are seeking employment alternatives. A second initiative is focused on social entrepreneurship, marrying entrepreneurship and serving the public good. Five different entrepreneurship curriculums will be covered in the workshop.
While Regional Innovation Networks (RINs) claim to bring innovation to market by helping their tenants experience high growth, great products die before their age just because they fail to capitalize the market and customer potential. In line with recent entrepreneurship research on networks (Slotte-Kock and Coviello, 2009; Hoang and Antoncic, 2003) focusing on the processes associated with network development, this study explore the relationship between RIN policies and their tenant performances, tracking how far companies benefit from their RIN in setting their own network over time. Our preliminary results suggest the existence of inflexion points in the process of developing networks. Failure to recognize them and to manage them efficiently may threaten the growth of startups. The contributions of this paper are relevant to the enhanced understanding of network development, and provide insights to entrepreneurs and network providers on how to maximize their relationship and to take advantage on them.

THE NEW GAZELLES:
AN EXPLORATORY STUDY OF HIGH-GROWTH ASIAN AMERICAN IMMIGRANT ENTREPRENEURS

Abstract of Doctoral Dissertation Presented for the 2010 ICSB World Conference
Category: Doctoral Consortium

May 30, 2010
Study on High-Growth Asian American Entrepreneurs

Background and Literature Review

Several scholars have emphasized the importance of entrepreneurs who established fast-growing firms, often referred to as high-growth entrepreneurs, for their contributions to job creation (Acs, Parsons, & Tracy, 2008; Birch, Haggardy & Parsons, 1995; Davidsson & Delmar, 2006; Delmar, Davidsson, & Gartner, 2003). Within the population of entrepreneurs in the U.S., there is mounting evidence of the important role played in economic growth and job creation by two sub-groups: (a) high-growth or high-impact companies (Acs et al., 2008), in particular, firms that are new and smaller, called “gazelles” by David Birch (1987); and (b) skilled immigrant entrepreneurs, in particular, Asian Americans in the high-tech industries (Hart, Acs, & Tracy, 2009; Wadhwa, Saxenian, Rissing, & Gereffi, 2007).

In the United States, Asian American immigrant entrepreneurs have emerged as one of the most successful group of entrepreneurs in terms of new venture creation, particularly in the high-tech industries (Hart et al., 2009). A report prepared by U.S. Small Business Administration on the small-business economy found that minority entrepreneurship continues to be an important part of the American economy, with Asians having the highest self-employment rates and highest rate of business ownership among all minority groups (Fairlie, 2008). According to Hart et al. (2009), “U.S. policymakers are focused as never before on the linkage between foreign-born talent and high-tech entrepreneurship” (p. 14). From an academic as well as from a policy perspective, there is need for a closer study of the cognitions, behaviors, and cultural factors that influence success among Asian American immigrant entrepreneurs.
Studies have reported that entrepreneurial cognition and behavior plays a key role in how opportunities are seen, perceived and acted upon. Broad agreement exists among entrepreneurial researchers that that seeing and acting upon opportunities is at the heart of entrepreneurship (Kirzner, 1973; Palich & Bagby, 1995; Stevenson & Gumpert, 1985; Stevenson & Jarillo, 1990). The fundamental premise of the proposed study is that since the seeing of and acting upon opportunity are fundamental to entrepreneurship, then understanding how special populations of successful entrepreneurs learn to see opportunities and take action to pursue them in the context of their culture may lead to a richer understanding of high-growth entrepreneurship.

Statement of the Problem

A review of the literature indicated a well-documented general problem in the field of entrepreneurship, which is that almost 50% of new businesses fail within 5 years (Shane, 2008) and among firms that survive, a relatively small number of entrepreneurial businesses achieve significant growth (Stangler, 2010). Given that high-growth firms started by immigrant entrepreneurs are important for economic growth and account for a disproportionate share of new employment in the United States (Reynolds & Curtin, 2007), it is important to understand the factors that drive their success.

The specific problem identified in the proposed study is that while there has been a growing recognition of the economic contributions of immigrant entrepreneurs, the theoretical framework to study immigrant entrepreneurship is inadequate (Sequeira & Rasheed, 2006). Despite the extraordinary success achieved by Asian American immigrant entrepreneurs in the high-tech industries (Hart et al., 2009; Saxenian, 1999,
2006), the cognitive and behavioral factors that undergird their success remain largely unexplored.

Statement of Purpose

The primary purpose of the proposed qualitative study with a multiple-case study design will be to investigate the entrepreneurial cognitions and behaviors involved in the seeing of and acting upon opportunity among Asian American immigrant entrepreneurs who have established high-growth business in the high-tech industries. The objective of the research is to gain an in-depth understanding of the cognitive, behavioral and cultural drivers that create unusual levels of success among Asian American immigrant entrepreneurs in the high-tech industries. To help relate the data collected with current literature, the proposed study will involve any exploration into how successful Asian American immigrant entrepreneurs experience, enact, and elucidate some of the existing theories and constructs that involve seeing and acting upon opportunities. The specific population for the proposed study will be Asian American immigrant entrepreneurs of Asian Indian ethnicity, who are key founders of high-growth firms in the high-tech industries and located in the East Coast of the United States.

Research Questions

The research questions posed in the proposed study are designed to guide the exploration of the patterns of thinking and action among Asian American immigrant entrepreneurs who are key founders of high-growth new ventures in the high-tech industry. The three research questions (RQ’s) are framed as follows:
RQ1. What are the cognitive processes used by high-growth Asian American immigrant entrepreneurs to see and act upon opportunities that lead to successful new venture outcomes?

RQ2. What are the behaviors reported by high-growth Asian American immigrant entrepreneurs to see and act upon opportunities that lead to successful new venture outcomes?

RQ3. How does the cultural context influence the cognitions and behaviors involved with the seeing of and acting upon opportunity among high-growth Asian American immigrant entrepreneurs?

Overview of Research Method and Design

The proposed study is a qualitative exploration of how Asian immigrant entrepreneurs who have established high-growth ventures in the high-technology (high-tech) industries experience and enact entrepreneurial cognition and behavior involved with the seeing of and acting upon opportunities. With the use of a multiple-case study research design that is holistic and takes into account the cultural context of the entrepreneur, the proposed study responds to the call by researchers that the domain of entrepreneurship must focus on high-growth entrepreneurs by the use of in-depth, descriptive, and theory building approaches (Bygrave, 2007; Davidsson, 2003). Data will be collected from multiple sources, in accordance with the strategy of triangulation of sources suggested by several scholars (Yin, 2009; Hancock & Algozzine, 2006). Three primary strategies will be used for the data collection: (a) a literature review of pertinent readings in the area of entrepreneurship, (b) semistructured interviews of the entrepreneur and a key-informant, and (c) data from other sources such as company documents and
archival records. The researcher then analyzes the data collected for themes and patterns and seeks to interpret the meaning of the information, using an iterative process that involves reviewing existing literature, seeking the opinion of experts, seeking clarification from the sources, and personal reflections of the researcher with the objective of understanding and gaining insights into the complex social phenomena.

To obtain answers to the research questions, the unit of analysis will be Asian American immigrant entrepreneurs. To help improve rigor, reduce misrepresentation, and enhance validity the proposed study will use various quality strategies suggested by case study experts, including, (a) thorough review of literature, (b) careful screening and selection of cases to ensure that the proper cases are identified prior to data collection, (c) use of a pilot study to refine data collection plans and procedures, (d) use of case study protocol to ensure the uniform procedures are used for all cases, (e) triangulation of data sources, (f) review of draft reports by participants, and (g) developing a case study database (Creswell, 2005; Hancock & Algozzine, 2006; Makela & Turcan, 2007; Yin, 2009). As with most qualitative approaches, the proposed study will emphasize the meaning that individual participants give to situations and also acknowledge the important role and personal experiences of the researcher (Yin, 2009).

Findings

The proposal has been approved and data collection has started from May 25, 2010. The preliminary findings will be presented at the ICSB conference in June 2010.

Significance and Implications

The results of this study could help guide policy makers and researchers (Merriam, 1998), and others who seek to understand the phenomenon of successful
entrepreneurship among immigrant entrepreneurs, a group that recent studies report is increasingly important to the creation of new jobs and the growth of the economy. By exploring the patterns of entrepreneurial cognition and behavior as well as the cultural factors involved with the seeing of and acting upon opportunities among successful Asian American immigrant entrepreneurs, this study could provide useful insights to prospective and nascent entrepreneurs who seek to model the thought and action patterns of successful entrepreneurs.

Finally, the most recent global economic crisis during 2007-2009 presents an unique opportunity to study the cognitions and behaviors of successful Asian American immigrant entrepreneurs during a period of recessions marked by resource constraints and high economic uncertainty. This is significant from a policy perspective as according the 2008 Global Entrepreneurship Monitor report “entrepreneurship is thought to be one of the mechanisms that helps turn around recessions by reallocating resources in such a way that promising new activities replace obsolete economic activities”.

In summary, the results of this study could provide insights and information into entrepreneurial cognitions and behaviors used by successful entrepreneurs that could prove useful for researchers, educators, policy makers, financial institutions, business leaders, sociologists, economists and to nascent entrepreneurs.

Estimated Time Frame for Completion of Study:

Data Collection: May-June 2010

Data Analysis and Recommendations: June- July 2010

Oral Defense: August 2010
Neuroentrepreneurship: What Can Entrepreneurship Scholars & Educators (& Practitioners) Learn from Neuroscience?

Norris Krueger, Jr., PhD

Abstract

We offer an overview of neuroentrepreneurship's potential to provide mechanisms for advancing entrepreneurship research and practice. More important, a recurring theme will be that neuroscience offers us a powerful alternate research sensibility that gives us some new key assumptions about the genesis of entrepreneurial decision making. We use some well-chronicled shortcomings and challenges in existing entrepreneurship research to profitably discuss how the application of neuroscience methodology can address these limitations and help extend entrepreneurship theory. We provide practical suggestions of a best practice application of neuroscience in entrepreneurship and identify research questions especially well suited for this methodology.

Introduction

A recent study at Cambridge (Lawrence et al. 2008) compared serial entrepreneurs to top managers and found that successful entrepreneurs and managers shared great ability at rational analysis ("cold" cognition). However, entrepreneurs demonstrated a significant edge in analyses that engaged both rational and emotional thinking ("hot" cognition). Perhaps unsurprisingly, 'hot' and 'cold' cognition tend to occur in different areas of the brain's front lobes.

This is but one striking study that suggests a fruitful research agenda for applying theory and methods from neuroscience to a deeper, richer understanding of entrepreneurs and the processes that lie beneath entrepreneurial cognition. We propose here to present (a) a concise overview of the key issues where neuroscience can play a useful role and (b) present

2 The author wishes to thank many colleagues including the participants of the Max Planck Institute Summer School and of the European Summer University, (Bodo, Norway) but especially the leadership in neuro-entrepreneurship of Professors Isabell Welpe (Technical University of Munich) and Angela Stanton (Chapman University) and Mellani Day (Colorado Christian University) plus the anonymous ICSB reviewers.
experimental evidence that examines interesting differences between economic entrepreneurs and social entrepreneurs.

Zald (2007) claimed that entrepreneurs differed from the general population in the numbers and density of dopamine receptors in their cerebral cortex. His claim centered on multiple experiments that demonstrated subjects who consistently took more risk also had significantly higher numbers of dopamine receptors. (Dopamine is a hormone released as essentially a reward, in this case for successfully accepting risk.) However, this research has not compared entrepreneurs to non-entrepreneurs, nor social entrepreneurs. Moreover, we have not looked at temporal changes: Does being an entrepreneur change one's dopamine receptors? We now know to ask such questions…and we have the tools to answer them.

We know that entrepreneurs engage in considerable (and complex) cognitive appraisal of opportunities (Welpe and various colleagues) but very recent experimental data (Krueger, Grichnik & Welpe 2009) suggests that when nascent entrepreneurs appraise separately the economic and social dimensions of their proposed venture, only appraisal of the social dimension engaged the subjects' 'hot' cognition. This suggests that social entrepreneurs, stereotyped as unusually passionate even for entrepreneurs, should be a fruitful vehicle for extending studies such as those described.

There is growing consensus in the literature that the central nervous system reacts differentially to risk. Functional magnetic resonance imaging (fMRI) studies reveal neural correlates of risky stimuli or decisions in various brain regions including the striatum, insula, inferior frontal gyrus, lateral orbitofrontal cortex, and anterior cingulate cortex (Paulus, Rogalsky, Simmons, Feinstein & Stein, 2003; Huettel, Song & McCarty, 2005; Kuhnen & Knutsin, 2005; Rolls, McCabe, & Redoutem 2007; Tor, O’Doherty, Dolan, & Schulz, 2007). Decision making under ambiguity and under uncertainty is correlated to activities in the amygdala, orbitofrontal cortex, inferior frontal gyrus, and nsula (Huettel, Stowe, Gordon, Warner & Platt, 2006; Hsu, Bhatt, Adolphs, Tranel & Camerer, 2005).

However, few explicit distinctions between entrepreneurs and non-entrepreneurs have been made in empirical studies, other than the two referenced above. Shane (2003) argues that entrepreneurs use a qualitatively different decision-making process than others. Yet, this theoretical explanation remains untested and thus unsupported by empirical investigation.
Moreover, it appears very likely that neuroscientific methods are the only way to efficiently and effectively address claims such as Shane's. Thus, this study aims at clarifying whether there is difference in actual behavior and neural activities between entrepreneurs and non-entrepreneurs. Risk taking behavior seems an ideal starting point for neuroscientific analysis of entrepreneurs (Stanton & Welpe, i.p.) Moreover, the literature suggests that risk-taking propensity need not generalize. Thus, we aim to clarify if social & economic entrepreneurs tend to be more willing to take risk in general and/or only in business related situations, e.g., does an “opportunity” be triggered into something actionable and which factors are inhibitors. Finally, a key conundrum in social entrepreneurship research circle is whether social entrepreneurs differ significantly from economic entrepreneurs in how they perceive and appraise opportunities. Recall that the Krueger et al. 2009 study above found cognitive appraisal differed between the economic dimension and social dimension. When subjects were induced to think like a social entrepreneur, we saw more 'hot' cognition. This suggests the value of testing social entrepreneurs and economic entrepreneurs, rather than just entrepreneurs and managers.

Neuroscience offers us a different way of thinking about our research and the research questions that we ask. Simply by recognizing there are deeper levels than behaviors and attitudes, we open the door to a greater understanding of what makes entrepreneurs act. We already know that there is very much that “lies beneath” our usual data on entrepreneurs and entrepreneurship (e.g. Krueger 2007) but even a cursory review of neuroscience suggests that there is far more than we realize – and perhaps we can realize. That is, neuroeconomics and other neuroscience domains also show us that much more of our behavior is driven by physiological/neurological factors than we really might want to believe. *Homo oeconomicus* might have been already dead but neuroscience may have added the proverbial stake in the heart.

Understanding entrepreneurial behaviors requires understanding entrepreneurial thinking at a deeper level (e.g., Krueger 2007). But if we need that deeper understanding then we need theory and methods to match. Entrepreneurship as a field of research still has to struggle for legitimacy (Shane 2003) as an independent field of research and scholars have struggled to understand the distinctive contribution of the field of entrepreneurship. Where does studying entrepreneurship inform other domains?
We have all been deluged by items about neuroscience – neuromarketing, neuroeconomics and so forth (even neuroethics). Much of that is hype – but much of it is even more valuable than it seems. The field of entrepreneurship has evolved from looking at just “words and deeds” (Herb Simon's 'semantic' level) to attitudes and beliefs ('symbolic' level), but deeper still there is the 'neurological' level where we look as directly as we can at neural processes and activities. If we are to look at the neurological level of human decision making, then it seems likely that this will be very useful for a better understanding of entrepreneurs and entrepreneurship.

* It is an opportunity to ask questions that we could not answer before
* It is an opportunity to ask questions that we couldn't even think to ask before
* It is also an opportunity to ask questions in a better way & to get better answers

The latter point is a good place to start. Results and progress in entrepreneurship have sometimes been limited (if not potentially distorted) for methodological reasons. Leading voices such as Shane (2000, 2004) and Venkataraman (e.g. 1997) have noted that we have not properly and rigorously specified the dependent and independent variables, let alone account for the common variance between them.

Consider the perhaps focal phenomenon in entrepreneurship, *opportunity*. Rigorous measurement of, for example, the value and the qualities of entrepreneurial opportunities (e.g. Markman & Baron 2003; Sarason, Dean, & Dillard 2006) has been too often lacking. Neither have we controlled for obvious confounds such as the opportunity costs and outside options of potential entrepreneurs (Shane & Venkataraman 2000) nor controlled carefully for context effects such as the effect of growth motivation (Shane 2003). For methodological reasons, we too often take a static instead of a dynamic perspective by simultaneously analyzing the antecedents of perception, evaluation and exploitation, which seems especially advisable given that many selection steps are involved until the decision for or against entrepreneurship is reached (Shane 2000, 2004).

All this means that previous research to date has yet to truly answer the question, ‘who perceives, evaluates and exploits entrepreneurial opportunities’ (Shane 2003). Simultaneously, it
brings into serious question the methodological rigor of entrepreneurship as a field of research, but even where substantively rigorous, we have made insufficient use of the entire scope of available empirical methods, in particular, we have grossly neglected the use of experiments (Schade 2005).

If the field has underachieved in studying one of its central constructs then it would seem reasonable to seek different, more suitable methodologies. Consider again Herb Simon's classic distinction depicted below in Figure 1. Entrepreneurship research spent its formative years focusing quite understandably on the surface or “semantic” level: What people say and do. More recently, the rising use of social psychology, behavioral economics, evolutionary sociology, and cognitive and even developmental psychology has enabled the field to explore at deeper levels such as Simon's “symbolic” level: What people feel and believe.

Insert Figure 1 about here

For example, consider research into entrepreneurial intentions. Using proven models such as the Theory of Planned Behavior has been highly productive and yielded deeper (and more useful) insights than merely observing words and behavior. However, it has recently become clear that entrepreneurial intentions themselves rest upon deeper phenomena such as deep anchoring beliefs (Krueger 2007; Brannback, et al. 2007). If deep beliefs are critical, then we need to find methods that permit us to delve more deeply. But if we delve more deeply, we must do so with great rigor.

Simon's third and deepest level was dubbed “neurological” and argues that there is a substrate that is biological in nature, that our physiology comes into play in ways that cannot be understand without direct examination. The rising tide of neuroscience appears to offer both conceptual insights and empirical research tools that will help.

Consider again entrepreneurial intentions, then consider the classic work of Benjamin Libet who demonstrated the provocative finding that the experimenter can often detect human intent in advance, suggesting a neurological antecedent to intent and behavior. In turn, that opens the door for us to ask some new questions as well as shedding light on some older ones (such as the antecedents of entrepreneurial intent.)
Let us next turn to a brief, simplified overview of neuroscience and its potential to advance entrepreneurship research.

**Neuroscience: What Entrepreneurship Scholars Should Notice**

Recently neuroscience has become popular in research applications on social science and behaviors. Neuroscience focuses on the “ultimate black box” – the brain - and infers information from images of brain activity and similar techniques (Camerer, et al. 2005) Entrepreneurship increasingly takes advantage of rigorous experimental methodologies to better understand deeper structures of entrepreneurial cognition. Neuroscience, in particular, gives us new ways to conceptualize and measure important facets of entrepreneurial decision making.

How can neuroscience best inform entrepreneurship?

(1) By answering questions that have thus far resisted analysis of causal relationships.

(2) By enabling us to ask new questions we could not even ask before, For example, we can begin to identify the actual drivers of opportunity perception, but we can also map its pre-decisional dynamics. Just as neuromarketing and neuroeconomics have already yielded important new insights, why not neuroentrepreneurship?

Neuroscience is a general term referring to a wide range of techniques in which neuroscience methodologies allow for the investigation of ‘theories in use’ (Argyris & Schon 1996) rather then ‘espoused theories of action’ (Shepherd & Zacharakis 1999), overcoming retrospective bias, and enable the collection of contingent respondent data as well as the study of interactions among independent variables (Hitt & Barr 1989) and the neurological correlates of entrepreneurial decisions and behavior.

Note in particular that the popular view of neuroscience as being all about use of PET scans and function MRI and other mechanisms, the key import of using neuroscience is directing our attention for the first time to the biological dimension, the physiological and neurological substrate that drives our behavior far more than we realize – or can realize.

Note also that the growing interest in neuroscience appears to be driving increased interest in and utilization of rigorous, controlled experiments. Experimental methods have been rarely used in entrepreneurship research, often on the grounds that one cannot explore “real
world” behavior in a lab setting. Neuroscience, particularly neuroeconomics, has clearly shown the power of using experiments.

Insert Figure 2 here

Neuroscientific methodologies have been successfully applied in many domains: Witness neuromarketing, neuroaccounting, neuroethics and especially neuroeconomics. Neuroeconomics research argues that we must explicitly consider much deeper cognitive phenomena, even physiological, if we are to understand important human decision processes (Andreasen 2006; Camerer, 2006). For one very important example, this requires explicit consideration of entrepreneurial emotions, not just rational cognitions, something too rarely considered in entrepreneurship research (Spoerrle & Welpe 2006; Mitchell et al. 2007; Acs, Audretsch, Day, Krueger, Stanton & Welpe 2008).

Neuroscientific methodology is a potential means to overcome previous limitations in entrepreneurship theory and methodology because it offers a number of possibilities to address some of the methodological shortcomings, especially as a well-suited methodology to investigate pre-entrepreneurial decision processes and the cognitive and emotional processes underlying them, which have recently risen on the entrepreneurship research agenda (Baron 2006). Consider for example the neuroscientific evidence that rational and emotional cognitions take place in different parts of the brain. We have long studied differences between “hot” and “cold” cognitions but this evidence places that work on much stronger foundations.

For another important example, while we understand that perceptions of opportunity are the heart of entrepreneurial thinking, we have only a superficial understanding of “opportunity” as a construct and how to measure it (Baron 2006). Neuroscience argues that if perception of an opportunity is a phenomenon of profound importance, then we should rigorously identify salient neurological markers of opportunity perception in real time and of their antecedents (Cacioppo & Perry 1985; Camerer 2006).

More important: Do we know what actually triggers entrepreneurial action? An important extension of this is the extent to which “automatic processes” are part of the entrepreneurship process. Automatic processes exert minute or no conscious effort on part of the individual
(Bargh et al. 1996; Camerer et al. 2005). Neuroscience offers the potential to understand the operations and effects of such processes: “Because people have little or no introspective access to these processes, or volitional control over them, and these processes were evolved to solve problems of evolutionary importance rather than respect logical dicta, the behavior these processes generate need not follow normative axioms of interference and choice (Camerer et al, 2005: 11).

**Limitations of Neuroscience**

Of course, neuroscience is far from a panacea and offers its own weaknesses and limitation for entrepreneurship research. We are particularly interested in finding those limits. For example: Entrepreneurial action is not necessarily an action of an individual, but can also be an action of a group of people. How well are neuroscientific methodologies suited to explain group decision processes (West 2007; Kerschreiter et al. 2007)?

We will go into more depth into some of these issues but first let us look at some of the more popularized findings from neuroscience applications that also have implications for entrepreneurship and entrepreneurs.

**Automatic vs. Intentional Processing:** We have already addressed the issue of deep beliefs. Where that has surfaced is in research that looks at our colorfully-titled “inner zombie”, decision processes that we are not mindful of. While we may often exhibit intentional, planned behavior, much of our decision making is automatic processing, driven by deep assumptions that we are likely unaware of. This is highly adaptive in that we cannot consciously process every single decision we face.

**Mental Prototypes:** However, since we operate under significant bounded rationality, there are many gaps that our minds readily fill – often based on those deep assumptions. If we have automaticized how to drive out of a skid on an icy road, that is good. If our deep assumption is an ugly racial prejudice, that is very bad. We all have mental prototypes (not just stereotypes per se) of “opportunity” and of “entrepreneur.” If someone's mental prototype of “entrepreneur” does not include them, it will be much harder for them to become (let alone succeed at) entrepreneurial (Baron 2006; Krueger 2007).
Fluid Intelligence: Very recent work by Jaeggi and colleagues (2008) showed that fluid intelligence [ability to solve new problems] need not be fixed, but can be increased by compelling subjects to solve important, complex new problems. Entrepreneurs are a population that almost by definition face a steady stream of important, complex new problems. They could make idea research subjects, Also, Jaeggi et al looked at activity in working memory as a key leverage point in this process, suggesting that this might be fruitfully explored neuroscientically.

Change Blindness: One of the most famous experiments asks viewers of a video to count how many times people pass a ball. In the middle of the video, a person in a gorilla suit walks through quite visibly, yet the experimental subjects tend to not see the gorilla at all. Later work by Triesch and colleagues argues that we focus our attention in ways that preclude noticing other things. Rather the physical appearance of a gorilla or Triesch's colored blocks, entrepreneurs may focus in ways that preclude them seeing obvious opportunities (or, worse, visible threats.) These attentional limits are grounded in neurological realities that we now have the tools to explore.

Opportunities from weaknesses in existing entrepreneurship research

The next section reviews some methodological challenges and shortcomings of entrepreneurship research that particularly illustrate the potential contributions of neuroscience for the study of, for example, entrepreneurial opportunities.

Pre-entrepreneurial processes: Affective & cognitive reasoning. Perception and positive evaluation of entrepreneurial opportunities are preconditions for any entrepreneurial activity it is surprising that most entrepreneurship research to date has started after the decision to exploit an entrepreneurial opportunity has been taken (Shane 2000). As a consequence, we know only little about the pre-exploitational decision processes of potential entrepreneurs. Thus, the majority of studies have not looked at the antecedents of the actual decision to act entrepreneurially but have focused on researching individuals who have already decided to become entrepreneurs. As a consequence we know only very little about the pre-entrepreneurial decision processes. However, the increasing interest in the concept of opportunity has been accompanied with an increased interest in the earliest phases of the entrepreneurial process
(Shane 2001, 2003) and researchers such as Shane (2003) have argued for the study of decision processes leading up to the decision to become an entrepreneur. Research studying the actual decision to exploit entrepreneurial opportunities would greatly enhance current understanding of entrepreneurship (Shane, 2003).

Studying pre-decisional processes lends itself well to experimental methods, however, the foregoing suggests that it is imperative to dig more deeply than surface phenomena and even beyond Simon's symbolic level and understand the physiological underpinnings.

A better understanding of the pre-entrepreneurial decision processes would also help us to better refute or confirm conceptual theories that have been put forward by scholars. For example, Shane (2003) argues that entrepreneurship uses a qualitatively different decision-making process than the one used by the participants to buy and sell standard resources in the market place. This theoretical explanation as Shane (2003) admits remains yet untested and thus unsupported and by empirical investigation. Currently, entrepreneurship scholars offer only theoretical descriptions of the judgmental decision-making processes that entrepreneurs use (Sarasvathy et al 2001). Ardichvili, Cardozo and Ray (2003) note that a number of conceptual models on the pre-entrepreneurial process have been proposed in recent years based on conflicting assumptions borrowed from a range of disciplines, ranging from cognitive psychology to Austrian economics.

Research on entrepreneurial cognition has increased during the last years and Mitchell et al. (2007) define entrepreneurial cognition as the knowledge structures that people use to make assessments, judgments and decisions involving opportunity evaluation and venture creation and growth. The Austrian perspective would argue that it is mainly differences in information that determines whether opportunities are discovered and exploited. Mitchell et al. (2007) already acknowledge upcoming changes to entrepreneurial cognition research: Besides emotions and affect they refer to entrepreneurial action as important route for further analysis. An important question in entrepreneurial cognition research is how entrepreneurs deal with information. Given the importance if the explaining opportunity discovery to our understanding of the entrepreneurship process, empirical evidence that supports or refutes the Austrian perspective of the discovery process is important (Shane 2000).

**Common variance bias.** Much of the existing empirical research has assumed that the
attributes of people who discover opportunities are uncorrelated with the attributes of the opportunities that they discover (Evans & Jovanovic 1989). Researchers making this assumption have studied how individual differences affect the way people exploit opportunities while ignoring attributes of the opportunities themselves. However, if human attributes are correlated with the opportunities that people discover, then these researchers have confounded attributes of entrepreneurs and opportunities in empirical tests of who is an entrepreneur (Venkatraman 1997). Entrepreneurship research needs to incorporate the interaction of opportunities and individuals and find ways to measure both in fair comparisons. The joint investigation of both factors is critical to the investigation of the individual-opportunity nexus advocated by Shane (2000, 2001, 2003) and other scholars. Entrepreneurship cannot be only a fixed attribute of certain people, but must involve their reaction to the existence of opportunities (Shane 2003). However, to date, very little research has incorporated both parts of the puzzle in a fair way.

**Dynamism of entrepreneurship processes.** Shane argues that entrepreneurship is a process with tremendous selection at each step and the field needs to use research methods that are appropriate to the study of the phenomenon. As entrepreneurship is a dynamic process it demands investigative techniques that take this dynamism into consideration. However, most research about entrepreneurship – whether it is psychological – or economic in nature – tends to be static, seeking to explain outcomes as if they are found in equilibrium or are in some sort of permanent state. Static research designs in entrepreneurship, however, are problematic, as they assume that a given independent variable influences all steps in the entrepreneurial process equally, and that the effects of a given independent variable do not select our some people at earlier stages in the process.

Shane, Locke & Collins (2003) emphasize that entrepreneurship is a process that occurs over time and criticized that previous research has not looked at the effects of independent variables on specific steps in the entrepreneurial process. Shane (2003) and Shane & Venkatraman (2000) argue that the discovery of opportunities does not automatically result in exploitation, but that opportunities are exploited only when an entrepreneur decides to exploit an opportunity she perceives. Failure to treat entrepreneurship as a dynamic process obscures the fact that most entrepreneurial activity is episodic, staged and short-lived and involves much
Simultaneously analyzing the antecedents of opportunity perception, evaluation and exploitation, seems especially advisable given that many selection steps are involved until the decision for or against entrepreneurship is reached (Shane 2000, 2004). As a result of the aforementioned limitations, previous research to date has insufficiently answered the question, ‘who perceives, evaluates and exploits entrepreneurial opportunities’ (Shane 2003), has led to inconsistent results with regard to the influence of individual characteristics on entrepreneurial behavior (e.g. Gartner 1988; Keh, Foo, & Lim 2002) and has questioned the methodological rigor of entrepreneurship as a field of research. Shane & Venkatraman (2000) also point out that to date we do not know why some people and not others exploit opportunities that they discover.

We need more research that examines the actual decision to exploit opportunities rather than the static nature of being an entrepreneur (Shane 2003). Research on the actual decision to exploit opportunities among people at risk of such exploitation would overcome many of the limitations inherent in much of our existing research on this topic as well as provide more precise explanations for how individual differences influence the entrepreneurial process (Shane 2003). By using a dynamic approach to investigation researchers could capture these essential features.

For example certain independent variables that are physiological in nature might have a different effect on opportunity discovery, evaluation and exploitation. For example, how does the role of trust affect the process - and vice-versa? Over a very short time horizon, one could argue that entrepreneurial decision making was classically rational, however, over the entire process, it makes plausible sense to consider the deeper level.

Consider also the role of triggers (e.g. Shapero's precipitating event [Krueger et al 2000]) that link intent to action. If triggering events do occur, entrepreneurship scholars need methods that permit identifying these phase changes in entrepreneurial thinking. Neuroscience research is beginning to understand the “aha!” moment, for example, when subjects considering future circumstances identify a positive future state, we see increased activity in the amygdala.³

Failure to consider the dynamic nature of the entrepreneurship process has led the field to develop an ignorance about these differences, which hinders the development of a true

³ Again, please note that we are simplifying, often significantly, to illustrate points.
understanding of entrepreneurship. But to fully consider the dynamics, we need the insights and the research sensibilities we find in neuroscience.

**Conflicting effects of independent variables.** Not analyzing potentially conflicting effects of independent variables on entrepreneurial processes has been a consistent *bête noire* for entrepreneurship scholars. For example, people who are high in independence may be more likely than those low in independence to exploit entrepreneurial opportunities, but they may not be better at formulating strategies that capture the returns of the entrepreneurial activity (Shane, 2003). It is likely that the factors that explain one part of the entrepreneurial process (e.g. opportunity evaluation) do not necessarily explain other parts (e.g. opportunity exploitation). Researchers interested in explaining the effects of independent variables on the exploitation of opportunities should also consider the potentially conflicting effects of specific individual variables on different aspects of the entrepreneurial process, and on performance at entrepreneurial activity (Shane 2003). This often requires experimental methods to counteract this and, again, the critical independent variables may well prove to be physiological.

**Perceived value of opportunities.** While it is apt to say “opportunity is in the eye of the beholder” we have often failed to use that in our research. A major criticism of prior research in entrepreneurship is that we simply use the construct “opportunity” and the size, quality, attributes and opportunity costs of entrepreneurial opportunities have not been controlled in a dynamic research design (Shane, Locke & Collins, 2003). Opportunities can differ on multiple dimensions. In order to accurately measure the effect of independent variables on entrepreneurial decisions, it is necessary to control the qualities and effects of opportunities (Shane, 2000; 2001). Venkatraman (1997) argues that opportunities are valuable for individuals if they exceed the entrepreneur’s opportunity costs and offer a premium for the illiquidity of money, time, and effort expended and a premium for bearing uncertainty and risk. Because opportunities will differ in these aforementioned qualities, the nature of opportunities will influence the entrepreneurial decisions (Shane, Locke & Collins 2003). Unless researchers know the effect exerted by the opportunities themselves, they cannot accurately assess the effect of the independent variables on entrepreneurial decisions. Without such controls, researchers cannot know whether the observed effects represent the effects of the independent variables or the
effects of the unobserved relationship between the opportunities and the independent variables, such as motivation to exploit opportunities (Shane 2000, 2001). Shane, Locke & Collins (2003) note that previous research has generally failed to control the effects of opportunities by modeling the value of the different opportunities pursued.

Future entrepreneurship research should thus study identical opportunities in designs, which allow respondents to make a series of entrepreneurial decisions in a controlled simulation, limiting sources of variance outside of the independent variables.

Note that all the foregoing suggests the growing realization that experimental methods are needed to address common method variance as well as to simultaneously assess rational and emotional cognitions.

**Neuroscientific designs as possible solutions?**

Entrepreneurship as a field of research is in need of methodologies that are able to study the phenomena. Shane (2003) argues that entrepreneurship researchers need to make changes to their research methodologies. First and foremost, researchers need to develop hypotheses and test explanations rather than just assemble facts. This, however, poses a not so trivial challenge for entrepreneurship researchers, since in real life studies, the situation in which a (potential) entrepreneur is involved can hardly be controlled, nor can the situation be manipulated and randomly assigned to (potential) entrepreneurs. Neuroscientific studies would seem a promising possibility.

Here we propose neuroscience as a source of research design (not just methodology) which allows for the current analysis of entrepreneurial decision processes while at the same time controlling for the situational specifics of entrepreneurial opportunities. By proposing experimental neuroscience our study also answers the call for research on methodologies that enable entrepreneurship researchers to simultaneously control for the influence of opportunity and individual characteristics on entrepreneurial decision-making (Shane et al. 2003). It also corresponds to Gatewood, Shaver, and Gartner (1995) who advocate the use of experimental designs in entrepreneurship research in order to randomize the allocation of respondents to research conditions.

Table 1: A possible classification of experiments

Schade & Burmeister (2008) offer the above Table 1.

Advantages of (different types of) neuroscientific experiments

One key advantage of using neuroscience experiments is their ability to focus closely on individual decisions (Schade, 2005). An experiment enables the plausible establishment of causality and, if properly designed, can exclude alternative interpretations by direct and indirect control. Experiments thus address the internal validity problem of empirical research in entrepreneurship. In entrepreneurship, many objects and relationships are dynamic or embedded in a dynamic environment and these dynamics threaten the reliability of identified relationships in field studies. Only with experimental control can we effectively discriminate the factors of interest from other factors, often rapidly changing. Schade (2005) explains the advantages and necessities of using experimental methods in entrepreneurship. More recently, Burmeister & Schade (2008) offer this ever-growing list of neuroscientific experiments (defined broadly).
It certainly appears that the ground has been tilled and appears fertile, it awaits only the next step, which is more explicit testing of physiological variables.

**What research questions appear particularly suited for neuroscience methodology?**

Obviously, there are many questions relevant to entrepreneurial decision making and action. Given the extent of research in neuromarketing and especially neuroeconomics, we already see the breadth and depth of potential topics where we need to consider Simon's neurological level. We have already discussed how some existing research challenges can be addressed. But what else seems fruitful? Table 2 above suggests there are many interesting questions. Moreover, there is a wide array of models and hypotheses from behavioral decision
theory that neuroeconomics has already begun to explore experimentally (e.g. Camerer et al 2005, Camerer 2006).

One area that seems especially intriguing for entrepreneurship scholars deals with deeper cognitive structures and how we can investigate them. For example, Mitchell (2000) notes that we can identify cues for an entrepreneurial script, but not detect the script directly. We may now have the tools to identify exactly when such a script is switched on or off. We had already mentioned the utility of identifying the triggers from intent to action. For example:

* When does this “good idea” coalesce into a genuine “opportunity”?  
* When does this “opportunity” be triggered into something actionable?

We already see hints of both these tipping points as entrepreneurial intentions evolve (Brannback, et al 2007). This research could vividly demonstrate them.

We know that in human learning, it is far more than merely acquiring items of knowledge content, true learning entails changes in how we structure that knowledge. Neuroscience methods may help us to see some hint of those differences. In particular, knowledge structures often change discontinuously in the wake of critical developmental experiences as show in Figure 3. (Another variant of the “aha!” moment.)

insert figure 3 here

The variety of potential topics is quite broad; the following is just a sampling of entrepreneurship-relevant topics:

**Behavioral Decision Theory**

Framing Effects & Paradoxes - Consider the extensive experimental evidence that has elucidated our understanding of things like Kahneman & Tversky's classic gain-loss framing effects (prospect theory) including work assessing the role of affect in decision making. What we are seeking to explain are the various consistent deviations from rationality that we observe, typically in pencil-and-paper exercises.

A very early experiment with an entrepreneurship theme showed how perceived self-
efficacy would override the Ellsberg Paradox which reflects aversion to high uncertainty [as opposed to Kahneman & Tversky looking at risk aversion.]

Research Opportunities: We can manipulate perceived uncertainty and observe decisional outcomes such as choice of script. Also, other paradoxes (e.g. the Allais paradox) that reflect seeming violations of rationality have not been well-tested in the lab, let alone in the entrepreneurial context.

Preferences - Preference judgments can now be observed through neuroimaging. Thus, entrepreneurial preferences with regard to resource mobilization, resource commitments, and decisions on how to exploit a perceived opportunity could be studied.

Research Opportunities: Human decisions are inherently multi-criteria; multi-attribute utility theory (MAUT) can be explored more directly with tight experimental controls. We have recently observed lexicographic preferences in entrepreneurial intentions (Douglas & Shepherd, 1999; Krueger, et al 2009).

Utilities - Activity in the rewarding behavior is likely to influence entrepreneurial decisions, e.g. how much to invest, general disposition to sell winning investments too early. Investing money and gaining is shown to correlate with activation in the rewarding system.

Research Opportunities: Neuroimaging technique allows us to measure the utility derived from a good objectively. There is also a difference between the expected and the experiences utility. Release of dopamine might lead to acceptance of risk more easily. Previous research shows that dysfunction on the OFC-amygdala-Nac reward circuit explains extreme risk-seeking behavior. All of these aspects could be studied experimentally.

Game Theory

A specific area of human decision making that lends itself to experimental study has been the use of games whose rules have been cleverly specified so as to elicit interesting phenomena. Much of neuroscience's best-known work has been focused on games.

Research Opportunity: The classic Prisoners Dilemma and the recently popularized Ultimatum Game have rarely, if ever, been used with an entrepreneurial setting. For example, could we reverse the Prisoners Dilemma with the “prisoners” replaced by two VCs unable to communicate about investing?
Perceptions

A core topic in any book on cognition is perception; it is also a core topic in any book on experimental psychology. Most of the key phenomena in entrepreneurship research are perceptions-based (Douglas 2008). What is “opportunity recognition” without opportunity perception? In the lab, we can manipulate perceptions quite readily.

Research Opportunities: Kirzner (1973) argued that entrepreneurs need a significant degree of alertness to opportunities. Alertness is likely situational (Shapero’s analogy was to ask in what directions is an entrepreneur’s antenna tuned?). Controlled experiments could map that ‘tuning.”

In general, we have devoted considerable effort to research into how we recognize, discover, identify or enact opportunities and threats. However, very little of that research has explored, for example, the psychophysics of perception.

Finally, entrepreneurs are renowned for their above-average abilities to “connect the dots” in enacting opportunities. Whether the experiments focus on "dot connecting" or on broader issues of pattern recognition, we can draw upon a long tradition of research into pattern recognition, its antecedents and consequences.

Emotions & Affect

Affect - . Neuroeconomics suggests that that decision-making as hypothesized in economic theory depends on prior emotional processes. To date only very few studies and economists have studied the role of emotions in entrepreneurial decision-making (e.g. Baron & Ward 2004).

Research Opportunities: We could look at the role of emotion in uncertain conditions. The influence of emotions on entrepreneurial decisions should be greater in situation is supposed to be even greater than in certain ones. Thus, entrepreneurship with all its uncertainty and risk makes a prime context for studying the impact of emotions on decisions. We could use cognitive appraisal theory (i.e., primary appraisal, rationality, irrationality, and coping potential) in entrepreneurial situations in order to examine the impact of cognitive and emotional processes on the evaluation and exploitation of entrepreneurial opportunities.
Passion & Fear – We can look specifically at passion and fear, two popular themes relating to entrepreneurial decision-making. Long ago, Keynes argued that initiative-taking was not a function of rational calculation but the presence/absence of a more emotional factor he called “animal spirits”.

Research Opportunity: As such, this would seem particularly amenable to study using neuroscience techniques; is entrepreneurial passion merely the arousal of the amygdala?

Trust - Cooperating, trusting others, etc are important aspects in the creation of a venture. We could design imagines or real scenarios in which we manipulate the social and the entrepreneurial aspect and see what influences evaluation and exploitation of these entrepreneurial opportunities. Social neuroscience provides insights into the neural mechanisms underlying our capacity to represent others intentions and feelings, referred to as “empathy” (Singer & Fehr, 2006).

Research Opportunities: What if trust is merely the consequence of a hormonal change (e.g. oxytocin)?

Conclusion and Recommendations for Future Research

We argue that neuroscientific methodologies studies are suitable for, at minimum, a subset of research questions in entrepreneurship. Neuroscientific methodologies studies are especially useful for controlling the value and of entrepreneurial opportunities, for analyzing the cognitive and affective processes in the pre-entrepreneurial decision processes (pre-stage) (including cognition and effective influences) and for studying decision-processes in a dynamic perspective.

However, it is important to note that neuroscience offers us a different way of thinking about our research and the research questions that we ask. Simply by recognizing there are deeper levels than the semantic and symbolic, we open the door to a greater understanding. There is very much that lies beneath our usual data on entrepreneurs and entrepreneurship.

Moreover, there is considerable evidence from neuroeconomics and elsewhere that much more of our behavior is driven by physiological/neurological factors than we really might want to believe.
We intended to provide a simple overview that examines the application of neuroscientific methodologies to existing research questions in entrepreneurship. At bottom, our intent was to make some small contribution to the discussion of how to test and develop entrepreneurship theory and to have added to the spectrum of entrepreneurship research methods, overcoming some of the challenges faced by alternative methodologies.

To conclude, we have all been deluged by items about neuroscience – neuromarketing, neuroeconomics and so forth. Again, some of that is hype – some of it is even more valuable than it seems. And again, if we are to look at the neurological level of human decision making, then it seems likely that this will be very useful for a better understanding of entrepreneurs and entrepreneurship. What should be growing now is the realization that neuroscience offers us a chance to learn things from entrepreneurs that we can apply even more broadly.

We may not like the answers we find – what if entrepreneurs really are born, not made? Or, more likely, driven by deep beliefs learned in early childhood? That entrepreneurial decision making is hostage to our neurochemistry?

Focus has been slowly but surely turning to the potential for entrepreneurship to lead local economies out of difficult economic times. The entrepreneurial sector has led the rest of the economy out of every recession since before 1900, yet we continue to wrestle with how do we best nurture entrepreneurial activity.

What is it that we should be doing? (Or not doing?)

We offer here a panel of four experts on this question. Each brings a strong theoretical perspective that they themselves championed, yet all four are equally passionate about the practical and pedagogical implications of their work.
Strategic Alliances between Small and Large Firms

Author: Bogdan Buduru
Email: bogdan.buduru@ic.gc.ca
Organization: Industry Canada

Abstract:
Small firms are sources of new ideas but lack the ability to develop them commercially in the way large firms do. This potential for mutual benefit is the focus here, aiming to understand how and why these linkages between small and large firms come about, and to investigate the “dark side” of these alliances. This paper identifies the resource-based and transaction costs theories as the most appropriate to jointly characterize the interaction between small and large firms. A questionnaire is used to jointly interview more than a dozen pairs of small and large partners. This study finds that (1) complementarity of resources allows for mutual help in surpassing internal and external constraints; (2) systemic and strategic learning is at least as important as technical learning; (3) asymmetric dependence and opportunistic behaviour are significant concerns; (4) virtually all interviewed firms expect strategic alliances to play an increasing role in the future.

Keywords: strategic alliance, small firms, large firms, resource complementarity, asymmetric dependence, opportunistic behaviour

I. Introduction

It is widely recognized throughout both policy and academic circles that one of the keys to growth in an economy’s competitiveness and prosperity lies in the degree of innovation in an economy. Macro efforts to stimulate innovation outputs however have varied in their effectiveness: while higher expenditures on research and development generally result, these have not always been translated into a larger number of commercialized innovations within a specific economy. At a deeper level the micro aspects of business activity suggests that entrepreneurship is also an important element in creating high growth companies and prosperity. Much attention has been directed at small high growth companies, which contribute

2 I am indebted to Professor Brahim Allali (HEC Montreal) for his tremendous efforts to put together six case studies as part of this project and to Chris Parsley for initiating this research and managing it throughout.
disproportionately to employment creation and which are consequently touted as engines of economic growth. However, the relationship between entrepreneurship and innovation at the level of the firm is not well understood. Moreover, small firms may be entrepreneurial and even R&D intensive, whereas large firms are big spenders on R&D but are not generally thought of as particularly entrepreneurial. Consequently examining the interplay between small and large firms and the strategies they adopt could increase our understanding of the entrepreneurship-innovation relationship and hence their ability to compete and prosper.

As a first step in this process this paper attempts to lay out a framework for examining the links between large firms and small firms with respect to entrepreneurial behaviour and innovation. This begins with the entrepreneurship definition adopted by the International Consortium on Entrepreneurship (ICE)\(^3\) and the Organization for Economic Cooperation and Development (OECD) which does consign entrepreneurial behaviour to small firms, but allows its existence in large firms. Small firms are often sources of important new ideas but lack the ability to develop them commercially in the way large firms do. It is this potential for mutual benefit that is at the heart of this project: to understand how and why these linkages between small and large firms come about and also to assess whether there is a role for government in facilitating such strategic alliances.

The research questions that this paper seeks to answer include: How are these mechanisms initiated? What specific arrangements are most effective for successful strategic alliances? What are the strategies for innovation that are pursued in small firms and large firms? How do they differ? How is entrepreneurship embedded in large firm strategies? What are the

\(^3\) Industry Canada has also been leading work on strategic alliances within the International Consortium on Entrepreneurship (ICE).
challenges to the start-up and stability of these linkages? How is decision making undertaken in the alliance?

This paper is structured as follows. The following section lays out the definition of entrepreneurship and strategic alliances\(^4\) and discusses the scope of these concepts. A literature review is then used to discuss the theoretical underpinnings of corporate behaviour, the reasons for strategic alliances and the findings from studies on the effectiveness and durability of strategic alliances. Some of the material is confined to an appendix for brevity of presentation. The last part of the paper seeks to use this information to identify the type of information sought and the considerations around the resources brought to an alliance that will need to be borne in mind in undertaking the case studies. A case study approach is pursued given that information on business strategy is generally unavailable at the level of the firm. Section IV describes the case study approach and presents preliminary results. Section V concludes.

\textbf{II. Concepts and Scope}

\textit{Entrepreneurship}: There are many definitions of entrepreneurship but this paper follows Ahmed and Hoffman (2007) and defines entrepreneurship as actions by individuals and/or business owners who seek to generate value, through the creation or expansion of economic activity, identifying and exploiting new products, processes or markets.

The definition highlights the essential feature of entrepreneurial activity as creating something new (products, processes or markets) which is suggestive of the role of innovation in entrepreneurship. The focus is on the activity not the organization or the individual. Furthermore by using the word “seeking” both success and failure are included in the notion of entrepreneurial activity.

\(^4\) Strategic alliances, partnerships, and collaborations will be use interchangeably throughout.
For the purpose of this paper it is important to underline that no reference is made in the definition to business size. Entrepreneurial activity can occur within a firm by an individual who has no stake in the company. Entrepreneurship can potentially exist within all companies and is not the sole preserve of small businesses and the self-employed. The concept of corporate entrepreneurship has thus evolved to describe the ways in which established firms – generally large ones – can be entrepreneurial.

*Corporate entrepreneurship (CE):* Teng (2007) defines CE as “the process by which firms innovate, form new businesses and transform themselves by changing their business domain or processes”. The aim is to “leverage current competencies and evolve new ones through innovation for the purpose of growth and corporate renewal” O’Connor and Hyland (2008). There is a clear and specific link to innovation as an important component of entrepreneurship.

Examples of corporate entrepreneurship include i) corporate venturing where established businesses create and advance new businesses within their firms in order to promote internal growth; ii) intrapreneurship – independent innovation by individuals within the established company – and the notions of championing an innovative idea and iii) fostering a management culture and attitudes that orients the company to being entrepreneurial. The distinct literature on corporate entrepreneurship is viewed through the lens of the large established firm which has resources to invest in different types of entrepreneurial activity (O’Connor and Hyland, 2008).

*Strategic alliances (SAs):* Linkages is a loose term that has been applied thus far – the subject of strategic alliances however is a recognizable strand in the CE literature. Strategic alliances are inter-firm cooperative arrangements that allow firms to temporarily seek resources from others for their own benefit. The partners’ autonomy is preserved and consequently the original entities do not lose significantly their independence in the choice of their objectives and
definition of their strategies (Dacin et al, 2007, BarNir and Smith, 2002). This is not the case with mergers and acquisitions, where a single chain of command is formed (e.g. Daimler Benz and Chrysler in 1998). Hence strategic alliances would include joint ventures - where two companies would establish a new company for the purpose of developing an innovation - but exclude mergers and acquisitions.

Specific cooperative agreements under a strategic alliance are bounded by two extremes: spot transactions undertaken by two firms, and their complete merger. In between lie a plethora of cooperative agreements that are characterized by a different degree of inter-organizational dependence. Examples include start-up assistance agreements, licensing agreements, franchising, know-how licensing, buyer-supplier relationships, outsourcing agreements, joint marketing agreements, non-equity cooperation in research, development or production equity joint ventures.

There is a vast richness of specific arrangements: both the legal form of the agreement and the strategic impact on the operations of each partner can vary and an infinite number of inter-organizational arrangements can be derived from the complex formal contracting and informal linkages (Diagram 1). In general, as one moves to the right there is an associated increase in contractual requirements as firms become more and more integrated. However, this is a gross oversimplification that cannot do justice to the richness characterizing the reality of those inter-firm multi-dimensional arrangements.

**Diagram 1**

[-----------------------------------------------]
Spot exchanges  Marketing agreements  Franchising  Equity joint ventures  Mergers

Alliances can be between partners that are competing firms or not. Alliances between competitors include shared-supply alliances, quasi-concentration alliances, and complementary alliances. Partnerships between non-competing firms can be categorized as international
expansion JV, vertical partnerships, and cross-industry agreements. The wide spectrum of inter-firm collaboration can range from R&D collaboration to cooperation in the commercialization aspects of market activities. These efforts are coordinated via a large and varied set of agreements, both formal and informal.

Large firms seem better placed to “go it alone” compared to small firms (Baum et al, 2000). They have more options at their disposal which in turn allows them to better compete in global markets. For example, large firms can choose to develop technology in-house, to acquire new technology across markets via licensing, or to collaborate in research ventures with universities, government research facilities, or with other firms. What they lack generally is flexibility in responding to market signals and the innovative intensity that characterize small firms. Hence, there is tremendous scope for collaboration between the large firms and small and medium-sized firms that will allow mutual help in surpassing internal and external constraints.

The essential point is that despite the wide range of specific activities, strategic alliances are just one avenue for firms to address their resource gaps. The next task is to examine the theoretical foundations of SAs and the results from the literature on strategic alliances.

III. Theories of Strategic Alliances

The review of the literature will consider not just the theoretical models of firm behaviour and how they explain strategic alliances but also specific reasons to join such alliances. Much of

---

5 International expansion, as the name suggests, is a strategic move whereby a company extends its activities into new geographic markets. Vertical integration corresponds to a strategy by which a company extends its activities upstream and downstream, in order to become its own supplier or customer (the make or buy decision). Cross-industry agreements achieve diversification by expanding a company beyond its industry of origin. The diversification can be either technology-related, market-related, or conglomerate in nature. (Hagedoorn, 2002).

6 Long-term strategic alliances are the main formal vehicle used to improve a firm’s competitive position and involve a significant amount of planning from the participants. Cooperative ventures with short life span exist as well, revolving around a more specific project, but they still require a certain amount of planning. Both types of venture, either long- or short-termed, involve commitment and resources devoted to the discovery and enforcement of new rules of the game defining the cooperative behaviour. Less formal inter-firm collaboration exists too, used to take advantage of unforeseen opportunities, or to implement last resort solutions.
these reasons relate to what assets small and large firms can bring to such a cooperative agreement and the differences between say a small high growth firm and a large established firm. Strategic alliances may therefore take advantage of synergies in the differences of the two types of organizations. However a further consideration is the degree to which strategic alliances are stable in the longer term and this is also addressed in the literature.

a) Theoretical Underpinnings of Corporate Behaviour

The number of theories of the firm is quite large and many are consistent with the establishment of strategic alliances. A broad selection of these theories is briefly outlined in Appendix A. Reuer (2004) and Faulkner and de Rond (2000) are good sources. From the literature however it is evident that the resource-based theory is the most prominent along with the theory of transactions costs (Das and Teng, 2000, Chen and Chen, 2003, Yasuda, 2005). Briefly, the resource-based theory allows for firms to maintain positive rents from its assets - unlike the theory perfect competition where competition always drive the rents to zero. A firm can sustain a competitive advantage by configuring its tangible and intangible assets in such a way that is difficult to imitate, or by acquiring resources, skills and capabilities that are durable yet not perfectly transferable or replicable. Where it cannot access all the resources it seeks, it can engage in a strategic alliance.

This theory can be couched in terms of transactions costs if the sustainable competitive advantage is thought of as a specific asset. Transactions costs are the costs of establishing and maintaining property rights over resources (e.g. monitoring transactions, negotiations, etc). Transactions cost theory looks at the choice between internalizing a certain economic activity and contracting for it over markets. Williamson, as one of the founders of this theory, emphasized asset specificity and the recurrent nature of transactions as key factors affecting the choices
concerning governance. As a result, cooperative behaviour would result in cost reductions through the choice of appropriate organizational structures (Chen and Chen, 2003, Yasuda 2005).

In essence the strategic alliance can therefore be viewed as reflecting what the small firm brings to the agreement, what the large firms brings to the agreement along with the potential to reduce transactions costs. The types of assets can typically be financial, technological, human resources or managerial capacity. The nature of these resources and their particular characteristics that make them able to command rents is explored further in the paper, but the development of strategic alliances can be viewed in reference to the resource based theory of the firm. Hence one needs to consider what the literature indicates on the general reasons for the existence of strategic alliances and then to discuss particular differences between a small firm interested in growing and a large firm interested in being more innovative and entrepreneurial.

b) The rationale for the existence of strategic alliances

The literature highlights a plethora of reasons as to why strategic alliances are attractive for firms generally. The following summary is, like any categorization, somewhat ad-hoc and does contain a certain overlap between categories. The following reasons are at various times found to be significant factors in the development of strategic alliances among firms of all sizes. Table 1 therefore offers a synthesis of the major reasons for alliances.

c) Different resources of small, growing firms versus larger, established corporations

Disruptive innovations increasingly originate in the private sector’s emerging growth firms7 (Das & Teng, 2000). In contrast, relatively large firms find it difficult to replicate the environment for spawning such rapid innovation. Both types of companies could therefore

---

7 Growth firms are not new companies: roughly half of them are in business for more than a decade before suddenly experiencing rapid growth (Acs et al, 2008). A small share of growth firms accounts for the bulk of the net job growth in an economy (Halabisky et al, 2006). Equally important, growth firms offer a large contribution to the overall innovation in the economy. They shake up markets and exert pressure on larger firms to innovate. To this extent, growth firms are qualitatively different than regular small firms.
benefit from a strategic alliance while speeding the process of experimenting with the firm’s own R&D ideas (Tatum 2007).

It is instructive to compare the environments in which small growing firms and large established firms operate. Areas of difference that are identified include 1) the nature of innovation; 2) the approach to the market, 3) the management culture, 4) the business model, and 5) capital deployment (Tatum 2007). These different dimensions suggest tremendous opportunities for synergy and what each partner can bring to the alliance, but they also highlight some sources of tension.

Small firms have been the primary source of innovation at the root of the industrial economies’ tremendous growth (Baumol, 2002, Audretsch and Aldridge, 2008). This is not to say that large firms have little contribution to or undertake ineffective innovation activities. In fact the bulk of R&D expenditure originates with the large firms. The main contention is that the two types of firms take on different roles in the process, with the specialization yielding spectacular results. The small firms are usually more technologically inventive than the large firms. As a result they manage to attract the most competent scientists and engineers. On the other hand, large firms are associated more with incremental innovation (Baumol, 2006, Audretsch & Feldman, 2003, O’Connor & Hyland, 2008, p. 22).

While regular firms prepare carefully for a product launch, small growing firms necessarily improvise as they go, discovering the right product and the target customer on the fly. In the early stages of the innovation process smaller entrepreneurial firms necessarily have to stay close to the customer base, which precludes a distribution channel such as the large established firms would employ.

In terms of management culture, established firms reward managers according to revenue and earnings, while small entrepreneurial firms reward management on the basis of the potential
impact of innovative products or processes. Since profitability in the latter case cannot yet be observed the appraisal is done by professional private equity investors and the focus is on the value added via innovation\textsuperscript{8}. Consequently the management skills required are quite different in an environment of product development in an ever-changing, fast-growth environment compare to that of overseeing of scaling-up production at large established firms.

The business models of small entrepreneurial firms are different from the large established firms as well. Large firms invest in new knowledge with the goal of using it in the context of the current business model by taking advantage of the current operating scale and the associated efficiencies. The constraint represented by the existing business model rarely allows for a disruptive market effect of the new knowledge. Whereas small entrepreneurial firms are in the process of continually refining the business plan and this inherent flexibility is a key aspect of the innovative potential.

Capital deployment also operates differently in the two cases. Established firms have pre-established deployment cycles of with semi-annual or annual frequency which entails elaborate planning. Small entrepreneurial firms, in turn, usually require a fast infusion of cash at the right moment, judged as appropriate by external private equity firms. Such flexibility is unlikely to be palatable to most established firms, and maybe the price paid is less radical innovation. Taking on high risk is not what large firms with a robust business model, established products and efficient distribution channels necessarily want to engage in.

\textsuperscript{8}At the same time, the more informal and flexible from an environment benefits innovation in small firms, allowing for better communication which in turn facilitates innovation. Large firms have become large by developing sales, manufacturing, and other organizational resources in a routinized fashion. All the highly efficient channels represent capabilities that make such firms highly sought after partners in an alliance with small firms.
Table 2 summarizes this discussion on the contributions small and large firms bring to the table as partners alliances. The resources put together by the two sides of an alliance are intended to be complementary, which is the source of the value creation of a partnership.

d) The resources of each partner

CE is about identifying new ways of doing business, developing new technologies, products, and processes, entering new markets, and, most importantly, devising new organizational forms. In today’s competitive environment firms have to be able to innovate along all these dimensions using proactive strategies.

Strategic alliances can greatly enhance the outcomes of CE. Interfirm cooperative arrangements like joint R&D or marketing agreements, joint-ventures, or minority stake alliances, provide the vehicles needed to materialize and experiment with new combinations of resources required to bring to the market new products and processes. The resource-based view of the firm emphasizes the presence of internal sources of perennial comparative advantage in firms. As such, this view clearly validates the use of strategic alliances in facilitating access to resources in the context offered by CE.

A key feature of entrepreneurship is the aggressive pursuit of growth opportunities. This effort attempts to overcome the inherent limitation represented by the current resources available to growth-oriented firms. The three major components of CE, innovation, strategic renewal, and corporate venturing, represent as many avenues to encounter new business opportunities while expanding. However, CE activities have significant resource implications, resulting almost always in the creation of resource gaps: the firm’s resource base needs to be augmented in order to take full advantage of new opportunities.

A resource gap represents the type and quantity of needed resources and may refer to financial, technological, human, and organizational resources. In entrepreneurial firms this gap
cannot usually be met by a simple reallocation of resources. Instead, filling resources gaps are tackled via market transactions, acquisitions, and strategic alliances. Tangible resources (e.g. physical, capital, financial) can be pursued via product, service, labour, and capital markets. Technological, knowledge, and organizational resources can be acquired via contract-based market transaction (e.g. licensing, consulting, etc.). Acquisition of another firm that has the needed resources is another way of bridging the resource gaps but the fact remains that most acquisitions fail to deliver the synergy sought through integration. Lastly, forging strategic alliances brings flexibility, cost and risk sharing among partners, and the much needed resources to meet resource gaps. Eisenhardt and Schoonhoven (1996) show empirically that more innovative firms tend to be associated to participation in alliances.

From the perspective of the resource-based theory, there are certain conditions or characteristics that resources need to have in order to enhance the firms’ value-creation potential. The resources need to be valuable, rare, imperfectly imitable, and imperfectly substitutable. More generally, the resources need to be heterogeneous and imperfectly mobile, and be able to impose ex ante and ex post limits to competition.

Each firm is idiosyncratic in terms of its mix of resources accumulated over time. It is this resource heterogeneity that fuels the search for alliances. However, the firm has to carefully amass superior, scarce resources in order to fare well in the alliance process and to preserve its competitive advantage over time. The larger the resource heterogeneity of partners, the larger the gains flowing from an alliance. At the same time, firms fearing opportunistic behaviour from potential partners may choose partners with a similar resource makeup, in order to better protect its resources. In this case, the benefits of an alliance are drastically reduced. In contrast, firms that are aggressive and willing to take risk will prefer a high degree of complementarity in their partners’ resources, reaping bigger rewards from alliances.
Imperfect mobility is a desirable feature of resources for firms entering strategic alliances because it insures that valuable resources cannot be easily bid away from the company. This leads to stabler alliances and sustainable comparative advantage for the firm. Imperfect mobility is obtained by focusing on relation-specific assets (e.g. site specificity, physical specificity, human asset specificity). Specific assets lead to lower coordination costs, effective cooperation, and significant trust between partners. However, asset specificity presents a high potential risk of opportunism since specific resources cannot be easily traded without significant loss of value. Firms fearing such risks may choose not to enter alliances or to use less specific assets, foregoing substantial benefits coming out of alliances.

e) The challenges faced by strategic alliances

Strategic alliances face significant management and operational challenges since they are based on top of a number of fault lines. These include: firm vs. group interest, short vs. long-term orientations, rigidity vs. flexibility in structure, differing firm goals and competitive environment, power differentials and asymmetric interdependence.

Alliances are seen as temporary commitments to be disposed of if the conditions that favour cooperation change. The calculus of cooperation vs. competition is different for each member of the alliance. The analysis is complex, with a multitude of factors playing a role, from factors internal to the firms, to intra-alliance factors, to those affecting inter-alliance competition, and finally to those factors present in the environment in which alliances compete. Non-cooperation has serious implications for SMEs since they are more likely to rely on outside resources to bring products and services to the market. SMEs need alliances the most but are also the most vulnerable since they often lack other lines of business to fall back on if their alliances fail.

The existence of multiple decision centres will lead to constant bargaining and class of interests, which may lead to paralysis or dissolution of the alliance. In other word, the alliance
mitigates some risks but creates a new set of risks. However, viable alliances have developed means to address challenges raised by incomplete contracts. While the firms remain independent, contributions are made continually by partners, which have limited control and share risks and benefits.

A particularly important challenge faced by firms contemplating setting up a strategic alliance is choosing a partner (Dacin et al, 1997, Das 2005, Das and Teng, 1998 and 2000, Miles et al, 1999). Since strategic alliances’ performance depends crucially on how well the particular characteristics of the partner firms fit together, it is essential for firm pondering a potential the decision to enter an alliance to perform a thorough partner analysis. This requires a joint assessment comprising both the market and the resources offered by the potential partner. A thorough evaluation would reveal important dimension of the would-be alliance, such as collective strengths and interdependencies (i.e. resource alignment), and help identify a good overall match with a partner.

f) What small and large firms get out of a strategic alliance?

Finally, then what does the literature tell us about the positive aspects for small and large firms from a strategic alliance? A study of 128 alliances between large and entrepreneurial firms in three US industries by Alvarez and Barney (2001) reveals interesting albeit not totally surprising findings. The small (or entrepreneurial) firm is defined as a firm with fewer than 150 employees that had been in existence for less than 5 years. In this sample the entrepreneurial firms had sales averaging $25 million while their large firm partners averaged $1 billion in sales. Large firms that are part of alliances with small firms gain access to new technologies and to state of the art engineering talent, together with excellent innovative capacity. Strategic alliances can offer legitimacy to small firms, together with access to distributional, marketing, and manufacturing
resources needed to commercialize its new technology. In addition, strategic alliances may constitute a vehicle to the financial capacity needed to bring a technology to market.

Alvarez and Barney’s main finding refers to the extent to which the two sides of an alliance benefit from it. While the potential gains from alliance are mutual, in some instances the small firms can suffer from it, and even endanger the survival of the firm. The key aspect of the success of the alliance seems to be the speed at which the large firm has gained access to the new technology representing the main asset brought in by the small firm. When this technology is the only resources contributed to the alliance by the small firm, most of the value created by the alliance is appropriated by the large firm.

The large firm need to study the products and processes associated with the new technology proposed by the small firm in order to successfully commercialize it (e.g. manufacture, market, and distribute it). This learning process is mostly one-sided, since it is difficult for the small firm to imitate the large firm’s organizational capabilities. The associated routines were usually developed over long periods of time during the growth process of the large firm. It is this asymmetry that leads to the imbalance in the benefits drawn from the alliance by the two parties. This mechanism is consistent with the resource-based view of the firm.

Once the large firm learns about the partner’s technology, it could elect to withdraw from, under-invest in, or shift resources away from the alliance, which would hurt the small firm. This danger constitutes the basis to the risks associated with joining an alliance by the small firm and may convince many a small firms to “go it alone”, which would prevent the benefits flowing from alliances to materialize (market failure occurs).

One solution to this issue from the point of view of a small firm that joins an alliance is to control somehow the rate at which the large firm learns about the technology. While this comes at a cost, delaying commercialization and diminishing the small firm’s cash flow early on, it
significantly improves the chances of keeping the alliance afloat. To alleviate those delays, the small firm can use elaborate (yet costly) contracts to put milestones in place and define specific terms and goals. Building their relationship on trust throughout is essential for both parties. However, the ideal strategy by the small firm, if feasible, is to bring a diversified set of resources to the table, either in terms of several available technologies or strong ability to produce a stream of new technologies. This would put the small firms on a more equal footing with the large firm, yielding the right incentives for the latter to continue to contribute to the alliance. This strategy comes at a cost as well, since the small firm has to make large early investments in R&D capabilities. The strategy is also consistent with the resource-based view of the firm.

Large firms also need to understand the dangers flowing from building an alliance with an entrepreneurial firm relying on a sole new technology as its contribution. Unless it enters the alliance attempting to expropriate the small firm, the large firm has to insure that its partner has or at least is capable of generating several technologies. In addition, it is beneficial for the alliance if the small firm has adequate management skills to learn from the large firm how to emulate organizational capabilities, and more generally, the skills needed to make an alliance successful. Another aspect that needs to be clarified early on is the preference by the small form to remain independent or not, and whether it intends to grow rapidly or not.

Smith et al (1991) look at inter-firm collaborative networks between a large variety of firms, including small and large firms, using a case study approach. The focus is on the contribution of individuals that are part of small or large firms and the often informal networks they are part of. These individuals are the entrepreneurs in the small firms, and the “intrapreneurs” in the large ones. Superimposed on these networks are those of the decision makers at the top level of each firm. The complexity of these networks makes it hard both to predict as well as to materialize the gains from collaboration.
IV. Case Studies and Results

There is a clear need for case studies approach here since the aim is to seek out information on business strategies. Some information on firm collaboration is available at a macro level (see data available from the Statistics Canada’s 2005 Innovation Surveys in Appendix B) but this paper seeks to study firms’ specific elements of strategic alliances. This kind of information is only really to be gleaned from a case study approach.

Selection Criteria for the Case Studies

This project examines strategic alliances (or partnership, relationships, linkages, collaborations) between a large firm (over 500 employees) and a small firm. The alliance may contain more than these two firms.

Requirements (must have):

- The small firm has to be Canadian owned and based in Canada, while the large firm can be foreign.
- The firms are independent (i.e. one does not have shares in the other company and joint ventures are excluded). That way we insure that the relationship is temporary, even though it can be long standing. The point is that since the firms are not linked via ownership, they have to work out an understanding. It is precisely this process our research project focuses on.
- The partnership should go beyond a simple seller-buyer relationship, i.e. we are not interested in cases, for example, where a small firm simply manufactures a component for a large firm. We are interested in richer collaborations, where the complementarity of skills, capabilities, and resources drives the relationship of the two firms.
Requirement (at least one aspect from the list below has to be present):

- temporary relationships/alliances/partnerships with a strong innovative and/or entrepreneurial component (i.e. there is an unambiguous newness aspect to the outcome of the collaboration)

- interfirm relation that is focused on the creation of new knowledge (technological or organisational) via interaction

- interfirm cooperation based on a collaborative transfer of knowledge (i.e. going beyond a simple license acquisition)

- partnership geared toward access to complementary resources (firms contributing diverse yet matching skills)

- relationships that facilitate product development and/or commercialisation (taking it to the market)

- special relationship with a supplier if linked to product development or improvement

The person responsible for the day-to-day management of the strategic alliance was interviewed in almost all cases. The exceptions include cases in which the person who set up the alliance was interviewed.

The questionnaire includes a large number of questions grouped in three categories. Examples of questions are presented below. While the task of going through all the questions appears daunting, most interviews were conducted in less than 30 minutes. Making the questionnaire available in advance and using an experienced interviewer insured the interviews were conducted in a reasonable time frame. All interviewees agreed to have the interview taped,

---

9 The full questionnaire is available from the author upon request.
although a majority of them requested confidentiality assurances. Here are examples of questions/issues addressed in the questionnaire.

1. **Dimensions defining the nature of alliances (some examples)**

   - Characteristics of the company (industry, main products/services, sales, number of workers, export activity, perception of the market it operates in – competition level, etc.)
   - Participation in strategic alliances (last ten years, last five, exclusive with foreign/domestic companies, how many still active)
   - Objectives for participation in alliances: pick several reasons from a list, and rank their relative importance.
   - Types of partners used: competitors, suppliers, clients, distributors, etc. Who are the most suitable partners? What are the criteria used to select partners?
   - Performance of alliance (process): life span, barriers to formation, risks, difficulties, stages, lessons learned, cooperation/competition balance, etc), decision making (has a formal assessment of the desirability of joining an alliance been done – e.g. cost-benefit analysis).
   - Impact of past and current alliances (including ranking): build firm’s knowledge base, etc.

2. **Specific questions targeting small-large relationships, as opposed to general alliances**

   - Who initiates the talks on building a SA?
   - What defines a good match between a small and large firm?
   - Are small firm – large firm alliances inherently more unstable than large-large or small-small alliances? Why?
   - What kind of role do contracts play in supporting a SA? Are there significant problems with enforcing such contracts?
   - How important is the learning associated with being a member in a SA?
3. Characteristics of Resources

- What are the strategic resources of the partners?
- Why are these resources “strategic”? What are their characteristics?
- Are these resources substitutable or imitable?
- How are the knowledge assets dealt with? Is there a danger that knowledge in small firms will be expropriated by the large firm? What measures protect against this?

Key Findings

The following results are preliminary findings that are quite illustrative of both the benefits flowing from strategic alliances and the issues encountered by the partners. The case studies completed identified a number of benefits of these arrangements that were also evident in the literature:

- By combining resources that are complementary, alliances allow the partners to overcome their respective internal and external constraints.
- The source of value creation inside an alliance comes from the fit between the different resources that the small and large firms bring as partners.
- Increasing revenue is not the number one reason for engaging in strategic alliances. Instead, accelerating market access and reducing innovation costs represent top reasons for joining a strategic alliance.
- There is significant evidence that the ability of firms to acquire and disseminate new knowledge is much more important than previously thought and systemic and strategic learning seem to be at least as important as technical learning.
- Virtually all interviewed firms expect strategic alliances to play an increasing role in the future, recognizing them as flexible vehicles bringing about tremendous benefits.
At the same time those interviewed emphasize the challenges faced by alliance partners.

- Important concerns of alliance members include heavy dependence by the small firm and potentially opportunistic behaviour by the large firm.
- Both small and large firms are aware of the risk of losing control of its intellectual property while engaged in alliances. However, evidence shows that small firms invest comparatively more in mitigating this risk, both at the time of setting up the alliance and during its unfolding.
- Strong interpersonal relationships and trust and compatibility of business culture between partners appear to be key success factors in an alliance.
- Small firms may be more risk averse and respondents noted that at times the benefits from strategic alliances may be bypassed because small firms may over-emphasize the risk of joining an alliance.

Respondents when asked also provided views on a possible government role in facilitating strategic alliances, specifically:

- Both small and large firms would welcome government efforts to facilitate greater inter-firm interaction through such mechanisms as creating opportunities for the firms to meet and by providing actionable intelligence in developing markets.
- Biotech firms specifically mentioned the government review process of products as an important cause for alliance failure. While the review necessarily includes the unsuccessful projects and the dissolution of narrowly focussed alliances, more transparency would be helpful.

The information contained in these cases of strategic alliances provides some policy implications. Greater understanding about the types of government support needed would help policy makers facilitate alliance formation and assist members in further developing such
partnerships. One promising area would be to examine the organizations that acted as intermediaries and facilitated the contacts between the small and large firms. Such efforts can reduce the loss from missed partnering opportunities and help to promote economic growth.

While the case studies cover a wide variety of industries, there is insufficient sampling to permit analysis of any industry-specific concerns related to alliances. The work suggests a more in-depth analysis of the value of networks and the role of intermediaries, including an assessment of the existing models, is needed to better understand the role of government and the precise mechanisms that can be utilized in these areas.

V. Conclusions

This study makes a number of specific contributions to the burgeoning literature on strategic alliances. First, it focuses on alliances between small and large firms, recognizing the tremendous scope of such collaborations. The complementarity of resources characterizing such interfirm cooperation allows for mutual help in surpassing internal and external constraints. Second, this study provides evidence showing that organization learning is much more important than previously thought. Specifically, systemic and strategic learning seems to be at least as important as technical learning. Third, this paper uncovers via case studies some of the main fault lines in strategic alliances between small and large firms. It highlights important concerns such as asymmetric dependence and opportunistic behaviour. Fourth, it finds that both small and large firms welcome governments to do more to facilitate their interaction.

Transaction costs theory
Appendix A

Theories framing cooperative behaviour can be divided in three broad areas: economic, organizational, and cooperative behaviour ones. A short description of each is offered below.

I. Economic theories

1. Strategic management theory (market power)
2. Transaction cost theory
3. Resource-based theory
4. Agency theory
5. Game theory
6. Real option theory

1. Strategic management theory (market power)

It originates with the publication of Competitive Strategy (1980) by Michael Porter. Paradoxically, competitive intensity is addressed with “positioning” and cooperative behaviour. The latter is a better instrument to achieve greater market power than, say mergers or acquisitions, and leads to better profitability. A host of other researchers then moved away from Porter’s atomistic view of the firm and toward the “keiretsu” approach to developing market power (“island of planned coordination in a sea of market relations”).

2. Transaction cost theory

The gist of TC theory: cooperative behaviour leads to cost reductions via different methods of organizing transactions. TCs are the costs of establishing and maintaining property rights over resources (e.g. monitoring transactions, negotiations, etc). TC theory looks at the choice between internalizing a certain economic activity and performing it over markets. Oliver Williamson advocated TC theory in the 1970s but the fundamental concepts were developed by Ronald Coase (1937, 1960). Williamson emphasized asset specificity and the recurrent nature of transactions as key factors affecting the choices concerning governance. The structures defining governance choices (e.g. joint ventures) are deemed as intermediaries between markets and hierarchies. While fundamentally sound and intellectually appealing, TC theory was criticized because it ignored factors important to the business decision maker, such as risk, synergy, and effectiveness, and because it adopts a static approach to cooperation.

3. Resource-based theory

Unlike the perfect competition story, this theory holds that competition cannot always drive the rents to zero. Instead, a firm can sustain a competitive advantage by configuring its tangible and intangible assets in a way that is difficult to imitate, or by acquiring resources, skills and capabilities durable yet not perfectly transferable or replicable. This theory can be couched in TC terms, with the sustainable competitive advantage thought of as a specific asset.
This theory focuses on the ability of principals (shareholders) to ensure the agents (management) are fulfilling the objectives of the principals. Agency theory looks at mechanisms constraining the agents’ self-serving behaviour, such as contracts and other incentives, with the goal of mitigating the asymmetry of information between principals and agents. Agency theory implies that both the principal and agent can be viewed as partners to a cooperating venture that need to clarify the split of returns from effective cooperation and need to put in place systems to share information and reduce opportunism.

5. Game theory

This theory looks at predictions of outcomes from games which involve several players whose interests are interconnected. It can be applied to a large variety of situations, such as sport, financial, and military affairs. It has started by focusing on non-cooperative games but quickly demonstrated that cooperation can emerge in a world of self interested players without a central authority, more likely in the case of repeated interaction. Short term non-cooperative dominant strategies yield to cooperative ones in repeated games with indeterminate end. Game theory makes valuable contributions to the analysis of cooperative strategies by revealing under what conditions cooperation is rewarding or undermined.

6. Real option theory

Standard finance theory states that no resource commitments should be made unless absolutely necessary, since the future will be different from that expected. Keeping one’s option open seems like a sensible strategy. In addition, investment in a portfolio of options helps diversify risk. For example, “compound options” offer, if exercised, access to further options, which in turn render more options. “Learning options” are those where the holders makes small investments to learn about new opportunities (e.g. specific technologies). Cooperation then serves to generate a portfolio of low-risk options which in turn open up further options down the road.

II. Organization theory

1. Resource dependence theory
2. Organizational learning
3. Social network theory
4. Ecosystem view
5. Structurationist perspective

1. Resource dependence theory

Firms are not internally self-sufficient and therefore require resources from the environment. To this degree, they are dependent on the environment in which they transact. Consequently, cooperation may ensue in order to provide firms with access to financial resources, expertise, skills, processes, or markets. Further, firms try to reduce uncertainty in their environment by cooperating with prominent parts of it, yet this attempt in itself will represent a source of additional risk (e.g. the danger of opportunism from the partner). Resource dependence theory is
consistent with the resource-based theory. The latter recognizes that firms’ performance depends to some degree on unique capabilities (core competencies) and sustained competitive advantage, and these can be leveraged within a cooperative setting in which are traded for access to capabilities held by other firms (e.g. knowledge, technologies, etc.). It is useful to note that there is a trade-off at play here: the firm accepts some loss of autonomy while entering cooperative enterprises, but gains in terms of improving its competitive edge.

2. Organizational learning

This learning refers to the ability of firms/organizations to acquire and disseminate new knowledge that can enhance their future performance. Of course, there is always the danger that certain organizational structures, or cultures, or vested interest will pose barriers to learning. There are several types of learning: routine learning (incremental), reframing learning (more fundamental reassessment), and secondary learning (development of learning mindsets/habits). An alternative classification (more intuitive) is technical, systemic, and strategic. A different breakdown of learning can refer to the collaborative type (transfer of knowledge and skills from the partner firm), and learning about the complex management of cooperative ventures.

3. Social network theory

The definition of a network is somewhat ambiguous, pretty much as that of a supply chain. Networks are pictured as a hybrid form situated on the spectrum between markets and hierarchies. Social networks are defined as persistent and structured sets of autonomous players who operate on the basis of implicit and open-ended contracts. Such contracts are socially rather than legally binding. The actions of actors that are part of the network are explained in the context of their position in the network seen in dynamic terms. This theory emphasizes social links by examining their formation, evolution, performance, and performance consequences.

4. Ecosystem view

Related to social networks, the ecosystem perspective views organizations/firms as members of a community of suppliers, producers, competitors, and other stakeholders that seek mutual support and jointly progress toward a shared vision. The incentive to cooperate is embedded in the perceived value of generating economies of scale and scope, and a reinvestment of return in this ecosystem to facilitate the arrival of future generations of products and services. The collapse of traditional industries gives rise to ecosystems with loosely defined boundaries. A firm’s profitability, in turn, would depend on its ability to manage relationships in this ecosystem, to position itself inside it, and to contribute to the competition with similar constellations. Key idea here, somewhat similar to the keiretsu: competition takes place not among firms, but among constellations of organization. Within its own constellation, the firm is busy creating a reputation for creditworthiness, reliability, predictability, and designing know-how. In a nutshell, the constellation creates the setting for successful collective action, taking cooperation to a different level. Not unlike market power theory, the ecosystem view implies that competitive rivalry is enhanced, rather than being inhibited. Like-minded groups of firms have better chance at catching up to industry leaders, narrow competitive gaps, and bring about less differentiation among competing firms.
5. Structurationist perspective

A relative newcomer, this view originates in a sociological approach to the study of alliances and points to the impossibility of meaningfully describing structure in the absence of considering strategic choice. Action emerges out of social structure and at the same time reproduces or transforms these structures.

III. Cooperative behaviour

1. Culture
2. Trust
3. Commitment

1. Culture

Organization culture and leadership, together with the role of national culture in the workplace are the main topics here. Since international strategic cooperation is more and more prevalent nowadays, both aspects need to be taken into account in order to set realistic expectations and putting in place appropriate operating rules governing communication and performance measurement. National culture appears to reside mostly in values, while corporate culture is lodged primarily in practices. Homogeneity is a measure of strength, while heterogeneity is a potential source of weakness. However, companies originating in different cultures have a lot to gain by learning from each other, providing that they appreciate their differences and do not need to spend a lot of resources trying to understand each other.

2. Trust

Trust and goodwill have been found to be vital in alliances of all kind by enhancing communication, stabilizing the relationship, and help avoid conflict by increasing partners’ tolerance for each other. While trust facilitates cooperation, it is not a necessary condition. However, trust is a social norm that lessens the need to use hierarchy to attenuate opportunism. As such, trust lowers transaction costs and increases investment returns, while enhancing the innovation and learning.

3. Commitment

Commitment is different than trust: one can be committed to a partner it depends on, but not trusting him; one can trust completely a partner but at the same time be committed only to a limited degree, preserving viable alternative courses of action. Commitment can be signalled in several ways: making large capital investment, sticking with the deal even when the going gets tough, disclosing proprietary information, etc.

HOW TO IDENTIFY AND ASSESS ENTREPRENEURIAL COMPETENCIES IN THE CONTEXT OF FRENCH MICRO-ENTERPRISES

We consider that the competitive advantage of small firms partly results from the competence of the entrepreneur to promote his project. Our purpose is to reply these questions: What competences are perceived by the entrepreneurs and institutional as necessary for small company manager? How can we translate these definitions into a self-diagnosis tool?

Our study is a continuation of the work done by Chandler and Jansen (1992) and Lorrain, Belley and Dussault (1998). Chandler and Jansen (1992) proposed the typology most often encountered in literature on entrepreneurship, and which had been approved by 134 SME managers: entrepreneurial, managerial and technical competencies. We present the main approaches to the subject of individual and entrepreneurial competences.

We propose first results of qualitative research carried out within the framework of a research project involving entrepreneurs, institutional management and academics: the Lorraine Managers’ Club. Qualitative data is gathered mainly through observation, individual and collective interviews. Concretely, our expert group is made up of 5 micro-enterprise managers, 6 management science researchers and 4 institutional representatives of the Regional Chamber of Trade, the Regional Professional Craftsmen’s Union and the Higher Institute of Trade.

The first results that we obtained concern 7 generic competences deemed necessary for the managers of small companies, irrespective of their area of business. We underline that the aim of this tool is perceptual measurement rather than objective evaluation of the competences of entrepreneurs. This raises the question of whether the mental image that entrepreneurs have of their competences matches their real competences. However, we do believe that perception-based competence measurement is a delicate issue, conditioned by the perceptions of the managers (Bandura, 1982; Spencer and Spencer, 1993) and necessitating considerable empirical resources (Lorrain et al, 1998).
1. Introduction

Opportunity identification is considered by many as the first step in the entrepreneurial process (Baron & Shane, 2006; Baron, 2004; Shane & Venkataraman, 2000). But from whence to entrepreneurial opportunities come? *Entrepreneurial opportunity* has been defined by some as the possibility to introduce innovative goods or services to a marketplace (Gaglio, 2004; Singh, 2000). From this perspective, an opportunity can only be considered an entrepreneurial opportunity if it is innovative or radical to a society or industries (Gaglio & Katz, 2001; Schumpeter, 1934; Shane & Venkataraman, 2000; Smith, Matthews, & Schenkel, 2009). By contrast, others have defined entrepreneurial opportunities simply as situations where “pure profit potential” exists (e.g., Kirzner, 1973) through the introduction of imitative goods or services generated by the earlier errors of other marketplace participants. Additionally, they can be seen as “arising from unanticipated independently-caused, changes in underlying market circumstances” (Kirzner, 1997: 7).

While debate clearly continues to focus on the issue of whether innovation (e.g., Schumpeter, 1934) or firm creation (e.g., Gartner, 1989) reflects the distinctiveness of entrepreneurship as a research domain, the focus of the debate has changed in recent years. Specifically, researchers have increasingly observed that a fundamentally important issue in its own right revolves around the nature or degree of opportunity novelty as a basis for firm founding (Bhave, 1994; Cliff, Jennings, & Greenwood, 2006; Davidsson & Wiklund, 2001; Shepherd, Douglas, & Shanley, 2000; Zimmerman & Zeitz, 2002). This is an important issue for research to inform because even though innovation can be a source of competitive advantage (Barney, 1991; Porter, 1991; Wernerfelt, 1984), not all firms successfully founded and sustained by entrepreneurs are based on innovative opportunities. For example, simple observation of the modern growth in franchise-based business ventures (e.g., Jiffy Lube, Valvoline, EZ Lube, etc.) suggests that the number of individual firms founded on the basis of imitative opportunities in a market is likely to
disproportionately outweigh those founded on the basis of innovative opportunities. Empirical research findings that distinguish imitative from innovative opportunities appear to support such anecdotal observation. For example, Aldrich (1999) found evidence suggesting the majority of new firms are actually founded simply by reproducing or imitating what has been done before.

Despite the contributions and insights of prior research, little work has explicitly sought to advance our understanding of the processes that bring about the differences between imitative and innovative opportunities. For example, Carland et al. (1984) have noted that innovation is a key factor that helps distinguish entrepreneurial opportunities from simple arbitrage opportunities (Carland, Hoy, Boulton, & Carland, 1984). Similarly, Shane (2001) focused on the impact that prior knowledge had on opportunity recognition by entrepreneurs. Yet as recent investigations illustrate (e.g., Fiet & Patel, 2009), empirical researchers have focused on the mechanisms influencing the pursuit of entrepreneurial opportunity more universally, rather than distinguishing between those that are innovative and those that are imitative in nature. As a result, insight into the nature and origins of opportunity and its relationship to the nascent firm founding process remains limited by the possibility that important contextual differences exist (Ucbasaran, Wright, & Westhead, 2006) and systematically differ across opportunities. In short, the need for research that focuses more explicitly on the nature and variation of entrepreneurial opportunities is highlighted (Shepherd & DeTienne, 2005; ).

We seek to address this gap by investigating four research questions designed to build on prior work (i.e., Corbett, 2005; Dimov, 2007; Shane & Venkataraman, 2000; Shane, 2001; Smith, Matthews, & Schenkel, 2009) emphasizing a more prominent role of the nature of the entrepreneurial opportunity. First, does the type of opportunity identification process (i.e., alertness versus systematic search) used by the entrepreneur impact type of opportunity (i.e., imitative versus innovative) likely to be identified? Second, does the heterogeneity of prior knowledge used by the entrepreneur influence the type of opportunity
identify by the entrepreneur? Third, does the combination of identification process type and heterogeneity of an entrepreneur’s prior knowledge influence the type of opportunity identified? Fourth, do these relationships differ between technology-based and nontechnology-based nascent venturing efforts? Our proposed model is as follows:

<INSERT FIGURE 1 ABOUT HERE>

This paper proceeds in the following manner. First, we review the literature on entrepreneurial opportunity identification processes with respect to two schools of thought that appear dominant in the entrepreneurship literature. We then review the literature focusing on entrepreneurial opportunities, paying particular attention to the innovative versus imitative distinction it reveals. This is followed by a discussion on how the hypotheses were tested based on data obtained from the Panel Study of Entrepreneurial Dynamics (PSED). The paper concludes with a discussion of our results and suggested future research directions.

2. Literature Review

2.1 Opportunity Identification Process

The purpose of this research is not to explore implications of the two types of opportunity identification processes – passive search and systematic search\(^1\) per se. Rather, it is to determine whether the use of systematic search or the process of entrepreneurial alertness in finding information systematically leads individuals to identify opportunities that are characterized as more innovative in nature. We now turn attention to a discussion of two broad schools of thought on how individuals identify entrepreneurial opportunities.

2.1.1 Systematic Search

One opportunity identification school of thought suggests that the search for information about unknown venture ideas can be replaced with the search for known information sources (Fiet, 1996). Scholars subscribing to this school of thought suggest that discovery of information about an opportunity is dependent on an entrepreneur’s prior specific knowledge. Proponents of this view further suggest that the use of a systematic search of information within an individual’s consideration set - grouping of information channels that emits signals that may indicate a potential discovery (Fiet, 2002) - might lead to a greater chance of discovering information within that particular consideration set than discovering information outside one’s consideration set (Patel & Fiet, 2009).

While systematic search research has yielded important insights into the opportunity identification process, a number of researchers have suggested that it is impossible to search systematically for unknown discoveries if the search domain itself is unknown (Kirzner, 1997; Kaish and Gilad, 1991). This argument is based on the idea that in an unbounded search domain, no optimal solution for which search can focus exists. Proponents of the systematic search perspective address this argument by suggesting that a consideration set approach restricts a person’s search domain to his/her prior knowledge, which in turn makes a the search for information possible as it is based on what the person possesses, rather than on a body of shared and commonly agreed upon information by market participants.

2.1.2 Passive Search
A second opportunity identification school of thought is based on Kirzner's early conceptualization of alertness, which is predominantly considered an economics-based perspective. In this work, Kirzner defined “alertness” as “the ability to notice without search opportunities that have hitherto been overlooked” (Kirzner, 1979: 48). Interestingly, his conceptualization does not suggest that individuals identify opportunities by pure accident. Rather, it suggests the notion of opportunity discovery through alertness is somewhere between that of deliberate search and that generated by pure luck (Kirzner, 1997), reflecting
what can be called *passive search*. While in the mode of passive search, the entrepreneur is receptive, but at the same time, not engaged in a formal, systematic search process (Ardichvili, Cardozo, & Ray, 2003). In other words, it is consistent with the proverbial idea that “chance favors the prepared mind”.

Like other Austrian economists (e.g., Hayek, 1945; Mises, 1949), Kirzner’s perspective suggests that opportunities exist at least in part because different people have access to different information in the form of facts, knowledge or data (Kirzner, 1997). Because differential access is likely to result in the possession of incomplete information by any one individual, it is also likely to lead to individuals making errors in the form of misallocated resources in the market. Some people rightly recognize that resource misallocations exist. These people then obtain the resources, recombine them, and exploit them in more efficient and effective uses (Casson, 1982).

The review above suggests that while both these perspectives (passive and systematic search) emphasize the importance of information access, they differ fundamentally from earlier work in that they suggest how individuals gain access to and use information could in turn lead to differences in the identification of an entrepreneurial opportunity.

### 2.2 Entrepreneurial Opportunities

Researchers take different views toward the nature of opportunities, which in turn suggests the potential for differences to exist with respect to how individuals are likely to come across them. Broadly, these views can be characterized as reflecting three schools of thought. The first view reflects the idea that opportunities reflect a physical tangibility that individuals can recognize. This view operates under the assumption that the source of demand and the source of supply readily exist but are unconnected by the existing market price mechanism. According to this school of thought, individuals recognize that an unmet need exists between existing sources of both supply and demand, and that this unmet need can be exploited. Because sources of both supply and demand already exist, exploitation of these types of
opportunities often described simply as taking the form of arbitrage (Alvarez & Barney, 2008; Gregoire, 2005; Venkataraman & Sarasvathy, 2001).

The second view reflects the idea that opportunities are created by individuals (e.g., Schumpeter, 1934). This view assumes that neither the source of supply nor demand exists, thus rendering the existence of a connection via the market mechanism impossible at the outset of the exploitation process. According to this school of thought, both supply and demand have to be created first, and then taken advantage of by individuals (i.e., entrepreneurs) to create opportunities for financial return (Venkataraman & Sarasvathy, 2001). In sum, the exploitation of these types of opportunities often described as taking the form of creative (Dimov, 2007) and development oriented (Ardichvili, Cardozo, & Ray, 2003) efforts on the part of the entrepreneur.

The third view considers the idea that opportunities reflect a physical tangibility in part, but also require the discovery or identification of additional elements that require action by individuals to bring into existence. This view operates under the assumption that either the source of demand or the source of supply is unknown (but not both) and unconnected by any market mechanism as a result. According to this school of thought, an individual discovers or identifies either a novel way to serve an existing market need, or discovers or identifies a new market that could be satisfied with an existing means of supply (Sarasvathy, 2001). This perspective shares qualities of the recognition and creativity views in that it acknowledges both identification aspect of existing resources, as well as the need to create or develop a corresponding connection between existing and potential uses in the marketplace over time (Ardichvili, Cardozo, & Ray, 2003: Dimov, 2007; Kirzner, 1997).

This review suggests that the existence of entrepreneurial opportunities can be conceptualized categorically those of either an imitative or innovative nature though such a dichotomy is rarely if ever expected to be observed in practice. Rather, in practice these ideal types are more likely to reflect
opposing ends of a continuum (Samuelsson and Davidsson, 2008; Weber 1947). Imitative opportunities can be seen as those that represent the existence of gaps and mismatches in information across market participants that could be profitably exploited (Kirzner, 1979). These imitative opportunities stem from changes in supply and demand which are in turn brought about by market inefficiencies (Aldrich & Martinez, 2001; Aldrich, 1999; Amason, Shrader, & Tompson, 2006; Kirzner, 1973; Shane, 2003). These opportunities are associated with routines and competencies that vary slightly from those of existing, similar ventures (Aldrich & Kenworthy, 1999; Aldrich & Martinez, 2001). By contrast, innovative opportunities can be conceptualized as those that evolve largely from creative human action coupled with changes in technology, political structure, regulatory environment, and social/demographic environments (Schumpeter, 1934; Shane, 2003). Research suggests that a hallmark of innovative opportunities is that they break away from existing knowledge and information streams (Amason et al., 2006; Shane, 2003), leading to the creation of products or services that are significantly novel or different from other existing products, services, or ventures.

3. Hypothesis Development
3.1 The Relationship between Opportunity Identification Process and Opportunity Type
Studies suggest that constrained, systematic search is focused on the search of known information sources, rather than a search for unknown venture ideas (e.g., Fiet, 2007). According to this information-based perspective, the search for information is constrained by an individual’s bounded rationality, as well as his/her prior knowledge. It suggests that entrepreneurs make use of existing informational channels – sources of signals (current information that changes a person’s ideas about future state) (Fiet, 1996; Fiet, 2007) to search for information. An underlying rationale of this school of thought is that opportunity identification would depend on “a fit between an entrepreneur’s specific knowledge and a particular venture idea” (Fiet, 2007: 5). This means that an individual must “identify domains in which he or she possesses prior, specific knowledge, create a set of information channels with a high probability of finding informative
clues of commercial potential, craft a search strategy, evaluate signals, and develop decision rules” (Fiet, Norton, & Clouse, 2007: 330). DeTienne and Chandler (2004: 244) further suggest that “search is envisioned as a sorting or winnowing through already existing opportunities and human creativity is not theorized to play a major role”.

The above discussion suggests that entrepreneurs who utilize a systematic search process to identify opportunities would be disproportionately attuned to information channels and signals related to their prior specific knowledge. Specifically, individuals who have only prior specific knowledge about a specific domain might miss information signals related to the broader domain itself, but not those relevant to potential entrepreneurial opportunities within the domain (Chang & Burke, 2007; D'Souza, 2009). Additionally, prior knowledge could lead to the entrepreneurs relying on biases such as neglect of probability (ignoring relevant information), framing effects (decisions being affected by irrelevant information), and anchoring (giving excessive weight to an unimportant but salient information) (Kahneman, Slovic, & Tversky, 1982; Nisbett & Ross, 1980; Sherman & Corty, 1984), which could in turn lead to the identification of opportunities that are of an imitative nature (D'Souza, 2009). Accordingly, we expect:

\[ H1a - Systematic search will be positively associated with the identification of imitative opportunities. \]

Research focusing on cognitive processes, by contrast, suggests a person’s mental models help direct and guide attention and information processing for specific situations that they encounter (Gaglio & Katz, 2001). Kaish and Gilad (1991), for instance, proposed and found empirical support for their hypothesis that individuals who did not search systematically for opportunities were able to position themselves in the flow of information so as to increase the probability of identifying opportunities (Gaglio & Katz, 2001). Similarly, other researchers have found that passive search, helps entrepreneurs overcome problems related to the newness of a product or service, as well as problems related to distribution of
information in situations where new technology is being introduced or new markets are being created (Baron & Markman, 1999). Gaglio and Katz (2001) further suggest that individuals employing alertness to identify opportunities not only have access to new information, but also utilize this information in a different way than do individuals who do not employ this process. In short, these findings seem to suggest a positive relationship between passive search and innovativeness. Accordingly, we expect:

\[ H1b \quad \text{Passive search will be positively associated with the identification of innovative opportunities.} \]

3.2 The Relationship between Prior Knowledge Heterogeneity and Opportunity Identification Process

In the field of entrepreneurship, prior knowledge has been studied as a form of human capital that often reflects the individual’s level of formal education, startup experience, work experience, and managerial experience (Cohen & Levinthal, 1990; Kim, Aldrich, & Keister, 2006; Schenkel, 2004). Theory suggests that not only does prior knowledge lead to the generation of business related skills (Boden & Nucci, 2000; Kim et al., 2006), but that people with prior knowledge of operating in a particular industry have an “edge” over people who do not have that specific industry information in identifying opportunities (Shane, 2000, 2003). This suggests that certain specific prior knowledge is necessary for the identification of at least some opportunities to occur (Dimov, 2003).

Prior knowledge has also been shown to lead to access to collective forms of capital (i.e., social and financial), such as the development of better relations with suppliers and customers (Kim et al., 2006). Further, research suggests that diverse elements of knowledge, when brought together, often lead to new combinations (Campbell, Marsden, & Hurlbert, 1986; Granovetter, 1973; Singh, 2000), and by extension new means – end frameworks. Paralleling such observations, this suggests that the identification of opportunities would be influenced positively by the heterogeneity of a person’s prior knowledge, at least in part, because it would increase the odds that both the tacit and explicit elements of knowledge will enter
into a potential nascent entrepreneur’s thinking to stimulate new means – end connections. Therefore, we
expect:

\textit{H2a} – An entrepreneur’s prior knowledge heterogeneity will influence the type opportunity identified
in such a way that more prior knowledge heterogeneity will be positively associated with
the identification of innovative opportunities.

\textit{H2b} - The relationship between the entrepreneurs’ opportunity identification process and the type
of opportunity identified will be moderated by the entrepreneur’s prior knowledge heterogeneity.

3.3 \textit{Influence of Technology Orientation}

Studies focusing on nascent entrepreneurial activity often make the assumption that prior
knowledge and opportunity identification process will have a universally consistent impact on the
opportunity identification process across all entrepreneurs (e.g., Patel & Fiet, 2009). Yet there is evidence
to suggest that entrepreneurs are not a cohesive group and that much can be gained by considering the
impact of these antecedent relationships across different contexts (Ucbasaran, Westhead, & Wright, 2001).

As suggested earlier, the passive or systematic way in which entrepreneur’s gains access to
information is expected to play an important part in the type of opportunities identified. Systematic search
for information is expected to lead to the accumulation of knowledge within a set paradigm. When dealing
with technology based venturing efforts, this knowledge would include information about existing and
emerging technologies along with potential market opportunities (Shane, 2000). However, individuals who
engage in a systematic search for information in a particular domain might at the same time be prone to
miss information generally related to the domain, but not specifically within the domain (Chang & Burke,
2007). Research has indeed found that individuals with knowledge about a particular domain do not always
engage in a thorough search for additional information because they take their knowledge for granted
(Chang & Burke, 2007; D'Souza, 2009), and that they rely on heuristics and are swayed by biases to a
large. Collectively, this would seem to suggest that individuals with domain specific knowledge would be
likely to gather information related to that domain as opposed to broader domains, and that such a leaning would be more likely to result in the identification of opportunities that are imitative in nature.

**H3 –** The relationship between the entrepreneurs’ opportunity identification process and the type of opportunity identified will be moderated by the technology orientation of the venture.

Liao and Welsch (2005) note that technology-based entrepreneurial activity is likely to be associated with greater emphasis on knowledge accumulation and learning than nontechnology-based entrepreneurial activity, which in turn has intensified the complexity of economic opportunity. Accordingly, it suggests that the role of prior knowledge as a source of human capital will occupy an increasingly central role in nascent entrepreneurial activity given further efforts to develop entrepreneurial opportunity through social relationships are often needed (Hitt et al., 2002). Therefore, it is possible that a greater degree of formal training will be associated with technologically based nascent entrepreneurial activity (e.g., Schenkel, Matthews, & Maslyn, 2006). It seems reasonable to expect that because technologically-oriented venturing activity will require greater degrees of formal knowledge accumulation and learning, it is also more likely to be associated with tacit knowledge, or knowledge that is not widely known or shared. By contrast, non-technologically oriented ventures are more likely to be associated with explicit knowledge, or knowledge that is by definition codifiable and more widely shared (Smith, Matthews, & Schenkel, 2009). Accordingly, we would expect that prior knowledge heterogeneity would facilitate more innovativeness in terms of opportunities identified in technologically-based efforts where tacit knowledge occupies a central role precisely because the heterogeneity could foster thinking about broader and as yet identified models for commercialization. In addition, such thinking would be less likely to encounter constraints associated with shared or preexisting commercialization models. By contrast, prior knowledge heterogeneity would facilitate less innovativeness in terms of opportunities identified in non technologically-based venturing activity where explicit knowledge occupies a central role because such knowledge would be associated
with a greater tendency toward convergence in thinking about the viability of commercial approaches. In short, the explicitness of the prior knowledge would lead to a convergence in thinking that acts as a constraint in terms of recognizing innovative opportunity. Accordingly, this leads us to the following hypotheses:

\[ H4 – The \text{ relationship between prior knowledge heterogeneity and the type of opportunity identified will be moderated by technology orientation of the venture.} \]

4. Data and Method
This research utilizes publicly available archival data from the Panel Study of Entrepreneurial Dynamics (PSED) in order to examine the proposed relationships. The PSED was designed to identify and collect data from a nationally representative sample of nascent entrepreneurs (Gartner, Shaver, Carter, & Reynolds, 2004).

4.1 Variables
4.1.1 Opportunity type. Measuring different types of opportunities is challenging in part because single item measures rarely capture the tacit (Smith et al., 2009) and innovative (Samuelsson & Davidsson, 2008) nature of the construct. Because our focus is on the innovative nature of the opportunity, we followed these authors by constructing a formative index designed to capture the summative, or composite, nature of the observed variables that allows each to contain measurement error (Samuelsson & Davidsson, 2008). Smith et al. (2009) point out that the primary difference between such a formative measure and its reflective counterpart revolves around the direction of causation. Reflective indicators are presumed to “reflect” the unidimensionality of a construct such that individual indicators should be correlated with other indicators. By contrast, formative indicators are presumed to “cause” the latent construct. Because indicators represent different construct dimensions they need not be correlated, nor represent the same underlying dimension. The advantages of formative measures include the ability to construct a more informative measure by allowing the identification of qualitatively different indicators of the construct in a given
situation, as well as one that can be utilized more generally across situations (e.g., industries) (Samuelsson & Davidsson, 2008). The innovativeness opportunity index was constructed from five items following Samuelsson and Davidsson (2008) in order to enhance the comparability of our results. The first and second items asked respondents whether or not intellectual property protection has (Q124) or (Q125) would be applied for (patent, trademark, or design protection). These items were combined into a single item initially given the conceptual overlap in the context of this study’s primary research question. Because intellectual property protection is based on creativity and innovation, responses indicating an application has not or would not be filed were then coded as 0 and those indicating one has or would be filed available coded as 1. The third item (Q300) asked respondents if spending money on research and development will be a major priority for this new business. Responses indicating research and development spending would not be a priority were coded as 0 and those indicating it would be a priority coded as 1. The fourth item (Q297) asked respondents if the new firm has a unique advantage compared to the competitors. Responses indicating no unique competitive advantage were coded as 0 and those indicating a unique competitive advantage coded as 1. The fifth item (Q293) asked respondents if the new firm’s competition is or is expected to be low, moderate or strong. We reasoned that no or low competition or expected competition is indicative of an innovative product (coded as 1), whereas moderate or strong competition or expected competition is indicative of an imitative opportunity (coded as 0). Each of the dichotomous responses was then added to create an opportunity innovativeness index score with a potential response range from 0 (imitative) to 4 (innovative).

4.1.2 Opportunity identification process. This measure consisted of three items. Each asked respondents to report their level of agreement with respect to how well a statement described the firm and its situation. The first description (QK1j) suggested the respondent had “engaged in a deliberate, systematic search for an idea for a new business”. A second (QK1l) suggested that for the respondent, “identifying business
opportunities has involved several learning steps over time, rather than a one-time thing”. Each of these items was coded on a one (completely disagree) to five (completely agree) Likert-type scale. A third item (QK1k) suggested that “the best business ideas just come, without a need to search for them” (reverse coded to facilitate interpretation consistency). These items were aggregated into a single measure for subsequent data analysis, with a higher score reflecting a more systematic search-based process given prior research demonstrating strong internal consistency among these items (Patel & Fiet, 2009).

4.1.3 Prior knowledge heterogeneity. This measure was constructed from four items following prior research suggesting that tacit or implicit knowledge gained through experience plays a particularly influential role as source of human capital in the recognition of opportunity (e.g., Davidsson & Honig, 2003; D'Souza, 2009; Koller, 1988; Schenkel, 2004; Shane, 2000; Smith et al., 2009). Respondents were to identify how many years of full time, paid work experience they had in any field (Q340), as well as managerial, supervisory, or administrative responsibilities (Q341). Respondents were also asked to identify how many years of work experience they had in the industry where the new business would compete (Q199) and how many other businesses they’d helped start (Q200). Responses indicating experience along each of these dimensions were coded as 0 and those indicating any level of experience coded as 1. Each of these dichotomous responses was then added to create a prior knowledge heterogeneity index score with a potential response range from 0 to 4 and a higher score reflecting greater heterogeneity.

4.1.4 Technology vs. Non-Technology Orientation. Item 301 of the phone survey asked, “Would you consider this new business to be hi-tech? If nascent entrepreneurs answered, “no,” we classified the nascent entrepreneur’s orientation as non technologically-based (NT) and coded these responses as 0. If nascent entrepreneurs answered, “yes,” we classified this type of the nascent entrepreneur’s orientation technologically-based (T) and coded these responses as 1.

5. Results and Findings
Table 1 reports means, standard deviations, and zero-order correlations among variables for all nascent entrepreneurs. Whereas opportunity identification process was unrelated to opportunity type, results suggest that having heterogeneous prior knowledge (r = .159, p < .05) was positively and significantly associated with more innovative opportunity.

Does the type of opportunity identification process (i.e., passive versus systematic search) used by the entrepreneur impact type of opportunity (i.e., imitative versus innovative) likely to be identified? Multiple regression results presented in table 2 suggest it does not. As shown in model 1, opportunity identification process (i.e., passive search and systematic search) was unrelated (β = -.022, p > .05) to opportunity type (i.e., imitative versus imitative) suggesting no support for hypothesis 1a or 1b.

Does the heterogeneity of prior knowledge used by the entrepreneur influence the type of opportunity identify by the entrepreneur? Multiple regression results presented in table 2 suggest it does. As shown in model 1, results suggest prior knowledge heterogeneity is positively related to opportunity innovativeness (β = .158, p < .05) suggesting support for hypothesis 2a.

Does the combination of prior heterogeneity knowledge and identification process type utilized influence the type of opportunity identified? Results suggest it does not. We followed Baron and Kenny's (Baron & Kenny, 1986) suggestion to test for an interaction between prior knowledge heterogeneity and opportunity identification process. Model 2 of the multiple regression results shows that despite the overall regression model being significant, the interaction between opportunity identification process and prior knowledge heterogeneity is unrelated to opportunity type (β = .20, p < .05). Thus no support is found for hypothesis 2b.
Do these proposed relationships differ between technology-based and nontechnology-based nascent venturing efforts? Tables 3 and 4 below reports means, standard deviations, and zero-order correlations among variables for those individuals engaged in the creation of technology oriented and nontechnology oriented nascent new ventures respectively. As in the full sample, results in technology oriented sub-sample suggest prior knowledge heterogeneity was also positively and significantly associated with more innovative opportunity type. By contrast, no significant relationship was found in the non-technology oriented sub-sample.

<Insert Table 3 about here>
<Insert Table 4 about here>

Multiple regression results presented in tables 5 and 6 show a similar distinction in pattern between nascent technology-oriented and nontechnology oriented venturing efforts, but the results offer no support for hypothesis 3 or 4. As shown in model 1 of table 5, neither the opportunity identification process ($\beta = 0.065, p > .10$) nor significantly prior knowledge heterogeneity ($\beta = 0.167, p < .10$) were significantly related to the type of opportunity identified for technology-oriented nascent venturing efforts. Similarly, as shown in model 1 of table 5, the opportunity identification process ($\beta = -0.046, p > .10$) was not significantly related to the type of opportunity identified for nontechnology-oriented nascent venturing efforts. Although prior knowledge heterogeneity ($\beta = 0.149, p < .10$) was marginally related to the identification of opportunities of a more innovative nature, the overall regression model was not rendering this finding unreliable.

Despite not find statistical significant main effects, we followed Baron and Kenny’s (Baron & Kenny, 1986) suggestion to test for an interaction between opportunity identification process and prior knowledge heterogeneity for both subsamples. Model 2 in tables 5 and 6 show these results. Interestingly these results show that not only is the overall regression model statistically significant, the interaction between opportunity identification process and prior knowledge heterogeneity is also negatively and marginally significantly related to opportunity type ($\beta = -1.188, p < .10$) for technology-oriented nascent venturing
efforts (table 5). By contrast, neither the overall regression model nor the interaction between opportunity identification process and prior knowledge heterogeneity predicting opportunity type ($\beta = -1.188, p < .10$) were statistically significant for technology-oriented nascent venturing efforts (table 6).

6. Discussion and Limitations

Researchers have found that an important issue in the field revolves around the degree of innovativeness of newly identified opportunities that in turn may lead to firm founding (Bhave, 1994; Cliff et al., 2006; Davidsson & Wiklund, 2001; Shepherd et al., 2000; Zimmerman & Zeitz, 2002). However, there is little to no research done on the antecedents of innovative and imitative opportunities. By way of this study, we fill this void by looking at the effect of the two most prominent aspects of opportunity identification in the entrepreneurship literature – effect of prior knowledge, and effect of opportunity identification process used by the entrepreneur.

Based on past literature, we proposed that the type of opportunity identification process used would impact the type of opportunity identified in such a way that individuals who used passive search would identify innovative opportunities, while individuals who used systematic search would identify imitative opportunities. Our results suggest that despite the relationships proposed in this investigation, the level of search (i.e., more passive versus more systematic) is unrelated to the innovativeness of the opportunities identified.

Second, we hypothesized that the heterogeneity of the entrepreneur’s prior knowledge would be positively associated with the innovativeness of the opportunity identified. Our results find statistically significant support for this hypothesis, suggesting that individuals who make use of heterogeneous prior knowledge are likely to identify opportunities that are more innovative in nature. We hypothesized further that the heterogeneity of the entrepreneur’s prior knowledge in conjunction with the search process
employed would be associated with the innovativeness of the opportunity identified but found no support for
this hypothesis.

Third, and based on literature that suggested that there is a potential difference between
technology and non-technologically oriented venturing efforts, we hypothesized that the relationship
between the entrepreneurs’ opportunity identification process and the type of opportunity identified would
be moderated by the technology orientation of the venture (H3), and that the relationship between prior
knowledge and the type of opportunity identified would be moderated by technology orientation of the
venture (H4). Results suggest that neither of these hypotheses were statistically supported. Interestingly
however, when looking at technology oriented nascent venturing efforts, and running the model that
contained the interaction term, we did find marginal statistical significance for both hypothesis H3 as well as
hypothesis H4.

One reason for these unexpected finding and the potential limitation it represents could be that the
use of a formative measure fails to accurately capture the nature or fullness of the entrepreneurial
construct. Simply put, the methodological use of formative versus a reflective measure undoubtedly
introduces the potential for the issue of measurement error to exist. However, given the measure was
developed based upon prior investigations (i.e., Samuelsson & Davidsson, 2008; Smith et al., 2009), we
believe this suggests that one potentially fruitful direction for future researchers revolves around further
exploring and examining the dimensionality of “opportunity” as a construct. For example, future
researchers may want to explore how the relationships that other constructs known to be related to
entrepreneurial opportunity compare with those demonstrated through the measure utilized in this study.

Although based on a nationally representative sample, it is also important to note that the findings
reflected in this investigation are limited in that they reflect a U.S. base population. This suggests that it
remains possible that the present results may not generalize to other cultures. Consequently, future research is necessary to address the potentially important cross-cultural possibilities.

7. Conclusion and Implications

While debate clearly continues to focus on the role innovation plays in as a determinant of the distinctiveness of entrepreneurship as a discipline, it is increasingly argued that a fundamentally important issue in its own right revolves around the degree of opportunity novelty as a basis for firm founding (Bhave, 1994; Cliff et al., 2006; Davidsson & Wiklund, 2001; Shepherd et al., 2000; Zimmerman & Zeitz, 2002). Our paper points out that unraveling the interdependencies of the various relationships may be more complex than earlier research has suggested. For example, despite studies suggesting that passive and systematic forms of search activities may lead to different types of opportunities, our findings do not suggest the existence of a systematic relationship between the opportunity identification process and the types of opportunities identified. By contrast, possessing a greater breadth of heterogeneous prior knowledge does appear to provide a basis for identifying more innovative opportunities. Perhaps more interesting, the effect of prior knowledge heterogeneity appears to hold regardless of whether or not a passive or active approach to identifying opportunities is taken.

OPPORTUNITY IDENTIFICATION: ROLE OF KNOWLEDGE HETEROGENEITY AND OPPORTUNITY IDENTIFICATION PROCESS

Rodney D’Souza

1. Introduction

Opportunity identification is considered by many as the first step in the entrepreneurial process (Baron & Shane, 2006; Baron, 2004; Shane & Venkataraman, 2000). But from whence to entrepreneurial opportunities come? Entrepreneurial opportunity has been defined by some as the possibility to introduce innovative goods or services to a marketplace (Gaglio, 2004; Singh, 2000). From this perspective, an opportunity can only be considered an entrepreneurial opportunity if it is innovative or radical to a society or industries (Gaglio & Katz, 2001; Schumpeter, 1934; Shane & Venkataraman, 2000; Smith, Matthews, & Schenkel, 2009). By contrast, others have defined entrepreneurial opportunities simply as situations where “pure profit potential” exists (e.g., Kirzner, 1973) through the introduction of imitative goods or services generated by the earlier errors of other marketplace participants. Additionally, they can be seen as “arising from unanticipated independently-caused, changes in underlying market circumstances” (Kirzner, 1997: 7).

While debate clearly continues to focus on the issue of whether innovation (e.g., Schumpeter, 1934) or firm creation (e.g., Gartner, 1989) reflects the distinctiveness of entrepreneurship as a research domain, the focus of the debate has changed in recent years. Specifically, researchers have increasingly observed that a fundamentally important issue in its own right revolves around the nature or degree of opportunity novelty as a basis for firm founding (Bhave, 1994; Cliff, Jennings, & Greenwood, 2006; Davidsson & Wiklund, 2001; Shepherd, Douglas, & Shanley, 2000; Zimmerman & Zeitz, 2002). This is an important issue for
research to inform because even though innovation can be a source of competitive advantage (Barney, 1991; Porter, 1991; Wernerfelt, 1984), not all firms successfully founded and sustained by entrepreneurs are based on innovative opportunities. For example, simple observation of the modern growth in franchise-based business ventures (e.g., Jiffy Lube, Valvoline, EZ Lube, etc.) suggests that the number of individual firms founded on the basis of imitative opportunities in a market is likely to disproportionately outweigh those founded on the basis of innovative opportunities. Empirical research findings that distinguish imitative from innovative opportunities appear to support such anecdotal observation. For example, Aldrich (1999) found evidence suggesting the majority of new firms are actually founded simply by reproducing or imitating what has been done before.

Despite the contributions and insights of prior research, little work has explicitly sought to advance our understanding of the processes that bring about the differences between imitative and innovative opportunities. For example, Carland et al. (1984) have noted that innovation is a key factor that helps distinguish entrepreneurial opportunities from simple arbitrage opportunities (Carland, Hoy, Boulton, & Carland, 1984). Similarly, Shane (2001) focused on the impact that prior knowledge had on opportunity recognition by entrepreneurs. Yet as recent investigations illustrate (e.g., Fiet & Patel, 2009), empirical researchers have focused on the mechanisms influencing the pursuit of entrepreneurial opportunity more universally, rather than distinguishing between those that are innovative and those that are imitative in nature. As a result, insight into the nature and origins of opportunity and its relationship to the nascent firm founding process remains limited by the possibility that important contextual differences exist (Ucbasaran, Wright, & Westhead, 2006) and systematically differ across opportunities. In short,
the need for research that focuses more explicitly on the nature and variation of entrepreneurial opportunities is highlighted (Shepherd & DeTienne, 2005;).

We seek to address this gap by investigating four research questions designed to build on prior work (i.e., Corbett, 2005; Dimov, 2007; Shane & Venkataraman, 2000; Shane, 2001; Smith, Matthews, & Schenkel, 2009) emphasizing a more prominent role of the nature of the entrepreneurial opportunity. First, does the type of opportunity identification process (i.e., alertness versus systematic search) used by the entrepreneur impact type of opportunity (i.e., imitative versus innovative) likely to be identified? Second, does the heterogeneity of prior knowledge used by the entrepreneur influence the type of opportunity identify by the entrepreneur? Third, does the combination of identification process type and heterogeneity of an entrepreneur’s prior knowledge influence the type of opportunity identified? Fourth, do these relationships differ between technology-based and nontechnology-based nascent venturing efforts? Our proposed model is as follows:

<INSERT FIGURE 1 ABOUT HERE>

This paper proceeds in the following manner. First, we review the literature on entrepreneurial opportunity identification processes with respect to two schools of thought that appear dominant in the entrepreneurship literature. We then review the literature focusing on entrepreneurial opportunities, paying particular attention to the innovative versus imitative distinction it reveals. This is followed by a discussion on how the hypotheses were tested based on data obtained from the Panel Study of Entrepreneurial Dynamics (PSED). The paper concludes with a discussion of our results and suggested future research directions.

2. Literature Review

2.1 Opportunity Identification Process
The purpose of this research is not to explore implications of the two types of opportunity identification processes – passive search and systematic search\(^1\) per se. Rather, it is to determine whether the use of systematic search or the process of entrepreneurial alertness in finding information systematically leads individuals to identify opportunities that are characterized as more innovative in nature. We now turn attention to a discussion of two broad schools of thought on how individuals identify entrepreneurial opportunities.

2.1.1 Systematic Search

One opportunity identification school of thought suggests that the search for information about unknown venture ideas can be replaced with the search for known information sources (Fiet, 1996). Scholars subscribing to this school of thought suggest that discovery of information about an opportunity is dependent on an entrepreneur’s prior specific knowledge. Proponents of this view further suggest that the use of a systematic search of information within an individual’s consideration set - grouping of information channels that emits signals that may indicate a potential discovery (Fiet, 2002) - might lead to a greater chance of discovering information within that particular consideration set than discovering information outside one’s consideration set (Patel & Fiet, 2009).

While systematic search research has yielded important insights into the opportunity identification process, a number of researchers have suggested that it is impossible to search systematically for unknown discoveries if the search domain itself is unknown (Kirzner, 1997; Kaish and Gilad, 1991). This argument is based on the idea that in an unbounded search domain,
no optimal solution for which search can focus exists. Proponents of the systematic search perspective address this argument by suggesting that a consideration set approach restricts a person’s search domain to his/her prior knowledge, which in turn makes the search for information possible as it is based on what the person possesses, rather than on a body of shared and commonly agreed upon information by market participants.

2.1.2 Passive Search

A second opportunity identification school of thought is based on Kirzner's early conceptualization of alertness, which is predominantly considered an economics-based perspective. In this work, Kirzner defined “alertness” as “the ability to notice without search opportunities that have hitherto been overlooked” (Kirzner, 1979: 48). Interestingly, his conceptualization does not suggest that individuals identify opportunities by pure accident. Rather, it suggests the notion of opportunity discovery through alertness is somewhere between that of deliberate search and that generated by pure luck (Kirzner, 1997), reflecting what can be called passive search. While in the mode of passive search, the entrepreneur is receptive, but at the same time, not engaged in a formal, systematic search process (Ardichvili, Cardozo, & Ray, 2003). In other words, it is consistent with the proverbial idea that “chance favors the prepared mind”.

Like other Austrian economists (e.g., Hayek, 1945; Mises, 1949), Kirzner’s perspective suggests that opportunities exist at least in part because different people have access to different information in the form of facts, knowledge or data (Kirzner, 1997). Because differential access is likely to result in the possession of incomplete information by any one individual, it is also likely to lead to individuals making errors in the form of misallocated resources in the market.
Some people rightly recognize that resource misallocations exist. These people then obtain the resources, recombine them, and exploit them in more efficient and effective uses (Casson, 1982).

The review above suggests that while both these perspectives (passive and systematic search) emphasize the importance of information access, they differ fundamentally from earlier work in that they suggest how individuals gain access to and use information could in turn lead to differences in the identification of an entrepreneurial opportunity.

2.2 Entrepreneurial Opportunities

Researchers take different views toward the nature of opportunities, which in turn suggests the potential for differences to exist with respect to how individuals are likely to come across them. Broadly, these views can be characterized as reflecting three schools of thought. The first view reflects the idea that opportunities reflect a physical tangibility that individuals can recognize. This view operates under the assumption that the source of demand and the source of supply readily exist but are unconnected by the existing market price mechanism. According to this school of thought, individuals recognize that an unmet need exists between existing sources of both supply and demand, and that this unmet need can be exploited. Because sources of both supply and demand already exist, exploitation of these types of opportunities often described simply as taking the form of arbitrage (Alvarez & Barney, 2008; Gregoire, 2005; Venkataraman & Sarasvathy, 2001).

The second view reflects the idea that opportunities are created by individuals (e.g., Schumpeter, 1934). This view assumes that neither the source of supply nor demand exists, thus rendering the existence of a connection via the market mechanism impossible at the outset of the exploitation process. According to this school of thought, both supply and demand have to be created first, and then taken advantage of by individuals (i.e., entrepreneurs) to create

Page 6 of 28
opportunities for financial return (Venkataraman & Sarasvathy, 2001). In sum, the exploitation of these types of opportunities often described as taking the form of creative (Dimov, 2007) and development oriented (Ardichvili, Cardozo, & Ray, 2003) efforts on the part of the entrepreneur.

The third view considers the idea that opportunities reflect a physical tangibility in part, but also require the discovery or identification of additional elements that require action by individuals to bring into existence. This view operates under the assumption that either the source of demand or the source of supply is unknown (but not both) and unconnected by any market mechanism as a result. According to this school of thought, an individual discovers or identifies either a novel way to serve an existing market need, or discovers or identifies a new market that could be satisfied with an existing means of supply (Sarasvathy, 2001). This perspective shares qualities of the recognition and creativity views in that it acknowledges both identification aspect of existing resources, as well as the need to create or develop a corresponding connection between existing and potential uses in the marketplace over time (Ardichvili, Cardozo, & Ray, 2003; Dimov, 2007; Kirzner, 1997).

This review suggests that the existence of entrepreneurial opportunities can be conceptualized categorically those of either an imitative or innovative nature though such a dichotomy is rarely if ever expected to be observed in practice. Rather, in practice these ideal types are more likely to reflect opposing ends of a continuum (Samuelsson and Davidsson, 2008; Weber 1947). Imitative opportunities can be seen as those that represent the existence of gaps and mismatches in information across market participants that could be profitably exploited (Kirzner, 1979). These imitative opportunities stem from changes in supply and demand which are in turn brought about by market inefficiencies (Aldrich & Martinez, 2001; Aldrich, 1999; Amason, Shrader, & Tompson, 2006; Kirzner, 1973; Shane, 2003). These opportunities are
associated with routines and competencies that vary slightly from those of existing, similar ventures (Aldrich & Kenworthy, 1999; Aldrich & Martinez, 2001). By contrast, innovative opportunities can be conceptualized as those that evolve largely from creative human action coupled with changes in technology, political structure, regulatory environment, and social/demographic environments (Schumpeter, 1934; Shane, 2003). Research suggests that a hallmark of innovative opportunities is that they break away from existing knowledge and information streams (Amason et al., 2006; Shane, 2003), leading to the creation of products or services that are significantly novel or different from other existing products, services, or ventures.

3. Hypothesis Development

3.1 The Relationship between Opportunity Identification Process and Opportunity Type

Studies suggest that constrained, systematic search is focused on the search of known information sources, rather than a search for unknown venture ideas (e.g., Fiet, 2007). According to this information-based perspective, the search for information is constrained by an individual’s bounded rationality, as well as his/her prior knowledge. It suggests that entrepreneurs make use of existing informational channels – sources of signals (current information that changes a person’s ideas about future state) (Fiet, 1996; Fiet, 2007) to search for information. An underlying rationale of this school of thought is that opportunity identification would depend on “a fit between an entrepreneur’s specific knowledge and a particular venture idea” (Fiet, 2007: 5). This means that an individual must “identify domains in which he or she possesses prior, specific knowledge, create a set of information channels with a high probability of finding informative clues of commercial potential, craft a search strategy, evaluate signals, and develop decision rules” (Fiet, Norton, & Clouse, 2007: 330). DeTienne and Chandler (2004:
further suggest that “search is envisioned as a sorting or winnowing through already existing opportunities and human creativity is not theorized to play a major role”.

The above discussion suggests that entrepreneurs who utilize a systematic search process to identify opportunities would be disproportionately attuned to information channels and signals related to their prior specific knowledge. Specifically, individuals who have only prior specific knowledge about a specific domain might miss information signals related to the broader domain itself, but not those relevant to potential entrepreneurial opportunities within the domain (Chang & Burke, 2007; D'Souza, 2009). Additionally, prior knowledge could lead to the entrepreneurs relying on biases such as neglect of probability (ignoring relevant information), framing effects (decisions being affected by irrelevant information), and anchoring (giving excessive weight to an unimportant but salient information) (Kahneman, Slovic, & Tversky, 1982; Nisbett & Ross, 1980; Sherman & Corty, 1984), which could in turn lead to the identification of opportunities that are of an imitative nature (D'Souza, 2009). Accordingly, we expect:

**H1a – Systematic search will be positively associated with the identification of imitative opportunities.**

Research focusing on cognitive processes, by contrast, suggests a person’s mental models help direct and guide attention and information processing for specific situations that they encounter (Gaglio & Katz, 2001). Kaish and Gilad (1991), for instance, proposed and found empirical support for their hypothesis that individuals who did not search systematically for opportunities were able to position themselves in the flow of information so as to increase the probability of identifying opportunities (Gaglio & Katz, 2001). Similarly, other researchers have found that passive search, helps entrepreneurs overcome problems related to the newness of a
product or service, as well as problems related to distribution of information in situations where new technology is being introduced or new markets are being created (Baron & Markman, 1999). Gaglio and Katz (2001) further suggest that individuals employing alertness to identify opportunities not only have access to new information, but also utilize this information in a different way than do individuals who do not employ this process. In short, these findings seem to suggest a positive relationship between passive search and innovativeness. Accordingly, we expect:

\[ H1b – \text{Passive search will be positively associated with the identification of innovative opportunities.} \]

3.2 The Relationship between Prior Knowledge Heterogeneity and Opportunity Identification Process

In the field of entrepreneurship, prior knowledge has been studied as a form of human capital that often reflects the individual’s level of formal education, startup experience, work experience, and managerial experience (Cohen & Levinthal, 1990; Kim, Aldrich, & Keister, 2006; Schenkel, 2004). Theory suggests that not only does prior knowledge lead to the generation of business related skills (Boden & Nucci, 2000; Kim et al., 2006), but that people with prior knowledge of operating in a particular industry have an “edge” over people who do not have that specific industry information in identifying opportunities (Shane, 2000, 2003). This suggests that certain specific prior knowledge is necessary for the identification of at least some opportunities to occur (Dimov, 2003).

Prior knowledge has also been shown to lead to access to collective forms of capital (i.e., social and financial), such as the development of better relations with suppliers and customers.
Further, research suggests that diverse elements of knowledge, when brought together, often lead to new combinations (Campbell, Marsden, & Hurlbert, 1986; Granovetter, 1973; Singh, 2000), and by extension new means – end frameworks. Paralleling such observations, this suggests that the identification of opportunities would be influenced positively by the heterogeneity of a person’s prior knowledge, at least in part, because it would increase the odds that both the tacit and explicit elements of knowledge will enter into a potential nascent entrepreneur’s thinking to stimulate new means – end connections. Therefore, we expect:

\[H_2a\] – An entrepreneur’s prior knowledge heterogeneity will influence the type opportunity identified in such a way that more prior knowledge heterogeneity will be positively associated with the identification of innovative opportunities.

\[H_2b\] - The relationship between the entrepreneurs’ opportunity identification process and the type of opportunity identified will be moderated by the entrepreneur’s prior knowledge heterogeneity.

3.3 Influence of Technology Orientation

Studies focusing on nascent entrepreneurial activity often make the assumption that prior knowledge and opportunity identification process will have a universally consistent impact on the opportunity identification process across all entrepreneurs (e.g., Patel & Fiet, 2009). Yet there is evidence to suggest that entrepreneurs are not a cohesive group and that much can be gained by considering the impact of these antecedent relationships across different contexts (Ucbasaran, Westhead, & Wright, 2001).
As suggested earlier, the passive or systematic way in which entrepreneur’s gains access to information is expected to play an important part in the type of opportunities identified. Systematic search for information is expected to lead to the accumulation of knowledge within a set paradigm. When dealing with technology based venturing efforts, this knowledge would include information about existing and emerging technologies along with potential market opportunities (Shane, 2000). However, individuals who engage in a systematic search for information in a particular domain might at the same time be prone to miss information generally related to the domain, but not specifically within the domain (Chang & Burke, 2007). Research has indeed found that individuals with knowledge about a particular domain do not always engage in a thorough search for additional information because they take their knowledge for granted (Chang & Burke, 2007; D'Souza, 2009), and that they rely on heuristics and are swayed by biases to a large. Collectively, this would seem to suggest that individuals with domain specific knowledge would be likely to gather information related to that domain as opposed to broader domains, and that such a leaning would be more likely to result in the identification of opportunities that are imitative in nature.

H3 – The relationship between the entrepreneurs’ opportunity identification process and the type of opportunity identified will be moderated by the technology orientation of the venture.

Liao and Welsch (2005) note that technology-based entrepreneurial activity is likely to be associated with greater emphasis on knowledge accumulation and learning than nontechnology-based entrepreneurial activity, which in turn has intensified the complexity of economic opportunity. Accordingly, it suggests that the role of prior knowledge as a source of human
capital will occupy an increasingly central role in nascent entrepreneurial activity given further efforts to develop entrepreneurial opportunity through social relationships are often needed (Hitt et al., 2002). Therefore, it is possible that a greater degree of formal training will be associated with technologically based nascent entrepreneurial activity (e.g., Schenkel, Matthews, & Maslyn, 2006). It seems reasonable to expect that because technologically-oriented venturing activity will require greater degrees of formal knowledge accumulation and learning, it is also more likely to be associated with tacit knowledge, or knowledge that is not widely known or shared. By contrast, non-technologically oriented ventures are more likely to be associated with explicit knowledge, or knowledge that is by definition codifiable and more widely shared (Smith, Matthews, & Schenkel, 2009). Accordingly, we would expect that prior knowledge heterogeneity would facilitate more innovativeness in terms of opportunities identified in technologically-based efforts where tacit knowledge occupies a central role precisely because the heterogeneity could foster thinking about broader and as yet identified models for commercialization. In addition, such thinking would be less likely to encounter constraints associated with shared or preexisting commercialization models. By contrast, prior knowledge heterogeneity would facilitate less innovativeness in terms of opportunities identified in non-technologically-based venturing activity where explicit knowledge occupies a central role because such knowledge would be associated with a greater tendency toward convergence in thinking about the viability of commercial approaches. In short, the explicitness of the prior knowledge would lead to a convergence in thinking that acts as a constraint in terms of recognizing innovative opportunity. Accordingly, this leads us to the following hypotheses:

**H4** – *The relationship between prior knowledge heterogeneity and the type of opportunity identified will be moderated by technology orientation of the venture.*
4. Data and Method

This research utilizes publicly available archival data from the Panel Study of Entrepreneurial Dynamics (PSED) in order to examine the proposed relationships. The PSED was designed to identify and collect data from a nationally representative sample of nascent entrepreneurs (Gartner, Shaver, Carter, & Reynolds, 2004).

4.1 Variables

4.1.1 Opportunity type. Measuring different types of opportunities is challenging in part because single item measures rarely capture the tacit (Smith et al., 2009) and innovative (Samuelsson & Davidsson, 2008) nature of the construct. Because our focus is on the innovative nature of the opportunity, we followed these authors by constructing a formative index designed to capture the summative, or composite, nature of the observed variables that allows each to contain measurement error (Samuelsson & Davidsson, 2008). Smith et al. (2009) point out that the primary difference between such a formative measure and its reflective counterpart revolves around the direction of causation. Reflective indicators are presumed to “reflect” the unidimensionality of a construct such that individual indicators should be correlated with other indicators. By contrast, formative indicators are presumed to “cause” the latent construct. Because indicators represent different construct dimensions they need not be correlated, nor represent the same underlying dimension. The advantages of formative measures include the ability to construct a more informative measure by allowing the identification of qualitatively different indicators of the construct in a given situation, as well as one that can be utilized more generally across situations (e.g., industries) (Samuelsson & Davidsson, 2008). The innovativeness opportunity index was constructed from five items following Samuelsson and
Davidson (2008) in order to enhance the comparability of our results. The first and second items asked respondents whether or not intellectual property protection has (Q124) or (Q125) would be applied for (patent, trademark, or design protection). These items were combined into a single item initially given the conceptual overlap in the context of this study’s primary research question. Because intellectual property protection is based on creativity and innovation, responses indicating an application has not or would not be filed were then coded as 0 and those indicating one has or would be filed available coded as 1. The third item (Q300) asked respondents if spending money on research and development will be a major priority for this new business. Responses indicating research and development spending would not be a priority were coded as 0 and those indicating it would be a priority coded as 1. The fourth item (Q297) asked respondents if the new firm has a unique advantage compared to the competitors. Responses indicating no unique competitive advantage were coded as 0 and those indicating a unique competitive advantage coded as 1. The fifth item (Q293) asked respondents if the new firm’s competition is or is expected to be low, moderate or strong. We reasoned that no or low competition or expected competition is indicative of an innovative product (coded as 1), whereas moderate or strong competition or expected competition is indicative of an imitative opportunity (coded as 0). Each of the dichotomous responses was then added to create an opportunity innovativeness index score with a potential response range from 0 (imitative) to 4 (innovative).

4.1.2 Opportunity identification process. This measure consisted of three items. Each asked respondents to report their level of agreement with respect to how well a statement described the firm and its situation. The first description (QK1j) suggested the respondent had “engaged in a deliberate, systematic search for an idea for a new business”. A second (QK1l) suggested that for the respondent, “identifying business opportunities has involved several learning steps over
time, rather than a one-time thing”. Each of these items was coded on a one (completely disagree) to five (completely agree) Likert-type scale. A third item (QK1k) suggested that “the best business ideas just come, without a need to search for them” (reverse coded to facilitate interpretation consistency). These items were aggregated into a single measure for subsequent data analysis, with a higher score reflecting a more systematic search-based process given prior research demonstrating strong internal consistency among these items (Patel & Fiet, 2009).

4.1.3 Prior knowledge heterogeneity. This measure was constructed from four items following prior research suggesting that tacit or implicit knowledge gained through experience plays a particularly influential role as source of human capital in the recognition of opportunity (e.g., Davidsson & Honig, 2003; D'Souza, 2009; Koller, 1988; Schenkel, 2004; Shane, 2000; Smith et al., 2009). Respondents were to identify how many years of full time, paid work experience they had in any field (Q340), as well as managerial, supervisory, or administrative responsibilities (Q341). Respondents were also asked to identify how many years of work experience they had in the industry where the new business would compete (Q199) and how many other businesses they’d helped start (Q200). Responses indicating experience along each of these dimensions were coded as 0 and those indicating any level of experience coded as 1. Each of these dichotomous responses was then added to create a prior knowledge heterogeneity index score with a potential response range from 0 to 4 and a higher score reflecting greater heterogeneity.

4.1.4 Technology vs. Non-Technology Orientation. Item 301 of the phone survey asked, “Would you consider this new business to be hi-tech? If nascent entrepreneurs answered, “no,” we classified the nascent entrepreneur’s orientation as non technologically-based (NT) and coded these responses as 0. If nascent entrepreneurs answered, “yes,” we classified this type of the nascent entrepreneur’s orientation technologically-based (T) and coded these responses as 1.
5. Results and Findings

Table 1 reports means, standard deviations, and zero-order correlations among variables for all nascent entrepreneurs. Whereas opportunity identification process was unrelated to opportunity type, results suggest that having heterogeneous prior knowledge ($r = .159, p < .05$) was positively and significantly associated with more innovative opportunity.

<Insert Table 1 about here>

Does the type of opportunity identification process (i.e., passive versus systematic search) used by the entrepreneur impact type of opportunity (i.e., imitative versus innovative) likely to be identified? Multiple regression results presented in table 2 suggest it does not. As shown in model 1, opportunity identification process (i.e., passive search and systematic search) was unrelated ($\beta = -.022, p > .05$) to opportunity type (i.e., imitative versus imitative) suggesting no support for hypothesis 1a or 1b.

<Insert Table 2 about here>

Does the heterogeneity of prior knowledge used by the entrepreneur influence the type of opportunity identify by the entrepreneur? Multiple regression results presented in table 2 suggest it does. As shown in model 1, results suggest prior knowledge heterogeneity is positively related to opportunity innovativeness ($\beta = .158, p < .05$) suggesting support for hypothesis 2a.

Does the combination of prior heterogeneity knowledge and identification process type utilized influence the type of opportunity identified? Results suggest it does not. We followed Baron and Kenny’s (Baron & Kenny, 1986) suggestion to test for an interaction between prior knowledge heterogeneity and opportunity identification process. Model 2 of the multiple regression results shows that despite the overall regression model being significant, the
interaction between opportunity identification process and prior knowledge heterogeneity is unrelated to opportunity type ($\beta = .20$, $p < .05$). Thus no support is found for hypothesis 2b.

Do these proposed relationships differ between technology-based and nontechnology-based nascent venturing efforts? Tables 3 and 4 below reports means, standard deviations, and zero-order correlations among variables for those individuals engaged in the creation of technology oriented and non-technology oriented nascent new ventures respectively. As in the full sample, results in technology oriented sub-sample suggest prior knowledge heterogeneity was also positively and significantly associated with more innovative opportunity type. By contrast, no significant relationship was found in the non-technology oriented sub-sample.

<Insert Table 3 about here>

<Insert Table 4 about here>

Multiple regression results presented in tables 5 and 6 show a similar distinction in pattern between nascent technology-oriented and nontechnology oriented venturing efforts, but the results offer no support for hypothesis 3 or 4. As shown in model 1 of table 5, neither the opportunity identification process ($\beta = 0.065$, $p > .10$) nor significantly prior knowledge heterogeneity ($\beta = 0.167$, $p < .10$) were significantly related to the type of opportunity identified for technology-oriented nascent venturing efforts. Similarly, as shown in model 1 of table 5, the opportunity identification process ($\beta = -0.046$, $p > .10$) was not significantly related to the type of opportunity identified for nontechnology-oriented nascent venturing efforts. Although prior knowledge heterogeneity ($\beta = 0.149$, $p < .10$) was marginally related to the identification of opportunities of a more innovative nature, the overall regression model was not rendering this finding unreliable.
Despite not finding statistical significant main effects, we followed Baron and Kenny’s (Baron & Kenny, 1986) suggestion to test for an interaction between opportunity identification process and prior knowledge heterogeneity for both subsamples. Model 2 in tables 5 and 6 show these results. Interestingly these results show that not only is the overall regression model statistically significant, the interaction between opportunity identification process and prior knowledge heterogeneity is also negatively and marginally significantly related to opportunity type ($\beta = -1.188, p < .10$) for technology-oriented nascent venturing efforts (table 5). By contrast, neither the overall regression model nor the interaction between opportunity identification process and prior knowledge heterogeneity predicting opportunity type ($\beta = -1.188, p < .10$) were statistically significant for technology-oriented nascent venturing efforts (table 6).

6. Discussion and Limitations

Researchers have found that an important issue in the field revolves around the degree of innovativeness of newly identified opportunities that in turn may lead to firm founding (Bhave, 1994; Cliff et al., 2006; Davidsson & Wiklund, 2001; Shepherd et al., 2000; Zimmerman & Zeitz, 2002). However, there is little to no research done on the antecedents of innovative and imitative opportunities. By way of this study, we fill this void by looking at the effect of the two most prominent aspects of opportunity identification in the entrepreneurship literature – effect of prior knowledge, and effect of opportunity identification process used by the entrepreneur.

Based on past literature, we proposed that the type of opportunity identification process used would impact the type of opportunity identified in such a way that individuals who used passive search would identify innovative opportunities, while individuals who used systematic
search would identify imitative opportunities. Our results suggest that despite the relationships proposed in this investigation, the level of search (i.e., more passive versus more systematic) is unrelated to the innovativeness of the opportunities identified.

Second, we hypothesized that the heterogeneity of the entrepreneur’s prior knowledge would be positively associated with the innovativeness of the opportunity identified. Our results find statistically significant support for this hypothesis, suggesting that individuals who make use of heterogeneous prior knowledge are likely to identify opportunities that are more innovative in nature. We hypothesized further that the heterogeneity of the entrepreneur’s prior knowledge in conjunction with the search process employed would be associated with the innovativeness of the opportunity identified but found no support for this hypothesis.

Third, and based on literature that suggested that there is a potential difference between technology and non-technologically oriented venturing efforts, we hypothesized that the relationship between the entrepreneurs’ opportunity identification process and the type of opportunity identified would be moderated by the technology orientation of the venture (H3), and that the relationship between prior knowledge and the type of opportunity identified would be moderated by technology orientation of the venture (H4). Results suggest that neither of these hypotheses were statistically supported. Interestingly however, when looking at technology oriented nascent venturing efforts, and running the model that contained the interaction term, we did find marginal statistical significance for both hypothesis H3 as well as hypothesis H4.

One reason for these unexpected finding and the potential limitation it represents could be that the use of a formative measure fails to accurately capture the nature or fullness of the entrepreneurial construct. Simply put, the methodological use of formative versus a reflective measure undoubtedly introduces the potential for the issue of measurement error to exist.
However, given the measure was developed based upon prior investigations (i.e., Samuelsson & Davidsson, 2008; Smith et al., 2009), we believe this suggests that one potentially fruitful direction for future researchers revolves around further exploring and examining the dimensionality of “opportunity” as a construct. For example, future researchers may want to explore how the relationships that other constructs known to be related to entrepreneurial opportunity compare with those demonstrated through the measure utilized in this study.

Although based on a nationally representative sample, it is also important to note that the findings reflected in this investigation are limited in that they reflect a U.S. base population. This suggests that it remains possible that the present results may not generalize to other cultures. Consequently, future research is necessary to address the potentially important cross-cultural possibilities.

7. Conclusion and Implications

While debate clearly continues to focus on the role innovation plays in as a determinant of the distinctiveness of entrepreneurship as a discipline, it is increasingly argued that a fundamentally important issue in its own right revolves around the degree of opportunity novelty as a basis for firm founding (Bhave, 1994; Cliff et al., 2006; Davidsson & Wiklund, 2001; Shepherd et al., 2000; Zimmerman & Zeitz, 2002). Our paper points out that unraveling the interdependencies of the various relationships may be more complex than earlier research has suggested. For example, despite studies suggesting that passive and systematic forms of search activities may lead to different types of opportunities, our findings do not suggest the existence of a systematic relationship between the opportunity identification process and the types of opportunities identified. By contrast, possessing a greater breadth of heterogeneous prior knowledge does appear to provide a basis for identifying more innovative opportunities. Perhaps
more interesting, the effect of prior knowledge heterogeneity appears to hold regardless of whether or not a passive or active approach to identifying opportunities is taken.

The Experiential Classroom Workshop
Chair: Dr. Michael Morris (Professor and Clinic Director at Oklahoma State University, Immediate Past-President of USASBE)

The Experiential Classroom Workshop has been designed as an extension to the annual Experiential Classroom event that has emerged as one of the most popular clinics dedicated to sharing leading-edge teaching practices and enhancing teaching skills. More than 700 faculty from around the world have attended the Experiential Classroom over the past 10 years. This workshop will focus on helping those who are new to the teaching of entrepreneurship, including both faculty and practitioners, to learn best classroom practices and a number of highly creative and effective experiential approaches, ranging from cases, business plans, and the use of entrepreneurs in the classroom to having students conduct entrepreneurial audits, the concept of marketing inventions and consulting engagements. Participants will be able to talk directly with program leaders and find more information about attending the Experiential Classroom XI in September 2010.
Research Opportunities with the Panel Study of Entrepreneurial Dynamics (PSED): An Introduction

Chair: Paul Reynolds (Co-Principal Investigator: PSED I, II)

The two Panel Study of Entrepreneurial Dynamics [PSED] cohorts provide detailed descriptions of business creation in the United States. Both cohorts are representative samples of U.S. nascent entrepreneurs. The PSED I sample is based on screening completed in 1998-2000 and the PSED II sample was identified in 2005-2006; there have been three annual follow-up interviews with both cohorts. These public data sets [www.psed.isr.umich.edu] are the only sources of longitudinal information on national samples of the business creation in the United States. There are many factors and processes associated with implementation of a profitable new business. The two PSED data sets provide extensive opportunities for analysis. This workshop will provide an overview of the major features of the research protocol, describe the data sets, review the issues critical for the analysis, and discuss some preliminary findings.
ICSB eForum on Open Innovation
Chair: Oyvin Kyvik (Director of Kyruco Investments A.S., Norway and Director of Pro-Ex International, S.L., Spain)

Innovation has long been recognized as a key driver of entrepreneurship and economic growth. In the 19th and 20th centuries innovations were seen primarily as products and processes to be guarded, lest they be stolen and copied by competitors. Patents and copyrights gave some protection, but sometimes the innovation was seen as so important that its basic nature must be kept secret. This process of “closed innovation” sees maintaining control as a central concern. While this worked well for quite a while, the very nature of how entrepreneurial organizations create new ideas and develop them into marketable products and processes has, in the 21st century, changed. This is because control and secrecy now hinder rather than protect innovation. Individuals and organizations are no longer isolated; we are now connected with the ability to communicate instantly with almost anyone anywhere. This has led to a change in the basic approach to innovation, now labeled “open innovation.”

The ICSB eForum on Open innovation will explore the concept of open innovation and examine its current and future developments.
Journal of Small Business Management (JSBM) Reviewer Workshop for Younger Researchers
Chair: David Smallbone (Professor and Associate Director of the Small Business Research Centre at Kingston University; JSBM Associate Editor; ICSB President-Elect)

The JSBM Reviewer Workshop has been established to train new and potential reviewers, with a specific focus on younger researchers. Chaired by JSBM Associate Editor David Smallbone, this workshop will include the participation of experienced reviewers and editors, such as JSBM Editor-in-Chief George Solomon, who will talk about their own experiences as reviewers for high-quality journals and also give constructive feedback to inexperienced reviewers who wish to strengthen their skill set. The editors will also discuss the expectations of reviewers and how you can fit in.
“Like an Artist, like a Poet”

– Understanding, and Improving, Entrepreneurship Through Art

Jacqueline Fendt

Abstract

This is a positioning paper about relationships between art and entrepreneurship, and in particular entrepreneurial learning and becoming. It proposes a number of theoretical and conceptual links between art and enterprising. It is suggested that art can be a source of inspiration for many elements of entrepreneurial agency, such as the capacity to recognize and act upon opportunity, to create, to innovate, to frame, to raise funds, to bootstrap, to manage ambiguity, to persist in the face of adversity, etc. and that entrepreneurs can in many ways be viewed as artists. The paper aims to exchange about relationships between art and the entrepreneurial process, away from classical equilibrium-based understandings, toward creative process views inspired from a broad range of relevant and seemingly irrelevant perspectives. This is work in progress.

Setting the Scene

“We are <giving responsibility> to new people, with new ideas; entrepreneurs, not MBAs... people who really look at, feel, touch the market. Creative people, artists, not businessmen. And you have to bring in new, young people who do not sit before a computer at the bank and try to make money with shares. I have my philosophy about entrepreneurs. An entrepreneur is always also an artist who creates products, who creates jobs and communicates it to the people. Picasso was an artist who was an entrepreneur. In Swatch Group, entrepreneurs are running the show and not financiers. I threw out every banker that worked for our company”. Nicolas Hayek, President of Swatch, in a TV interview, 2009

Think different. Apple Computers, tag line

What is the essence of entrepreneurship? Is it the “pursuit of opportunity” beyond available resources (Stevenson 2000) … Or is it “ away of thinking and acting, that is
opportunity obsessed (…) with the purpose of value creation” (Timmons 1994) a “…a subversive activity (that) upsets the status quo, disrupts accepted ways of doing things, and alters traditional patterns of behavior” (Smilor 1997)? What opportunity? What value? What behavior? And how can entrepreneurship be learned or, for that matter, taught? Recently, educational programs devoted to entrepreneurship have proliferated at business schools, from a handful in the 1980s to over 1600 in 2005 (Kuratko 2005). Such programs are today almost all built around a core module that seeks to simulate some type of venture creation: student teams are put together and, following a number of courses, are instructed to identify a market opportunity, develop a corresponding business model, build a community of stakeholders around their nascent project, write up a business plan and finally pitch before a jury, usually made up of entrepreneurs, investors and lecturers. Research proposes situated learning, ‘emotional exposure’ (Pittaway and Cope 2007), an experiential transformation process (Politis 2005), exposure to discontinuation, to crises (Cope 2005; Deakins and Freel 1998; Taylor and Thorpe 2004), and to extreme time pressure (Smilor 1997:334). Students should step outside their ‘reality as a student’ (Pittaway & Cope 2007:227) and actively engage in becoming ‘insiders’ (Brown & Duguid 1991:48). But insiders of what? The term value in the “…purpose of value creation” (Timmons, 1994) inherent in many entrepreneurship definitions is today more often than not interpreted – and taught –, from a purely economic perspective.

This stance, and a malaise that we share with a growing number of scholars with the reigning unified thought about education methods in entrepreneurship (and management for that matter) leads us to continuously experiment with novel pedagogic elements, involving individual and collective reflections on the self, on societal leadership, on moral agency in enterprise, and on the general development of a social culture (Raelin 1997; Raelin 2000).
Very often, this search leads us to grapple with art.

We start this paper with a succinct overview of the field of entrepreneurship and we then briefly frame our understanding of art. Based on this theoretical underpinning we propose and discuss some key relationships between the two fields. We suggest that art can be a source of inspiration for many elements of entrepreneurial agency, such as the capacity to recognize and act upon opportunity, to create, to innovate, to frame, to raise funds, to bootstrap, to manage ambiguity, to persist in the face of adversity, etc. and that entrepreneurs can in many ways be viewed as artists. After that, we zoom on what we consider to be the most striking common base, the need for paradigm-changing thought and agency, and we argue our case. Based on this, we evoke some propositions on pedagogic content and form for the learning and teaching of enterprise at business schools. This is work in progress and we forward it in the hope for dialog. We believe that objectivity does not repose on the lone shoulders of each author, but that it results from the interplay, and the dialog (Sachs 2003). If one is wrong, there surely is someone out there to point this out. If somebody bothers to answer, then the paper did stimulate somebody somewhere and thus fulfilled its most noble mission.

**On Entrepreneurship**

“Entrepreneurship is a subversive activity. It upsets the status quo, disrupts accepted ways of doing things, and alters traditional patterns of behavior. It is, at heart, a change process that undermines current market conditions by introducing something new or different in response to perceived needs.” Raymond W. Smilor, Kauffman Foundation, 1997

At Harvard, in 1983, entrepreneurship was described as “an intellectual onion”: “You peel it back layer by layer and when you get to the center, there is nothing there, but you are crying (Stevenson 2000).” This remark reflected a long-standing set of complaints by thought
leaders around the 1970s (Drucker 1985; Kirzner 1973) regarding the lack of a theoretical framework of this field of thought. Since the 1980s, studies have begun to show the vital importance of ventures and small business in job creation (Birch 1987), and a change in the sociology of entrepreneurship has soon followed, not only in the USA, but in many parts of the world (Thornton 1999), including Europe. Since the 1990s entrepreneurship is occurring at a higher rate (Gartner 1990) and with more capital behind it that at any time in the past century (Gompers et al. 2005). Today, the progress of entrepreneurship as a scholarly and educational field has been “enhanced by the societal environment in which it flourished and by the strong development of theoretical underpinnings (Stevenson 2000:1).

Entrepreneurship is increasingly recognized as a powerful stimulus for value creation at individual, company and societal levels. Within companies, entrepreneurial action results in product, service, process, and administrative innovations (Lawler 1987; Levinthal 1996; Miles and Covin 2002; Schumpeter 1934). From such actions then emerges strategic renewal (Hitt et al. 2001; Ireland et al. 2003a) and different types of value for various stakeholders (Hitt, Ireland, Camp, & Sexton, 2001). To society, entrepreneurship contributes through employment creation (Zahra et al. 2001; Zahra et al. 1999), technological progress, economic revitalization (Birley 1986 Zahra, 2005) and cultural change (Carayannis et al. 2003; McGrath et al. 1992; Young and Sexton 1997). Significant emergence of entrepreneurship education as a distinct field began in the 1980s (Kuratko 2005, Zeithaml & Rice 1987). Business schools worldwide are increasingly aware of the need to facilitate their students’ access to this alternative life trajectory to the classical corporate executive career. Over 1600 entrepreneurship programs had been developed worldwide by the year 2000 (Katz 2003) and the number is increasing. Downstream value chain issues such as venture capital, angel financing and other financing techniques, and the need for effective networking and
communication to obtain these, emerged in the 1990s (Dimov and Shepherd 2005; Lévesque et al. 2009; Shepherd and Zacharakis 2001; Shepherd and Zacharakis 2002).

However, for a field to be considered a field, and to be taught, there should be some kind of consensus of what exactly it entails. This does however not seem to be the case for entrepreneurship. Entrepreneurship is a “widely dispersed, loosely connected domain of issues “ (Ireland and Webb 2007), a “mosaic of issues to be explored” (Zahra 2005:254). It displays eclectic and pervasive advantages and for that reason attracts researchers from diverse disciplines, for example accounting, anthropology, economics, finance, management, marketing, operations management, political science, psychology and sociology. The domains of Management and of Entrepreneurship are often compared and are defined today as neither mutually inclusive nor exclusive. Their relationship is described as overlapping (Hitt et al. 2001; Ireland and Webb 2007). The former is considered more opportunity-driven, the latter is more resource- and “conversation”-driven (Ireland, Hitt and Sirmon 2003). The relation between Strategy and Entrepreneurship is sometimes discussed. Entrepreneurial strategies have been identified and shown to have important common denominators, issues, and trade-offs between entrepreneurship and strategy (Hitt et al. 2001) and this has yielded the field of strategic entrepreneurship, a unique distinct construct through which companies can create wealth. It is composed of an entrepreneurial mindset, an entrepreneurial culture and entrepreneurial leadership, and of the “strategic management of resources and creativity to develop innovations” (Ireland et al. 2003:963). Corporate entrepreneurship and the need for internal corporate venturing have also gained much attention during the past decade(Kuratko et al. 2001; Miles and Covin 2002; Morris and Kuratko 2002; Zahra et al. 1999). On a micro-level, many diverse types of entrepreneurs and the equally diverse methods they use to
achieve success have motivated much research on psychological aspects (Kickul and Gundry 2002). Such concepts as entrepreneurial spirit, entrepreneurial mindset and entrepreneurial culture are growing area of interest all over the world (Buchholz and Rosenthal 2005; Fayolle 2000; Gartner et al. 1992; McDougall and Oviatt 2003; Minniti 2005; Zahra et al. 2001). The concept of risk and trade-offs in entrepreneurship – particularly its demanding and stressful nature – have also been intensely researched (McGrath, MacMillan, & Scheinbert 1992). Women and minority entrepreneurs have emerged and been inquired. They appear to face different kinds of obstacles and opportunities (Chaganti and Greene 2002; Greene et al. 2003; Gundry and Welsch 2001). On the macro-level, the economic and social contributions of entrepreneurs, of new companies, of small and midsize enterprises (SME) and of family businesses has been shown to be disproportionately high regarding employment creation, innovation, and economic renewal, compared with the contributions of top 500 companies (Aldrich 1999; Chrisman et al. 2003). Last but not least, ethics and entrepreneurship, sustainable entrepreneurship and social entrepreneurship have become a fast growing area of research, partly due to recent systemic deficiencies of the classic capitalist systems and resulting scandals occurring in large corporations, partly due to an increased conscientization regarding ecological and societal issues (Bucar and Hisrich 2001; Buchholz and Rosenthal 2005; Carter 2007; Kuratko 2005; Morris et al. 2002).

For the purpose of this paper we focus on the theoretical body of entrepreneurship that addresses consideration of the motivations of people to become entrepreneurs, and to make entrepreneurial decisions. Major characteristics and motivations that influence the entrepreneurial process, as prior researchers have suggested, are: i) need for achievement, ii) locus of control, iii) risk-taking propensity, iv) tolerance of ambiguity, v) ambidexterity and
vi) Type A behavior, including competitive, restless striving and constantly struggle against all types of limitations, such as time (Begley and Boyd 1987) and resources (Stevenson 1983). These behaviors are widely regarded as hallmarks of entrepreneurial agency – and these behaviors, we found, are also widely prevalent in artistic agency.
**On Art**

If you cannot say it, point to it. *Ludwig Wittgenstein*

Art is not a handicraft, it is the transmission of feeling the artist has experienced. *Leo Tolstoy*

And so each venture
Is a new beginning, a raid on the inarticulate
With shabby equipment always deteriorating
In the general mess of imprecision of feeling,
Undisciplined squads of emotion. And what there is to conquer
By strength and submission, has already been discovered
Once or twice, or several times, by men whom one cannot hope
To emulate – but there is no competition –
There is only the fight to recover what has been lost
And found and lost again and again: and now, under conditions
That seem unpropitious. But perhaps neither gain nor loss.
For us, there is only the trying. The rest is not our business.
*T. S. Eliot*

“I always took for granted that the best art was political and was revolutionary. It doesn’t mean that art has an agenda or a politics to argue; it means the questions being raised were explorations into kinds of anarchy, kinds of change, identifying errors, flaws, vulnerabilities in systems.” *Tony Morrison* (Bogart, 2007:1)

**Framing**

We shall not even attempt to define art here: this is an ongoing project of study, thought and inquiry, ever since man exists and creates, and, in a sense, arts’ definition and redefinition, is part of art. The study of the meaning of art is a philosophical branch, aesthetics, in its own right (Levinson 2003). We shall just, in a few words, frame what we address when we speak of art, or the arts, in this study. We shall here address the act (or process) – and/or of the product – of deliberately arranging elements with the intention to affect thought, senses and emotions. We think of diverse range of human activities, creations, and modes of expression, including music, poetry, film, literature, theatre, photography, installations, sculpture, paintings, video, Internet and mobile device art, and more. We also think, with Tolstoy, of art as a use of indirect means to communicate from one person to another (Tolstoy 1897). Art as *mimesis* or representation has roots in the philosophy of Aristotle. Kant, and later Fry, Bell, Adorno, Merleau-Ponty, Lyotard and others brought us
theory (Adorno 1959; Adorno 1969; Andersen and Oxvig 2009; Grosz 2008; Lyotard 1983; Merleau-Ponty 1960), Heidegger brought us an interpretation of art as a political weapon, as a means by which a community self-expresses and frames itself (Heidegger 2001). Britannica online brings forward "the use of skill and imagination in the creation of aesthetic objects, environments, or experiences that can be shared with others." Defined in this way, artistic works have existed forever. The first and broadest sense of art is its Latin translation of "skill" or "craft." Artifact, artificial, artifice and many more uses bear some relation to its etymology.

**Purpose**

Another, more recent definition is of art is as an abbreviation for creative art(s) or fine art(s) defining competencies put to use to express creativity, or to engage others’ aesthetic senses. Depending on the perception of the finesse applied, and of whether the creation has a practical use or not, such works will be labeled crafts, or applied art, just as, when used deliberately commercially, the term commercial art is used. These distinctions on issues of purpose, which are highly definitional and have their origins in human beings’ different paradigms and perceptions, are especially interesting because a frequent metaphorical connection and/or a proposed relationship between entrepreneurship and art is likely to evoke this apparent dichotomy that one type of creation (art) is – or even must be – completely free, pure, devoid of any utilitarianism, essential; for the sole purpose of beauty, of the gesture - whereas entrepreneurial creation is for the purpose of material gain, of profit. However, art often has goals beyond pure creativity and self-expression. The purpose of art is manifold and includes the wish to communicate ideas, such as in politically-, minority-, spiritually-, and/or philosophically-driven art (Comisso 2000; Danesi 2008; Debord 1961; Debord 1997); to
create essence, beauty, pleasure; or to provoke emotions of all kinds. The purpose may also be none, or, on the other end of the scale, totally commissioned by a third party. Some areas of entrepreneurship are naturally mixing with art: in advertising, skills and disciplines collide and collaborate: writers, artists, dramatists, salesmen, marketers, psychologists, statisticians, media analysts, entrepreneurs, etc. Professionalism and societal responsibility must be defined in terms applicable to each of these; roles relate to others – and to the whole. Each must feel responsible for the consequence – profits, sales, and societal impact – of his action. There is much to be learned, here. In sum, material, constructive, destructive, healing, subversive and other transactional transformational purposes (Barthes 1957) are perfectly common to art. We identify intentional, conscious actions to bring about change, to comment on aspects of society – or to want to change it, more or less radically and anarchically (Barnard 2004; Berkowitz 1999; Chollet 2004); agency that aims to address discrimination, to bring to light minority issues, to simply communicate (Mithen 1999), to entertain, or to sell something, outright.

Much as entrepreneurship, therefore, art is eclectic, lacks a theoretical framework, and can be perceived in endless ways, for example as an activity compelled by personal need to express oneself, as a discipline of inquiry, or rather many disciplines, a discipline of production, a study of creative skill, a creative process, a product, a work, an object; but also as an echo, as the receiver’s perception of the creative act or the produced object. The arts discipline) are a collection of disciplines (arts) that produce artworks (art as objects) that are compelled by a personal drive (art as activity) and echo or reflect a message, mood, or symbolism for the viewer to interpret (art as experience). Artworks can be defined by purposeful, creative interpretations of limitless concepts or ideas in order to communicate
something to another person. Artworks can be explicitly made for this purpose or interpreted based on images or objects. Art, as we use it for the sake of this exploratory thought paper, includes all these prisms and others that may come up as we think along.

**So Why Art and Entrepreneurship?**

“I don’t want you to think of this as just film… no, listen to me, we’re here to make a dent in the universe. Otherwise why even be here? We’re creating a completely new consciousness. Like an artist, or a poet. We are rewriting the history about human thought with what we’re doing. That’s how you have to think of this…” *(attributed to)* Steve Jobs, speaking to Ridley Scott, *in the opening sequence of the movie “Pirates of Silicon Valley”, 1999.*

“I’m a deeply superficial person.” *Andy Warhol*

"Your pen will be consumed before you have fully described what the painter presents to you immediately using his science: and your tongue will be paralyzed from thirst and your body foreworn with sleepiness before you will be able to represent in words what the painter shows you in an instant.” *Leonardo da Vinci, Treatise on Painting, 1680*

“First, we believe that the world must be changed. We desire the most liberatory possible change of the society and the life in which we find ourselves confined. We know that such change is possible by means of pertinent actions.” *G. Debord, introd. to Report on the Construction of Situations, McDonough, 2004:29*

It is the entrepreneurs themselves that first gave us the idea. As in some above citations of Steve Jobs (Apple) and Nicholas Hayek (Swatch), the metaphor of the artist plays a recurrent role in many autobiographies, interviews and other interactions with entrepreneurs. Many entrepreneurs like to see themselves as artists and we wanted to know why. As we began to study the phenomenon, we found both a budding body of research in management science grappling with art and, vice versa, some rapprochement from the arts toward management and organization science, the most developed being the interface treating the management of the arts (institutions). Still, with this latter exception, for the most part of the literature, management remains in the management corner and art literature firmly concerned with art. But theory on arts can be a source for inspiration for management science scholars – and more particularly so for entrepreneurship scholars. Beyond the numerous
references to the nonconformity of both (Smilor 1997), the part of rebellion, of norm-transgression (Miller et al. 1997), of avant-garde, of work at the liminal (Turner 1974) and in the interstices of conventions and systems (Hjorth 2004; Hjorth 2007), we find that there are endless parallels and associations waiting to be studied. Too many phenomena ring a bell, many conditions for agency are very similar, too many concepts, constructs and theories seem to directly address entrepreneurial issues. We purport, for the sake of debate, that entrepreneurs and artists can learn from each other, and that entrepreneurs can in many ways be viewed as artists. Some – non exhaustive – examples:

**Context**

Reframing is telling the truth as we see it – telling it forcefully, straightforwardly and articulately, with moral conviction and without hesitation. The language must fit the conceptual reframing, a reframing from the perspective of progressive values. It is not just a matter of words, though the right ones are needed to evoke progressive frames. George Lakoff.

The present economic crisis (2008-2010) is a wake up call and many of us are clearly asking new questions and seeking new answers – and, one could argue, that is exactly art’s business! But also that of entrepreneurs, who seek and build opportunities in the yet undefined spaces between a world in place and a world to come. Phenomena and concepts worth examining as avant-garde, ways-of-seeing, activist art, art embodied, moral aesthetics, collective memory, presentational knowing, etc.

**Content and Meaning**

Art asks essentially some of the same questions than entrepreneurship regarding content: are you truly creating value? Are you privileging content over form, or form over content, e.g. over or underselling? Content is the matter contained by form, the meaning, the sense, the message contained within a receptacle. This receptacle can be a physical container,
or a story, a metaphor; a business plan. Just as in business school classrooms, conservatories teach some form of technique, or, as Bogart explains, “…a very watered-down idea of technique, but young theatre artists are rarely encouraged to grapple or wrestle with issues and content. They are taught how to tackle a character in a play, but they are not asked; ‘what is a play?’, ‘what is its function?’, ‘what does this play mean now?’, why is it necessary?’” (2007). This rings a bell with entrepreneurship education as explained earlier. In order to examine issues about content and meaning, Bogart suggests five themes: i) begin with necessity, ii) develop perception (fight numbness: remember that the purpose is to wake people up, so learn to see and sense beyond routine), iii) find out what is missing (ours is a culture of excess, we are cluttered with too many material things and with counterfeit emotions. What is lacking, what is missing? Start from there.), iv) learn what you need now (what do you need to know about the world in order to share what you must and want to share: learn it now) and v) develop patience give the time needed for creation). (Bogart 2007:109). These themes, expressed in other, more entrepreneurial terms – for example stay hungry, have a unique selling proposition, focus on a niche, recognize opportunity, exploit the strategic gap, etc. seem to apply almost one to one to entrepreneurship.

**Purpose: Survival, Profit, Altruism and Wanting to Change the World**

And so each venture
Is a new beginning, a raid on the inarticulate
With shabby equipment always deteriorating
In the general mess of imprecision of feeling,
Undisciplined squads of emotion. And what there is to conquer
By strength and submission, has already been discovered
Once or twice, or several times, by men whom one cannot hope
To emulate – but there is no competition –
There is only the fight to recover what has been lost
And found and lost again and again: and now, under conditions
That seem unpropitious. But perhaps neither gain nor loss.
For us, there is only the trying. The rest is not our business.

*T. S. Eliot*
Entrepreneurship educators are faced with ever more students wishing to engage in something that has become known as social entrepreneurship. Indeed, today we distinguish social entrepreneurs – who use entrepreneurial principles to organize, create and manage ventures to make social change, and assess success in terms of impact on society as well as profit – and business entrepreneurs who typically measure performance solely in profit and return. It is possible that this distinction might fade. We argue that artists have by definition always had to align a devotion to art for art’s sake and the economic need for self-management, and could inspire us here. On the other hand, while not every baker, ironmonger, car industry supplier or tax advisor wants to change the world, many entrepreneurs do. In the vein of the Steve Jobs quote at the beginning of this paper, many entrepreneurs are on some kind of mission. And their notion of ‘value creation’ is often more holistic than just economic. Artists ‘make worlds’, and in a sense so do entrepreneurs. This statement invokes the utopian image of the ‘modernist innocence’ of the artist. For a while this image given way to one of a artist under the pressure and the manipulations of the cold and calculative logic of the ‘dominant neoliberal economism’. It was regretted that the artist be ‘…transformed into an entrepreneur conjuring all kinds of strategies in order to be visible just for a few minutes’ (Madra 2009). This absolutist, dichotomous perspective of the two worlds has somewhat changed. We purport that while it can be asserted that the artist is an individual who has the ability to change the world or at least, more cautiously, that artists are individuals who believe they can change the world, this also goes, in a sense, for entrepreneurs.

Use of Resources

The Internet brings about a phenomenal process of dematerialization. This and low
communication costs provoke – and permit, to speak in terms of opportunity – structural decentralization. This sets completely new demands upon entrepreneurs, and opens new doors: they do not need to produce anything but can build entire companies by buying and combining all types of services. Identification, smart assembly, dynamic organization and adaptation of product and service components, but also of people, can best be compared to the work of a collagist, a composer, or a conductor. To bring people into new arrangements one needs to be acutely aware and sustainably respectful of their physical, emotional and mental dispositions.

**Attitude, Disposition, Authenticity, Fragility**

The most demanding part of living a lifetime of an artist is the strict discipline of forcing oneself to work steadfastly along the nerve of one’s own most intimate sensitivity. *Anne Truitt*

Things are not difficult to do; rather what is difficult is to put yourself into a state to do them. *Constantin Brancusi*

Sustainably value-creating entrepreneurs must be authentic, construct that directly applies to works of art, (considered ‘authentic’ if its origins, authorship, provenance etc. can be identified) and of the artwork’s character as an expression of the artist’s and/or society’s, values and beliefs. For example rap artists engage in distinct discourses to find a dialectic between the unique and the mundane, between succeeding—makin’ it—and remaining loyal to the values of your community or culture—“keeping it real” (Sköld 2007).

**Experiential Learning, Cognition and Emotion**

Art is most pleasurable not when it closes us down, narrows our perceptions and sympathies, draws boundaries of appropriateness or goodness, but when it opens us up. *Charles L. Mee Jr.*

A man gains awareness of what he is through his selfhood in a world in which he plays an active part. He is one who has learned that he completely loses insight into the general course of affairs, if he tries to stand outside as a mere spectator aspiring towards a knowledge of the whole. *Karl Jaspers, Man in the Modern Age, 1931*
Entrepreneurial agency necessitates a behavior based on both cognition and emotion, i.e. to think and act with both brain halves. Societal changes must be anticipated, talent must be translated into economic value, stakeholders must be mobilized, and sense-making metaphors, storytelling – key artistic techniques – play a role (Downing 2005; Fletcher 2007; Fletcher and Watson 2007; Hill and Levenhagen 1995; Hjorth 2007; Martens et al. 2007). Musicians, painters, designers, playwrights, actors are increasingly involved in enterprise, not only in promotion, but in the act of conception and production. Many startups, micro-enterprises, freelancers, make their competitive advantage a distinctive appearance, form, content, sound, etc. that they embed or embody in products or services.

**Anticipation, Opportunity Recognition**

> The moment one gives close attention to anything, even a blade of grass, it becomes a mysterious, awesome, indescribably magnified world of itself. Almost an “unrecognizable” world. *Henry Miller*

> One can travel the world and see nothing. To achieve understanding it is necessary not to see many things, but to look hard at what you do see. *Giorgio Morandi*

> To take photographs means to recognize (...) both the fact itself and the rigorous organization of visually perceived forms that give meaning. It is putting one’s head, one’s eyes and ones heart on the same axis. *Henri Cartier-Bresson."

The recognition and pursuit of opportunity is a central construct of entrepreneurship (Baron 2006; Fendt and Bureau 2010; Stevenson 1983; Timmons 1994). What if it had to do with capacity to anticipate paradigmatic change, to associate the unassociated, to recognize parallels, to perceive the common in an uncommon way?

**Entrepreneurial Artist, Artistic Entrepreneur**

> I once considered fundraising an obligatory activity divorced from the artistic process. I have come to understand that fundraising can, in fact, be part of the creative act. Fundraising is an action that can help to speak the project into existence.” *Anne Bogart (Bogart 2007:27)*
Artists themselves, be they Madonna, or Andy Warhol, the latest boys band or less spectacular players, are most likely organized as entrepreneurs and they create value – and a living for themselves and sometimes impressively many others – by sharing and exposing their fragility on the one hand and through vision, business acumen, understanding of the customer and industry, leveraging competencies, continuous renewal – and some degree of sometimes very surprising but effective resource organizing, ranging from what has come to be known in entrepreneurship as “bootstrapping”, to often highly streamlined innovation-generating industries.

Architecture as an Organizational Construct

Other phenomena resemble structural principles of architecture. Informatics, the home base of many modern entrepreneurial ventures, is a structural and coordinative science and the analysis, association and transfer of structures from one discipline to another is a core competence.

Doing It – And the Contrary of It

Float like a butterfly, sting like a bee. *Muhammad Ali*

The grace of human life is not to lack insecurities, but to turn them to good use. *Julius Novick*

The art of theater is about living outside your own skin and identifying with the ancestors who empower you to speak. Articulate, describe, redescribe, find your own words, finish sentences, transform the irritations of daily life into expression, point, signal in the face of the ephemeral, frame what you believe and say it well. And this is why the theater keeps on compelling artists and audiences to gather together. We are asked to stand up in the present moment and to speak courageously for those who came before, to speak against familiar currents, from a state of imbalance and as articulately as we can manage.” *Anne Bogart* (2007:29)
Time is the school in which we learn. Time is the fire in which we burn. *Delmore Schwartz*

He takes a step back,
He’s under attack
He knows that no one can touch him now
He seems so at ease
A strange inner peace,
It’s all that he’s feeling somehow.
He’s got all kinds of time,
He’s got all kinds of time
All kinds of time… *Song Lyrics of “All kinds of time” by Fountains of Wayne, 1996*

Paradoxes, dilemmas and (true and false) dichotomies of all types are the playgrounds from which entrepreneurial agency and artistic oeuvre emerge alike. The dichotomy between work as a managerially ordered place and conditions for creativity within such an order calls for temporal, spatial, sonar, visual, haptic concepts to create space for play. Traditionally, in management science, practices and theories remain by and large embedded in classical paradigms of hierarchy and bureaucracy. More broadly, managers live in a world of opposites such as formal vs. informal organization (Roethlisberger and Dixon 1939) mechanistic vs. organic (Burns and Stalker 1961), open vs. closed systems (Katz and Kahn 1966), organizational dilemmas (Bradach and Eccles 1989; March 1991; Tushman and Smith 2002), centralization vs. decentralization (Bartlett and Ghoshal 1998), short-term or long-term (Crossan et al. 2008; McGrath et al. 2001), global efficiency and country sensitivity (Bartlett 1986; Bartlett and Ghoshal 1998; Doz and Prahalad 1986; Harzing 2000; Prahalad and Doz 1999), stability vs. change, inner vs. outer direction, and so on. These and other opposites – the most highly cited now being March’s (1991) exploitation vs. exploration – are often viewed as dilemmas.

Time is the school in which we learn. Time is the fire in which we burn. *Delmore Schwartz*

He takes a step back,
He’s under attack
He knows that no one can touch him now
He seems so at ease
A strange inner peace,
It’s all that he’s feeling somehow.
He’s got all kinds of time,
He’s got all kinds of time
All kinds of time…

*Song Lyrics of “All kinds of time” by Fountains of Wayne, 1996*

Such structures and models force executives to go in for all kinds of trade-offs, often under extreme time constraint and on the basis of insufficient data. De Witt and Meyer (1999) suggest that these and similar opposites confront managers with ‘paradoxes’. The prevailing solution to dilemmas advocated is ‘balance’ (Bradach 1997) or ‘optimal mix’ (March 1999) i.e., attempt to benefit from both sides by striving for some kind of synthesis (De Witt & Meyer 1999), or pursuit of ‘synergistic dynamics’ (Christensen and Foss 1997). The problem is that balance between poles like globalization and localization or exploitation and exploration is ‘impossible’, as March (1999) puts it. Scholarship is unanimous that such linear practices and theories are inadequate (Anderson et al. 1999; Beckham 2002; Brown and Eisenhardt 1997; Doz and Prahalad 1986; Osborn 2008; Osborn et al. 2002; Osborn and Hunt 2007; Schoonhoven and Jelinek 1990; Thomas et al. 2005; Weick and Sutcliffe 2001), especially in knowledge economies, which emphasize decentralized organizations and coevolutionary ecologies (Lichtenstein et al. 2006; Uhl-Bien et al. 2007).

An emerging body of research speaks of ambidexterity (Probst and Raisch 2005; Tushman and O'Reilly 1996) as the capability to ‘be both’ of two opposites. Both in art and in entrepreneurship we find such ambidexterity. Our brief narrative analysis has yielded that as management practitioners, and scholars, entrepreneurs find it hard to understand and manage nonlinear phenomena. When the entrepreneurs we met explain their ambidextrous agency, it seems like an evidence to them, as if they had ‘no choice but not to choose’. It is not that they particularly like complexity and ambiguity, nor risk-taking for that matter. On the contrary,
they prefer to shun these phenomena – but then do not. They describe a sort of incapacity to take either-or for an answer, to let go of either alternative, and therefore a necessity to hold on to them as long as they can! This is quite opposite to classic managerial behavior. Part of being a good manager is traditionally the capacity (implying the guts, the courage) to effectively and rapidly make (sometimes painful) decisions. When observing artists, and some entrepreneurs, at work and feeling the incredible tension inherent in some of their ambidextrous work, one wonders which approach takes more guts to do. To do it and the contrary of it seems a non-negotiable evidence in creative contexts. It is perceived as (or not) a hunting ground for opportunity and/or as a window to the future, to the next paradigm.

Both entrepreneurs and artists are often autopoietic (Maturana and Varela 1992) and self-organized (Kauffman 1993) and display dynamic capability. Dynamic capability transgresses the classic resource-based approach to coping with changing environments (Teece 2007). Eisenhardt and Martin observe that when markets are dynamic, ‘dynamic’ capabilities are: “simple, experiential, unstable processes that rely on quickly created new knowledge and iterative execution to produce adaptive, but unpredictable outcomes” (2000:1106). To Brown and Eisenhardt (1997) dynamic capabilities rely on ‘semistructures’ so as to avoid chaos and to allow new capabilities to emerge continually.

First Experiences, Emerging Hypotheses, and Further Research

Do I contradict myself? Very well then I contradict myself.
(I am a large, I contain multitudes). Walt Whitman

Trinity: “No one has ever done anything like this.”
Neo: “That’s why it’s going to work.” Dialog from the movie Matrix, 1999
From what we have studied and experienced so far, the craft entrepreneurship goes far beyond organized knowledge in the shape of the application of tools, models and methods. It involves the unleashing, transfer and socialization of independence and imagination. Imagination is composed of guessing, dreaming, recognizing, erring, doubting, supposing, trying and suchlike – much the opposite of what we teach at business schools. It necessitates human understanding that emerges from self-exposure, risk-taking, grappling, and therefore necessitates an atmosphere of generosity and trust. It involves work at the most intimate level of human beings, at the level of speech, of paradigm. If this is so, then the craft of entrepreneurship education must go equally far beyond the transmission of organized knowledge, such as business modeling, business planning, venture valuation, etc. One hypothesis that seems to emerge that to enable this type of deep level of change to occur, we should engage students in play: more precisely in the “subtle play of ideas through a process of paradigm shifting in which the conceptual lenses by which we apprehend the world is critically exposed and their consequences understood” (Chia, 1996:411). The essential knowledge is therefore a heightened sensitivity, a human understanding, a keen mind that is alert and receptive to the business opportunities likely to be hidden in the interstices between worlds and emerging from human interaction. Entrepreneurial opportunity is often hidden in the “inbetween”, in the gaps between homogenous and closed worlds. We purport that involvement with the arts can unleash the necessary associative capacity of becoming entrepreneurs. The arts are by definition inquiring disciplines, they frame, associate, anticipate and sense impulses better and earlier than other disciplines. The have an interest in “revealing the way micro-practices of ordering and organizing influence and shape our perception of reality (Chia, 1996).
Our educational practice is focused on *simplification* of the complexity, the multiplicity of phenomena into manageable ‘models’ and 'axioms', and from there into methods and tools. From the arts we can learn to *complexify* our thought and hence sensitize us to the subtle nuances of the world around us and to speculate and anticipate what is ahead. Chia calls this ‘heightened aesthetic consciousness’, and considers it crucial for the entrepreneurial imagination to flourish (1996). The truth does not exist as one thing; rather, it is a tension between opposites. Hegel stated that all human development is driven by the conflict of opposites, a dynamic he called dialectic.

To discover and better understand the discussed phenomena, and perhaps find some more, we have begun to invite art into our business school classrooms – and to set out, with our entrepreneurship students, to find art: in the cities, in business, in life. For example:

- we fully associate artists (painters, sculptors, film makers) and art and design students to our programs (final year master entrepreneurship major), both as faculty and students.
- We give formal assignments to students to express their experience of entrepreneurial becoming in poems, essays, collages, foods, sounds, etc.
- We invite entrepreneurs to our classrooms for testimonials. We film these, discuss them in small teams of scholars and students, and have begun some narrative analyses.
- We assign students to early-stage entrepreneurial ventures (usually ventures created by graduates of preceding classes), for interviews and for different types of consulting missions. We ask the students to translate their experiences in short video sequences.
• Last but not least, we regularly work with techniques originally applied by Dadaists and then refined by the Situationists International (SI) in the 1950s around Guy Debord, namely the creation of situation, the détournement (“the reuse of preexisting artistic elements in a new ensemble”, Knabb, 1981:67) and the dérive (drift; a “technique of rapid passage through varied ambiences” Knabb, 1981: 63). You could say that we practice a “détournement” (turn around, deviation) of Lettrist and Situationist practices for the purpose of a novel kind of entrepreneurship education. These methods were central to the Situationist movement and their intent to revolutionize art, and later society in its entirety. In a sense, this same intent is underlying here: to change entrepreneurship education, so as to change entrepreneurship, and ultimately society. In sum, we include in our pedagogic program a critique of current entrepreneurship education and some malaises experienced with methods and their application, drawing on the literature and on our own teaching and research experience and supporting our discussion with evidence from other scholars. This exercise that helps us complement – and sometimes escape from – the rational, predictive, deterministic entrepreneurial toolbox of business plan writing and so on, goes beyond the capacity of this paper and is described in separate studies (for example: Bureau and Fendt 2010).

These are first, encouraging experiences that are completely lacking academic validity for now. From a methodological viewpoint we are still reflecting on how to proceed. For now, we document in detail all processual and outcome-specific data, such as: assignments, results, immediate and deferred reactions, and so on. We aim to render our hypotheses more robust about parallels between the two described worlds. What can we learn for entrepreneurship from art? What essence, meaning, theories, behaviors and also techniques, could we adopt
from art, and from artists, and/or artistic movements, from music, poetry, from Impressionism, Expressionism, Dadaism, Action Art, Concept Art, the Movida, Jazz improvisation, Living Theatre, contemporary urban avant-garde projects, to name an insufficient few, and – last but not least – from life itself?

Chia purports that “…the cultivation of the 'entrepreneurial imagination' is the singular most important contribution university business schools can make to the world, and “…instead of the prevalent emphasis on the vocationalizing of business/management programmes in order to make them more 'relevant', university business schools should adopt a deliberate educational strategy that privileges the 'weakening' of thought processes so as to encourage and stimulate the entrepreneurial imagination” (1995:412. We adhere to this and would like to find out more about how to do this. This may require a fairly radical shift in pedagogical priorities away from teaching analytical problem-solving skills to cultivating a 'paradigm-shifting' mentality. We have shown how creators need to excel in the art of crafting relationship between sets of apparently disparate ideas and thus bring alive the facts they are attempting to impart. Only when such facts are embellished and illuminated by a mind possessing an intimate sense for the power and beauty of ideas and the bearing of one set of ideas on another, can they become pregnant with meaning and therefore able to excite the entrepreneurial imagination.

This study sharesrst reflections on the engagement by scholars and artists, across a number of creative arts disciplines, in the advancement of entrepreneurship research and education. It has begun to pose such questions as: What knowledge about enterprising can such an engagement with creative arts reveal that may not be revealed by other modes of
inquiry and teaching? And what implications does engagement with the arts have for extending our understandings of the role of practice-based inquiry and pedagogy and multiple intelligences in the production of knowledge? And how can the outcomes and broader applications of artistic research and pedagogy enhance understandings of artistic practice as research and pedagogy? Based on the literature search, on dozens of exploratory interactions with entrepreneurs, and on our first educational experiments, we purport that to invite literature and the arts into entrepreneurship research and education can provide new openings for the exploration of the self, of relationships, of framing and of entrepreneurial becoming.

We also suggest that what Chia calls “the micro-logics of perceptual organization, necessary for cultivating a critical sensitivity to hidden assumptions and subtle relationships in social situations” will be furthered and that these enhanced capabilities will further entrepreneurial becoming and entrepreneurial achievement. This study sets the scene for an experimental research to consider and share relationships between the arts and the entrepreneurial process, away from classical equilibrium-based understandings, toward creative process views inspired from a broad range of relevant and seemingly irrelevant perspectives. This is work in progress we hope for all kinds of stimulating echoes, and we shall be back.

Stevenson, H. "Why Entrepreneurship Has Won!" Presented at USASBE National Conference.

1 (Bechard & Gregoire, 2005; Fendt, Paris, & Bureau, 2008; Kuratko, 2005). These exercises comes along with more or less contextual embeddedness, e.g. interaction between students and the “real world” (Brindley & Ritchie, 2000). But does this method work? Some benefits are evidenced (Pittaway & Cope, 2007a, (Arlotto, Boissin, & Maurin, 2007; Fukugawa, 2005; Ridder & Van der Sijde, 2003, Carson, 1985; Chan & Anderson, 1994; Daly, 2001; Katz, Gundry, Low, & Starr, 1996; Wani, Garg, & Sharma, 2004), but it is unclear whether such normative programs shape graduates to become more effective entrepreneurs – and what type of entrepreneurs.
The Impact of an Entrepreneur or Small Business Owner’s Education on Knowledge Acquisition

David Tomczyk, Mark Phillips, and Jung Hyun Lee
The George Washington University

ABSTRACT

Entrepreneurs and small business owners come from a wide variety of educational backgrounds. This study will investigate the relationship between the educational background of small business owners and entrepreneurs and the training methods they utilize with their workforce. We hypothesize that the educational level of owners and small business owners will correlate with training methods they use on their employees. This study examines survey data collected from 135 entrepreneurs and small business owners in the Washington, DC area. The results indicate that while employer age rather than training level may be more influential in their choices of employee training methods.

Introduction

Entrepreneurs and small business owners come from a wide variety of educational backgrounds. While some graduate from college or graduate schools and use their training and education to run their business, others drop out from high school and rely solely upon their innate knowledge and instincts. Likewise, the educational backgrounds of the employees of owners vary widely, a fact that places a unique set of challenges and requirements upon an owner’s approach toward employee training.

This study will investigate the relationship between the educational background of small business owners and entrepreneurs and the training methods they utilize with their workforce. We hypothesize that the educational level of owners and small business owners will correlate with training methods they use on their employees. For example, managers without formal
education will be less likely to use methods and tools that mimic formal education. In addition, managers with strong academic backgrounds may expose their employees to training methods directed towards long-term benefits because their educational backgrounds stress more strategic and long-term views.

For this study, we seek to look at two topics related to knowledge acquisition in a small business, whether by an entrepreneur or small business owner. They are:

1. Does an owner’s educational background affect the methods and tools chosen for training the owner and the management team?

2. Does an owner’s educational background affect the owner’s perceived need for training throughout the business?

The following section will set forth theoretical support underlying the hypotheses posed above. Thereafter, an explanation of the nature of the data collection and analysis methods will be provided. Finally, the results of the study will be discussed along with their attendant implications and avenues for future research.

Theoretical Background

Small businesses and their human resource management (HRM) practices are drawing increased attention in the literature (Harney & Dundon, 2006). In particular, the importance of developing the employees who drive the entrepreneurial venture toward success is vital to the continued operation and growth of the business. However, despite the size of the market for training (estimated at billions of dollars each year), there is comparably little research focusing on it, much less the factors that contribute to the decision to seek training for employees (Banks, Bures, & Champion, 1987).
Employee development, and especially manager training, has grown to be a popular topic among business periodicals, which now discuss the benefits and costs of training, and advertisements in such media often include classes and seminars on a variety of management topics. Not surprisingly, the lack of skilled human resources along with employee training and development has been attributed to why American companies are losing market share in the global marketplace (Lichtenstein, 1992; Senge, 1994; Cross & Funk, 1997; Yochelson, 2000; Carnevale, 2005). In fact, a National Federation of Independent Business Small Business Poll entitled *The Changing Search for Employees* indicates that 71 percent of small employers feel that qualified employees are hard to find (Dennis, 2001), meaning employers must actively seek training for their employees, just to have them function at their jobs. In addition, a 2004 Administaff survey of small and medium firms found that, although respondents were somewhat optimistic about the future, they were still concerned about providing adequate training and motivation for employees (Administaff, 2005). Adding to this grim portrait of employee training, the Bureau of Labor Statistics projects that during the next decade, 30 percent of new jobs will require some postsecondary education or vocational training (Carnevale, 2005).

Assuming current projections and research findings hold true, owners and managers of small and medium enterprises will have to rely on less qualified employees, who will require a greater degree of training and development in order to be productive (Carnevale, 2005). As a result, managers will have to develop the mindset that their employees are a significant investment, constituting their firm’s human capital, and therefore apply the same effort to keep employees well maintained. Viewed in this light, training and development of employees must be seen as imperative to firm survival.
To Train or Not to Train

Employers provide their employees with training and development for numerous reasons. Initially, employers may wish to orient new hires to the organization or teach them how to perform in their positions. Many organizations later wish to improve the performance of some employees or prepare other employees for pending promotions or revisions to their current positions in terms of design, processes, or technology (Fisher, Schoenfeldt, & Shaw, 1999). Many small firms follow the mantra that it is cheaper to retain and retrain workers than fire and rehire (Wells, 2001). This philosophy points to the fact that including training as part of a company’s HRM program can actually help motivate—and thereby increase the retention of—employees, providing new experiences even to veteran employees (Deshpande, Golhar, & Stamm, 1993, Hornsby & Kuratko, 1990).

More direct evidence of the benefits of training employees comes from a recent study conducted by the American Society for Training & Development (Pangarkar, 2002/2003). The study demonstrated that there is evidence of a direct relationship between how much a firm spends on employee training and the percentage of increase in organizational performance. Other studies that included training as a component of an HRM program found similar results (Hayton, 2003; Way, 2002). Thus, evidence shows that organizations may be rewarded financially for investing in their employees through increased profits and low employee turnover. Thus, it is not surprising that seventy percent of all employers provide some type of formal training for employees (Noe, 1998). In one research study, 75 percent of respondents in firms with fewer than 500 employees received some training (Schaaf, 1998).

Despite all of the evidence in support of training, though, many small business owners do not train their employees. Tracey (2001) identifies reasons why this may be so, including: (1) not
knowing how to give employees the training they need; (2) not knowing what materials are relevant to necessitate proper training; (3) not knowing how to measure the effectiveness of training; and (4) not knowing how to encourage employees to use the new skills learned or evaluating whether learning has actually occurred. Harney and Dundon (2006) and Wright and Boswell (2002) noted that even among “good” employers, practices can differ greatly, even from what best practice models would suggest. Much research tends to assume that small businesses are purely rational entities (Scott, 2003) that capture only a part of how HR systems work (Ferris, Arthur, Berkson, Kaplan, Cook-Harrell, & Frink, 1998).

In the end, though, the benefits of training are clear. As described earlier, small and medium enterprises can raise organizational productivity by training and developing their employees. By conducting training, these firms can ensure that the right people learn the right things at the right time and in the right priority order (O’Connor, Bronner, & Delaney, 1996).

However, one of the key questions left unexplored is what drives owners’ decisions about training. Williamson and Cable (2003), in fact, encourage researchers to consider social environmental factors in HRM theories. Our study seeks to look at one such factor—the owner’s educational background as a factor affecting training preferences.

**Methodology**

**Sample and Data**

The data for this paper comes from a small business training and internet questionnaire conducted by the Center for Entrepreneurial Excellence (CFEE) at The George Washington University School of Business. CFEE sent the survey to three hundred entrepreneurs and small business owners in the DC area. 135 surveys were completed and returned to the Center. The
survey covered a variety of topics, including demographic and background information about the entrepreneur or small business owner, the types of training methods and tools used, and the areas of training sought for self-development and development of the management team. Each of the survey questions allowed entrepreneurs and small business owners to identify which training topics and methods/tools are most relevant to their businesses. These aspects were aggregated into larger constructs, allowing us create scales, built around common themes. Training topics were gathered into three categories: Finance-focused (accounting and recordkeeping, how to obtain capital, and financial analysis and cost control) (range 0 to 12, mean 5.41, standard deviation 1.5333, Cronbach’s α 0.735), Sales-focused (researching your market, increasing sales, promotional strategy, international trade) (range 0 to 12, mean 7.05, standard deviation 1.627, Cronbach’s α 0.591), and Business Operations-focused (inventory management, engineering R&D, personnel, and computer systems) (range 0 to 16, mean 6.86, standard deviation 2.176, Cronbach’s α 0.764). For all three categories, lower values indicate a greater demand for that type of training.

The training methods and tools were grouped into lecture-based (range 0 to 28, mean 12.66, standard deviation 3.917, Cronbach’s α 0.871) and hands-on-based (range 0 to 36, mean 16.39, standard deviation 4.252, Cronbach’s α 0.863). Both scales are scored such that lower values indicate a greater preference for a certain style of training. Note that inclusion in one group or the other does not preclude a training method or tool from including both lecture and hands-on elements. Instead, it indicates the primary method for conveying information. For lecture-based training, the information usually comes from a recognized expert in the field who provides information while the trainee passively accepts the information. In hands-on-based training, information may be conveyed initially, but the student then applies that information to
the job or a simulation, providing directed practice. We regressed the educational attainments of the entrepreneurs and small business owners, along with appropriate control variables, against these scales.

The survey directly asked for the respondent’s maximum educational level obtained. The responses received fell into one of three categories: high school education, undergraduate education, and vocational school. We also had a population who did not respond to the question. The vocational school category had only six respondents, and so they were merged with the non-response category. We detected no biases in the data from those who failed to respond to the question, and so we included them as a third category of “mixed educational background.” We suspect that their lack of response may have been due to an unwillingness to share low educational achievement; however, our survey did not have any questions that could validate this theory.

**Control Variables**

For this study, we sought to use three control variables. The first is the gender of the small business owner. Interestingly, although the survey was sent to a mixed population of male and female owners, the usable responses were all male. As such, gender was left out of the regressions. The second control variable included was the age of the owner, included in the questionnaire in six age ranges: 18-25, 26-35, 36-45, 46-55, 56-65, and 66 and over. As shown in previous studies (Solomon & Tomczyk, 2007), age has a significant effect on the types of training sought, and so we include it in our regressions. Finally, we also include the age of the firm (expressed as an integer, mean 2.86, standard deviation 23.851) to control for the effect of organizational inertia. Older businesses may be more inclined to pursue more traditional training
topics and methods, and so we include this variable to control for any such effect. Finally, we included the number of full-time and part-time employees in the firm in order to control for any preference effects caused by having more employees. Presumably, owners of larger firms would prefer training that could reach more employees, meaning an increased preference for lecture-based training, rather than hands-on-based, an effect that has been studied before (Deshpande & Golhar, 1994), although not specifically in the context of training. In addition, larger firms are more likely to be concerned with business operations-focused training as they can have people who specialize in helping the firm to maintain or grow in size. Industry of the firms was collected and considered for inclusion, but the number of firms in each category was too low to yield any significant response.

Results

In the regressions below, the mixed educational background group was the baseline category.

In all three instances, the educational attainment of the owner was not significant. Thus, Hypothesis 1 is unconfirmed. However, the results of the three regressions show that older owners value all types of training more than other owners. In addition, for finance-focused training the number of part-time employees is significant.

Based on the results of these two regressions looking at the effect of owners’ educational attainment on the preferred methods and tools used for training, Hypothesis 2 is unconfirmed. Neither the high school group nor the undergraduate group showed any significant difference from their peers. However, the age of the owners was significant in both regressions, showing that older owners are more favorably inclined toward both training methodology.

**Discussion and Limitations**

The results of the analysis show that our two hypotheses are unsupported. This indicates that a small business owner’s educational background is unconnected to the importance placed on training, meaning that all owners realize the need for training for their employees, and they seek the most effective method for such training. However, this explanation must be considered
along with one significant caveat; we were unable to gather sufficient responses from several of the other educational background categories to be able to generalize this finding across all backgrounds. Future studies should actively seek these other groups to determine whether the preferences are consistent universally.

We also found that older owners were more interested each type of training and training methodology than their younger counterparts. This may be due to the fact that the importance of training is an appreciation acquired over time. Veteran owners may realize that it is better to hire employees with strong work ethics and an ability to learn, than to hire someone with knowledge that may well become dated within a few years. The data show that with each decade older an owner is, the desire for training and the flexibility toward how that training is conveyed is increased. However, future studies should consider adding additional granularity to this component, allowing more thorough examination than using age brackets can allow.

Another finding was that the size of the firm, specifically the number of part-time employees, increased the desire for financial-focused training by small business owners. The result may indicate that firms that rely heavily on part-time employees often must hire people who lack financial skills and acumen. There are two primary explanations for this. The first is that the skills necessary to handle financial responsibilities require extensive time investment by the employee, and people who have invest the requisite time prefer full-time employment. The second possibility is that the people owners hire for part-time employment are not financially skilled, and recognizing this fact, owners seek to correct this deficit of knowledge.
Conclusion

This study has offered several academic and practical contributions. First, the study has shed light on the small business owner’s motivation in choosing certain training methods and topics over others. In addition, this study revealed an unexpected key characteristic that determines an owner’s capacity for recognizing and addressing employee training needs: their age. Second, with the establishment of empirical correlation between age of the owner and training preferences and the lack of a connection between educational background and training preferences, conceptual explanatory models may be developed to explain the relationship, or lack thereof, between these components. Finally, this study lays the foundation for future studies that may assess the effect of the synergy between owner demographics and training methods upon various performance measures.

From a practical standpoint, the results of this study may help inform the marketing decisions of training firms. Understanding how the demographics of the owner affect training preferences may help firms better tailor their marketing to match those owners most likely to make purchases. Such training facilities include academic institutions that already have or are developing workshops, seminars, and other educational opportunities as part of their outreach to their communities.

Small Business Training & Internet Questionnaire, conducted by George Washington University through the Center for Entrepreneurial Excellence (CFEE).

Experiential learning is significantly impacting many aspects of instructional pedagogy. It’s relevance and applicability often come into question – not so in these areas: student field case consulting and business plan competitions. In the former, the Small Business Institute (S.B.I.), a national organization, has mastered the art and skill of pedagogical delivery. We discuss, along with some student teams, the benefits of connecting students and businesses through the S.B.I. model. Skills are refined and reinforced, while business owners have real solutions to erstwhile problems. A parallel application of skills occurs when student teams develop winning business plans. These are explored as to benefits for learning and future careers for aspiring entrepreneurs. Again, the how’s and why’s are reinforced through student teams. In both opportunities for learning and growth, the true values of the educational experience are revealed.

Keywords: student consulting, business plans, experiential learning
This research explored the relationship between leader cognitive models of strategic thinking and firm performance. It provides an empirical examination of the link between influential streams of strategic management thinking perceived as the top manager decision-making strategies, and organizational success. The hypotheses tested were generated from a classification model yielding four cognitive models of strategic management thought. Regression analysis was used to examine the relationship between cognitive models of strategic thinking and firm performance. The respondents were 127 (31 percent of the population) top managers from the population of Croatian firms. ROE and ROA, available from secondary sources, were used to assess financial performance.

Key words: cognitive models, strategy, strategic thinking

Introduction

In one of the earliest definitions of strategic management Steiner (1969) defined it as the -- scientific discipline that helps top managers scan the environment, define the mission and the vision, strategy formulation, its implementation, control and evaluation. Consistent with the Steiner’s focus on top managers as strategic decision makers, in the McKinsey Survey - Improving Strategic Planning (McKinsey Survey 2006), 62 percent of the respondents reported that the majority of strategic decisions in the firm are made by a small proportion of senior managers, i.e., the CEO or equivalent. Those in charge of the process of strategic management provide direction to the firm not just by making strategic decisions, but more deeply, by sharing and embedding a perception of “effective” strategic management on the whole firm.

This paper is consistent with an invitation from researchers (Hiller, Hambrick 2005, Delgado-Garcia, De La Fuente- Sabate 2010) to incorporate new psychological constructs into the upper echelons perspective. The leader's “cognitive model of strategic thinking” can be characterized as resulting from the set of influences, formal and informal learning, and field tested experiences that mold executive leaders over the course of a career. Each top
manager has his/her own specific cognitive model of strategic thinking. With the advent of modern strategic theory and the learning systems that translate theory into practice, it is reasonable to assume that a majority of top leaders demonstrate a preference for a particular strategic thinking model – a thinking model that will to a greater or lesser extent reflect existing theory. This in turn allows for the identification of discernable cognitive models of strategic thinking.

In the first section of this paper we present the short review of the Croatian management research. The second section develops and showcases the theoretical drivers of the research. Section three presents two hypotheses and their underlying logic. Section four reports the research design and analytical methodology. Section five reports the empirical results. Section six discusses the results, while section seven calls attention to the limitations of the study and propositions for further research.

**The Croatian Top Management Research**

Strategy research conducted on Croatian firms is limited to several studies conducted over the past decade. The first study (Alfirević 2000) demonstrated the lingering influence of state driven organizational designs. The research showed that despite that the need for fundamental changes in competitive environment top managers of Croatian firms did not perceive that change was required. Top managers reported of being satisfied with the organizational design of their own firm. In a second study (Buble et.al. 2003), using data based on the international research conducted in 2001, identified successful strategic behaviors of Croatian and Slovenian firms on a comparative basis. Apart from the theoretically accepted strategic models of behavior, the results evidenced the significant relation between the firms’ financial performance and organizational culture. When the researchers compared variances in strategic behavior between the Croatian and Slovenian
strategic business units a number of apparent differences appeared. (Note: because only a small number of Croatian firms was available at the time of the study, the differences are not statistically significant). Nonetheless the investigators were able to report that:

• Croatian business units do not implement investing strategies as frequently as do the Slovenian ones;
• A larger share of the Croatian business units had no explicitly defined and implemented generic business strategy;
• A smaller share of Croatian units applied collaborative strategies.

These limited studies offered only a general idea of the qualitative characteristics of the Croatian management. This paper is intended to investigate compliment and extend the earlier studies of contemporary Croatia.

**Theory Development**

The richness of theories and directions in strategic management over the past four decades makes the overview on the progress of the discipline difficult. Most scholars agree that the most influential theories of strategic management were mainly developed in the USA (Kesner 2005).

The accumulated practice and research on specific topics in strategic management has yielded a rich set of distinctive and diverse typologies/models of strategic thinking (Mintzberg 1973; Grandori 1984; Chaffee 1985; Ansoff 1987; Hart 1992; Idenburg 1993; Hampden- Turner 1993; Whittington 1993; Mintzberg 1994; McKiernan 1996; Mintzberg, Ahlstrand, and Lampel 1998; Haberberg, Rieple 2001; Jelenc 2004). They all present a theoretically based approach toward the process of formulating, implementing and controlling firm strategies. Figure 1 provides a summary of a number of writers on the topic. When looking closely at the review of the models of strategic thinking it is possible to detect
three large groups of different authors' approaches to the subject. The first group is the measurement approach which seeks to scale strategic behaviors within a prescribed categorical framework. It is not important the group in which top managers has been put, but rather a point on the continuum about his preferences (for example Bourgeois and Brodwin (1984) listed commander, change, collaborative, cultural and creative as the classification sorted by the increasing level of engaging employees in the process of strategic management). The second group is the categorial approach, in which one, two or three criteria are important to make two/three/four relations available for top managers (for example Whittington lists classical, evolutionary, processual and systemic approach according to the outcomes of strategy and the processes by which is it made). The third group are the classifications with non-categorial approach, rather different point of views that researched regarded as crucial and important to label. In this group there is no specific pattern or criterion rather a rule of thumb that guided researchers in their suggestions (for example McKiernan listed planning, practice, learning, positioning and resource-based view according to distinctive and clear way of identifying strategy past and future).
Taken together this wide ranging, yet interwoven, set of efforts to capture the essence of strategic management can be characterized as a paradigm according to Kuhn (1996). A paradigm is defined as the constellation of beliefs, values and techniques shared by the members of a given community (Kuhn 1996). In other words, the paradigm identified here represents the set of values, attitudes and perspectives shared by a group of theoreticians and top managers. The category comprising any single model very slightly in number and nature depending on the perspective of researcher but they are all drawn from a common set of core aspirations and assumptions.
Jelenc (2004) and Jelenc, Vrdoljak- Raguž (2010) analyzed and coded these different models and empirically derived a meta-typology postulating four Cognitive Models of Strategic Thinking – Classical, Environmental, Competitive and Contemporary.

The **Classical model** presents what have come to be thought of as the basics of strategic management. It has the deepest historical roots and is strongly identified with US authors in the post WWII period of corporate economic expansion. Within the classical model of strategic management there are two major streams of thought - the conceptual and the planning approaches. The underlying idea of the conceptual stream is the call to establish a fit between the outer and inner environment. Christensen et.al. (1985) and Andrews (1971, 1987) specify the process of strategy formulation as a deliberate and conscious act of analysis for fit. The planning approach of strategic management is characterized as a more formal procedure, formal training, and the formal analysis with a bunch of numbers (Mintzberg, Ahlstrand, Lampel, 1998). According to this approach, the focus is on the objective analyses within and outside the firm, which help create arguments as features of the planning procedure. *To predict and to prepare* (Ackoff, 1983 cited in Mintzberg, Ahlstrand and Lampel 1998) is the motto in planning the future. Figure 2 identifies the leading contributors to the classical cognitive model of strategic management.
Figure 2 Contributions to the Classical cognitive model

The **Environmental** cognitive model of strategic management is distinguished by its focus on the reactive and passive ways of transitioning from the past to the future. Drawing heavily on biological science based insights about natural selection, according to this view in the world, strategy is about how the firm adapts and changes according to the imperatives of the forces from the environment. Adding to insights gathered from biological theory, this approach taps into anthropology for insights into the role of culture and into political science theory to discuss the importance of power. A core assumption of the environmental model is that the behavior of the individual within the firm can be explained with the individual’s embeddedness in a social system, more accurately, to a set of social relations with the family, state, professional and educational background, religion and nationality, sex and social class. This sociologically dependent behavior reflects a modus operandi defining what is acceptable, desirable and what is not, i.e. what is shameful and punishable. Because societies are too complicated and people are too individual to expect uniformity of behavior, according
to the Enviromental cognitive model every strategist should analyze his social characteristics, characteristics of his colleagues, partners, and competitors to acquire an image of social discourse diversities and rules of acceptable behaviors (Whittington 1993). Figure 3 presents the contribution of key researchers within environmental school.

The **Competitive** model of strategic management is distinguished by its call for an active attitude towards the future, emphasizing the importance of competitive advantage. The model emphasizes the development, nourishment, and sustainability of the competitive advantages as representing the main reason for a firm’s success. The positioning and analytical schools of strategic management develop the models of competitiveness on several levels: industry level (Porter 1979, 1980, 1991), firm level seen through the entrepreneurial school (Schumpeter 1934, 1947) or individual level seen through the visionary school (Drucker 1970; Mintzberg 1973). The resource-based strategy (Grant 1991; Barney 1991; Teece 1990; Penrose 1959; Prahalad and Hamel 1990) describes strategy formulation according to the resources and capabilities that must be considered as strategic and at the same time dynamic and sustainable in order to accomplish a long-run success. Figure 4 lists the contribution of the Competitive model.
The Contemporary cognitive model of strategic thinking is the fourth and newest perspective on the study of strategy. This school does not challenge classical school per se, but rather its focus in on a change in underlying logic of strategy with a focus on the importance of collaboration and cognition. The model emphasizes the need for mutual understanding. It's adherents believe that competitive tensions reduce the business rationale of all competitors, thus making them weaker (Chaharbaghib and Willis 1998). It is more important to learn and gain knowledge and notions on how to be different and how to collaborate in order to achieve goals and success. The cognitive school (Wick 1987; Smircich and Stubbart 1985) tries to explain the way in which strategy is formulated in the head of the strategists. The learning school (Cyert and March 1963; Normann 1977; Argyris and Schön 1978; Senge 1990) thinks that the process of strategic management is complex, however, they believe it can be successfully created and managed by continuous learning about the process and about the ways of improving it. Figure 5 showcases important contributors to this model.
Proposed theoretical cognitive models of strategic thinking have been developed in the form of hypothesis and empirically tested on the sample of Croatian top managers.

**Hypothesis**

The aim of this paper, as showcased in Figure 6, is twofold. The first objective is to test for the existence of the four proposed cognitive models of strategic management. The second objective is to investigate the impact of top manager cognitive pre-dispositions and firm financial performance.
As argued above the strategic behavior of a given firm is strongly influenced by the underlying cognitive map of its most influential leader. These personal cognitive maps are reflections of values, beliefs and assumptions about the correct way to organize and address competitive challenges. The top managers’ personal paradigm and subsequent strategic behavior can be grouped and simplified into several constructs that represent distinctive top manager orientations (classical, environmental, competitive, and contemporary models). Setting the number of cognitive models of strategic thinking to four can be limiting, but at the same time it offers a balance between the reality of complex business environments and the mainstream paradigms of strategic business thinking.

**Hypothesis 1:** *The way of perceiving the process of strategic management is represented by four cognitive models of strategic thinking.*

Strategic management is a process whose ultimate aim is to achieve a firm performance goal. This goal could be expressed in financial terms (e.g. percentage of profit increase within five years…) or in the non-financial term (e.g. entering new foreign markets, launching new products, merging with other firms). No matter how the goals have been
expressed, the results are expressed in financial measures. Measuring performance is relevant to managers because it helps them make decisions about resource allocation. The strategic fit is a core concept in normative models of strategy formulation. The pursuit of the strategic fit has traditionally been viewed as a desirable performance implication. The way top manager perceives the process of strategic management and forms his cognitive model of strategic thinking is related to the results of his actions - financial results of the firm. His strategic behavior is directly influencing strategic actions, strategy implementation and final results.

Hypothesis 2: Firm performance will be impacted by the leader’s preferred cognitive model. Differences in firm performance will be observed across the four cognitive strategic management schools - Classical, Environmental, Competitive, and Contemporary.

We chose the questionnaire as the instrument for empirical research the top managers’ perceptions of the process of strategic management, more precisely, cognitive models of strategic management thought. Given the research environment it was determined that a printed questionnaire was the most appropriate for data collection. The questionnaire was initially tested with a pilot study. In this phase, semi-structured interviews were conducted with three top managers and consulting two academics. The semi-structured interview with the three top managers offered insights the structure and wording of questions. They read the statements and suggested reformulating some questions, deleting and adding questions in order to elaborate on some issues making them more understandable. Their suggestions added to the straightforwardness of statements and a better understanding of instructions. The academic consultants offered suggestions regarding methodological improvements to better relate questionnaire statements to the research hypothesis and called attention to potential logical errors. After revising the questionnaire according to the suggested improvements, it
was distributed to the population of Croatian firms employing at least 250 employees (401 firms in total).

We used the official database of the Croatian Chamber of Economy (www.hgk.hr) to select the firms according to the criteria of the number of employees. On August 18, 2005, the database listed 401 firms that had 250 and more employees. Data collection took place from October 2006 until June 2007. During that period, we sent the questionnaire by post twice. All respondents received a letter of support issued by the Croatian Chamber of Commerce and web portal q21.net. A number of top managers were personally contacted via telephone, fax, e-mail and/or in person. Data collected continued until the end of June 2007, at that point 127 managers had responded, 31.82 % of the total population.

Hair et.al. (2005) suggests that, as a rule, a study should include at least five times as many observations as there are variables, but the more acceptable size would be a ten-to-one-ratio. In case of this paper, there are nine times more observations than there are variables (ten variables of strategic thinking and four schools of strategic management in comparison to 127 observations).

The empirical research showed that the average respondent and the average firm have the following profiles:

- Top manager answered the questionnaire (60.6 percent),
- Top manager is between 46 and 60 years of age (56.7 percent),
- Top manager holds a university degree (66.1 percent),
- Top manager has been on the current position between two and five years (41.7 percent),
- Prior to the current position, he/she worked inside the firm (53.5 percent),
- Firm employs between 250 and 500 employees (55.9 percent),
- It is a privately owned firm (56.7 percent),
- Firm produces a product rather than offering a service (55.9 percent),
• Firm operates in the energy production and distribution industry (44.9 percent),
• Firm has been operating for more than 31 years (70.1 percent), and
• Firm works mainly on the domestic market (48 percent).

The sample is statistically representative of the population according to several criteria. T-tests showed no significant difference between respondents and non-respondents on the following criteria: form of ownership \( (t = 0.614, \text{ d.f. 399, } p> 0.10) \), legal form of firm \( (t = 1.137, \text{ d.f. 399, } p> 0.10) \), origin of capital \( (t = 0.770, \text{ d.f. 399, } p> 0.10) \), and Croatian National Classification of Industries \( (t = 0.483, \text{ d.f. 399, } p>0.10) \). There was, however, one criterion showing a statistically significant difference between respondent and non-respondents: the number of employees in the firm \( (t = 0.842, \text{ d.f. 399, } p<0.10) \). The data showed that the responding firms tend to employ slightly more employees than non-responding ones.

The geographical distribution of respondents according to county chambers in Croatia is presented in Figure 7. The percentage of population and the percentage of responses of Croatian firms within individual county chambers is shown to be more or less balanced.

The research unit of the analysis was the top manager’s perception. In each of the firm there was only one top manager asked to answer the questionnaire. As indicated, prior researched has demonstrated that the top manager is the person most responsible for the process of strategic management in the firm. The top managers’ paradigm about the process of strategic management strongly influences the way the process of strategic management is formulated and the way it is going to be implemented, controlled, and evaluated. Top managers influence the perception of their direct subordinates and other employees in the firm, thus building the image of the firm in the market. The top managers’ perception is a part of their paradigm, according to which they shape their style of management and leadership and the way they comprehend the environment, the firm, and the future of their firm. The perception of the strategic management process does not interfere with the strategy content (e.g. the specific features of their industry or market characteristics), but rather the way it is approached.

This paper uses the term top manager, as the term representing the person who manages and leads at the strategic apex of the firm. It could be the case of a single person or a team. The job title for this function is has some variation - chief executive officer, managing director, top manager, general manager, senior manager – while actual job content is quite similar.

Source: Empirical data

Independent Variable

The research unit of the analysis was the top manager’s perception. In each of the firm there was only one top manager asked to answer the questionnaire. As indicated, prior researched has demonstrated that the top manager is the person most responsible for the process of strategic management in the firm. The top managers’ paradigm about the process of strategic management strongly influences the way the process of strategic management is formulated and the way it is going to be implemented, controlled, and evaluated. Top managers influence the perception of their direct subordinates and other employees in the firm, thus building the image of the firm in the market. The top managers’ perception is a part of their paradigm, according to which they shape their style of management and leadership and the way they comprehend the environment, the firm, and the future of their firm. The perception of the strategic management process does not interfere with the strategy content (e.g. the specific features of their industry or market characteristics), but rather the way it is approached.

This paper uses the term top manager, as the term representing the person who manages and leads at the strategic apex of the firm. It could be the case of a single person or a team. The job title for this function is has some variation - chief executive officer, managing director, top manager, general manager, senior manager – while actual job content is quite similar.
Dependent Variable

Business performance – as indicated by financial viability - is the ultimate goal of firm's existence. In this paper we were able to secure quantitative measure of business performance - return on equity and return on assets. Because strategy involves the use of resources that give the company a competitive advantage (Barney 1991) and ROA yields the most direct information about how efficiently tangible resources have been allocated (Hull and Rothenberg 2008). ROA, therefore, is the most common accounting-based performance measure (Bergh and Ngah-Lim 2008) highly correlating with other measures such as return on sales (ROS) and return on equity (ROE). Both measures, ROE and ROA are highly dependent on the industry. They represent how effectively the company is converting cash, total assets (ROA) and equity (ROE) into net income. Many business experts recommend examining ROE and ROA over a longer period, not just for the previous year. This will take out any abnormal numbers out of the picture and will give a more realistic view. Over the long run, firms that are good at generating higher profits with the available assets are more viable and beneficial for business investments. In this research ROA and ROE are three year averages. The three-year average has the advantage of smoothing the data so as to better represent strategic performance and viability.

Results

The results of the research are classified by the hypothesis while the final conclusion summarizes all the results of the empirical research.

Hypothesis 1: The way of perceiving the process of strategic management is resented by four types of strategic management schools.

The validity for constructs of strategic cognitive models is tested by construct, symptomatic or theoretical validity in two ways (Psychometrics, 2001/2002). The subjective method of testing theoretical validity is performed by generating sentences/premises in order
to develop a questionnaire based on theoretical literature. In this research, once the questionnaire was created, two professors of strategic management read the statements and suggested content improvements. Each of the premises is founded on a specific paper and/or idea and supported by relevant literature. The objective method of testing validity was performed through factor analysis and by generating the most relevant premises of the schools of strategic management. We also conducted a face validity test (http://writing.colostate.edu/guides/research/relval/com2b2.cfm). In order to ensure that the questionnaire is well suited for practitioners in terms of statement clarity and straightforwardness of instructions, we consulted three top managers working in Croatian firms.

The constructs first of all tested for reliability using the Cronbach alpha test for internal consistency. Results for each of the proposed strategic thinking orientations are presented in the Figure 8. The generally accepted cut off level is 0.7. Using this as the reference score three of the four proposed orientation scales meet this threshold. The Cronbach alpha for the construct of classical school of strategic management was 0.776. Both competitive, (alpha = 0.840) and contemporary (alpha =0.841) school of strategic management had satisfactory levels of internal reliability. Only the environmental school orientation failed to meet the threshold with an alpha score of has 0.622<sup>1</sup>.

1 Cronbach alpha measures consistency among the individual items in a scale. It is not a statistical test; rather a coefficient or reliability and therefore the level of acceptance could be interpreted in a variety of ways (Cortina 1993; Cronbach 1951; Nunnally 1967; Peterson 1994; Voss et al. 2000). Cronbach alpha is recommended to be above 0.7, but not much higher than 0.9 (Nunnally 1994). The level of acceptance in the cognitive and psychometric testing is 0.75 or 0.80. Even between fields of psychology, the level of Cronbach alpha depends on the type of study. For example, cognitive tests (tests of intelligence or achievement) tend to be more reliable (above 0.8) than tests of attitude or personality (in cut-off point of 0.7 is more suitable). Other social sciences level is usually set at 0.7. The logic behind the level of 0.7 is the thinking that at that level the standard error of measurement will be over half (0.55) a standard deviation (Nunnally 1967; Thorndike and Hagen 1977). Some put the limit as low as 0.60 in case of the explanatory study (Kline 1999). The general attitude about strategic thinking was a challenge to measure and harder to create a construct. The acceptance level depends on the purpose of the test (explanatory or applied) or measure in question (Swailes and McIntyre- Bhatty 2002). As reported in Peterson (Peterson 1994), Nunnally changed his reliability recommendations from his 1967 edition of Psychometric Theory in his 1978 edition. In 1967, he recommended that a minimally acceptable

reliability for preliminary research should be in the range of 0.5 to 0.6, whereas in 1978 he increased the recommended level to 0.7 (without explanation). The values beneath the level of 0.7 should not be disregarded automatically due to the several reasons. One reason for Cronbach alpha to be deflated is the fact that the construct measures several different ideas or different attributes/dimensions rather than one (Swailes and McIntyre-Bhatty 2002), and the correlations among items are weak or not present at all. Cronbach alpha measures how well their items measure a single one-dimensional latent construct. Therefore it is suggested to run a factor analysis and group the items within the same dimension and run the test of reliability once again (http://www.ats.ucla.edu/stat/spss/faq/alpha.html).

The second reason could be small number of items in the scale (Cortina 1993; Field 2005), especially below seven (McKennell 1978 cited in Swailes and McIntyre-Bhatty 2002). Research performed by several researchers (Churchill and Peter 1984; Bruner and Hensel 1993; Peterson 1994) proved the positive relationship between scale length (the number of items included in a scale) and the reliability of the scale. This was based on the idea that the wider are the scales, the greater are the variances, and therefore the alpha is increased. One interesting point is that scales with a central point (five or seven points) tend to generate higher alphas than those with four, like in this case) or six points (Voss et.al. 2000).

* For the statistical purpose, the premises are coded. The text of the items is listed in the appendix.

Source: Empirical data

The factor analysis and factor loading generated three cognitive models of strategic thinking. The names of each of the construct derived from the school that predominately forms the construct. Therefore, Hypothesis 1 is statistically strongly supported for two of proposed cognitive orientations and modestly supported for a third.
A one-way ANOVA between three constructs of strategic management schools and the variable (VAR01²) yields support for Hypothesis 2. Variable (VAR01) denotes the positive value or negative value of the selected financial results (ROE, ROA) for firms that prioritized selected strategic cognitive models. Competitive-contemporary cognitive model (N= 33) showed a significant relation ($F_{(1,125)} = 4.509, p<0.05$) positive relationship between orientations and financial results. Only the top managers leading and managing according to the premises of the competitive-contemporary school of strategic management have significantly better (positive) financial results than the top managers with cognitive orientations toward the other schools of strategic management. One might conclude that the majority of the top managers that picked the competitive-contemporary school of strategic management actually made a good choice because this choice is significantly related to the better (positive) financial results.

Figure 10 presents the financial results of each of the constructs of strategic management schools. The most frequently used construct is Competitive-Contemporary. The second is Classical school and the least used is Environmental school. The most successful orientation is among Croatian top managers is Competitive-Contemporary when the firm performance measure is ROA. In contrast the research indicates that the Environmental school is most effective if the performance criterion is ROE.

²Variable VAR01 was coded for either positive/negative values of profit.

Table 11 also reveals several interesting insights. Moreover, 2.3 percent of the ROE variances can be explained with the environmental school of strategic management. The variances of ROA value could be explained with only 1.8 percent with the classical school but with the significance level of p<0.10.

Source: Empirical data

Hypothesis 2 is partially supported firm performance is impacted by the leader’s preferred cognitive model. Differences in firm performance are observed across the four cognitive strategic management thoughts: Classical, Environmental and Competitive-contemporary model.

Discussion

The empirical results reflect the complexity, contradictions and multi-perspectives of strategic management in practice. The results have similarities with the analysis performed in
2004 in Primorsko-goranska Chamber (Jelenc 2005). Thus, the results confirm the research done in 2004 and generalized to firms doing business in all of the Republic of Croatia. The orientations of Classical, Environmental and Competitive-contemporary have been shown in this study to be distinctive strategic cognitive models of strategic thinking.

In addition, the most frequently used model of strategic management was shown to be the competitive-contemporary cognitive model, followed by classical model and then by environmental model of strategic management. From this information, we might conclude that the top managers in the Croatian firms predominantly think according to the premises of the Competitive-contemporary model of strategic management.

One of the possible explanations for the popularity of this combined model of thinking could be the emergence of co-opetition (Brandenburger, Nalebuff 1996) a neologism rediscover by game theorists and used to describe cooperative competition. The construct of the classical model is recognized as a separate cognitive model which calls attention to the presence of the basic ideas of strategic management within top managers cognitive model of strategic thinking. The third group is the environmental school appears to the preferred cognitive model of the top managers sensitive to the importance and strength of the environment, natural selection principles, and adaptation to the changes recognized in the competitive landscape.

In addition, this research is the first to empirically demonstrate the relationship between strategic thinking orientation and firm performance. We discovered that firms lead by managers choosing the Competitive-contemporary model of strategic thinking have positive financial results as measured by ROA. The top managers that chose competitive-contemporary model have the highest financial results when the criterion is the mean value of ROA in the period 2004-2006. When the criterion is the mean value of ROE, the most suitable way of top managers’ approach is according to the premises of the Environmental
model. When researching the relation between the models and financial results with the regression analysis, the environmental model explained 2.3 percent of variances of ROE, and classical school can explain 1.8 percent of variance of ROA. At the first glance, this percentage is small, but reflects the direct influence and importance of top managers viewpoint on the financial results of the Croatian firms. The relation is established, while the nature of this relation is still subject for further research.

Limitations

There are several limitations in both the theoretical and the empirical part of this paper. The limitations of the theoretical part lie in the assumptions. Key assumptions included the following: a) the top manager is the person in charge of the process of strategic management, b) his/her opinion about strategic issues is relevant for the firm, and c) the subjective opinion of the top manager is indicative of the firm’s approach toward the process of strategic management. Furthermore, we assumed that the way the top manager perceives the process, influences the way his employees approach the process and that this reflects on the entire firm. Each of the assumptions is open to challenge since empirical research supporting them is lacking.

The limitations of the empirical portion of the paper are several. The nature of strategic management includes three time frames: the past, the present, and the future. Top managers are influenced by the past events and experience, they resolve current problems, and make plans to prepare themselves and the firm for future challenges. We conducted the field research about top managers’ perception of the process of strategic management in 2006-2007. Their perception reflected their strategic behavior at that moment. This strategic behavior became effective in 2007-2008 and the first financial indicators will be seen in 2008 or 2009. This would be the appropriate time lag for the strategic decisions to prove their
accountability. Thus, the financial results of 2008-2009 that will be published in the first half of 2010 will be the best indicators about the most suitable ways of strategic thinking and schools of strategic management. They will additionally show how much the financial results do depend on the construct of schools of strategic management. There is a vast majority of top managers in the sample performing their duty for two years and longer (41.7 percent of top managers had been on their current position 2-5 years, 23.6 percent of top managers 6-10 years, and 16.5 percent for 11 or more years). We concluded it is rational to take into account their perception in the period of 2006-2007 and compare it with the financial results of 2004-2006. In order to avoid the statistical bias in financial results we took into consideration the average value of the three financial indicators in the period of 2004-2006.

The second limitation we faced is that there is only one respondent in each of the firms who could fill in the questionnaire. Because of this, one might conclude that the results of this field research provided biased answers. The aim of this field research was to find out about the perception of the person in charge of the process of strategic management and not the opinion of managers at lower levels or employees in general. The opinion of the top manager is the only perception that we were interested in the firm. The subjectivity was intended and deliberate. It would be illusionary to ask for an objective opinion about a subjective perception. The subjective opinion of the top manager becomes the objective criteria for middle management.

**Further research**

At the conclusion of this paper, we would like to point out several possible directions for further research. The schools of strategic management are one of the topics that will keep appearing in strategic management literature from time to time. It may not be the mainstream research track but rather the method that researchers will use in order to denote the
advancement in the field of strategic management. It will offer quite an extensive and refreshing overview of the existing paradigms and the guidelines for future research. The research of strategic management schools is like a look in the mirror of strategic management research, suggesting which topic is passé, which topic should be more emphasized and which topic has the potential to evolve.

Strategic management is oriented on goals and their financial and non-financial results. Top managers should base their behavior on the direct strategy-financial result relationship in order to receive as much dynamic feedback about interactions and continuous improvement. This will help to build and maintain the top managers’ faith in strategic management, since it will prove itself beneficial to their work.

Moreover, the future research of strategic management in Croatia should be focused on several additional issues. This research could be continued and evolved into a longitudinal research that would further depict patterns and trends, and the way these patterns and trends change through time. Due to the nature of research and the respondents included in the empirical analysis there should be at least a five-year time frame. This period is long enough for the top managers to change their perception about the process of strategic management and change the dominant type of strategic thinking. The research should be directed towards more qualitative methods in order to grasp the strategy-as-practice skill. The learning experience of top managers is a valuable asset, a tacit knowledge that should be more researched in order to acquire new notions and insights that will result in better and more efficient future managers/strategists.

Classifying Entrepreneurship within a Business Development Framework

zaccarobert@uaeu.ac.ae

Abstract

The phenomenon of entrepreneurship from the time of its first observance until the present day has been striving for an identity. This paper marks out a distinctive evolutionary path of thought on entrepreneurship and uses its referent and counterpart to support a conceptual view of entrepreneurship within a business development framework. The work brings to bear a two-dimensional intersecting spectra diagram describing entrepreneurship as one of four archetypes of the business development manager.

Introduction

Entrepreneurship is being recognized more and more frequently by academics and practitioners alike as the way forward in addressing present and future economic and social challenges. However, entrepreneurial terminology is inconsistently used within the public and scientific sphere. This inconsistency portends a lack of a consensus on the meaning of entrepreneurship, one that is coherent with classical as well as contemporary scientific thought. By extension without a clear and universally accepted understanding of entrepreneurship its
framing is hopelessly fluid and hard to set down which confuses and complicates the role entrepreneurship plays within the scheme of management discipline. The dialog on entrepreneurship has availed itself not only with explanations of entrepreneurship but also with various proposed counterparts to entrepreneurship, which adds to the problem and confusion.

There is a general agreement among contemporary authors that all these confusions must be addressed for proper scientific underpinning (Berglund & Johansson, 2007: 77) and for its ease and accuracy of translation into practical applications among management professionals. That the confusion has rained this long is odd considering that the entrepreneur has been recognized as the agent driving business development from the time of Cantillon in the 18th century to the present day. However, because of its prominent place within the business development arena, substantive thought and attention has been allocated to its examination to warrant that the framing of entrepreneurship can be confidently established.

The progress of the entrepreneurial discipline, as with other disciplines, is a cumulative effort. The theoretical conceptual framework presented below is not an auto-referential framework; rather it is an integrated framework, integrating various conceptualizations of entrepreneurship. The study works under the basic assumption that order within current and past knowledge of entrepreneurship is existent. The methodology therefore grasps the relevant knowledge and organizes it in such a way to produce order from which a consensus view on entrepreneurship and its framework can be expressed and studied.

Entrepreneurship is an abstraction of an observable phenomenon. Since the phenomenon is ubiquitous, the term entrepreneurship is quite familiar. But familiarity does not preclude uncertainty, because as an abstraction it is necessarily ambiguous and ambiguity causes miscommunication which leads to misunderstandings. Entrepreneurship from the time the
phenomenon was first observed up until the present day has been striving for an identity. An identity that brings its ideas closer to the true object of the phenomenon and one that describes its distinctive nature. The conceptual scheme presented here sorts the complexity of the determinants of entrepreneurship and uses its referent and counterpart to form a framework. The identification of the dominant referent is important, because it leads to the formulation of the counterpart, which represents the compliment to entrepreneur. Together, the entrepreneur and its counterpart help to delineate the framework. With the wrong referent or with an ambiguous referent the proper framework is unattainable and effective communication is diminished.

To this end the research explores the dialog revolving around the research questions, What are the relevant concepts of the entrepreneur and its managerial counterpart?, and How can the relationships between the entrepreneur and its managerial counterpart be viewed within a theoretical framework? The research process begins with a description of selected conceptual views on entrepreneurship marking out an evolutionary path of thought towards an opportunity-based conceptualization of entrepreneurship; propositions are then made supporting the interrelationship of a new combination of concepts within and among the entrepreneurial management and administrative management constructs; the concluding section presents the entrepreneur, intrapreneur, administrator, and promoter as distinct archetypes within the business development theoretical framework and their relationships are depicted in graphic form. The result show a finer distinction than Stevenson and Jarillo’s (1990) entrepreneur who is presented as the promoter. The driving force behind this study is the recognition that entrepreneurship theory can be advanced when the three key components referent, counterpart, and framework are established. Establishing these three components is a necessary precondition for a theoretical
grounded conceptualization. It will allow for consistency in studying entrepreneurship and can be drawn upon in future research.

**Dialog on Entrepreneurship**

There has been documented dialog on how to define entrepreneurship stemming back to the 18th century when Richard Cantillon ‘argued that entrepreneurship entailed bearing risk of buying at certain prices and selling at uncertain prices’ (Roberts, Stevenson, Sahlman, Marshall & Hamermesh, 2007: 4). In the early 19th century the French economist Say broadened the definition and wrote ‘the task of the entrepreneur is to combine the factors of production (capital, knowledge, and labor) into a business firm (Say, 2001: xxxi).’ It was a step beyond what Cantillon had written on the role of the entrepreneur and it allowed Say to distinguish the entrepreneur from that of the manager.

About 100 years later the Austrian economist Schumpeter noted that ‘Say failed to realize that the phrase “combining factors” when applied to a going concern, denotes little more than routine management: and the task of combining factors becomes a distinctive one only when applied not to the current administration of a going concern but to the organization of a new one (Schumpeter, 2003: 530).’ Schumpeter held that the entrepreneur's task is “creative destruction”, that entrepreneurship disrupts market equilibrium, and the essential tool is innovation (Drucker, 1985).

Kirzner extending the work begun by Mises and Hayek of the Austrian school debated Schumpeter’s concept of entrepreneurship. For Schumpeter ‘the essence of entrepreneurship is
the ability to break away from routine, to destroy existing structures, to move the system away from the even, circular flow of equilibrium. For Kirzner, “the crucial element in entrepreneurship is the ability to see unexploited opportunities whose prior existence meant that the initial evenness of the circular flow was illusory – that, far from being a state of equilibrium, it represented a situation of disequilibrium inevitably destined to be disrupted.’ Schumpeter’s entrepreneur ‘is the disruptive, disequilibrating force that dislodges the market from the somnolence of equilibrium’; while Kirzner’s entrepreneur is ‘the equilibrating force whose activity responds to the existing tensions and provides those corrections for which the unexploited opportunities have been crying out (Kirzner, 1973: 72-73).’

Kirzner opens for philosophical debate whether profit opportunities are waiting to be grasped or upon seeing such opportunities the entrepreneur in fact creates them. The dichotomy between the entrepreneur who is alert to the discovery of hitherto overlooked exogenous created changes and the entrepreneur who is the source of disruptive changes to perceived equilibrium state or status quo is an innocuous one (Kirzner 1999, 1973). Both are seen as agents ‘responding to existing imbalances in the market (Kirzner, 2008: 9)’, and ‘opportunities are seen as both existing and created (Berglund, 2007: 243)’.

Shane and Venkataraman (2000: 220, 2001) recognize entrepreneurship as the existence, discovery, and exploitation of entrepreneurial opportunity. Entrepreneurial opportunity they define as opportunity that require the discovery of ‘new means-ends relationships that are generated by a given change’; distinguished from opportunities to enhance efficiency or optimize ‘within existing means-ends framework’. This corroborates Schumpeter’s notion of the entrepreneur breaking away from routine and alludes to a counterpart, albeit a descriptive one.
Erikson (2001: 12) espouses that the complementary effects of a three dimensional framework, the ‘capacity to recognize opportunities, to coordinate (and combine) scarce resources, and to see ventures through to fruition’, captures the very nature of entrepreneurship and provides a useful tool for analysis of entrepreneurial potential. This can be seen as a compilation of Kirzner and Say’s view.

Furthering the idea of an entrepreneurial counterpart Schumpeter, Chandler, and Stevenson recognized the entrepreneurial function as distinct from the administrative or management function. Schumpeter (1951: 253) considering the work of Ricardo, Marx, Mills, and Say concluded that although a sharp dividing line between entrepreneurial activity and what he calls ordinary administrative or management activity cannot be drawn it does not ‘prevent the distinction from being possible and useful.’ Schumpeter recognizes the distinctive element to mean acting ‘outside of the pale of routine’ the creative response as opposed to the adaptive response to given conditions. Chandler (1991) recognizes the entrepreneurial function as value-creation and administrative function as loss prevention of a firm.

Previous studies by Stevenson have identified pressures that pull a firm towards either side of a management spectrum with administration on one side and entrepreneurship on the other. Stevenson sees entrepreneurship as a behavioral phenomenon and an approach to management. He equivocates the entrepreneur to the “promoter” ‘who feels confident of his or her ability to seize opportunity regardless of the resources under current control’ and the administrator as the “trustee” ‘who emphasizes the efficient utilization of existing resources.’ He places the promoter and trustee at endpoints of a spectrum and identifies eight dimensions of business practice that influence entrepreneurial behavior and administrative behavior (Roberts et
al., 2007: 5; Stevenson & Jarillo, 1990). Brown, Davidsson, & Wiklund (2001) have operationalized Stevenson’s conceptualization and the results from their empirical test validate six out of the eight dimensions found within Stevenson’s theoretical reasoning.

Stevenson’s conceptualization of entrepreneurship ‘is coherent with classical as well as contemporary definitions of entrepreneurship’ as it echoes Kirzner’s “alertness to opportunity” and Shane and Venkataraman “discovery and exploitation of opportunity” (Brown et al., 2001: 954). Stevenson and Jarillo’s intellectual pursuit is the one for which this present study most closely evolves from. Table 1 summarizes the conceptual views on the dichotomy of management function in respect to business development activities.

Zahra and Dess (2001) recognize that dialog and debate in entrepreneurship as a field of research is controversial and there is a need for a ‘framework that defines its domain, its building blocks and variables of interest.’ Shane and Venkataraman (2000 & 2001) also recognize that the phenomenon of entrepreneurship lacks a unifying conceptual framework. Singh (2001) scrutinizes the past literature defining entrepreneurial opportunity and he believes to move research forward, entrepreneurship scholars should continue their debate until a clear consensus unfolds and definitional frameworks are established. McFadzean, O’Loughlin, and Shaw (2005a,b) recognize that previous models on entrepreneurship and innovation are fragmented and they have sought to develop a framework for the corporate entrepreneur and the innovative process.

---

**Entrepreneurial and Administrative Management Approach to**

**Business Development**
There are a few key areas this study aims to develop in order to add value to what is already known in the field. The first, the entrepreneurship approach to management is well established as an opportunity based function. This study will show that administrative approach to management can also be considered as an opportunity based function. The second, the administrator has been identified as a counterpart to the entrepreneur. This study also propagates the administrator as the counterpart, but in the true sense of the word, that is, as a complement or as a function of management that completes the whole, going further then Stevenson and Jarillo’s (1990) trustee or Chanler’s (1991) loss preventor. The third, the administrative and entrepreneurial approach to management as Stevenson and Jarillo (1990) suggest will be refined and stated as the two approaches to business development. The fourth, their constructs will be organized along two dimensions and become the two protagonist to facilitate conceptualization. The fifth, the identification of the referent to both entrepreneurial and administrative management will reinforce the constructs and conceptual scheme. The case for all these points will be laid out through a combination of definitions, analysis and situation descriptions.

In the evolution of markets, industry competition and market dynamics play prominent roles in influencing an enterprise’s market position. For continued business growth managers are experiencing pressures on two fronts; there are pressures that push the individual manager to increase operation effectiveness by employing best practices and at the same time to innovate by responding to change. These pressures force managers into playing dual roles that can be viewed on a spectrum with administration management on one side and entrepreneurial management on the other side. The qualitative nature of these pressure forces are dependent on situation factors or conditions that favor or inhibit entrepreneurial activity (Roberts et al., 2007; Schumpeter, 1951; Shane & Venkataraman, 2001).
The analysis begins with an overview of management approaches to business development as viewed from the administrative and entrepreneurial perspective. It is assumed that both administrators and entrepreneurs, alike, try to maximize value for the company, but how they go about it is entirely different. The administrative manager focuses on the implementation of known and proven best practices in the pursuit of new opportunities, opportunities that leverage the advantages of existing resources. And the entrepreneurial manager focuses on innovation in the pursuit of new opportunities, opportunities that do not necessarily utilize existing resources.

The conceptual scheme presented in Figure 1 shows the administrative manager and entrepreneurial manager construct. In graphic form the conceptual scheme depicts the relationships among the administrative and entrepreneurial manager’s concepts and in so doing clarifies their respective approach to business development. The present section sets out to demonstrate how the concepts are interrelated and proposition specifying the connections will be supported. It should be noted that while the construct ideas (administrative management and entrepreneurial management) and the concepts themselves have been identified in past literature the concept combination is new signifying a new meaning to the construct ideas.
To facilitate the analysis, an economic measurement is sought for business development. Revenue or market share increases can be considered indicators of business development, but since they do not account for the cost of gaining such increases, profit growth proves to be a better indicator or measure of business development. If a particular action adds more to a firm’s revenue than its costs or if it takes more away from its costs than its revenue then the action has generated profits. It is fair to say that any activity that produces an increase in profits may be considered a business development activity, which is in the scope or realm of virtually every manager, regardless of discipline or level within the company. Furthermore, business development can embrace either profit growth in the existing business or profit growth in an entirely new business. The implication is that because both approaches to business development strive to advance or achieve profit growth, the pursuit of opportunity analogous to the pursuit of opportunity for profit is an overarching concept common to both entrepreneurial and administrative management approach to business development. Both approaches are proactive.
opportunity seeking forward looking perspectives. And refutes Shane and Venkateraman (2000) notion that the entrepreneur is at “the nexus of two phenomena: the presence of lucrative opportunity and the presence of enterprising individuals (De Carolis & Saparito, 2006)” and that “entrepreneurs are individuals who recognize and exploit new business opportunity by funding new ventures (Baron, 2008)”. These are necessary condition, but not sufficient in establishing entrepreneurship.

There are a number of practices that allow a company to achieve profit growth. Bringing down costs, eliminating wasted effort, and outsourcing inefficient activities to more specialized third parties directly affect profits by the reduction of costs. Employing more advanced technologies and skilled workers, along with motivating employees better and managing activities with greater insight has its advantages in increasing productivity, i.e. achieving greater output per hour of work. Entering new markets and introducing new products/services or improving existing products/services can result in an increase in market share or revenue and lead to profit growth.

While the business growth opportunities are self evident in each of these practices, to draw a distinction between the two approaches to business development an additional question must be answered. Was the practice accomplished by employing known or proven best practices or was it through innovation? The answer to this question will determine whether it was an administrative or an entrepreneurial approach to business development and will serve to clarify the first dimension seen in the construct diagram.

Innovation is the single most common theme underlying all forms of entrepreneurship suggesting a strong link between entrepreneurship and innovation (Schumpeter, 1934, Kreiser &
Davis, 2009, Woolley & Rottner, 2008, and Alrich & Ruef, 2006). Schumpeter for example argues that innovation is the cornerstone of entrepreneurial activity and innovation is the fundamental undertaking of the entrepreneurial organization (Woolley & Rottner, 2008). Making innovation the natural referent for entrepreneurship.

Counterpart signifies a fit with a complement perfectly to complete a whole. If opposite sides of a spectrum are defined everything in between these ends are comprehensible. Innovation is necessarily new and unknown and unproven, best practices are necessarily existing, known and proven. One can discover or explore the new and implement or exploit the known.

For example, employing more advanced technology could be an administrative or an entrepreneurial approach depending on whether the technology originated from outside the company environment or from within the company environment, and whether competitors already utilize the technology. If technology was purchased from an outside vendor, such as a management consultant and is already being utilized by direct competitors, then this is an administrative activity. Miller (1983) states that ‘theorist would not call a firm entrepreneurial if it changed its technology or product line simply by directly imitating competitors.’ If the technology evolved from within the company’s proprietary sources, giving the company first rights to the use and benefits, then this is an entrepreneurial activity. If this propriety technology is applicable in geographical markets around the world, it could be considered a global or absolute innovation. If the technology was carried over from another industry or another geographical market, and local competitors are not yet utilizing this technology, it could constitute a local or relative innovation and be considered entrepreneurial. Additionally, if a company formulates a new combination of existing technology, this constitutes an
entrepreneurial activity, because even though singularly the technologies are existing, known, and proven the combination itself is new and constitutes an innovation. As a side note, entrepreneurial profit gain can be factored out of total profit gains and distinguished as monopoly gain due to the fact that competitors are not reaping the same benefits from the exclusivity of activity (Schumpeter, 1951: 222).

The same line of reasoning can be utilized for the other business development practices. Is the new management technique or practice one that is copied and implemented within the company environment or does the management techniques have some original or customized aspects? The extent of originally speaks to the degree or prominence of innovation involved in that activity. The entering new markets case would provoke the following questions: Why wasn’t the company engaged in that market before? Were there barriers to entry? If so, how were these barriers overcome? Was it by employing best practices or was it through innovation? Answering these questions will reveal if it is an administrative or an entrepreneurial activity. And was the new product or service improvement accomplished by employing known and proven techniques or was it a result of an in-house discovery? All of the above can lead to increased profits or business growth.

For further clarity let us look at the administrative approach and the entrepreneurial approach as viewed on the far ends of the spectrum. Recall that, while the endpoints are defined, ‘there is a spectrum of managerial behavior that lies between these end points.’ The portion to the left of the mid-point can be defined as predominantly administrative behavior. The portion to the right of the mid-point can be defined as predominantly entrepreneurial behavior (Roberts et al., 2007: 5).
On the one hand, the manager can play only the administrative role, and focus on nothing but the implementation of known and proven best practices within existing resource constraints. In one aspect this is good. The manager searches out the ‘best available technologies, skills, management techniques, and purchased inputs – which constitutes the sum of all existing best practices at any given time. This can apply to individual activities, to group of linked activities, and to the entire activities of the company (Porter, 1996: 62).’ This contributes to the enterprise’s success today by increasing the value of the current offering and/or by reducing costs.

The full effect of this single focus is not seen however, until the next product life cycle. If the emphasis on the efficient utilization of existing resources comes at the expense of not pursuing opportunities which may not necessarily utilize existing resources it could be the start of declining profits for that business. The manager might find out that while his/her competitors were also paying attention to their administrative duties, or at least made provisions for the administrative work, they were proactive in developing innovative ideas in the pursuit of opportunities better suited for the new reality of the ever-changing market.

On the other hand, the approach to management can also be weighted too far on the entrepreneurial side, the right side of the spectrum. If this exaggerated weighting comes at the expense of not employing best practices, meaning best practices are being neglected, then there may also be adverse effects. Improving operational effectiveness by employing best practices should be treated as a given. Productivity improvements resulting from employing best practices is a determinant of profit growth. A common explanation for productivity gains, in recent years, is attributed to information technology spending. ‘Gains in labor productivity are important
because they allow firms to produce more for a given amount of labor, an advantage they then can use to lower prices, to increase market share, for increasing wages to attract higher skilled workers, or to expand investment (Rhoads, 2002).

Managers need the cost advantage that comes from running a business with greater effectiveness, or else, the manager runs the risk discovering an innovative opportunity and developing it into a growth business only to concede the position a short time later to a competitor, who initially follows the leader and then with superior operational effectiveness becomes the new leader. Because innovative products or services command premium prices, they are attractive targets and ‘irresistible amid thin profit margins and expanding global competition (Aeppel, 2004).’ Even patented products might not provide sufficient protection against followers if someone else can “design-around” it easily and make it for less.

If situational factors force a manager to maintain an extreme entrepreneurial position - which implies continuous attention on the search for and development of innovative opportunities - it will be especially necessary to make provisions for any necessary administrative work by hiring or partnering with a professional manager trained to perform this function. The entrepreneurial focused manager may be on the extreme right of the spectrum, but because of the provisions made, the enterprise is appropriately weighted or balanced.

While both management approaches aim for business development, usually for sustainable profit growth, profit growth that can be preserved, both approaches are necessary, and neither is sufficient on its own. The two approaches are complements and reinforce one another. Managers of enterprises are constantly challenged to balance the demands of business development by continually improving their performance on the operational effectiveness front
and by continually searching for new opportunities on the innovation front. To satisfy the requirements on both fronts they are faced with hard choices in regards to dividing their time and the enterprises resources. The resulting performance benefits, however, reduce the risk and ensure the future viability of the business. ‘Nothing could be as risky as optimizing resources in areas where the proper and profitable course is innovation, that is, where the opportunities for innovation already exist (Drucker, 1985).’ It is equally important to know what to change as well as what not to change; when to make a change and how the change should be manifested.

The introduction of the second dimension to business development will bring to bear another aspect of the administrator and entrepreneur. Administrative managers are predominantly resource oriented. Resource oriented managers spend their time searching for markets for the products and services already produced by their operating assets (Roberts et al., 2007), and they view business opportunities through the lens of their existing assets and capabilities. They ask themselves, Do we have the resources necessary to make this investment work? or Given what we have, what is the best we can do? (Hamel, 1995) They are interested in exploiting their existing form of business (Midgley, 2009: 62), utilizing assets and resources to build and maintain their competitive advantage (Kreiser & Davis, 2009)

Entrepreneurial managers are predominantly opportunity oriented. Entrepreneurs create products and services specifically to respond to changing market requirements and the merit of the opportunity is the more dominating factor for investment decisions. Entrepreneurs also leverage their existing assets and capabilities, but in contrast to administrators, they assess business opportunities without being biased or constrained by where they are at a given moment in time. This could mean liquidating of most if not all existing assets for the benefit of the new
business - in essence starting all over again (Roberts et al., 2007). They are interested in exploiting new forms of business (Midgley, 2009: 62).

Entrepreneurs nevertheless need resources at various stages of development. Entrepreneurs may not have the resources to begin with, but this is not acting as a constraint or is not a limiting factor in their effort to pursue new opportunities. They are confident enough in the merit of the opportunity to realize that the only limitation is their ability to find and attract the resources necessary when and if they need it. They prefer multi-staged commitment of resources with minimum commitment at each stage of the development process. They are tentative or temporarily dedicated, because they are not sure if they are right and want to see what will happen. Also they don’t need to own resources to have use of them, resulting in low fixed costs (Roberts et al., 2007).

If we accept that administration managers are resource oriented, that is, they search for markets for the products and services they already produce and they assess opportunities by whether they have the resources necessary to make the investment work, then it is fair to say that if the administrator decided to act, that is, pursue a new opportunity or create new business he/she would more likely than not to already be in possession of and have control over resources required to fulfill the investment obligation. Thus, the administrative manager would be inclined to allocate the appropriate resources already under his/her control to the investment opportunity. If likewise we accept that entrepreneurial managers are opportunity oriented, that is, the market requirements takes precedent over resource capability, then the opportunity focused manager would more likely than not be needing additional resources other than what is on-hand and currently controlled. Thus this type of manager would be naturally inclined to attract these
additional resources when needed; for the manager does not have the luxury to allocate resources for which he/she does not possess or does not control (Hamel, 1999; Jarillo, 1989).

**Conclusion**

This study organizes the existent body of knowledge that supports propositions underlying a conceptual view of entrepreneurship within a business development framework. In particular, the research explores the evolution thought pattern starting from Cantillon’s pioneering work, through Say’s, Schumpeter’s and Kirzner’s work which extended the knowledge base of the entrepreneurship discipline and to contemporary authors particularly Chandler, Erikson, Stevenson and Jarillo who are striving to anchor entrepreneurship in its appropriate place.

The paper presents an administrative manager and entrepreneurial manager construct diagram. In graphic form the conceptual scheme depicts the relationships among the administrative and entrepreneurial manager’s concepts and in so doing clarifies their respective approach to business development. The paper demonstrates that the concepts are interrelated and proposition specifying the connections are supported.

The work brings to bear a two-dimensional intersecting spectra diagram describing four archetypes of the business development manager. The two-by-two matrix defined by these two dimensions place entrepreneurship within a broad business development framework and it describes the skills the development effort of the manager or enterprise require. The usefulness of establishing a classification that distinguishes between different types of management
approaches to business development provides common terminology for discussing and assessing the degree and type of challenge the enterprise faces in the development process.

The framing of entrepreneurship offers several contributions: (I) Conceptualization integrates 3 key components to study entrepreneurship theory (1) innovativeness as a referent, (2) administrator as a counterpart, and (3) business development as a framework. All of which have been commonly utilized across previous conceptualizations but never synthesized to form an integrated solution. The conceptualization informs the policy decisions of enterprise executives or managers.

ICSB Conference Cincinnati Session

Saturday June 26 at 1:30 pm

Session Description

**Entrepreneurship and the Campus: Lessons from the Field**

This interactive session will examine how various foundations, donors, colleges and universities are infusing entrepreneurship throughout the campus. From undergraduate minors in entrepreneurship, to student-led entrepreneurship clubs, to career services programs, to IP-driven university starts ups, this session will discuss various successful approaches. Participants will discover effective cross-campus designs that can enlarge entrepreneurship legitimacy among interdisciplinary administrators and colleagues.

Presenters:

**Dr. Judith Cone,**  
Special Assistant to the Chancellor for Innovation and Entrepreneurship, University of North Carolina at Chapel Hill  
Former Vice President of the Kauffman Foundation USA

**Dr. G. Dale Meyer**  
Distinguished Professor Emeritus  
University of Colorado – Boulder  
Senior Chairman, Western Partners Worldwide Foundation
HELPING ENTREPRENEURS LINK BUSINESS & FINANCE STRATEGIES
Dileep Rao, Ph.D.

Abstract

Poor management and finance skills are among the key reasons for business failure. This paper discusses web-based worksheets to help entrepreneurs develop financial projections, estimate financing needs, and select appropriate financing by entering 14 numbers and making some simplifying assumptions. These worksheets help entrepreneurs decide the right financing structure based on their investment, and debt or equity available. Entrepreneurs can also analyze options to decide the right pricing based on sales, profits and asset needs, and the right growth rate based on cash flow. This “what if” analysis can help entrepreneurs better link their business and finance strategies, select the business strategy to fit their financial situation and goals, and develop their starting finance plan and financing structure. The key benefit of the worksheets is that entrepreneurs can understand linkages between business decisions and financial implications and needs.

Introduction

Among the biggest reasons for business failure are said to include lack of experience, insufficient capital, poor inventory management, over-investment in fixed assets, poor credit arrangement management, and unexpected growth (Ames 1983). All of these reasons fall under the categories of poor management skills and poor finance skills. Due to this lack of skills, fewer than half of new businesses survive for more than two years (Song 2010; Song, and Parry).

According to Drucker (Drucker 2001), not knowing how to manage is the single largest reason for the failure of new ventures. To manage well, entrepreneurs need to understand their markets, and develop reasonable financial projections, determine financial needs and design their financial structure based on their requirements and reasonable assumptions.

This paper shows how entrepreneurs can improve their management and finance skills by learning to link their business and finance strategies. While this is unlikely to lead to universal success due to competition, which is another reason for business failure (Berle 1989), the
expectation is that those who know how to link their business and finance strategies can make their businesses stronger and are more likely to succeed, all other things being equal.

Finance expertise includes financial management, as discussed above, and financing expertise. To finance their venture, entrepreneurs can use their own resources, obtain funds from family and friends, or seek financing from non-related parties or development finance sources in the form of debt, equity or grants. They fail if they are unable to pay their lenders when due, if they are unable to raise sufficient equity to pay for their losses or fund their growth, or they close down due to lack of cash flow or perceived potential. Equity usually has a higher financial cost, has the risk of potential loss of control, and is also tough to find. According to the Small Business Administration, there are about 600,000 new businesses started each year (SBA website). Between 2000 and 2009, venture capital institutions funded an average of 333 startups per year (PWC MoneyTree Survey). Angels financed about 55,480 ventures in 2008 with about 45 percent of these in the seed or startup stage (Sohl 2008). That amounts to about 25,000 ventures financed by angels. This means that the vast majority of new ventures (and growing ventures) have to fund their needs from the entrepreneur’s savings, cash flow, friends, or family. Or they can select debt.

But how much debt should the business obtain? Leverage can cause the venture to fail since it requires that the venture achieve sufficient sales and cash flow in time to pay debt service, and is usually based on an “optimistic view of the future” (Gilbert 1990). To determine the right levels of debt and timing for debt service, companies need to understand their potential cash flow under various possible scenarios and use realistic assumptions to determine acceptable levels of risk. Debt also allows a smaller margin of error and a higher risk for entrepreneurs. In many small businesses, the level of assets is insufficient for bank financing (Gilbert 1990). This
can mean that entrepreneurs need to pledge their personal assets such as their homes. This makes their decision to borrow very risky when compared with that of executives who do not assume any personal liability.

Entrepreneurs are less likely to fail when they know their gross margins and cash flows (Osborne 1993). But for a startup, this is an unknown and the need to gauge the relationship between the assumptions for sales, gross margins, expenses and assets, the anticipated finance needs and reasonable financial structure becomes more of an imperative.

Entrepreneurs can therefore benefit if they can link their sales and marketing strategy and expenses, prices, sales, margins, growth rate, financing needs, amount of debt and equity they should get, debt service, cash flow under various scenarios, and potential dilution under equity to gauge the option that best balances the business potential and the entrepreneur’s risk.

After the business is operational, entrepreneurs need to be able to monitor their performance against their projections regularly to see how well their companies are performing against their expectations and compare their cash flow to their debt service requirements (Neely 1998). The need to monitor does not diminish if the venture is financed with equity. Investors also have expectations of returns and exits (Gilbert 1990) and they expect the venture to be managed without hiccups. Otherwise, they may change management (if the investors have the right to do so) or not fund future rounds, which could result in the closing of the venture.

Lastly, new business development requires a variety of skills including technical, operations, sales, marketing and finance expertise, and often the entrepreneur needs to know enough about all of these to serve the customers and develop an advantage. There are few entrepreneurs who are competent in all the areas, and many entrepreneurs do not have the resources to hire experts. A study by the author (Rao 2010) shows that of the 28 entrepreneurs
who built $100 million+ (sales and/or valuation) businesses in Minnesota, the two strongest skills, after leadership, were in sales (64 percent) and financial management (64 percent). This is an unusual combination. Many entrepreneurs are not naturally skilled in financial management and often leave financial projections, financing and monitoring to others, such as their accountant. While ventures with entrepreneurial teams may have a full set of skills, individual entrepreneurs often need to learn these skills themselves. Studies have shown that individuals often refuse to engage in “close and trustful relationships with representatives of other disciplines” (Luthje 2006, and Prugl). This means that the ability to teach financial management skills to otherwise qualified entrepreneurs could be a valuable tool.

**Addressing the Need: Help Entrepreneurs Link Business and Finance**

This paper discusses a set of web-based worksheets that help entrepreneurs without finance expertise to develop a basic financial model of their business to project their financial statements, estimate the amount of financing needed, and design an appropriate financing structure based on an analysis of multiple business scenarios and assumptions. This simple “what if” analysis can help entrepreneurs to better select the business strategy that best fits their financial situation and goals. It can help entrepreneurs link their business and finance strategies, and develop their starting finance plan and financing structure.

One of the key problems in entrepreneurial education is that most entrepreneurs, especially those who come from a sales or operations background, are not very comfortable with financial statements. Accounting and financial controls often seem alien especially due to the complexity of the tax code, and they seek the assistance of accountants to develop their projections.
This can be true even of business school students. The author teaches MBA students, many of whom learn how to analyze existing financial statements, calculate trends, variances and ratios. But they are often lost if they are asked to develop a set of financial projections from scratch for a new venture. They are usually unaware of the various assumptions they have to make that affect the financial statements, and how they interrelate to each other. More importantly, they do not seem to understand the links between their business strategy and their financial needs and profitability.

This often leads to problems after they start the business. Even though entrepreneurs state, and maybe think, that their projections are conservative, the reality is that projections hardly ever come true. And even if the projections were conservative, higher sales levels than projected can require the business to need more cash to sustain the higher levels of business activity. Entrepreneurs often do not realize the implications of any changes from their projections and so are blissfully unaware of impending problems. As an example, their sales may be lower than projected and they don’t realize that their losses may be higher and cash outflow higher still and one day they realize that they don’t have the cash to meet payroll. This can lead to failure through insufficient capital.

The above is just one scenario. Many entrepreneurs are uncomfortable with numbers and think that only their accountant needs to know their numbers. This sometimes leads them to not know their true costs or the relationship between sales, pricing, assets and cash flow, and think that they can do better by selling more. Entrepreneurs need to understand how their business decisions can affect their financial results.

Entrepreneurs could also do better if they could test the impact of their business decisions on their financial results and financing needs. This would include understanding the impact of
sales levels, business strategy, and pricing on the amount of profits, cash flow, assets, and financing structure. Therefore it is important to find ways to help entrepreneurs understand the basics of financial statements, how they reflect business performance and how their financial results are linked to their business decisions. This can help the entrepreneurs make better decisions to reach their goals.

The goal of the “60 Minute Finance Plan™” is to help entrepreneurs develop their basic financial projection and to determine their needs without being overwhelmed in accounting minutiae. This means getting the first draft of the basic finance projections done with some simplifying assumptions and then adding the complexity, which has to do with debt and taxes.

How to Help Entrepreneurs understand their Numbers

How does an instructor or advisor teach entrepreneurs to understand what the numbers mean to the business? This paper suggests a step-wise approach to teach entrepreneurs to understand financial statements and to use this knowledge in their business.

A lot of the complexity of financial statements arises from depreciation and interest. Without depreciation, equipment would be just another expense and so would interest. Interest payments are more complicated because they depend on the level of debt, which can be influenced by the interest payments.

Therefore in the first cut, the “60 Minute Finance Plan” is designed to assume that there are no fixed assets to depreciate or interest costs to calculate. A ‘starter’ financial statement for a new company can be determined by using 14 numbers. Instead of fixed assets, the entrepreneur can include an equivalent amount into leasing costs so that the financial statements are accurate assuming an all-equity financed venture. Fixed assets and depreciation could be added after the
first cut of financials is developed. To use the worksheets (see www.infinancing.com), the entrepreneur enters the following numbers and clicks the “apply” buttons:

- Tax rate
- Interest rate on debt
- Year one sales
- Sales growth rate
- Cost of goods as percent of sales
- Sales and marketing costs as percent of sales
- General and administrative costs as percent of sales
- Lease payments for all fixed assets for each year
- Accounts receivable as percent of sales
- Inventory as percent of sales
- Other current assets as percent of sales
- Accounts payable as percent of sales
- Accruals as percent of sales
- Other current liabilities as percent of sales
- Initial investment assuming equity

Based on the above numbers, the worksheets at infinancing.com provide the following financial statements:

- Income statements as shows in Figure 1.
- Balance sheet as shown in Figure 2.
- Cash flow statements as shown in Figure 3.
- Finance needs by use for each year, as shown in Figure 4.

Balance Sheet Output

![Image of a balance sheet output]

The balance sheet output contains detailed financial information for different years, including assets, liabilities, and equity. The data is presented in a tabular format, with columns for different years and categories such as cash and short-term investments, accounts receivable, inventories, and more. Each category is followed by the corresponding financial figures for each year, allowing for a clear comparison and analysis over time.

Figure 4.

Financing Needs Output
Benefits to Entrepreneurs

Understanding how to develop projections and the links between business strategies and financial results can help entrepreneurs improve their management of the business. The entrepreneur can use the spreadsheets to evaluate alternate financing options, and decide the right scenario for the business, including the impact of pricing and growth rate on sales, net income, cash flow and cash needs. By developing financial worksheets tied to assumptions, entrepreneurs can evaluate the “what-if” of a business. Some of the links that entrepreneurs can understand include:

Sales, assets, debt and equity: Due to the link between sales and balance sheet items, such as receivables, inventory, and payables, entrepreneurs can immediately understand the effect of increasing sales on assets needed. They can also control fixed assets by evaluating the level of fixed asset lease payments for each level of sales, giving them a perspective of the amount of total financing they need for the level of sales they expect.

Prices, sales, assets, and cash flow: Pricing can be a major decision for entrepreneurs. Many want to price low to make it easier to get sales. But lower sales, in addition to the potential of sparking a price war, may result in higher sales, assets and financing needed by the business, and lower profits and reduced cash flow for lenders and investors. These worksheets allow the entrepreneur to understand the connection between the level of pricing and sales, gross margins, cash flow and asset needs.

Market segment, costs of selling, and cash flow: Some market segments are potentially big and look attractive. But they could also require large upfront investments in marketing, even before the company benefits from any sales. Also, if the segment requires that the entrepreneur work through intermediaries, such as distributors or retailers, the net amount received could be
much lower than the suggested retail price, further reducing margins and cash flow. Understanding this connection can help entrepreneurs find the right segment.

*Growth rate, assets and cash flow:* As many entrepreneurs realize after they are in business, if they are able to increase internal cash flow, they are more likely to get external cash. Financiers like to finance businesses that are strong, which means those with high internal cash flow. And cash flow is often a function of growth rate. A higher growth rate can require more assets and more financing. Finding the right growth rate can be a crucial decision so that the venture does not run out of money.

*Fixed costs, margins and break-even levels:* Raising money becomes much easier after the business starts to show a profit. The worksheets can help entrepreneurs understand the scenario that best balances market domination and break-even levels. This understanding may encourage entrepreneurs to bootstrap and do more with less by using strategies such as outsourcing more operations, and making more costs variable.

In all ventures, especially new ones, the business and finance strategies are intertwined. Entrepreneurial strategies are limited by available financing and financing availability is usually affected by the strategy. But entrepreneurs seem to regard the development of these strategies as a sequential process. By understanding the links, entrepreneurs may understand their strategic options at various financing levels, and be in a better negotiating position with financiers. These worksheets allow entrepreneurs to experiment with alternative options to decide which scenario best captures their selected market while finding the best financing option.

**Conclusion**

While this paper only describes the initial starter financial projection and needs, entrepreneurs can also add additional complexity such as taxes and debt, with the related interest
costs. Entrepreneurs can use the IRS Publication 946 (How to depreciate properly) to calculate the level of depreciation for the anticipated amount of fixed assets, and add them to the balance sheet and income statement. Most likely, the entrepreneurs will use their accountant to calculate the precise amounts. They can also calculate the amount of debt they can borrow using the senior and subordinated debt worksheets and enter the interest costs in the financial statement. This can allow them to recalculate the financial needs of the business. The equity valuation worksheet allows the entrepreneur to understand the potential dilution they will incur at each round. The key benefit of the “60 Minute Finance Plan™” is that entrepreneurs can understand the linkages between their business decisions and the financial implications and finance needs.

Title: Critical Mass is Critical: A View Into the Changing World of Scholarly Communications

Abstract: In this changing world of scholarly research, each slice of the scholarly communication spectrum plays an important role. Creating content is no longer a concern. There is abundance, in fact an overabundance of scholarly research and other information. Scarcity is no longer the issue.

The issue is creating a model for producing, sharing, and maintaining scholarly communications through communities that are sustainable and enhance innovative research by other scientists. Online communities provide significant value to the widest array of users, including scientists and other professionals. Scholarly communities, based on an interdisciplinary approach, encourage innovative research. Sustainability and innovative research are critical to providing the broadest spectrum of scholarly communication to the greatest number of users. Providing access to epic amounts of content is not enough, the communities also need to increase the efficient use of the content and provide user focused tools that allow the scientists to be the most efficient and effective in their research activities.

Using data from the Social Science Research Network's (SSRN) Entrepreneurship Research & Policy Network and other sources, this presentation will provide a brief history of how scholarly communications have changed in recent years and outline an approach for using online communities to produce innovative results.

Abstract

Across centuries and across time, the role of women remains rooted into eternity. It forever remains the same and at the same time goes through many transitions. It takes centuries for women’s role to unfold in different forms, shapes and sizes and to move in new directions (Indira Parikh and Bharthi, 2005). Once upon a time the large part of the world was designed such that men could only set up enterprises. Then there were women who by compulsion of circumstances took up income generating activities to sustain themselves and their family. The men of these women were either not there or if they were there would not or could not take the responsibilities of sustaining the family (Indira Parikh & Bharthi Kollan, 2005). Small business and entrepreneurship in India are the prime-force in generating productive employment and ensuring a more equitable distribution of income in the process of economic development of the country. It facilitated effective mobilization of resources of capital and skills which helps to reduce poverty and unemployment.

Andhra Pradesh a Southern state in India has witnessed a proactive policy to improve the social and economic benefits to the poor women. The government of Andhra Pradesh has provided a variety of services for empowering women’s through different programmes. The IKP Scheme was started during the year 2004-05 with an objective of providing interest subsidy on the loans taken by the Self Help Groups. In the year 2005, the scope of the 2 projects was expanded to cover all mandals and all villages of the state and the comprehensive programme was named as “Indira Kranthi Patham (IKP)”. The scheme is applicable to all loans extended by banks on or after 1st July 2004, under SHG Bank Linkage Programme (2007, APMAS).
Under this Indira Kranthi Patham one such program is Pavalla Vaddi, where the objective of this scheme is to encourage income-earning activities among the poor women by obtaining from Micro Finance through bank linkage to reduce the financial burden. The present study is to identify the beneficiaries of this scheme, and the successful women in the Self Help Groups, analyse the process and list out the problems in implementation and examine the impact of this program on women.

**Introduction**

"It is my dream. It is my firm determination, to make one crore Self-Help Group women of the State lakhiers (Lakshadhikaris”) through bank loans with the "Pavala Vaddi” scheme in the next four years. I am sure we can achieve it.

Dr Y S Rajasekhara Reddy
(Ex. Chief Minister, Andhra Pradesh)

Across centuries and across time, the role of women remains rooted into eternity. It forever remains the same and at the same time goes through many transitions. It takes centuries for women’s role to unfold in different forms, shapes and sizes and to move in new directions (Indira Parikhand and Bharthi, 2005). The government of Andhra Pradesh has taken up the theme of women’s empowerment as one of the strategies to tackle the social–economic poverty. To reach for the development of women other kinds of actions are also needed, actions that focus on persons with disabilities and their representative organizations. The objective of Andhra Pradesh government is each family in state should be out of poverty and enjoy life with dignity, equity within the family, freedom from hunger, decent income: > Rs. 5000 per month, 3-4 sources. Supporting women entrepreneurs to introduce new schemes to setup enterprises enhances the potential to increase productivity, create employment, reduce poverty, and promote local development. Women go into business in a variety of forms, including self-employment, SMEs, social entrepreneurship, cooperatives and many more. For women to recognize their entrepreneurial potential, it is important to promote role models that coincide with their realities and aspirations.
SHGs - A MOVEMENT IN ANDHRA PRADESH

There are about 4.65 lakhs women SHGs in Andhra Pradesh covering nearly 61.70 lakhs poor women (APMAS, 2007). Andhra Pradesh alone has about half of SHGs organized in the Country. The SHGs are also popularly called DWCRA Groups, and this name became popular after the DWCRA programme (Development of Women and Children in Rural Areas) through which women’s groups were assisted initially. The SHGs are not only resorting to thrift but also are taking small loans out of the corpus available with the group. The group corpus consists of savings, government assistance and also bank loan. Members use the loan out of group corpus for their personal needs initially, however in the long run such loans are utilised for income generation activities. Since inception an amount of Rs.1556.90 crores is mobilized as corpus by these groups (APMAS, 2007).

MICRO CREDIT TO SHGs:

Micro credit summit conducted in 1997 in Washington resolved to reach 100 million poor women by 2005 all over the world. In Andhra Pradesh alone, 61.70 lakh women were covered under micro credit with a saving of a rupee per day and the financial institutions extending loans up to 4 times to the amount of group savings. From the year 1997 to January 2003, Banks extended a loan of Rs.1345 crores to SHG and the recovery of loans is more than 95%. Recently commercial banks have reduced interest rate on the loans extended to SHGs from 12% to 9% (APMAS, 2007).

PAVALA VADDI

Pavala vaddi meaning a 25 paisa interest is one of the most innovative and effective incentive scheme introduced in the sector in the country. Interest subsidy scheme was started during the year 2004-05 with an objective of providing interest subsidy on the loans taken by the Self Help Groups. The scheme is applicable to all loans extended by banks on or after 1st July 2004, under SHG Bank Linkage Programme. The incentive will be in the form of reimbursement of interest whatever is above 3% interest irrespective of bank interest rates. The subsidy shall not include penal interest, liquidated damages etc., paid to the bank. An amount of Rs. 1000.00 lakhs is allocated in the budget and the amount has been released during the current year. During the year 2005-06, an amount of Rs. 8900.00 lakhs is being year marked towards interest subsidy on the loans taken by SHGs under SHG Linkage programme.
The groups should repay the loans as per the schedule negotiated with the banks. In case any group is in default of interest/ principal for more than three months, it becomes ineligible under the scheme. To avail this subsidy, groups simple will have to regularly repay loan installments including interest to the bank. They are not required to obtain and submit any applications or certificates. Government will make arrangements to remit the subsidy amount directly in the savings bank account of all eligible groups or reimbursed the subsidy amount to groups through cheques.

Banks need just to furnish the list of all eligible groups and the amount details to the DRDA/ IKP personal. Though total financial outlays are limited under Pavala Vaddi, the scheme proved to be most effective in getting prompt repayment from the groups. It appears that the bankers also realized the potential of the scheme in getting prompt repayment and they started lending to SHGs liberally. All state governments and the central government are advised to implement similar scheme in place of their existing incentive schemes for SHGs/ poor. It may be worth noting, that the AP government appears to be replaced the erstwhile revolving fund scheme with this PV scheme (FAPPCI, 2003).

**The present study**

After the state election in 2004, a paradigm shift took place in the state development policies/ programs. Investments have been increased in rural and agriculture development. Incentives/ subsidies have been provided to the poor and vulnerable sections. State administration is made to be more accountable to the people. The SHG bank linkage got big boost in recent years. Therefore, it was felt that it would be very useful to assess the impact of the paradigm shift, which took place in 2004 on the process of women’s empowerment in general and SHG members’ in particular.

**Objectives of the study**

1. To understand the status and process of women empowerment in the district
2. To identify the beneficiaries of this scheme
3. To analyse the successful business women in the SHGs
4. To analyse and compare the standard of living of these women from the past years
THE METHODOLOGY
The study was based on both secondary and primary sources of data. Primary data was collected from 50 women doing small businesses with the help of Pavala Vaddi, in the Hyderabad region with a structured questionnaire. Data – both factual and opinion – was collected from these women relating to their group, social and economic condition, the processes etc. data collected was content analyzed and presented in the form of graph and simple statistical treatment. Secondary data was collected from books, journals, websites and other literature available.

THE FINDINGS OF THE STUDY
Over 56% of the women fall under the age of 26-35, 38% are in the age of 36-45 and only 6% of them in 18-25 years of age (Graph 1). It may be interesting to explore the reasons for higher representation of women in the age of 26-35 years. The religions of these women are 44% of each are Hindus and Muslims and only 12% are Christians (Graph 2). Majority 86% of them are married, 8% are widows, 4% are separated and 2% are single (Graph 3). The education of these women are 30% are illiterate, it indicates that the governments contribution in imparting literacy skills among its members. 22% & 18 are LP & UP, 14% are from High School, and 16% are +2 (Graph 1). The larger proportion of high school educated members, primary educated members in the sample suggests higher economic and cultural inequalities among the members.

Out of the sample, over 34% are Nuclear, and 60% belong to joint families living together and 6% are single member families (Graph 5). Majority of the members are expected to be wife status in the family. In total 60% members are wives, 32% are mothers, and 8% are mother in laws and daughter-in-laws and daughters (Graph 6). In total 88% are male headed and only 12% are female headed families including a single members families (Graph 7).

The economic conditions of the respondent from the sample 28% are salaried, 48% are self employed, petty business, 24% are house wives (Graph 8). . The monthly average income of the family before joining the group (app.): 8% are in 1001-1500 Rs,
50% come under 1501-2000, 38% in 2001 – 3000, 4% in 3001-4000 Rs (Graph 9). This show the conditions of these families are below poverty line.

The motivation to become a member of the SHG 24 % financial benefit, 28% image, 48% to earn (Graph 10). The motivations for joining into such group are: 52% through government, 22% by the support of the friends, 14% from neighbours and 12 % from SHGs (Graph 11). This shows how the governments’ active participation in motivating the women. There are no dropouts in the SHGs.100% the registers, account books, reports are maintained properly (Graph 12). The degree of change in decision making in the family after becoming the member in the group and starting the business are mobility –increased by 34% and very much increased 66% (Graph 13), education of children – increased 60% and very much increased 40% (Graph 14), investment/loans- no change 12%, increased 62%, very much increased 26% (Graph 15), healthcare – no change 2%, increased 62%, and very much increased 36% (Graph 16).

Men helping women in household work: cooking – no change 24%, increased 66% and very much increased 10% (Graph 17), brining water/fuel – 50% increased and 50% very much increased (Graph 18), cleaning 58% increased and 42% very much increased (Graph 19), going to market 52 % increased and 48% very much increased (Graph 20). Allowing women to go out for work- no change 6% increased 38%, very much increased 56% (Graph 21). This is good improvement in empowering women. Recognizing the value of the women’s household work: no change 2% increased 68% and very much increased 30% (Graph 22).

Over 100% don’t have a Saving Bank Account before joining the group (Graph 23). The source of finance that these women bear before joining the group money lenders 54%, wait for the salaries 26% and relatives and friends 20% (Graph 24). 100% of the women took loan after the joining the group (Graph 25). Over 24% of the women are still taking loan from the money lenders and 76% no (Graph 26).

Activity of the enterprise represented by women were 14 % food, 20% clothing, any other 18%, small Kirana stores 32% and saris and tailoring 16% (Graph 27). The women who underwent training were yes 32% no 40% and NA 28% (Graph 28). The total cost of the project 1000 -8000 were 22%, 8000-15000 were 6%, 1500-25000
were 32%, and from 25000-35000 it was 40% (Graph 29). The average monthly profit of these women after taking loan was 2000-3000- 14%, 3000-4000- 36%, 4000-5000- 34%, 5000-6000-16% (Graph 30). This shows that they are benefited by their businesses.

**Conclusion**

This study of women running small business with the help of *pavala vaddi* in Hyderabad was designed to determine the successful women and the major benefits they had gotten from being in the business. The members have attained more empowerment during the last years. The government in the year 2004 introduced the scheme by giving loans with less interest and easy repayments. Most of women have started the business by themselves, had small kirana shops, and the standard of living of these families have changed and the degree of change in decision making in family after becoming the member in the group has increased. Men started helping women in household work i.e. cooking, cleaning, etc, and allowing women to go out for work. The quality of groups has increased because of rigorous efforts of the project. Member’s access to health care is an area of concern, education to the members and the children and bringing the awareness about the current issues should be taken more care. The amount of the loan should be increased so that they can increase the size of the business. The observed change in women in small business empowerment might have be the result of some swift changes in economic and other fields.

The government should promote such activities to the welfare of the women in backward areas and it should continue such programs where women are uplifted. Encourage involvement of women entrepreneurs from non-Governmental organizations, voluntary agencies and such bodies involved in promotion and development, by providing them support, assistance and making use of their expertise for development of entrepreneurship.
Supporting media campaigns, workshops, trade fairs, exhibitions and other promotional events— involving governments, employers’ and workers’ organizations and local communities—to provide women entrepreneurs with a platform to promote voices for change and be inspirational for other women. Promoting policies that assist women in establishing small- and micro-businesses, including providing business skills training, access to communication technology and credits to enhance the productivity.

The amount of the loan should be increased so that they can increase the size of the business. The observed change in women in small business empowerment might have be the result of some swift changes in economic and other fields.

The government should promote such activities to the welfare of the women in backward areas and it should continue such programs where women are uplifted. Encourage involvement of women entrepreneurs from non-Governmental organizations, voluntary agencies and such bodies involved in promotion and development, by providing them support, assistance and making use of their expertise for development of entrepreneurship.

Supporting media campaigns, workshops, trade fairs, exhibitions and other promotional events—involving governments, employers’ and workers’ organizations and local communities—to provide women entrepreneurs with a platform to promote voices for change and be inspirational for other women. Promoting policies that assist women in establishing small- and micro-businesses, including providing business skills training, access to communication technology and credits to enhance the productivity.

THE GLOBAL ENTREPRENEURSHIP MONITOR (GEM)

The Global Entrepreneurship Monitor (GEM) is the most comprehensive ongoing study of entrepreneurship in the world. GEM’s 50+ national teams conduct annual research measuring entrepreneurial attitudes, activity, and aspirations with the goal to help governments, businesses, and educators design policies, develop programs, and aid entrepreneurs in generating new jobs and wealth.

This session will focus on the exciting details surrounding GEM research, current impacts, and how you can be a part this major research undertaking at a time when individual entrepreneurial activity may hold the key to transforming the global economy.
